Corrective Action Taken:	The initialization state of the module is corrected.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Initialization state of the modules in the DDRSMINIT byte.
<i>Good Data</i> =	Correct initialization states of the modules.
<i>Logical Index</i> =	Module number whose initialization state is incorrect.
<i>Dump</i> =	NA.

Table 36 Error Code: HIMRSMISOL

Error Code:	HIMRSMISOL
Error Description:	The RSMISOL bit for an IM other than HIM does not match RISOL bit.
Possible Error Effect:	The isolation state of the RSM is incorrect.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Isolation state of the RSMs in the DDRSMISOL byte.
<i>Good Data</i> =	Correct isolation states of RSMs.
<i>Logical Index</i> =	IM number whose isolation state is incorrect.
<i>Dump</i> =	NA.

Table 37 Error Code: HIMRSMSEP

Error Code:	HIMRSMSEP
Error Description:	The RSMSEP byte for a non MMRSIM IM is not zero.
Possible Error Effect:	The separation state of the module is incorrect.
Corrective Action Taken:	The separation state of the module is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Separation state of the modules in the DDRSMSEP byte.
<i>Good Data</i> =	Correct separation states of the modules.
<i>Logical Index</i> =	Module number whose separation state is incorrect.
<i>Dump</i> =	NA.

Table 38 Error Code: INV

Error Code:	INV
Error Description:	The DDRSEP byte for an HSM is not zero.
Possible Error Effect:	The separation state of the HSM is incorrect.
Corrective Action Taken:	The separation state of the HSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Separation state of the HSM in the DDRSMSEP byte.
<i>Good Data</i> =	Correct separation states of the HSM.
<i>Logical Index</i> =	Module number whose separation state is incorrect.
<i>Dump</i> =	NA.

Table 39 Error Code: LNK_CTS_NUM

Error Code:	LNK_CTS_NUM
Error Description:	The data in either DDCTS0 or DDCTS1 pertaining to the even and odd CTS link numbers is inconsistent with the data maintained in the ODD relation RLMODATT.
Possible Error Effect:	Incorrect link information will be used.
Corrective Action Taken:	The data in either DDCTS0 or DDCTS1 will be updated to be consistent with the ODD relation RLMODATT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	0 if error is pertaining to DDCTS0 or 1 if error is pertaining to DDCTS1.
<i>Bad Data</i> =	Return value from DDREAD call.
<i>Good Data</i> =	ODD rIMODATT data for this SM. Even CTS link number for DDCTS0 and ODD CTS link number for DDCTS1.
<i>Logical Index</i> =	The number of the SM whose link information is in error.
<i>Dump</i> =	Copy of the rIMODATT tuple of the SM in question.

Table 40 Error Code: LNK2ILST

Error Code:	LNK2ILST
Error Description:	The DD key summary status does not match the actual value returned by TM.
Possible Error Effect:	A major or minor alarm may sound, when it should or not sound.
Corrective Action Taken:	The corresponding DD key will be updated with the appropriate value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Bad DD key value.
<i>Good Data =</i>	Good DD key value.
<i>Logical Index =</i>	The DD key that had the error.
<i>Dump =</i>	NA.

Table 41 Error Code: MODATT

Error Code:	MODATT
Error Description:	An attempt to obtain a rIMODATT tuple with a given key failed. The audit has not taken any recovery measures other than to inform the user of the existence of the error.
Possible Error Effect:	Since this check occurred after it was determined that an RSM number existed for an HSM, the audit will simply go on to the next RSM, if any, hanging off the HSM.
Corrective Action Taken:	None.
Manual Action Required:	If this error is rolling that user should investigate the condition.
Dump Description:	
<i>Error Address =</i>	Address of the rIMODATT tuple key.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key to the rIMODATT tuple which is the RSM module number.
<i>Dump =</i>	NA.

Table 42 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	Corresponding rIHSMRSM tuple could not be found in the database. This error will continue to print out until fixed by the user.
Possible Error Effect:	May cause asserts and/or interrupts by various application programs.
Corrective Action Taken:	None.
Manual Action Required:	Using ODBE, insert the missing rIHSMRSM tuple using the key which is dumped in the Logical Index of this error report.
Dump Description:	
<i>Error Address =</i>	Address of rIHSMRSM tuple buffer.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (<i>hsmnum</i>) of the rIHSMRSM tuple buffer.
<i>Dump =</i>	NA.

Table 43 Error Code: RCMISOL

Error Code:	RCMISOL
Error Description:	The communication module vintage is not CM2 and the data delivery keys DDRCMISOL and DDSCMISOL are not cleared. These two keys can only be set in CM2 offices.
Possible Error Effect:	The DD keys will contain the incorrect status. As a result, communication module maintenance functionality may not be available.
Corrective Action Taken:	Write both the DDRCMISOL and DDSCMISOL keys to DDNORMAL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The data delivery DDSCMISOL data.
<i>Bad Data =</i>	The data delivery DDRCMISOL data.
<i>Good Data =</i>	Glcmm0vint.
<i>Logical Index =</i>	Glcmm1vint.
<i>Dump =</i>	NA.

Table 44 Error Code: RSMINITO

Error Code:	RSMINITO
Error Description:	The RMSINIT byte for an RSM is not zero.
Possible Error Effect:	The initialization state of the RSM is incorrect.
Corrective Action Taken:	The initialization state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Initialization state of the RSM in the DDRSMINIT byte.
<i>Good Data =</i>	Correct initialization states of the RSM.
<i>Logical Index =</i>	Module number whose initialization state is incorrect.
<i>Dump =</i>	NA.

Table 45 Error Code: RSMINITO

Error Code:	RSMINITO
Error Description:	The RSMINIT byte for an HSM is not zero.
Possible Error Effect:	The initialization state of the HSM is incorrect.
Corrective Action Taken:	The initialization state of the HSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Initialization state of the HSM in the DDRSMINIT byte.
<i>Good Data =</i>	Correct initialization states of the HSM.
<i>Logical Index =</i>	Module number whose initialization state is incorrect.
<i>Dump =</i>	NA.

Table 46 Error Code: RSMSEPO

Error Code:	RSMSEPO
Error Description:	The RSMSEP byte for an RSM is not zero.
Possible Error Effect:	The separation state of the RSM is incorrect.
Corrective Action Taken:	The separation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Separation state of the RSM in the DDRSMSEP byte.
<i>Good Data =</i>	Correct separation states of the RSM.
<i>Logical Index =</i>	Module number whose separation state is incorrect.
<i>Dump =</i>	NA.

Table 47 Error Code: RSMSEPO

Error Code:	RSMSEPO
Error Description:	The RSMSEP byte for an HSM is not zero.
Possible Error Effect:	The separation state of the HSM is incorrect.
Corrective Action Taken:	The separation state of the HSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Separation state of the HSM in the DDRSMSEP byte.
<i>Good Data =</i>	Correct separation states of the HSM.
<i>Logical Index =</i>	Module number whose separation state is incorrect.
<i>Dump =</i>	NA.

Table 48 Error Code: SCMISOL

Error Code:	SCMISOL
Error Description:	The CM isolation DD status key DDSCMISOL is incorrectly set in the pending state (DDPCMISOL). A <i>Good Data</i> value of 1 indicates that the CM isolation DD request key DDRCMISOL is not normal and entry into manual CM isolation should be in progress. However, there is no CM isolation request on the SMARS queue.

	A <i>Good Data</i> value of 0 indicates that DDRCMISOL is normal and an AM/CM re-synchronization should be in progress. However, the SMrsmode re-synchronization flag is SMRSNULL.
Possible Error Effect:	The DDSCMISOL DD key is stuck in what should be a transient pending state giving incorrect CM isolation status and stubbing off PCD auditing. Some communication module maintenance functionality may not be available.
Corrective Action Taken:	Write the DDSCMISOL key to DDNORMAL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Value for DDRCMISOL.
<i>Bad Data</i> =	Value for DDSCMISOL.
<i>Good Data</i> =	Either 0 or 1, see Error Description.
<i>Logical Index</i> =	Value for SMrsmode.
<i>Dump</i> =	NA.

Table 49 Error Code: STUCK

Error Code:	STUCK
Error Description:	The RSMISOL byte for an RSM is not zero.
Possible Error Effect:	Invalid state of the RSM single RSM offices should always have the isolation bits set to zero.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Isolation byte DDRSMISOL.
<i>Good Data</i> =	Written value of zero to DMRSMISOL.
<i>Logical Index</i> =	RSM module number.
<i>Dump</i> =	NA.

Table 50 Error Code: TYPE

Error Code:	TYPE
Error Description:	A switching module (SM) type in data delivery (DD) key DDSM2000 is inconsistent with RLMODATT (rIMODATT.unitttype = SMSM2000 and DDSM2000 = DD CLEAR for the SM or rIMODATT.unitttype != SMSM2000 and DDSM2000 = DDSET for the SM).
Possible Error Effect:	Call processing may take incorrect actions for the given SM.
Corrective Action Taken:	The audit writes DDSM2000 to agree with rIMODATT.unitttype. That is, if rIMODATT.unitttype = SMSM2000, the audit writes the value of DDSM2000 to DDSET for this SM. Otherwise, the audit writes the value of DDSM2000 for this SM to DD CLEAR.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Value in DDSM2000 for the SM.
<i>Good Data</i> =	SM type (rIMODATT.unitttype)
<i>Logical Index</i> =	SM number (rIMODATT.module)
<i>Dump</i> =	rIMODATT tuple for this SM.

Table 51 Error Code: UEQRSMISOL

Error Code:	UEQRSMISOL
Error Description:	The RSMISOL bit for an unequipped RSM does not match RISOL bit.
Possible Error Effect:	The isolation state of the RSM is incorrect.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Isolation state of the RSMs in the DDRSMISOL byte.
<i>Good Data</i> =	Correct isolation states of RSMs.
<i>Logical Index</i> =	Offset of the unequipped RSM.
<i>Dump</i> =	NA.

Table 52 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up, after taking a reset.
Possible Error Effect:	Causes resets and/or asserts.
Corrective Action Taken:	Reinitialize audit global data, return audit complete, and wait for next cycle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	AUddindex (tells audit which SM to check next).

DD-B

Software Release: 5E12 - 5E13

1. DATA DELIVERY (DD) AUDIT

The data delivery (DD) mechanism and audit covers data in the operational kernel process (OKP) and switch maintenance kernel process (SMKP) environments in the administrative module (AM), communications module processor (CMP) as well as the operating system for distributed switching-switching modules (OSDS-SMs) environment. The audit verifies the consistency of different data delivery data against other static data, data delivery, and global data. The audit reports errors it detects and makes the slave data consistent with available master data. If no master data exists, the data delivery data is set to a safe state. Data delivery data in incorrect states could disable call processing and cause problems for maintenance, billing, and growth; hence the need for the DD audit.

The DD audit runs in the CMP, OKP, SM, and SMKP environments in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The DD audit checks the consistency of a number of different DD data structures. The term "DD key" refers to an identifier for information maintained by data delivery. Some of these data structures exist in the AM as AM-only data, some exist in the AM on a per SM basis, some exist in the AM on a per message class basis, and some of the data exists only in the SMs. The DD data structures checked are referenced by the following DD keys:

DDAPDLDSL	DDDIOPMODEL	DDPCONFIGSTL	DDRSMSEP
DDASPTRIGL	DDEQSTATL	DDPSSWSTATL	DDRTCDELNK
DDAUEWRKL	DDHOSTNUML	DDPVNALWL	DDRTCENET
DDCM_VINTL	DDIMTYPEL	DDRISOLL	DDSASWC
DDCNIMINL	DDMATECMPL	DDRMSWCKL	DDSCMISOL
DDCNIOOSL	DDMGDSCBL	DDRSEPL	DDSINIT
DDCTS0L	DDMGLOGBL	DDRSMINIL	DDSMIN
DDCTS1L	DDMGPRIBL	DDRSMISOLL	DDSREX
DDDASCDL			

3. AUDIT CHECKS

The audit makes the following checks and takes the specified actions.

Check	Environment	Action
DDAPDLDSL	SM	Checks the new data delivery key DDAPDLDSL against the AP link status table (PSaplst[]). DDAPDLDSL provides a summary of the status of the AP data link digital subscribe lines (DSLs) for a given SM. PSaplst[] contains information on the status of each of the individual AP data link DSLs. If the two values found do not match, an audit error is reported and DDAPDLDSL will be updated to agree with the information found in PSaplst[].
DDASPTRIG	OKP	Checks DD data associated with key DDASPTRIG against the data against the rIDS_APP tuple referenced by the key of CCAINR01. When the rIDS_APP tuple is not found, the DD data should indicate clear. When the rIDS_APP tuple is found and the global parameter is DBPVN_SSP, the DD data should be set.
DDAUEWRK	SMKP	Checks DD data associated with key DDAUEWRK against a global variable, AUEleact, which is maintained by audit control. When the global variable is set, the DD data should be set and when the global variable is clear, the DD data should indicate clear. If an inconsistency is detected, the DD data will be updated to be consistent with the global variable.
DDCM_VINT	OSDS-M	Checks DD data associated with key DDCM_VINT against the SM's office dependent data (ODD) global variable Glcm_vint. If an inconsistency is detected, the DD data will be updated to be consistent with the global variable. An audit error concerning this data is expected during the conversion of a communication module, model 1 (CM1) office to a CM2 office.

DDCNIMIN	OKP	Checks DD data associated with key DDCNIMIN against the DD data associated with key DDSMIN. If DDSMIN is set to indicate minmode, then DDCNIMIN should be set to indicate common network interface (CNI) minmode. If there is an inconsistency, both DD data will be set to not minmode.
DDCNIOOS	OKP	Checks DD data associated with key DDCNIOOS against the ODD variable Glccs. If an office is unequipped with CNI, the DD data should be set indicating that CNI is disabled. If there is an inconsistency, the DD data will be made consistent with the ODD.
DDCTS0	OKP	Checks DD data associated with key DDCTS0 against the even CTS link number stored in MODATT. If there is an inconsistency, the DD data will be made consistent with the ODD.
DDCTS1	OKP	Checks DD data associated with key DDCTS1 against the odd CTS link number stored in MODATT. If there is an inconsistency, the DD data will be made consistent with the ODD.
DDDIOPMODE	OKP	Checks DD data associated with key DDDIOPMODE. If the DD data is set to indicate disk independent mode, a message will be sent to application integrity monitor (AIM) to verify a valid disk independent mode. This will be done by AIM checking the essential disks statuses in the equipment configuration database (ECD). If an inconsistency exists, AIM will reset the DD data to be consistent with the ECD.
DDEQPROCS	OKP/CMP	Checks DD data associated with the key DDEQPROCS against the processors equipage status maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data is made consistent with the ODD.
DDEQSTAT	OKP/CMP	Checks DD data associated with key DDEQSTAT against the SM equipage status maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data will be made consistent with the ODD. (The DD data here is different than that associated with key DDEQIMS.)
DDHOSTNUM	OKP/CMP	Checks DD data associated with key DDHOSTNUM against the host module number maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data will be made consistent with the ODD.
DDIMTYPE	OKP	Checks DD data associated with key DDIMTYPE against the SM type maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data will be made consistent with the ODD.
DDMATECMP	SMKP/CMP	Checks DD data associated with key DDMATECMP against the hostnum field maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data will be made consistent with the ODD.
DDMGDSCB	OKP	Checks DD data associated with key DDMGDSCB against DD data associated with keys DDMGLOGB and DDMGPRTB. If any of the DD data indicates to log or print messages, then the DD data for discard should not be set. If an inconsistency exists, the discard data will be set to not discard.
DDMGLOGB	OKP	This represents the DD data for logging messages. See the check for DDMGDSCB.
DDMGPRTB	OKP	This represents the DD data for printing messages. See the check for DDMGDSCB.
DDPCONFIGST	SMKP	Checks the key DDPCONFIGST for soft switch status by going off of the PCD state for the unit. In the case of a program update, the soft switch periodically resets the key so that the user knows that the program update uses the key.
DDPSSWSTAT	SMKP	Checks DD data associated with key DDPSSWSTAT against the soft switch status. If an inconsistency exists between the soft switch status and the PCD, the DD audit will update the DD key with the PCD information.
DDPVNALW	OKP	Checks DD data associated with key DDPVNALW against the existence of an rIDS_APP tuple referenced by the key of CCPVN (when Glpvn_ofc is set to DBPVN_SSP) or CCNS800. When the rIDS_APP tuple is not found, the DD data should indicate clear. When the rIDS_APP tuple is found and Glpvn_ofc is DBPVN_SSP or Glssp is DBYES, the DD data should be set.
DDRISOL	OSDS-M	Checks are done in a remote switching module (RSM) to verify that the separation information (DDRSEP) about an RSM in a multimodule site is consistent with the corresponding master data kept in DDRISOL.
DDRMSWCK	OSDS-M	Checks DD data associated with key DDRMSWCK against DDSASWCK data. If DDSASWCK data is off-normal, DDRMSWCK data should be off-normal.

DDRSEP	OSDS-M	The data in DDRSEP is the master copy representing the separation status of all the RSMs in a multimodule site it is arranged on a per module basis. The value in DDRSMSEP is compared against this data, and used in correcting any inconsistencies.
DDRSMINIT	OSDS-M	Checks are done to verify that the module initialization information (DDRSMINIT) about a module in a multimodule site is consistent with the corresponding master data kept in DDSINIT. When an inconsistency occurs, the DDRSMINIT status for a given module is set to the value of DDSINIT.
DDRSMISOL	OSDS-M	Checks are done to verify that the isolation status (DDRSMISOL) about a module in a multimodule site is consistent with the master status kept in DDRISOL. When an inconsistency occurs, the DDRSMISOL status for a given module is set to the value of DDRISOL.
DDRSMSSEP	OSDS-M	The data in this 10-bit word is arranged based on the number RSMs in a multimodule site. The separation status of each RSM is maintained here. Checks are done to verify that the separation status (DDRSMSSEP) is consistent with the master status kept in DDRSEP. When an error is found, the wrong bit in DDRSMSEP is set to the value of DDRSEP.
DDRTCENET, DDRTCDELNK	OKP	Checks DD data associated with the key DDRTCENET against the data delivery key DDRTCDELNK sent by the global billing SM. If the two values found do not match, an audit error is reported and DDRTCENET will be updated to agree with DDRTCDELNK.
DDSASWCK	OKP	Checks DD data associated with key DDSASWCK against DDRMSWCK data. If DDRMSWCK data is off-normal, DDSASWCK data should be off-normal.
DDSINIT	OSDS-M	Checks DD data associated with key DDSINIT against the global variable INmode. If an inconsistency exists, the DD data will be made consistent with the global variable.
DDSMCOUNT	OKP	Checks the new data delivery key DDSMCOUNT against the actual number of SMS (including special growth). If the two values do not match, an audit error is reported, and the DDSMCOUNT is updated with the correct value.
DDSMIN	SM	Checks SM DD data associated with DDSMIN against the global variable G1thrt1. If the DD data indicates minmode and the global variable does not, the DD data will be set to not minmode.
DDSREX	OKP	Checks DD data associated with key DDSREX against the inhibit allow status of routine exercises maintained in a global routine exercise table (DGlddb[module].rxinh1st. enable1). If an inconsistency exists, the DD data will be made consistent with the global table.
DDSCMISOL	SMKP	Checks DD data associated with the key DDSCMISOL against the status of the CM isolation request DD key DDRCMISOL and either the SMARS job queue or the SMrsmode AM/CM re-synchronization flag. If an inconsistency exists, the DD data is written to normal.

4. ERROR HANDLING

If the ASP service features find errors, the data delivery bit is updated to be consistent with the static relation RLDS_APP.

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: ACT_DDASPTRIG

Error Code:	ACT_DDASPTRIG
Error Description:	The data delivery data from the key DDASPTRIG is set to indicate ASP 0.1 activation. The static data in rlds_APP does not find a match using a key of CCAINR01, so data delivery data should indicate ASP 0.1 is de-activated.

Possible Error Effect:	Wasting SM data resources.
Corrective Action Taken:	The data delivery data DDASPTRIG is set to indicate ASP 0.1 de-activation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Return code from DD read.
<i>Good Data =</i>	The database return from reading the RLDS_APP relation.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 2 Error Code: ACT_DDPVNALW

Error Code:	ACT_DDPVNALW
Error Description:	The value of the data delivery key, DDPVNALW, is set to indicate ASP activation. A match in static data rIDS_APP does not exist for either of the following keys: (1) A key of CCPVN when Glpvn_ofc is set to DBPVN_SSP, and (2) A key of CCNS800. Therefore, DDPVNALW should not be set.
Possible Error Effect:	Wasting SM data resources.
Corrective Action Taken:	The value of DDPVNALW is cleared to indicate ASP de-activation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Return code from DD read.
<i>Good Data =</i>	The database return from reading the RLDS_APP relation.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 3 Error Code: BAD_DDTBL

Error Code:	BAD_DDTBL
Error Description:	An invalid state field (not AUDDDO, AUDDSKIP or AUDDDONE) in the data delivery audit table (AUdd1tbl[]), has been detected.
Possible Error Effect:	The data delivery audit may not be able to audit all the data items it is supposed to.
Corrective Action Taken:	Reinitialize the index (AUddindx), and start from the beginning of the audit the next time it is entered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of local check table, AUdd1tbl[].
<i>Bad Data =</i>	The state element for the indicated table entry (AUdd1tbl[AUddindx].state).
<i>Good Data =</i>	Maximum array index which when added to 1 equals the number of entries in the table (AUdd_flag).
<i>Logical Index =</i>	Index into the table (AUddindx).
<i>Dump =</i>	The data delivery audit table (AUdd1tbl[]) of entries for the indicated processor.

Table 4 Error Code: BIT1MAP

Error Code:	BIT1MAP
Error Description:	<i>In OKP or CMP:</i> The bit in DDeqmhppe[] associated with a particular switching module (SM) is set incorrectly. That is, either the bit indicates message handler (MH) connectivity for that SM when it should not (the bit is set) or the bit indicates no MH connectivity for that SM when the SM should have it (the bit is clear). See the dump description to determine which of the following cases applies [note that the "rIMODATT tuple" is the tuple associated with the particular SM (rIMODATT.module)]:

	- The bit is set but no rMODATT tuple exists for the SM. - The bit is set but at least one of the rMODATT <i>ql_ntwk0</i> or <i>ql_ntwk1</i> fields has value DBNO. - The bit is clear but both of the rMODATT <i>ql_ntwk0</i> and <i>ql_ntwk1</i> fields have value DBYES. <i>In an SM-2000:</i> The SM's copy of DDeqmhpipe[] is inconsistent with the <i>qends[]</i> fields in the rIQENDPTS tuples where rIQENDPTS.qservice = QLOSDS (representing MH connectivity) and rIQENDPTS.qserv_num = 0 (the default value, used for non-CCS connectivity). Specifically, for each bit in DDeqmhpipe[], that bit should be set if, and only if, the corresponding bits are set in rIQENDPTS.qends[] for both networks (rIQENDPTS.qnetwork = QLNET0 and QLNET1).
Possible Error Effect:	If the bit is set when it should be clear, quad linked packet switching (QLPS) network traffic may be routed to an SM unable to accept it. If the bit is clear when it should be set, the QLPS network may be degraded because it is unable to route to the associated SM.
Corrective Action Taken:	<i>In OKP or CMP:</i> The audit triggers an update of the bit in DDeqmhpipe[] and any other DD data associated with the SM. <i>In SM-2000:</i> The audit triggers a reinitialization of DDeqmhpipe[].
Manual Action Required:	None.
Dump Description:	
<i>In OKP or CMP:</i>	
<i>Error Address =</i>	SM equipage status (rMODATT.eqstat). A value of SMUNEQ may indicate that no rMODATT tuple exists for this SM.
<i>Bad Data =</i>	rMODATT.ql_ntwk0.
<i>Good Data =</i>	rMODATT.ql_ntwk1.
<i>Logical Index =</i>	The associated SM number (used in rMODATT.module when trying to read the rMODATT tuple).
<i>Dump =</i>	NA.
<i>In an SM-2000:</i>	
<i>Error Address =</i>	Current entry in rIQENDPTS.qends[] for network QLNET0.
<i>Bad Data =</i>	Current entry in DDeqmhpipe[] being checked.
<i>Good Data =</i>	Current entry in rIQENDPTS.qends[] for network QLNET1.
<i>Logical Index =</i>	Index of the entry in DDeqmhpipe[] being checked. That is, the index of the first entry to have an error.
<i>Dump 1 =</i>	DDeqmhpipe[].
<i>Dump 2 =</i>	The rIQENDPTS tuple associated with network QLNET0.

Table 5 Error Code: CLIDAT

Error Code:	CLIDAT
Error Description:	An attempt failed to obtain a rCLIDAT tuple with a given cluster ID. The audit has not taken any recovery measures other than to inform the user of the existence of the error.
Possible Error Effect:	Since this check occurred after it was determined that an RSM number existed for an HSM, the audit will simply go on to the next RSM, if any, that is hanging off the HSM.
Corrective Action Taken:	None.
Manual Action Required:	If this error is rolling, the user should investigate the condition. Most likely the

	office information for the RLMODATT and RLCLIDAT relations need correction.
Dump Description:	
<i>Error Address</i> =	Address of the rCLIDAT buffer.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Cluster ID to which RSM belongs.
<i>Dump</i> =	rCLIDAT buffer.

Table 6 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit has detected an inconsistency between data delivery data associated with the SM's count status and that value calculated by the AUddsmcnt() function.
Possible Error Effect:	Incorrect SM count status could be accessed.
Corrective Action Taken:	The data delivery data associated with the SM's count status will be made consistent with that calculated in the AUddsmcnt() function.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery SM count status.
<i>Good Data</i> =	SM count from AUddsmcnt().
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 7 Error Code: DD_MODATT

Error Code:	DD_MODATT
Error Description:	The audit can't read the ODD relation RLMODATT with the given generic plan (GP) number.
Possible Error Effect:	The GP audit data checks may not be done for a particular GP.
Corrective Action Taken:	None.
Manual Action Required:	Validate the GP number that the checks are failing for. Validate the tuple for this GP in the ODD relation RLMODATT.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Return from DBfrdtup.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The number of the GP that the checks can't be done for.
<i>Dump</i> =	The tuple from the ODD relation RLMODATT for the GP in question.

Table 8 Error Code: DDAMABIL

Error Code:	DDAMABIL
Error Description:	The AM's billing stream indicators maintained in AMsmmap on a per SM basis do not agree with those maintained in the ODD relation RLMODATT.
Possible Error Effect:	Billing data may be sent to the wrong billing stream.
Corrective Action Taken:	Make the AMsmmap billing stream indicators consistent with the ODD relation RLMODATT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	AMsmmap data for this SM.
<i>Good Data</i> =	ODD rIMODATT data for this SM.
<i>Logical Index</i> =	The number of the SM whose billing stream indicator data is in error.
<i>Dump</i> =	Copy of the rIMODATT tuple of the SM in question.

Table 9 Error Code: DDAUEWRK

Error Code:	DDAUEWRK
Error Description:	The relationship between data delivery data associated with key DDAUEWRK and global variable AUEleact, is not correct.
Possible Error Effect:	The routine and elevated audits in OKP of the AM may never be scheduled to run.
Corrective Action Taken:	The data delivery data associated with key DDAUEWRK will be made consistent

	with global variable AUEleact.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The data delivery DDAUEWRK data.
<i>Good Data</i> =	The global variable AUEleact, maintained by audit control.
<i>Logical Index</i> =	The mode the audit was running in.
<i>Dump</i> =	NA.

Table 10 Error Code: DDCMVINT

Error Code:	DDCMVINT
Error Description:	The audit has detected an inconsistency between the SM's data delivery data associated with key DDCM_VINT and the ODD global variable Glcm_vint.
Possible Error Effect:	Speed of the XPC chips may be temporarily lost.
Corrective Action Taken:	Set the data delivery data to agree with that in the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery DDCM_VINT data.
<i>Good Data</i> =	ODD Glcm_vint.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 11 Error Code: DDCNIOOS

Error Code:	DDCNIOOS
Error Description:	The audit has detected an inconsistency between data delivery data associated with the office CNI equipage state and the office CNI equipage state maintained in the ODD variable Glccs.
Possible Error Effect:	CNI unique software may be executing abnormally.
Corrective Action Taken:	The data delivery data associated with the office CNI equipage state will be made consistent with the office CNI equipage state maintained in the ODD variable Glccs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery office CNI equipage state.
<i>Good Data</i> =	ODD office CNI equipage state.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 12 Error Code: DDEQIMS

Error Code:	DDEQIMS
Error Description:	The audit has detected an inconsistency in data delivery data between the processor's static equipage status (rIMODATT.eqstat) and the processor's dynamic equipage status in the DDeqims[] array.
Possible Error Effect:	Calls could be incorrectly routed to the processor.
Corrective Action Taken:	The data delivery data associated with the processor's equipage status will be made consistent with the processors equipage status maintained in the ODD relation RLMODATT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery processor equipage data (bit from DDeqims[] array).
<i>Good Data</i> =	ODD processor equipage data (rIMODATT.eqstat).
<i>Logical Index</i> =	The number of the processor whose equipage is in question (rIMODATT.module).
<i>Dump</i> =	Copy of the tuple for this processor from the ODD relation RLMODATT.

Table 13 Error Code: DDEQPROC

Error Code:	DDEQPROC
Error Description:	The audit has detected an inconsistency between data delivery data associated

	with a processors equipage status and the processors equipage status maintained in the ODD relation RLMODATT.
Possible Error Effect:	Calls could be incorrectly routed to the processor.
Corrective Action Taken:	The data delivery data associated with the processors equipage state will be made consistent with the processors equipage state maintained in the ODD relation RLMODATT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery processor equipage data.
<i>Good Data =</i>	ODD processor equipage data.
<i>Logical Index =</i>	The number of the processor whose equipage is in question.
<i>Dump =</i>	Copy of the tuple for this processor from the ODD relation RLMODATT.

Table 14 Error Code: DDEQSTAT

Error Code:	DDEQSTAT
Error Description:	The audit has detected an inconsistency between data delivery data associated with a processor's equipage status and the processor's equipage status maintained in the ODD relation RLMODATT. With the introduction of the CMP, if the DDEQSTAT error rolls out most likely there is an inconsistency between the AM's version of RLMODATT and the CMP's version of RLMODATT.
Possible Error Effect:	Calls could be incorrectly routed to the SM.
Corrective Action Taken:	The data delivery data associated with the SM's equipage state will be made consistent with the SM equipage state maintained in the ODD relation RLMODATT.
Manual Action Required:	Manual action is required only if the error is rolling out for the same SM. The office database editor (ODBE) should be used to make the CMP and AM's versions of RLMODATT consistent. The tuple to be updated is keyed off of the processor number given in the logical index field of the Dump Description.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery processor equipage data.
<i>Good Data =</i>	ODD processor equipage state.
<i>Logical Index =</i>	The number of the processor whose equipage is in question.
<i>Dump =</i>	Copy of the tuple for this processor from the ODD relation RLMODATT.

Table 15 Error Code: DDHOSTNUM

Error Code:	DDHOSTNUM
Error Description:	The audit has detected an inconsistency between data delivery data associated with a module's host SM number and the module's host SM number maintained in the ODD relation RLMODATT.
Possible Error Effect:	Fault recovery actions for an RSM may fail.
Corrective Action Taken:	The data delivery data associated with the module's host SM number will be made consistent with that maintained in the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery host SM number data.
<i>Good Data =</i>	ODD host SM number data.
<i>Logical Index =</i>	The number of the SM whose host number is in question.
<i>Dump =</i>	Copy of the tuple for this SM from the ODD relation RLMODATT.

Table 16 Error Code: DDIMTYPE

Error Code:	DDIMTYPE
Error Description:	The audit has detected an inconsistency between data delivery data associated with an SM's type and the SM's type maintained in the ODD relation RLMODATT.
Possible Error Effect:	Various commands associated with the type of SM may not give accurate results.

Corrective Action Taken:	The data delivery data associated with the SM's type will be made consistent with that maintained in the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery SM type data.
<i>Good Data</i> =	ODD SM type data.
<i>Logical Index</i> =	The module number of the module whose type is in question.
<i>Dump</i> =	Copy of the tuple for this SM from the ODD relation RLMODATT.

Table 17 Error Code: DDINDEX

Error Code:	DDINDEX
Error Description:	The index into the data delivery audit table, AUdd1tbl[], is out of range.
Possible Error Effect:	The data delivery audit may not be able to audit all the data items it is supposed to, or an out of range address may be tried and executed.
Corrective Action Taken:	Reinitialize the index, and start from the beginning of the audit the next time it is entered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the local check table, AUdd1tbl[].
<i>Bad Data</i> =	The index that is out of range (AUddindx).
<i>Good Data</i> =	Maximum array index which when added to 1 equals the number of entries in the table (AUdd flag).
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 18 Error Code: DDMATECMP

Error Code:	DDMATECMP
Error Description:	The audit has detected an inconsistency between data delivery data associated with a CMP's mate number and the CMP's hostnum field maintained in the ODD relation RLMODATT.
Possible Error Effect:	Bad return value from reading for a CMP's mate.
Corrective Action Taken:	The data delivery data associated with the CMP's mate number will be made consistent with that maintained in the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery mate CMP number data.
<i>Good Data</i> =	ODD hostnum field.
<i>Logical Index</i> =	The number of the CMP whose mate number is in question.
<i>Dump</i> =	Copy of the tuple for this CMP from the ODD relation RLMODATT.

Table 19 Error Code: DDMGDSCB

Error Code:	DDMGDSCB
Error Description:	The audit has detected an inconsistency between data delivery data associated with the log, print, and discard status of a message class.
Possible Error Effect:	Messages of a particular message class may be discarded when they should not be.
Corrective Action Taken:	The data delivery data associated with the print status will be set to print the messages. At the same time, internally to data delivery, the discard status for the message class will be turned off so as not to discard the messages associated with the message class involved.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Data delivery log status for the message class. This is not an address, it's a data value.
<i>Bad Data</i> =	Data delivery discard status for the message class.
<i>Good Data</i> =	Data delivery print status for the message class. This is not necessarily good data, it's just some data that's used in determining consistency.
<i>Logical Index</i> =	Index into data delivery message class arrays.
<i>Dump</i> =	NA.

Table 20 Error Code: DD_MODATT

Error Code:	DD_MODATT
Error Description:	The audit can't read the ODD relation RLMODATT with the given SM number.
Possible Error Effect:	The AM per SM audit data checks may not be done for a particular SM.
Corrective Action Taken:	None.
Manual Action Required:	Validate the SM number that the checks are falling for. Validate the tuple for this SM in the ODD relation RLMODATT.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Return from DBfrdtup.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The number of the SM that the checks can't be done for.
<i>Dump =</i>	The tuple from the ODD relation RLMODATT for the SM in question.

Table 21 Error Code: DDRTCD

Error Code:	DDRTCD
Error Description:	The DDRTCDENET bit in the AM does not match DDRTCDELNK bit sent from the Global Billing SM.
Possible Error Effect:	Status information that controls whether real time billing data should be sent to the global billing SM is incorrect. Billing data may be inappropriately buffered (or not buffered) in an originating SM's real time billing memory (RTBM).
Corrective Action Taken:	The DDRTCDENET is set equal to DDRTCDELNK.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	DDRTCDENET.
<i>Good Data =</i>	DDRTCDELNK.
<i>Logical Index =</i>	Global billing SM number.
<i>Dump =</i>	NA.

Table 22 Error Code: DDSASWCK

Error Code:	DDSASWCK
Error Description:	The audit has detected an inconsistency between data delivery data associated with access keys DDSASWCK and DDRMSWCK.
Possible Error Effect:	The wrong inhibit status of automatic software checks may be displayed to the user.
Corrective Action Taken:	The data delivery data associated with access DDSASWCK will be made consistent with data delivery data associated with access key DDRMSWCK.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery data DDSASWCK.
<i>Good Data =</i>	Data delivery data DDRMSWCK.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 23 Error Code: DDSINIT

Error Code:	DDSinIT
Error Description:	The audit has detected an inconsistency between data delivery data associated with the SM's initialization state and global variable INmode.
Possible Error Effect:	An incorrect state of initialization could be indicated to the user.
Corrective Action Taken:	The data delivery data associated with the SM's initialization state will be made consistent with INmode.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery SM initialization state.
<i>Good Data =</i>	INmode, SM's initialization state.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 24 Error Code: DDSINIT

Error Code:	DDSINIT
Error Description:	The audit has detected an inconsistency between data delivery data associated with the AM's initialization status and that data in Sldapdata table, maintained by AIM, that reflects the AM initialization progress.
Possible Error Effect:	Incorrect AM initialization status could be reflected to user.
Corrective Action Taken:	The data delivery data associated with the AM's initialization allow status will be made consistent with that maintained by AIM.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery AM initialization status.
<i>Good Data =</i>	AIM AM initialization status.
<i>Logical Index =</i>	The number of the module whose status is in question.
<i>Dump =</i>	NA.

Table 25 Error Code: DDSMIN

Error Code:	DDSMIN
Error Description:	The audit has detected an inconsistency between data delivery data associated with the SM's minmode status and the G1thrt1 global variable used to throttle call originations.
Possible Error Effect:	An invalid minmode condition may be indicated to user.
Corrective Action Taken:	The data delivery data associated with the SM's minmode status will be made consistent with the G1thrt1 variable.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery SM minmode status.
<i>Good Data =</i>	G1thrt1 global variable.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 26 Error Code: DDSMIN

Error Code:	DDSMIN
Error Description:	The relationship between data delivery data associated with AM minmode and CNI minmode is not correct.
Possible Error Effect:	An invalid AM minmode condition could be in effect.
Corrective Action Taken:	The data delivery data associated with AM minmode and CNI minmode are set to NOT AM minmode and NOT CNI minmode.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	The data delivery AM minmode data.
<i>Good Data =</i>	The data delivery AM CNI minmode data. (This should not be interpreted as the good data, but rather as the other data used to determine the inconsistency.)
<i>Logical Index =</i>	The mode the audit was running in.
<i>Dump =</i>	NA.

Table 27 Error Code: DDSREX

Error Code:	DDSREX
Error Description:	The audit has detected an inconsistency between data delivery data associated with a module's routine exercise inhibit/allow status and the inhibit/allow status maintained by REX.
Possible Error Effect:	Incorrect routine exercise inhibit/allow status could be reflected to user.
Corrective Action Taken:	The data delivery data associated with the module's inhibit/allow status will be made consistent with that maintained by REX.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery REX inhibit/allow status.

<i>Good Data</i> =	REX inhibit/allow status (example, 00010203). Reading from left: 00 = Not used. 01 = REX status of fabric. 02 = REX status of ELS. 03 = REX status of DGN.
<i>Logical Index</i> =	The number of the module whose status is in question.
<i>Dump</i> =	NA.

Table 28 Error Code: DDSREX

Error Code:	DDSREX
Error Description:	The audit has detected an inconsistency between data delivery data associated with the CM's routine exercise inhibit/allow status and the inhibit/allow status maintained by REX.
Possible Error Effect:	Incorrect routine exercise inhibit/allow status could be reflected to user.
Corrective Action Taken:	The data delivery data associated with the CM's inhibit/allow status will be made consistent with that maintained by REX.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery REX inhibit/allow status.
<i>Good Data</i> =	REX inhibit/allow status.
<i>Logical Index</i> =	The number of the module whose status is in question.
<i>Dump</i> =	NA.

Table 29 Error Code: DDSVCDGRD

Error Code:	DDSVCDGRD
Error Description:	A non MMRS RSM has been found whose DDSVCDGRD ("service degraded") key is set. This key refers to the status of an SM's DLIs. Since RSMs use RLIs, the key should always be clear.
Possible Error Effect:	Erroneous link status information could cause faulty call handling.
Corrective Action Taken:	The DD data is reset to the correct value (DDCLEAR).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The value of the DDSVCDGRD key for this RSM.
<i>Good Data</i> =	The correct value for the key (DDCLEAR).
<i>Logical Index</i> =	The SM number.
<i>Dump</i> =	NA.

Table 30 Error Code: DEACT_DDASPTRIG

Error Code:	DEACT_DDASPTRIG
Error Description:	The data delivery data from the key DDASPTRIG is cleared to indicate ASP 0.1 activation. The static data in rIDS_APP finds a match using a key of CCAINR01 and the global parameter <i>Glpvn_ofc</i> is set to DBPVN_SSP, so data delivery data should indicate ASP is de-activated.
Possible Error Effect:	Wasting SM data resources.
Corrective Action Taken:	The data delivery data DDASPTRIG is set to indicate ASP 0.1 de-activation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Return code from DD read.
<i>Good Data</i> =	The correct value for the key (DDSET).
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 31 Error Code: DEACT_DDPVNALW

Error Code:	DEACT_DDPVNALW
Error Description:	The value of the data delivery key, DDPVNALW, is clear to indicate ASP de-activation. A match in static data rIDS_APP exists for one of the following keys: (1) A key of CCPVN when Glpvn_ofc is set to DBPVN_SSP, or (2) A key of CCNS800. Also, the office type is a service switching point (SSP) or Glssp is set to DBYES. Therefore, DDPVNALW should be set.
Possible Error Effect:	Wasting SM data resources.
Corrective Action Taken:	The value of DDPVNALW is set to indicate ASP activation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Return code from DD read.
<i>Good Data =</i>	The correct value for the key (DDSET).
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 32 Error Code: EQPISOLSEP

Error Code:	EQPISOLSEP
Error Description:	An RSM in a MMRS site was found to be separated without isolation, in the master copies RISOL and RSEP respectively.
Possible Error Effect:	Reduction in the number of RSM available in the MMRS site.
Corrective Action Taken:	The separation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Separation state of the RSM in RSEP.
<i>Good Data =</i>	Correct separation state of the RSM to the value of RISOL.
<i>Logical Index =</i>	Module number.
<i>Dump =</i>	NA.

Table 33 Error Code: EQPRSMISOL

Error Code:	EQPRSMISOL
Error Description:	The RSMISOL bit for an equipped RSM does not match RISOL bit.
Possible Error Effect:	The isolation state of the RSM is incorrect.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Isolation state of the RSMs in the DDRSMISOL byte.
<i>Good Data =</i>	Correct isolation states of RSMs.
<i>Logical Index =</i>	IM number whose isolation state is incorrect.
<i>Dump =</i>	NA.

Table 34 Error Code: EQPRSMINIT

Error Code:	EQPRSMINIT
Error Description:	The initialization status of an RSM in a MMRS site does not agree with the information kept in the master copy SINIT.
Possible Error Effect:	This causes loss of MMRS resources.
Corrective Action Taken:	The initialization state of the RSM is corrected to agree with SINIT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Initialization state of the RSMs in the DDRSMINIT byte.
<i>Good Data =</i>	Value of SINIT which is written on to DDRSMINIT.
<i>Logical Index =</i>	MMRS module number.
<i>Dump =</i>	NA.

Table 35 Error Code: EQPRSMSEP

Error Code:	EQPRSMSEP
Error Description:	The separation status of an RSM in a MMRSM site does not agree with the information kept in the master copy RSEP.
Possible Error Effect:	This causes loss of MMRSM resources.
Corrective Action Taken:	The separation state of the RSM is corrected to agree with RSEP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Separation state of the RSMs in the DDRSMSEP byte.
<i>Good Data =</i>	Value of RSEP which is written on the DDRSMSEP.
<i>Logical Index =</i>	MMRSM module number.
<i>Dump =</i>	NA.

Table 36 Error Code: HIMRSMINIT

Error Code:	HIMRSMINIT
Error Description:	The RSMINIT byte for non MMRSM IMs is not zero.
Possible Error Effect:	The initialization state of the module is incorrect.
Corrective Action Taken:	The initialization state of the module is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Initialization state of the modules in the DDRSMINIT byte.
<i>Good Data =</i>	Correct initialization states of the modules.
<i>Logical Index =</i>	Module number whose initialization state is incorrect.
<i>Dump =</i>	NA.

Table 37 Error Code: HIMRSMISOL

Error Code:	HIMRSMISOL
Error Description:	The RSMISOL bit for an IM other than HIM does not match RISOL bit.
Possible Error Effect:	The isolation state of the RSM is incorrect.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Isolation state of the RSMs in the DDRSMISOL byte.
<i>Good Data =</i>	Correct isolation states of RSMs.
<i>Logical Index =</i>	IM number whose isolation state is incorrect.
<i>Dump =</i>	NA.

Table 38 Error Code: HIMRSMSEP

Error Code:	HIMRSMSEP
Error Description:	The RSMSEP byte for a non MMRSM IM is not zero.
Possible Error Effect:	The separation state of the module is incorrect.
Corrective Action Taken:	The separation state of the module is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Separation state of the modules in the DDRSMSEP byte.
<i>Good Data =</i>	Correct separation states of the modules.
<i>Logical Index =</i>	Module number whose separation state is incorrect.
<i>Dump =</i>	NA.

Table 39 Error Code: INV

Error Code:	INV
Error Description:	The DDRSEP byte for an HSM is not zero.
Possible Error Effect:	The separation state of the HSM is incorrect.
Corrective Action Taken:	The separation state of the HSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.

<i>Bad Data</i> =	Separation state of the HSM in the DDRSMSEP byte.
<i>Good Data</i> =	Correct separation states of the HSM.
<i>Logical Index</i> =	Module number whose separation state is incorrect.
<i>Dump</i> =	NA.

Table 40 Error Code: LNK_CTS_NUM

Error Code:	LNK_CTS_NUM
Error Description:	The data in either DDCTS0 or DDCTS1 pertaining to the even and odd CTS link numbers is inconsistent with the data maintained in the ODD relation RLMODATT.
Possible Error Effect:	Incorrect link information will be used.
Corrective Action Taken:	The data in either DDCTS0 or DDCTS1 will be updated to be consistent with the ODD relation RLMODATT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	0 if error is pertaining to DDCTS0 or 1 if error is pertaining to DDCTS1.
<i>Bad Data</i> =	Return value from DDREAD call.
<i>Good Data</i> =	ODD rIMODATT data for this SM. Even CTS link number for DDCTS0 and ODD CTS link number for DDCTS1.
<i>Logical Index</i> =	The number of the SM whose link information is in error.
<i>Dump</i> =	Copy of the rIMODATT tuple of the SM in question.

Table 41 Error Code: LNK2ILST

Error Code:	LNK2ILST
Error Description:	The DD key summary status does not match the actual value returned by TM.
Possible Error Effect:	A major or minor alarm may sound, when it should or not sound.
Corrective Action Taken:	The corresponding DD key will be updated with the appropriate value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Bad DD key value.
<i>Good Data</i> =	Good DD key value.
<i>Logical Index</i> =	The DD key that had the error.
<i>Dump</i> =	NA.

Table 42 Error Code: MODATT

Error Code:	MODATT
Error Description:	An attempt to obtain a rIMODATT tuple with a given key failed. The audit has not taken any recovery measures other than to inform the user of the existence of the error.
Possible Error Effect:	Since this check occurred after it was determined that an RSM number existed for an HSM, the audit will simply go on to the next RSM, if any, hanging off the HSM.
Corrective Action Taken:	None.
Manual Action Required:	If this error is rolling that user should investigate the condition.
Dump Description:	
<i>Error Address</i> =	Address of the rIMODATT tuple key.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key to the rIMODATT tuple which is the RSM module number.
<i>Dump</i> =	NA.

Table 43 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	Corresponding rHSMRSM tuple could not be found in the database. This error will continue to print out until fixed by the user.
Possible Error Effect:	May cause asserts and/or interrupts by various application programs.
Corrective Action Taken:	None.
Manual Action Required:	Using ODBE, insert the missing rHSMRSM tuple using the key which is dumped in the Logical Index of this error report.

Dump Description:	
<i>Error Address</i> =	Address of rHSMRSM tuple buffer.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key (<i>hsmnum</i>) of the rHSMRSM tuple buffer.
<i>Dump</i> =	NA.

Table 44 Error Code: RCMISOL

Error Code:	RCMISOL
Error Description:	The communication module vintage is not CM2 and the data delivery keys DDRCMISOL and DDSCMISOL are not cleared. These two keys can only be set in CM2 offices.
Possible Error Effect:	The DD keys will contain the incorrect status. As a result, communication module maintenance functionality may not be available.
Corrective Action Taken:	Write both the DDRCMISOL and DDSCMISOL keys to DDNORMAL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The data delivery DDSCMISOL data.
<i>Bad Data</i> =	The data delivery DDRCMISOL data.
<i>Good Data</i> =	Gldm0vint.
<i>Logical Index</i> =	Gldm1vint.
<i>Dump</i> =	NA.

Table 45 Error Code: RSMINITO

Error Code:	RSMINITO
Error Description:	The RMSINIT byte for an RSM is not zero.
Possible Error Effect:	The initialization state of the RSM is incorrect.
Corrective Action Taken:	The initialization state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Initialization state of the RSM in the DDRSMINIT byte.
<i>Good Data</i> =	Correct initialization states of the RSM.
<i>Logical Index</i> =	Module number whose initialization state is incorrect.
<i>Dump</i> =	NA.

Table 46 Error Code: RSMINITO

Error Code:	RSMINITO
Error Description:	The RSMINIT byte for an HSM is not zero.
Possible Error Effect:	The initialization state of the HSM is incorrect.
Corrective Action Taken:	The initialization state of the HSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Initialization state of the HSM in the DDRSMINIT byte.
<i>Good Data</i> =	Correct initialization states of the HSM.
<i>Logical Index</i> =	Module number whose initialization state is incorrect.
<i>Dump</i> =	NA.

Table 47 Error Code: RSMSEPO

Error Code:	RSMSEPO
Error Description:	The RSMSEP byte for an RSM is not zero.
Possible Error Effect:	The separation state of the RSM is incorrect.
Corrective Action Taken:	The separation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Separation state of the RSM in the DDRSMSEP byte.
<i>Good Data</i> =	Correct separation states of the RSM.
<i>Logical Index</i> =	Module number whose separation state is incorrect.
<i>Dump</i> =	NA.

Table 48 Error Code: RSMSEPO

Error Code:	RSMSEPO
Error Description:	The RSMSEP byte for an HSM is not zero.
Possible Error Effect:	The separation state of the HSM is incorrect.
Corrective Action Taken:	The separation state of the HSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Separation state of the HSM in the DDRSMSEP byte.
<i>Good Data =</i>	Correct separation states of the HSM.
<i>Logical Index =</i>	Module number whose separation state is incorrect.
<i>Dump =</i>	NA.

Table 49 Error Code: SCMISOL

Error Code:	SCMISOL
Error Description:	The CM isolation DD status key DDSCMISOL is incorrectly set in the pending state (DDPCMISOL). A <i>Good Data</i> value of 1 indicates that the CM isolation DD request key DDRCMISOL is not normal and entry into manual CM isolation should be in progress. However, there is no CM isolation request on the SMARS queue. A <i>Good Data</i> value of 0 indicates that DDRCMISOL is normal and an AM/CM re-synchronization should be in progress. However, the SMrsmode re-synchronization flag is SMRSNULL.
Possible Error Effect:	The DDSCMISOL DD key is stuck in what should be a transient pending state giving incorrect CM isolation status and stubbing off PCD auditing. Some communication module maintenance functionality may not be available.
Corrective Action Taken:	Write the DDSCMISOL key to DDNORMAL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Value for DDRCMISOL.
<i>Bad Data =</i>	Value for DDSCMISOL.
<i>Good Data =</i>	Either 0 or 1, see Error Description.
<i>Logical Index =</i>	Value for SMrsmode.
<i>Dump =</i>	NA.

Table 50 Error Code: STUCK

Error Code:	STUCK
Error Description:	The RSMISOL byte for an RSM is not zero.
Possible Error Effect:	Invalid state of the RSM single RSM offices should always have the isolation bits set to zero.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Isolation byte DDRSMISOL.
<i>Good Data =</i>	Written value of zero to DMRSMISOL.
<i>Logical Index =</i>	RSM module number.
<i>Dump =</i>	NA.

Table 51 Error Code: TYPE

Error Code:	TYPE
Error Description:	A switching module (SM) type in data delivery (DD) key DDSM2000 is inconsistent with RLMODATT (rlMODATT.unitttype = SMSM2000 and DDSM2000 = DD CLEAR for the SM or rlMODATT.unitttype != SMSM2000 and DDSM2000 = DD SET for the SM).
Possible Error Effect:	Call processing may take incorrect actions for the given SM.
Corrective Action Taken:	The audit writes DDSM2000 to agree with rlMODATT.unitttype. That is, if

	rIMODATT.unittype = SMSM2000, the audit writes the value of DDSM2000 to DDSET for this SM. Otherwise, the audit writes the value of DDSM2000 for this SM to DDCLEAR.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value in DDSM2000 for the SM.
<i>Good Data =</i>	SM type (rIMODATT.unittype)
<i>Logical Index =</i>	SM number (rIMODATT.module)
<i>Dump =</i>	rIMODATT tuple for this SM.

Table 52 Error Code: UEQRSMISOL

Error Code:	UEQRSMISOL
Error Description:	The RSMISOL bit for an unequipped RSM does not match RISOL bit.
Possible Error Effect:	The isolation state of the RSM is incorrect.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Isolation state of the RSMs in the DDRSMISOL byte.
<i>Good Data =</i>	Correct isolation states of RSMs.
<i>Logical Index =</i>	Offset of the unequipped RSM.
<i>Dump =</i>	NA.

Table 53 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up, after taking a reset.
Possible Error Effect:	Causes resets and/or asserts.
Corrective Action Taken:	Reinitialize audit global data, return audit complete, and wait for next cycle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	AUddindex (tells audit which SM to check next).

DD-C

Software Release: 5E14 and later

1. DATA DELIVERY (DD) AUDIT

The data delivery (DD) mechanism and audit covers data in the operational kernel process (OKP) and switch maintenance kernel process (SMKP) environments in the administrative module (AM), communications module processor (CMP) as well as the operating system for distributed switching-switching modules (OSDS-SMs) environment. The audit verifies the consistency of different data delivery data against other static data, data delivery, and global data. The audit reports errors it detects and makes the slave data consistent with available master data. If no master data exists, the data delivery data is set to a safe state. Data delivery data in incorrect states could disable call processing and cause problems for maintenance, billing, and growth; hence the need for the DD audit.

The DD audit runs in the CMP, OKP, SM, and SMKP environments in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The DD audit checks the consistency of a number of different DD data structures. The term "DD key" refers to an identifier for information maintained by data delivery. Some of these data structures exist in the AM as AM-only data, some exist in the AM on a per SM basis, some exist in the AM on a per message class basis, and some of the data exists only in the SMs. The DD data structures checked are referenced by the following DD keys:

DDAPDLDSL	DDDIOPMODEL	DDPCONFIGSTL	DDRSMSEP
DDASPTRIGL	DDEQSTATL	DDPSSWSTATL	DDRTCDELNK
DDAUEWRKL	DDHOSTNUML	DDPVNALWL	DDRTCENET
DDCM_VINTL	DDIMYPEL	DDRISOLL	DDSASWC
DDCNIMINL	DDMATECMPL	DDRMSWCKL	DDSCMISOL
DDCNIOOSL	DDMGDSCBL	DDRSEPL	DDSINIT
DDCTS0L	DDMGLOGBL	DDRSMINITL	DDSMIN
DDCTS1L	DDMGPRTL	DDRSMISOLL	DDSREX
DDDASCDL			

3. AUDIT CHECKS

The audit makes the following checks and takes the specified actions.

Check	Environment	Action
DDAPDLDSL	SM	Checks the new data delivery key DDAPDLDSL against the AP link status table (PSaplst[]). DDAPDLDSL provides a summary of the status of the AP data link digital subscribe lines (DSLs) for a given SM. PSaplst[] contains information on the status of each of the individual AP data link DSLs. If the two values found do not match, an audit error is reported and DDAPDLDSL will be updated to agree with the information found in PSaplst[].
DDASPTRIG	OKP	Checks DD data associated with key DDASPTRIG against the data against the rIDS_APP tuple referenced by the key of CCAINR01. When the rIDS_APP tuple is not found, the DD data should indicate clear. When the rIDS_APP tuple is found and the global parameter is DBPVN_SSP, the DD data should be set.
DDAUEWRK	SMKP	Checks DD data associated with key DDAUEWRK against a global variable, AUEleact, which is maintained by audit control. When the global variable is set, the DD data should be set and when the global variable is clear, the DD data should indicate clear. If an inconsistency is detected, the DD data will be updated to be consistent with the global variable.
DDCM_VINT	OSDS-M	Checks DD data associated with key DDCM_VINT against the SM's office dependent data (ODD) global variable Glcm_vint. If an inconsistency is detected, the DD data will be updated to be consistent with the global variable. An audit error concerning this data is expected during the conversion of a communication module, model 1 (CM1) office to a CM2 office.

DDCNIMIN	OKP	Checks DD data associated with key DDCNIMIN against the DD data associated with key DDSMIN. If DDSMIN is set to indicate minmode, then DDCNIMIN should be set to indicate common network interface (CNI) minmode. If there is an inconsistency, both DD data will be set to not minmode.
DDCNIOOS	OKP	Checks DD data associated with key DDCNIOOS against the ODD variable Glccs. If an office is unequipped with CNI, the DD data should be set indicating that CNI is disabled. If there is an inconsistency, the DD data will be made consistent with the ODD.
DDCTS0	OKP	Checks DD data associated with key DDCTS0 against the even CTS link number stored in MODATT. If there is an inconsistency, the DD data will be made consistent with the ODD.
DDCTS1	OKP	Checks DD data associated with key DDCTS1 against the odd CTS link number stored in MODATT. If there is an inconsistency, the DD data will be made consistent with the ODD.
DDDIOPMODE	OKP	Checks DD data associated with key DDDIOPMODE. If the DD data is set to indicate disk independent mode, a message will be sent to application integrity monitor (AIM) to verify a valid disk independent mode. This will be done by AIM checking the essential disks statuses in the equipment configuration database (ECD). If an inconsistency exists, AIM will reset the DD data to be consistent with the ECD.
DDEQPROCS	OKP/CMP	Checks DD data associated with the key DDEQPROCS against the processors equipage status maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data is made consistent with the ODD.
DDEQSTAT	OKP/CMP	Checks DD data associated with key DDEQSTAT against the SM equipage status maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data will be made consistent with the ODD. (The DD data here is different than that associated with key DDEQIMS.)
DDHOSTNUM	OKP/CMP	Checks DD data associated with key DDHOSTNUM against the host module number maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data will be made consistent with the ODD.
DDIMTYPE	OKP	Checks DD data associated with key DDIMTYPE against the SM type maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data will be made consistent with the ODD.
DDMATECMP	SMKP/CMP	Checks DD data associated with key DDMATECMP against the hostnum field maintained in the ODD relation RLMODATT. If an inconsistency exists, the DD data will be made consistent with the ODD.
DDMGDSCB	OKP	Checks DD data associated with key DDMGDSCB against DD data associated with keys DDMGLOGB and DDMGPRTB. If any of the DD data indicates to log or print messages, then the DD data for discard should not be set. If an inconsistency exists, the discard data will be set to not discard.
DDMGLOGB	OKP	This represents the DD data for logging messages. See the check for DDMGDSCB.
DDMGPRTB	OKP	This represents the DD data for printing messages. See the check for DDMGDSCB.
DDPCONFIGST	SMKP	Checks the key DDPCONFIGST for soft switch status by going off of the PCD state for the unit. In the case of a program update, the soft switch periodically resets the key so that the user knows that the program update uses the key.
DDPSSWSTAT	SMKP	Checks DD data associated with key DDPSSWSTAT against the soft switch status. If an inconsistency exists between the soft switch status and the PCD, the DD audit will update the DD key with the PCD information.
DDPVNALW	OKP	Checks DD data associated with key DDPVNALW against the existence of an rIDS_APP tuple referenced by the key of CCPVN (when Glpvn_ofc is set to DBPVN_SSP) or CCNS800. When the rIDS_APP tuple is not found, the DD data should indicate clear. When the rIDS_APP tuple is found and Glpvn_ofc is DBPVN_SSP or Glssp is DBYES, the DD data should be set.
DDRISOL	OSDS-M	Checks are done in a remote switching module (RSM) to verify that the separation information (DDRSEP) about an RSM in a multimodule site is consistent with the corresponding master data kept in DDRISOL.
DDRMSWCK	OSDS-M	Checks DD data associated with key DDRMSWCK against DDSASWCK data. If DDSASWCK data is off-normal, DDRMSWCK data should be off-normal.

DDRSEP	OSDS-M	The data in DDRSEP is the master copy representing the separation status of all the RSMs in a multimodule site it is arranged on a per module basis. The value in DDRSMSEP is compared against this data, and used in correcting any inconsistencies.
DDRSMINIT	OSDS-M	Checks are done to verify that the module initialization information (DDRSMINIT) about a module in a multimodule site is consistent with the corresponding master data kept in DDSINIT. When an inconsistency occurs, the DDRSMINIT status for a given module is set to the value of DDSINIT.
DDRSMISOL	OSDS-M	Checks are done to verify that the isolation status (DDRSMISOL) about a module in a multimodule site is consistent with the master status kept in DDRISOL. When an inconsistency occurs, the DDRSMISOL status for a given module is set to the value of DDRISOL.
DDRSMSSEP	OSDS-M	The data in this 10-bit word is arranged based on the number RSMs in a multimodule site. The separation status of each RSM is maintained here. Checks are done to verify that the separation status (DDRSMSSEP) is consistent with the master status kept in DDRSEP. When an error is found, the wrong bit in DDRSMSEP is set to the value of DDRSEP.
DDRTCENET, DDRTCDELNK	OKP	Checks DD data associated with the key DDRTCENET against the data delivery key DDRTCDELNK sent by the global billing SM. If the two values found do not match, an audit error is reported and DDRTCENET will be updated to agree with DDRTCDELNK.
DDSASWCK	OKP	Checks DD data associated with key DDSASWCK against DDRMSWCK data. If DDRMSWCK data is off-normal, DDSASWCK data should be off-normal.
DDSINIT	OSDS-M	Checks DD data associated with key DDSINIT against the global variable INmode. If an inconsistency exists, the DD data will be made consistent with the global variable.
DDSMCOUNT	OKP	Checks the new data delivery key DDSMCOUNT against the actual number of SMS (including special growth). If the two values do not match, an audit error is reported, and the DDSMCOUNT is updated with the correct value.
DDSMIN	SM	Checks SM DD data associated with DDSMIN against the global variable G1thrtl. If the DD data indicates minmode and the global variable does not, the DD data will be set to not minmode.
DDSREX	OKP	Checks DD data associated with key DDSREX against the inhibit allow status of routine exercises maintained in a global routine exercise table (DGldb[module].rxinh1st. enable1). If an inconsistency exists, the DD data will be made consistent with the global table.
DDSCMISOL	SMKP	Checks DD data associated with the key DDSCMISOL against the status of the CM isolation request DD key DDRCMISOL and either the SMARS job queue or the SMrsmode AM/CM re-synchronization flag. If an inconsistency exists, the DD data is written to normal.

4. ERROR HANDLING

If the ASP service features find errors, the data delivery bit is updated to be consistent with the static relation RLDS_APP.

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: ACT_DDASPTRIG

Error Code:	ACT_DDASPTRIG
Error Description:	The data delivery data from the key DDASPTRIG is set to indicate ASP 0.1 activation. The static data in rlds_APP does not find a match using a key of CCAINR01, so data delivery data should indicate ASP 0.1 is de-activated.

Possible Error Effect:	Wasting SM data resources.
Corrective Action Taken:	The data delivery data DDASPTRIG is set to indicate ASP 0.1 de-activation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Return code from DD read.
<i>Good Data =</i>	The database return from reading the RLDS_APP relation.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 2 Error Code: ACT_DDPVNALW

Error Code:	ACT_DDPVNALW
Error Description:	The value of the data delivery key, DDPVNALW, is set to indicate ASP activation. A match in static data rIDS_APP does not exist for either of the following keys: (1) A key of CCPVN when Glpvn_ofc is set to DBPVN_SSP, and (2) A key of CCNS800. Therefore, DDPVNALW should not be set.
Possible Error Effect:	Wasting SM data resources.
Corrective Action Taken:	The value of DDPVNALW is cleared to indicate ASP de-activation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Return code from DD read.
<i>Good Data =</i>	The database return from reading the RLDS_APP relation.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 3 Error Code: BAD_DDTBL

Error Code:	BAD_DDTBL
Error Description:	An invalid state field (not AUDDDO, AUDDSKIP or AUDDDONE) in the data delivery audit table (AUdd1tbl[]), has been detected.
Possible Error Effect:	The data delivery audit may not be able to audit all the data items it is supposed to.
Corrective Action Taken:	Reinitialize the index (AUddindx), and start from the beginning of the audit the next time it is entered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of local check table, AUdd1tbl[].
<i>Bad Data =</i>	The state element for the indicated table entry (AUdd1tbl[AUddindx].state).
<i>Good Data =</i>	Maximum array index which when added to 1 equals the number of entries in the table (AUdd_flag).
<i>Logical Index =</i>	Index into the table (AUddindx).
<i>Dump =</i>	The data delivery audit table (AUdd1tbl[]) of entries for the indicated processor.

Table 4 Error Code: BIT1MAP

Error Code:	BIT1MAP
Error Description:	<i>In OKP or CMP:</i> The bit in DDeqmhppe[] associated with a particular switching module (SM) is set incorrectly. That is, either the bit indicates message handler (MH) connectivity for that SM when it should not (the bit is set) or the bit indicates no MH connectivity for that SM when the SM should have it (the bit is clear). See the dump description to determine which of the following cases applies [note that the "rIMODATT tuple" is the tuple associated with the particular SM (rIMODATT.module)]:

	- The bit is set but no rIMODATT tuple exists for the SM. - The bit is set but at least one of the rIMODATT <i>ql_ntwk0</i> or <i>ql_ntwk1</i> fields has value DBNO. - The bit is clear but both of the rIMODATT <i>ql_ntwk0</i> and <i>ql_ntwk1</i> fields have value DBYES. <i>In an SM-2000:</i> The SM's copy of DDeqmhpipe[] is inconsistent with the <i>qends[]</i> fields in the rIQENDPTS tuples where rIQENDPTS.qservice = QLOSDS (representing MH connectivity) and rIQENDPTS.qserv_num = 0 (the default value, used for non-CCS connectivity). Specifically, for each bit in DDeqmhpipe[], that bit should be set if, and only if, the corresponding bits are set in rIQENDPTS.qends[] for both networks (rIQENDPTS.qnetwork = QLNET0 and QLNET1).
Possible Error Effect:	If the bit is set when it should be clear, quad linked packet switching (QLPS) network traffic may be routed to an SM unable to accept it. If the bit is clear when it should be set, the QLPS network may be degraded because it is unable to route to the associated SM.
Corrective Action Taken:	<i>In OKP or CMP:</i> The audit triggers an update of the bit in DDeqmhpipe[] and any other DD data associated with the SM. <i>In SM-2000:</i> The audit triggers a reinitialization of DDeqmhpipe[].
Manual Action Required:	None.
Dump Description:	
<i>In OKP or CMP:</i>	
<i>Error Address =</i>	SM equipage status (rIMODATT.eqstat). A value of SMUNEQ may indicate that no rIMODATT tuple exists for this SM.
<i>Bad Data =</i>	rIMODATT.ql_ntwk0.
<i>Good Data =</i>	rIMODATT.ql_ntwk1.
<i>Logical Index =</i>	The associated SM number (used in rIMODATT.module when trying to read the rIMODATT tuple).
<i>Dump =</i>	NA.
<i>In an SM-2000:</i>	
<i>Error Address =</i>	Current entry in rIQENDPTS.qends[] for network QLNET0.
<i>Bad Data =</i>	Current entry in DDeqmhpipe[] being checked.
<i>Good Data =</i>	Current entry in rIQENDPTS.qends[] for network QLNET1.
<i>Logical Index =</i>	Index of the entry in DDeqmhpipe[] being checked. That is, the index of the first entry to have an error.
<i>Dump 1 =</i>	DDeqmhpipe[].
<i>Dump 2 =</i>	The rIQENDPTS tuple associated with network QLNET0.

Table 5 Error Code: CLIDAT

Error Code:	CLIDAT
Error Description:	An attempt failed to obtain a rCLIDAT tuple with a given cluster ID. The audit has not taken any recovery measures other than to inform the user of the existence of the error.
Possible Error Effect:	Since this check occurred after it was determined that an RSM number existed for an HSM, the audit will simply go on to the next RSM, if any, that is hanging off the HSM.
Corrective Action Taken:	None.
Manual Action Required:	If this error is rolling, the user should investigate the condition. Most likely the

	office information for the RLMODATT and RLCLIDAT relations need correction.
Dump Description:	
<i>Error Address</i> =	Address of the rCLIDAT buffer.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Cluster ID to which RSM belongs.
<i>Dump</i> =	rCLIDAT buffer.

Table 6 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit has detected an inconsistency between data delivery data associated with the SM's count status and that value calculated by the AUddsmcnt() function.
Possible Error Effect:	Incorrect SM count status could be accessed.
Corrective Action Taken:	The data delivery data associated with the SM's count status will be made consistent with that calculated in the AUddsmcnt() function.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery SM count status.
<i>Good Data</i> =	SM count from AUddsmcnt().
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 7 Error Code: DD_MODATT

Error Code:	DD_MODATT
Error Description:	The audit can't read the ODD relation RLMODATT with the given generic plan (GP) number.
Possible Error Effect:	The GP audit data checks may not be done for a particular GP.
Corrective Action Taken:	None.
Manual Action Required:	Validate the GP number that the checks are failing for. Validate the tuple for this GP in the ODD relation RLMODATT.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Return from DBfrdtup.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The number of the GP that the checks can't be done for.
<i>Dump</i> =	The tuple from the ODD relation RLMODATT for the GP in question.

Table 8 Error Code: DDAMABIL

Error Code:	DDAMABIL
Error Description:	The AM's billing stream indicators maintained in AMsmmap on a per SM basis do not agree with those maintained in the ODD relation RLMODATT.
Possible Error Effect:	Billing data may be sent to the wrong billing stream.
Corrective Action Taken:	Make the AMsmmap billing stream indicators consistent with the ODD relation RLMODATT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	AMsmmap data for this SM.
<i>Good Data</i> =	ODD rIMODATT data for this SM.
<i>Logical Index</i> =	The number of the SM whose billing stream indicator data is in error.
<i>Dump</i> =	Copy of the rIMODATT tuple of the SM in question.

Table 9 Error Code: DDAUEWRK

Error Code:	DDAUEWRK
Error Description:	The relationship between data delivery data associated with key DDAUEWRK and global variable AUEleact, is not correct.
Possible Error Effect:	The routine and elevated audits in OKP of the AM may never be scheduled to run.
Corrective Action Taken:	The data delivery data associated with key DDAUEWRK will be made consistent

	with global variable AUEleact.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The data delivery DDAUEWRK data.
<i>Good Data</i> =	The global variable AUEleact, maintained by audit control.
<i>Logical Index</i> =	The mode the audit was running in.
<i>Dump</i> =	NA.

Table 10 Error Code: DDCMVINT

Error Code:	DDCMVINT
Error Description:	The audit has detected an inconsistency between the SM's data delivery data associated with key DDCM_VINT and the ODD global variable Glcm_vint.
Possible Error Effect:	Speed of the XPC chips may be temporarily lost.
Corrective Action Taken:	Set the data delivery data to agree with that in the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery DDCM_VINT data.
<i>Good Data</i> =	ODD Glcm_vint.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 11 Error Code: DDCNIOOS

Error Code:	DDCNIOOS
Error Description:	The audit has detected an inconsistency between data delivery data associated with the office CNI equipage state and the office CNI equipage state maintained in the ODD variable Glccs.
Possible Error Effect:	CNI unique software may be executing abnormally.
Corrective Action Taken:	The data delivery data associated with the office CNI equipage state will be made consistent with the office CNI equipage state maintained in the ODD variable Glccs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery office CNI equipage state.
<i>Good Data</i> =	ODD office CNI equipage state.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 12 Error Code: DDEQIMS

Error Code:	DDEQIMS
Error Description:	The audit has detected an inconsistency in data delivery data between the processor's static equipage status (rIMODATT.eqstat) and the processor's dynamic equipage status in the DDeqims[] array.
Possible Error Effect:	Calls could be incorrectly routed to the processor.
Corrective Action Taken:	The data delivery data associated with the processor's equipage status will be made consistent with the processors equipage status maintained in the ODD relation RLMODATT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery processor equipage data (bit from DDeqims[] array).
<i>Good Data</i> =	ODD processor equipage data (rIMODATT.eqstat).
<i>Logical Index</i> =	The number of the processor whose equipage is in question (rIMODATT.module).
<i>Dump</i> =	Copy of the tuple for this processor from the ODD relation RLMODATT.

Table 13 Error Code: DDEQPROC

Error Code:	DDEQPROC
Error Description:	The audit has detected an inconsistency between data delivery data associated

	with a processors equipage status and the processors equipage status maintained in the ODD relation RLMODATT.
Possible Error Effect:	Calls could be incorrectly routed to the processor.
Corrective Action Taken:	The data delivery data associated with the processors equipage state will be made consistent with the processors equipage state maintained in the ODD relation RLMODATT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery processor equipage data.
<i>Good Data =</i>	ODD processor equipage data.
<i>Logical Index =</i>	The number of the processor whose equipage is in question.
<i>Dump =</i>	Copy of the tuple for this processor from the ODD relation RLMODATT.

Table 14 Error Code: DDEQSTAT

Error Code:	DDEQSTAT
Error Description:	The audit has detected an inconsistency between data delivery data associated with a processor's equipage status and the processor's equipage status maintained in the ODD relation RLMODATT. With the introduction of the CMP, if the DDEQSTAT error rolls out most likely there is an inconsistency between the AM's version of RLMODATT and the CMP's version of RLMODATT.
Possible Error Effect:	Calls could be incorrectly routed to the SM.
Corrective Action Taken:	The data delivery data associated with the SM's equipage state will be made consistent with the SM equipage state maintained in the ODD relation RLMODATT.
Manual Action Required:	Manual action is required only if the error is rolling out for the same SM. The office database editor (ODBE) should be used to make the CMP and AM's versions of RLMODATT consistent. The tuple to be updated is keyed off of the processor number given in the logical index field of the Dump Description.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery processor equipage data.
<i>Good Data =</i>	ODD processor equipage state.
<i>Logical Index =</i>	The number of the processor whose equipage is in question.
<i>Dump =</i>	Copy of the tuple for this processor from the ODD relation RLMODATT.

Table 15 Error Code: DDHOSTNUM

Error Code:	DDHOSTNUM
Error Description:	The audit has detected an inconsistency between data delivery data associated with a module's host SM number and the module's host SM number maintained in the ODD relation RLMODATT.
Possible Error Effect:	Fault recovery actions for an RSM may fail.
Corrective Action Taken:	The data delivery data associated with the module's host SM number will be made consistent with that maintained in the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery host SM number data.
<i>Good Data =</i>	ODD host SM number data.
<i>Logical Index =</i>	The number of the SM whose host number is in question.
<i>Dump =</i>	Copy of the tuple for this SM from the ODD relation RLMODATT.

Table 16 Error Code: DDIMTYPE

Error Code:	DDIMTYPE
Error Description:	The audit has detected an inconsistency between data delivery data associated with an SM's type and the SM's type maintained in the ODD relation RLMODATT.
Possible Error Effect:	Various commands associated with the type of SM may not give accurate results.

Corrective Action Taken:	The data delivery data associated with the SM's type will be made consistent with that maintained in the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery SM type data.
<i>Good Data</i> =	ODD SM type data.
<i>Logical Index</i> =	The module number of the module whose type is in question.
<i>Dump</i> =	Copy of the tuple for this SM from the ODD relation RLMODATT.

Table 17 Error Code: DDINDEX

Error Code:	DDINDEX
Error Description:	The index into the data delivery audit table, AUdd1tbl[, is out of range.
Possible Error Effect:	The data delivery audit may not be able to audit all the data items it is supposed to, or an out of range address may be tried and executed.
Corrective Action Taken:	Reinitialize the index, and start from the beginning of the audit the next time it is entered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the local check table, AUdd1tbl[.]
<i>Bad Data</i> =	The index that is out of range (AUddindx).
<i>Good Data</i> =	Maximum array index which when added to 1 equals the number of entries in the table (AUdd flag).
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 18 Error Code: DDMATECMP

Error Code:	DDMATECMP
Error Description:	The audit has detected an inconsistency between data delivery data associated with a CMP's mate number and the CMP's hostnum field maintained in the ODD relation RLMODATT.
Possible Error Effect:	Bad return value from reading for a CMP's mate.
Corrective Action Taken:	The data delivery data associated with the CMP's mate number will be made consistent with that maintained in the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery mate CMP number data.
<i>Good Data</i> =	ODD hostnum field.
<i>Logical Index</i> =	The number of the CMP whose mate number is in question.
<i>Dump</i> =	Copy of the tuple for this CMP from the ODD relation RLMODATT.

Table 19 Error Code: DDMGDSCB

Error Code:	DDMGDSCB
Error Description:	The audit has detected an inconsistency between data delivery data associated with the log, print, and discard status of a message class.
Possible Error Effect:	Messages of a particular message class may be discarded when they should not be.
Corrective Action Taken:	The data delivery data associated with the print status will be set to print the messages. At the same time, internally to data delivery, the discard status for the message class will be turned off so as not to discard the messages associated with the message class involved.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Data delivery log status for the message class. This is not an address, it's a data value.
<i>Bad Data</i> =	Data delivery discard status for the message class.
<i>Good Data</i> =	Data delivery print status for the message class. This is not necessarily good data, it's just some data that's used in determining consistency.
<i>Logical Index</i> =	Index into data delivery message class arrays.
<i>Dump</i> =	NA.

Table 20 Error Code: DD_MODATT

Error Code:	DD_MODATT
Error Description:	The audit can't read the ODD relation RLMODATT with the given SM number.
Possible Error Effect:	The AM per SM audit data checks may not be done for a particular SM.
Corrective Action Taken:	None.
Manual Action Required:	Validate the SM number that the checks are falling for. Validate the tuple for this SM in the ODD relation RLMODATT.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Return from DBfrdtup.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The number of the SM that the checks can't be done for.
<i>Dump =</i>	The tuple from the ODD relation RLMODATT for the SM in question.

Table 21 Error Code: DDRTCD

Error Code:	DDRTCD
Error Description:	The DDRTCDENET bit in the AM does not match DDRTCDELNK bit sent from the Global Billing SM.
Possible Error Effect:	Status information that controls whether real time billing data should be sent to the global billing SM is incorrect. Billing data may be inappropriately buffered (or not buffered) in an originating SM's real time billing memory (RTBM).
Corrective Action Taken:	The DDRTCDENET is set equal to DDRTCDELNK.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	DDRTCDENET.
<i>Good Data =</i>	DDRTCDELNK.
<i>Logical Index =</i>	Global billing SM number.
<i>Dump =</i>	NA.

Table 22 Error Code: DDSASWCK

Error Code:	DDSASWCK
Error Description:	The audit has detected an inconsistency between data delivery data associated with access keys DDSASWCK and DDRMSWCK.
Possible Error Effect:	The wrong inhibit status of automatic software checks may be displayed to the user.
Corrective Action Taken:	The data delivery data associated with access DDSASWCK will be made consistent with data delivery data associated with access key DDRMSWCK.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery data DDSASWCK.
<i>Good Data =</i>	Data delivery data DDRMSWCK.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 23 Error Code: DDSINIT

Error Code:	DDSinIT
Error Description:	The audit has detected an inconsistency between data delivery data associated with the SM's initialization state and global variable INmode.
Possible Error Effect:	An incorrect state of initialization could be indicated to the user.
Corrective Action Taken:	The data delivery data associated with the SM's initialization state will be made consistent with INmode.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery SM initialization state.
<i>Good Data =</i>	INmode, SM's initialization state.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 24 Error Code: DDSINIT

Error Code:	DDSINIT
Error Description:	The audit has detected an inconsistency between data delivery data associated with the AM's initialization status and that data in Sldapdata table, maintained by AIM, that reflects the AM initialization progress.
Possible Error Effect:	Incorrect AM initialization status could be reflected to user.
Corrective Action Taken:	The data delivery data associated with the AM's initialization allow status will be made consistent with that maintained by AIM.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery AM initialization status.
<i>Good Data =</i>	AIM AM initialization status.
<i>Logical Index =</i>	The number of the module whose status is in question.
<i>Dump =</i>	NA.

Table 25 Error Code: DDSMIN

Error Code:	DDSMIN
Error Description:	The audit has detected an inconsistency between data delivery data associated with the SM's minmode status and the G1thrt1 global variable used to throttle call originations.
Possible Error Effect:	An invalid minmode condition may be indicated to user.
Corrective Action Taken:	The data delivery data associated with the SM's minmode status will be made consistent with the G1thrt1 variable.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery SM minmode status.
<i>Good Data =</i>	G1thrt1 global variable.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 26 Error Code: DDSMIN

Error Code:	DDSMIN
Error Description:	The relationship between data delivery data associated with AM minmode and CNI minmode is not correct.
Possible Error Effect:	An invalid AM minmode condition could be in effect.
Corrective Action Taken:	The data delivery data associated with AM minmode and CNI minmode are set to NOT AM minmode and NOT CNI minmode.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	The data delivery AM minmode data.
<i>Good Data =</i>	The data delivery AM CNI minmode data. (This should not be interpreted as the good data, but rather as the other data used to determine the inconsistency.)
<i>Logical Index =</i>	The mode the audit was running in.
<i>Dump =</i>	NA.

Table 27 Error Code: DDSREX

Error Code:	DDSREX
Error Description:	The audit has detected an inconsistency between data delivery data associated with a module's routine exercise inhibit/allow status and the inhibit/allow status maintained by REX.
Possible Error Effect:	Incorrect routine exercise inhibit/allow status could be reflected to user.
Corrective Action Taken:	The data delivery data associated with the module's inhibit/allow status will be made consistent with that maintained by REX.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Data delivery REX inhibit/allow status.

<i>Good Data</i> =	REX inhibit/allow status (example, 00010203). Reading from left: 00 = Not used. 01 = REX status of fabric. 02 = REX status of ELS. 03 = REX status of DGN.
<i>Logical Index</i> =	The number of the module whose status is in question.
<i>Dump</i> =	NA.

Table 28 Error Code: DDSREX

Error Code:	DDSREX
Error Description:	The audit has detected an inconsistency between data delivery data associated with the CM's routine exercise inhibit/allow status and the inhibit/allow status maintained by REX.
Possible Error Effect:	Incorrect routine exercise inhibit/allow status could be reflected to user.
Corrective Action Taken:	The data delivery data associated with the CM's inhibit/allow status will be made consistent with that maintained by REX.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data delivery REX inhibit/allow status.
<i>Good Data</i> =	REX inhibit/allow status.
<i>Logical Index</i> =	The number of the module whose status is in question.
<i>Dump</i> =	NA.

Table 29 Error Code: DDSVCDGRD

Error Code:	DDSVCDGRD
Error Description:	A non MMRS RSM has been found whose DDSVCDGRD ("service degraded") key is set. This key refers to the status of an SM's DLIs. Since RSMs use RLIs, the key should always be clear.
Possible Error Effect:	Erroneous link status information could cause faulty call handling.
Corrective Action Taken:	The DD data is reset to the correct value (DDCLEAR).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The value of the DDSVCDGRD key for this RSM.
<i>Good Data</i> =	The correct value for the key (DDCLEAR).
<i>Logical Index</i> =	The SM number.
<i>Dump</i> =	NA.

Table 30 Error Code: DEACT_DDASPTRIG

Error Code:	DEACT_DDASPTRIG
Error Description:	The data delivery data from the key DDASPTRIG is cleared to indicate ASP 0.1 activation. The static data in rIDS_APP finds a match using a key of CCAINR01 and the global parameter <i>Glpvn_ofc</i> is set to DBPVN_SSP, so data delivery data should indicate ASP is de-activated.
Possible Error Effect:	Wasting SM data resources.
Corrective Action Taken:	The data delivery data DDASPTRIG is set to indicate ASP 0.1 de-activation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Return code from DD read.
<i>Good Data</i> =	The correct value for the key (DDSET).
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 31 Error Code: DEACT_DDPVNALW

Error Code:	DEACT_DDPVNALW
Error Description:	The value of the data delivery key, DDPVNALW, is clear to indicate ASP de-activation. A match in static data rIDS_APP exists for one of the following keys: (1) A key of CCPVN when Glpvn_ofc is set to DBPVN_SSP, or (2) A key of CCNS800. Also, the office type is a service switching point (SSP) or Glssp is set to DBYES. Therefore, DDPVNALW should be set.
Possible Error Effect:	Wasting SM data resources.
Corrective Action Taken:	The value of DDPVNALW is set to indicate ASP activation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Return code from DD read.
<i>Good Data =</i>	The correct value for the key (DDSET).
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 32 Error Code: EQPISOLSEP

Error Code:	EQPISOLSEP
Error Description:	An RSM in a MMRS site was found to be separated without isolation, in the master copies RISOL and RSEP respectively.
Possible Error Effect:	Reduction in the number of RSM available in the MMRS site.
Corrective Action Taken:	The separation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Separation state of the RSM in RSEP.
<i>Good Data =</i>	Correct separation state of the RSM to the value of RISOL.
<i>Logical Index =</i>	Module number.
<i>Dump =</i>	NA.

Table 33 Error Code: EQPRSMISOL

Error Code:	EQPRSMISOL
Error Description:	The RSMISOL bit for an equipped RSM does not match RISOL bit.
Possible Error Effect:	The isolation state of the RSM is incorrect.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Isolation state of the RSMs in the DDRSMISOL byte.
<i>Good Data =</i>	Correct isolation states of RSMs.
<i>Logical Index =</i>	IM number whose isolation state is incorrect.
<i>Dump =</i>	NA.

Table 34 Error Code: EQPRSMINIT

Error Code:	EQPRSMINIT
Error Description:	The initialization status of an RSM in a MMRS site does not agree with the information kept in the master copy SINIT.
Possible Error Effect:	This causes loss of MMRS resources.
Corrective Action Taken:	The initialization state of the RSM is corrected to agree with SINIT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Initialization state of the RSMs in the DDRSMINIT byte.
<i>Good Data =</i>	Value of SINIT which is written on to DDRSMINIT.
<i>Logical Index =</i>	MMRS module number.
<i>Dump =</i>	NA.

Table 35 Error Code: EQPRSMSEP

Error Code:	EQPRSMSEP
Error Description:	The separation status of an RSM in a MMRSM site does not agree with the information kept in the master copy RSEP.
Possible Error Effect:	This causes loss of MMRSM resources.
Corrective Action Taken:	The separation state of the RSM is corrected to agree with RSEP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Separation state of the RSMs in the DDRSMSEP byte.
<i>Good Data =</i>	Value of RSEP which is written on the DDRSMSEP.
<i>Logical Index =</i>	MMRSM module number.
<i>Dump =</i>	NA.

Table 36 Error Code: HIMRSMINIT

Error Code:	HIMRSMINIT
Error Description:	The RSMINIT byte for non MMRSM IMs is not zero.
Possible Error Effect:	The initialization state of the module is incorrect.
Corrective Action Taken:	The initialization state of the module is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Initialization state of the modules in the DDRSMINIT byte.
<i>Good Data =</i>	Correct initialization states of the modules.
<i>Logical Index =</i>	Module number whose initialization state is incorrect.
<i>Dump =</i>	NA.

Table 37 Error Code: HIMRSMISOL

Error Code:	HIMRSMISOL
Error Description:	The RSMISOL bit for an IM other than HIM does not match RISOL bit.
Possible Error Effect:	The isolation state of the RSM is incorrect.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Isolation state of the RSMs in the DDRSMISOL byte.
<i>Good Data =</i>	Correct isolation states of RSMs.
<i>Logical Index =</i>	IM number whose isolation state is incorrect.
<i>Dump =</i>	NA.

Table 38 Error Code: HIMRSMSEP

Error Code:	HIMRSMSEP
Error Description:	The RSMSEP byte for a non MMRSM IM is not zero.
Possible Error Effect:	The separation state of the module is incorrect.
Corrective Action Taken:	The separation state of the module is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Separation state of the modules in the DDRSMSEP byte.
<i>Good Data =</i>	Correct separation states of the modules.
<i>Logical Index =</i>	Module number whose separation state is incorrect.
<i>Dump =</i>	NA.

Table 39 Error Code: INV

Error Code:	INV
Error Description:	The DDRSEP byte for an HSM is not zero.
Possible Error Effect:	The separation state of the HSM is incorrect.
Corrective Action Taken:	The separation state of the HSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.

<i>Bad Data</i> =	Separation state of the HSM in the DDRSMSEP byte.
<i>Good Data</i> =	Correct separation states of the HSM.
<i>Logical Index</i> =	Module number whose separation state is incorrect.
<i>Dump</i> =	NA.

Table 40 Error Code: LNK_CTS_NUM

Error Code:	LNK_CTS_NUM
Error Description:	The data in either DDCTS0 or DDCTS1 pertaining to the even and odd CTS link numbers is inconsistent with the data maintained in the ODD relation RLMODATT.
Possible Error Effect:	Incorrect link information will be used.
Corrective Action Taken:	The data in either DDCTS0 or DDCTS1 will be updated to be consistent with the ODD relation RLMODATT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	0 if error is pertaining to DDCTS0 or 1 if error is pertaining to DDCTS1.
<i>Bad Data</i> =	Return value from DDREAD call.
<i>Good Data</i> =	ODD rIMODATT data for this SM. Even CTS link number for DDCTS0 and ODD CTS link number for DDCTS1.
<i>Logical Index</i> =	The number of the SM whose link information is in error.
<i>Dump</i> =	Copy of the rIMODATT tuple of the SM in question.

Table 41 Error Code: LNK2ILST

Error Code:	LNK2ILST
Error Description:	The DD key summary status does not match the actual value returned by TM.
Possible Error Effect:	A major or minor alarm may sound, when it should or not sound.
Corrective Action Taken:	The corresponding DD key will be updated with the appropriate value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Bad DD key value.
<i>Good Data</i> =	Good DD key value.
<i>Logical Index</i> =	The DD key that had the error.
<i>Dump</i> =	NA.

Table 42 Error Code: MODATT

Error Code:	MODATT
Error Description:	A remote switching module (RSM) from static relation RLHSMRSM (rIHSMRSM.rsmnum[index]) has no corresponding tuple in the RLMODATT relation. That is, a database read failed for relation RLMODATT using rIMODATT.module = rIHSMRSM.rsmnum[index] where the RSM number was valid (!= 0).
Possible Error Effect:	The RSM can not be made operational.
Corrective Action Taken:	None.
Manual Action Required:	Either RLHSMRSM is corrupt (it contains an incorrect RSM number) or the RSM has not been fully specified in the static ODD. Technicians should determine if the RSM number corresponds to a real SM and either remove the reference from RLHSMRSM or add all missing static ODD using recent change or ODBE. See poprules for RLMODATT and RLHSMRSM for more information.
Dump Description:	
<i>Error Address</i> =	Index into rIHSMRSM.rsmnum[].
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The host SM (HSM) number. This is the key to the rIHSMRSM tuple (rIHSMRSM.hsmnum).
<i>Logical Index</i> =	The RSM number. This is the key to the rIMODATT tuple (rIMODATT.module) for which the database read failed.
<i>Dump</i> =	The RLHSMRSM tuple.

Table 43 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	Corresponding rHSMRSM tuple could not be found in the database. This error will continue to print out until fixed by the user.
Possible Error Effect:	May cause asserts and/or interrupts by various application programs.
Corrective Action Taken:	None.
Manual Action Required:	Using ODBE, insert the missing rHSMRSM tuple using the key which is dumped in the Logical Index of this error report.
Dump Description:	
<i>Error Address =</i>	Address of rHSMRSM tuple buffer.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (<i>hsmnum</i>) of the rHSMRSM tuple buffer.
<i>Dump =</i>	NA.

Table 44 Error Code: RCMISOL

Error Code:	RCMISOL
Error Description:	The communication module vintage is not CM2 and the data delivery keys DDRCMISOL and DDSCMISOL are not cleared. These two keys can only be set in CM2 offices.
Possible Error Effect:	The DD keys will contain the incorrect status. As a result, communication module maintenance functionality may not be available.
Corrective Action Taken:	Write both the DDRCMISOL and DDSCMISOL keys to DDNORMAL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The data delivery DDSCMISOL data.
<i>Bad Data =</i>	The data delivery DDRCMISOL data.
<i>Good Data =</i>	Glcml0vint.
<i>Logical Index =</i>	Glcml1vint.
<i>Dump =</i>	NA.

Table 45 Error Code: RSMINITO

Error Code:	RSMINITO
Error Description:	The RMSINIT byte for an RSM is not zero.
Possible Error Effect:	The initialization state of the RSM is incorrect.
Corrective Action Taken:	The initialization state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Initialization state of the RSM in the DDRSMINIT byte.
<i>Good Data =</i>	Correct initialization states of the RSM.
<i>Logical Index =</i>	Module number whose initialization state is incorrect.
<i>Dump =</i>	NA.

Table 46 Error Code: RSMINITO

Error Code:	RSMINITO
Error Description:	The RSMINIT byte for an HSM is not zero.
Possible Error Effect:	The initialization state of the HSM is incorrect.
Corrective Action Taken:	The initialization state of the HSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Initialization state of the HSM in the DDRSMINIT byte.
<i>Good Data =</i>	Correct initialization states of the HSM.
<i>Logical Index =</i>	Module number whose initialization state is incorrect.
<i>Dump =</i>	NA.

Table 47 Error Code: RSMSEPO

Error Code:	RSMSEPO
Error Description:	The RSMSEP byte for an RSM is not zero.
Possible Error Effect:	The separation state of the RSM is incorrect.
Corrective Action Taken:	The separation state of the RSM is corrected.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Separation state of the RSM in the DDRSMSEP byte.
<i>Good Data</i> =	Correct separation states of the RSM.
<i>Logical Index</i> =	Module number whose separation state is incorrect.
<i>Dump</i> =	NA.

Table 48 Error Code: RSMSEPO

Error Code:	RSMSEPO
Error Description:	The RSMSEP byte for an HSM is not zero.
Possible Error Effect:	The separation state of the HSM is incorrect.
Corrective Action Taken:	The separation state of the HSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Separation state of the HSM in the DDRSMSEP byte.
<i>Good Data</i> =	Correct separation states of the HSM.
<i>Logical Index</i> =	Module number whose separation state is incorrect.
<i>Dump</i> =	NA.

Table 49 Error Code: SCMISOL

Error Code:	SCMISOL
Error Description:	The CM isolation DD status key DDSCMISOL is incorrectly set in the pending state (DDPCMISOL). A <i>Good Data</i> value of 1 indicates that the CM isolation DD request key DDRCMISOL is not normal and entry into manual CM isolation should be in progress. However, there is no CM isolation request on the SMARS queue. A <i>Good Data</i> value of 0 indicates that DDRCMISOL is normal and an AM/CM re-synchronization should be in progress. However, the SMrsmode re-synchronization flag is SMRSNULL.
Possible Error Effect:	The DDSCMISOL DD key is stuck in what should be a transient pending state giving incorrect CM isolation status and stubbing off PCD auditing. Some communication module maintenance functionality may not be available.
Corrective Action Taken:	Write the DDSCMISOL key to DDNORMAL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Value for DDRCMISOL.
<i>Bad Data</i> =	Value for DDSCMISOL.
<i>Good Data</i> =	Either 0 or 1, see Error Description.
<i>Logical Index</i> =	Value for SMrsmode.
<i>Dump</i> =	NA.

Table 50 Error Code: STUCK

Error Code:	STUCK
Error Description:	The RSMISOL byte for an RSM is not zero.
Possible Error Effect:	Invalid state of the RSM single RSM offices should always have the isolation bits set to zero.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Isolation byte DDRSMISOL.
<i>Good Data</i> =	Written value of zero to DMRSMISOL.
<i>Logical Index</i> =	RSM module number.
<i>Dump</i> =	NA.

Table 51 Error Code: TYPE

Error Code:	TYPE

Error Description:	A switching module (SM) type in data delivery (DD) key DDSM2000 is inconsistent with RMODATT (rMODATT.unitttype = SMSM2000 and DDSM2000 = DDCLEAR for the SM or rMODATT.unitttype != SMSM2000 and DDSM2000 = DDSET for the SM).
Possible Error Effect:	Call processing may take incorrect actions for the given SM.
Corrective Action Taken:	The audit writes DDSM2000 to agree with rMODATT.unitttype. That is, if rMODATT.unitttype = SMSM2000, the audit writes the value of DDSM2000 to DDSET for this SM. Otherwise, the audit writes the value of DDSM2000 for this SM to DDCLEAR.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value in DDSM2000 for the SM.
<i>Good Data =</i>	SM type (rMODATT.unitttype)
<i>Logical Index =</i>	SM number (rMODATT.module)
<i>Dump =</i>	rMODATT tuple for this SM.

Table 52 Error Code: UEQRSMISOL

Error Code:	UEQRSMISOL
Error Description:	The RSMISOL bit for an unequipped RSM does not match RISOL bit.
Possible Error Effect:	The isolation state of the RSM is incorrect.
Corrective Action Taken:	The isolation state of the RSM is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Isolation state of the RSMs in the DDRSMISOL byte.
<i>Good Data =</i>	Correct isolation states of RSMs.
<i>Logical Index =</i>	Offset of the unequipped RSM.
<i>Dump =</i>	NA.

Table 53 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up, after taking a reset.
Possible Error Effect:	Causes resets and/or asserts.
Corrective Action Taken:	Reinitialize audit global data, return audit complete, and wait for next cycle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	AUddindex (tells audit which SM to check next).

DFIMP

Software Release: 5E10 and later

1. DIGITAL FACILITIES INTERFACE MICROPROCESSOR (DFIMP) AUDIT

The SLC® 96 digital facility interface (S-DFI) contains several circuits, including a time-slot interchange unit (TSI), a signal framer, and a microprocessor (MP) that controls the flow of signals through the S-DFI. Refer to Figure 1. Control information regulated by the microprocessor includes whether the derived data link (a sample of bits from the T1 line compared to a pattern for control purposes) is used and whether the TSI of the S-DFI is bypassed (it is bypassed for mode II lines). Other functions of the microprocessor include checking the format of signals between the S-DFI and the remote terminal and checking the status of the time assignment unit (TAU) bits. The microprocessor stores the control information in random access memory (RAM). The DFIMP audit verifies the information in the control RAM to ensure that service degradations do not result from errors such as overwriting a mode I S-DFI with mode II data.

The audit is part of the Switch Maintenance audits subgroup.

2. DATA STRUCTURES

DFIMP audit is the control RAM in the S-DFI microprocessor. The audit checks four bytes of information against the circuit data relation (RLCKTDATA) and various header files. The four bytes of information checked in the control RAM are the firmware configuration byte, the framer mode byte, the receive sink/transmit formatter (RS/TF) mode byte, and the TAU activity byte.

Figure 1 (DFIMP-1) DFIMP Hardware

3. AUDIT CHECKS

The audit reads the control RAM bytes and compares information in them with appropriate fields in RLCKTDATA and the header files.

- (a) When checking the firmware configuration byte, the audit determines whether the derived data link field is used, whether the S-DFI is bypassed, and other maintenance information.
- (b) The framer mode byte controls the format of the bit frames on the T1 lines. For American systems, the byte is set to zero because the T1 lines contain 24 time slots. The framer mode byte of other systems specifies different formats.
- (c) The receive sink/transmit formatter mode byte is checked to ensure that control signaling between the S-DFI and the remote terminal is correct.
- (d) The TAU activity byte, used only by mode II lines, indicates whether TAU activity should be on or off. This check is excluded if the S-DFI is not active.

- (e) The audit also ensures that the system on/off counter is on and the talk-back channel on the S-DFI is functioning when the S-DFI is active.

4. ERROR HANDLING

The audit corrects errors by sending a recovery message to the peripheral fault recovery program for the S-DFI. Peripheral fault recovery sends a message to the maintenance request administrator (MRA) program, which switches calls to the protection T1 line and its associated S-DFI. The faulty S-DFI is removed from service, diagnosed, initialized, and restored to service when all the diagnostic tests pass.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: CKTDATA

Error Code:	CKTDATA
Error Description:	Cannot access the RLCKTDATA relation.
Possible Error Effect:	Cannot initialize the S-DFI hardware.
Corrective Action Taken:	None.
Manual Action Required:	Yes.
Dump Description:	
<i>Error Address</i> =	Address of the rICKTDATA tuple.
<i>Bad Data</i> =	Expected value of the tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding riSMEST tuple.

Table 2 Error Code: C_FAIL_SLC

Error Code:	C_FAIL_SLC
Error Description:	The SLC [®] 96 A facility firmware configuration for the control information indicates not to send the C field.
Possible Error Effect:	The DFI will lose communication with the remote terminal.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the firmware configuration byte.
<i>Bad Data</i> =	Value of bits 0 and 1 of the byte.
<i>Good Data</i> =	Correct value of bits 0 and 1 of the byte.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding riSMEST tuple.

Table 3 Error Code: DDL_FLD

Error Code:	DDL_FLD
Error Description:	The firmware configuration byte is checked for DDL fields. None are expected.
Possible Error Effect:	None. Not a good error state.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the firmware configuration byte.
<i>Bad Data</i> =	Bits 0 and 1 of the firmware configuration byte.
<i>Good Data</i> =	Correct value for bits 0 and 1.

<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding rISMEST tuple.

Table 4 Error Code: DDL_MODE

Error Code:	DDL_MODE
Error Description:	The firmware configuration byte is checked for D4 mode.
Possible Error Effect:	The DFI will go out of frame and lose communication with the PICB.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the firmware configuration byte.
<i>Bad Data</i> =	Bits 3 through 5 of the firmware configuration byte.
<i>Good Data</i> =	Correct value for bits 3 through 5.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding rISMEST tuple.

Table 5 Error Code: DDL_MSG_FLD

Error Code:	DDL_MSG_FLD
Error Description:	The SLC [®] 96 A facility firmware configuration for the control information indicates not to send A, M, S and C fields.
Possible Error Effect:	The DFI will lose communication with the remote terminal.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the firmware configuration byte.
<i>Bad Data</i> =	Value of bits 0 and 1 of the byte.
<i>Good Data</i> =	Correct value of bits 0 and 1 of the byte.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding rISMEST tuple.

Table 6 Error Code: DFI_MODE

Error Code:	DFI_MODE
Error Description:	Cannot find the firmware configuration byte in the ODD.
Possible Error Effect:	The S-DFI may not be initialized correctly.
Corrective Action Taken:	None.
Manual Action Required:	Yes. Incorrect office data is indicated.
Dump Description:	
<i>Error Address</i> =	Address of the rCKTDATA tuple being read.
<i>Bad Data</i> =	Expected value of the tuple.
<i>Good Data</i> =	Not used.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding rISMEST tuple.

Table 7 Error Code: FIRMW_CONFIG

Error Code:	FIRMW_CONFIG
Error Description:	The control information in the firmware configuration byte of the SLC [®] 96 A facility is incorrect.
Possible Error Effect:	The Remote Terminal will not process calls. May also cause maintenance alarms.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the firmware configuration byte.
<i>Bad Data</i> =	Bits 0 and 1 of the firmware configuration byte.
<i>Good Data</i> =	Correct value for bits 0 and 1.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding rSMEST tuple.

Table 8 Error Code: FRAME_MODE

Error Code:	FRAME_MODE
Error Description:	The framer mode byte is not marked SLC [®] 96.
Possible Error Effect:	The remote terminal will not work.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the framer mode byte.
<i>Bad Data</i> =	Value of bits 0 - 6 of the framer mode byte.
<i>Good Data</i> =	Correct value for bits 0 - 6.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding rSMEST tuple.

Table 9 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	Could not read the DFI circuit name from rIS96DFI.
Possible Error Effect:	Cannot initialize.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Not used.
<i>Bad Data</i> =	Not used.
<i>Good Data</i> =	Expected value of the tuple.
<i>Logical Index</i> =	DFI name in the tuple.
<i>Dump</i> =	rIS96DFI structure.

Table 10 Error Code: MODE

Error Code:	MODE
Error Description:	One or more of bits 2 through 4 of the firmware configuration byte are incorrect.
Possible Error Effect:	May kill call processing. SLC [®] 96 will not function properly. May not be able to make phone calls. Stable calls are usually dropped.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the firmware configuration byte.
<i>Bad Data</i> =	Value of bits 2 through 4.
<i>Good Data</i> =	Correct value of bits 2 through 4.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding rSMEST tuple.

Table 11 Error Code: NONEPROC

Error Code:	NONEPROC
Error Description:	Echoed data from the DFI does not match data sent.
Possible Error Effect:	DFI isn't really working.
Corrective Action Taken:	Audit will send a message to SMIM requesting a restoral of the DFI.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Address of the data returned by the DFI.
<i>Bad Data</i> =	Char received.
<i>Good Data</i> =	Complement of char sent.
<i>Logical Index</i> =	SDFI name.
<i>Dump</i> =	NA.

Table 12 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	A S-DFI is in use, but the TAU activity byte is OFF for MODE II SLC [®] 96.
Possible Error Effect:	Turns off originations from shelf served by the DFI.
Corrective Action Taken:	Message is sent to SMIM to recover the SDFI.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	TAU activity byte.
<i>Bad Data</i> =	TAU activity byte.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	rIS96DFI circuit name.
<i>Dump</i> =	Corresponding rSMEST tuple.

Table 13 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	A S-DFI is not in use, but the TAU activity byte is ON for MODE II SLC [®] 96.
Possible Error Effect:	Can cause unwanted activity messages from a non-active DFI.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	TAU activity byte.
<i>Bad Data</i> =	TAU activity byte.
<i>Good Data</i> =	1.
<i>Logical Index</i> =	rIS96DFI circuit name.
<i>Dump</i> =	Corresponding rSMEST tuple.

Table 14 Error Code: NOT_SLC

Error Code:	NOT_SLC
Error Description:	Bits 0 through 6 of the framer mode byte do not indicate SLC [®] 96.
Possible Error Effect:	The DFI may go out of frame and/or lose communication with the PICB.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the framer mode byte.
<i>Bad Data</i> =	Bits 0 through 6 of the framer mode byte.
<i>Good Data</i> =	Correct value for bits 0 through 6.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding rSMEST tuple.

Table 15 Error Code: ODD_DATA

Error Code:	ODD_DATA
Error Description:	Cannot find the firmware configuration byte in the ODD.
Possible Error Effect:	The S-DFI may not be initialized correctly.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the CKTDATA tuple being read.
<i>Bad Data</i> =	Expected value of the tuple.
<i>Good Data</i> =	Not used.

<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding riSMEST tuple.

Table 16 Error Code: RS_TF_BITS

Error Code:	RS_TF_BITS
Error Description:	Bits 2 through 6 of the RS/TF mode are incorrect.
Possible Error Effect:	No traffic will get through the S-DFI.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the RS_TF Mode byte.
<i>Bad Data</i> =	Value of bits 2 through 6 of the RS_TF Mode byte.
<i>Good Data</i> =	Correct value of bits 2 through 6.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding riSMEST tuple.

Table 17 Error Code: RS_TF_MODE

Error Code:	RS_TF_MODE
Error Description:	One or more of bits 2 through 6 of the RS_TF (receive sync transmit formatter) mode byte are incorrect.
Possible Error Effect:	Signaling between S-DFI and the Remote Terminal will be messed up (that is, can not ring).
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS and diagnosed. If it is ATP, it is initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the RS_TF Mode byte.
<i>Bad Data</i> =	Value of bits 2 through 6.
<i>Good Data</i> =	Correct value of bits 2 through 6.
<i>Logical Index</i> =	DFI circuit name.
<i>Dump</i> =	Corresponding riSMEST tuple.

Table 18 Error Code: SANCLK

Error Code:	SANCLK
Error Description:	SDFI system counter was turned off. Never valid for active DFI.
Possible Error Effect:	DFI isn't really working.
Corrective Action Taken:	Audit will send a message to SMIM requesting a restoral of the DFI.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the data returned by the DFI.
<i>Bad Data</i> =	Char received.
<i>Good Data</i> =	Complement of char sent.
<i>Logical Index</i> =	SDFI name.
<i>Dump</i> =	NA.

Table 19 Error Code: SLC_MODE

Error Code:	SLC_MODE
Error Description:	Cannot find the S-DFI mode attribute in the ODD.
Possible Error Effect:	The S-DFI may not be initialized correctly.
Corrective Action Taken:	None.
Manual Action Required:	Yes. Incorrect office data is indicated.
Dump Description:	
<i>Error Address</i> =	Address of the riCKTDATA tuple being read.
<i>Bad Data</i> =	Expected value of the tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	DFI circuit name.

<i>Dump</i> =	Corresponding rSMEST tuple.

Table 20 Error Code: STUFF_PAT

Error Code:	STUFF_PAT
Error Description:	The stuffing pattern for Mode II concentrated SLC [®] 96 is incorrect.
Possible Error Effect:	Some calls will be blocked from getting through the DFI.
Corrective Action Taken:	A message is sent to PFR, which then sends a message to MRA to do a protection line switch. The S-DFI in question is taken OOS, diagnosed, (if ATP) initialized and put back into service by performing a protection line switch.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the ODD stuffing pattern.
<i>Bad Data</i> =	Value of the ODD stuffing pattern.
<i>Good Data</i> =	DFI stuffing pattern.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Corresponding rSMEST tuple.

Table 21 Error Code: TIMEOUT

Error Code:	TIMEOUT
Error Description:	Failed to get response from active DFI. It shouldn't be active if it won't respond.
Possible Error Effect:	DFI isn't really working.
Corrective Action Taken:	Audit will send a message to SMIM requesting a restoral of the DFI.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rCKTDATA tuple.
<i>Bad Data</i> =	Expected value of the tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rS96DFI circuit name.
<i>Dump</i> =	Corresponding rSMEST tuple.

Table 22 Error Code: TUPLE

Error Code:	TUPLE
Error Description:	Could not read the DFI circuit name from rCKTDATA.
Possible Error Effect:	Cannot initialize the S-DFI hardware.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rCKTDATA tuple.
<i>Bad Data</i> =	Expected value of the tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rS96DFI circuit name.
<i>Dump</i> =	Corresponding rSMEST tuple.

DFISHELF

Software Release: 5E10 and later

1. DIGITAL FACILITIES INTERFACE SHELF (DFISHELF) AUDIT

The *SLC*® 96 remote terminal contains as many as four shelves of customer lines; 24 customer lines may terminate on one shelf. Two shelves make up one shelf group, or bank. The T1 lines, each of which contains 24 time slots, are allocated by shelf for mode I (unconcentrated) service and by bank for mode III (concentrated) service. The T1 lines terminate on *SLC*® 96 digital facility interfaces (S-DFIs) in the digital carrier line unit (DCLU) in the switching module. The digital facilities interface shelf audit (DFISHELF) ensures that the shelves of each remote terminal are assigned properly to the S-DFIs. The audit is part of the Switch Maintenance audits subgroup.

2. DATA STRUCTURES

This audit checks two dynamic relations, the *SLC*® 96 digital facilities interface relation (RLS96DFI) and the *SLC*® 96 shelf relation (RLS96SHELF), and the static *SLC*® 96 equipment configuration relation (RLS96EQUIP). As Figure 1 shows, the RLS96DFI relation contains the name of the shelf that each S-DFI serves. The tuples of the relation are indexed by the S-DFI name; each tuple contains the name of the shelf associated with it. There is a separate tuple for the protection S-DFI. The RLS96SHELF relation contains a tuple for each equipped shelf or shelf group. The tuples of the relation are indexed by the shelf name; each tuple contains the name of the S-DFI associated with it. The static RLS96EQUIP relation contains the name of the remote terminal and the S-DFIs associated with the shelves in it.

——— # = One-To-One Linkage

Figure 1 (DFISHELF-1) Data Structures of the DFISHELF Audit

3. AUDIT CHECKS

The audit invokes the static driver (DRSTATIC) to read a tuple of RLS96EQUIP and obtain an S-DFI circuit name. Using the S-DFI circuit name, the audit reads rIS96DFI and checks the shelf circuit name. Valid values are either a shelf circuit name or null. The audit proceeds to RLS96SHELF and verifies that the tuple with the shelf circuit name obtained in RLS96DFI contains the same S-DFI circuit name. After the audit makes these consistency checks, it examines the line switch field of the derived data link (the derived data link is a sample of T1 signals used for control purposes). The line switch field tells the state of the protection line. Valid states are in-service, out-of-service, and the number of the shelf being served.

- If the protection line is not serving a shelf, the dfip field in rIS96DFI should be null, as it is in Figure 1 .
- If the protection line is serving a specific shelf (for example, shelf A), the dfip field in rIS96DFI must contain the name of shelf A. The tuple in rIS96SHELF for shelf A must contain the value of dfip. The audit ensures that the dfia field in rIS96DFI is null.
- If the protection line is being switched in or out, the audit verifies that a terminal process is associated with the switching activity. For every remote terminal it checks, the audit sends a message to the T1 peripheral fault recovery program to check the state of the shelves for the remote terminal. The audit steps through

RLS96DFI and RLS96SHELF and checks RLCKTDATA and RLS96EQUIP to determine the existence of the dynamic tuples in RLS96DFI and RLS96SHELF.

4. ERROR HANDLING

The DFISHELF audit recovers from errors by inserting tuples into RLS96DFI and RLS96SHELF based on the circuit names obtained from RLS96EQUIP, if needed. It then sends a recovery message to the T1 line peripheral fault recovery system process, which calls a recovery function. The audit treats consistency errors by initializing the data structures to their normal state (the state in which S-DFI a serves shelf A, S-DFI b serves shelf B, etc.) because the audit cannot determine the assignment of the protection line.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: DDL_PDFI_EQP

Error Code:	DDL_PDFI_EQP
Error Description:	The protection line DFI is not equipped in rIS96EQUIP but the derived data link S field is not NULL.
Possible Error Effect:	Unknown.
Corrective Action Taken:	Initialize the remote terminal.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Copy of the shelf name from the DDL.
<i>Bad Data</i> =	Shelf name from DDL.
<i>Good Data</i> =	Value indicating no shelf assigned to P-DFI.
<i>Logical Index</i> =	Remote terminal name.
<i>Dump</i> =	rIS96EQUIP tuple.

Table 2 Error Code: DDL_SHELF

Error Code:	DDL_SHELF
Error Description:	Inconsistent hardware (from S fields of derived data link) and software information (from rIS96DFI tuple) was detected.
Possible Error Effect:	Unknown.
Corrective Action Taken:	Initialize the remote terminal.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Protection line rIS96DFI tuple.
<i>Bad Data</i> =	Shelf name from tuple.
<i>Good Data</i> =	Shelf name from the derived data link S field.
<i>Logical Index</i> =	Circuit name.
<i>Dump</i> =	Protection line rIS96DFI tuple.

Table 3 Error Code: DEADPID

Error Code:	DEADPID
Error Description:	A shelf is undergoing a protection line switch, but the process performing it is invalid.
Possible Error Effect:	Possible problems routing calls.
Corrective Action Taken:	The remote terminal is initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Entry in table of processes performing PLS.
<i>Bad Data</i> =	PID in error.
<i>Good Data</i> =	Index into table of PLS processes.
<i>Logical Index</i> =	Remote terminal name from rIS96EQUIP tuple.
<i>Dump 1</i> =	PLS process.
<i>Dump 2</i> =	rIS96DFI tuple.
<i>Dump 3</i> =	rIS96SHELF tuple.

Table 4 Error Code: DER_DFI

Error Code:	DER_DFI
Error Description:	The dfi name in the rIS96SHELF tuple contains a different name than what was derived from the rIS96EQUIP tuple.
Possible Error Effect:	Unknown.
Corrective Action Taken:	Initialize the remote terminal.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIS96SHELF tuple.
<i>Bad Data =</i>	dfi name in that tuple.
<i>Good Data =</i>	dfi name derived from the rIS96EQUIP tuple.
<i>Logical Index =</i>	Circuit name.
<i>Dump 1 =</i>	rIS96SHELF tuple.
<i>Dump 2 =</i>	rIS96DFI tuple.

Table 5 Error Code: DER_SHELF

Error Code:	DER_SHELF
Error Description:	The shelf name in the rIS96DFI tuple contains a different name than what was derived from the rIS96EQUIP tuple.
Possible Error Effect:	Unknown.
Corrective Action Taken:	Initialize the remote terminal.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIS96DFI tuple.
<i>Bad Data =</i>	Shelf name in that tuple.
<i>Good Data =</i>	Shelf name derived from the rIS96EQUIP tuple.
<i>Logical Index =</i>	Circuit name.
<i>Dump 1 =</i>	rIS96DFI tuple.
<i>Dump 2 =</i>	rIS96SHELF tuple.

Table 6 Error Code: DFILOSTTUP

Error Code:	DFILOSTTUP
Error Description:	There is a tuple missing in the rIS96DFI relation.
Possible Error Effect:	Possible problems when routing SLC [®] 96 calls.
Corrective Action Taken:	The tuple is created and initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIS96DFI tuple.
<i>Bad Data =</i>	Relation ID.
<i>Good Data =</i>	Remote terminal name.
<i>Logical Index =</i>	Circuit name used to read the rIS96DFI relation.
<i>Dump 1 =</i>	rIS96DFI tuple.
<i>Dump 2 =</i>	rIS96EQUIP tuple.

Table 7 Error Code: DFI_MODE

Error Code:	DFI_MODE
Error Description:	An inconsistent shelf mode was detected between the rIS96DFI tuple and the rIS96EQUIP tuple.
Possible Error Effect:	Problems routing SLC [®] 96 calls.
Corrective Action Taken:	The shelf mode in the rIS96DFI tuple is changed to agree with the rIS96EQUIP tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIS96DFI tuple.
<i>Bad Data =</i>	rIS96DFI shfmode field.
<i>Good Data =</i>	rIS96EQUIP bankmode field.
<i>Logical Index =</i>	Circuit name.
<i>Dump 1 =</i>	rIS96DFI tuple.
<i>Dump 2 =</i>	rIS96EQUIP tuple.

Table 8 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	An extra rIS96DFI or rIS96SHELF tuple exists for rICKTDATA. The <i>Bad Data</i> field indicates which one.
Possible Error Effect:	Call processing resources will decrease due to hung tuples.
Corrective Action Taken:	If <i>Bad Data</i> equals 1, then the rIS96DFI tuple will be deleted from the data base because the corresponding static rICKTDATA tuple does not exist or is unequipped. If <i>Bad Data</i> equals 2, then the rIS96SHELF tuple will be deleted from the data base because the corresponding static rIS96EQUIP tuple does not exist.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIS96DFI or rIS96SHELF tuple.
<i>Bad Data</i> =	Error refers to an extra: 1 = rIS96DFI tuple. 2 = rIS96SHELF tuple.
<i>Good Data</i> =	1 = rICKTDATA or rIS96EQUIP does not exist. 2 = rICKTDATA is not equipped.
<i>Logical Index</i> =	Circuit name.
<i>Dump</i> =	rIS96DFI or rIS96SHELF tuple.

Table 9 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	There is a missing tuple in the rSMEST relation corresponding to the SHELF.
Possible Error Effect:	Unknown.
Corrective Action Taken:	The remote terminal is initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rSMEST tuple.
<i>Bad Data</i> =	Relation ID for rSMEST.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Circuit name.
<i>Dump</i> =	rSMEST tuple.

Table 10 Error Code: LOST_SHELF

Error Code:	LOST_SHELF
Error Description:	There is a tuple missing in the rIS96SHELF relation.
Possible Error Effect:	Possible problems routing SLC [®] 96 calls.
Corrective Action Taken:	The tuple is created and initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIS96SHELF tuple.
<i>Bad Data</i> =	Relation ID for rIS96SHELF.
<i>Good Data</i> =	Remote terminal name indicating which rIS96EQUIP tuple.
<i>Logical Index</i> =	Circuit name.
<i>Dump 1</i> =	rIS96SHELF tuple.
<i>Dump 2</i> =	rIS96DFI tuple.

Table 11 Error Code: ONE2ONE

Error Code:	ONE2ONE
Error Description:	A point-to-point-back check failed.
Possible Error Effect:	Loss of call processing resources due to unlinked tuples.
Corrective Action Taken:	Initialize the remote terminal.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIS96DFI or rIS96SHELF tuple.

<i>Bad Data</i> =	The shelf or dfl name field in that tuple in error.
<i>Good Data</i> =	Assumed name from rIS96EQUIP tuple.
<i>Logical Index</i> =	Remote terminal name.
<i>Dump 1</i> =	Original rIS96DFI tuple.
<i>Dump 2</i> =	rIS96SHELF tuple.
<i>Dump 3</i> =	Protection rIS96DFI tuple.

Table 12 Error Code: PLS_COMP

Error Code:	PLS_COMP
Error Description:	The rIS96DFI tuple indicates that a protection line switch has occurred, but the protection line DFI in the rIS96EQUIP tuple is not equipped.
Possible Error Effect:	Unknown.
Corrective Action Taken:	Initialize the remote terminal.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIS96DFI tuple which should have been replaced by the protection line DFI.
<i>Bad Data</i> =	Shelf field of the rIS96DFI tuple.
<i>Good Data</i> =	Shelf name from the rIS96EQUIP tuple.
<i>Logical Index</i> =	Circuit name.
<i>Dump 1</i> =	rIS96DFI tuple.
<i>Dump 2</i> =	rIS96SHELF tuple.
<i>Dump 3</i> =	rIS96EQUIP tuple.

Table 13 Error Code: PLS_PDFI

Error Code:	PLS_PDFI
Error Description:	The protection line DFI does not indicate that a protection line switch is happening (at least according to the rIS96DFI tuple).
Possible Error Effect:	Unknown.
Corrective Action Taken:	The remote terminal is initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIS96DFI tuple (for the protection line).
<i>Bad Data</i> =	Shelf field of the protection line rIS96DFI tuple.
<i>Good Data</i> =	Value for protection line switching.
<i>Logical Index</i> =	Circuit name.
<i>Dump 1</i> =	Protection line rIS96DFI tuple.
<i>Dump 2</i> =	Original rIS96DFI tuple.
<i>Dump 3</i> =	rIS96SHELF tuple.

Table 14 Error Code: PLS_SDFI

Error Code:	PLS_SDFI
Error Description:	This rIS96DFI tuple is under protection line switch, as such the s96shelf field should be null and it is not.
Possible Error Effect:	Unknown.
Corrective Action Taken:	Initialize the remote terminal.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIS96DFI tuple.
<i>Bad Data</i> =	Shelf field of tuple.
<i>Good Data</i> =	Remote terminal name.
<i>Logical Index</i> =	Circuit name.
<i>Dump 1</i> =	Original rIS96DFI tuple.
<i>Dump 2</i> =	rIS96SHELF tuple.
<i>Dump 3</i> =	Protection rIS96DFI tuple.

Table 15 Error Code: SLCLOSTTUP

Error Code:	SLCLOSTTUP
Error Description:	There is a tuple missing in the rIS96DFI relation corresponding to a protection line DFI.
Possible Error Effect:	Possible problems routing SLC [®] 96 calls.
Corrective Action Taken:	The tuple is created and initialized.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	rlS96DFI tuple.
<i>Bad Data</i> =	Relation ID.
<i>Good Data</i> =	Remote terminal name from rlS96EQUIP tuple.
<i>Logical Index</i> =	Circuit name.
<i>Dump 1</i> =	Protection rlS96DFI tuple.
<i>Dump 2</i> =	Original rlS96DFI tuple.
<i>Dump 3</i> =	rlS96SHELF tuple.

DFMAP

Software Release: 5E10 and later

1. DIGITAL SUBSCRIBER LINE FACILITIES MAP (DFMAP) AUDIT

The hardware that connects the "T" card in the line group (LGC) in the integrated services line unit (ISLU) to the protocol handlers (PHs) in the packet switching unit (PSU) includes the data fanout circuit (DF), time slot interchange unit (TSIU), peripheral interface data buses (PIDBs), directly connected PIDBs (DPIDBs), common data boards (CDs), and protocol handler data buses (PDBs), as Figure 1 shows. The PSU contains five shelves with 16 protocol handlers. There is one PDB per protocol handler, and 32 time slots per PDB. Digital subscriber line (DSL) maintenance audits check various aspects of this integrated service digital network (ISDN) hardware to ensure that the switch does not lose resources. The audits include the DFMAP audit, the integrated services port administration buffer audit (ISPABUF), and the terminal process control buffer audit (TPCBUF). Routine port conditioning (RPC) is also used to recover lost resources.

The DFMAP audit is part of the Peripheral Control audits subgroup.

2. DATA STRUCTURES

The DFMAP audit uses three data structures: the peripheral control data fanout map array (PCdfmap), the peripheral control data fanout link array (PCdflink), and the PIDB time slot data block relation (rIPTSB). The PCdfmap array is a bit map that contains a busy/idle entry for each time slot on the PDBs. The PCdflink array contains the key of the rIPTSB, which identifies the PIDB and time slot connected to the PDB. For correct interpretation of the data in PCdfmap and PCdflink, the DFMAP audit checks the circuit data relation (RLCKTDATA) and the switch maintenance equipment status relation (RLSMEST) to determine whether the protocol handler is in either the active or standby state. These data structures are shown in Figure 2 .

Figure 1 (DFMAP-1) ISLU Hardware

Figure 2 (DFMAP-2) Data Structures of the DFMAP Audit

3. AUDIT CHECKS

The DFMAP audit starts from the protocol handler side of the data fanout (DF) circuit and looks at information in rIPTSB on the DPIDB side. It makes the following checks.

- The audit determines whether each time slot entry in PCdfmap is busy or idle. It then checks the corresponding entry in PCdflink.
- If the PCdfmap entry is busy or idle and the PCdflink entry is not null, the audit assumes the PCdflink entry is a key and makes a point-to/point-back check to ensure that the corresponding tuple rIPTSB points back to the PDB on which the time slot exists.
- For a protocol handler that is neither active nor standby, the audit checks PCdfmap to ensure that all the time slot bits are busy and PCdflink to ensure that all the time slot entries are null.

When maintenance is being performed on a protocol handler, there is not a peripheral interface data bus (PIDB) associated with the PH data bus (PDB). However, all of the time slots on the PDB must be marked busy so that a path does not get set up using one of the time slots. This scenario requires that the PCdfmap be marked busy for all of the time slots on the given PDB, but a rIPTSB tuple will not exist. The PCdflink entry will contain PCDMYPTSB to indicate this situation.

4. ERROR HANDLING

Idle PCdfmap entries with a key in PCdflink and an rIPTSB tuple that points back to PCdflink are made busy. Busy PCdfmap entries with a key in PCdflink and no corresponding rIPTSB tuples are made idle and the PCdflink entry is made null.

When the semantic check function encounters the PCDMYPTSB value in PCdflink, it will not look for a rIPTSB. Instead, it will check the corresponding bit in PCdfmap to make sure that it is marked busy by calling the macro AUISIDLDFMAP(). If not, an error will be reported and the PCdfmap bit will be set to busy. The bit will be busied using the macro AUBSYDFMAP().

The DFMAP audits schedule the PTSB, CKTDATA, and PHDSLGP audits as related audits.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BUSY3MAP

Error Code:	BUSY3MAP
Error Description:	The rISMEST tuple indicates that the PH is neither active nor standby, but PCdfmap[][] is marked idle.
Possible Error Effect:	Path hunt might try to use the time slots.
Corrective Action Taken:	PCdfmap[][] is marked with all time slots busy for the given PH.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCdfmap[][].
<i>Bad Data =</i>	Value of PCdfmap[][].
<i>Good Data =</i>	0xffffffff.
<i>Logical Index =</i>	Circuit name of PH.
<i>Dump 1 =</i>	rUNITDATA tuple.
<i>Dump 2 =</i>	rISMEST tuple.

Table 2 Error Code: BUSY4MAP

Error Code:	BUSY4MAP
Error Description:	The rUNITDATA tuple indicates that the PH is not operational, but PCdfmap[][] is marked idle.
Possible Error Effect:	Path hunt might try to use the time slots.
Corrective Action Taken:	PCdfmap[][] is marked with all time slots busy for the given PH.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCdfmap[][].
<i>Bad Data =</i>	Value of PCdfmap[][].
<i>Good Data =</i>	0xffffffff.
<i>Logical Index =</i>	Circuit name of PH.
<i>Dump =</i>	rUNITDATA tuple.

Table 3 Error Code: BUSY5MAP

Error Code:	BUSY5MAP
Error Description:	There is no rUNITDATA tuple which indicates that the PH is not equipped, but PCdfmap[][] is marked idle.
Possible Error Effect:	Path hunt might try to use the time slots.
Corrective Action Taken:	PCdfmap[][] is marked with all time slots busy for the given PH.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCdfmap[][].
<i>Bad Data =</i>	Value of PCdfmap[][].
<i>Good Data =</i>	0xffffffff.
<i>Logical Index =</i>	Circuit name of PH.
<i>Dump =</i>	NA.

Table 4 Error Code: DSL_GRP

Error Code:	DSL_GRP
Error Description:	For an in-service PH, the DSL group found in the rIPTSB tuple does not match the indices of PCdflink[][] that was used to retrieve the key of the rIPTSB tuple.
Possible Error Effect:	The linkage between rIPTSB and PCdflink[][] has been broken.
Corrective Action Taken:	The time slot in PCdfmap[] idled and the PCdflink[][] is idled and the PCdflink[][] entry is set to null.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of dsl_group attribute in rIPTSB tuple.
<i>Bad Data =</i>	Value of dsl_group attribute in rIPTSB tuple.
<i>Good Data =</i>	Circuit name of PH.
<i>Logical Index =</i>	Key of rIPTSB tuple.
<i>Dump =</i>	rIPTSB tuple.

Table 5 Error Code: MAINT_STATE

Error Code:	MAINT_STATE

Error Description:	PCdflink[][] is marked with the PCDMYPTSB key which is used to indicate that a PDB time slot is being used for maintenance. But this is not possible because the PH is not out of service.
Possible Error Effect:	One of the time slots is being tied up needlessly.
Corrective Action Taken:	The PDB time slot in PCdfmap[][] is marked available (idle) and PCdflink[][] is marked with null.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCdflink[][].
<i>Bad Data</i> =	Value of PCdflink[][].
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Circuit name of PH in first two bytes and PDB time slot in last two bytes.
<i>Dump</i> =	PCmnbstat structure.

Table 6 Error Code: MAINT_STATE2

Error Code:	MAINT_STATE2
Error Description:	According to the PCmnbstat structure, the PDB time slot is not being used for maintenance, although PCdflink[][] looks like it is.
Possible Error Effect:	One of the time slots is being tied up needlessly.
Corrective Action Taken:	The PDB time slot in PCdflink[][] is marked with null.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCdflink[][].
<i>Bad Data</i> =	Value of PCdflink[][].
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Circuit name of PH in first two bytes and PDB time slot in last two bytes.
<i>Dump</i> =	PCmnbstat structure.

Table 7 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	PCdfmap[][] has a PDB time slot for an in-service PH marked busy but PCdflink[][] does not contain a key for a rIPTSB tuple.
Possible Error Effect:	One of the time slots is being tied up needlessly.
Corrective Action Taken:	The PDB time slot in PCdfmap[] does not contain a key for a rIPTSB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCdfmap[][].
<i>Bad Data</i> =	Value of PCdfmap[][].
<i>Good Data</i> =	Circuit name of PH.
<i>Logical Index</i> =	PDB time slot.
<i>Dump</i> =	NA.

Table 8 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	For an in-service PH, the rIPTSB and PCdflink[][] data indicate that a D-channel path is set up on the given time slot, but PCdfmap[][] indicates that the time slot is idle.
Possible Error Effect:	Path hunt might try to use the time slot for another path.
Corrective Action Taken:	The time slot bit in PCdfmap[][] indicates that the time slot is idle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCdfmap[][].
<i>Bad Data</i> =	Value of PCdfmap[][].
<i>Good Data</i> =	Circuit name of PH.
<i>Logical Index</i> =	PDB time slot in error.
<i>Dump</i> =	NA.

Table 9 Error Code: NULL3LINK

Error Code:	NULL3LINK
Error Description:	The rSMEST tuple indicates that the PH is not active or standby, but PCdflink[][] is not marked with null.

Possible Error Effect:	Path hunt might try to use the time slots.
Corrective Action Taken:	PCdflink[][] is marked with null for the given PDB time slot.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCdflink[][].
<i>Bad Data =</i>	Value of PCdflink[][].
<i>Good Data =</i>	0.
<i>Logical Index =</i>	Circuit name of PH in first two bytes and PDB time slot in last two bytes.
<i>Dump 1 =</i>	rUNITDATA tuple.
<i>Dump 2 =</i>	rSMEST tuple.

Table 10 Error Code: NULL4LINK

Error Code:	NULL4LINK
Error Description:	The rUNITDATA tuple indicates that the PH is not operational, but PCdflink[][] is not marked with null.
Possible Error Effect:	Path hunt might try to use the time slot.
Corrective Action Taken:	PCdflink[][] is marked with null for the given PDB time slot.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCdflink[][].
<i>Bad Data =</i>	Value of PCdflink[][].
<i>Good Data =</i>	0.
<i>Logical Index =</i>	Circuit name of PH in first two bytes and PDB time slot in last two bytes.
<i>Dump =</i>	rUNITDATA tuple.

Table 11 Error Code: NULL5LINK

Error Code:	NULL5LINK
Error Description:	There is no rUNITDATA tuple which indicates that the PH is not equipped, but PCdflink[][] is not marked with null.
Possible Error Effect:	Path hunt might try to use the time slot.
Corrective Action Taken:	PCdflink[][] is marked with null for the given PDB time slot.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCdflink[][].
<i>Bad Data =</i>	Value of PCdflink[][].
<i>Good Data =</i>	0.
<i>Logical Index =</i>	Circuit name of PH in first two bytes and PDB time slot in last two bytes.
<i>Dump =</i>	NA.

Table 12 Error Code: READSMEST

Error Code:	READSMEST
Error Description:	A rUNITDATA tuple was found for the PH, but a corresponding rSMEST tuple was not found.
Possible Error Effect:	The status (such as, ACT, STBY, OOS, and so forth) of the PH cannot be determined.
Corrective Action Taken:	Recovery of the missing rSMEST tuple is handled by the CKTDATA audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Circuit Name of the PH.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	rUNITDATA tuple.

Table 13 Error Code: TSBUSYIDLE

Error Code:	TSBUSYIDLE
Error Description:	The audit found the tsuse field in the rIPTSB tuple associated with the PCdfmap[][] array entry under audit to be in an invalid state for the PCdfmap[][] entry to have been marked busy. For every PCdfmap[][] array entry, if there exists a corresponding rIPTSB tuple, a relationship should exist where:

	PCdfmap[PSIU shelf][PSIU PH] and PCdflink[PSIU shelf][PSIU PH][timeslot] corresponding array entries exist for a given PSIU shelf and PH, and PCdflink[PSIU shelf][PSIU PH][timeslot] is not 0 and not PCDMYPTSB, and (key) rIPTSB.ptsb = PCdflink[PSIU shelf][PSIU PH][timeslot], and rIPTSB.use is marked one of the legal full or quarter time slot "uses" as specified by type DMPTSBUSE.
Possible Error Effect:	ROP clutter and call failures since the invalid data will not be cleaned up until after the selective initialization completes and the DFMAP and PTSB audits are scheduled routinely.
Corrective Action Taken:	The corresponding PCdfmap[][] and PCdflink[][] entries for this PSIU shelf, PSIU PH, and time slot are idled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCdfmap[][] array entry under audit.
<i>Bad Data</i> =	The contents of the PCdfmap[][] array entry under audit.
<i>Good Data</i> =	The use field in the rIPTSB tuple.
<i>Logical Index</i> =	The logical key of the rIPTSB tuple (ptsb).
<i>Dump</i> =	The contents of the rIPTSB tuple.

Table 14 Error Code: TSMAP2

Error Code:	TSMAP2
Error Description:	For an in-service PH, the PDB time slot found in the rIPTSB tuple does not match the index of PCdflink[][] that was used to retrieve the key of the rIPTSB tuple.
Possible Error Effect:	The linkage between rIPTSB and PCdflink[][] has been broken.
Corrective Action Taken:	The time slot in PCdfmap[][] is idled and the PCdflink[][] entry is set to null.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIPTSB tuple.
<i>Bad Data</i> =	Value of pdb_ts attribute in rIPTSB tuple.
<i>Good Data</i> =	Circuit name of PH in first two bytes and PDB time slot in last two bytes.
<i>Logical Index</i> =	Key of rIPTSB tuple.
<i>Dump</i> =	rIPTSB tuple.

Table 15 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up after taking a reset.
Possible Error Effect:	Causes resets and/or asserts.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

DFNIBBLE-A

Software Release: 5E10 - 5E11

1. DATA FANOUT NIBBLE AUDIT (DFNIBBLE)

The data fanout nibble (DFNIBBLE) audit monitors data fanout (DF) flexible time slot assignment. The DF flexible time slot assignment allows the assignment of up to 128 D-channels to a single protocol handler.

2. DATA STRUCTURES

The data structures contain the following information:

- The bit maps are considered as slave data when point-to-point-back (PTPB) checks pass between rIPTSB and the link maps.
- The DF idle nibble bus time slot count are considered slave data to the bit map.
- The DF nibble bus time slot summaries are treated as slave data to the DF nibble bus time slot count.
- Audit control mechanisms, which schedule related audits to run immediately after an audit has found an error, is utilized to maintain consistency across all of the data structures.

3. AUDIT CHECKS

A function does all of the error detection and error recovery in-line.

- The current configuration of the PSUCOM determines how to interpret the data found in the arrays.
- Conditional time breaks are taken by calling AUCTB() after looping on every eight nibble bus time slots.
- The error detection parameters are range checked after every time break.
- The DT bits are read after every time break because of the possibility of a reconfiguration during the time break. Consequently the data structures could have one interpretation before the time break and a different interpretation after the time break.
- A count of the number of nibble bus time slots found idle a packet data bus (PDB) time slot will be kept. The data structures are updated if they do not agree with the count taken while traversing through all eight nibble bus time slots.
- The PTPB check between rIPTSB and the link is performed in the following manner. The rIPTSB tuple is derived by taking the physical key found in the link and calling the macro DAGETPTSB(key) to get a pointer to the rIPTSB tuple. From the physical PH circuit name the shelf can be derived by using the macro SMGSLFPPH(). Now all of the information in the rIPTSB has been translated into a form that will be compared with the error detection parameters.

4. ERROR HANDLING

All error detection and recovery is built into the semantic check function. What follows is the discussion on the actions which are taken for the different values found in the new data. Table 1 provides a summary of the following paragraphs.

Table 1 Audit Recovery Actions

PCdfnblink	PCdfnibble	rIPTSB PTPB ^a	Error Check	Recovery Action Found ^b
null	idle	not done	no	
null	busy	not done	yes	idle
key	idle	success	yes	busy
key	idle	failure	yes	null
key	busy	success	no	
key	busy	failure	yes	idle
				null
mcte ^c	idle	not done	yes	busy
mcte ^c	busy	not done	no	
Notes: a. point-to-point-back b. Audit reports an error and schedules PTSB and DFMAP audits when an error is found. c. Special value is used to indicate diagnostics is performing maintenance.				

If the PSUCOM is found to be in duplex failure, the DFNIBBLE audit expects to find the functions set properly. If any entry in any of these arrays is incorrect, it is changed to the expected value.

When the PSUCOM is in the normal mode of operation (active/standby), the audit takes the following actions based upon what is found in the link.

null = The corresponding function entry is expected to be idle and is recovered to this value when in error.

The idle count is incremented by one.

key = A PTPB check with rIPTSB is performed as described in the previous section. If the check passes, a function is busy and is recovered to this value if it is not. If the PTPB check fails, the appropriate functions are restored to their correct values. The idle count variable is incremented by one if the PTPB check fails.

maintenance flag = The special value PCDMYPTSB is placed into the link indicating that diagnostics is performing maintenance. At this time no rIPTSB tuple is allocated. Also, it is expected that a particular function is marked busy and the audit enforces this.

After every eight nibble bus time slots are looped through, the functions are checked against the idle count variable and updated to reflect what is calculated with the idle count variable.

Note that some of the recovery actions described here result in inconsistencies in other data structures. These are resolved by the related audit mechanisms. When the DFNIBBLE audit finds an error, the PTSB, DFMAP, and PHDSLGP audits are scheduled to run in the elevated mode.

Table 2 Error Code: BADIDLE

Error Code:	BADIDLE
Error Description:	The maintenance status structure appears to be idle, but some of the data is not the correct for idle.
Possible Error Effect:	The data in PCmnbstat structure cannot be believed.
Corrective Action Taken:	The maintenance nibble bus status structure (PCmnbstat) is set to the correct idle values.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCmnbstat.
<i>Bad Data =</i>	NA.

<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	PCmnbstat structure.

Table 3 Error Code: BADTSCOUNT

Error Code:	BADTSCOUNT
Error Description:	The count of idle nibble bus time slots (PCdfnbcnt) does not agree with what is in PCdfnibble.
Possible Error Effect:	PC might be distributing the nibble bus time slots unequally which increases the probability of blocking.
Corrective Action Taken:	The count is corrected to how many are marked busy in PCdfnibble.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the PCdfnbcnt entry.
<i>Bad Data</i> =	Value of the PCdfnbcnt entry.
<i>Good Data</i> =	Count of idle time slots in PCdfnibble.
<i>Logical Index</i> =	Two bytes in the form H'xyy where: xx = PSU shelf yy = PDB time slot.
<i>Dump</i> =	NA.

Table 4 Error Code: BADTSSUM

Error Code:	BADTSSUM
Error Description:	The summary of idle nibble bus time slots does not agree with the count of idle nibble bus time slots.
Possible Error Effect:	PC might be distributing the nibble bus time slots unequally which increases the probability of blocking.
Corrective Action Taken:	The summary arrays (PCdfnbidle and PCdf1nbidle) are made consistent with PCdfnbcnt.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Count of idle time slots in PCdfnbcnt.
<i>Logical Index</i> =	Two bytes in the form H'xyy where: xx = PSU shelf. yy = PDB time slot.
<i>Dump 1</i> =	Summary of idle NB time slots (PCdfnbidle).
<i>Dump 2</i> =	Critical summary of idle NB time slots (PCdf1nbidle).

Table 5 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	The PCdfnblink entry points to a rIPTSB tuple which does not have the proper timeslot use. The rIPTSB tuple is probably corrupted.
Possible Error Effect:	The data within the rIPTSB tuple cannot be used. There appears to be some internal inconsistencies within the rIPTSB tuple.
Corrective Action Taken:	The bad use is reported as an error and the PTSB audit is scheduled to run. The nibble bus time slot is idled in PCdfnibble and set to null in PCdfnblink.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIPTSB tuple.
<i>Bad Data</i> =	Use field of the rIPTSB tuple.
<i>Good Data</i> =	The tsuse field in the rIPTSB tuple.
<i>Logical Index</i> =	Three bytes in the form H'xyyzz where:

	xx = PSU shelf.
	yy = PSU shelf.
	zz = Nibble bus time slot.
<i>Dump 1 =</i>	rIPTSB tuple.
<i>Dump 2 =</i>	PCdfnibble entry.
<i>Dump 3 =</i>	PCdfnblink entry.

Table 6 Error Code: DFLINK

Error Code:	DFLINK
Error Description:	The PCmnbstat, PCdflink, and PCdfnblink structures failed a point-to-point-back check. For the PDB and nibble bus time slots found in PCmnbstat, PCdflink and PCdfnblink should have had the dummy rIPTSB key which indicates maintenance.
Possible Error Effect:	One of the PDB and/or nibble bus time slots might be tied up needlessly.
Corrective Action Taken:	The PCmnbstat structure is idled. The remaining portion of the DFNIBBLE audit and the DFMAP audit will clean up PCdfnblink and PCdflink if necessary.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Four bytes in the form H'wwxxyzz where: ww = PSU shelf. xx = PSU shelf. yy = PSU shelf. zz = Nibble bus time slot.
<i>Dump 1 =</i>	PCmnbstat global structure.
<i>Dump 2 =</i>	PCdflink entry.
<i>Dump 3 =</i>	PCdfnblink entry.

Table 7 Error Code: DTREAD

Error Code:	DTREAD
Error Description:	The DT key DTACTPBS was being read to determine if the PSUCOM was in duplex failure. The DT read returned an invalid value.
Possible Error Effect:	The configuration of the PSUCOM cannot be determined. Thus the audit is terminated.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value returned from DT read.
<i>Good Data =</i>	0.
<i>Logical Index =</i>	DTACTPBS.
<i>Dump =</i>	NA.

Table 8 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	The time found in PCmnbstat is invalid.
Possible Error Effect:	The PCmnbstat structure contains useless data.
Corrective Action Taken:	The PCmnbstat structure is idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.

<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	PCmnbstat structure.
<i>Dump 2</i> =	The current time.

Table 9 Error Code: MAINT_STATE

Error Code:	MAINT_STATE
Error Description:	The PCdfnblink entry is marked as being used for maintenance, but the global maintenance nibble bus status structure PCmnbstat, which keeps track of which nibble bus time slot is being used, does not agree.
Possible Error Effect:	One of the nibble bus time slots is being tied up needlessly.
Corrective Action Taken:	The PCdfnblink entry is set to null and the PCdfnibble time slot is set to idle (0).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad PCdfnblink entry.
<i>Bad Data</i> =	Bad PCdfnblink entry.
<i>Good Data</i> =	Null value for PCdfnblink.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump</i> =	PCmnbstat structure.

Table 10 Error Code: MKBUSY

Error Code:	MKBUSY
Error Description:	The PSUCOM is in duplex failure according to DT bits or the given PSU shelf is not operational. However, some of the bits in PCdfnibble are idle.
Possible Error Effect:	PC could hunt time slots on the DF nibble bus.
Corrective Action Taken:	All bits in PCdfnibble for the given shelf and PDB time slot are marked busy (1).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad PCdfnibble entry.
<i>Bad Data</i> =	Bad PCdfnibble entry.
<i>Good Data</i> =	Value for all time slots busy.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = First nibble bus time slot in error.
<i>Dump</i> =	NA.

Table 11 Error Code: MKNULL

Error Code:	MKNULL
Error Description:	The PSUCOM is in duplex failure according to DT bits or the given PSU shelf is not operational. However, one of the entries in PCdfnblink appears to have a rIPTSB key.
Possible Error Effect:	PC could hunt time slots on the DF nibble bus.
Corrective Action Taken:	The PCdfnblink entry for the given PSU shelf, PDB time slot, and nibble bus time slot is marked with null (0).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad PCdfnblink entry.
<i>Bad Data</i> =	Bad PCdfnblink entry.

<i>Good Data</i> =	Null value for PCdfnblink.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump</i> =	NA.

Table 12 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	The rIPTSB tuple and PCdfnblink entry pass the point-to-point-back check, but the time slot in PCdfnibble is marked idle.
Possible Error Effect:	PC might hunt the time slot even though it is still being used.
Corrective Action Taken:	The nibble bus time slot in PCdfnibble is busied (1).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCdfnibble entry.
<i>Bad Data</i> =	Value of PCdfnibble entry.
<i>Good Data</i> =	PCdfnibble with time slot busied.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump 1</i> =	PCdfnblink entry.
<i>Dump 2</i> =	rIPTSB tuple.

Table 13 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	The nibble bus time slot has been marked busy, but no rIPTSB tuple has been set up in PCdfnblink.
Possible Error Effect:	One of the nibble bus time slots is being tied up needlessly.
Corrective Action Taken:	The nibble bus time slot is idled both in software (PCdfnibble) and in hardware (with a disconnect in the DF hardware)
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of busy PCdfnibble entry.
<i>Bad Data</i> =	Value of busy PCdfnibble entry.
<i>Good Data</i> =	PCdfnibble entry with time slot idled.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump</i> =	PCdfnblink.

Table 14 Error Code: READSMEST

Error Code:	READSMEST
Error Description:	The audit was not able to read the rISMEST relation for one side of the PSUCOM CC's.
Possible Error Effect:	The audit cannot determine the configuration of the PSUCOM. Consequently

	the PC global data cannot be audited.
Corrective Action Taken:	The CKTDATA audit is scheduled from this audit to have the rISMEST tuple populated from the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Circuit name of PSUCOM.
<i>Dump =</i>	NA.

Table 15 Error Code: TIMEOUT

Error Code:	TIMEOUT
Error Description:	One of the nibble bus time slots has been held for maintenance for over one hour.
Possible Error Effect:	One of the nibble bus time slots is being tied up needlessly.
Corrective Action Taken:	The nibble bus and PDB time slots are released. PCmnbstat is idled, PCdfnlink and PCdfnblink are set to null, and PCdfnibble is idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump 1 =</i>	PCmnbstat structure.
<i>Dump 2 =</i>	The current time.

Table 16 Error Code: TSIDLE_BUSY

Error Code:	TSIDLE_BUSY
Error Description:	The nibble bus time slot is being used for maintenance, but PCdfnibble has it marked as being idle.
Possible Error Effect:	PC might try to use the nibble bus time slot when it is already being used for maintenance.
Corrective Action Taken:	The nibble bus time slot is marked busy in PCdfnibble.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad PCdfnibble entry.
<i>Bad Data =</i>	Value of bad PCdfnibble entry.
<i>Good Data =</i>	PCdfnibble entry with time slot busied.
<i>Logical Index =</i>	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump =</i>	NA.

Table 17 Error Code: TSNO_MATCH

Error Code:	TSNO_MATCH
Error Description:	The rIPTSB tuple and the PCdfnblink entries do not pass the point-to-point-back check. The PSU shelf, PDB time slot, and nibble bus time slot found in the rIPTSB tuple does not match the indices of PCdfnblink.
Possible Error Effect:	A nibble bus time slot might be tied up needlessly.
Corrective Action Taken:	The time slot is idled. PCdfnblink is set to null (0) and PCdfnibble is idled (0) for the nibble bus time slot.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the PCdfnblink entry.
<i>Bad Data =</i>	Value of the PCdfnblink entry.
<i>Good Data =</i>	NA.

<i>Logical Index</i> =	Three bytes in the form H'xyyzz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump</i> =	riPTSB tuple.

Table 18 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up after taking a reset.
Possible Error Effect:	Causes resets and/or ASSERTS.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

DFNIBBLE-B

Software Release: 5E12 and later

1. DATA FANOUT NIBBLE AUDIT (DFNIBBLE)

The data fanout nibble (DFNIBBLE) audit monitors data fanout (DF) flexible time slot assignment. The DF flexible time slot assignment allows the assignment of up to 128 D-channels to a single protocol handler.

2. DATA STRUCTURES

The data structures contain the following information:

- The bit maps are considered as slave data when point-to-point-back (PTPB) checks pass between rIPTSB and the link maps.
- The DF idle nibble bus time slot count are considered slave data to the bit map.
- The DF nibble bus time slot summaries are treated as slave data to the DF nibble bus time slot count.
- Audit control mechanisms, which schedule related audits to run immediately after an audit has found an error, is utilized to maintain consistency across all of the data structures.

3. AUDIT CHECKS

A function does all of the error detection and error recovery in-line.

- The current configuration of the PSUCOM determines how to interpret the data found in the arrays.
- Conditional time breaks are taken by calling AUCTB() after looping on every eight nibble bus time slots.
- The error detection parameters are range checked after every time break.
- The DT bits are read after every time break because of the possibility of a reconfiguration during the time break. Consequently the data structures could have one interpretation before the time break and a different interpretation after the time break.
- A count of the number of nibble bus time slots found idle a packet data bus (PDB) time slot will be kept. The data structures are updated if they do not agree with the count taken while traversing through all eight nibble bus time slots.
- The PTPB check between rIPTSB and the link is performed in the following manner. The rIPTSB tuple is derived by taking the physical key found in the link and calling the macro DAGETPTSB(key) to get a pointer to the rIPTSB tuple. From the physical PH circuit name the shelf can be derived by using the macro SMGSLFPPH(). Now all of the information in the rIPTSB has been translated into a form that will be compared with the error detection parameters.

4. ERROR HANDLING

All error detection and recovery is built into the semantic check function. What follows is the discussion on the actions which are taken for the different values found in the new data. Table 1 provides a summary of the following paragraphs.

Table 1 Audit Recovery Actions

PCdfnblink	PCdfnibble	rIPTSB PTPB ^a	Error Check	Recovery Action Found ^b
null	idle	not done	no	
null	busy	not done	yes	idle
key	idle	success	yes	busy
key	idle	failure	yes	null
key	busy	success	no	
key	busy	failure	yes	idle
				null
mcte ^c	idle	not done	yes	busy
mcte ^c	busy	not done	no	
Notes: a. point-to-point-back b. Audit reports an error and schedules PTSB and DFMAP audits when an error is found. c. Special value is used to indicate diagnostics is performing maintenance.				

If the PSUCOM is found to be in duplex failure, the DFNIBBLE audit expects to find the functions set properly. If any entry in any of these arrays is incorrect, it is changed to the expected value.

When the PSUCOM is in the normal mode of operation (active/standby), the audit takes the following actions based upon what is found in the link.

null = The corresponding function entry is expected to be idle and is recovered to this value when in error.

The idle count is incremented by one.

key = A PTPB check with rIPTSB is performed as described in the previous section. If the check passes, a function is busy and is recovered to this value if it is not. If the PTPB check fails, the appropriate functions are restored to their correct values. The idle count variable is incremented by one if the PTPB check fails.

maintenance flag = The special value PCDMYPTSB is placed into the link indicating that diagnostics is performing maintenance. At this time no rIPTSB tuple is allocated. Also, it is expected that a particular function is marked busy and the audit enforces this.

After every eight nibble bus time slots are looped through, the functions are checked against the idle count variable and updated to reflect what is calculated with the idle count variable.

Note that some of the recovery actions described here result in inconsistencies in other data structures. These are resolved by the related audit mechanisms. When the DFNIBBLE audit finds an error, the PTSB, DFMAP, and PHDSLGP audits are scheduled to run in the elevated mode.

Table 2 Error Code: BADIDLE

Error Code:	BADIDLE
Error Description:	The maintenance status structure appears to be idle, but some of the data is not the correct for idle.
Possible Error Effect:	The data in PCmnbstat structure cannot be believed.
Corrective Action Taken:	The maintenance nibble bus status structure (PCmnbstat) is set to the correct idle values.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCmnbstat.
<i>Bad Data =</i>	NA.

<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	PCmnbstat structure.

Table 3 Error Code: BADTSCOUNT

Error Code:	BADTSCOUNT
Error Description:	The count of idle nibble bus time slots (PCdfnbcnt) does not agree with what is in PCdfnibble.
Possible Error Effect:	PC might be distributing the nibble bus time slots unequally which increases the probability of blocking.
Corrective Action Taken:	The count is corrected to how many are marked busy in PCdfnibble.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the PCdfnbcnt entry.
<i>Bad Data</i> =	Value of the PCdfnbcnt entry.
<i>Good Data</i> =	Count of idle time slots in PCdfnibble.
<i>Logical Index</i> =	Two bytes in the form H'xyy where: xx = PSU shelf yy = PDB time slot.
<i>Dump</i> =	NA.

Table 4 Error Code: BADTSSUM

Error Code:	BADTSSUM
Error Description:	The summary of idle nibble bus time slots does not agree with the count of idle nibble bus time slots.
Possible Error Effect:	PC might be distributing the nibble bus time slots unequally which increases the probability of blocking.
Corrective Action Taken:	The summary arrays (PCdfnbidle and PCdf1nbidle) are made consistent with PCdfnbcnt.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Count of idle time slots in PCdfnbcnt.
<i>Logical Index</i> =	Two bytes in the form H'xyy where: xx = PSU shelf. yy = PDB time slot.
<i>Dump 1</i> =	Summary of idle NB time slots (PCdfnbidle).
<i>Dump 2</i> =	Critical summary of idle NB time slots (PCdf1nbidle).

Table 5 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	The PCdfnblink entry points to a rIPTSB tuple which does not have the proper timeslot use. The rIPTSB tuple is probably corrupted.
Possible Error Effect:	The data within the rIPTSB tuple cannot be used. There appears to be some internal inconsistencies within the rIPTSB tuple.
Corrective Action Taken:	The bad use is reported as an error and the PTSB audit is scheduled to run. The nibble bus time slot is idled in PCdfnibble and set to null in PCdfnblink.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIPTSB tuple.
<i>Bad Data</i> =	Use field of the rIPTSB tuple.
<i>Good Data</i> =	The tsuse field in the rIPTSB tuple.
<i>Logical Index</i> =	Three bytes in the form H'xyyzz where:

	xx = PSU shelf.
	yy = PSU shelf.
	zz = Nibble bus time slot.
<i>Dump 1 =</i>	rIPTSB tuple.
<i>Dump 2 =</i>	PCdfnibble entry.
<i>Dump 3 =</i>	PCdfnblink entry.

Table 6 Error Code: DFLINK

Error Code:	DFLINK
Error Description:	The PCmnbstat, PCdflink, and PCdfnblink structures failed a point-to-point-back check. For the PDB and nibble bus time slots found in PCmnbstat, PCdflink and PCdfnblink should have had the dummy rIPTSB key which indicates maintenance.
Possible Error Effect:	One of the PDB and/or nibble bus time slots might be tied up needlessly.
Corrective Action Taken:	The PCmnbstat structure is idled. The remaining portion of the DFNIBBLE audit and the DFMAP audit will clean up PCdfnblink and PCdflink if necessary.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Four bytes in the form H'wwxxyzz where: ww = PSU shelf. xx = PSU shelf. yy = PSU shelf. zz = Nibble bus time slot.
<i>Dump 1 =</i>	PCmnbstat global structure.
<i>Dump 2 =</i>	PCdflink entry.
<i>Dump 3 =</i>	PCdfnblink entry.

Table 7 Error Code: DTREAD

Error Code:	DTREAD
Error Description:	The DT key DTACTPBS was being read to determine if the PSUCOM was in duplex failure. The DT read returned an invalid value.
Possible Error Effect:	The configuration of the PSUCOM cannot be determined. Thus the audit is terminated.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value returned from DT read.
<i>Good Data =</i>	0.
<i>Logical Index =</i>	DTACTPBS.
<i>Dump =</i>	NA.

Table 8 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	The time found in PCmnbstat is invalid.
Possible Error Effect:	The PCmnbstat structure contains useless data.
Corrective Action Taken:	The PCmnbstat structure is idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.

<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	PCmnbstat structure.
<i>Dump 2</i> =	The current time.

Table 9 Error Code: MAINT_STATE

Error Code:	MAINT_STATE
Error Description:	The PCdfnblink entry is marked as being used for maintenance, but the global maintenance nibble bus status structure PCmnbstat, which keeps track of which nibble bus time slot is being used, does not agree.
Possible Error Effect:	One of the nibble bus time slots is being tied up needlessly.
Corrective Action Taken:	The PCdfnblink entry is set to null and the PCdfnibble time slot is set to idle (0).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad PCdfnblink entry.
<i>Bad Data</i> =	Bad PCdfnblink entry.
<i>Good Data</i> =	Null value for PCdfnblink.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump</i> =	PCmnbstat structure.

Table 10 Error Code: MKBUSY

Error Code:	MKBUSY
Error Description:	The PSUCOM is in duplex failure according to DT bits or the given PSU shelf is not operational. However, some of the bits in PCdfnibble are idle.
Possible Error Effect:	PC could hunt time slots on the DF nibble bus.
Corrective Action Taken:	All bits in PCdfnibble for the given shelf and PDB time slot are marked busy (1).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad PCdfnibble entry.
<i>Bad Data</i> =	Bad PCdfnibble entry.
<i>Good Data</i> =	The value of the local traffic variable.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = First nibble bus time slot in error.
<i>Dump</i> =	NA.

Table 11 Error Code: MKNULL

Error Code:	MKNULL
Error Description:	The PSUCOM is in duplex failure according to DT bits or the given PSU shelf is not operational. However, one of the entries in PCdfnblink appears to have a rIPTSB key.
Possible Error Effect:	PC could hunt time slots on the DF nibble bus.
Corrective Action Taken:	The PCdfnblink entry for the given PSU shelf, PDB time slot, and nibble bus time slot is marked with null (0).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad PCdfnblink entry.
<i>Bad Data</i> =	Bad PCdfnblink entry.

<i>Good Data</i> =	The value of the local traffic variable.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump</i> =	NA.

Table 12 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	The rIPTSB tuple and PCdfnblink entry pass the point-to-point-back check, but the time slot in PCdfnibble is marked idle.
Possible Error Effect:	PC might hunt the time slot even though it is still being used.
Corrective Action Taken:	The nibble bus time slot in PCdfnibble is busied (1).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCdfnibble entry.
<i>Bad Data</i> =	Value of PCdfnibble entry.
<i>Good Data</i> =	PCdfnibble with time slot busied.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump 1</i> =	PCdfnblink entry.
<i>Dump 2</i> =	rIPTSB tuple.

Table 13 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	The nibble bus time slot has been marked busy, but no rIPTSB tuple has been set up in PCdfnblink.
Possible Error Effect:	One of the nibble bus time slots is being tied up needlessly.
Corrective Action Taken:	The nibble bus time slot is idled both in software (PCdfnibble) and in hardware (with a disconnect in the DF hardware)
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of busy PCdfnibble entry.
<i>Bad Data</i> =	Value of busy PCdfnibble entry.
<i>Good Data</i> =	PCdfnibble entry with time slot idled.
<i>Logical Index</i> =	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump</i> =	PCdfnblink.

Table 14 Error Code: READSMEST

Error Code:	READSMEST
Error Description:	The audit was not able to read the rISMEST relation for one side of the PSUCOM CC's.
Possible Error Effect:	The audit cannot determine the configuration of the PSUCOM. Consequently

	the PC global data cannot be audited.
Corrective Action Taken:	The CKTDATA audit is scheduled from this audit to have the rISMEST tuple populated from the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Circuit name of PSUCOM.
<i>Dump =</i>	NA.

Table 15 Error Code: TIMEOUT

Error Code:	TIMEOUT
Error Description:	One of the nibble bus time slots has been held for maintenance for over one hour.
Possible Error Effect:	One of the nibble bus time slots is being tied up needlessly.
Corrective Action Taken:	The nibble bus and PDB time slots are released. PCmnbstat is idled, PCdfnlink and PCdfnblink are set to null, and PCdfnibble is idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump 1 =</i>	PCmnbstat structure.
<i>Dump 2 =</i>	The current time.

Table 16 Error Code: TSIDLE_BUSY

Error Code:	TSIDLE_BUSY
Error Description:	The nibble bus time slot is being used for maintenance, but PCdfnibble has it marked as being idle.
Possible Error Effect:	PC might try to use the nibble bus time slot when it is already being used for maintenance.
Corrective Action Taken:	The nibble bus time slot is marked busy in PCdfnibble.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad PCdfnibble entry.
<i>Bad Data =</i>	Value of bad PCdfnibble entry.
<i>Good Data =</i>	PCdfnibble entry with time slot busied.
<i>Logical Index =</i>	Three bytes in the form H'xyyz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump =</i>	NA.

Table 17 Error Code: TSNO_MATCH

Error Code:	TSNO_MATCH
Error Description:	The rIPTSB tuple and the PCdfnblink entries do not pass the point-to-point-back check. The PSU shelf, PDB time slot, and nibble bus time slot found in the rIPTSB tuple does not match the indices of PCdfnblink.
Possible Error Effect:	A nibble bus time slot might be tied up needlessly.
Corrective Action Taken:	The time slot is idled. PCdfnblink is set to null (0) and PCdfnibble is idled (0) for the nibble bus time slot.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the PCdfnblink entry.
<i>Bad Data =</i>	Value of the PCdfnblink entry.
<i>Good Data =</i>	NA.

<i>Logical Index</i> =	Three bytes in the form H'xyzz where: xx = PSU shelf. yy = PDB time slot. zz = Nibble bus time slot.
<i>Dump</i> =	riPTSB tuple.

Table 18 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up after taking a reset.
Possible Error Effect:	Causes resets and/or ASSERTS.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

14. DI - DZ

DISPDB

Software Release: 5E10 and later

1. DISPLAY DATA BLOCK (DISPDB) AUDIT

The display data block (DISPDB) audit schedules audits and handles additional recovery actions such as asserts, single process purges (SSPs) and escalations. The dynamic relation RLDISPDB is used by the display capability to store data before displaying it on customer premises equipment (CPE), in a forty alphanumeric character string. This relation has a one-to-one linkage to the rIBRCSDB relation. When a display feature is activated, a rDISPDB tuple is removed from the rIDBHEADC idle list and linked to a rIBRCSDB tuple and is then used to store display data. The DISPDB audit must verify the linkages associated with a display data block, for each IDSN call that has a display feature.

The rDISPDB tuples are only needed by terminals with display features. In the case when all allocated tuples have been used, the CPE display will always display a default message (INCOMING CALL or OUTGOING CALL), depending on the terminal process.

The DISPDB audit is part of the Feature Control audits subgroup. It runs in the initialization and segmented mode and operates in the OSDS-M environment.

2. DATA STRUCTURES

The DISPDB audit fields consist of the key, display data, a member linkage to the RLBRSCDB relation, and a linkage to the rIDBHEADC idle list. The display data can be associated with a call or can be data for the number of calls on queue. When used to store call data, the RLDISPDB is associated with the originating or terminating terminal process; when used to store queue data, it is associated with the display terminal process (DISPTP).

3. AUDIT CHECKS

The DISPDB audit calls the DRINASEK driver. This driver ensures that the tuple is either linked to a rIBRCSDB tuple or to an rIDBHEADC idle list, checks the key, and calls the semantic check function, which verifies the data stored in the tuple. The DISPDB audit consists of an entry, semantic, recovery and an idle function. All linkage and semantic checks must pass before the audit proceeds to the next tuple. If they do not, the data cannot be assumed to be valid and the tuple will be linked to the rIDBHEADC idle list.

4. ERROR HANDLING

If the logical and physical keys are not consistent the tuple is zapped and placed on the idle list. If a linkage is semantic error is found the recovery function checks the process associated with the RLDISPDB relation. If it is a DISPTP the tuple will be recovered to the idle list. If the process is on OTP or TTP the linkage to the rIBRCSDB will be zeroed and the rDISPDB recovered to the idle list. If all is well, the audit gets the next tuple.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BDLINK

Error Code:	BDLINK
Error Description:	This tuple is not on the idle list, the owner linkage is zero but the member linkage is also zero.
Possible Error Effect:	The rDISPDB tuple has been garbaged, you cannot trust the data in this tuple.
Corrective Action Taken:	Report the error on the ROP and return to the driver to put the tuple on the idle list.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	Address of the rDISPDB.
<i>Bad Data</i> =	Member linkage to rIBRCSDB.
<i>Good Data</i> =	Owner linkage.
<i>Logical Index</i> =	Port name.
<i>Dump</i> =	rDISPDB tuple.

Table 2 Error Code: DISP

Error Code:	DISP
Error Description:	A rDISPDB with an invalid linkage has been found.
Possible Error Effect:	The one-to-one linkage to the BRCSDB tuple is not zero and the call reference field is zero. This means that this DISPDB tuple has an associated Display Terminal process, which means that it is not associated with a call. Data will not be display, the screen will be blank.
Corrective Action Taken:	The audit idles the rDISPDB tuple and zeros the linkage to the BRCSDB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rDISPDB.
<i>Bad Data</i> =	Non-zero value of linkage.
<i>Good Data</i> =	Call reference value in the rDALB.
<i>Logical Index</i> =	Key of rDISPDB.
<i>Dump</i> =	rDISPDB.

Table 3 Error Code: OWN_LINK

Error Code:	OWN_LINK
Error Description:	A rDISPDB is supposed to be idle but is not linked to the rDISPDB idle list.
Possible Error Effect:	The rDISPDB is in a limbo condition, unusable by call processing.
Corrective Action Taken:	The audit idles the rDISPDB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rDISPDB.
<i>Bad Data</i> =	Owner link of rDISPDB.
<i>Good Data</i> =	Physical key of idle head cell.
<i>Logical Index</i> =	Key of rDISPDB.
<i>Dump</i> =	NA.

Table 4 Error Code: RELPTR

Error Code:	RELPTR
Error Description:	This pointer to the rDALB tuple is invalid.
Possible Error Effect:	The correct rDALB tuple will not be gotten, you cannot trust the data in this tuple.
Corrective Action Taken:	Report the error on the ROP and get the next tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rDISPDB.
<i>Bad Data</i> =	One-to-one linkage to rIBRCSDB.
<i>Good Data</i> =	Key to rDALB.
<i>Logical Index</i> =	Key to rDISPDB.
<i>Dump</i> =	rDISPDB tuple.

Table 5 Error Code: RPTRBAD

Error Code:	RPTRBAD
Error Description:	This pointer to the rIBRCSDB tuple is invalid.
Possible Error Effect:	The correct rIBRCSDB tuple will not be gotten, you cannot trust the data in this tuple.
Corrective Action Taken:	Report the error on the ROP and get the next tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rDISPDB.
<i>Bad Data</i> =	One-to-one linkage to rIBRCSDB.
<i>Good Data</i> =	Key to rIBRCSDB.
<i>Logical Index</i> =	Key to rDISPDB.

<i>Dump</i> =	rDISPDB tuple.

Table 6 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	A rDISPDB is in the idle state but some of its linkages not involved in the idle list mapping are nonzero.
Possible Error Effect:	Some resource is linked to a rDISPDB on the idle list and may be unusable by call processing.
Corrective Action Taken:	The audit idles the rDISPDB tuple and zeros the linkages involved.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rDISPDB.
<i>Bad Data</i> =	Non-zero value of linkage.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Key of rDISPDB.
<i>Dump</i> =	rDISPDB.

DLI

Software Release: 5E10 and later

1. DUAL LINK INTERFACE (DLI) AUDIT

The dual link interface circuits (DLIs) reside in the switching modules but they are considered parts of the office network and timing complex (ONTC). Each local switching module contains two DLIs. The DLIs are connected to the time-multiplexed switch (TMS) in the communication module (CM) by means of fiber optic cables. The fiber-optic cable link between the DLIs and the TMS are the time-multiplexed switch links (TMSLNKs). Figure 1 shows these circuits. Status information about these circuits is kept in the peripheral configuration database (PCD). Several audits check the PCD, including the communication link audit (CLNK), the dual link interface audit (DLI), the PCD audit, and the time-multiplexed switch link audit (TMSLNK).

The DLI audit is part of the switch maintenance audits subgroup. It runs in the SMKP environment in the segmented mode.

2. DATA STRUCTURES

The DLI audit checks the SMddli array in the peripheral configuration database. The status of the DLIs is kept in the array. The audit also checks the data delivery data that is set up for each DLI. These data structures are depicted in Figure 2 .

Figure 1 (DLI-1) Dual Link Interface Circuits

Figure 2 (DLI-2) Data Structures of the DLI Audit

3. AUDIT CHECKS

The audit makes software checks, vertical checks, external checks, and deferred maintenance administrator monitor (DMAM) checks. .AL a .LI The audit checks for the internal consistency within the dynamic peripheral configuration data base for the DLI and checks the consistency between the office dependent data (ODD) and the PCD. The DLI must be in an allowable state. Allowable states include active (ACT) if the SM is operational, out-of-service unequipped (OOS UNEQ) if the SM is unequipped or not a local SM, and out-of-service manual remove (OOS MAN RMV) if the SM is in a special growth state (SGRO). .LI The vertical check ensures the consistency of the DLI state in the PCD with the state of its controlling hardware unit, the office network and timing complex common (ONTCCOM). .LI The audit makes external checks on the SMddli array and special data such as data delivery bits. For out-of-service units in transient states, the audit ensures that some activity is scheduled as pending on DMAM's queue. Before taking corrective action, the audit ensures that the DLI is not in a transient state by checking the switch maintenance and recovery software (SMARS) queue. The SMARS queue contains a record of all maintenance activities. If fault recovery is in progress, the audit is rescheduled. If fault recovery is not in progress, an error is reported.

4. ERROR HANDLING

The type of error determines the actions the audit takes.

If a software internal check or a vertical check fails, the audit places the DLI in a valid state.

If the external check fails, the audit assumes that the DLI state is correct and updates any corresponding data to agree with the state of the DLI.

If the DMAM check fails, the DLI is in a stuck state. The audit places it in a valid state and requests a conditional restoration of the DLI.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not

found.

The audit produces the following error code(s).

Table 1 Error Code: CSADLI

Error Code:	CSADLI
Error Description:	The dual link interface (DLI) is in an active state but both time-multiplexed switch links (TMSLNKs) are out of service trouble.
Possible Error Effect:	The DLI is active when it should not be.
Corrective Action Taken:	The audit puts the DLI in an out of service state and sends a conditional restore for the DLI.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Number of the DLI which was found in error.
<i>Logical Index =</i>	Office network and timing complex (ONTC) side the error was found on (that is, 0 or 1).
<i>Dump =</i>	Audit's copy of the data read.

Table 2 Error Code: DDSVCDGRD

Error Code:	DDSVCDGRD
Error Description:	The service degrade data for this dual link interface (DLI) was found in error.
Possible Error Effect:	The service degrade state for this DLI and switching module (SM) is not correct.
Corrective Action Taken:	The audit corrects the service degrade data for the DLI and SM.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Number of the DLI which was found in error.
<i>Logical Index =</i>	Office network and timing complex (ONTC) side the error was found on (that is, 0 or 1).
<i>Dump =</i>	Audit's copy of the data read.

Table 3 Error Code: DLI_DD_CLI

Error Code:	DLI_DD_CLI
Error Description:	The vintage in data delivery data for the dual link interface (DLI) was found to be in error.
Possible Error Effect:	The DLI may be configured wrong.
Corrective Action Taken:	The audit updates the data delivery data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Number of the DLI which was found in error.
<i>Logical Index =</i>	Office network and timing complex (ONTC) side the error was found on (that is, 0 or 1).
<i>Dump =</i>	Audit's copy of the data read.

Table 4 Error Code: DLI_DD_UNIQUE

Error Code:	DLI_DD_UNIQUE
Error Description:	The unique part of the data delivery data for the dual link interface (DLI) was found to be in error.
Possible Error Effect:	The DLI may be configured wrong.
Corrective Action Taken:	The audit updates the data delivery data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Number of the DLI which was found in error.
<i>Logical Index =</i>	Office network and timing complex (ONTC) side the error was found on (that is,

	0 or 1).
<i>Dump</i> =	Audit's copy of the data read.

Table 5 Error Code: DLI_DD_UNIVERSAL

Error Code:	DLI_DD_UNIVERSAL
Error Description:	The universal part of the data delivery data for the dual link interface (DLI) was found to be in error.
Possible Error Effect:	The DLI may be configured wrong.
Corrective Action Taken:	The audit updates the data delivery data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Number of the DLI which was found in error.
<i>Logical Index</i> =	Office network and timing complex (ONTC) side the error was found on (that is, 0 or 1).
<i>Dump</i> =	Audit's copy of the data read.

Table 6 Error Code: DLS_DMAM

Error Code:	DLS_DMAM
Error Description:	The dual link interface (DLI) is in a out of service state where there should be some deferred work being done on it but Deferred Maintenance Administrator and Monitor (DMAM) does not have an entry in its queue for this unit.
Possible Error Effect:	The DLI is out-of-service with no automatic action pending to restore it to service.
Corrective Action Taken:	Audit requests a conditional restore on the unit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Number of the DLI which was found in error.
<i>Logical Index</i> =	Office network and timing complex (ONTC) side the error was found on (that is, 0 or 1).
<i>Dump</i> =	Audit's copy of the data read.

Table 7 Error Code: DLI_FE

Error Code:	DLI_FE
Error Description:	The dual link interface (DLI) was in an out of service family state but the parent office network and timing complex (ONTC) is in service.
Possible Error Effect:	The DLI is out of service when it should not be.
Corrective Action Taken:	The audit restores the DLI.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Number of the DLI which was found in error.
<i>Logical Index</i> =	Office network and timing complex (ONTC) side the error was found on (that is, 0 or 1).
<i>Dump</i> =	Audit's copy of the data read.

Table 8 Error Code: DLI_PCD

Error Code:	DLI_PCD
Error Description:	A dual link interface (DLI) has been found to be in an invalid state.
Possible Error Effect:	Fault recovery may be asserting on bad data. This could be the result of purging a fault recovery process in SMKP.
Corrective Action Taken:	The audit places the unit in a valid state.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Number of the DLI which was found in error.

<i>Logical Index</i> =	Office network and timing complex (ONTC) side the error was found on (that is, 0 or 1).
<i>Dump</i> =	Audit's copy of the data read.

Table 9 Error Code: INDEX

Error Code:	INDEX
Error Description:	The audit's cursor is out-of-range.
Possible Error Effect:	Audit could assert because it's trying to read information for a unit which does not exist.
Corrective Action Taken:	The cursor is reset to a valid value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Audit's cursor value found to be bad.
<i>Dump</i> =	NA.

Table 10 Error Code: MODATT

Error Code:	MODATT
Error Description:	The audit has found a problem with the rIMODATT relation in the office dependent data base (ODD).
Possible Error Effect:	A switching module (SM) may be having communication problems.
Corrective Action Taken:	None.
Manual Action Required:	If the error repeats check the rIMODATT relation tuple whose key is the SM number given in GOOD DATA.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	DBfrdtup return code.
<i>Good Data</i> =	SM number used to read the rIMODATT relation.
<i>Logical Index</i> =	Number of the DLI which was found in error.
<i>Dump 1</i> =	Local buffer used in DBfrdtup(
<i>Dump 2</i> =	Audit's copy of the data read.

Table 11 Error Code: PCD

Error Code:	PCD
Error Description:	The audit has found an error which it cannot correct this may be due to a bad office dependent data (ODD), bad static data or the audit recovery table needs to be changed.
Possible Error Effect:	The audit will not recover this error.
Corrective Action Taken:	The audit will not recover this error.
Manual Action Required:	Check if the ODD is correct for the Peripheral Configuration Data (PCD). The included relations are: rISAUTISS For automatic time-slot switching. rIMODATT For the SMs.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Number of the DLI which was found in error.
<i>Logical Index</i> =	Office network and timing complex (ONTC) side the error was found on (that is, 0 or 1).
<i>Dump</i> =	Audit's copy of the data read.

Table 12 Error Code: SAITISS

Error Code:	SAITISS
Error Description:	The audit has found a problem with the rISAUTISS relation in the office dependent data base (ODD).

Possible Error Effect:	Automatic time-slot switching (AUTISS) may not be in the right state.
Corrective Action Taken:	None.
Manual Action Required:	If the error repeats, check the rISAUTISS relation.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	DBfrdtup return code.
<i>Good Data =</i>	SM number used to read the rIMODATT relation.
<i>Logical Index =</i>	Number of the DLI which was found in error.
<i>Dump 1 =</i>	Local buffer used in DBfrdtup()
<i>Dump 2 =</i>	Audit's copy of the data read.

Table 13 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up after taking a reset.
Possible Error Effect:	Causes resets, and or asserts.
Corrective Action Taken:	Return audit complete, wait for next go around.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	DLI audit cursor.
<i>Dump =</i>	NA.

DLTDATA

Software Release: 5E10 and later

1. DATA LINK TERMINAL DATA (DLTDATA) AUDIT

The DLTDATA audit is part of the Terminal Maintenance audits subgroup. It runs in the OSDS-M environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The DLTDATA audit uses the terminal maintenance data link terminal data array (TMdlt_data), the integrated services inter-SM path relation (RLISMPATH), and the digital subscriber line equipage relation (RLDSLEQUIP).

3. AUDIT CHECKS

The audit checks the TMdlt_data array against the RLISMPATH and RLDSLEQUIP relations.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: LNK_SM_NUM

Error Code:	LNK_SM_NUM
Error Description:	The mate SM number stored in TMdlt_data[] does not agree with the mate SM number found in the corresponding rLISMPATH tuple.
Possible Error Effect:	An inter-SM nailup could be out of order.
Corrective Action Taken:	The audit updates the TMdlt_data[] entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Mate SM number found in TMdlt_data[].
<i>Good Data =</i>	Mate SM number found in rLISMPATH.
<i>Logical Index =</i>	The index to the TMdlt_data[] array.
<i>Dump 1 =</i>	The TMdlt_data[] array element.
<i>Dump 2 =</i>	The rLDSLEQUIP tuple.
<i>Dump 3 =</i>	The rLISMPATH tuple.

Table 2 Error Code: LOGCHAN

Error Code:	LOGCHAN
Error Description:	The PH channel number stored in TMdlt_data[] does not agree with the DSL MEMBER found in the corresponding rLDSLEQUIP tuple.
Possible Error Effect:	An inter-SM nailup could be out of order.
Corrective Action Taken:	The audit updates the TMdlt_data[] entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	PH channel number found in TMdlt_data[].
<i>Good Data =</i>	DSL MEMBER found in rLDSLEQUIP.
<i>Logical Index =</i>	The index to the TMdlt_data[] array.
<i>Dump 1 =</i>	The TMdlt_data[] array element.
<i>Dump 2 =</i>	The rLDSLEQUIP tuple.
<i>Dump 3 =</i>	The rLISMPATH tuple.

Table 3 Error Code: LOST_DSLDATA

Error Code:	LOST_DSLDATA

Error Description:	The audit has found a tuple in the rIISMPATH relation but the corresponding tuple in the rIDSLEQUIP relation is missing.
Possible Error Effect:	There is an ODD inconsistency between the two relations.
Corrective Action Taken:	None.
Manual Action Required:	Office personnel must correct the ODD inconsistency between the RLISMPATH relation and the RLDSLEQUIP relation. The key to both relations is printed in <i>Good Data</i> .
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Return value from DBfrdtup().
<i>Good Data</i> =	The key used to read the relations.
<i>Logical Index</i> =	The index to the TMdlt_data[] array.
<i>Dump 1</i> =	The TMdlt_data[] array element.
<i>Dump 2</i> =	The rIDSLEQUIP tuple.
<i>Dump 3</i> =	The rIISMPATH tuple.

Table 4 Error Code: MASTER_LINK

Error Code:	MASTER_LINK
Error Description:	The master SM indicator stored in TMdlt_data[] does not agree with the one found in the corresponding rIISMPATH tuple.
Possible Error Effect:	An inter-SM nailup could be out of order.
Corrective Action Taken:	The audit updates the TMdlt_data[] entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The master SM indicator found in TMdlt_data[].
<i>Good Data</i> =	The master SM indicator found in rIISMPATH.
<i>Logical Index</i> =	The index to the TMdlt_data[] array.
<i>Dump 1</i> =	The TMdlt_data[] array element.
<i>Dump 2</i> =	The rIDSLEQUIP tuple.
<i>Dump 3</i> =	The rIISMPATH tuple.

Table 5 Error Code: MATELINK

Error Code:	MATELINK
Error Description:	The mate DLT number stored in TMdlt_data[] does not agree with the mate DLT number found in the corresponding rIISMPATH tuple.
Possible Error Effect:	An inter-SM nailup could be out of order.
Corrective Action Taken:	The audit updates the TMdlt_data[] entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Mate DLT number found in TMdlt_data[].
<i>Good Data</i> =	Mate DLT found in rIISMPATH.
<i>Logical Index</i> =	The index to the TMdlt_data[] array.
<i>Dump 1</i> =	The TMdlt_data[] array element.
<i>Dump 2</i> =	The rIDSLEQUIP tuple.
<i>Dump 3</i> =	The rIISMPATH tuple.

Table 6 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit has gotten a bad return from DBfrdtup() when reading the rIISMPATH relation.
Possible Error Effect:	The ODD could be bad.
Corrective Action Taken:	None.
Manual Action Required:	Office personnel should check the RLISMPATH relation. The key to the relation is printed in <i>Good Data</i> .
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Return value from DBfrdtup().
<i>Good Data</i> =	The key used to read the relations.
<i>Logical Index</i> =	The index to the TMdlt_data[] array.
<i>Dump 1</i> =	The TMdlt_data[] array element.
<i>Dump 2</i> =	The rIDSLEQUIP tuple.

<i>Dump 3 =</i>	The rISMPATH tuple.

Table 7 Error Code: PHDSLGP

Error Code:	PHDSLGP
Error Description:	The PH number stored in TMDlt_data[] does not agree with the DSL GROUP found in the corresponding rIDSLEQUIP tuple.
Possible Error Effect:	An inter-SM nailup could be out of order.
Corrective Action Taken:	The audit updates the TMDlt_data[] entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	PH number found in TMDlt_data[].
<i>Good Data =</i>	DSL GROUP found in rIDSLEQUIP.
<i>Logical Index =</i>	The index to the TMDlt_data[] array.
<i>Dump 1 =</i>	The TMDlt_data[] array element.
<i>Dump 2 =</i>	The rIDSLEQUIP tuple.
<i>Dump 3 =</i>	The rISMPATH tuple.

Table 8 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit has been entered by audit control to clean up after a reset.
Possible Error Effect:	Causes resets and or asserts.
Corrective Action Taken:	The audit is restarted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

DLTSBDB

Software Release: 5E10 and later

1. LINE TIME SLOT BRIDGING DATA BLOCK (DLTSBDB) AUDIT

The DLTSBDB audit verifies internal consistency of the RLDLTSBDB relation by performing linkages and semantic checks. The RLDLTSBDB relation contains per call information for a line assigned to have the bridging capability. The audit runs segmented in the operating system for distributed switching-switching module (OSDS-SM) environment, and during a selective init.

2. DATA STRUCTURES

The RLDLTSBDB relation is a dynamic, indexed, sequential relation. When idle, the rIDLTSBDB tuple is linked to an idle list owned by a tuple in the RLDB_HEADC relation. When it is busy, the rIDLTSBDB tuple is linked to an rCLDB tuple, which is also linked to an rPCBLA tuple. (Refer to Figure 1.)

Figure 1 (DLTSBDB-1) Line Time Slot Bridging Data Block Busy Linkage

3. AUDIT CHECKS

The DLTSBDB audit entry function calls the audit driver when the audit is invoked. The driver checks key, quarantine state, and linkage of an rIDLTSBDB tuple. When all tests pass, the driver calls the audit semantic function to verify data consistency of that tuple. The following checks are performed if a specific attribute indicates that the current call is null:

- (a) The owner field of the rIDLTSBDB tuple should be the headcell.
- (b) The linkage zero check should return a zero, given the relation information.

The current call otherwise will not be null and the following checks are performed:

- (a) The rIDLTSBDB tuple linkage to the rCLDB tuple should not be zero.
- (b) The rCLDB tuple logical key should be equal to the linkage from the rIDLTSBDB tuple minus the rCLDB tuple key shift.
- (c) The rCLDB tuple linkage to the rPCBLA tuple should not be zero.

- (d) The flag indicating the rIPCBLA tuple linkage to the rCLDB tuple should be DBYES, and the rIPCBLA tuple logical key should be equal to the linkage from rCLDB tuple minus the rIPCBLA tuple key shift.

4. ERROR HANDLING

If an error occurs, the DLTSBDB audit prints an error message and returns a failure back to the driver. For recovery, the rDLTSBDB tuple is placed on the idle list in the audit recovery function. The DLTSBDB audit schedules the CLDB, PCBLA and DB_HEADC audits as related audits. The DLTSBDB audit produces these error codes.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	A dynamic tuple of line time slot bridging relation is linked to an incorrect list.
Possible Error Effect:	Lost resources vital to call processing.
Corrective Action Taken:	The dynamic tuple is recovered to the correct idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rDLTSBDB tuple.
<i>Bad Data =</i>	Owner field of rDLTSBDB tuple.
<i>Good Data =</i>	Physical key of correct idle list.
<i>Logical Index =</i>	Key of rDLTSBDB tuple.
<i>Dump =</i>	rDLTSBDB tuple.

Table 2 Error Code: BDLINK

Error Code:	BDLINK
Error Description:	When LTSB process exists, there must be a linkage between rDLTSBDB tuple and rCLDB tuple. A check in the linkage field to rCLDB tuple indicates null.
Possible Error Effect:	Related audits will run and the corresponding DLTSBDB calls will be torn down.
Corrective Action Taken:	The dynamic LTSB tuple is zeroed and placed on the idle list. LTSB process will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rDLTSBDB tuple.
<i>Bad Data =</i>	rDLTSBDB linkage field to rCLDB.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of rDLTSBDB tuple.
<i>Dump =</i>	rDLTSBDB tuple.

Table 3 Error Code: BLINK

Error Code:	BLINK
Error Description:	When LTSB process exists, there must be a linkage between member rCLDB tuple and owner rIPCBLA tuple. However, the owner field of rCLDB indicates null.
Possible Error Effect:	Related audits will run and the corresponding DLTSBDB calls will be torn down.
Corrective Action Taken:	The dynamic LTSB tuple is zeroed and placed on the idle list. LTSB process will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rCLDB tuple.
<i>Bad Data =</i>	Owner field of rCLDB tuple.
<i>Good Data =</i>	rDLTSBDB linkage field to rCLDB.
<i>Logical Index =</i>	Key of rCLDB tuple.
<i>Dump =</i>	NA.

Table 4 Error Code: NONEPROC

Error Code:	NONEPROC
Error Description:	When LTSB process exists, the ltsb_alwd bit in rIPCBLA tuple should set to one. All linkage checks passed but the bit indicates zero.
Possible Error Effect:	Related audits will run and the corresponding DLTSBDB calls will be torn down.
Corrective Action Taken:	The dynamic LTSB tuple is zeroed and placed on the idle list. LTSB process will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rDLTSBDB tuple.
<i>Bad Data =</i>	rIPCBLA bit.
<i>Good Data =</i>	Correct value of rIPCBLA bit.
<i>Logical Index =</i>	Key of rDLTSBDB tuple.
<i>Dump =</i>	rDLTSBDB tuple.

Table 5 Error Code: FBKDPTR

Error Code:	FBKDPTR
Error Description:	When LTSB process exists, owner rIPCBLA tuple should link to member rCLDB tuple and also the pcbld_alwd bit should set to one. Either the bit is in error, or invalid pointer is returned which results in key error.
Possible Error Effect:	Related audits will run and the corresponding DLTSBDB calls will be torn down.
Corrective Action Taken:	The dynamic LTSB tuple is zeroed and placed on the idle list. LTSB process will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rDLTSBDB tuple.
<i>Bad Data =</i>	cldb_flag bit in rIPCBLA tuple.
<i>Good Data =</i>	Owner logical key of rCLDB tuple.
<i>Logical Index =</i>	Key of rDLTSBDB tuple.
<i>Dump 1 =</i>	rDLTSBDB tuple.
<i>Dump 2 =</i>	rIPCBLA tuple.

Table 6 Error Code: FFWDPTR

Error Code:	FFWDPTR
Error Description:	Invalid key in rCLDB tuple.
Possible Error Effect:	Related audits will run and the corresponding DLTSBDB calls will be torn down.
Corrective Action Taken:	The dynamic LTSB tuple is zeroed and placed on the idle list. LTSB process will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rDLTSBDB tuple.
<i>Bad Data =</i>	Key of rCLDB tuple.
<i>Good Data =</i>	Key of rDLTSBDB tuple link.
<i>Logical Index =</i>	Key of rDLTSBDB tuple.
<i>Dump 1 =</i>	rDLTSBDB tuple.
<i>Dump 2 =</i>	Corresponding rCLDB tuple.

Table 7 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	A dynamic tuple of the line time slot bridging relation is linked to an idle list, but its linkage fields are non-zero.
Possible Error Effect:	Lost resources vital to call processing.
Corrective Action Taken:	The dynamic tuple is zeroed and placed on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rDLTSBDB tuple.
<i>Bad Data =</i>	Non-zero value of linkage.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of rDLTSBDB tuple.
<i>Dump =</i>	rDLTSBDB tuple.

DNGSDB

Software Release: 5E12 and later

1. DNU-S GROUP SCAN DATA BLOCK (DNGSDB) AUDIT

A group scan data block is linked to an active concentrated buffer headcell when a line origination is buffered. Each group scan data block represents a group of eight lines. Each line in a group is represented by one bit. If the bit is set, there is an origination on the line waiting to be processed. The DNU-S group scan data block audit (DNGSDB) ensures that group scan data block tuples (rIDNGSDBs) are properly linked to one of the concentrated buffer headcell tuples (rICBHC). The rICBHC tuples represent the idle list or one of several active lists. The audit also checks the name of the first port in the scan group that is stored in an rIDNGSDB tuple.

2. DATA STRUCTURES

For details on the fields contained in the RLDNGSDB relation, refer to the 5ESS® Translations Data Manual (235-600-1xx) and the 5ESS® Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	An rIDNGSDB tuple has an incorrect unit type stored in it.
Possible Error Effect:	An incorrect circuit will be addressed.
Corrective Action Taken:	The audit corrects the invalid unit type designation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDNGSDB tuple.
<i>Bad Data =</i>	rIDNGSDB tuple's unit type.
<i>Good Data =</i>	Derived unit type.
<i>Logical Index =</i>	Key of rIDNGSDB tuple.
<i>Dump 1 =</i>	rUNITDATA tuple.
<i>Dump 2 =</i>	rIDNGSDB tuple.

Table 2 Error Code: GRPINFO

Error Code:	GRPINFO
Error Description:	The first rIDNGSDB tuple should be empty (except for the key) but is not.
Possible Error Effect:	Garbage left in the relation, which may be invalidly accessed and taken to be valid data.
Corrective Action Taken:	The tuple is cleared.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDNGSDB.
<i>Bad Data =</i>	Key of rIDNGSDB.
<i>Good Data =</i>	group name.
<i>Logical Index =</i>	Key of rIDNGSDB.
<i>Dump =</i>	rIDNGSDB tuple.

Table 3 Error Code: MODE

Error Code:	MODE
Error Description:	An rIDNGSDB tuple contains an incorrect shfmode value.
Possible Error Effect:	An incorrect circuit will be addressed.
Corrective Action Taken:	The audit reinitializes the shfmode attribute.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDNGSDB.
<i>Bad Data =</i>	Shfmode value.
<i>Good Data =</i>	Correct shfmode value.
<i>Logical Index =</i>	Key of rIDNGSDB.
<i>Dump 1 =</i>	rUNITDATA tuple.
<i>Dump 2 =</i>	rIDNGSDB tuple.

Table 4 Error Code: NULL3LINK

Error Code:	NULL3LINK
Error Description:	A non-idle rIDNGSDB tuple is not linked to an rIGSLK tuple.
Possible Error Effect:	An incorrect circuit will be addressed.
Corrective Action Taken:	The audit recovers the rIDNGSDB tuple to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDNGSDB.
<i>Bad Data =</i>	gsdbm.st. link value.
<i>Good Data =</i>	DALNKNUL.
<i>Logical Index =</i>	Key of rIDNGSDB.
<i>Dump =</i>	rIDNGSDB tuple.

Table 5 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	A non-idle rIDNGSDB tuple is not linked to valid owner.
Possible Error Effect:	An incorrect circuit will be addressed.
Corrective Action Taken:	The audit recovers the rIDNGSDB tuple to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDNGSDB.
<i>Bad Data =</i>	gsdbm.st. ownk value.
<i>Good Data =</i>	0.
<i>Logical Index =</i>	Key of rIDNGSDB.
<i>Dump =</i>	rIDNGSDB tuple.

Table 6 Error Code: R_PORT

Error Code:	R_PORT
Error Description:	An rIDNGSDB tuple does not have a correct port value.
Possible Error Effect:	An incorrect circuit will be addressed.
Corrective Action Taken:	The audit recovers the invalid port attribute.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDNGSDB.
<i>Bad Data =</i>	Incorrect port value.
<i>Good Data =</i>	Correct port value.
<i>Logical Index =</i>	Key of rIDNGSDB.
<i>Dump 1 =</i>	rUNITDATA tuple.
<i>Dump 2 =</i>	rICKT_PORT tuple.
<i>Dump 3 =</i>	rIDNGSDB tuple.

Table 7 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	An rIDNGSDB tuple is on the idle list, but contains other invalid linkages.
Possible Error Effect:	An incorrect circuit will be addressed.
Corrective Action Taken:	The audit recovers the tuple.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	Address of rIDNGSDB.
<i>Bad Data</i> =	Incorrect linkage value.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Key of rIDNGSDB.
<i>Dump</i> =	rIDNGSDB tuple.

DOC

Software Release: 5E10 and later

1. DYNAMIC OVERLOAD CONTROL (DOC) AUDIT

The common channel signaling (CCS) system includes network management functions. The network management functions include dynamic overload control (DOC), provision of data on CCS controls, and reports of switching congestion conditions. The dynamic overload control relation (RLDOC) keeps track of dynamic overload controls. It is audited periodically to ensure its accuracy so that controls can be applied to the affected trunk groups. The DOC audit is part of the Routing and Terminal Allocation audits subgroup. It runs in the OSDS-M environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The DOC audit uses the dynamic overload control relation (RLDOC), the group to trunk group controls relation (RLGRP_TGC), and the database headcells relation (RLDB_HEADC). These data structures are shown in Figure 1.

Figure 1 (DOC-1) Data Structures of the DOC Audit

3. AUDIT CHECKS

To verify the linkages in the RLDOC relation, the audit invokes the linkage driver (DRLINK) once for each audit segment. The linkage driver ensures that each tuple in RLDOC has a valid one-to-one linkage to the RLGRP_TGC relation. The linkage driver also verifies the linkage to the RLDB_HEADC relation. The linkage driver calls the semantic check function after verifying the linkage of each rlDOC tuple. The audit performs the following checks:

- (a) The audit verifies the all active rIDOC tuples have a non-null linkage back to the rIGRP_TGC relation.
- (b) The audit verifies the consistency between the control attribute and the control id field of rIGRP_TGC.
- (c) The audit verifies that the tuples are either busy or idle and that they are linked to the busy/idle lists in rIDB_HEADC.

If a control tuple is removed, the automatic control change (NMTG_AUTOCHG) 30-second discrete is set.

4. ERROR HANDLING

The audit reports errors when any check fails. It zeroes the linkage areas of the erroneous tuples and links them to the appropriate idle list.

The DOC audit schedules the GRPTGC and DBHEADC audits as related audits when it finds errors.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	A tuple with valid linkages and data to qualify as busy is not on the busy list.
Possible Error Effect:	If this tuple is on the idle list, the data could be lost when the supposedly idle tuple is made active.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDOC tuple.
<i>Bad Data =</i>	Contents of st_ownc field.
<i>Good Data =</i>	Busy list headcell.
<i>Logical Index =</i>	Key to rIDOC tuple.
<i>Dump =</i>	Contents of rIDOC tuple.

Table 2 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	A tuple that has no link into rIGRP_TGC is not fully idled.
Possible Error Effect:	When the tuple is made active again, some fields may be carried over.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDOC tuple.
<i>Bad Data =</i>	Contents of st_ownc field.
<i>Good Data =</i>	Idle list headcell.
<i>Logical Index =</i>	Key of rIDOC tuple.
<i>Dump =</i>	Contents of rIDOC tuple.

Table 3 Error Code: NULLCNTL

Error Code:	NULLCNTL
Error Description:	A tuple on the busy list has a non-active control type.
Possible Error Effect:	Unknown.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDOC tuple.
<i>Bad Data =</i>	Contents of action field.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of tuple.

<i>Dump</i> =	Contents of rIDOC tuple.

DPB-A

Software Release: 5E10 - 5E11

1. D-CHANNEL PROTOCOL BLOCK (DPB) AUDIT

and the D-channel protocol block (DPB) are used to handle communications between the integrated services digital network (ISDN) periphery and the processes that control the ISDN ports. The DPB corresponds to the D-channel port, or the permanent packet of the channel, and has one DALB linked to it for each process that needs to communicate with the ISDN customer premises equipment (CPE). Most (but not all) of these processes control B-port served by the D-port.

For the integrated digital carrier unit (IDCU) the rIDPB tuple is used to represent the embedded operation channel (EOC) and the timeslot management channel (TMC) channels. A shared linkage is used to link these rIDPB tuples to the IDCU remote terminal linkage block (rIRTLB) instead of a rIDALB linkage and to the remote terminal identifier linkage area (rIRTEILA) instead of the rTEILA tuple.

In addition to the DALB linkages, the DPB contains pointers to the path through the switch network that connects the D-channel line card (T-card or U-card) or the inter-switch packet trunk to the protocol handler (PH), and the information required to control the handshaking and data transmission over the D-channel to the ISDN CPE.

2. DATA STRUCTURES

DPB is used for all ISDN applications which connect a port to a PH. Examples of PH ports are:

- Digital subscriber line (DSL) D-channel.
- DSL B-channel for packet switching.
- Interswitch packet trunk.
- Inter-switching module (SM) port.
- Data link terminal (DLT) port.
- Extended digital subscriber line (EDSL) D-channel.
- DSL B-channel for on-demand packet switching.
- Integrated digital carrier unit (IDCU) EOC/TMC channels.
- CDMA packet pipe trunk.
- CDMA speech handler (PHV) trunk.

The RLDPB, an indexed relation in the switching modules (SMs), contains the D-channel port name and peripheral interface data bus (PIDB) time slot block keys for the integrated services line unit (ISLU) and packet switching units (PSUs). The audit also uses the D-channel application linkage block relation (RLDALB), the PIDB time slot block relation (RLPTSB), the port type relation (RLPORTTYP), the digital subscriber line (SDL) equipage relation (RLDSLEQUIP), and the port linkage area relation (RLPORTLA).

For an ISDN or ISDN attendant D-channel DPB, services subscribed by the users (represented by TEDB) are initialized and linked to the DPB during full initialization.

When the CPE is plugged in and terminal end point identifier (TEI) is generated, the TEI linkage area (TEILA) is linked to the DPB.

This only applies to ISDN or ISDN ATTENDANT D-channels. The other channels, such as operator services position system (OSPS), CDMA, EDSL or PRI, have no TEDB or TEILA linked to the DPB. For non-OSPS PRI ISDN calls or CDMA packet pipe or speech handler trunks, no DALB is linked to the DPB. Please refer to the data diagrams for the DPB and related data structure. Refer to Figure 1 and Figure 2.

3. AUDIT CHECKS

- (1) The audit first verifies that the DPB belongs to a valid D-channel or packet B-channel.
- (2) The audit verifies that the key in DPB is correct.
- (3) The audit verifies that all linkages between the DALB and the DPB are correct.

This linkages will be null when the rDALB tuple is involved with primary rate interface (PRI) calls for a non-facility associated signaling (NFAS) and D-channel back up (DCBU) features excluding OSPS PRI calls.

- (4) The audit verifies that all linkages between the DPB and the following are correct:
 - Terminal equipment data block (TEDB).
 - Remote terminal linkage block (rRTLb).
 - Remote terminal endpoint identifier linkage area (rRTEILA).
 - TEI linkage area (TEILA).
 - Peripheral interface data bus time slot backs (PTSBs).
- (5) The audit verifies that data transmission rates and protocol data in the DPB are correct.
- (6) If channel is being monitored for protocol transmission, the audit verifies that the protocol monitor job tables are consistent each other.
- (7) The audit verifies that B-channels management data stored in the PDB is consistent with the corresponding B-channel status in PORTLA and B-channel configuration in rDSLEQUIP.
- (8) The audit verifies the path between the DPB and the PTSB is set per the routine port condition table.
- (9) For CDMA packet pipe trunks, the audit verifies that the number of PTSB's that should be associated with the packet pipe (according to the count in rIPP_MEM) are all there.
- (10) For ISDN or ISDN attendant lines, the D-channel DPB should link to the terminal equipment data block (TEDB). Other channels such as OSPS, extended digital subscriber lines (EDSLs) should not have linkages to TEDBs.
- (11) The audit verifies the number of TEILAs linked to DPB is the same as the specified in the DPB and is not greater than the maximum number configured in the rDSLEQUIP.
- (12) The audit verifies that the basic rate interface (BRI) class and binding data stored in the DPB is derived from the corresponding rDSLEQUIP tuple.
- (13) The audit provides existence checks on B-channel DPBs used for on demand B-channel package services (ODB). The audit also verifies the consistency of B-channel management data related to ODB.
- (14) The audit verifies the associated group information (rDPB.agi1_bchan and rDPB.agi2_bchan).

- (15) The audit verifies all the fields related to the NFAS/DCBU features for PRI calls, namely, interf_id, prigrp, pri_type and srwait.

4. ERROR HANDLING

If any errors are detected in a DPB tuple, the audit determines if a process currently owns the D-channel. If a process is found, the audit recovers the data by requesting a single process purge of the owning process.

If the DPB does not have a living process, the audit reinitializes the protocol and data rate information. The audit attempts to preserve the DALB, TEDB, and TEILA lists and the physical path through the PTSB's, since changes to either of these could result in lost data. The audit recovers these linkages if they do not pass the point to point back checks. (NON-ODB calls only. For ODB calls, the tuple and all linkages are idled.)

During recovery the rIDPB field is cleared to DBNO.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: ACCPTR

Error Code:	ACCPTR
Error Description:	The ODB B-channel rIDPB tuple corresponding to a given rIORTLA tuple associated with the B-channel's port could not be accessed by the audit. For every rIORTLA tuple associated with an ODB B-channel port there should exist a corresponding B-channel rIDPB tuple where rIORTLA.port = rIDPB.port.
Possible Error Effect:	ODB calls cannot be set up on one of the B-channels for this DSL.
Corrective Action Taken:	The B-channel management data in the D-channel rIDPB tuple is idled out to indicate that no ODB calls are up on the B-channel (b1use or b2use marked to DMIDDLE_USE and b1pty_resb or b2pty_resv marked to 0 depending on which B-channel was using ODB).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIORTLA tuple for the B-channel's port.
<i>Bad Data =</i>	The logical key of the D-channel rIDPB tuple (port).
<i>Good Data =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Logical Index =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Dump 1 =</i>	The rIORTLA tuple for the B-channel's port.
<i>Dump 2 =</i>	The rIDPB tuple for the D-channel.

Table 2 Error Code: ASSOC_PTSB

Error Code:	ASSOC_PTSB
Error Description:	For non-CDMA calls, the owner linkage field to the rIPTSb tuple dppto must be null as those PTSBs are linked through the semantic linkages, islu_ptsb and psiu_ptsb. The DPB audit found this field to be non null.
Possible Error Effect:	Possible failure of IDCU and other non-CDMA calls.
Corrective Action Taken:	The dppto linkage is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The st_headk field of the dppto field of the rIDPB tuple.
<i>Bad Data =</i>	The st_talk field of the dppto field of the rIDPB tuple.
<i>Good Data =</i>	The phctyp field of the rIDPB tuple.
<i>Logical Index =</i>	The port field, key, of the rIDPB tuple.
<i>Dump =</i>	The rIDPB tuple being audited.

Table 3 Error Code: ASSOC_TUP

Error Code:	ASSOC_TUP

Error Description:	The corresponding rIODPSOP static tuple for a given ODB DSL and party could not be accessed. For every D-channel rIDPB tuple where the B-channel management data indicates ODB is in use on the DSL (rIDPB.b1use or b2use = DMOB_USE) there should exist a corresponding rIODPSOP static tuple where (key) rIDPB.port = (key) rIODPSOP.port and (key) rIODPSOP.party = (rIDPB.X >> rIODPSOP.party & (DMUCHAR)1) where X = b1pty_resv or b2pty_resv in the D-channel rIDPB tuple.
Possible Error Effect:	An unauthorized subscriber may be using the ODB feature.
Corrective Action Taken:	The B-channel port is quarantined (rIORTLA.quarstate set to AUAUSET) and the B-channel management data in the associated D-channel rIDPB tuple is recovered to an idle state (b1use or b2use marked DMIDLE_USE and b1pty_resv or b2pty_resv marked to 0 depending on which B-channel was using ODB).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIORTLA tuple for the B-channel's port.
<i>Bad Data =</i>	The logical key of the D-channel rIDPB tuple (port).
<i>Good Data =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Logical Index =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Dump 1 =</i>	The rIORTLA tuple for the B-channel's port.
<i>Dump 2 =</i>	The rIDPB tuple for the D-channel.

Table 4 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	Either the blkcall, pktcampon or the srwait field of the rIDPB tuple is set but the D-channel port is not owned as indicated by the state of the rIORTLA tuple of this D port (DBPSIDLE) which is an error.
Possible Error Effect:	• If the blkcall field is set, then one can not originate or terminate to this DSL as the call is blocked. • If the pktcampon field is set, the D port indicates it is camped on when it is not. • If the srwait field is set, the D port will time out waiting for SERV and SERV ACK messages.
Corrective Action Taken:	Audit will force the recovery of the rIDPB tuple being audited.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The blkcall field of the rIDPB tuple.
<i>Bad Data =</i>	The pktcampon field of the rIDPB tuple.
<i>Good Data =</i>	The srwait field of the rIDPB tuple.
<i>Logical Index =</i>	The port field, key, of the rIDPB tuple.
<i>Dump 1 =</i>	The rIDPB tuple being audited.
<i>Dump 2 =</i>	The rIORTLA tuple of the D-channel involved.

Table 5 Error Code: BADPTSB

Error Code:	BADPTSB
Error Description:	One of the PTSB's pointed to by the D-channel protocol block did not point back to the D-channel.
Possible Error Effect:	Potential for breaking the D-channel signaling path.
Corrective Action Taken:	PTSB pointers are cleared. Process owning DPB is purged if any. D-port is turned over to terminal maintenance for recovery.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The key of the rIPTSB tuple that should have been linked to the rIDBP tuple under audit.
<i>Bad Data =</i>	PTSB number.
<i>Good Data =</i>	NA.

<i>Logical Index</i> =	Port number of D-port.
<i>Dump 1</i> =	The rIDPB tuple.
<i>Dump 2</i> =	The rIPTSB tuple.

Table 6 Error Code: BADIDLE2

Error Code:	BADIDLE2
Error Description:	B2-channel usage field is not consistent with DSLEQUIP.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	B2-channel usage field is reset to initialized value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The error code sequence number: 1 = DMNO_SERV. 2 = DMPPB_USE. 3 = DMIDLE_USE.
<i>Good Data</i> =	B2-channel usage in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 7 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The pri_type field of the rIDPB tuple did not match the same field from the static rIPRIGRP tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	The pri_type field of the rIDPB will be corrected with the value found in the same field of the static rIPRIGRP tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The prigrp field of the rIDPB tuple.
<i>Bad Data</i> =	The pri_type field of the rIDPB tuple.
<i>Good Data</i> =	The pri_type field of the rIPRIGRP tuple.
<i>Logical Index</i> =	The port field, key, of the rIDPB tuple.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 8 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	B-channel management data in DPB is not correct. Either B-channel usage is wrong or party reservation bits are not correctly set.
Possible Error Effect:	B-channel could be blocked for call processing.
Corrective Action Taken:	B-channel data are reinitialized correctly per DSLEQUIP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The error indicator. 1 = B-channel is configured as NO_SERV, but B-channel management data is not set to initialized value. 2 = B-channel is configured as X_25, but B-channel management data is not set to DMPB_USE or party reservations are not zero. 3 = B-channel is used for default service or operator use but party reservation is not zero or no TEDB is linked to DPB. 4 = B-channel is used for TM-USE but party reservation is not zero.

	5 = B-channel is used for CSV, CSD or ODB use, but party reservation is not set or no TEDB is linked to PDB. 6 = B-channel is used for CSV, CSD or ODB use, but party reservation bit is not consistent with PCBLA (process). 7 = If B-channel is owned by process, B-channel usage should not be IDLE_USE, VRSV-USE, PPB_USE or NO_SERV. 8 = If B-channel is not owned by process and usage field is indicated as IDLE-USE, then party reservation bit should not be set. 9 = When B-channel is not owned by process but used by shared DN (usage field is DMVRSV_USE), party reservation bits should not be zero and TEDB, DALB should link to DPB. 10 = The B-channel usage field is not defined in the system.
<i>Good Data</i> =	Valid values are: 1 = B1 channel has problem. 2 = B2 channel has problem.
<i>Logical Index</i> =	Port number of D-port.
<i>Dump</i> =	rIDPB tuple.

Table 9 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	The value in rIPP_MEM.num_mem indicates that a certain number of rIPTSB tuples should be linked to this rIDPB when it is stable the number of tuples is wrong.
Possible Error Effect:	This packet pipe is not correctly set up for CDMA calls and will cause a loss of data.
Corrective Action Taken:	Audits will force recovery of the rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The PH channel type of the port (rIDPB.phctyp).
<i>Bad Data</i> =	The number of rIPTSB tuples that are currently linked (local cnt).
<i>Good Data</i> =	The number of rIPTSB tuples that should be linked (rIPP_MEM.num_mem).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump 1</i> =	The contents of the rIDPB tuple.
<i>Dump 2</i> =	The contents of the rIPP_MEM tuple.
<i>Dump 3</i> =	The contents of the rIFC_PORTTYP tuple.

Table 10 Error Code: BINDERR

Error Code:	BINDERR
Error Description:	The binding related data such as blport_set are not set correctly in DPB.
Possible Error Effect:	This DSL may have signaling and binding problems.
Corrective Action Taken:	blport_set in DPB is correctly set to be consistent with DSLEQUIP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	blport_set in DPB.
<i>Good Data</i> =	bind_lport in DSLEQUIP. (if bind_lport in DSLEQUIP is not zero, then blport_set in DPB should be set to DBYES).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 11 Error Code: BIT1MAP

Error Code:	BIT1MAP
Error Description:	The audible alert party bits should not be set when DSL is idle.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The audible alert party bits will be reset to zero.
Manual Action Required:	NA.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The audible party in DPB.
<i>Good Data =</i>	0.
<i>Logical Index =</i>	The rIDPB key - port name.
<i>Dump =</i>	The rIDPB tuple.

Table 12 Error Code: BLINK

Error Code:	BLINK
Error Description:	There should be no linkage between a B-channel rIDPB tuple used for the ODB feature and TEDB, and the B-channel rIDPB tuple's tedb_flag should be DBNO. Either one or both of these conditions was found to be in error.
Possible Error Effect:	The B-channel rIDPB tuple, and related data are in an invalid state resulting in wasted resources.
Corrective Action Taken:	The B-channel rIDPB tuple, and related ODB call processing data are recovered to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the B-DPB.
<i>Bad Data =</i>	The tedb link flag.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key of the B-DPB tuple.
<i>Dump =</i>	The B-channel rIDPB (which will contain the status of the linkage to the TEDB).

Table 13 Error Code: BOTHCHAN

Error Code:	BOTHCHAN
Error Description:	An associated group (rIDPB.agi1_bchan or rIDPB.agi2_bchan) is using both B-channels, when only one is allowed. Terminals identified in a group by the bit map rIDSLEQUIP.agipty# coincide with both B-channels identified in bit maps rIDPB.b1pty_resv and rIDPB.b2pty_resv.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	None.
Manual Action Required:	Check assignment of associated groups and multi-line hunt groups (MLHG) on RC/V Views 23.2 (DIGITAL SUBSCRIBER LINE) and 23.3 (ASSOCIATED GROUP). Check for overlapping groups, and MLHGs which occur in both groups.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	rIDPB.agi1_bchan.
<i>Good Data =</i>	rIDPB.agi2_bchan.
<i>Logical Index =</i>	Key of DPB (rIDPB.port).
<i>Dump 1 =</i>	rIDPB tuple.
<i>Dump 2 =</i>	rIDSLEQUIP tuple.

Table 14 Error Code: CHAN_ZERO

Error Code:	CHAN_ZERO
Error Description:	B-channel management data are not set to initialized value for non-ISDN line.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	B-channel management data are reset to initialized value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDPB key - port name.
<i>Dump =</i>	The rIDPB tuple.

Table 15 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The number of TEILA linked to DPB is not equal to those specified in DPB (tot_terms field).
Possible Error Effect:	The error may cause binding and signaling problem.
Corrective Action Taken:	tot_terms field in DPB is reset to correct number.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	tot_terms in DPB.
<i>Good Data</i> =	The actual TEILA linked to DPB.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 16 Error Code: DBCHAN

Error Code:	DBCHAN
Error Description:	B1-channel usage field is not consistent with DSLEQUIP.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	B1-channel usage field is reset to initialized value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The error code sequence number: 1 = Should be DMNO_SERV. 2 = Should be DMPPB_USE. 3 = Should be DMIDLE_USE.
<i>Good Data</i> =	B1-channel usage in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 17 Error Code: DPB_LINK

Error Code:	DPB_LINK
Error Description:	An invalid linkage is found between a B-channel rIDPB tuple used for the ODB feature and an rIPTSB tuple.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	The ODB call will be torn down and related data recovered to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The invalid linkage between the B-channel DPB and the PTSB.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	DPB key.
<i>Dump 1</i> =	The rIDPB tuple.
<i>Dump 2</i> =	The rIPTSB tuple.

Table 18 Error Code: DSL_RATE

Error Code:	DSL_RATE
Error Description:	Data rate in DPB differs from ODD data rate.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	Process owning DPB is purged if any D-PORT is turned over to terminal maintenance for recovery.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data rate found in DPB.
<i>Good Data</i> =	Data rate according to ODD.
<i>Logical Index</i> =	Port number of D-port.

<i>Dump</i> =	NA.

Table 19 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	The logical PH number and physical PH channel data in a B-channel rIDPB tuple used for ODB did not match the data contained in the corresponding rIODPSOP static tuple. For B-channel rIDPB tuples used for ODB calls, the ph_number and ph_cn attributes must be represented in rIODPSOP.ph_number and rIODPSOP.ph_cn or ph_cn2 where, for the associated D-channel, (key) rIDPB.port = (key) rIODPSOP.port and (key) rIDPSOP.party = (rIDPB.X >> rIODPSOP.party & (DMUCHAR)1) where X = b1pty_resv or b2pty_resv in the D-channel rIDPB tuple associated with the B-channel rIDPB tuple under audit.
Possible Error Effect:	An unauthorized subscriber may be using the ODB feature.
Corrective Action Taken:	The ODB call process is purged and the ODB call owning the B-channel is torn down.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the B-channel rIDPB tuple under audit.
<i>Bad Data</i> =	The PH number the rIDPB tuple (ph_number)
<i>Good Data</i> =	The PH number found in the rIODPSOP static tuple (ph_number).
<i>Logical Index</i> =	The key of the rIDPB tuple under audit (port).
<i>Dump 1</i> =	The B-channel rIDPB tuple under audit.
<i>Dump 2</i> =	The associated D-channel rIDPB tuple for the DSL.
<i>Dump 3</i> =	The associated rIODPSOP static tuple.

Table 20 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The audit has detected an rIDPB dynamic tuple without a corresponding static tuple where: - the DPB does not have the static rIDSLEQUIP tuple with rIDPB.port = rIDSLEQUIP.dsl OR - there is no user subscribed to the on-demand-packet feature with rIDPB.port = rIODPSOP.port
Possible Error Effect:	If call processing or terminal maintenance attempts to access the unassigned resources represented by this tuple, operations may be disrupted.
Corrective Action Taken:	Tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key value.
<i>Dump</i> =	The rIDPB tuple.

Table 21 Error Code: GPORT

Error Code:	GPORT
Error Description:	The specified B-channel port is not populated or key or B-channel PORTLA is wrong.
Possible Error Effect:	Application code may assert when accessing the data and B-channel cannot be used.
Corrective Action Taken:	PORTLA or FCPORTTYPE audit will be scheduled as related audit to detect this error and correct it.
Manual Action Required:	If FC_PORTTYPE is missing, then manual action is required to insert the B-channel FC PORTTYPE tuple. (Look good data in the dump.)
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.

<i>Bad Data</i> =	The key of B-PORTLA in the system (maybe 0xffff).
<i>Good Data</i> =	The key of B-PORTLA which should be in the system.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 22 Error Code: GRPINFO

Error Code:	GRPINFO
Error Description:	Based on the bit maps rIDSLEQUIP.agipty1 and rIDPB.b#pty_resv the associated group information rIDPB.agi1_bchan is set to the incorrect value. The range of values is FCNO_BCHAN, FCB1_CHAN, and FCB2_CHAN.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	rIDPB.agi1_bchan is set to the correct value listed below.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	rIDPB.agi1_bchan.
<i>Good Data</i> =	Correct value of rIDPB.agi1_bchan.
<i>Logical Index</i> =	The rIDPB key (rIDPB.port).
<i>Dump</i> =	The rIDPB tuple.

Table 23 Error Code: GRP2INFO

Error Code:	GRP2INFO
Error Description:	Based on the bit maps rIDSLEQUIP.agipty2 and rIDPB.b#pty_resv the associated group information rIDPB.agi2_bchan is set to the incorrect value. The range of values is FCNO_BCHAN, FCB1_CHAN, and FCB2_CHAN.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	rIDPB.agi2_bchan is set to the correct value listed below.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	rIDPB.agi2_bchan.
<i>Good Data</i> =	Correct value of rIDPB.agi2_bchan.
<i>Logical Index</i> =	The rIDPB key (rIDPB.port).
<i>Dump</i> =	The rIDPB tuple.

Table 24 Error Code: IL_PTYE

Error Code:	IL_PTYE
Error Description:	The lp_type in rIFC_PORTTYP does not indicate that the port B-channel rIDPB is associated with a B-channel port.
Possible Error Effect:	Wasted resources since this tuple cannot be used for anything.
Corrective Action Taken:	The B-channel rIDPB tuple and related data, if any, will be recovered to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The lp_type in rIFCPORTTYP.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the DPB tuple.
<i>Dump</i> =	The DPB tuple.

Table 25 Error Code: IDLE_LINKED

Error Code:	IDLE_LINKED
Error Description:	EOC/TMC ports on an IDCU TR303 have a invalid link between the rIDPB and the rRTLb tuple.
Possible Error Effect:	Tasks for this RT may be lost and not completed.
Corrective Action Taken:	The EOC/TMC port will be recovered and the link restarted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.

<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump</i> =	The contents of the rIDPB tuple.

Table 26 Error Code: INV

Error Code:	INV
Error Description:	Either the interf_id or the prigrp field of the rIDPB tuple did not match the same field from the static rIDCHNPRI tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	Both the interf_id and the prigrp fields of the rIDPB tuple will be corrected with the values found in the same fields of the static rIDCHNPRI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The interf_id field of the rIDPB tuple.
<i>Bad Data</i> =	The prigrp field of the rIDCHNPRI tuple.
<i>Good Data</i> =	The interf_id field of the rIDCHNPRI tuple.
<i>Logical Index</i> =	The prigrp field of the rIDPB tuple.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 27 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	BRI class of service in DPB is not consistent with DSLEQUIP.
Possible Error Effect:	This DSL may have signaling and binding problems.
Corrective Action Taken:	briclass in DPB is correctly set to be consistent with DSLEQUIP and the port is put on the to be idled list (TMLTTBI) to be reinitialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	briclass in DPB.
<i>Good Data</i> =	briclass in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 28 Error Code: INVOWNER

Error Code:	INVOWNER
Error Description:	The default service TEDB should link to the DSL which has subscribed default service feature but it links to other DSL.
Possible Error Effect:	No default service is provided in this DSL.
Corrective Action Taken:	The DSL will be recovered and all the TEDBs will be reinitialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The DSL which TEDB links to.
<i>Good Data</i> =	The DSL which TEDB should link to.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 29 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	The audit received an unrecognized or invalid return from TMdpbprt().
Possible Error Effect:	The rIDPB tuple cannot be audited.
Corrective Action Taken:	The audit skips the rIDPB tuple since it cannot access any related data required for auditing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIFC_PORTTYP static tuple passed to TMdpbprt().
<i>Bad Data</i> =	The return received from TMdpbprt().
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The rIFC_PORTTYP static tuple.

Table 30 Error Code: L2MON

Error Code:	L2MON
Error Description:	The port is requested to be monitored for protocol but the data used is inconsistent.
Possible Error Effect:	Switch may waste resources to monitor the unrequested port.
Corrective Action Taken:	The port is marked as not being monitored.
Manual Action Required:	NA.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The pmon field in DPB.
<i>Good Data</i> =	DBNO (0).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 31 Error Code: LEVEL_1

Error Code:	LEVEL_1
Error Description:	Level two profile in the ODD does not match profile in the DPB.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	Process owning DPB is purged if any D-port is turned over to terminal maintenance for recovery.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Level 2 profile found in DPB.
<i>Good Data</i> =	Level 2 profile according to ODD.
<i>Logical Index</i> =	Port number of D-port.
<i>Dump</i> =	NA.

Table 32 Error Code: LEVEL_3

Error Code:	LEVEL_3
Error Description:	The level three state in the DPB did not match the level three state derived from the circuit type information in the PORTTYP and DSLEQUIP tuple.
Possible Error Effect:	Potential for breaking the D-channel signaling path.
Corrective Action Taken:	Level three state is updated to match the static ODD data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Level three state from the DPB.
<i>Good Data</i> =	Level three state derived from the ODD.
<i>Logical Index</i> =	Port number of D-port.
<i>Dump</i> =	DPB is dumped.

Table 33 Error Code: MISSTUP

Error Code:	MISSTUP
Error Description:	DSL should have default service feature but there is no default service TEDB linked to DPB or TEDB key is wrong.
Possible Error Effect:	No default service is provided in this DSL.
Corrective Action Taken:	Print the error and request related audits to insert TEDB or correct the TEDB errors.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The TEDB key in the system.
<i>Good Data</i> =	The TEDB key which should be.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 34 Error Code: NONNULL

Error Code:	NONNULL
Error Description:	The servclass and lp_type fields of the static rIFC_PORTTYPE tuple indicates that this D channel is not used for NFAS and DCBU PRI D-channel (AUportbuf.servclass not != FCEDSL and AUportbuf.lp_type != PCTDCHAN).

	And yet audit found that one of the three fields related to NFAS and DCBU D channel, namely, interf_id, prigrp, and pri_type has a non null value.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	All the three fields will be set to the null value (interf_id->PSNO_INTID, prigrp->TMNULLPRI and pri_type->TMNULL_TYPE).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The interf_id field of the rIDPB tuple.
<i>Bad Data =</i>	The prigrp field of the rIDPB tuple.
<i>Good Data =</i>	The pri_type field of the rIDPB tuple.
<i>Logical Index =</i>	The rIDPB tuple's key, port field.
<i>Dump =</i>	The rIDPB tuple being audited.

Table 35 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	For an NFAS/DCBU PRI calls, the linkage field to the rIDALB tuple dpdao must be null as no DALBs used in such type of PRI calls is linked to DPBs. Audit found this field to be non null.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	Audit will force recovery of this rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The st_headk field of the dpdao field of the rIDPB tuple.
<i>Bad Data =</i>	The st_tailk field of the dpdao field of the rIDPB tuple.
<i>Good Data =</i>	The prigrp field of the rIDPB tuple.
<i>Logical Index =</i>	The port field, key, of the rIDPB tuple.
<i>Dump =</i>	The rIDPB tuple being audited.

Table 36 Error Code: NOPCBLA

Error Code:	NOPCBLA
Error Description:	While looking for a process on the port associated with the rIDPB tuple during selective initialization, the DA function call returned an error saying that database corruption exists. The audit error report dumps rIORTLA because that is what it has access to.
Possible Error Effect:	The port would normally be taken down unless a barge-in call pickup process exists for this port. Since database error was returned, the port will be taken down.
Corrective Action Taken:	The tuple is quarantined, so that the audit forces recovery of the rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The pointer to the rIORTLA tuple.
<i>Bad Data =</i>	The value returned from the DA function call.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIORTLA tuple's key, port field.
<i>Dump =</i>	The rIORTLA tuple being audited.

Table 37 Error Code: NOTIDLE2

Error Code:	NOTIDLE2
Error Description:	A rIDPB tuple not currently used for ODB was found to have its logical PH number (ph_number) and physical channel number (ph_cn) attributes set to invalid values. For D-channel rIDPB tuples, or rIDPB B-channel tuples which are not associated with B-channels used for the ODB feature, the PH and channel attributes are unused and should be set to idle values (PSPHNULL and zero respectively).
Possible Error Effect:	Call processing will never be able to use the associated B-channel for ODB since the PH and channel attributes make it appear that the B-channel already has a PH and channel assigned and in use.
Corrective Action Taken:	The ph_number and ph_cn attributes are recovered to their idle values (PSPHNULL and 0 respectively).
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The contents of the ph_number and ph_cn attributes. (rIDPB.ph_number << 4 rIDPB.ph_cn)
<i>Good Data</i> =	The null values for ph_number and ph_cn (PSPHNULL << 4 (DMPHCN) 0).
<i>Logical Index</i> =	The rIDPB tuple's key (port).
<i>Dump</i> =	The rIDPB tuple.

Table 38 Error Code: NULL4LINK

Error Code:	NULL4LINK
Error Description:	The PH channel type indicates that this is a packet pipe or speech handler trunk so the owner linkage to the PTSB should be non-zero. Instead, the semantic linkage (islu_ptsb or psiu_ptsb) to the PTSB is non-zero.
Possible Error Effect:	If call processing or terminal maintenance attempts to access the resources represented by this tuple, operations may be disrupted.
Corrective Action Taken:	Audits will force recovery of the rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The islu_ptsb field of the rIDPB tuple.
<i>Bad Data</i> =	The psiu_ptsb field of the rIDPB tuple.
<i>Good Data</i> =	The phctyp field of the rIDPB tuple.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 39 Error Code: ODDLOSTUP

Error Code:	ODDLOSTUP
Error Description:	The PORTTYP relation indicates that the DSL for this port must be equipped, but the DSLEQUIP tuple is missing from the static ODD. If the GOOD DATA is 2, the DPB audit was unable to obtain the static relation tuple (RLPP_MEM) needed to audit the dynamic rIDPB tuple for the CDMA packet pipe either there is no packet pipe member tuple with the same port as the DPB or PP_MEM key is wrong.
Possible Error Effect:	If the <i>Good Data</i> is 1, the audit cannot verify any data in the DPB. If it is bad, the audit has no way to fix it. If the <i>Good Data</i> is 2, packet pipe members cannot be located for packet pipe call processing.
Corrective Action Taken:	None.
Manual Action Required:	If the <i>Good Data</i> is 1, office personnel will need to use ODBE to put the missing DSLEQUIP tuple back into the ODD, since ODBE does not permit removing the PORTTYP tuple under these circumstances. If the <i>Good Data</i> is 2, office personnel will need to use ODBE to put the missing PP_MEM tuple into the ODD. Find out the value of the port.member from the dump of the rIDPB tuple. The port.module will be the processor receiving the audit. Using these as the key, insert the static rIPP_MEM tuple. For the other fields of the tuple, refer to the terminal maintenance and trigger area.
Dump Description:	
<i>Error Address</i> =	If the <i>Good Data</i> is 1, the address of the rDSLEQUIP tuple. If the <i>Good Data</i> is 2, the address of the rIDPB tuple.
<i>Bad Data</i> =	The logical port type (rIFC_PORTTYP.lp_type).
<i>Good Data</i> =	Valid values are:
	1 = Could not read the rDSLEQUIP tuple.
	2 = Could not read the rIPP_MEM tuple.
<i>Logical Index</i> =	The rIDPB key (rIDPB.port).
<i>Dump 1</i> =	The contents of the rIDPB tuple.
<i>Dump 2</i> =	The contents of the rIFC_PORTTYP tuple.

Table 40 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	DPB tuples that are not used by IDCU or CDMA must be linked to TEDB, DALB, and TEILA tuples. This DPB tuple is not linked to one of them. If <i>Good Data</i> is 1, it is not linked to TEDB. If <i>Good Data</i> is 2, it is not linked to DALB. If <i>Good Data</i> is 3, it is not linked to TEILA.
Possible Error Effect:	Problem in call processing.
Corrective Action Taken:	The rIDPB tuple is quarantined so that the tuple is recovered by audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The linkage, either TEDB, DALB, or TEILA. (See under GOOD DATA.)
<i>Good Data</i> =	Valid values are: 1 = The bad linkage is to a TEDB. 2 = The bad linkage is to a DALB. 3 = The bad linkage is to a TEILA.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 41 Error Code: PHCTYPE

Error Code:	PHCTYPE
Error Description:	The PH channel circuit type stored in an rIDPB tuple, which is associated with a B-channel port used for the ODB feature, was found inconsistent from the type derived from the B-channel management data stored in static ODD (rIFC_PORTTYPE).
Possible Error Effect:	The PORT could be OOS.
Corrective Action Taken:	The "phctype" field is updated in the DPB to agree with the B-channel management data stored in static ODD (rIFC_PORTTYP).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the DPB tuple.
<i>Bad Data</i> =	Value of the "phctype" field in the DPB.
<i>Good Data</i> =	Value of "phctyp" computed from the ODD.
<i>Logical Index</i> =	Port name.
<i>Dump</i> =	The DPB tuple.

Table 42 Error Code: PHDSLGP

Error Code:	PHDSLGP
Error Description:	There are currently two ODB calls up on this DSL. However, the logical PH and physical PH channel numbers stored in the rIDPB tuples for each B-channel are identical. When ODB calls are up on each B-channel of a DSL, the ph_number and ph_cn attributes in each ODB B-channel rIDPB tuple must be unique to each other. Since it is physically impossible to set up ODB calls on a DSL under these conditions, this error is an indication that the ph_number and ph_cn attributes in one or both rIDPB tuples became corrupted after both ODB calls were set up on the DSL. The occurrence of this error is an indication that the PH and channel data does not reflect the actual PH and channel(s) being used for ODB call activities.
Possible Error Effect:	The ODB connection(s) on this DSL cannot be cleanly torn down. Attempts by call processing to do so may result in asserts and/or audit errors.
Corrective Action Taken:	Both B-channel rIPORTLA tuples are quarantined for recovery (rIPORTLA.quarstate marked AUAUSET). The B-channel management data in the D-channel rIDPB tuple (b1use, b2use, b1pty_resv and b2pty_resv) are marked to idle states (DMIDDLE_USE and 0 respectively). Lastly, the logical PH number (ph_number) and physical channel number (ph_cn) attributes in the B1

	and B2 rIDPB tuples are marked to an idle state (PSPHNULL and 0 respectively). Any ODB call processes up on the DSL will then be purged and any other related call data will be idled out by related audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the B-channel rIDPB ODB B-channel tuple under audit.
<i>Bad Data =</i>	The logical PH number (ph_number) in the B-channel rIDPB ODB B-channel tuple under audit.
<i>Good Data =</i>	The physical PH channel number (ph_cn) in the B-channel rIDPB ODB B-channel tuple under audit.
<i>Logical Index =</i>	The key of the B-channel rIDPB ODB B-channel tuple (port).
<i>Dump 1 =</i>	The contents of the B-channel rIDPB ODB B-channel tuple under audit.
<i>Dump 2 =</i>	The contents of the "other" B-channel rIDPB ODB B-channel tuple.
<i>Dump 3 =</i>	The contents of the D-channel rIDPB tuple on the DSL.

Table 43 Error Code: PHNUNEQUIP

Error Code:	PHNUNEQUIP
Error Description:	The dsl_group and/or member obtain from the static tuple rIDSLEQUIP do not match the ph_number and/or ph_cn stored in the rIDPB tuple.
Possible Error Effect:	Problems in call processing.
Corrective Action Taken:	The rIDPB tuple is recovered by audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	PH number (rIDPB.ph_number).
<i>Good Data =</i>	DSL_group (rIDSLEQUIP.dsl_group).
<i>Logical Index =</i>	The rIDPB tuple's key, port field.
<i>Dump 1 =</i>	The rIDPB tuple being audited.
<i>Dump 2 =</i>	The rIDSLEQUIP tuple being audited.

Table 44 Error Code: PLE_STATE

Error Code:	PLE_STATE
Error Description:	The plestate attribute is incorrect.
Possible Error Effect:	D-channel will be idled.
Corrective Action Taken:	The rIDPB tuple will be initialized and made idle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPB.
<i>Bad Data =</i>	Incorrect plestate.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key of rIDPB.
<i>Dump =</i>	rIDPB.

Table 45 Error Code: PORT

Error Code:	PORT
Error Description:	Using port field of the rIDPB tuple as the member field and GI_pcrd as the module field of the dport key field of rIDCHNPRI tuple, audit tried to read the static rIDCHNPRI tuple and failed. Audit must find this static ODD tuple and will continue to take this error until it is inserted by office personnel. Look at the manual action required field below as to how to insert the tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	Both the interf_id and the prigrp fields of the rIDPB tuple will be reset to their null values and audit will retun.
Manual Action Required:	Using port field of the rIDPB tuple as the member field and GI_pcrd as the module field of the dport key field of rIDCHNPRI tuple, insert the static rIDCHNPRI tuple. As for the values of the other fields, refer to the terminal maintenance and triggers area.
Dump Description:	
<i>Error Address =</i>	The prigrp field of the rIDPB tuple.
<i>Bad Data =</i>	The interf_id field of the rIDPB tuple.
<i>Good Data =</i>	The pri_type field of the rIDPB tuple.

<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 46 Error Code: PROC_TO

Error Code:	PROC_TO
Error Description:	The process owning B-channel port does not link properly with the B-channel PORTLA.
Possible Error Effect:	Application code may assert when accessing the data and B-channel cannot be used.
Corrective Action Taken:	The PORTLA will be quarantined and process will be purged.
Manual Action Required:	NA.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The process number of PCBLA.
<i>Good Data</i> =	The expected process number from PORTLA.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 47 Error Code: PSTATUS

Error Code:	PSTATUS
Error Description:	The level 3 profile obtained from rFC_PORTTYP and rIODPSOP static ODD did not match the level 3 profile stored in a B-channel rIDPB tuple being used for the ODB feature.
Possible Error Effect:	The B-channel signaling path may be corrupted.
Corrective Action Taken:	The level 3 data will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the B-DPB tuple.
<i>Bad Data</i> =	The level 3 profile found in the B-DPB tuple.
<i>Good Data</i> =	The level 3 profile derived from static data.
<i>Logical Index</i> =	The key of the B-DPB tuple.
<i>Dump</i> =	The B-channel DPB tuple.

Table 48 Error Code: PTR3

Error Code:	PTR3
Error Description:	According to the D-channel rIDPB tuple for a DSL with two ODB B-channels assigned, both B-channels currently have ODB calls up, however, only one rIDPB B-channel tuple could be accessed by the audit. For each B-channel "use" field in the D-channel rIDPB tuple which is marked to indicate ODB is in use on the respective B-channel (b1use and/or b2use = DMODB_USE) there should exist a corresponding ODB B-channel rIDPB tuple.
Possible Error Effect:	If the B-channel is assigned the ODB feature, then ODB calls can never be originated on this B-channel.
Corrective Action Taken:	The B-channel management data in the associated D-channel rIDPB tuple which corresponds to the B-channel under audit will be recovered to an idle state (b1use or b2use set to DMIDDLE_USE and b1pty_resv or b2pty_resv set to 0 depending on which B-channel was marked as using ODB).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the D-channel rIDPB tuple for the DSL.
<i>Bad Data</i> =	Informational: The b1use field in the D-channel rIDPB tuple.
<i>Good Data</i> =	Informational: The b2use field in the D-channel rIDPB tuple.
<i>Logical Index</i> =	The key of the D-channel rIDPB tuple (port)
<i>Dump</i> =	The D-channel rIDPB tuple.

Table 49 Error Code: PTSB_LINK

Error Code:	PTSB_LINK
Error Description:	The routine port conditioning table indicates that a call path should be up (TMportcond[rIORTLA.list where rIORTLA.port = rIDPB.port].ispathup =

	TMPCYES) but the rIDPB tuple is not linked to an rIPTSB tuple (rIDPB.islu_ptsb = 0 and rIDPB.psiu_ptsb = 0) and no process owns the port (rIORTLA.proc_cplr.st_headk = 0 where rIORTLA.port = rIDPB.port). The rIDPB tuple should be linked to an rIPTSB tuple if the routine port conditioning table indicates a path should be up for a given port list except if the port is owned by a process.
Possible Error Effect:	The time slots associated with the rIPTSB tuple will be lost to the system, thus reducing the total number of available time slots.
Corrective Action Taken:	The rIDPB tuple is recovered to an idle state, and the rIORTLA tuple is placed on the to-be-idled list (rIORTLA.list = TMLTTBI), and the terminal maintenance unloader is awakened to process the rIORTLA tuple so that it is eventually set to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The list the port associated with the RLDPB is on (rIORTLA.list where rIORTLA.port = rIDPB.port).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key (rIDPB.port) of the rIDPB tuple.
<i>Dump 1 =</i>	The contents of the rIDPB tuple.
<i>Dump 2 =</i>	The contents of the associated rIORTLA tuple.

Table 50 Error Code: QUAR_INV

Error Code:	QUAR_INV
Error Description:	The port is not on a recovery list, so the quarantine state should not be in a race condition, but it is.
Possible Error Effect:	Lost resources since this port is out-of-service.
Corrective Action Taken:	The rIDPB tuple is quarantined so it can be recovered by audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The quarantine state (rIDPB.quarstat).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDPB tuple's key, port field.
<i>Dump =</i>	NA.

Table 51 Error Code: R_COUNTS

Error Code:	R_COUNTS
Error Description:	The number of TEILA linked to DPB is greater than what user subscribes (specify in DSLEQUIP).
Possible Error Effect:	The error may cause binding and signaling problem.
Corrective Action Taken:	The DSL will be reinitialized and recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	Number of TEILA linked to DPB.
<i>Good Data =</i>	Number of TEILA allowed in DSLEQUIP.
<i>Logical Index =</i>	The rIDPB key - port name.
<i>Dump =</i>	The rIDPB tuple.

Table 52 Error Code: SGNOOD

Error Code:	SGNOOD
Error Description:	Using prigrp field of the rIDPB tuple as the key field of rIPRIGRP tuple, audit tried to read the static rIPRIGRP tuple and failed. Audit must find this static ODD tuple and will continue to take this error until it is inserted by office personnel. Look at the manual action required field below as to how to insert the tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	The pri_type field of the rIDPB tuple will be reset to its null value (TMNULL TYPE) and audit will retun.
Manual Action Required:	Find out the value of the prigrp field from the dump of the rIDPB tuple. Use it as

	the key field insert the static rIPRGRP tuple. As for the other fields of the tuple, refer to the terminal maintenance and trigger area.
Dump Description:	
<i>Error Address</i> =	The pri_type field of the rIDPB tuple.
<i>Bad Data</i> =	The prigrp field of the rIDPB tuple.
<i>Good Data</i> =	The interf_id field of the rIDPB tuple.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 53 Error Code: TEDBFLAG

Error Code:	TEDBFLAG
Error Description:	The tedb_flag attribute in the DPB tuple is incorrectly set.
Possible Error Effect:	An incorrect linkage may exist between the DPB and either a TEDB tuple or a DALB tuple. This may effect call processing.
Corrective Action Taken:	The tedb_flag will be correctly set according to the servclass found at FC_PORTTYPE. If it is ISDN or ISDN attendant DSL, then tedb_flag will be set to DBYES. If it is an EOC/TMC port, then the tedb_flag is set to DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Valid values are: 0 = If the tedb_flag should be set to DBYES. 1 = If the tedb_flag should be set to DBNO.
<i>Good Data</i> =	Valid values are: 0 = If not ISDN and ISDN attendant or if EOC/TMC port. 1 = If it is ISDN or ISDN attendant.
<i>Logical Index</i> =	The rIDPB key (rIDPB.port).
<i>Dump</i> =	RLDPB.

Table 54 Error Code: TEDBLINK

Error Code:	TEDBLINK
Error Description:	An invalid linkage is found between the rIDPB tuple and a rTEDB tuple.
Possible Error Effect:	Switch cannot communicate with customer premise equipment. EOC/TMC port on IDCUI TR303 have lost communication with the switch.
Corrective Action Taken:	Port will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Linkage value from rIDPB tuple to rTEDB (rIDPB.tedb_own.st_headk).
<i>Good Data</i> =	0. There should not be a linkage between the tuples.
<i>Logical Index</i> =	The rIDPB key.
<i>Dump</i> =	The contents of rIDPB tuple.

Table 55 Error Code: TEIBAD

Error Code:	TEIBAD
Error Description:	The fixed terminal endpoint identifier (FTEI) flag indicator in the rIDPB tuple is incorrect. It does not match the same indicator in the corresponding rIDSLEQUIP tuple. This flag is used by call processing to determine if there is a FTEI resource on this digital subscriber line (DSL).
Possible Error Effect:	FTEI resources on this DSL may not function correctly on this DSL.
Corrective Action Taken:	The flag indicator (pfitei) is recovered to the value specified in the corresponding rIDSLEQUIP flag.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.

<i>Bad Data</i> =	The value of pfixtei in the rIDPB before correction.
<i>Good Data</i> =	The value of pfixtei in the corresponding rIDSLEQUIP tuple.
<i>Logical Index</i> =	The rIDPB key.
<i>Dump 1</i> =	The contents of rIDPB tuple.
<i>Dump 2</i> =	The contents of rIDSLEQUIP tuple.

Table 56 Error Code: TEILALINK

Error Code:	TEILALINK
Error Description:	For non-ISDN line. TEILA should not link to DPB.
Possible Error Effect:	Service cannot be received from this port.
Corrective Action Taken:	The port will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The port which TEILA links to.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 57 Error Code: TPWAIT

Error Code:	TPWAIT
Error Description:	The tpwait field associated with this DPB is not set correctly according to data in the PORTLA.
Possible Error Effect:	"tpwait" should be on for EOC/TMC ports plus X.75, X.75\, and IP trunks when ISPA terminal process (TP) is waiting for a level 2 setup message and off for all others.
Corrective Action Taken:	The tpwait field will be updated according to the information present in the PORTLA if this is the only error detected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the dpb tuple.
<i>Bad Data</i> =	Value of "tpwait" field in the DPB.
<i>Good Data</i> =	"tpwait" value determined from PORTLA.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	The DPB tuple.
<i>Dump 2</i> =	The PORTLA tuple.

Table 58 Error Code: TWOLINKS

Error Code:	TWOLINKS
Error Description:	A broken linkage is found when traversing the rTEILA tuple through this rIDPB tuple. A broken linkage to rRTEILA tuple is found on an IDCU TR303 EOC/TMC port.
Possible Error Effect:	Application codes may assert and some of CPEs may not receive any service.
Corrective Action Taken:	The DSL will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 59 Error Code: TYPE

Error Code:	TYPE
Error Description:	The PH channel type stored in the DPB does not agree with that which was computed from the ODD.
Possible Error Effect:	The PORT could be OOS.
Corrective Action Taken:	The "phctyp" field is updated in the DPB to agree with the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the DPB tuple.

<i>Bad Data</i> =	Value of the "phctyp" field in the DPB.
<i>Good Data</i> =	Value of "phctyp" computer from the ODD.
<i>Logical Index</i> =	Port name.
<i>Dump</i> =	The rIDPB tuple.

Table 60 Error Code: UNEQUAL

Error Code:	UNEQUAL
Error Description:	rIDPB.agi1_bchan and rIDPB.agi2_bchan are equal. This means that both groups are using the same B-channel, which is not allowed.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	None.
Manual Action Required:	Check assignment of associated groups and MLHGs on RC/V Views 23.2 (DIGITAL SUBSCRIBER LINE) and 23.3 (ASSOCIATED GROUP). Check for overlapping groups, and MLHGs which occur in both groups.
Dump Description:	
<i>Error Address</i> =	Address of the rIDPB tuple.
<i>Bad Data</i> =	rIDPB.agi1_bchan
<i>Good Data</i> =	rIDPB.agi2_bchan
<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump</i> =	The rIDPB tuple.

Table 61 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	All rIDPB tuples for EOC/TMC ports on an IDCUC TR303 should have a linkage to an rIRTEILA tuple.
Possible Error Effect:	Message flow between the SM and IDCUC RT303 is interrupted.
Corrective Action Taken:	EOC/TMC port is recovered and communication restarted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump</i> =	The contents of the rIDPB tuple.

DPB-B

Software Release: 5E12 only

1. D-CHANNEL PROTOCOL BLOCK (DPB) AUDIT

The D-channel application linkage block (DALB) and the D-channel protocol block (DPB) are used to handle communications between the integrated services digital network (ISDN) periphery and the processes that control the ISDN ports. The DPB corresponds to the D-channel port, or the permanent packet of the channel, and has one DALB linked to it for each process that needs to communicate with the ISDN customer premises equipment (CPE). Most (but not all) of these processes control B-port served by the D-port.

For the integrated digital carrier unit (IDCU) the rIDPB tuple is used to represent the embedded operation channel (EOC) and the timeslot management channel (TMC) channels. A shared linkage is used to link these rIDPB tuples to the IDCU remote terminal linkage block (rIRTLB) instead of a rIDALB linkage and to the remote terminal identifier linkage area (rIRTEILA) instead of the rTEILA tuple.

In addition to the DALB linkages, the DPB contains pointers to the path through the switch network that connects the D-channel line card (T-card or U-card) or the inter-switch packet trunk to the protocol handler (PH), and the information required to control the handshaking and data transmission over the D-channel to the ISDN CPE.

2. DATA STRUCTURES

DPB is used for all ISDN applications which connect a port to a PH. Examples of PH ports are:

- Digital subscriber line (DSL) D-channel.
- DSL B-channel for packet switching.
- Interswitch packet trunk.
- Inter-switching module (SM) port.
- Data link terminal (DLT) port.
- Extended digital subscriber line (EDSL) D-channel.
- DSL B-channel for on-demand packet switching.
- Integrated digital carrier unit (IDCU) EOC/TMC channels.
- CDMA packet pipe trunk.
- CDMA speech handler (PHV) trunk.

The RLDPB, an indexed relation in the switching modules (SMs), contains the D-channel port name and peripheral interface data bus (PIDB) time slot block keys for the integrated services line unit (ISLU) and packet switching units (PSUs). The audit also uses the D-channel application linkage block relation (RLDALB), the PIDB time slot block relation (RLPTSB), the port type relation (RLPORTTYP), the digital subscriber line (SDL) equipage relation (RLDSLEQUIP), and the port linkage area relation (RLPORTLA).

For an ISDN or ISDN attendant D-channel DPB, services subscribed by the users (represented by TEDB) are initialized and linked to the DPB during full initialization.

When the CPE is plugged in and terminal end point identifier (TEI) is generated, the TEI linkage area (TEILA) is linked to the DPB.

This only applies to ISDN or ISDN ATTENDANT D-channels. The other channels, such as operator services position system (OSPS), CDMA, EDSL or PRI, have no TEDB or TEILA linked to the DPB. For non-OSPS PRI ISDN calls or CDMA packet pipe or speech handler trunks, no DALB is linked to the DPB. Please refer to the data diagrams for the DPB and related data structure. Refer to Figure 1 and Figure 2.

3. AUDIT CHECKS

- (a) The audit first verifies that the DPB belongs to a valid D-channel or packet B-channel.
- (b) The audit verifies that the key in DPB is correct.
- (c) The audit verifies that all linkages between the DALB and the DPB are correct. This linkage will be null when the rDALB tuple is involved with primary rate interface (PRI) calls for a non-facility associated signaling (NFAS) and D-channel back up (DCBU) features excluding OSPS PRI calls.
- (d) The audit verifies that all linkages between the DPB and the following are correct:
 - Terminal equipment data block (TEDB).
 - Remote terminal linkage block (rIRTLB).
 - Remote terminal endpoint identifier linkage area (rIRTEILA).
 - TEI linkage area (TEILA).
 - Peripheral interface data bus time slot backs (PTSBs).
- (e) The audit verifies that data transmission rates and protocol data in the DPB are correct.
- (f) If channel is being monitored for protocol transmission, the audit verifies that the protocol monitor job tables are consistent each other.
- (g) The audit verifies that B-channels management data stored in the PDB is consistent with the corresponding B-channel status in PORTLA and B-channel configuration in rIDSLEQUIP.
- (h) The audit verifies the path between the DPB and the PTSB is set per the routine port condition table.
- (i) For CDMA packet pipe trunks, the audit verifies that the number of PTSB's that should be associated with the packet pipe (according to the count in rIPP_MEM) are all there.
- (j) For ISDN or ISDN attendant lines, the D-channel DPB should link to the terminal equipment data block (TEDB). Other channels such as OSPS, extended digital subscriber lines (EDSLs) should not have linkages to TEDBs.
- (k) The audit verifies the number of TEILAs linked to DPB is the same as the specified in the DPB and is not greater than the maximum number configured in the rIDSLEQUIP.
- (l) The audit verifies that the basic rate interface (BRI) class and binding data stored in the DPB is derived from the corresponding rIDSLEQUIP tuple.
- (m) The audit provides existence checks on B-channel DPBs used for on demand B-channel package services (ODB). The audit also verifies the consistency of B-channel management data related to ODB.
- (n) The audit verifies the associated group information (rIDPB.agi1_bchan and rIDPB.agi2_bchan).
- (o) The audit verifies all the fields related to the NFAS/DCBU features for PRI calls, namely, interf_id, prigrp,

pri_type and srwait.

4. ERROR HANDLING

If any errors are detected in a DPB tuple, the audit determines if a process currently owns the D-channel. If a process is found, the audit recovers the data by requesting a single process purge of the owning process.

If the DPB does not have a living process, the audit reinitializes the protocol and data rate information. The audit attempts to preserve the DALB, TEDB, and TEILA lists and the physical path through the PTSB's, since changes to either of these could result in lost data. The audit recovers these linkages if they do not pass the point to point back checks. (NON-ODB calls only. For ODB calls, the tuple and all linkages are idled.)

During recovery the rIDPB field is cleared to DBNO.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: ACCPTR

Error Code:	ACCPTR
Error Description:	The ODB B-channel rIDPB tuple corresponding to a given rIORTLA tuple associated with the B-channel's port could not be accessed by the audit. For every rIORTLA tuple associated with an ODB B-channel port there should exist a corresponding B-channel rIDPB tuple where rIORTLA.port = rIDPB.port.
Possible Error Effect:	ODB calls cannot be set up on one of the B-channels for this DSL.
Corrective Action Taken:	The B-channel management data in the D-channel rIDPB tuple is idled out to indicate that no ODB calls are up on the B-channel (b1use or b2use marked to DMIDDLE_USE and b1pty_resb or b2pty_resv marked to 0 depending on which B-channel was using ODB).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIORTLA tuple for the B-channel's port.
<i>Bad Data =</i>	The logical key of the D-channel rIDPB tuple (port).
<i>Good Data =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Logical Index =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Dump 1 =</i>	The rIORTLA tuple for the B-channel's port.
<i>Dump 2 =</i>	The rIDPB tuple for the D-channel.

Table 2 Error Code: ASSOC_PTSB

Error Code:	ASSOC_PTSB
Error Description:	For ADT and non-CDMA calls, the owner linkage field to the rIPTSB tuple dppto must be null, as non-CDMA PTSBs are linked through the semantic linkages, islu_ptsb and psiu_ptsb and ADT trunks have no associations with rIPTSB's. The DPB audit found this field to be non null.
Possible Error Effect:	Possible failure of ADT, IDCUs and other non-CDMA calls.
Corrective Action Taken:	The dppto linkage is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The st_headk field of the dppto field of the rIDPB tuple.
<i>Bad Data =</i>	The st_tailk field of the dppto field of the rIDPB tuple.
<i>Good Data =</i>	The phctyp field of the rIDPB tuple.
<i>Logical Index =</i>	The port field, key, of the rIDPB tuple.
<i>Dump =</i>	The rIDPB tuple being audited.

Table 3 Error Code: ASSOC_TUP

Error Code:	ASSOC_TUP

Error Description:	The corresponding rIODPSOP static tuple for a given ODB DSL and party could not be accessed. For every D-channel rIDPB tuple where the B-channel management data indicates ODB is in use on the DSL (rIDPB.b1use or b2use = DMODB_USE) there should exist a corresponding rIODPSOP static tuple where (key) rIDPB.port = (key) rIODPSOP.port and (key) rIODPSOP.party = (rIDPB.X >> rIODPSOP.party & (DMUCHAR)1) where X = b1pty_resv or b2pty_resv in the D-channel rIDPB tuple.
Possible Error Effect:	An unauthorized subscriber may be using the ODB feature.
Corrective Action Taken:	The B-channel port is quarantined (rIORTLA.quarstate set to AUAUSET) and the B-channel management data in the associated D-channel rIDPB tuple is recovered to an idle state (b1use or b2use marked DMIDLE_USE and b1pty_resv or b2pty_resv marked to 0 depending on which B-channel was using ODB).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIORTLA tuple for the B-channel's port.
<i>Bad Data =</i>	The logical key of the D-channel rIDPB tuple (port).
<i>Good Data =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Logical Index =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Dump 1 =</i>	The rIORTLA tuple for the B-channel's port.
<i>Dump 2 =</i>	The rIDPB tuple for the D-channel.

Table 4 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	Either the blkcall, pktcampon or the srwait field of the rIDPB tuple is set but the D-channel port is not owned as indicated by the state of the rIORTLA tuple of this non-FRBC port (DBPSIDLE), or the port is an FRBC trunk and both the SVC jobid and the SVC job's process ID are null.
Possible Error Effect:	Possible error effects are: • If the blkcall field is set, then one can not originate or terminate to this DSL as the call is blocked. • If the pktcampon field is set, the D port indicates it is camped on when it is not. • If the srwait field is set, the D port will time out waiting for SERV and SERV ACK messages.
Corrective Action Taken:	Audit will force the recovery of the rIDPB tuple being audited.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The blkcall field of the rIDPB tuple.
<i>Bad Data =</i>	The pktcampon field and the srwait field of the rIDPB tuple (rIDPB.pktcampon rIDPB.srwait).
<i>Good Data =</i>	The logical port type (rIFC_PORTTYP.lp_type).
<i>Logical Index =</i>	The port field, key, of the rIDPB tuple.
<i>Dump 1 =</i>	The rIDPB tuple being audited.
<i>Dump 2 =</i>	The rIORTLA tuple involved.

Table 5 Error Code: BADPTSB

Error Code:	BADPTSB
Error Description:	One of the PTSB's pointed to by the D-channel protocol block did not point back to the D-channel.
Possible Error Effect:	Potential for breaking the D-channel signaling path.
Corrective Action Taken:	PTSB pointers are cleared. Process owning DPB is purged if any. D-port is turned over to terminal maintenance for recovery.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	The key of the rIPTSB tuple that should have been linked to the rIDBP tuple under audit.
<i>Bad Data</i> =	PTSB number.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	PORT number of D-port.
<i>Dump 1</i> =	The rIDPB tuple.
<i>Dump 2</i> =	The rIPTSB tuple.

Table 6 Error Code: BADIDLE2

Error Code:	BADIDLE2
Error Description:	B2-channel usage field is not consistent with DSLEQUIP.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	B2-channel usage field is reset to initialized value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The error code sequence number: 1 = Should be DMNO_SERV. 2 = Should be DMPPB_USE. 3 = Should be DMIDLE_USE.
<i>Good Data</i> =	B2-channel usage in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 7 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The pri_type field of the rIDPB tuple did not match the same field from the static rIPRIGRP tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	The pri_type field of the rIDPB will be corrected with the value found in the same field of the static rIPRIGRP tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The prigrp field of the rIDPB tuple.
<i>Bad Data</i> =	The pri_type field of the rIDPB tuple.
<i>Good Data</i> =	The pri_type field of the rIPRIGRP tuple.
<i>Logical Index</i> =	The port field, key, of the rIDPB tuple.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 8 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	B-channel management data in DPB is not correct. Either B-channel usage is wrong or party reservation bits are not correctly set.
Possible Error Effect:	B-channel could be blocked for call processing.
Corrective Action Taken:	B-channel data are reinitialized correctly per DSLEQUIP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The error indicator. 1 = B-channel is configured as NO_SERV, but B-channel management data is not set to initialized value. 2 = B-channel is configured as X_25, but B-channel management data is not set to DMPB_USE or party reservations are not zero. 3 = B-channel is used for default service or operator use but party reservation

	is not zero or no TEDB is linked to DPB. 4 = B-channel is used for TM-USE but party reservation is not zero. 5 = B-channel is used for CSV, CSD or ODB use, but party reservation is not set or no TEDB is linked to PDB. 6 = B-channel is used for CSV, CSD or ODB use, but party reservation bit is not consistent with PCBLA (process). 7 = If B-channel is owned by process, B-channel usage should not be IDLE_USE, VRSV-USE, PPB_USE or NO_SERV. 8 = If B-channel is not owned by process and usage field is indicated as IDLE-USE, then party reservation bit should not be set. 9 = When B-channel is not owned by process but used by shared DN (usage field is DMVRSV_USE), party reservation bits should not be zero and TEDB, DALB should link to DPB. 10 = The B-channel usage field is not defined in the system.
<i>Good Data</i> =	Valid values are: 1 = B1 channel has problem. 2 = B2 channel has problem.
<i>Logical Index</i> =	PORT number of D-port.
<i>Dump</i> =	rIDPB tuple.

Table 9 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	The value in rIPP_MEM.num_mem indicates that a certain number of rIPTSB tuples should be linked to this rIDPB when it is stable the number of tuples is wrong.
Possible Error Effect:	This packet pipe is not correctly set up for CDMA calls and will cause a loss of data.
Corrective Action Taken:	Audits will force recovery of the rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The PH channel type of the port (rIDPB.phctyp).
<i>Bad Data</i> =	The number of rIPTSB tuples that are currently linked (local cnt).
<i>Good Data</i> =	The number of rIPTSB tuples that should be linked (rIPP_MEM.num_mem).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump 1</i> =	The contents of the rIDPB tuple.
<i>Dump 2</i> =	The contents of the rIPP_MEM tuple.
<i>Dump 3</i> =	The contents of the rIFC_PORTTYP tuple.

Table 10 Error Code: BINDERR

Error Code:	BINDERR
Error Description:	The binding related data such as blport_set are not set correctly in DPB.
Possible Error Effect:	This DSL may have signaling and binding problems.
Corrective Action Taken:	blport_set in DPB is correctly set to be consistent with DSLEQUIP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	blport_set in DPB.
<i>Good Data</i> =	bind_lport in DSLEQUIP. (if bind_lport in DSLEQUIP is not zero, then blport_set in DPB should be set to DBYES).

<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 11 Error Code: BIT1MAP

Error Code:	BIT1MAP
Error Description:	The audible alert party bits should not be set when DSL is idle.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The audible alert party bits will be reset to zero.
Manual Action Required:	NA.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The audible party in DPB.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 12 Error Code: BLINK

Error Code:	BLINK
Error Description:	There should be no linkage between a B-channel rIDPB tuple used for the ODB feature and TEDB, and the B-channel rIDPB tuple's tedb_flag should be DBNO. Either one or both of these conditions was found to be in error.
Possible Error Effect:	The B-channel rIDPB tuple, and related data are in an invalid state resulting in wasted resources.
Corrective Action Taken:	The B-channel rIDPB tuple, and related ODB call processing data are recovered to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the B-DPB.
<i>Bad Data</i> =	The tedb_link flag.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the B-DPB tuple.
<i>Dump</i> =	The B-channel rIDPB (which will contain the status of the linkage to the TEDB).

Table 13 Error Code: BOTHCHAN

Error Code:	BOTHCHAN
Error Description:	An associated group (rIDPB.agi1_bchan or rIDPB.agi2_bchan) is using both B-channels, when only one is allowed. Terminals identified in a group by the bit map rIDSLEQUIP.agipty# coincide with both B-channels identified in bit maps rIDPB.b1pty_resv and rIDPB.b2pty_resv.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	None.
Manual Action Required:	Check assignment of associated groups and multi-line hunt groups (MLHG) on RC/V Views 23.2 (DIGITAL SUBSCRIBER LINE) and 23.3 (ASSOCIATED GROUP). Check for overlapping groups, and MLHGs which occur in both groups.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	rIDPB.agi1_bchan.
<i>Good Data</i> =	rIDPB.agi2_bchan.
<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump 1</i> =	rIDPB tuple.
<i>Dump 2</i> =	rIDSLEQUIP tuple.

Table 14 Error Code: CHAN_ZERO

Error Code:	CHAN_ZERO
Error Description:	B-channel management data are not set to initialized value for non-ISDN line.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	B-channel management data are reset to initialized value.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 15 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The number of TEILA linked to DPB is not equal to those specified in DPB(<i>tot_terms</i> field).
Possible Error Effect:	The error may cause binding and signaling problem.
Corrective Action Taken:	<i>tot_terms</i> field in DPB is reset to correct number.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	<i>tot_terms</i> in DPB.
<i>Good Data</i> =	The actual TEILA linked to DPB.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 16 Error Code: DBCHAN

Error Code:	DBCHAN
Error Description:	B1-channel usage field is not consistent with DSLEQUIP.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	B1-channel usage field is reset to initialized value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The error code sequence number: 1 = Should be DMNO_SERV. 2 = Should be DMPPB_USE. 3 = Should be DMIDLE_USE.
<i>Good Data</i> =	B1-channel usage in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 17 Error Code: DEADPID

Error Code:	DEADPID
Error Description:	There is a non-null call activity check process ID, but the process no longer exists.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The call activity check process ID is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The PH channel type of the rIDPB tuple (<i>rIDPB.phctype</i>).
<i>Bad Data</i> =	The process number of the call activity check pid (<i>rIDPB.cac_pid.procno</i>).
<i>Good Data</i> =	The uniqueness of the call activity check pid (<i>rIDPB.cac_pid.uniq</i>).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 18 Error Code: DPB_LINK

Error Code:	DPB_LINK
Error Description:	An invalid linkage is found between a B-channel rIDPB tuple used for the ODB feature and an rIPTSB tuple.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	The ODB call will be torn down and related data recovered to an idle condition.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The invalid linkage between the B-channel DPB and the PTSB.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	DPB key.
<i>Dump 1</i> =	The rIDPB tuple.
<i>Dump 2</i> =	The rIPTSB tuple.

Table 19 Error Code: DSL_RATE

Error Code:	DSL_RATE
Error Description:	Data rate in DPB differs from ODD data rate.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	Process owning DPB is purged if any D-port is turned over to terminal maintenance for recovery.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data rate found in DPB.
<i>Good Data</i> =	Data rate according to ODD.
<i>Logical Index</i> =	Port number of D-port.
<i>Dump</i> =	NA.

Table 20 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	The logical PH number and physical PH channel data in a B-channel rIDPB tuple used for ODB did not match the data contained in the corresponding rIODPSOP static tuple. For B-channel rIDPB tuples used for ODB calls, the ph_number and ph_cn attributes must be represented in rIODPSOP.ph_number and rIODPSOP.ph_cn or ph_cn2 where, for the associated D-channel, (key) rIDPB.port = (key) rIODPSOP.port and (key) rIODPSOP.party = (rIDPB.X >> rIODPSOP.party & (DMUCHAR)1) where X = b1pty_resv or b2pty_resv in the D-channel rIDPB tuple associated with the B-channel rIDPB tuple under audit.
Possible Error Effect:	An unauthorized subscriber may be using the ODB feature.
Corrective Action Taken:	The ODB call process is purged and the ODB call owning the B-channel is torn down.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the B-channel rIDPB tuple under audit.
<i>Bad Data</i> =	The PH number the rIDPB tuple (ph_number)
<i>Good Data</i> =	The PH number found in the rIODPSOP static tuple (ph_number)
<i>Logical Index</i> =	The key of the rIDPB tuple under audit (port)
<i>Dump 1</i> =	The B-channel rIDPB tuple under audit.
<i>Dump 2</i> =	The associated D-channel rIDPB tuple for the DSL.
<i>Dump 3</i> =	The associated rIODPSOP static tuple.

Table 21 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The audit has detected an rIDPB dynamic tuple without a corresponding static tuple where: - the DPB does not have the static rIDSLEQUIP tuple with rIDPB.port = rIDSLEQUIP.dsl or - there is no user subscribed to the on-demand-packet feature with rIDPB.port = rIODPSOP.port
Possible Error Effect:	If call processing or terminal maintenance attempts to access the unassigned resources represented by this tuple, operations may be disrupted.
Corrective Action Taken:	Tuple is deleted.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	Address of the tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key value.
<i>Dump</i> =	The rIDPB tuple.

Table 22 Error Code: GPORT

Error Code:	GPORT
Error Description:	The specified B-channel port is not populated or key or B-channel PORTLA is wrong.
Possible Error Effect:	Application code may assert when accessing the data and B-channel cannot be used.
Corrective Action Taken:	PORTLA or FCPORTTYPE audit will be scheduled as related audit to detect this error and correct it.
Manual Action Required:	If FC_PORTTYPE is missing, then manual action is required to insert the B-channel FC_PORTTYPE tuple. (Look good data in the dump.)
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The key of B-PORTLA in the system (maybe 0xffff).
<i>Good Data</i> =	The key of B-PORTLA which should be in the system.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 23 Error Code: GRPINFO

Error Code:	GRPINFO
Error Description:	Based on the bit maps rIDSLEQUIP.agipty1 and rIDPB.b#pty_resv the associated group information rIDPB.agi1_bchan is set to the incorrect value. The range of values is FCNO_BCHAN, FCB1_CHAN, and FCB2_CHAN.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	rIDPB.agi1_bchan is set to the correct value listed below.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	rIDPB.agi1_bchan.
<i>Good Data</i> =	Correct value of rIDPB.agi1_bchan.
<i>Logical Index</i> =	The rIDPB key (rIDPB.port).
<i>Dump</i> =	The rIDPB tuple.

Table 24 Error Code: GRP2INFO

Error Code:	GRP2INFO
Error Description:	Based on the bit maps rIDSLEQUIP.agipty2 and rIDPB.b#pty_resv the associated group information rIDPB.agi2_bchan is set to the incorrect value. The range of values is FCNO_BCHAN, FCB1_CHAN, and FCB2_CHAN.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	rIDPB.agi2_bchan is set to the correct value listed below.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	rIDPB.agi2_bchan.
<i>Good Data</i> =	Correct value of rIDPB.agi2_bchan.
<i>Logical Index</i> =	The rIDPB key (rIDPB.port).
<i>Dump</i> =	The rIDPB tuple.

Table 25 Error Code: IL_PTYE

Error Code:	IL_PTYE
Error Description:	The lp_type in rIFC_PORTTYP does not indicate that the port B-channel rIDPB is associated with a B-channel port.
Possible Error Effect:	Wasted resources since this tuple cannot be used for anything.
Corrective Action Taken:	The B-channel rIDPB tuple and related data, if any, will be recovered to an idle condition.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The lp_type in rIFCPORTTYP.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the DPB tuple.
<i>Dump</i> =	The DPB tuple.

Table 26 Error Code: IDLE_LINKED

Error Code:	IDLE_LINKED
Error Description:	EOC/TMC ports on an IDCU TR303 have a invalid link between the rIDPB and the rRTLb tuple.
Possible Error Effect:	Tasks for this RT may be lost and not completed.
Corrective Action Taken:	The EOC/TMC port will be recovered and the link restarted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump</i> =	The contents of the rIDPB tuple.

Table 27 Error Code: INV

Error Code:	INV
Error Description:	Either the interf_id or the prigrp field of the rIDPB tuple did not match the same field from the static rIDCHNPRI tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	Both the interf_id and the prigrp fields of the rIDPB tuple will be corrected with the values found in the same fields of the static rIDCHNPRI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The interf_id field of the rIDPB tuple.
<i>Bad Data</i> =	The prigrp field of the rIDCHNPRI tuple.
<i>Good Data</i> =	The interf_id field of the rIDCHNPRI tuple.
<i>Logical Index</i> =	The prigrp field of the rIDPB tuple.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 28 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	BRI class of service in DPB is not consistent with DSLEQUIP.
Possible Error Effect:	This DSL may have signaling and binding problems.
Corrective Action Taken:	briclass in DPB is correctly set to be consistent with DSLEQUIP and the port is put on the to be idled list (TMLTTBI) to be reinitialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	briclass in DPB.
<i>Good Data</i> =	briclass in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 29 Error Code: INVOWNER

Error Code:	INVOWNER
Error Description:	The default service TEDB should link to the DSL which has subscribed default service feature but it links to other DSL.
Possible Error Effect:	No default service is provided in this DSL.
Corrective Action Taken:	The DSL will be recovered and all the TEDBs will be reinitialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The DSL which TEDB links to.
<i>Good Data</i> =	The DSL which TEDB should link to.

<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 30 Error Code: INVUSAGE

Error Code:	INVUSAGE
Error Description:	Non-FRBC trunks must have a null SVC job identifier and null SVC job process ID this trunk has a non-null SVC attribute.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The SVC job identifier and SVC job process ID is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The logical port type of the rIDPB tuple (rIFC_PORTTYP.lp_type).
<i>Bad Data</i> =	The SVC job identifier of the rIDPB tuple (rIDPB.svcjob_id).
<i>Good Data</i> =	The SVC job process ID of the rIDPB tuple (rIDPB.svcjob_pid).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 31 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	The audit received an unrecognized or invalid return from TMdppbprt().
Possible Error Effect:	The rIDPB tuple cannot be audited.
Corrective Action Taken:	The audit skips the rIDPB tuple since it cannot access any related data required for auditing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIFC_PORTTYP static tuple passed to TMdppbprt().
<i>Bad Data</i> =	The return received from TMdppbprt().
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The rIFC_PORTTYP static tuple.

Table 32 Error Code: L2MON

Error Code:	L2MON
Error Description:	The port is requested to be monitored for protocol but the data used is inconsistent.
Possible Error Effect:	Switch may waste resources to monitor the unrequested port.
Corrective Action Taken:	The port is marked as not being monitored.
Manual Action Required:	NA.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The pmon field in DPB.
<i>Good Data</i> =	DBNO(0).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 33 Error Code: LEVEL_1

Error Code:	LEVEL_1
Error Description:	Level two profile in the ODD does not match profile in the DPB.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	Process owning DPB is purged if any D-port is turned over to terminal maintenance for recovery.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Level 2 profile found in DPB.
<i>Good Data</i> =	Level 2 profile according to ODD.
<i>Logical Index</i> =	Port number of D-port.
<i>Dump</i> =	NA.

Table 34 Error Code: LEVEL_3

Error Code:	LEVEL_3

Error Description:	The level three state in the DPB did not match the level three state derived from the circuit type information in the PORTTYP and DSLEQUIP tuple.
Possible Error Effect:	Potential for breaking the D-channel signaling path.
Corrective Action Taken:	Level three state is updated to match the static ODD data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Level three state from the DPB.
<i>Good Data</i> =	Level three state derived from the ODD.
<i>Logical Index</i> =	PORT number of D-port.
<i>Dump</i> =	DPB is dumped.

Table 35 Error Code: MISSTUP

Error Code:	MISSTUP
Error Description:	DSL should have default service feature but there is no default service TEDB linked to DPB or TEDB key is wrong.
Possible Error Effect:	No default service is provided in this DSL.
Corrective Action Taken:	Print the error and request related audits to insert TEDB or correct the TEDB errors.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The TEDB key in the system.
<i>Good Data</i> =	The TEDB key which should be.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 36 Error Code: NONNULL

Error Code:	NONNULL
Error Description:	The servclass and lp_type fields of the static rIFC_PORTTYPE tuple indicates that this D channel is not used for NFAS and DCBU PRI D channel(AUportbuf.servclass not != FCEDSL and AUportbuf.lp_type != PCTDCHAN). And yet audit found that one of the three fields related to NFAS and DCBU D channel, namely, interf_id, prigrp, and pri_type has a non null value.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	All the three fields will be set to the null value (interf_id->PSNO_INTID, prigrp->TMNULLPRI and pri_type->TMNULL_TYPE).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The interf_id field of the rIDPB tuple.
<i>Bad Data</i> =	The prigrp field of the rIDPB tuple.
<i>Good Data</i> =	The pri_type field of the rIDPB tuple.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 37 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	For an NFAS/DCBU PRI calls, the linkage field to the rIDALB tuple dpdao must be null as no DALBs used in such type of PRI calls is linked to DPBs. Audit found this field to be non null.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	Audit will force recovery of this rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The st_headk field of the dpdao field of the rIDPB tuple.
<i>Bad Data</i> =	The st_tailk field of the dpdao field of the rIDPB tuple.
<i>Good Data</i> =	The prigrp field of the rIDPB tuple.
<i>Logical Index</i> =	The port field, key, of the rIDPB tuple.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 38 Error Code: NOACCBK

Error Code:	NOACCBK
Error Description:	For FRBC calls, when either the SVC job ID or the SVC job PID is non-null, future SVC calls must be blocked. If the block-call bit is set to 0 (DBNO), calls are not blocked.
Possible Error Effect:	SVC calls are attempted and fail later.
Corrective Action Taken:	Audit will set the block-call bit to 1 (DBYES).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The SVC job identifier (rIDPB.svcjob_id).
<i>Bad Data =</i>	The SVC job process identifier (rIDPB.svcjob_pid.procno).
<i>Good Data =</i>	The SVC job process ID's unique bit (rIDPB.svcjob_pid.uniq).
<i>Logical Index =</i>	The port field, key, of the rIDPB tuple.
<i>Dump =</i>	The rIDPB tuple being audited.

Table 39 Error Code: NOPCBLA

Error Code:	NOPCBLA
Error Description:	While looking for a process on the port associated with the rIDPB tuple during selective initialization, the DA function call returned an error saying that database corruption exists. The audit error report dumps rPORTLA because that is what it has access to.
Possible Error Effect:	The port would normally be taken down unless a barge-in call pickup process exists for this port. Since database error was returned, the port will be taken down.
Corrective Action Taken:	The tuple is quarantined, so that the audit forces recovery of the rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The pointer to the rPORTLA tuple.
<i>Bad Data =</i>	The value returned from the DA function call.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rPORTLA tuple's key, port field.
<i>Dump =</i>	The rPORTLA tuple being audited.

Table 40 Error Code: NOTIDLE2

Error Code:	NOTIDLE2
Error Description:	A rIDPB tuple not currently used for ODB was found to have its logical PH number (ph_number) and physical channel number (ph_cn) attributes set to invalid values. For D-channel rIDPB tuples, or rIDPB B-channel tuples which are not associated with B-channels used for the ODB feature, the PH and channel attributes are unused and should be set to idle values (PSPHNULL and zero respectively).
Possible Error Effect:	Call processing will never be able to use the associated B-channel for ODB since the PH and channel attributes make it appear that the B-channel already has a PH and channel assigned and in use.
Corrective Action Taken:	The ph_number and ph_cn attributes are recovered to their idle values (PSPHNULL and 0 respectively).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The contents of the ph_number and ph_cn attributes. (rIDPB.ph_number << 4 rIDPB.ph_cn)
<i>Good Data =</i>	The null values for ph_number and ph_cn (PSPHNULL << 4 (DMPHCN) 0).
<i>Logical Index =</i>	The rIDPB tuple's key (port).
<i>Dump =</i>	The rIDPB tuple.

Table 41 Error Code: NULL4LINK

Error Code:	NULL4LINK
Error Description:	The PH channel type indicates that this is a ADT, packet pipe or speech handler trunk so the semantic linkage to the rIPTSB (islu_ptsb or psiu_ptsb) should be

	zero, but instead is non-zero.
Possible Error Effect:	If call processing or terminal maintenance attempts to access the resources represented by this tuple, operations may be disrupted.
Corrective Action Taken:	The semantic linkage to the rIPTSB is nulled out (rIDPB.islu_ptsb and rIDPB.psiu_ptsb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The islu_ptsb field of the rIDPB tuple.
<i>Bad Data =</i>	The psiu_ptsb field of the rIDPB tuple.
<i>Good Data =</i>	The phctyp field of the rIDPB tuple.
<i>Logical Index =</i>	The rIDPB tuple's key, port field.
<i>Dump =</i>	The rIDPB tuple being audited.

Table 42 Error Code: ODDLOSTUP

Error Code:	ODDLOSTUP
Error Description:	The RLPORRTYP relation indicates that the DSL for this port must be equipped, but the rIDSLEQUIP tuple is missing from the static ODD. If the <i>Good Data</i> is 2, the DPB audit was unable to obtain the static relation tuple (rIPP_MEM) needed to audit the dynamic rIDPB tuple for the CDMA packet pipe either there is no packet pipe member tuple with the same port as the DPB or PP_MEM key is wrong.
Possible Error Effect:	If the <i>Good Data</i> is 1, the audit cannot verify any data in the DPB. If it is bad, the audit has no way to fix it. If the <i>Good Data</i> is 2, packet pipe members cannot be located for packet pipe call processing.
Corrective Action Taken:	None.
Manual Action Required:	If the <i>Good Data</i> is 1, the craft will need to use ODBE to put the missing DSLEQUIP tuple back into the ODD, since ODBE does not permit removing the PORTTYP tuple under these circumstances. If the <i>GOOD DATA</i> is 2, the craft will need to use ODBE to put the missing PP_MEM tuple into the ODD. Find out the value of the port.member from the dump of the rIDPB tuple. The port.module will be the processor receiving the audit. Using these as the key, insert the static rIPP_MEM tuple. For the other fields of the tuple, refer to the terminal maintenance and trigger area.
Dump Description:	
<i>Error Address =</i>	If the <i>Good Data</i> is 1, the address of the rIDSLEQUIP tuple. If the <i>Good Data</i> is 2, the address of the rIDPB tuple.
<i>Bad Data =</i>	The logical port type (rIFC_PORTTYP.lp_type).
<i>Good Data =</i>	Valid values are: 1 = Could not read the rIDSLEQUIP tuple. 2 = Could not read the rIPP_MEM tuple.
<i>Logical Index =</i>	The rIDPB key (rIDPB.port).
<i>Dump 1 =</i>	The contents of the rIDPB tuple.
<i>Dump 2 =</i>	The contents of the rIFC_PORTTYP tuple.

Table 43 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	An FRBC trunk has a non-null SVC job identifier, but it is not within the range of valid values for such a field.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The SVC job identifier is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The logical port type of the rIDPB tuple (rIFC_PORTTYP.lp_type).
<i>Bad Data =</i>	The SVC job identifier of the rIDPB tuple (rIDPB.svcjob_id).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDPB key - port name.

<i>Dump</i> =	The rIDPB tuple.

Table 44 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	DPB tuples that are not used by IDCU or certain types of CDMA must be linked to TEDB, DALB, and/or TEILA tuples. This DPB tuple is not correctly linked to one of them. If the <i>Good Data</i> is 1, it is incorrectly linked to TEDB 2, DALB or 3, TEILA.
Possible Error Effect:	Problem in call processing.
Corrective Action Taken:	The rIDPB tuple is quarantined so that the tuple is recovered by audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The linkage, either TEDB, DALB, or TEILA. (Refer to <i>Good Data</i> .)
<i>Good Data</i> =	Valid values are: 1 = The bad linkage is to a TEDB. 2 = The bad linkage is to a DALB. 3 = The bad linkage is to a TEILA.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 45 Error Code: PHCTYPE

Error Code:	PHCTYPE
Error Description:	The PH channel circuit type stored in an rIDPB tuple, which is associated with a B-channel port used for the ODB feature, was found inconsistent from the type derived from the B-channel management data stored in static ODD (rIFC_PORTTYPE).
Possible Error Effect:	The PORT could be OOS.
Corrective Action Taken:	The "phctype" field is updated in the DPB to agree with the B-channel management data stored in static ODD (rIFC_PORTTYP).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the DPB tuple.
<i>Bad Data</i> =	Value of the "phctype" field in the DPB.
<i>Good Data</i> =	Value of "phctyp" computed from the ODD.
<i>Logical Index</i> =	Port name.
<i>Dump</i> =	The DPB tuple.

Table 46 Error Code: PHDSLGP

Error Code:	PHDSLGP
Error Description:	There are currently two ODB calls up on this DSL. However, the logical PH and physical PH channel numbers stored in the rIDPB tuples for each B-channel are identical. When ODB calls are up on each B-channel of a DSL, the ph_number and ph_cn attributes in each ODB B-channel rIDPB tuple must be unique to each other. Since it is physically impossible to set up ODB calls on a DSL under these conditions, this error is an indication that the ph_number and ph_cn attributes in one or both rIDPB tuples became corrupted after both ODB calls were set up on the DSL. The occurrence of this error is an indication that the PH and channel data does not reflect the actual PH and channel(s) being used for ODB call activities.
Possible Error Effect:	The ODB connection(s) on this DSL cannot be cleanly torn down. Attempts by call processing to do so may result in asserts and/or audit errors.
Corrective Action Taken:	Both B-channel rIORTLA tuples are quarantined for recovery (rIORTLA.quarstate marked AUAUSET). The B-channel management data in

	the D-channel rIDPB tuple (b1use, b2use, b1pty_resv and b2pty_resv) are marked to idle states (DMIDLE_USE and 0 respectively). Lastly, the logical PH number (ph_number) and physical channel number (ph_cn) attributes in the B1 and B2 rIDPB tuples are marked to an idle state (PSPHNULL and 0 respectively). Any ODB call processes up on the DSL will then be purged and any other related call data will be idled out by related audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the B-channel rIDPB ODB B-channel tuple under audit.
<i>Bad Data =</i>	The logical PH number (ph_number) in the B-channel rIDPB ODB B-channel tuple under audit.
<i>Good Data =</i>	The physical PH channel number (ph_cn) in the B-channel rIDPB ODB B-channel tuple under audit.
<i>Logical Index =</i>	The key of the B-channel rIDPB ODB B-channel tuple (port).
<i>Dump 1 =</i>	The contents of the B-channel rIDPB ODB B-channel tuple under audit.
<i>Dump 2 =</i>	The contents of the "other" B-channel rIDPB ODB B-channel tuple.
<i>Dump 3 =</i>	The contents of the D-channel rIDPB tuple on the DSL.

Table 47 Error Code: PHNUNEQUIP

Error Code:	PHNUNEQUIP
Error Description:	The dsl_group and/or member obtain from the static tuple rIDSLEQUIP do not match the ph_number and/or ph_cn stored in the rIDPB tuple.
Possible Error Effect:	Problems in Call Processing.
Corrective Action Taken:	The rIDPB tuple is recovered by audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	PH number (rIDPB.ph_number).
<i>Good Data =</i>	DSL_group (rIDSLEQUIP.dsl_group).
<i>Logical Index =</i>	The rIDPB tuple's key, port field.
<i>Dump 1 =</i>	The rIDPB tuple being audited.
<i>Dump 2 =</i>	The rIDSLEQUIP tuple being audited.

Table 48 Error Code: PLE_STATE

Error Code:	PLE_STATE
Error Description:	The plestate attribute is incorrect.
Possible Error Effect:	D-channel will be idled.
Corrective Action Taken:	The rIDPB tuple will be initialized and made idle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPB.
<i>Bad Data =</i>	Incorrect plestate.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key of rIDPB.
<i>Dump =</i>	rIDPB.

Table 49 Error Code: PORT

Error Code:	PORT
Error Description:	Using port field of the rIDPB tuple as the member field and GI_pcrd as the module field of the dport key field of rIDCHNPRI tuple, audit tried to read the static rIDCHNPRI tuple and failed. Audit must find this static ODD tuple and will continue to take this error until it is inserted by office personnel. Refer to the Manual Action Required field as to how to insert the tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	Both the interf_id and the prigrp fields of the rIDPB tuple will be reset to their null values and audit will retun.
Manual Action Required:	Using port field of the rIDPB tuple as the member field and GI_pcrd as the module field of the dport key field of rIDCHNPRI tuple, insert the static rIDCHNPRI tuple. As for the values of the other fields, refer to the terminal maintenance and triggers area.

Dump Description:	
<i>Error Address</i> =	The prigrp field of the rIDPB tuple.
<i>Bad Data</i> =	The interf_id field of the rIDPB tuple.
<i>Good Data</i> =	The pri_type field of the rIDPB tuple.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 50 Error Code: PROC_LOST

Error Code:	PROC_LOST
Error Description:	An FRBC trunk has a non-null SVC job process ID, but the process is non-existent.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The SVC job process ID is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The logical port type of the rIDPB tuple (rIFC_PORTTYP.lp_type).
<i>Bad Data</i> =	The SVC job process ID's process number (rIDPB.svcjob_pid.procn).
<i>Good Data</i> =	The SVC job process ID's uniqueness (rIDPB.svcjob_pid.uniq).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 51 Error Code: PROC_TO

Error Code:	PROC_TO
Error Description:	The process owning B-channel port does not link properly with the B-channel PORTLA.
Possible Error Effect:	Application code may assert when accessing the data and B-channel cannot be used.
Corrective Action Taken:	The PORTLA will be quarantined and process will be purged.
Manual Action Required:	NA.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The process number of PCBLA.
<i>Good Data</i> =	The expected process number from PORTLA.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 52 Error Code: PSTATUS

Error Code:	PSTATUS
Error Description:	The level 3 profile obtained from rIFC_PORTTYP and rIODPSOP static ODD did not match the level 3 profile stored in a B-channel rIDPB tuple being used for the ODB feature.
Possible Error Effect:	The B-channel signaling path may be corrupted.
Corrective Action Taken:	The level 3 data will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the B-DPB tuple.
<i>Bad Data</i> =	The level 3 profile found in the B-DPB tuple.
<i>Good Data</i> =	The level 3 profile derived from static data.
<i>Logical Index</i> =	The key of the B-DPB tuple.
<i>Dump</i> =	The B-channel DPB tuple.

Table 53 Error Code: PTR3

Error Code:	PTR3
Error Description:	According to the D-channel rIDPB tuple for a DSL with two ODB B-channels assigned, both B-channels currently have ODB calls up, however, only one rIDPB B-channel tuple could be accessed by the audit. For each B-channel "use" field in the D-channel rIDPB tuple which is marked to indicate ODB is in use on the respective B-channel (b1use and/or b2use = DMOB_USE) there should exist a corresponding ODB B-channel rIDPB tuple.
Possible Error Effect:	If the B-channel is assigned the ODB feature, then ODB calls can never be

	originated on this B-channel.
Corrective Action Taken:	The B-channel management data in the associated D-channel rIDPB tuple which corresponds to the B-channel under audit will be recovered to an idle state (b1use or b2use set to DMIDLE_USE and b1pty_resv or b2pty_resv set to 0 depending on which B-channel was marked as using ODB).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the D-channel rIDPB tuple for the DSL.
<i>Bad Data =</i>	Informational: The b1use field in the D-channel rIDPB tuple.
<i>Good Data =</i>	Informational: The b2use field in the D-channel rIDPB tuple.
<i>Logical Index =</i>	The key of the D-channel rIDPB tuple (port)
<i>Dump =</i>	The D-channel rIDPB tuple.

Table 54 Error Code: PTSB_LINK

Error Code:	PTSB_LINK
Error Description:	The routine port conditioning table indicates that a call path should be up (TMportcond[rIORTLA.list where rIORTLA.port = rIDPB.port].ispathup = TMPCYES) but the rIDPB tuple is not linked to an rIPTSB tuple (rIDPB.islu_ptsb = 0 and rIDPB.psiu_ptsb = 0) and no process owns the port (rIORTLA.proc_cplr.st_headk = 0 where rIORTLA.port = rIDPB.port). The rIDPB tuple should be linked to an rIPTSB tuple if the routine port conditioning table indicates a path should be up for a given port list except if the port is owned by a process.
Possible Error Effect:	The time slots associated with the rIPTSB tuple will be lost to the system, thus reducing the total number of available time slots.
Corrective Action Taken:	The rIDPB tuple is recovered to an idle state, and the rIORTLA tuple is placed on the to-be-idled list (rIORTLA.list = TMLTTBI), and the terminal maintenance unloader is awakened to process the rIORTLA tuple so that it is eventually set to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The list the port associated with the RLDPB is on (rIORTLA.list where rIORTLA.port = rIDPB.port).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key (rIDPB.port) of the rIDPB tuple.
<i>Dump 1 =</i>	The contents of the rIDPB tuple.
<i>Dump 2 =</i>	The contents of the associated rIORTLA tuple.

Table 55 Error Code: QUAR_INV

Error Code:	QUAR_INV
Error Description:	The port is not on a recovery list, so the quarantine state should not be in a race condition, but it is.
Possible Error Effect:	Lost resources since this port is out-of-service.
Corrective Action Taken:	The rIDPB tuple is quarantined so it can be recovered by audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The quarantine state (rIDPB.quarstat).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDPB tuple's key, port field.
<i>Dump =</i>	NA.

Table 56 Error Code: QUE

Error Code:	QUE
Error Description:	An FRBC trunk has a non-null SVC job identifier, but the ISPA job is no longer on the queue.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The SVC job identifier is nulled out.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	The logical port type of the rIDPB tuple (rFC_PORTTYP.lp_type).
<i>Bad Data</i> =	The SVC job identifier of the rIDPB tuple (rIDPB.svcjob_id).
<i>Good Data</i> =	The return value from the function call, TMisqjobid.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 57 Error Code: R_COUNTS

Error Code:	R_COUNTS
Error Description:	The number of TEILA linked to DPB is greater than what user subscribes (specify in DSLEQUIP).
Possible Error Effect:	The error may cause binding and signaling problem.
Corrective Action Taken:	The DSL will be reinitialized and recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	Number of TEILA linked to DPB.
<i>Good Data</i> =	Number of TEILA allowed in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 58 Error Code: SGNOOD

Error Code:	SGNOOD
Error Description:	Using prigrp field of the rIDPB tuple as the key field of rIPRIGRP tuple, audit tried to read the static rIPRIGRP tuple and failed. Audit must find this static ODD tuple and will continue to take this error until it is inserted by office personnel. Refer to the manual action required field as to how to insert the tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	The pri_type field of the rIDPB tuple will be reset to its null value(TMNULL_TYPE) and audit will return.
Manual Action Required:	Find out the value of the prigrp field from the dump of the rIDPB tuple. Use it as the key field insert the static rIPRIGRP tuple. As for the other fields of the tuple, refer to the terminal maintenance and trigger area.
Dump Description:	
<i>Error Address</i> =	The pri_type field of the rIDPB tuple.
<i>Bad Data</i> =	The prigrp field of the rIDPB tuple.
<i>Good Data</i> =	The interf_id field of the rIDPB tuple.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 59 Error Code: TEDBFLAG

Error Code:	TEDBFLAG
Error Description:	The tedb_flag attribute in the DPB tuple is incorrectly set.
Possible Error Effect:	An incorrect linkage may exist between the DPB and either a TEDB tuple or a DALB tuple. This may effect call processing.
Corrective Action Taken:	The tedb_flag will be correctly set according to the servclass found at FC_PORTTYPE. If it is ISDN or ISDN attendant DSL, then tedb_flag will be set to DBYES. If it is an EOC/TMC port, then the tedb_flag is set to DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Valid values are: 0 = If the tedb_flag should be set to DBYES. 1 = If the tedb_flag should be set to DBNO.
<i>Good Data</i> =	Valid values are: 0 = If not ISDN and ISDN attendant or if EOC/TMC port.

	1 = If it is ISDN or ISDN attendant.
<i>Logical Index</i> =	The rIDPB key (rIDPB.port).
<i>Dump</i> =	RLDPB.

Table 60 Error Code: TEDBLINK

Error Code:	TEDBLINK
Error Description:	An invalid linkage is found between the rIDPB tuple and a rTEDB tuple.
Possible Error Effect:	Switch cannot communicate with customer premise equipment. EOC/TMC port on IDCU TR303 have lost communication with the switch.
Corrective Action Taken:	Port will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Linkage value from rIDPB tuple to rTEDB (rIDPB.tedb_ own.st_headk).
<i>Good Data</i> =	0. There should not be a linkage between the tuples.
<i>Logical Index</i> =	The rIDPB key.
<i>Dump</i> =	The contents of rIDPB tuple.

Table 61 Error Code: TEIBAD

Error Code:	TEIBAD
Error Description:	The fixed terminal endpoint identifier (FTEI) flag indicator in the rIDPB tuple is incorrect. It does not match the same indicator in the corresponding rIDSLEQUIP tuple. This flag is used by call processing to determine if there is a FTEI resource on this digital subscriber line (DSL).
Possible Error Effect:	FTEI resources on this DSL may not function correctly on this DSL.
Corrective Action Taken:	The flag indicator (pfitei) is recovered to the value specified in the corresponding rIDSLEQUIP flag.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The value of pfitei in the rIDPB before correction.
<i>Good Data</i> =	The value of pfitei in the corresponding rIDSLEQUIP tuple.
<i>Logical Index</i> =	The rIDPB key.
<i>Dump 1</i> =	The contents of rIDPB tuple.
<i>Dump 2</i> =	The contents of rIDSLEQUIP tuple.

Table 62 Error Code: TEILALINK

Error Code:	TEILALINK
Error Description:	For non-ISDN line. TEILA should not link to DPB.
Possible Error Effect:	Service cannot be received from this port.
Corrective Action Taken:	The port will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The port which TEILA links to.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 63 Error Code: TPWAIT

Error Code:	TPWAIT
Error Description:	The tpwait field associated with this DPB is not set correctly according to data in the PORTLA.
Possible Error Effect:	"tpwait" should be on for EOC/TMC ports plus X.75, X.75', FRBC and IP trunks when ISPA terminal process (TP) is waiting for a level 2 setup message, and off for all other ports.
Corrective Action Taken:	The tpwait field will be updated according to the information present in the PORTLA if this is the only error detected.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Service class of the dpb tuple (rIFC_PORTTYP.servclass).
<i>Bad Data</i> =	Value of "tpwait" field in the DPB.
<i>Good Data</i> =	"tpwait" value determined from PORTLA.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	The DPB tuple.
<i>Dump 2</i> =	The PORTLA tuple.

Table 64 Error Code: TWOLINKS

Error Code:	TWOLINKS
Error Description:	A broken linkage is found when traversing the rTEILA tuple through this rIDPB tuple. A broken linkage to rRTEILA tuple is found on an IDCUC TR303 EOC/TMC port.
Possible Error Effect:	Application codes may assert and some of CPEs may not receive any service.
Corrective Action Taken:	The DSL will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 65 Error Code: TYPE

Error Code:	TYPE
Error Description:	The PH channel type stored in the DPB does not agree with that which was computed from the ODD.
Possible Error Effect:	The PORT could be OOS.
Corrective Action Taken:	The "phctyp" field is updated in the DPB to agree with the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the DPB tuple.
<i>Bad Data</i> =	Value of the "phctyp" field in the DPB.
<i>Good Data</i> =	Value of "phctyp" computer from the ODD.
<i>Logical Index</i> =	Port name.
<i>Dump</i> =	The rIDPB tuple.

Table 66 Error Code: UNEQUAL

Error Code:	UNEQUAL
Error Description:	rIDPB.agi1_bchan and rIDPB.agi2_bchan are equal. This means that both groups are using the same B-channel, which is not allowed.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	None.
Manual Action Required:	Check assignment of associated groups and multi-Line hunt groups (MLHG) on RC/V View 23.2 (DIGITAL SUBSCRIBER LINE) and 23.3 (ASSOCIATED GROUP). Check for overlapping groups, and MLHGs which occur in both groups.
Dump Description:	
<i>Error Address</i> =	Address of the rIDPB tuple.
<i>Bad Data</i> =	rIDPB.agi1_bchan
<i>Good Data</i> =	rIDPB.agi2_bchan
<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump</i> =	The rIDPB tuple.

Table 67 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	All rIDPB tuples for EOC/TMC ports on an IDCUC TR303 should have a linkage to an rRTEILA tuple.
Possible Error Effect:	Message flow between the SM and IDCUC RT303 is interrupted.
Corrective Action Taken:	EOC/TMC port is recovered and communication restarted.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Address of the rDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of DPB (rDPB.port).
<i>Dump</i> =	The contents of the rDPB tuple.

DPB-C

Software Release: 5E13 and later

1. D-CHANNEL PROTOCOL BLOCK (DPB) AUDIT

The D-channel application linkage block (DALB) and the D-channel protocol block (DPB) are used to handle communications between the integrated services digital network (ISDN) periphery and the processes that control the ISDN ports. The DPB corresponds to the D-channel port, or the permanent packet of the channel, and has one DALB linked to it for each process that needs to communicate with the ISDN customer premises equipment (CPE). Most (but not all) of these processes control B-port served by the D-port.

For the integrated digital carrier unit (IDCU) the rIDPB tuple is used to represent the embedded operation channel (EOC) and the timeslot management channel (TMC) channels. A shared linkage is used to link these rIDPB tuples to the IDCU remote terminal linkage block (rIRTLB) instead of a rIDALB linkage and to the remote terminal identifier linkage area (rIRTEILA) instead of the rTEILA tuple.

In addition to the DALB linkages, the DPB contains pointers to the path through the switch network that connects the D-channel line card (T-card or U-card) or the inter-switch packet trunk to the protocol handler (PH), and the information required to control the handshaking and data transmission over the D-channel to the ISDN CPE.

2. DATA STRUCTURES

DPB is used for all ISDN applications which connect a port to a PH. Examples of PH ports are:

- Digital subscriber line (DSL) D-channel.
- DSL B-channel for packet switching.
- Interswitch packet trunk.
- Inter-switching module (SM) port.
- Data link terminal (DLT) port.
- Extended digital subscriber line (EDSL) D-channel.
- DSL B-channel for on-demand packet switching.
- Integrated digital carrier unit (IDCU) EOC/TMC channels.
- CDMA packet pipe trunk.
- CDMA speech handler (PHV) trunk.

The RLDPB, an indexed relation in the switching modules (SMs), contains the D-channel port name and peripheral interface data bus (PIDB) time slot block keys for the integrated services line unit (ISLU) and packet switching units (PSUs). The audit also uses the D-channel application linkage block relation (RLDALB), the PIDB time slot block relation (RLPTSB), the port type relation (RLPORTTYP), the digital subscriber line (SDL) equipage relation (RLDSLEQUIP), and the port linkage area relation (RLPORTLA).

For an ISDN or ISDN attendant D-channel DPB, services subscribed by the users (represented by TEDB) are initialized and linked to the DPB during full initialization.

When the CPE is plugged in and terminal end point identifier (TEI) is generated, the TEI linkage area (TEILA) is linked to the DPB.

This only applies to ISDN or ISDN ATTENDANT D-channels. The other channels, such as operator services position system (OSPS), CDMA, EDSL or PRI, have no TEDB or TEILA linked to the DPB. For non-OSPS PRI ISDN calls or CDMA packet pipe or speech handler trunks, no DALB is linked to the DPB. Please refer to the data diagrams for the DPB and related data structure. Refer to Figure 1 and Figure 2 .

Figure 1 (DPB-1) Non ISDN or ISDN Attendant D-Channel

Figure 2 (DPB-2) Non ISDN or ISDN Attendant D-Channel

3. AUDIT CHECKS

- The audit first verifies that the DPB belongs to a valid D-channel or packet B-channel.
- The audit verifies that the key in DPB is correct.
- The audit verifies that all linkages between the DALB and the DPB are correct. This linkages will be null when the rIDALB tuple is involved with primary rate interface (PRI) calls for a non-facility associated signaling (NFAS) and D-channel back up (DCBU) features excluding OSPS PRI calls.
- The audit verifies that all linkages between the DPB and the following are correct:
 - Terminal equipment data block (TEDB).

- Remote terminal linkage block (rRTLb).
 - Remote terminal endpoint identifier linkage area (rRTEILA).
 - TEI linkage area (TEILA).
 - Peripheral interface data bus time slot backs (PTSBs).
- (e) The audit verifies that data transmission rates and protocol data in the DPB are correct.
- (f) If channel is being monitored for protocol transmission, the audit verifies that the protocol monitor job tables are consistent each other.
- (g) The audit verifies that B-channels management data stored in the PDB is consistent with the corresponding B-channel status in PORTLA and B-channel configuration in rIDSLEQUIP.
- (h) The audit verifies the path between the DPB and the PTSB is set per the routine port condition table.
- (i) For CDMA packet pipe trunks, the audit verifies that the number of PTSB's that should be associated with the packet pipe (according to the count in rIPP_MEM) are all there.
- (j) For ISDN or ISDN attendant lines, the D-channel DPB should link to the terminal equipment data block (TEDB). Other channels such as OSPS, extended digital subscriber lines (EDSLs) should not have linkages to TEDBs.
- (k) The audit verifies the number of TEILAs linked to DPB is the same as the specified in the DPB and is not greater than the maximum number configured in the rIDSLEQUIP.
- (l) The audit verifies that the basic rate interface (BRI) class and binding data stored in the DPB is derived from the corresponding rIDSLEQUIP tuple.
- (m) The audit provides existence checks on B-channel DPBs used for on demand B-channel package services (ODB). The audit also verifies the consistency of B-channel management data related to ODB.
- (n) The audit verifies the associated group information (rIDPB.agi1_bchan and rIDPB.agi2_bchan).
- (o) The audit verifies all the fields related to the NFAS/DCBU features for PRI calls, namely, interf_id, prigrp, pri_type and srvwait.

4. ERROR HANDLING

If any errors are detected in a DPB tuple, the audit determines if a process currently owns the D-channel. If a process is found, the audit recovers the data by requesting a single process purge of the owning process.

If the DPB does not have a living process, the audit reinitializes the protocol and data rate information. The audit attempts to preserve the DALB, TEDB, and TEILA lists and the physical path through the PTSB's, since changes to either of these could result in lost data. The audit recovers these linkages if they do not pass the point to point back checks. (NON-ODB calls only. For ODB calls, the tuple and all linkages are idled.)

During recovery the rIDPB field is cleared to DBNO.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: ACCPTR

Error Code:	ACCPTR
Error Description:	The ODB B-channel rIDPB tuple corresponding to a given rIORTLA tuple associated with the B-channel's port could not be accessed by the audit. For every rIORTLA tuple associated with an ODB B-channel port there should exist a corresponding B-channel rIDPB tuple where rIORTLA.port = rIDPB.port.
Possible Error Effect:	ODB calls cannot be set up on one of the B-channels for this DSL.
Corrective Action Taken:	The B-channel management data in the D-channel rIDPB tuple is idled out to indicate that no ODB calls are up on the B-channel (b1use or b2use marked to DMIDDLE_USE and b1pty_resb or b2pty_resv marked to 0 depending on which B-channel was using ODB).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIORTLA tuple for the B-channel's port.
<i>Bad Data =</i>	The logical key of the D-channel rIDPB tuple (port).
<i>Good Data =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Logical Index =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Dump 1 =</i>	The rIORTLA tuple for the B-channel's port.
<i>Dump 2 =</i>	The rIDPB tuple for the D-channel.

Table 2 Error Code: ASSOC_PTSB

Error Code:	ASSOC_PTSB
Error Description:	For ADT and non-CDMA calls, the owner linkage field to the rIPTSB tuple dppto must be null, as non-CDMA PTSBs are linked through the semantic linkages, islu_ptsb and psiu_ptsb and ADT trunks have no associations with rIPTSB's. The DPB audit found this field to be non null.
Possible Error Effect:	Possible failure of ADT, IDCU and other non-CDMA calls.
Corrective Action Taken:	The dppto linkage is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The st_headk field of the dppto field of the rIDPB tuple.
<i>Bad Data =</i>	The st_talk field of the dppto field of the rIDPB tuple.
<i>Good Data =</i>	The phctyp field of the rIDPB tuple.
<i>Logical Index =</i>	The port field, key, of the rIDPB tuple.
<i>Dump =</i>	The rIDPB tuple being audited.

Table 3 Error Code: ASSOC_TUP

Error Code:	ASSOC_TUP
Error Description:	The corresponding rIODPSOP static tuple for a given ODB DSL and party could not be accessed. For every D-channel rIDPB tuple where the B-channel management data indicates ODB is in use on the DSL (rIDPB.b1use or b2use = DMODB_USE) there should exist a corresponding rIODPSOP static tuple where (key) rIDPB.port = (key) rIODPSOP.port and (key) rIODPSOP.party = (rIDPB.X >> rIODPSOP.party & (DMUCHAR)1) where X = b1pty_resv or b2pty_resv in the D-channel rIDPB tuple.
Possible Error Effect:	An unauthorized subscriber may be using the ODB feature.
Corrective Action Taken:	The B-channel port is quarantined (rIORTLA.quarstate set to AUAUSET) and the B-channel management data in the associated D-channel rIDPB tuple is recovered to an idle state (b1use or b2use marked DMIDDLE_USE and b1pty_resv or b2pty_resv marked to 0 depending on which B-channel was using ODB).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIORTLA tuple for the B-channel's port.
<i>Bad Data =</i>	The logical key of the D-channel rIDPB tuple (port).
<i>Good Data =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Logical Index =</i>	The key of the B-channel rIORTLA tuple (port).
<i>Dump 1 =</i>	The rIORTLA tuple for the B-channel's port.
<i>Dump 2 =</i>	The rIDPB tuple for the D-channel.

Table 4 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	Either the blkcall, pktcampon or the srwait field of the rIDPB tuple is set but the D-channel port is not owned as indicated by the state of the rIORTLA tuple of this non-FRBC port (DBPSIDLE), or the port is an FRBC trunk and both the SVC jobid and the SVC job's process ID are null.
Possible Error Effect:	Possible error effects are: • If the blkcall field is set, then one can not originate or terminate to this DSL as the call is blocked. • If the pktcampon field is set, the D port indicates it is camped on when it is not. • If the srwait field is set, the D port will time out waiting for SERV and SERV ACK messages.
Corrective Action Taken:	Audit will force the recovery of the rIDPB tuple being audited.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The blkcall field of the rIDPB tuple.
<i>Bad Data =</i>	The pktcampon field and the srwait field of the rIDPB tuple (rIDPB.pktcampon rIDPB.srwait).
<i>Good Data =</i>	The logical port type (rIFC_PORTTYP.lp_type).
<i>Logical Index =</i>	The port field, key, of the rIDPB tuple.
<i>Dump 1 =</i>	The rIDPB tuple being audited.
<i>Dump 2 =</i>	The rIORTLA tuple involved.

Table 5 Error Code: BADPTSB

Error Code:	BADPTSB
Error Description:	One of the PTSB's pointed to by the D-channel protocol block did not point back to the D-channel.
Possible Error Effect:	Potential for breaking the D-channel signaling path.
Corrective Action Taken:	PTSB pointers are cleared. Process owning DPB is purged if any. D-port is turned over to terminal maintenance for recovery.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The key of the rIPTSB tuple that should have been linked to the rIDBP tuple under audit.
<i>Bad Data =</i>	PTSB number.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	PORT number of D-port.
<i>Dump 1 =</i>	The rIDPB tuple.
<i>Dump 2 =</i>	The rIPTSB tuple.

Table 6 Error Code: BADIDLE2

Error Code:	BADIDLE2
Error Description:	B2-channel usage field is not consistent with DSLEQUIP.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	B2-channel usage field is reset to initialized value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The error code sequence number: 1 = Should be DMNO_SERV. 2 = Should be DMPPB_USE.

	3 = Should be DMIDLE_USE.
<i>Good Data</i> =	B2-channel usage in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 7 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The pri_type field of the rIDPB tuple did not match the same field from the static rIPRIGRP tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	The pri_type field of the rIDPB will be corrected with the value found in the same field of the static rIPRIGRP tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The prigrp field of the rIDPB tuple.
<i>Bad Data</i> =	The pri_type field of the rIDPB tuple.
<i>Good Data</i> =	The pri_type field of the rIPRIGRP tuple.
<i>Logical Index</i> =	The port field, key, of the rIDPB tuple.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 8 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	B-channel management data in DPB is not correct. Either B-channel usage is wrong or party reservation bits are not correctly set.
Possible Error Effect:	B-channel could be blocked for call processing.
Corrective Action Taken:	B-channel data are reinitialized correctly per DSLEQUIP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The error indicator. 1 = B-channel is configured as NO_SERV, but B-channel management data is not set to initialized value. 2 = B-channel is configured as X_25, but B-channel management data is not set to DMPB_USE or party reservations are not zero. 3 = B-channel is used for default service or operator use but party reservation is not zero or no TEDB is linked to DPB. 4 = B-channel is used for TM-USE but party reservation is not zero. 5 = B-channel is used for CSV, CSD or ODB use, but party reservation is not set or no TEDB is linked to PDB. 6 = B-channel is used for CSV, CSD or ODB use, but party reservation bit is not consistent with PCBLA (process). 7 = If B-channel is owned by process, B-channel usage should not be IDLE_USE, VRSV-USE, PPB_USE or NO_SERV. 8 = If B-channel is not owned by process and usage field is indicated as IDLE-USE, then party reservation bit should not be set. 9 = When B-channel is not owned by process but used by shared DN (usage field is DMVRSV_USE), party reservation bits should not be zero and TEDB, DALB should link to DPB.

	10 = The B-channel usage field is not defined in the system.
<i>Good Data</i> =	Valid values are: 1 = B1 channel has problem. 2 = B2 channel has problem.
<i>Logical Index</i> =	PORT number of D-port.
<i>Dump</i> =	rIDPB tuple.

Table 9 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	The value in rIPP_MEM.num_mem indicates that a certain number of rIPTSB tuples should be linked to this rIDPB when it is stable the number of tuples is wrong.
Possible Error Effect:	This packet pipe is not correctly set up for CDMA calls and will cause a loss of data.
Corrective Action Taken:	Audits will force recovery of the rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The PH channel type of the port (rIDPB.phctyp).
<i>Bad Data</i> =	The number of rIPTSB tuples that are currently linked (local cnt).
<i>Good Data</i> =	The number of rIPTSB tuples that should be linked (rIPP_MEM.num_mem).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump 1</i> =	The contents of the rIDPB tuple.
<i>Dump 2</i> =	The contents of the rIPP_MEM tuple.
<i>Dump 3</i> =	The contents of the rIFC_PORTTYP tuple.

Table 10 Error Code: BDPID

Error Code:	BDPID
Error Description:	There is a non-null owner process ID, but the process does not exist any longer.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The owner process ID is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The PH channel type of the rIDPB tuple (rIDPB.phctype).
<i>Bad Data</i> =	The process number of the owner process ID (rIDPB.opid.procno).
<i>Good Data</i> =	The uniqueness of the owner pid (rIDPB.opid.uniq).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 11 Error Code: BINDERR

Error Code:	BINDERR
Error Description:	The binding related data such as blport_set are not set correctly in DPB.
Possible Error Effect:	This DSL may have signaling and binding problems.
Corrective Action Taken:	blport_set in DPB is correctly set to be consistent with DSLEQUIP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	blport_set in DPB.
<i>Good Data</i> =	bind_lport in DSLEQUIP. (if bind_lport in DSLEQUIP is not zero, then blport_set in DPB should be set to DBYES).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 12 Error Code: BIT1MAP

Error Code:	BIT1MAP
Error Description:	The audible alert party bits should not be set when DSL is idle.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The audible alert party bits will be reset to zero.

Manual Action Required:	NA.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The audible party in DPB.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 13 Error Code: BLINK

Error Code:	BLINK
Error Description:	There should be no linkage between a B-channel rIDPB tuple used for the ODB feature and TEDB, and the B-channel rIDPB tuple's tedb_flag should be DBNO. Either one or both of these conditions was found to be in error.
Possible Error Effect:	The B-channel rIDPB tuple, and related data are in an invalid state resulting in wasted resources.
Corrective Action Taken:	The B-channel rIDPB tuple, and related ODB call processing data are recovered to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the B-DPB.
<i>Bad Data</i> =	The tedb_link flag.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the B-DPB tuple.
<i>Dump</i> =	The B-channel rIDPB (which will contain the status of the linkage to the TEDB).

Table 14 Error Code: BOTHCHAN

Error Code:	BOTHCHAN
Error Description:	An associated group (rIDPB.agi1_bchan or rIDPB.agi2_bchan) is using both B-channels, when only one is allowed. Terminals identified in a group by the bit map rIDSLEQUIP.agipty# coincide with both B-channels identified in bit maps rIDPB.b1pty_resv and rIDPB.b2pty_resv.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	None.
Manual Action Required:	Check assignment of associated groups and multi-line hunt groups (MLHG) on RC/V Views 23.2 (DIGITAL SUBSCRIBER LINE) and 23.3 (ASSOCIATED GROUP). Check for overlapping groups, and MLHGs which occur in both groups.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	rIDPB.agi1_bchan.
<i>Good Data</i> =	rIDPB.agi2_bchan.
<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump 1</i> =	rIDPB tuple.
<i>Dump 2</i> =	rIDSLEQUIP tuple.

Table 15 Error Code: CHAN_ZERO

Error Code:	CHAN_ZERO
Error Description:	B-channel management data are not set to initialized value for non-ISDN line.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	B-channel management data are reset to initialized value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 16 Error Code: COUNTS

Error Code:	COUNTS

Error Description:	The number of TEILA linked to DPB is not equal to those specified in DPB(tot_terms field).
Possible Error Effect:	The error may cause binding and signaling problem.
Corrective Action Taken:	tot_terms field in DPB is reset to correct number.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	tot_terms in DPB.
<i>Good Data</i> =	The actual TEILA linked to DPB.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 17 Error Code: DBCHAN

Error Code:	DBCHAN
Error Description:	B1-channel usage field is not consistent with DSLEQUIP.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	B1-channel usage field is reset to initialized value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The error code sequence number: 1 = Should be DMNO_SERV. 2 = Should be DMPPB_USE. 3 = Should be DMIDLE_USE.
<i>Good Data</i> =	B1-channel usage in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 18 Error Code: DEADPID

Error Code:	DEADPID
Error Description:	There is a non-null call activity check process ID, but the process no longer exists.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The call activity check process ID is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The PH channel type of the rIDPB tuple (rIDPB.phctype).
<i>Bad Data</i> =	The process number of the call activity check pid (rIDPB.cac_pid.procno).
<i>Good Data</i> =	The uniqueness of the call activity check pid (rIDPB.cac_pid.uniq).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 19 Error Code: DPB_LINK

Error Code:	DPB_LINK
Error Description:	An invalid linkage is found between a B-channel rIDPB tuple used for the ODB feature and an rIPTSB tuple.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	The ODB call will be torn down and related data recovered to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The invalid linkage between the B-channel DPB and the PTSB.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	DPB key.
<i>Dump 1</i> =	The rIDPB tuple.
<i>Dump 2</i> =	The rIPTSB tuple.

Table 20 Error Code: DSL_RATE

Error Code:	DSL_RATE
Error Description:	Data rate in DPB differs from ODD data rate.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	Process owning DPB is purged if any D-port is turned over to terminal maintenance for recovery.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Data rate found in DPB.
<i>Good Data</i> =	Data rate according to ODD.
<i>Logical Index</i> =	Port number of D-port.
<i>Dump</i> =	NA.

Table 21 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	The logical PH number and physical PH channel data in a B-channel rIDPB tuple used for ODB did not match the data contained in the corresponding rIODPSOP static tuple. For B-channel rIDPB tuples used for ODB calls, the ph_number and ph_cn attributes must be represented in rIODPSOP.ph_number and rIODPSOP.ph_cn or ph_cn2 where, for the associated D-channel, (key) rIDPB.port = (key) rIODPSOP.port and (key) rIDPSOP.party = (rIDPB.X >> rIODPSOP.party & (DMUCHAR)1) where X = b1pty_resv or b2pty_resv in the D-channel rIDPB tuple associated with the B-channel rIDPB tuple under audit.
Possible Error Effect:	An unauthorized subscriber may be using the ODB feature.
Corrective Action Taken:	The ODB call process is purged and the ODB call owning the B-channel is torn down.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the B-channel rIDPB tuple under audit.
<i>Bad Data</i> =	The PH number the rIDPB tuple (ph_number)
<i>Good Data</i> =	The PH number found in the rIODPSOP static tuple (ph_number)
<i>Logical Index</i> =	The key of the rIDPB tuple under audit (port)
<i>Dump 1</i> =	The B-channel rIDPB tuple under audit.
<i>Dump 2</i> =	The associated D-channel rIDPB tuple for the DSL.
<i>Dump 3</i> =	The associated rIODPSOP static tuple.

Table 22 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The audit has detected an rIDPB dynamic tuple without a corresponding static tuple where: - the DPB does not have the static rIDSLEQUIP tuple with rIDPB.port = rIDSLEQUIP.dsl or - there is no user subscribed to the on-demand-packet feature with rIDPB.port = rIODPSOP.port
Possible Error Effect:	If call processing or terminal maintenance attempts to access the unassigned resources represented by this tuple, operations may be disrupted.
Corrective Action Taken:	Tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key value.
<i>Dump</i> =	The rIDPB tuple.

Table 23 Error Code: GPORT

Error Code:	GPORT

Error Description:	The specified B-channel port is not populated or key or B-channel PORTLA is wrong.
Possible Error Effect:	Application code may assert when accessing the data and B-channel cannot be used.
Corrective Action Taken:	PORTLA or FCPORTTYPE audit will be scheduled as related audit to detect this error and correct it.
Manual Action Required:	If FC_PORTTYPE is missing, then manual action is required to insert the B-channel FC_PORTTYPE tuple. (Look good data in the dump.)
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The key of B-PORTLA in the system (maybe 0xffff).
<i>Good Data =</i>	The key of B-PORTLA which should be in the system.
<i>Logical Index =</i>	The rIDPB key - port name.
<i>Dump =</i>	The rIDPB tuple.

Table 24 Error Code: GRPINFO

Error Code:	GRPINFO
Error Description:	Based on the bit maps rIDSLEQUIP.agipty1 and rIDPB.b#pty_resv the associated group information rIDPB.agi1_bchan is set to the incorrect value. The range of values is FCNO_BCHAN, FCB1_CHAN, and FCB2_CHAN.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	rIDPB.agi1_bchan is set to the correct value listed below.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	rIDPB.agi1_bchan.
<i>Good Data =</i>	Correct value of rIDPB.agi1_bchan.
<i>Logical Index =</i>	The rIDPB key (rIDPB.port).
<i>Dump =</i>	The rIDPB tuple.

Table 25 Error Code: GRP2INFO

Error Code:	GRP2INFO
Error Description:	Based on the bit maps rIDSLEQUIP.agipty2 and rIDPB.b#pty_resv the associated group information rIDPB.agi2_bchan is set to the incorrect value. The range of values is FCNO_BCHAN, FCB1_CHAN, and FCB2_CHAN.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	rIDPB.agi2_bchan is set to the correct value listed below.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	rIDPB.agi2_bchan.
<i>Good Data =</i>	Correct value of rIDPB.agi2_bchan.
<i>Logical Index =</i>	The rIDPB key (rIDPB.port).
<i>Dump =</i>	The rIDPB tuple.

Table 26 Error Code: IL_PTYE

Error Code:	IL_PTYE
Error Description:	The lp_type in rIFC_PORTTYP does not indicate that the port B-channel rIDPB is associated with a B-channel port.
Possible Error Effect:	Wasted resources since this tuple cannot be used for anything.
Corrective Action Taken:	The B-channel rIDPB tuple and related data, if any, will be recovered to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The lp_type in rIFCPORTTYP.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key of the DPB tuple.
<i>Dump =</i>	The DPB tuple.

Table 27 Error Code: IDLE_LINKED

Error Code:	IDLE_LINKED
Error Description:	EOC/TMC ports on an IDCU TR303 have a invalid link between the rIDPB and the rRTLb tuple.
Possible Error Effect:	Tasks for this RT may be lost and not completed.
Corrective Action Taken:	The EOC/TMC port will be recovered and the link restarted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump</i> =	The contents of the rIDPB tuple.

Table 28 Error Code: INV

Error Code:	INV
Error Description:	Either the interf_id or the prigrp field of the rIDPB tuple did not match the same field from the static rIDCHNPRI tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	Both the interf_id and the prigrp fields of the rIDPB tuple will be corrected with the values found in the same fields of the static rIDCHNPRI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The interf_id field of the rIDPB tuple.
<i>Bad Data</i> =	The prigrp field of the rIDCHNPRI tuple.
<i>Good Data</i> =	The interf_id field of the rIDCHNPRI tuple.
<i>Logical Index</i> =	The prigrp field of the rIDPB tuple.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 29 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	BRI class of service in DPB is not consistent with DSLEQUIP.
Possible Error Effect:	This DSL may have signaling and binding problems.
Corrective Action Taken:	briclass in DPB is correctly set to be consistent with DSLEQUIP and the port is put on the to be idled list (TMLTTBI) to be reinitialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	briclass in DPB.
<i>Good Data</i> =	briclass in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 30 Error Code: INVOWNER

Error Code:	INVOWNER
Error Description:	The default service TEDB should link to the DSL which has subscribed default service feature but it links to other DSL.
Possible Error Effect:	No default service is provided in this DSL.
Corrective Action Taken:	The DSL will be recovered and all the TEDBs will be reinitialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The DSL which TEDB links to.
<i>Good Data</i> =	The DSL which TEDB should link to.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 31 Error Code: INVUSAGE

Error Code:	INVUSAGE
Error Description:	Non-FRBC trunks must have a null SVC job identifier and null SVC job process ID this trunk has a non-null SVC attribute.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The SVC job identifier and SVC job process ID is nulled out.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The logical port type of the rIDPB tuple (rIFC_PORTTYP.lp_type).
<i>Bad Data</i> =	The SVC job identifier of the rIDPB tuple (rIDPB.svcjob_id).
<i>Good Data</i> =	The SVC job process ID of the rIDPB tuple (rIDPB.svcjob_pid).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 32 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	The audit received an unrecognized or invalid return from TMDpbprt().
Possible Error Effect:	The rIDPB tuple cannot be audited.
Corrective Action Taken:	The audit skips the rIDPB tuple since it cannot access any related data required for auditing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIFC_PORTTYP static tuple passed to TMDpbprt().
<i>Bad Data</i> =	The return received from TMDpbprt().
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The rIFC_PORTTYP static tuple.

Table 33 Error Code: L2MON

Error Code:	L2MON
Error Description:	The port is requested to be monitored for protocol but the data used is inconsistent.
Possible Error Effect:	Switch may waste resources to monitor the unrequested port.
Corrective Action Taken:	The port is marked as not being monitored.
Manual Action Required:	NA.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The pmon field in DPB.
<i>Good Data</i> =	DBNO(0).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 34 Error Code: LEVEL_1

Error Code:	LEVEL_1
Error Description:	Level two profile in the ODD does not match profile in the DPB.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	Process owning DPB is purged if any D-port is turned over to terminal maintenance for recovery.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Level 2 profile found in DPB.
<i>Good Data</i> =	Level 2 profile according to ODD.
<i>Logical Index</i> =	Port number of D-port.
<i>Dump</i> =	NA.

Table 35 Error Code: LEVEL_3

Error Code:	LEVEL_3
Error Description:	The level three state in the DPB did not match the level three state derived from the circuit type information in the PORTTYP and DSLEQUIP tuple.
Possible Error Effect:	Potential for breaking the D-channel signaling path.
Corrective Action Taken:	Level three state is updated to match the static ODD data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Level three state from the DPB.
<i>Good Data</i> =	Level three state derived from the ODD.
<i>Logical Index</i> =	PORT number of D-port.

<i>Dump</i> =	DPB is dumped.

Table 36 Error Code: MISSTUP

Error Code:	MISSTUP
Error Description:	DSL should have default service feature but there is no default service TEDB linked to DPB or TEDB key is wrong.
Possible Error Effect:	No default service is provided in this DSL.
Corrective Action Taken:	Print the error and request related audits to insert TEDB or correct the TEDB errors.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The TEDB key in the system.
<i>Good Data</i> =	The TEDB key which should be.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 37 Error Code: NONNULL

Error Code:	NONNULL
Error Description:	The servclass and lp_type fields of the static rIFC_PORTTYPE tuple indicates that this D channel is not used for NFAS and DCBU PRI D channel(AUportbuf.servclass not != FCEDSL and AUportbuf.lp_type != PCTDCHAN). And yet audit found that one of the three fields related to NFAS and DCBU D channel, namely, interf_id, prigrp, and pri_type has a non null value.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	All the three fields will be set to the null value (interf_id->PSNO_INTID, prigrp->TMNULLPRI and pri_type->TMNULL_TYPE).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The interf_id field of the rIDPB tuple.
<i>Bad Data</i> =	The prigrp field of the rIDPB tuple.
<i>Good Data</i> =	The pri_type field of the rIDPB tuple.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 38 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	For an NFAS/DCBU PRI calls, the linkage field to the rIDALB tuple dpdao must be null as no DALBs used in such type of PRI calls is linked to DPBs. Audit found this field to be non null.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	Audit will force recovery of this rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The st_headk field of the dpdao field of the rIDPB tuple.
<i>Bad Data</i> =	The st_tailk field of the dpdao field of the rIDPB tuple.
<i>Good Data</i> =	The prigrp field of the rIDPB tuple.
<i>Logical Index</i> =	The port field, key, of the rIDPB tuple.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 39 Error Code: NOACCBLK

Error Code:	NOACCBLK
Error Description:	For FRBC calls, when either the SVC job ID or the SVC job PID is non-null, future SVC calls must be blocked. If the block-call bit is set to 0 (DBNO), calls are not blocked.
Possible Error Effect:	SVC calls are attempted and fail later.
Corrective Action Taken:	Audit will set the block-call bit to 1 (DBYES).
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	The SVC job identifier (rIDPB.svcjob_id).
<i>Bad Data</i> =	The SVC job process identifier (rIDPB.svcjob_pid.procno).
<i>Good Data</i> =	The SVC job process ID's unique bit (rIDPB.svcjob_pid.uniq).
<i>Logical Index</i> =	The port field, key, of the rIDPB tuple.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 40 Error Code: NOPCBLA

Error Code:	NOPCBLA
Error Description:	While looking for a process on the port associated with the rIDPB tuple during selective initialization, the DA function call returned an error saying that database corruption exists. The audit error report dumps rIORTLA because that is what it has access to.
Possible Error Effect:	The port would normally be taken down unless a barge-in call pickup process exists for this port. Since database error was returned, the port will be taken down.
Corrective Action Taken:	The tuple is quarantined, so that the audit forces recovery of the rIDPB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The pointer to the rIORTLA tuple.
<i>Bad Data</i> =	The value returned from the DA function call.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIORTLA tuple's key, port field.
<i>Dump</i> =	The rIORTLA tuple being audited.

Table 41 Error Code: NOTIDLE2

Error Code:	NOTIDLE2
Error Description:	A rIDPB tuple not currently used for ODB was found to have its logical PH number (ph_number) and physical channel number (ph_cn) attributes set to invalid values. For D-channel rIDPB tuples, or rIDPB B-channel tuples which are not associated with B-channels used for the ODB feature, the PH and channel attributes are unused and should be set to idle values (PSPHNULL and zero respectively).
Possible Error Effect:	Call processing will never be able to use the associated B-channel for ODB since the PH and channel attributes make it appear that the B-channel already has a PH and channel assigned and in use.
Corrective Action Taken:	The ph_number and ph_cn attributes are recovered to their idle values (PSPHNULL and 0 respectively).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The contents of the ph_number and ph_cn attributes. (rIDPB.ph_number << 4 rIDPB.ph_cn)
<i>Good Data</i> =	The null values for ph_number and ph_cn (PSPHNULL << 4 (DMPHCN) 0).
<i>Logical Index</i> =	The rIDPB tuple's key (port).
<i>Dump</i> =	The rIDPB tuple.

Table 42 Error Code: NULL4LINK

Error Code:	NULL4LINK
Error Description:	The PH channel type indicates that this is a ADT, packet pipe or speech handler trunk so the semantic linkage to the rIPTSB (islu_ptsb or psiu_ptsb) should be zero, but instead is non-zero.
Possible Error Effect:	If call processing or terminal maintenance attempts to access the resources represented by this tuple, operations may be disrupted.
Corrective Action Taken:	The semantic linkage to the rIPTSB is nulled out (rIDPB.islu_ptsb and rIDPB.psiu_ptsb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The islu_ptsb field of the rIDPB tuple.
<i>Bad Data</i> =	The psiu_ptsb field of the rIDPB tuple.
<i>Good Data</i> =	The phctyp field of the rIDPB tuple.

<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 43 Error Code: ODDLOSTUP

Error Code:	ODDLOSTUP
Error Description:	The RLPORTTYP relation indicates that the DSL for this port must be equipped, but the rIDSLEQUIP tuple is missing from the static ODD. If the <i>Good Data</i> is 2, the DPB audit was unable to obtain the static relation tuple (rIPP_MEM) needed to audit the dynamic rIDPB tuple for the CDMA packet pipe either there is no packet pipe member tuple with the same port as the DPB or PP_MEM key is wrong.
Possible Error Effect:	If the <i>Good Data</i> is 1, the audit cannot verify any data in the DPB. If it is bad, the audit has no way to fix it. If the <i>Good Data</i> is 2, packet pipe members cannot be located for packet pipe call processing.
Corrective Action Taken:	None.
Manual Action Required:	If the <i>Good Data</i> is 1, the craft will need to use ODBE to put the missing DSLEQUIP tuple back into the ODD, since ODBE does not permit removing the PORTTYP tuple under these circumstances. If the <i>GOOD DATA</i> is 2, the craft will need to use ODBE to put the missing PP_MEM tuple into the ODD. Find out the value of the port.member from the dump of the rIDPB tuple. The port.module will be the processor receiving the audit. Using these as the key, insert the static rIPP_MEM tuple. For the other fields of the tuple, refer to the terminal maintenance and trigger area.
Dump Description:	
<i>Error Address</i> =	If the <i>Good Data</i> is 1, the address of the rIDSLEQUIP tuple. If the <i>Good Data</i> is 2, the address of the rIDPB tuple.
<i>Bad Data</i> =	The logical port type (rIFC_PORTTYP.lp_type).
<i>Good Data</i> =	Valid values are:
	1 = Could not read the rIDSLEQUIP tuple.
	2 = Could not read the rIPP_MEM tuple.
<i>Logical Index</i> =	The rIDPB key (rIDPB.port).
<i>Dump 1</i> =	The contents of the rIDPB tuple.
<i>Dump 2</i> =	The contents of the rIFC_PORTTYP tuple.

Table 44 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	An FRBC trunk has a non-null SVC job identifier, but it is not within the range of valid values for such a field.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The SVC job identifier is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The logical port type of the rIDPB tuple (rIFC_PORTTYP.lp_type).
<i>Bad Data</i> =	The SVC job identifier of the rIDPB tuple (rIDPB.svcjob_id).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 45 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	DPB tuples that are not used by IDCU or certain types of CDMA must be linked to TEDB, DALB, and/or TEILA tuples. This DPB tuple is not correctly linked to one of them. If the <i>Good Data</i> is 1, it is incorrectly linked to TEDB 2, DALB or 3, TEILA.

Possible Error Effect:	Problem in call processing.
Corrective Action Taken:	The rIDPB tuple is quarantined so that the tuple is recovered by audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The linkage, either TEDB, DALB, or TEILA. (Refer to <i>Good Data</i> .)
<i>Good Data =</i>	Valid values are: 1 = The bad linkage is to a TEDB. 2 = The bad linkage is to a DALB. 3 = The bad linkage is to a TEILA.
<i>Logical Index =</i>	The rIDPB tuple's key, port field.
<i>Dump =</i>	The rIDPB tuple being audited.

Table 46 Error Code: PHCTYPE

Error Code:	PHCTYPE
Error Description:	The PH channel circuit type stored in an rIDPB tuple, which is associated with a B-channel port used for the ODB feature, was found inconsistent from the type derived from the B-channel management data stored in static ODD (rIFC_PORTTYPE).
Possible Error Effect:	The PORT could be OOS.
Corrective Action Taken:	The "phctype" field is updated in the DPB to agree with the B-channel management data stored in static ODD (rIFC_PORTTYPE).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the DPB tuple.
<i>Bad Data =</i>	Value of the "phctype" field in the DPB.
<i>Good Data =</i>	Value of "phctyp" computed from the ODD.
<i>Logical Index =</i>	Port name.
<i>Dump =</i>	The DPB tuple.

Table 47 Error Code: PHDSLGP

Error Code:	PHDSLGP
Error Description:	There are currently two ODB calls up on this DSL. However, the logical PH and physical PH channel numbers stored in the rIDPB tuples for each B-channel are identical. When ODB calls are up on each B-channel of a DSL, the ph_number and ph_cn attributes in each ODB B-channel rIDPB tuple must be unique to each other. Since it is physically impossible to set up ODB calls on a DSL under these conditions, this error is an indication that the ph_number and ph_cn attributes in one or both rIDPB tuples became corrupted after both ODB calls were set up on the DSL. The occurrence of this error is an indication that the PH and channel data does not reflect the actual PH and channel(s) being used for ODB call activities.
Possible Error Effect:	The ODB connection(s) on this DSL cannot be cleanly torn down. Attempts by call processing to do so may result in asserts and/or audit errors.
Corrective Action Taken:	Both B-channel rIORTLA tuples are quarantined for recovery (rIORTLA.quarstate marked AUAUSET). The B-channel management data in the D-channel rIDPB tuple (b1use, b2use, b1pty_resv and b2pty_resv) are marked to idle states (DMIDDLE_USE and 0 respectively). Lastly, the logical PH number (ph_number) and physical channel number (ph_cn) attributes in the B1 and B2 rIDPB tuples are marked to an idle state (PSPHNULL and 0 respectively). Any ODB call processes up on the DSL will then be purged and any other related call data will be idled out by related audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the B-channel rIDPB ODB B-channel tuple under audit.

<i>Bad Data</i> =	The logical PH number (ph_number) in the B-channel rIDPB ODB B-channel tuple under audit.
<i>Good Data</i> =	The physical PH channel number (ph_cn) in the B-channel rIDPB ODB B-channel tuple under audit.
<i>Logical Index</i> =	The key of the B-channel rIDPB ODB B-channel tuple (port).
<i>Dump 1</i> =	The contents of the B-channel rIDPB ODB B-channel tuple under audit.
<i>Dump 2</i> =	The contents of the "other" B-channel rIDPB ODB B-channel tuple.
<i>Dump 3</i> =	The contents of the D-channel rIDPB tuple on the DSL.

Table 48 Error Code: PHNUNEQUIP

Error Code:	PHNUNEQUIP
Error Description:	The dsl_group and/or member obtain from the static tuple rIDSLEQUIP do not match the ph_number and/or ph_cn stored in the rIDPB tuple.
Possible Error Effect:	Problems in Call Processing.
Corrective Action Taken:	The rIDPB tuple is recovered by audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	PH number (rIDPB.ph_number).
<i>Good Data</i> =	DSL group (rIDSLEQUIP.dsl_group).
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump 1</i> =	The rIDPB tuple being audited.
<i>Dump 2</i> =	The rIDSLEQUIP tuple being audited.

Table 49 Error Code: PLE_STATE

Error Code:	PLE_STATE
Error Description:	The plestate attribute is incorrect.
Possible Error Effect:	D-channel will be idled.
Corrective Action Taken:	The rIDPB tuple will be initialized and made idle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIDPB.
<i>Bad Data</i> =	Incorrect plestate.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of rIDPB.
<i>Dump</i> =	rIDPB.

Table 50 Error Code: PORT

Error Code:	PORT
Error Description:	Using port field of the rIDPB tuple as the member field and GI_pcrd as the module field of the dport key field of rIDCHNPRI tuple, audit tried to read the static rIDCHNPRI tuple and failed. Audit must find this static ODD tuple and will continue to take this error until it is inserted by office personnel. Refer to the Manual Action Required field as to how to insert the tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	Both the interf_id and the prigrp fields of the rIDPB tuple will be reset to their null values and audit will return.
Manual Action Required:	Using port field of the rIDPB tuple as the member field and GI_pcrd as the module field of the dport key field of rIDCHNPRI tuple, insert the static rIDCHNPRI tuple. As for the values of the other fields, refer to the terminal maintenance and triggers area.
Dump Description:	
<i>Error Address</i> =	The prigrp field of the rIDPB tuple.
<i>Bad Data</i> =	The interf_id field of the rIDPB tuple.
<i>Good Data</i> =	The pri_type field of the rIDPB tuple.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 51 Error Code: PROC_LOST

Error Code:	PROC_LOST

Error Description:	An FRBC trunk has a non-null SVC job process ID, but the process is non-existent.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The SVC job process ID is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The logical port type of the rIDPB tuple (rIFC_PORTTYP.lp_type).
<i>Bad Data</i> =	The SVC job process ID's process number (rIDPB.svcjob_pid.procno).
<i>Good Data</i> =	The SVC job process ID's uniqueness (rIDPB.svcjob_pid.uniq).
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 52 Error Code: PROC_TO

Error Code:	PROC_TO
Error Description:	The process owning B-channel port does not link properly with the B-channel PORTLA.
Possible Error Effect:	Application code may assert when accessing the data and B-channel cannot be used.
Corrective Action Taken:	The PORTLA will be quarantined and process will be purged.
Manual Action Required:	NA.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The process number of PCBLA.
<i>Good Data</i> =	The expected process number from PORTLA.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 53 Error Code: PSTATUS

Error Code:	PSTATUS
Error Description:	The level 3 profile obtained from rIFC_PORTTYP and rIODPSOP static ODD did not match the level 3 profile stored in a B-channel rIDPB tuple being used for the ODB feature.
Possible Error Effect:	The B-channel signaling path may be corrupted.
Corrective Action Taken:	The level 3 data will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the B-DPB tuple.
<i>Bad Data</i> =	The level 3 profile found in the B-DPB tuple.
<i>Good Data</i> =	The level 3 profile derived from static data.
<i>Logical Index</i> =	The key of the B-DPB tuple.
<i>Dump</i> =	The B-channel DPB tuple.

Table 54 Error Code: PTR3

Error Code:	PTR3
Error Description:	According to the D-channel rIDPB tuple for a DSL with two ODB B-channels assigned, both B-channels currently have ODB calls up, however, only one rIDPB B-channel tuple could be accessed by the audit. For each B-channel "use" field in the D-channel rIDPB tuple which is marked to indicate ODB is in use on the respective B-channel (b1use and/or b2use = DMOB_USE) there should exist a corresponding ODB B-channel rIDPB tuple.
Possible Error Effect:	If the B-channel is assigned the ODB feature, then ODB calls can never be originated on this B-channel.
Corrective Action Taken:	The B-channel management data in the associated D-channel rIDPB tuple which corresponds to the B-channel under audit will be recovered to an idle state (b1use or b2use set to DMIDLE_USE and b1pty_resv or b2pty_resv set to 0 depending on which B-channel was marked as using ODB).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the D-channel rIDPB tuple for the DSL.
<i>Bad Data</i> =	Informational: The b1use field in the D-channel rIDPB tuple.
<i>Good Data</i> =	Informational: The b2use field in the D-channel rIDPB tuple.

<i>Logical Index</i> =	The key of the D-channel rIDPB tuple (port)
<i>Dump</i> =	The D-channel rIDPB tuple.

Table 55 Error Code: PTSB_LINK

Error Code:	PTSB_LINK
Error Description:	The routine port conditioning table indicates that a call path should be up (TMportcond[rIORTLA.list where rIDPB.port = rIDPB.port].ispathup = TMPCYES) but the rIDPB tuple is not linked to an rIPTSB tuple (rIDPB.islu_ptsb = 0 and rIDPB.psiu_ptsb = 0) and no process owns the port (rIORTLA.proc_cplr.st_headk = 0 where rIORTLA.port = rIDPB.port). The rIDPB tuple should be linked to an rIPTSB tuple if the routine port conditioning table indicates a path should be up for a given port list except if the port is owned by a process.
Possible Error Effect:	The time slots associated with the rIPTSB tuple will be lost to the system, thus reducing the total number of available time slots.
Corrective Action Taken:	The rIDPB tuple is recovered to an idle state, and the rIORTLA tuple is placed on the to-be-idled list (rIORTLA.list = TMLTTBI), and the terminal maintenance unloader is awakened to process the rIORTLA tuple so that it is eventually set to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The list the port associated with the RLDPB is on (rIORTLA.list where rIORTLA.port = rIDPB.port).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key (rIDPB.port) of the rIDPB tuple.
<i>Dump 1</i> =	The contents of the rIDPB tuple.
<i>Dump 2</i> =	The contents of the associated rIORTLA tuple.

Table 56 Error Code: QUAR_INV

Error Code:	QUAR_INV
Error Description:	The port is not on a recovery list, so the quarantine state should not be in a race condition, but it is.
Possible Error Effect:	Lost resources since this port is out-of-service.
Corrective Action Taken:	The rIDPB tuple is quarantined so it can be recovered by audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	The quarantine state (rIDPB.quarstat).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	NA.

Table 57 Error Code: QUE

Error Code:	QUE
Error Description:	An FRBC trunk has a non-null SVC job identifier, but the ISPA job is no longer on the queue.
Possible Error Effect:	Application code may assert when accessing the data.
Corrective Action Taken:	The SVC job identifier is nulled out.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The logical port type of the rIDPB tuple (rIFC_PORTTYP.lp_type).
<i>Bad Data</i> =	The SVC job identifier of the rIDPB tuple (rIDPB.svcjob_id).
<i>Good Data</i> =	The return value from the function call, TMisqjobid.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 58 Error Code: R_COUNTS

Error Code:	R_COUNTS

Error Description:	The number of TEILA linked to DPB is greater than what user subscribes (specify in DSLEQUIP).
Possible Error Effect:	The error may cause binding and signaling problem.
Corrective Action Taken:	The DSL will be reinitialized and recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	Number of TEILA linked to DPB.
<i>Good Data</i> =	Number of TEILA allowed in DSLEQUIP.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 59 Error Code: SGNOOD

Error Code:	SGNOOD
Error Description:	Using prigrp field of the rIDPB tuple as the key field of rIPRIGRP tuple, audit tried to read the static rIPRIGRP tuple and failed. Audit must find this static ODD tuple and will continue to take this error until it is inserted by office personnel. Refer to the manual action required field as to how to insert the tuple.
Possible Error Effect:	Possible failure of the NFAS/DCBU PRI calls.
Corrective Action Taken:	The pri_type field of the rIDPB tuple will be reset to its null value (TMNULL TYPE) and audit will retun.
Manual Action Required:	Find out the value of the prigrp field from the dump of the rIDPB tuple. Use it as the key field insert the static rIPRIGRP tuple. As for the other fields of the tuple, refer to the terminal maintenance and trigger area.
Dump Description:	
<i>Error Address</i> =	The pri_type field of the rIDPB tuple.
<i>Bad Data</i> =	The prigrp field of the rIDPB tuple.
<i>Good Data</i> =	The interf_id field of the rIDPB tuple.
<i>Logical Index</i> =	The rIDPB tuple's key, port field.
<i>Dump</i> =	The rIDPB tuple being audited.

Table 60 Error Code: TEDBFLAG

Error Code:	TEDBFLAG
Error Description:	The tedb_flag attribute in the DPB tuple is incorrectly set.
Possible Error Effect:	An incorrect linkage may exist between the DPB and either a TEDB tuple or a DALB tuple. This may effect call processing.
Corrective Action Taken:	The tedb_flag will be correctly set according to the servclass found at FC_PORTTYPE. If it is ISDN or ISDN attendant DSL, then tedb_flag will be set to DBYES. If it is an EOC/TMC port, then the tedb_flag is set to DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Valid values are: 0 = If the tedb_flag should be set to DBYES. 1 = If the tedb_flag should be set to DBNO.
<i>Good Data</i> =	Valid values are: 0 = If not ISDN and ISDN attendant or if EOC/TMC port. 1 = If it is ISDN or ISDN attendant.
<i>Logical Index</i> =	The rIDPB key (rIDPB.port).
<i>Dump</i> =	RLDPB.

Table 61 Error Code: TEDBLINK

Error Code:	TEDBLINK
Error Description:	An invalid linkage is found between the rIDPB tuple and a rTEDB tuple.

Possible Error Effect:	Switch cannot communicate with customer premise equipment. EOC/TMC port on IDCU TR303 have lost communication with the switch.
Corrective Action Taken:	Port will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Linkage value from rIDPB tuple to rITEDB (rIDPB.tedb_own.st_headk).
<i>Good Data =</i>	0. There should not be a linkage between the tuples.
<i>Logical Index =</i>	The rIDPB key.
<i>Dump =</i>	The contents of rIDPB tuple.

Table 62 Error Code: TEIBAD

Error Code:	TEIBAD
Error Description:	The fixed terminal endpoint identifier (FTEI) flag indicator in the rIDPB tuple is incorrect. It does not match the same indicator in the corresponding rIDSLEQUIP tuple. This flag is used by call processing to determine if there is a FTEI resource on this digital subscriber line (DSL).
Possible Error Effect:	FTEI resources on this DSL may not function correctly on this DSL.
Corrective Action Taken:	The flag indicator (pfitei) is recovered to the value specified in the corresponding rIDSLEQUIP flag.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	The value of pfitei in the rIDPB before correction.
<i>Good Data =</i>	The value of pfitei in the corresponding rIDSLEQUIP tuple.
<i>Logical Index =</i>	The rIDPB key.
<i>Dump 1 =</i>	The contents of rIDPB tuple.
<i>Dump 2 =</i>	The contents of rIDSLEQUIP tuple.

Table 63 Error Code: TEILALINK

Error Code:	TEILALINK
Error Description:	For non-ISDN line. TEILA should not link to DPB.
Possible Error Effect:	Service cannot be received from this port.
Corrective Action Taken:	The port will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDPB tuple.
<i>Bad Data =</i>	The port which TEILA links to.
<i>Good Data =</i>	0.
<i>Logical Index =</i>	The rIDPB key - port name.
<i>Dump =</i>	The rIDPB tuple.

Table 64 Error Code: TPWAIT

Error Code:	TPWAIT
Error Description:	The tpwait field associated with this DPB is not set correctly according to data in the PORTLA.
Possible Error Effect:	"tpwait" should be on for EOC/TMC ports plus X.75, X.75', FRBC and IP trunks when ISPA terminal process (TP) is waiting for a level 2 setup message, and off for all other ports.
Corrective Action Taken:	The tpwait field will be updated according to the information present in the PORTLA if this is the only error detected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Service class of the dpb tuple (rIFC_PORTTYP.servclass).
<i>Bad Data =</i>	Value of "tpwait" field in the DPB.
<i>Good Data =</i>	"tpwait" value determined from PORTLA.
<i>Logical Index =</i>	NA.
<i>Dump 1 =</i>	The DPB tuple.
<i>Dump 2 =</i>	The PORTLA tuple.

Table 65 Error Code: TWOLINKS

Error Code:	TWOLINKS
Error Description:	A broken linkage is found when traversing the rTEILA tuple through this rIDPB tuple. A broken linkage to rIRTEILA tuple is found on an IDCU TR303 EOC/TMC port.
Possible Error Effect:	Application codes may assert and some of CPEs may not receive any service.
Corrective Action Taken:	The DSL will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDPB key - port name.
<i>Dump</i> =	The rIDPB tuple.

Table 66 Error Code: TYPE

Error Code:	TYPE
Error Description:	The PH channel type stored in the DPB does not agree which that which was computed from the ODD.
Possible Error Effect:	The PORT could be OOS.
Corrective Action Taken:	The "phctyp" field is updated in the DPB to agree with the ODD.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the DPB tuple.
<i>Bad Data</i> =	Value of the "phctyp" field in the DPB.
<i>Good Data</i> =	Value of "phctyp" computer from the ODD.
<i>Logical Index</i> =	Port name.
<i>Dump</i> =	The rIDPB tuple.

Table 67 Error Code: UNEQUAL

Error Code:	UNEQUAL
Error Description:	rIDPB.agi1_bchan and rIDPB.agi2_bchan are equal. This means that both groups are using the same B-channel, which is not allowed.
Possible Error Effect:	CSV, CSD, or ODB calls may be illegally blocked or allowed.
Corrective Action Taken:	None.
Manual Action Required:	Check assignment of associated groups and multi-Line hunt groups (MLHG) on RC/V View 23.2 (DIGITAL SUBSCRIBER LINE) and 23.3 (ASSOCIATED GROUP). Check for overlapping groups, and MLHGs which occur in both groups.
Dump Description:	
<i>Error Address</i> =	Address of the rIDPB tuple.
<i>Bad Data</i> =	rIDPB.agi1_bchan
<i>Good Data</i> =	rIDPB.agi2_bchan
<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump</i> =	The rIDPB tuple.

Table 68 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	All rIDPB tuples for EOC/TMC ports on an IDCU TR303 should have a linkage to an rIRTEILA tuple.
Possible Error Effect:	Message flow between the SM and IDCU RT303 is interrupted.
Corrective Action Taken:	EOC/TMC port is recovered and communication restarted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIDPB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of DPB (rIDPB.port).
<i>Dump</i> =	The contents of the rIDPB tuple.

DPCDPCI

Software Release: 5E11 and later

1. DESTINATION POINT CODE TO DESTINATION POINT CODE INDEX (DPCDPCI) AUDIT

DPCDPCI audit uses the static relation RLDPC_DPCI to verify the existence of the dynamic RLDPC_STAT relation (destination point code status). The missing rIDPC_STAT tuple will be inserted in the system by this audit.

2. DATA STRUCTURES

For details on the fields contained in the RLDPCDPCI relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx).

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BAD_DPC

Error Code:	BAD_DPC
Error Description:	The rIDPC_STAT.dpc does not equal rIDPC_DPCI.dpc for the destination point code (DPC) index (rIDPC_STAT.dpci).
Possible Error Effect:	A copy of the DPC information is kept in the protocol handler (PH). If the PH information is not correct, the routing function in the PH cannot find the correct destination for message signaling units (MSUs).
Corrective Action Taken:	The audit sets rIDPC_STAT.dpc equal to rIDPC_DPCI.dpc and sends a message to the signaling, transfer and route management (STRM) process to order the DPCs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIDPC_STAT tuple.
<i>Bad Data =</i>	rIDPC_STAT.dpc.
<i>Good Data =</i>	rIDPC_DPCI.dpc (key of rIDPC_DPCI).
<i>Logical Index =</i>	rIDPC_STAT.dpci (key of rIDPC_STAT).
<i>Dump =</i>	NA.

Table 2 Error Code: DPC_BAD

Error Code:	DPC_BAD
Error Description:	The CCaccpcidx_dpc[message transfer part (MTP) for accounting. CCaccpcidx_dpc[rIDPC_DPCI.accpcindx] does not equal rIDPC_DPCI.dpc from a tuple whose key is rIDPC_DPCI.dpcindx.
Possible Error Effect:	Incorrect translation occur while attempting to populate the counts message sent to the administration module (AM). All counts are lost for that index value due to the incorrect translations.
Corrective Action Taken:	The audit sets CCaccpcidx_dpc[rIDPC_DPCI.accpcindx] equal to rIDPC_DPCI.dpc.

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_DPCI.accpcindx.
<i>Bad Data =</i>	CCaccpcidx_dpc[rIDPC_DPCI.accpcindx].
<i>Good Data =</i>	rIDPC_DPCI.dpc.
<i>Logical Index =</i>	rIDPC_DPCI.dpcindx.
<i>Dump =</i>	NA.

Table 3 Error Code: DUPTUP

Error Code:	DUPTUP
Error Description:	The audit tries to insert an rIDPC_STAT tuple which it believes to be missing. The insert fails because the position of the tuple with the missing key is occupied. This indicates that the key of the tuple which is believed to be missing is incorrect.
Possible Error Effect:	A copy of the DPC information is kept in the PH. If the information is not correct, the routing function in the PH cannot find the correct destination for message signaling units.
Corrective Action Taken:	The DPCSTAT audit deletes the incorrect rIDPC_DPCI tuple which occupies the position of the missing rIDPC_DPCI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	rIDPC_STAT.dpci.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 4 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	There is no tuple in relation RLDPC_STAT with a key equal to rIDPC_DPCI.dpcindx.
Possible Error Effect:	A copy of the DPC information is kept in the PH. The information includes the destination point code index (DPCI) of the DPC. If the information is not correct, the routing function in the PH cannot find the correct destination for message signaling units.
Corrective Action Taken:	The audit constructs, inserts and links the missing rIDPC_STAT tuple to the rILS_STAT and rIRCGTMR idle lists and sends a message to the STRM process to order the DPCs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	rIDPC_DPCI.dpcindx.
<i>Logical Index =</i>	rIDPC_DPCI.dpc.
<i>Dump =</i>	NA.

Table 5 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	An entry in CCacc[codx_dpc[] is not in use because its index does not equal rIDPC_DPCI.accpcindx from any rIDPC_DPCI tuple. The entry should be set to its null value ((DMULONG)CCEMPTYTUP) but is not.
Possible Error Effect:	An incorrect value in the table could be translated to a valid DPC.
Corrective Action Taken:	The audit sets the CCaccpcidx_dpc[] entry to (DMULONG)CCEMPTYTUP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CCaccpcidx_dpc[index].
<i>Good Data =</i>	(DMULONG)CCEMPTYTUP.
<i>Logical Index =</i>	Index.
<i>Dump =</i>	NA.

Table 6 Error Code: OPCODE

Error Code:	OPCODE
Error Description:	The CCaccpcidx_dpc[] has the point codes related to the MTP for accounting. CCaccpcidx_dpc[1] should equal the office point code (Gloffpc) but does not.
Possible Error Effect:	Incorrect translation occurs while attempting to populate the counts message sent to the AM. All counts are lost for that index value due to the incorrect translations.
Corrective Action Taken:	The audit sets CCaccpcidx_dpc[1] equal to Gloffpc.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CCaccpcidx_dpc[1].
<i>Good Data =</i>	Gloffpc (office point code).
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 7 Error Code: SDATA_CON_ERR

Error Code:	SDATA_CON_ERR
Error Description:	The audit tries to find a tuple in relation RLDPC_INFO with a key equal to rIDPC_DPCI.dpcindx. The tuple in relation RLDPC_INFO does not exist.
Possible Error Effect:	The DPC information in the PH will not be initialized correctly. If the DPC information is not correct, the routing function in the PH cannot find the correct destination for MSUs.
Corrective Action Taken:	None.
Manual Action Required:	Insert a tuple into RLDPC_INFO such that the rIDPC_INFO.dpcindx equals rIDPC_DPCI.dpcindx for the DPC (rIDPC_DPCI.dpc). Consult the population rules for RLDPC_INFO and RLDPC_DPCI.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	rIDPC_DPCI.dpcindx.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	rIDPC_DPCI.dpc.
<i>Dump =</i>	NA.

DPCSTAT

Software Release: 5E11 and later

1. DESTINATION POINT CODE STATUS (DPCSTAT) AUDIT

DPCSTAT audit step through every tuple in the dynamic relation RLDPC_STAT (destination point code status). For every tuple, it checks the existence of the corresponding static relation RLDPC_DPCI (destination point code to destination point code index). The audit also checks the linkage between RLDPC_STAT and RLLS_STAT (link set status) and RLCLS_STAT (combined link set status). It also checks the semantic data in the RLDPC_STAT against RLS7RDB (CCS7 routing data block), RLLS_STAT and RLLNK_STAT (link status). This audit also makes sure that eight rIS7RDB tuples existing for each destination point code (DPC). Any missing rIS7RDB tuple will be inserted.

2. DATA STRUCTURES

For details on the fields contained in the RLDPC_STAT relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: ACC_BAD

Error Code:	ACC_BAD
Error Description:	CCsmdpcls_ht[] is the DPC to link set routing table which is built from RLDPC_STAT. CCsmdpcls_ht[rIDPC_STAT.dpci].access does not equal rIDPC_STAT.acc for a DPC.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	The audit sets CCsmdpcls_ht[rIDPC_STAT.dpci].access equal to rIDPC_STAT.acc for the DPC index (DPCI).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CCsmdpcls_ht[rIDPC_STAT.dpci].
<i>Bad Data =</i>	CCsmdpcls_ht[rIDPC_STAT.dpci].access.
<i>Good Data =</i>	rIDPC_STAT.acc.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 2 Error Code: APC_BAD

Error Code:	APC_BAD
Error Description:	The error is due to one of the following: 1 = NMpcc7buf[rIDPC_STAT.dpci].apc is DBYES and rIDPC_STAT.apcindx is 0 for a DPCI. NMpcc7buf[rIDPC_STAT.dpci].apc should be DBNO for the same DPCI, but is not. 2 = NMpcc7buf[rIDPC_STAT.dpci].apc is DBNO and rIDPC_STAT.apcindx is

	not 0 for a DPCI. NMpcc7buff[rIDPC_STAT.dpci].apc should be DBYES for the same DPCI, but is not.
Possible Error Effect:	Corresponds to the Error Description as follows: 1 = Network management (NM) may report that a point code is an adjacent point code (APC) when it is not. Routing through this APC fails. 2 = NM may report that a point code is not an APC when it is. This APC is not used for routing.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = Audit sets NMpcc7buff[rIDPC_STAT.dpci].apc to DBNO. 2 = Audit sets NMpcc7buff[rIDPC_STAT.dpci].apc to DBYES.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	(1) or (2) indicates Error Description, Error Effect and Corrective Action.
<i>Bad Data =</i>	NMpcc7buff[rIDPC_STAT.dpci].apc.
<i>Good Data =</i>	rIDPC_STAT.apc.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 3 Error Code: ARRAY_ENTRY_BAD

Error Code:	ARRAY_ENTRY_BAD
Error Description:	CCapci2dpci[] is the adjacent point code index (APCI) to DPCI table. CCsmdpcls_ht[] is the DPC to link set routing table. CCapci2dpci[index] must equal CCsmdpcls_ht[CCapci2dpci[index].dpci].apcindx, but does not.
Possible Error Effect:	Signaling traffic and route management (STRM) messages may be going to incorrect signaling points, resulting in dropped or misrouted calls.
Corrective Action Taken:	The audit sets CCapci2dpci[index] equal to CCsmdpcls_ht[CCapci2dpci[index].dpci].apcindx.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	CCdpclsidx.
<i>Bad Data =</i>	CCapci2dpci[index].
<i>Good Data =</i>	CCsmdpcls_ht[CCapci2dpci[index]].apcindx.
<i>Logical Index =</i>	Index.
<i>Dump =</i>	NA.

Table 4 Error Code: BAD_APCI

Error Code:	BAD_APCI
Error Description:	The error is due to one of the following: 1 = rIDPC_STAT.apcindx does not equal rIDPC_INFO.apcindx for the DPCI. 2 = CCsmdpcls_ht[rIDPC_STAT.dpci].apcindx does not equal rIDPC_STAT.apcindx for the DPCI. 3 = CCapci2dpci[CCsmdpcls_ht[rIDPC_STAT.dpci]].apcindx does not equal rIDPC_STAT.apcindx.
Possible Error Effect:	STRM messages may be going to incorrect signaling points, resulting in dropped or misrouted calls in both cases.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = The audit sets rIDPC_STAT.apcindx equal to rIDPC_INFO.apcindx.

	2 = The audit sets CCsmdpcls_ht[rIDPC_STAT.dpci].apcindx equal to rIDPC_STAT.apcindx for the DPCI. 3 = The audit sets CCapci2dpci[CCsmdpcls_ht[rIDPC_STAT.dpci]].apcindx equal to rIDPC_STAT.apcindx.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	(1), (2) or (3) indicates Error Description, Corrective Action and Dump Description.
<i>Bad Data</i> =	Corresponds to the Error Description and Corrective Action, as follows: 1 = rIDPC_STAT.apcindx.
<i>Good Data</i> =	Corresponds to the Error Description and Corrective Action, as follows: 1 = rIDPC_INFO.apcindx. 2 = rIDPC_STAT.apcindx. 3 = rIDPC_STAT.dpci.
<i>Logical Index</i> =	Corresponds to the Error Description and Corrective Action, as follows: 1 = rIDPC_INFO.dpci. 2 = rIDPC_STAT.dpci. 3 = rIDPC_STAT.apcindx.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 5 Error Code: BAD_BIT_SET

Error Code:	BAD_BIT_SET
Error Description:	A DPC is an APC. Its remote route status bit in rIDPC_STAT.rrs is not set.
Possible Error Effect:	Route set testing is done unnecessarily on the direct link to the APC.
Corrective Action Taken:	The audit sets the remote route status bit for the DPC in rIDPC_STAT.rrs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDPC_INFO.apcindx.
<i>Bad Data</i> =	rIDPC_STAT.rrs.
<i>Good Data</i> =	rIDPC_STAT.dpc.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	NA.

Table 6 Error Code: BAD_CONGEST

Error Code:	BAD_CONGEST
Error Description:	A DPC is inaccessible. Its remote route congestion (rIDPC_STAT.rmtcg) should be equal to CCNOCONG, but is not.
Possible Error Effect:	STRM tries unsuccessfully to reduce the remote congestion level of an inaccessible DPC.
Corrective Action Taken:	The audit sets rIDPC_STAT.rmtcg equal to CCNOCONG for the DPC.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDPC_STAT.dpc.
<i>Bad Data</i> =	rIDPC_STAT.rmtcg.
<i>Good Data</i> =	CCNOCONG.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 7 Error Code: BAD_DPC

Error Code:	BAD_DPC
Error Description:	The audit checks the ordering of the DPCs in CCdpc2dpci[] against the ordering in RLDPC_STAT. The array is missing a DPC.
Possible Error Effect:	Common channel signaling 7 (CCS7) cannot signal/route to the missing DPC.
Corrective Action Taken:	The audit sets CCdpc2dpci[].dpc to rIDPC_STAT.dpc, and CCdpc2dpci[].dpci to rIDPC_STAT.dpci, and triggers table hashsums to be recalculated.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc of previous rIDPC_STAT tuple.
<i>Bad Data =</i>	CCdpc2dpci[index].dpc which is out of order.
<i>Good Data =</i>	rIDPC_STAT.dpc from the current tuple.
<i>Logical Index =</i>	Index.
<i>Dump =</i>	NA.

Table 8 Error Code: BAD_LSOWNER

Error Code:	BAD_LSOWNER
Error Description:	The error is due to one of the following: 1 = A DPC is owned by a link set (rILS_STAT.lsnun), but the link set is neither the normal link set nor one of the alternate link sets used to reach the DPC. 2 = A DPC is owned by a combined link set (rCLS_STAT.lsnun + CC7MXLS), but the combined link set is neither the normal combined link set nor one of the alternate combined link sets used to reach the DPC.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC in both cases.
Corrective Action Taken:	The audit links the rIDPC_STAT tuple to the rILS_STAT idle list and sends a message to do route correction to the STRM system process.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPC_STAT tuple.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 1 = rILS_STAT.lsnun. 2 = rCLS_STAT.lsnun + CC7MXLS.
<i>Good Data =</i>	(1) or (2) indicates Error and Dump Descriptions.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple..

Table 9 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	The error is due to one of the following: 1 = rIDPC_STAT.cls_own is set to DBNO. The rIDPC_STAT.dpc_ls.st_ownk should contain the physical key of a tuple in relation RLLS_STAT but it does not. 2 = rIDPC_STAT.cls_own is set to DBYES. The rIDPC_STAT.dpc_ls.st_ownk should contain the physical key of a tuple in relation RLCLS_STAT but it does not.
Possible Error Effect:	Traffic diversion is not done correctly.
Corrective Action Taken:	In either case, the audit links the rIDPC_STAT tuple to the rILS_STAT idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPC_STAT tuple.

<i>Bad Data</i> =	rIDPC_STAT.dpc.
<i>Good Data</i> =	(1) or (2) indicates Error Description.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 10 Error Code: BADIDLE

Error Code:	BADIDLE
Error Description:	The remote route status bit in rIDPC_STAT.rss for a DPCI is set. The routing data block (RDB) for the DPCI of the DPC is on route set test (RST) timing but it should not be on RST timing.
Possible Error Effect:	Unnecessary RST timing messages are generated for the DPC.
Corrective Action Taken:	The audit removes the DPCI from route set test timing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIDPC_STAT tuple.
<i>Bad Data</i> =	rIRSTMR.rnum.
<i>Good Data</i> =	rIDPC_STAT.dpci.
<i>Logical Index</i> =	rIS7RDB.rdb_id.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 11 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	The DPC is inaccessible. The RDB for the DPCI of the DPC should be on RST timing but it is not.
Possible Error Effect:	STRM tries unsuccessfully to reduce the remote congestion level of an inaccessible DPC.
Corrective Action Taken:	The RDB is placed on RST timing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIDPC_STAT tuple.
<i>Bad Data</i> =	rIRSTMR.rnum invalid owner.
<i>Good Data</i> =	rIDPC_STAT.dpci.
<i>Logical Index</i> =	rIS7RDB.rdb_id.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 12 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	An rIS7RDB tuple should exist for every offset of a DPCI. The audit determines that a tuple is missing and uses a database (DB) primitive to insert the tuple. The primitive fails to insert the tuple.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	The audit tries the insertion during its next iteration.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	rIDPC_STAT.dpci.
<i>Good Data</i> =	Offset of the routing data block tuple.
<i>Logical Index</i> =	rIS7RDB.rdb_id.
<i>Dump</i> =	NA.

Table 13 Error Code: BDPCR

Error Code:	BDPCR
Error Description:	CCsmdpcis_ht[rIDPC_STAT.dpci].norm_rte does not equal rIDPC_STAT.rt_prll for a DPCI.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	The audit sets CCsmdpcis_ht[rIDPC_STAT.dpci].norm_rte equal to rIDPC_STAT.rt_prll.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Address of copy of CCsmdpcls_ht[] entry.
<i>Bad Data</i> =	CCsmdpcls_ht[].norm_rte.
<i>Good Data</i> =	rIDPC_STAT.rt_prll.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 14 Error Code: BIT1MAP

Error Code:	BIT1MAP
Error Description:	A DPC is marked accessible (rIDPC_STAT.acc equals DBYES), but the bit for its DPCI in the bitmap in the adjacent point code index array (CCdpc_status[]) is not set to 1.
Possible Error Effect:	CCS7 resources may be wasted trying to make an accessible DPC inaccessible.
Corrective Action Taken:	The audit sets the bit in the bitmap in CCdpc_status[] to 1.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDPC_STAT.acc.
<i>Bad Data</i> =	Incorrect bit value.
<i>Good Data</i> =	rIDPC_STAT.dpc.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	NA.

Table 15 Error Code: BIT2MAP

Error Code:	BIT2MAP
Error Description:	A DPC is marked inaccessible (rIDPC_STAT.acc equals DBNO) but the bit for its DPCI in the bitmap in adjacent point code index array (CCdpc_status[]) is not set to 0.
Possible Error Effect:	CCS7 resources may be wasted trying to make an inaccessible DPC accessible.
Corrective Action Taken:	The audit sets the bit in the bitmap in CCdpc_status[] to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDPC_STAT.acc.
<i>Bad Data</i> =	Incorrect bit value.
<i>Good Data</i> =	rIDPC_STAT.dpc.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	NA.

Table 16 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	The DPC is accessible. Its remote congestion is set to not congested. The RDB for the DPCI of the DPC is on RST timing but it should not be on RST timing.
Possible Error Effect:	STRM tries unsuccessfully to reduce the remote congestion level of an inaccessible DPC.
Corrective Action Taken:	The DPC is unlinked from the rIRCGTMR busy list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIDPC_STAT tuple.
<i>Bad Data</i> =	Logical key of rIRCGTMR owner.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 17 Error Code: CCINDEX

Error Code:	CCINDEX
Error Description:	The error is due to one of the following: 1 = The CCS parameter CCapcindx does not equal the number of adjacent point code indexes (APCIs) in the office (rIINDEX.max_idx) where rIINDEX.idx_name = CCAPCINDEX. 2 = The CCS parameter CCdpcsidx does not equal the highest DPCI in the

	office (rIINDEX.max_idx), where rIINDEX.idx_name = CCDPCIMAX.
Possible Error Effect:	In both cases, calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = The audit sets CCapcindx equal to rIINDEX.max_idx. 2 = The audit sets CCdpclsidx equal to rIINDEX.max_idx.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	(1) or (2) indicates Error and Dump Descriptions.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 1 = CCapcindx. 2 = CCdpclsidx.
<i>Good Data =</i>	rIINDEX.max_idx.
<i>Logical Index =</i>	Corresponds to the Error Description as follows: 1 = CCAPCINDEX. 2 = CCDPCIMAX.
<i>Dump =</i>	NA.

Table 18 Error Code: CLS1_LSNUM_MISS

Error Code:	CLS1_LSNUM_MISS
Error Description:	The owner of a DPC is a combined link set. Link set one (rICLS_STAT.lsn1) of the combined link set (rICLS_STAT.clsnum) is not found in RLLS_STAT.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	The audit inserts the missing link set in RLLS_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpci.
<i>Bad Data =</i>	rICLS_STAT.lsn1.
<i>Good Data =</i>	rIDPC_STAT.dpc.
<i>Logical Index =</i>	rICLS_STAT.clsnum.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 19 Error Code: CLS2_LSNUM_MISS

Error Code:	CLS2_LSNUM_MISS
Error Description:	The owner of a DPC is a combined link set. Link set two (rICLS_STAT.lsn2) of the combined link set (rICLS_STAT.clsnum) is not found in RLLS_STAT.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	The audit inserts the missing link set in RLLS_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpci.
<i>Bad Data =</i>	rICLS_STAT.lsn2.
<i>Good Data =</i>	rIDPC_STAT.dpc.
<i>Logical Index =</i>	rICLS_STAT.clsnum.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 20 Error Code: CLSNUM_BAD

Error Code:	CLSNUM_BAD
Error Description:	The error is due to one of the following:

	1 = The link set (rIDPC_DPCI.lnk_set) which owns a DPC is a combined link set. A tuple whose key (rCLS_STAT.clsnum) equals rIDPC_DPCI.lnk_set - CC7MXLS does not exist in RLCLS_STAT. 2 = An alternate link set (rIDPC_DPCI.altls[0]) for a DPC is a combined link set. A tuple whose key (rCLS_STAT.clsnum) equals rIDPC_INFO.altls[] - CC7MXLS does not exist in RLCLS_STAT
Possible Error Effect:	In either case, traffic diversion is not done correctly.
Corrective Action Taken:	Another audit inserts the missing tuple into relation RLCLS_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index into rIDPC_INFO.altls[].
<i>Bad Data =</i>	Corresponds to the Error Description as follows:
	1 = rIDPC_DPCI.lnk_set. 2 = rIDPC_INFO.altls[index].
<i>Good Data =</i>	(1) or (2) indicates Error and Dump Descriptions.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 21 Error Code: CLS_BAD

Error Code:	CLS_BAD
Error Description:	The error is due to one of the following: 1 = The normal route for a DPC is a combined link set (rIDPC_DPCI.lnk_set) but rIDPC_STAT.cls[0] does not equal rIDPC_DPCI.lnk_set. 2 = The normal route for a DPC is a combined link set (rIDPC_DPCI.lnk_set), but rIDPC_STAT.rte[0] does not equal the offset of the routing data block for the normal route used to reach the DPC. 3 = The first alternate route for a DPC is a combined link set (rIDPC_INFO.altls[0] > CC7MXLS), but rIDPC_STAT.cls[] does not equal rIDPC_INFO.altls[] for the DPC. 4 = An alternate route for a DPC is a combined link set (rIDPC_INFO.altls[] > CC7MXLS), but rIDPC_STAT.rte[0] does not equal the offset of the routing data block for the alternate route used to reach the DPC.
Possible Error Effect:	Traffic diversion is not done correctly in all cases.
Corrective Action Taken:	Corresponds to the Error Description as follows:
	1 = The audit sets rIDPC_STAT.cls[0] equal to rIDPC_DPCI.lnk_set for the DPC. 2 = The audit sets rIDPC_STAT.rte[0] equal to 0 for the DPC. 3 = The audit sets rIDPC_STAT.cls[] equal to rIDPC_INFO.altls[]. 4 = The audit set rIDPC_STAT.rte[] equal to the offset.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	(1), (2) or (3) indicates Error Description, Corrective Action and Dump Description.
<i>Bad Data =</i>	Corresponds to the Error Description and Corrective Action, as follows:

	1 = rIDPC_STAT.cls[0]. 2 = rIDPC_STAT.rte[0].
<i>Good Data</i> =	Corresponds to the Error Description and Corrective Action, as follows: 1 = rIDPC_DPCI.lnk_set. 2 = 0 (offset of first routing data block). 4 = Offset of the routing data block for alternate route.
<i>Logical Index</i> =	Corresponds to the Error Description and Corrective Action, as follows: 1 = rIDPC_STAT.dpci. 2 = rIDPC_STAT.dpci.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 22 Error Code: CLS_LSNUM_BAD

Error Code:	CLS_LSNUM_BAD
Error Description:	A DPC is owned by a combined link set (rCLS_STAT.clsnum). CCsmdpcls_ht[rIDPC_STAT.dpci].ls does not equal rCLS_STAT.clsnum + CC7MXLS for the DPC.
Possible Error Effect:	Traffic diversion is not done correctly.
Corrective Action Taken:	The audit sets CCsmdpcls_ht[rIDPC_STAT.dpci].ls equal to rCLS_STAT.clsnum + CC7MXLS.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDPC_STAT.dpc.
<i>Bad Data</i> =	CCsmdpcls_ht[rIDPC_STAT.dpci].ls.
<i>Good Data</i> =	rCLS_STAT.clsnum + CC7MXLS.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	NA.

Table 23 Error Code: CON_ERR_APC_DPC

Error Code:	CON_ERR_APC_DPC
Error Description:	The audit tries to get the adjacent DPCI for a DPC which is an adjacent DPC for an APCI. It uses rAPCI_APC.apc to find a match in RLDPC_DPCI for rAPCI_APC.apc but cannot find a match.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	None.
Manual Action Required:	Insert an RLDPC_DPCI tuple with the key (rIDPC_DPCI.dpc) equal to rAPCI_APC.apc. Refer to population rules for RLDPC_DPCI.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rIDPC_DPCI.dpc.
<i>Dump</i> =	NA.

Table 24 Error Code: CONFLICT

Error Code:	CONFLICT
Error Description:	The error is one of the following: 1 = The current DPC (rIDPC_STAT.dpc) is an SCCP DPC because there is a tuple in relation relation RLDPC_SSN whose rIDPC_SSN.dpc equals

	rIDPC_STAT.dpc and whose rIDPC_SSN.net_num equals the current global switching module (GSM) number. The rIDPC_STAT.sccp_con for this DPC should be set to DBYES but is not. 2 = The current DPC (rIDPC_STAT.dpc) is not an SCCP DPC because there is no tuple in relation RLDPC_SSN whose rIDPC_SSN.dpc equals rIDPC_STAT.dpc and whose rIDPC_SSN.net_num equals the current GSM number. The rIDPC_STAT.sccp_con for this DPC should be set to DBNO but is not.
Possible Error Effect:	Corresponds to the Error Description as follows: 1 = The message transfer part (MTP) on this GSM thought that the DPC is not an SCCP DPC. MTP has not been reporting status changes of the DPC to SCCP. SCCP may be routing its traffic over an incorrect route or may be blocking traffic. 2 = The MTP on this GSM thought that the DPC is an SCCP DPC. Some real-time is spent reporting status changes of the DPC to SCCP which will ignore the reports.
Corrective Action Taken:	The audit set rIDPC_STAT.sccp_con to DBYES in the first case and to DBNO in the second case.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	AUnet_num (SCCP's number for the current GSM).
<i>Bad Data =</i>	rIDPC_STAT.sccp_con.
<i>Good Data =</i>	Correct value for rIDPC_STAT.sccp_con.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of RLDPC_STAT tuple.

Table 25 Error Code: COUNT_BAD

Error Code:	COUNT_BAD
Error Description:	While stepping through the list of DPCs in the office (using rIDPC_STAT.nextdpc), the audit has found either: 1 = Too many DPCs (more than rIINDX.max_idx) or 2 = Too few DPCs (less than rIINDX.max_idx).
Possible Error Effect:	CCS7 cannot build the routing table, and the audit cannot verify the routing table because dynamic relation rIDPC_STAT is corrupt. CCS7 cannot signal/route to any DPC.
Corrective Action Taken:	The audit triggers table hashsums to be recalculated and sends a message to STRM to regenerate the DPCs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc.
<i>Bad Data =</i>	rIDPC_STAT.nextdpc.
<i>Good Data =</i>	rIINDX.max_idx.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 26 Error Code: DPCZERO_ERROR

Error Code:	DPCZERO_ERROR
Error Description:	The rIDPC_STAT tuple with the key (rIDPC_STAT.dpci) of zero contains the DPCI (rIDPC_STAT.nextdpc) of the first DPC in the office. This tuple with the key of zero must exist, but does not.
Possible Error Effect:	CCS7 cannot signal/route to any DPC.

Corrective Action Taken:	The audit inserts the rIDPC_STAT tuple with the key of zero.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 27 Error Code: DPCI_CON_ERR

Error Code:	DPCI_CON_ERR
Error Description:	CCdpc2dpci[] is the DPC to DPCI table built from rIDPC_STAT. CCdpc2dpci[].dpci does not equal rIDPC_STAT.dpci for a DPC.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	The audit sets CCdpc2dpci[].dpci equal to rIDPC_STAT.dpci.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpci.
<i>Bad Data =</i>	CCdpc2dpci[index].dpci.
<i>Good Data =</i>	rIDPC_STAT.dpci.
<i>Logical Index =</i>	Index.
<i>Dump =</i>	NA.

Table 28 Error Code: DPCPRE_SUC

Error Code:	DPCPRE_SUC
Error Description:	The audit is unable to read the rIDPC_STAT tuple whose key is stored in the current rIDPC_STAT tuple's nextdpc field. rIDPC_STAT.nextdpc from the current rIDPC_STAT tuple is used to read another rIDPC_STAT tuple, but the read is not successful.
Possible Error Effect:	The audit cannot check that the routing table is correctly populated due to incorrect database linkage of the DPCs. CCS7 cannot signal/route to the DPC whose DPCI is stored in rIDPC_STAT.nextdpc of the current rIDPC_STAT tuple.
Corrective Action Taken:	The audit triggers table hashsums to be recalculated and sends a message to STRM to regenerate the DPCs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPC_STAT tuple.
<i>Bad Data =</i>	rIDPC_STAT.nextdpc of current tuple.
<i>Good Data =</i>	rIDPC_STAT.dpc of current tuple.
<i>Logical Index =</i>	rIDPC_STAT.dpci of current tuple.
<i>Dump =</i>	NA.

Table 29 Error Code: DPC_ACC

Error Code:	DPC_ACC
Error Description:	The error is due to one of the following: 1 = The DPC is owned by the rILS_STAT idle list because rIDPC_STAT.dpc_ls.st_ownd equals DBDPC_STATIDLE. The rIDPC_STAT.acc in the tuple equals DBYES, but should equal DBNO. 2 = The DPC is owned by the rILS_STAT busy list because rIDPC_STAT.dpc_ls.st_ownd is greater than DBDPC_STATIDLE. The rIDPC_STAT.acc in the tuple equals DBNO, but should equal DBYES. 3 = The DPC is owned by the rICLS_STAT busy list because rIDPC_STAT.dpc_ls.st_ownd has the physical key of a tuple in relation RLCLS_STAT. The rIDPC_STAT.acc equals DBNO, but should equal DBYES.

Possible Error Effect:	Corresponds to the Error Description as follows: 1 = Invalid accessibility status could be sent to the signaling message handler (SMH). The SMH in turn may try to send a message to link set 0. 2 = Incorrect data may be sent to the SMH. If the SMH's tables are built from the corrupted data, the SMH may send message to the DPC since it will assume that DPC is accessible even though it is not. 3 = Incorrect data may be sent to the SMH. If the SMH's tables are built from the corrupted data, the SMH may send message to the DPC since it will assume that DPC is accessible even though it is not.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = The audit sets rIDPC_STAT.acc equal to DBNO and sets rIDPC_STAT.rmtcg equal to CCNOCONG. 2 = The audit links the rIDPC_STAT tuple to the rILS_STAT idle list and sends a message to the STRM to do route correction. 3 = The audit links the rIDPC_STAT tuple to the rILS_STAT idle list and sends a message to the STRM to do route correction.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc.
<i>Bad Data =</i>	Corresponds to the Error Description, Error Effect and Corrective Action as follows: 1 = rILS_STAT.lsnnum. 2 = rILS_STAT.lsnnum. 3 = rCLS_STAT.clsnum.
<i>Good Data =</i>	(1), (2), or (3) indicates Error Description, Corrective Action and Dump Description.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 30 Error Code: DPC_BAD

Error Code:	DPC_BAD
Error Description:	The error is due to one of the following: 1 = The rIDPC_STAT.dpc does not equal rIDPC_DPCI.dpc for the DPCI of a DPC. 2 = CCsmdpcls_ht[rIDPC_STAT.dpci].dpc does not equal rIDPC_STAT.dpc for the DPCI of a DPC.
Possible Error Effect:	Operational code accesses incorrect data if it tries to use rIDPC_STAT.dpc as the key to read rIDPC_DPCI.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = The audit sets rIDPC_STAT.dpc equal to rIDPC_DPCI.dpc. 2 = The audit has CCsmdpcls_ht[rIDPC_STAT.dpci].dpc set equal to rIDPC_STAT.dpc.

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	(1) or (2) indicates Error Description, Corrective Action and Dump Description.
<i>Bad Data =</i>	Corresponds to the Error Description and Corrective Action as follows: 1 = rIDPC_STAT.dpc. 2 = CCsmdpcis_ht[rIDPC_STAT.dpci].dpc.
<i>Good Data =</i>	Corresponds to the Error Description and Corrective Action as follows: 1 = rIDPC_DPCI.dpc. 2 = rIDPC_STAT.dpc.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 31 Error Code: DPC_CON_ERR

Error Code:	DPC_CON_ERR
Error Description:	The number of DPCs in the office (CCno_dpc_sm) does not equal the number the audit reads from rIINDEX.max_idx.
Possible Error Effect:	Any DPC inserted/deleted using recent change (RC) either fails or invalidates the ordering of the DPCs if the insert/delete succeeds. CCS7) cannot signal/route to the DPC which was inserted, or CCS7 may try to signal/route to the DPC which was deleted.
Corrective Action Taken:	The audit sets CCno_dpc_sm equal to rIINDEX.max_idx.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CCno_dpc_sm.
<i>Bad Data =</i>	Value of CCno_dpc_sm.
<i>Good Data =</i>	rIINDEX.max_idx.
<i>Logical Index =</i>	rIINDEX.idx_name.
<i>Dump =</i>	NA.

Table 32 Error Code: EXTRA_DPC

Error Code:	EXTRA_DPC
Error Description:	RLDPC_STAT indicates that the office has DPCs (rIDPC_STAT.nextdpc != 0 for the tuple with the key of zero), but there are no DPCs in the office (rIINDEX.max_idx for CCS7 == zero).
Possible Error Effect:	There is an invalid DPC in the routing table. CCS7 never accesses it, but the routing table is built incorrectly. This may trigger asserts during SM/PH initializations.
Corrective Action Taken:	The audit sets rIDPC_STAT.nextdpc in the tuple with the key of zero to zero.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPC_STAT tuple.
<i>Bad Data =</i>	rIDPC_STAT.nextdpc
<i>Good Data =</i>	rIINDEX.max_idx.
<i>Logical Index =</i>	CCDPCINDEX.
<i>Dump =</i>	NA.

Table 33 Error Code: GRPINFO

Error Code:	GRPINFO
Error Description:	The APCI (rILS_STAT.apci) does not equal rILS_GRP.apci for the same link set which is a primary/alternate route for a DPC. The link set is the key to both relations (rILS_STAT.lsnnum and rILS_GRP.lsnnum).
Possible Error Effect:	If operational code tries to translate the APCI to an APC, it will get the wrong APC or no APC at all.

Corrective Action Taken:	The audit sets rLS_STAT.apci equal to rLS_GRP.apci for the link set.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rLS_STAT.
<i>Bad Data =</i>	rLS_STAT.apci.
<i>Good Data =</i>	rLS_GRP.apci.
<i>Logical Index =</i>	Link set number.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 34 Error Code: IDLE_BUSY

Error Code:	IDLE_BUSY
Error Description:	A destination point code (DPC) is owned by the rLS_STAT idle list. It is also owned by the rRCGTMR busy list, but should not be on remote congestion timing because it is on the idle list of relation RLLS_STAT.
Possible Error Effect:	STRM tries unsuccessfully to reduce the remote congestion level of an inaccessible DPC.
Corrective Action Taken:	The audit unlinks the DPC's rIDPC_STAT tuple from the rRCGTMR busy list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPC_STAT tuple.
<i>Bad Data =</i>	Key of rRCGTMR owner tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 35 Error Code: INDEX

Error Code:	INDEX
Error Description:	CCsmdpcls_ht[rIDPC_STAT.dpci].mtxindx does not equal rIDPC_STAT.mtxindx for a DPC.
Possible Error Effect:	Operational code will access incorrect data if it uses CCsmdpcls_ht[rIDPC_STAT.dpci].mtxindx to index into the policing matrix table.
Corrective Action Taken:	The audit sets CCsmdpcls_ht[rIDPC_STAT.dpci].mtxindx equal to rIDPC_STAT.mtxindx.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc.
<i>Bad Data =</i>	CCsmdpcls_ht[rIDPC_STAT.dpci].mtxindx.
<i>Good Data =</i>	rIDPC_STAT.mtxindx.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	NA.

Table 36 Error Code: INFO_ERR

Error Code:	INFO_ERR
Error Description:	The accessibility of the DPC in the NM array (NMpcc7buff[rIDPC_STAT.dpci].cur_dpc_inac) does not equal rIDPC_STAT.acc.
Possible Error Effect:	Incorrect point code status could be reported to the remote network management center.
Corrective Action Taken:	The audit sets NMpcc7buff[rIDPC_STAT.dpci].cur_dpc_inac to DBNO if rIDPC_STAT.acc is DBYES and to DBYES if rIDPC_STAT.acc is DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc.
<i>Bad Data =</i>	NMpcc7buff[rIDPC_STAT.dpci].cur_dpc_inac.
<i>Good Data =</i>	rIDPC_STAT.acc.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	NA.

Table 37 Error Code: INV

Error Code:	INV
Error Description:	The remote congestion value (rIDPC_STAT.rmtcg) for a DPC is set to an invalid value.

Possible Error Effect:	The remote congestion of the DPC on the SM might not agree with remote congestion status of the DPC on the responsible PH.
Corrective Action Taken:	The audits corrects the value of the remote route congestion during its next iteration.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPC_STAT tuple.
<i>Bad Data =</i>	rIDPC_STAT.rmtcg.
<i>Good Data =</i>	rIDPC_STAT.dpc.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	NA.

Table 38 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	There is an extra DPC in CCdpc2dpci[] that is not linked in rIDPC_STAT.
Possible Error Effect:	The rIDPC_STAT.nextdpc linkage in rIDPC_STAT is corrupt. If the routing table is rebuilt from this incorrect rIDPC_STAT, routing to the DPC is lost (see good data), and CCS7 may do invalid routing diversion. This triggers asserts during fault recovery from signaling link failures or signaling network reconfiguration.
Corrective Action Taken:	The audit triggers table hashsums to be recalculated and sends a message to STRM to regenerate the DPCs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc of previous rIDPC_STAT tuple.
<i>Bad Data =</i>	rIDPC_STAT.dpc of current rIDPC_STAT tuple.
<i>Good Data =</i>	DPC not linked in rIDPC_STAT.
<i>Logical Index =</i>	rIDPC_STAT.dpci of previous rIDPC_STAT tuple.
<i>Dump =</i>	NA.

Table 39 Error Code: INVOWNER

Error Code:	INVOWNER
Error Description:	The rIDPC_STAT.acc equals DBYES for a DPC. Its rIDPC_STAT.rmtcg equals a valid congestion value, but the rIDPC_STAT tuple is linked to a busy rIRCGTMR tuple whose logical key is greater than the maximum (DBRCGTMX + DBSFRCGTMR) allowed.
Possible Error Effect:	The DPC is continuously congested and certain level 4 MSUs might not be generated.
Corrective Action Taken:	The audit sets rIDPC_STAT.rmtcg equal to CCNOCONG and unlinks the rIDPC_STAT tuple from the rIRCGTMR tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Value of GIcongupd
<i>Bad Data =</i>	Key of rIRSTMR owner (rIDPC_STAT.dpc ls.st_ownk).
<i>Good Data =</i>	rIDPC_STAT.rmtcg.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 40 Error Code: INV_IDLE

Error Code:	INV_IDLE
Error Description:	The rIDPC_STAT.acc equals DBYES for a DPC. Its rIDPC_STAT.rmtcg equals a valid congestion value, but the rIDPC_STAT tuple is not linked to the rIRCGTMR busy list. The rIDPC_STAT.dpc ls.st_ownk equals DBNULL.
Possible Error Effect:	The DPC is continuously congested and certain level 4 MSUs might not be generated.
Corrective Action Taken:	The audit sets rIDPC_STAT.rmtcg to CCNOCONG.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc.
<i>Bad Data =</i>	Logical key of rIRSTMR owner tuple (rIDPC_STAT.dpc ls.st_ownk).
<i>Good Data =</i>	rIDPC_STAT.rmtcg.
<i>Logical Index =</i>	rIDPC_STAT.dpci.

<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 41 Error Code: LISTEND_BAD

Error Code:	LISTEND_BAD
Error Description:	The ordering of the DPCs in CCdpc2dpci[] has been verified. The CCdpc2dpci[].dpc of the next entry in the table should be zero to mark the end of the list, but it is not zero.
Possible Error Effect:	CCS7 does invalid routing diversion. This triggers asserts during fault recovery from signaling link failures or signaling network reconfiguration.
Corrective Action Taken:	The audit sets CCdpc2dpci[].dpc in the end of the list entry to zero and triggers table hashsums to be recalculated.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CCdpc2dpci[indx].dpci.
<i>Bad Data</i> =	CCdpc2dpci[index].dpc.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Index.
<i>Dump</i> =	NA.

Table 42 Error Code: LSNUM_BAD

Error Code:	LSNUM_BAD
Error Description:	A DPC is owned by a link set because rIDPC_STAT.clsown is set to DBNO but CCsmdpcls_ht[rIDPC_STAT.dpci].ls does not equal rLS_STAT.lsnun of the owning link set.
Possible Error Effect:	Traffic diversion is not done correctly.
Corrective Action Taken:	The audit sets CCsmdpcls_ht[rIDPC_STAT.dpci].ls equal to rLS_STAT.lsnun of the owning link set.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDPC_STAT.dpc.
<i>Bad Data</i> =	CCsmdpcls_ht[rIDPC_STAT.dpci].ls.
<i>Good Data</i> =	rLS_STAT.lsnun.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	NA.

Table 43 Error Code: LS_CON_ERR

Error Code:	LS_CON_ERR
Error Description:	The error is due to one of the following: 1 = The primary link set for a DPC is a combined link set (rIDPC_DPCI.lnk_set), but there is no tuple in rCLS_LS with a key (rCOS_STAT.clsnum) equal to rIDPC_DPCI.lnk_set. 2 = An alternate link set for a DPC is a combined link set (rIDPC_INFO.altls[]), but there is no tuple in rCLS_LS with a key (rCLS_STAT.clsnum) equal to rIDPC_INFO.altls[]. 3 = A tuple in rLS_GRP with the key (rLS_GRP.lsnun) equal to rIDPC_DPCI.lnk_set or rIDPC_INFO.altls[], if a regular link set, or a component of rIDPC_DPCI.lnk_set or rIDPC_INFO.altls[], if a combined link set, does not exist.
Possible Error Effect:	In all cases, calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	None.
Manual Action Required:	Corresponds to the Error Description as follows: 1 = Insert a tuple into RLCLS_LS with rCLS_LS.cls equal to rIDPC_DPCI.lnk_set. Consult population rules for RLCLS_LS.

	2 = Insert a tuple into RLCLS_LS with rCLS_LS.cls equal to rIDPC_INFO.altls[]. Consult population rules for RLCLS_LS. 3 = Insert a tuple into RLLS_GRP with rLS_GRP.lsnnum equal to the link set number listed in bad data.
Dump Description:	
<i>Error Address =</i>	(1), (2) or (3) indicates Error Description, Manual Action, and Dump Description.
<i>Bad Data =</i>	Corresponds to the Error Description and manual action as follows: 1 = rIDPC_DPCI.lnk_set. 3 = Link set number.
<i>Good Data =</i>	Corresponds to the Error Description and manual action as follows: 1 = rIDPC_DPCI.dpcindx. 2 = rIDPC_STAT.dpc. 3 = NA.
<i>Logical Index =</i>	Corresponds to the Error Description and manual action as follows: 1 = rIDPC_DPCI.dpc. 2 = rIDPC_INFO.dpcindx. 3 = Link set number.
<i>Dump =</i>	NA.

Table 44 Error Code: LS_STAT_NO

Error Code:	LS_STAT_NO
Error Description:	One of the link sets used for routing to a DPC does not exist in rLS_STAT. The link set is either a primary route or an alternate route. The link set may be in relation RLDPC_DPCI (rIDPC_DPCI.lnk_set), relation RLDPC_INFO (rIDPC_INFO.altls[] or relation RLCLS_LS (rCLS_LS.ls1 or rCLS_LS.ls2).
Possible Error Effect:	Calls cannot be routed to the DPC.
Corrective Action Taken:	Another audit inserts the missing link set in relation RLLS_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Link set number.
<i>Dump =</i>	NA.

Table 45 Error Code: MINDX

Error Code:	MINDX
Error Description:	The policing matrix index (rIDPC_STAT.mtxindx) for a DPC does not equal rIDPC_DPCI.mtxindx where the key of relation RLDPC_DPCI is rIDPC_DPCI.dpc.
Possible Error Effect:	Operational code accesses incorrect data if it uses rIDPC_STAT.mtxindx to index into the policing matrix table.
Corrective Action Taken:	The audit sets rIDPC_STAT.mtxindx equal to rIDPC_DPCI.mtxindx.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc.

<i>Bad Data</i> =	rIDPC_STAT.mtxindx.
<i>Good Data</i> =	rIDPC_DPCI.mtxindx.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	NA.

Table 46 Error Code: MISSING

Error Code:	MISSING
Error Description:	RLDPC_STAT indicates that the office has no DPCs (rIDPC_STAT.nextdpc == 0 for the tuple with the key of zero), but there are DPC in the office (rINDX.max_idx for CCS7 != zero).
Possible Error Effect:	CCS7 cannot build the routing table, and the audit cannot verify the routing table because dynamic relation rIDPC_STAT is corrupt. CCS7 cannot signal/route to any DPC.
Corrective Action Taken:	The audit sends STRM a message to regenerate the DPCs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDPC_STAT.dpci.
<i>Bad Data</i> =	rIDPC_STAT.nextdpc.
<i>Good Data</i> =	rINDX.max_idx.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 47 Error Code: MISSTUP

Error Code:	MISSTUP
Error Description:	Measurements in RLSMDPCCNT are used for adjacent signaling point (ASP) and non-ASP reports. A tuple with the key of rIDPC_STAT.dpci + CCITT7NDX for a DPCI does not exist.
Possible Error Effect:	A DPC exists without any measurements data. Measurements data is lost.
Corrective Action Taken:	The audit inserts the rSMDPCCNT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIDPC_STAT tuple.
<i>Bad Data</i> =	rIDPC_STAT.dpci + CCITT7NDX.
<i>Good Data</i> =	rIDPC_STAT.dpci.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	NA.

Table 48 Error Code: NOMATCH

Error Code:	NOMATCH
Error Description:	The APCI of a link set for a DPC does not exist in rIAPCI_APC. The key of relation RLAPCI_APC is rIAPCI_APC.apci and it is the APCI of one of the alternate link sets whose remote route status (RRS) bit in rIDPC_STAT.rrs does not match the RRS bit in rIDPC_STAT.rrs for the normal link set. The audit derives the APCIs from relation RLLS_STAT for each link set.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	Another audit corrects the APCIs in relation RLLS_STAT for the link sets of the normal and alternate routes of the DPC.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIDPC_STAT tuple.
<i>Bad Data</i> =	APCI used to read rIAPCI_APC.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	NA.

Table 49 Error Code: NONNULL

Error Code:	NONNULL
Error Description:	CCsmdpcls_htf[] is the DPC to link set routing table. An entry in CCsmdpcls_htf[] should be 0, but is not because the corresponding bit in AUccg_bits[] used to

	indicate that the entry was processed is not set.
Possible Error Effect:	Cross-checks done by recent change and verify (RC/V) may cause data validation errors when the office routing data are changed.
Corrective Action Taken:	The audit sets the CCsmdpcls_ht[] entry to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CCsmdpcls_ht[index] entry.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Index.
<i>Dump =</i>	Contents of non-null CCsmdpcls_ht[index] entry.

Table 50 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	The CCdpc2dpci[].dpc of the last entry in the table must be zero to mark the end of the table, but it is not zero.
Possible Error Effect:	Indexes into the routing table may be incorrect. CCS7 code may try to route to an incorrect DPC.
Corrective Action Taken:	The audit sets CCdpc2dpci[\$nbsp;].dpc in the last entry in the table to zero and triggers table hashsums to be recalculated.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of last CCdpc2dpci[index] entry.
<i>Bad Data =</i>	CCdpc2dpci[index].dpc.
<i>Good Data =</i>	0 (value of what last CCdpc2dpci[].dpc entry should be).
<i>Logical Index =</i>	Index of last CCdpc2dpci[] entry.
<i>Dump =</i>	NA.

Table 51 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	The rIDPC_STAT.acc for a DPC is set to DBNO. The DPC should not be linked to the rRCGTMR busy list, but it is. (The rIDPC_STAT.tcrd.st_ownk should equal DBNULL, but it does not.)
Possible Error Effect:	STRM tries unsuccessfully to reduce remote congestion level of an inaccessible DPC.
Corrective Action Taken:	The audit unlinks the DPC from the rRCGTMR busy list. The DPC is not linked to an idle list since it is assumed that if the DPC is not on the busy list, it is idle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPC_STAT tuple.
<i>Bad Data =</i>	Key of rRCGTMR owner tuple (rIDPC_STAT.tcrd.st_ownk).
<i>Good Data =</i>	DBRCIDLE (value of what rIDPC_STAT.tcrd.st_ownk should be).
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 52 Error Code: NOTZERO

Error Code:	NOTZERO
Error Description:	There are no DPCs in the office (rLINDX.max_idx for CCS7 is zero). CCdpc2dpci[0].dpc, CCdpc2dpci[0].dpci, and CCdpc2dpci[1].dpc should all be zero, but one or more is not zero.
Possible Error Effect:	CCS7 does invalid routing diversion. This triggers asserts during fault recovery from signaling link failures or signaling network reconfiguration.
Corrective Action Taken:	The audit sets CCdpc2dpci[0].dpc, CCdpc2dpci[0].dpci and CCdpc2dpci[1].dpc to zero.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CCdpc2dpci[0] entry.
<i>Bad Data =</i>	CCdpc2dpci[0].dpc.
<i>Good Data =</i>	CCdpc2dpci[0].dpci.
<i>Logical Index =</i>	CCdpc2dpci[1].dpc.
<i>Dump =</i>	NA.

Table 53 Error Code: NOT_SORTED

Error Code:	NOT_SORTED
Error Description:	The previous rIDPC_STAT.dpc is greater than the current rIDPC_STAT.dpc. This indicates that the ordering of the DPCs is incorrect. The DPCs should be in ascending order.
Possible Error Effect:	The audit cannot check that the routing table is correctly populated due to incorrect database linkage of the DPCs. CCS7 may fail to find a particular DPC when searching CCdpc2dpci[], and so would not be able to signal/route to that DPC.
Corrective Action Taken:	The audit triggers table hashsums to be recalculated and sends a message to STRM to regenerate the DPCs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc of current rIDPC_STAT tuple.
<i>Bad Data =</i>	rIDPC_STAT.dpci of current rIDPC_STAT tuple.
<i>Good Data =</i>	rIDPC_STAT.dpc of previous rIDPC_STAT tuple.
<i>Logical Index =</i>	rIDPC_STAT.dpci of previous rIDPC_STAT tuple.
<i>Dump =</i>	NA.

Table 54 Error Code: NOT_ZERO

Error Code:	NOT_ZERO
Error Description:	The error is due to one of the following: 1 = An unused element in the combined link set array (rIDPC_STAT.cls[]) or the routing data block array (rIDPC_STAT.rte[]) for a DPC should be 0 or 0xff, respectively, but is not. An unused element in the combined link set array means that there is no combined link set used to reach the DPC. An unused element in the routing data block array corresponds to the unused combined link set array element. 2 = The RRS bits in rIDPC_STAT.rrs for the unused routing data blocks should not be set, but one or more are set.
Possible Error Effect:	Incorrect data may be used for routing.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = The audit sets the unused rIDPC_STAT.cls[] entry to 0 and sets the unused rIDPC_STAT.rte[] entry to 0xff. 2 = The audit clears the RRS bit for the unused routing data block.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPC_STAT tuple.
<i>Bad Data =</i>	Corresponds to the Error Description and Corrective Action as follows:
	2 = Offset of the routing data block.
<i>Good Data =</i>	(1) or (2) indicates Error Description, Corrective Action and Dump Description.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 55 Error Code: NO_1RDB_DPCI

Error Code:	NO_1RDB_DPCI
Error Description:	The RRS bits (rIDPC_STAT.rrs) for parallel link sets for a DPC are not equal but there is no tuple in rIS7RDB for the DPC whose APCI for one of the parallel link sets matches the DPCI for the DPC. The key for an rIS7RDB tuple is rIS7RDB.rdb_id and is equal to (rIDPC_STAT.dpci * CCRDB_DPC) + the RDB

	offset).
Possible Error Effect:	Operational code may not use an accessible route if RRS was marked inaccessible, or if the RRS is marked accessible but it really is not, the remote exchange will return transfer prohibited.
Corrective Action Taken:	The audit insets the missing rIS7RDB tuple during the audit's next iteration.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_DPCI.dpc.
<i>Bad Data =</i>	rIAPCI_APC.apci_apc.
<i>Good Data =</i>	Offset of routing data block.
<i>Logical Index =</i>	rIDPC_DPCI.dpcindx.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 56 Error Code: NO_MATCH_LS_STAT

Error Code:	NO_MATCH_LS_STAT
Error Description:	Either the primary or one of the alternate link sets for a DPC that is derived from rIDPC_DPCI.lnk_set or rIDPC_INFO.altls[], respectively, does not have a tuple in relation RLLS_STAT whose key (rILS_STAT.lsnun) matches the link set.
Possible Error Effect:	Operational code does not find dynamic information about the link set or any of its links. Change over or change back cannot be performed on any link in the link set.
Corrective Action Taken:	The missing tuple whose key (rILS_STAT.lsnun) is equal to the primary or alternate link set is inserted into relation RLLS_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIDPC_STAT.dpc
<i>Bad Data =</i>	Index.
<i>Good Data =</i>	rIDPC_DPCI.lnk_set.
<i>Logical Index =</i>	rIDPC_INFO.altls[index].
<i>Dump =</i>	NA.

Table 57 Error Code: NO_RST_DPCI

Error Code:	NO_RST_DPCI
Error Description:	The remote route status bit in rIDPC_STAT.rrs for the DPCI of an APCI is clear. The DPC for the DPCI should be on route set test timing, but is not. That is, rIS7RDB.rsrd.st_ownk for the DPCI should have the physical key of a valid rIRSTMR tuple but it does not.
Possible Error Effect:	Calls being routed to the DPC may be blocked when they should no longer be blocked.
Corrective Action Taken:	The audit sends STRM a message to put the DPC on route set test timing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	APCI.
<i>Bad Data =</i>	Offset of the routing data block.
<i>Good Data =</i>	rIDPC_STAT.rrs.
<i>Logical Index =</i>	rIDPC_STAT.dpci for the APCI.
<i>Dump =</i>	NA.

Table 58 Error Code: PCI_BAD

Error Code:	PCI_BAD
Error Description:	The error is one of the following: 1 = The rIDPC_STAT.pci (point code index) does not equal rIDPC_DPCI.pci for the DPCI (destination point code index). 2 = CCsmdpcls_ht[rIDPC_STAT.dpci].pci does not equal rIDPC_STAT.pci for the DPCI (rIDPC_STAT.dpci).
Possible Error Effect:	Corresponds to the Error Description as follows:

	1 = Operational code accesses incorrect data if it tries to use rIDPC_STAT.dpc as the key to read rIDPC_DPCI, and routing will not be done to the correct point code. 2 = SS7 calls do not complete.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = The audit sets rIDPC_STAT.pci equal to rIDPC_DPCI.pci. 2 = The audit has CCsmdpcls_ht[rIDPC_STAT.dpci].pci set equal to rIDPC_STAT.pci.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	(1) or (2) indicates Error Description, Error Effect, Corrective Action, and Dump Description.
<i>Bad Data</i> =	Corresponds to the Error Description, Error Effect, Corrective Action, and Dump Description as follows: 1 = rIDPC_STAT.pci. 2 = CCsmdpcls_ht[rIDPC_STAT.dpci].pci.
<i>Good Data</i> =	Corresponds to the Error Description, Error Effect, Corrective Action, and Dump Description as follows: 1 = rIDPC_DPCI.pci. 2 = rIDPC_STAT.pci.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	Corresponds to the Error Description as follows: 1 = NA. 2 = Contents of rIDPC_STAT tuple.

Table 59 Error Code: PTCODE_BAD

Error Code:	PTCODE_BAD
Error Description:	NMpcc7buf[rIDPC_STAT.dpci].ptcode does not equal rIDPC_STAT.dpc.
Possible Error Effect:	NM reports status of an incorrect DPC for a DPCI. Routing to the DPC may fail.
Corrective Action Taken:	The audit sets NMpcc7buf[rIDPC_STAT.dpci].ptcode equal to rIDPC_STAT.dpc.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of NMpcc7buf[rIDPC_STAT.dpci] entry.
<i>Bad Data</i> =	NMpcc7buf[rIDPC_STAT.dpci].ptcode.
<i>Good Data</i> =	rIDPC_STAT.dpc.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	NA.

Table 60 Error Code: RDB_BAD

Error Code:	RDB_BAD
Error Description:	The error is one of the following: 1 The audit calls a CCS7 function to retrieve the representative RDB for the associated cluster-route one of the APCIs. The audit then tries to find a tuple in relation RLS7RDB whose key (rIS7RDB.rdb_id) equals the retrieved RDB.

	2 = The audit calls a CCS 7 function to retrieve the representative RDB for the associated cluster-route one of the APCIs serving a DPC. The audit then tries to find a tuple in relation RLS7RDB whose key (rlS7RDB.rdb_id) equals the retrieved RDB.
Possible Error Effect:	In both cases, a DPC may have an incorrect accessibility status and signaling traffic may be routed to this DPC over incorrect link sets.
Corrective Action Taken:	In both cases, another audit verifies data in CCCrdata[] and CCcr_rdb[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	(1) or (2) indicates Error Description.
<i>Bad Data =</i>	APCI for the cluster-route.
<i>Good Data =</i>	RDB for the cluster-route.
<i>Logical Index =</i>	rlDPC_STAT.dpci of current tuple.
<i>Dump =</i>	Contents of RLDPC_STAT tuple.

Table 61 Error Code: RDB_MISSING

Error Code:	RDB_MISSING
Error Description:	An rlS7RDB tuple for one of the offsets for an rlDPC_STAT.dpci does not exist. The offset is the number of the routing data block for a DPCI. It has a value of 0 through CCRDB_DPC.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC for the DPCI.
Corrective Action Taken:	The missing rlS7RDB tuple is inserted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	rlDPC_STAT.dpci.
<i>Good Data =</i>	Offset of the routing data block.
<i>Logical Index =</i>	rlS7RDB.rdb_id.
<i>Dump =</i>	NA.

Table 62 Error Code: READ

Error Code:	READ
Error Description:	The tuple with the key of 0 (rlDPC_STAT.dpci = 0) does not exist in RLDPC_STAT.
Possible Error Effect:	CCS7 cannot signal/route to any DPC.
Corrective Action Taken:	The audit inserts the missing tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 63 Error Code: RID

Error Code:	RID
Error Description:	The error is one of the following: 1 = The RRS bits in rlDPC_STAT.rrs for APCIs are not equal. The audit calls a CCS7 function to retrieve the representative RDB for the associated cluster-route one of the APCIs, but the function fails to retrieve the RDB. 2 = The audit calls a CCS 7 function to retrieve the representative RDB for the associated cluster-route one of the APCIs serving a DPC, but the function fails to retrieve the RDB.
Possible Error Effect:	In both cases, a DPC may have an incorrect accessibility status and signaling traffic may be routed to this DPC over incorrect link sets.

Corrective Action Taken:	In both cases, another audit verifies data in CCCrdata[] and CCcr_rdb[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	(1) or (2) indicates Error Description.
<i>Bad Data</i> =	APCI for the cluster-route.
<i>Good Data</i> =	Cluster.
<i>Logical Index</i> =	rIDPC_STAT.dpci of current tuple.
<i>Dump</i> =	Contents of RLDPC_STAT tuple.

Table 64 Error Code: ROUTE_STATUS

Error Code:	ROUTE STATUS
Error Description:	The audit has detected inconsistent parallel route status. 1 = The owner of a DPC is a regular link set. The normal route for the DPC is regular link set. The APCI of the owning link set equals the APCI of the normal route. This indicates that the routes are parallel, but rIDPC_STAT.rt_prll for the DPC is set to DBNO instead of DBYES. 2 = The owner of a DPC is a regular link set. The normal route for the DPC is a combined link set. The APCI of the owning link set equals the APCI of the normal or the first alternate route. This indicates that the routes are parallel, but rIDPC_STAT.rt_prll for the DPC is set to DBNO instead of DBYES. 3 = The owner of a DPC is a combined link set. The normal route for the DPC is a regular link set. The APCIs of the component link sets equal the APCI of the normal route. This indicates that the routes are parallel, but rIDPC_STAT.rt_prll for the DPC is set to DBNO instead of DBYES. 4 = The normal route for DPC is a combined link set. The APCI of the link set which owns the DPC equals the APCI of the normal or first alternate route and the APCI of the other link set equals the APCI of the normal or first alternate route. This indicates that the routes are parallel, but rIDPC_STAT.rt_prll for the DPC is set to DBNO instead of DBYES.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC in all cases.
Corrective Action Taken:	In all cases, the audit sets rIDPC_STAT.rt_prll to the correct value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDPC_DPCI.lnk_set (owning link set).
<i>Bad Data</i> =	rIDPC_STAT.rt_prll.
<i>Good Data</i> =	(1), (2), (3), or (4) indicates Dump Description.
<i>Logical Index</i> =	rIDPC_STAT.dpci.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 65 Error Code: RRSTATUS

Error Code:	RRSTATUS
Error Description:	The normal and alternate route for a DPC are parallel because their APCIs (rIDPC_STAT.apci) are equal. The respective RRS bits in rIDPC_STAT.rrs of these parallel routes must also be equal but are not.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an inaccessible DPC.
Corrective Action Taken:	The audit marks the RRS for both the normal and alternate route inaccessible.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	APCI of the normal route.
<i>Bad Data</i> =	APCI of an alternate route.
<i>Good Data</i> =	The RRS bit in rIDPC_STAT.rrs for the normal route.
<i>Logical Index</i> =	The RRS bit in rIDPC_STAT.rrs for the alternate route.
<i>Dump</i> =	Contents of rIDPC_STAT tuple.

Table 66 Error Code: SDATA_CON_ERR

Error Code:	SDATA_CON_ERR
Error Description:	The audit reads RLINDEX with the appropriate key (rlINDEX.idx_name) to find: 1 = The number of APCs in the office (rlINDEX.max_idx). 2 = The highest DPCI in the office (rlINDEX.max_idx). 3 = The number of DPCs in the office (rlINDEX.max_idx). The rlINDEX tuple does not exist. The tuple should exist because the SM is a global SM (GI_pcird equals Glglobalsm) and the CCS7 package is present for this office. Which case applies can be determined by the value of bad data.
Possible Error Effect:	No CCS7 signaling/routing is done for the office in all cases.
Corrective Action Taken:	None.
Manual Action Required:	Corresponds to the Error Description as follows: 1 = Insert the missing rlINDEX tuple with rlINDEX.idx_name set to CCAPCINDEX and rlINDEX.max_idx set to the number of APCs in the office. 2 = Insert the missing rlINDEX tuple with rlINDEX.idx_name set to CCDPCIMAX and rlINDEX.max_idx set to the highest DPCI in the office. 3 = Insert the missing rlINDEX tuple with rlINDEX.idx_name set to CCDPCINDEX and rlINDEX.max_idx set to the number of DPCs in the office. Consult the population rules for relation RLINDEX.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	(1), (2), or (3) indicates Error Description, Manual Action and Dump Description.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Appropriate key corresponds to the Error Description and manual action as follows: 1 = CAPCINDEX. 2 = CDPCIMAX. 3 = CDPCINDEX.
<i>Dump =</i>	NA.

Table 67 Error Code: SMLOSS_INC

Error Code:	SMLOSS_INC
Error Description:	NM's count (NMsmc7loss) of the inaccessible DPCs does not equal the count taken by the audit. The audit counts a DPC as inaccessible if its rIDPC_STAT.acc is set to DBNO.
Possible Error Effect:	Incorrect status regarding the accessibility of a DPC may be sent to the remote network centers and calls may not be routed to the DPC.
Corrective Action Taken:	The audit sets NMsmc7loss equal to the count as determined by the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NMsmc7loss.
<i>Good Data =</i>	Count as determined by the audit.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 68 Error Code: SMRCG_INC

Error Code:	SMRCG_INC
Error Description:	NM's count (NMsmc7rcg) of the remotely congested DPCs does not equal the count taken by the audit. The audit counts a DPC as remotely congested if its rIDPC_STAT.rmtcg is not set to CCNOCONG.
Possible Error Effect:	Incorrect status regarding the congestion of a DPC may be sent to the remote network centers and calls may not be routed to the DPC.
Corrective Action Taken:	The audit sets NMsmc7rcg equal to the count as determined by the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NMsmc7rcg.
<i>Good Data =</i>	Count as determined by the audit.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 69 Error Code: STPRTE_BAD

Error Code:	STPRTE_BAD
Error Description:	The error is due to one of the following: 1 = The signaling transfer point (rIDPC_STAT.stprte) does not equal rIDPC_INFO.stprte for a DPC. 2 = The signaling transfer point in the routing table (CCsmdpcls_ht[rIDPC_STAT.dpci].stprte) does not equal rIDPC_STAT.stprte for a DPC.
Possible Error Effect:	Signaling traffic may be routed or not routed according to the value of the signaling transfer point.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = The audit sets rIDPC_STAT.stprte equal to rIDPC_INFO.stprte. 2 = The audit sets CCsmdpcls_ht[rIDPC_STAT.dpci].stprte equal to rIDPC_STAT.stprte.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	(1) or (2) indicates Error Description, Corrective Action and Dump Description.
<i>Bad Data =</i>	Corresponds to the Error Description and Corrective Action as follows: 1 = rIDPC_STAT.stprte. 2 = CCsmdpcls_ht[rIDPC_STAT.dpci].stprte.
<i>Good Data =</i>	Corresponds to the Error Description and Corrective Action as follows: 1 = rIDPC_INFO.stprte. 2 = rIDPC_STAT.stprte.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of rIDPC_STAT tuple.

Table 70 Error Code: UPDATE_FAILED

Error Code:	UPDATE_FAILED
Error Description:	CCsmdpcls_ht[] is the DPC to link set routing table. An attempt to correct an CCsmdpcls_ht[rIDPC_STAT.dpci] entry failed.
Possible Error Effect:	Calls may be dropped and/or unnecessary network traffic may be routed to an

	inaccessible DPC.
Corrective Action Taken:	The audit makes another update attempt during its next iteration.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CCsmdpcis ht[rIDPC_STAT.dpci] entry in error.
<i>Bad Data =</i>	Return value from attempt.
<i>Good Data =</i>	rIDPC_STAT.dpc.
<i>Logical Index =</i>	rIDPC_STAT.dpci.
<i>Dump =</i>	Contents of what array entry should be.

Table 71 Error Code: XTRA_DPC

Error Code:	XTRA_DPC
Error Description:	NMpcc7buf[] has an entry for each valid DPC. An entry has its visit and new fields set to DBNO and its pcode field not set to 0. This indicates that there is an extra DPC entry in NMpcc7buf[].
Possible Error Effect:	A nonexistent DPC could be reported to the remote NM center.
Corrective Action Taken:	The audit deletes the extra DPC in NMpcc7buf[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of NMpcc7buf[index] entry.
<i>Bad Data =</i>	NMpcc7buf[index].ptcode.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Index.
<i>Dump =</i>	NA.

Table 72 Error Code: ZERO_TUP_BAD

Error Code:	ZERO_TUP_BAD
Error Description:	The rIDPC_STAT.dpc in the rIDPC_STAT tuple with the key of 0 (rIDPC_STAT.dpci = 0) does not equal 0. This DPC must be the lowest DPC because it is used to check the ordering of the DPCs.
Possible Error Effect:	The ordering of the DPCs may be incorrect. If the ordering is incorrect, signaling/routing to a particular DPC cannot be done.
Corrective Action Taken:	The audit sets rIDPC_STAT.dpc equal to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIDPC_STAT tuple.
<i>Bad Data =</i>	rIDPC_STAT.dpc.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

DS0B**Software Release:** 5E10 and later**1. DIGITAL SERVICE 0 BLOCK (DS0B) AUDIT**

The DS0B audit performs the dynamic to static and semantic checks of the integrated digital service unit (IDCU) digital service (DS1) facility time slots. These times slots are also known as DS0Bs (there are 24 DS0Bs per DS1). It uses the indexed access relation driver DRINDEX to loop through the RLDS0B relation.

2. DATA STRUCTURES

The data structure being audited by the DS0B audit is a relational structure known as RLDS0B. One rIDS0B tuple is allocated for each DS0B time slot on an IDCU DS1 facility. The rIDS0B tuple is comprised of many fields, the ones that are audited are:

day	= The day this DS0 was put into 7 second timing.
ds_ch	= Shared one-to-one linkage to the rICHDB or the rIPTSB.
ds0b (KEY)	= The DS1 and DS0 number.
dscm	= Set-member linkage to the rCCBCOM tuple.
dscqo	= Set-owner linkage to the rCQB tuple.
portname	= The port name of the port using this DS0.
quarstat	= The quarantine state.
state	= The state of this DS0.
tod	= Time of day this DS0 was put into 7 second timing.
use	= Indicates how the rIDS0B is being used (such as, PPD, PPB, ODB, nail-up, hairpin, circuit switched analog, or circuit switched digital port).

3. AUDIT CHECKS

The audit checks done are as follows:

ASSOC_PORT	= The rIDS0B tuple is being used for hairpin connection but the rIDS0B.portname field is not a valid port.
BADUSE	= The path information in rNAILUP are not correct for a given hairpin connection. tuples are different.
CCBCOM_LINK	= The rIDS0B tuple linkage to rCCBCOM tuple is broken.
CHDB_LINK	= The rIDS0B tuple linkage to rICHDB tuple is broken.
CKTDATA	= The rNAILUP information associated with the rCKTDATA tuple is not correct.
CQB_LINK	= The rIDS0B tuple linkage to rCQB tuple is broken.
EXTRATUP	= The rCKTDATA tuple for the DS1 facility is missing.

GPORT	= The rIDS0B and rCCBCOM tuples port information do not match.
LOST_CKTDATA	= The rCKTDATA tuple associated with the rNAILUP tuple is missing.
LOST_PORTLA	= The rPORTLA tuple is missing for a given port.
LOST_SMEST	= The rSMEST tuple for the DS1 facility is missing.
LPORT	= The time slot information in an rIDS0B and rPORTLA
NON_NULL	= The rIDS0B tuple linkage to rCCBCOM tuple was broken.
NOT7SEC	= The rIDS0B tuple has been on DS0B7SEC list for more than 100 seconds.
ODDLOSTTUP	= The rNAILUP tuple is missing for a given hairpin connection.
OUTOFRANGE	= The rIDS0B.use field was invalid.
PORTNAME	= The port information in the rIDS0B and rPTSB tuples are inconsistent.
PTSB_LINK	= The rIDS0B tuple linkage to rPTSB tuple is broken.
STATE	= The rIDS0B.state field was not correct.
STUCK	= The rIDS0B tuple is stuck in the set-up state for 2 audit cycles.
WRONGLIST	= The rIDS0B tuple is on the wrong list.
ZERO_LINK	= An idle rIDS0B tuple has a non-null linkage.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: ASSOC_PORT

Error Code:	ASSOC_PORT
Error Description:	The rIDS0B tuple is being used for hairpin connection but the rIDS0B.portname field is not a valid port. This field should contain the name of the port that the rIDS0B tuple is hairpinned to.
Possible Error Effect:	The rIDS0B tuple is not hairpinned to the correct port and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list will be determined by the IS/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 2 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	The rIDS0B tuple is used for hairpin connection but the path information in the

	static rINAILUP tuple does not match the information in the rIDS0B tuple.
Possible Error Effect:	The wrong rIDS0B tuple is being used for hairpin connection. The rIDS0B tuple will be recovered to the correct list. The list is determined by IS/OOS state of the DS1 facility's rSMEST.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDS0B tuple in error.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDS0B.ds0b key field.
<i>Dump 1</i> =	The rIDS0B tuple in error.
<i>Dump 2</i> =	The rINAILUP tuple.

Table 3 Error Code: CCBCOM_LINK

Error Code:	CCBCOM_LINK
Error Description:	The rIDS0B tuple was not linked to a valid rCCBCOM tuple.
Possible Error Effect:	The rIDS0B resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDS0B tuple in error.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDS0B.ds0b field key.
<i>Dump</i> =	The rIDS0B tuple in error.

Table 4 Error Code: CHDB_LINK

Error Code:	CHDB_LINK
Error Description:	The rIDS0B tuple was not linked to a valid rCHDB tuple. to be.
Possible Error Effect:	The rIDS0B tuple resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDS0B tuple in error.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDS0B.ds0b key field.
<i>Dump</i> =	The rIDS0B tuple in error.

Table 5 Error Code: CKTDATA

Error Code:	CKTDATA
Error Description:	The rIDS0B tuple is a time slot on a DS1 facility. The audit tried to read the rCKTDATA tuple for the DS1 facility but it was missing from the database.
Possible Error Effect:	The rINAILUP tuple does not contain a valid circuit name and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDS0B tuple in error.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDS0B.ds0b key field.
<i>Dump</i> =	The rIDS0B tuple in error.

Table 6 Error Code: CQB_LINK

Error Code:	CQB_LINK
Error Description:	The rIDS0B tuple is not validly linked to an rCQB tuple.

Possible Error Effect:	The rIDS0B resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 7 Error Code: GPORT

Error Code:	GPORT
Error Description:	The rIDS0B.portname is not matching the port information in the rCCBCOM.port field
Possible Error Effect:	The rIDS0B tuple is not linked to the correct port and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 8 Error Code: LOST_CKTDATA

Error Code:	LOST_CKTDATA
Error Description:	The rIDS0B tuple is a time slot on a DS1 facility. The audit tried to read the rCKTADTA tuple for the DS1 facility but it was missing from the database.
Possible Error Effect:	The rNAILUP tuple does not contain a valid circuit name and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 9 Error Code: LOST_PORTLA

Error Code:	LOST_PORTLA
Error Description:	The rPORTLA tuple whose key is the rIDS0B.portname field in the or the rNAILUP.port3 member is lost.
Possible Error Effect:	The rIDS0B tuple is not hairpinned to the correct port and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	The list that the rIDS0B tuple is linked to.
<i>Good Data =</i>	The list that the rIDS0B tuple should be linked to.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump 1 =</i>	The rIDS0B tuple in error.
<i>Dump 2 =</i>	The dump of the rNAILUP tuple.

Table 10 Error Code: LOST_SMEST

Error Code:	LOST_SMEST

Error Description:	The rIDS0B tuple is a time slot on a DS1 facility. The audit tried to read the rSMEST tuple for the DS1 facility but it was missing from the database.
Possible Error Effect:	Call processing will try to use an unusable rIDS0B tuple.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the out-of-service list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 11 Error Code: LPORT

Error Code:	LPORT
Error Description:	The rIDS0B.portname field is used as the key to read the rIORTLA tuple. The rIORTLA.ds0b was found not to match rIDS0B.ds0b.
Possible Error Effect:	The rIDS0B tuple is not hairpinned to the correct port and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	The list that the rIDS0B tuple is linked to.
<i>Good Data =</i>	The list that the rIDS0B tuple should be linked to.
<i>Logical Index =</i>	The key of the rIDS0B tuple.
<i>Dump 1 =</i>	The rIDS0B tuple in error.
<i>Dump 2 =</i>	The rINAILUP tuple.

Table 12 Error Code: NON-NULL

Error Code:	NON-NULL
Error Description:	The rIDS0B tuple was not suppose to be linked to an rCCBCOM tuple but was found to be linked to one.
Possible Error Effect:	The rIDS0B tuple is not used correctly and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 13 Error Code: NOT7SEC

Error Code:	NOT7SEC
Error Description:	The rIDS0B tuple is being used for 7 second timing but has been there for more than 100 seconds. The tuple is stuck in that state and is not usable.
Possible Error Effect:	The rIDS0B tuple is not usable and the resource is lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	The list that the rIDS0B tuple is linked to.
<i>Good Data =</i>	The list that the rIDS0B tuple should be linked to.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump 1 =</i>	The rIDS0B tuple in error.
<i>Dump 2 =</i>	The local structure that contains the current time and date.

Table 14 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The rIDS0B tuple is being used for hairpin connection but there is no static rINAILUP tuple in the database with the rIDS0B.portname field used as the key.
Possible Error Effect:	The rIDS0B tuple is not hairpinned to the correct port and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IN/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.portname field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 15 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The rIDS0B.use field was set to an out of range value.
Possible Error Effect:	The rIDS0B tuple is not used correctly and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 16 Error Code: PORTNAME

Error Code:	PORTNAME
Error Description:	The rIDS0B.use is set for PCDPPD (provisioned packet D-channel) but the rIPTSB.pfdb.ftspstb.portname field does not match the rIDS0B.portname field information.
Possible Error Effect:	The rIDS0B tuple is not used correctly and the resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 17 Error Code: PTSB_LINK

Error Code:	PTSB_LINK
Error Description:	The rIDS0B tuple is not linked to a valid rIPTSB tuple.
Possible Error Effect:	The DS0B resource will be lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIDS0B tuple in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rIDS0B.ds0b key field.
<i>Dump =</i>	The rIDS0B tuple in error.

Table 18 Error Code: STATE

Error Code:	STATE

Error Description:	The rIDS0B.state field was not set to match the use of the tuple (such as, the rIDS0B tuple may be used in a stable call, but the rIDS0B.state field is set to PCIDLE, or the rIDS0B tuple may be idle but the rIDS0B.state field is set to PCDSTABLE).
Possible Error Effect:	The rIDS0B tuple is not usable.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list that is recovered to is dependent on the IS/OOS state of the DS1 facility.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDS0B tuple in error.
<i>Bad Data</i> =	The value of the rIDS0B.state field.
<i>Good Data</i> =	The value of what the rIDS0B.state field should be.
<i>Logical Index</i> =	The key of the rIDS0B tuple (rIDS0B.ds0b).
<i>Dump</i> =	The rIDS0B tuple in error.

Table 19 Error Code: STUCK

Error Code:	STUCK
Error Description:	The rIDS0B.state field was found to be set to call setup state (PCDSETUP) or call tear down (PCDTEARDOWN) value for 2 audit cycles. It implies that it is stuck in this state since both setup up and tear down take less than 1 audit cycle to be accomplished.
Possible Error Effect:	The rIDS0B tuple is not usable.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list that is recovered to is dependent on the IS/OOS state of the DS1 facility.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDS0B tuple in error.
<i>Bad Data</i> =	The value of the rIDS0B.quarstat field
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the rIDS0B tuple (rIDS0B.ds0b).
<i>Dump</i> =	The rIDS0B tuple in error.

Table 20 Error Code: WRONGLIST

Error Code:	WRONGLIST
Error Description:	The rIDS0B tuple is linked to the wrong list.
Possible Error Effect:	The rIDS0B tuple is not usable.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1's rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDS0B tuple in error.
<i>Bad Data</i> =	The list that the rIDS0B tuple is currently linked to.
<i>Good Data</i> =	The list the rIDS0B tuple should be linked to.
<i>Logical Index</i> =	The rIDS0B.ds0b key field.
<i>Dump</i> =	The rIDS0B tuple in error.

Table 21 Error Code: ZEROLINK

Error Code:	ZEROLINK
Error Description:	The rIDS0B tuple is idle but one of the linkages has a none null value.
Possible Error Effect:	The rIDS0B tuple is not usable and the resource is lost.
Corrective Action Taken:	The rIDS0B tuple will be recovered to the correct list. The list is determined by the IS/OOS state of the DS1 facility's rSMEST.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDS0B tuple in error.
<i>Bad Data</i> =	The value of the non zero link found.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIDS0B.ds0b key field.
<i>Dump</i> =	The rIDS0B tuple in error.

DSCC

Software Release: 5E10 and later

1. DIGITAL SERVICE CIRCUIT COMMON BOARDS (DSCC) AUDIT

The global digital service unit (GDSU) provides low usage digital service functions such as conferencing and transmission test facilities. The two service groups in the GDSU contain information about GDSU common boards, such as which peripheral interface data bus (PIDB) time slots are used by the GDSU subtending circuits. Each tuple in the digital service circuit relation (RLDSCC) has a one-to-one correspondence with a GDSU common board.

The digital service circuit common boards audit (DSCC) verifies that every rLDSCC tuple has a corresponding tuple in the static circuit data relation (RLCKTDATA) and in the dynamic circuit data block common area relation (RLCDBCOM). This audit also verifies that the GDSU PIDB time slot channel in rLDSCC is consistent with the channel in the associated rLCDBCOM tuple. If extra tuples collect in RLDSCC, hardware growth is inhibited; therefore, the DSCC audit is needed to identify inconsistencies, delete extra tuples, and correct bad keys.

This audit is part of the peripheral control audits subgroup. It runs in the OSDS-M environment in the initialization and segmented modes.

2. DATA STRUCTURES

The DSCC audit uses the data in the static circuit data relation (RLCKTDATA) to verify the data in the dynamic digital service circuit common relation (RLDSCC). The RLDSCC relation contains dynamic information such as the circuit name and the TSI channel array, which specifies whether channels are busy. Figure 1 shows the fields in rLDSCC checked by the audit. The value in the TSI channel array is verified against the associated circuit data block common area relation (RLCDBCOM) link to its associated channel data block relation (RLCHDB).

Figure 1 (DSCC-1) Digital Service Circuit Common Relation

3. AUDIT CHECKS

The digital service circuit common audit uses the static driver (DRSTATIC) to step through the RLDSCC relation.

- (a) Initially, the audit calls a dynamic to static existence check function to perform the following checks:
- (1) For each tuple in RLDSCC, the existence check function verifies that a corresponding tuple exists in the static RLCKTDATA relation.
 - (2) It checks for any extra rDSCC tuples.
 - (3) It checks the equipage state of rCKTDATA. If the state is unequipped (UNEQ), no rDSCC tuple should exist for that corresponding circuit.

(b) Next, the audit calls a semantic check function to perform the following checks:

- (1) If rICKTDATA is operational or in a growth state, the semantic check function verifies that an associated rCDBCOM tuple exists.
- (2) The audit calculates all possible GDSU subtending circuit names in the GDSU service group, and for each name, it accesses the associated rCDBCOM tuple. If no rCDBCOM tuple is found, the circuit is unequipped and the audit tries the next circuit.
- (3) The audit accesses the associated rICKTDATA tuple. If no tuple is found, an error is reported. Otherwise, the audit uses the channel allocation field (dbchan) in rICKTDATA as the array entry for obtaining the corresponding PIDB time slot channel number.
- (4) Depending on the channel assignment (the chnasn field in rICKTDATA), the audit compares the value in the rIDSCC tuple array against the rCDBCOM link to rICHDB.
 - If chnasn equals PCNOCHAN (no channel), no checking is done.
 - If chnasn equals PCINITCHAN (dedicated at initialization) or PCALLOCHAN (allocated when used), the audit checks the array value. If an inconsistency exists between the array value and the rCDBCOM link to rICHDB, an error is reported.
- (5) The audit steps through the array in the rIDSCC tuple and accesses an rICHDB tuple for each assigned (non -1) entry. The rICHDB link to rCDBCOM is used to access the associated rICKTDATA tuple. If no rICKTDATA tuple is found, an error is reported. If a tuple is found and the chnasn field does not equal PCNOCHAN, the array entry (not the contents) is compared with the dbchan field in rICKTDATA. If the two fields are not equal, an error is reported. If the chnasn field does equal PCNOCHAN, no checking is done.

4. ERROR HANDLING

Any tuple in RLDSCC that does not correspond to a tuple in RLCKTDATA, or has a corresponding rICKTDATA tuple in the unequipped state (UNEQ), is deleted and an error is reported.

If the rIDSCC tuple has valid rICKTDATA information but no associated rCDBCOM tuple, an error is reported.

If the rIDSCC TSI channel array entry is inconsistent with the rCDBCOM channel (link to rICHDB), the rIDSCC TSI channel array entry is corrected and an error is reported.

The CDBCOM audit is scheduled as a related audit to complete the recovery procedure.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: DBCHAN

Error Code:	DBCHAN
Error Description:	While stepping through the tsichan array in the rIDSCC tuple, an array entry was found that does not match the dbchan value in rICKTDATA.
Possible Error Effect:	The erroneously marked tsichan array entry in rIDSCC may cause serious problems if accessed by other operation or maintenance software (such as, IIA).
Corrective Action Taken:	Correct the tsichan array entries in rIDSCC. Set the erroneous entry to -1 and

	set the entry corresponding to dbchan to the channel number from rCHDB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIDSCC tuple.
<i>Bad Data</i> =	Value of tsichan array entry.
<i>Good Data</i> =	dbchan value from rCKTDATA.
<i>Logical Index</i> =	Circuit name of the rIDSCC tuple.
<i>Dump</i> =	NA.

Table 2 Error Code: DSCC_CDB

Error Code:	DSCC_CDB
Error Description:	The rIDSCC tsichan array entry does not match the link to rCHDB in rCDBCOM. This error also occurs if the link to rCHDB is 0 and the tsichan array entry is not -1.
Possible Error Effect:	The erroneously marked tsichan array entry in rIDSCC may cause serious problems if accessed by other operation or maintenance software (such as, IIA).
Corrective Action Taken:	Correct the tsichan array entry in rIDSCC.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIDSCC tuple.
<i>Bad Data</i> =	Value of tsichan array entry.
<i>Good Data</i> =	The link to rCHDB in rCDBCOM.
<i>Logical Index</i> =	Circuit name of the rIDSCC tuple.
<i>Dump 1</i> =	rIDSCC tuple.
<i>Dump 2</i> =	rCDBCOM tuple.

Table 3 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The rIDSCC tuple corresponds to an rCKTDATA tuple which is unequipped or not of the type "PCGDSUCOM".
Possible Error Effect:	Loss of resources and possible problems if operational or maintenance software accesses this data (such as, IIA).
Corrective Action Taken:	Delete the rIDSCC tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIDSCC tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Circuit name of the rIDSCC tuple.
<i>Dump</i> =	rIDSCC tuple.

Table 4 Error Code: LOSTCDB

Error Code:	LOSTCDB
Error Description:	The rCCDBCOM tuple for this valid rIDSCC tuple is vacant.
Possible Error Effect:	The GDSU common board circuit data is missing which may cause problems for the interrupt inhibit administrator (IIA).
Corrective Action Taken:	None. The CDBCOM audit is scheduled as a related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Circuit name of the rIDSCC tuple.
<i>Dump</i> =	rIDSCC tuple.

Table 5 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	The channel assignment for the GDSU subtending circuit in question is assigned at initialization time. However, the tsichan array entry in rIDSCC does not match the link to rCHDB in rCDBCOM.
Possible Error Effect:	The erroneously marked tsichan array entry in rIDSCC may cause serious

	problems if accessed by other operation or maintenance software (such as, IIA).
Corrective Action Taken:	Correct the tsichan array entry in rIDSCC.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIDSCC tuple.
<i>Bad Data =</i>	Value of tsichan array entry.
<i>Good Data =</i>	The link to rICHDB in rCDBCOM.
<i>Logical Index =</i>	Circuit name of the rIDSCC tuple.
<i>Dump 1 =</i>	rIDSCC tuple.
<i>Dump 2 =</i>	rCDBCOM tuple.

Table 6 Error Code: TSMAP2

Error Code:	TSMAP2
Error Description:	There is garbage in one of the tsichan array entries in rIDSCC.
Possible Error Effect:	This garbage could cause other operational and maintenance software to cause problems (such as, IIA).
Corrective Action Taken:	The array entry is recovered to -1.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIDSCC tuple.
<i>Bad Data =</i>	Value in the tsichan array entry.
<i>Good Data =</i>	-1.
<i>Logical Index =</i>	Circuit name of the rIDSCC tuple.
<i>Dump 1 =</i>	rIDSCC tuple.
<i>Dump 2 =</i>	rCDBCOM tuple.

Table 7 Error Code: TUPLE

Error Code:	TUPLE
Error Description:	The rCDBCOM tuple for this GDSU subtending circuit appears to be an extra tuple. The read of rICKTDATA with this circuit name resulted in a no-match.
Possible Error Effect:	The extra tuple ties up resources.
Corrective Action Taken:	None. The CDBCOM audit is scheduled as a related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rCDBCOM tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Circuit name of the rIDSCC tuple.
<i>Dump 1 =</i>	rIDSCC tuple.
<i>Dump 2 =</i>	rCDBCOM tuple.

DSLEQUIP

Software Release: 5E10 and later

1. DIGITAL SUBSCRIBER LINE EQUIPMENT STATUS (DSLEQUIP) AUDIT

The DSLEQUIP audit performs a static-to-dynamic existence check against the dynamic terminal equipment data block (TEDB) relation for a subscriber of default service. The DLSEQUIP audit also performs a static-to-dynamic existence check against the dynamic integrated service digital network (ISDN) maintenance data block (ISMDB) relation. This audit is part of ISDNBASE package and resides on the operating system for distributed switching-switching module (OSDS-SM). The DSLEQUIP audit is running at the segmented mode as well as the initialization mode during selective initialization.

2. DATA STRUCTURES

The RLDSLEQUIP is a static relation with the port as the key. If the user subscribes to default service in this digital subscriber line (DSL), the dflt_grp field in DSLEQUIP indicates the default group number. (Refer to Figure 1 .)

Figure 1 (DSLEQUIP-1) Data Structures of the DSLEQUIP Audit

3. AUDIT CHECKS

The AUdrstatic (static driver) is used to step through the RLDSLEQUIP relation. For every tuple, the driver calls the DSLEQUIP static-to-dynamic existence check function. For DSL subscribed default service, the DSLEQUIP audit ensures that the default service TEDB is initialized. If the TEDB is missing, the DSLEQUIP audit inserts the TEDB and links it to the owning D-channel port block (DPB). For every DSLEQUIP tuple, there should exist a corresponding ISMDB tuple. The key of ISMDB tuple consists of dsl group and member from DSLEQUIP. The ISMDB is used for all application that support ISDN protocols. Any missing ISMDB tuple will be inserted.

4. ERROR HANDLING

Any missing TEDB tuple is initialized and linked to the DPB and any missing ISMDB tuple is just initialized.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	The DSL has default service feature but the corresponding TEDB tuple does not exist or for each tuple in DSLEQUIP, there should exist corresponding ISMDB tuple.
Possible Error Effect:	Users cannot originate calls by using default service or no protocol monitor available on this channel.
Corrective Action Taken:	If the TEDB tuple, the tuple is initialized and linked to DPB (D-channel process block). If the ISMDB tuple, the tuple is just initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the missing dynamic (TEDB or ISMDB).
<i>Bad Data =</i>	Relation is of the missing dynamic (TEDB or ISMDB).
<i>Good Data =</i>	Expected dynamic (TEDB or ISMDB) key.
<i>Logical Index =</i>	Port name of DSL.
<i>Dump =</i>	Dump of the rDSLEQUIP tuple.

DSLOWN

Software Release: 5E10 and later

1. DIGITAL SUBSCRIBER LINE (DSL) OWNERSHIP MECHANISM (DSLOWN) AUDIT

The DSLOWN audit verifies that the DSL digital subscriber loop-resources, that are associated with an *ANSI*[®] U-CARD, are allocated and queued promptly. The DSLOWN audit also verifies that no one resource is allocated for more than one user at any time. The audit performs this by checking the entries in every DSLOWN tuple that exist in the system. The DSLOWN tuples exist only when some maintenance activity is taking place on a DSL resource.

2. DATA STRUCTURES

The DSLOWN audit, audits the data structure rDSLOWN. This data structure contains the information regarding the DSL resource that is presently worked on. The other data structures referenced in this audit are the rCKTDATA and rPCBLA.

3. AUDIT CHECKS

The main purpose of the DSLOWN routine audit flow is to sequence through every existing DSLOWN tuple and verify its legitimacy. This verification is performed by the following steps for every existing tuple.

- (1) For every existing DSLOWN tuple, a static CKTDATA tuple should also exist. The "cktname" field of the CKTDATA tuple should be the same as the "cktname" field of the DSLOWN tuple. Also, the "ckttype" field of the CKTDATA tuple should be of the *ANSI*[®] or spare *ANSI*[®] type circuit enumeration.
- (2) In any existing DSLOWN tuple, at least one live Process Identifier (PID) should exist in one of the five structures of that DSLOWN tuple. (Refer to Figure 1.)
- (3) For every live PID that the DSLOWN audit locates in any of the structures, a PCBLA tuple should also exist. The PCBLA's "dslown" field should be set to "DBYES". The DSLOWN audit invokes the DRSTATIC driver to sequence through every existing DSLOWN tuple.

Figure 1 (DSLOWN-1) rIDSLOWN Tuple

4. ERROR HANDLING

Whenever the audit locates a problem with a rIDSLOWN tuple, the audit deletes that tuple and the corresponding related audits that are scheduled to run, to recover the other data structures. (PCBLA audit to recover rIPCBLA tuple). For example, the Process Control Block Linkage Area (PCBLA) audit recovering the rIPCBLA tuple.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The circuit name field in the rIDSLOWN tuple (ckname) contains a circuit name that is not of type <i>ANSI</i> [®] U-card (PCU_ANSI) or <i>ANSI</i> [®] spare U-card (PCSPRU_ANSI) as specified by the circuit type (type) field in the corresponding

	static rICKTDATA tuple.
Possible Error Effect:	Terminal maintenance (TM) may try to seize a DSL resource that does not exist causing asserts.
Corrective Action Taken:	The rIDSLOWN tuple will be deleted from the database.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIDSLOWN tuple found in error.
<i>Bad Data</i> =	The circuit type field (type) from the rICKTDATA tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The circuit name field (cktname) from the rIDSLOWN tuple found in error.
<i>Dump 1</i> = 1	The rIDSLOWN tuple found in error.
<i>Dump 2</i> = 1	The process control block (OSbpcb[]) of the owning process of this rIDSLOWN tuple (res_own[].pid.procno).

Table 2 Error Code: DEADPID

Error Code:	DEADPID
Error Description:	A rIDSLOWN tuple was found to have a PID with no matching rIPCBLA tuple.
Possible Error Effect:	This will cause a resource to be allocated to more than one user, which is not to be allowed.
Corrective Action Taken:	Delete the rIDSLOWN tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDSLOWN tuple.
<i>Bad Data</i> =	The number of the dead PID found.
<i>Good Data</i> =	The number of the RES_OWN structure within the rIDSLOWN tuple.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	rIDSLOWN tuple.

Table 3 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	An extra rIDSLOWN tuple exists with no matching rICKTDATA tuple.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	Delete the extra rIDSLOWN tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDSLOWN tuple.
<i>Bad Data</i> =	0.
<i>Good Data</i> =	Circuit name.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	rIDSLOWN tuple.

Table 4 Error Code: NOPBCBLA

Error Code:	NOPBCBLA
Error Description:	A rIDSLOWN tuple was found to have a matching rIPCBLA tuple, but the dslown filed in the rIPCBLA was not set to DBYES.
Possible Error Effect:	Eventual purge of the process owning that tuple if still alive.
Corrective Action Taken:	Delete the rIDSLOWN tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIDSLOWN tuple.
<i>Bad Data</i> =	The value the dslown field of the rIPCBLA.
<i>Good Data</i> =	The number of the RES_OWN structure within the rIDSLOWN.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	rIDSLOWN tuple.

DT

Software Release: 5E10 and later

1. DATA TRANSPORT (DT) AUDIT

The DT audit is part of the system integrity audits subgroup. It is part of the integrated services digital network packet (ISDNPKT) loadable package. It runs in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The audit checks data transport data structures in the switching module processor (SMP).

3. AUDIT CHECKS

The audit checks the master copy of the data against data transports private copy.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: CSAERR

Error Code:	CSAERR
Error Description:	The data transport DTSABMRCV bit does not agree with the value found in the ODD office parameter Glsabm.
Possible Error Effect:	The PHs are using the wrong value.
Corrective Action Taken:	The data transport value is updated to agree with the ODD office parameter.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value read from data transport.
<i>Good Data =</i>	The value found in Glsabm.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 2 Error Code: DSL_RATE

Error Code:	DSL_RATE
Error Description:	The data transport DTRATEPRD bit does not agree with the value found in the SMP.
Possible Error Effect:	The PHs are using the wrong value.
Corrective Action Taken:	The data transport value is updated to agree with the SMP rate period.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value read from data transport.
<i>Good Data =</i>	The value found in the SMP.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 3 Error Code: LEV2_CL

Error Code:	LEV2_CL
Error Description:	The data transport DTLEV2ERR bit does not agree with the value found in the ODD office parameter Gll2err.
Possible Error Effect:	The PHs are using the wrong value for their threshold.
Corrective Action Taken:	The data transport value is updated to agree with the ODD office parameter.

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value read from data transport.
<i>Good Data =</i>	The value found in Gll2err.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 4 Error Code: LNK_SM_NUM

Error Code:	LNK_SM_NUM
Error Description:	The data transport DTSMNUM bit does not agree with the value found in the ODD office parameter G1_pcid.
Possible Error Effect:	The PHs are using the wrong value.
Corrective Action Taken:	The data transport value is updated to agree with the ODD office parameter.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value read from data transport.
<i>Good Data =</i>	The value found in G1_pcid.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 5 Error Code: LVLNUM

Error Code:	LVLNUM
Error Description:	The data transport DTPSNUM bit does not agree with the value found in the ODD office parameter Glpsn.
Possible Error Effect:	The PHs are using the wrong value.
Corrective Action Taken:	The data transport value is updated to agree with the ODD office parameter.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value read from data transport.
<i>Good Data =</i>	The value found in Glpsn.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 6 Error Code: MINDX

Error Code:	MINDX
Error Description:	The data transport DTXMITHRSH bit does not agree with the value found in the ODD office parameter Glretrans.
Possible Error Effect:	The PHs are using the wrong value.
Corrective Action Taken:	The data transport value is updated to agree with the ODD office parameter.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value read from data transport.
<i>Good Data =</i>	The value found in Glretrans.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 7 Error Code: OFCNAME

Error Code:	OFCNAME
Error Description:	The data transport DTFCSRCV bit does not agree with the value found in the ODD office parameter G1badfcs.
Possible Error Effect:	The PHs are using the wrong value.
Corrective Action Taken:	The data transport value is updated to agree with the ODD office parameter.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value read from data transport.
<i>Good Data =</i>	The value found in G1badfcs.
<i>Logical Index =</i>	NA.

<i>Dump</i> =	NA.

Table 8 Error Code: P_TMPINH1

Error Code:	P_TMPINH1
Error Description:	The data transport DTPHAUINH bit does not agree with the PH audit inhibit status which is in the SMP.
Possible Error Effect:	The PH audit inhibit and allow status does not agree with the SMP status.
Corrective Action Taken:	The data transport value is updated to agree with the SMP status.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Value read from data transport.
<i>Good Data</i> =	The value found in the SMP.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 9 Error Code: P_TMPINH2

Error Code:	P_TMPINH2
Error Description:	The data transport DTPIAUINH bit does not agree with the PI audit inhibit status which is in the SMP.
Possible Error Effect:	The PI audit inhibit and allow status does not agree with the SMP status.
Corrective Action Taken:	The data transport value is updated to agree with the SMP status.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Value read from data transport.
<i>Good Data</i> =	The value found in SMP.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 10 Error Code: SEG_CL

Error Code:	SEG_CL
Error Description:	The data transport DTSEGSIZE bit does not agree with the value found in the ODD office parameter Glsegsz.
Possible Error Effect:	The PHs are using the wrong value.
Corrective Action Taken:	The data transport value is updated to agree with the ODD office parameter.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Value read from data transport.
<i>Good Data</i> =	The value found in Glsegsz.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 11 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit has been entered by audit control to clean up after a reset.
Possible Error Effect:	Causes resets and or asserts.
Corrective Action Taken:	The audit is restarted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

DYNPICB

Software Release: 5E12 and later

1. DYNAMIC PICB (DYNPICB) AUDIT

Peripheral interface control buses pass control information from the peripheral units to the module controller/time-slot interchanger (MC/TSI). The information passed over the bus includes control and timing configurations. The DYNPICB audit ensures that the dynamic peripheral interface control bus relation (RLDYNPICB) is identical to the static peripheral interface control bus relation (RLPICB).

2. DATA STRUCTURES

For details on the fields contained in the RLDYNPICB relation, refer to the 5ESS® Translations Data Manual (235-600-1xx) and the 5ESS® Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	The static and dynamic copies of rPICB are not identical.
Possible Error Effect:	May not be able to properly set up calls. Depending on the type of peripheral interface control bus (PICB) that is wrong, it might also cause hardware problem.
Corrective Action Taken:	The static version of rPICB is copied into the dynamic version.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Beginning address of the dynamic tuple that is found to be in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	PICB number.
<i>Dump 1 =</i>	Dynamic rPICB tuple under audit.
<i>Dump 2 =</i>	Static rPICB tuple that is considered correct.

15. E - G

E911DB

Software Release: 5E10 and later

1. ENHANCED 911 DATA BLOCK (E911DB) AUDIT

The enhanced 911 data block (E911DB) audit audits the RLE911DB relation, used for the enhanced 911 (E911) feature. 911 service is a Bell Operation Company (BOC) basic exchange service that provides access to emergency bureaus by dialing three digits "911" from any telephone. The major advantages of E911 over the basic 911 (B911) service on the switch are:

- The ability to selectively route the call to the appropriate agency, based on the calling party's automatic number identification (ANI).
- Delivery of caller's ANI to public safety answering point (PSAP) (location or equipment at the location where emergency attendants receive 911 calls) for display at an attendant position.
- Support of the E911 PSAP which enables subsequent retrieval of the caller's name and location from an automatic location identification (ALI)/data management system (DMS) for display at the attendant position.
- The ability to selectively transfer the call to up to six directory numbers (DNs) based upon the caller's ANI.

The E911 capability provides full 1A E911 service transparency on the switch. The E911DB audit runs in the OSDS-M environment in the segmented mode.

2. DATA STRUCTURES

The primary data structure for this audit is the RLE911DB relation. It is a dynamic, indirect access sequential keyed relation that is used to store the alternate PSAP DNs, selective transfer DNs, the ANI, the numbering plan digit (NPD), the emergency serving central office (ESCO) and the flash indicator. It is used by the originating terminal process (OTP) and the terminating terminal process (TTP) of the E911 calls. All idle rLE911DB tuples must be linked with owner-member linkages to the idle list owned by rIDB_HEADC tuple. (Refer to Figure 1.) All busy rLE911DB tuples must be linked one-to-one to rPCBLA tuples. (Refer to Figure 2.) Global parameter Gle911cnt indicates the number of rLE911DB tuples to be populated during initialization.

Figure 1 (E911DB-1) Owner-Member Linkages with rIDB_HEADC Tuple

Figure 2 (E911DB-2) One-to-one Linkages with rIPCBLA

3. AUDIT CHECKS

The E911DB audit invokes the DRINASEK driver to make the linkages and semantic checks for each rIE911DB tuple. It also uses the following error codes. This listing gives a basic indication of the order of the checks. For details regarding each error code see the comment blocks given.

IDLE_LINK = Check validity of linkages when rIE911DB tuple is on idle list.
 NOPCBLA = Check validity of linkages when rIE911DB tuple is used in a call and linked to rIPCBLA tuple.
 ZERO_LINK = Check validity of owner field of rIE911DB tuple.

NOTE: Normally when a rIPCBLA tuple (process) is involved with another data block in setting up a call, when we find any kind of linkage errors, we put the data block to free list and purge the process to which it was linked. Since rIE911DB tuple is used only to set up the E911 call, if we find any linkage errors in rIE911DB tuple, only the rIE911DB tuple will be put back to the free list and the process (rIPCBLA tuple) involved with that call will stay. The linkage field linking rIPCBLA tuple to the rIE911DB tuple will be nulled.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this document, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	The owner field of the rIE911DB tuple, e911db_ptr→e911_mem.st_ownk, indicates that it is neither on the idle list nor linked to a rIPCBLA tuple. The rIE911DB tuple should be linked to rIDB_HEADC tuple when idle and should be linked to rIPCBLA tuple when in use.
Possible Error Effect:	Lost resource which may result in no e911 calls getting originated.
Corrective Action Taken:	The tuple will be put on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIE911DB tuple being audited.
<i>Bad Data =</i>	The value of the owner field of the rIE911DB tuple, e911db_ptr→e911_mem.st_ownk.
<i>Good Data =</i>	DBE911IDLE, the number of the rIDB_HEADC tuple to which all idle rIE911DB tuples should be linked.
<i>Logical Index =</i>	Key of the rIE911DB tuple being audited.
<i>Dump =</i>	The rIE911DB tuple being audited.

Table 2 Error Code: NOPCBLA

Error Code:	NOPCBLA
Error Description:	A rIE911DB tuple is marked busy (rIE911DB.e911_mem.st_ownk == DALNKNUL) but the one-to-one linkage to an associated rIPCBLA tuple is not marked (rIE911DB.e911_mem.st_link == DALNKNUL). For all busy rIE911DB tuples, there must be a linkage to an associated rIPCBLA tuple.
Possible Error Effect:	Possible E911 resource exhaustion resulting in E911 origination failures. Possible switch resource overload alarms.
Corrective Action Taken:	The tuple is recovered to the RLDB_HEADC idle list head cell (DBE911IDLE).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIE911DB tuple being audited.
<i>Bad Data =</i>	DALNKNUL.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key of the rIE911DB tuple being audited (rIE911DB.e911db).
<i>Dump =</i>	The contents of the rIE911DB tuple being audited.

Table 3 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	The owner field of the rIE911DB tuple, e911db_ptr→e911_mem.st_ownk, indicates that this should be linked to idle list (to a rIDB_HEADC tuple), but other linkage(s) for this rIE911DB tuple are found to be nonnull.
Possible Error Effect:	An e911 call may be purged by audit or this is a lost resource.
Corrective Action Taken:	The tuple will be put on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIE911DB tuple being audited.
<i>Bad Data =</i>	The value of the return variable from idle state linkage checks.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of the rIE911DB tuple being audited.
<i>Dump =</i>	The rIE911DB tuple being audited.

ECD

Software Release: 5E10 and later

1. EQUIPMENT CONFIGURATION DATABASE (ECD) AUDIT

The equipment configuration database (ECD) audit verifies the description of hardware and selected software resources that are stored in the ECD. The audit is divided into three parts (called members), each invoked by a separate input message.

Three copies of the ECD are kept all of the time, one in core memory and two on disk.

ECD 1 produces a structural audit of the incore ECD.

ECD 2 produces a structural audit of either the operating system (ECD) or the application (APPLCD).

ECD 3 produces a raw data audit of the incore ECD.

The ECD audits are routinely scheduled as timed audits in the correcting disk ECD's mode.

Auditing the ECD requires correct information in the low-level access (LLA) system. Therefore, ECD audits may invoke an LLA audit.

SIM requests ECD audits regularly to examine the ECDs. The user can invoke these audits by using the AUD:ECD input messages described.

NOTE: Do not run an ECD audit while a recent change is being applied.

1.1 Requesting ECD Audits

To request an audit of the incore ECD, use the following input message:

```
AUD:ECD=a[:b|:c|:b,c];
```

To request a structural audit of the operating system portion of the disk ECD, use the following input message:

```
AUD:ECD=2,INS="ecd"[:b|:c|:b,c];
```

To request a structural audit of the application portion of the disk ECD, use the following input message:

```
AUD:ECD=2,INS="appecd"[:b|:c|:b,c];
```

In all three input messages:

a = The type of incore audit. Valid values are:

1 = Specifies a structural audit.

3 = Specifies a raw data audit.

b = Correcting or non correcting. Valid values are:

CORR = Specifies that an audit should correct errors (default).

NCG = Specifies that an audit does not correct errors.

c	= The type of report. Valid values are:
DETL	= Generates a raw data report for each error found and an audit completion message (default). (Only a limited number of raw data reports are generated.)
SUM	= Generates only an audit completion message when the audit terminates. Raw data reports are not generated for any errors found.

To interpret system responses to the AUD:ECD input message, refer to the APP:AUD Appendix in the Appendixes section of the Input Messages manual (235-600-700).

1.2 Interpreting AUD ECD Output Messages and Error Reports

The ECD audit prints an output message after each audit. It is produced by the system integrity output formatter and includes the information requested by the input message. For more detailed information about the AUD ECD output message, see the Output Messages manual (235-600-750).

Three categories of errors are reported by the AUD ECD output message: 3, 4, and 5.

Category 3 errors:

- Cause the audit to stop.
- Cannot be corrected by the audit.
- Error number starts with a 3.

Category 4 errors:

- Do not stop the audit.
- Cannot be corrected by the audit.
- Error number starts with a 4.

Category 5 errors:

- Do not stop the audit.
- Are corrected when the audit is in the correcting mode.
- Are not corrected when the audit is not in the correcting mode.
- Error number starts with a 5.

Table 1 is a list of error messages.

Table 1 ECD AUDIT ERROR MESSAGES

Category	Error Number	Meaning
3	3000	Cannot open incore ECD.
3	3001	malloc failure.
3	3002	read failure.
3	3003	Audit ECD has more records than incore ECD.

3	3004	Incore ECD has more records than audit ECD.
3	3005	lla_rdget failure for incore ECD to check RCV semaphore.
3	3006	Recent change in progress.
3	3007	lla_ainit failure for structural audit.
3	3008	lla_irel failure for incore ECD.
3	3009	lla_dbrel failure.
3	3010	Cannot open disk ECD.
3	3011	lla_nsgrid failure.
3	3012	getport failure.
3	3013	getseg failure.
3	3014	lla_iatt failure for incore ECD.
3	3015	lla_opensq failure for incore ECD.
3	3016	Audit copy corrupted.
3	3017	fopen failure.
3	3018	fread failure.
3	3019	fseek failure.
3	3020	fwrite failure.
3	3021	Disk ECD time stamp does not match incore ECD. Incorrect or missing audit ECD, request assistance in correcting this error.
3	3022	Driver PID notification table entries out of space.
3	3023	Unable to create segment because of insufficient swap space or there is insufficient user address space.
3	3024	Audits blocked during offline boot - try later.
4	4000	lla_rinfo failure.
4	4001	Incore RID does not match audit.
4	4002	lla_rdget failure.
4	4003	Record size of incore ECD does not match record size audit ECD.
4	4004	Record type of incore does not match audit ECD.
4	4005	lla_uprid failure.
4	4006	Unable to notify driver of local copy record changes.
4	4007	Possible disk ECD inconsistency (structure corrected).
4	4008	Structural audit cannot continue without previous corrections.
4	4009	UCB points down to a UCB which does not point back up.
4	4010	UCB has incorrect UP0 pointer for its side chain.
4	4011	UCB has incorrect UP1 pointer for its side chain.
4	4012	UCB points down to the beginning of a side chain loop.
4	4013	UCB should not have a side pointer.
4	4014	UCB points down to itself.
5	5000	Record corrected. Incore record data will be followed by audit record data.
5	5001	Record needs correction. Incore record data will be followed by audit record data.

The DATA1 through DATA4 fields are always zero in AUD ECD error messages. Additional information is provided in the supplementary data portion of each message. Complete lists of supplementary data messages may be found on the AUD ECD output message page and in Table 2.

If the audits are unable to interface with the audit control subsystem, AUD output messages cannot be issued. In that event, the supplementary data portion of each error message will be printed as a separate output message.

The LLA audit output messages come in three types:

- DIAG = Diagnostic only.
- RCVY = Error detection and associated recovery actions.
- UNRCVY = Detection of an unrecoverable error.

A percent character, "%", followed by an x, lx, d, and ld in an error message means that the appropriate value is substituted into the output message at this point.

- d = Integer decimal number.
- ld = Long (4-byte) decimal number.
- lx = Long (4-byte) hexadecimal number.

x = Integer hexadecimal number.

Table 2 LLA AUDIT ERROR MESSAGES

Error Code	Status	Message	Description
100	RCVY	STRAUD00	Incore database sanity ID overwritten with 0x%lx.
101	RCVY	STRAUD01	Offset to software demand paging (SDP) SPACE structure being reset from 0x%lx to 0x%x.
102	RCVY	STRAUD02	Offset to user data section being reset from 0x%lx to 0x%lx.
103	UNRCVY	STRAUD03	User rootid in DMLHEAD(=0x%lx) was reinitialized.
104	RCVY	STRAUD04	Startup database size being reset from 0x%lx to 0x%lx.
105	RCVY	STRAUD05	Space maxpage being reset from 0x%lx to 0x%lx.
106	RCVY	STRAUD06	Number of SDP space allocation stacks being reset from 0x%lx to 0x%lx.
107	RCVY	STRAUD07	Pointer to SDP stacks being reset from 0x%lx to 0x%lx.
108	RCVY	STRAUD08	SDP space pointer to environ being reset from 0x%lx to 0x%lx.
109	RCVY	STRAUD09	ENVIRON manager pointer being reset from 0x%lx to 0x%lx.
110	RCVY	STRAUD10	SDP manager frame pointer being reset from 0x%lx to 0x%lx.
111	RCVY	STRAUD11	SDP manager page ID being reset from 0x%lx to 0x0.
112	RCVY	STRAUD12	SDP manager use count being reset from 0x%lx to 0x1.
113	RCVY	STRAUD13	SDP manager next index being reset from 0x%lx to 0x1.
114	RCVY	STRAUD14	SDP manager previous index being reset from 0x%lx to 0x1.
115	RCVY	STRAUD15	SDP manager page ID being reset from 0x%lx to IDNULL.
116	RCVY	STRAUD16	SDP manager use count reset from 0x%lx to 0x0.
117	RCVY	STRAUD17	SDP manager next index being reset from 0x%lx to 0x0.
118	RCVY	STRAUD18	SDP manager previous index being reset from 0x%lx to 0x0.
200	DIAG	SDPAUD00	Stack entry 0x%lx next ID overwritten with 0x%lx.
201	DIAG	SDPAUD01	Stack entry 0x%lx on %d list size %ld out of range.
202	RCVY	SDPAUD02	Resetting depth of %d control stack from %ld to %ld.
203	RCVY	SDPAUD03	Resetting next ID of %d control stack from 0x%lx to 0x%lx.
204	RCVY	SDPAUD04	Stack entry 0x%lx next ID being reset from 0x%lx to 0x%lx.
205	RCVY	SDPAUD05	Resetting next ID of %d control stack from 0x%lx to 0x%lx.
206	DIAG	SDPAUD06	Four-byte stack entry 0x%lx top found to have incorrect value 0x%lx.
207	RCVY	SDPAUD07	Resetting top itemid of 4-byte stack from 0x%lx to 0x%lx.
208	RCVY	SDPAUD08	Resetting depth of 4-byte stack from %ld to %ld.
209	RCVY	SDPAUD09	Resetting top of 4-byte stack from 0x%lx to 0x%lx.
210	RCVY	SDPAUD10	Four-byte stack entry 0x%lx next ID being reset from 0x%lx to 0x%lx.
300	UNRCVY	DMLAUD00	Unable to load DMLHEAD structure with SDP.
301	RCVY	DMLAUD01	DML sanity ID at itemid = 0 was overwritten with 0x%lx.
302	RCVY	DMLAUD02	DML page size overwritten with %d, should be %d.
303	RCVY	DMLAUD03	Number of RIDs in ridblk per page overwritten with %d, should be %d.
304	DIAG	DMLAUD04	Start of set header list found to have incorrect value 0x%lx.
305	DIAG	DMLAUD05	Set start points to bad set header at 0x%lx.
306	DIAG	DMLAUD06	End of set header list overwritten with 0x%lx.
307	DIAG	DMLAUD07	Set end points to bad set header at 0x%lx.
308	RCVY	DMLAUD08	Set start itemid being reset to 0x%lx from 0x%lx.
309	RCVY	DMLAUD09	Set end itemid being reset to 0x%lx from 0x%lx.
310	DIAG	DMLAUD10	Start of RID block list found to have incorrect value 0x%lx.
311	DIAG	DMLAUD11	RID block start points to bad RID block header at 0x%lx.
312	DIAG	DMLAUD12	End of RID block list found to have incorrect value 0x%lx.
313	DIAG	DMLAUD13	RID block end points to bad RID block at 0x%lx.
314	RCVY	DMLAUD14	RID block start itemid reset to 0x%lx from 0x%lx.
315	RCVY	DMLAUD15	RID block end itemid being reset to 0x%lx from 0x%lx.
316	RCVY	DMLAUD16	SPACE page size found to have incorrect value %d, should be %d.
317	RCVY	DMLAUD17	SPACE curleft being reset from 0x%lx to 0x%lx.
400	RCVY	SETAUD00	CSet header sanity ID at 0x%lx found to have incorrect value 0x%lx.
401	RCVY	SETAUD01	Previous link field in set header at 0x%lx being reset from 0x%lx to 0x%lx.
402	RCVY	SETAUD02	Next link field in set header at 0x%lx being reset from 0x%lx to 0x%lx.
500	RCVY	RBLAUD00	RID block sanity ID at 0x%lx overwritten with 0x%lx.
501	RCVY	RBLAUD01	Previous link field in RID block at 0x%lx being reset from 0x%lx to 0x%lx.
502	RCVY	RBLAUD02	Next link field in RID block at 0x%lx being reset from 0x%lx to 0x%lx.
600	RCVY	BCKAUD00	Record sanity ID at 0x%lx found to have incorrect value 0x%lx.
601	RCVY	BCKAUD01	Record at 0x%lx back link being reset from 0x%lx to 0x%lx.
602	RCVY	BCKAUD02	RID block slot at 0x%lx being reset from 0x%lx to 0x%lx.
603	RCVY	BCKAUD03	RID block slot 0x%lx bad, being reset from 0x%lx to 0x%lx.
700	RCVY	ORPAUD00	Resetting ridblk slot at 0x%lx to 0x%lx from 0x%lx.
800	RCVY	FREAUD00	RID block 0x%lx being put on free RID block list at head.
801	RCVY	FREAUD01	RID block 0x%lx on free list has no free slots.
900	DIAG	FRLAUD00	RID block 0x%lx next free link found to have incorrect value 0x%lx.

901	DIAG	FRLAUD01	dmlhead link to start of RID block free list found to have incorrect value 0x%lx.
1000	RCVY	FRLAUDR00	RID block 0x%lx next free link being reset from 0x%lx to 0x%lx.
1001	RCVY	FRLAUDR01	Resetting free RID block ID in dmlhead from 0x%lx to 0x%lx.
1200	UNRCVY	SHDAUD00	Set 0x%lx ordinal in both header and accessid bad.
1201	RCVY	SHDAUD01	Set 0x%lx ordinal being reset from 0x%x to 0x%x.
1202	RCVY	SHDAUD02	Set 0x%lx number of access methods being reset from %d to %d.
1203	RCVY	SHDAUD03	Set 0x%lx cluster flag being reset from 0x%x to 0x%x.
1204	RCVY	SHDAUD04	Set 0x%lx, access method %d, accessid being reset from 0x%lx to 0x%lx.
1205	RCVY	SHDAUD05	Set 0x%lx, access method %d, page size being reset from 0x%x to 0x%x.
1206	RCVY	SHDAUD06	Set 0x%lx, access method %d, key length being reset from %d to %d.
1300	RCVY	DMLAUDR0	Start and end RID block links being reset from 0x%lx, 0x%lx to 0x%lx, 0x%lx.
1301	RCVY	DMLAUDR1	Start and end set header links being reset from 0x%lx, 0x%lx to 0x%lx, 0x%lx.

1.3 Responding to AUD ECD Error Reports

If the ECD audit was run in the noncorrecting mode, run it again in the correcting mode. If the error persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.

ECDOWN

Software Release: 5E10 and later

1. EQUIPMENT CONFIGURATION DATABASE OWNER (ECDOWN) AUDIT

The equipment configuration database owner (ECDOWN) audit verifies the entries in the ECD manager requester table. It ensures that no software resources are owned by an inactive or dead process. This information includes records of software resources assigned to the different active processes and devices.

The ECDOWN audit is scheduled to run routinely as a timed audit in the correcting mode.

ECDOWN has only one member and can be requested by either SIM or the user.

NOTE: Do not run an ECDOWN audit while a recent change or a manual diagnostic is being applied.

1.1 Requesting the ECDOWN Audit

To request an ECDOWN audit, use the following input message:

```
AUD:ECDOWN=1[:a|:b|:a,b];
```

where:

a = Correcting or non correcting. Valid values are:

CORR = Specifies that an audit should correct errors (default).

NCG = Specifies that an audit does not correct errors.

b = Type of report. Valid values are:

DETL = Generates a raw data report for each error found and an audit completion message (default). (Only a limited number of raw data reports are generated.)

SUM = Generates only an audit completion message when the audit terminates. Raw data reports are not created for any errors found.

To interpret system responses to the AUD:ECDOWN input message, refer to the APP:AUD Appendix in the Appendixes section of the Input Messages manual (235-600-700).

1.2 Interpreting AUD ECDOWN Output Messages and Error Reports

The ECDOWN audit prints an output message after each audit. It is produced by the system integrity output formatter and includes the information requested by the input message. For more detailed information about the AUD:ECDOWN output message, see the Output Messages manual (235-600-750).

ECDOWN can find two categories of errors: 1 and 2. Category 1 errors are not correctable; category 2 errors are correctable. Table 1 gives the error codes and their meanings.

Table 1 ECDOWN AUDIT ERROR MESSAGES

Category	Error Number	Meaning
1	100	Unable to release special device file; RID = 0x%1x.
1	101	Unable to release UCB; RID = 0x%1x.

1	102	Improper reserved entity - not SDF or UCB.
2	200	Special device file released; RID = 0x%1x.
2	201	UCB released; RID = 0x%1x.
2	202	Special device file should be released; RID = 0x%1x.
2	203	UCB should be released; RID = 0x%1x.

1.3 Responding to AUD ECDOWN Error Reports

If the ECDOWN audit was run in the noncorrecting mode, rerun it in the correcting mode. If the error persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.

EDSLTRKG

Software Release: 5E11 and later

1. ELECTRONIC DIRECTORY SERVICE TRUNK GROUP (EDSLTRKG) AUDIT

Calling name information delivery-primary rate interface (CNAM-PRI) is one of three components of the calling name for ISDN PRI feature on custom and national ISDN PRI. The CNAM-PRI component provides name information; either name characters, a private indication, or an unavailable indication, to a subscribed PRI interface at the time of call setup. The electronic directory service trunk group audit verifies the static data relation RLEDSLTRKG to the dynamic data relation RLPCNAM. For each tuple in RLEDSLTRKG where calling name is "allowed" and automatic message accounting is "usage sensitive", the relation RLPCNAM is searched for a tuple with the same group number. If an entry is not found in RLPCNAM then it is added and initialized.

2. DATA STRUCTURES

For details on the fields contained in the RLEDSLTRKG relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

EFD-A

Software Release: 5E10 - 5E12

1. ETHERNET FRAME DESCRIPTOR (EFD) AUDIT

Frames are used to transmit data through the ethernet network. ethernet frame descriptors (EFDs), elements of CMeTfduse[] or CMeRfduse[], are used to represent per-frame information such as type and ownership. EFDs are passed between data structures by linking them in different lists.

2. DATA STRUCTURES

The following data is used by the EFD audit:

CMeTfduse[]	= Transmit Ethernet Frame Descriptors.
CMeTfdidle	= Transmit EFD idle list.
CMeRfduse[]	= Receive Ethernet Frame Descriptors.
CMeRfdidle	= Receive EFD idle list.
CMqccscswcfg[]	= QUICC SCC software configuration profiles.
CMqccdb[]	= QUICC Channel data block.
CMscddb	= SONIC Channel data block.
CMeinq	= Ethernet interrupt/base level input queue head.
CMsipcb	= System integrity protocol control block.

3. AUDIT CHECKS

The EFD audit makes the following checks:

BADLINK	= Check an EFD's level 2 linkages.
BADUSE	= Check an EFD's usetype.
CORRUPT_IDLE	= Verify an idle EFD.
HEAD	= Verify idle list head.
IDLE_LINK	= Check an in-use list entry.
INVUSAGE	= Check for lost EFDs.
IS_NOTUSED	= Check an unused list entry.
RCVACCBK	= Check a receiving EFD's level 1 linkages and buffer.
QUE	= Verify CMeinq EFD ownership.
ZAP	= Check for system interrupt handling.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]), and one for receive EFDs (CMeRfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMeRfdidle). One or more of the following is true of a non-idle (usetype != CMENFREE) EFD: - EFD.I2_next = CMNIL_NDX, but the EFD is not the last one on the list. [On the message handler (MH), the end of the list is stored in CMsipcb.l_ifd. On the switching module (SM, not valid for SM-2000), it is the same, unless the EFD.usetype = CMENINQ, in which case it is CMeinq.unload]. - EFD.I2_prev = CMNIL_NDX, but the EFD is not the first one on the list. (On the MH, the head of the list is stored in CMsipcb.f_ifd. On the ASM, it is the same, unless the EFD.usetype = CMENINQ, in which case it is CMeinq.load). - EFD.I2_next != CMNIL_NDX, but is not valid (is ≥ max). - EFD.I2_prev != CMNIL_NDX, but is not valid (is ≥ max). - EFD.I2_next is < max, but that EFD's I2_prev field != the current EFD's index. - EFD.I2_prev is < max, but that EFD's I2_next field != the current EFD's index.
Possible Error Effect:	The EFD is not available for use. If enough EFDs became unavailable, the SM (switching module) would lose any ethernet connections.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	EFD type (2 means TEFD, 3 means REFD).
<i>Bad Data</i> =	EFD's user bits (EFD.bf_owner).
<i>Good Data</i> =	EFD's usage type (EFD.usetype).
<i>Logical Index</i> =	EFD's index.
<i>Dump 1</i> =	The EFD.
<i>Dump 2</i> =	EFD indexed by EFD.I2_next if I2_next is < max; otherwise NA.
<i>Dump 3</i> =	EFD indexed by EFD.I2_prev if I2_prev is < max; otherwise NA.

Table 2 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	An EFD's usage type is out-of-range (EFD.usetype ≥ CMENUMAX).
Possible Error Effect:	The out-of-range value may cause asserts. In any case, the EFD is not

	processed correctly. Any frame associated with the EFD may be dropped.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The EFD type: 2 means transmit EFD, an element of CMeTfduse[]. 3 means receive EFD, an element of CMeRfduse[].
<i>Bad Data</i> =	EFD's usage type (EFD.usetype).
<i>Good Data</i> =	CMENUMAX.
<i>Logical Index</i> =	EFD's index.
<i>Dump</i> =	The EFD.

Table 3 Error Code: CORRUPT_IDLE

Error Code:	CORRUPT_IDLE
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMeTfduse[CMETNUMBUF]) and one for receive EFDs (CMeRfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMeTfdidle and CMeRfdidle). An idle EFD (EFD.usetype = CMENFREE) does not contain the expected default value in one or more of its attributes: • EFD.qindx is out-of-range (> the idle stack's toppt field). • The idle stack's efdindx[EFD.qindx] != the EFD's index. • One or more of the following are != CMNIL_NDX: • I1_prev • I1_next • I2_prev • I2_next • EFD.bf_owner != CME_NO_OWNER.
Possible Error Effect:	The EFD is not available for use or the EFD idle stack is corrupt. If enough EFDs became unavailable, the SM would lose ethernet connectivity.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	EFD type (2 means TEFD, 3 means REFD).
<i>Bad Data</i> =	EFD's user bits (EFD.bf_owner).
<i>Good Data</i> =	EFD's usage type (EFD.usetype).
<i>Logical Index</i> =	EFD's index.
<i>Dump</i> =	The EFD.

Table 4 Error Code: HEAD

Error Code:	HEAD
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMeTfduse[CMETNUMBUF]), and one for receive EFDs (CMeRfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMeTfdidle and CMeRfdidle).

	An EFD idle stack is corrupt. One or more of the following are true: - The idle stack toppt value is out-of-range ($> \text{max}$ or $< \text{min}$). - The idle stack toppt is $< \text{max}$ and the idle stack entry fdindx[toppt+1] $\neq \text{CMNIL\_NDX}$. - The idle stack toppt is $< \text{max}$ and the idle stack entry fdindx[toppt+1] $\neq \text{CMNIL\_NDX}$.
Possible Error Effect:	The EFDs can not be allocated. The SM may lose ethernet connectivity.
Corrective Action Taken:	The audit clears the EFD idle stack (toppt = 0) and rebuilds the idle list (links all EFDs whose usetype is CMENFREE to the idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The EFD type. Valid values are: 2 = Transmit EFDs. 3 = Receive EFDs.
<i>Bad Data</i> =	The idle stack toppt .
<i>Good Data</i> =	The value of "max".
<i>Logical Index</i> =	The minimum number of EFDs expected in the list.
<i>Dump</i> =	NA.

Table 5 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]), and one for receive EFDs (CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMerfdidle). An EFD in-use idle stack entry ($\text{index} \leq \text{idle stack toppt}$) is corrupt. One or more of the following is true ("idle_efd" refers to the contents of the idle stack entry fdindx[index]): $\text{idle\_efd} \geq \text{max}$ - The EFD indexed the contents of idle stack entry efdindx[idle_efd] and does not point back to the idle list ($\text{EFD.qindx} \neq \text{idle\_efd}$).
Possible Error Effect:	EFDs may not be allocatable. If so, the SM may lose ethernet connectivity.
Corrective Action Taken:	If this is the first in-use idle list entry ($\text{index} = \text{idle stack toppt}$), the audit clears the idle stack entry (efdindx[index] = CMNIL_NDX) and decrements the count of idle EFDs (toppt is decremented). Otherwise, the audit puts a good value into the entry. That is, the audit sets efdindx[index] = efdindx[toppt], relinks ($\text{EFD.qindx} = \text{index}$), clears the old entry (efdindx[CMbufidle.toppt] = CMNIL_NDX), and decrements the number of idle EFDs (decrements toppt).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	EFD type (2 means TEFD, 3 means REFD).
<i>Bad Data</i> =	Value from idle stack entry (EFD index).
<i>Good Data</i> =	value of "max".
<i>Logical Index</i> =	Index into idle stack.

<i>Dump</i> =	NA.

Table 6 Error Code: INVUSAGE

Error Code:	INVUSAGE
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMeTfduse[CMETNUMBUF]), and one for receive EFDs (CMeRfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMeTfdidle and CMeRfdidle). An EFD is owned only by level 1 (EFD.bf_owner & CM_L1_OWNER != 0, but EFD.bf_owner and CM_L2_OWNER = 0) and has not been touched for several minutes (EFD.au_detect = 1 and EFD.au_recover = 1).
Possible Error Effect:	The EFD is not available for use. If enough EFDs became unavailable, the SM could lose ethernet connectivity.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	EFD type (2 means TEFd, 3 means REFD).
<i>Bad Data</i> =	EFD's user bits (EFD.bf_owner).
<i>Good Data</i> =	EFD's usage type (EFD.usetype).
<i>Logical Index</i> =	EFD's index.
<i>Dump</i> =	The EFD.

Table 7 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMeTfduse[CMETNUMBUF]), and one for receive EFDs (CMeRfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMeTfdidle and CMeRfdidle). An unused EFD idle stack entry is not null (index < toppt and efdindx[index] != CMNIL_NDX).
Possible Error Effect:	EFDs may not be allocatable. If so, the SM may lose ethernet connectivity.
Corrective Action Taken:	The audit clears the EFD idle stack entry (efdindx[index] = CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	EFD type (2 means TEFd, 3 means REFD).
<i>Bad Data</i> =	Contents of the idle stack entry (efdindx[index]).
<i>Good Data</i> =	CMNIL_NDX.
<i>Logical Index</i> =	Index into the idle stack.
<i>Dump</i> =	NA.

Table 8 Error Code: QUE

Error Code:	QUE
Error Description:	CMeinq contains invalid EFD linkages. One or more of the following is true: • CMeinq.load ≥ CMERNUMBUF and is != CMNIL_NDX. • CMeinq.unload ≥ CMERNUMBUF and is != CMNIL_NDX. • CMeinq.load < CMERNUMBUF but CMeRfduse[CMeinq.load].usetype != CMENINQ. • CMeinq.unload < CMERNUMBUF but CMeRfduse[CMeinq.unload].usetype != CMENINQ.

Possible Error Effect:	The queue of receive EFDs is corrupt. The SM may lose ethernet connectivity.
Corrective Action Taken:	The audit clears CMeinq (CMeinq.load and CMeinq.unload = CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CMeinq.load.
<i>Good Data =</i>	CMeinq.unload.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 9 Error Code: RCVACCBK

Error Code:	RCVACCBK
Error Description:	An receive ethernet frame (REFD) descriptor, entry in CMerfduse[], is in use (EFD.usetype = CMENRCV), but is not linked correctly at level 1. That is, one or more of the following are true: - EFD.I1_channel != CMQCENET (this check is only for the SM). - EFD.I1_next = CMNIL_NDX, but CMCDBENTRY.rcv_unload != the EFD's index. - EFD.I1_prev = CMNIL_NDX, but CMCDBENTRY.rcv_load != the EFD's index. - EFD.I1_next != CMNIL_NDX, but is not valid (is ≥ max). - EFD.I1_prev != CMNIL_NDX, but is not valid (is ≥ max). - EFD.I1_next is < max, but CMerfduse[EFD.I1_next].I1_prev != the EFD's index. - EFD.I1_prev is < max, but CMerfduse[EFD.I1_prev].I1_next != the EFD's index. - EFD.bd does not contain a valid linkage to the buffer.
Possible Error Effect:	The SM may lose ethernet connectivity.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack (CMerfdidle).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	EFD type (2 means TEFD, 3 means REFD).
<i>Bad Data =</i>	EFD's user bits (EFD.bf_owner).
<i>Good Data =</i>	EFD's usage type (EFD.usetype).
<i>Logical Index =</i>	EFD's index.
<i>Dump 1 =</i>	The EFD.
<i>Dump 2 =</i>	EFD indexed by EFD.I1_next if I1_next is < max; otherwise NA.
<i>Dump 3 =</i>	EFD indexed by EFD.I1_prev if I1_prev is < max; otherwise NA.

Table 10 Error Code: ZAP

Error Code:	ZAP
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]), and one for receive EFDs (CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMerfdidle). The audit takes this error as a result of a write protect violation, out-of-range

	read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit: • Clears the idle stack entry (efdindx[] = CMNIL_NDX), if any, that was being audited when the stimulus occurred. • Recovers the EFD, if any, which was being audited when the stimulus occurred. Specifically, the audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Message handler (MH): SMmhrunning (the current base-level loop job). SM: NA.
<i>Bad Data</i> =	EFD type being audited when the stimulus occurred (2 means transmit EFD, 3 means receive EFD).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Current EFD index (which may be out-of-range).
<i>Dump</i> =	The EFD.

EFD-B

Software Release: 5E13 and later

1. ETHERNET FRAME DESCRIPTOR (EFD) AUDIT

Frames are used to transmit data through the ethernet network. ethernet frame descriptors (EFDs), elements of CMeTfduse[] or CMerfduse[], are used to represent per-frame information such as type and ownership. EFDs are passed between data structures by linking them in different lists.

2. DATA STRUCTURES

The following data is used by the EFD audit:

CMeTfduse[]	= Transmit ethernet frame descriptors.
CMeTfdidle	= Transmit EFD idle list.
CMerfduse[]	= Receive ethernet frame descriptors.
CMerfdidle	= Receive EFD idle list.
CMqccscswcfg[]	= QUICC SCC software configuration profiles.
CMqccdb[]	= QUICC channel data block.
CMscddb	= SONIC channel data block.
CMeinq	= Ethernet interrupt/base level input queue head.
CMsipcb	= System integrity protocol control block.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanations in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMeTfduse[CMETNUMBUF]), and one for receive EFDs (CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMeTfdidle and CMerfdidle). One or more of the following is true of a non-idle (<i>usetype</i> != CMENFREE) EFD: EFD.I2_next = CMNIL_NDX, but the EFD is not the last one on the list.

	[On the MH (message handler), the end of the list is stored in Cmsipcb.l_ifd. On the SM (switching module, not valid for SM-2000), it is the same, unless the EFD.usetype = CMENINQ, in which case it is CMeinq.unload]. - EFD.I2_prev = CMNIL_NDX, but the EFD is not the first one on the list. (On the MH, the head of the list is stored in Cmsipcb.f_ifd. On the ASM, it is the same, unless the EFD.usetype = CMENINQ, in which case it is CMeinq.load). - EFD.I2_next != CMNIL_NDX, but is not valid (is $\geq$ max). - EFD.I2_prev != CMNIL_NDX, but is not valid (is $\geq$ max). - EFD.I2_next is $<$ max, but that EFD's I2_prev field != the current EFD's index. - EFD.I2_prev is $<$ max, but that EFD's I2_next field != the current EFD's index.
Possible Error Effect:	The EFD is not available for use. If enough EFDs became unavailable, the SM (switching module) would lose any ethernet connections.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The EFD type. Valid values are: 2 = TEFD. 3 = REFD.
<i>Bad Data =</i>	EFD's user bits (EFD.bf_owner).
<i>Good Data =</i>	EFD's usage type (EFD.usetype).
<i>Logical Index =</i>	EFD's index.
<i>Dump 1 =</i>	The EFD.
<i>Dump 2 =</i>	EFD indexed by EFD.I2_next if I2_next is $<$ max otherwise NA.
<i>Dump 3 =</i>	EFD indexed by EFD.I2_prev if I2_prev is $<$ max otherwise NA.

Table 2 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	An EFD's usage type is out-of-range (EFD.usetype $\geq$ CMENUMAX).
Possible Error Effect:	The out-of-range value may cause asserts. In any case, the EFD is not processed correctly. Any frame associated with the EFD may be dropped.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The EFD type. Valid values are: 2 = TEFD. 3 = REFD.
<i>Bad Data =</i>	EFD's usage type (EFD.usetype).
<i>Good Data =</i>	CMENUMAX.
<i>Logical Index =</i>	EFD's index.
<i>Dump =</i>	The EFD.

Table 3 Error Code: CORRUPT_IDLE

Error Code:	CORRUPT_IDLE
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]) and one for receive EFDs (CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMerfdidle). An idle EFD (EFD.usetype = CMENFREE) does not contain the expected default value in one or more of its attributes: • EFD.qindx is out-of-range (> the idle stack's <i>toppt</i> field). • The idle stack's efdindx[EFD.qindx] != the EFD's index. • One or more of the following are != CMNIL_NDX: • <i>l1_prev</i> • <i>l1_next</i> • <i>l2_prev</i> • <i>l2_next</i> • EFD.bf_owner != CME_NO_OWNER.
Possible Error Effect:	The EFD is not available for use or the EFD idle stack is corrupt. If enough EFDs became unavailable, the SM would lose ethernet connectivity.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The EFD type. Valid values are: 2 = Transmit EFD, an element of CMetfduse[]. 3 = Receive EFD, an element of CMerfduse[].
<i>Bad Data</i> =	EFD's user bits (EFD.bf_owner).
<i>Good Data</i> =	EFD's usage type (EFD.usetype).
<i>Logical Index</i> =	EFD's index.
<i>Dump</i> =	The EFD.

Table 4 Error Code: HEAD

Error Code:	HEAD
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]), and one for receive EFDs (CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMerfdidle). An EFD idle stack is corrupt. One or more of the following are true: • The idle stack <i>toppt</i> value is out-of-range (> max or < min). • The idle stack entry <i>fdindx[toppt]</i> = CMNIL_NDX.

	The idle stack <i>toppt</i> is < max and the idle stack entry <i>fdindx[toppt+1] != CMNIL_NDX</i>.
Possible Error Effect:	The EFDs can not be allocated. The SM may lose ethernet connectivity.
Corrective Action Taken:	The audit clears the EFD idle stack (<i>toppt</i> = 0) and rebuilds the idle list (links all EFDs whose <i>usetype</i> is CMENFREE to the idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The EFD type. Valid values are: 2 = TEFD. 3 = REFD.
<i>Bad Data</i> =	The idle stack <i>toppt</i> .
<i>Good Data</i> =	The value of "max".
<i>Logical Index</i> =	The minimum number of EFDs expected in the list.
<i>Dump</i> =	NA.

Table 5 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]), and one for receive EFDs (CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMerfdidle). An EFD in-use idle stack entry (<i>index</i> ≤ idle stack <i>toppt</i>) is corrupt. One or more of the following is true ("idle_efd" refers to the contents of the idle stack entry <i>fdindx[index]</i>): <i>idle_efd</i> ≥ max - The EFD indexed the contents of idle stack entry <i>efdindx[idle_efd]</i> and does not point back to the idle list (<i>EFD.qindx != idle_efd</i>).
Possible Error Effect:	EFDs may not be allocatable. If so, the SM may lose ethernet connectivity.
Corrective Action Taken:	If this is the first in-use idle list entry (<i>index</i> = idle stack <i>toppt</i>), the audit clears the idle stack entry (<i>efdindx[index] = CMNIL_NDX</i>) and decrements the count of idle EFDs (<i>toppt</i> is decremented). Otherwise, the audit puts a good value into the entry. That is, the audit sets <i>efdindx[index] = efdindx[toppt]</i>, relinks (<i>EFD.qindx = index</i>), clears the old entry (<i>efdindx[CMbufidle.toppt] = CMNIL_NDX</i>), and decrements the number of idle EFDs (decrements <i>toppt</i>).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The EFD type. Valid values are: 2 = Transmit EFDs. 3 = Receive EFDs.
<i>Bad Data</i> =	Value from idle stack entry (EFD index).
<i>Good Data</i> =	value of "max".
<i>Logical Index</i> =	Index into idle stack.
<i>Dump</i> =	NA.

Table 6 Error Code: INVUSAGE

Error Code:	INVUSAGE
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]), and one for receive EFDs (CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMerfdidle). An EFD is owned only by level 1 (EFD.bf_owner & CM_L1_OWNER != 0, but EFD.bf_owner and CM_L2_OWNER = 0) and has not been touched for several minutes (EFD.au_detect = 1 and EFD.au_recover = 1).
Possible Error Effect:	The EFD is not available for use. If enough EFDs became unavailable, the SM could lose ethernet connectivity.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The EFD type. Valid values are: 2 = TEFD. 3 = REFD.
<i>Bad Data =</i>	EFD's user bits (EFD.bf_owner).
<i>Good Data =</i>	EFD's usage type (EFD.usetype).
<i>Logical Index =</i>	EFD's index.
<i>Dump =</i>	The EFD.

Table 7 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]), and one for receive EFDs (CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMerfdidle). An unused EFD idle stack entry is not null ($index < toppt$ and $efdindx[index] \neq CMNIL\_NDX$).
Possible Error Effect:	EFDs may not be allocatable. If so, the SM may lose ethernet connectivity.
Corrective Action Taken:	The audit clears the EFD idle stack entry ($efdindx[index] = CMNIL\_NDX$).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The EFD type. Valid values are: 2 = TEFD. 3 = REFD.
<i>Bad Data =</i>	Contents of the idle stack entry ($efdindx[index]$).
<i>Good Data =</i>	CMNIL_NDX.
<i>Logical Index =</i>	Index into the idle stack.
<i>Dump =</i>	NA.

Table 8 Error Code: LNKIALST

Error Code:	LNKIALST
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]), and one for receive EFDs (CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMerfdidle).

	One or more of the following is true of a non-idle (<i>usetype</i> != CMENFREE) EFD. - EFD.melnk is out of range ($0 \leq \text{melnk} < \text{SMELNUMELNK}$ is in range). - EFD.I3_next = CMNIL_NDX, but the EFD is not the last one on the list. - EFD.I3_prev = CMNIL_NDX, but the EFD is not the first one on the list. - EFD.I3_next != CMNIL_NDX, but is not valid ($\text{is} \geq \text{max}$). - EFD.I3_prev != CMNIL_NDX, but is not valid ($\text{is} \geq \text{max}$). - EFD.I3_next is $< \text{max}$, but that EFD's <i>I2_prev</i> field != the current EFD's index. - EFD.I3_prev is $< \text{max}$, but that EFD's <i>I2_next</i> field != the current EFD's index. The list owner can be determined by the value of CMextsysbl[melnk][0].melnk_serv: CMESRTCD: CMMhatpl3q <i>first</i> and <i>last</i>. CMSEEC: CMmhesl3q[melnk] <i>first</i> and <i>last</i>.
Possible Error Effect:	The EFD list is broken. This may cause asserts, lost resources, lost frames or other problems.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The EFD type. Valid values are:
	2 = TEFD.
	3 = REFD.
<i>Bad Data</i> =	EFD's user bits (EFD.bf_owner).
<i>Good Data</i> =	EFD's usage type (EFD.usetype).
<i>Logical Index</i> =	EFD's index.
<i>Dump 1</i> =	The EFD.
<i>Dump 2</i> =	EFD indexed by EFD.I3_next if <i>I3_next</i> is $< \text{max}$ otherwise NA.
<i>Dump 3</i> =	EFD indexed by EFD.I3_prev if <i>I3_prev</i> is $< \text{max}$ otherwise NA.

Table 9 Error Code: QUE

Error Code:	QUE
Error Description:	CMeinq contains invalid EFD linkages. One or more of the following is true: - CMeinq.load $\geq$ CMERNUMBUF and is != CMNIL_NDX. - CMeinq.unload $\geq$ CMERNUMBUF and is != CMNIL_NDX. - CMeinq.load $<$ CMERNUMBUF but CMerfduse[CMeinq.load].usetype != CMENINQ. - CMeinq.unload $<$ CMERNUMBUF but

	CMerfduse[CMeinq.unload].usetype != CMENINQ.
Possible Error Effect:	The queue of receive EFDs is corrupt. The SM may lose ethernet connectivity.
Corrective Action Taken:	The audit clears CMeinq (CMeinq.load and CMeinq.unload = CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CMeinq.load.
<i>Good Data =</i>	CMeinq.unload.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 10 Error Code: RCVACCBK

Error Code:	RCVACCBK
Error Description:	An receive ethernet frame (REFD)descriptor , entry in CMerfduse[], is in use (EFD.usetype = CMENRCV), but is not linked correctly at level 1. That is, one or more of the following are true: - EFD.I1_channel != CMQCENET (this check is only for the SM). - EFD.I1_next = CMNIL_NDX, but CMCDBENTRY.rcv_unload != the EFD's index. - EFD.I1_prev = CMNIL_NDX, but CMCDBENTRY.rcv_load != the EFD's index. - EFD.I1_next != CMNIL_NDX, but is not valid (is $\geq$ max). - EFD.I1_prev != CMNIL_NDX, but is not valid (is $\geq$ max). - EFD.I1_next is < max, but CMerfduse[EFD.I1_next].I1_prev != the EFD's index. - EFD.I1_prev is < max, but CMerfduse[EFD.I1_prev].I1_next != the EFD's index. - EFD.bd does not contain a valid linkage to the buffer.
Possible Error Effect:	The SM may lose ethernet connectivity.
Corrective Action Taken:	The audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the EFD idle stack (CMerfdidle).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The EFD type. Valid values are: 2 = TEFD. 3 = REFD.
<i>Bad Data =</i>	EFD's user bits (EFD.bf_owner).
<i>Good Data =</i>	EFD's usage type (EFD.usetype).
<i>Logical Index =</i>	EFD's index.
<i>Dump 1 =</i>	The EFD.
<i>Dump 2 =</i>	EFD indexed by EFD.I1_next if I1_next is < max, otherwise NA.
<i>Dump 3 =</i>	EFD indexed by EFD.I1_prev if I1_prev is < max otherwise NA.

Table 11 Error Code: ZAP

Error Code:	ZAP
Error Description:	There are two arrays of EFDs. One is for transmit EFDs (CMetfduse[CMETNUMBUF]), and one for receive EFDs

	(CMerfduse[CMERNUMBUF]). The error address value indicates which array was being checked when the error was detected. Each array is also associated with it's own stack of idle elements (CMetfdidle and CMerfdidle). The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit: • Clears the idle stack entry (<i>efdindx[]</i> = CMNIL_NDX), if any, that was being audited when the stimulus occurred. • Recovers the EFD, if any, which was being audited when the stimulus occurred. Specifically, the audit unlinks the EFD from any other data structures, sets all fields to default values, and puts the EFD on the idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Message handler (MH): SMmhrunning (the current base-level loop job). SM: NA.
<i>Bad Data =</i>	The EFD type being audited when the stimulus occurred. Valid values are: 2 = Transmit EFD. 3 = Receive EFD.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Current EFD index (which may be out-of-range).
<i>Dump =</i>	The EFD.

EISCALL

Software Release: 5E10 and later

1. EXTERNAL INFORMATION SYSTEM CALL (EISCALL) AUDIT

An rEISCALL tuple contains data associated with the external information system (EIS) interface for a listings services call assigned to a call processing data links (CPDLs).

2. DATA STRUCTURES

The data structure of EISCALL audit is the EIS call relation (RLEISCALL). When the rEISCALL tuples are not handling calls they are connected to rEIS_LNK idle head cell (DBEISIDLE) and if they are in use, they are linked to rEIS_LNK CPDLs.

3. AUDIT CHECKS

The EISCALL audit invokes the DRINASEK driver to execute the syntactic checks, and invoke the semantic function. For each tuple, the EISCALL audit makes the following checks after the driver has verified the linkages. For details regarding each error code, see the comment block given.

EISTP = Check rEISCALL terminal process against rEIS_LNK.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: EISTP

Error Code:	EISTP
Error Description:	The rEISCALL terminal process (eistp) differs from rEIS_LNK terminal process (eistp). Therefore the call is not connected to the correct CPDLs.
Possible Error Effect:	In the worst case no EISCALL tuples are available.
Corrective Action Taken:	rEISCALL tuple is initialized and placed on the idle list (DBEISIDLE).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rEISCALL tuple.
<i>Bad Data</i> =	rEISCALL terminal process (eistp).
<i>Good Data</i> =	rEIS_LNK terminal process (eistp).
<i>Logical Index</i> =	Logical key of rEISCALL (smcid) tuple.
<i>Dump</i> =	rEISCALL tuple.

EISLKSEL

Software Release: 5E10 and later

1. EXTERNAL INFORMATION SYSTEM LINK SELECT (EISLKSEL) AUDIT

An rEISLKSEL tuple contains data associated with the external information system (EIS) interface which contains the number of available call processing data links (CPDLs). Its purposes is to indicate which of the 16 EIS CPDLs on a specific EIS switching module (SM) are available for assignment of new calls for a particular EIS.

2. DATA STRUCTURES

The data structure for EISLKSEL audit is the EIS link select relation (RLEISLKSEL). This audit runs on SMs which contains OPSMDAAC package.

3. AUDIT CHECKS

The EISLKSEL audit invokes the DRINDEX driver to execute the syntactic checks and then invoke the semantic function.

For each tuple, the EISLKSEL audit makes the following check after the driver has verified the keys. For details regarding each error code, see the comment blocks given.

AVAIL_CNT = Verify the number of CPDLs that is available.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: AVAIL_CNT

Error Code:	AVAIL_CNT
Error Description:	The number of call processing data link (rEISLKSEL.avail_cnt) available for EIS is invalid.
Possible Error Effect:	An available CPDLs might not be taken.
Corrective Action Taken:	Update the available count (rEISLKSEL.avail_cnt).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rEISLKSEL tuple.
<i>Bad Data</i> =	rEISLKSEL old available count (avail_cnt).
<i>Good Data</i> =	rEISLKSEL newly calculated available count (avail_cnt).
<i>Logical Index</i> =	Logical key of rEISLKSEL (eis_id) tuple.
<i>Dump</i> =	rEISLKSEL tuple.

EISLNK

Software Release: 5E10 and later

1. EXTERNAL INFORMATION SYSTEM LINK MESSAGE DATA (EISLNK) AUDIT

An rEIS_LNK tuple contains data associated with the external information system (EIS) interface. RLEIS_LNK contains a tuple for each assigned call processing data links (CPDLs) on a switching module (SM). It is keyed by the SM relative CPDLs number (0 through 15).

2. DATA STRUCTURES

The data structure for EISLNK audit is the EIS link message data relation (RLEIS_LNK). RLEIS_LNK provides a set-owner relationship with rEISCALL tuples. A logical key of negative 1 (DBEISIDLE), the idle list, contains the idle list for rEISCALL tuples. Each of the rEISCALL tuples represent a call associated with the respective CPDLs.

3. AUDIT CHECKS

The EISLNK audit invokes the DRLINK driver to execute the syntactic checks and then invokes the semantic function. For each tuple, the EIS_LNK audit makes the following checks after the driver has verified the linkages. For details regarding each error code, see the comment blocks given.

CAL_CNT	= Check if the call count is valid.
EISID	= Check if the EISID is correct.
ESSWID	= Check if the EIS Switch ID is valid.
EISTP	= Check if the EIS Terminal process is valid.
EISVENDOR	= Check if the EIS vendor is correct.
MSG_SET_ID	= Check if the message set id is correct.
MX_CALL_LNK	= Check if the maximum number of calls are correct.
MX_LNK_CAP	= Check if the maximum link capacity is correct.
NOTZERO	= Check if the tuple attributes are initialized to 0.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: CAL_CNT

Error Code:	CAL_CNT
Error Description:	The RLEIS_LNK audit call count is invalid for the number of linked calls.
Possible Error Effect:	The number of available call processing data link is incorrect.
Corrective Action Taken:	Update the call count.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rEIS_LNK tuple.
<i>Bad Data</i> =	Old EIS_LNK (call_cnt) call count.
<i>Good Data</i> =	Newly calculated EIS_LNK call count.

<i>Logical Index</i> =	Logical key of rEIS_LNK (sm_rlnk) tuple.
<i>Dump</i> =	rEIS_LNK tuple.

Table 2 Error Code: EISID

Error Code:	EISID
Error Description:	Verify that the EISID is equal to X_NAME in static relation rEISDSL.
Possible Error Effect:	The EIS ID is out of range.
Corrective Action Taken:	Update EISID with static relation rEISDSL x_name.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rEIS_LNK tuple.
<i>Bad Data</i> =	rEIS_LNK eis_id.
<i>Good Data</i> =	rEISDSL x_name.
<i>Logical Index</i> =	Logical key of rEIS_LNK (sm_rlnk) tuple.
<i>Dump</i> =	rEIS_LNK tuple.

Table 3 Error Code: EISSWID

Error Code:	EISSWID
Error Description:	rEIS_LNK EIS Switch ID differs from static rEIS_DATA EIS Switch ID.
Possible Error Effect:	The EIS switch id contains the wrong value.
Corrective Action Taken:	Update rEIS_LNK eis_swid with rEIS_DATA eis_swid.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rEIS_LNK tuple.
<i>Bad Data</i> =	rEIS_LNK EIS switch id (eis_swid).
<i>Good Data</i> =	rEIS_DATA EIS switch id (eis_swid).
<i>Logical Index</i> =	Logical key of rEIS_LNK (sm_rlnk) tuple.
<i>Dump</i> =	rEIS_LNK tuple.

Table 4 Error Code: EISTP

Error Code:	EISTP
Error Description:	The EIS terminal process is not the same as the feature data block terminal process.
Possible Error Effect:	Invalid terminal process.
Corrective Action Taken:	The corresponding rEIS_LNK tuple is reinitialized and all the associated rEISCALL tuples are initialized and place on the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rEIS_LNK tuple.
<i>Bad Data</i> =	EIS_LNK terminal process(eistp).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of rEIS_LNK (sm_rlnk) tuple.
<i>Dump</i> =	rEIS_LNK tuple.

Table 5 Error Code: EISVENDOR

Error Code:	EISVENDOR
Error Description:	The rEIS_LNK vendor is different from rEIS_DATA vendor.
Possible Error Effect:	Trying to communicate with the wrong EIS vendor.
Corrective Action Taken:	Update rEIS_LNK eis_vendor with rEIS_DATA eis_vendor.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rEIS_LNK tuple.
<i>Bad Data</i> =	rEIS_LNK EIS vendor (eis_vendor) number.
<i>Good Data</i> =	rEIS_DATA EIS vendor (eis_vendor) number.
<i>Logical Index</i> =	Logical key of rEIS_LNK (sm_rlnk) tuple.
<i>Dump</i> =	rEIS_LNK tuple.

Table 6 Error Code: MSG_SET_ID

Error Code:	MSG_SET_ID
Error Description:	The rEIS_LNK message set identification is different from rEIS_DATA message set identification.

Possible Error Effect:	Receiving invalid messages.
Corrective Action Taken:	Update rEIS_LNK msg_set_id with rEIS_DATA msg_set_id
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rEIS_LNK tuple.
<i>Bad Data =</i>	rEIS_LNK message set id (msg_set_id).
<i>Good Data =</i>	rEIS_DATA message set id (msg_set_id).
<i>Logical Index =</i>	Logical key of rEIS_LNK (sm_rlnk) tuple.
<i>Dump =</i>	rEIS_LNK tuple.

Table 7 Error Code: MX_CALL_LNK

Error Code:	MX_CALL_LNK
Error Description:	The maximum number of calls supported by an rEIS_LNK is different from rEIS_DATA maximum number of calls.
Possible Error Effect:	Allow the incorrect number of calls on the link.
Corrective Action Taken:	Update max_call_lnk with rEIS_DATA max_call_lnk
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rEIS_LNK tuple.
<i>Bad Data =</i>	EIS link maximum call link (mx_call_lnk) value.
<i>Good Data =</i>	rEIS_DATA maximum call link (mx_call_lnk) value.
<i>Logical Index =</i>	Logical key of rEIS_LNK (sm_rlnk) tuple.
<i>Dump =</i>	rEIS_LNK tuple.

Table 8 Error Code: MX_LNK_CAP

Error Code:	MX_LNK_CAP
Error Description:	The maximum link capacity in messages per second is different from rEIS_DATA maximum link capacity.
Possible Error Effect:	Allow too many or not enough calls on the link at one time
Corrective Action Taken:	Update rEIS_LNK mx_lnk_cap with rEIS_DATA mx_lnk_cap
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rEIS_LNK tuple.
<i>Bad Data =</i>	rEIS_LNK maximum link capacity (mx_lnk_cap).
<i>Good Data =</i>	rEIS_DATA maximum link capacity (mx_lnk_cap).
<i>Logical Index =</i>	Logical key of rEIS_LNK (sm_rlnk) tuple.
<i>Dump =</i>	rEIS_LNK tuple.

Table 9 Error Code: NOTZERO

Error Code:	NOTZERO
Error Description:	The attributes in the tuples are not initialized to zero.
Possible Error Effect:	The tuple is initialized incorrectly.
Corrective Action Taken:	Zap the tuple (AUzaptup) and recover the key.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rEIS_LNK tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Initialize the tuple to 0.
<i>Logical Index =</i>	Logical key of rEIS_LNK number.
<i>Dump =</i>	rEIS_LNK tuple.

EISSM

Software Release: 5E10 and later

1. EXTERNAL INFORMATION SYSTEM SWITCHING MODULE (EISSM) AUDIT

An rEISSM tuple contains data associated with the external information system (EIS) interface for listings services. The data contains the minimum number of call processing data links (CPDLs) needed to support the switching module (SM) during the busy hours and the total number of CPDLs assigned to the SM.

2. DATA STRUCTURES

The data structure for EISSM audit is the static relation containing the minimum number of data CPDL needed by an EIS on a SM relation (RLEIS_SM) during busy hours.

3. AUDIT CHECKS

The EISSM audit invokes the DRSTATIC driver to execute the syntactic check and invoke the semantic checks. For each tuple, the EISSM audit makes the following check after the driver has verified the keys. For details regarding each error code, see the comment block given.

LOSTTUP = Checking for LOST tuple in RLEISLKSEL relation.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	A tuple is in the static relation RLEIS_SM and not in RLEISLKSEL.
Possible Error Effect:	A tuple is missing from relation RLEISLKSEL.
Corrective Action Taken:	The lost tuple will be inserted in RLEISLKSEL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rEIS_SM tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Static rEIS_SM EIS ID (eis_id) tuple key.
<i>Logical Index</i> =	Logical key of rEIS_SM (eis_id) tuple.
<i>Dump</i> =	rEIS_SM tuple.

ENTRY7

Software Release: 5E10 and later

1. MCAH TABLE ENTRY (ENTRY7) AUDIT

The ENTRY7 audit is responsible for verifying the linkage data and other semantic data which is stored in the RENTRY7 relation. This audit runs in both the switching module (SM) and the administrative module (AM). Refer to Figure 1 for a pictorial view of the linkages related to the rENTRY7 tuple.

2. DATA STRUCTURES

The ENTRY7 relation is a dynamic relation which contains CCS7 message consolidation and acknowledgement handler (MCAH) table entries. Each entry in this relation represents one of the following MCAH entities:

- A consolidation entry for a CCS7 maintenance message about to be sent to the far-office.
- An acknowledgement pending entry representing a CCS7 maintenance message already sent to the far-office by MCAH.
- A "reset acknowledgement received" entry representing pending PSA work for reset message acknowledgements already received.

⇔ =One to One linkage.
 → =Owner-member linkage.
 — =Nonstandard linkage.

Figure 1 (ENTRY7-1) RLENTY7 Linkages

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the

ERROR HANDLING section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BAD_HEAD_TAIL

Error Code:	BAD_HEAD_TAIL
Error Description:	The value of cic for this rENTRY7 tuple was found to be greater than the cic for the next linked ENTRY7.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Quarantine the related CINDX7 to be recovered by the CINDX7 audit and recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the associated rENTRY7 tuple.
<i>Bad Data =</i>	The value of the cic field in rENTRY7 tuple.
<i>Good Data =</i>	The value of the cic field in the next rENTRY7 tuple.
<i>Logical Index =</i>	The key of the rENTRY7 tuple (entry).
<i>Dump 1 =</i>	Contents of the rENTRY7 tuple.
<i>Dump 2 =</i>	Contents of the next linked rENTRY7 tuple.

Table 2 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	An rENTRY7 tuple was found to not be linked to either the RAR or IDLE list but the linkage to the CINDX7 was null. The CINDX linkage should not be null.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the associated rENTRY7 tuple.
<i>Bad Data =</i>	The linkage field to the CINDX7.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key of the rENTRY7 tuple (entry).
<i>Dump =</i>	Contents of the rENTRY7 tuple.

Table 3 Error Code: BADPROTOCOL

Error Code:	BADPROTOCOL
Error Description:	The value of protocol for this rENTRY7 tuple was not set to DBISUP7 and it should be.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the associated rENTRY7 tuple.
<i>Bad Data =</i>	The value of the protocol field in rENTRY7 tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key of the rENTRY7 tuple (entry).
<i>Dump =</i>	Contents of the rENTRY7 tuple.

Table 4 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	If this ENTRY7 is owned by the RAR list, then either the mtype field in this rENTRY7 tuple was not set to TMMC_RESET or the type field was not set to TMMC_I_RAR or TMMC_B_RAR. Otherwise, the error is reported because the mtype and/or type fields are not set to in-range values.

Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the associated rENTRY7 tuple.
<i>Bad Data =</i>	The value of the type field in rENTRY7 tuple.
<i>Good Data =</i>	The value of the mtype field in rENTRY7 tuple.
<i>Logical Index =</i>	The key of the rENTRY7 tuple (entry).
<i>Dump =</i>	Contents of the rENTRY7 tuple.

Table 5 Error Code: BIT1MAP

Error Code:	BIT1MAP
Error Description:	The value of cic_map for this rENTRY7 tuple was set to TMNULCICMASK when it should not be.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the associated rENTRY7 tuple.
<i>Bad Data =</i>	TMNULCICMASK.
<i>Good Data =</i>	The value of the cic_map field in rENTRY7 tuple.
<i>Logical Index =</i>	The key of the rENTRY7 tuple (entry).
<i>Dump =</i>	Contents of the rENTRY7 tuple.

Table 6 Error Code: HEAD

Error Code:	HEAD
Error Description:	The value of cic for this rENTRY7 tuple was found to be less than the cic for the previous linked ENTRY7.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Quarantine the related CINDX7 to be recovered by the CINDX7 audit and recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the associated rENTRY7 tuple.
<i>Bad Data =</i>	The value of the cic field in rENTRY7 tuple.
<i>Good Data =</i>	The value of the cic field in the previous rENTRY7 tuple.
<i>Logical Index =</i>	The key of the rENTRY7 tuple (entry).
<i>Dump 1 =</i>	Contents of the rENTRY7 tuple.
<i>Dump 2 =</i>	Contents of the previous linked rENTRY7 tuple.

Table 7 Error Code: INDEX

Error Code:	INDEX
Error Description:	The value of pci for this rENTRY7 tuple does not match the PCI of the owning CINDX7's related PCILST7.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the associated rENTRY7 tuple.
<i>Bad Data =</i>	The value of the pci field in rENTRY7 tuple.
<i>Good Data =</i>	The value of the pci field in the related rPCILST7 tuple.
<i>Logical Index =</i>	The key of the rENTRY7 tuple (entry).
<i>Dump 1 =</i>	Contents of the rENTRY7 tuple.
<i>Dump 2 =</i>	Contents of the owning rCINDX7 tuple.
<i>Dump 3 =</i>	Contents of the rPCILST7 tuple related to the owning rCINDX7 tuple.

Table 8 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	This rENTRY7 tuple is not linked to the correct owner tuple. For CNI platform rENTRY7 tuples (rPCI7_LAB.psu_mod == 0) the rENTRY7 tuple should be linked to an owner in the range of (TMT7CNI_MIN + DBSFTIMER7) <

	(rENTRY7.timer_mem.st_ownk) < (TMT7CNI_MAX + DBSFTIMER7). For PSU platform rENTRY7 tuples (rPCI7_LAB.psu_mod != 0), the owner should be in the range of (TMT7PSU_MIN + DBSFTIMER7) < (rENTRY7.timer_mem.st_ownk) < (TMT7PSU_MAX + DBSFTIMER7).
Possible Error Effect:	Possible asserts during CCS timer operations. Possible timer resource exhaustion.
Corrective Action Taken:	The rENTRY7 tuple is recovered to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rENTRY7 tuple.
<i>Bad Data</i> =	The key of the rENTRY7 tuple.
<i>Good Data</i> =	The contents of rPCI7_LAB.psu_mod.
<i>Logical Index</i> =	The key of the rENTRY7 tuple.

Table 9 Error Code: MISSING

Error Code:	MISSING
Error Description:	For a given rENTRY7 tuple under audit, a corresponding rLAB7PRT or rPCI7_LAB static tuple is missing. For every rENTRY7 dynamic tuple there should exist a corresponding rLAB7PRT and rPCI7_LAB static tuple, where (rENTRY7.pci == rPCI7_lab.pci, for tuples where rENTRY7.type == TMMC_ACKPEND) and (rLAB7PRT.cic == rENTRY7.cic, for tuples where rENTRY7.singlet == DBNO). This error indicates that the rENTRY7 tuple is marked active, but there are no associated timer resources in use.
Possible Error Effect:	Possible asserts from CCS timer operations. Possible exhaustion of CCS timer resources.
Corrective Action Taken:	The rENTRY7 tuple is recovered to an idle condition.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Not an address. The relation ID of the missing static relation's tuple (RLLAB7PRT, or RLPCI7_LAB) is dumped.
<i>Bad Data</i> =	The cic field in the rENTRY7 tuple.
<i>Good Data</i> =	The pci field in the rENTRY7 tuple.
<i>Logical Index</i> =	The logical key, entry of the rENTRY7 tuple.
<i>Dump</i> =	The contents of the rENTRY7 tuple.

Table 10 Error Code: NONNULL

Error Code:	NONNULL
Error Description:	The two pass check for owner linkage has detected that the ENTRY7 is not on the RAR or IDLE list and the owner link is still set to DALNKNUL.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the associated rENTRY7 tuple.
<i>Bad Data</i> =	The value of the quarstate field in rENTRY7 tuple.
<i>Good Data</i> =	The value of the owner link field in rENTRY7 tuple.
<i>Logical Index</i> =	The key of the rENTRY7 tuple (entry).
<i>Dump</i> =	Contents of the rENTRY7 tuple.

Table 11 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The value of range for this rENTRY7 tuple was found to not be in range (1-23) when the type is TMMC_ACKPEND and the singlet is set to DBNO.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the associated rENTRY7 tuple.
<i>Bad Data</i> =	The value of the range field in rENTRY7 tuple.
<i>Good Data</i> =	1.
<i>Logical Index</i> =	The key of the rENTRY7 tuple (entry).

<i>Dump</i> =	Contents of the rENTRY7 tuple.

Table 12 Error Code: TRACK_SM

Error Code:	TRACK_SM
Error Description:	In the SM, the value of sm for this rENTRY7 tuple does not agree with the value of Gl_pcrd.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Reset the value of sm to agree with Gl_pcrd.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the associated rENTRY7 tuple.
<i>Bad Data</i> =	The value of the sm field in rENTRY7 tuple.
<i>Good Data</i> =	Gl_pcrd.
<i>Logical Index</i> =	The key of the rENTRY7 tuple (entry).
<i>Dump</i> =	Contents of the rENTRY7 tuple.

Table 13 Error Code: TYPE

Error Code:	TYPE
Error Description:	For an rENTRY7 tuple on the RAR list, either the mtype or type field are not set to a valid value. The valid value for mtype is TMMC_RESET and the valid values for type are TMMC_I_RAR or TMMC_B_RAR.
Possible Error Effect:	Incorrect MCAH table entry usage.
Corrective Action Taken:	Recover this ENTRY7 to the IDLE list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the associated rENTRY7 tuple.
<i>Bad Data</i> =	The value of the type field in rENTRY7 tuple.
<i>Good Data</i> =	The value of the mtype field in rENTRY7 tuple.
<i>Logical Index</i> =	The key of the rENTRY7 tuple (entry).
<i>Dump</i> =	Contents of the rENTRY7 tuple.

Table 14 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	An idle ENTRY7 has a non-zero value in one of its linkage fields.
Possible Error Effect:	Resources are not made available to users.
Corrective Action Taken:	Recover this rENTRY7 tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the associated rENTRY7 tuple.
<i>Bad Data</i> =	Return value from zero linkage check.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the rENTRY7 tuple (entry).
<i>Dump</i> =	Contents of the rENTRY7 tuple being audited.

EPKB

Software Release: 5E10 and later

1. EXTENDED PACKET BUFFER (EPKB) AUDIT

The EPKB audit performs some checks on the dynamic relation RLEPKB. The tuples of RLEPKB are temporary storage buffers for messages from the applications processor system process (APSP) destined for an applications processor (AP). The EPKB audit uses the indirect access sequential key driver (DRINASEK) to traverse through the RLEPKB relation tuple by tuple. The key and quarantine bit are checked for each tuple. The audit does not look at the other attributes in the tuple. Users of this other information do self auditing on the data.

2. DATA STRUCTURES

The rLEPKB relation is a dynamic relation of temporary storage buffers for messages from the APSP destined for an AP. The EPKB audit runs in the operating system for distributed switching-switching module (OSDS-SM) environment.

3. AUDIT CHECKS

The EPKB audit insures that the key in each rLEPKB tuple is correct and a check of the quarantine bit is made. The indirect access sequential key driver (DRINASEK) is used to step through the rLEPKB relation tuple by tuple. The audit is entered from audit control.

4. ERROR HANDLING

If an error is detected, the DRINASEK driver zeroes out the tuple and puts the key back in.

EQUIP

Software Release: 5E10 and later

1. *SLC*[®] 96 EQUIPMENT (EQUIP) AUDIT

The *SLC*[®] 96 sends signals from subscriber lines to the digital carrier line unit (DCLU) within the switching modules. The subscriber lines terminate on shelves in the *SLC*[®] 96 remote terminal; each shelf connects to a *SLC*[®] 96 digital facility interface circuit (S-DFI) in the switching module over a T1 line. The equipment configuration relation (RLS96EQUIP) contains static (write-protected) data about the shelves, S-DFIs, and T1 lines. The equipment audit (EQUIP) verifies that the static *SLC*[®] 96 data in rls96EQUIP is internally consistent and also identifies missing tuples in the *SLC*[®] 96 shelf relation (RLS96SHELF), the *SLC*[®] 96 digital facilities interface relation (RLS96DFI), and the *SLC*[®] 96 T1 usage relation (RLS96T1USG). If tuples are missing in any of these dynamic relations, dynamic resources are lost.

This audit is part of the switch maintenance audits subgroup. It runs in the OSDS-M environment in the initialization and segmented modes.

2. DATA STRUCTURES

The EQUIP audit uses information in the static equipment configuration relation (RLS96EQUIP) to verify information in the *SLC*[®] 96 shelf relation (RLS96SHELF), the *SLC*[®] 96 digital facilities interface relation (RLS96DFI), and the *SLC*[®] 96 T1 usage relation (RLS96T1USG). Figure 1 shows the fields in RLS96EQUIP checked by the audit. The audit verifies that the digital facility interface (dfi) field and the bank mode (bank0mode or bank1mode) field are consistent.

Figure 1 (EQUIP-1) Equipment Configuration Relation

3. AUDIT CHECKS

The EQUIP audit checks the modes of the RLS96EQUIP relation. If RLS96EQUIP is running in the update mode, the audit ends and runs during its next audit cycle. If RLS96EQUIP is not in the update mode, the audit invokes the static driver (DRSTATIC) to step through the tuples in RLS96EQUIP. The DRSTATIC driver calls a static to dynamic existence check function to perform the following checks:

- (a) For each tuple in rLS96EQUIP, the audit compares the information in the digital facility interface (dfia) and bank mode (bank0mode) fields.
 - (1) If no inconsistency exists, the audit verifies the existence of an associated tuple in either the RLS96SHELF, RLS96DFI, or RLS96T1USG relation. The audit uses the information in the dfi field to verify the existence of a tuple in the rLS96DFI relation. The audit uses the information in the remote terminal name (rt_name) field plus a shelf name determined by the dfi field to verify the existence of tuples in the RLS96SHELF and RLS96T1USG relations.
 - (2) If an inconsistency exists, an error is reported requiring manual action.
- (b) The audit performs the same comparison as stated in (a) between the dfib and bank0mode fields.

- (c) The audit performs the same comparison as stated in (a) between the dfic and bank1mode fields.
- (d) The audit performs the same comparison as stated in (a) between the dfid and bank1mode fields.

4. ERROR HANDLING

Any inconsistency in the RLS96EQUIP relation is reported as an error. This type of error requires manual action to correct the problem.

If a tuple that should exist is missing in either the RLS96SHELF, RLS96DFI, or RLS96T1USG relation, the audit inserts that tuple into the appropriate relation.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: DFIA

Error Code:	DFIA
Error Description:	When a rIS96EQUIP tuple exists, shelf A must be marked equipped and a valid DFI name must be in dfia field. This error was taken because either the bank0mode field is marked PCUNEQ or the difa field is PCNULLDFI.
Possible Error Effect:	Unknown.
Corrective Action Taken:	None.
Manual Action Required:	Correct either the bank0mode field or the dfia field.
Dump Description:	
<i>Error Address =</i>	Address of the rIS96EQUIP tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of the rIS96EQUIP tuple in error.
<i>Dump =</i>	Dump of the rIS96EQUIP tuple.

Table 2 Error Code: DFIB

Error Code:	DFIB
Error Description:	The bank0mode of the rIS96EQUIP tuple indicates PCMODE2, concentrated mode, but the dfib field is not null.
Possible Error Effect:	Unknown.
Corrective Action Taken:	None.
Manual Action Required:	Correct either the bank0mode field or the dfib field.
Dump Description:	
<i>Error Address =</i>	Address of the rIS96EQUIP tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of the rIS96EQUIP tuple in error.
<i>Dump =</i>	Dump of the rIS96EQUIP tuple.

Table 3 Error Code: DFIC

Error Code:	DFIC
Error Description:	The bank1mode of the rIS96EQUIP tuple indicates PCUNEQ, this bank unequipped, but the DFIC field is not null.
Possible Error Effect:	Unknown.
Corrective Action Taken:	None.
Manual Action Required:	Correct either the bank1mode field or the dfic field.
Dump Description:	
<i>Error Address =</i>	Address of the rIS96EQUIP tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of the rIS96EQUIP tuple in error.

<i>Dump</i> =	Dump of the rIS96EQUIP tuple.

Table 4 Error Code: DFID

Error Code:	DFID
Error Description:	The bank1mode of the rIS96EQUIP tuple indicates PCMODE2, concentrated mode, but the dfid field is not null.
Possible Error Effect:	Unknown.
Corrective Action Taken:	None.
Manual Action Required:	Correct either the bank1mode field or the dfid field.
Dump Description:	
<i>Error Address</i> =	Address of the rIS96EQUIP tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of the rIS96EQUIP tuple in error.
<i>Dump</i> =	Dump of the rIS96EQUIP tuple.

Table 5 Error Code: EQUIP_DFID

Error Code:	EQUIP_DFID
Error Description:	The bank1mode of the rIS96EQUIP tuple indicates PCMODE2, concentrated mode, but the dfid field is not null.
Possible Error Effect:	Unknown.
Corrective Action Taken:	None.
Manual Action Required:	Correct either the bank1mode field or the dfid field.
Dump Description:	
<i>Error Address</i> =	Address of the rIS96EQUIP tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of the rIS96EQUIP tuple in error.
<i>Dump</i> =	Dump of the rIS96EQUIP tuple.

Table 6 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	The rIS96EQUIP indicates that a rIS96DFI, rIS96SHELF, or rIS96T1USG tuple should exist but the tuple does not exist.
Possible Error Effect:	This could cause asserts because the static data exists but the dynamic data does not exist, causing dynamic data to be erroneously used.
Corrective Action Taken:	The rIS96DFI, rIS96SHELF, or the rIS96T1USG tuple will be inserted into the database.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIS96EQUIP tuple.
<i>Bad Data</i> =	The relation identification of the tuple found missing.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the tuple found missing.
<i>Dump</i> =	Dump of the rIS96EQUIP tuple.

EXENET-A

Software Release: 5E12 only

1. EXTERNAL ETHERNET LINK (EXENET) AUDIT

Sockets are the interface to send and receive data using the ethernet network. They are used to represent per-connection information such as state and data buffers. The SOCKET can be linked to a PIPE or a MELNK based upon its socket system type or its protocol type. The audit verifies linkages among CMsocket[], CMesmepipe, CMesmelnk and CMmhatpl3q.

2. DATA STRUCTURES

The following data are used by the EXENET audit:

CMsocket[] = Socket protocol control block.

CMesmepipe = MEPIPE dynamic data.

CMesmelnk = MELNK dynamic data.

CMmhatpl3q = MH level 3 queue dynamic data.

3. AUDIT CHECKS

The EXENET audit makes the following checks:

BADLINK = Check of MHATPL3Q frame descriptor ownership.

BADRANGE_INDEX = Range check index into CMsocket[] for MELNK.

BADTYPE = Check value of CMsocket[].so_systype for MEPIPE.

BDCOUNT = Check of MHATPL3Q frame descriptor count.

NULL3LINK = Consistency check of MHATPL3Q frame descriptor ownership fields.

OUTOFRANGE = Range check index into CMsocket[] for MEPIPE.

TYPE = Check values in CMsocket[] for MELNK.

ZAP = Check for system interrupt handling.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	The linkage between a MHATPL3Q and the ethernet frame descriptors (EFDs) it appears to own is invalid. Specifically, one or more of the following is true: - CMetfduse[CMmhatpl3q[0].first].l3_prev does not equal CMNIL_NDX - CMetfduse[CMmhatpl3q[0].first].bf_owner & CM_L3_OWNER does not equal 0

	- CMetfduse[CMmhatpl3q[0].first].usetype does not equal CMENXMT - CMetfduse[CMmhatpl3q[0].last].l3_next does not equal CMNIL_NDX - CMetfduse[CMmhatpl3q[0].last].bf_owner & CM_L3_OWNER does not equal 0 - CMetfduse[CMmhatpl3q[0].last].usetype does not equal CMENXMT
Possible Error Effect:	Frames associated with the MHATPL3Q are not transmitted properly.
Corrective Action Taken:	The audit sets CMmhatpl3q[index].first, .last, .ready and .blocked to CMNIL_NDX and the transmit count to 0.
Manual Action Required:	None.
Dump Description:	
Error Address =	Owner of EFDs (CMMHATPL3Q).
Bad Data =	NA.
Good Data =	NA.
Logical Index =	Index into CMmhatpl3q[].
Dump =	CMmhatpl3q[index].

Table 2 Error Code: BADRANGE_INDEX

Error Code:	BADRANGE_INDEX
Error Description:	The audit finds that the index into the CMsocket[] in CMesmelnk[] (CMesmelnk[AUEXE_IDX][side].so_indx[0]) is not within range.
Possible Error Effect:	The MELNK is removed.
Corrective Action Taken:	The audit sets the index into CMsocket[] in CMesmelnk[] (CMesmelnk[AUEXE_IDX][i].so_indx[0]) to its null value (CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
Error Address =	Side of CMesmelnk[][].
Bad Data =	CMesmelnk[AUEXE_IDX][side].so_indx[0].
Good Data =	CM_NUMSOPCB.
Logical Index =	AUEXE_IDX.
Dump =	Contents of CMesmelnk[AUEXE_IDX][side].

Table 3 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The audit finds that the systype in the CMsocket[] entry to which the PIPE points is not equal to CMSOST_HUB.
Possible Error Effect:	The MELNK is removed and real time call detail (RTCD) records may be lost.
Corrective Action Taken:	The audit sets the index into CMsocket[] in CMesmepipe[][] (CMesmepipe.ping_so_indx[0]) to its null value (CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
Error Address =	NA.
Bad Data =	CMsocket[CMesmepipe.ping_so_indx[side]].so_systype.
Good Data =	CMSOST_HUB.
Logical Index =	Side.
Dump 1 =	Contents of CMsocket[CMesmepipe.ping_so_indx[side]].
Dump 2 =	Contents of CMesmepipe.

Table 4 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	An MHATPL3Q does not own any EFDs (elements of CMetfduse[]), but has a non-zero transmit queue count (MHATPL3Q.xmit_q != 0).
Possible Error Effect:	MHATPL3Q frame handling code may take incorrect actions.
Corrective Action Taken:	The audit clears the transmit queue count (MHATPL3Q.xmit_q = 0).
Manual Action Required:	None.
Dump Description:	
Error Address =	AUCMATPL3Q.
Bad Data =	The transmit queue count (MHATPL3Q.xmit_q).
Good Data =	NA.

<i>Logical Index</i> =	Index into CMmhatpl3q[].
<i>Dump</i> =	NA.

Table 5 Error Code: NULL3LINK

Error Code:	NULL3LINK
Error Description:	One or more of an MHATPL3Q's EFD (element of CMetfduse[]) ownership fields (<i>f_ifd</i> , <i>l_ifd</i> , <i>ready</i> , or <i>blocked</i>) contained an out-of-range value (!= CMNIL_NDX and > CM_NUMBUF).
Possible Error Effect:	Frames associated with the MHATPL3Q are not transmitted properly.
Corrective Action Taken:	The audit sets all of the frame descriptor ownership fields (listed in the error description) to CMNIL_NDX. Any lost frame descriptors are picked up by the EFD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	AUCMATPL3Q..
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Transmit queue count (MHATPL3Q.xmit_q).
<i>Logical Index</i> =	Index into CMmhatpl3q[].
<i>Dump</i> =	Contents of CMmhatpl3q[index].

Table 6 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The audit finds the index into CMsocket[] in CMesmepipe[] (CMesmepipe.ping_so_idx[0]) is not within range.
Possible Error Effect:	The MELNK is removed and real time call detail (RTCD) records may be lost.
Corrective Action Taken:	The audit sets the index into CMsocket[] in CMesmepipe[] (CMesmepipe.ping_so_idx[0]) to its null value (CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	CMesmepipe.ping_so_idx[side].
<i>Good Data</i> =	CM_NUMSOPCB.
<i>Logical Index</i> =	Side.
<i>Dump</i> =	Contents of CMesmepipe.

Table 7 Error Code: TYPE

Error Code:	TYPE
Error Description:	The audit finds one of the following: - CMsocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].so_protocol does not equal CMIPTCP or - CMsocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].so_systype does not equal CMSOST_RTCD.
Possible Error Effect:	The MELNK is removed.
Corrective Action Taken:	The audit sets the index into CMsocket[] in CMesmelnk[] (CMesmelnk[AUEXE_IDX][side].so_idx[0]) to its null value (CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	AUEXE_IDX.
<i>Bad Data</i> =	CMsocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].so_systype.
<i>Good Data</i> =	CMsocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].so_protocol.
<i>Logical Index</i> =	Side.
<i>Dump 1</i> =	Contents of CMsocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].
<i>Dump 2</i> =	Contents of CMesmelnk[AUEXE_IDX][side].

Table 8 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.

Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit requests that the system integrity protocol (SIP) be reset to a safe state.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Number of the PIPE or the MELNK.
<i>Logical Index =</i>	Either 0 for PIPE data structure or 1 for MELNK data structure.
<i>Dump =</i>	NA.

EXENET-B

Software Release: 5E13 and later

1. EXTERNAL ETHERNET LINK (EXENET) AUDIT

Sockets are the interface to send and receive data using the ethernet network. They are used to represent per-connection information such as state and data buffers. The SOCKET can be linked to a MEPIPE or a MELNK based upon its socket system type or its protocol type. The audit verifies linkages among CMsocket[], CMesmepipe, CMesmelnk and CMmhatpl3q.

2. DATA STRUCTURES

The following data are used by the EXENET audit:

CMsocket[] = Socket protocol control block.

CMesmepipe = MEPIPE dynamic data.

CMesmelnk = MELNK dynamic data.

CMmhatpl3q = MH level 3 queue dynamic data.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	The linkage between either CMmhatpl3q or an entry in CMmhesl3q[melnk] and the ethernet frame descriptors (EFDs) it appears to own is invalid. Specifically, one or more of the following is true: • CMetfduse[CMmhatpl3q.first].l3_prev does not equal CMNIL_NDX • CMetfduse[CMmhatpl3q.first].bf_owner & CM_L3_OWNER does not equal 0 • CMetfduse[CMmhatpl3q.first].usetype does not equal CMENXMT • CMetfduse[CMmhatpl3q.last].l3_next does not equal CMNIL_NDX • CMetfduse[CMmhatpl3q.last].bf_owner & CM_L3_OWNER does not equal 0 • CMetfduse[CMmhatpl3q.last].usetype does not equal CMENXMT
Possible Error Effect:	Layer 3 may assert, lose frames or EFDs.
Corrective Action Taken:	The audit sets the EFD owner's <i>first</i> , <i>last</i> , <i>ready</i> and <i>blocked</i> fields to CMNIL_NDX and the <i>xmit_cnt</i> to 0.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	EFD owner type.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The EFD count value (<i>xmit_cnt</i>).
<i>Logical Index</i> =	NA or melnk number.
<i>Dump</i> =	The EFD owner.

Table 2 Error Code: BADRANGE_INDEX

Error Code:	BADRANGE_INDEX
Error Description:	The audit finds that the index into the CMsocket[] in CMesmelnk[] (CMesmelnk[AUEXE_IDX][side].so_idx[0]) is not within range.
Possible Error Effect:	The MELNK is restarted.
Corrective Action Taken:	The audit sets the index into CMsocket[] in CMesmelnk[] (CMesmelnk[AUEXE_IDX][side].so_idx[0]) to its null value (CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Side of CMesmelnk[][].
<i>Bad Data</i> =	CMesmelnk[AUEXE_IDX][side].so_idx[0].
<i>Good Data</i> =	CM_NUMSOPCB.
<i>Logical Index</i> =	MELNK number.
<i>Dump</i> =	Contents of CMesmelnk[AUEXE_IDX][side].

Table 3 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The audit finds that the systype in the CMsocket[] entry to which the PIPE points is not equal to CMSOST_HUB.
Possible Error Effect:	The MEPIPE is restarted and real time call detail (RTCD) records may be lost.
Corrective Action Taken:	The audit sets the index into CMsocket[] in CMesmepipe[][] (CMesmepipe.ping_so_idx[0]) to its null value (CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	CMsocket[CMesmepipe.ping_so_idx[side]].so_systype.
<i>Good Data</i> =	CMSOST_HUB.
<i>Logical Index</i> =	Side.
<i>Dump 1</i> =	Contents of CMsocket[CMesmepipe.ping_so_idx[side]].
<i>Dump 2</i> =	Contents of CMesmepipe.

Table 4 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	Either CMmhatpl3q or CMmhesl3q[melnk] do not own any EFDs (elements of CMetfduse[]), but have a non-zero EFD count (<i>xmit_cnt</i> != 0). The owner can be determined based on the value in the report's <i>Error Address</i> field.
Possible Error Effect:	Layer 3 EFD frame handling code may take incorrect actions.
Corrective Action Taken:	The audit clears the EFD count (<i>xmit_cnt</i> = 0).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	EFD owner type.
<i>Bad Data</i> =	The EFD count (<i>xmit_cnt</i>).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA or the melnk value.
<i>Dump</i> =	NA.

Table 5 Error Code: NULL3LINK

Error Code:	NULL3LINK
Error Description:	An out of range value (> CMETNUMBUF and != CMNIL_NDX) was found in at least one EFD linkage field (<i>first</i> , <i>last</i> , <i>ready</i> , <i>blocked</i>) in either CMmhatpl3q or an entry in CMmhesl3q[melnk].
Possible Error Effect:	The out of range values may cause asserts, lost frames or lost EFDs.

Corrective Action Taken:	The audit sets all of the frame descriptor ownership fields (listed in the error description) to CMNIL_NDX. Any lost frame descriptors are picked up by the EFD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The EFD owner type.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	The EFD count field (<i>xmit_cnt</i>).
<i>Logical Index =</i>	NA or melnk number.
<i>Dump =</i>	The EFD owner structure.

Table 6 Error Code: OUTFRANGE

Error Code:	OUTFRANGE
Error Description:	The audit finds the index into CMssocket[] in CMesmepipe[] (CMesmepipe.ping_so_idx[side]) is not within range.
Possible Error Effect:	The MEPIPE is restarted and real time call detail (RTCD) records may be lost.
Corrective Action Taken:	The audit sets the index into CMssocket[] in CMesmepipe[][] (CMesmepipe.ping_so_idx[side]) to its null value (CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CMesmepipe.ping_so_idx[side].
<i>Good Data =</i>	CM_NUMSOPCB.
<i>Logical Index =</i>	Side.
<i>Dump =</i>	Contents of CMesmepipe.

Table 7 Error Code: TYPE

Error Code:	TYPE
Error Description:	The audit finds one of the following: - CMssocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].so_protocol does not equal CMIPTCP or - CMssocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].so_systype does not equal CMSOST_RTCD.
Possible Error Effect:	The MELNK is restarted.
Corrective Action Taken:	The audit sets the index into CMssocket[] in CMesmelnk[] (CMesmelnk[AUEXE_IDX][side].so_idx[0]) to its null value (CMNIL_NDX).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	AUEXE_IDX.
<i>Bad Data =</i>	CMssocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].so_systype.
<i>Good Data =</i>	CMssocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].so_protocol.
<i>Logical Index =</i>	Side.
<i>Dump 1 =</i>	Contents of CMssocket[CMesmelnk[AUEXE_IDX][side].so_idx[0]].
<i>Dump 2 =</i>	Contents of CMesmelnk[AUEXE_IDX][side].

Table 8 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Index used in auditing data.
<i>Logical Index =</i>	An identifier indicating the data being audited at the time of the error.
<i>Dump =</i>	NA.

EXRR

Software Release: 5E10 and later

1. EXTENDED REROUTE (EXRR) AUDIT

Trunk group controls are a set of regulators used to protect an office from excessive routing requests and to expand routing patterns during busy periods. These regulators control the number of calls that can access a trunk group. A hierarchy exists within the trunk group controls. The group trunk group controls relation (RLGRP_TGC) maps active trunk groups in an office to trunk groups that have controls associated with them. The trunk group controls relation (RLTGC) maps the trunk groups and their associated controls to a specific control. The extended reroute relation (RLEXRR) maps a specific reroute control to a series of trunk groups designated to be the trunks on which the call attempts termination. The extended reroute audit (EXRR) verifies the linkages between the extended reroute relation (RLEXRR) and the trunk group controls relation (RLTGC). The audit also checks for lost resources by verifying linkages to the data base head cells relation (RLDB_HEADC).

This audit is part of the Routing and Terminal Allocation audits subgroup. It operates in the OKP environment in the segmented modes.

2. DATA STRUCTURES

The data structures checked by the EXRR audit are the extended reroute relation (RLEXRR), the trunk group controls relation (RLTGC), and the database headcells relation (RLDB_HEADC). Figure 1 illustrates the layout of RLEXRR and shows the items checked by the audit. Included in the information within the tuples is the control identification, which is the point-back linkage to the RLTGC relation.

Figure 1 (EXRR-1) Extended Reroute Relation

3. AUDIT CHECKS

To verify the linkages in the extended reroute relation, the EXRR audit calls the linkage driver (DRLINK). The DRLINK driver ensures that each tuple in RLEXRR has a valid one-to-one linkage to the associated rITGC relation. The DRLINK driver also verifies the owner-member linkages to the RLDB_HEADC relation. The DRLINK driver invokes the semantic check function after verifying the linkages of each rLEXRR tuple. The semantic check function performs the following checks:

- (a) The audit reads the control ID field and verifies that the rITGC associated with the current rLEXRR tuple has attributes with the proper hunt and control types.
- (b) The audit verifies that all tuples in rLEXRR are either busy or idle.

4. ERROR HANDLING

The audit reports errors when any linkage check or semantic check fails. The audit zeroes the linkage areas of the erroneous tuples and links them to the appropriate idle list.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	A tuple with valid linkages and data to qualify as busy is not on the busy list.
Possible Error Effect:	This tuple is taking up space in the relation that could be used for active tuples.
Corrective Action Taken:	The tuple is reinitialized and placed on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of current tuple.
<i>Bad Data</i> =	Contents of owner field.
<i>Good Data</i> =	Idle list headcell.
<i>Logical Index</i> =	rrlink field of rLEXRR tuple.
<i>Dump</i> =	Contents of rLEXRR tuple.

Table 2 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	A tuple has null pointers and data to indicate that it should be on the idle list. However, it is not on the idle list.
Possible Error Effect:	There is an idle tuple which can never be made active since it is not on the idle list.
Corrective Action Taken:	The tuple is reinitialized and placed on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of current tuple.
<i>Bad Data</i> =	Contents of owner field.
<i>Good Data</i> =	Idle list headcell.
<i>Logical Index</i> =	rrlink field of rLEXRR tuple.
<i>Dump</i> =	Contents of rLEXRR tuple.

Table 3 Error Code: RRHTYPE

Error Code:	RRHTYPE
Error Description:	The rLEXRR tuple does not have a spray or ordered hunt type indicated in rlvTGC.
Possible Error Effect:	This rLEXRR tuple should never be accessed by network management but it is

	taking up space in the relation.
Corrective Action Taken:	The tuple is reinitialized and placed on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of current rEXRR tuple.
<i>Bad Data =</i>	Hunt type indicated in the rTGC tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	rlink field of rEXRR tuple.
<i>Dump 1 =</i>	Contents of rEXRR tuple.
<i>Dump 2 =</i>	Contents of associated rTGC tuple.

FACPM

Software Release: 5E10 and later

1. FACILITY PERFORMANCE MONITORING STATE (FACPM) AUDIT

Performance monitoring can be inhibited or allowed on a DS1 facility. The current status of both the 15 minute and daily reports is contained in the RLFACTHRS relation. This relation contains both the dynamic and static inhibit/allow status for both the 15 minute and daily reports. The dynamic performance monitoring status can be changed by using the inhibit/allow commands and this is not audited. The performance monitoring static status can be set by using recent change and is maintained in a protected relation (either RLFACTHRS or RLDF2THRS). The FACPM audit verifies that the static inhibit/allow states are consistent in the rIFACPM tuple with the protected data information in the threshold relation.

2. DATA STRUCTURES

The protected RLPMFACGRP relation associates a DS1 or DFI-2 facility with a performance monitoring group. Each facility has one rIPMFACGRP tuple and one rIFACPM tuple. The protected RLFACTHRS relation contains the performance monitoring thresholds and the static inhibit/allow status for each DS1 performance monitoring group. The RLDF2THRS relation contains the performance monitoring thresholds and the static inhibit/allow status for each DFI-2 performance monitoring group. The IDCU performance monitoring data structures are shown in Figure 1. The DFI-2 performance monitoring data structures are shown in Figure 2.

Figure 1 (FACPM-1) IDCU Performance Monitoring Data Structures

Figure 2 (FACPM-2) DFI-2 Performance Monitoring Data Structures

3. AUDIT CHECKS

The FACPM audit uses the DRSTATIC audit driver to step through the RLFACPM relation. The FACPM audit uses the following error codes. This listing gives a basic indication of the order of the checks. For details regarding each error code see the comment blocks given. For each tuple, the FACPM audit makes the following checks:

- BADTYPE = Check the relation ID type.
- EXTRATUP = Check for extra tuples.
- KEY = Check the tuple's key.
- ODDLOSTUP = Check threshold tuples.
- STATUS = Check the static inhibit/allow bits.
- TYPE = Check the circuit type.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The relation ID based on the circuit type and determined in the audit for the threshold data does not equal either RLFACTHRSH or RLDF2THRSH.
Possible Error Effect:	User process stack overwritten.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIFACPM tuple.
<i>Bad Data =</i>	Relid of threshold relation.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	DS1 or DFI-2 Facility name (rIFACPM.facname).
<i>Dump 1 =</i>	The contents of rIFACPM tuple.
<i>Dump 2 =</i>	The contents of rIPMFACGRP tuple.

Table 2 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	A dynamic tuple in RLFACTPM relation with the facility name as key does not have a corresponding tuple in RLPMFACGRP with the same key value.
Possible Error Effect:	Extra rIFACPM tuple contains performance monitoring status for unknown facility.
Corrective Action Taken:	The extra rIFACPM tuple is deleted from the database.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIFACPM tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Facility name (rIFACPM.facname).
<i>Dump =</i>	The contents of rIFACPM tuple.

Table 3 Error Code: KEY

Error Code:	KEY
Error Description:	The rIFACPM tuple has a corrupt key value. The FACPM audit has reconstructed the key value which does not match the current key value in rIFACPM.
Possible Error Effect:	The database has been corrupted. Users cannot update the performance monitoring status for this facility.
Corrective Action Taken:	The key field is updated with the reconstructed facility name.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIFACPM tuple.
<i>Bad Data =</i>	Invalid key for facility name (rIFACPM.facname).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Facility name (rIPMFACGRP.facpmkey).
<i>Dump =</i>	The contents of rIFACPM tuple.

Table 4 Error Code: ODDLOSTUP

Error Code:	ODDLOSTUP
Error Description:	The protected relation that holds the threshold information for performance monitoring facilities is missing.
Possible Error Effect:	Threshold information is missing and could cause performance monitoring errors.
Corrective Action Taken:	None. The threshold information has to be inserted manually.

Manual Action Required:	Using the circuit type as reported in Bad Data below and relation ID as reported in Good Data below for the facility, insert the desired threshold information into either the RLFACTHRSH(1734) or RLDF2THRSH(1851).
Dump Description:	
<i>Error Address</i> =	Address of rIPMFACGRP tuple.
<i>Bad Data</i> =	Circuit type (rIPMFACGRP.ckttype).
<i>Good Data</i> =	Relation ID of missing threshold tuple.
<i>Logical Index</i> =	Performance monitoring group (rIPMFACGRP.pmgrp).
<i>Dump</i> =	The contents of rIPMFACGRP tuple with the key (rIPMFACGRP.facname).

Table 5 Error Code: STATUS

Error Code:	STATUS
Error Description:	The status for the static inhibit/allow state for the 15 minute or daily report in the unprotected RLFACTHRSH relation does not match the data in the protected threshold relation (RLFACTHRSH or RLDF2THRSH).
Possible Error Effect:	Reports that should be inhibited could be printed or reports that should be printed could be suppressed.
Corrective Action Taken:	Status in the unprotected rIFACPM tuple is reset to match the status in the threshold tuple for this facility.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The 15 minute report status in rIFACPM tuple (rIFACPM.salrt15).
<i>Bad Data</i> =	The daily report status in rIFACPM tuple (rIFACPM.salrtday).
<i>Good Data</i> =	The 15 minute report status in either rIFACTHRSH or rIDF2THRSH tuple (rIFACTHRSH.inh15 or rIDF2THRSH.inh15).
<i>Logical Index</i> =	The daily report status in either rIFACTHRSH or rIDF2THRSH tuple (rIFACTHRSH.inhday or rIDF2THRSH.inh24).
<i>Dump 1</i> =	The contents of rIFACPM tuple.
<i>Dump 2</i> =	The contents of rIPMFACGRP tuple.

Table 6 Error Code: TYPE

Error Code:	TYPE
Error Description:	Invalid circuit type was found in the RLPMFACGRP relation.
Possible Error Effect:	Performance monitoring is attempted on circuit which is not appropriate for this type of monitoring.
Corrective Action Taken:	The audit error is reported to inform the user of this invalid circuit so that the invalid rIPMFACGRP tuple can be removed.
Manual Action Required:	Using the circuit type reported in Bad Data, the performance monitoring group reported in Good Data, and facility name reported in Logical Index delete the rIPMFACGRP tuple.
Dump Description:	
<i>Error Address</i> =	Address of rIPMFACGRP tuple.
<i>Bad Data</i> =	The circuit type (rIPMFACGRP.ckttype).
<i>Good Data</i> =	Performance monitoring group (rIPMFACGRP.pmgrp).
<i>Logical Index</i> =	Facility name (rIPMFACGRP.facname).
<i>Dump</i> =	The contents of rIPMFACGRP tuple.

FACSTAT-A

Software Release: 5E10 - 5E11

1. FACILITY STATUS FOR FAST PORT TERMINATION (FACSTAT) AUDIT

The facility status for fast port termination is used to keep the inhibit/allow traffic status for all facilities connected to a given time slot interchanger (TSI) link. This information is used by call processing to determine quickly if a port is available rather than just assigning a port and having it fail later in the process.

The FACSTAT audit is responsible for ensuring the integrity of tuples in the RLFACSTAT relation. For the digital networking unit-synchronous optical network (SONET) (DNU_S), this relation contains bitmaps that indicates whether the virtual peripheral interface data bus (VPIDB) associated with a digital signal 1 (DS1) facility has a carrier group alarm (CGA) or is inhibited from receiving termination attempts. Bits in the bitmaps are audited against the rISMEST tuples associated with facilities represented by this bit position. For DNU_S, each bit position indicates the VPIDB number of the facilities used in port termination.

2. DATA STRUCTURES

In the case of DNU_S, the RLFACSTAT relation is a dynamic relation that contains information used to describe the inhibit/allow traffic status of VPIDB facilities used in basic call processing. The RLFACSTAT relation is an indexed compaction access relation that is keyed by the *fakey* field. The *fakey* field is composed of the switching module (SM) number and the TSI slice and port number.

For DNU_S facilities, the *inhibit* attribute is a bitmap indicating whether the VPIDB associated with a digital signal level 1 (DS1) facility is to be inhibited from receiving termination attempts. The least significant bit (rightmost bit) is associated with VPIDB 0 and the most significant bit (leftmost bit) is associated with VPIDB 31.

The hierarchy DNU_S facilities is as follows: the signaling terminal equipment (STE) has an associated subscriber test station 1 (STS1). Each STS1 has 28 virtual tributaries 1.5 (VT1.5) and 28 DS1s associated with it. Each DS1 has a total of 24 digital signal level 0 (DS0) circuits with it. CGAs can occur on any of the circuits except the DS0 level. If a parent circuit is out of service, then its children circuits should be inhibited from receiving termination attempts. If any parent circuits have GCAs, then its children circuits should also have a CGA.

For DNU_S facilities, the *cga* attribute is a bitmap indicating whether the VPIDB associated with a DS1 facility was inhibited from receiving termination attempts because of a CGA on that facility. The least significant bit (rightmost bit) is associated with VPIDB 0 and the most significant bit (leftmost bit) is associated with VPIDB 31.

The *quarstat* field is the audits quarantine state that is currently not being used.

The rFACSTAT tuples have no linkage associated with them. These tuples reside on both the communication module processor (CMP) and each switching module (SM). In the CMP, there are 40 tuples per SM in continuous storage up to a maximum of 920 tuples. Each SM has 40 RLFACSTAT tuples in continuous storage. The SM versions are considered the masters. Every time the audit runs in the SM, it will request that a copy of the 40 tuples be sent to the CMP so that its tuples are refreshed every audit cycle. This refresh mechanism prevents the need for an interprocessor audit.

3. AUDIT CHECKS

The FACSTAT audit will perform different checks in both the CMP and the SM environments. In the CMP, the FACSTAT audit uses the DRSTATIC driver to step through the RLMODATT static relation and make sure the corresponding rFACSTAT tuples exist. The SM version of the FACSTAT audit uses the DRINDEXED driver to step through the RLFACSTAT relation and perform the semantic checks on the rFACSTAT tuples. The CMP and SM checks are listed separately below.

If the CMP FACSTAT audit is entered, the following checks are performed for each tuple in the RLMODATT

relation:

LOSTTUP = Check to make sure that each rIMODATT tuple with a *unittype* of SMSM2000 has 40 rIFACSTAT tuples associated with it in the CMP.

If the SM FACSTAT audit is entered, the following checks are performed for each tuple in the RLFACSTAT relation.

ALARM = Check to make sure that the CGA bits corresponding to unequipped DNU_S or DLTU2 facilities are 0.

ALWOOS = Check to make sure that a DS1 circuit is not marked inhibited in RLFACSTAT when none of its parent circuits (STE, STS, or VT1.5) are out of service.

INHHDW = Check to make sure that a DS1 circuit that has a parent with a CGA is also marked as having a CGA in rIFACSTAT.

INHSTATE = Check to make sure that a DS1 circuit is marked inhibited in RLFACSTAT when one of its parent circuits is out of service.

LOSTTUP = Check to make sure there are 40 rIFACSTAT tuples in an SM-2000.

ODDLOSTUP = Check to make sure the rUNIT_CKT tuples are available for the STE, STS1, VT1.5, and DS1 circuits. Also make sure the rIPLI_LNK tuple is available for these circuits. The error type is determined by the key value as to which tuple was missing.

SALW = Check to make sure that a DS1 circuit is not marked with a CGA in the RLFACSTAT relation when the circuit itself or none of its parents have a CGA associated with them.

SMEST = Check to make sure there are rSMEST tuples available for the STE, STS1, VT1.5, and DS1 circuits. The key field in the dump will determine which tuple is missing.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	The FACSTAT audit running in the CMP has detected that an rIFACSTAT tuple corresponding to an rIMODATT tuple is missing. Every rIMODATT tuple with <i>unittype</i> of SMSM2000 should have 40 rIFACSTAT tuples corresponding to it.
Possible Error Effect:	Facility status for fast port termination may be impaired affecting call processing.
Corrective Action Taken:	The missing rIFACSTAT tuple is inserted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the corresponding rIMODATT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The <i>module</i> field of the rIMODATT tuple.
<i>Logical Index</i> =	The logical key of the rIFACSTAT tuple inserted (<i>fakey</i>).
<i>Dump</i> =	The rIMODATT tuple.

Table 2 Error Code: ALARM

Error Code:	ALARM

Error Description:	The audit detected that a <i>cga</i> bit associated with an unequipped DNU_S or DLTU2 facility is not 0.
Possible Error Effect:	The alarm levels in DNU_S or DLTU2 facilities may not reflect the correct levels.
Corrective Action Taken:	The corresponding <i>cga</i> bit in the rFACSTAT tuple is turned off.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rFACSTAT tuple.
<i>Bad Data</i> =	This is 0 if a DNU_S facility or 1 if a DLTU2 facility.
<i>Good Data</i> =	The corresponding <i>pct_link</i> field from the corresponding rPLI_LNK tuple if this is a DNU_S facility. Otherwise it is the <i>pidb_num</i> field from the corresponding rPIDB for DLTU2 facilities.
<i>Logical Index</i> =	The bit mask showing the position of the corrupted <i>cga</i> bit.
<i>Dump 1</i> =	The rFACSTAT tuple.
<i>Dump 2</i> =	The associated rVPIDB_F tuple for DNU_S facilities or the associated rPIDB tuple for DLTU2 facilities.

Table 3 Error Code: ALWOOS

Error Code:	ALWOOS
Error Description:	The audit detected that a DS1 facility is marked inhibited in an rFACSTAT tuple (that is, inhibit bit is set to 1) when the DS1 and all its parents are not out of service.
Possible Error Effect:	Calls may be routed away from this DS1 facility when it is operational and in service.
Corrective Action Taken:	The inhibit bit corresponding to this DS1 facility is turned off.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rFACSTAT tuple.
<i>Bad Data</i> =	The value of the inhibit bit associated with this DS1 before correction.
<i>Good Data</i> =	The bit mask showing the relative position of the bit in rFACSTAT.
<i>Logical Index</i> =	The logical key of the rFACSTAT tuple.
<i>Dump 1</i> =	The rFACSTAT tuple.
<i>Dump 2</i> =	The associated rVPIDB_F tuple.
<i>Dump 3</i> =	The associated DS1 rSMEST tuple.
<i>Dump 4</i> =	The associated VT1.5 rSMEST tuple.
<i>Dump 5</i> =	The associated STS1 rSMEST tuple.
<i>Dump 6</i> =	The associated STE rSMEST tuple.

Table 4 Error Code: INHHDW

Error Code:	INHHDW
Error Description:	The audit has detected a DS1 facility that either has a CGA associated with it or one of its parents has a CGA and the corresponding CGA bit in the rFACSTAT tuple is not set.
Possible Error Effect:	Calls may be routed to this DS1 facility when it has a CGA and unable to terminate calls.
Corrective Action Taken:	The CGA bit corresponding to this DS1 facility is turned on.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rFACSTAT tuple.
<i>Bad Data</i> =	The value of the CGA bit associated with this DS1 before correction.
<i>Good Data</i> =	The bit mask showing the relative position of the bit in rFACSTAT.
<i>Logical Index</i> =	The logical key of the rFACSTAT tuple.
<i>Dump 1</i> =	The rFACSTAT tuple.
<i>Dump 2</i> =	The associated rVPIDB_F tuple.
<i>Dump 3</i> =	The associated DS1 rSMEST tuple.
<i>Dump 4</i> =	The associated VT1.5 rSMEST tuple.
<i>Dump 5</i> =	The associated STS1 rSMEST tuple.
<i>Dump 6</i> =	The associated STE rSMEST tuple.

Table 5 Error Code: INHSTATE

Error Code:	INHSTATE
Error Description:	The audit has detected a DS1 facility that is not marked inhibited in the rFACSTAT tuple when either it or one of its parents are out of service.

	Therefore, it should be marked inhibited.
Possible Error Effect:	Calls may be routed to this DS1 facility when it is out of service and unable to terminate calls.
Corrective Action Taken:	The inhibit bit corresponding to this DS1 facility is turned on.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rFACSTAT tuple.
<i>Bad Data</i> =	The value of the inhibit bit associated with this DS1 before correction.
<i>Good Data</i> =	The bit mask showing the relative position of the bit in rFACSTAT.
<i>Logical Index</i> =	The logical key of the rFACSTAT tuple.
<i>Dump 1</i> =	The rFACSTAT tuple.
<i>Dump 2</i> =	The associated rVPIDB_F tuple.
<i>Dump 3</i> =	The associated DS1 rSMEST tuple.
<i>Dump 4</i> =	The associated VT1.5 rSMEST tuple.
<i>Dump 5</i> =	The associated STS1 rSMEST tuple.
<i>Dump 6</i> =	The associated STE rSMEST tuple.

Table 6 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	The SM portion of the FACSTAT audit detected a missing rFACSTAT tuple. Every SM must have at least 40 rFACSTAT tuples.
Possible Error Effect:	Facility status for fast port termination for this SM may be degraded or not operational. This may impact call terminations.
Corrective Action Taken:	The missing rFACSTAT tuple is inserted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the buffer containing the rFACSTAT tuple inserted.
<i>Bad Data</i> =	The value of the <i>tsi link</i> associated with this rFACSTAT tuple.
<i>Good Data</i> =	The SM number of the SM missing the rFACSTAT tuple.
<i>Logical Index</i> =	The logical key of the rFACSTAT tuple.
<i>Dump</i> =	NA.

Table 7 Error Code: ODDLOSTUP

Error Code:	ODDLOSTUP
Error Description:	The SM portion of the FACSTAT audit was unable to obtain a static relation tuple needed to audit the dynamic rFACSTAT tuples. The KEY field in the audit dump will indicate which static tuple the audit was unable to obtain. The KEY field values and the associated static tuples missing are listed below: 0 = The audit was unable to read rUNIT_CKT for a DS1 facility. 1 = The audit was unable to read rUNIT_CKT for a VT1.5 facility. 2 = The audit was unable to read rUNIT_CKT for an STS-1 facility. 3 = The audit was unable to read rUNIT_CKT for an STE facility. 4 = The audit was unable to read rPLI_LNK for this TSI link. The good data in the dump will vary according to the KEY field as follows: 0 Good data is the <i>tsi link</i> for these DNU_S facilities. 1 = Good data is the circuit index of the DS1 facility. 2 = Good data is the circuit index of the VT1.5 facility. 3 = Good data is the circuit index of the STS-1 facility.

	4 = Good data is the circuit index of the STE facility. The dump in the audit error will also vary according to the KEY value as follows: 0 = The rIFACSTAT and rVPIDB_F tuples are dumped. 1 = The rIFACSTAT and rVPIDB_F tuples are dumped. 2 = The rIFACSTAT and rVPIDB_F tuples are dumped. 3 = The rIFACSTAT and rVPIDB_F tuples are dumped. 4 = Only the rIFACSTAT tuple is dumped.
Possible Error Effect:	The contents of the rIFACSTAT tuple can not be audited and is therefore subject to corruption.
Corrective Action Taken:	None.
Manual Action Required:	The missing tuple(s) must be inserted by recent change.
Dump Description:	
<i>Error Address</i> =	The address of the rIFACSTAT tuple under audit.
<i>Bad Data</i> =	The return code from DBfrdtup() used to read the static relation.
<i>Good Data</i> =	This will vary based on the Logical Index field as indicated above.
<i>Logical Index</i> =	This is the value of KEY as indicated above.
<i>Dump</i> =	This will vary based on the value of KEY.

Table 8 Error Code: SALW

Error Code:	SALW
Error Description:	The audit detected that a DS1 facility is marked as having a CGA when the DS1 and all its parents have no CGAs
Possible Error Effect:	Calls may be routed away from this DS1 facility when it is operational and in service.
Corrective Action Taken:	The CGA bit corresponding to this DS1 facility is turned off.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIFACSTAT tuple.
<i>Bad Data</i> =	The value of the CGA bit associated with this DS1 before correction.
<i>Good Data</i> =	The bit mask showing the relative position of the bit in rIFACSTAT.
<i>Logical Index</i> =	The logical key of the rIFACSTAT tuple.
<i>Dump 1</i> =	The rIFACSTAT tuple.
<i>Dump 2</i> =	The associated rVPIDB_F tuple.
<i>Dump 3</i> =	The associated DS1 rSMEST tuple.
<i>Dump 4</i> =	The associated VT1.5 rSMEST tuple.
<i>Dump 5</i> =	The associated STS1 rSMEST tuple.
<i>Dump 6</i> =	The associated STE rSMEST tuple.

Table 9 Error Code: SMEST

Error Code:	SMEST
Error Description:	The SM portion of the FACSTAT audit was unable to obtain an rSMEST tuple for either a DS1, VT1.5, STS-1, or STE facility. 0 = The audit was unable to read rSMEST for a DS1 facility. 1 = The audit was unable to read rSMEST for a VT1.5 facility. 2 = The audit was unable to read rSMEST for a STS-1 facility. 3 = The audit was unable to read rSMEST for a STE facility.
Possible Error Effect:	The contents of the rIFACSTAT tuple can not be audited and is therefore subject

	to corruption.
Corrective Action Taken:	The SMEST audit is scheduled to correct the RLSMEST relation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIFACSTAT tuple under audit.
<i>Bad Data =</i>	This is the circuit index of the DNU_S facility.
<i>Good Data =</i>	This is the circuit name of the DNU_S facility.
<i>Logical Index =</i>	This is the value of KEY as indicated above.
<i>Dump 1 =</i>	The rIFACSTAT tuple.
<i>Dump 2 =</i>	The associated rVPIDB_F tuple.

FACSTAT-B

Software Release: 5E12 and later

1. FACILITY STATUS FOR FAST PORT TERMINATION (FACSTAT) AUDIT

The facility status for fast port termination is used to keep the inhibit/allow traffic status for all facilities connected to a given time slot interchanger (TSI) link. This information is used by call processing to determine quickly if a port is available rather than just assigning a port and having it fail later in the process.

The FACSTAT audit is responsible for ensuring the integrity of tuples in the RLFACSTAT relation. For the digital networking unit-synchronous optical network (SONET) (DNU-S), this relation contains bitmaps that indicates whether the virtual peripheral interface data bus (VPIDB) associated with a digital signal 1 (DS1) facility has a carrier group alarm (CGA) or is inhibited from receiving termination attempts. Bits in the bitmaps are audited against the rISMEST tuples associated with facilities represented by this bit position. For DNU-S, each bit position indicates the VPIDB number of the facilities used in port termination.

2. DATA STRUCTURES

For details on the fields contained in the RLFACSTAT relation, refer to the 5ESS[®] Translations Data Manual (235-600-1xx) and the 5ESS[®] Dynamic Data Manual (235-600-2xx).

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: ALARM

Error Code:	ALARM
Error Description:	The audit detected that a <i>cga</i> bit associated with a facility is not correct according to the carrier group alarm (CGA) status of that facility.
Possible Error Effect:	The CGA processing for this facility may be incorrect.
Corrective Action Taken:	The <i>cga</i> bit in the rFACSTAT tuple is corrected to the proper value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rFACSTAT tuple that is corrupted.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The position of the corrupted bit (that is, bit mask position).
<i>Logical Index</i> =	The logical key of the corrupted rFACSTAT tuple.
<i>Dump</i> =	The corresponding AUFACSDUMP audit structure.

Table 2 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The FACSTAT audit has encountered an unknown facility type connected to a PLI link.
Possible Error Effect:	Inhibit and allow processing in rFACSTAT for this unknown facility will not be processed correctly.

Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the buffer to hold the corresponding rIPLI_LNK tuple.
<i>Bad Data</i> =	The <i>unitttype</i> field from the corresponding rIVPIDB_F tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The corresponding <i>tsi_link</i> value.
<i>Dump 1</i> =	The corresponding rIFACSTAT tuple.
<i>Dump 2</i> =	The corresponding rIVPIDB_F tuple.

Table 3 Error Code: CKTNAME

Error Code:	CKTNAME
Error Description:	The FACSTAT audit could not obtain the rICGACKT tuple for a facility connected to a DLTU.
Possible Error Effect:	The fast port inhibit feature for this facility may not be functioning properly.
Corrective Action Taken:	The CGACKT audit will be scheduled as a related audit to correct the problem.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the corresponding rISMEST tuple.
<i>Bad Data</i> =	The <i>unitttype</i> field from the corresponding rIPICB tuple.
<i>Good Data</i> =	The corresponding facility number.
<i>Logical Index</i> =	The circuit name of the facility.
<i>Dump 1</i> =	The corresponding rISMEST tuple.
<i>Dump 2</i> =	The corresponding rIPICB tuple.

Table 4 Error Code: INHSTATE

Error Code:	INHSTATE
Error Description:	The FACSTAT audit found that the corresponding inhibit bit for a facility in the rIFACSTAT was not correct.
Possible Error Effect:	The fast port inhibit feature for this facility may not be working correctly.
Corrective Action Taken:	The inhibit status for this facility is corrected in the corresponding rIFACSTAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the corresponding rIFACSTAT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The bit mask showing the position of the bad bit value in rIFACSTAT.
<i>Logical Index</i> =	The logical key of the rIFACSTAT tuple.
<i>Dump</i> =	The AUFACSDUMP audit structure.

Table 5 Error Code: NCKTS

Error Code:	NCKTS
Error Description:	The FACSTAT audit was unable to obtain the rICGACKT tuple for a facility that is connected to a PLI link.
Possible Error Effect:	The fast port inhibit processing for this facility may not be processed correctly.
Corrective Action Taken:	The CGACKT audit is scheduled as a related audit to correct the problem.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rICGACKT tuple returned from DA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The vpidb number associated with the facility.
<i>Logical Index</i> =	The circuit name of the facility.
<i>Dump 1</i> =	The corresponding rIFACSTAT tuple.
<i>Dump 2</i> =	The corresponding rIVPIDB_F tuple.

Table 6 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The FACSTAT audit was not able to obtain needed static data for a facility capable of fast port inhibit. The dump will vary depending on the value of <i>Good Data</i> and <i>Error Address</i> .
Possible Error Effect:	Fast port inhibit for this facility may not function correctly.
Corrective Action Taken:	None.

Manual Action Required:	Office personnel must insert the missing static data.
Dump Description:	
<i>Error Address</i> =	If <i>Good Data</i> is zero, this is the address of the buffer to hold the missing rPLI_LNK tuple. Otherwise, it is the relation ID of the static tuple missing, either RLCKTDATA or RLUNIT_CKT.
<i>Bad Data</i> =	If <i>Good Data</i> is zero, this is the return from DBfrdtup. Otherwise, it is the <i>unitnumber</i> associated with the facility.
<i>Good Data</i> =	This is zero or the value PCDS1SFAC.
<i>Logical Index</i> =	If <i>Good Data</i> is zero, this is the <i>tsi_link</i> value associated with the facility. Otherwise, it is the circuit name of the facility.
<i>Dump 1</i> =	This is the corresponding rFACSTAT tuple.
<i>Dump 2</i> =	If <i>Good Data</i> is not zero, this is the dump of the corresponding rVPIDB_F tuple.

Table 7 Error Code: READSMEST

Error Code:	READSMEST
Error Description:	The FACSTAT audit could not read the associated rSMEST tuple for a DLTU connected facility.
Possible Error Effect:	The fast port inhibit processing for this feature may not be working properly.
Corrective Action Taken:	The CKTDATA audit is scheduled as a related audit to correct the problem.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the buffer to receive the rPICB tuple.
<i>Bad Data</i> =	The associated <i>unittype</i> of the facility.
<i>Good Data</i> =	The associated facility number.
<i>Logical Index</i> =	The circuit name of the facility.
<i>Dump 1</i> =	The associated rPIDB for this facility.
<i>Dump 2</i> =	The associated rPICB for this facility.

Table 8 Error Code: SMEST

Error Code:	SMEST
Error Description:	The FACSTAT audit was not able to obtain the associated rSMEST tuple for a DNU DS1 facility.
Possible Error Effect:	Fast port inhibit will probably not work correctly for this DS1 facility.
Corrective Action Taken:	The CKTDATA audit is scheduled as a related audit to correct the problem.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The circuit index for the DS1 facility.
<i>Bad Data</i> =	The <i>unitnumber</i> associated with this facility.
<i>Good Data</i> =	The value of PCDS1SFAC.
<i>Logical Index</i> =	The DS1 facility circuit name.
<i>Dump 1</i> =	The associated rFACSTAT tuple.
<i>Dump 2</i> =	The associated rVPIDB_F tuple.

FARPID

Software Release: 5E10 and later

1. FAR PROCESS ID AUDIT (FARPID)

A plain old telephone service (POTS) telephone call involves linkages between two terminal processes. This linkage is not implemented by means of one-to-one or owner-member linkage schemes. Instead, two terminal processes are linked when the system places an audit identification mnemonic (ID) within the process control block linkage area of each process. This ID identifies the other process, called the "far process"; the ID is called the far process ID. Since feature calls may involve more than two parties, each process control block linkage area contains two far process IDs. For example, each process in a three-way call contains two far process IDs. Far process IDs are also stored in associated data structures such as the associated process block relation (RLAPB), the general purpose annexed data block relation (RLGPAXDB), and the call leg data block relation (RLCLDB) in the switching module (SM). For POTS calls, the second far process ID is null, which indicates that it is not linked to another process.

Terminal processes involved in a call communicate by means of the message mechanism provided by the operating system for distributed switching (OSDS). For example, when the originating party hangs up, the corresponding process sends a message to the far process that tells it to disconnect the call and terminate. If the ID for the far process is incorrect, the far process will not receive the message. The far process is stuck and its resources (port, time slot, and so forth) are lost.

The FARPID audit verifies the far process linkage for all stable terminal processes by examining the far process ID items of the process control block linkage areas and associated data. Processes are either transient or stable, depending on the content of the customer state (custat) item in the process control block linkage area of a process (for example, dialing is transient and talking is stable). This audit checks linkages only within a given switching module (SM). E-bit discontinuity checks handle inter-SM linkages.

This audit is part of the feature control audits subgroup.

2. DATA STRUCTURES

The data structures checked by the FARPID audit are the process control block linkage area relation (RLPCBLA), the RLGPAXDB, the RLCLDB, and the RLAPB. Figure 1 illustrates the layout of a process control block linkage area. The two items checked by the audit are the far process ID fields (farpid and fpid2). The data is used in this way during POTS calls. Figure 2 illustrates how far processes are monitored for business and residential customer services (BRCS), advanced mobile phone service (AMPS), and operator services position system (OSPS) type calls. For BRCS calls, the far process data is stored in rICLDB tuples linked from the rIPCBLA. For AMPS calls, the far process data is stored in rIGPAXDB tuples linked from the rIPCBLA. For OSPS calls, the far process data is stored in rIAPB tuples linked from the rIPCBLA.

Figure 1 (FARPID-1) Process Control Block Linkage Area Far Process ID Fields

PROCESS 1

Figure 2 (FARPID-2) Process Control Block Linkage Area Far Process ID Fields

3. AUDIT CHECKS

The FARPID audit calls the static driver (DRSTATIC) once for each audit segment. The DRSTATIC driver accesses each process control block linkage area and performs the following semantic checks for each process field:

- If the process control block linkage area is transient, a headcell, a system process, or associated with a host switching module (HSM) terminal process, nothing is checked and the next process control block linkage area is accessed.
- If the process control block linkage area is stable, the process control block linkage area far process ID(s) is examined. If a far process ID is null or exists in a different processor, no further checks are made for that far process ID. If a far process ID contains a value other than null, the audit verifies that the specified far process actually exists. If it does not exist, control is returned to the DRSTATIC driver with an error indication.
- If the specified far process exists in the current processor, the audit verifies that the far process ID of the far process process control block linkage area contains the ID of the original process (point-back check). If it does not, control is returned to the static driver (DRSTATIC) driver with an error indication.
- If the process control block linkage area is stable and more than ten minutes have passed since the last time that Keep-Alive checking was done for an AMPS terminal process, do the following:
 - If one of the far processes is an *AUTOPLEX*TM (APX) system process and the class of service of that far processes points to a portless APX process and the keep-alive bit (pcblaka) is set to DBYES, send an MGAXCHK message to the APX system process on the far process' SM so the system process verifies that the far party is still active.
 - If the far process is an APX terminal process conference circuit, send an MGAXCHK message to the APX system process on the far process' SM so the system process verifies that the far party is still active.
 - If this process is an APX terminal process and owns a conference circuit, send an MGAXCHK message to the APX terminal process so that process checks its far parties to see if they are still active.

4. ERROR HANDLING

If a process control block linkage area is found to have a far process ID that does not point to a valid far process, the corresponding process is purged. If the far process ID of a far process process control block linkage area does not point back to the original process, the original process is purged.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

Table 1 Error Code: DBREAD

Error Code:	DBREAD
Error Description:	The rIPCBLA tuple associated with this process could not be accessed.
Possible Error Effect:	The rIPCBLA tuple may be a lost resource, unusable by call processing.
Corrective Action Taken:	Related audit PCBLA is scheduled to check for consistent states.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIPCBLA.
<i>Bad Data =</i>	The process number of the rIPCBLA tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The process number of the rIPCBLA tuple.
<i>Dump =</i>	The rIPCBLA tuple.

Table 2 Error Code: FPID_LINK

Error Code:	FPID_LINK
Error Description:	The far process ID (FARPID) being checked does not claim to be associated with the pcbla being checked. No lists owned by the far terminal process' PCBLA have the near terminal process process ID (PID) specified in it. This process is thus considered lost.
Possible Error Effect:	A terminal associated with this process is invalidly denied service. In addition, many occurrences of this type could cause the system to run out of processes.
Corrective Action Taken:	The process is purged from the system.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIPCBLA tuple when Good Data is zero else the bad process ID.
<i>Bad Data =</i>	The key of the tuple containing the far process.
<i>Good Data =</i>	If Dump 2 indicates GPAXDB, 1 for FAR1 2 for FAR2 3 for FAR3 otherwise it is 0.
<i>Logical Index =</i>	procno of this pcbla.
<i>Dump 1 =</i>	rIPCBLA.
<i>Dump 2 =</i>	Additional data requested, identified in the dump.
<i>Dump 3 =</i>	When Dump 2 indicates GPAXDB, rIPCBLA for far party.

Table 3 Error Code: TIMESTAMP

Error Code:	TIMESTAMP
Error Description:	The OSDS ITIME (OSnow) seems to have moved backwards. Possible corruption of the global variable, AUfar_time, used for transient timing may have occurred.
Possible Error Effect:	The audit's transient timing has been interrupted. Lost resources may take longer to recover because transient timing must be restarted.
Corrective Action Taken:	AUfar_time will be updated with the current OSDS ITIME (OSnow) and processing will continue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the transient timing global variable (AUfar_time).
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump 1 =</i>	Content of the transient timing variable (AUfar_time).
<i>Dump 2 =</i>	Content of the current OSDS ITIME (OSnow).

FCASITBL

Software Release: 5E10 and later

1. FEATURE CONTROL ASI UTD TABLE (FCASITBL) AUDIT

Advanced service access (ASI) is a switch based capability which will provide the telephone operating companies with the ability to connect an intelligent peripheral (IP) to subscribers on the switch. The telephone operating companies would utilize IP to support a variety of services for the purpose of providing automated call handling for the subscriber. The FCASITBL audit will insure the integrity of the FCasitbl[] array structure that is used to hold the PIDs of processes using ASI universal tone decoder (UTD) resources.

2. DATA STRUCTURES

The FCASITBL audit references the following attributes of the FCasitbl[] global array:

pcrid = The processor where the owning UTD process is resident.
 procno = The process number of the owning UTD process.
 uniq = The uniqueness attribute of the owning UTD process.

In addition the audit references the following global values:

AUutdindx = Pointer to the entry in FCasitbl[] currently being audited or FCTBLSTR.
 AUutd_use = Audits count of the valid processes owning a UTD currently in the FCasitbl[] array.
 FCHUNDRD = Global constant used to determine the number of UTDs in use as a percentage.
 FCMAXUTD = Global constant used to determine the maximum number of number of entries in the FCasitbl[] array.
 FCTBLALL = Global constant used to define the first index into the FCasitbl[] array.
 FCTBLSTR = Global constant used to define the first index into the FCasitbl[] array that may contain a valid PID.
 FCTBLEND = Global constant used to define the last index into the FCasitbl[] array that may contain a valid PID.
 FClstrel = Pointer to the last relased entry in FCasitbl[] or the last available entry.
 FCutd_use = Count of the valid processes owning a UTD currently in the FCasitbl[] array.
 Glasiulim = The maximum number of UTDs that can be allocated in the FCasitbl[] array.
 GI_utd = Global constant used to determine number of UTDs in use as a percentage.

All entries in the Fcasitbl[] array should be marked OSnullpid unless they are currently in use. A maximum of (Glasiulim * GI_utd) entries may be in use at any one time. The FCasitbl[FCTBLALL] entry is the first entry in the table and is never used (must always be set to OSnullpid). FClstrel should contain the index into FCasitbl[] array whose entry is OSnullpid or FCTBLALL. If FClstrel is set to FCTBLALL, a search for the next OSnullpid entry in the FCasitbl[] array will be done. FCutd_use should always contain the number of valid PIDs in the FCasitbl[] array using UTD resources.

3. AUDIT CHECKS

The FCASITBL audit makes the following checks: If the FCASITBL audit is entered:

- NOTIDLE = Check that the entry FCasitbl[FCTBLALL] is OSnullpid.
- OUTOFRANGE = Check that the FClstrel pointer is within range.
- ZAP = Check to see if audit was entered as the result of a reset.

For every entry in the FCasitbl[] array:

- If the entry is not OSnullpid:
 - BDPID = Check that the process in the entry is a valid process.
 - INDEX = Check that the FClstrel pointer is pointing to a valid null entry in FCasitbl[].
- If the entry is OSnullpid:
 - BDCOUNT = Check that the FCutd_use count is valid.
 - RANGE = Check that the FCutd_use is within a valid range.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	The global count, FCutd_use, which counts the number of valid PIDs in the FCasitbl[] array did not match the audit count, AUutd_use, after stepping through the array entries.
Possible Error Effect:	A wrong usage count could lead to over or under allocation of UTD resources in the switch.
Corrective Action Taken:	The usage count, FCutd_use, is set to the value of the audit count, AUutd_use.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the global count, FCutd_use.
<i>Bad Data =</i>	The incorrect value of FCutd_use.
<i>Good Data =</i>	The correct value of the global count, AUutd_use.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 2 Error Code: BDPID

Error Code:	BDPID
Error Description:	A PID no longer associated with a valid process was found in an FCasitbl[] array entry.
Possible Error Effect:	A process that has abnormally ended failed to release its UTD resource. This may prevent other processes from using this UTD resource.
Corrective Action Taken:	The FCasitbl[] array entry found to be in error is set to OSnullpid.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	The address of the FCasitbl[] array entry found to contain an invalid PID.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The value of OSnullpid.
<i>Logical Index</i> =	The index into the FCasitbl[] array containing the entry in error.
<i>Dump</i> =	The value of the FCasitbl[] array entry at the time of error.

Table 3 Error Code: INDEX

Error Code:	INDEX
Error Description:	In stepping through the FCasitbl[] array, it was found that the global variable FClstrel contains an index of a non-null entry (not OSnullpid). Since FClstrel is used to assign the next null entry in FCasitbl[] array a valid PID, it should always point to a null entry or contain FCTBLALL (indicating a search must be done for a null entry).
Possible Error Effect:	This error could cause the reallocation of a UTD resource that is currently allocated to another process.
Corrective Action Taken:	FClstrel is set to FCTBLALL to indicate a search needs to be done for the next OSnullpid entry in the FCasitbl[] array.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the global variable, FClstrel.
<i>Bad Data</i> =	The value of FClstrel that was in error.
<i>Good Data</i> =	The value of FCTBLALL.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 4 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	The entry FCasitbl[FCTBLALL] was not set to OSnullpid. This entry should always be set to OSnullpid since it is never used.
Possible Error Effect:	The FCasitbl[] array may be corrupt leading to lost UTD resources.
Corrective Action Taken:	The FCasitbl[FCTBLALL] entry is set to OSnullpid.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the FCasitbl[FCTBLALL] entry.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The value of OSnullpid.
<i>Logical Index</i> =	The value of FCTBLALL.
<i>Dump</i> =	The value of FCasitbl[FCTBLALL] at the time of error.

Table 5 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	A check on the index pointing to the last entry released, FClstrel, was made, and this global variable was found to be outside the range of the FCasitbl[] array. FClstrel should contain the index into FCasitbl[] containing an OSnullpid entry or FCTBLALL.
Possible Error Effect:	The FCasitbl[] array may be corrupt leading to lost UTD resources.
Corrective Action Taken:	The global variable, FClstrel, is set to FCTBLALL to indicate a search needs to be done to find the next OSnullpid entry in the FCasitbl[] array.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the FClstrel global variable.
<i>Bad Data</i> =	The value of FClstrel at the time of error.
<i>Good Data</i> =	The value of FCTBLALL.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 6 Error Code: RANGE

Error Code:	RANGE
Error Description:	The count of valid PIDs in FCasitbl[], FCutd_use, was found to be out of range

	with the limits set by the global variables Glasiulim and Gl_ utd.
Possible Error Effect:	This condition may lead to over allocation of UTD resources.
Corrective Action Taken:	None.
Manual Action Required:	Users should verify that the UTD usage parameters set by recent change are correct or need to be increased. Also, the global limit parameters Glasiulim and Gl_ utd may have been corrupted. Normally, this condition would indicate a severe sanity problem in the effected SM.
Dump Description:	
<i>Error Address</i> =	The address of the FCutd_ use variable.
<i>Bad Data</i> =	The value of (FCutd_ use * FCHUNRD) at the time of error.
<i>Good Data</i> =	The value of (Glasiulim * Gl_ utd) at the time of error.
<i>Logical Index</i> =	The value of Gl_ utd at the time of error.
<i>Dump</i> =	NA.

FCLINE

Software Release: 5E10 and later

1. INDIVIDUAL LINE FEATURE DATA (FCLINE) AUDIT

Local area signaling services (LASS) features make use of a list of telephone numbers, usually directory numbers (DNs), associated with the user. When the user receives a call from a DN on such a list, special treatment is provided to the call. The "client" features requiring such lists are:

Computer Access Restriction (CAR) = Enables a customer to receive circuit switched data calls only from calling parties whose identity attributes have been put on the customer's screening list.

Selective Call Acceptance (SCA) = Allows customers to accept calls only from parties whose identity attributes are on the customers SCA list.

Selective Call Forwarding (SCF) = Enables a customer to designate a SCF list whereby call parties whose identity attributes are contained on the list are forwarded to individually designated remote numbers as specified in the SCF list.

Selective Call Rejection (SCR) = Enables customers to receive voice calls only from parties whose identity attributes are contained in an SCR list.

Selective Distinct Alert (SDA) = Enables customers to select, through the use of an SDA list, which calling parties will be provided distinctive alerting treatment.

Screen List Editing (SLE) = Enables users to interactively create, activate, edit and delete screening lists of identity attributes associated with the customer's DN.

The RLFC_LINE relation is used by several LASS features to indicate whether or not a particular line should have access to a LASS feature. The FCLINE audit runs in all switching modules (SMs) in segmented mode and is also scheduled as a post initialization audit as part of a selective initialization.

2. DATA STRUCTURES

The RLFC_LINE relation is a static relation used in conjunction with the static global variables Glac_access (automatic callback), Glar_access (automatic recall), Glcot_access (customer originated trace), Glscrac (selective call rejection), Glscac (selective call acceptance), Glscfac (selective call forwarding), and Glstdaac (selective distinctive alert), and the static relation RLTRMFEATS [where rIFC_LINE.lpt_type (key) = rITRMTFEATS.lpt_type (key)] to determine if tuples in the dynamic line history block relations RLAN_ILHB, RLAN_OLHB, RLIS_ILHB, and RLIS_OLHB should exist. If any of the global variables are marked UNAVAILABLE or TEMP_UNAVAIL then the dynamic relations should not exist and no auditing is done. Otherwise, static-to-dynamic existence relationships exist between RLFC_LINE and the dynamic relations RLAN_ILHB, RLAN_OLHB, RLIS_ILHB, and RLIS_OLHB according to the following rules:

- If Glar_access is marked GEN_AVAIL (generally available) then RLAN_OLHB or RLIS_OLHB should exist depending on whether the port is analog or ISDN. If ISDN, then rIFC_LINE.lpt_type = LPT_ISDN; if analog, rIFC_LINE.lpt_type = LPT_OTHER. In both cases the RLFC_LINE brc_trm and trmbfg attributes are DBYES and the key for RLFC_LINE (rIFC_LINE.lport) is that same as lport (key) in RLAN_OLHB or RLIS_OLHB.
- If Glac_access is marked GEN_AVAIL (generally available) then RLAN_ILHB or RLIS_ILHB should exist depending on whether the port is analog or ISDN. If ISDN, then rIFC_LINE.lpt_type = LPT_ISDN; if analog, rIFC_LINE.lpt_type = LPT_OTHER. In both cases the RLFC_LINE brc_trm and trmbfg attributes are DBYES and the key for RLFC_LINE (rIFC_LINE.lport) is that same as lport (key) in RLAN_ILHB or RLIS_ILHB.
- If any of the remaining global variables listed are marked GEN_AVAIL (generally available) then RLAN_ILHB or

RLIS_ILHB should exist depending on whether the port is analog or ISDN. If ISDN, then rIFC_LINE.lpt_type = LPT_ISDN; if analog, rIFC_LINE.lpt_type = LPT_OTHER. In both cases the RLFC_LINE brc_trm and trmbfg attributes are DBYES and the key for RLFC_LINE (rIFC_LINE.lport) is that same as lport (key) in RLAN_ILHB or RLIS_ILHB.

3. AUDIT CHECKS

The FCLINE audit uses the DRSTATIC driver, and for each rIFC_LINE tuple makes the following checks: If any of the global variables are marked UNAVAILABLE or TEMP_UNAVAIL then no checks are done.

If **none** of the global variables are marked UNAVAILABLE or TEMP_UNAVAIL:

ANILHBKEY	= Check that the keys agree for RLFC_LINE and RLAN_ILHB.
ANOLHBKEY	= Check that the keys agree for RLFC_LINE and RLAN_OLHB.
CL	= Check for correct population of Glcot_access.
HTYPE	= Check that RLFC_LINE lpt_type is LPT_OTHER or LPT_ISDN when brc_trm and trmbfg are both DBYES for AR features.
ISILHBKEY	= Check that the keys agree for RLFC_LINE and RLIS_ILHB.
ISOLHBKEY	= Check that the keys agree for RLFC_LINE and RLIS_OLHB.
LLOSTISILHB	= Check that an rIIS_ILHB tuple exists for this rIFC_LINE tuple for AC, COT, LSF, and ICLID features.
LOSTANOLHB	= Check that an rIAN_OLHB tuple exists for this rIFC_LINE tuple.
LOSTISOLHB	= Check that an rIIS_OLHB tuple exists for this rIFC_LINE static tuple with the AR feature assigned.
RANGE	= Check that RLFC_LINE lpt_type is LPT_OTHER or LPT_ISDN when brc_trm and trmbfg are both DBYES for AC, COT and LSF (Lass Selective) features.
SGNODD	= Check for correct population of Glac_access.
TYPE	= Check for correct population of Glar_access.
XLOSTANILHB	= Check that an rIAN_ILHB tuple exists for this rIFC_LINE tuple for AC, COT, LSF, and ICLID features.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ANILHBKEY

Error Code:	ANILHBKEY
Error Description:	The audit has detected an inconsistency between the lport attribute in the rIFC_LINE tuple and the lport attribute of the associated dynamic rIAN_ILHB

	tuple.
Possible Error Effect:	The rIAN_ILHB tuple may not be able to be accessed correctly. This may affect calls associated with LASS features ICLID, COT, LSF, and AC.
Corrective Action Taken:	The audit will report an error and correct the dynamic rIAN_ILHB to agree with the static rIFC_LINE.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Local address of the rIAN_ILHB tuple.
<i>Bad Data</i> =	lport attribute of the dynamic rIAN_ILHB tuple.
<i>Good Data</i> =	lport attribute of the static rIFC_LINE tuple.
<i>Logical Index</i> =	port.member attribute of the rIFC_LINE tuple in question.
<i>Dump</i> =	The static data rIFC_LINE tuple in question.

Table 2 Error Code: ANOLHBKEY

Error Code:	ANOLHBKEY
Error Description:	The audit has detected an inconsistency between the lport attribute in the rIFC_LINE tuple and the lport attribute of the associated dynamic rIAN_OLHB tuple.
Possible Error Effect:	The rIAN_OLHB tuple may not be able to be accessed correctly. This may affect calls associated with LASS feature AR.
Corrective Action Taken:	The audit will report an error and correct the dynamic rIAN_OLHB to agree with the static rIFC_LINE.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Local address of the rIAN_OLHB tuple.
<i>Bad Data</i> =	lport attribute of the dynamic rIAN_OLHB tuple.
<i>Good Data</i> =	lport attribute of the static rIFC_LINE tuple.
<i>Logical Index</i> =	port.member attribute of the rIFC_LINE tuple in question.
<i>Dump</i> =	The static data rIFC_LINE tuple in question.

Table 3 Error Code: CL

Error Code:	CL
Error Description:	The audit has found the static global variable Glocot_access is populated incorrectly.
Possible Error Effect:	The audit will not be able to complete its checks of related line history blocks (rIAN_ILHB, rIIS_ILHB) associated with the LASS feature COT or LSF.
Corrective Action Taken:	The audit will report an error and continue on to the next rIFC_LINE tuple.
Manual Action Required:	The global parameter Glocot_access must be checked for correctness. If the parameter is incorrect, the audit will continue to print this error.
Dump Description:	
<i>Error Address</i> =	Not an address; value of local acflag or lsfflag used indicate if an associated rIAN_ILHB or rIIS_ILHB should exist to support the LASS feature AC.
<i>Bad Data</i> =	Value of Glocot_access.
<i>Good Data</i> =	cot_alw attribute of the static rIFC_LINE tuple; used to indicate whether COT or LSF is available for a line.
<i>Logical Index</i> =	lport field of the static rIFC_LINE tuple.
<i>Dump</i> =	The static data rIFC_LINE tuple.

Table 4 Error Code: HTYPE

Error Code:	HTYPE
Error Description:	The audit has detected an inconsistency between the static data in rIFC_LINE. The inconsistency indicates that the lpt_type attribute is not consistent with the brc_trm and/or the trmbfg attributes.
Possible Error Effect:	The audit cannot complete its checks between a rIFC_LINE tuple and any related line history block tuple (rIAN_OLHB, rIIS_ILHB etc.).
Corrective Action Taken:	The audit will report an error and continue on to the next rIFC_LINE tuple.
Manual Action Required:	The rIFC_LINE tuple in question must be examined to determine whether the brc_trm, trmbfg, and lpt_type attributes are populated correctly. If they are not correct, the audit will continue to report this error until they are corrected.
Dump Description:	
<i>Error Address</i> =	Not an address, this is the value of the trmbfg attribute of the rIFC_LINE tuple in

	question.
<i>Bad Data</i> =	lpt_type attribute of the rIFC_LINE tuple in question.
<i>Good Data</i> =	brc_trm attribute of the rIFC_LINE tuple in question.
<i>Logical Index</i> =	lport attribute of the rIFC_LINE tuple in question.
<i>Dump</i> =	The static data rIFC_LINE tuple in question.

Table 5 Error Code: ISILHBKEY

Error Code:	ISILHBKEY
Error Description:	The audit has detected an inconsistency between the lport attribute in the rIFC_LINE tuple and the lport attribute of the associated dynamic rIIS_ILHB tuple.
Possible Error Effect:	The rIIS_ILHB tuple may not be able to be accessed correctly. This may affect calls associated with LASS features ICLID, COT, LSF, and AC.
Corrective Action Taken:	The audit will report an error and correct the dynamic rIIS_ILHB to agree with the static rIFC_LINE.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Local address of the rIIS_ILHB tuple.
<i>Bad Data</i> =	lport attribute of the dynamic rIIS_ILHB tuple.
<i>Good Data</i> =	lport attribute of the static rIFC_LINE tuple.
<i>Logical Index</i> =	port.member attribute of the rIFC_LINE tuple in question.
<i>Dump</i> =	The static data rIFC_LINE tuple in question.

Table 6 Error Code: ISOLHBKEY

Error Code:	ISOLHBKEY
Error Description:	The audit has detected an inconsistency between the lport attribute in the rIFC_LINE tuple and the lport attribute of the associated dynamic rIIS_OLHB tuple.
Possible Error Effect:	The rIIS_OLHB tuple may not be able to be accessed correctly. This may affect calls associated with LASS feature AR.
Corrective Action Taken:	The audit will report an error and correct the dynamic rIIS_OLHB to agree with the static rIFC_LINE.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Local address of the rIIS_OLHB tuple.
<i>Bad Data</i> =	lport attribute of the dynamic rIIS_OLHB tuple.
<i>Good Data</i> =	lport attribute of the static rIIS_LINE tuple.
<i>Logical Index</i> =	port.member attribute of the rIFC_LINE tuple in question.
<i>Dump</i> =	The static data rIFC_LINE tuple in question.

Table 7 Error Code: LLOSTISILHB

Error Code:	LLOSTISILHB
Error Description:	The audit has found that an associated dynamic rIIS_ILHB tuple is either missing or is garbaged to 0xffff.
Possible Error Effect:	The rIIS_ILHB tuple may not be able to be accessed correctly. This may affect calls associated with LASS features ICLID, COT, LSF, and AC.
Corrective Action Taken:	The audit will report an error and correct/insert the dynamic rIIS_ILHB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	0.
<i>Bad Data</i> =	0.
<i>Good Data</i> =	lport attribute of the static rIFC_LINE tuple.
<i>Logical Index</i> =	lport field of the dynamic rIIS_ILHB tuple in question.
<i>Dump</i> =	The static data rIFC_LINE tuple.

Table 8 Error Code: LOSTANOLHB

Error Code:	LOSTANOLHB
Error Description:	The audit has found that an associated dynamic rIAN_OLHB tuple is either missing or is garbaged to 0xffff.
Possible Error Effect:	The rIAN_OLHB tuple may not be able to be accessed correctly. This may affect

	calls associated with LASS feature AR.
Corrective Action Taken:	The audit will report an error and correct/insert the dynamic rIAN_OLHB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	0.
<i>Bad Data =</i>	0.
<i>Good Data =</i>	lport attribute of the static rIFC_LINE tuple.
<i>Logical Index =</i>	lport field of the dynamic rIAN_OLHB tuple in question.
<i>Dump =</i>	The static data rIFC_LINE tuple.

Table 9 Error Code: LOSTISOLHB

Error Code:	LOSTISOLHB
Error Description:	The audit has found that an associated dynamic rIIS_OLHB tuple is either missing or is garbaged to 0xffff.
Possible Error Effect:	The rIIS_OLHB tuple may not be able to be accessed correctly. This may affect calls associated with LASS feature AR.
Corrective Action Taken:	The audit will report an error and correct/insert the dynamic rIIS_OLHB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	0.
<i>Bad Data =</i>	0.
<i>Good Data =</i>	lport attribute of the static rIFC_LINE tuple.
<i>Logical Index =</i>	lport field of the dynamic rIIS_OLHB tuple in question.
<i>Dump =</i>	The static data rIFC_LINE tuple.

Table 10 Error Code: RANGE

Error Code:	RANGE
Error Description:	The audit has detected an inconsistency between the static data in rIFC_LINE. The inconsistency indicates that the lpt_type attribute is not consistent with the brc_trm and/or the trmbfg attributes.
Possible Error Effect:	The audit cannot complete its checks between a rIFC_LINE tuple and any related line history block tuple (rIAN_OLHB, rIIS_ILHB etc.)
Corrective Action Taken:	The audit will report an error and continue on to the next rIFC_LINE tuple.
Manual Action Required:	The rIFC_LINE tuple in question must be examined to determine whether the brc_trm, trmbfg, and lpt_type attributes are populated correctly. If they are not correct, the audit will continue to report this error until they are corrected.
Dump Description:	
<i>Error Address =</i>	Not an address, this is the value of the brc_trm attribute of the rIFC_LINE tuple in question.
<i>Bad Data =</i>	lpt_type attribute of the rIFC_LINE tuple in question.
<i>Good Data =</i>	trmbfg attribute of the rIFC_LINE tuple in question.
<i>Logical Index =</i>	lport attribute of the rIFC_LINE tuple in question.
<i>Dump =</i>	The static data rIFC_LINE tuple in question.

Table 11 Error Code: SGNODD

Error Code:	SGNODD
Error Description:	The audit has found the static global variable Glar_access is populated incorrectly.
Possible Error Effect:	The audit will not be able to complete its checks of related line history blocks (rIAN_ILHB, rIIS_ILHB) associated with the LASS feature AC.
Corrective Action Taken:	The audit will report an error and continue on to the next rIFC_LINE tuple.
Manual Action Required:	The global parameter Glac_access must be checked for correctness. If the parameter is incorrect, the audit will continue to print this error.
Dump Description:	
<i>Error Address =</i>	0.
<i>Bad Data =</i>	Value of Glac_access.
<i>Good Data =</i>	ac_alw attribute of the static rIFC_LINE tuple; used to indicate whether AC is available for a line.
<i>Logical Index =</i>	lport field of the static rIFC_LINE tuple.
<i>Dump =</i>	The static data rIFG_LINE tuple.

Table 12 Error Code: TYPE

Error Code:	TYPE
Error Description:	The audit has found the static global variable Glar_access is populated incorrectly.
Possible Error Effect:	The audit will not be able to complete its checks of related line history blocks (rIAN_OLHB, rIIS_OLHB) associated with the LASS feature AR.
Corrective Action Taken:	The audit will report an error and continue on to the next rIFC_LINE tuple.
Manual Action Required:	The global parameter Glar_access must be checked for correctness. If the parameter is incorrect, the audit will continue to print this error.
Dump Description:	
<i>Error Address =</i>	0.
<i>Bad Data =</i>	Value of Glar_access.
<i>Good Data =</i>	ar_alw attribute of the static rIFC_LINE tuple; used to indicate whether AR is available for a line.
<i>Logical Index =</i>	lport field of the static rIFC_LINE tuple.
<i>Dump =</i>	The static data rIFC_LINE tuple.

Table 13 Error Code: XLOSTANILHB

Error Code:	XLOSTANILHB
Error Description:	The audit has found that an associated dynamic rIAN_ILHB tuple is either missing or is garbaged to 0xffff.
Possible Error Effect:	The rIAN_ILHB tuple may not be able to be accessed correctly. This may affect calls associated with LASS features ICLID, COT, LSF, and AC.
Corrective Action Taken:	The audit will report an error and correct/insert the dynamic rIAN_ILHB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	0.
<i>Bad Data =</i>	0.
<i>Good Data =</i>	lport attribute of the static rIFC_LINE tuple.
<i>Logical Index =</i>	lport field of the dynamic rIAN_ILHB tuple in question.
<i>Dump =</i>	The static data rIFC_LINE tuple.

FCTRUNK

Software Release: 5E10 and later

1. FEATURE DATA FOR TRUNKS RELATION (FCTRUNK) AUDIT

The feature data for trunks relation, RLFC_TRUNK, is used by call processing operations in the switch. The relations contains trunk related information such as trunk port, group and member data, equipment unit type, and unit number. Since RLFC_TRUNK is a static relation's contents are used as the master data for comparison against various dynamic relations. The FCTRUNK audit provides this audit functionality. The FCTRUNK audit resides in all switching modules (SMs) and runs in routine and elevated segmented modes.

2. DATA STRUCTURES

One tuple exists in the RLFC_TRUNK relation for every trunk member in the SM. The FCTRUNK audit performs checks based on the following fields:

- port* = The key of the rIFC_TRUNK tuple. For every trunk port assigned the automated call assurance and hundred second scan (ACA and HSS) feature, a corresponding tuple should exist in the rIACA_HSS dynamic relation, where rIFC_TRUNK.port.member == rIACA_HSS.port and rIFC_TRUNK.port.module == GI_pcrd.
- tgroup* = The trunk group to which the member assigned to the port belongs, where rIFC_TRUNK.tgroup represents a tuple in the RLRT_TRKG static relation, and rIFC_TRUNK.tgroup == rIRT_TRKG.grpnum.

3. AUDIT CHECKS

the following checks: If the FCTRUNK audit gets entered:

- KEY = Verify that the key stored in a rIACA_HSS tuple is valid.
- LOSTTUP = Verify that a corresponding tuple in the rIACA_HSS dynamic relation exists for a given tuple in the RLFC_TRUNK relation, where rIFC_TRUNK.port.member == rIACA_HSS.port.
- TRKG = Obtain the corresponding tuple in the RLRT_TRKG relation for a given tuple in the RLFC_TRUNK relation, where rIFC_TRUNK.tgroup == rIRT_TRKG.grpnum.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this document, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: KEY

Error Code:	KEY
Error Description:	A rIACA_HSS tuple has been found with a corrupted key.
Possible Error Effect:	Asserts out of measurement scanning applications, and invalid trunk measurements.
Corrective Action Taken:	The key of the rIACA_HSS tuple is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIACA_HSS tuple found with the corrupted key.
<i>Bad Data =</i>	The key of the rIACA_HSS tuple (rIACA_HSS.port).

<i>Good Data</i> =	The key of the corresponding tuple in the RLFC_TRUNK static relation (rlFC_TRUNK.port.member).
<i>Logical Index</i> =	The key of the corresponding tuple in the RLFC_TRUNK static relation (rlFC_TRUNK.port.member).
<i>Dump 1</i> =	The contents of the rlACA_HSS dynamic tuple found with the corrupted key.
<i>Dump 2</i> =	The contents of the corresponding tuple in the RLFC_TRUNK static relation with key equal to rlFC_TRUNK.port.member.

Table 2 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	A rlACA_HSS tuple has been found missing from the database. For every tuple in the RLFC_TRUNK relation with the ACA and HSS feature activated, there should exist a corresponding dynamic tuple in the RLACA_HSS relation (where rlFC_TRUNK.port.member == rlACA_HSS.port, rlRT_TRKG.grpnum == rlFC_TRUNK.tgroup and rlRT_TRKG.nlactive == DBYES OR rlRT_TRKG.sht_thres > 0 OR rlRT_TRKG.lht_thres > 0).
Possible Error Effect:	Asserts out of measurement scanning applications, and invalid trunk measurements.
Corrective Action Taken:	The missing rlACA_HSS tuple is inserted into the database.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The key of the corresponding tuple in the RLFC_TRUNK static relation (rlFC_TRUNK.port.member).
<i>Logical Index</i> =	The key of the corresponding tuple in the RLFC_TRUNK static relation (rlFC_TRUNK.port.member).
<i>Dump</i> =	The contents of the tuple in the RLFC_TRUNK static relation with key equal to rlFC_TRUNK.port.member.

Table 3 Error Code: TRKG

Error Code:	TRKG
Error Description:	A rlFC_TRUNK static tuple was found for which no rlRT_TRKG tuple exists.
Possible Error Effect:	Trunk routing failures.
Corrective Action Taken:	None.
Manual Action Required:	Using ODBE, determine if the trunk group represented by the rlACA_HSS tuple key (trunk port) exists, by reading the RLGROUP_PORT relation with rlGROUP_PORT.portgrp.grpnum set to the group number in RLFC_TRUNK "Bad Data" dumped with the audit message, and the rlGROUP_PORT.portgrp.grptype set to TM_TRK. Set rlGROUP_PORT.member to the member number dumped in the RLACA_HSS dump which comes out with the audit message. If a tuple exists, insert a corresponding tuple in the RLRT_TRKG relation with rlRT_TRKG.grpnum set to rlGROUP_PORT.portgrp.grpnum. If a tuple does not exist, use recent change to delete the ACA and HSS feature from this trunk port. Then remove the trunk port and insert it again. Verify that the rlGROUP_PORT static tuple is created. Finally, add the ACA and HSS feature to the trunk port.
Dump Description:	
<i>Error Address</i> =	The address of the rlACA_HSS tuple.
<i>Bad Data</i> =	The tgroup field in the rlFC_TRUNK static tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the rlACA_HSS tuple (rlACA_HSS.port).
<i>Dump 1</i> =	The contents of the rlACA_HSS tuple.
<i>Dump 2</i> =	The contents of the associated tuple in the RLFC_TRUNK relation.

FD

Software Release: 5E10 and later

1. FRAME DESCRIPTOR (FD) AUDIT

Frames are used to transmit data through the quad linked packet switched (QLPS) network. Frame descriptors (FDs), elements of CMfduse[], are used to represent per-frame information such as type and ownership. FDs are passed between data structures by linking them in different lists.

2. DATA STRUCTURES

The following data is used by the FD audit:

CMbufidle	= Buffer idle list.
CMfduse[]	= SM-2000 frame descriptors.
CMspcdb[]	= SPYDER-T channel data block.
CMsptduse[]	= SPYDER-T transmit descriptor.

3. AUDIT CHECKS

The following checks are performed by the FD audit:

ALNK2QUE	= Check for corrupt linkage for an FD in transmit or message queue.
BADLINK	= Check linkages on non-idle FD's.
BADUSE	= Check for out of range FD usage type.
CORRUPT_IDLE	= Check for default attribute values for an idle FD.
HEAD	= Check for corrupt index for an FD in CMbufidle.
IDLE_LINK	= Check for corrupt FD in-use idle stack entry.
INVUSAGE	= Check for owned FD by level 1 not being touched for several minutes.
IS_NOTUSED	= Check for unused entries being non-null.
QUE	= Check for corrupt linkage for an FD in transmit or message queue.
RCVACCBLK	= Check for invalid level 1 linkages for an in-use receive FD.
ZAP	= A reset was taken during the audit.

4. ERROR HANDLING

In general, the audit will clear the FD idle stack and rebuild the idle list.

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: ALNK2QUE

Error Code:	ALNK2QUE
Error Description:	An FD (entry in CMfduse[]) appears to be in either the transmit queue (CMBUFUSE.usetype = CMXMTQ) or message queue (CMBUFUSE.usetype = CMMSGQ), but the linkage to the queue is corrupt: CMXMTQ: • CMBUFUSE.link is not CM_LINK0 or CM_LINK1. • CMBUFUSE.qindx is greater than CM_X25MOD. CMMSGQ: • CMBUFUSE.link is not CM_LINK0 or CM_LINK1. • CMBUFUSE.qindx is greater than CM_OUTQLEN.
Possible Error Effect:	The FD is not available for use. If enough FDs became unavailable, the QLPS network would lose capacity.
Corrective Action Taken:	The audit unlinks the FD from any other data structures, sets all fields to default values, and puts the FD on the FD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Head of the FD idle stack (CMbufidle.toppt).
<i>Bad Data =</i>	FD's user bits (CMBUFUSE.bf_owner).
<i>Good Data =</i>	FD's usage type (CMBUFUSE.usetype).
<i>Logical Index =</i>	FD's index (index into CMfduse[]).
<i>Dump =</i>	FD (entry in CMfduse[]).

Table 2 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	One or more of the following is true of a non-idle (usetype != CMFREES) FD (entry in CMfduse[]): • FD.llcb is out of range ($\geq$ QLNLLCBS). • FD.next_ifd = CMNIL_NDX, but QLllcb[FD.llcb].l_ifd != the FD's index. • FD.back_ifd = CMNIL_NDX, but QLllcb[FD.llcb].f_ifd != the FD's index. • FD.next_ifd != CMNIL_NDX, but is not valid (is $\geq$ CM_NUMBUF). • FD.back_ifd != CMNIL_NDX, but is not valid (is $\geq$ CM_NUMBUF). • FD.next_ifd is $<$ CM_NUMBUF, but CMfduse[FD.next_ifd].back_ifd != the FD's index. • FD.back_ifd is $<$ CM_NUMBUF, but CMfduse[FD.back_ifd].next_ifd != the FD's index.
Possible Error Effect:	The FD is not available for use. If enough FDs became unavailable, the QLPS network would lose capacity.
Corrective Action Taken:	The audit unlinks the FD from any other data structures, sets all fields to default values, and puts the FD on the FD idle stack.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Head of the FD idle stack (CMbufidle.toppt).
<i>Bad Data</i> =	FD's user bits (CMBUFUSE.bf_owner).
<i>Good Data</i> =	FD's usage type (CMBUFUSE.usetype).
<i>Logical Index</i> =	FD's index (index into CMfduse[]).
<i>Dump 1</i> =	FD (entry in CMfduse[]).
	Up to two of the following dumps will also be provided in the order listed depending on the values of the FD linkage fields:
<i>Dump 2</i> =	FD indexed by CMBUFUSE.next_ifd if next_ifd is < CM_NUMBUF.
<i>Dump 3</i> =	FD indexed by CMBUFUSE.back_ifd if back_ifd is < CM_NUMBUF.
<i>Dump 4</i> =	The first 64 bytes of CMmsgbuff[FD index].
<i>Dump 5</i> =	The owning QLLCB (QLlcb[CMBUFUSE.lcb]) if lcb is < QLNLLCBS.

Table 3 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	An FD's usage type is out of range (CMBUFUSE.usetype ≥ CMMAXFDUSE).
Possible Error Effect:	The out-of-range value may cause asserts. In any case, the FD is not processed correctly. Any frame associated with the FD may be dropped.
Corrective Action Taken:	The audit unlinks the FD from any other data structures, sets all fields to default values, and puts the FD on the FD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	FD's usage type (CMBUFUSE.usetype).
<i>Good Data</i> =	CMMAXFDUSE.
<i>Logical Index</i> =	FD's index (index into CMfduse[]).
<i>Dump</i> =	FD (entry in CMfduse[]).

Table 4 Error Code: CORRUPT_IDLE

Error Code:	CORRUPT_IDLE
Error Description:	An idle FD (CMBUFUSE.usetype = CMFREES) does not contain the expected default value in one or more of its attributes: • CMBUFUSE.qindx is out of range (> CMbufidle.toppt). • CMbufidle.fdindx[CMBUFUSE.qindx] != the FD's index. • CMBUFUSE.link != 0. • One or more of the following are != CMNIL_NDX: • l1_prev • l1_next • td_indx [message handler (MH) only] • back_ifd • next_ifd • CMBUFUSE.l1_channel != CMSPCHNULL. • CMBUFUSE.pack_type != -1. • CMBUFUSE.lcb != QLLIXNULL. • CMBUFUSE.length != 0.

	• CMBUFUSE.bf_owner != CM_NO_OWNER.
Possible Error Effect:	The FD is not available for use or the FD idle stack is corrupt. If enough FDs became unavailable, the QLPS network would lose capacity.
Corrective Action Taken:	The audit unlinks the FD from any other data structures, sets all fields to default values, and puts the FD on the FD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Head of the FD idle stack (CMbufidle.toppt).
<i>Bad Data =</i>	FD's user bits (CMBUFUSE.bf_owner).
<i>Good Data =</i>	FD's usage type (CMBUFUSE.usetype).
<i>Logical Index =</i>	FD's index (index into CMfduse[]).
<i>Dump =</i>	FD (entry in CMfduse[]).

Table 5 Error Code: HEAD

Error Code:	HEAD
Error Description:	The FD (entry in CMfduse[]) is corrupt. One or more of the following are true: • CMbufidle.toppt is out-of-range (> CM_NUMBUFS). • CMbufidle.fdindx[CMbufidle.toppt] = CMNIL_NDX. • CMbufidle.fdindx[CMbufidle.toppt+1] != CMNIL_NDX.
Possible Error Effect:	FDs can not be allocated. No new frames can be transmitted. If the processor on which the audit is running is an MH, the switching module (SM) associated with the MH may lose communication with the QLPS network. If the processor the audit is running on is a QLPS gateway processor (QGP), the QLPS network may lose capacity or may lose communication to some SMs.
Corrective Action Taken:	The audit clears the FD idle stack (CMbufidle.toppt = 0) and rebuilds the idle list (links all FDs whose usetype is CMFREES to the idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CMbufidle.toppt.
<i>Good Data =</i>	qlcib_idx QLLIXNULL.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 6 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	An FD in-use idle stack entry (index <= CMbufidle.toppt) is corrupt. One or more of the following is true ("idle_fd" refers to the contents of the idle stack entry: CMbufidle.fdindx[index]): • idle_fd ≥ CM_NUMBUF • idle_fd < 0 • CMfduse[idle_fd].qindx != index into CMbufidle.fdindx[]
Possible Error Effect:	FDs may not be allocatable. If so, no new frames can be transmitted. If the processor the audit is running on is an MH, the SM associated with the MH may lose communication with the QLPS network.

	If the processor the audit is running on is a QGP, the QLPS network may lose capacity or may lose communication to some SMs.
Corrective Action Taken:	If this is the first in-use idle list entry (index = CMbufidle.toppt), the audit clears the entry (CMbufidle.fdindx[index] = CMNIL_NDX) and decrements the count of idle FDs (decrements CMbufidle.toppt). Otherwise, the audit puts a good value into the entry. That is, the audit sets CMbufidle.fdindx[indx] = CMbufidle.fdindx[CMbufidle.toppt], relinks the FD (CMfduse[CMbufidle.fdindx[CMbufidle.toppt]].qindx = index), clears the old entry (CMbufidle.fdindx[CMbufidle.toppt] = CMNIL_NDX), and decrements the number of idle FDs (decrements CMbufidle.toppt).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Index into CMbufidle.fdindx[].
<i>Good Data</i> =	CM_NUMBUF.
<i>Logical Index</i> =	Contents of CMbufidle.fdindx[index] ("idle_fd").
<i>Dump</i> =	NA.

Table 7 Error Code: INVUSAGE

Error Code:	INVUSAGE
Error Description:	An FD (entry in CMfduse[]) is owned only by level 1 (CMBUFUSE.bf_owner & CM_L1_OWNER != 0, but CMBUFUSE.bf_owner and CM_L2_OWNER = 0) and has not been touched for several minutes (CMBUFUSE.au_detect = 1 and CMBUFUSE.au_recover = 1).
Possible Error Effect:	The FD is not available for use. If enough FDs became unavailable, the QLPS network would lose capacity.
Corrective Action Taken:	The audit unlinks the FD from any other data structures, sets all fields to default values, and puts the FD on the FD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Head of the FD idle stack (CMbufidle.toppt).
<i>Bad Data</i> =	FD's user bits (CMBUFUSE.bf_owner).
<i>Good Data</i> =	FD's usage type (CMBUFUSE.usetype).
<i>Logical Index</i> =	FD's index (index into CMfduse[]).
<i>Dump</i> =	FD (entry in CMfduse[]).

Table 8 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	An unused entry (index > CMbufidle.toppt) in the FD (entry in CMfduse[]) is not null (CMbufidle.fdindx[index] != CMNIL_NDX).
Possible Error Effect:	FDs may not be allocatable. If so, no new frames can be transmitted. If the processor the audit is running on is an MH, the SM associated with the MH may lose communication with the QLPS network. If the processor the audit is running on is a QGP, the QLPS network may lose capacity or may lose communication to some SMs.
Corrective Action Taken:	The audit clears the FD idle stack (CMbufidle.toppt = 0) and rebuilds the idle list (links all FDs whose usetype is CMFREES to the idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Contents of CMbufidle.fdindx[index].
<i>Good Data</i> =	CMNIL_NDX.
<i>Logical Index</i> =	Index into CMbufidle.fdindx[].
<i>Dump</i> =	NA.

Table 9 Error Code: QUE

Error Code:	QUE
Error Description:	An FD (entry in CMfduse[]) appears to be in either the transmit or message queue (CMBUFUSE.usetype = CMXMTQUE or CMMSGQUE) but the linkage to the queue is corrupt. Specifically: CMXMTQ = cmCOMLKDATA.fdindx != the FD's index, or the FD's queue slot can not be reached from the load and unload queue indexes. CMMSGQ = cmMSGQ.fdindx[CMBUFUSE].qindx != the FD's index, or the FD's queue slot cannot be reached from the load and unload queue indexes.
Possible Error Effect:	The FD is not available for use. If enough FDs became unavailable, the QLPS network would lose capacity.
Corrective Action Taken:	The audit unlinks the FD from any other data structures, sets all fields to default values, and puts the FD on the FD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Head of the FD idle stack (CMbufidle.toppt).
<i>Bad Data =</i>	FD's user bits (CMBUFUSE.bf_owner).
<i>Good Data =</i>	FD's usage type (CMBUFUSE.usetype).
<i>Logical Index =</i>	FD's index (index into CMfduse[]).
<i>Dump =</i>	FD (entry in CMfduse[]).

Table 10 Error Code: RCVACBLK

Error Code:	RCVACBLK
Error Description:	An FD (entry in CMfduse[]) is in use as a receive FD (CMBUFUSE.usetype = CMRCVBUF) and is owned by an unused channel data block (CMspcdb[CMBUFUSE.I1_channel].state = CMCHSTOFF), but has invalid level 1 linkages. That is, one or more of the following are true: • CMBUFUSE.I1_next = CMNIL_NDX, but CMCDBENTRY.rcv_unload != the FD's index. • CMBUFUSE.I1_prev = CMNIL_NDX, but CMCDBENTRY.rcv_load != the FD's index. • CMBUFUSE.I1_next != CMNIL_NDX, but is not valid (is ≥ CM_NUMBUF). • CMBUFUSE.I1_prev != CMNIL_NDX, but is not valid (is ≥ CM_NUMBUF). • CMBUFUSE.I1_next is < CM_NUMBUF, but CMfduse[CMBUFUSE.I1_next].I1_prev != the FD's index. • CMBUFUSE.I1_prev is < CM_NUMBUF, but CMfduse[CMBUFUSE.I1_prev].I1_next != the FD's index.
Possible Error Effect:	The FD is not available for use. If enough FDs became unavailable, the QLPS network would lose capacity.
Corrective Action Taken:	The audit unlinks the FD from any other data structures, sets all fields to default values and puts the FD on the FD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Head of the FD idle stack (CMbufidle.toppt).
<i>Bad Data =</i>	FD's user bits (CMBUFUSE.bf_owner).
<i>Good Data =</i>	FD's usage type (CMBUFUSE.usetype).
<i>Logical Index =</i>	FD's index (index into CMfduse[]).
<i>Dump 1 =</i>	FD (entry in CMfduse[]).

	Up to two of the following dumps will also be provided in the order listed depending on the values of the FD linkage fields:
<i>Dump 2</i> =	FD indexed by CMBUFUSE.next_ifd if next_ifd is < CM_NUMBUF.
<i>Dump 3</i> =	FD indexed by CMBUFUSE.back_ifd if back_ifd is < CM_NUMBUF.
<i>Dump 4</i> =	The first 64 bytes of CMmsgbuff[FD index].

Table 11 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit: - clears (set = CMNIL_NDX) the entry (if any) in CMbufidle.fdindx[] which was being audited when the stimulus occurred. - recovers the FD, if any, which was being audited when the stimulus occurred. Specifically, the audit unlinks the FD from any other data structures, sets all fields to default values, and puts the FD on the FD idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	SMmhrunning (the current base-level loop job).
<i>Bad Data</i> =	Current entry in CMbufidle.fdindx[].
<i>Good Data</i> =	Current index into CMbufidle.fdindx[].
<i>Logical Index</i> =	Current FD index (index into CMfduse[]).
<i>Dump</i> =	FD (entry in CMfduse[]).

FMGR

Software Release: 5E10 and later

1. FILE MANAGERS (FMGR) AUDIT

The file manager (FMGR) audits verify the data in the file manager task table and other internal buffers. Nine correcting, frequency-group audits make up the FMGR family.

- FMGR1 - Task queue audit. The FMGR task table audit checks the validity of certain fields that describe an active task. If more than 10 tasks are active, it looks for active tasks that have been road blocked for more than 7 minutes or less. When a road-blocked task is found, it is torn down, its resources are freed, and an acknowledgment is sent to the requester. Besides being scheduled routinely with the other FMGR audits, this audit is requested by the file manager when its task table is in or near overload.
- FMGR2 - Internal inode table audit. The FMGR inode audit verifies the integrity of the incore inode table by checking certain fields that track the current state of the inode (such as the status, use count, and time stamp fields). FMGR 2 compares the use count field against the number of opens on a file and then checks the count field's status. FMGR 2 also checks the time stamp field and, if it indicates that the disk inode has not been updated with the past three hours, FMGR compares the disk inode with the incore inode.
- FMGR3 - Hash table and internal inode pointer table audit. The FMGR inode hash table audit verifies the integrity of the inode hash table and the inode free chain. The inode hash table chains inodes with the same hash value together to speed up the search for an inode. FMGR validates these chains and ensures that each incore inode is either on the free chain or on one of the hash chains.
- FMGR4 - File table audit. The FMGR file table audit verifies the integrity of the file manager's internal file table. FMGR 4 validates the fields that link a file table entry to an incore inode, to other file table entries, and to capability table entries. (A file table entry is made for each open on a file.) FMGR 4 also compares its count field with the number of capability table entries that are linked to the count field.
- FMGR5 - Internal capability table audit. The FMGR capability table audit validates the capability table. A major purpose of this audit is to detect and remove capabilities that belong to dead processes. FMGR 5 also checks the integrity of the chain of capabilities that are linked to a file table entry.
- FMGR6 - Buffer audit. The FMGR buffer audit validates the management of the internal buffers that buffer input/output (I/O) to or from the file manager's data or a requester's address space. The internal buffers are linked together into devices hash chains to facilitate the search and the free buffers are also linked into the free chain. FMGR 6 validates these linked chains and the buffer status. Additionally, FMGR 6 checks the validity of locks on the file system super blocks.
- FMGR7 - Mount table audit. The FMGR mount table audit validates the inode pointers and buffer pointers in the mount table.
- FMGR8 - Delayed queue audit. The FMGR delayed queue audit ensures that the open and mount delayed queues are consistent with the current number of active, open, and mount tasks.
- FMGR9 - Message queue audit. THE FMGR delayed queue audit checks for message buffer overload in the file manager's message queue.

The file manager audits are routinely scheduled in the correcting mode. Any of these audits may be manually requested, particularly if routine audit scheduling has been disabled and there is reason to suspect that a resource

has been disabled.

Any errors that occur are corrected automatically by each audit.

CAUTION: FMGR1 and FMGR5 are recovery audits and should not be inhibited without consulting your next level of technical support.

1.1 Requesting FMGR Audits

To request an audit of the FMGR resources, use the following input message:

```
AUD:FMGR=a[:b|:c|:b,c];
```

where:

a = Specifies the member number of the FMGR audit. Valid values are:

- 1 = Task queue audit.
- 2 = Internal inode table audit.
- 3 = Hash table and internal inode pointer table audit.
- 4 = File table audit.
- 5 = Internal capability table audit.
- 6 = Buffer audit.
- 7 = Mount table audit.
- 8 = Delayed queue audit.
- 9 = Message queue audit.

b = Indicates whether audit should correct errors. Valid values are:

- CORR = Specifies that an audit should correct errors (default).
- NCG = Specifies that an audit does not correct errors.

c = Indicates what type of report or messages should be generated. Valid values are:

- DETL = Generates a raw data report for each error found plus an audit completion message (default). (A limited number of raw data reports are generated.)
- SUM = Generates only an audit completion message when the audit terminates. Raw data reports are not generated for any errors that are found.

To interpret system responses to the AUD:FMGR input messages, see the APP:AUD Appendix in the Appendixes section of Input Messages manual (235-600-700).

1.2 Interpreting FMGR Output Messages and Error Reports

The AUD FMGR output messages report the termination status of the FMGR audits and/or any errors found while executing the audit. For detailed explanations of the FMGR output messages, see the Output Messages manual (235-600-750).

Table 1 lists the FMGR audit error messages and their associated categories. Error categories include the following:

- Category 0 = Errors that are easily corrected (for example, resetting a bit or individual value). There is no recovery action when the maximum is exceeded.
- Category 1 = Errors that involve multiple structures of the same audited resource (for example, rebuilding the inode pointer chain). The audit aborts when the maximum is exceeded.
- Category 2 = Errors that require searches of structures other than the type being audited and usually require restoring part of the audited resource, category 1 (for example, rebuilding the file pointers of an inode table entry). There is no recovery action when the maximum is exceeded.
- Category 3 = Errors that require input/output (for example, rereading the superblock of a mounted file system). The audit aborts when the maximum is exceeded.
- Category 4 = Errors that require a total rebuild of a structure (for example, restoring a mount table entry). The recovery action when the maximum is exceeded - phase level 1.
- Category 5 = Errors that require a task tear down (for example, a task that has timed out). The recovery action when the maximum is exceeded - phase level 1.

Table 1 FMGR AUDIT ERRORS

Category	Error Number	Meaning
5	2	FMGR 1 - Task queue audit
0	3	Task header - invalid task ID.
5	4	Task header - invalid sleep address.
5	5	Task header - invalid task stack address.
5	6	Task header - invalid message address.
0	7	Task header - task time-out.
		Task header - invalid time stamp.
2	12	FMGR 2 - Inode audit
0	13	Inode - bad i_count value.
0	14	Inode - bad i_wcount value.
15	0	Inode - invalid task ID.
3	16	Inode - invalid time stamp.
2	17	Inode - disk/incore mismatch.
2	19	Inode - invalid file table pointer.
2	25	Inode - invalid mount pointer.
0	26	Inode - incorrect inuse count.
0	27	Invalid inode table size.
0	28	Invalid degrowth page marker.
0	28	Inode - incorrect mount table pointer.
0	92	Inode - invalid open count for driver.
2	21	FMGR 3 - Inode hash table audit.
4	22	Inode hash - bad value.
4	24	Inode pointer - bad chain.
		Inode pointer - invalid chain pointer.
0	31	FMGR 4 - File table audit.
2	32	File - invalid FLOCK flag.
2	33	File - invalid inode pointer.
2	34	File - invalid capability pointer.
0	35	File - invalid file pointer.
2	36	File - invalid task ID.
0	39	File - bad use count of open files.
2	40	File - incorrect count of file table entries in use.
0	90	File - invalid free list.
		File - invalid file table size.

0	91	File - invalid degrowth page marker.
1	41	FMGR 5 - Capability table audit.
2	42	Capability - nonexistent process.
2	43	Capability - invalid file pointer.
2	44	Capability - invalid capability pointer.
2	45	Capability - invalid capability pointer in file table entry.
0	46	Capability - invalid capability chain.
2	47	Capability - incorrect count of capability table entries in use.
0	48	Capability - invalid free list.
0	49	Capability - incorrect capability table size.
0	49	Capability - incorrect degrowth page marker.
4	51	FMGR 6 - Buffer audit.
4	52	Buffer - bad available list.
0	54	Buffer - bad device chain.
0	55	Buffer - invalid available list pointer.
0	56	Buffer - invalid device pointer.
2	57	Buffer - invalid buffer address.
0	58	Buffer - invalid mount pointer.
5	59	Buffer - invalid task ID.
0	60	Buffer - input/output time-out.
0	61	Buffer - bad time stamp.
0	62	Buffer - bad superblock ilist lock.
0	62	Buffer - bad superblock free lock.
0	64	Buffer - invalid total number of free inodes.
0,2	72	FMGR 7 - Mount table audit.
0	74	Mount - invalid superblock buffer pointer.
2	75	Mount - invalid mount inode pointer.
0	77	Mount - invalid root inode pointer.
2	82	Mount - invalid task ID.
2	83	FMGR 8 - Delayed queue audit.
		Delayed queue - bad number, open.
		Delayed queue - bad number, mount.
5	81	FMGR 9 - Message queue audit.
		Overload - large message queue.

1.3 Responding to AUD FMGR Error Reports

If any FMGR audit reports an error, take the appropriate action suggested. Use the correcting (default) mode on all manual requests. If errors are still present after taking the indicated action, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.

Audit Reporting Error	Action
FMGR 1	Rerun audit.
FMGR 2	Rerun FMGR 2, then run FMGR 3.
FMGR 3	Rerun FMGR 3, then run FMGR 2.
FMGR 4	Rerun FMGR 4, then run FMGR 5.
FMGR 5	Rerun FMGR 5, then run FMGR 4.
FMGR 6	Rerun audit.
FMGR 7	Rerun audit.
FMGR 8	Rerun audit.
FMGR 9	Run FMGR 1.

FSBLK

Software Release: 5E10 and later

1. FILE SYSTEM BLOCK AUDIT (FSBLK)

The file system block (FSBLK) audit verifies the integrity consistency of the free block list, the block usage bit map, and the inodes of the file system specified by the instance name.

It detects out-of-range block assignments in inodes and duplicate ownership of blocks by two or more inodes. When run in the correcting mode, it rebuilds the bitmap, free block list, and free inode list.

FSBLK also detects bad blocks and duplicate blocks and verifies the size and mode of each file in a file system. It is one of two dynamic file system audits (refer to the FSLINK audit). FSBLK is a complete file system audit and can run on mounted or unmounted file systems.

Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual (235-600-700) for a list of the file systems that the *UNIX*® RTR operating system supplies ECD audit-instance records for.

The FSBLK audit for these file systems should be scheduled as a timed audit to be run at a specified time during the day and week when the application load is minimal.

Since the correction of errors found may alter a file in a way the application did not intend, it is suggested that the audit be scheduled to run in non-correcting mode. The audit may then be run in the correcting mode after the identity of the affected files is determined. To run the FSBLK audit on another file system, the application must add an audit-instance record for that file system.

The audit may use considerable processing time, especially for a large system or on a file system with a lot of current activity.

The FSBLK audit may be run on mounted or unmounted file systems.

NOTE: Any instance of this audit will be blocked during a field update or a program update involving the file system named in the instance. Similarly, a field or program update may not be started while the FSBLK audit of a file system affected by the update is running.

When you have reason to suspect internal damage of a file system, you may manually request FSBLK 1. Run the audit first in the non-correcting mode. If errors are reported and they are correctable, you can then rerun the audit in the correcting mode.

1.1 Requesting the FSBLK Audit

To request an FSBLK audit, use the following input message:

```
AUD:FSBLK=a,INS="b"[:c|:d|:c,d][PARAM="e"];
```

where:

a = Member number to be audited.

NOTE: The value input for a is dependent upon the instance. Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual (235-600-700).

b = Instance to be audited. Instance names are the special device files corresponding to the file system audited. Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual (235-600-700) for a complete list of device file names.

- c = Audit action. Valid values are:
- CORR = Audit should correct errors.
- NCG = Audit should not correct errors (default).
- d = Type of report generated. Valid values are:
- DETL = Generates a detailed raw data report for each error found followed by an audit completion message (default). (A limited number of reports is generated.)
- SUM = Generates only a summary audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.
- e = Backup parameter. This field is used to check the file system for the appropriateness of generating a backup tape. When specified, the audit may report error conditions that, normally, would not be considered errors, but could result in the creation of an improper backup tape. These errors are not correctable.

To interpret system responses to the AUD:FSBLK input message, refer to the APP:AUD Appendix in the Appendix section of the Input Messages manual (235-600-700).

1.2 Interpreting AUD FSBLK Output Messages and Error Reports

The FSBLK audit prints an output message after each audit. It reports the termination status of the FSBLK audit and/or any errors found while executing the audit. For more detailed information about the AUD:FSBLK output message, see the Output Messages manual (235-600-750). Table 1 is a list of error messages.

The FSBLK audit uses the following error categories:

- Category 1 - Errors generally indicate noncorrectable system errors apart from the audit. The errors will cause the audit to terminate prematurely. No recover action is required.
- Category 3 - Errors indicate problems with an individual file in the file system being audited. File system corruption has occurred.

Table 1 FSBLK AUDIT ERRORS

Category	Error Number	Meaning
1	1	Bad superblock label.
3	2	Bad file mode.
3	3	Bad file size.
3	4	Bad block. The block is out of the file system block range.
3	5	Duplicate block number.
3	6	Bad address blocks. The address block contains invalid block addresses.
2	7	Temporary file found in file system when audit invoked with PARAM="BACKUP". This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action possible or needed for this condition.
1	8	Audit library initialization failed.
1	9	Unable to open device file.
1	10	Unable to start device file.
1	11	Device file not block type.
1	12	Unable to allocate message.
1	13	Unable to queue message.
1	14	Unable to add segments.

1	15	Unable to read superblock.
1	16	Unable to access block or get buffer to read block.
1	17	Unable to get free block.
1	18	Unable to access inode.
1	19	Unable to remove a segment.
1	20	Cannot mount device.
1	21	Unable to get bitmap segment ID.
1	22	Bitmap I/O failed.
1	26	Device file is open for writing.
1	35	File manager segment list is full.

1.3 Responding to AUD FSBLK Error Reports

Even in the correcting mode, FSBLK does not correct all the errors it finds. Errors that are not corrected and the action that should be taken are listed in Table 2.

Table 2 SPECIAL ERROR MESSAGES

Error Number	Action to be Taken
1-2	Error is not correctable. Back up the file system from the backup source.
3-6	Use the input message OP:FNAME [refer to the OP:FNAME input message in the Input Messages manual (235-600-700)] to print the full file pathname of the damaged file. To correct the error, rerun the audit in the correcting mode.
7	No action is required.
8, 12-22	An error in accessing the disk or in getting system resources has occurred. Check the disk status and/or system resource usage. Rerun the FSBLK audit when the system is quiet and disks are active.
9-11	The divide file for the file system does not exist or it is the wrong type. Check and repair/create the device file that defines the file system.
26	The device file is open for writing. Try again later.
35	This will occur when the maximum number of file manger tasks are running and using the available file manager segment table slots. Rerun the audit at different times during the day when there are no other file system audits running. If the problem persists, execute a level 3 initialization. If the problem still persists, then create an off-line memory dump tape and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.

FSCMPT

Software Release: 5E10 and later

1. FILE SYSTEM COMPACTION (FSCMPT) AUDIT

The file system compaction (FSCMPT) audit provides a facility for merging free disk blocks of a file system to form a large free contiguous space. This will alleviate the problem of fragmentation of free disk space in a file system that interferes with the allocation of space for contiguous files. The facility to compact a file system will be executed as a file system correcting audit that can be invoked by the user.

An extent is a set of contiguous blocks within a file system. A file system becomes fragmented when the total number of free blocks available for extent files is larger than the size of an allocation request, but the size of each free extent is less than the required amount.

After the *UNIX*[®] RTR operating system has been updated several times, the free blocks of the file system become distributed into small contiguous sets separated by used blocks. From this fragmented state, the compaction audit will create a large set of contiguous free blocks by merging some of the free blocks together.

To compact the file system, the compaction audit first surveys the file system to determine the following:

- The total number of free blocks in the file system
- The portions of used blocks allocated to regular and contiguous/extent files
- The size of the largest extent file in the file system.

This information together with the *max/min* parameter is used to set a compaction goal (the number of free blocks that it will attempt to merge into a single free extent). This number will be less than the total number of free blocks.

The number and distribution of *regular* file blocks has a large impact on the compaction overhead and may further limit the compaction goal. Because of the cost in system time and resources, the audit tries to avoid moving *regular* files, preferring to move contiguous/extent files instead. The *cond* parameter restricts the number of regular file blocks that will be moved to 511, the size of the free block chain from which blocks for regular files are taken. If the *ucl* parameter is specified, the number of regular file blocks that will be moved is limited only by availability of relocation space.

Each file system on which the compaction audit will be run should be carefully reviewed and thoroughly tested under appropriate load conditions. Both the outcome and performance of the file system compaction audit is dependent on the application environment.

The following rules apply when compacting a file system:

- The audit should be run during periods of light system activity.
- The amount of activity occurring in the file system undergoing compaction should be kept to a minimum if possible.
- The audit should **not** be run as a routine audit.

The compaction audit may be run in a noncorrecting mode or in a correcting mode. If the compaction audit is run in noncorrecting mode, the compaction goal that has been determined is reported with an error code 2. The information in the report includes the following:

DATA1 = Total number of free blocks in the file system.

- DATA2 = Number of contiguous free blocks to be created by compaction.
- DATA3 = Current largest number of contiguous free blocks.
- DATA4 = A projection of the number of I/O jobs required to do the compaction.

Each of the DATA items is reported in hexadecimal notation.

In the correcting mode, after mapping the file system and setting the compaction goal, used blocks are relocated in order to merge the free blocks into a large free extent. At the conclusion of the compaction, an error code 3 report contains the following information.

- DATA1 = total number of free blocks in the file system.
- DATA2 = number of contiguous free blocks created by the compaction effort.
- DATA3 = largest number of contiguous free blocks before compaction.
- DATA4 = the number of I/O jobs involved in doing the compaction.

All error codes except 2 and 3 report error conditions that prevent the audit from completing. For the interpretation and recommended action for each error code, refer to the AUD:FSCMPT output message page in the Output Message Manual (235-600-750).

1.1 When to Use the Compaction Audit

If an attempt to allocate a number of blocks for a contiguous or extent file fails, that is, the number allocated is less than the amount requested, the following procedures should be used.

- (1) Using one of the following two methods, determine whether there are sufficient free blocks in the file system that contains the file.

- At the *UNIX*® system terminal, enter:

```
df<filesystem>
```

- At the user terminal, enter:

```
OP:STATUS,FREEDISK,FN="a";
```

Where *a* is the full pathname to the file system.

If the number of free blocks is not smaller than the desired amount, continue to the next step. Otherwise, some files may need to be removed from the file system to make more free space.

- (2) Run the FSBLK audit in noncorrecting mode, by entering:

```
AUD:FSBLK=1,INS="<filesystem>":NCG;
```

If no errors are reported, proceed to the next step. If errors are reported, refer to the Output Message Manual (235-600-750) for interpretation and recommended action to be taken.

- (3) Run the FSBLK audit in correcting mode by entering:

```
AUD:FSBLK=1,INS="<filesystem>":CORR;
```

This causes all free blocks to be returned to the pool of free blocks available for both regular and extent files. If the required number of contiguous blocks still cannot be allocated, the file system compaction audit may be able to merge enough free blocks for the allocation.

- (4) Perform the steps listed in the How to Use the Compaction Audit section.

1.2 How to Use the Compaction Audit

The input message that runs the file system compaction audit can be entered manually on the maintenance terminal or craft shell terminal.

- (1) Run the compaction audit in noncorrecting (NCG) mode with increasingly liberal parameters as listed below:

```
AUD:FSCMPT=1,INS="<filesystem>":NCG:PARAM="MIN,COND";
AUD:FSCMPT=1,INS="<filesystem>":NCG:PARAM="MAX,COND";
AUD:FSCMPT=1,INS="<filesystem>":NCG:PARAM="MIN,UCL";
AUD:FSCMPT=1,INS="<filesystem>":NCG:PARAM="MAX,UCL";
```

The projected number of contiguous free blocks that the compaction audit will be able to create when run in correcting mode is reported in DATA 2 of the error code 2 report. For most file systems, this projected number will increase as you progress through the list. When DATA2 in the output message is large enough, proceed to the next step.

- (2) Run the audit in correcting (CORR) mode with the pair of parameters selected. An error 3 reports the compaction completed with DATA 2 specifying the number of contiguous free blocks now available in the file system. This may be less than the amount projected in step 1. In this case, you may rerun the audit in correcting mode with the same parameters or return to step 1, using the next pair of parameters in the list.

The file system compaction audit can run on mounted or unmounted file systems.

1.3 Requesting the FSCMPT Audit

When running the FSCMPT audit, it should first be run in the noncorrecting mode to determine the results and cost of compacting the file system. Then it should be run in the correcting mode with the selected parameters to compact the file system. To request an FSCMPT audit, use the following input message:

```
AUD:FSCMPT=a,INS="b" [ ; c ; d | ; c, d ] [ : PARAM="{ e | f | e, f } " ] ;
```

where:

- a = Member number of the FSCMPT audit. The administrative module (AM) audit is member number 1.
- b = The instance to be audited. Instance names are the special devices files corresponding to the file system audited. Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual (235-600-700) for specific device file names.

To run the FSCMPT audit on another file system, the application must add an audit instance record for the file system.

- c = Correcting or not correcting. Valid values are:

CORR = Audit should correct errors and complete the compaction.

NCG = Audit should not correct errors and should not do the compaction (default).

d = Type of report generated. Valid values are:

DETL = Generates both a raw data report for each error found and an audit-completion message (default). Only a limited number of raw data reports are generated.

SUM = Generates only an audit-completion message when the audit terminates. Raw data reports are not generated for any errors found.

e = Type of effort compaction. Valid values are:

MIN = Perform or report for a minimum effort compaction (default).

MAX = Perform or report for a maximum effort compaction.

f = Number of file blocks relocated. Valid values are:

COND = Limit number of regular file blocks relocated to achieve compaction (default).

UCL = An unlimited number of regular file blocks may be relocated to achieve compaction.

1.4 Interpreting AUD FSCMPT Output Messages and Error Reports

The AUD FSCMPT 1 output messages report the termination status of the FSCMPT audit and provide information about errors that were found while the audit was executing.

For more detailed information about the AUD:FSCMPT output message, refer to the Output Messages manual (235-600-750). Table 1 is a list of error messages.

The FSCMPT audit uses three error categories. These categories are defined as follows.

Category 1 = Errors generally indicate noncorrectable system errors apart from the audit. These errors will cause the audit to terminate prematurely. No recovery action is required.

Category 3 = Errors indicate problems with an individual file in the file system being audited. File system corruption has occurred.

Category 5 = Errors are informational only, and are not actual errors.

Table 1 FSCMPT AUDIT ERRORS

Category	Error Number	Meaning
1	1	Bad superblock label.
5	2	Not an error; contains information. Refer to How to Use the Compaction Audit.
5	3	Not an error; contains information. Refer to How to Use the Compaction Audit.
3	4	Bad block. The block is out of the file system block range.
3	5	Duplicate block number.
3	6	Bad address block.
1	8	Audit library initialization failed.
1	9	Unable to open device file.
1	10	Unable to start device file.
1	11	Device file not a block device.

1	12	Unable to allocate a message.
1	13	Unable to queue a message.
1	14	Unable to add segments.
1	16	Unable to access block (or get buffer to read block).
1	17	Unable to get a free block.
1	18	Unable to access inode.
1	19	Unable to remove a segment.
1	20	Cannot mount the device.
1	21	Unable to get bitmap segment ID.
1	22	Bitmap I/O failed.
1	23	No available structure for mapping allocated blocks for the compaction.
1	24	Concurrent file system activity is interfering with the compaction effort.
1	25	I/O attempt failed.
1	26	The device file is open for writing.
1	35	Partition for the file system on which the device file resides.

1.5 Responding to AUD FSCMPT Error Reports

Even in the correcting mode, FSCMPT does not correct all the errors it finds. Errors that are not corrected and the action that should be taken are listed in Table 2 .

Table 2 SPECIAL ERROR MESSAGES

Error Number	Action to be Taken
1	Error may not be corrected. Back up the file system from backup source.
4-6	For block errors run the block audit in the noncorrecting mode. If it finds an error, run the block audit in the correcting mode.
8-23, 25, 26	Error may not be corrected; refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.
24	Run this audit with reduced file system activity.
35	This will occur when the maximum number of file manger tasks are running and using the available file manager segment table slots. Rerun the audit at different times during the day when there are no other file system audits running. If the problem persists, execute a level 3 initialization. If the problem still persists, then create an off-line memory dump tape and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.

FSLINK

Software Release: 5E10 and later

1. FILE SYSTEM LINK (FSLINK) AUDIT

The file system link (FSLINK) audit verifies the linkage among the directories and inodes of the file system specified by the instance name.

It detects a disagreement between the link count in an inode and the number of references to the inode in the directories of the file system. In the correcting mode, it corrects the inode link count that does not agree with the number of references, invalidates a directory entry with an invalid inode number, and moves an inode that has no directory references to a *lost&found* directory.

Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual (235-600-700) for a list of the file systems that the *UNIX*® RTR operating system supplies ECD audit-instance records for.

It is recommended that the FSLINK audit for these file systems be scheduled as a timed audit, to be run at specified times during the day and week, at a time when the application load is minimal.

Since the correction of errors found may alter a file in a way the application may not intend, it is suggested that the audit be scheduled to run in the non-correcting mode. The audit may then be run in the correcting mode after the identity of the affected files is determined. To run the FSLINK audit on another file system, the application must add an audit-instance record file for that file system.

This audit may use considerable processing time especially for a large system, or on a file system with a lot of current activity.

The FSLINK audit can be run on a mounted or unmounted file system.

1.1 Requesting the FSLINK Audit

When you have reason to suspect internal damage of a file system, you may manually request an FSLINK audit. Run the audit first in the non-correcting mode. If errors are reported, and they are correctable, you can then rerun the audit in the correcting mode. To request an FSLINK audit, use the following input message:

```
AUD:FSLINK=a,INS="b"[:c|:d|:c,d][:PARAM="e"];
```

Where:

a = Member number to be audited.

NOTE: The value input for a is dependent upon the instance. Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual, 235-600-700.

b = Instance to be audited. Instance names are the special device files corresponding to the file system audited. Refer to the APP:AUD-SDF appendix in the Appendixes section of the Input Messages manual, 235-600-700, for a complete list of special device file names.

c = Audit action. Valid value(s):

CORR = Audit should correct errors.

NCG = Audit does not correct errors (default).

d = Type of report. Valid value(s):

DETL = Generate a raw data report for each error found followed by an audit completion message (default). (A limited number of reports is generated.)

SUM = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

e = BACKUP parameter. This field is used to check the file system for the appropriateness of generating a backup tape. When specified, the audit may report error conditions that, normally, would not be considered errors, but could result in the creation of an improper backup tape. These errors are not correctable.

Refer to the APP:AUD appendix in the Appendixes section of the Input Messages manual, 235-600-700, to interpret system responses to the AUD:FSLINK input message.

1.2 Interpreting AUD:FSLINK Output Message and Error Reports

The FSLINK audit prints an output message after each audit. The output message reports the termination status of the FSLINK audit and provides information about errors that were found while the audit was executing. For more detailed information about the AUD:FSLINK output message, refer to the 5ESS[®] Switch Output Messages manual, 235-600-750.

The FSLINK audit uses two error categories.

Category 1 = Errors generally indicate noncorrectable system errors apart from the audit. These errors will cause the audit to terminate prematurely. No recovery action is required.

Category 2 = Errors indicate problems with the file system directory structure. File system corruption has occurred.

Refer to Table 1.

Table 1 FSLINK Audit Errors

Category	Error Number	Meaning
1	1	Bad super block label.
2	2	Mutilated inode in the inode table.
2	3	Bad directory entry.
2	4	Bad directory block (block out of file system block range).
2	5	Bad link count (link count in inode not same as number of references in directories).
2	6	Unreferenced inode.
2	7	Link count of the director inode is less than 2.
1	8	Audit library initialization failed.
1	9	Unable to open device file.
1	10	Unable to stat device file.
1	11	Device file not block device.
1	12	Unable to allocate a message.
1	13	Unable to queue a message.
1	14	Unable to add segments.
1	16	Unable to access block (or get buffer to read block).
1	18	Unable to access inode.
1	19	Unable to remove a segment.
1	20	Cannot mount the device.
1	26	The device file is open for writing.
2	27	Current directory entry could not be referenced from the parent directory.
2	28	Current directory entry cannot reference its parent directory.
2	29	Current directory entry has a bad inode.
2	30	References to a free inode.

2	31	Current directory has more than one parent directory.
2	32	Current directory is not reachable from file system root.
1	33	Active but unreferenced file in file system when audit invoked with PARAM="BACKUP".
2	35	File manager segment list is full.

1.3 Responding to AUD:FSLINK Error Reports

Even in the correcting mode, FSLINK may not correct all the errors it finds. Another process may be using the inode, so that the audit may not need to be run more than once to correct the errors. Errors that are detected and/or corrected and the action that should be take are listed in Table 2

Table 2 Special Error Messages

Error Number	Action to be Taken
1, 2, 4, 7	These error codes are generally not correctable. Before backing up the file system from the backup source, rerun the audit in the correcting (CORR) mode; this may correct some of the errors.
3, 5, 27 - 32	Use the input message OP:FNAME to print the full path name of file. Refer to the Input Messages manual, 235-600-700. To correct errors, rerun the audit in the CORR mode.
6	The unreferenced file cannot be reached in the file system by any name. To correct errors, rerun the audit in the CORR mode.
8, 12 - 14, 16, 18 - 20	Check disk status and/or system resource usage. Rerun audit when the system is quiet and disks active. Disk-access error or system-resource-access error has occurred.
9 - 11	Check and repair or create a device file that defines the file system. Device file is non-existent or the wrong type.
15, 17	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.
26	Rerun the audit later. If error persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.
33	This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action for this condition.
35	This will occur when the maximum number of file manager tasks are running and using all available file manager segment table slots. Rerun the audit at different times during the day when there are no other file system audits running. If the problem persists, execute a level 3 initialization. If the problem still persists, then create an off-line memory dump tape and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.

GCKTI

Software Release: 5E10 and later

1. GLOBAL SERVICE CIRCUIT (GCKTI) AUDIT

Conference circuits are used for conference calling and for verifying that busy lines are actually busy. The conference circuits are part of the global digital service unit (GDSU) and are resources that can be accessed from any switching module (SM) in an office. Each office has a specified number of conference circuits; therefore, it is important that these resources be operational.

The peripheral control subsystem uses the static (write-protected) global conference circuit relation (RLGCKTI) to initialize the conference circuit access table dynamic relation (RLCCATBL) and the global conference circuit access parameters (PCccap and PC6ccap). The global service circuit audit (GCKTI) performs static-to-dynamic existence checks between RLGCKTI and RLCCATBL, and verifies the index and number of circuits listed in PCccap and PC6ccap.

This audit is part of the peripheral control audits subgroup. It runs in the communication module processor (CMP) environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The GCKTI audit verifies the dynamic conference circuit access table relation (RLCCATBL) against the static global conference circuit relation (RLGCKTI). The RLGCKTI relation contains information about all conference circuits, such as the switching module number (im), the remote switching module number (rsm), the GDSU service group key (sg), the service group number (sgn), the digital service unit number (dsu), the number of circuits (nckts), and an index to the conference circuit access table (index). The RLCCATBL relation should contain the same information.

The PCccap and PC6ccap structures contain the maximum index to RLCCATBL for any global digital services unit service group 0, and the maximum number of three- or six-port circuits in any global digital services unit service group. (Refer to Figure 1.)

Figure 1 (GCKTI-1) Data Structures

3. AUDIT CHECKS

The global service circuit audit uses the static driver (DRSTATIC) to step through the tuples in rLGCKTI. The DRSTATIC driver calls a semantic check function to perform the following checks:

- DSUGCKT = Check the digital service unit (dsu) in the rlCCATBLE tuple against rLGCKTI.
- DYN_STAT = Check the key (ccadx) of the rlCCATBL tuple against rLGCKTI.
- IMGCKT = Check the module number (im) in the rlCCATBL tuple against rLGCKTI.
- NCKTS3P = Check the number of 3-port conference circuits (d3port.nckts) in the rlCCATBLE tuple against rLGCKTI.

- NCKTS6P = Check the number of 6-port conference circuits (d6port.nckts) in the rICCATBLE tuple against rIGCKTI.
- RSMBIT = Check the remote switch module (RSM) bit (rsmbit) in the rICCATBL tuple against rIGCKTI.
- SGGCKT = Check the service group (sg) in the rICCATBL tuple against rIGCKTI.
- SNGCKT = Check the service group number (sgn) in the rICCATBL tuple against rIGCKTI.

If the audit is about to complete the following checks are made:

- CKTCNT = Check the maximum number of circuits (mnckts) in the PCccap and PC6ccap arrays against rIGCKTI.
- MINDX = Check the minimum index (mindx) in the PCccap and PC6ccap arrays against rIGCKTI.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: CKTCNT

Error Code:	CKTCNT
Error Description:	If the logical index is 0 then the maximum number of 3-port conference circuits (mnckts) in PCccap is less than the number of circuits counted in the rIGCKTI tuple. If the logical index is 1 then the maximum number of 6-port conference circuits (mnckts) in PC6ccap is less than the number of circuits counted in the rIGCKTI tuple.
Possible Error Effect:	Possible blocking of conference calls due to skip flags being set when not necessary.
Corrective Action Taken:	Set PCccap.mnckts or PC6ccap.mnckts to the number of circuits counted in the rIGCKTI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCccap (logical index = 0) or PC6ccap (logical index = 1).
<i>Bad Data =</i>	Maximum number of circuits found in PCccap or PC6ccap.
<i>Good Data =</i>	Circuit count in rIGCKTI tuple.
<i>Logical Index =</i>	0 indicates PCccap was in error 1 indicates PC6ccap was in error.
<i>Dump =</i>	NA.

Table 2 Error Code: DSUGKCT

Error Code:	DSUGKCT
Error Description:	The digital service unit field (dsu) in the rICCATBL tuple does not match the corresponding field (dsu) in the rIGCKTI tuple.
Possible Error Effect:	Possible blocking of conference calls due to calls being routed to wrong digital service unit.
Corrective Action Taken:	The digital service unit field (dsu) in the rICCATBL tuple is set to the value of the corresponding field (dsu) in the rIGCKTI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rICCATBL tuple found in error.
<i>Bad Data =</i>	Digital service unit field (dsu) from the rICCATBL tuple.
<i>Good Data =</i>	Digital service unit field (dsu) from the rIGCKTI tuple.
<i>Logical Index =</i>	Key of the rICCATBL tuple found in error.
<i>Dump =</i>	rICCATBL tuple found in error.

Table 3 Error Code: IMGCKT

Error Code:	IMGCKT
Error Description:	The switching module field (im) in the rICCATBL tuple does not match the corresponding field (im) in the rIGCKTI tuple.
Possible Error Effect:	Possible blocking of conference calls due to calls being routed to the wrong SM.
Corrective Action Taken:	The switching module field (im) in the rICCATBL tuple is set to the value of the corresponding field (im) in the rIGCKTI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rICCATBL tuple found in error.
<i>Bad Data</i> =	Switching module field (im) from the rICCATBL tuple.
<i>Good Data</i> =	Switching module field (im) from the rIGCKTI tuple.
<i>Logical Index</i> =	Key of the rICCATBL tuple found in error.
<i>Dump</i> =	rICCATBL tuple found in error.

Table 4 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	The key (ccadx) of the rICCATBL tuple does not match the corresponding field (index) in the rIGCKTI tuple.
Possible Error Effect:	Possible blocking of conference calls, due to garbage in the rICCATBL tuple.
Corrective Action Taken:	The key (ccadx) field of the rICCATBL tuple is set to the value of the corresponding field (index) in the rIGCKTI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rICCATBL tuple found in error.
<i>Bad Data</i> =	Logical index (ccadx) of the rICCATBL tuple found in error.
<i>Good Data</i> =	Logical index (index) of the rIGCKTI tuple.
<i>Logical Index</i> =	Key of the rICCATBL tuple found in error.
<i>Dump</i> =	rICCATBL tuple found in error.

Table 5 Error Code: MINDX

Error Code:	MINDX
Error Description:	If the logical index is 0 then the minimum index field (mindx) in PCccap does not match the minimum index calculated from the RLGCKTI relation. If the logical index is 1 then the minimum index field (mindx) in PC6ccap does not match the minimum index calculated from the RLGCKTI relation.
Possible Error Effect:	Longer allocation time for conference circuits.
Corrective Action Taken:	Set PCccap.mindx or PC6ccap.mindx to the value calculated from the RLGCKTI relation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCccap (logical index = 0) or PC6ccap (logical index = 1).
<i>Bad Data</i> =	Minimum index (mindx) value from PCccap (logical index = 0) or PC6ccap (logical index = 1).
<i>Good Data</i> =	Minimum index value obtained from RLGCKTI relation.
<i>Logical Index</i> =	Valid values are: 0 = PCccap was in error. 1 = PC6ccap was in error.
<i>Dump</i> =	NA.

Table 6 Error Code: NCKTS3P

Error Code:	NCKTS3P
Error Description:	The number of 3-port conference circuits (d3port.nckts) in the rICCATBL tuple does not agree with the number of 3-port conference circuits (boardXX.nckts) found in the rIGCKTI tuple.
Possible Error Effect:	Possible blocking of conference calls, due to garbage in the rICCATBL tuple.

Corrective Action Taken:	The number of 3-port circuits (d3port.nckts) in the rICCATBL tuple is set to the number of 3-port conference circuits (boardXX.nckts) found in the rIGCKTI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rICCATBL tuple found in error.
<i>Bad Data =</i>	Number of 3-port conference circuits (d3port.nckts) from the rICCATBL tuple.
<i>Good Data =</i>	Number of 3-port conference circuits (boardXX.nckts) from the rIGCKTI tuple.
<i>Logical Index =</i>	Key of the rICCATBL tuple found in error.
<i>Dump =</i>	rICCATBL tuple found in error.

Table 7 Error Code: NCKTS6P

Error Code:	NCKTS6P
Error Description:	The number of 6-port conference circuits (d6port.nckts) in the rICCATBL tuple does not agree with the number of 6-port conference circuits (boardXX.nckts) found in the rIGCKTI tuple.
Possible Error Effect:	Possible blocking of conference calls, due to garbage in the rICCATBL tuple.
Corrective Action Taken:	The number of 6-port circuits (d6port.nckts) in the rICCATBL tuple is set to the number of 6-port conference circuits (boardXX.nckts) found in the rIGCKTI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rICCATBL tuple found in error.
<i>Bad Data =</i>	Number of 6-port conference circuits (d6port.nckts) from the rICCATBL tuple.
<i>Good Data =</i>	Number of 6-port conference circuits (boardXX.nckts) from the rIGCKTI tuple.
<i>Logical Index =</i>	Key of the rICCATBL tuple found in error.
<i>Dump =</i>	rICCATBL tuple found in error.

Table 8 Error Code: RSMBIT

Error Code:	RSMBIT
Error Description:	The remote switching module field (rsm) in the rICCATBL tuple does not match the corresponding field (rms) in the rIGCKTI tuple.
Possible Error Effect:	Possible blocking of conference calls.
Corrective Action Taken:	The remote switching module field (rsm) in the rICCATBL tuple is set to the value of the corresponding field (rsm) in the rIGCKTI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rICCATBL tuple found in error.
<i>Bad Data =</i>	The value of the remote switching module field (rsm) from the rICCATBL tuple.
<i>Good Data =</i>	The value of the remote switching module field (rsm) from the rIGCKTI tuple.
<i>Logical Index =</i>	Key of the rICCATBL tuple found in error.
<i>Dump =</i>	rICCATBL tuple found in error.

Table 9 Error Code: SGGKCT

Error Code:	SGGKCT
Error Description:	The service group field (sg) in the rICCATBL tuple does not match the corresponding field (sg) in the rIGCKTI tuple.
Possible Error Effect:	Possible blocking of conference calls due to calls being routed to wrong service group.
Corrective Action Taken:	The service group field (sg) in the rICCATBL tuple is set to the value of the corresponding field (sg) in the rIGCKTI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rICCATBL tuple found in error.
<i>Bad Data =</i>	The service group field (sg) from the rICCATBL tuple.
<i>Good Data =</i>	The service group field (sg) from the rIGCKTI tuple.
<i>Logical Index =</i>	Key of the rICCATBL tuple found in error.
<i>Dump =</i>	rICCATBL tuple found in error.

Table 10 Error Code: SNGKCT

Error Code:	SNGKCT
Error Description:	The service group number field (sgn) in the rICCATBL tuple does not match the corresponding field (sgn) in the rIGCKTI tuple.

Possible Error Effect:	Possible blocking of conference calls due to calls being routed to wrong service group number.
Corrective Action Taken:	The service group number field (sgn) in the rICCATBL tuple is set to the value of the corresponding field (sgn) in the rIGCKTI tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rICCATBL tuple found in error.
<i>Bad Data</i> =	The service group number field (sgn) from the rICCATBL tuple.
<i>Good Data</i> =	The service group number field (sgn) from the rIGCKTI tuple.
<i>Logical Index</i> =	Key of the rICCATBL tuple found in error.
<i>Dump</i> =	rICCATBL tuple found in error.

GPAXDB-A

Software Release: 5E10 - 5E13

1. GENERAL PURPOSE ANNEXED DATA BLOCK (GPAXDB) AUDIT

The RLGPAXDB relation is used by the 5E-AMPS feature to define the sub-processes (NEAR, FAR1, FAR2, FAR3) of an *AUTOPLEX*[®] (APX) call. Tuples in RLGPAXDB are linked either to an idle list from rIDB_HEADC, to an rIPCBLA tuple (when APX is using a terminal process), or to an rIAPXCTBL tuple (when APX is using the system process and two non-cell site trunks are involved).

The purpose of the GPAXDB audit is to ensure the integrity of the semantic data and linkages of the rIGPAXDB tuples in the RLGPAXDB relation. The GPAXDB audit runs in the switching module environment in segmented mode. It is also called during selective initialization.

2. DATA STRUCTURES

The RLGPAXDB dynamic relation contains information on near and far parties involved in an APX call, including the user (rIGPAXDB.client_tag) to identify whether the call is CL_APX1 (holding information for the near and first far leg), or CL_APX2 [with information for the second and third far leg(s)]. The GPAXDB audit references the following dynamic relations:

- RLDB_HEADC = One tuple of this relation acts as the idle list headcell for relation RLGPAXDB, linked through *gpaxdb_mem*.
- RLAPXCTBL = A busy rIGPAXDB tuple may be linked through *spidx* to an rIAPXCTBL tuple, and/or
- RLPCBLA = A busy rIGPAXDB tuple may be linked through *gpaxdb_mem.st_ownk* to an rIPCBLA tuple.

3. AUDIT CHECKS

For each rIGPAXDB tuple found in the relation, the audit makes the following checks:

- MEMBAD = Some of the linkage in rIGPAXDB.gpaxdb_mem is corrupt.
- NOPCBLA = If the rIGPAXDB tuple is neither idle nor APX, it must be linked to an rIPCBLA tuple.
- OWNLINK = When the rIGPAXDB tuple is idle, it must be owned by the idle list.
- WRONGLIST = Check that the user of the previous rIGPAXDB tuple is appropriate for this one.

If the rIGPAXDB tuple is busy:

- CALLID_BAD = The rIGPAXDB tuple should have a valid call record index.
- DEADPID = The tuple should be linked to an active rIPCBLA tuple.
- IDLE_LINK = If the user of the rIGPAXDB tuple is an APX process (rIGPAXDB.client_tag = CL_APX1 or CL_APX2), it must be linked to an rIPCBLA or rIAPXCTBL tuple.
- PID = When a far process is in the same SM, it must be an active process.
- UNEQUAL = When the rIGPAXDB tuple is linked to an APX system process, the key of the rIGPAXDB tuple (rIGPAXDB.gpaxdb) must match one of the semantic links in rIAPXCTBL (rIAPXCTBL.gpaxidx1 and gpaxidx2).

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: CALLID_BAD

Error Code:	CALLID_BAD
Error Description:	The call record index is out of range. This field should reference a valid call record (zero to CRMAX - 1).
Possible Error Effect:	Either the tuple (and any other resources linked to it) is lost or the call it was supposed to be associated with will not be able to reliably access information about call legs.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The invalid call record index (<i>rIGPAXDB.gpaxdata.far.cid.crindx</i>).
<i>Good Data =</i>	The number of the Far party (1=far1, 2=far2, 3=far3).
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump =</i>	The rIGPAXDB tuple where the error was found.

Table 2 Error Code: DEADPID

Error Code:	DEADPID
Error Description:	The rIGPAXDB tuple is not linked to its headcell nor to an active rIPCBLA tuple, nor is it zero. It must be linked to one of them.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The linkage to the rIPCBLA owning the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb mem.st ownk - DBSFPCBLA</i>).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump 1 =</i>	The rIGPAXDB tuple where the error was found.
<i>Dump 2 =</i>	The process control block.

Table 3 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	The user of an rIGPAXDB tuple is an APX process (<i>rIGPAXDB.client_tag</i> = CL_APX1 or CL_APX2), but the tuple has no link to rIPCBLA tuple or to an rAPXCTBL tuple. An active rIGPAXDB APX tuple must be linked to a terminal or system process.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The linkage to the rIPCBLA tuple (<i>rIGPAXDB.gpaxdb mem.st ownk</i>).

<i>Good Data</i> =	The semantic link to the APX system process (<i>rIGPAXDB.gpaxdata.spidx</i>).
<i>Logical Index</i> =	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump</i> =	The rIGPAXDB tuple where the error was found.

Table 4 Error Code: MEMBAD

Error Code:	MEMBAD
Error Description:	The linkage test for the rIGPAXDB tuple failed.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data</i> =	The user of the rIGPAXDB tuple (<i>rIGPAXDB.client_tag</i>).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump</i> =	The rIGPAXDB tuple where the error was found.

Table 5 Error Code: NOPCBLA

Error Code:	NOPCBLA
Error Description:	The user of the rIGPAXDB tuple is other than null or APX, but it is not linked to a rIPCBLA tuple.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data</i> =	The linkage to the rIPCBLA tuple (<i>rIGPAXDB.gpaxdb_mem.st_ownk</i>).
<i>Good Data</i> =	The user of the rIGPAXDB tuple (<i>rIGPAXDB.client_tag</i>).
<i>Logical Index</i> =	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump</i> =	The rIGPAXDB tuple where the error was found.

Table 6 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	The user of the rIGPAXDB tuple is null, but it is not linked to the idle list.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data</i> =	The linkage to the idle list in rIDB_HEADC (<i>rIGPAXDB.gpaxdb_mem.st_ownk</i>).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump</i> =	The rIGPAXDB tuple where the error was found.

Table 7 Error Code: PID

Error Code:	PID
Error Description:	The far party is in the same switching module as the rIGPAXDB tuple, but the process of the far party is not active.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.

Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The process number of the far party.
<i>Good Data =</i>	The number of the Far party (1=far1, 2=far2, 3=far3).
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump 1 =</i>	The rIGPAXDB tuple where the error was found.
<i>Dump 2 =</i>	The process control block.

Table 8 Error Code: UNEQUAL

Error Code:	UNEQUAL
Error Description:	The rIGPAXDB tuple is linked to an APX system process, but neither of the semantic links in the rIAPXCTBL tuple (rIAPXCTBL.gpaxidx1 or gpaxidx2) holds the key to this rIGPAXDB tuple.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The two semantic links in the rIAPXCTBL tuple to the rIGPAXDB tuples (the RLAPXCTBL <i>gpaxidx1</i> field << 16 the RLAPXCTBL <i>gpaxidx2</i> field).
<i>Good Data =</i>	The semantic link in the rIGPAXDB tuple to the rIAPXCTBL tuple (<i>rIGPAXDB.gpaxdata.spidx</i>).
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump 1 =</i>	The rIGPAXDB tuple where the error was found.
<i>Dump 2 =</i>	The rIAPXCTBL tuple where the error was found.

Table 9 Error Code: WRONGLIST

Error Code:	WRONGLIST
Error Description:	The rIGPAXDB tuple has a backward link on the active list, but the user of the previous rIGPAXDB tuples is: • Not CL_NULL, if the current rIGPAXDB tuple has no user, or • CL_NULL if the current rIGPAXDB tuple has a user.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The user of the previous rIGPAXDB tuple (<i>rIGPAXDB.client_tag</i>).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump =</i>	The rIGPAXDB tuple where the error was found.

GPAXDB-B

Software Release: 5E14 and later

1. GENERAL PURPOSE ANNEXED DATA BLOCK (GPAXDB) AUDIT

The RLGPAXDB relation is used by the 5E-AMPS feature to define the sub-processes (NEAR, FAR1, FAR2, FAR3) of an *AUTOPLEX*[®] (APX) call. Tuples in RLGPAXDB are linked either to an idle list from rIDB_HEADC, to an rIPCBLA tuple (when APX is using a terminal process), or to an rIAPXCTBL tuple (when APX is using the system process and two non-cell site trunks are involved).

The purpose of the GPAXDB audit is to ensure the integrity of the semantic data and linkages of the rIGPAXDB tuples in the RLGPAXDB relation. The GPAXDB audit runs in the switching module environment in segmented mode. It is also called during selective initialization.

2. DATA STRUCTURES

The RLGPAXDB dynamic relation contains information on near and far parties involved in an APX call, including the user (rIGPAXDB.client_tag) to identify whether the call is CL_APX1 (holding information for the near and first far leg), or CL_APX2 [with information for the second and third far leg(s)]. The GPAXDB audit references the following dynamic relations:

- RLDB_HEADC = One tuple of this relation acts as the idle list headcell for relation RLGPAXDB, linked through *gpaxdb_mem*.
- RLAPXCTBL = A busy rIGPAXDB tuple may be linked through *spidx* to an rIAPXCTBL tuple, and/or
- RLPCBLA = A busy rIGPAXDB tuple may be linked through *gpaxdb_mem.st_ownk* to an rIPCBLA tuple.

3. AUDIT CHECKS

For each rIGPAXDB tuple found in the relation, the audit makes the following checks:

- MEMBAD = Some of the linkage in rIGPAXDB.gpaxdb_mem is corrupt.
- NOPCBLA = If the rIGPAXDB tuple is neither idle nor APX, it must be linked to an rIPCBLA tuple.
- OWNLINK = When the rIGPAXDB tuple is idle, it must be owned by the idle list.
- WRONGLIST = Check that the user of the previous rIGPAXDB tuple is appropriate for this one.

If the rIGPAXDB tuple is busy:

- CALLID_BAD = The rIGPAXDB tuple should have a valid call record index.
- DEADPID = The tuple should be linked to an active rIPCBLA tuple.
- IDLE_LINK = If the user of the rIGPAXDB tuple is an APX process (rIGPAXDB.client_tag = CL_APX1 or CL_APX2), it must be linked to an rIPCBLA or rIAPXCTBL tuple.
- PID = When a far process is in the same SM, it must be an active process.
- UNEQUAL = When the rIGPAXDB tuple is linked to an APX system process, the key of the rIGPAXDB tuple (rIGPAXDB.gpaxdb) must match one of the semantic links in rIAPXCTBL (rIAPXCTBL.gpaxidx1 and gpaxidx2).

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: CALLID_BAD

Error Code:	CALLID_BAD
Error Description:	The call record index is out of range. This field should reference a valid call record (zero to CRMAX - 1).
Possible Error Effect:	Either the tuple (and any other resources linked to it) is lost or the call it was supposed to be associated with will not be able to reliably access information about call legs.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The invalid call record index (<i>rIGPAXDB.gpaxdata.far.cid.crindx</i>).
<i>Good Data =</i>	The number of the Far party (1=far1, 2=far2, 3=far3).
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump =</i>	The rIGPAXDB tuple where the error was found.

Table 2 Error Code: DEADPID

Error Code:	DEADPID
Error Description:	The rIGPAXDB tuple is not linked to its headcell nor to an active rIPCBLA tuple, nor is it zero. It must be linked to one of them.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The linkage to the rIPCBLA owning the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb mem.st ownk - DBSFPCBLA</i>).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump 1 =</i>	The rIGPAXDB tuple where the error was found.
<i>Dump 2 =</i>	The process control block.

Table 3 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	The user of an rIGPAXDB tuple is an APX process (<i>rIGPAXDB.client_tag = CL_APX1 or CL_APX2</i>), but the tuple has no link to rIPCBLA tuple or to an rAPXCTBL tuple. An active rIGPAXDB APX tuple must be linked to a terminal or system process.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The linkage to the rIPCBLA tuple (<i>rIGPAXDB.gpaxdb mem.st ownk</i>).

<i>Good Data</i> =	The semantic link to the APX system process (<i>rIGPAXDB.gpaxdata.spidx</i>).
<i>Logical Index</i> =	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump</i> =	The rIGPAXDB tuple where the error was found.

Table 4 Error Code: MEMBAD

Error Code:	MEMBAD
Error Description:	The linkage test for the rIGPAXDB tuple failed.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data</i> =	The user of the rIGPAXDB tuple (<i>rIGPAXDB.client_tag</i>).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump</i> =	The rIGPAXDB tuple where the error was found.

Table 5 Error Code: NOPCBLA

Error Code:	NOPCBLA
Error Description:	The user of the rIGPAXDB tuple is other than null or APX, but it is not linked to a rIPCBLA tuple.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data</i> =	The linkage to the rIPCBLA tuple (<i>rIGPAXDB.gpaxdb_mem.st_ownk</i>).
<i>Good Data</i> =	The user of the rIGPAXDB tuple (<i>rIGPAXDB.client_tag</i>).
<i>Logical Index</i> =	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump</i> =	The rIGPAXDB tuple where the error was found.

Table 6 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	The user of the rIGPAXDB tuple is null, but it is not linked to the idle list.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data</i> =	The linkage to the idle list in rIDB_HEADC (<i>rIGPAXDB.gpaxdb_mem.st_ownk</i>).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump</i> =	The rIGPAXDB tuple where the error was found.

Table 7 Error Code: PID

Error Code:	PID
Error Description:	The far party is in the same switching module as the rIGPAXDB tuple, but the process of the far party is not active.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.

Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The process number of the far party.
<i>Good Data =</i>	The number of the Far party (1=far1, 2=far2, 3=far3).
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump 1 =</i>	The rIGPAXDB tuple where the error was found.
<i>Dump 2 =</i>	The process control block.

Table 8 Error Code: UNEQUAL

Error Code:	UNEQUAL
Error Description:	The rIGPAXDB tuple is linked to an APX system process, but neither of the semantic links in the rIAPXCTBL tuple (rIAPXCTBL.gpaxidx1 or gpaxidx2) holds the key to this rIGPAXDB tuple.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The two semantic links in the rIAPXCTBL tuple to the rIGPAXDB tuples (the RLAPXCTBL <i>gpaxidx1</i> field << 16 the RLAPXCTBL <i>gpaxidx2</i> field).
<i>Good Data =</i>	The semantic link in the rIGPAXDB tuple to the rIAPXCTBL tuple (<i>rIGPAXDB.gpaxdata.spidx</i>).
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump 1 =</i>	The rIGPAXDB tuple where the error was found.
<i>Dump 2 =</i>	The rIAPXCTBL tuple where the error was found.

Table 9 Error Code: WRONGLIST

Error Code:	WRONGLIST
Error Description:	The rIGPAXDB tuple has a backward link on the active list, but the user of the previous rIGPAXDB tuples is: - Not CL_NULL, if the current rIGPAXDB tuple has no user, or - CL_NULL if the current rIGPAXDB tuple has a user.
Possible Error Effect:	This resource may not be needed any longer for the call. This may cause possible call failures if the system exhausts the number of available rIGPAXDB tuples.
Corrective Action Taken:	The rIGPAXDB tuple is recovered to an idle state, and related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIGPAXDB tuple where the error was found.
<i>Bad Data =</i>	The user of the previous rIGPAXDB tuple (<i>rIGPAXDB.client_tag</i>).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key to the rIGPAXDB tuple (<i>rIGPAXDB.gpaxdb</i>).
<i>Dump =</i>	The rIGPAXDB tuple where the error was found.

GPFTIMER

Software Release: 5E12 and later

1. GENERAL PURPOSE FUNCTION TIMERS (GPFTIMER) AUDIT

The RLGPFTIMER relation is used to implement general purpose function timers.

2. DATA STRUCTURES

For details on the fields contained in the RLGPFTIMER relation, refer to the 5ESS® Translations Data Manual (235-600-1xx) and the 5ESS® Dynamic Data Manual (235-600-2xx).

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description."

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	A general purpose function timer client relation tuple is not linked correctly to the rIGPFTIMER tuple being audited. Specifically, the relation ID and tuple key stored in rIGPFTIMER.udata indicate a tuple which does not contain the rIGPFTIMER tuple key in any of its timer linkage fields.
Possible Error Effect:	The rIGPFTIMER tuple is not available for use. Additional tuples also may not be available depending on conditions. If enough tuples are not available, it could cause timer allocation failures due to a lack of resources.
Corrective Action Taken:	The audit reinitializes the rIGPFTIMER tuple and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIGPFTIMER.timer_type.
<i>Bad Data =</i>	The client relation ID.
<i>Good Data =</i>	The (logical) tuple key of the client relation.
<i>Logical Index =</i>	The rIGPFTIMER tuple key (rIGPFTIMER.gpftimer).
<i>Dump 1 =</i>	The rIGPFTIMER tuple.
<i>Dump 2 =</i>	The client relation tuple.

Table 2 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The client relation ID in an rIGPFTIMER tuple's user data (rIGPFTIMER.udata) is corrupt or contains a value not expected by the audit.
Possible Error Effect:	The rIGPFTIMER tuple may not be available for use. Additional tuples also may not be available depending on conditions. If enough tuples are not available, it could cause timer allocation failures due to a lack of resources. The other possibility is that a new client type was introduced but the audit was not updated. This error should be escalated to the next level of support. Refer

	to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.
Corrective Action Taken:	The audit reinitializes the rGPFTIMER tuple and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rGPFTIMER.timer_type.
<i>Bad Data =</i>	The client relation ID.
<i>Good Data =</i>	The (logical) tuple key of the client relation.
<i>Logical Index =</i>	The rGPFTIMER tuple key (rGPFTIMER.gpftimer).
<i>Dump =</i>	The rGPFTIMER tuple.

Table 3 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	An rGPFTIMER tuple is not idle (rGPFTIMER.timer_type != TMTTNULL) but is either linked to the idle list (rGPFTIMER.link_mem.st_ownk = DBIDLEGPFTIMER+DBSFOHTIMER) or has an invalid timer type (rGPFTIMER.timer_type ≥ TMTMRMAX).
Possible Error Effect:	Varies according to conditions. If the timer is linked to the idle list the effect is minimal. If the timer is in use but contains an invalid timer type, the timer will not be processed correctly when it expires.
Corrective Action Taken:	The audit reinitializes the rGPFTIMER tuple and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rGPFTIMER.timer_type.
<i>Bad Data =</i>	rGPFTIMER.link_mem.st_ownk.
<i>Good Data =</i>	TMTMRMAX.
<i>Logical Index =</i>	The rGPFTIMER tuple key (rGPFTIMER.gpftimer).
<i>Dump =</i>	The rGPFTIMER tuple.

Table 4 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	An rGPFTIMER tuple is idle (rGPFTIMER.timer_type = TMTTNULL) but is not linked to the idle list (rGPFTIMER.link_mem.st_ownk != DBIDLEGPFTIMER+DBSFOHTIMER).
Possible Error Effect:	The rGPFTIMER tuple may not be available for use. Additional tuples also may not be available depending on conditions. If enough tuples are not available, it could cause timer allocation failures due to a lack of resources. Otherwise, the timer is in use but with a corrupted timer type which means the timer will not be processed correctly when it expires.
Corrective Action Taken:	The audit reinitializes the rGPFTIMER tuple and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rGPFTIMER.timer_type.
<i>Bad Data =</i>	rGPFTIMER.link_mem.st_ownk.
<i>Good Data =</i>	DBIDLEGPFTIMER.
<i>Logical Index =</i>	The rGPFTIMER tuple key (rGPFTIMER.gpftimer).
<i>Dump =</i>	The rGPFTIMER tuple.

Table 5 Error Code: READ

Error Code:	READ
Error Description:	The audit was unable to retrieve a pointer to the client relation tuple which appears to own the rGPFTIMER tuple being audited.
Possible Error Effect:	The rGPFTIMER tuple may not be available for use. Additional tuples also may not be available depending on conditions. If enough tuples are not available, it could cause timer allocation failures due to a lack of resources.
Corrective Action Taken:	The audit reinitializes the rGPFTIMER tuple and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rGPFTIMER.timer_type.

<i>Bad Data</i> =	The client relation ID.
<i>Good Data</i> =	The (logical) tuple key of the client relation.
<i>Logical Index</i> =	The rIGPFTIMER tuple key (rIGPFTIMER.gpftimer).
<i>Dump 1</i> =	The rIGPFTIMER tuple.
<i>Dump 2</i> =	The invalid client tuple data retrieved by the audit.

Table 6 Error Code: STUCK

Error Code:	STUCK
Error Description:	An rIGPFTIMER tuple is on a timing or timeout list but was not been processed by the timer process during its last pass through the lists. If the rIGPFTIMER tuple is not processed, the timer it represents will never expire.
Possible Error Effect:	Varies according to conditions including what timer client relation is involved and what the timer is being used for.
Corrective Action Taken:	The audit reinitializes the rIGPFTIMER tuple and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIGPFTIMER.timer_type.
<i>Bad Data</i> =	The timer's increment field (rIGPFTIMER.tcount).
<i>Good Data</i> =	The timer's check field (rIGPFTIMER.shadow_cnt).
<i>Logical Index</i> =	The rIGPFTIMER tuple key (rIGPFTIMER.gpftimer).
<i>Dump 1</i> =	The rIGPFTIMER tuple.
<i>Dump 2</i> =	The client relation tuple (the relation ID and tuple key can be read out of rIGPFTIMER.udata).

Table 7 Error Code: TRANCK

Error Code:	TRANCK
Error Description:	An rIGPFTIMER is being held in local (non-relation) data (the relation ID in the rIGPFTIMER.udata is TMNO_REL_ID) but has been held there too long.
Possible Error Effect:	The rIGPFTIMER tuple may not be available for use. Additional tuples also may not be available depending on conditions. If enough tuples are not available, it could cause timer allocation failures due to a lack of resources.
Corrective Action Taken:	The audit reinitializes the rIGPFTIMER tuple and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rIGPFTIMER.timer_type.
<i>Bad Data</i> =	rIGPFTIMER.quarstate.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIGPFTIMER tuple key (rIGPFTIMER.gpftimer).
<i>Dump</i> =	The rIGPFTIMER tuple.

GRPPORT

Software Release: 5E10 and later

1. GROUP AND MEMBER NUMBER TO PORT (GRPPORT) AUDIT

To process a call during stand alone (SA) condition, the routing and terminal allocation (RTA) routing process in the remote switching module (RSM) and in the optically remote module (ORM) must determine the ports that are available for terminating calls. For every member of the global multi-line hunt group (MLHG), a rIGROUP_PORT tuple must exist in the switching module (SM) which owns the port in the designated hunting SM and in the designated routing SM. During SA, related tuples of RLGROUP_PORT relation, tuples for which the RSM/ORM are the owners or the hunting SM, have an associated active member in the multiline hunt group member status relation (RLMEM) or in the multiline hunt large group member status relation (RLLGMEM) see MEM/LGMEM audits).

The RLGROUP_PORT relation works with both rLMEM and RLLGMEM relations to ensure that missing tuples are added to these relations. The relation also makes sure that for all related tuples of rIGROUP_PORT, the corresponding member in rLMEM/rLLGMEM is active (set to "1").

In the RSM/ORM, the audit operates in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented mode. This audit is scheduled only during the SA mode.

2. DATA STRUCTURES

The data structures checked by the GRPPORT audit are the relations RLMEM and RLLGMEM.

The RLMEM/RLLGMEM relations are dynamic relations that contain information about small/large multi-line hunt group. This information is kept on bit maps, with each bit representing a member of the MLHG. The bit map is included in each tuple in the status relations RLMEM/RLLGMEM. When a member is populated for a MLHG, the corresponding bit must be set to "1" to indicate the member is active. If the member is not active, the bit must be set to "0".

3. AUDIT CHECKS

The GRPPORT audit uses the static driver (DRSTATIC) to step through the RLGROUP_PORT relation and sequentially retrieve tuples. The DRSTATIC driver invokes a semantic check function that verifies each rIGROUP_PORT tuple against the rLMEM/rLLGMEM tuples by using the key (group number) of rIGROUP_PORT to read the dynamic relations. To determine which dynamic relation to read (RLMEM or RLLGMEM), the semantic function reads RLRT_MHG relation to get the hunt type.

The audit looks specifically for missing tuples, and for members that are marked as not active in rLMEM/rLLGMEM tuple, but for which there is a corresponding tuple in RLGROUP_PORT relation.

4. ERROR HANDLING

Missing tuples are created in RLMEM/RLLGMEM relation. Bits that are set to "0" (not active) and that are associated with a MLHG member are corrected to "1" (active). If a tuple of the member status relation contains an invalid data in its key, the key is corrected. If rIRT_MHG tuple contains an improper hunt type, an error message requesting manual action is printed on the read-only printer (ROP).

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: HTYPE

Error Code:	HTYPE
Error Description:	The multi-line hunt group information relation, RLRT_MHG, contains a tuple which has an invalid hunt type. This error will repeat until fixed by the user.
Possible Error Effect:	Inability to hunt to lines in this group and possible ASSERT failures.
Corrective Action Taken:	None.
Manual Action Required:	The hunt type in rIRT_MHG is invalid. Determine the nature of the database inconsistency and correct it. This message will repeat until corrective action is taken by the user.
Dump Description:	
<i>Error Address</i> =	Address of the tuple buffer.
<i>Bad Data</i> =	Hunt type of the group.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Group number of the MLH group.
<i>Dump</i> =	rIRT_MHG tuple.

Table 2 Error Code: INVMEM

Error Code:	INVMEM
Error Description:	The corresponding member in the dynamic relations RLMEM/RLMGEM is initialized incorrectly to invalid ("0").
Possible Error Effect:	Initialization was wrong and calls will fail to that member.
Corrective Action Taken:	The member will be set to valid ("1").
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the dynamic tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	1 (valid member).
<i>Logical Index</i> =	grpnum of this tuple.
<i>Dump</i> =	rIMEM/rILGMEM tuple.

Table 3 Error Code: KEY

Error Code:	KEY
Error Description:	The tuple of the relation RLMEM has wrong key.
Possible Error Effect:	Use of this tuple might propagate errors.
Corrective Action Taken:	The correct value of the key will be inserted in the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIMEM tuple having the wrong key.
<i>Bad Data</i> =	The value of the wrong key.
<i>Good Data</i> =	The correct value of the key.
<i>Logical Index</i> =	The correct value of the key.
<i>Dump</i> =	The contents of the rIMEM tuple with the wrong key.

Table 4 Error Code: LGKEY

Error Code:	LGKEY
Error Description:	The tuple of the relation rILGMEM has wrong key.
Possible Error Effect:	Use of this tuple might propagate errors.
Corrective Action Taken:	The correct value of the key will be inserted in the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rILGMEM tuple having the wrong key.
<i>Bad Data</i> =	The value of the wrong key.
<i>Good Data</i> =	The correct value of the key.
<i>Logical Index</i> =	The correct value of the key.
<i>Dump</i> =	The contents of the rILGMEM tuple with the wrong key.

Table 5 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	There is a tuple missing from the dynamic relation RLMEM/RLMGEM.
Possible Error Effect:	MLHG members will be initialized incorrectly and call will fail.
Corrective Action Taken:	The tuple is created and initialized.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Address of the dynamic tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	0 = Missing tuple in rMEM relation. 1 = Missing tuple in rLGMEM relation.
<i>Logical Index</i> =	Key of the lost tuple.
<i>Dump</i> =	Dump of the lost tuple.

Table 6 Error Code: ODDLOSTUP

Error Code:	ODDLOSTUP
Error Description:	The audit has found an inconsistency between the static relations RLGRPPORT and RLRT_MHG. The key or rIGRPPORT tuple is used to access a tuple in RLRT_MHG relation but no matching tuple is found and the audit cannot continue to do checks.
Possible Error Effect:	Audit continue to the next tuple or RLGRPPORT relation.
Corrective Action Taken:	Audit report an error.
Manual Action Required:	Verify tuples rIRT_MHG and rIGRPPORT in the ODD, using the rIGRPPORT key found in the "Logical Index" field of the audit report. Corresponding tuple rIRT_MHG with the same key should exist on the same SM or the tuple rIGRPPORT may be invalid. Correct any inconsistencies found.
Dump Description:	
<i>Error Address</i> =	The address of the rIGRPPORT tuple.
<i>Bad Data</i> =	The key of rIRT_MHG tuple returned from the base.
<i>Good Data</i> =	The key used to access rIRT_MHG tuple.
<i>Logical Index</i> =	The key used to access rIRT_MHG tuple.
<i>Dump</i> =	The contents of the rIGRPPORT tuple.

GRPTGC

Software Release: 5E10 and later

1. GROUP TRUNK GROUP CONTROLS (GRPTGC) AUDIT

Trunk group controls are a set of regulators used to protect an office from excessive routing requests and to expand routing patterns during busy periods. These regulators control the number of calls that can access a trunk group. A hierarchy exists within the trunk group controls. The group trunk group controls relation (RLGRP_TGC) maps active trunk groups in an office to trunk groups that have controls associated with them. The trunk group controls relation (RLTGC) maps the trunk groups and their associated manual controls to a specific control. The extended reroute relation (RLEXRR) maps a specific reroute control to a series of trunk groups designated to be the trunks on which the call attempts termination. The dynamic overload control (RLDOC) and trunk reservation (RLTR) relations map the TGs into their associated automatic controls.

The group trunk group controls audit (GRPTGC) verifies that busy tuples in the group trunk group controls relation (RLGRP_TGC) are correctly linked to one of the following relations: the trunk owner relation (RLTKOWNER), the trunk status relation (RLTKSTAT), or the large trunk status relation (RLLGTKSTAT) to ensure that each busy tuple has a valid trunk group associated with it. The audit verifies that the control(s) are properly linked to the trunk group controls relation (RLTGC), which may specify from one to four controls, and/or the dynamic overload control (RLDOC) and/or trunk reservation (RLTR) relations. The GRPTGC audit also checks for lost resources by verifying linkages to the database headcells relation (RLDB_HEADC).

This audit is part of the routing and terminal allocation audits subgroup. It operates in the OKP environment in the segmented modes.

2. DATA STRUCTURES

The data structures checked by the GRPTGC audit are the group trunk group controls relation (RLGRP_TGC), the trunk group controls relation (RLTGC), the dynamic overload control relation (RLDOC), the trunk reservation relation (RLTR), the trunk status relation (RLTKSTAT), the large trunk status relation (RLLGtKstat), the trunk owner relation (RLTKOWNER), and the database head cells relation (RLDB_HEADC). Figure 1 illustrates the layout of RLGRP_TGC and shows the items checked by the audit. The RLGRP_TGC is a dynamic relation that contains information about controls placed on individual trunk groups. Included in the information within the tuples is the point-back to one of the RLTKSTAT, RLLGtKstat, or RLTKOWNER relations, and the trunk group controls fields (cant, skip, cro, canf, rr, tr, and doc) that point the to RLTGC, RLTR, and RLDOC relations.

Figure 1 (GRPTGC-1) rIGRP_TGC Linkages**3. AUDIT CHECKS**

To verify the linkages in the group trunk group controls relation, the GRPTGC audit calls the linkage driver (DRLINK) once for each audit segment. The DRLINK driver ensures that each tuple in RLGRP_TGC has at least one valid linkage to the appropriate control relations. The DRLINK driver also verifies the owner-member linkage to the RLDB_HEADC relation, and the one-to-one linkage (grpnum) to one of the following relations: RLTKSTAT, RLLGTKSTAT, or RLTKOWNER. The DRLINK driver invokes the semantic check function after verifying the linkages of each rIGRP_TGC tuple. The semantic check function performs the following checks:

- (a) The audit verifies that each of the control fields is either linked to the appropriate control relation or contains a null pointer.
 - If they are not null, the cant, skip, cro, canf, and rr attributes should be linked to rITGC.
 - If it is not null, the tr attribute should be linked to rITR.
 - If it is not null, the doc attribute should be linked to rIDOC.

If a link exists, the audit verifies that the type of control associated with the link is the type of control represented in the rITGC, rITR, or rIDOC relation.

- (b) The audit verifies that all tuples in rIGRP_TGC are either busy or idle.
- (c) The audit verifies that all active DOC controls are owned by a network management timing list.
- (d) The audit verifies that all tuples owned by a network management timing list have valid timing links.

4. ERROR HANDLING

The audit reports errors when any linkage check or semantic check fails. The audit zeroes the linkage areas of the erroneous tuples and links them to the rIGRP_TGC idle list.

The GRPTGC audit schedules the DBHEADC, DOC, LGTKSTAT, NMTR, TGC, TKOWNER, and TKSTAT audits as related audits when it detects errors.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: CANFCNTL

Error Code:	CANFCNTL
Error Description:	The canf field pointer is not pointing to a rITGC tuple with the canf control type.
Possible Error Effect:	If the link points to a tuple with the incorrect control type it would be possible for the trunk group to have multiple controls of the same type.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGRP_TGC tuple.
<i>Bad Data</i> =	Contents of canf field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Contents of grpkey field.
<i>Dump 1</i> =	Contents of rIGRP_TGC tuple.
<i>Dump 2</i> =	Contents of rITGC tuple.

Table 2 Error Code: CANTCNTL

Error Code:	CANTCNTL
Error Description:	The cant field pointer is not pointing to a rITGC tuple with the cant control type.
Possible Error Effect:	If the link points to a tuple with the incorrect control type it would be possible for the trunk group to have multiple controls of the same type.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGRP_TGC tuple.
<i>Bad Data</i> =	Contents of cant field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Contents of grpkey field.
<i>Dump 1</i> =	Contents of rIGRP_TGC tuple.
<i>Dump 2</i> =	Contents of rITGC tuple.

Table 3 Error Code: CROCNTL

Error Code:	CROCNTL
Error Description:	The cro field pointer is not pointing to a rITGC tuple with the cro control type.
Possible Error Effect:	If the link points to a tuple with the incorrect control type, it would be possible for the trunk group to have multiple controls of the same type.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGRP_TGC tuple.
<i>Bad Data</i> =	Contents of cro field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Contents of grpkey field.
<i>Dump 1</i> =	Contents of rIGRP_TGC tuple.
<i>Dump 2</i> =	Contents of rITGC tuple.

Table 4 Error Code: DOCCNTL

Error Code:	DOCCNTL
Error Description:	The doc field pointer is not pointing to a rIDOC tuple with the cant or skip control type.
Possible Error Effect:	If the link points to a tuple with the incorrect control type it would be possible for the trunk group to have an incorrect response to a DOC signal.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGRP_TGC tuple.
<i>Bad Data</i> =	Contents of doc field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Contents of grpkey field.
<i>Dump 1</i> =	Contents of rIGRP_TGC tuple.
<i>Dump 2</i> =	Contents of rIDOC tuple.

Table 5 Error Code: DOCLVL

Error Code:	DOCLVL
Error Description:	The doc_lvl field indicates that a DOC signal has been received for this DOC, but no timer is timing the control.
Possible Error Effect:	The DOC would never time out. More calls would be controlled then was necessary.
Corrective Action Taken:	The doc_lvl field is set to zero (the DOC control is turned off).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGRP_TGC tuple.
<i>Bad Data</i> =	Contents of doc_lvl field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Contents of grpkey field.
<i>Dump</i> =	Contents of rIGRP_TGC tuple.

Table 6 Error Code: GSCACT

Error Code:	GSCACT
Error Description:	The gsc_act field indicates that a GSC control is active, but no timer is timing the control.
Possible Error Effect:	The GSC control would never time out. More calls than intended would be forced to seek alternate routes.
Corrective Action Taken:	The gsc_act field is set to zero (the GSC control is turned off).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIGRP_TGC tuple.
<i>Bad Data =</i>	Contents of gsc_act field.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Contents of grpkey field.
<i>Dump =</i>	Contents of rIGRP_TGC tuple.

Table 7 Error Code: NMTIML

Error Code:	NMTIML
Error Description:	The timing list used to turn off automatic NM controls is corrupted.
Possible Error Effect:	The control will never time out.
Corrective Action Taken:	The audit removes the tuple from the corrupted timing list (the control is turned off).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIGRP_TGC tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Contents of grpkey field.
<i>Dump =</i>	Contents of rIGRP_TGC tuple.

Table 8 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	A tuple with valid linkages and data to qualify as busy is not on the busy list.
Possible Error Effect:	If this tuple is on the idle list the data could be lost when the supposedly idle tuple is made active.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIGRP_TGC tuple.
<i>Bad Data =</i>	Contents of st_ownk field.
<i>Good Data =</i>	Busy list headcell.
<i>Logical Index =</i>	Key of rIGRP_TGC tuple.
<i>Dump =</i>	Contents of rIGRP_TGC tuple.

Table 9 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	A tuple has null pointer and data to indicate that it is idle but it is not on the idle list.
Possible Error Effect:	This is an idle tuple which can never be made active since it is not on the idle list.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIGRP_TGC tuple.
<i>Bad Data =</i>	Contents of st_ownk field.
<i>Good Data =</i>	Idle list headcell.
<i>Logical Index =</i>	Key of rIGRP_TGC tuple.
<i>Dump =</i>	Contents of rIGRP_TGC tuple.

Table 10 Error Code: RRCNTL

Error Code:	RRCNTL

Error Description:	The rr field pointer is not pointing to a rITGC tuple with the rr control type.
Possible Error Effect:	If the link points to a tuple with the incorrect control type it would be possible for the trunk group to have multiple controls of the same type.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGRP_TGC tuple.
<i>Bad Data</i> =	Contents of rr field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Contents of grpkey field.
<i>Dump 1</i> =	Contents of rIGRP_TGC tuple.
<i>Dump 2</i> =	Contents of rITGC tuple.

Table 11 Error Code: SKIPCNTL

Error Code:	SKIPCNTL
Error Description:	The skip field pointer is not pointing to a rITGC tuple with the skip control type.
Possible Error Effect:	If the link points to a tuple with the incorrect control type it would be possible for the trunk group to have multiple controls of the same type.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGRP_TGC tuple.
<i>Bad Data</i> =	Contents of skip field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Contents of grpkey field.
<i>Dump 1</i> =	Contents of rIGRP_TGC tuple.
<i>Dump 2</i> =	Contents of rITGC tuple.

Table 12 Error Code: TRCNTL

Error Code:	TRCNTL
Error Description:	The tr field pointer is not pointing to a rITR tuple with the cant or skip control type.
Possible Error Effect:	If the link points to a tuple with the incorrect control type it would be possible for the trunk group to have an incorrect response to a TR signal.
Corrective Action Taken:	The audit will reinitialize the tuple and place it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGRP_TGC tuple.
<i>Bad Data</i> =	Contents of tr field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Contents of grpkey field.
<i>Dump 1</i> =	Contents of rIGRP_TGC tuple.
<i>Dump 2</i> =	Contents of rITR tuple.

GSDB-A

Software Release: 5E10 only

1. GROUP SCAN DATA BLOCK (GSDB) AUDIT

A group scan data block is linked to an active concentrated buffer headcell when a line origination is buffered. Each group scan data block represents a group of eight lines. Each line in a group is represented by one bit. If the bit is set, there is an origination on the line waiting to be processed.

The group scan data block audit (GSDB) ensures that group scan data block tuples (rIGSDBs) are properly linked to one of the concentrated buffer headcell tuples (rICBHC). The rICBHC tuples represent the idle list or one of several active lists. The audit also checks the name of the first port in the scan group that is stored in an rIGSDB tuple.

This audit is part of the peripheral control audits subgroup.

2. DATA STRUCTURES

The data structures checked by the GSDB audit are the group scan data block relation (RLGSDB) and the concentrated buffer headcell relation (RLCBHC). The RLGSDB relation is owned by RLCBHC. Figure 1 illustrates the layout of a group scan data block, and Figure 2 illustrates the owner-member linkage between rICBHC and rIGSDB.

3. AUDIT CHECKS

The GSDB audit uses the static driver (DRSTATIC) to step through the group scan data block relation (RLGSDB). The DRSTATIC driver calls a dynamic to static existence check function to perform the following check.

- (1) For each non-SLC[®] 96 related tuple in RLGSDB, the existence check function calculates a grid name. The grid name is used to verify that an associated tuple exists in the circuit data relation (RLCKTDATA).
- (2) Next, a semantic check function is called to perform the following checks:
 - (a) The audit ensures that all port names stored in rIGSDB tuples are correct. The port name (cktname) is algorithmically derived from the logical key; if there is an error, an incorrect circuit will be addressed.
 - (b) The audit checks the member linkage of each rIGSDB to an rICBHC tuple to verify that it belongs to a list owned by an rICBHC tuple.

4. ERROR HANDLING

If a tuple that should exist is missing in the rLCKTDATA relation, the audit inserts that tuple into the relation.

Any tuples that fail these checks are reinitialized and placed on the idle list. Any error codes used within the drivers (drstatic, drlink) also apply here.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: CKTNAME

Error Code:	CKTNAME
Error Description:	An rIGSDB tuple has an incorrect cktname stored in it. The cktname is

	algorithmically derived from the logical key (grpname). Therefore, something has overwritten it.
Possible Error Effect:	An incorrect circuit will be addressed.
Corrective Action Taken:	The audit reinitializes the rIGSDB tuple and places it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGSDB tuple.
<i>Bad Data</i> =	rIGSDB tuple's ckname.
<i>Good Data</i> =	Derived ckname.
<i>Logical Index</i> =	Key of rIGSDB tuple.
<i>Dump</i> =	rIGSDB tuple.

Table 2 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	An extra rIGSDB tuple was found. Either the read of rICKTDATA was successful and the equipage status was SMUNEQ, or the read failed.
Possible Error Effect:	Garbage left in the relation, which may be invalidly accessed and taken to be valid data.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGSDB.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of rIGSDB.
<i>Dump</i> =	rIGSDB tuple.

Table 3 Error Code: TUPLE

Error Code:	TUPLE
Error Description:	A dummy rIGSDB tuple contains nonzero data. Since the dummy tuple is never used for anything, something has written into it in error.
Possible Error Effect:	Invalid attempts to use the dummy tuple.
Corrective Action Taken:	The audit reinitializes the dummy tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGSDB.
<i>Bad Data</i> =	Nonzero tuple data.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Key of rIGSDB.
<i>Dump</i> =	Dummy rIGSDB.

GSDB-B

Software Release: 5E11 and later

1. GROUP SCAN DATA BLOCK (GSDB) AUDIT

A group scan data block is linked to an active concentrated buffer headcell when a line origination is buffered. Each group scan data block represents a group of eight lines. Each line in a group is represented by one bit. If the bit is set, there is an origination on the line waiting to be processed.

The group scan data block audit (GSDB) ensures that group scan data block tuples (rIGSDBs) are properly linked to one of the concentrated buffer headcell tuples (rICBHC). The rICBHC tuples represent the idle list or one of several active lists. The audit also checks the name of the first port in the scan group that is stored in an rIGSDB tuple.

This audit is part of the Peripheral Control audits subgroup.

2. DATA STRUCTURES

The data structures checked by the GSDB audit are the group scan data block relation (RLGSDB) and the concentrated buffer headcell relation (RLCBHC). The RLGSDB relation is owned by RLCBHC. Figure 1 illustrates the layout of a group scan data block, and Figure 2 illustrates the owner-member linkage between RLCBHC and RLGSDB.

rIGSDB

LOGICAL KEY (grpname)
PORT NAME OF FIRST PORT IN SCAN GROUP (cktname)
TIME WHEN ORIG REPORT IS DISPENSED FROM REPORT QUEUE (origtime)
SCAN MASK BITS OF 8 LINES IN GROUP (lineihbt)
LAST LOOK BITS OF 8 LINES IN GROUP (line11)

Figure 1 (GSDB-1) Group Scan Data Block

— * = Owner-Member Linkage

Figure 2 (GSDB-2) rIGSDB Linkages

3. AUDIT CHECKS

The GSDB audit uses the static driver (DRSTATIC) to step through the group scan data block relation (RLGSDB). The DRSTATIC driver calls a dynamic to static existence check function to perform the following check.

- (1) For each non-SLC[®] 96 related tuple in RLGSDB, the existence check function calculates a grid name. The grid name is used to verify that an associated tuple exists in the circuit data relation (RLCKTDATA).
- (2) Next, a semantic check function is called to perform the following checks:
 - (a) The audit ensures that all port names stored in rIGSDB tuples are correct. The port name (cktname) is algorithmically derived from the logical key; if there is an error, an incorrect circuit will be addressed.
 - (b) The audit checks the member linkage of each rIGSDB to an rICBHC tuple to verify that it belongs to a list owned by an rICBHC tuple.

4. ERROR HANDLING

If a tuple that should exist is missing in the rICKTDATA relation, the audit inserts that tuple into the relation.

Any tuples that fail these checks are reinitialized and placed on the idle list. Any error codes used within the drivers (drstatic, drlink) also apply here.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: CKTNAME

Error Code:	CKTNAME
Error Description:	An rIGSDB tuple has an incorrect cktname stored in it. The cktname is algorithmically derived from the logical key (grpname). Therefore, something has overwritten it.
Possible Error Effect:	An incorrect circuit will be addressed.
Corrective Action Taken:	The audit reinitializes the rIGSDB tuple and places it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGSDB tuple.
<i>Bad Data</i> =	rIGSDB tuple's cktname.
<i>Good Data</i> =	Derived cktname.
<i>Logical Index</i> =	Key of rIGSDB tuple.
<i>Dump</i> =	rIGSDB tuple.

Table 2 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	An extra rIGSDB tuple was found. Either the read of rICKTDATA was successful and the equipage status was SMUNEQ, or the read failed.
Possible Error Effect:	Garbage left in the relation, which may be invalidly accessed and taken to be valid data.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGSDB.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of rIGSDB.
<i>Dump</i> =	rIGSDB tuple.

Table 3 Error Code: TUPLE

Error Code:	TUPLE
Error Description:	A dummy rIGSDB tuple contains nonzero data. Since the dummy tuple is never used for anything, something has written into it in error.
Possible Error Effect:	Invalid attempts to use the dummy tuple.
Corrective Action Taken:	The audit reinitializes the dummy tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIGSDB.
<i>Bad Data</i> =	Nonzero tuple data.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Key of rIGSDB.
<i>Dump</i> =	Dummy rIGSDB.

GSLK-A

Software Release: 5E11 - 5E13

1. GROUP SUMMARY SCAN DATA LINKAGE BLOCK (GSLK) AUDIT

A group summary scan data linkage block is used by peripheral control to link different types of group summary data block (GSDB) relations (that is, RLGSDb, RLAI_GSDb, RLDNGSDb, and so forth) to the concentrated buffer head cell relation (RLCBHC).

2. DATA STRUCTURES

For details on the fields contained in the RLGSLK relation, refer to the 5ESS[®] Translations Data Manual (235-600-1xx) and the 5ESS[®] Dynamic Data Manual (235-600-2xx).

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	An rGSLK tuple was found with a bad one-to-one linkage to a group summary scan data block (that is, rIGSDb, rIAI_GSDb). This rGSLK tuple points to another tuple, but that tuple does not point back.
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rGSLK tuple.
<i>Bad Data =</i>	Linkage map identification.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (rGSLK.linknum) of the rGSLK tuple.
<i>Dump =</i>	rGSLK tuple.

Table 2 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The rGSLK tuple is queued for origination, but the unit type attribute (rGSLK.utype) is not recognized by the audit.
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rGSLK tuple.
<i>Bad Data =</i>	Unit type value (rGSLK.unittyp) from the rGSLK tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (rGSLK.linknum) of the rGSLK tuple.
<i>Dump =</i>	rGSLK tuple.

Table 3 Error Code: INVOWNER

Error Code:	INVOWNER

Error Description:	The rGSLK tuple is linked to an invalid list.
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rGSLK tuple.
<i>Bad Data</i> =	Contents of the owner linkage (rGSDB.gscbm.st_ownk).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key (rGSLK.linknum) of the rGSLK tuple.
<i>Dump</i> =	rGSLK tuple.

Table 4 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	The rGSLK tuple is linked to the idle list, but the unit type attribute (rGSLK.unitttype) is not set to SMNULLUNIT.
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rGSLK tuple.
<i>Bad Data</i> =	Unit type (rGSLK.unitttype).
<i>Good Data</i> =	SMNULLUNIT.
<i>Logical Index</i> =	Logical key (rGSLK.linknum) of the rGSLK tuple.
<i>Dump</i> =	rGSLK tuple.

Table 5 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	The rGSLK tuple is on the idle list, but is still linked to a group summary scan data block (that is, rGSDB, rIAI_GSDB).
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rGSLK tuple.
<i>Bad Data</i> =	Nonnull data found in the rGSLK tuple.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Logical key (rGSLK.linknum) of the rGSLK tuple.
<i>Dump</i> =	rGSLK tuple.

GSLK-B

Software Release: 5E14 and later

1. GROUP SUMMARY SCAN DATA LINKAGE BLOCK (GSLK) AUDIT

A group summary scan data linkage block is used by peripheral control to link different types of group summary data block (GSDB) relations (that is, RLGSDb, RLAI_GSDb, RLDNGSDb, and so forth) to the concentrated buffer head cell relation (RLCBHC).

2. DATA STRUCTURES

For details on the fields contained in the RLGSLK relation, refer to the 5ESS® Translations Data Manual (235-600-1xx) and the 5ESS® Dynamic Data Manual (235-600-2xx).

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	An rIGSLK tuple was found with a bad one-to-one linkage to a group summary scan data block (that is, rIGSDb, rLAI_GSDb). This rIGSLK tuple points to another tuple, but that tuple does not point back.
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rIGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIGSLK tuple.
<i>Bad Data =</i>	Linkage map identification.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (rIGSLK.linknum) of the rIGSLK tuple.
<i>Dump =</i>	rIGSLK tuple.

Table 2 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The rIGSLK tuple is queued for origination, but the unit type attribute (rIGSLK.utype) is not recognized by the audit.
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rIGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIGSLK tuple.
<i>Bad Data =</i>	Unit type value (rIGSLK.unittyp) from the rIGSLK tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (rIGSLK.linknum) of the rIGSLK tuple.
<i>Dump =</i>	rIGSLK tuple.

Table 3 Error Code: INVOWNER

Error Code:	INVOWNER

Error Description:	The rGSLK tuple is linked to an invalid list.
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rGSLK tuple.
<i>Bad Data</i> =	Contents of the owner linkage (rGSDB.gscbm.st_ownk).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key (rGSLK.linknum) of the rGSLK tuple.
<i>Dump</i> =	rGSLK tuple.

Table 4 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	The rGSLK tuple is linked to the idle list, but the unit type attribute (rGSLK.unitttype) is not set to SMNULLUNIT.
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rGSLK tuple.
<i>Bad Data</i> =	Unit type (rGSLK.unitttype).
<i>Good Data</i> =	SMNULLUNIT.
<i>Logical Index</i> =	Logical key (rGSLK.linknum) of the rGSLK tuple.
<i>Dump</i> =	rGSLK tuple.

Table 5 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	The rGSLK tuple is on the idle list, but is still linked to a group summary scan data block (that is, rGSDB, rAI GSDB).
Possible Error Effect:	May cause errors in processing the queue for line originations.
Corrective Action Taken:	The audit reinitializes the rGSLK tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rGSLK tuple.
<i>Bad Data</i> =	Nonnull data found in the rGSLK tuple.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Logical key (rGSLK.linknum) of the rGSLK tuple.
<i>Dump</i> =	rGSLK tuple.

16. H - IM

HCCALLTQ

Software Release: 5E10 and later

1. HEAD CELLS FOR CALL TYPE QUEUES (HCCALLTQ) AUDIT

Features of the operator services position system (OSPS) include basic automatic call distribution (ACD) and call handling. These features contain the call processing software needed for an operator to log onto a basic services terminal (BST) and handle requests for operator services. The ACD device routes calls to available positions. Audits are needed to maintain the integrity of the data structures needed to perform these OSPS functions. The HCCALLTQ audit verifies call type related information.

2. DATA STRUCTURES

The HCCALLTQ audit uses three relations, the static call type information relation (RLCTINFO), the dynamic head cells for call type queues relation (RLHCCALLTQ), and the call queue data block relation (RLCQDB). These data structures are shown in Figure 1.

Figure 1 (HCCALLTQ-1) Data Structures of the HCCALLTQ Audit

3. AUDIT CHECKS

The HCCALLTQ audit calls the dynamic driver (DRDYN) to step through the call queue data block head cells. The driver examines the links for each tuple. If they are valid, it invokes the semantic check function to perform the following checks:

- The audit ensures that the fields in rLHCCALLTQ contain valid values. Most fields should contain the same values as the corresponding fields in rLCTINFO.
- The audit makes a count of the call queue data blocks that are linked to the rLHCCALLTQ tuple and checks the count with the **calls_inq** field of rLHCCALLTQ.
- The audit also validates the head cell linkages to rLCQDB.

- (d) The audit also checks for extra rIHCCALLTQ tuples. If there is not a corresponding rICTINFO tuple, the rIHCCALLTQ tuple is zeroed out.

4. ERROR HANDLING

If any inconsistencies are found in rIHCCALLTQ, the inconsistent values are replaced with the correct data from rICTINFO or, in the case of a count error, the calculated count.

The HCCALLTQ audit schedules the CQDB audit as a related audit when it detects errors.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The number of rICQDB tuples linked to this HCCALLTQ is inconsistent with the value in the calls_inq attribute.
Possible Error Effect:	The tuple contains invalid information.
Corrective Action Taken:	The value in the calls_inq attribute is replaced with the correct value obtained by the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIHCCALLTQ.
<i>Bad Data =</i>	cltq_ptr→calls_inq.
<i>Good Data =</i>	calls_count.
<i>Logical Index =</i>	Key of rIHCCALLTQ.
<i>Dump =</i>	rIHCCALLTQ tuple.

Table 2 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	An extra tuple was found.
Possible Error Effect:	The extra tuple contains garbage, which may be invalidly accessed and presumed to be valid data.
Corrective Action Taken:	The extra rIHCCALLTQ tuple that was found is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIHCCALLTQ.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of rIHCCALLTQ.
<i>Dump =</i>	rIHCCALLTQ tuple.

Table 3 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The static tuple rICTINFO does not exist for the dynamic tuple rIHCCALLTQ.
Possible Error Effect:	The data in rIHCCALLTQ is based upon data in rICTINFO, but the rICTINFO tuple doesn't exist when it should.
Corrective Action Taken:	The rICTINFO must be created and initialized.
Manual Action Required:	Action must be taken to create and initialize the missing rICTINFO tuple.
Dump Description:	
<i>Error Address =</i>	Address of rIHCCALLTQ tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of rIHCCALLTQ.
<i>Dump =</i>	rIHCCALLTQ.

Table 4 Error Code: SEMANTIC

Error Code:	SEMANTIC
Error Description:	The dynamic data for this tuple in rHCCALLTQ is corrupted. It is compared against the static data in rICTINFO.
Possible Error Effect:	The tuple contains invalid information.
Corrective Action Taken:	The audit will replace the incorrect data with valid data from the rICTINFO tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHCCALLTQ.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of rHCCALLTQ.
<i>Dump =</i>	rHCCALLTQ tuple.

HCCLLQ

Software Release: 5E11 and later

1. HEAD CELLS OF CALL QUEUES (HCCLLQ) AUDIT

The automatic call distributor (ACD) management information system presents queued calls for processing to available agents who are logged into the switch through an integrated digital services (ISDN) position having full business and residential customer services (BRCS) features. Each call queue data block whether it is idle or representing a call is associated with the data in the RLHC_CLLQ (head cells of call queues) relation. Data in this relation is audited by the HCCLLQ audit which runs in routine and elevated segmented modes.

2. DATA STRUCTURES

For details on the fields contained in the RLHC_CLLQ relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit found that the idle rHC_CLLQ tuple's maximum number of calls count, max_calls, value is incorrect.
Possible Error Effect:	Calls may not be queued properly.
Corrective Action Taken:	The rHC_CLLQ max_calls field will be corrected to the value of the call queue maximum calls Glcqmcs_global parameter.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the idle rHC_CLLQ tuple.
<i>Bad Data =</i>	The tuple's maximum number of calls count (rHC_CLLQ.max_calls).
<i>Good Data =</i>	The value of the call queue maximum calls global parameter (Glcqmcs).
<i>Logical Index =</i>	The logical key of the idle rHC_CLLQ tuple.
<i>Dump =</i>	The idle rHC_CLLQ tuple.

Table 2 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit found that the rHC_CLLQ tuple's calls in queue count, calls_inq, value is incorrect.
Possible Error Effect:	Calls in this queue may not be processed properly.
Corrective Action Taken:	The rHC_CLLQ calls_inq field will be corrected to the value calculated by the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rHC_CLLQ tuple.
<i>Bad Data =</i>	The tuple's calls in queue count (rHC_CLLQ.calls_inq).
<i>Good Data =</i>	The value for calls in queue calculated by the audit.
<i>Logical Index =</i>	The logical key of the rHC_CLLQ tuple.

<i>Dump</i> =	The rIHC_CLLQ tuple.

Table 3 Error Code: SEMANTIC

Error Code:	SEMANTIC
Error Description:	The audit found an inconsistency between the dynamic rIHC_CLLQ tuple and the static rICQPARM tuple.
Possible Error Effect:	This may result in call queuing not functioning properly.
Corrective Action Taken:	The rIHC_CLLQ tuple is recovered based on the corresponding static data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIHC_CLLQ tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The logical key of the rIHC_CLLQ tuple.
<i>Dump 1</i> =	The rIHC_CLLQ tuple.
<i>Dump 2</i> =	The rICQPARM tuple.

HCSERVTM

Software Release: 5E10 and later

1. HEAD CELLS FOR SERVING TEAM POSITION QUEUES (HCSERVTM) AUDIT

Features of the operator services position system (OSPS) include basic automatic call distribution (ACD) and call handling. These features contain the call processing software needed for an operator to log onto a basic services terminal (BST) and handle requests for operator services. The ACD device routes calls to available positions. Audits are needed to maintain the integrity of the data structures needed to perform these OSPS functions. The HCSERVTM audit ensures the accuracy of the position lists on a serving team basis and verifies the number of positions logged into each team field.

2. DATA STRUCTURES

The HCSERVTM audit uses three data structures: the static serving team information relation (RLSTINFO), the dynamic serving team head cells relation (RLHCSERVTM), and the serving team queue data block relation (RLSTQDB). These data structures are shown in Figure 1.

Figure 1 (HCSERVTM-1) Data Structures of the HCSERVTM Audit

3. AUDIT CHECKS

The HCSERVTM audit calls the dynamic driver (DRDYN) to step through the serving team queue data block head cells relation (rLHCSERVTM). If the linkages are valid, the audit will invoke the semantic check function, which performs the following checks:

- (a) The serving team field (serv_tm), which is the key of rLHCSERVTM, should have a match in the corresponding field of rLSTINFO. If it does not, the rLHCSERVTM tuple is deleted as an extra tuple.
- (b) The audit counts the serving team queue data blocks in rLSTQDB and ensures that the count equals the count in the number of logins field (num_login) in rLHCSERVTM.

4. ERROR HANDLING

The audit deletes rHCSEVTM tuples without matching rISTINFO tuples. The audit replaces erroneous counts in the num_login field with the calculated count.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The number of rISTQDB tuples linked to this HCSEVTM is inconsistent with the value in the num_login attribute.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The value in rHCSEVTM tuple attribute (num_login) is replaced with the calculated value obtained by the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rHCSEVTM tuple.
<i>Bad Data</i> =	rHCSEVTM tuple attribute num_login.
<i>Good Data</i> =	Calculated value of login_count.
<i>Logical Index</i> =	rHCSEVTM tuple.
<i>Dump</i> =	rHCSEVTM tuple.

Table 2 Error Code: DUPTUP

Error Code:	DUPTUP
Error Description:	An extra rHCSEVTM tuple was found that does not have a corresponding rIST_PARM tuple.
Possible Error Effect:	The extra rHCSEVTM tuple contains invalid information, which may be invalidly accessed and presumed to be valid data.
Corrective Action Taken:	The extra rHCSEVTM tuple that was found is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rHCSEVTM tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rHCSEVTM tuple.
<i>Dump</i> =	rHCSEVTM tuple.

Table 3 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	An extra rHCSEVTM tuple was found that does not have a corresponding rISTINFO tuple.
Possible Error Effect:	The extra rHCSEVTM tuple contains invalid information, which may be invalidly accessed and presumed to be valid data.
Corrective Action Taken:	The extra rHCSEVTM tuple that was found is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rHCSEVTM tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rHCSEVTM tuple.
<i>Dump</i> =	rHCSEVTM tuple.

Table 4 Error Code: ODD_COUNT

Error Code:	ODD_COUNT
Error Description:	The number of rISTQDB tuples shown to be handling calls from supporting queues does not equal the num_sup attribute in rHCSEVTM tuple.

Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The value in the rIHCSERVMT tuple attribute (num_sup) is replaced with the calculated value obtained by the audit (sup_count).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIHCSERVMT tuple.
<i>Bad Data =</i>	rIHCSERVMT tuple attribute num_sup.
<i>Good Data =</i>	The calculated value sup_count.
<i>Logical Index =</i>	rIHCSERVMT tuple.
<i>Dump =</i>	rIHCSERVMT tuple.

Table 5 Error Code: ODD_DATA

Error Code:	ODD_DATA
Error Description:	The maximum number of rISTQDB tuple that may be handling calls from supporting queues, as indicated by the mxnumsup attribute, is not equal to the product of the num_login and mxpcntsup attributes divided by 100.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The value in rIHCSERVMT tuple attribute (mxnumsup) is replaced with the calculated value obtained by the audit (mxnumsup).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIHCSERVMT tuple.
<i>Bad Data =</i>	rIHCSERVMT tuple attribute (mxnumsup).
<i>Good Data =</i>	Calculated value of mxnumsup.
<i>Logical Index =</i>	rIHCSERVMT tuple.
<i>Dump =</i>	rIHCSERVMT tuple.

Table 6 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The static tuple rISTINFO does not exist for the dynamic tuple rIHCSERVMT.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	None
Manual Action Required:	Action must be taken to insert the missing static rISTINFO tuple with the logical key of rIHCSERVMT tuple.
Dump Description:	
<i>Error Address =</i>	Address of rIHCSERVMT tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	rIHCSERVMT tuple.
<i>Dump =</i>	rIHCSERVMT tuple.

Table 7 Error Code: R_COUNTS

Error Code:	R_COUNTS
Error Description:	The number of rISTQDB tuples linked to the busy list of this rIHCSERVMT tuple is inconsistent with the value in the num_busy attribute.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The value in the num_busy attribute is replaced with the calculated value (busy_count).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIHCSERVMT tuple.
<i>Bad Data =</i>	rIHCSERVMT tuple attribute num_busy.
<i>Good Data =</i>	Calculated busy count (busy_count).
<i>Logical Index =</i>	rIHCSERVMT tuple.
<i>Dump =</i>	rIHCSERVMT tuple.

Table 8 Error Code: SEMANTIC

Error Code:	SEMANTIC
Error Description:	The dynamic data for this tuple in rIHCSERVMT is corrupted. It is compared against the static data in rISTINFO tuple attributes (intra_alwd and mxpcntsup).
Possible Error Effect:	Varies according to conditions.

Corrective Action Taken:	The audit will replace the incorrect data with valid data from the rISTINFO tuple attributes (intra_alwd and mxpcntsup).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rHCSESVTM tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rHCSESVTM tuple.
<i>Dump</i> =	rHCSESVTM tuple.

Table 9 Error Code: SPLOSTUP

Error Code:	SPLOSTUP
Error Description:	The static rINTERFLW tuple does not exist for the dynamic rHCSESVTM tuple.
Possible Error Effect:	The data in rHCSESVTM is based upon data in rINTERFLW, but the rINTERFLW tuple doesn't exist when it should.
Corrective Action Taken:	None
Manual Action Required:	Action must be taken to insert the missing static rINTERFLW tuple with the logical key of rHCSESVTM tuple.
Dump Description:	
<i>Error Address</i> =	Address of rHCSESVTM tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rHCSESVTM tuple.
<i>Dump</i> =	rHCSESVTM tuple.

Table 10 Error Code: UNEQUAL

Error Code:	UNEQUAL
Error Description:	The dynamic data for this tuple in rHCSESVTM is corrupted. It is compared against the static data in rINTERFLW tuple attributes (if_on and rr_on).
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit will replace the incorrect data with valid data from the rINTERFLW tuple attributes (if_on and rr_on).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rHCSESVTM tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rHCSESVTM tuple.
<i>Dump</i> =	rHCSESVTM tuple.

HCSRVQ

Software Release: 5E11 and later

1. HEAD CELLS OF SERVING TEAM QUEUE (HCSRVQ) AUDIT

The automatic call distributor (ACD) management information system presents queued calls for processing to available agents who are logged into the switch through an integrated digital services (ISDN) position having full business and residential customer services (BRCS) features. Each serving team queue block whether it is unoccupied or being used by an agent is associated with the data in the RLHC_SRVQ (head cells of serving team queues) relation. Data in this relation is audited by the HCSRVQ audit which runs in routine and elevated segmented modes.

2. DATA STRUCTURES

For details on the fields contained in the RLHC_SRVQ relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx).

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BAD_COUNTS

Error Code:	BAD_COUNTS
Error Description:	The audit found that the value for the rLHC_SRVQ count of the rLHC_CLLQ cwait attributes in the call queues associated with this serving team, cw_lamp, is incorrect.
Possible Error Effect:	This serving team's call wait lamp may not function properly.
Corrective Action Taken:	The rLHC_SRVQ cw_lamp field will be corrected to the value calculated by this audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	N/A
<i>Bad Data =</i>	The tuple's count of rLHC_CLLQ cwait attributes (rLHC_SRVQ.cw_lamp).
<i>Good Data =</i>	The audit calculated count.
<i>Logical Index =</i>	The logical key of the rLHC_SRVQ tuple.
<i>Dump 1 =</i>	The rLHC_SRVQ tuple.
<i>Dump 2 =</i>	The rLCQMASK tuple.

Table 2 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit found that the rLHC_SRVQ number of busy serving team positions count, num_busy, value is incorrect.
Possible Error Effect:	This serving team's call processing may not function properly.
Corrective Action Taken:	The rLHC_SRVQ num_busy field will be corrected to the value calculated by this audit.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	0. This distinguishes this COUNTS error from others.
<i>Bad Data</i> =	The tuple's number of busy positions count (rIHC_SRVQ.num_busy).
<i>Good Data</i> =	The number of busy positions calculated by the audit.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump</i> =	The rIHC_SRVQ tuple.

Table 3 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit found that the rIHC_SRVQ number of supporting queues count, num_sup, value is incorrect.
Possible Error Effect:	This serving team's call processing may not function properly.
Corrective Action Taken:	The rIHC_SRVQ num_sup field will be corrected to the value calculated by this audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	1. This distinguishes this COUNTS error from others.
<i>Bad Data</i> =	The tuple's number of supporting queues count (rIHC_SRVQ.num_sup).
<i>Good Data</i> =	The number of supporting queue calls being served calculated by the audit.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump</i> =	The rIHC_SRVQ tuple.

Table 4 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit found that the rIHC_SRVQ number of agents logged in count, num_login, value is incorrect.
Possible Error Effect:	This serving team's call processing may not function properly.
Corrective Action Taken:	The rIHC_SRVQ num_login field will be corrected to the value calculated by this audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	2. This distinguishes this COUNTS error from others.
<i>Bad Data</i> =	The tuple's number of logged in count (rIHC_SRVQ.num_login).
<i>Good Data</i> =	The number of logged in count calculated by the audit.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump</i> =	The rIHC_SRVQ tuple.

Table 5 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit found that the rIHC_SRVQ maximum number of team positions allowed to handle calls from supporting queues count, mxnumsup, value is incorrect.
Possible Error Effect:	This serving team's supporting queue call processing may not function properly.
Corrective Action Taken:	The rIHC_SRVQ mxnumsup field will be corrected to the value calculated by this audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	3. This distinguishes this COUNTS error from others.
<i>Bad Data</i> =	The tuple's maximum number of supporting queue calls (rIHC_SRVQ.mxnumsup).
<i>Good Data</i> =	The audit calculated count.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump</i> =	The rIHC_SRVQ tuple.

Table 6 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit found that the value for the count of call queues associated with principle serving team, cq_count, was inconsistent between the dynamic rIHC_SRVQ tuple and its corresponding static rICQMASK tuple.
Possible Error Effect:	Principle serving team call processing may not function properly.

Corrective Action Taken:	The rIHC_SRVQ cq_count field will be corrected to the rICQMASK cq_count value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	4. This distinguishes this COUNTS error from others.
<i>Bad Data =</i>	The tuple's count of principle serving team's call queues (rIHC_SRVQ.cq_count).
<i>Good Data =</i>	The rICQMASK count of principle serving team's call queues (rICQMASK.cq_count).
<i>Logical Index =</i>	The logical key of the rIHC_SRVQ tuple.
<i>Dump 1 =</i>	The rIHC_SRVQ tuple.
<i>Dump 2 =</i>	The rICQMASK tuple.

Table 7 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit found that the value for the count of call queues associated with the supporting serving team, scq_count, was inconsistent between the dynamic rIHC_SRVQ tuple and its corresponding static rICQMASK tuple.
Possible Error Effect:	Supporting serving team call processing may not function properly.
Corrective Action Taken:	The rIHC_SRVQ scq_count field will be corrected to the rICQMASK cq_count value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	5. This distinguishes this COUNTS error from others.
<i>Bad Data =</i>	The tuple's count of supporting serving team's call queues (rIHC_SRVQ.scq_count).
<i>Good Data =</i>	The rICQMASK count of supporting serving team's call queues (rICQMASK.cq_count).
<i>Logical Index =</i>	The logical key of the rIHC_SRVQ tuple.
<i>Dump 1 =</i>	The rIHC_SRVQ tuple.
<i>Dump 2 =</i>	The rICQMASK tuple.

Table 8 Error Code: NOTZERO

Error Code:	NOTZERO
Error Description:	The audit found that the rIHC_SRVQ tuple corresponding to the unoccupied positions head cell has a non-zero count value for either the count of call queues associated with principle serving team, cq_count or the count of call queues associated with the supporting serving team, scq_count, but this tuple's supporting queue number field, supq, was not zero. These counts should always be zero, since they are associated with the unoccupied positions list.
Possible Error Effect:	This may cause call processing resources to be used incorrectly.
Corrective Action Taken:	The audit will set the rIHC_SRVQ tuple's cq_count and scq_count fields to zero.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIHC_SRVQ tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The logical key of the rIHC_SRVQ tuple.
<i>Dump =</i>	The rIHC_SRVQ tuple.

Table 9 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit found the static principle serving team rICQMASK (call queue bit masks) tuple missing.
Possible Error Effect:	The audit cannot correct the count, so the principle serving team call processing may not function properly.
Corrective Action Taken:	None.
Manual Action Required:	The missing static rICQMASK tuple must be inserted for the principle serving team. It should be inserted by recent change or ODBE with the key being the value which is dumped in good data.

Dump Description:	
<i>Error Address</i> =	0. This distinguishes this ODDLOSTTUP error from others.
<i>Bad Data</i> =	Return value from DB (DBNO_MATCH).
<i>Good Data</i> =	The serving team key of the rICQMASK tuple.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump</i> =	The rIHC_SRVQ tuple.

Table 10 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit found the static supporting serving team rICQMASK (call queue bit masks) tuple missing.
Possible Error Effect:	The audit cannot correct the count, so the supporting serving team call processing may not function properly.
Corrective Action Taken:	None.
Manual Action Required:	The missing static rICQMASK tuple must be inserted for the supporting serving team. It should be inserted by recent change or ODBE with the key being the value which is dumped in good data.
Dump Description:	
<i>Error Address</i> =	1. This distinguishes this ODDLOSTTUP error from others.
<i>Bad Data</i> =	Return value from DB (DBNO_MATCH).
<i>Good Data</i> =	The serving team key of the rICQMASK tuple.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump</i> =	The rIHC_SRVQ tuple.

Table 11 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit found the static rISTPARM (serving team parameters) tuple missing.
Possible Error Effect:	The audit cannot recover the rIHC_SRVQ intra_alwd and mxpcntsup fields due to the missing rISTPARM tuple, so the supporting serving team call processing may not function properly.
Corrective Action Taken:	None.
Manual Action Required:	The missing static rISTPARM tuple must be inserted for the serving team. It should be inserted by recent change or ODBE with the key being the value which is dumped in good data.
Dump Description:	
<i>Error Address</i> =	2. This distinguishes this ODDLOSTTUP error from others.
<i>Bad Data</i> =	Return value from DB (DBNO_MATCH).
<i>Good Data</i> =	The serving team key of the rISTPARM tuple.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump</i> =	The rIHC_SRVQ tuple.

Table 12 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit found the static principle serving team rICQMASK (call queue bit masks) tuple missing.
Possible Error Effect:	The audit cannot recover the count, so the principle serving team call processing may not function properly.
Corrective Action Taken:	None.
Manual Action Required:	The missing static rICQMASK tuple must be inserted for the principle serving team. It should be inserted by recent change or ODBE with the key being the value which is dumped in good data.
Dump Description:	
<i>Error Address</i> =	3. This distinguishes this ODDLOSTTUP error from others.
<i>Bad Data</i> =	Return value from DB (DBNO_MATCH).
<i>Good Data</i> =	The serving team key of the rICQMASK tuple.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump</i> =	The rIHC_SRVQ tuple.

Table 13 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP

Error Description:	The audit found the static supporting serving team rICQMASK (call queue bit masks) tuple missing.
Possible Error Effect:	The audit cannot recover the count, so the supporting serving team call processing may not function properly.
Corrective Action Taken:	None.
Manual Action Required:	The missing static rICQMASK tuple must be inserted for the supporting serving team. It should be inserted by recent change or ODBE with the key being the value which is dumped in good data.
Dump Description:	
<i>Error Address</i> =	4. This distinguishes this ODDLOSTTUP error from others.
<i>Bad Data</i> =	Return value from DB (DBNO_MATCH).
<i>Good Data</i> =	The serving team key of the rICQMASK tuple.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump</i> =	The rIHC_SRVQ tuple.

Table 14 Error Code: SEMANTIC

Error Code:	SEMANTIC
Error Description:	The audit found an inconsistency between the dynamic rIHC_SRVQ tuple and the static rISTPARM tuple.
Possible Error Effect:	This may result in call processing not functioning properly.
Corrective Action Taken:	The rIHC_SRVQ tuple is recovered based on the corresponding static data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIHC_SRVQ tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The logical key of the rIHC_SRVQ tuple.
<i>Dump 1</i> =	The rIHC_SRVQ tuple.
<i>Dump 2</i> =	The rISTPARM tuple.

HLSC

Software Release: 5E10 and later

1. HIGH-LEVEL SERVICE CIRCUIT (HLSC) AUDIT

Line units (both models LU 1 and LU 2) contain from four to six high-level service circuits that serve 64 channel circuits each. The integrated services line unit Z_card (ISLU) contains six high-level service circuit that service up to 512 analog line cards. The high-level service circuit performs three major functions:

- Testing for a satisfactory origination.
- Testing for a satisfactory termination.
- Ringing.

The software representing the high-level service circuit contains operational code and status tables such as the long job occupancy map and the short job occupancy map. The long job occupancy map contains one bit per half second of time a process may be on the high-level service circuit. The short job occupancy map contains one bit per 50 milliseconds of time. The high-level service circuit may be time-shared among several processes. The high-level service circuit audit (HLSC) ensures that the high-level service circuits can be allocated properly. The audit checks all the high-level service circuits in each line unit.

This audit is part of the peripheral control audits subgroup. It runs in the OSDS-M environment in the initialization and segmented modes.

2. DATA STRUCTURES

The HLSC audit checks the dynamic high-level service circuit relation (RLHLSC), the static high-level service circuit relation (RLHS_CKT), and the circuit data relation (RLCKTDATA). Within each tuple of RLHLSC is the channel control block user array (ccbusr), which indicates the channels using the high-level service circuit. The audit obtains information from the circuit data block common area relation (RLCDBCOM) and the channel control block common area relation (RLCCBCOM). The audit also verifies data in several arrays: the long job occupancy map (PChlunit) and the channel control block foreground communication region (pcCCBFG). Two tables, one for ringing high-level service circuits (Hltabl1) and one for non-ringing high-level service circuits (Hltabl2) are checked at the end of the HLSC audit routine. Figure 1 shows these data structures.

Figure 1 (HLSC-1) Data Structures

3. AUDIT CHECKS

The HLSC audit invokes the dynamic driver (DRDYN) to step through the tuples of RLHLSC and perform the following semantic checks. As the driver steps through rHLSC, it obtains the logical key of each tuple. The audit calculates the line unit to which the tuple (that is, the high-level service circuit represented by the tuple) belongs, and the internal high-level service circuit number.

- (1) Based on the line unit number and internal circuit number, the audit calculates the circuit name. With the circuit name, the audit checks the circuit data relation (rCKTDATA) and ensures that the line unit is equipped with the high-level service circuit (that is, the audit ensures that the circuit exists).

If the audit does not find the appropriate tuple in rCKTDATA, it makes a cross-reference check to rHS_CKT. If the tuple exists in rHS_CKT, the audit reports an error because a tuple of rCKTDATA has been lost. If the

tuple does not exist in rLHS_CKT and rICKTDATA, there should be no dynamic data in the rHLSC tuple.

The tuple in rICKTDATA provides information about the equipage state of the circuit. If the circuit is in the operational or growth state, dynamic data for the tuple should exist in rHLSC.

- (2) The audit checks the circuit name from rICKTDATA against the circuit name of the rHLSC tuple. The same circuit name is used to obtain the related tuple in rCDBCOM. If the circuit name in rHLSC and rICKTDATA do not agree, the audit reports an error and passes the name of the related rCDBCOM tuple to the recovery function. The tuples of rCDBCOM contain status information (in-service and out-of-service) for the service circuits; the circuit status determines the recovery actions the audit takes.
- (3) If the circuit names in rHLSC and rICKTDATA agree, the audit obtains the circuit status from rCDBCOM.

- (a) If the circuit is out of service, the related PChlunit array entries should all be busy. If they are not, the audit invokes the recovery function and reports the error.

If the entries in PChlunit are busy, the audit checks the rHLSC tuple and ensures that all the slots in the ccbusr array are on the out-of-service list. The audit considers slots not on the out-of-service list errors and invokes the recovery function.

- (b) If the high-level service circuit is in service, the audit checks each slot in the PChlunit array. If the entry is set, there must be a corresponding entry in the ccbusr array within rHLSC that is not null. The audit examines the pcCCBFG communication region entry for the tuple of rCCBCOM using the high-level service circuit based on the ccbusr array entry. The audit performs a point-to/point-back check from rHLSC to the channel control block foreground communication region for processes time-sharing the high-level service circuit.

If the entry is not set, the audit tests the slot in the ccbusr array for consistency.

- (4) After all rHLSC tuples have been audited, the audit interfaces with the Peripheral Control subsystem (PC) by calling a function to check the Hltabl1 and Hltabl2 tables. If the PC function detects an error, it returns a failure to the audit and corrects the data itself. The failure triggers a GRPINFO audit error.

4. ERROR HANDLING

Error recovery depends on whether the circuit is in or out of service. The audit makes the determination based on the information in rCDBCOM.

If the circuit is out of service, the audit makes the PChlunit array busy and adds each slot in the ccbusr array to the out-of-service list. The audit then quarantines the rCDBCOM tuple.

If the circuit is in service, the audit initializes PChlunit. It quarantines all related slots of the ccbusr array if they are set and if they pass a point-to/point-back check between rHLSC and the channel control block foreground communication region. If the tuples of the ccbusr array are not set, the audit initializes them.

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: ALWOOS

Error Code:	ALWOOS
Error Description:	The high level service circuit is out-of-service but the long job occupancy map is not marked busy.

Possible Error Effect:	The high level service circuit is in an inconsistent state and not totally out-of-service.
Corrective Action Taken:	The audit zeroes the long job occupancy map for the high level service circuit in error. All rICBCOM tuples associated with the high level service circuit are quarantined. The ccbusr array is zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHLSC tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	rHLSC tuple.
<i>Dump</i>	rHLSC tuple high level service circuit number. Long job occupancy map for the line unit.

Table 2 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	The high level service circuit is marked traffic busy in the long job occupancy map, but the rICBCOM user array is not active indicating that an rICBCOM is not using the high level service circuit on a call.
Possible Error Effect:	A high level service circuit is incorrectly activated on a call.
Corrective Action Taken:	The audit zeroes the long job occupancy map for the high level service circuit in error. All rICBCOM tuples associated with the high level service circuit are quarantined. The ccbusr array is zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHLSC tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	rHLSC tuple.
<i>Dump =</i>	rHLSC tuple high level service circuit number. Long job occupancy map for the line unit.

Table 3 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	Garbage has been found in an rHLSC tuple that should be vacant (zeroed out).
Possible Error Effect:	Propagation of errors in PC allocation of HLSC resources.
Corrective Action Taken:	The tuple is zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHLSC tuple.
<i>Bad Data =</i>	Garbage in the name field (circuit name).
<i>Good Data =</i>	The circuit name found in rUNITDATA.
<i>Logical Index =</i>	The physical key of the rHLSC tuple.
<i>Dump</i>	rHLSC tuple.

Table 4 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	Garbage has been found in an rHLSC tuple that should be vacant (zeroed out).
Possible Error Effect:	Propagation of errors in PC allocation of HLSC resources.
Corrective Action Taken:	The tuple is zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHLSC tuple.
<i>Bad Data =</i>	Garbage in the name field (circuit name).
<i>Good Data =</i>	0.
<i>Logical Index =</i>	0.
<i>Dump</i>	rHLSC tuple.

Table 5 Error Code: GRPINFO

Error Code:	GRPINFO
Error Description:	The HLSC preferred ringing group information tables are inconsistent with

	respect to the HLSC long job occupancy tables. The PChlconfig function audits these tables for all HLSCs over all line units. The recovery of the preferred ringing group tables is done by the PChlconfig function. No additional information is needed for analysis.
Possible Error Effect:	The HLSC resource allocation for long/short jobs may be affected.
Corrective Action Taken:	The PChlconfig function corrects the inconsistency.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump</i>	NA.

Table 6 Error Code: HLSC_CCB

Error Code:	HLSC_CCB
Error Description:	The high level service circuit is marked traffic busy, but the rCCBCOM using this time portion of the high level service circuit fails point-to/point-back checks.
Possible Error Effect:	A high level service circuit is incorrectly activated on a call.
Corrective Action Taken:	The audit zeroes the long job occupancy map for the high level service circuit in error. All rCCBCOM tuples associated with the high level service circuit are quarantined. The ccbusr array is zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHLSC tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	rHLSC tuple.
<i>Dump =</i>	rHLSC tuple High level service circuit number. Long job occupancy map for the line unit.

Table 7 Error Code: IDLE_BUSY

Error Code:	IDLE_BUSY
Error Description:	The high level service circuit is marked traffic idle in the long job occupancy map, but the rCCBCOM user array is not idle indicating that a rCCBCOM is using the high level service circuit on a call.
Possible Error Effect:	A high level service circuit is incorrectly activated on a call.
Corrective Action Taken:	The audit zeroes the long job occupancy map for the high level service circuit in error. All rCCBCOM tuples associated with the high level service circuit are quarantined. The ccbusr array is zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHLSC tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	rHLSC tuple.
<i>Dump =</i>	rHLSC tuple High level service circuit number. Long job occupancy map for the line unit.

Table 8 Error Code: KEY

Error Code:	KEY
Error Description:	The rHLSC tuple circuit name is not the same as the rHS_CKT tuple circuit name.
Possible Error Effect:	Erroneous job allocation for the HLSC.
Corrective Action Taken:	The circuit name is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHLSC tuple.
<i>Bad Data =</i>	rHLSC circuit name.
<i>Good Data =</i>	rHS_CKT circuit name.
<i>Logical Index =</i>	DA key calculated for the rHLSC tuple.

<i>Dump</i>	rHLSC tuple.

Table 9 Error Code: OOSQUAL

Error Code:	OOSQUAL
Error Description:	The high level service circuit is out-of-service but there is an active call using the circuit.
Possible Error Effect:	An out-of-service circuit is in an inconsistent state and is being used by call processing when it shouldn't.
Corrective Action Taken:	The audit zeroes the long job occupancy map for the high level service circuit in error. All rICCB COM tuples associated with the high level service circuit are quarantined. The ccbusr array is zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rHLSC tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	rHLSC tuple.
<i>Dump</i> =	rHLSC tuple high level service circuit number. Long job occupancy map for the line unit.

Table 10 Error Code: TUPLE

Error Code:	TUPLE
Error Description:	The rICKTDATA tuple for the HLSC shows the circuit unequipped. There should be no dynamic data for this circuit, however the audit found garbage in the rHLSC tuple.
Possible Error Effect:	Errors may be propagated to PC for HLSC job allocation.
Corrective Action Taken:	The tuple is zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rHLSC tuple.
<i>Bad Data</i> =	Contents in the key field of the rHLSC tuple.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	DA key calculated for the rHLSC tuple.
<i>Dump</i>	NA.

HTLSEQN

Software Release: 5E10 and later

1. AUTOQUOTE HOTEL/MOTEL (HTLSEQN) AUDIT

This audit verifies the data in the RLHTL_SEQN relation. It checks the key and seq_num fields.

The RLHTL_SEQN relation is built from the static relation RLFC_HOTEL. This audit accesses each tuple in RLFC_HOTEL. For every auto-quote hotel identifier (aqhid), it checks to make sure there exists a rHTL_SEQN tuple. The audit then checks to see if the key is correct; it should be equal to the aqhid+1. If it is not, then an error is reported and the key is corrected. Next the sequence number field (seq_num) of the rHTL_SEQN relation is checked to make sure that it is in the valid range (1-999). If it is invalid, an error is reported and the field is set to 1.

2. DATA STRUCTURES

Figure 1 illustrates the basic audit structure.

Figure 1 (HTLSEQN-1) HTLSEQN Audit Structure Chart

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The HTLSEQN audit calls the DRSTATIC driver. The driver calls AU\$dhtl_seqn() to perform the semantic checks.

When a lost tuple is found, a new tuple is created and inserted into the RLHTL_SEQN relation. When other errors are found, the error is reported and the error is corrected if possible. If not, the tuple is zeroed out and reinitialized.

The HTLSEQN audit uses the following error codes, and also all those used by the driver, AUdrstatic.

Table 1 Error Code: KEY

Error Code:	KEY
Error Description:	The hotelid field in rHTL_SEQN is not the correct value (aqhid+1).
Possible Error Effect:	None.
Corrective Action Taken:	The rHTL_SEQN tuple will be updated with the hotelid field set to the aqhid field + 1 of the FC_HOTEL relation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHTL_SEQN.
<i>Bad Data =</i>	hotelid field of rHTLSEQN.
<i>Good Data =</i>	aqhid field + 1 of rFC_HOTEL.
<i>Logical Index =</i>	rHTL_SEQN.
<i>Dump =</i>	Contents of the rHTL_SEQN tuple.

Table 2 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	An rHTL_SEQN does not exist for a port when it should.
Possible Error Effect:	This will cause lost resources.
Corrective Action Taken:	The rHTL_SEQN tuple will be inserted into the database.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHTL_SEQN.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	rHTL_SEQN (aqhid + 1).
<i>Dump =</i>	NA.

Table 3 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The seq_numb field in rHTL_SEQN is not within the range 1 - 999.
Possible Error Effect:	This will cause a bad sequence number to be used.
Corrective Action Taken:	The rHTL_SEQN tuple will be updated with the seq_numb field set to 1.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rHTL_SEQN.
<i>Bad Data =</i>	seq_numb field of rHTLSEQN.
<i>Good Data =</i>	1.
<i>Logical Index =</i>	rHTL_SEQN.
<i>Dump =</i>	Contents of the rHTL_SEQN tuple.

ICLIDIDX

Software Release: 5E10 and later

1. INDIVIDUAL CALLING LINE IDENTIFICATION FOR CALLING NUMBER DELIVERY INDEX (ICLIDIDX) AUDIT

The RLICLIDIDX relation is used by the LASS feature ICLID to index into the RLCNDDATA and RLCNAMDATA (usage sensitive only) relations. The ICLIDIDX audit performs static to dynamic existence checks of the static RLICLIDIDX relation to the dynamic RLCNDDATA and RLCNAMDATA (usage sensitive only) relations. The audit is also scheduled during a selective initialization.

2. DATA STRUCTURES

The RLICLIDIDX relation is a static relation used by the ICLIDIDX audit to perform static to dynamic existence checks of the dynamic RLCNDDATA and RLCNAMDATA (usage sensitive only) data structure.

3. AUDIT CHECKS

The ICLIDIDX audit steps through the RLICLIDIDX relation and verifies that a corresponding dynamic rICNDDATA and rICNAMDATA (usage sensitive only) data tuples exists.

4. ERROR HANDLING

If a rLICLIDIDX tuple exists with no corresponding dynamic rICNDDATA tuple, the audit inserts and initializes the corresponding dynamic tuple. If a rLICLIDIDX tuple for usage sensitive only exists with no corresponding dynamic rICNAMDATA tuple, the audit inserts and initializes the corresponding dynamic tuple.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: KEY

Error Code:	KEY
Error Description:	The audit has detected an inconsistency between the static data in RLICLID_IDX and the dynamic data in RLCNDDATA. The inconsistency indicates that the static data ic_idx field does not match the key field of the corresponding dynamic rICNDDATA tuple.
Possible Error Effect:	An available rICNDDATA tuple may never be used for the ICLID feature.
Corrective Action Taken:	The audit will correct the key field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Not an address; itm_idx field of the related static rLICLID_IDX tuple.
<i>Bad Data =</i>	ic_idx of the rICNDDATA tuple (key field).
<i>Good Data =</i>	ic_idx of the related static rLICLID_IDX tuple.
<i>Logical Index =</i>	itm_type of the related static rLICLID_IDX tuple.
<i>Dump =</i>	The dynamic data rICNDDATA tuple; the static data rLICLID_IDX tuple.

Table 2 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	The audit has detected an inconsistency between the static data in RLICLID_IDX and the dynamic data in either RLCNDDATA or RLCNAMDATA. The inconsistency indicates that the static data has a tuple and yet no corresponding dynamic rICNDDATA or rICNAMDATA tuple exists.
Possible Error Effect:	Not enough rICNDDATA or rICNAMDATA tuples may be available for the ICLID feature information.

Corrective Action Taken:	The audit will insert a rICNDDATA or rICNAMDATA tuple and get it initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Relation ID for either RLCNDDATA or RLCNAMDATA.
<i>Good Data =</i>	ic_idx field of rLICLID_IDX (static data) tuple.
<i>Logical Index =</i>	The key of the rICNDDATA tuple that is missing.
<i>Dump =</i>	The static data rLICLID_IDX tuple.

Table 3 Error Code: MEMKEY

Error Code:	MEMKEY
Error Description:	The audit has detected an inconsistency between the static data in RLICLID_IDX and the dynamic data in RLCNAMDATA. The inconsistency indicates that the static data ic_idx field does not match the key field of the corresponding dynamic rICNAMDATA tuple.
Possible Error Effect:	An available rICNAMDATA tuple may never be used for the usage-sensitive ICLID feature.
Corrective Action Taken:	The audit will correct the key field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Not an address; itm_idx field of the related static rLICLID_IDX tuple.
<i>Bad Data =</i>	ic_idx of the rICNAMDATA tuple (key field).
<i>Good Data =</i>	ic_idx of the related static rLICLID_IDX tuple.
<i>Logical Index =</i>	itm_type of the related static rLICLID_IDX tuple.
<i>Dump =</i>	The dynamic data rICNAMDATA tuple; the static data rLICLID_IDX tuple.

ICPEST

Software Release: 5E10 and later

1. INTERPROCESSOR CENTRAL PROCESSOR EQUIPMENT STATUS TABLE (ICPEST) AUDIT

The metallic service units (MSUs) in the interface modules provide metallic access, GDX compensation, scanning, and power conversion. Another important function, testing, is handled by the MSUs by connecting test leads to the metallic test interconnect buses (MTIBs). Each MSU has access points for 14 MTIBs. The allocation of MTIBs depends on the software states stored in the central processor equipment status table relation (RLCPEST) and the switch maintenance equipment status table relation (RLSMEST) for proper operation. The equipment status table relations are checked by four audits: the switch maintenance equipment status table audit (SMEST), the administrative module equipment status table audit (CPEST), the circuit data audit (CKTDATA), and ICPEST. Of these, only ICPEST is an interprocessor audit. ICPEST ensures that the maintenance request administrator (MRA) can run diagnostics on the MTIBs by checking the maintenance states of both starting points (the preferred end and the other end) for diagnostics. Diagnostics may only be run from these two starting points. When the MRA diagnoses MTIBs, it starts from one switching module (the preferred end) and sequentially checks the MTIB connections through all the switching modules (SMs) to the last SM. If the preferred end is isolated, the MRA begins diagnosing MTIB connections from the module designated the other end.

The audit is part of the peripheral control audits subgroup. It runs in the communication module processor (CMP) and SM in the segmented mode.

2. DATA STRUCTURES

The audit checks the fields recording the status of the MTIBs and the process identifications in the two equipment status table relations, RLCPEST and RLSMEST, shown in Figure 1. The ICPEST audit also refers to the following data:

Glond = This global parameter contains the preferred SM to start MTIB diagnostics.

Glond = This global parameter contains the other SM to start MTIB diagnostics.

Figure 1 (ICPEST-1) Data Structures of the ICPEST Audit

3. AUDIT CHECKS

The CMP provides the master control of the audit. The master data, the RLSMEST relation, resides in the switching modules. In the CMP the following audit checks are performed:

If the audit has just been entered:

ZAP = Check if the audit has been entered due to a system interrupt.

If not:

BAS_EQPG = Check if the base state (bas_stat) field in the rLCPEST tuple is consistent with the data collected from the other (Glotend) SM.

BAS_STAT = Check if the base state (bas_stat) field is set correctly compared to data collected from the SMs.

BASEQUAL = Check if the base state (bas_stat) field in the rLCPEST tuple is consistent with the data collected

from the preferred (Glonend) SM.

IMPID	= Check if the process identification (tp_pid) field in the rICPEST tuple is consistent with the data collected from the preferred (Glonend) SM.
PID	= Check if the terminal process identification in the rICPEST tuple is null (OSnullpid) for an idle MTIB.
SMEST	= Check if the state activity (stat_act) field in the rICPEST tuple is consistent with data collected from both SMs.
STATUS	= Check if the state activity (stat_act) field in the rICPEST tuple is in a valid state.
TID	= Check if the process identification (tp_pid) field in the rICPEST tuple is consistent with the data collected from the other (Glotend) SM.

In the SM, the following audit checks are performed.

Collect MTIB maintenance status:

CKTDSMEST = Check if the rISMEST tuple is missing for this MTIB.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BASEQUAL

Error Code:	BASEQUAL
Error Description:	The base state field (bas_stat) in the rICPEST tuple in the CMP has been found to be different from the base state field (bas_stat) in the rISMEST tuple in the preferred SM (Glonend) for this MTIB. For both the preferred SM (Glonend) and the other SM (Glotend), a message is sent from the CMP to the SM to collect maintenance status for all 14 MTIBs. In the SM the maintenance status is retrieved using data in the rISMEST tuple. The data collected from the rISMEST tuple is the base state (bas_stat), the state activity (stat_act), and the terminal process identification (tp_pid). This data is then sent to the CMP and compared to data stored in the rICPEST tuple.
Possible Error Effect:	The MTIB associated with the rICPEST tuple may not be removed or restored. Also, the MTIB will not be allocated to perform metallic testing.
Corrective Action Taken:	The rICPEST tuple will be recovered to an in-service state, the corresponding rIMPHDATA tuple in the CMP will be quarantined (quar = AUAUSET), and a message will be sent to both SMs to recover the rICDBCOM and rISMEST tuples associated with this MTIB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rICPEST tuple found in error.
<i>Bad Data =</i>	The base state (bas_stat) from the rICPEST tuple found in error.
<i>Good Data =</i>	The base state (bas_stat) from the rISMEST tuple in the preferred SM (Glonend).
<i>Logical Index =</i>	Logical key (unit_id) of the rICPEST tuple found in error (MTIB circuit name).
<i>Dump 1 =</i>	rICPEST tuple found in error.

<i>Dump 2 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLonend). SM.
<i>Dump 3 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLotend). SM.

Table 2 Error Code: BAS_EQPG

Error Code:	BAS_EQPG
Error Description:	The base state field (bas_stat) in the rICPEST tuple in the CMP has been found to be different from the base state field (bas_stat) in the rSMEST tuple in the other SM (Glotend) for this MTIB. For both the preferred SM (Glonend) and the other SM (Glotend), a message is sent from the CMP to the SM to collect maintenance status for all 14 MTIBs. In the SM the maintenance status is retrieved using data in the rSMEST tuple. The data collected from the rSMEST tuple is the base state (bas_stat), the state activity (stat_act), and the terminal process identification (tp_pid). This data is then sent to the CMP and compared to data stored in the rICPEST tuple.
Possible Error Effect:	The MTIB associated with the rICPEST tuple may not be removed or restored. Also, the MTIB will not be allocated to perform metallic testing.
Corrective Action Taken:	The rICPEST tuple will be recovered to an in-service state, the corresponding rIMPHDATA tuple in the CMP will be quarantined (quar = AUAUSET), and a message will be sent to both SMs to recover the rCDBCOM and rSMEST tuples associated with this MTIB. The equipment status tables in the AM and both end SM's are idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rICPEST tuple found in error.
<i>Bad Data =</i>	The base state (bas_stat) from the rICPEST found in error.
<i>Good Data =</i>	The base state (bas_stat) from the rSMEST tuple in the other SM (Glotend).
<i>Logical Index =</i>	Logical key (unit_id) of the rICPEST tuple found in error (MTIB circuit name).
<i>Dump 1 =</i>	rICPEST tuple found in error.
<i>Dump 2 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLonend). SM.
<i>Dump 3 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLotend). SM.

Table 3 Error Code: BAS_STAT

Error Code:	BAS_STAT
Error Description:	The state activity field (stat_act) from the rICPEST tuple in the CMP and the state activity field (stat_act) from both rSMEST tuples in the preferred (Glonend) and the other (Glotend) SMs are idle. However, base state field (bas_stat) in the rICPEST tuple in the CMP has been found to be different from the base state field (bas_stat) in the rSMEST tuple in the preferred (Glonend) or other (Glotend) SM for this MTIB. For both the preferred SM (Glonend) and the other SM (Glotend), a message is sent from the CMP to the SM to collect maintenance status for all 14 MTIBs. In the SM the maintenance status is retrieved using data in the rSMEST tuple. The data collected from the rSMEST tuple is the base state (bas_stat), the state activity (stat_act), and the terminal process identification (tp_pid). This data is then sent to the CMP and compared to data stored in the rICPEST tuple.
Possible Error Effect:	The MTIB associated with the rICPEST tuple may not be removed or restored. Also, the MTIB will not be allocated to perform metallic testing.
Corrective Action Taken:	The rICPEST tuple will be recovered to an in-service state, the corresponding rIMPHDATA tuple in the CMP will be quarantined (quar = AUAUSET), and a

	message will be sent to both SMs to recover the rICDBCOM and rSMEST tuples associated with this MTIB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rICPEST tuple found in error.
<i>Bad Data =</i>	The base state (bas_stat) from the rICPEST tuple found in error.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (unit_id) of the rICPEST tuple found in error (MTIB circuit name).
<i>Dump 1 =</i>	rICPEST tuple found in error.
<i>Dump 2 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLonend). SM.
<i>Dump 3 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLotend). SM.

Table 4 Error Code: CKTDSMEST

Error Code:	CKTDSMEST
Error Description:	The global parameter indicating the preferred SM (Glonend) or the other SM (Glotend) in the CMP indicate that MTIBs exist on this SM, however, the rSMEST dynamic tuple is not in the data base in the SM. This error indicates that either the global parameters are corrupt or the rSMEST tuple is erroneously missing from the database.
Possible Error Effect:	The MTIB associated with the rICPEST tuple may not be removed or restored. Also, the MTIB will not be allocated to perform metallic testing.
Corrective Action Taken:	The CKTDATA audit will be schedule to insert the rSMEST tuple into the database.
Manual Action Required:	If this error occurs over and over it could be an ODD inconsistency between the RLCKDTATA relation in the SM and the global parameters specifying the preferred SM (Glonend) and the other SM (Glotend) located in the CMP. If this SM contains an MSU: • Check the RLMUMTIB relation to find out if this SM is one of the end SMs. • If this SM is not an end SM, then the global parameters must be updated according to the RLMUMTIB relation. • If this is an end SM, then a tuple must be inserted into the RLCKTDATA relation for all this MTIB. If the SM does not contain an MSU, update the global parameters according to the RLMUMTIB relation.
Dump Description:	
<i>Error Address =</i>	Address of the rSMEST tuple buffer.
<i>Bad Data =</i>	Circuit name of the MTIB found missing in the database.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 5 Error Code: IMPID

Error Code:	IMPID
Error Description:	The process identification field (tp_pid) from the rICPEST tuple in the CMP has been found to be different from the process identification field (tp_pid) from the rSMEST tuple in the preferred SM (Glonend) for this MTIB. For both the preferred SM (Glonend) and the other SM (Glotend), a message is sent from the CMP to the SM to collect maintenance status for all 14 MTIBs. In the SM the maintenance status is retrieved using data in the

	rSMEST tuple. The data collected from the rSMEST tuple is the base state (bas_stat), the state activity (stat_act), and the terminal process identification (tp_pid). This data is then sent to the CMP and compared to data stored in the rCPEST tuple.
Possible Error Effect:	The MTIB associated with the rCPEST tuple may not be removed or restored. Also, the MTIB will not be allocated to perform metallic testing.
Corrective Action Taken:	The rCPEST tuple will be recovered to an in-service state, the corresponding rIMPHDATA tuple in the CMP will be quarantined (quar = AUAUSET), and a message will be sent to both SMs to recover the rCDBCOM and rSMEST tuples associated with this MTIB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rCPEST tuple found in error.
<i>Bad Data =</i>	The process identification field (tp_pid) from the rCPEST tuple found in error.
<i>Good Data =</i>	The process identification field (tp_pid) from the rSMEST tuple in the preferred SM (Glonend).
<i>Logical Index =</i>	Logical key (unit_id) of the rCPEST tuple found in error (MTIB circuit name).
<i>Dump 1 =</i>	rCPEST tuple found in error.
<i>Dump 2 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (Glonend). SM.
<i>Dump 3 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (Glotend). SM.

Table 6 Error Code: PID

Error Code:	PID
Error Description:	The state activity field (stat_act) from the rCPEST tuple in the CMP and the state activity field (stat_act) from both rSMEST tuples in the preferred (Glonend) and the other (Glotend) SMs are idle. However, process identification field (tp_pid) in the rCPEST tuple in the CMP has been found to be different from the process identification field (tp_pid) in the rSMEST tuple in the preferred (Glonend) or other (Glotend) SM for this MTIB. For both the preferred SM (Glonend) and the other SM (Glotend), a message is sent from the CMP to the SM to collect maintenance status for all 14 MTIBs. In the SM the maintenance status is retrieved using data in the rSMEST tuple. The data collected from the rSMEST tuple is the base state (bas_stat), the state activity (stat_act), and the terminal process identification (tp_pid). This data is then sent to the CMP and compared to data stored in the rCPEST tuple.
Possible Error Effect:	The MTIB associated with the rCPEST tuple may not be removed or restored. Also, the MTIB will not be allocated to perform metallic testing.
Corrective Action Taken:	The rCPEST tuple will be recovered to an in-service state, the corresponding rIMPHDATA tuple in the CMP will be quarantined (quar = AUAUSET), and a message will be sent to both SMs to recover the rCDBCOM and rSMEST tuples associated with this MTIB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rCPEST tuple found in error.
<i>Bad Data =</i>	The process identification field (tp_pid) from the rCPEST tuple found in error.
<i>Good Data =</i>	Null process identification (OSnullpid).
<i>Logical Index =</i>	Logical key (unit_id) of the rCPEST tuple found in error (MTIB circuit name).
<i>Dump 1 =</i>	rCPEST tuple found in error.
<i>Dump 2 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (Glonend). SM.
<i>Dump 3 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (Glotend). SM.

Table 7 Error Code: SMEST

Error Code:	SMEST
Error Description:	The state activity field (stat_act) from the rCPEST tuple in the CMP has been found to be idle (DBIDLE), but the data collected from the SMs indicate that state activity field (stat_act) in the rSMEST tuple in the preferred SM (Glonend) or other SM (Glotend) is busy (DBBUSY). For both the preferred SM (Glonend) and the other SM (Glotend), a message is sent from the CMP to the SM to collect maintenance status for all 14 MTIBs. In the SM the maintenance status is retrieved using data in the rSMEST tuple. The data collected from the rSMEST tuple is the base state (bas_stat), the state activity (stat_act), and the terminal process identification (tp_pid). This data is then sent to the CMP and compared to data stored in the rCPEST tuple.
Possible Error Effect:	The MTIB associated with the rCPEST tuple may not be removed or restored. Also, the MTIB will not be allocated to perform metallic testing.
Corrective Action Taken:	The rCPEST tuple will be recovered to an in-service state, the corresponding rIMPHDATA tuple in the CMP will be quarantined (quar = AUAUSET), and a message will be sent to both SMs to recover the rCDBCOM and rSMEST tuples associated with this MTIB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rCPEST tuple found in error.
<i>Bad Data =</i>	The state activity field (stat_act) from the rCPEST tuple found in error.
<i>Good Data =</i>	The state activity field (stat_act) from the rSMEST tuple in the preferred SM (Glonend).
<i>Logical Index =</i>	Logical key (unit_id) of the rCPEST tuple found in error (MTIB circuit name).
<i>Dump 1 =</i>	rCPEST tuple found in error.
<i>Dump 2 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (Glonend). SM.
<i>Dump 3 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (Glotend). SM.

Table 8 Error Code: STATUS

Error Code:	STATUS
Error Description:	The state activity field (stat_act) in the rCPEST tuple in the CMP has been found to be different from the base state field (bas_stat) in the rSMEST tuple in the preferred SM (Glonend) or the other SM (Glotend) for this MTIB. For both the preferred SM (Glonend) and the other SM (Glotend), a message is sent from the CMP to the SM to collect maintenance status for all 14 MTIBs. In the SM the maintenance status is retrieved using data in the rSMEST tuple. The data collected from the rSMEST tuple is the base state (bas_stat), the state activity (stat_act), and the terminal process identification (tp_pid). This data is then sent to the CMP and compared to data stored in the rCPEST tuple.
Possible Error Effect:	The MTIB associated with the rCPEST tuple may not be removed or restored. Also, the MTIB will not be allocated to perform metallic testing.
Corrective Action Taken:	The rCPEST tuple will be recovered to an in-service state, the corresponding rIMPHDATA tuple in the CMP will be quarantined (quar = AUAUSET), and a message will be sent to both SMs to recover the rCDBCOM and rSMEST tuples associated with this MTIB. P
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rCPEST tuple found in error.
<i>Bad Data =</i>	The state activity field (stat_act) from the rCPEST tuple found in error.
<i>Good Data =</i>	The state activity field (stat_act) from the rSMEST tuple in the preferred SM (Glonend).
<i>Logical Index =</i>	Key of the rCPEST tuple found in error (MTIB circuit name).
<i>Dump 1 =</i>	rCPEST tuple found in error.

<i>Dump 2 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLonend). SM.
<i>Dump 3 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLotend). SM.

Table 9 Error Code: TID

Error Code:	TID
Error Description:	The process identification field (tp_pid) in the rICPEST tuple in the CMP has been found to be different from the process identification field (tp_pid) in the rSMEST tuple in the other SM (Glotend) for this MTIB. For both the preferred SM (Glonend) and the other SM (Glotend), a message is sent from the CMP to the SM to collect maintenance status for all 14 MTIBs. In the SM the maintenance status is retrieved using data in the rSMEST tuple. The data collected from the rSMEST tuple is the base state (bas_stat), the state activity (stat_act), and the terminal process identification (tp_pid). This data is then sent to the CMP and compared to data stored in the rICPEST tuple.
Possible Error Effect:	The MTIB associated with the rICPEST tuple may not be removed or restored. Also, the MTIB will not be allocated to perform metallic testing.
Corrective Action Taken:	The rICPEST tuple will be recovered to an in-service state, the corresponding rIMPHDATA tuple in the CMP will be quarantined (quar = AUAUSET), and a message will be sent to both SMs to recover the rCDBCOM and rSMEST tuples associated with this MTIB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rICPEST tuple found in error.
<i>Bad Data =</i>	The process identification field from the rICPEST tuple found in error.
<i>Good Data =</i>	The process identification field from the rSMEST tuple in the other SM (Glotend).
<i>Logical Index =</i>	Key of the rICPEST tuple found in error (MTIB circuit name).
<i>Dump 1 =</i>	rICPEST tuple found in error.
<i>Dump 2 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLonend). SM.
<i>Dump 3 =</i>	Status activity (stat_act), base state (bas_stat), and the terminal process identification (tp_pid) from the preferred SM (GLotend). SM.

Table 10 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to perform recovery after taking a system interrupt (such as, write protect, out-of-range read, and so forth).
Possible Error Effect:	May cause further resets, audits, and or asserts.
Corrective Action Taken:	None, all data that would have caused the reset is reinitialized on the next invocation of the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	The SM believed to the have a connection to the MTIB (rICPEST tuple under audit).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

ICR

Software Release: 5E10 and later

1. INTERCOM CALLING RESTRICTION (ICR) AUDIT

The purpose of ICR audit is to perform static-to-dynamic existence checks between RLICR and RLICRST, or RLICRLGST. Any missing tuples in the dynamic relations will be inserted by this audit.

2. DATA STRUCTURES

The RLICR relation is a static, indexed SM relation with group id as key. It is group partitioned, that is, for SMs containing the member of this SFG, one rLICR tuple is populated. This relation indicates the maximum number of simultaneous calls available for this SFG, AMA, and SFG busy lamp information, whether the SFG is a large or a small group and which SM the SFG is tracked.

The ICR audit will be located at AUICR module as part of BASE package. It runs in the segmented mode and operates in the OSDS-M environment.

If the rLICR tuple is located at the tracking SM, ICR audit will perform the existence check between the static relation RLICR and the dynamic relations RLICRST or RLICRLGST depending on the size of this SFG. If the maximum number of simultaneous calls is greater than 96 (large group), the corresponding rLICRLGST tuple must be existed. Otherwise, the rLICRST tuple should be populated at this SM. Any missing rLICRST or rLICRLGST tuple is inserted by this function.

If rLICRST or rLICRLGST tuple should be existed in the tracking SM and it is not, then an attempt will be made to insert the missing tuple via "DBfintup" and an error message is printed. An assert is fired if data base insert fails.

3. AUDIT CHECKS

ICR audit steps through the static relation RLICR one tuple at a time. For each tuple populated at the tracking SM, this audit verifies that the corresponding tuple is existing at either the relation RLICRST or RLICRLGST depending upon the size of this SFG group. If the corresponding tuple is not found, the audit inserts it and prints an error message on the ROP.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	There is a tuple missing in the dynamic RLICRST or RLICRLGST relation; the corresponding static tuple is in RLICR relation.
Possible Error Effect:	Application codes will ASSERT and calls originated for this ICR group will be rejected.
Corrective Action Taken:	The tuple is created and initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rLICR tuple.
<i>Bad Data =</i>	0--Missing rLICRST, 1--Missing rLICRLGST.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of lost tuple.
<i>Dump =</i>	Dump of the rLICR tuple.

ICRLGST

Software Release: 5E10 and later

1. INTERCOM CALLING RESTRICTION LARGE STATUS (ICRLGST) AUDIT

The purpose of this audit is to perform dynamic-to-static existence checks between RLICRLGST and RLICR. Any extra RLICRLGST tuples are deleted. This audit also performs the key check and validates the RLICRLGST data.

2. DATA STRUCTURES

The RLICRLGST relation is a dynamic, indexed switching module (SM) relation with a group number as key. It contains the busy count maximum, busy/idle bit maps for call processing and keep alive status, current busy count, AMA billing flag and busy lamp status. If the SM is the tracking SM for this SFG and the maximum number of simultaneous calls is greater than 96, one RLICRLGST tuple should be populated at this SM.

The ICRLGST audit keep alive function performs the keep alive auditing on the busy/idle bits in the RLICRLGST relation. (Refer to Table 1.) If the busy_idle bit indicates the member is idle, this is a "don't care" situation for the keep alive and the audit proceeds to the next busy_idle bit.

If the busy_idle bit is busy, the audit examines the keep alive bit for that member. If the keep alive bit is set to 0, this is a safe state and the audit will set the keep alive bit to 1. If the keep alive bit is 1, this means that the keep alive has visited this member for longer than two keep alive audit cycles. The keep alive audit assumes that this member is stuck busy and will idle the busy_idle bit for this member and adjust the busy count. (Refer to Figure 1.)

Table 1 ICRLGST AUDIT KEEP ALIVE CALL FUNCTION

Keep Alive Bit	Call Processing Bit	Keep Alive Function Action
0	Busy	Set keep alive bit to 1
0	Idle	Don't care
1	Busy	Set keep alive bit to 0 + call processing bit to idle
1	Idle	Don't care

Figure 1 (ICRLGST-1) Existence Checks Processing

3. AUDIT CHECKS

The ICRLGST audit is located at AUicr module as part of the BASE package. The ICRLGST audit steps through the dynamic relation RLICRST and RLICRLGST respectively one tuple at a time. For each tuple, the following checks are performed:

- (1) Perform dynamic-to-static existence check. For each tuple, verify that the corresponding tuple is existing at the static relation rLICR for the tracking SM. If it is not, this tuple is deleted and an error message is printed on the ROP.
- (2) Verify the consistency between rLICR and rLICRLGST regarding size, AMA billing status and the type of ICR busy lamp. The ICR busy lamp could be associated with the analog or attendant console. If there is any inconsistency, the dynamic data is corrected to be consistent with the static data.
- (3) It verifies that current busy counts are the same as those indicated by busy/idle bit map. If there is any inconsistency, the current busy count is reset.

- (4) If this SFG has an analog or attendant console equipped with busy lamp, the busy lamp will be turned on/off according to the current busy count.

If any inconsistency is found by this semantic function, the dynamic data in the rLICRLGST tuple is corrected and the ICRLGST audit continues execution without returning FALSE to the driver, which causes the driver to take a time break.

4. ERROR HANDLING

If no tuple is found in RLICR, and RLICRLGST indicates that it exists, an attempt is made to delete the extra tuple and an error message is printed. Audit control also schedules the related audit to be run at the elevated mode after the ICRLGST audit is completed.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 2 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The busy lamp type indicated by rLICRLGST dynamic tuple is inconsistent with that specified in the static rLICR tuple.
Possible Error Effect:	The attendant console may receive erroneous lamp treatment.
Corrective Action Taken:	Correct busy lamp type of rLICRLGST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad rLICRLGST tuple.
<i>Bad Data =</i>	Busy lamp type at rLICRLGST.
<i>Good Data =</i>	Busy lamp type at rLICR.
<i>Logical Index =</i>	Key of rLICRLGST tuple.
<i>Dump =</i>	rLICRLGST tuple.

Table 3 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The busy count does not agree with that calculated from busy/idle status array.
Possible Error Effect:	Several error effects may happen: • ICR calls may be erroneously rejected. • The attendant console may receive erroneous lamp treatment. • Application code may waste time to search idle member.
Corrective Action Taken:	Correct busy count field to be consistent with busy/idle array.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad rLICRLGST tuple.
<i>Bad Data =</i>	Busy count before correction.
<i>Good Data =</i>	Actual busy count of busy/idle status.
<i>Logical Index =</i>	Key of rLICRLGST tuple.
<i>Dump =</i>	rLICRLGST tuple.

Table 4 Error Code: DDAMABIL

Error Code:	DDAMABIL
Error Description:	The AMA flag indicated by rLICRLGST dynamic tuple is inconsistent with that specified in the static rLICR tuple.
Possible Error Effect:	The AMA report could be erroneously generated or discarded.

Corrective Action Taken:	Correct AMA flag field of rLICRLGST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad rLICRLGST tuple.
<i>Bad Data =</i>	AMA flag at rLICRLGST.
<i>Good Data =</i>	AMA flag at rLICR.
<i>Logical Index =</i>	Key of rLICRLGST tuple.
<i>Dump =</i>	rLICRLGST tuple.

Table 5 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The rLICRLGST tuple should not be populated at this SM, because the corresponding static rLICR tuple does not exist.
Possible Error Effect:	ICR calls originated from non-tracking SM may be erroneously accepted or rejected.
Corrective Action Taken:	The rLICRLGST tuple will be deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad rLICRLGST tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of rLICRLGST tuple.
<i>Dump =</i>	rLICRLGST tuple.

Table 6 Error Code: KEY

Error Code:	KEY
Error Description:	An invalid key value is found in the rLICRLGST tuple.
Possible Error Effect:	The intercom calls of this SFG will be rejected. Assert should be taken from application code.
Corrective Action Taken:	A key error will be reported and corrected by the ICRLGST audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad rLICRLGST tuple.
<i>Bad Data =</i>	The error key.
<i>Good Data =</i>	Correct key value.
<i>Logical Index =</i>	Key of rLICRLGST tuple.
<i>Dump =</i>	rLICRLGST tuple.

Table 7 Error Code: RQSIZE

Error Code:	RQSIZE
Error Description:	The size indicated by rLICRLGST dynamic tuple is different from that specified in the static rLICR tuple.
Possible Error Effect:	The ICR calls may be erroneously rejected or free calls may be allowed.
Corrective Action Taken:	Correct the size field of rLICRLGST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad rLICRLGST tuple.
<i>Bad Data =</i>	Size at rLICRLGST.
<i>Good Data =</i>	Size at rLICR.
<i>Logical Index =</i>	Key of rLICRLGST tuple.
<i>Dump =</i>	rLICRLGST tuple.

Table 8 Error Code: TUPLE

Error Code:	TUPLE
Error Description:	The rLICRLGST tuple should not be populated at this SM. Either this SM is not tracking the SM or the size is not a large SFG.
Possible Error Effect:	If rLICRLGST is not populated at the tracking SM, application code will assert and request ICRLGST audit. No ICR mechanism will be implemented.
Corrective Action Taken:	The rLICRLGST tuple will be deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad rLICRLGST tuple.

<i>Bad Data</i> =	The tracking SM of rLICR tuple. The size of rLICRLGST may be wrong. Check the rLICRLGST dump to verify that information.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of rLICRLGST tuple.
<i>Dump</i> =	rLICRLGST tuple.

ICRST

Software Release: 5E10 and later

1. INTERCOM CALLING RESTRICTION STATUS (ICRST) AUDIT

The purpose of this audit is to perform dynamic-to-static existence checks between RLICRST and RLICR. Any extra rLICRST tuples are deleted. This audit also performs the key check and validates the rLICRST data.

2. DATA STRUCTURES

The RLICRST relation is a dynamic, indexed SM relation with group number as key. It contains the busy count maximum, busy/idle bit maps for call processing and keep alive status, current busy count, AMA billing flag and busy lamp status. If the switching module (SM) is the tracking SM for this SFG and the maximum number of simultaneous calls is not greater than 96, one rLICRST tuple should be populated at this SM.

The ICRST audit keep alive function performs the keep alive auditing on the busy/idle bits in the RLICRST relation. (Refer to Table 1.) If the busy_idle bit indicates the member is idle, this is a "don't care" situation for the keep alive and the audit proceeds to the next busy_idle bit.

If the busy_idle bit is busy, the audit examines the keep alive bit for that member. If the keep alive bit is set to 0, this is a safe state and the audit will set the keep alive bit to 1. If the keep alive bit is 1, this means that the keep alive has visited this member for longer than two keep alive audit cycles. The keep alive audit assumes that this member is stuck busy and will idle the busy_idle bit for this member and adjust the busy count. Refer to Figure 1.

Table 1 ICRST AUDIT KEEP ALIVE FUNCTION

Keep Alive Bit	Call Processing Bit	Keep Alive Function Action
0	Busy	Set keep alive bit to 1
0	Idle	Don't care
1	Busy	Set keep alive bit to 0 + call processing bit to idle
1	Idle	Don't care

Figure 1 (ICRST-1) Existence Checks Processing

3. AUDIT CHECKS

The ICRST audit is located at AUicr module as part of the BASE package. It runs in the segmented mode and operates in the OSDS-M environment. The ICRST audit steps through the dynamic relation RLICRST and RLICRLGST respectively one tuple at a time. For each tuple, the following checks are performed:

- Perform dynamic-to-static existence check. For each tuple, verify that the corresponding tuple is existing at the static relation rlICR for the tracking SM. If it is not, this tuple is deleted and an error message is printed on the ROP.
- Verify the consistency between rlICR and rlICRST regarding size, AMA billing status and the type of ICR busy lamp. The ICR busy lamp could be associated with analog or attendant console. If there is any inconsistency, the dynamic data is corrected to be consistent with the static data.

- (c) It verifies that current busy counts are the same as those indicated by busy/idle bit map. If there is any inconsistency, the current busy count is reset.
- (d) If this SFG has an analog or attendant console equipped with busy lamp, the busy lamp will be turned on/off according to the current busy count.

If any inconsistency is found by this semantic function, the dynamic data in the rLICRST tuple is corrected and the ICRST audit continues execution without returning FALSE to the driver, which causes the driver to take a time break.

4. ERROR HANDLING

If no tuple is found in rLICR, and RLICRST indicates that it exists, an attempt is made to delete the extra tuple and an error message is printed. Audit control also schedules the related audit to be run at the elevated mode after the ICRST audit is completed.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 2 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The busy lamp type indicated by rLICRST dynamic tuple is inconsistent with that specified in the static rLICR tuple.
Possible Error Effect:	The attendant console may receive erroneous lamp treatment.
Corrective Action Taken:	Correct busy lamp type of rLICRST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad rLICRST tuple.
<i>Bad Data =</i>	Busy lamp type at rLICRST.
<i>Good Data =</i>	Busy lamp type at rLICR.
<i>Logical Index =</i>	Key of rLICRST tuple.
<i>Dump =</i>	rLICRST tuple.

Table 3 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The busy count does not agree with that calculated from busy/idle status array.
Possible Error Effect:	Several error effects may happen: • ICR calls may be erroneously rejected. • The attendant console may receive erroneous lamp treatment. • Application code may waste time to search idle member.
Corrective Action Taken:	Correct busy count field to be consistent with busy/idle array.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of bad rLICRST tuple.
<i>Bad Data =</i>	Busy count before correction.
<i>Good Data =</i>	Actual busy count of busy/idle status.
<i>Logical Index =</i>	Key of rLICRST tuple.
<i>Dump =</i>	rLICRST tuple.

Table 4 Error Code: DDAMABIL

Error Code:	DDAMABIL

Error Description:	The AMA flag indicated by rICRST dynamic tuple is inconsistent with that specified in the static rICR tuple.
Possible Error Effect:	The AMA report could be erroneously generated or discarded.
Corrective Action Taken:	Correct AMA flag field of rICRST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad rICRST tuple.
<i>Bad Data</i> =	AMA flag at rICRST.
<i>Good Data</i> =	AMA flag at rICR.
<i>Logical Index</i> =	Key of rICRST tuple.
<i>Dump</i> =	rICRST tuple.

Table 5 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The rICRST tuple should not be populated at this SM, because the corresponding static rICR tuple does not exist.
Possible Error Effect:	ICR calls originated from non-tracking SM may be erroneously accepted or rejected.
Corrective Action Taken:	The rICRST tuple will be deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad rICRST tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of rICRST tuple.
<i>Dump</i> =	rICRST tuple.

Table 6 Error Code: KEY

Error Code:	KEY
Error Description:	An invalid key value is found in the rICRST tuple.
Possible Error Effect:	The intercom calls of this SFG will be rejected. Assert should be taken from application code.
Corrective Action Taken:	A key error will be reported and corrected by the ICRST audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad rICRST tuple.
<i>Bad Data</i> =	The error key.
<i>Good Data</i> =	Correct key value.
<i>Logical Index</i> =	Key of rICRST tuple.
<i>Dump</i> =	rICRST tuple.

Table 7 Error Code: RQSIZE

Error Code:	RQSIZE
Error Description:	The size indicated by rICRST dynamic tuple is different from that specified in the static rICR tuple.
Possible Error Effect:	The ICR calls may be erroneously rejected or free calls may be allowed.
Corrective Action Taken:	Correct the size field of rICRST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad rICRST tuple.
<i>Bad Data</i> =	Size at rICRST.
<i>Good Data</i> =	Size at rICR.
<i>Logical Index</i> =	Key of rICRST tuple.
<i>Dump</i> =	rICRST tuple.

Table 8 Error Code: TUPLE

Error Code:	TUPLE
Error Description:	The rICRST tuple should not be populated at this SM, either this SM is not tracing SM or the size is not a large SFG.
Possible Error Effect:	If rICRST is not populated at the tracking SM, application code will assert and request ICRST audit. And free ICR calls will be given.

Corrective Action Taken:	The rIICRST tuple will be deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad rIICRST tuple.
<i>Bad Data</i> =	The tracking SM of rIICR tuple. The size of rIICRST may be wrong for this tuple. Check the rIICRST dump to verify that information.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of rIICRST tuple.
<i>Dump</i> =	rIICRST tuple.

ICRTG

Software Release: 5E11 and later

1. INCOMING ROUTING DATA (ICRTG) AUDIT

ICRTG audit steps through the RLLAB7_SM relation. For each tuple in the RLLAB7_SM, the audit makes sure that the SM number in the CCicrtg[] is the same as the data in the RLLAB7_SM (CCS7 trunk routing data, which converts destination point code index and circuit identification code to the SM number which the trunk resides).

2. DATA STRUCTURES

For details on the fields contained in the RLLAB7_SM relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	The dynamic flag CCicrmp does not equal static value Gleicr but no update is in progress (the value dumped in the error address field of the audit report is not SILOCKOUT).
Possible Error Effect:	CCicrtg[] may not be sent to the protocol handlers. CCS call processing could fail.
Corrective Action Taken:	The audit sets CCicrmp to the value of Gleicr (reported in the good data field of the audit error report).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Return from check for updates.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Gleicr.
<i>Logical Index =</i>	CCicrmp.
<i>Dump =</i>	NA.

Table 2 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	One of the following cases applies: (1) Gleicr equals DBYES but at least one of the following is true: - This is not a global SM (GI_pcrd != Gglobalsm). - The SM has no CCS PH3s or PH6s according to dynamic array SMph_type[] (which is built from relation RLDSLGDATA). That is, for all entries in the array, SMPH_TYPE.imgtype != SMPH3C and != SMPH6C.

	(2) Gleicr equals DBNO but both of the following are true: - This is a global SM (Glglobalsm). - At least one entry in SMph_type[] indicates that a CCS PH3 or PH6 is equipped (SMPH_TYPE.imgtype = SMPH3C or SMPH6C).
Possible Error Effect:	CCicrtg[] may not get sent to the protocol handlers (PHs). CCS call processing may fail.
Corrective Action Taken:	The PHDSLGP audit will run as a related audit and correct any errors in SMph_type[]. However, if the PHDSLGP audit does not find any errors and this error continues to be found, there may be a problem with the value of Gleicr, Glglobalsm or RLDSLGDATA. In this case, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual. Population rules for the above mentioned global data may also help technicians determine the exact problem.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Glglobalsm.
<i>Bad Data =</i>	PH number of the first CCS PH3, if any. Or this value will be SMMAXPH.
<i>Good Data =</i>	Gleicr.
<i>Logical Index =</i>	CCicrmp.
<i>Dump =</i>	NA.

Table 3 Error Code: MISSING

Error Code:	MISSING
Error Description:	Gleicr is set to DBYES and no update is in progress (the value dumped in the error address field of the audit report is not SILOCKOUT) but the Glicrsa[] optional data region has not been populated correctly according to system integrity.
Possible Error Effect:	CCicrtg[] may not have been sent to the protocol handlers. CCS call processing could fail.
Corrective Action Taken:	The audit initiates a rebuild of the CCicrtg[] table.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Return from check for updates.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Gleicr.
<i>Logical Index =</i>	CCicrmp.
<i>Dump =</i>	NA.

Table 4 Error Code: NOMATCH

Error Code:	NOMATCH
Error Description:	A CCicrtg[] entry is not populated in the Glicrsa[] optional data region. Note that the CCicrtg[] entry is accessed by using the static relation's (RLLAB7_SM on a non-RSM, RLLAB7SM on an RSM) keys (dpci and cic) as the keys to a hashing process which determines the array index.
Possible Error Effect:	CCS routing may fail sometimes because of the unpopulated CCicrtg[] entry.
Corrective Action Taken:	The audit attempts to insert the missing CCicrtg[] entry into the Glicrsa[] optional data region.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rLLAB7_SM.sm (in a non-RSM). rLLAB7SM.sm (in an RSM).
<i>Bad Data =</i>	rLLAB7_SM.pci (in a non-RSM). rLLAB7SM.pci (in an RSM).
<i>Good Data =</i>	NA.

<i>Logical Index</i> =	rLAB7_SM.cic (in a non-RSM). rLAB7SM.cic (in an RSM).
<i>Dump</i> =	NA.

Table 5 Error Code: READ

Error Code:	READ
Error Description:	The audits attempts to read an rIDPC_STAT tuple whose key (rIDPC_STAT.dpci) matches rLAB7SM.dpci but a tuple in relation RLDPC_STAT is not found.
Possible Error Effect:	CCicrtg[] may not be sent to the PHs. Common channel signaling (CCS7) routing may fail when attempting to route to the destination point code (DPC) identified by rLAB7SM.dpci.
Corrective Action Taken:	Another audit inserts the missing tuple into relation RLDPC_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	rLAB7SM.sm.
<i>Good Data</i> =	rLAB7SM.cic.
<i>Logical Index</i> =	rLAB7SM.dpci.
<i>Dump</i> =	NA.

Table 6 Error Code: SEARCH_FAILED

Error Code:	SEARCH_FAILED
Error Description:	A CCicrtg[] entry could not be found in the Glicrsa[] optional data region and the table is fully populated. Note that the CCicrtg[] entry is accessed by using the static relation's (RLLAB7_SM on a non-RSM, RLLAB7SM on an RSM) keys (dpci and cic) as the keys to a hashing process which determines the array
Possible Error Effect:	CCS routing may fail sometimes because of the missing CCicrtg[] entry.
Corrective Action Taken:	None. This error is only for information. Something may be wrong with the Glicrsa[] optional data region layout or CCS code may have a bug. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rLAB7_SM.sm (on a non-RSM). rLAB7SM.sm (on an RSM).
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	rLAB7_SM.pci (on a non-RSM). rLAB7SM.pci (on an RSM).
<i>Logical Index</i> =	rLAB7_SM.cic (on a non-RSM). rLAB7SM.cic (on an RSM).
<i>Dump</i> =	NA.

Table 7 Error Code: TBL_ERR

Error Code:	TBL_ERR
Error Description:	An entry in CCicrtg[] contains an sm field which does not match the sm field in the corresponding static rLAB7_SM (on a non-remote switching module) or rLAB7SM (on a remote switching module) tuple. Note that the CCicrtg[] entry is accessed by using the static relation's keys (dpci and cic) as the keys to a hashing process which determines the array index.
Possible Error Effect:	CCS routing may fail when attempting to route to the switching module provided in the CCicrtg[] entry.
Corrective Action Taken:	The audit triggers an update of the CCicrtg[] entry. In particular, CCICRTG.sm will be set to the value from rLAB7_SM.sm (on a non-RSM) or rLAB7SM (on an RSM).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rLAB7_SM.sm (on a non-RSM). rLAB7SM.sm (on an RSM).
<i>Bad Data</i> =	rICRTG.sm.
<i>Bad Data</i> =	rLAB7_SM.pci (on a non-RSM). rLAB7SM.pci (on an RSM).
<i>Logical Index</i> =	rLAB7_SM.cic (on a non-RSM). rLAB7SM.cic (on an RSM).
<i>Dump</i> =	NA.

Table 8 Error Code: UPDATE_FAILED

Error Code:	UPDATE FAILED
Error Description:	Due to recovery from other errors, the audit has made enough updates to the CCicrtg[] array that a table rebuild is needed.
Possible Error Effect:	Since access to the CCicrtg[] array is done using a hashing algorithm, if too many updates are made, additional insertions may result in collisions.
Corrective Action Taken:	The audit initiates a rebuild of the CCicrtg[] table.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	A hashing key to the CCicrtg[] index: rLAB7_SM.dpci (in a non-RSM), rLAB7SM.dpci (in an RSM).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The other hashing key to the CCicrtg[] index: rLAB7_SM.cic (in a non-RSM), rLAB7SM.cic (in an RSM).
<i>Dump =</i>	NA.

Table 9 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect error, out of range read, or invalid operation by foreground or any audit system process.
Possible Error Effect:	Varies depending on the process that took the interrupt and what the interrupt was.
Corrective Action Taken:	This report is for information only.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CCicrmpm.
<i>Good Data =</i>	Gleicr.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

IDDS1**Software Release:** 5E10 and later**1. INTEGRATED DIGITAL SERVICE UNIT-DIGITAL SERVICE FACILITY (IDDS1) AUDIT**

The IDDS1 audit will perform the semantic checks of the integrated digital service unit (IDCU) digital service (DS1) facility array PCidds1[][].

2. DATA STRUCTURES

The data structure being audited by IDDS1 audit is the PCidds1[][] array. It is a doubly indexed array (PCidds1[idcu][ds1]) where the indexes are the IDCU number and the digital service facility DS1 number. The array fields and a brief description is as follows:

PCidds1[][].usage	= Contains the busy/idle status of the DS0 time slots.
PCidds1[][].rtsmask	= Contains the DS0 times slots that have been permanently or semi-permanently reserved (0 means reserved, 1 means idle).
PCidds1[][].rtpos	= Contains the DS1 number from the RT perspective (that is, 1-128).
PCidds1[][].maintst	= Contains the in-service/out-of-service state of the DS1 facility.

3. AUDIT CHECKS

The IDDS1 audit will perform the semantic checks of the PCidds1[][] array fields. The audit sequence is as follows:

ZAP	= Verify the audit entry mode.
ODDLOSTTUP	= Read the rIDS1_PT tuple for a given DS1 facility.
SMEST	= Read the rSMEST tuple for the DS1 facility.
TSOOSQUAL	= Audit the PCidds1[][].maintst field.
DEFRTPOS	= Audit the PCidds1[][].rtpos field for default value.
GR_RTMASK	= Audit the PCidds1[][].rtsmask field for the default value.
BADRTMASK	= Audit the PCidds1[][].rtsmask field against the rIDS1_PT tuple.
MAINT_STATE	= Audit PCidds1[][].maintst field is audited against the DS1's rISMSET tuple.
BAS_STATE	= Audit PCidds1[][].maintst field against the DS1's rSMEST tuple that is on protection.
RTPOS	= Audit PCidds1[][].rtpos field against the rIDS1_PT tuple.
KEY	= Read the rIDS0B tuple for a given rIDS0B.ds0b field.
IDLE_BUSY	= Audit the PCidds1[][].usage field for the correct idle setting.
BUSY_IDLE	= Audit the PCidds1[][].usage field for the correct busy setting.
STATE_VAR	= Audit the rIDS0B.use field for in-range value.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: BADRTMASK

Error Code:	BADRTMASK
Error Description:	The contents of the PCidds1[][].rtsmask field was found different than the value derived from the rIDS1_PT tuple.
Possible Error Effect:	The call processing will not be able to use that particular DS1 facility.
Corrective Action Taken:	The contents of the PCidds1[][].rtsmask field will be set to the value derived from the rIDS1_PT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the PCidds1[][] array.
<i>Bad Data =</i>	The contents of the PCidds1[][].rtsmask field.
<i>Good Data =</i>	The contents of what the PCidds1[][].rtsmask field should be. It is derived from the rIDS1_PT tuple.
<i>Logical Index =</i>	The circuit name of the DS1 facility.
<i>Dump 1 =</i>	The contents of the PCidds1[][] array.
<i>Dump 2 =</i>	The contents of the rIDS1_PT tuple.

Table 2 Error Code: BAS_STATE

Error Code:	BAS_STATE
Error Description:	The PCidds1[][].maintst field was found to be out-of-service while the rISMEST tuple for the DS1 facility was out-of-service protected. The PCidds1[][].maintst field is expected to be active since the DS1 facility is protected.
Possible Error Effect:	The call processing will not be able to use that particular DS1 facility.
Corrective Action Taken:	The audit will correct the PCidds1[][].maintst field to be active.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the PCidds1[][] array.
<i>Bad Data =</i>	The contents of the PCidds1[][].maintst field.
<i>Good Data =</i>	The contents of what the PCidds1[][].maintst field should be, which is an active state.
<i>Logical Index =</i>	The circuit name of the DS1 facility.
<i>Dump 1 =</i>	The contents of the DS1 facility rISMEST tuple.
<i>Dump 2 =</i>	The contents of the PCidds1[][] array.

Table 3 Error Code: BUSY_IDLE

Error Code:	BUSY_IDLE
Error Description:	The bit in PCidds1[][].usage field was found to be busy but it should have been idle. This determination was made when the rIDS0B tuple for the DS0 time slot being audited was read and the use field in it was that of an idle DS0 time slot.
Possible Error Effect:	The call processing will not be able to use that particular DS0 time slot.
Corrective Action Taken:	The audit will idle out the corresponding bit in PCidds1[][].usage field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the PCidds1[][] array.
<i>Bad Data =</i>	The value of the bit found idle which is a 0.
<i>Good Data =</i>	The value of the what the bit should be which is a 1.
<i>Logical Index =</i>	The DS0 time slot number found at error which is a number from 0-23.
<i>Dump 1 =</i>	The contents of the rIDS0B tuple.
<i>Dump 2 =</i>	The contents of the PCidds1[][] array.

Table 4 Error Code: DEFRTPOS

Error Code:	DEFRTPOS
Error Description:	The PCidds1[][].rtpos field was supposed to be set to the default value which is 0XFF but was found not to be so.
Possible Error Effect:	The call processing will try to use that DS1 facility but it is not usable.
Corrective Action Taken:	The audit will set the PCidds1[][].rtpos field to the default value of 0XFF.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidss1[][] array.
<i>Bad Data</i> =	The contents of the PCidss1[][].rtpos field.
<i>Good Data</i> =	The contents of what the PCidss1[][].rtpos field should be.
<i>Logical Index</i> =	The circuit name of the DS1 facility.
<i>Dump</i> =	The contents of the PCidss1[][] array.

Table 5 Error Code: GR_RTMASK

Error Code:	GR_RTMASK
Error Description:	The audit was expecting the PCidss1[][].rtmask field to be set to the default value 0X00FFFFFF but was found not to be.
Possible Error Effect:	The call processing will try to use the DS1 facility but it is not usable.
Corrective Action Taken:	The audit will set the PCidss1[][].rtmask field to the default value of 0X00FFFFFF.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidss1[][] array.
<i>Bad Data</i> =	The contents of the PCidss1[][].rtpos field.
<i>Good Data</i> =	The contents of what the PCidss1[][].rtpos field should be.
<i>Logical Index</i> =	The name of the DS1 facility.
<i>Dump</i> =	The contents of the PCidss1[][] array will be dumped.

Table 6 Error Code: IDLE_BUSY

Error Code:	IDLE_BUSY
Error Description:	The bit in PCidss1[][].usage field was found to be idle but it should have been busy. This determination was made when the rIDS0B tuple for the DS0 time slot being audited was read and the use field in it was that of a stable call.
Possible Error Effect:	The call processing will reuse that particular DS0 time slot.
Corrective Action Taken:	The audit will busy out the corresponding bit in PCidss1[][].usage field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidss1[][] array.
<i>Bad Data</i> =	The value of the bit found idle which is a 1.
<i>Good Data</i> =	The value of what the bit should be which is a 0.
<i>Logical Index</i> =	The DS0 time slot number found at error which is a number from 0-23.
<i>Dump 1</i> =	The contents of the rIDS0B tuple.
<i>Dump 2</i> =	The contents of the PCidss1[][] array.

Table 7 Error Code: KEY

Error Code:	KEY
Error Description:	The rIDS0B tuple was missing from the database.
Possible Error Effect:	The call processing will not be able to use that particular DS0 time slot.
Corrective Action Taken:	The audit will busy out the corresponding bit in PCidss1[][].usage field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidss1[][] array.
<i>Bad Data</i> =	The rIDS0B.ds0b key field.
<i>Good Data</i> =	The time slot on the DS1 facility being audited.
<i>Logical Index</i> =	The rIDS0B.dsob key field.
<i>Dump</i> =	The contents of the PCidss1[][] array.

Table 8 Error Code: MAINT_STATE

Error Code:	MAINT_STATE
Error Description:	The PCidss1[][].maintst field was found to be different from the maintenance state of the rSMEST tuple.
Possible Error Effect:	The call processing will not be able to use that particular DS1 facility.
Corrective Action Taken:	The PCidss1[][].maintst field will be corrected to match that of the rSMEST tuple maintenance state.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidss1[][] array.

<i>Bad Data</i> =	The contents of the PCidds1[][].maintst field.
<i>Good Data</i> =	The contents of what the PCidds1[][].maintst field which is that of the rSMEST bas_stat field.
<i>Logical Index</i> =	The name of the DS1 facility.
<i>Dump 1</i> =	The dump of the DS1 facility rSMEST tuple.
<i>Dump 2</i> =	The contents of the PCidds1[][] array.

Table 9 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The rIDS1 audit tried to read the rIDS1_PT tuple for a given DS1 facility but there was no tuple in the database with that key.
Possible Error Effect:	The call processing will not be able to use that particular DS1 facility.
Corrective Action Taken:	None.
Manual Action Required:	Office personnel should insert a tuple in the rIDS1_PT tuple for the given
Dump Description:	
<i>Error Address</i> =	The address of the rIDS1_PT buffer.
<i>Bad Data</i> =	The name of the DS1 facility.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The circuit name of the DS1 facility.
<i>Dump</i> =	The contents of the rIDS1_PT buffer will be dumped.

Table 10 Error Code: RTPOS

Error Code:	RTPOS
Error Description:	The PCidds1[][].rtpos field was found to be inconsistent with what the rIDS1_PT tuple contents.
Possible Error Effect:	The call processing will not be able to use that particular DS1 facility.
Corrective Action Taken:	The audit will correct the PCidds1[][].rtpos field to be consistent with the rt_ds1 field in rIDS1_PT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidds1[][] array.
<i>Bad Data</i> =	The contents of the PCidds1[][].rtpos field.
<i>Good Data</i> =	The contents of what the PCidds1[][].rtpos field should be, which is derived from the rt_ds1 field in rIDS1_PT tuple.
<i>Logical Index</i> =	The circuit name of the DS1 facility.
<i>Dump</i> =	The contents of the PCidds1[][] array.

Table 11 Error Code: SMEST

Error Code:	SMEST
Error Description:	The rSMEST tuple for the DS1 facility was missing from the database.
Possible Error Effect:	The maintenance (removal and restoration) of the DS1 facility will not be possible.
Corrective Action Taken:	The audit will verify that all the fields in the PCidds1[][] entry being audited are set to the default value until the rSMEST tuple is inserted in the database by the related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rSMEST pointer.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The circuit name of the DS1 facility.
<i>Dump</i> =	The contents of the rIDS1_PT buffer will be dumped.

Table 12 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	The use field in rDSOB tuple was found to be an out of range value.
Possible Error Effect:	The call processing will not be able to use that particular DS0 time slot.
Corrective Action Taken:	The audit will idle out the corresponding bit in PCidds1[][].usage field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidds1[][] array.

<i>Bad Data</i> =	The value of the use field in rIDS0B tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The DS0 time slot number found at error which is a number from 0-23.
<i>Dump 1</i> =	The contents of the rIDS0B tuple.
<i>Dump 2</i> =	The contents of the PCidss1[][] array.

Table 13 Error Code: TSOOSQUAL

Error Code:	TSOOSQUAL
Error Description:	The PCidss1[][].maintst field was found to be active, it should have been out-of-service.
Possible Error Effect:	The call processing will try to use that particular DS1 facility but it is not usable.
Corrective Action Taken:	The audit will set the PCidss1[][].maintst field to the out-of-service state.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidss1[][] array.
<i>Bad Data</i> =	The value of the PCidss1[][].maintst field.
<i>Good Data</i> =	The value of what the PCidss1[][].maintst field should be.
<i>Logical Index</i> =	The circuit name of the DS1 facility.
<i>Dump</i> =	The contents of the PCidss1[][] array.

Table 14 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to provide recovery after taking a reset. When a reset occurs (usually triggered by an illegal or out of range memory access), the audit which was running at the time is aborted, and is then rescheduled to run in AUZAP mode to provide recovery of related data left inconsistent as a result of the reset.
Possible Error Effect:	The audit may continue to cause memory access violations, increasing the probability of drastic recovery action and preventing the audit from checking for further errors.
Corrective Action Taken:	The data which caused the reset is initialized by the next entry of the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

IDLPRRT

Software Release: 5E10 and later

1. HUNTED IDLE PORT (IDLPRRT) AUDIT

During call processing, the RTA subsystem routes traffic based on the port status in the administrative module (AM). The RTA routing process determines the busy/idle status of each port by hunting in the AM. (Hunting is the process of selecting one of a set of available ports that satisfy a calling customer.) The busy/idle status of the port is made up of both the hunt key status and the hunted port status. Audits ensure that both are correct. The hunted idle port audit (IDLPRRT) verifies the hunted port status and ensures that ports that are idle in the switching module (SM) are listed as idle in the AM.

The IDLPRRT audit is an interprocessor audit that begins in the AM and audits one SM each time it runs. It will not audit the same SM twice in less than 15 minutes; that is, the minimum entry rate per SM is 15 minutes. In large office, the audit may require several cycles to audit all the SMs. To do this, the IDLPRRT audit runs in all three modes of the ABACABA audit cycle-seven times (and hence, seven SMs) per audit cycle. For example, the audit cycle when there is a heavy call load requires about 15 minutes in the AM. In an office with 80 SMs, three hours will be required before all the SMs are audited.

This audit is part of the routing and terminal allocation audits subgroup. It operates in both the operational kernel process (OKP) and operating system for distributed switching-switching module (OSDS-SM) environments in the post initialization and segmented modes.

The audit sequences through all the PORTLA tuples and loads each in service, hunted and idle port into a data message to be sent to the AM. The message loading is handled by the semantic function AUSidlprt. To accommodate the changes introduced by the CSD feature, the semantic function will check each hunted and idle port to see if it is a B-channel portname. If it is, the line unit is stripped from the portname. The ltype is checked to see if it is LU3. For LU3 and B-channel port is sent to the AM. Otherwise, the B-channel is converted to a D-channel port and then sent to the AM. In the AM, the function RTauptav is called to update the LNSTAT and LGLNSTAT relations.

This audit works only for trunk ports. The part of IDLPRRT responsible for idling of stuck MLHGs members has been replaced by the Keep Alive mechanism.

2. DATA STRUCTURES

The IDLPRRT audit operates on the port list relation (RLPRTLST) and the port linkage area relation (RLPORTLA) in the SM. The port list relation consists of the head cells for the lists of in-service and forced-in-service ports. The port linkage area relation contains information about the associations the port has with its processes and about the primary abbreviated status of the port.

The IDLPRRT audit is an interprocessor audit whose control is in the AM which calls the IDLPRRT audit collection function in the SM. The SM collection function collects the busy/idle status of the ports in rPORTLA and returns a message which contains the idle ports, to the AM to update the rLNSTAT.

IDLPRRT checks the busy/idle status in the RLLTMSTAT relation by going through the RLIS_LINE relation and checking if the lead_module is set to the current module and that the ltype is IS_MLHG. If these conditions are met, we can access an RLIS_TERM relation to check the cpe_type. If the cpe_type is set to IS_TYPATT, the port has an attendant associated with it.

When dealing with the attendant, a DPB tuple must be accessed in order to find a TEDB linked to it. When a TEDB tuple is identified, a check is run to see if the sca bit is set to DBNUU. If it is, go through the RLLTMSTAT relation to check the busy/idle status by ANDing the status bits together.

If the cpe_type of the port is not IS_TYPATT, the audit goes through the rLTMSTAT relation to check the busy/idle

status by ORing the status bits together.

The audit then sends a message to the AM which contains the ports that are idle. The message is distributed to update the RLLNSTAT relation which might have a port marked busy when it should be idle.

Relations RLLNSTAT and RLLGLNSTAT will not be populated in the AM environment anymore.

SM

AM

Figure 1 (IDLPRT-1) Hunted Idle Port Audit

3. AUDIT CHECKS

The IDLPRT audit calls the traverse driver (DRTRAV) to traverse the tuples of the RLPORTLA relation.

This audit begins in an SM (refer to Figure 1) and searches the port linkage area relation (RLPORTLA) for hunted ports. When it finds a hunted port, it determines whether the port is busy or idle. If the hunted port is busy, the audit proceeds to the next port in the RLPORTLA relation. If the hunted port is idle, the audit notes this in a message (each message contains a total of 64 ports) to be sent to the AM. The AM compares the list of idle ports received from the SMs with the status of those ports that it contains.

The audit calls besides DRTRAN driver, the DRSTATIC driver. DRSTATIC is used for stepping through the rIIS_LINE tuples.

This audit may make the AM think that a port in the SM is idle when it is actually busy. This error occurs when the status of the port in the SM changes from idle to busy between the time it is audited and the time the AM receives information about its status. However, the error is insignificant because a call to a busy hunted port is automatically routed to the next idle port. The audit will recover the inconsistency the next time it runs.

The IDLPRT audit may find four errors during its execution:

- (1) The SM portion of the audit is called in the wrong mode (any mode other than segmented). If this occurs, the audit fires a returning assert that makes audit control initialize partition control for the audit.

- (2) Partition control has been corrupted. If this occurs, the audit fires an assert that purges the audit process.
- (3) The data message sent to the AM returns an invalid return code. If this occurs, the audit fires an assert that purges the audit process.
- (4) The DRTRAV driver finds a linkage error in a port linkage area (rIPORTLA) tuple. If this occurs, the IDLPRT audit aborts and schedules the PORTLA audit to run in the elevated segmented mode as a related audit.

If the IDLPRT audit detects an inconsistency between the AM and SM the port status is updated. If the audit encounters any errors with the static relation reads, an error is printed and the user is required to take manual action.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this document, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	There was a missing tuple found for rIIS_TERM.
Possible Error Effect:	Lost resources.
Corrective Action Taken:	Fire an assert and return AUFALSE to the driver.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Logical address of the rIIS_TERM tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key of the rIIS_TERM tuple.
<i>Dump =</i>	NA.

Table 2 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered after taking a reset.
Possible Error Effect:	A machine reset has occurred.
Corrective Action Taken:	The audit has returned to Audit Control.
Manual Action Required:	No manual action is required.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Partition cursor.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

IDPIDB

Software Release: 5E10 and later

1. INTEGRATED DIGITAL SERVICE UNIT FACILITY PIDB (IDPIDB) AUDIT

The IDPIDB audit will perform the semantic checks of the integrated digital service unit (IDCU) peripheral interface database (PIDB).

2. DATA STRUCTURES

The data structure being audited by IDPIDB audit is the PCidpidb[][] array. It is a doubly indexed array (PCidpidb[idcu][pidb]) where the indexes are the IDCU number and the PIDB number. The array components (fields and a brief description) are as follows:

PCidpidb[][].usage	= Contains the busy/idle status of the PIDB time slots.
PCidpidb[][].rtsmask	= Contains the times slots that have permanently or semi-permanently been reserved (0 means reserved, 1 means idle).
PCidpidb[][].syspidb	= The system PIDB number.
PCidpidb[][].type	= The type of PIDB.
PCidpidb[][].maintst	= The maintenance status of the PIDB (active, out-of-service or blocked).

3. AUDIT CHECKS

The IDPIDB audit will perform the semantic checks of the PCidpidb[][] array structure. The audit sequence is as follows:

ZAP	= The audit entry mode is verified.
MAINT_STATE2	= The PCidpidb[][].maintst field is audited for default setting.
NON_NULL	= The PCidpidb[][].type field is audited for the default setting.
GR_SYSPIDB	= The PCidpidb[][].syspidb field is audited for the default setting.
GR_RTMASK	= The PCidpidb[][].rtsmask field is audited for the default setting.
ODDLOSTTUP	= The rISF14 tuple should exist for a given equipped IDCU.
ODDLOSTTUP	= The rIDPIDB_PT tuple should exist for given PIDB circuit name.
BADRTMASK	= The PCidpidb[][].rtsmask field is audited against the static rIDPIDB_PT tuple.
SMEST	= The rISMEST tuple for a given PIDB is read.
ACCBK	= A now authorized DUALPIDB is unblocked for path hunting.
NOTBUSY	= A now idle unauthorized DUALPIDB is removed from service.
MAINT_STATE	= The PCidpidb[][].maintst field is audited against the rISMEST tuple.
BADTYPE	= The PCidpidb[][].type field is audited against the rCKTDATA.pidbtype field.

SYSPIDB	= The PCidpidb[][].syspidb is audited against the static rCKTDATA.pidb field.
BADUSE	= An unauthorized DUALPIDB is path hunt blocked and removed from service if idle.
KEY	= The rIPTSB tuple for a given PIDB is read.
IDLE_BUSY	= The PCidpidb[][].usage is audited for an idle rIPTSB tuple.
BUSYIDLE	= The PCidpidb[][].usage is audited for an busy rIPTSB tuple.
STATE_VAR	= The rIPTSB.use field is audited.

4. ERROR HANDLING

The general audit error handling mechanism is to print the error code and make the PCidpidb[][] array consistent with the data that it is being compared against (such as, rSMEST tuple, rDPIDB_PT tuple and so forth). If a user intervention is required (such as, in the case of a missing static data) then a user intervention error code will be printed.

The audit produces the following error code(s).

Table 1 Error Code: ACCBLK

Error Code:	ACCBLK
Error Description:	The IDPIDB audit found that a PCDUALPIDB's path hunt was blocked even though it is within the valid pidb limit.
Possible Error Effect:	Call processing will not be able to use that particular PIDB facility.
Corrective Action Taken:	The PCidpidb[][].maintst will be set to match the value derived from the rSMEST tuples for the PIDBs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The IDCU unit number.
<i>Bad Data</i> =	The count of active PCDUALPIDBs.
<i>Good Data</i> =	The pidb limit defined in rSF14 for this IDCU.
<i>Logical Index</i> =	The circuit name of the PIDB facility.
<i>Dump 1</i> =	The contents of the rSF14 tuple.
<i>Dump 2</i> =	The contents of the PCidpidb[][] array.

Table 2 Error Code: BADRTMASK

Error Code:	BADRTMASK
Error Description:	The IDPIDB audit found a the PCidpidb[][].rtsmask field not to be set to what the static rDPIDB_PT tuple states it should be set to.
Possible Error Effect:	The call processing will not be able to use that particular PIDB facility.
Corrective Action Taken:	The PCidpidb[][].rtsmask will be set to match the value derived from the static rDPIDB_PT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidpidb[][] array.
<i>Bad Data</i> =	The contents of the PCidpidb[][].rtsmask field.
<i>Good Data</i> =	The contents of what the PCidpidb[][].rtsmask field should be.
<i>Logical Index</i> =	The circuit name of the PIDB facility.
<i>Dump</i> =	The contents of the PCidpidb[][] array.

Table 3 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The PCidpidb[][].type field was found to be different from what the static rCKTDATA.pidbtype field states it should be.
Possible Error Effect:	The call processing will not be able to use that PIDB facility.
Corrective Action Taken:	The audit will set the PCidpidb[][].pidbtype field to match the pidbtype

	rICKTDATA.pidbtype field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidpidb[][] array.
<i>Bad Data</i> =	The contents of the PCidpidb[][].type field.
<i>Good Data</i> =	The contents of what the PCidpidb[][].type field should be.
<i>Logical Index</i> =	The circuit name of the PIDB facility.
<i>Dump</i> =	The contents of the PCidpidb[][] array.

Table 4 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	The IDPIDB audit found a PCDUALPIDB over the authorized limit defined by rISF14.
Possible Error Effect:	The call processing should not be able to use that particular PIDB facility.
Corrective Action Taken:	The PCDUALPIDB will be blocked from use by call processing.
Manual Action Required:	The office engineers should refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual to obtain authorization to use additional PIDBs.
Dump Description:	
<i>Error Address</i> =	The IDCU unit number.
<i>Bad Data</i> =	The count of active PCDUALPIDBs.
<i>Good Data</i> =	The pidb limit defined in rISF14 for this IDCU.
<i>Logical Index</i> =	The circuit name of the PIDB facility.
<i>Dump 1</i> =	The contents of the rISF14 tuple.
<i>Dump 2</i> =	The contents of the PCidpidb[][] array.

Table 5 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	The bit in PCidpidb[][].usage field was found to be busy but it should have been idle. This determination was made when the rIPTSB.use field was that of an idle rIPTSB.
Possible Error Effect:	The call processing will not be able to use that particular PIDB time slot.
Corrective Action Taken:	The audit will idle out the corresponding bit in PCidpidb[][].usage field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidpidb[][] array.
<i>Bad Data</i> =	The contents of the PCidpidb[][].usage field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIPTSB.ptsb key.
<i>Dump 1</i> =	The contents of the rIPTSB tuple.
<i>Dump 2</i> =	The contents of the PCidpidb[][] array.

Table 6 Error Code: GR_RTMASK

Error Code:	GR_RTMASK
Error Description:	The IDPIDB audit found the PCidpidb[][].rtsmask field not set to the default value which is 0xFFFFFFFF.
Possible Error Effect:	The call processing will try to use that particular PIDB facility but it is not usable.
Corrective Action Taken:	The audit will set the PCidpidb[][].rtsmask field to the default value which is 0xFFFFFFFF.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidpidb[][] array.
<i>Bad Data</i> =	The contents of the PCidpidb[][].rtsmask field.
<i>Good Data</i> =	The contents of what the PCidpidb[][].rtsmask field should be which is 0X.FFFFFFFF.
<i>Logical Index</i> =	The circuit name of the IDCU DIB facility.
<i>Dump</i> =	The contents of the PCidpidb[][] array.

Table 7 Error Code: GR_SYSPIDB

Error Code:	GR_SYSPIDB
Error Description:	The IDPIDB audit found the PCidpidb[][].syspidb field not set to the default

	value which is 0XFF.
Possible Error Effect:	The call processing will try to use that particular PIDB facility but it is not usable.
Corrective Action Taken:	The audit will set the field to the default value which is 0XFF.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the PCidpidb[][] array.
<i>Bad Data =</i>	The contents of the PCidpidb[][].syspidb field.
<i>Good Data =</i>	The contents of what the PCidpidb[][].syspidb field should be which is 0XFF.
<i>Logical Index =</i>	The circuit name of the IDCUCIDB facility.
<i>Dump =</i>	The contents of the PCidpidb[][] array.

Table 8 Error Code: IDLE_BUSY

Error Code:	IDLE_BUSY
Error Description:	The bit in PCidpidb[][].usage was found to be idle but it should have been busy. This determination was made when the rIPTSB tuple for the PIDB time slot being audited was read and the rIPTSB.use field was that of a stable call.
Possible Error Effect:	The call processing will reuse that particular PIDB time slot.
Corrective Action Taken:	The audit will busy out the corresponding bit in PCidpidb[][].usage field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the PCidpidb[][] array.
<i>Bad Data =</i>	The contents of the PCidpidb[][].usage field.
<i>Good Data =</i>	The contents of what the bit should be which is a 0.
<i>Logical Index =</i>	The rIPTSB.ptsb key field.
<i>Dump 1 =</i>	The contents of the rIPTSB tuple.
<i>Dump 2 =</i>	The contents of the PCidpidb[][] array.

Table 9 Error Code: KEY

Error Code:	KEY
Error Description:	The rIPTSB tuple was missing for a given PIDB time slot.
Possible Error Effect:	The call processing will not be able to use that PIDB time slot.
Corrective Action Taken:	The audit will busy out the bit in PCidpidb[][].usage field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rIPTSB tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	The rIPTSB.ptsb key field.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	The contents of the rIPTSB tuple.

Table 10 Error Code: MAINT_STATE

Error Code:	MAINT_STATE
Error Description:	The PCidpidb[][].maintst field was found to be different from what the rSMEST.bas_stat field is.
Possible Error Effect:	The call processing will not be able use that particular PIDB facility for call processing.
Corrective Action Taken:	The audit will set the PCidpidb[][].maintst field to match the rSMEST.bas_stat field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the PCidpidb[][] array.
<i>Bad Data =</i>	The contents of the PCidpidb[][].maintst field.
<i>Good Data =</i>	The contents of what the PCidpidb[][].maintst field should be.
<i>Logical Index =</i>	The circuit name of the DS1 facility.
<i>Dump =</i>	The contents of the PCidpidb[][] array.

Table 11 Error Code: MAINT_STATE2

Error Code:	MAINT_STATE2
Error Description:	The IDPIDB audit found the PCidpidb[][].maintst field not to be set to the default value which is SMOOS.
Possible Error Effect:	The call processing will try to use that particular PIDB facility but it is not usable.
Corrective Action Taken:	The audit will set the PCidpidb[][].maintst field to the SMOOS value.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidpidb[][] array.
<i>Bad Data</i> =	The contents of the PCidpidb[][].maintst field.
<i>Good Data</i> =	The contents of what the PCidpidb[][].maintst field should be.
<i>Logical Index</i> =	The circuit name of the IDCU PIDB facility.
<i>Dump</i> =	The contents of the PCidpidb[][] array.

Table 12 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	The IDPIDB audit found the PCidpidb[][].type field not set to the default value which is PCNULLPIDB.
Possible Error Effect:	The call processing will try to use that particular PIDB facility but it is not usable.
Corrective Action Taken:	The audit will set the PCidpidb[][].type field to the SMOOS value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidpidb[][] array.
<i>Bad Data</i> =	The contents of the PCidpidb[][].type field.
<i>Good Data</i> =	The contents of what the PCidpidb[][].type field should be.
<i>Logical Index</i> =	The circuit name of the IDCU DIDB facility.
<i>Dump</i> =	The contents of the PCidpidb[][] array.

Table 13 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	The IDPIDB audit found a PCDUALPIDB over the authorized limit defined by rISF14. Now that this PIDB is traffic idle, it will be removed from service.
Possible Error Effect:	Call processing should not be able to use that particular PIDB facility.
Corrective Action Taken:	The PCDUALPIDB will be blocked from use by call processing and removed from service.
Manual Action Required:	The office engineers should contact their next level of technical assistance to obtain authorization to use additional PIDBs.
Dump Description:	
<i>Error Address</i> =	The IDCU unit number.
<i>Bad Data</i> =	The count of active PCDUALPIDBs.
<i>Good Data</i> =	The pidb limit defined in rISF14 for this IDCU.
<i>Logical Index</i> =	The circuit name of the PIDB facility.
<i>Dump 1</i> =	The contents of the rISF14 tuple.
<i>Dump 2</i> =	The contents of the PCidpidb[][] array.

Table 14 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The IDPIDB audit found a missing rIDPIDB_PT tuple for a given PIDB circuit name. The rCKTDATA.pidbtype field states that it is a directly connected PIDB, therefore, there should exist an rIDPIDB_PT tuple in the database.
Possible Error Effect:	The call processing will not be able to use that particular PIDB facility.
Corrective Action Taken:	None.
Manual Action Required:	The user should insert an rIDPIDB_PT in the database.
Dump Description:	
<i>Error Address</i> =	The address of the PCidpidb[][] array.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	The contents of the PCidpidb[][] array.
<i>Dump 2</i> =	The CKTDATA tuple.

Table 15 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The IDPIDB audit found a missing rISF14 or rPIDBLIMIT tuple for an equipped IDCU.
Possible Error Effect:	Call processing will default to using four PCDUALPIDBs for path hunting.
Corrective Action Taken:	None.

Manual Action Required:	The office engineers should refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual to create the missing tuple for the IDCU unit specified in the Error Address field with the appropriate pidb limit.
Dump Description:	
<i>Error Address</i> =	The idcu unit number.
<i>Bad Data</i> =	The circuit name for the associated PCIDUALPIDB.
<i>Good Data</i> =	The PIDB number.
<i>Logical Index</i> =	0.
<i>Dump</i> =	None.

Table 16 Error Code: SMEST

Error Code:	SMEST
Error Description:	The rSMEST tuple for a given PIDB facility is missing from the database.
Possible Error Effect:	The maintenance (removal and restoration) of the PIDB facility will not be possible.
Corrective Action Taken:	The audit will verify that all the fields in the PCidpidb[][] entry being audited are set to the default value until the rSMEST tuple is inserted in the database by the related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rSMEST tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The circuit name of the PIDB facility.
<i>Dump</i> =	The contents of the PCidpidb[][] array.

Table 17 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	The rIPTSB.use field was found to be out of range.
Possible Error Effect:	The call processing will not be able to use that particular PIDB time slot.
Corrective Action Taken:	The audit will idle out the corresponding bit in PCidpidb[][].usage field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidpidb[][] array.
<i>Bad Data</i> =	The contents of the rIPTSB.use field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The rIPTSB.ptsb key field.
<i>Dump 1</i> =	The contents of the rIPTSB tuple.
<i>Dump 2</i> =	The contents of the PCidpidb[][] array.

Table 18 Error Code: SYSPIDB

Error Code:	SYSPIDB
Error Description:	The PCidpidb[][].syspidb field was found to be different from what the static rCKTDATA.pidb field states it should be.
Possible Error Effect:	The call processing will not be able to use that PIDB facility.
Corrective Action Taken:	The audit will set the PCidpidb[][].syspidb field to match the rCKTDATA.pidb field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the PCidpidb[][] array.
<i>Bad Data</i> =	The contents of the PCidpidb[][].syspidb field.
<i>Good Data</i> =	The contents of what the PCidpidb[][].syspidb field should be.
<i>Logical Index</i> =	The circuit name of the PIDB facility.
<i>Dump</i> =	The contents of the PCidpidb[][] array.

Table 19 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to provide recovery after taking a reset. When a reset occurs (usually triggered by an illegal or out of range memory access), the audit which was running at the time is aborted, and is then rescheduled to run in AUZAP mode to provide recovery of related data left inconsistent as a result of

	the reset.
Possible Error Effect:	The audit may continue to cause memory access violations, increasing the probability of drastic recovery action and preventing the audit from checking for further errors.
Corrective Action Taken:	The data which caused the reset is initialized by the next entry of the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

IFD-A**Software Release:** 5E10 - 5E11**1. INTERNAL FRAME DESCRIPTOR (IFD) AUDIT**

IFDs are used in packet switching to keep track of frame ownership. Each IFD owns one or more buffer descriptors (BDs) which are used to control ownership of the buffers which contain the packet information. There are two types of IFDs:

- (1) IFDs linked to logical link control blocks (LLCBs) or quad-linked packet switched LLCBs (QLLCBs).
- (2) IFDs linked to arbitrary structures based on the IFD.client and IFD.clientidx fields.

These two types are mutually exclusive. That is, a given audit environment will include at most one of the two types. Error reports specific to one of the types have been noted as such below. Errors for which the associated checks differ between the types have also been noted.

Finally, the BD linkage field in an IFD may be implemented as either an offset or as a pointer. Since this does not affect the checks done, the implementation is not mentioned below.

2. DATA STRUCTURES

IFDs using the *llcb* field to track ownership may be owned by elements of PSllcb[] or QLllcb[]. IFDs whose ownership is based on the *client* and *clientidx* fields may be owned by elements of PSllcb[] or PVvccb[]. Either type may be owned by the free list headcell (PSrifdhd).

3. AUDIT CHECKS

The following list gives a basic indication of the order of the checks made by this audit. If the audit is being (re)entered:

ZAP = Check for system interrupt handling.

If the audit is completing:

STATUS = Check for integrity monitor invocation handling.

If the audit is checking an IFD:

BADOWNER = Check of IFD owner type.

BDLINK = Validity check of the IFD's BD linkage field.

IFD_LINK = Linkage check between an IFD and its owner.

OUTOFRANGE = Range check IFD ownership fields.

PT2PT = Linkage check between IFDs.

If the audit is recovering an IFD:

HD_CELL = Validity check of PSrifdhd.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	This check only applies to IFDs using fields <i>client</i> and <i>clientidx</i> for IFD to owner linkages. IFD.client (owner type) is not valid.
Possible Error Effect:	IFD handling code may assert. Otherwise, the IFD is probably lost and will contribute to the possibility of IFD resource failures.
Corrective Action Taken:	The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The IFD BD linkage field (IFD.bd or IFD.bdptr).
<i>Bad Data</i> =	IFD.client (the invalid IFD owner type).
<i>Good Data</i> =	IFD.clientidx.
<i>Logical Index</i> =	IFD number (index into PSifd[]).
<i>Dump</i> =	The IFD.

Table 2 Error Code: BDLINK

Error Code:	BDLINK
Error Description:	An internal frame descriptor's (IFD's) buffer descriptor (BD) linkage field is invalid. That is, either the IFD is idle (linked to PSrfdhd[]) and the BD field is not PSBDNULL or the IFD is not idle and the BD field does not contain a valid value.
Possible Error Effect:	If the IFD is idle, it may be preventing valid users from accessing the BD. If this happened often enough, the processor could experience BD resource failures. Otherwise, IFD user code may assert or otherwise fail when handling the IFD.
Corrective Action Taken:	The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The IFD BD linkage field (IFD.bd or IFD.bdptr).
<i>Bad Data</i> =	IFD to IFD linkage fields. The top 16 bits contain IFD.next_ifd. The lower 16 bits contain IFD.back_ifd.
<i>Good Data</i> =	IFD owner information (IFD.llcb or the top 16 bits contain IFD.client and the lower 16 bits contain IFD.clientidx).
<i>Logical Index</i> =	IFD number (index into PSifd[]).
<i>Dump</i> =	NA.

Table 3 Error Code: HD_CELL

Error Code:	HD_CELL
Error Description:	The IFD free list headcell (PSrfdhd) is corrupt. That is, one or more of the following is true: - PSrfdhd.first or PSrfdhd.last are out of range ($\geq$ PSRIFDS). (< PSRIFDS) but PSifd[PSrfdhd.first].back_ifd != PSIFDNULL or (depending on IFD type) llcb != PSLLCBNULL or <i>clientidx</i> !=

	PSICLNULL. ($< \text{PSRIFDS}$) but $\text{PSifd}[\text{PSrfdhd.first}].\text{next\_ifd} \neq \text{PSIFDNULL}$ or (depending on IFD type) $\text{llcb} \neq \text{PSLLCBNULL}$ or $\text{clientidx} \neq \text{PSICLNULL}$.
Possible Error Effect:	Allocation of IFDs may not be possible. This would cause all frames to be dropped.
Corrective Action Taken:	The audit rebuilds the IFD free list by clearing the headcell and linking all IFDs whose (depending on IFD type) llcb field = PSLLCBNULL or client field = PSINOCIENT .
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Minimum valid IFD index.
<i>Bad Data</i> =	Number of IFDs (PSRIFDS).
<i>Good Data</i> =	Null IFD index (PSIFDNULL).
<i>Logical Index</i> =	The IFD under audit when the error was detected.
<i>Dump</i> =	The IFD free list headcell (PSrfdhd).

Table 4 Error Code: IFD_LINK

Error Code:	IFD_LINK
Error Description:	There is an IFD to IFD linkage failure. At least one of the following is true: - IFD.next_ifd is in range ($< \text{PSRIFDS}$) but $\text{PSifd}[\text{IFD.next\_ifd}].\text{back\_ifd} \neq \text{IFD index}$. - IFD.$\text{back\_ifd}$ is in range ($< \text{PSRIFDS}$) but $\text{PSifd}[\text{IFD.back\_ifd}].\text{next\_ifd} \neq \text{IFD index}$. - The owner information between two linked IFDs does not match. Either: - IFD.$\text{llcb} \neq [\text{next or back}] \text{IFD.llcb}$ or - IFD.client or $\text{clientidx} \neq [\text{next or back}]$
Possible Error Effect:	The list of IFDs is broken. If the current list is the idle list, the processor might experience IFD resource failures. Otherwise, IFD user code may assert or otherwise fail while trying to process the frame associated with this IFD.
Corrective Action Taken:	The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The IFD BD linkage field (IFD.bd or IFD.bdptr).
<i>Bad Data</i> =	IFD owner linkage fields. The top 16 bits contain the owner's f_ifd field. The lower 16 bits contain the owner's i_ifd field.
<i>Good Data</i> =	IFD owner information (IFD.llcb or the top 16 bits contain IFD.client and the lower 16 bits contain IFD.clientidx).
<i>Logical Index</i> =	IFD number (index into $\text{PSifd}[]$).
<i>Dump 1</i> =	The IFD.
<i>Dump 2</i> =	If the PSIFD.next_ifd is $< \text{PSRIFDS}$, this will be the IFD indexed by that value. Otherwise the dump will not appear. Note that the error address printed in the dump message will be 0.
<i>Dump 3</i> =	If the PSIFD.back_ifd is $< \text{PSRIFDS}$, this will be the IFD indexed by that value. Otherwise the dump will not appear. Note that the error address printed in the dump message will be 1.

Table 5 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The IFD owner information is out of range. That is, one of the following is true: • IFD.llcb is not equal to PSLLCBNULL but is greater than or equal to both PSRLLCBS and QLNLLCBS. • IFD.client is a valid type but the associated IFD.clientidx value is out of range (the valid values depend on the <i>client</i> type).
Possible Error Effect:	The IFD is not available for use. If enough IFDs became unavailable, the processor might experience IFD resource failures.
Corrective Action Taken:	The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The IFD BD linkage field (IFD.bd or IFD.bdptr).
<i>Bad Data</i> =	IFD to IFD linkage fields: The top 16 bits contain IFD.next_ifd. The lower 16 bits contain IFD.back_ifd.
<i>Good Data</i> =	IFD owner information: IFD.llcb or The top 16 bits contain IFD.client. The lower 16 bits contain IFD.clientidx.
<i>Logical Index</i> =	IFD number (index into PSifd[]).
<i>Dump</i> =	NA.

Table 6 Error Code: PT2PT

Error Code:	PT2PT
Error Description:	One or more of the following is true about an IFD: • IFD.next_ifd = PSIFDNULL but the IFD is not the last IFD on the list according to the owning structure's <i>l_ifd</i> field. • IFD.back_ifd = PSIFDNULL but the IFD is not the first IFD on the list according to the owning structure's <i>f_ifd</i> field. • One or both of the IFD's IFD linkage fields (PSIFD.next_ifd and PSIFD.back_ifd) is out of range ($\neq$ PSIFDNULL and $\geq$ PSRIFDS).
Possible Error Effect:	The IFD is not available for use. If enough IFDs became unavailable, the processor might experience IFD resource failures.
Corrective Action Taken:	The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The IFD BD linkage field (IFD.bd or IFD.bdptr).
<i>Bad Data</i> =	IFD to IFD linkage fields. The top 16 bits contain IFD.next_ifd. The lower 16 bits contain IFD.back_ifd.
<i>Good Data</i> =	IFD owner information (IFD.llcb or the top 16 bits contain IFD.client and the lower 16 bits contain IFD.clientidx).
<i>Logical Index</i> =	IFD number (index into PSifd[]).
<i>Dump 1</i> =	The IFD.
<i>Dump 2</i> =	If the PSIFD.next_ifd is $<$ PSRIFDS, this will be the IFD indexed by that value. Otherwise the dump will not appear. Note that the error address printed in the dump message will be 0.
<i>Dump 3</i> =	If the PSIFD.back_ifd is $<$ PSRIFDS, this will be the IFD indexed by that value. Otherwise the dump will not appear. Note that the error address printed in the dump message will be 1.

Table 7 Error Code: STATUS

Error Code:	STATUS
Error Description:	This check only applies to IFDs using fields <i>client</i> and <i>clientidx</i> for IFD to owner linkages. Integrity monitor has invoked the IFD audit because of a packet switching internal frame descriptor (PSIFD) resource problem.
Possible Error Effect:	Frames can not be passed if IFDs are not available.
Corrective Action Taken:	The audit determines which PSRLCB is the heaviest PSIFD user and idles all PSIFDs belonging to the PSRLCB in question (PSIFD.client = PSICRLCB and PSIFD.clientidx = PSRLCB index).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The number of IFDs being used by the maximum user.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Index of the maximum user (index into PSrlcb[]).
<i>Dump</i> =	The maximum user.

Table 8 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	If the IFD index is in range (< PSRIFDS), the audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	The number of IFDs (PSRIFDS).
<i>Logical Index</i> =	IFD number (index into PSifd[]). This value may be out of range ($\geq$ PSRIFDS).
<i>Dump</i> =	The IFD if the IFD index is in range. Otherwise, NA.

IFD-B

Software Release: 5E12 and later

1. INTERNAL FRAME DESCRIPTOR (IFD) AUDIT

IFDs are used in packet switching to keep track of frame ownership. Each IFD owns one or more buffer descriptors (BDs) which are used to control ownership of the buffers which contain the packet information.

IFDs may be linked to arbitrary structures based on the IFD.client and IFD.clientidx fields.

Finally, the BD linkage field in an IFD may be implemented as either an offset or as a pointer. Since this does not affect the checks done, the implementation is not mentioned below.

2. DATA STRUCTURES

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	The IFD free list headcell (PSrfdhd) contains the index of an IFD (PSrfdhd.first or PSrfdhd.last) which is not idle (IFD.client != PSICLNULL or IFD.clientidx != PSICLNULLIDX).
Possible Error Effect:	IFD handling code may assert. Packet traffic may be lost if IFDs cannot be allocated. This may in turn cause processor resource overload reports.
Corrective Action Taken:	The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The index of the corrupted IFD list.
<i>Bad Data =</i>	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Good Data =</i>	The number of IFDs found in the list.
<i>Logical Index =</i>	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Dump 1 =</i>	IFD linkage information for this client.

Table 2 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The audit was unable to retrieve IFD linkage information for the IFD free list headcell (PSrfdhd).
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit rebuilds the IFD free list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The top 16 bits contain the count of IFDs found on the list. The lower 16 bits contain the index to the failed IFD list.

<i>Bad Data</i> =	An internal value indicating the reason the linkage retrieval failed.
<i>Good Data</i> =	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Logical Index</i> =	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Dump</i> =	NA.

Table 3 Error Code: BDLINK

Error Code:	BDLINK
Error Description:	An IFD either owns a BD when it should not or does not own a BD when it should.
Possible Error Effect:	Either one or more BDs are being held when they should not be, possibly contributing to resource overload, or, data associated with the frame may be lost.
Corrective Action Taken:	The audit idles the IFD and, depending on the IFD owner type, may take additional recovery on that owner.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The IFD's BD field (IFD.bd or IFD.bdptr).
<i>Bad Data</i> =	The top 16 bits contain the IFD.next_ifd field value. The lower 16 bits contain the IFD.back_ifd field value.
<i>Good Data</i> =	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Logical Index</i> =	IFD number (index into PSifd[]).
<i>Dump 1</i> =	The IFD.
<i>Dump 2</i> =	The IFD indexed by the current IFD.next_ifd field (if available).
<i>Dump 3</i> =	The IFD indexed by the current IFD.back_ifd field (if available).
<i>Dump 4</i> =	The IFD owner (if available).

Table 4 Error Code: HEAD

Error Code:	HEAD
Error Description:	Corruption has been detected in the owner linkage of an IFD list.
Possible Error Effect:	IFD resources may become lost.
Corrective Action Taken:	The audit recovers IFD list linkages and, depending on the IFD owner type, may take additional recovery on that owner.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The index of the corrupted IFD list.
<i>Bad Data</i> =	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Good Data</i> =	The number of IFDs found in the list.
<i>Logical Index</i> =	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Dump 1</i> =	IFD linkage information for this client.
<i>Dump 2</i> =	There may be an optional second dump containing debugging information.

Table 5 Error Code: IFD_LINK

Error Code:	IFD_LINK
Error Description:	There is an IFD to IFD linkage failure. At least one of the following is true: • IFD.next_ifd is in range (< PSRIFDS) but PSifd[IFD.next_ifd].back_ifd != IFD index. • IFD.back_ifd is in range (< PSRIFDS) but PSifd[IFD.back_ifd].next_ifd != IFD index. • The owner information between two linked IFDs does not match (IFD.client or clientidx != [next or back] IFD.client or clientidx).
Possible Error Effect:	The list of IFDs is broken. If the current list is the idle list, the processor might

	experience IFD resource failures. Otherwise, IFD user code may assert or otherwise fail while trying to process the frame associated with this IFD.
Corrective Action Taken:	The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The IFD BD linkage field (IFD.bd or IFD.bdptr).
<i>Bad Data =</i>	IFD owner linkage fields. The top 16 bits contain the owner's <i>f_ifd</i> field. The lower 16 bits contain the owner's <i>l_ifd</i> field.
<i>Good Data =</i>	The top 16 bits contain IFD.client. The lower 16 bits contain IFD.clientidx.
<i>Logical Index =</i>	IFD number (index into PSifd[]).
<i>Dump 1 =</i>	The IFD.
<i>Dump 2 =</i>	The IFD indexed by the current IFD.next_ifd field (if available).
<i>Dump 3 =</i>	The IFD indexed by the current IFD.back_ifd field (if available).
<i>Dump 4 =</i>	The IFD owner (if available).

Table 6 Error Code: NONNULL

Error Code:	NONNULL
Error Description:	An IFD list which should be empty is not empty.
Possible Error Effect:	IFD resources may become lost.
Corrective Action Taken:	The audit idles the IFD and, depending on the IFD owner type, may take additional recovery on that owner.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The index of the corrupted IFD list.
<i>Bad Data =</i>	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Good Data =</i>	The number of IFDs found in the list.
<i>Logical Index =</i>	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Dump 1 =</i>	IFD linkage information for this client.
<i>Dump 2 =</i>	There may be an optional second dump containing debugging information.

Table 7 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The audit was unable to retrieve IFD list information for the owner of this IFD (represented by IFD.client and IFD.clientidx).
Possible Error Effect:	The IFD is not available for use. If enough IFDs became unavailable, the processor might experience IFD resource failures.
Corrective Action Taken:	The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The IFD BD linkage field (IFD.bd or IFD.bdptr).
<i>Bad Data =</i>	An internal value indicating the reason the linkage retrieval failed.
<i>Good Data =</i>	The top 16 bits contain IFD.client. The lower 16 bits contain IFD.clientidx.
<i>Logical Index =</i>	IFD number (index into PSifd[]).
<i>Dump =</i>	The IFD.

Table 8 Error Code: PT2PT

Error Code:	PT2PT
Error Description:	One or more of the following is true about an IFD: • IFD.next_ifd = PSIFDNULL but the IFD is not the last IFD on the list according to the owning structure's <i>l_ifd</i> field. • IFD.back_ifd = PSIFDNULL but the IFD is not the first IFD on the list according to the owning structure's <i>f_ifd</i> field.

	One or both of the IFD's IFD linkage fields (IFD.next_ifd and IFD.back_ifd) is out of range (!= PSIFDNULL and ≥ PSRIFDS).
Possible Error Effect:	The IFD is not available for use. If enough IFDs became unavailable, the processor might experience IFD resource failures.
Corrective Action Taken:	The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The IFD BD linkage field (IFD.bd or IFD.bdptr).
<i>Bad Data =</i>	IFD to IFD linkage fields. The top 16 bits contain IFD.next_ifd. The lower 16 bits contain IFD.back_ifd.
<i>Good Data =</i>	The top 16 bits contain IFD.client. The lower 16 bits contain IFD.clientidx.
<i>Logical Index =</i>	IFD number (index into PSifd[]).
<i>Dump 1 =</i>	The IFD.
<i>Dump 2 =</i>	The IFD indexed by the current IFD.next_ifd field (if available).
<i>Dump 3 =</i>	The IFD indexed by the current IFD.back_ifd field (if available).
<i>Dump 4 =</i>	The IFD owner (if available).

Table 9 Error Code: READ

Error Code:	READ
Error Description:	The audit was unable to retrieve IFD list information for the IFD free list headcell (PSrifdhd).
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit rebuilds the IFD free list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The number of IFDs found on the IFD list.
<i>Bad Data =</i>	An internal value indicating the reason the linkage retrieval failed.
<i>Good Data =</i>	The maximum number of IFDs allowed on an IFD list.
<i>Logical Index =</i>	The top 16 bits contain the IFD.client field value. The lower 16 bits contain the IFD.clientidx field value.
<i>Dump =</i>	There may be an optional dump containing debugging information.

Table 10 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	If the index indicating the last IFD that was checked is in range (< PSRIFDS), The audit unlinks the IFD from any list it is in, sets all fields to their default values and links it to the IFD idle list. Any BDs that had been associated with this IFD will be recovered by the related BD audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	The number of IFDs (PSRIFDS).
<i>Logical Index =</i>	IFD number (index into PSifd[]). This value may be out of range (≥ PSRIFDS).
<i>Dump =</i>	The IFD if the IFD index is in range. Otherwise, NA.

IMIIA

Software Release: 5E10 and later

1. INTERRUPT INHIBIT ADMINISTRATOR (IMIIA) AUDIT

The interrupt inhibit administrator (IIA) is a program that controls the state of the inhibit bits for all the hardware in the switching modules (SMs). The interrupt inhibit administrator is called by fault recovery, the maintenance request administrator (MRA), or by manual request using an INH:INTR,[bit], ALW:INTR,[bit], RST:[circuit], or a RMV:[circuit] input message. Refer to the Input Messages manual (235-600-700). The state of the inhibit bits is either inhibit (INH) or allow (ALW). Specifically, the IIA controls 38 bits on the following eight registers: the reset mask register, the hardware reset source mask register, the software reset source mask register, the data link interface (DLI) error mask register, the three interrupt controller registers, and the write protect control register.

The basic states of hardware in the duplex SM environment are active, standby, out-of-service, and unavailable. The switching module interrupt inhibit administrator audit (IMIIA) checks both sides of the switching module (SM) if the SM's state is active/standby. If the SM's state is either active/out-of-service or active/unavailable, the audit checks only the active side, except for the mate controller ready-time out bit (MMTRT). In this case, an interrupt may be allowed on an out-of-service circuit. The audit does not alter the hardware configuration; it alters the hardware interrupt mask registers to reflect the hardware state.

The IMIIA audit also performs interrupt status checks on the remote clock (RCLK) circuit. The clock is a duplex circuit. Regardless of the number of active processors, the audit checks both clock sides.

This audit is part of the switch maintenance audits subgroup. It operates in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented mode.

Figure 1 (IMIIA-1) IIA Arrays

2. DATA STRUCTURES

Figure 1 shows the two arrays in global data checked by the IMIIA audit: the inhibit administrator module processor current state array (SMiampcs) and the inhibit administrator module processor qualifiers array (SMiampq). The SMiampcs array is 16 words long. Words zero through seven reflect the state of the eight registers for controller zero; words eight through 15 contain the states of the eight registers for controller one. This array changes with the current state of the hardware. The qualifiers array (SMiampq), which describes how each inhibit bit was set, is 76 words long. Words zero through 37 are for the 38 bits in the eight registers for controller zero, and words 38 through 75 are for the corresponding bits for controller one. The audit checks one write-protected relation: the circuit data relation (RLCKTDATA). This relation may be modified only by using recent change procedures.

The audit also checks one variable array, the switch maintenance current state array (SMmccustat).

3. AUDIT CHECKS

The IMIIA audit checks the consistency between the software image of the interrupt masks and the hardware state of the interrupt masks. Initially, the audit allows parity checking on the time slot interchanger (TSI). Then the audit performs the following checks on the SM, DLI, and control interface (CI) interrupt masks.

- (a) The audit first determines which side is currently executing (0 or 1) to know which half of the software image array should be used.
- (b) The audit determines if the mate side should be audited. If the state is out-of-service or unavailable (OOS or UNAV), no audit is performed on the mate.
- (c) Then the audit performs the following checks for each of the 38 bits on the side to be audited.
 - (1) The audit reads the appropriate hardware register to get the actual state of the bit (ALW or INH).
 - (2) The audit reads the SMiampcs array to obtain the software image for the same bit.
 - (3) The audit checks the SMiampq array and ensures that it contains one of three acceptable values: TEMP, AUTO, or MAN. These qualifiers describe how the inhibit bit was set: either temporarily (TEMP) while diagnostics are running, automatically (AUTO) during fault recovery, or manually (MAN) as requested by maintenance personnel. Any other value will cause an audit error report, and the value is changed to AUTO.
 - (4) The audit calls a function to calculate the normal state for the bit. The function called depends on the bit involved. For CI bits, the audit checks rICKTDATA to determine if the corresponding CI is operational. The normal state for an operational CI is allow. For all other cases, the normal state is inhibit. For SM and DLI bits, the audit checks the SMmccustat array to determine if the circuit is active or standby. The normal state for an active or standby SM or DLI is allow. For all other cases, the normal state is inhibit.
 - (5) If no errors are detected for the bit, the audit checks the TEMP/INHIBIT state. This state should only be detected by the audit if the unit is being actively diagnosed. If this state is detected, the audit reports it and then continues. If this state is not detected, the audit checks if the hardware value of the mask matches the software image of the mask. When the audit runs in a remote switch module (RSM) environment, it performs another check on DLI bits. The audit verifies that the FI hardware value is consistent with the DLI software image. If there is an inconsistency, the audit reports it and corrects it.

On each call to the remote clock check routine, the audit determines whether the hardware interrupt status for the clock and its child circuit (RCXC, RCOXC, RCOSC, or RCREP) is consistent with the switch maintenance equipment status table (rISMEST) interrupt information.

4. ERROR HANDLING

If an inconsistency exists between the normal state and the software image, the audit changes the hardware interrupt mask register to agree with the normal state. One exception is the MMTRT bit. If the software image for MMTRT is inhibit, the audit reports the error and corrects it. This bit should never be masked.

The audit then updates the appropriate bits for the circuit in the current state array (SMiampcs) to that state. The audit proceeds to the qualifiers array where it updates the qualifier to AUTO. Once the registers and arrays are updated, the software and actual hardware configuration are consistent, and the audit proceeds to the next bit.

Remote clock errors are corrected by calling the interrupt administration peripheral refresh routine, which updates the hardware status of the RCLK PICB and child circuit control communication buffer (CCB) with the interrupt status information in rSMEST provided that the parent remote clock is not out of service.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: CR_DATA

Error Code:	CR_DATA
Error Description:	This type of error indicates that some or all of the current data related to MCTSI critical regions (SMcrnt and the structure SMcrdata) is not in the expected state. SMcrnt should be equal to zero at this point which indicates that no critical regions are in effect at this time. Also, SMcrdata.who should be set to SMCRWNULL (0) and SMcrdata.level should be set to SMCRNULL (0). SMcrdata.data_1 holds additional information passed into SMcrbegin() by the caller.
Possible Error Effect:	Various critical region asserts may be seen indicating such problems as a user asking for a critical region when one is already invoked (SMCRCOUNT) or a user asking to end a critical region when they don't have one (SMCRBEND). Until the corruption is corrected, a user may be unable to obtain a critical region. Also, much of the SM hardware error detection may be disabled.
Corrective Action Taken:	The critical region data and the associated hardware are refreshed to the expected state which indicates that no critical region is in effect.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Starting address of the global structure SMcrdata.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	The bad data dumped out with the audit error report should be interpreted as follows (each letter represents 4 bits of data): vvwwxxxxxyyyzzzz where: vv = SMcrdata.who. ww = SMcrdata.level. xxxx = SMcrdata.intlev. yyyy = SMcrnt. zzzz = 2 bytes of padding (ignore).

Table 2 Error Code: CSTATE

Error Code:	CSTATE
Error Description:	This type of error indicates that the software current state image, which is kept in SMiampcs[] does not agree with the hardware mask bit state. Further comparison of each state to the normal state showed that the hardware state was correct and that the software current state image was incorrect.
Possible Error Effect:	Unexpected interrupts.
Corrective Action Taken:	The current state, which is kept in SMiampcs[] and indexed by the image

	number plus the image offset, is updated to the normal state of either allow (SMALLOW) or inhibit (SMINHIBIT). The normal state depends upon the state of the circuit corresponding to the bit number. The current state qualifier, which is kept in SMiampq[] and indexed by the bit number plus the bit offset is updated to auto (SMIA_AUTO). The hardware is refreshed to match the current state in SMiampcs[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of SMiampcs[], indexed by the image number plus the image offset.
<i>Bad Data</i> =	Current bit state.
<i>Good Data</i> =	Normal bit state.
<i>Logical Index</i> =	Bit number plus the bit offset.
<i>Dump</i> =	NA.

Table 3 Error Code: MP_HDW_IA

Error Code:	MP_HDW_IA
Error Description:	This type of error indicates that the hardware mask bit state does not agree with the software current state image, which is kept in SMiampcs[]. Further comparison of each state to the normal state showed that the software current state image was correct and that the hardware mask bit state was in error.
Possible Error Effect:	Unexpected interrupts.
Corrective Action Taken:	The current state, which is kept in SMiampcs[] and indexed by the image number plus the image offset, is updated to the normal state of either allow (SMALLOW) or inhibit (SMINHIBIT). The normal state depends upon the state of the circuit corresponding to the bit number. The current state qualifier, which is kept in SMiampq[] and indexed by the bit number plus the bit offset is updated to auto (SMIA_AUTO). The hardware is refreshed to match the current state in SMiampcs[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Hardware mask bit state.
<i>Good Data</i> =	Normal bit state.
<i>Logical Index</i> =	Bit number plus the bit offset.
<i>Dump</i> =	NA.

Table 4 Error Code: MM_ALWOOS

Error Code:	MM_ALWOOS
Error Description:	This type of error indicates that the current state, which is kept in SMiampcs[] and indexed by the image number plus the register offset, is allow (SMALLOW) while the state of the circuit corresponding to the bit number is out of service (OOS). This combination of alw/oos is illegal because interrupts should never be allowed on a nonoperational circuit. This error code corresponds only to the module controller mask bits.
Possible Error Effect:	Unexpected interrupts from an out-of-service, unequipped, or a prior-to-out-of-service circuit.
Corrective Action Taken:	The current state, which is kept in SMiampcs[] and indexed by the image number plus the register offset, is updated to the normal state of inhibit (SMINHIBIT). The current state qualifier, which is kept in SMiampq[] and indexed by the bit number plus the bit offset, is updated to auto (SMIA_AUTO). The hardware is refreshed to match the current state in SMiampcs[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of SMiampcs[], indexed by the image number plus the register offset.
<i>Bad Data</i> =	Current state, which is kept in SMiampcs[] and indexed by the image number plus the register offset.
<i>Good Data</i> =	Normal state.
<i>Logical Index</i> =	Bit number plus the bit offset.
<i>Dump</i> =	NA.

Table 5 Error Code: M_NOTINH

Error Code:	M_NOTINH
Error Description:	This type of error indicates that a mask bit that is always inhibited is in the allow (SMALLOW) or an unknown state.
Possible Error Effect:	Unexpected interrupts from an out-of-service, unequipped, or growth circuit.
Corrective Action Taken:	The current state, which is kept in SMiampcs[] and indexed by the image number plus the register offset, is updated to the normal state of inhibit (SMINHIBIT). The current state qualifier, which is kept in SMiampq[] and indexed by the bit number plus the bit offset, is updated to auto (SMIA_AUTO). The hardware is refreshed to match the current state in SMiampcs[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of SMiampcs[], indexed by the image number plus the register offset.
<i>Bad Data</i> =	Current state, which is kept in SMiampcs[] and indexed by the image number plus the register offset.
<i>Good Data</i> =	Normal state.
<i>Logical Index</i> =	Bit number plus the bit offset.
<i>Dump</i> =	NA.

Table 6 Error Code: M_TMPINH

Error Code:	M_TMPINH
Error Description:	This type of error indicates that the current state qualifier, which is kept in SMiampq[] and indexed by the bit number plus the bit offset, is temporary (SMIATEMP) and the current state, which is kept in SMiampcs[] and indexed by the image number plus the image offset, is inhibit (SMINHIBIT). The combination of temp/inh is illegal because it should never be seen by anything but a running diagnostic phase, which never takes a real time break. This error code pertains only to the module controller mask bits.
Possible Error Effect:	Interrupts are blocked unnecessarily.
Corrective Action Taken:	The current state, which is kept in SMiampcs[] and indexed by the image number plus the image offset, is updated to the normal state of either allow (SMALLOW) or inhibit (SMINHIBIT). The normal state depends upon the state of the circuit corresponding to the bit number. The current state qualifier, which is kept in SMiampq[] and indexed by the bit number plus the bit offset is updated to auto (SMIA_AUTO). The hardware is refreshed to match the current state in SMiampcs[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of SMiampcs[], indexed by the image number plus the image offset.
<i>Bad Data</i> =	Current state, which is kept in SMiampcs[] and indexed by the image number plus the register offset.
<i>Good Data</i> =	Normal state.
<i>Logical Index</i> =	Bit number plus the bit offset.
<i>Dump</i> =	NA.

Table 7 Error Code: M_UNKQUAL

Error Code:	M_UNKQUAL
Error Description:	This type of error indicates that the current state qualifier, which is kept in SMiampq[] and indexed by the bit number plus the bit offset, is of an unknown type (not SMIA_AUTO, SMIA_MAN, or SMIATEMP). This error code pertains strictly to module controller mask bits.
Possible Error Effect:	Could cause asserts and rejection of all IIA requests to inhibit or allow interrupts on this circuit.
Corrective Action Taken:	The current state qualifier, which is kept in SMiampq[] and indexed by the bit number plus the bit offset is updated to auto (SMIA_AUTO).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of SMiampq[], indexed by the bit number plus the bit offset.

<i>Bad Data</i> =	Current state qualifier in SMiampq[], indexed by the bit number plus the bit offset.
<i>Good Data</i> =	New qualifier (SMIA_AUTO).
<i>Logical Index</i> =	Bit number plus the bit offset.
<i>Dump</i> =	NA.

Table 8 Error Code: PROC_IA

Error Code:	PROC_IA
Error Description:	This type of error indicates that a mask bit that is always allowed is in the inhibit (SMINHIBIT) state. Currently this error code only pertains to the module controller mate ready timeout mask.
Possible Error Effect:	Upon switching to the mate module controller system could roll on time out errors.
Corrective Action Taken:	The current state, which is kept in SMiampcs[] and indexed by the image number plus the register offset, is updated to the normal state of allow (SMALLOW). The current state qualifier, which is kept in SMiampq[] and indexed by the bit number plus the bit offset, is updated to auto (SMIA_AUTO). The hardware is refreshed to match the current state in SMiampcs[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of SMiampcs[], indexed by the image number plus the register offset.
<i>Bad Data</i> =	Current state, which is kept in SMiampcs[] and indexed by the image number plus the register offset.
<i>Good Data</i> =	Normal state.
<i>Logical Index</i> =	Bit number plus the bit offset.
<i>Dump</i> =	NA.

Table 9 Error Code: P_ALWOOS

Error Code:	P_ALWOOS
Error Description:	This type of error indicates that the Equipment Status Table current state is allow (SMALLOW), while the state of the circuit is either out of service (OOS) or prior to out of service (PROOS). This combination is illegal because interrupts should never be allowed on an OOS or PROOS circuit. This error code pertains only to the peripheral audit function.
Possible Error Effect:	Unwanted interrupts during a diagnostic, rolling interrupts, and degrading machine performance.
Corrective Action Taken:	The Equipment Status Table current state is updated to the normal state of inhibit (SMINHIBIT). The Equipment Status Table current state qualifier is updated to auto (SMIA_AUTO). The peripheral hardware and the software images are refreshed to match the current state of the Equipment Status Table.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the Equipment Status Table tuple.
<i>Bad Data</i> =	Current state.
<i>Good Data</i> =	Normal state.
<i>Logical Index</i> =	Circuit name in the tuple.
<i>Dump</i> =	NA.

Table 10 Error Code: P_HDW_IA

Error Code:	P_HDW_IA
Error Description:	This type of error indicates that the hardware mask bit state of the RLI does not agree with the software current state image of the RLI, which is kept in SMiampcs[].
Possible Error Effect:	Unexpected interrupts.
Corrective Action Taken:	The current state, which is kept in SMiampcs[] and indexed by the image number plus the image offset, is updated to the normal state of either allow (SMALLOW) or inhibit (SMINHIBIT). The normal state depends upon the state of the circuit corresponding to the bit number. The current state qualifier, which is

	kept in SMiampq[] and indexed by the bit number plus the bit offset is updated to auto (SMIA_AUTO). The hardware is refreshed to match the current state of the RLI in SMiampcs[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	RLI mask bit state.
<i>Good Data</i> =	Normal bit state.
<i>Logical Index</i> =	Bit number plus the bit offset.
<i>Dump</i> =	NA.

Table 11 Error Code: P_TMPINH2

Error Code:	P_TMPINH2
Error Description:	This type of error indicates that the Equipment Status Table current state qualifier is temporary (SMIATEMP) and the current state is inhibit (SMINHIBIT). This combination is illegal because it should only be seen while running a diagnostic phase, which never takes a real time break with temporary inhibits in place. This condition probably means a diagnostic phase was purged before it had a chance to clean up from temp/inh to temp/alw. This error code only pertains to the peripheral audit function.
Possible Error Effect:	Interrupts are blocked unnecessarily.
Corrective Action Taken:	The Equipment Status Table current state is updated to the normal state of allow (SMALLOW). The Equipment Status Table current state qualifier is updated to auto (SMIA_AUTO). The peripheral hardware and the software images are refreshed to match the current state of the Equipment Status Table.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the Equipment Status Table tuple.
<i>Bad Data</i> =	Current state qualifier.
<i>Good Data</i> =	New qualifier.
<i>Logical Index</i> =	Circuit name in the tuple.
<i>Dump</i> =	NA.

Table 12 Error Code: P_UNKQUAL

Error Code:	P_UNKQUAL
Error Description:	This type of error indicates that the Equipment Status Table current state qualifier is of an unknown type (not SMIA_AUTO, SMIA_MAN, or SMIATEMP). This error code pertains strictly to the peripheral audit function.
Possible Error Effect:	Cause asserts, and reject all IIA requests for the circuit.
Corrective Action Taken:	The Equipment Status Table current state is updated to the normal state of either allow (SMALLOW) or inhibit (SMINHIBIT), where the normal state depends upon the service state of the circuit. The Equipment Status Table current state qualifier is updated to auto (SMIA_AUTO). The peripheral hardware and the software images are refreshed to match the current state of the Equipment Status Table.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the Equipment Status Table tuple.
<i>Bad Data</i> =	Current state qualifier.
<i>Good Data</i> =	New qualifier.
<i>Logical Index</i> =	Circuit name in the tuple.
<i>Dump</i> =	NA.

Table 13 Error Code: P_UNKSTAT2

Error Code:	P_UNKSTAT2
Error Description:	This type of error indicates that the Equipment Status Table current state is of an unknown type (not SMALLOW, or SMINHIBIT). This error code only pertains to the peripheral audit function.
Possible Error Effect:	Cause asserts, and reject IIA calls for this circuit.

Corrective Action Taken:	The Equipment Status Table current state is updated to the normal state of allow (SMALLOW). The Equipment Status Table current state qualifier is updated to auto (SMIA_AUTO). The peripheral hardware and the software images are refreshed to match the current state of the Equipment Status Table.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the Equipment Status Table tuple.
<i>Bad Data</i> =	Current state.
<i>Good Data</i> =	Normal state.
<i>Logical Index</i> =	Circuit name in the tuple.
<i>Dump</i> =	NA.

17. IN - J

INPCB-A

Software Release: 5E12 only

1. ETHERNET INTERNET PROTOCOL CONTROL BLOCK (INPCB) AUDIT

Internet protocol is used to transmit and receive data through an ethernet network. The INPCBs are used to represent per-connection information such as foreign IP addresses and port numbers. They are either idle and are linked to the idle list or linked and are linked to a SOCKET and possibly to a transmission control protocol control block (TCPCB). The audit verifies linkages among CMinpcb[], CMtcpcb[], CMsocket[] and CMidleinpcb and verifies data within every entry in CMinpcb[].

2. DATA STRUCTURES

The following data are used by the INPCB audit:

CMinpcb[] = Internet protocol control block.

CMtcpcb[] = TCP control block.

CMsocket[] = Socket protocol control block.

CMidleinpcb = Internet control block idle list.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: BACKLINK

Error Code:	BACKLINK
Error Description:	The next field in the current CMinpcb[] entry is out of range.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	busy_list.inp_next.
<i>Bad Data =</i>	busy_list.inp_prev.
<i>Good Data =</i>	CMinpcb[index].inp_next.
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump =</i>	Contents of CMinpcb[index].

Table 2 Error Code: BACKLINK1

Error Code:	BACKLINK1
Error Description:	The CMinpcb[] entry is the first member in a linked list of busy entries. One of the following conditions has occurred: • CMinpcb[index].inp_next is not within range, • CMinpcb[index].inp_next equals the index into CMinpcb[],

	• CMinpcb[CMinpcb[index].inp_next].inp_prev does not equal the index into CMinpcb[] or • CMinpcb[CMinpcb[index].inp_next].inp_head_ptr does not equal inp_head_ptr of the owner.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CMinpcb[CMinpcb[index].inp_next].inp_prev.
<i>Good Data =</i>	CMinpcb[CMinpcb[index].inp_next].inp_head_ptr.
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump =</i>	Contents of CMinpcb[index].

Table 3 Error Code: BACKLINK2

Error Code:	BACKLINK2
Error Description:	The CMinpcb[] entry is the last member in a linked list of busy entries. One of the following conditions has occurred: • CMinpcb[index].inp_prev is not within range, • CMinpcb[index].inp_prev equals the index into CMinpcb[], • CMinpcb[CMinpcb[index].inp_prev].inp_next does not equal the index into CMinpcb[] or • CMinpcb[CMinpcb[index].inp_prev].inp_head_ptr does not equal inp_head_ptr of the owner.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CMinpcb[CMinpcb[index].inp_prev].inp_head_ptr.
<i>Good Data =</i>	CMinpcb[CMinpcb[index].inp_prev].inp_next.
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump =</i>	Contents of CMinpcb[index].

Table 4 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	The audit finds the MEPIPE is OOS but its entry in CMinpcb[] is marked that it is linked when it should not be linked.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	CMinpcb[index].inp_socket.
<i>Bad Data =</i>	CMinpcb[CMinpcb[index].inp_socket].so_pcb.
<i>Good Data =</i>	CMinpcb[index].inp_next.
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump 1 =</i>	Contents of CMinpcb[index].

<i>Dump 2 =</i>	Contents of CMscddb.state.

Table 5 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	There is no CMincpb[] entry linked to this busy list owner but its <i>inp_head_ptr</i> field is not the null value (CM_NULL). The entry in CMatpmbuff[] can be linked to one of three busy lists. The value in <i>Good Data</i> indicates to which busy list the error refers. 0 = CMintcp, 1 = CMinudp and 2 = CMinrip.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit sets the <i>inp_head_ptr</i> field of the owner to CM_NULL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	<busy>[side].inp_head_ptr.
<i>Good Data =</i>	1, 2 or 3.
<i>Logical Index =</i>	Side of busy list which has the error.
<i>Dump =</i>	Contents of CMinpcb[index].

Table 6 Error Code: BADPROTOCOL

Error Code:	BADPROTOCOL
Error Description:	For protocols other than CMIPTCP, the <i>inp_pccb</i> field should be its null value but it is not.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	CMinpcb[index].inp_ppcb.
<i>Bad Data =</i>	CMsocket[CMinpcb[index].inp_socket].so_protocol.
<i>Good Data =</i>	CMinpcb[index].inp_socket.
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump =</i>	Contents of CMinpcb[index].

Table 7 Error Code: BADRANGE_INDEX

Error Code:	BADRANGE_INDEX
Error Description:	An entry in CMinpcb[] should be linked to an entry in CMsocket[] if the <i>CMscdb.state</i> is not CMCHSTOFF. One of the following has occurred: • CMinpcb[index].inp_qindx does not equal CMNIL_NDX, • CMinpcb[index].inp_socket is out of range, • CMinpcb[index].inp_next is out of range, • CMinpcb[index].inp_prev is out of range or • CMsocket[CMinpcb[index].inp_socket].so_pcb does not equal the index into CMinpcb[].

Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMinpcb[index].inp_socket.
<i>Bad Data</i> =	CMinpcb[index].inp_next.
<i>Good Data</i> =	CMsocket[CMinpcb[index].inp_socket].so_pcb.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 8 Error Code: BADSTATE

Error Code:	BADSTATE
Error Description:	The state of an entry in CMinpcb[] is out of range.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	CMinpcb[index].inp_cbstate.
<i>Good Data</i> =	CMINCBMAX
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 9 Error Code: BAD_HEAD_TAIL

Error Code:	BAD_HEAD_TAIL
Error Description:	Either one or both indices in the owner of the current CMinpcb[] which have the head and tail of the linked CMinpcb[] entries is out of range. The entry in CMatpmbuff[] can be linked to one of three busy lists. The value in <i>Good Data</i> indicates to which busy list the error refers. 0 = CMintcp. 1 = CMinudp. 2 = CMinrip.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit repairs the linked list by linking around the bad entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	<busy>[side].inp_next.
<i>Bad Data</i> =	<busy>.inp_prev.
<i>Good Data</i> =	1, 2 or 3.
<i>Logical Index</i> =	Side of busy list which has the error.
<i>Dump</i> =	Contents of CMinpcb[<busy>].

Table 10 Error Code: BAD_LINK_DATA

Error Code:	BAD_LINK_DATA
Error Description:	The current CMinpcb[] entry is linked to a busy list. One of the following has occurred: CMinpcb[<owner>].inp_next].inp_head_ptr does not equal address of <owner>.

	• CMinpcb[<owner>.inp_next].inp_prev does not equal CMNIL_NDX, • CMinpcb[<owner>.inp_prev].inp_head_ptr does not equal address of <owner> or • CMinpcb[<owner>.inp_prev].inp_next does not equal CMNIL_NDX. The entry in CMatpmbuff[] can be linked to one of three busy lists. The value in <i>Good Data</i> indicates to which busy list the error refers. 0 = CMintcp, 1 = CMinudp and 2 = CMinrip.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit repairs the linked list by linking around the bad entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMinpcb[<busy>[side].inp_next].inp_prev.
<i>Bad Data</i> =	CMinpcb[<busy>[side].inp_next].inp_next.
<i>Good Data</i> =	1, 2 or 3.
<i>Logical Index</i> =	Side of busy list which has the error.
<i>Dump 1</i> =	Contents of <busy>[side].
<i>Dump 2</i> =	<busy>[side].inp_next.
<i>Dump 3</i> =	<busy>[side].inp_prev.

Table 11 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	The CMinpcb[] is allocated but not linked. Application code allocated the entry but was not able to complete linking it.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	CMinpcb[index].inp_cbstate.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 12 Error Code: HEAD

Error Code:	HEAD
Error Description:	The current CMinpcb[] entry should be linked to a busy list but is not linked.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMinpcb[index].inp_ppcb
<i>Bad Data</i> =	CMsocket[CMinpcb[index].inp_socket].so_protocol.
<i>Good Data</i> =	CMinpcb[index].inp_socket.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 13 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	An INPCB in-use idle stack entry ($\text{index} \leq \text{idle\_stack\_toppt}$) is corrupt. One or more of the following is true ("idle_inpcb" refers to the contents of the idle stack entry <i>inpcb[index]</i>): - idle_inpcb $\geq$ max - The INPCB indexed the contents of idle stack entry <i>inpcb[idle_inpcb]</i> and does not point back to the idle list ($\text{INPCB.inp\_qindx} \neq \text{idle\_inpcb}$).
Possible Error Effect:	INPCB may not be allocatable. If so, the switching module (SM) may lose ethernet connectivity.
Corrective Action Taken:	If this is the first in-use idle list entry ($\text{index} = \text{idle\_stack\_toppt}$), the audit clears the idle stack entry (<i>inpcb[index]</i> = CMNIL_NDX) and decrements the count of idle INPCBs (<i>toppt</i> is decremented). Otherwise, the audit puts a good value into the entry. That is, the audit sets <i>inpcb[index]</i> = <i>sopcb[toppt]</i>, relinks ($\text{INPCB.inp\_qindx} = \text{index}$), clears the old entry (<i>so_pcb[CMidleinpcb.toppt]</i> = CMNIL_NDX), and decrements the number of idle INPCBs (decrements <i>toppt</i>).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Indicates INPCB idle list (CMidleinpcb).
<i>Bad Data</i> =	Value from idle stack entry (INPCB index).
<i>Good Data</i> =	value of "max".
<i>Logical Index</i> =	Index into idle stack.
<i>Dump</i> =	NA.

Table 14 Error Code: IDLE_OWNER

Error Code:	IDLE_OWNER
Error Description:	A CMinpcb[] idle stack is corrupt. One or more of the following is true: - The idle stack <i>toppt</i> value is out-of-range ($> \text{max}$ or $< \text{min}$). - The idle stack entry <i>inpcb[toppt]</i> = CMNIL_NDX. - The idle stack <i>toppt</i> is $< \text{max}$ and the idle stack entry <i>inpcb[toppt+1]</i> $\neq$ CMNIL_NDX.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit clears the CMinpcb[] idle stack (<i>toppt</i> = 0) and rebuilds the idle list (links all entries whose <i>inp_cbstate</i> is CMINCBFREE to the idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMidleinpcb.inpcb[CMidleinpcb.toppt]
<i>Bad Data</i> =	CMidleinpcb.inpcb[CMidleinpcb.toppt+1].
<i>Good Data</i> =	CM_NUMINPCB.
<i>Logical Index</i> =	CMidleinpcb.toppt
<i>Dump</i> =	NA.

Table 15 Error Code: INDEX

Error Code:	INDEX
Error Description:	Based on the protocol in CMsocket[], the entry in CMinpcb[] should be linked to a CMtcpcb[] entry. One of the following conditions has occurred: The <i>inp_ppcb</i> is out of range or

	The <i>t_inpcb</i> in the <i>CMinpcb[]</i> entry does not point back to the <i>CMinpcb[]</i> entry.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (<i>CMidleinpcb</i>).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	<i>CMinpcb[index].inp_socket</i> .
<i>Bad Data</i> =	<i>CMtpcb[CMinpcb[index].inp_ppcb].t_inpcb</i> .
<i>Good Data</i> =	<i>CMinpcb[index].inp_ppcb</i> .
<i>Logical Index</i> =	Index into <i>CMinpcb[]</i> .
<i>Dump</i> =	Contents of <i>CMinpcb[index]</i> .

Table 16 Error Code: INDRANGE_BAD

Error Code:	INDRANGE_BAD
Error Description:	The previous field in the current <i>CMinpcb[]</i> entry is out of range.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (<i>CMidleinpcb</i>).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	<i>busy_list.inp_next</i> .
<i>Bad Data</i> =	<i>busy_list.inp_prev</i> .
<i>Good Data</i> =	<i>CMinpcb[index].inp_prev</i> .
<i>Logical Index</i> =	Index into <i>CMinpcb[]</i> .
<i>Dump</i> =	Contents of <i>CMinpcb[index]</i> .

Table 17 Error Code: INV

Error Code:	INV
Error Description:	The <i>CMinpcb[index].inp_ppcb</i> is null but <i>CMsocket[CMinpcb[index].inp_socket].so_protocol</i> is not a valid protocol.
Possible Error Effect:	For RTCD, RTCD messages may be lost. For VCDX, OSDS messages may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (<i>CMidleinpcb</i>).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	<i>CMinpcb[index].inp_ppcb</i> .
<i>Bad Data</i> =	<i>CMsocket[CMinpcb[index].inp_socket].so_protocol</i> .
<i>Good Data</i> =	<i>CMinpcb[index].inp_socket</i> .
<i>Logical Index</i> =	Index into <i>CMinpcb[]</i> .
<i>Dump</i> =	Contents of <i>CMinpcb[index]</i> .

Table 18 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	The state of a <i>CMinpcb[]</i> is one not recognized by the audit.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (<i>CMidleinpcb</i>).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	<i>CMinpcb[index].inp_cbstate</i> .
<i>Good Data</i> =	NA..
<i>Logical Index</i> =	Index into <i>CMinpcb[]</i> .
<i>Dump</i> =	Contents of <i>CMinpcb[index]</i> .

Table 19 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	An unused INPCB idle stack entry is not null (<i>index < toppt</i> and <i>inpcb[index] != CMNIL_NDX</i>).
Possible Error Effect:	INPCBs may not be allocatable. If so, the SM may lose ethernet connectivity.
Corrective Action Taken:	The audit clears the INPCB idle stack entry (<i>inpcb[index] = CMNIL_NDX</i>).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Indicate INPCB idle list (<i>CMidleinpcb</i>).
<i>Bad Data =</i>	Contents of the idle stack entry (<i>inpcb[index]</i>).
<i>Good Data =</i>	CMNIL_NDX.
<i>Logical Index =</i>	Index into the idle stack.
<i>Dump =</i>	NA.

Table 20 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	One of the fields in an idle <i>CMinpcb[]</i> entry is not its default value.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (<i>CMidleinpcb</i>).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	<i>CMidleinpcb.inpcb[CMMinpcb[index].inp_qindx]</i> .
<i>Good Data =</i>	<i>CMinpcb[index].inp_cbstate</i> .
<i>Logical Index =</i>	Index into <i>CMinpcb[]</i> .
<i>Dump =</i>	Contents of <i>CMinpcb[index]</i> .

Table 21 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit: • Clears the idle stack entry, if any, that was being audited when the stimulus occurred. • Recovers the <i>CMinpcb[]</i> entry, if any, which was being audited when the stimulus occurred. Specifically, the audit unlinks the entry from any other data structures, sets all fields to default values and puts the entry on the idle stack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	<i>CMidleinpcb.inpcb[CM_NUMSOPCB - AUcur_audstat.position]</i> .
<i>Good Data =</i>	<i>CM_NUMINPCB - AUcur_audstat.position</i> .
<i>Logical Index =</i>	<i>AUcur_audstat.position</i>
<i>Dump =</i>	Contents of <i>CMinpcb[AUcur_audstat.position]</i> .

INPCB-B

Software Release: 5E13 and later

1. ETHERNET INTERNET PROTOCOL CONTROL BLOCK (INPCB) AUDIT

Internet protocol is used to transmit and receive data through an ethernet network. The INPCBs are used to represent per-connection information such as foreign IP addresses and port numbers. They are either idle and are linked to the idle list or linked and are linked to a SOCKET and possibly to a transmission control protocol control block (TCPCB). The audit verifies linkages among CMinpcb[], CMtcpcb[], CMsocket[] and CMidleinpcb and verifies data within every entry in CMinpcb[].

2. DATA STRUCTURES

The following data are used by the INPCB audit:

CMinpcb[] = Internet protocol control block.
 CMtcpcb[] = TCP control block.
 CMsocket[] = Socket control block.
 CMidleinpcb = Internet protocol control block idle list.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: BACKLINK

Error Code:	BACKLINK
Error Description:	The next field in the current CMinpcb[] entry is out of range.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	busy_list.inp_next.
<i>Bad Data =</i>	busy_list.inp_prev.
<i>Good Data =</i>	CMinpcb[index].inp_next.
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump =</i>	Contents of CMinpcb[index].

Table 2 Error Code: BACKLINK1

Error Code:	BACKLINK1
Error Description:	The CMinpcb[] entry is in a linked list of busy entries. One of the following conditions has occurred: • CMinpcb[CMinpcb[index].inp_next].inp_prev does not equal the index into CMinpcb[] or

	CMinpcb[CMinpcb[index].inp_next].inp_head_ptr does not equal inp_head_ptr of the owner.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CMinpcb[CMinpcb[index].inp_next].inp_prev.
<i>Good Data =</i>	CMinpcb[CMinpcb[index].inp_next].inp_head_ptr.
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump =</i>	Contents of CMinpcb[index].

Table 3 Error Code: BACKLINK2

Error Code:	BACKLINK2
Error Description:	The CMinpcb[] entry is in a linked list of busy entries. One of the following conditions has occurred: - CMinpcb[CMinpcb[index].inp_prev].inp_next does not equal the index into CMinpcb[] or - CMinpcb[CMinpcb[index].inp_prev].inp_head_ptr does not equal inp_head_ptr of the owner.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CMinpcb[CMinpcb[index].inp_prev].inp_head_ptr.
<i>Good Data =</i>	CMinpcb[CMinpcb[index].inp_prev].inp_next.
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump =</i>	Contents of CMinpcb[index].

Table 4 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	The audit finds the MEPIPE is OOS but an entry in CMinpcb[] is marked that it is linked when it should not be linked.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	CMinpcb[index].inp_socket.
<i>Bad Data =</i>	CMsocket[CMinpcb[index].inp_socket].so_pcb.
<i>Good Data =</i>	CMinpcb[index].inp_next.
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump 1 =</i>	Contents of CMinpcb[index].
<i>Dump 2 =</i>	Contents of CMscddb.state.

Table 5 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	There is no CMinpcb[] entry linked to this busy list owner but CMinpcb[].inp_head_ptr is not the null value (CM_NULL).

	The entry in CMinpcb[] can be linked to one of three busy lists. The value in <i>Good Data</i> indicates to which busy list the error refers. 0 = CMintcp, 1 = CMinudp or 2 = CMinrip.
Possible Error Effect:	Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit sets the <i>inp_head_ptr</i> field of the owner to CM_NULL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	<busy>[side].inp_head_ptr.
<i>Good Data</i> =	1, 2 or 3.
<i>Logical Index</i> =	Side of busy list which has the error.
<i>Dump</i> =	Contents of CMinpcb[index].

Table 6 Error Code: BADPROTOCOL

Error Code:	BADPROTOCOL
Error Description:	For protocols other than CMIPTCP, the <i>inp_pcb</i> field should be its null value but it is not.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMinpcb[index].inp_ppcb.
<i>Bad Data</i> =	CMsocket[CMinpcb[index].inp_socket].so_protocol.
<i>Good Data</i> =	CMinpcb[index].inp_socket.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 7 Error Code: BADRANGE_INDEX

Error Code:	BADRANGE_INDEX
Error Description:	An entry in CMinpcb[] should be linked to an entry in CMsocket[] if the CMscdb.state is not CMCHSTOFF. One of the following has occurred: • CMinpcb[index].inp_qindx does not equal CMNIL_NDX, • CMinpcb[index].inp_socket is out of range, • CMsocket[CMinpcb[index].inp_socket].so_pcb does not equal the index into CMinpcb[].
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMinpcb[index].inp_socket.
<i>Bad Data</i> =	CMinpcb[index].inp_next.
<i>Good Data</i> =	CMsocket[CMinpcb[index].inp_socket].so_pcb.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 8 Error Code: BADSTATE

Error Code:	BADSTATE
Error Description:	The state of an entry in CMinpcb[] is out of range.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	CMinpcb[index].inp_cbstate.
<i>Good Data =</i>	CMINCBMAX
<i>Logical Index =</i>	Index into CMinpcb[].
<i>Dump =</i>	Contents of CMinpcb[index].

Table 9 Error Code: BAD_HEAD_TAIL

Error Code:	BAD_HEAD_TAIL
Error Description:	Either one or both indices in the owner of the current CMinpcb[] which have the head and tail of the linked CMinpcb[] entries is out of range. The entry in CMinpcb[] can be linked to one of three busy lists. The value in <i>Good Data</i> indicates to which busy list the error refers. 0 = CMintcp, 1 = CMinudp or 2 = CMinrip.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit repairs the linked list by linking around the bad entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	<busy>[side].inp_next.
<i>Bad Data =</i>	<busy>.inp_prev.
<i>Good Data =</i>	1, 2 or 3.
<i>Logical Index =</i>	Side of busy list which has the error.
<i>Dump =</i>	Contents of CMinpcb[<busy>].

Table 10 Error Code: BAD_LINK_DATA

Error Code:	BAD_LINK_DATA
Error Description:	The current CMinpcb[] entry is linked to a busy list. One of the following has occurred: • CMinpcb[<owner>].inp_next.inp_head_ptr does not equal address of <owner> , • CMinpcb[<owner>].inp_next.inp_prev does not equal CMNIL_NDX, • CMinpcb[<owner>].inp_prev.inp_head_ptr does not equal address of <owner> or • CMinpcb[<owner>].inp_prev.inp_next does not equal CMNIL_NDX. The entry in CMinpcb[] can be linked to one of three busy lists. The value in <i>Good Data</i> indicates to which busy list the error refers. 0 = CMintcp,

	1 = CMinudp or 2 = CMinrip.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit repairs the linked list by linking around the bad entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMinpcb[<busy>[side].inp_next].inp_prev.
<i>Bad Data</i> =	CMinpcb[<busy>[side].inp_next].inp_next.
<i>Good Data</i> =	1, 2 or 3.
<i>Logical Index</i> =	Side of busy list which has the error.
<i>Dump 1</i> =	Contents of <busy>[side].
<i>Dump 2</i> =	<busy>[side].inp_next.
<i>Dump 3</i> =	<busy>[side].inp_prev.

Table 11 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	The CMinpcb[] is allocated but not linked. Application code allocated the entry but was not able to complete linking it.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	CMinpcb[index].inp_cbstate.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 12 Error Code: HEAD

Error Code:	HEAD
Error Description:	The current CMinpcb[] entry should be linked to a busy list but is not linked.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMinpcb[index].inp_ppcb
<i>Bad Data</i> =	CMsocket[CMinpcb[index].inp_socket].so_protocol.
<i>Good Data</i> =	CMinpcb[index].inp_socket.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 13 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	A INPCB in-use idle stack entry (index ≤ CMidleinpcb.toppt) is corrupt. One or more of the following is true: • CMidleinpcb.inpcb[index] ≥ CM_NUMINPCB • CMidleinpcb.inpcb[index] ≥ 0 • CMinpcb[CMidleinpcb.inpcb[index]].inp_qindx != index into CMidleinpcb.inpcb[].

Possible Error Effect:	INPCB may not be allocatable. If so, the switching module (SM) may lose ethernet connectivity.
Corrective Action Taken:	If this is the first in-use idle list entry (index = CMidleinpcb.toppt), the audit clears the idle stack entry (CMidleinpcb[index] = CMNIL_NDX) and decrements the count of idle INPCB (CMidleinpcb.toppt is decremented). Otherwise, the audit puts a good value into the entry. That is, the audit sets CMidleinpcb.inpcb[index] = CMidleinpcb.inpcb[CMidleinpcb.toppt], relinks the INPCB (CMinpcb[CMidleinpcb.inpcb[CMidleinpcb.toppt]].inp_qindx = index), clears the old entry (CMidleinpcb.inpcb[CMidleinpcb.toppt] = CMNIL_NDX) and decrements the number of idle TCPBs (decrements CMidleinpcb.toppt).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	AUINPTYPE.
<i>Bad Data</i> =	Index of next available idle CMinpcb[].
<i>Good Data</i> =	CM_NUMINPCB.
<i>Logical Index</i> =	Index into CMidleinpcb.tcpb[].
<i>Dump</i> =	NA.

Table 14 Error Code: IDLE_OWNER

Error Code:	IDLE_OWNER
Error Description:	A CMinpcb[] idle stack is corrupt. One or more of the following is true: - The idle stack CMidleinpcb.toppt value is out-of-range (> max or < min). - The idle stack entry CMidleinpcb.inpcb[CMidleinpcb.toppt] = CMNIL_NDX. - The idle stack CMidleinpcb.toppt is < max and the idle stack entry CMidleinpcb.inpcb[CMidleinpcb.toppt+1] != CMNIL_NDX.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit sets CMidleinpcb.toppt = 0 and rebuilds the idle list (links all entries whose CMinpcb[].inp_cbstate is CMINCBFREE to the idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMidleinpcb.inpcb[CMidleinpcb.toppt]
<i>Bad Data</i> =	CMidleinpcb.inpcb[CMidleinpcb.toppt+1].
<i>Good Data</i> =	CM_NUMINPCB.
<i>Logical Index</i> =	CMidleinpcb.toppt
<i>Dump</i> =	NA.

Table 15 Error Code: INDEX

Error Code:	INDEX
Error Description:	Based on the protocol in CMsocket[], the entry in CMinpcb[index] should be linked to a CMtcpb[CMinpcb[index].inp_ppcb] entry. One of the following conditions has occurred: - The CMinpcb[].inp_ppcb is out of range or - The CMtcpb[CMinpcb[index].inp_ppcb].t_inpcb does not point back to the CMinpcb[index] entry.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	CMinpcb[index].inp_socket.
<i>Bad Data</i> =	CMtpcb[CMinpcb[index].inp_ppcb].t_inpcb.
<i>Good Data</i> =	CMinpcb[index].inp_ppcb.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 16 Error Code: INDRANGE_BAD

Error Code:	INDRANGE_BAD
Error Description:	The previous field in the current CMinpcb[] entry is out of range.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	busy_list.inp_next.
<i>Bad Data</i> =	busy_list.inp_prev.
<i>Good Data</i> =	CMinpcb[index].inp_prev.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 17 Error Code: INV

Error Code:	INV
Error Description:	The CMinpcb[index].inp_ppcb is null but CMsocket[CMinpcb[index].inp_socket].so_protocol is not a valid protocol.
Possible Error Effect:	For RTCD, RTCD messages may be lost. For VCDX, OSDS messages may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	CMinpcb[index].inp_ppcb.
<i>Bad Data</i> =	CMsocket[CMinpcb[index].inp_socket].so_protocol.
<i>Good Data</i> =	CMinpcb[index].inp_socket.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 18 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	The state of a CMinpcb[] is one not recognized by the audit.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	CMinpcb[index].inp_cbstate.
<i>Good Data</i> =	NA..
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 19 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	An unused INPCB idle stack entry (index > CMidleinpcb.toppt) is not null (CMidleinpcb.inpcb[index] != CMNIL_NDX and index < CMidleinpcb.toppt)
Possible Error Effect:	INPCBs may not be allocatable. If so, the SM may lose ethernet connectivity.
Corrective Action Taken:	The audit clears the INPCB idle stack entry (CMidleinpcb.inpcb[index] = CMNIL_NDX).
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	AUINPTYPE.
<i>Bad Data</i> =	Contents of the idle stack entry (CMidleinpcb.inpcb[index]).
<i>Good Data</i> =	CMNIL_NDX.
<i>Logical Index</i> =	Index into the idle stack.
<i>Dump</i> =	NA.

Table 20 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	One of the fields in an idle CMinpcb[] entry is not its default value.
Possible Error Effect:	For VCDX, ethernet link to workstation is restarted. Calls needing workstation may fail. For RTCD, MELNK is restarted. A RTCD record may be lost.
Corrective Action Taken:	The audit has all fields set to default values, unlinks it from any list on which it may be and puts the entry on the idle stack (CMidleinpcb).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	AUINPTYPE.
<i>Bad Data</i> =	CMidleinpcb.inpcb[CMinpcb[index].inp_qindx].
<i>Good Data</i> =	CMinpcb[index].inp_cbstate.
<i>Logical Index</i> =	Index into CMinpcb[].
<i>Dump</i> =	Contents of CMinpcb[index].

Table 21 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit: • Clears the idle list entry, if any, that was being audited when the stimulus occurred. • Recovers the CMinpcb[] entry, if any, which was being audited when the stimulus occurred. Specifically, the audit unlinks the entry from any other data structures, sets all fields to default values and puts the entry on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	CMidleinpcb.inpcb[CM_NUMINPCB - AUcur_audstat.position].
<i>Good Data</i> =	CM_NUMINPCB - AUcur_audstat.position.
<i>Logical Index</i> =	AUcur_audstat.position
<i>Dump</i> =	Contents of CMinpcb[AUcur_audstat.position].

INSPDATA

Software Release: 5E11 and later

1. INSPECT DATA (INSPDATA) AUDIT

ISDN inspect, a network-provided service, allows National ISDN phase 3 users to be presented (using displays) with information about feature activators, idle call appearances, and non-idle call appearances. The relation RLINSPDATA holds the daily ISDN inspect delivered counts per lport.

2. DATA STRUCTURES

The RLINSPDATA dynamic relation is the dynamic representation of the number of Inspect usage-sensitive terminals or lports. Its key (lport) is obtained from the static relation RLIS_TERM and the only other attribute is the count of the number of ISDN inspect usages for the lport.

Read the static RLIS_TERM tuple with the same key. If RLIS_TERM.ama_insp is DBYES, return AUEXISTS; else return AUEXTRA so this RLINSPDATA tuple is deleted.

3. AUDIT CHECKS

The INSPDATA audit uses the DRINDEX audit driver. There are no error checks specific to this audit.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

IPCSPCI

Software Release: 5E14 and later

1. ISUP POINT CODES (IPCSPCI) AUDIT

This audit steps through the RLIPCS_PCI (ISUP point code status relation) and checks the data in it against the RLPCI_RTE (point code route relation).

2. DATA STRUCTURES

For details on the fields contained in the RLIPCS_PCI and the RLPCI_RTE relations refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: DBREAD

Error Code:	DBREAD
Error Description:	The audit attempts to read a rIPCI_RTE tuple but fails.
Possible Error Effect:	Integrated services digital network user part (ISUP) calls may be affected.
Corrective Action Taken:	The related audit PCIRTE is scheduled and attempts to insert the missing rIPCI_RTE tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIIPCS_PCI tuple.
<i>Bad Data =</i>	Dynamic point code index (rIPCI_RTE.pci).
<i>Good Data =</i>	Static point code index (rIIPCS_PCI.pci).
<i>Logical Index =</i>	NA.
<i>Dump =</i>	Contents of rIIPCS_PCI tuple.

Table 2 Error Code: NOMATCH

Error Code:	NOMATCH
Error Description:	The audit detects either rIPCI_RTE.isup_opc does not match rIIPCS_PCI.isup_opc or rIPCI_RTE.isup_dpc does not match rIIPCS_PCI.isup_dpc.
Possible Error Effect:	ISUP calls may be affected.
Corrective Action Taken:	The audit sets rIPCI_RTE.isup_opc equal to rIIPCS_PCI.isup_opc and sets rIPCI_RTE.isup_dpc equal to rIIPCS_PCI.isup_dpc and notifies application code about the correction.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rIPCI_RTE.isup_opc.
<i>Bad Data =</i>	rIIPCS_PCI.isup_opc.
<i>Good Data =</i>	rIPCI_RTE.isup_dpc.
<i>Logical Index =</i>	rIIPCS_PCI.isup_dpc.
<i>Dump 1 =</i>	Contents of rIIPCS_PCI tuple.
<i>Dump 2 =</i>	Contents of rIPCI_RTE tuple.

ISANBUS

Software Release: 5E10 and later

1. INTEGRATED SERVICES ACCESS NETWORK BUS (ISANBUS) AUDIT

The integrated service line unit (ISLU) Z-interface (ISLU-Z) converts digital signals to analog. The ISLU-Z uses ringing generators (RGs) and metallic access network (MAN) circuits. Several audits check the data structures related to the ISLU-Z circuits: the ringing generator occupancy table audit (RGOCCUP), the ringing generator task data block audit (RGTDDB), the ringing generator bus audit (RGBUS), the channel control block user audit (CCBUSR), the ISLU-Z access network bus audit (ISANBUS), and the spare line card audit (SPRCRD). The ISANBUS audit checks the peripheral control arrays used for allocating the use of the ISLU metallic access network.

The ISANBUS audit is part of the peripheral control audits subgroup. It is part of the Integrated services line unit (ISLU) application loadable package (ISLUAPP).

Refer to the "Audit Checks" section below for more information about the use and purpose of the ISANBUS audit.

2. DATA STRUCTURES

The ISANBUS audit uses the following data structures. The peripheral control line group bus array (PClgbus) allocates and deallocates time-shared users for the ISLU's metallic access network line group bus. The peripheral control test bus array (PCtstbus) allocates time-shared users for the ISLU's metallic access network test bus. The peripheral control bus maps array (PCbusmaps) contains occupancy bitmaps for the ISLU line group and test group buses. The peripheral control bus idle array (PCbusidle) consists of 256 bits that correspond inversely to the bits in PCbusmaps. The audit also checks states in the switch maintenance equipment status relation (RLSMEST), the circuit data block common area relation (RLCDBCOM), the circuit queue block relation (RLCQB), and the channel control block common area relation (RLCCBCOM).

3. AUDIT CHECKS

The ISANBUS audit verifies the manner and mode of its input data, then calls its semantic check function to make the following checks. For each line group and test bus on an integrated services line unit (ISLU):

For each line group bus:

LOSTCDB = Read rICDBCOM for bus.

READSMEST = Read rISMEST for bus.

If circuit is active:

NIDLE = Check maintenance bit in PC for one.

NOTIDLE = Check maintenance bit in PC for zero.

If circuit is out-of-service:

CDBCOM = Read rICDBCOM for bus.

IDLE_LINK = Check rICDBCOM owner.

NOCCB = Read rICCB COM for bus.

OWNER = Check rICDBCOM owner.

STATE = Check maintenance bit.

If queue bit is not set:

CQB_LINK = Queue bit not set, but linked to an rICQB.

If queue bit is set:

CQBCDB = Queue bit set, but not linked to an rICQB.

If user bit is set:

ASSOC_CDB = Can't access the rICBCOM.

LNK_FE = Compare bus array with PCbusmaps array.

For each test bus:

OWNLINK = Read rICDBCOM for bus.

SMEST = Read rSMEST for bus.

If circuit is active:

NOTBUSY = Check maintenance bit in PC for zero.

STATE_IDL = Check maintenance bit in PC for one.

If circuit is out-of-service:

CDBITS = Read rICBCOM for bus.

COUNT_CDB = Read rICDBCOM for bus.

MAINT_STATE = Check maintenance bit.

STATE_VAR = Check rICDBCOM owner.

WRONGLIST = Check rICDBCOM owner.

If the queue bit is not set:

CQBHEADC = Queue bit not set, but linked to an rICQB.

If the queue bit is set:

CQBCCB = Queue bit set, but not linked to an rICQB.

If the user bit is set:

DSCC_CDB	= Can't access the rCCBCOM.
IDL_STATE	= PCbusmaps indicates busy; PCbusidle indicates idle.
INV	= Verify that the first bit in PCbusidle is one.
STATE_LNK	= Compare bus array with PCbusmaps array.
STATE_SET	= PCbusmaps indicates idle; PCbusidle indicates busy.

For each entry in PCbusmaps[]:

BUSY3MAP	= The PCbusmaps entry is not idle, but no entries exist in its bitmap.
BUSYIDLE	= The PCbusmaps entry is not idle, but no entries exist in its ccbusr.
GRBG	= Can't retrieve rCDBCOM whose key was found in PCbusmaps.
INV_STATE	= A busy entry in PCbusmaps[].ccbusr exists, but the hardware path is free to the circuit.
IS_NOTUSED	= The PCbusmaps entry is idle, but a non-idle entry exists in its bitmap.
LPSTATE	= rCCBCOM lpstate is invalid for this PCbusmaps entry.
NOACCBK	= Can't retrieve rCDBCOM whose key was found in PCbusmaps.
TSIDLE_BUSY	= The PCbusmaps entry is idle, but a non-idle entry exists in its ccbusr.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ASSOC_CDB

Error Code:	ASSOC_CDB
Error Description:	The audit cannot access the rCCBCOM associated with a PCbusmaps entry.
Possible Error Effect:	An LGBUS may not be usable.
Corrective Action Taken:	Set the PCbusmaps ccbusr field to null.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	PCbusmaps ccbusr field.
<i>Good Data</i> =	Return code from trying to access rCCBCOM tuple.
<i>Logical Index</i> =	LGBUS tuple usr field.
<i>Dump</i> =	NA.

Table 2 Error Code: BUSY3MAP

Error Code:	BUSY3MAP
Error Description:	A PCbusmaps[] entry is not idle (PCbusmaps[].backlink is not equal to 0xffff) but there are no entries in its associated bitmap array (PCbusmaps[].bitmap[]).
Possible Error Effect:	Resources used for ISLU-Z ringing may be lost.
Corrective Action Taken:	All resources for this entry are cleared. The PCbusidle bit is cleared, PCbusmaps[].backlink is cleared, PCbusmaps[].ccbusr[] and PCbusmaps[].bitmap[] arrays are cleared.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	Address of entry in PCbusmaps.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Array index of PCbusmaps.
<i>Dump</i> =	PCbusmaps entry.

Table 3 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	A PCbusmaps[] entry is not idle (PCbusmaps[].backlink is not equal to 0xffff) but there are no entries in its associated ccbusr array (PCbusmaps[].ccbusr[]).
Possible Error Effect:	Resources used for ISLU-Z ringing may be lost.
Corrective Action Taken:	All resources for this entry are cleared. The PCbusidle bit is cleared, PCbusmaps[].backlink is cleared, PCbusmaps[].ccbusr[] and PCbusmaps[].bitmap[] arrays are cleared.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of entry in PCbusmaps.
<i>Bad Data</i> =	PCNULLCCB.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Array index of PCbusmaps.
<i>Dump</i> =	PCbusmaps entry.

Table 4 Error Code: CDBCOM

Error Code:	CDBCOM
Error Description:	The audit cannot access an associated rICBCOM tuple.
Possible Error Effect:	An LGBUS may not be usable.
Corrective Action Taken:	Quarantine the associated rICBCOM tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Return code from trying to access the rICBCOM tuple.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	Associated rICBCOM tuple.
<i>Dump 2</i> =	Associated rICBCOM tuple.

Table 5 Error Code: CDBCOM

Error Code:	CDBITS
Error Description:	Cannot access the rICBCOM tuple associated with this TSTBUS.
Possible Error Effect:	A TSTBUS may not be usable.
Corrective Action Taken:	Quarantine the associated rICBCOM tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Return code from trying to access rICBCOM.
<i>Logical Index</i> =	rICBCOM tuple name field, circuit name of TSTBUS being checked.
<i>Dump 1</i> =	Associated rICBCOM tuple.
<i>Dump 2</i> =	rSMEST tuple for the TSTBUS being checked.

Table 6 Error Code: COUNT_CDB

Error Code:	COUNT_CDB
Error Description:	The audit cannot access an associated rICBCOM tuple.
Possible Error Effect:	A TSTBUS may not be usable.
Corrective Action Taken:	Schedule the CKTDATA and CCBCOM audits.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Return code from trying to access the rICBCOM tuple.
<i>Logical Index</i> =	NA.

<i>Dump 1</i> =	Associated rICDBCOM tuple.
<i>Dump 2</i> =	Wrong CCBCOM accessed.

Table 7 Error Code: CQBCCB

Error Code:	CQBCCB
Error Description:	The TSTBUS queue field indicates queuing but the associated rICDBCOM indicates no queuing.
Possible Error Effect:	An TSTBUS may not be usable.
Corrective Action Taken:	Set the TSTBUS queue bit to indicate no queuing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	TSTBUS queue bit. (Not actually bad data.)
<i>Good Data</i> =	rICDBCOM queuing data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Associated rICDBCOM tuple.

Table 8 Error Code: CQB CDB

Error Code:	CQB CDB
Error Description:	The LGBUS queue field indicates queuing but the associated rICDBCOM indicates no queuing.
Possible Error Effect:	A LGBUS may not be usable.
Corrective Action Taken:	Set the LGBUS queue bit to indicate no queuing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LGBUS queue bit. (Not actually bad data.)
<i>Good Data</i> =	rICDBCOM queuing data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Associated rICDBCOM tuple.

Table 9 Error Code: CQBHEADC

Error Code:	CQBHEADC
Error Description:	The TSTBUS queue field indicates no queuing but the associated rICDBCOM indicates other than no queuing.
Possible Error Effect:	An TSTBUS may not be usable.
Corrective Action Taken:	Quarantine the associated rICDBCOM tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	TSTBUS queue bit. (Not actually bad data.)
<i>Good Data</i> =	rICDBCOM queuing data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Associated rICDBCOM tuple.

Table 10 Error Code: CQB_LINK

Error Code:	CQB_LINK
Error Description:	The LGBUS queue field indicates no queuing but the associated rICDBCOM indicates other than no queuing.
Possible Error Effect:	An LGBUS may not be usable.
Corrective Action Taken:	Quarantine the associated rICDBCOM tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LGBUS queue bit. (Not actually bad data.)
<i>Good Data</i> =	rICDBCOM queuing data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Associated rICDBCOM tuple.

Table 11 Error Code: CQB_LINK

Error Code:	CQB_LINK

Error Description:	The LGBUS queue field indicates queuing but the associated rICDBCOM indicates no queuing.
Possible Error Effect:	An LGBUS may not be usable.
Corrective Action Taken:	Set the LGBUS queue bit to indicate no queuing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LGBUS queue bit. (Not actually bad data.)
<i>Good Data</i> =	rICDBCOM queuing data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Associated rICDBCOM tuple.

Table 12 Error Code: DSCC_CDB

Error Code:	DSCC_CDB
Error Description:	The audit cannot access the rICCB COM associated with a busmaps entry.
Possible Error Effect:	A TSTBUS may not be usable.
Corrective Action Taken:	Set the busmaps ccbusr field to null.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Busmaps ccbusr field.
<i>Good Data</i> =	Return code from trying to access rICCB COM tuple.
<i>Logical Index</i> =	TSTBUS tuple usr field.
<i>Dump</i> =	NA.

Table 13 Error Code: GRBG

Error Code:	GRBG
Error Description:	An RLCCB COM key exists in the ccbusr array of PCbusmaps[] (PCbusmaps[].ccbusr[]), but no valid rICCB COM exists with that key.
Possible Error Effect:	Resources used for ISLU-Z ringing may be lost.
Corrective Action Taken:	All resources for this entry are cleared. The PCbusidle bit is cleared, PCbusmaps[].backlink is cleared, PCbusmaps[].ccbusr[] and PCbusmaps[].bitmap[] arrays are cleared. Associated PCtstbus and PClgbus entries are also cleared.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of entry in PCbusmaps.
<i>Bad Data</i> =	Invalid entry in PCbusmaps[].ccbusr[].
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Array index of PCbusmaps.
<i>Dump</i> =	PCbusmaps entry.

Table 14 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	The LGBUS tuple reports out-of-service in rISMEST and is linked to an idle list.
Possible Error Effect:	An LGBUS may not be usable.
Corrective Action Taken:	Report the error and schedule the CKTDATA audit to link back to correct list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Idle list linked to.
<i>Good Data</i> =	LGBUS rISMEST base state.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	rISMEST tuple for the LGBUS being checked.
<i>Dump 2</i> =	Associated rICDB COM tuple.

Table 15 Error Code: IDL_STATE

Error Code:	IDL_STATE
Error Description:	The audit has detected an inconsistency between a bit in busidle and the corresponding entry in busmaps.
Possible Error Effect:	The tuple in busmaps may try to be accessed incorrectly.

Corrective Action Taken:	Set the bit in busidle to 1, indicating busy.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value of bit in busidle.
<i>Good Data =</i>	Value of backlink field in busmaps.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 16 Error Code: INV

Error Code:	INV
Error Description:	The first bit in the PCbusidle array is not set to 1.
Possible Error Effect:	The first tuple in busmaps may try to be accessed incorrectly.
Corrective Action Taken:	Set the bit to 1.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value of first bit in PCbusidle.
<i>Good Data =</i>	Value the first bit in PCbusidle should be.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 17 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	Less than success has been returned from PC check timeslot path function.
Possible Error Effect:	A loss of RG resources could develop.
Corrective Action Taken:	Quarantine the rCCBCOM tuple associated to the entry in busmaps.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Element in busmaps array being referenced. (Not actually bad data.)
<i>Good Data =</i>	Second index into busmaps array.
<i>Logical Index =</i>	Service group.
<i>Dump =</i>	rCCBCOM tuple to be quarantined.

Table 18 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	An entry in PCbusmaps has no backlink to CCBCOM but one or more of its bitmap entries are non-zero.
Possible Error Effect:	Loss of ISLU-Z ringing resources.
Corrective Action Taken:	All bitmap entries for this PCbusmap are zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCbusmaps entry.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Zero.
<i>Logical Index =</i>	Index into PCbusmaps.
<i>Dump =</i>	PCbusmaps entry.

Table 19 Error Code: LNK_FE

Error Code:	LNK_FE
Error Description:	The audit has detected an inconsistency between the LGBUS tuple being checked and the associated backlink field in the associated busmap array.
Possible Error Effect:	An LGBUS may not be usable.
Corrective Action Taken:	Set the LGBUS usr field to zero. Set the corresponding busmaps backlink field to 0xffff. Idle the corresponding entry in the PCbusidle array.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Value of busmaps backlink field (Not an address).
<i>Bad Data =</i>	Number of the line unit the LGBUS belongs to. (Not actually bad data.)
<i>Good Data =</i>	Number of the LGBUS.
<i>Logical Index =</i>	Service group of LGBUS.

<i>Dump</i> =	NA.

Table 20 Error Code: LOSTCDB

Error Code:	LOSTCDB
Error Description:	Cannot access the rCCBCOM associated with this LGBUS.
Possible Error Effect:	An LGBUS may not be able to used.
Corrective Action Taken:	Related CKTDATA audit should make the cdbcom tuple available
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of cdbcom tuple, provided via DA primitive.
<i>Bad Data</i> =	Name field of cdbcom returned from DA.
<i>Good Data</i> =	unit_id field of related rSMEST tuple.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	rSMEST tuple for the LGBUS being checked.
<i>Dump 2</i> =	Associated rCDBCOM tuple.

Table 21 Error Code: LPSTATE

Error Code:	LPSTATE
Error Description:	The lpstate of a rCCBCOM tuple associated with an entry in busmaps is incorrect.
Possible Error Effect:	A loss of RG resources could develop.
Corrective Action Taken:	Set the busmaps ccbusr field to null, clear the appropriate PCbusidle bit, reset the busmaps backlink field to 0xffff, and zero out the busmaps bitmap fields.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	rCCBCOM lpstate.
<i>Good Data</i> =	PCRING.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	rCCBCOM tuple.

Table 22 Error Code: MAINT_STATE

Error Code:	MAINT_STATE
Error Description:	The TSTBUS is out of service in rSMEST and the TSTBUS maintenance bit is not set.
Possible Error Effect:	An TSTBUS may be used when it should not be.
Corrective Action Taken:	Set the maintenance bit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	TSTBUS maintenance bit.
<i>Good Data</i> =	rSMEST TSTBUS tuple basestate.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	rSMEST tuple for the TSTBUS being checked.

Table 23 Error Code: NIDLE

Error Code:	NIDLE
Error Description:	The LGBUS tuple is active in rSMEST, the LGBUS maintenance bit is set to indicate maintenance activity and yet the rCDBCOM tuple associated with the LGBUS is not linked to a valid maintenance process.
Possible Error Effect:	An LGBUS may not be usable.
Corrective Action Taken:	Quarantine the associated rCDBCOM tuple and zero the LGBUS maintenance bit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LGBUS maintenance bit.
<i>Good Data</i> =	What the rCDBCOM is linked to.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	Associated rCDBCOM tuple.
<i>Dump 2</i> =	rSMEST tuple for the LGBUS being checked.

Table 24 Error Code: NOACCBK

Error Code:	NOACCBK
Error Description:	While auditing PCbusmap[] entries, was not able to access the related rCCBCOM tuple.
Possible Error Effect:	A PCbusmaps[] entry may be improperly linked.
Corrective Action Taken:	Set the PCbusmaps entry to an idle state and idle the usr field in the related PCtstbus[] or PClgbus[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CCBCOM tuple returned from DA primitive.
<i>Bad Data =</i>	ccbnum field of CCBCOM tuple returned from DA primitive.
<i>Good Data =</i>	ccbusr field of PCbusmaps[] entry being checked.
<i>Logical Index =</i>	PCbusmaps entry being checked.
<i>Dump =</i>	CCBCOM tuple retrieved by DA primitive.

Table 25 Error Code: NOCCB

Error Code:	NOCCB
Error Description:	Cannot access the CCBCOM tuple for a PClgbus[][] entry that is OOS in SMEST and not on an OOS list. The PClgbus[][] entry should be owned by a maintenance process with an associated CCBCOM tuple.
Possible Error Effect:	A PClgbus[][] entry may be improperly linked.
Corrective Action Taken:	Quarantine the related CDBCOM tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CCBCOM tuple returned from DA function.
<i>Bad Data =</i>	0.
<i>Good Data =</i>	Return from DA function.
<i>Logical Index =</i>	Name field of related CDBCOM tuple.
<i>Dump 1 =</i>	Related CDBCOM tuple.
<i>Dump 2 =</i>	Related SMEST tuple.

Table 26 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	The PCtstbus tuple is active in rSMEST, the PCtstbus maintenance bit indicates no maintenance, and yet the rCDBCOM associated with this PCtstbus is not on the idle list.
Possible Error Effect:	An PCtstbus may not be usable.
Corrective Action Taken:	Quarantine the associated rCDBCOM tuple and schedule the rCDBCOM audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Place where the associated TSTBUS is linked to.
<i>Good Data =</i>	Value of the idle list the PCtstbus should be linked to.
<i>Logical Index =</i>	NA.
<i>Dump 1 =</i>	rSMEST tuple for the PCtstbus being checked.
<i>Dump 2 =</i>	Associated rCDBCOM tuple.

Table 27 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	The LGBUS tuple is active in rSMEST, the LGBUS maintenance bit indicates no maintenance, and yet the rCDBCOM tuple associated with this LGBUS is not on the idle list.
Possible Error Effect:	An LGBUS may not be usable.
Corrective Action Taken:	Quarantine the associated rCDBCOM tuple and schedule the CDBCOM audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Place where the associated LGBUS is linked to.
<i>Good Data =</i>	Value of the idle list the LGBUS should be linked to.
<i>Logical Index =</i>	NA.
<i>Dump 1 =</i>	rSMEST tuple for the LGBUS being checked.

<i>Dump 2 =</i>	Associated rICBCOM tuple.

Table 28 Error Code: OWNER

Error Code:	OWNER
Error Description:	The owner of the LGBUS is not a maintenance process when it should be.
Possible Error Effect:	An LGBUS may not be usable.
Corrective Action Taken:	Quarantine the associated rICBCOM tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rSMEST basestate for the LGBUS being checked.
<i>Bad Data =</i>	Associated rICBCOM lpstate.
<i>Good Data =</i>	What the lpstate should be.
<i>Logical Index =</i>	rICBCOM→cdccm.st ownk.
<i>Dump 1 =</i>	Associated rICBCOM tuple.
<i>Dump 2 =</i>	Associated rICBCOM tuple.
<i>Dump 3 =</i>	rSMEST tuple for the LGBUS being checked.

Table 29 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	Cannot access the rICBCOM associated with this PCtstbus[][].
Possible Error Effect:	A TSTBUS may not be usable.
Corrective Action Taken:	Related CKTDATA audit should make the rICBCOM tuple available.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CDBCOM tuple, provided via DA primitive.
<i>Bad Data =</i>	Name field of CDBCOM returned from DA.
<i>Good Data =</i>	unit_id field of related rSMEST tuple.
<i>Logical Index =</i>	NA.
<i>Dump 1 =</i>	rSMEST tuple for the LGBUS being checked.
<i>Dump 2 =</i>	Associated rICBCOM tuple.

Table 30 Error Code: READSMEST

Error Code:	READSMEST
Error Description:	The audit cannot read rSMEST data associated with the PClgbus being checked.
Possible Error Effect:	A PClgbus may not be usable.
Corrective Action Taken:	Report the error and schedule the CKTDATA and SMEST audits to determine if an rSMEST entry should exist for the PClgbus being checked.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Line unit that the PClgbus belongs. (Not actually bad data.)
<i>Good Data =</i>	PClgbus number.
<i>Logical Index =</i>	Circuit name for the PClgbus being checked.
<i>Dump =</i>	NA.

Table 31 Error Code: SMEST

Error Code:	SMEST
Error Description:	The audit cannot read rSMEST data associated with the PCtstbus being checked.
Possible Error Effect:	A PCtstbus may not be usable.
Corrective Action Taken:	Report the error and schedule the CKTDATA and SMEST audits to determine if a rSMEST entry should exist for the PCtstbus being checked.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Return code from trying to access rSMEST data for the PCtstbus being checked.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Circuit name for the PCtstbus being checked.
<i>Dump =</i>	NA.

Table 32 Error Code: STATE

Error Code:	STATE
Error Description:	The PClgbus is reported to be out-of-service in rSMEST and the PClgbus maintenance bit is not set.
Possible Error Effect:	An PClgbus may be used when it should not be.
Corrective Action Taken:	Set the maintenance bit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	PClgbus maintenance bit.
<i>Good Data =</i>	rSMEST PClgbus tuple basestate.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	rSMEST tuple for the PClgbus being checked.

Table 33 Error Code: STATE_IDL

Error Code:	STATE_IDL
Error Description:	The PCtstbus tuple is active in rSMEST, the PCtstbus maintenance bit is set to indicate maintenance activity, and yet the rCDBCOM tuple associated with the PCtstbus is not linked to a valid maintenance process.
Possible Error Effect:	An PCtstbus may not be usable.
Corrective Action Taken:	Quarantine the associated rCDBCOM tuple and zero the PCtstbus maintenance bit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	PCtstbus maintenance bit.
<i>Good Data =</i>	What the rCDBCOM tuple is linked to.
<i>Logical Index =</i>	NA.
<i>Dump 1 =</i>	Associated rCDBCOM tuple.
<i>Dump 2 =</i>	rSMEST tuple for the PCtstbus being checked.

Table 34 Error Code: STATE_LNK

Error Code:	STATE_LNK
Error Description:	The audit has detected an inconsistency between the TSTBUS tuple being checked and the associated backlink field in the associated busmap array.
Possible Error Effect:	A TSTBUS may not be usable.
Corrective Action Taken:	Set the TSTBUS usr field to zero. Set the corresponding busmaps backlink field to 0xffff. Idle the corresponding entry in the PCbusidle array.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Value of busmaps backlink field (Not an address).
<i>Bad Data =</i>	Number of the line unit the TSTBUS belongs to. (Not actually bad data.)
<i>Good Data =</i>	Number of the TSTBUS.
<i>Logical Index =</i>	Service group of TSTBUS.
<i>Dump =</i>	NA.

Table 35 Error Code: STATE_SET

Error Code:	STATE_SET
Error Description:	The audit has detected an inconsistency between a bit in PCbusidle and the corresponding entry in busmaps.
Possible Error Effect:	The tuple in busmaps may not try to be accessed.
Corrective Action Taken:	Set the bit in PCbusidle to 0, indicating idle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the PCbusmaps[] entry with the error.
<i>Bad Data =</i>	Value of bit in PCbusidle.
<i>Good Data =</i>	Value of backlink field in busmaps.
<i>Logical Index =</i>	Entry in PCbusmaps[] being checked.
<i>Dump 1 =</i>	Related PCbusidle[] entry.
<i>Dump 2 =</i>	PCbusmaps[] entry.

Table 36 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	The owner of the TSTBUS is not a maintenance process when it should be.
Possible Error Effect:	A TSTBUS may not be usable.
Corrective Action Taken:	Quarantine the associated rICBCOM tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rISMEST basestate for the TSTBUS being checked. (Not an address.)
<i>Bad Data =</i>	Associated rICBCOM LPSTATE.
<i>Good Data =</i>	What the LPSTATE should be.
<i>Logical Index =</i>	rICDBCOM→cdccm.st_ownk.
<i>Dump 1 =</i>	Associated rICDBCOM tuple.
<i>Dump 2 =</i>	Associated rICBCOM tuple.
<i>Dump 3 =</i>	rISMEST tuple for the TSTBUS being checked.

Table 37 Error Code: TSIDLE_BUSY

Error Code:	TSIDLE_BUSY
Error Description:	A PCbusmaps[] entry is idle (PCbusmaps[].backlink is equal to 0xffff) but an element in its ccbusr array is not idle (PCbusmaps[].ccbusr[]).
Possible Error Effect:	Resources used for ISLU-Z ringing may be lost.
Corrective Action Taken:	The ccbusr array is cleared.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of entry in PCbusmaps.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Array index of PCbusmaps.
<i>Dump =</i>	PCbusmaps entry.

Table 38 Error Code: WRONGLIST

Error Code:	WRONGLIST
Error Description:	The TSTBUS tuple is out of service in rISMEST and linked to an idle list.
Possible Error Effect:	An PCtstbus may not be usable.
Corrective Action Taken:	Report the error and schedule the CKTDATA audit to link back to correct list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Idle list linked to.
<i>Good Data =</i>	PCtstbus rISMEST base state.
<i>Logical Index =</i>	NA.
<i>Dump 1 =</i>	rISMEST tuple for the PCtstbus being checked.
<i>Dump 2 =</i>	Associated rICDBCOM tuple.

Table 39 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit has been invoked after taking a system reset.
Possible Error Effect:	Causes asserts to fire and/or system resets.
Corrective Action Taken:	The audit has been returned to audit control and will be rescheduled for recovery activities.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

ISATUCD

Software Release: 5E10 and later

1. ATTENDANT TERMINAL UNIFORM CALL DISTRIBUTION (ISATUCD)

The purpose of this audit is to perform dynamic-to-static existence checks between rISATUCD and rLICX_ICI tuples. Any surplus rISATUCD tuples are deleted. This audit also performs the key type check for these dynamic tuples.

The dynamic relation RLISATUCD is an indexed relation, keyed by the integrated services digital network (ISDN) attendant terminal index. The relation RLISATUCD contains the ISDN attendant uniform call distribution (UCD) hunt variables and out-of-service (OOS) status for the ISAT group. This relation must be present for any group which is an ISAT hunt type.

2. DATA STRUCTURES

The RLISATUCD relation contains the ISDN attendant UCD hunt variable and OOS bit status.

The ISATUCD audit is part of the AURtaque module. It operates in the operating system for distributed switching-switching module (OSDS-SM) environment.

3. AUDIT CHECKS

The ISATUCD audit performs existence checks between the static relation RLICX_ICI accessed by information from RLRT_MHG, and the dynamic relation RLISATUCD.

If no tuple is found in RLICX_ICI and RLISATUCD indicates that it exists and if recent change is not active on RLICX_ICI, then an attempt is made to delete the extra tuple and an error message is printed.

4. ERROR HANDLING

When the audit encounters an error, an error message is printed on the read-only printer (ROP) and an attempt is made to recover from an error.

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	An extra rISATUCD tuple found for an ISDN attendant multi-line hunt group.
Possible Error Effect:	Unable to preempt the lines in this group and possible ASSERT failures.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rISATUCD tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of the rISATUCD tuple.
<i>Dump =</i>	Dump of the rISATUCD tuple.

Table 2 Error Code: KEY

Error Code:	KEY
Error Description:	An rISATUCD tuple has bad data in the key (isat_idx) field for an ISDN attendant multi-line hunt group.
Possible Error Effect:	Unable to preempt the lines in this group and possible ASSERT failures.

Corrective Action Taken:	The key is restored to its correct value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rllSATUCD tuple.
<i>Bad Data</i> =	Contents of the isat_idx field in the rllSATUCD tuple.
<i>Good Data</i> =	Correct of the rllSATUCD tuple.
<i>Logical Index</i> =	Key of the rllSATUCD tuple.
<i>Dump</i> =	Dump of the rllSATUCD tuple.

ISDCCFG

Software Release: 5E10 and later

1. ISLU COMMON DATA PATH CONFIGURATION (ISDCCFG) AUDIT

The integrated services line unit (ISLU) common data path configuration table is dynamic data that contains the D-channel type, the common data configuration, and the circuit names of the primary and secondary common data for each of the eight possible peripheral units. This global dynamic array is associated with the ISLU and remote ISLU (RISLU) peripheral units.

The ISDCCFG audit is part of the peripheral control audits subgroup.

2. DATA STRUCTURES

The main data structures used by the ISDCCFG audit are the ISLU common data path configuration array (PCiscdconfig[]), the ISLU peripheral interface data bus relation (RLISLUPIDB), a static relation, the switch maintenance equipment status relation (RLSMEST), a dynamic relation, and the peripheral control line unit service group name (PClusgname[] array. These data structures are shown in Figure 1 .

Figure 1 (ISDCCFG-1) Data Structures

3. AUDIT CHECKS

The ISDCCFG audit steps through PCiscdconfig[] for all peripheral units and performs the following checks:

- Ensures that the D-channel type and common data configuration are the same as the values in the static RLISLUPIDB relation.

- (b) Checks the circuit names of primary and secondary common data against rISMEST. The key of rISMEST (cktname) is formed as follows:

If the common data configuration field is in the active/standby mode, the circuit name in the primary common data should match an rISMEST tuple with a bas_stat of active. The circuit name in the secondary common data should match the rISMEST tuple with a bas_stat of standby. Statuses other than active or standby in rISMEST should have null in the primary or secondary common data fields.

If the common data configuration field is in the active/active mode, the circuit name in the primary common data should match an rISMEST tuple with a bas_stat of active major. The circuit name in the secondary common data should match the rISMEST tuple with a bas_stat of active minor. Statuses other than active major or active minor in rISMEST should have null in the primary or secondary common data fields.

- (c) Ensures that the common data bits in the ISLU/RISLU universal control interface (UCI) are consistent with the data in the primary and secondary common data fields.

4. ERROR HANDLING

If the audit detects an inconsistency in the D-channel type field and common data configuration fields, the audit will report the error and change the common data configuration to agree with data in rISLUPIDB. The audit changes inconsistencies in the primary and secondary common data to agree with rISMEST.

If inconsistencies are found between common data bits in the ISLU/RISLU UIC and PCiscdconfig[] array, errors are reported and the common data bits are updated to reflect the status of PCiscdconfig[].

The CKTDATA, ISPIDBTS, ISLIDBTS, and PTSB audits are scheduled as related audits.

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	The ISLU common controller restoral bit in PCiscdconfig[] is not correct.
Possible Error Effect:	None.
Corrective Action Taken:	The ISLU common controller restoral bit will be restored to its correct value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCiscdconfig[].
<i>Bad Data =</i>	Content of ISLU common controller restoral flag.
<i>Good Data =</i>	Corrected ISLU common controller restoral value.
<i>Logical Index =</i>	Line unit number.
<i>Dump =</i>	Both common controller rISMEST tuples.

Table 2 Error Code: CCNON

Error Code:	CCNON
Error Description:	The common controller duplex fail array SMccdupfail[] is not correct.
Possible Error Effect:	None.

Corrective Action Taken:	The common controller duplex fail array will be restored to its correct value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of SMccdupfail[].
<i>Bad Data =</i>	Content of common controller duplex fail flag.
<i>Good Data =</i>	Corrected common controller duplex fail flag.
<i>Logical Index =</i>	Line unit number.
<i>Dump =</i>	Both common controller rISMEST tuples.

Table 3 Error Code: CDBCOM

Error Code:	CDBCOM
Error Description:	The rCDBCOM tuple associated with the ISLU common data Circuit or ISLU common control cannot be accessed due to a failure from dynamic access (DA) primitives or the key of the rCDBCOM tuple has been mutilated.
Possible Error Effect:	This may cause application code to assert when trying to access the rCDBCOM tuples associated with the ISLU common data and ISLU common control circuits during a removal or restoral of these circuits.
Corrective Action Taken:	The CKTDATA and CDBCOM audits will be scheduled as a related audit to recover the rCDBCOM tuples.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rCDBCOM tuple.
<i>Bad Data =</i>	cktname.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 4 Error Code: CDBITS

Error Code:	CDBITS
Error Description:	The common data bits in the general processor control register or peripheral service state register is not correct.
Possible Error Effect:	None.
Corrective Action Taken:	The common data error in the UCI register will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Line unit number.
<i>Bad Data =</i>	Contents of registers.
<i>Good Data =</i>	Register contents should be.
<i>Logical Index =</i>	swno.
<i>Dump =</i>	NA.

Table 5 Error Code: CDCFG

Error Code:	CDCFG
Error Description:	The common data configuration in PCiscdconfig[] is not correct.
Possible Error Effect:	None.
Corrective Action Taken:	The common data configuration is restored to its correct value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the PCiscdconfig[].
<i>Bad Data =</i>	Contents of the common data configuration in PCiscdconfig[].
<i>Good Data =</i>	Corrected common data configuration.
<i>Logical Index =</i>	Line unit number.
<i>Dump =</i>	rISLUPIDB tuple.

Table 6 Error Code: CDPRIM

Error Code:	CDPRIM
Error Description:	The common data primary configuration is not correct.
Possible Error Effect:	None.
Corrective Action Taken:	The common data primary configuration will be corrected.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Address of PCiscdconfig[].
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	swno.
<i>Dump</i> =	Both common data rISMEST tuples and PCiscdconfig[].

Table 7 Error Code: CDCEC

Error Code:	CDCEC
Error Description:	The common data secondary configuration is not correct.
Possible Error Effect:	If the common data packs are in the load shared configuration no paths will be set-up on the secondary side.
Corrective Action Taken:	The common data secondary configuration will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCiscdconfig[].
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	swno.
<i>Dump</i> =	Both common data rISMEST tuples and PCiscdconfig[].

Table 8 Error Code: DCHAN

Error Code:	DCHAN
Error Description:	The D-channel type in PCiscdconfig[] is not correct.
Possible Error Effect:	None.
Corrective Action Taken:	The D-channel type is restored to its correct type.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCiscdconfig[].
<i>Bad Data</i> =	Contents of the D channel type in PCiscdconfig[].
<i>Good Data</i> =	Corrected D channel type.
<i>Logical Index</i> =	Line unit number.
<i>Dump</i> =	rISLUPIDB tuple.

Table 9 Error Code: E_BIT

Error Code:	E_BIT
Error Description:	The operational scanning bit (HWMSCAN) in the processor control register (HWPCTRL) of the unified control interface (UCI) is not enabled. This bit should only be inhibited during a common controller duplex failure.
Possible Error Effect:	Operational scanning may be turned off for this common data causing line card origination to be seen by the switch. Line card terminations can still be made.
Corrective Action Taken:	The operational scanning bit (HWMSCAN) in the processor control register (HWPCTRL) of the UCI will be enabled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the UIC register being read.
<i>Bad Data</i> =	Content of the operational scanning bit.
<i>Good Data</i> =	The operational scanning bit enabled value (HWMSCAN).
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 10 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	The common datas are in an inconsistent state (for example: cd1 - OOS and cd2 - STBY).
Possible Error Effect:	No call processing can take place.
Corrective Action Taken:	The CKTDATA audit will be scheduled as a related audit to recover the rISMEST tuples for the common datas to the proper state.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCiscdconfig[].
<i>Bad Data</i> =	NA.

<i>Good Data</i> =	NA.
<i>Logical Index</i> =	swno.
<i>Dump 1</i> =	Common data 0 rISMEST tuple.
<i>Dump 2</i> =	Common data 1 rISMEST tuple.
<i>Dump 3</i> =	PCiscdconfig[] array.

Table 11 Error Code: PIDB

Error Code:	PIDB
Error Description:	The key of rISLUPIDB generated from PClusgname[] is not correct.
Possible Error Effect:	Audit ISDCDCFG for this line unit will be skipped.
Corrective Action Taken:	The PICB audit will be scheduled to correct the error.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	PICB number.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Line unit number.
<i>Dump</i> =	NA.

Table 12 Error Code: RDREG

Error Code:	RDREG
Error Description:	The UCI register reading failed.
Possible Error Effect:	None.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Register address.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	(1) General processor control register. (2) Peripheral service state register.
<i>Dump</i> =	NA.

Table 13 Error Code: READSMEST

Error Code:	READSMEST
Error Description:	The key of rISMEST tuple for the active common controller calculated for this equipped RISLU/ISLU was not found (no match from DB read).
Possible Error Effect:	Remainder of the ISDCFG audit for this line unit will be skipped.
Corrective Action Taken:	The CKTDATA audit will be scheduled to correct the error.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The key of rISMEST tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Line unit number.
<i>Dump</i> =	NA.

Table 14 Error Code: SMEST

Error Code:	SMEST
Error Description:	The key of rISMEST generated from PClusgname[] is not correct.
Possible Error Effect:	Audit ISDCDCFG for this line unit will be skipped.
Corrective Action Taken:	The PICB and CKTDATA audits will be scheduled to correct the error.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The key of rISMEST tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Line unit number.
<i>Dump</i> =	NA.

Table 15 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was invoked after taking a system reset.
Possible Error Effect:	Causes resets and/or ASSERTS.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Line unit number.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

ISILHB

Software Release: 5E10 and later

1. INCOMING LINE HISTORY BLOCK FOR INTEGRATED SERVICES DIGITAL NETWORK (ISDN) AND SHARED ANALOG LINES (ISILHB) AUDIT

ISDN incoming line history blocks are used by several of the LASS features to store incoming call data, associated with the ISDN and shared analog lines. The ISILHB audit performs dynamic to static existence checks of the dynamic RLIS_ILHB relation. The audit is also scheduled as a post initialization audit, as part of a selective initialization.

2. DATA STRUCTURES

The RLIS_ILHB relation is a dynamic indirect access nonsequential keyed relation. The ISILHB audit checks several pieces of static data to verify the proper existence of rlIS_ILHB tuples. The static data, referenced, is shown. Global Variables:

Gl_pcrd
 Glac_access
 Glcot_access
 Glascaac, Glscfac, Glscrac, Glldaac

Static Relations:

RLLPT_PT
 RLFC_LINE
 RLTRMFEATS
 DRINDEX

3. AUDIT CHECKS

The ISILHB audit steps through the RLIS_ILHB relation and verifies whether or not a tuple in the relation should exist.

4. ERROR HANDLING

If a rlIS_ILHB tuple exists that should not, the audit removes the tuple from the RLIS_ILHB relation.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The audit has detected an rlAISILHB dynamic tuple without a corresponding static tuple or global parameter in the system. • rlISILHB.lport = rlLPT_PT.lport (with lpt_type = LPT_ISDN) • Glac_access Glcot_access is set to unavailable. • rlFC_LINE.ac_alw = DBNO (with rlFC_LINE.port = rlLPT_PT.port)

	• rIFC_LINE.cot_alw = DBNO (with rIFC_LINE.port = rILPT_PT.port)
Possible Error Effect:	If call processing attempts to access this tuple, services/operations may be disrupted.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rILSILHB tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key of the rILSILHB tuple in question.
<i>Dump =</i>	rILSILHB tuple in question.

Table 2 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit has found an inconsistency between the static relations rILPT_PT and rIFC_LINE. The audit is using the port and party fields of a rILPT_PT tuple to access a tuple in rIFC_LINE, however it is not able to access the rIFC_LINE tuple so the audit cannot continue to do checks on this tuple.
Possible Error Effect:	The rILSILHB audit will not be able to complete its checks on this tuple.
Corrective Action Taken:	The audit will print an error and continue onto the next tuple.
Manual Action Required:	Check the rILPT_PT and rIFC_LINE relations in the ODD. The rILPT_PT key, lport, found in the "GOOD DATA" field of the audit report, should be used to access the rILPT_PT tuple. The rILPT_PT tuple should have a port and party field which serve as the keys to the rIFC_LINE relation. There should exist a corresponding tuple in rIFC_LINE with the port and party found in rILPT_PT.
Dump Description:	
<i>Error Address =</i>	Not an address; this is the port field of the buffer used to access the rIFC_LINE tuple.
<i>Bad Data =</i>	Party field of the buffer used to access the rIFC_LINE tuple.
<i>Good Data =</i>	lport field of the rILPT_PT tuple used access the associated rIFC_LINE tuple.
<i>Logical Index =</i>	The key of the rILSILHB tuple in question.
<i>Dump 1 =</i>	rILSILHB tuple in question.
<i>Dump 2 =</i>	Associated rILPT_PT tuple.
<i>Dump 3 =</i>	Buffer used to access rIFC_LINE.

ISLIDBTS

Software Release: 5E10 and later

1. ISLU LINE CARD INTERFACE DATA BUS TIME SLOT (ISLIDBTS) AUDIT

The line card interface data bus (LIDB) is a data bus that carries two types of call data. Pulse code modulation (PCM) voice data is carried over 64 kilobit/second B-channels. Protocol control data is carried over 16 Kbs D-channels, or one-quarter time slots. The LIDBs connect the integrated services line unit (ISLU) line group controllers (LGCs) with the common data (CD) circuits. The line cards connect to the line group controllers through group interface data buses (GIDBs).

The ISLIDBTS audit is part of the peripheral control audits subgroup. Refer to the **AUDIT CHECKS** section for more information about the purpose of the ISLIDBTS audit.

2. DATA STRUCTURES

Figure 1 shows the data structures the audit uses. The primary data structure checked by the audit is the peripheral control ISLU line card interface data bus time slot array (PCislidbts). The array is made up of bit map arrays containing the statuses of completely idle time slots and partially full time slots for line card interface databuses (LIDBs) associated with the line group controllers, and static masks for direct D-channel reserved time slot path hunting. The array also contains the relative peripheral interface data bus (PIDB) number associated with each of the 32 LIDB time slots and the maintenance state of each LGC, which is a copy of the base state from the switch maintenance equipment status table relation (RLSMEST). The RLSMEST relation contains the equipment status (active, out-of-service, and so forth) for each circuit in the SM. Circuits of interest to the ISLIDBTS audit are the LGCs or STIs. Other data structures the audit uses include the peripheral control line unit service group name array (Pclusgname) and the PIDB time slot block relation (RLPTSB). The Pclusgname array holds a mask containing the upper eight bits [peripheral interface control bus (PICB) number plus one] for circuits in a line unit service group. The RLPTSB relation contains busy/idle path information for each of the four one-quarter time slots (D-channels) in a full 64 Kbs PIDB time slot. It also holds B-channel information, depending on the use of the PIDB time slot. The relation contains the digital subscriber line (DSL) group number for the PIDB time slot as well as port names for each one-quarter time slot member, transient timing flags for each one-quarter time slot, and linkage fields.

The audit also uses the following relations. The ISLU PIDB relation (RLISLUPIDB) contains the type of D-channels (direct or cut through), CD configuration of the ISLU (active/standby or active/active), and an array of relative PIDBs assigned for the ISLU. The key is the PICB assigned for the ISLU. The ISLU LGC relation (RLISLULGC) contains a line card array that indicates the type of line cards used in the ISLU, and the static direct PIDB path hunt mask for each LGC in the ISLU. The DSL equipage relation (RLEQUIPDSL) contains the DSL group and member assigned for a particular D-channel port. The circuit data relation (RLCKTDATA) contains the equipage state of the circuits in the SM (operational, unequipped, growth, and so forth). The circuits of concern are the LGCs.

Figure 1 (ISLIDBTS-1) Detailed Data Structures

3. AUDIT CHECKS

The audit steps through the eight possible line units in the SMs and makes the following checks for the ISLU, and RISLU, and DCLU-5.

- Loop through all 32 LIDB time slots on the LGC or STI, taking a time break after auditing groups of four time slots, checking each common data (CD) side (service group 0 or 1) in the ISLU.

- (b) Read rCKTDATA to obtain the equipage state of the STI or LGC. If it is unequipped or unpopulated, the PCislidbts map maintenance state for the LGC/STI should be out-of-service (OOS). If it is not OOS, an error is reported. If the LGC/STI is operational, the audit moves on to make further checks.
- (c) Read rISLUPIDB using PClusname to get the PICB number. If the read fails, report a manual action ODD error. If the read is successful, the audit saves the data and proceeds.
- (d) Read rISLULGC. If the read fails, report a manual action ODD error. If the read succeeds, verify the static copy of the directly connected PIDB time slot path hunt mask with the dynamic copy stored in the PCislidbts[][] map. If they are inconsistent, the audit reports an error and updates the dynamic copy.
- (e) Read rSMEST for the LGC. If the LGC is not MRA BUSY, check the maintenance state of the LGC in PCislidbts[][] against the rSMEST base state. If it is in error, report the error and recover the maintenance state to that of rSMEST. If the read of rSMEST fails, report the error and schedule the CKTDATA audit.

NOTE: The following checks are made for each time slot. The state of the PCislidbts map is represented as idlemmap, partialmap, and relpidbts.

- (a) Check that LGC control time slots are marked complete, full, or null. If they are not marked, (report an error) and recover the time slot to the proper state.
- (b) Check that a null relative PIDB time slot entry has a corresponding value of complete, idle, or null in PCislidbts. If it does not, (report error) and recover.
- (c) For non-null relative PIDB time slot entries, get the PIDB type from rISLUPIDB. Construct the key of the corresponding rIPTSB tuple based on the type of PIDB (CD configuration, active/active or active/standby). If there is no PIDB type, recover the LIDBTS time slot to complete/idle/null.
- (d) Perform a key check of the rIPTSB tuple. If there is an error, recover the PCislidbts time slot to complete/idle/null.
- (e) Check the usage of the rIPTSB tuple.
 - (1) If the rIPTSB tuple usage is null, recover the associated time slot because relative PIDB is non-null.
 - (2) If it is used for duplex or simplex B-channels, verify that the port name in the rIPTSB matches this LGC or STI. If it does not match, recover the LIDBTS time slot. Next, verify that the LIDBTS map is complete/full/non-null. If it is not, (report error) and recover LIDBTS to complete/full/non-null.
 - (3) If the tuple is used for D-channels or packet B-channels, check to see if any transient conditions exist. If a transient condition exists, move on to next time slot. If a transient condition does not exist, count the number of busy one-quarter time slots in rIPTSB. If a member is assigned a DSL group, get the DSL group number from rIPTSB and read rEQUIPDSL to verify it. If the read fails, (report an error) and recover PCislidbts to complete/idle/null. If the read succeeds, check that the D-channel port matches this LGC or STI. If it does not, (report an error) and recover PCislidbts to complete/idle/null. If no member is assigned, verify that the number of busy one-quarter time slots is consistent with the status of the PCislidbts map. If it is inconsistent, recover PCislidbts to the correct state.
 - (4) If it is used for maintenance, verify that the B-channel port name in rIPTSB matches this LGC or STI. If it does not, (report an error) and recover PCislidbts to complete/idle/null. Next, verify that PCislidbts[][] is complete/full. If it is not, report the error and recover to complete/full.
 - (5) If the rIPTSB tuple is used for a packet switch unit (PSU) PIDB time slot, report an error and recover PCislidbts[][] to complete/idle/null.

- (6) If the usage field is out of range, report an error and recover PCislidbts to complete/idle/null.

4. ERROR HANDLING

The audit in general handles errors as follows. For details, see the explanations of the checks in the Audit Checks section. The audit changes inconsistencies between rISMEST and the maintenance state in PCislidbts to the value in rISMEST. The audit sets the control time slot bit to busy when it detects control time slot errors. For other time slot bit inconsistencies, the audit sets the idlemap/partmap status to idle/complete. The corresponding rIPTSB tuples will be recovered by the peripheral interface data bus time slot block (PTSB) audit.

The audit schedules the CKTDATA and PTSB audits as related audits when it detects errors.

The audit produces the following error code(s).

Table 1 Error Code: BIT1MAP

Error Code:	BIT1MAP
Error Description:	The dynamic copy of DPIDB time slot mask does not match the static copy.
Possible Error Effect:	The mask is out of date.
Corrective Action Taken:	Causes an interrupt in checking the data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of LIDBTS entry.
<i>Bad Data =</i>	Dynamic copy of DPIDB reserved TS mask.
<i>Good Data =</i>	Static copy of DPIDB reserved TS mask.
<i>Logical Index =</i>	LGC or STI circuit name.
<i>Dump =</i>	NA.

Table 2 Error Code: EQUIP_DSL

Error Code:	EQUIP_DSL
Error Description:	Static data inconsistency between rIEQUIPDSL.
Possible Error Effect:	There could be a loss of resources or possible path hunt problems.
Corrective Action Taken:	Recover the status of the relative PIDB to idle and set idlemap to 1 and partmap to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the LIDBTS entry.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	LGC or STI circuit name.
<i>Dump =</i>	LIDB map entry.

Table 3 Error Code: IDLE_BUSY

Error Code:	IDLE_BUSY
Error Description:	The partmap is not completely full and the idlemap is marked idle.
Possible Error Effect:	Call will not be completed correctly.
Corrective Action Taken:	Resets the partmap and idlemap to the correct status.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of LIDBTS entry.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	LGC or STI circuit name.
<i>Dump =</i>	rIPTSB tuple and the LIDB map entry.

Table 4 Error Code: KEY

Error Code:	KEY
Error Description:	The key in the rIPTSB tuple does not match the key passed.
Possible Error Effect:	The rIPTSB tuple has probably been mutilated.

Corrective Action Taken:	Recover the correct state of the maps for this time slot.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	Contents of rIPTSB tuple (dynamic).
<i>Good Data</i> =	Contents of rIPTSB tuple (static).
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	NA.

Table 5 Error Code: LGC_CTS

Error Code:	LGC_CTS
Error Description:	The relative PIDB fields are not idle or the partial and idle maps are not equal to zero.
Possible Error Effect:	CTS (control time slot) may be invalidly used for path hunt.
Corrective Action Taken:	Recover the CTS by setting the idlemap, partialmap, and relpidb.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	LIDB map entry.

Table 6 Error Code: LGCMAINT

Error Code:	LGCMAINT
Error Description:	(1) The LGC is not operational for rICKTDATA and the maintenance field is not marked OOS. (2) The LIDB map should be marked in-service for the rISMEST.
Possible Error Effect:	Operational code may improperly access the circuit.
Corrective Action Taken:	Recover the LIDB map to SMOOS for rICKTDATA.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the LIDBTS entry.
<i>Bad Data</i> =	Maintenance state found in LIDBTS map entry.
<i>Good Data</i> =	Corresponds to Error Description as follows:
	(1) OOS base state value. (2) ACT base state value.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	NA.

Table 7 Error Code: MAINT_STATE

Error Code:	MAINT_STATE
Error Description:	The LGC name from the rIPTSB tuple does not match the LGC currently being audited.
Possible Error Effect:	Call will not be completed correctly.
Corrective Action Taken:	Idle the partial and idlemaps and also relpidb and continue to next time slot.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	rIPTSB tuple and the LIDB map entry.

Table 8 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	The idlemaps and partmap should be in the busy state.
Possible Error Effect:	Loss of resources.
Corrective Action Taken:	Print an error and set idlemaps and partmaps to busy state.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	LIDB map entry.

Table 9 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	When the rIPTSB tuple is idle, the relpidb in the LIDB map is idle.
Possible Error Effect:	There will be a loss of resources and possible path hunt problems.
Corrective Action Taken:	Recover the LIDB map entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the LIDBTS entry.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Contents of the rIPTSB tuple.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	LIDB map entry.

Table 10 Error Code: NO_PIDB

Error Code:	NO_PIDB
Error Description:	CD configuration other than shared load and active/standby is used which is not known by audit.
Possible Error Effect:	CTS will be invalidly used for path hunt.
Corrective Action Taken:	Print an error and continue to the next LGC or STI.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	LIDB map entry.

Table 11 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	Static data inconsistency with rICKTDATA.
Possible Error Effect:	Loss of resources and path hunt will be affected.
Corrective Action Taken:	None.
Manual Action Required:	Find the nature of the inconsistency and correct it. This error will continue until corrected.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	pidb circuit name.
<i>Dump</i> =	NA.

Table 12 Error Code: PIDBTS

Error Code:	PIDBTS
Error Description:	The data in the LIDB map (PCislidbts[] []) indicated that this time slot was being used for line card diagnostics. However, either the rISMEST tuple associated with the line card was not found to be busy, (stat_act == DBBUSY), the idlemmap indicates idle, or the partmap indicates that it is not completely full
Possible Error Effect:	The LIDB time slot that was under audit will be lost to the system and can lead to degradation of ISDN type calls.

Corrective Action Taken:	Set the idlemap for this time slot to idle (1), set the partmap top indicate completely idle (0), and set the relative pidb field to idle (0xf). This will be done for both sides of the map. To insure proper recovery in the event that the rISMEST tuple was in error, the CKTDATA audit will be scheduled as a related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDB map found to be in error (PCidlibts[lu] [gc]).
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC ircuit name.
<i>Dump</i> =	NA.

Table 13 Error Code: PTSB_LINK

Error Code:	PTSB_LINK
Error Description:	(1) The port name from the rIPTSB tuple is not on the specified LGC. (2) The port name from the rEQUIPDSL tuple is not on the specified LGC.
Possible Error Effect:	There will be a loss of resources and possible path hunt problems.
Corrective Action Taken:	Idle all the ports and continue to the next time slot.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	Dynamic value of LGC.
<i>Good Data</i> =	Static value of LGC.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	LIDB map entry.

Table 14 Error Code: READSMEST

Error Code:	READSMEST
Error Description:	The data in the LIDB map (PCislibts[] []) indicated that this time slot was being used for line card diagnostics. However, the rISMEST tuple associated with the line card was not found in the data base by the Data Base Manager (DBM). Either the data in the LIDB map was corrupt or the rISMEST tuple is erroneously missing from the data base.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	Set the idlemap for this time slot to idle (1), set the partmap to indicate completely idle (0), and set the relative pidb field to idle (0xf). This will be done for both sides of the map. To insure proper recovery in the event that the rISMEST tuple is missing from the data base, the CKTDATA audit will be scheduled as a related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDB map found to be in error (PCidlibts[lu] [gc]).
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC circuit name.
<i>Dump</i> =	NA.

Table 15 Error Code: RELPIDB

Error Code:	RELPIDB
Error Description:	The relpidb fields do not match for active/standby check.
Possible Error Effect:	The standby bus copy will not match the active bus copy.
Corrective Action Taken:	Update the standby bus copy so it matches the active bus copy.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.

<i>Bad Data</i> =	relpidb fields for side 1.
<i>Good Data</i> =	relpidb fields for side 0.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	NA.

Table 16 Error Code: SMEST

Error Code:	SMEST
Error Description:	Unable to read rSMEST.
Possible Error Effect:	rCKTDATA is able to be read but rSMEST is unable to be read.
Corrective Action Taken:	Schedule the SMEST audit as a related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	NA.

Table 17 Error Code: STATE

Error Code:	STATE
Error Description:	Either the idlemmap is not busy or the partmap is full for the LGC or STI.
Possible Error Effect:	Loss of resources and possible path hunt problems.
Corrective Action Taken:	Print an error and recover the maps to the correct states.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	LIDB map entry.

Table 18 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	For PCPPSCUT (PSU default) case maps are set to incorrect states.
Possible Error Effect:	Loss of resources and possible hunt path problems.
Corrective Action Taken:	Print an error and recover the maps to idle state and then continue onto the next time slot.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	Contents of the use field in the rIPTSB tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	rIPTSB tuple and the LIDB map entry.

Table 19 Error Code: STUCKBUSY

Error Code:	STUCKBUSY
Error Description:	When the LIDBTS is used for maintenance, the partmap is not full or idlemmap is not busy.
Possible Error Effect:	Loss of resources or possible path hunt problems.
Corrective Action Taken:	Recover the maps to busy and report an error.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	rIPTSB tuple and LIDB map entry.

Table 20 Error Code: TSIDLE_BUSY

Error Code:	TSIDLE_BUSY

Error Description:	With the relative PIDB field set to 0xf, the LIDB map is not set to idle.
Possible Error Effect:	CTS may be invalidly used for path hunt.
Corrective Action Taken:	Recover the CTS by setting the idlemmap, and partmap to idle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LIDBTS entry.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	LIDB map entry.

Table 21 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was invoked after taking a system reset.
Possible Error Effect:	Causes system reset and/or asserts to fire.
Corrective Action Taken:	The audit has been returned to audit control and will be rescheduled for recovery activities.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LGC or STI circuit name.
<i>Dump</i> =	NA.

ISLINE

Software Release: 5E10 and later

1. INTEGRATED SERVICES LINE (ISLINE) AUDIT

The purpose of the ISLINE audit is to perform static-to-dynamic existence checks between rIIS_LINE and rIPPSAST. For each tuple in rIIS_LINE that has the lead module equal to the switching module (SM) and the port processor (PP) bit, RLis_line.pp_stat is equal to DBYES, the rIPPSAST tuple will be checked for existence. Any missing tuples in rIPPSAST are inserted.

Another added purpose of the ISLINE is to maintain data consistency between the static rIIS_LINE tuple and the dynamic rICPNBNCNT tuple.

2. DATA STRUCTURES

The ISLINE audit runs in the segmented mode and operates in the operating system for distributed switching-switching module (OSDS-SM) environment.

3. AUDIT CHECKS

The purpose of this audit is to perform static-to-dynamic existence checks between rIIS_LINE and rIPPSAST. For each tuple in rIIS_LINE that has the lead module equal to that SM and the PP feature indicator and RLis_line.pp_stat equal to DBYES, the rIPPSAST tuple is checked for existence. Any missing dynamic tuple in rIPPSAST is inserted.

The audit also performs a check on the existence of the dynamic rICPNBNCNT tuple when the "bill_opt" attribute is set to USAGE_SENS in the rIIS_LINE tuple.

4. ERROR HANDLING

If no tuple is found in rIPPSAST and rIIS_LINE indicates it should exist, and if recent change is not active on rIIS_LINE, the missing tuple is inserted and an error message is printed. An assert is fired if the database insert fails. The PP flags are initialized to zero.

If the ISLINE audit finds an error, then the CPNBNCNT audit is run as a related audit.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	There is a tuple missing in the dynamic RLPPSAST/RLCPNBNCNT relation for a corresponding static RLIS_LINE relation. Cannot establish priority call for missing rIPPSAST tuple. The BAD DATA field in the dump indicate the missing dynamic tuple: 997 is the relid for rIPPSAST and 1291 is for rICPNBNCNT.
Possible Error Effect:	Inability to do existence checking between ISLINE and PPSAST and ASSERT failures due to call termination. If missing rICPNBNCNT, then lost information for billing.
Corrective Action Taken:	The tuple is created and initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIIS_LINE tuple.
<i>Bad Data =</i>	Relation ID of missing tuple.
<i>Good Data =</i>	0 or one key of lost rICPNBNCNT tuple.

<i>Logical Index</i> =	Key of lost tuple.
<i>Dump</i> =	Dump of the rllS LINE tuple.

ISLPCB

Software Release: 5E14 and later

1. ISLP CONNECTION CONTROL BLOCK (ISLPCB) AUDIT

The ISLPCB is the control block for the ISLP channels and contains the host-to-DSP and DSP-to-host ISLP buffer descriptors (ISLPBD). This audit verifies the integrity of the host-to-DSP and DSP-to-host pointers to the head and tail queues.

2. DATA STRUCTURES

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: PTR1

Error Code:	PTR1
Error Description:	One or more of the host-to-DSP or DSP-to-host head and tail pointers are mis-aligned.
Possible Error Effect:	Invalid data may be passed for a call.
Corrective Action Taken:	The head pointers are reinitialized to point to the first entry in the arrays and the tail pointers to the last entry in the arrays.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Host-to-DSP address (PVislpcb[index].hd_queue.hdq[0]).
<i>Bad Data =</i>	DSP-to-host address (PVislpcb[index].dh_queue.dhq[0]).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The array number that failed.
<i>Dump =</i>	PVislpstack[index].

ISLUTRAN

Software Release: 5E10 and later

1. ISLU TRANSACTION (ISLUTRAN) AUDIT

The integrated services line unit (ISLU) Z analog interface (ISLU-Z) provides analog call processing on the ISLU, including plain old telephone service (POTS) calls, multi-party calls, and coin phone operations on the ISLU. Several audits check the data structures used by the ringing generators (RGs), metallic access network (MAN), and sparing of faulty line cards. The audits include the peripheral control (PC) ringing occupancy table audit (RGOCUP), the PC ringing task data block audit (RGTDDB), the ringing generator bus audit (RGBUS), the channel control block user audit (CCBUSR), the ISLU-Z access network bus audit (ISANBUS), the spare line card audit (SPRCRD), and the ISLU transaction audit (ISLUTRAN). The ISLUTRAN audit checks the global PC array that contains information about the line units that are ISLUs or remote ISLUs (RISLUs). The ISLUTRAN audit is part of the peripheral control audits subgroup.

2. DATA STRUCTURES

The ISLUTRAN audit checks the information in the PC ISLU transactions array (PCislutrans). The PCislutrans array has eight indices that indicate which line units in the SM are ISLUs or RISLUs. For example, if line units 4 and 6 are ISLUs, then PCislutrans[4] = 4 and PCislutrans[6] = 6. The rest of the indices would be initialized to 0xffff. The PCislutrans array is used by operational code to quickly determine which line unit to use for ringing.

3. AUDIT CHECKS

IDL_STATE = PCislutrans[] entry should be empty but is not.

STATUS = PCislutrans[] entry is incorrect for an ISLU/RISLU.

ZAP = The audit was entered after a memory violation.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: IDL_STATE

Error Code:	IDL_STATE
Error Description:	The PCislutrans global array indices that should be 0xffff, meaning that there no more RISLU/ISLU's in the switch, have some other number in them.
Possible Error Effect:	Ringing data has been made invalid.
Corrective Action Taken:	The PCislutrans index is set to 0xffff.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of PCislutrans array entry.
<i>Bad Data</i> =	Contents of PCislutrans entry.
<i>Good Data</i> =	0xffff.
<i>Logical Index</i> =	Index into PCislutrans.
<i>Dump</i> =	PCislutrans array.

Table 2 Error Code: STATUS

Error Code:	STATUS
Error Description:	The PCislutrans global array does not contain the right information about which LUs are (R)ISLU'S.

Possible Error Effect:	Ringing data has been made invalid.
Corrective Action Taken:	The (R)ISLU number is put into the appropriate PCislutrans index.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of PCislutrans array entry.
<i>Bad Data =</i>	Contents of PCislutrans entry.
<i>Good Data =</i>	(R)ISLU number.
<i>Logical Index =</i>	LU number.
<i>Dump =</i>	PCislutrans array.

Table 3 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was invoked after taking a system reset.
Possible Error Effect:	Causes asserts to fire and/or a system reset.
Corrective Action Taken:	The audit has been returned to audit control and will be rescheduled for recovery activities.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

ISMDB

Software Release: 5E10 and later

1. INTEGRATED SERVICES DIGITAL NETWORK (ISDN) MAINTENANCE DATA BLOCK (ISMDB) AUDIT

The ISMDB relation is a dynamic indexed relation, which is used for all applications that support ISDN protocols.

2. DATA STRUCTURES

The data structure checked by the ISMDB audit is the ISDN maintenance data block relation (RLISMDB).

3. AUDIT CHECKS

ISMDB audit performs existence check between the dynamic data in RLISMDB and the static data in RLEQUIPDSL or RLPSX25LN.

4. ERROR HANDLING

Any extra ISMDB tuple is marked as deleted and initialized.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: EXTRATUP

Error Code:	EXTRATUP					
Error Description:	The audit has detected an rIDPB dynamic tuple without a corresponding static tuple where: rISMDB Key Format 1514131211109876543210 <table><tr><td>0</td><td>0</td><td>DSL Group</td><td>0</td><td>DSL Member</td></tr></table> (1) rISMDB.dslgm.DSL_group = rEQUIPDSL.dsl_group rISMDB.dslgm.DSL_member = rEQUIPDSL.member (2) rISMDB.dslgm.DSL_group = rlpsx25ln.ph_number rISMDB.dslgm.DSL_member = rlpsx25ln.ph_ch	0	0	DSL Group	0	DSL Member
0	0	DSL Group	0	DSL Member		
Possible Error Effect:	If call processing or terminal maintenance attempts to access the unassigned resources for protocol monitoring, operations may be disrupted.					
Corrective Action Taken:	Tuple is deleted.					
Manual Action Required:	None.					
Dump Description:						
Error Address =	Address of the tuple.					
Bad Data =	NA.					
Good Data =	NA.					
Logical Index =	PSX25LN key.					
Dump =	RLPSX25LN.					

ISOLHB

Software Release: 5E10 and later

1. OUTGOING LINE HISTORY BLOCK FOR INTEGRATED SERVICES DIGITAL NETWORK (ISDN) AND SHARED ANALOG LINES (ISOLHB) AUDIT

ISDN outgoing line history blocks are used by several of the LASS features to store outgoing call data, associated with the ISDN and shared analog lines. The ISOLHB audit performs dynamic to static existence checks of the dynamic RLIS_OLHB relation. It is also scheduled as a post initialization audit, as part of a selective initialization.

2. DATA STRUCTURES

The RLIS_OLHB relation is a dynamic indirect access nonsequential keyed relation. The ISOLHB audit checks several pieces of static data to verify the proper existence of rLIS_OLHB tuples. The static data, referenced, is shown.

3. AUDIT CHECKS

The ISOLHB audit steps through the rLIS_OLHB relation and verifies whether or not a tuple in the relation should exist.

4. ERROR HANDLING

If a rLIS_OLHB tuple exists that should not, the audit removes the tuple from the RLIS_OLHB relation.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The audit has detected an rLISOLHB dynamic tuple without a corresponding static tuple or global parameter in the system. • rLANOLHB.lport = rLPT_PT.lport (with lpt_type = LPT_ISDN). • Glar_access is set to unavailable. • rIFC_LINE.ar_alw = DBNO (with rIFC_LINE.port = rLPT_PT.port)
Possible Error Effect:	If call processing attempts to access this tuple, services/operations may be disrupted.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the IS_OLHB tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key of the rLIS_OLHB tuple in question.
<i>Dump =</i>	rLIS_OLHB tuple in question.

Table 2 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit has found an inconsistency between the static relations rLPT_PT and rIFC_LINE. The audit is using the port and party fields of a rLPT_PT tuple to

	access a tuple in rIFC_LINE, however it is not able to access the rIFC_LINE tuple so the audit cannot continue to do checks on this tuple.
Possible Error Effect:	The ISOLHB audit will not be able to complete its checks on this tuple.
Corrective Action Taken:	The audit will print an error and continue on to the next tuple.
Manual Action Required:	Check the rLPT_PT and rIFC_LINE relations in the ODD. The rLPT_PT key, lport, found in the "GOOD DATA" field of the audit report, should be used to access the rLPT_PT tuple. The rLPT_PT tuple should have a port and party field which serve as the keys to the rIFC_LINE relation. There should exist a corresponding tuple in rIFC_LINE with the port and party found in rLPT_PT.
Dump Description:	
<i>Error Address =</i>	Not an address; this is the port field of the buffer used to access the rIFC_LINE tuple.
<i>Bad Data =</i>	Party field of the buffer used to access the rIFC_LINE tuple.
<i>Good Data =</i>	lport field of the rLPT_PT tuple used access the associated rIFC_LINE tuple.
<i>Logical Index =</i>	The key of the rIIS_OLHB tuple in question.
<i>Dump 1 =</i>	rIIS_OLHB tuple in question.
<i>Dump 2 =</i>	Associated rLPT_PT tuple.

ISPABUF

Software Release: 5E10 and later

1. INTEGRATED SERVICES PORT ADMINISTRATION BUFFER (ISPABUF) AUDIT

There are several types of ports in the switch that need administering, including line unit ports, *SLC*® 96 ports, and integrated service digital network (ISDN) B- and D-channel ports. The integrated services port administrator (ISPA) takes care of port functions such as routine conditioning to ensure that the hardware and software are consistent. Two audits check the tuple buffers associated with the system and terminal processes involved with port administration, the ISPABUF audit the terminal process control buffer (TPCBUF) audit.

The ISPABUF audit is part of the terminal maintenance audits subgroup.

2. DATA STRUCTURES

The ISPABUF audit uses two data structures: the ISPA buffer relation (RLISPABUF) and the terminal process buffers relation (RLTPCBUF). The RLISPABUF relation ensures that different ISPA functions with different priorities are scheduled properly. It also is used for creating and monitoring the terminal processes. The audit also refers to the data base head cell relation (RLDB_HEADC), which contains tuples for the different priority levels in RLISPABUF. These data structures are shown in Figure 1.

Figure 1 (ISPABUF-1) Data Structures of the ISPABUF Audit

3. AUDIT CHECKS

The ISPABUF audit invokes the linkage driver (DRLINK) to check the linkages of RLISPABUF to RLTPCBUF and RLDB_HEADC. It calls the semantic function to check the range of the priorities in RLISPABUF. The semantic function also ensures that tuples of a certain priority are linked to the proper tuple of RLDB_HEADC.

4. ERROR HANDLING

If the audit detects an error with the busy lists, the list is considered critical. The audit will patch the list, if possible.

The ISPABUF audits schedules the TPCBUF and DBHEADC audits as related audits when it detects errors.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	The rISPABUF tuple has a job priority of TMPAUDIT (input.priority) , which is reserved for routine port conditioning (RPC) jobs. However the tuple is not being used for the RPC job(input.job not equal to TMRTNCOND).
Possible Error Effect:	ISPA could be preventing RPC jobs from running.
Corrective Action Taken:	The rISPABUF tuple is returned to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the bad rISPABUF tuple.
<i>Bad Data =</i>	The current ISPA job type, input.job .
<i>Good Data =</i>	The ISPA job type for RPC jobs, TMRTNCOND.
<i>Logical Index =</i>	Key of the rISPABUF tuple, bufkey .
<i>Dump =</i>	The rISPABUF tuple.

Table 2 Error Code: PROCPRIOR

Error Code:	PROCPRIOR
Error Description:	The priority attribute found in the rISPABUF tuple is out of range of the possible priority values.
Possible Error Effect:	ISPA could be scheduling jobs at the wrong priority.
Corrective Action Taken:	The rISPABUF tuple is returned to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of input structure in rISPABUF tuple.
<i>Bad Data =</i>	Priority found in rISPABUF tuple.
<i>Good Data =</i>	Maximum priority value allowed.
<i>Logical Index =</i>	Key of rISPABUF tuple, bufkey .
<i>Dump =</i>	rISPABUF tuple.

Table 3 Error Code: TWOLINKS

Error Code:	TWOLINKS
Error Description:	Only one ISPA Routine Port Conditioning(RPC) job is allowed to be scheduled at a given time. Audit found that the current rISPABUF tuple under audit is not the first and only tuple on the list.
Possible Error Effect:	Someone other than the RPC scheduler may be requesting RPC jobs.
Corrective Action Taken:	The rISPABUF tuple is returned to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the bad rISPABUF tuple.
<i>Bad Data =</i>	Logical key of the previous rISPABUF tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Key of the bad rISPABUF tuple, bufkey .
<i>Dump =</i>	The rISPABUF tuple.

Table 4 Error Code: WRONGLIST

Error Code:	WRONGLIST
Error Description:	The linkage field in the rISPABUF tuple indicates the tuple is on one of the priority queues, but the priority attribute indicates the tuple is on a different priority queue.
Possible Error Effect:	ISPA could be scheduling jobs at the wrong priority.
Corrective Action Taken:	The rISPABUF tuple is returned to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of owner linkage in rISPABUF tuple.
<i>Bad Data =</i>	Key of owner tuple found in rISPABUF tuple linkage.

<i>Good Data</i> =	Key of owner tuple converted from priority attribute through use of TMispr_i_hc[] array.
<i>Logical Index</i> =	Key of rISPABUF tuple, bufkey .
<i>Dump</i> =	rISPABUF tuple.

ISPIDBTS

Software Release: 5E10 and later

1. ISLU PERIPHERAL INTERFACE DATA BUS TIME SLOT (ISPIDBTS) AUDIT

The integrated services line unit (ISLU) peripheral interface data bus (PIDB) time slot map array contains the busy/idle status of the PIDB time slots, from the common data (CDs) to the time slot interchanger (TSI), and a record of the remaining available time slots. It contains the PIDB type, maintenance state, and the data interface service group number. The data structure is audited by the PIDBTS audit to ensure that the status of the bits in the array are consistent with the hardware state. This map is used for ISLUs, remote integrated services line units (RISLUs), and directly connected line units-5 (DCLU-5s).

The ISPIDBTS audit is part of the peripheral control audits subgroup.

Refer to the **AUDIT CHECKS** section for more information about the use and purpose of the ISPIDBTS audit.

2. DATA STRUCTURES

The main data structure checked by the audit is the peripheral control ISLU PIDB time slot map array (PCispidbts). The audit obtains the PIDB circuit name from the line unit service group name array (Pclusgname). The PIDB type is checked against data contained in the circuit data relation (RLCKTDATA). Several fields are checked against the switch maintenance equipment status table relation (RLSMEST). The audit also checks the B- and D-channel time slots against information contained in the PIDB time slot block relation (RLPTSB). These data structures are shown in Figure 1 .

Figure 1 (ISPIDBTS-1) Data Structures

3. AUDIT CHECKS

For each PCispdbts array entry, the audit makes the following checks:

- Check that the unit is an ISLU, RISLU, or DCLU-5. If it is not, the audit proceeds to the next entry.
- Check that the PIDB is equipped. If it is not equipped, the audit proceeds to the next entry.
- Check the PIDB type against the PIDB type in the corresponding tuple of rCKTDATA. If there is an inconsistency, and error is reported and the PCispdbts array is updated to agree with rCKTDATA.
- Check the system PIDB (syspidb) in the PCispdbts[][] array against the system PIDB (pidb) in the corresponding tuple of rCKTDATA. If there is an inconsistency, and error is reported and the PCispdbts array is updated to agree with rCKTDATA.
- Check the associated PICB (asspicb) in the PCispdbts[][] array if this PIDB is associated with a RISLU.

The associated PICB should be the same as the associated PICB (assoc) field in the rLISLUPIDB tuple. If the unit is an ISLU or DCLU-5, then the associated PICB (ascpicb) field in PCispdbts[][] should be 0x7f. If inconsistencies are found, the ascpicb field is recovered to either 0x7f or to the corresponding tuple of RLISLUPIDB.

- (f) Access rSMEST and verify the qualifier and base state fields. The key of rSMEST (cktname) is formed as follows:

Figure 2 rSMEST Key

- (g) If the maintenance state is in-service, the audit checks the entry against rIPTSB. The busy/idle state of the PCispdbts should match the busy/idle status of the rIPTSB. If inconsistencies are found, PCispdbts will be updated to agree with the rIPTSB state.
- (h) Check the clear channel (clrchan) in the PCispdbts array. ISLUs and DCLUs always have 64kb/s clear channels and thus clrchan should indicate this. RISLUs either contain 64kb/s clear channels or 56kb/s non-clear channels. For RISLUs the clrchan field is audited against data in rCKTDATA.

NOTE: In each of the above instances, errors are reported when inconsistencies arise.

4. ERROR HANDLING

The PCpidbts array is changed to agree with the data in RLCKTDATA, RLSMEST, RLPTSB as appropriate.

The PTSB and CKTDATA audits are scheduled as related audits.

If an error is found in the active/standby state, the time slot use is corrected. Otherwise, the map is idled for the load shared configuration. The protocol handler (PH) status and member status will be corrected to match the values in rIODPSOP.

The audit produces the following error code(s).

Table 1 Error Code: ALWOOS

Error Code:	ALWOOS
Error Description:	The maintenance state in PCispdbts[][] is not OOS when rCKTDATA tuple is not found.
Possible Error Effect:	Call processing may try to use an unequipped ISLU PIDB time slot.
Corrective Action Taken:	The maintenance state in PCispdbts[][] will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of PCispdbts[][].
<i>Bad Data =</i>	The contents of maintenance state.
<i>Good Data =</i>	The corrected maintenance state.
<i>Logical Index =</i>	The circuit name of rCKTDATA tuple.
<i>Dump =</i>	The PCispdbts[][].

Table 2 Error Code: ASSOC_PTSB

Error Code:	ASSOC_PTSB
Error Description:	The PTSB cduse was found to be inconsistent with the PCispdbts[][] tsuse.

Possible Error Effect:	The CD side in use is not known to Call Processing, since it is not correctly reflected in dynamic data.
Corrective Action Taken:	If the PTSB cduse indicates ACTIVE/STANDBY the PCispidbts[][] tsuses for both sides are idled out. If the PTSB cduse is LOAD SHARED or some state other than the legal states previously mentioned, the rIPTSB tuple is quarantined, and the PCispidbts[][] time slot for side 0 is idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the PCispidbts[] array entry found in error.
<i>Bad Data =</i>	The cduse field from the rIPTSB tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The logical key (ptsb) of the rIPTSB tuple.
<i>Dump 1 =</i>	The rIPTSB tuple.
<i>Dump 2 =</i>	The PCispidbts[] array entry found in error.

Table 3 Error Code: BAD_PTSB

Error Code:	BAD_PTSB
Error Description:	The Peripheral Interface Data Bus (PIDB) associated with this PCispidbts[] array entry is in an active/standby mode but the PIDB type (type) field is inconsistent between the PCispidbts[] array entry for side 0 versus side 1.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The PIDB type (type) field in the PCispidbts[] array entry associated with the standby side is updated from the active side. The PIDB type (type) field of the active side has already been audited.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the PCispidbts[] array entry found in error.
<i>Bad Data =</i>	The PIDB type (type) field from the PCispidbts[] array entry associated with the standby side.
<i>Good Data =</i>	The PIDB type (type) field from the PCispidbts[] array entry associated with the active side.
<i>Logical Index =</i>	The PIDB circuit name.
<i>Dump =</i>	NA.

Table 4 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The type field in the PCispidbts[][] map for an unequipped Integrated Services Line Unit (ISLU) Peripheral Interface Data Bus (PIDB) is not set to PCNULLPIDB.
Possible Error Effect:	Can cause asserts from Switch Maintenance (SMIM) when restoring an ISLU Common Data (CD) circuit to in-service.
Corrective Action Taken:	The type field in the PCispidbts[][] map will be recovered to PCNULLPIDB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the PCispidbts[][] array.
<i>Bad Data =</i>	The circuit name of the corresponding ISLU PIDB.
<i>Good Data =</i>	(0) PCNULLPIDB.
<i>Logical Index =</i>	The circuit name of the corresponding ISLU PIDB.
<i>Dump =</i>	The PCispidbts[][] global array.

Table 5 Error Code: BUSMATCH

Error Code:	BUSMATCH
Error Description:	The standby PIDB time slot usage is inconsistent with active PIDB.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The standby PIDB time slot usage will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of PCispidbts[][].
<i>Bad Data =</i>	The contents of standby PIDB time slot usage.

<i>Good Data</i> =	The corrects of active PIDB time slot usage.
<i>Logical Index</i> =	PIDB circuit name.
<i>Dump</i> =	NA.

Table 6 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	The state field (usage) in the PCispidbts[] array for this time slot is marked busy but the state field (use) in the corresponding rIPTSB tuple indicates this time slot is idle.
Possible Error Effect:	Call Processing would be accessing invalid data and asserting.
Corrective Action Taken:	The state field (usage) in the PCispidbts[] array for this time slot is marked idle to match the state of the corresponding rIPTSB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the PCispidbts[] array entry found in error.
<i>Bad Data</i> =	The state field (usage) from the PCispidbts[] array.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The logical key field (ptsb) of the rIPTSB tuple.
<i>Dump 1</i> =	The rIPTSB tuple.
<i>Dump 2</i> =	The PCispidbts[] array entry found in error.

Table 7 Error Code: CDSEC

Error Code:	CDSEC
Error Description:	The Peripheral Interface Data Bus (PIDB) associated with this PCispidbts[] array entry is in an active/standby mode but the associated PICB (ascpicb) field is inconsistent between the PCispidbts[] array entry for side 0 versus side 1.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The associated PICB (ascpicb) field in the PCispidbts[] array entry associated with the standby side is updated from the active side. The associated Peripheral Interface Control Bus (PICB) field (ascpicb) for the active side has already been audited.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the PCispidbts[] array entry found in error.
<i>Bad Data</i> =	The associated PICB (ascpicb) field from the PCispidbts[] array entry associated with the standby side.
<i>Good Data</i> =	The associated PICB (ascpicb) field from the PCispidbts[] array entry associated with the active side.
<i>Logical Index</i> =	The PIDB circuit name.
<i>Dump</i> =	NA.

Table 8 Error Code: CLRCH

Error Code:	CLRCH
Error Description:	The data in the clrchan field of PCispidbts[][] is incorrect.
Possible Error Effect:	Customer service is degraded.
Corrective Action Taken:	Clrchan is rewritten to agree with data from RLCKTDATA.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of PCispidbts[][].
<i>Bad Data</i> =	The contents of PCispidbts[][].clrchan[].
<i>Good Data</i> =	The correct value of PCispidbts[][].clrchan[].
<i>Logical Index</i> =	LU, PIDB, CD.
<i>Dump</i> =	PCispidbts[][].

Table 9 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	The DPIDB mask stored in the PCispidbts[][] global array, which indicated that this time slot for a DPIDB is assigned a nailed up connection, did not match the one stored in static data (rIDPIDB_PT).
Possible Error Effect:	Call Processing would be accessing invalid data and asserting.

Corrective Action Taken:	The mask in PCispdbts[][] is corrected to match the one in static data (rIDPIDB_PT).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the PCispdbts[][] global array.
<i>Bad Data =</i>	The mask found in PCispdbts[][] .
<i>Good Data =</i>	The mask found in static data (rIDPIDB_PT).
<i>Logical Index =</i>	The key of the rIDPIDB_PT static tuple.
<i>Dump 1 =</i>	The PCispdbts[][] global array.
<i>Dump 2 =</i>	The rIDPIDB_PT static tuple.

Table 10 Error Code: IDLE_BUSY

Error Code:	IDLE_BUSY
Error Description:	The state field (usage) in the PCispdbts[] array for this time slot is marked idle but the state field (use) in the corresponding rIPTSB tuple indicates this time slot is busy.
Possible Error Effect:	Call Processing would be accessing invalid data and asserting.
Corrective Action Taken:	The state field (usage) in the PCispdbts[] array for this time slot is marked busy to match the state of the corresponding rIPTSB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the PCispdbts[] array entry found in error.
<i>Bad Data =</i>	The state field (usage) from the PCispdbts[] array.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The logical key field (ptsb) of the rIPTSB tuple.
<i>Dump 1 =</i>	The PCispdbts[] array entry found in error.
<i>Dump 2 =</i>	The rIPTSB tuple.

Table 11 Error Code: MAINT_STATE

Error Code:	MAINT_STATE
Error Description:	The maintenance state in PCispdbts[][] is not correct.
Possible Error Effect:	If the maintenance status (bas_stat = SMEST) in rSMEST is active, the PIDB is lost to the system. If the maintenance status is out-of-service (bas_stat = SMEST), then call processing may try to use an out-of-service PIDB time slot, which may lead to a peripheral interrupt.
Corrective Action Taken:	The maintenance state in PCispdbts[][] will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of PCispdbts[][] .
<i>Bad Data =</i>	The contents of maintenance state.
<i>Good Data =</i>	The corrected maintenance state.
<i>Logical Index =</i>	The circuit name of rCKTDATA tuple.
<i>Dump 1 =</i>	The rCKTDATA tuple or rSMEST tuple.
<i>Dump 2 =</i>	The PCispdbts[][] .

Table 12 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit could not read the rIDPIDB_PT static tuple.
Possible Error Effect:	Asserts from Call Processing.
Corrective Action Taken:	None.
Manual Action Required:	There is an inconsistency in the static data since there should be a corresponding rIDPIDB_PT tuple for the rCKTDATA tuple previously read, this error will fire until the missing rIDPIDB_PT tuple is inserted by office personnel, which has the same key as the rCKTDATA tuple dumped by this error.
Dump Description:	
<i>Error Address =</i>	The address of the PCispdbts[][] global array.
<i>Bad Data =</i>	The key of the rCKTDATA tuple for which there was no corresponding rIDPIDB_PT tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key of the rCKTDATA static tuple.
<i>Dump 1 =</i>	The PCispdbts[][] global array.
<i>Dump 2 =</i>	The rCKTDATA static tuple.

Table 13 Error Code: PIDB

Error Code:	PIDB
Error Description:	The static rISLUPIDB tuple associated with the rIPTSB tuple under audit has been found to be missing from the data base.
Possible Error Effect:	May cause asserts from application and maintenance programs.
Corrective Action Taken:	The audit will skip to the next PCispdbts[] array entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The logical key (picb) of the rISLUPIDB tuple.
<i>Dump =</i>	The PCispdbts[] array entry.

Table 14 Error Code: PIDBTS

Error Code:	PIDBTS
Error Description:	The associated Peripheral Interface Control Bus (PICB) field (ascpicb) in the PCispdbts[] array is not set to 0x7F for an Integrated Services Line Unit (ISLU) Peripheral Interface Data Bus (PIDB) or set to the associated PICB field (assoc) from the static rISLUPIDB field for a RISLU PIDB.
Possible Error Effect:	May cause asserts from application and maintenance programs.
Corrective Action Taken:	The associated PICB field (ascpicb) in the PCispdbts[] array will be set to 0x7F for an ISLU PIDB or set to the associated PICB field (assoc) from the static rISLUPIDB field for a RISLU PIDB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the PCispdbts[] array entry found in error.
<i>Bad Data =</i>	The associated PICB field (ascpicb) from the PCispdbts[] array.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The circuit name of the PIDB associated with this PCispdbts[] array entry.
<i>Dump =</i>	The PCispdbts[] array entry.

Table 15 Error Code: SMEST

Error Code:	SMEST
Error Description:	The key generated from PClusname[] for rISMEST is not correct.
Possible Error Effect:	The PIDB will be skipped in ISPIDBTS audit.
Corrective Action Taken:	Related audits will be scheduled to correct error.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of PCispdbts[][].
<i>Bad Data =</i>	The contents of maintenance state.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The rISMEST key.
<i>Dump =</i>	The PCispdbts[][].

Table 16 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	The PIDB has an invalid use type.
Possible Error Effect:	All time slots on this PIDB are lost to the system.
Corrective Action Taken:	The PIDB time slot usage in PCispdbts[] will be idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of PCispdbts[][].
<i>Bad Data =</i>	The contents of PIDB time slot usage.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	PIDB circuit name.
<i>Dump 1 =</i>	The rIPTSB tuple.
<i>Dump 2 =</i>	The PCispdbts[][].

Table 17 Error Code: SYSPIDB

Error Code:	SYSPIDB
Error Description:	The system PIDB number in PCispidbts[][] is not correct.
Possible Error Effect:	May cause peripheral control to set up a path on a wrong PIDB which will cause parity errors and the call to fail.
Corrective Action Taken:	The system PIDB number in PCispidbts[][] will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of PCispidbts[][].
<i>Bad Data =</i>	The contents of system PIDB number.
<i>Good Data =</i>	The corrected system PIDB number.
<i>Logical Index =</i>	The circuit name of rCKTDATA tuple.
<i>Dump 1 =</i>	The rCKTDATA tuple.
<i>Dump 2 =</i>	The PCispidbts[][].

Table 18 Error Code: TS_USAGE

Error Code:	TS_USAGE
Error Description:	The PIDB time slots usage in PCispidbts[] is not correct.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The PIDB time slot usage in PCispidbts[] will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of PCispidbts[][].
<i>Bad Data =</i>	The contents of PIDB time slot usage.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	PIDB circuit name.
<i>Dump 1 =</i>	The rIPTSB tuple.
<i>Dump 2 =</i>	The PCispidbts[][].

Table 19 Error Code: TSMAP2

Error Code:	TSMAP2
Error Description:	The state field (usage) in the PCispidbts[] array for this time slot is marked idle but the state field (use) in the corresponding rIPTSB tuple indicates this time slot is busy.
Possible Error Effect:	Call Processing would be accessing invalid data and asserting.
Corrective Action Taken:	The state field (usage) in the PCispidbts[] array for this time slot is marked busy to match the state of the corresponding rIPTSB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the PCispidbts[] array entry found in error.
<i>Bad Data =</i>	The state field (usage) from the PCispidbts[] array.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The logical key field (ptsb) of the rIPTSB tuple.
<i>Dump 1 =</i>	The rIPTSB tuple.
<i>Dump 2 =</i>	The PCispidbts[] array entry found in error.

Table 20 Error Code: TYPE

Error Code:	TYPE
Error Description:	The PIDB type in PCispidbts[][] is not correct.
Possible Error Effect:	All time slots on this PIDB are lost to the system.
Corrective Action Taken:	The PIDB type in PCispidbts[][] will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of PCispidbts[][].
<i>Bad Data =</i>	The contents of PIDB type.
<i>Good Data =</i>	The corrected PIDB type.
<i>Logical Index =</i>	The circuit name of rCKTDATA tuple.
<i>Dump 1 =</i>	The rCKTDATA tuple.
<i>Dump 2 =</i>	The PCispidbts[][].

Table 21 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was invoked after taking a system reset.

Possible Error Effect:	Causes resets and/or asserts.
Corrective Action Taken:	The audit has been returned to audit control and will be rescheduled for recovery activities.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Line unit number.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Time slot number.
<i>Dump =</i>	NA.

ISTERM

Software Release: 5E10 and later

1. TERMINAL (ISTERM) AUDIT

The static relation RLIS_TERM contains digital subscriber line terminal feature data. There is a field in this relation which is used to determine whether tuples in the dynamic relation RLATTM_BLF should be populated. The new switching module (SM) audit, ISTERM, has been introduced to detect, report, and correct data inconsistencies found between this static relation and the associated dynamic relation.

The static relation RLIS_TERM is being used to check whether tuples in dynamic relation RLATTM_BLF should be populated as well as to do some semantic data checking. If the ISTERM audit encounters any errors, the ATTM_BLF audit will be run as a related audit at elevated mode.

2. DATA STRUCTURES

For details on the fields contained in the RLIS_TERM relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

The ISTERM audit performs the following functions:

- (a) The ISTERM audit will invoke the AUdrstatic driver to step through the tuples of RLIS_TERM. No error checking will be performed by the driver. (It is used only to step through the static relation.) The static relation RLIS_TERM is being used to check whether tuples in dynamic relation RLATTM_BLF should be populated as well as to do some semantic data checking.
- (b) Performs static to dynamic checks between static RLIS_TERM and dynamic RLATTM_BLF.

4. ERROR HANDLING

If the static relation RLIS_TERM indicates that a tuple in RLATTM_BLF should be populated and it is not, an error will be reported and function RTattmblf() will be called. This function, given a latidx, will insert, link to the appropriate idle list, and initialize the semantic RLATTM_BLF tuple.

If the static relation RLIS_TERM latidx field does not match that found in RLATTM_BLF, an error will be reported and the RLATTM_BLF latidx will be corrected to match that in RLIS_TERM.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: HEAD

Error Code:	HEAD
Error Description:	The audit is trying to link an RLATTM_BLF tuple back to its idle list but is finding that the RLATTH_BLF tuple that serves as its idlelist headcell is in error. The ATTM_BLF will not link tuples back to the idlelist as long as the RLATTH_BLF tuple serving as the idlelist headcell is in error. This could result in numerous ATTM_BLF audit errors until the idlelist headcell is recovered.
Possible Error Effect:	An available RLATTM_BLF tuple may never be used to reflect attendant console information.

Corrective Action Taken:	The audit will schedule the ATTHBLF audit to recover the idlelist head cell in error.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Local pointer to buffer to hold idlelist headcell tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	latidx field of the related ODD rIIS_TERM tuple.
<i>Dump =</i>	The static data rIISTERM tuple.

Table 2 Error Code: HTYPE

Error Code:	HTYPE
Error Description:	The audit is trying to link an rIATTM_BLF tuple back to it's idle list but is finding that the ODD variable Gllatiablf is indicating that no rIATTH_BLF tuples should exist to serve as the idlelist headcell. There is an inconsistency between the ODD rIIS_TERM which has a latidx > 1 indicating that rIATTM_BLF tuples should exist and the ODD variable Gllatiablf that says no rIATTH_BLF tuples should exist. This could result in numerous ATTMBLF and ISTERM audit errors until the ODD is made consistent.
Possible Error Effect:	Attendant console operation will be impaired. (that is, wrong statuses will show up on the console: attendant console call processing may not work.)
Corrective Action Taken:	The ODD needs to be made consistent. The bad data in the audit dump is the value found in Gllatiablf while the good data indicates the value of the latidx field of a rIIS_TERM tuple. You can not have Gllatiablf set to less than 1 while rIIS_TERM has latidx fields set to > 0.
Manual Action Required:	Correct the ODD to make Gllatiablf and rIIS_TERM consistent. Check other attendant console ODD for consistency.
Dump Description:	
<i>Error Address =</i>	Local pointer to rIATTM_BLF tuple.
<i>Bad Data =</i>	ODD Gllatiablf.
<i>Good Data =</i>	ODD rIIS_TERM latidx field.
<i>Logical Index =</i>	latidx field of the rIATTM_BLF tuple, may be -1 if no rIATTM_BLF tuple exists when it should exist.
<i>Dump =</i>	The static data rIISTERM tuple.

Table 3 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	The audit is trying to get a rIATTM_BLF tuple inserted, initialized and linked to the appropriate idle list. It seems that the function to do this has failed. The failure could be due to inconsistent ODD between rIIS_TERM latidx fields and Gllatiablf ODD variable or it could be the result of data base primitives failure to insert tuples; or parameters have been garbaged during the calling of the function.
Possible Error Effect:	Attendant console operation will be impaired. (that is, wrong statuses will show up on the console; attendant console call processing may not work.)
Corrective Action Taken:	The audit will try and get the data corrected the next time it is called. If this error continues check the ODD and the action of the data base primitives.
Manual Action Required:	If the error continues check the ODD to make sure Gllatiablf and rIIS_TERM are consistent.
Dump Description:	
<i>Error Address =</i>	Not an address; latidx of the related rIIS_TERM tuple
<i>Bad Data =</i>	Return value from the RTA function that does the insert, initialize and link. 0 = GLSUCCESS, everything is ok. -1 = GLFAIL, Gllatiablf is < 1. -800 = RTA_FAIL, rIIS_TERM latidx is < 1. Any other value is the return value from database primitives used to insert and link the rIATTM_BLF tuple.

<i>Good Data</i> =	ODD variable Gllatiablf.
<i>Logical Index</i> =	latidx field of the rIATTM_BLF tuple, may be -1 if no rIATTM_BLF tuple exists when it should exist.
<i>Dump</i> =	The static data rIISTERM tuple.

Table 4 Error Code: KEY

Error Code:	KEY
Error Description:	The audit has detected an inconsistency between the static data in rIISTERM and the dynamic data in rIATTM_BLF. The inconsistency indicate that the static data latidx field does not match the key field of the corresponding dynamic rIATTM_BLF tuple.
Possible Error Effect:	An available rIATTM_BLF tuple may never be used to reflect attendant console information.
Corrective Action Taken:	The audit will correct the key field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of local pointer to rIATTM_BLF tuple.
<i>Bad Data</i> =	latidx field (key) of rIATTM_BLF tuple being checked.
<i>Good Data</i> =	latidx field of rIISTERM (static data) tuple.
<i>Logical Index</i> =	The lport (logical port) field of the rIISTERM tuple.
<i>Dump</i> =	The dynamic data rIATTM_BLF tuple; the static data rIISTERM tuple.

Table 5 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	The audit has detected an inconsistency between the static data in rIISTERM and the dynamic data in rIATTM_BLF. The inconsistency indicate that the static data has an entry in it's latidx field and yet no corresponding dynamic rIATTM_BLF tuple exists.
Possible Error Effect:	Not enough rIATTM_BLF tuples may be available to reflect attendant console information.
Corrective Action Taken:	The audit will insert a rIATTM_BLF tuple, get it initialized as well as linked to the appropriate idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	latidx field of rIISTERM (static data) tuple.
<i>Logical Index</i> =	The key of the rIATTM_BLF tuple that is missing.
<i>Dump</i> =	The static data rIISTERM tuple.

Table 6 Error Code: TYPE

Error Code:	TYPE
Error Description:	The audit is trying to link an rIATTM_BLF tuple back to it's idle list but is finding that the rIATTH_BLF tuple that serves as its idllelist headcell does not exist. The reason it does not exist could be due to inconsistent ODD related to the global variable Gllatiablf and the RLIS_TERM relation. If the Gllatiablf indicates that no rIATTH_BLF tuples should exist, (that is, no ISDN attendant consoles) then the ODD rIIS_TERM relation should likewise reflect that no attendant consoles exist.
Possible Error Effect:	An available rIATTM_BLF tuple may never be used to reflect attendant console information.
Corrective Action Taken:	The audit will insert a rIATTM_BLF tuple, get it initialized as well as linked to the appropriate idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Local pointer to buffer to hold idllelist headcell tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	latidx field of the related ODD rIIS_TERM tuple.
<i>Dump</i> =	The static data rIISTERM tuple.

ISTF

Software Release: 5E10 and later

1. INTEGRATED SERVICES TEST FUNCTION (ISTF) AUDIT

The integrated services test function device measures the error rate of digital transmission devices such as digital subscriber lines (DSLs) and digital trunks. To ensure that the device is performing its full range of checks, it is audited periodically by the ISTF audit. Recovery on the device is performed only on the entire device.

The ISTF audit is part of the terminal maintenance audits subgroup.

2. DATA STRUCTURES

The ISTF audit checks three arrays and the integrated service test function relation (RLISTF): the active services count array (PCistfas), the busy/idle array (PCistf_chan), and the message pending queue array (PCistf_mpq). These data structures are shown in Figure 1.

Figure 1 (ISTF-1) Data Structures of the ISTF Audit

3. AUDIT CHECKS

The audit makes the following checks.

- The audit verifies the entries of PCistfas against the entries in PCistf_chan. If there are no rlISTF tuples, the PCistfas and PCistf_chan arrays should have null entries.
- The audit verifies that the entries in PCistf_chan and PCistfas are set to idle when an ISTF unit is grown into

the switch.

- (c) The audit checks the PCistf_mpq array when blockage occurs in sending messages to the test function device.

4. ERROR HANDLING

The audit initializes the array entries when it detects errors.

The ISTF audit schedules no related audits when it detects errors.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: AUOOS

Error Code:	AUOOS
Error Description:	The rSMEST tuple for the common board indicates that the ISTF unit is out of service; however, the active service array entry PCistfas[unit] does not agree. The rSMEST tuple is the master data.
Possible Error Effect:	Programs attempting to use this OOS unit will be connected to an OOS unit and will not work.
Corrective Action Taken:	The audit will set the active services array entry to OOS.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of active service entry - PCistfas[unit].
<i>Bad Data =</i>	Value in active service entry.
<i>Good Data =</i>	Value of PCOOS_ISTF.
<i>Logical Index =</i>	ISTF unit number.
<i>Dump =</i>	rSMEST tuple.

Table 2 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The number of busy states in the busy/idle array PCistf_chan[unit][chan] do not add up to the active services array entry count in PCistfas[unit].
Possible Error Effect:	The active services array entry may incorrectly assign channels in its fair share scheme.
Corrective Action Taken:	The ISTF unit and associated data structures are idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of active service entry - PCistfas[unit].
<i>Bad Data =</i>	Value of active service entry.
<i>Good Data =</i>	Actual count from adding up entries in PCistf_chan[][].
<i>Logical Index =</i>	ISTF unit number.
<i>Dump =</i>	PCistf_chan[unit][].

Table 3 Error Code: NULLCNTL

Error Code:	NULLCNTL
Error Description:	The active services array entry PCistfas[unit] indicates that the unit does not exist even though the rISTF tuple does exist.
Possible Error Effect:	Programs will never be allocated this unit even though it is active.
Corrective Action Taken:	The active services array entry PCistfas[unit] is idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of active service entry - PCistfas[unit].
<i>Bad Data =</i>	Value in active service entry.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	ISTF unit number.

<i>Dump</i> =	riSMEST tuple.

Table 4 Error Code: DEADPID

Error Code:	DEADPID
Error Description:	The message pending queue has the dead pid.
Possible Error Effect:	The dead pid occupied the message pending queue cause the resource lost.
Corrective Action Taken:	The dead pid has been reported and the message pending queue has been reshuffled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Message pending queue dead pid address.
<i>Bad Data</i> =	Message pending queue dead pid.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	ISTF unit number.
<i>Dump</i> =	NA.

Table 5 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The message pending queue pointers PCmpqFptr[unit] and PCmprRptr[unit] have values outside the range (size) of the circular queue.
Possible Error Effect:	Wild writes can occur if the pointer is used to insert a process ID.
Corrective Action Taken:	The pointers are reset to the beginning of the queue and the queue is emptied.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Message pending queue front pointer PCmpqFptr[unit].
<i>Bad Data</i> =	Front pointer (high byte) - rear pointer (low byte).
<i>Good Data</i> =	Value which pointer should be within - PCMAXCHANISTF.
<i>Logical Index</i> =	ISTF unit number.
<i>Dump</i> =	NA.

Table 6 Error Code: OWNER

Error Code:	OWNER
Error Description:	An entry in the busy/idle array PCistf_chan[unit][chan] had a valid busy state, but there was no owning process traceable through the rICDBCOM and rICCB COM tuples.
Possible Error Effect:	The channel will not be allocated for use.
Corrective Action Taken:	The busy/idle array PCistf_chan[unit] and active services array entry PCistfas[unit] are idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Pointer to rICCB COM tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of rICDB COM.
<i>Dump</i> =	NA.

Table 7 Error Code: SMEST

Error Code:	SMEST
Error Description:	A riISTF tuple exists, but the corresponding riSMEST tuple does not exist and the active services array entry PCistfas[unit] is not null.
Possible Error Effect:	Programs may attempt to use this unit, but they would eventually fail.
Corrective Action Taken:	Set the active services array entry PCistfas[unit] to null.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of active service entry - PCistfas[unit].
<i>Bad Data</i> =	Value in active service entry.
<i>Good Data</i> =	Value of PCNULL ISTF.
<i>Logical Index</i> =	ISTF unit number.
<i>Dump</i> =	NA.

Table 8 Error Code: STATE

Error Code:	STATE
Error Description:	The rICCBCom Ipstate attribute did not have a matching state to the busy/idle array entry PCistf_chan[unit][chan].
Possible Error Effect:	The rICCBCom tuple may have been assigned to another channel with a different service.
Corrective Action Taken:	The quarantine bit in rICCBCom is set, which causes this tuple to be received in a related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Pointer to rICCBCom tuple.
<i>Bad Data</i> =	Ipstate attribute in rICCBCom tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key to rICDBCom tuple.
<i>Dump 1</i> =	PCistf_chan[unit][chan].
<i>Dump 2</i> =	rICCBCom tuple.

Table 9 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	An entry in the busy/idle array PCistf_chan[unit][chan], did not have a valid state.
Possible Error Effect:	The corresponding channel may be avoided by the allocation program.
Corrective Action Taken:	The busy/idle array PCistf_chan[unit] and active services array PCistfas[unit] entry are idled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of service entry for channel - PCistf_chan[unit][chan].
<i>Bad Data</i> =	Value in service entry.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	ISTF unit number (high byte) - channel number (low byte).
<i>Dump</i> =	NA.

Table 10 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	The active services array element PCistfas[unit] was non-null, even though the rLISTF tuple does not exist.
Possible Error Effect:	A channel may be allocated to a unit which does not exist.
Corrective Action Taken:	The active services array entry PCistfas[unit] is nulled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of active service entry - PCistfas[unit].
<i>Bad Data</i> =	Value in active service entry.
<i>Good Data</i> =	Value of PCNULL_ISTF.
<i>Logical Index</i> =	ISTF unit number.
<i>Dump</i> =	NA.

JBLH

Software Release: 5E10 and later

1. JOB LIST HEAD CELL (JBLH) AUDIT

Call processing work, which is done primarily by terminal processes, falls into two categories: background (high-level processing) and foreground (low-level processing). Background processing involves customer features; foreground processing manipulates hardware. Background processes request foreground process work. If the foreground process is busy, the channel control block that represents the background process is buffered on a job list head cell. There is one job list head cell for each tuple of foreground work requested.

The job list head cell audit (JBLH) verifies the consistency of the job list head cell relation (RLJBLH). This audit is part of the peripheral control audits subgroup.

2. DATA STRUCTURES

The JBLH audit operates on the job list head cell relation (RLJBLH) and its owner linkage with the channel control block common area relation (RLCCBCOM). Figure 1 illustrates the rJBLH linkages.

Figure 1 (JBLH-1) rJBLH Linkages

3. AUDIT CHECKS

To verify the linkages associated with the job list head cells, the JBLH audit calls the linkage driver (DRLINK) once for each audit segment. After the linkages are verified, the driver invokes the JBLH semantic check function to perform the following checks:

- (a) The number in the total field of the semantic data should equal a count of channel control block common areas linked to that job list head cell; if it does not, an assert will occur.
- (b) When the audit counts channel control blocks linked to a job list head cell, it traverses channel control block linkages and performs a point-to-point-back check for the channel control blocks. If a check fails, the audit prints an error message.

Any tuples that fail the checks are reinitialized and placed on the idle list.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	A count of rCCBCOM tuple's linked to a rJBLH tuple does not equal the total field in the rJBLH tuple's semantic data. This total field is the count of how many rCCBCOM tuple's are linked to a particular rJBLH tuple.
Possible Error Effect:	There is a strong possibility of asserts occurring.
Corrective Action Taken:	The rJBLH tuple is zeroed and rCCBCOM tuple's linked to the rJBLH tuple are corrected when the CCBCOM audit is run.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rJBLH tuple address.
<i>Bad Data =</i>	The total field of the rJBLH tuple semantic data.
<i>Good Data =</i>	The count of rCCBCOM tuple's linked to the rJBLH tuple.
<i>Logical Index =</i>	Logical key of rJBLH tuple.
<i>Dump =</i>	rJBLH tuple.

Table 2 Error Code: SLAVEMAP

Error Code:	SLAVEMAP
Error Description:	The rCCBCOM point-to-point-back check failed.
Possible Error Effect:	The list is broken.
Corrective Action Taken:	The rJBLH tuple is zeroed.
Manual Action Required:	Request the CCBCOM audit if it has not already run.
Dump Description:	
<i>Error Address =</i>	rCCBCOM address.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key of rCCBCOM.
<i>Dump =</i>	rCCBCOM tuple.

18. K - LC

L2TL

Software Release: 5E10 and later

1. LEVEL 2 TIMING LIST (L2TL) AUDIT

The L2TL audit is part of the switch maintenance audits subgroup. It runs in the OSDS-M environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The L2TL audit uses the packet switching level 2 timing list head cell array (PStlists).

3. AUDIT CHECKS

The audit makes linkage checks within the PShists array.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	An error was found in the owner field of either the first or last field of the LLCB linked headcell.
Possible Error Effect:	Creates an error dump.
Corrective Action Taken:	Returns AUFALSE which reinitializes the free linked list owned by the headcell.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	"owner" value of the first element of the headcell.
<i>Bad Data =</i>	"owner" value of the last element of the headcell.
<i>Good Data =</i>	Valid "owner" value expected (timing list, timeout list, LAPB free linked list, LAPD free linked list).
<i>Logical Index =</i>	L2TL index.
<i>Dump =</i>	LLCB free linked headcell (PSRHEADCELL type).

Table 2 Error Code: HD_CELL

Error Code:	HD_CELL
Error Description:	The specified head cell's first or last element is out of range.
Possible Error Effect:	Prints an error report and continues.
Corrective Action Taken:	AUFALSE is returned and the head cell is nulled. The linked list owned by the head cell is rebuilt.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Starting range for the first/last head cell element.
<i>Bad Data =</i>	Ending range for the first/last head cell element.
<i>Good Data =</i>	Null value of the first and last.
<i>Logical Index =</i>	Head cell index.
<i>Dump =</i>	Head cell dump or PSRHEADCELL type: - unsigned short PSrllcbhd.first. - unsigned short PSrllcbhd.last.

Table 3 Error Code: HEAD

Error Code:	HEAD
Error Description:	Either 1) the level 3 timing headcell first's owner does not match the headcell value or 2) the first's ptimer is not null or 3) the level 3 timing headcell last's owner does not match the headcell value or 4) the last's ntimer is not null.
Possible Error Effect:	The audit reports the error and continues.
Corrective Action Taken:	The audit reports the error, corrects the level 3 timing headcell and rebuilds the timing linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	PST3NULL, null value that ntimer and ptimer are being compared against.
<i>Logical Index =</i>	Level 3 timing headcell number.
<i>Dump =</i>	AULNK (all sized as unsigned short): • "back" struct.'s owner field, • "back" struct.'s next field, • "back" elements back field, • current element being audited, • current element's owner, • current element's on this link list, • current element's back field, • data element null value, • head cell null value, • headcell's first element, • headcell's last element, • "next" element's owner field, • "next" element on this linked list, • "next" element's back field. NOTE: 0xaa is the default value and indicates either the field is not used or the values are out of range and the data cannot be read and is filled with 0xaa.

Table 4 Error Code: HEADBID

Error Code:	HEADBID
Error Description:	An error was found in the LLCB timing or timeout headcell.
Possible Error Effect:	Create an error dump.
Corrective Action Taken:	Returns AUFALSE which reinitializes the linked list owned by the headcell.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	AUcount - the count indicating which headcell.
	4 = LAPD linked list headcell.

	5 = LAPB linked list headcell.
<i>Good Data</i> =	Linked list null value.
<i>Logical Index</i> =	Linked list owner.
<i>Dump</i> =	AULNK type as defined in au/AUps/AUextern.h (all sized as unsigned short): • "back" struct.'s owner field, • "back" struct.'s next field, • "back" elements back field, • current element being audited, • current element's owner, • current element on this linked list, • current element's back field, • head cell null value, • headcell's first element, • headcell's last element, • data element null value, • next element's owner field, • "next" element on this linked list, • next element's back field. NOTE: 0xaa is the default value and indicates either the field is not used or the values are out of range and the data cannot be read and is filled with 0xaa.

Table 5 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up.
Possible Error Effect:	Single process purges the audit process.
Corrective Action Taken:	Return audit complete, wait for next go around.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	AUrunning, the audit ID that was running at the time of the interrupt.
<i>Dump</i> =	NA.

L3TE

Software Release: 5E10 and later

1. LEVEL 3 TIMING ELEMENT (L3TE) AUDIT

The L3TE audit is part of the switch maintenance audits subgroup. It runs in the OSDS-M environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The L3TE audit uses the packet switching level 3 timing element array (PSt3elem) and the packet switching level 3 timing list head cell array (PSt3head).

3. AUDIT CHECKS

The audit makes linkage checks within the PSt3elem array and with the PSt3head array.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	The owner field of the level 3 timing element is out of range.
Possible Error Effect:	Prints an error report.
Corrective Action Taken:	Returns AUFALSE and the level 3 timing element is nulled out and the owner set to PST3NULL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Lowest owner range value.
<i>Bad Data =</i>	Bad "owner" value.
<i>Good Data =</i>	Highest owner range value.
<i>Logical Index =</i>	Level 3 timing element number.
<i>Dump =</i>	NA.

Table 2 Error Code: LNK_CONFIG

Error Code:	LNK_CONFIG
Error Description:	For a level 3 timing element on NO LINKED LIST, either the next timer field, the previous timer field or the "owner" field is not a null value.
Possible Error Effect:	Prints an error report and corrects the appropriate field(s).
Corrective Action Taken:	The next timer field, the previous timer field and the list_owner fields are all nulled properly.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The previous timer value.
<i>Bad Data =</i>	The next timer value.
<i>Good Data =</i>	PST3NULL - valid null value for timer fields.
<i>Logical Index =</i>	Level 3 timing element number.
<i>Dump =</i>	cap_owner (PSCAPTYPE), the owner of the level 3 timing element.

Table 3 Error Code: MEMBER

Error Code:	MEMBER
Error Description:	The audit found a member error in the linked list of the specified audit.
Possible Error Effect:	Prints an error report and corrects the linked list.
Corrective Action Taken:	Return AUFALSE to calling function which rebuilds the linked list.

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Linked list null value.
<i>Logical Index =</i>	AUcount, the current element number.
<i>Dump =</i>	AULNK defined in au/AUps/AUextern.h (all sized as unsigned short): • "back" struct.'s owner field, • "back" struct.'s next field, • "back" elements back field, • current element being audited, • current element's owner, • current element on this linked list, • current element's back field, • data element null value, • head cell null value, • headcell's first element, • headcell's last element, • "next" element's owner field, • "next" element on this linked list, • "next" element's back field.

Table 4 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The level 3 timing element's next timer field or previous timer field is out of range.
Possible Error Effect:	Prints an error report.
Corrective Action Taken:	The function returns AUFALSE and the timing linked list is rebuilt.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The previous timer value.
<i>Bad Data =</i>	The next timer value.
<i>Good Data =</i>	PST3ALLTE - Maximum timer value.
<i>Logical Index =</i>	Level 3 timing element number.
<i>Dump =</i>	NA.

Table 5 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up after taking a reset.
Possible Error Effect:	Single process purges the audit process.
Corrective Action Taken:	Return audit complete, wait for next go around.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.

<i>Good Data</i> =	NA.
<i>Logical Index</i> =	AUrunning, Audit id that was running at the time of the interrupt.
<i>Dump</i> =	NA.

L3TL

Software Release: 5E10 and later

1. LEVEL 3 TIMING LIST (L3TL) AUDIT

The L3TL audit is part of the switch maintenance audits subgroup.

2. DATA STRUCTURES

The L3TL audit uses the packet switching level 3 timing list head cell array (PSt3head) and the level 3 timing elements (PSt3elem).

3. AUDIT CHECKS

The audit makes linkage checks within the PSt3head array and with the packet switch level 3 timing list element array (PSt3elem). It invokes its semantic check function to verify the timer fields within the array.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: HD_CELL

Error Code:	HD_CELL
Error Description:	The specified head cell's first or last elements are out of range.
Possible Error Effect:	Reports and error report and continues.
Corrective Action Taken:	AUFALSE is returned and the head cell is nulled and linked list owned by the head cell is rebuilt.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Starting range for the first/last head cell element.
<i>Bad Data =</i>	Ending range for the first/last head cell element.
<i>Good Data =</i>	Null value of the first and last.
<i>Logical Index =</i>	Head cell index.
<i>Dump =</i>	Head cell dump or PSRHEADCELL type.

Table 2 Error Code: HEAD

Error Code:	HEAD
Error Description:	Either (1) the level 3 timing head cell first's owner does not match the head cell value or (2) the first's ptimer is not null or (3) the level 3 timing head cell last's owner does not match the head cell value or (4) the last's ntimer is not null.
Possible Error Effect:	The audit will report the error and continue.
Corrective Action Taken:	The audit will report the error, correct the level 3 timing head cell and rebuild the timing linked list.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	PST3NULL, null value that ntimer and ptimer are being compared against.
<i>Logical Index</i> =	Level 3 timing head cell number.
<i>Dump</i> =	AULNK, as defined in au/AUps/AUextern.h (all sized as unsigned short): • "back" struct.'s owner field, • "back" struct.'s next field, • "back" elements back field, • current element being audited, • current element's owner, • current element on this linked list, • current element's back field, • data element null value, • head cell null value, • headcell's first element, • headcell's last element, • "next" element's owner field, • "next" element on this linked list, • "next" element's back field.

Table 3 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up.
Possible Error Effect:	Single process purges the audit process.
Corrective Action Taken:	Return audit complete, wait for next go around.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	AUrunning, Audit ID that was running at the time of the interrupt.
<i>Dump</i> =	NA.

LAESCASE

Software Release: 5E14 and later

1. LAES CASE DATA BLOCK (LAESCASE) AUDIT

A lawfully authorized electronic surveillance (LAES) case data block (PSlaescase[]) is used by packet switching to keep track of switching to keep track of call data channel (CDC) chaining and surveillance specific information.

2. DATA STRUCTURES

For details on the fields contained in the PSlaescase[] array, refer to the 5ESS® Translations Data Manual (235-600-1xx) and the 5ESS® Dynamic Data Manual (235-600-2xx).

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: INV_IDLE

Error Code:	INV_IDLE
Error Description:	A PSlaescase[] array entry is not in use by a ALDB (PSlaescase[].aldb_index = PSALDBNULL) but it is not linked to the idle list.
Possible Error Effect:	The PSlaescase[] array entry is not available for use and may contribute to resource overload in the PH.
Corrective Action Taken:	The audit unlinks the PSlaescase[] array entry from any list it is in, sets all fields to default values, and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	First entry on the idle list (PSlaescasehd.first).
<i>Bad Data =</i>	Last entry on the idle list (PSlaescasehd.last).
<i>Good Data =</i>	PSaldb[] array index (PSlaescase[].aldb_index)
<i>Logical Index =</i>	Index into the PSlaescase[] array.
<i>Dump 1 =</i>	PSlaescase[] array entry.
<i>Dump 2 =</i>	The "forward" PSlaescase[] array entry (PSlaescase[].fd_laescase_idx) if the index is in range (< PSMXLAESCASE).
<i>Dump 3 =</i>	The "backward" PSlaescase[] array entry (PSlaescase[].fk_laescase_idx) if the index is in range (< PSMXLAESCASE).

Table 2 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	The PSlaescase[] array idle list head cell (PSlaescasehd) is not empty (either <i>first</i> or <i>last</i> is != PSIAESCASENULL) but is not valid (either <i>first</i> or <i>last</i> is ≥ PSMXLAESCASE).
Possible Error Effect:	PSlaescase[] array entries can not be allocated and may contribute to resource overload in the PH.
Corrective Action Taken:	The audit rebuilds the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	First entry on the idle list (PSlaescasehd.first).
<i>Bad Data =</i>	Last entry on the idle list (PSlaescasehd.last).
<i>Good Data =</i>	Value of PSMXLAESCASE.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 3 Error Code: LISTEND_BAD

Error Code:	LISTEND_BAD
Error Description:	The PSlaescase[] array idle list head cell (PSrIaescasehd) contains the index (in either <i>first</i> or <i>last</i>) of a non-idle PSlaescase[] array entry (PSlaescase[].aldb_index != PSALDBNULL) or the PSlaescase[] array entry is not at the end of list as expected (PClaescase[].bk_laescase_idx or PClaescase[].fd_laescase_idx != PSIAESCASENULL depending on which end of the list the PSlaescase[] array entry is supposed to be at).
Possible Error Effect:	Allocation of the PSlaescase[] array entries may fail or the same PSlaescase[] array entry may be allocated more than once.
Corrective Action Taken:	The audit rebuilds the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	First entry on the idle list (PSrIaescasehd.first).
<i>Bad Data</i> =	Last entry on the idle list (PSrIaescasehd.last).
<i>Good Data</i> =	Value of PSIAESCASENULL.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	PSlaescase[] array entry at the head of the idle list (PSrIaescasehd.first).
<i>Dump 2</i> =	PSlaescase[] array entry at the tail of the idle list (PSrIaescasehd.last).

Table 4 Error Code: NONNULL

Error Code:	NONNULL
Error Description:	A PSlaescase[] array entry is in use by a ALDB (PSlaescase[].aldb_index != PSALDBNULL) but either it is still linked to the idle list or point-to point-back checks failed between this PSlaescase[] array entry and the ALDB.
Possible Error Effect:	Data in the PSlaescase[] array may cause the application to assert.
Corrective Action Taken:	The audit unlinks the PSlaescase[] array entry from any list it is in, sets all fields to default values, and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The "forward" PSlaescase[] array entry.
<i>Bad Data</i> =	The "backward" PSlaescase[] array entry.
<i>Good Data</i> =	PSaldb[] array index (PSlaescase[].aldb_index).
<i>Logical Index</i> =	Index into the PSlaescase[] array.
<i>Dump 1</i> =	PSlaescase[] array entry.
<i>Dump 2</i> =	The "forward" PSlaescase[] array entry (PSlaescase[].fd_laescase_idx) if the index is in range (< PSMXLAESCASE).
<i>Dump 3</i> =	The "backward" PSlaescase[] array entry (PSlaescase[].fk_laescase_idx) if the index is in range (< PSMXLAESCASE).
<i>Dump 4</i> =	The associated PSaldb[] array entry (PSlaescase[].aldb_index) if the index is in range (< PSMXALDB).

Table 5 Error Code: TRANCK

Error Code:	TRANCK
Error Description:	The recovery in-progress flag (PSlaescase[].rec_inprog) flag in the PSlaescase[] tuple has been stuck set (DBYES) for longer than 5 minutes.
Possible Error Effect:	May lead to lost resources and exhaustion of the PSlaescase[] resource.
Corrective Action Taken:	The audit unlinks the PSlaescase[] array entry from any list it is in, sets all fields to default values, and links it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSaldb[] array index (PSlaescase[].aldb_index).
<i>Bad Data</i> =	Content of the recovery in-progress flag (PSlaescase[].rec_inprog).
<i>Good Data</i> =	DBNO.
<i>Logical Index</i> =	Index into the PSlaescase[] array.
<i>Dump 1</i> =	PSlaescase[] array entry.
<i>Dump 2</i> =	The associated PSaldb[] array entry (PSlaescase[].aldb_index) if the index is in range (< PSMXALDB).

LCCB-A

Software Release: 5E10 - 5E11

1. LOGICAL CHANNEL CONTROL BLOCK (LCCB) AUDIT

The LCCB audit is part of the switch maintenance audits subgroup. It is part of the integrated services digital network packet (ISDNPKT) loadable package. It runs in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The LCCB audit uses the packet switching logical channel control block array (PSlccb) and the access link control block array (PSalcb).

3. AUDIT CHECKS

The audit makes linkage checks within the PSlccb array and with PSalcb. It makes semantic checks to ensure the correctness of data in PSlccb. The audit driver is drps.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: AUD_CH

Error Code:	AUD_CH
Error Description:	Audit error found for the channel. The audit has found an LCCB linked to an ALCB that has an out of range PH channel value.
Possible Error Effect:	Prints a report and corrects the field.
Corrective Action Taken:	The audit will report the error and correct the LCCB field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's alcb_index that it is linked to.
<i>Bad Data =</i>	LCCB's ALCB's PH channel number.
<i>Good Data =</i>	PSMAXCHN - one more than the maximum value the PH channel number can be.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 2 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	The PBG aggregate LCN count (PSpbgstat[].aggr_lcn) is inconsistent with the number of LCNs (LCCBs) associated with this PSpbgstat[] entry. The number of LCCBs that have the PSlccb[].loc_lcn_act and/or the PSlccb[].rem_lcn_act fields set to DBYES, should agree with the count in PSpbgstat[].aggr_lcn. The index to the PSpbgstat[] array is the PBG number found in PSlccb[].rem_pbg and/or PSlccb[].loc_pbg fields.
Possible Error Effect:	Incorrect overflow treatment could be applied. If PSpbgstat[].aggr_lcn is greater than the real count, calls could be blocked or charged premium when they shouldn't be. If PSpbgstat[].aggr_lcn is smaller than the real count, calls could be allowed or not charged premium when they should be.
Corrective Action Taken:	The audit will correct the PSpbgstat[].aggr_lcn field to the number of LCCBs associated with this entry.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	Address of the PSpbgstat[] entry.
<i>Bad Data</i> =	PSpbgstat[].aggr_lcn.
<i>Good Data</i> =	The number of LCCBs associated with this PSpbgstat[] entry.
<i>Logical Index</i> =	Index into PSpbgstat[] (PBG number).
<i>Dump</i> =	NA.

Table 3 Error Code: BADDATAR

Error Code:	BADDATAR
Error Description:	The audit found an LCCB that has the retransmission buffer or holdbuffer arrays that have more than one "hole" in the array. These array must be continuous with only one starting element.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Count of "start/stops" in retransmission array.
<i>Bad Data</i> =	Count of "start/stops" in hold buffer array.
<i>Good Data</i> =	AUTWO - Maximum plus one of the number of starts.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 4 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	The virtual call throughput class for the sending (PSlccb[].vc_tpc[PSCED]) and/or receiving (PSlccb[].vc_tpc[PSCING]) directions of an LCCB is/are out of range (PSTPC75 > PSlccb[].vc_tpc[] > PSTPC19200).
Possible Error Effect:	Calls could be blocked or charged premium when they shouldn't be.
Corrective Action Taken:	The LCCB is recovered to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSlccb[].vc_tpc[PSCED].
<i>Bad Data</i> =	PSlccb[].vc_tpc[PSCING].
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 5 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	The PH audit found an LCCB with an invalid owner field.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The error report is printed and AUFALSE returned to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LCCB's owner field.
<i>Good Data</i> =	LCCB index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 6 Error Code: BADSUPVSTAT

Error Code:	BADSUPVSTAT
Error Description:	Bad suspected pvc status. The audit has found an LCCB whose receiving window size or sending window size is 0. If either of these is 0, no packets can be transmitted or received properly. Recover the LCCB and request a routine port conditioning of the PVC.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling function which

	recovers the LCCB to the free linked list. Since this is a PVC, a routine port conditioning is requested to reset up the call.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's receiving window size "iwsze_rcv".
<i>Bad Data</i> =	LCCB's sending window size "iwsze_send".
<i>Good Data</i> =	LCCB index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 7 Error Code: BADTSCOUNT

Error Code:	BADTSCOUNT
Error Description:	The PBG aggregate throughput count (PSpbgstat[].aggr_tpc) is inconsistent with the throughput class of LCCBs associated with this PSpbgstat[] entry. The throughput class of the LCCBs that have the PSlccb[].loc_tpc_act and/or the PSlccb[].rem_tpc_act fields set to DBYES, should agree with the count in PSpbgstat[].aggr_tpc. The index to the PSpbgstat[] array is the PBG number found in PSlccb[].rem_pbg and/or PSlccb[].loc_pbg fields. Only the larger throughput classes between the sending (PSlccb[].vc_tpc[PSCED]) and the receiving (PSlccb[].vc_tpc[PSCING]) directions is included in PSpbgstat[].aggr_tpc.
Possible Error Effect:	Incorrect overflow treatment could be applied. If PSpbgstat[].aggr_tpc is greater than the real count, calls could be blocked or charged premium when they shouldn't be. If PSpbgstat[].aggr_tpc is smaller than the real count, calls could be allowed or not charged premium when they should be.
Corrective Action Taken:	The audit will correct the PSpbgstat[].aggr_tpc field to the throughput class collected from the LCCBs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the PSpbgstat[] array entry.
<i>Bad Data</i> =	PSpbgstat[].aggr_tpc.
<i>Good Data</i> =	The throughput class data collect from the LCCBs.
<i>Logical Index</i> =	The index into PSpbgstat[].
<i>Dump</i> =	NA.

Table 8 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The remote and/or the local PBG number of an LCCB is out of range (PSlccb[].rem_pbg and/or PSlccb[].loc_pbg > PSPBGMAX).
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The LCCB is recovered to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSlccb[].loc_pbg.
<i>Bad Data</i> =	PSlccb[].rem_pbg.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 9 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	An LCCB, in use for an X.75 (protocol for inter-network packet switching between international gateway packet switches) or X.75' (protocol for inter-switch packet switching network within the same switch network, but by switches of different manufacturers), has the huntflag bit set (lccbptr→huntflag) while the logical channel number field, lcn, (lccbptr→lcn) is out of range.
Possible Error Effect:	If this LCCB was used correctly and the lcn field got corrupted, we will lose this call else it is a waste of resource as this LCCB should be on the free list.
Corrective Action Taken:	The huntflag field is disabled (set to PSDISABLED).

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's huntflag field (lccbptr→huntflag).
<i>Bad Data =</i>	LCCB's lcn field (lccbptr→lcn).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	LCCB's cpstate field (lccbptr→cpstate).
<i>Dump 1 =</i>	The layer 3 data of type PSL3DATA associated with this LCCB.
<i>Dump 2 =</i>	LCCB's protstate field (lccbptr→protstate).
<i>Dump 3 =</i>	The al_pchn field of the ALCB associated with this LCCB (PSalcb[lccbptr→alcb_index].al_pchn).

Table 10 Error Code: BDLINK

Error Code:	BDLINK
Error Description:	The audit has found an LCCB on the free linked list or billing list of LCCBs that has a non-null buffer descriptor (BD) field. On the free or billing linked list, there should not be any BDs attached to the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's qdsetup_index (BD field).
<i>Bad Data =</i>	LCCB's mptmbd (modem pool TM BD field).
<i>Good Data =</i>	PSNULLOFF - Valid null value for the BD fields.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	(PSOFFSET) the LCCB's rctl_bfr field (BD). (PSOFFSET) the LCCB's ictrl_bfr field (BD). (PSOFFSET) the LCCB's intrpt_bfr field (BD).

Table 11 Error Code: BDPCR

Error Code:	BDPCR
Error Description:	The audit has found an LCCB on the free linked list or billing list of LCCBs that has a non-null BD field in either the holding buffer or retransmission buffer arrays. On the free or billing linked list, there should not be any BDs attached to the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's holding buffer element (hold_buff[]).
<i>Bad Data =</i>	LCCB's retransmission buffer element (retran_buff[]).
<i>Good Data =</i>	Index into the buffer array that is non-null.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 12 Error Code: BILLFLG

Error Code:	BILLFLG
Error Description:	An LCCB in use for an X.75' trunk has its billflg enabled.
Possible Error Effect:	A customer may be billed incorrectly.
Corrective Action Taken:	The field is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's billflg.
<i>Bad Data =</i>	The value in the LCCB's billflg (PSENABLED).
<i>Good Data =</i>	PSDISABLED.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 13 Error Code: BLINK

Error Code:	BLINK
Error Description:	BD linkage is corrupted. The audit has found an LCCB linked to an ALCB for a VC call with a protocol state (protstate) that must have a BD linked to the LCCB, but the qdsetup index BD field is null.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's protocol state (protstate).
<i>Bad Data =</i>	LCCB's qdsetup index (XACs BD).
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 14 Error Code: CHALLOC

Error Code:	CHALLOC
Error Description:	The audit found an LCCB linked to an ALCB that has an modem pool terminal maintenance (MPTM) or inter-switch (IT) PHC type but the channel type "chantype" is not a non-virtual type.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The call is torn down and associated resources (such as, the LCCB are returned to the appropriate idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's DCDB's PH channel type "phctype" - write protect data indicating IT or MPTM call type.
<i>Bad Data =</i>	LCCB's channel type - "chantype".
<i>Good Data =</i>	PSNVC TYPE - valid value for non-VC type for the LCCB's channel type.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	(size PSOFFSET) LCCB's modem pool terminal maintenance BD value.

Table 15 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit has found an LCCB where the COUNT of retransmission buffers and the hold buffers is greater than PSBFRIND.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which will return the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's count of retransmission buffers.
<i>Bad Data =</i>	LCCB's count of hold buffers.
<i>Good Data =</i>	PSBFRIND - maximum value for total buffer counts.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 16 Error Code: CURWFLG

Error Code:	CURWFLG
Error Description:	The audit has found an LCCB whose receiving window size or sending window size is out of range.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to recover the LCCB. Since this is a PVC, a routine port conditioning will be requested to reset up the call.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's receiving window size "r_ wsize".
<i>Bad Data =</i>	LCCB's sending window size "s_ wsize".
<i>Good Data =</i>	LCCB index.

<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 17 Error Code: CURWFLG

Error Code:	CURWFLG
Error Description:	The audit found an LCCB whose receiving window size or sending window size is out of range.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to recover the LCCB. Since this is a PVC, a routine port conditioning will be requested to reset up the call.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's receiving window size "r_ wsize".
<i>Bad Data</i> =	LCCB's sending window size "r_ wsize".
<i>Good Data</i> =	LCCB index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 18 Error Code: DFLG

Error Code:	DFLG
Error Description:	The huntflag should be disabled. The audit has found an LCCB whose data control data block's (DCDB) write protected huntgroup flag is NOT set but the LCCB's flag is enabled.
Possible Error Effect:	Prints a report and corrects the LCCB's field.
Corrective Action Taken:	The audit will report the error and set the LCCB's huntflag to PSDISABLED.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's logical channel number.
<i>Bad Data</i> =	LCCB's "huntflag" value.
<i>Good Data</i> =	PSDISABLED - valid value the huntflag should have.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 19 Error Code: DISP

Error Code:	DISP
Error Description:	Disabled pointer. Write protected huntgroup flag is set but the LCCB's logical channel number "lcn" is within the multi-line hunt group value.
Possible Error Effect:	Prints a report and corrects the LCCB's field.
Corrective Action Taken:	The audit will report the error and set the LCCB's huntflag to PSENABLED.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Highest LCN value of hunted range.
<i>Bad Data</i> =	LCCB's LCN field.
<i>Good Data</i> =	Lowest LCN of huntable range (HiPVC+1).
<i>Logical Index</i> =	LCCB's cpstate.
<i>Dump</i> =	LCCB's protstate.
	LCCB's PH channel number.

Table 20 Error Code: E_BIT

Error Code:	E_BIT
Error Description:	The audit has found an LCCB on the free linked list or billing list of LCCBs that has either the huntflag, mcp_tear or mcp_touch bit enabled. On the free or billing linked list, there should not be any of these fields set.
Possible Error Effect:	Prints a report and recovers the LCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's huntflag.
<i>Bad Data</i> =	LCCB's modem pool call processing tear bit. Indicating that the MPCP call is

	being torn down.
<i>Good Data</i> =	LCCB's modem pool call processing touch bit. Audit had previously seen the mcp_tear bit set and is timing the transient state.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 21 Error Code: HD_CELL

Error Code:	HD_CELL
Error Description:	The specified headcell's first or last elements are out of range.
Possible Error Effect:	Prints an error report and continues.
Corrective Action Taken:	AUFALSE is returned and the headcell is nulled. The linked list owned by the headcell is rebuilt.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Starting range for the first/last headcell element.
<i>Bad Data</i> =	Ending range for the first/last headcell element.
<i>Good Data</i> =	Null value of the first and last.
<i>Logical Index</i> =	headcell index.
<i>Dump</i> =	headcell dump or PSRHEADCELL type.

Table 22 Error Code: IMPID

Error Code:	IMPID
Error Description:	Invalid modem pool timing index. The audit has found an LCCB linked to an ALCB and there is a modem pool terminal maintenance BD offset but there isn't any timer pending.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which will return the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's modem pool "mptmbd" BD offset.
<i>Bad Data</i> =	LCCB's timacc[] MPTM element.
<i>Good Data</i> =	PST3NULL - valid null value for the timer array index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 23 Error Code: INV

Error Code:	INV
Error Description:	Write protected huntgroup flag is set but the high 2w information in the DCDB write protected data and the high incoming values are both 0.
Possible Error Effect:	Prints a report and recovers the LCCB's.
Corrective Action Taken:	The audit will report the error and return AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	hihunt - either high incoming that is 0.
<i>Good Data</i> =	PH channel number.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	l3data information: DMPS_LCN pvc_h_lcn = High pvc assigned LCN range, DMPS_LCN l_lcn_in = Low incoming assigned LCN range, DMPS_LCN h_lcn_in = High incoming assigned LCN range, DMPS_LCN l_lcn_2w = Low 2 way assigned LCN range, DMPS_LCN h_lcn_2w = High 2 way assigned LCN range,

	DMPS_LCN l_lcn_out = Low outgoing assigned LCN range,
	DMPS_LCN h_lcn_out = High outgoing assigned LCN range,
	DMBOOL_mhglg = MLHG indicator.

Table 24 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	An LCCB with an invalid cpstate field is queued on a DCCB. LCCBs queued on DCCBs should have the PSlccb[].cpstate field set to PSA_N0.
Possible Error Effect:	The Conditional Notification call associated with this LCCB entry will fail.
Corrective Action Taken:	The LCCB will be removed from the queue and recovered to the free linked list. Note that before removing the LCCB from the queue, the audit checks if the DCCB queue linked list is corrupted. If that is the case, the audit will call the queue recovery function to step through the PSlccb[] array and reconstruct the queue. Therefore, no errors are introduced by removing the LCCB from the queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	DCCB index.
<i>Bad Data</i> =	PSlccb[].cpstate.
<i>Good Data</i> =	PSA_N0.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 25 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	The audit has found an LCCB on the free linked list or billing list of LCCBs that has a non-null value in the timacc[] timer array used by X.25 access processor (XAC). On the free or billing linked list, there should not be any timers on for the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's index into the timacc[] array that is non-null.
<i>Bad Data</i> =	LCCB's tim value in the timacc[] array.
<i>Good Data</i> =	PST3NULL - valid null value for the timacc[] field.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 26 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	The PH audit has found an LCCB on the free or billing linked list with the alcb_index field not null.
Possible Error Effect:	Prints a report and corrects the LCCB's alcb_index field.
Corrective Action Taken:	The LCCB alcb_index field is set to PSALCBNULL and the audit continues.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's owner (free linked or billing linked list).
<i>Bad Data</i> =	LCCB's alcb_index field.
<i>Good Data</i> =	PSALCBNULL - the valid null field for the alcb_index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 27 Error Code: LNK_CONFIG

Error Code:	LNK_CONFIG

Error Description:	The PH audit has found an LCCB on no linked lists (linked to an ALCB) with either the forward lccb index field or back lccb index field is not null. Since this is not on a linked list, these fields must be null.
Possible Error Effect:	Prints a report and corrects the faulty fields.
Corrective Action Taken:	The error report is printed and then the forward and backward lccb index fields are nulled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's linked list forward pointer (fdlccb ind).
<i>Bad Data =</i>	LCCB's linked list backward pointer (bklccb ind).
<i>Good Data =</i>	PSLCCBNULL - Valid null value of linkage fields.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 28 Error Code: LNK2ALST

Error Code:	LNK2ALST
Error Description:	The PH audit has found an LCCB on no linked lists (linked to an ALCB) whose alcb index or lcn field is out of range.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling functions which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's alcb index field.
<i>Bad Data =</i>	LCCB's logical channel number (lcn). The slot number of the LCCB's ALCB's lccb index array.
<i>Good Data =</i>	PSHMAXALCB - Maximum value of alcb index field.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 29 Error Code: LOGCHAN

Error Code:	LOGCHAN
Error Description:	The PH audit has found an LCCB on the free linked list with the logical channel number (lcn) field not zero.
Possible Error Effect:	Prints a report and zeroes the LCCB's lcn field.
Corrective Action Taken:	The LCCB lcn field is zeroed out and the audit continues.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LCCB's lcn field.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 30 Error Code: MASTER_LINK

Error Code:	MASTER_LINK
Error Description:	The PH audit has found an LCCB on no linked lists (linked to an ALCB) and fails the point to point back check between LCCB and the ALCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The error report is printed and then AUFALSE is returned to recover the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's alcb index field.
<i>Bad Data =</i>	The LCCB that the LCCB's ALCB is pointing to.
<i>Good Data =</i>	LCCB's logical channel number (lcn). The slot number of the LCCB's ALCB's lccb index array.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 31 Error Code: MEMBER

Error Code:	MEMBER
Error Description:	The audit found a member error in the linked list of the specified audit.
Possible Error Effect:	Prints an error report and corrects the linked list.
Corrective Action Taken:	Return AUFALSE to calling function which rebuilds the linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Linked list null value.
<i>Logical Index</i> =	AUcount, the current element number.
<i>Dump</i> =	AULNK.

Table 32 Error Code: NMTIML

Error Code:	NMTIML
Error Description:	No marked timer was located. The audit found an LCCB linked to an ALCB for a VC with a protocol state (protstate) that requires a timer pending. Both the timacc[] array and the return from PST3query should indicate a timer and they don't.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's protocol state (protstate).
<i>Bad Data</i> =	LCCB's timacc[] VC element (timer tag).
<i>Good Data</i> =	LCCB index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 33 Error Code: ORCOUNTS

Error Code:	ORCOUNTS
Error Description:	The audit has found an LCCB where the number of non-null elements in the holdbuffer array does not match the "hb_qd" count recorded in the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LCCB's "hb_qd" count (IPs count of buffers that are being held).
<i>Good Data</i> =	Audits count of the non-null values in the hold buffer array.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 34 Error Code: OWNER

Error Code:	OWNER
Error Description:	The PSlccb[].qdccb_own field is out of range. This field should be set to a valid DCCB index in which the LCCB is queued.
Possible Error Effect:	The condition notification call associated with this LCCB entry will fail.
Corrective Action Taken:	The audit recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	PSlccb[].qdccb_own.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 35 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The PH audit found an LCCB on the free linked or billing linked list with the

	forward or backward LCCB pointers of the linked list out of range.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The error report is printed and AUFALSE is returned to the calling function which the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	PSLCCBNULL - the valid null field for the forward or backward pointers.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	AULNK.

Table 36 Error Code: PPAUD_CH

Error Code:	PPAUD_CH
Error Description:	PVC audit error on channel type. The audit found an LCCB linked to an ALCB of a PVC type but the channel type is bad.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The call is torn down and associated resources (such as, the LCCB are returned to the appropriate idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's logical channel number (LCN) indicating that this is a PVC call.
<i>Bad Data</i> =	LCCB's channel type - "chantype".
<i>Good Data</i> =	PSPVC_TYPE - valid value for permanent virtual call (PVC) type for the LCCB's channel type.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 37 Error Code: QUAR

Error Code:	QUAR
Error Description:	The audit found an LCCB with its quarantine bit set.
Possible Error Effect:	Prints out a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LCCB's quarantine bit value (quar_bit).
<i>Good Data</i> =	DBNO - valid value for the quarantine bit indicating no problems.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 38 Error Code: R_COUNTS

Error Code:	R_COUNTS
Error Description:	The audit found an LCCB where the number of non-null elements in the holdbuffer array plus the retransmission buffer does not match the value of the LCCB's rtb_qd (retransmission count) and LCCB's shold_qd (hold buffer count).
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's "rtb_qd" (retransmission count).
<i>Bad Data</i> =	LCCB's "shold_qd" count (IPs count of buffers that are being held).
<i>Good Data</i> =	Audits count of the non-null values in the retransmission buffer and hold buffer.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 39 Error Code: R_CSTATE

Error Code:	R_CSTATE
Error Description:	Range check on CP state. The audit found an LCCB linked to an ALCB for a VC

	call with an out of range "cpstate" value.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LCCB's "cpstate" state value.
<i>Good Data =</i>	PSA F6 - Maximum "cpstate" value.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 40 Error Code: RETRYTIME

Error Code:	RETRYTIME
Error Description:	A timer was not found when retrying to send or hold a buffer. The audit found an LCCB where there is more than one buffer marked in the retransmission array or the holdbuffer array which indicates there is at least one BD attached to the LCCB but there isn't any timer pending for this LCCB. There must be a timer for any BD on an LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Audit's count of hold buffer BDs.
<i>Bad Data =</i>	Audit's count of retransmission BDs.
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 41 Error Code: SPTIME

Error Code:	SPTIME
Error Description:	Suspect PVC timer. The audit has found an LCCB linked to an ALCB for a PVC call with a "cpstate" that requires a timer pending. No timer is indicated, so the LCCB will be recovered.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's cpstate state value.
<i>Bad Data =</i>	autimer - local value indicating that there is a timer tag in tim[] array. This should be DBYES.
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 42 Error Code: STATE

Error Code:	STATE
Error Description:	The audit found an LCCB linked to an ALCB with an invalid state field.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LCCB's protocol state (protstate).
<i>Good Data =</i>	PSMAX_VCSTATE - Maximum protstate value.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 43 Error Code: STATE_SET

Error Code:	STATE_SET
Error Description:	The queued incoming field (PSlccb[].qd_incom) of an LCCB is not PSNULLOFF. This field should only be used when the internal circuit state (PSlccb[].cpstate) is PSA_N0.
Possible Error Effect:	The condition notification call associated with this entry will fail.
Corrective Action Taken:	The LCCB is recovered to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	PSlccb[].qd_incom.
<i>Bad Data =</i>	PSlccb[].cpstate.
<i>Good Data =</i>	PSNULLOFF.
<i>Logical Index =</i>	LCCB's logical channel number (PSlccb[].lcn).
<i>Dump =</i>	NA.

Table 44 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	The audit found an LCCB linked to an ALCB of a non-virtual call type that has both the XAC protocol state field and the IP "cpstate" field indicating states where no timers are pending. This LCCB configuration must have a timer and one of the two state fields must be in a state requiring a timer.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and return AUFALSE which recovers LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's protocol state "protstate" (for XAC).
<i>Bad Data =</i>	LCCB's cpstate (for IP).
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 45 Error Code: STUCK

Error Code:	STUCK
Error Description:	The audit found an LCCB that is currently waiting for PVC data from the SMP for update of the completed PVC information (pvcw4data is PSENABLE), however there are no timers pending. Since the "wait for data" state is considered a transient state by audits, there must be a timer to trigger some resultant action but the audits did not find one pending.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's logical channel number (lcn).
<i>Bad Data =</i>	LCCB's protocol state "protstate" (for XAC).
<i>Good Data =</i>	LCCB's ALCBs PH channel number ("al_phcn").
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 46 Error Code: TID

Error Code:	TID
Error Description:	Timer index is invalid. The audit found an LCCB linked to an ALCB. There is a BD offset in "qdsetup_index" but no timer is pending.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's "qdsetup" BD offset.

<i>Bad Data</i> =	LCCB's "protstate".
<i>Good Data</i> =	LCCB's timacc[PST3VC].
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	(size PSTINDEX) return from PSt3query indicating that there is a timer or not.

Table 47 Error Code: TIDBAD

Error Code:	TIDBAD
Error Description:	Timer index bad. The audit found an LCCB linked to an ALCB with a timer tag value in the tim[] array; however, PSt3query has no record of any actual timers pending for this LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's "cpstate".
<i>Bad Data</i> =	LCCB's "protstate".
<i>Good Data</i> =	LCCB's ALCB's PH channel number ("al_phcn").
<i>Logical Index</i> =	Logical PH number.
<i>Dump</i> =	LCCB's tim array - "tim[PSTIMTAGS]".

Table 48 Error Code: TIME_EXC

Error Code:	TIME_EXC
Error Description:	A timer is executing. The audit found an LCCB on the free linked list or billing list of LCCBs that has a recorded timer when PSt3_query is called to inquire information for the timers for this LCCB. For LCCBs on a billing or free linked list, there should not be any timers on for the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The return from PSt3_query() timer inquiry function.
<i>Good Data</i> =	PSNOTIMER - valid null value for the PSt3_query function for no timer.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 49 Error Code: TIMEORDER

Error Code:	TIMEORDER
Error Description:	The audit found an LCCB linked to an ALCB with a timer tag value in the PVC timer slot of the timacc[] array; however, the protstates is not S1 or S2, or the pvcw4data field is DBNO and should be DBYES.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Timer tag of the PVC slot of timacc[] array.
<i>Bad Data</i> =	LCCB's protocol state "protstate".
<i>Good Data</i> =	LCCB's pvcw4data that should be DBYES.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 50 Error Code: TIMEOUT

Error Code:	TIMEOUT
Error Description:	An LCCB with no active timer is queued on a DCCB.
Possible Error Effect:	The Condition Notification call associated with this entry will fail.
Corrective Action Taken:	The LCCB is recovered to the free linked list.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	DCCB index.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 51 Error Code: TIMERLST

Error Code:	TIMERLST
Error Description:	The audit found an LCCB on the free linked list or billing list of LCCBs that has a non-null value in the tim[] timer array used by interprocessor communications (IP). On the free or billing linked list, there should not be any timers on for the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's index into the tim[] array that is non-null.
<i>Bad Data</i> =	LCCB's tim value in the tim[] array.
<i>Good Data</i> =	PST3NULL - valid null value for the tim[] field.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 52 Error Code: TIMESTAMP

Error Code:	TIMESTAMP
Error Description:	The audit found an LCCB linked to an ALCB. There is at least one BD in either ictl_bfr, intrpt_bfr, or rctl_bfr but there is no timer pending. Whenever a BD is linked to an LCCB, there must be timer; therefore the LCCB will be recovered.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's "ictl_bfr" BD offset.
<i>Bad Data</i> =	LCCB's "intrpt_bfr" BD offset.
<i>Good Data</i> =	PSNULLOFF - valid null BD offset.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	(PSOFFSET size) - LCCB's "rctl_bfr" BD offset.

Table 53 Error Code: TPID

Error Code:	TPID
Error Description:	A timer pending invalid. The audit has found an LCCB linked to an ALCB for a VC call with a "cpstate" that requires a timer pending. No timer is indicated, so the LCCB will be recovered.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's "cpstate" state value.
<i>Bad Data</i> =	autimer - local value indicating that there is a timer tag in tim[] array. This should be DBYES.
<i>Good Data</i> =	LCCB index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 54 Error Code: TRANCK

Error Code:	TRANCK
Error Description:	The audit found an LCCB whose modem pool call is presently being torn down.

	Audits will time this transient state for at least 5 minutes. No audit sees this condition 5 minutes later so the LCCB will be torn down.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PH channel number.
<i>Bad Data</i> =	LCCB's modem pool call touch bit that audit sets and will interrogate 5 minutes later to see if it is set and needs to tear the LCCB down.
<i>Good Data</i> =	Logical PH number.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 55 Error Code: TYPE

Error Code:	TYPE
Error Description:	The audit found an LCCB linked to an ALCB of a VC type but the channel type is found bad.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The call is torn down and associated resources (such as, the LCCB are returned to the appropriate idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's logical channel number.
<i>Bad Data</i> =	LCCB's channel type - "chantype".
<i>Good Data</i> =	PSVC_TYPE - valid value for virtual call (VC) type for the LCCB's channel type.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 56 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up.
Possible Error Effect:	Single process purges the audit process.
Corrective Action Taken:	Return audit complete, wait for next go around.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	AUrunning, audit ID that was running at the time of the interrupt.
<i>Dump</i> =	NA.

LCCB-B

Software Release: 5E12 only

1. LOGICAL CHANNEL CONTROL BLOCK (LCCB) AUDIT

The LCCB audit is part of the switch maintenance audits subgroup. It is part of the integrated services digital network packet (ISDNPKT) loadable package. It runs in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The LCCB audit uses the packet switching logical channel control block array (PSlccb) and the access link control block array (PSalcb).

3. AUDIT CHECKS

The audit makes linkage checks within the PSlccb array and with PSalcb. It makes semantic checks to ensure the correctness of data in PSlccb. The audit driver is drps.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: AUD_CH

Error Code:	AUD_CH
Error Description:	Audit error found for the channel. The audit has found an LCCB linked to an ALCB that has an out of range PH channel value.
Possible Error Effect:	Prints a report and corrects the field.
Corrective Action Taken:	The audit will report the error and correct the LCCB field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's alcb_index that it is linked to.
<i>Bad Data =</i>	LCCB's ALCB's PH channel number.
<i>Good Data =</i>	PSMAXCHN - one more than the maximum value the PH channel number can be.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 2 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	The PBG aggregate LCN count (PSpbgstat[].aggr_lcn) is inconsistent with the number of LCNs (LCCBs) associated with this PSpbgstat[] entry. The number of LCCBs that have the PSlccb[].loc_lcn_act and/or the PSlccb[].rem_lcn_act fields set to DBYES, should agree with the count in PSpbgstat[].aggr_lcn. The index to the PSpbgstat[] array is the PBG number found in PSlccb[].rem_pbg and/or PSlccb[].loc_pbg fields.
Possible Error Effect:	Incorrect overflow treatment could be applied. If PSpbgstat[].aggr_lcn is greater than the real count, calls could be blocked or charged premium when they shouldn't be. If PSpbgstat[].aggr_lcn is smaller than the real count, calls could be allowed or not charged premium when they should be.
Corrective Action Taken:	The audit will correct the PSpbgstat[].aggr_lcn field to the number of LCCBs associated with this entry.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	Address of the PSpbgstat[] entry.
<i>Bad Data</i> =	PSpbgstat[].aggr_lcn.
<i>Good Data</i> =	The number of LCCBs associated with this PSpbgstat[] entry.
<i>Logical Index</i> =	Index into PSpbgstat[] (PBG number).
<i>Dump</i> =	NA.

Table 3 Error Code: BADDATAR

Error Code:	BADDATAR
Error Description:	The audit found an LCCB that has the retransmission buffer or holdbuffer arrays that have more than one "hole" in the array. These array must be continuous with only one starting element.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Count of "start/stops" in retransmission array.
<i>Bad Data</i> =	Count of "start/stops" in hold buffer array.
<i>Good Data</i> =	AUTWO - Maximum plus one of the number of starts.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 4 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	The virtual call throughput class for the sending (PSlccb[].vc_tpc[PSCED]) and/or receiving (PSlccb[].vc_tpc[PSCING]) directions of an LCCB is/are out of range (PSTPC75 > PSlccb[].vc_tpc[] > PSTPC19200).
Possible Error Effect:	Calls could be blocked or charged premium when they shouldn't be.
Corrective Action Taken:	The LCCB is recovered to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSlccb[].vc_tpc[PSCED].
<i>Bad Data</i> =	PSlccb[].vc_tpc[PSCING].
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 5 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	The PH audit found an LCCB with an invalid owner field.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The error report is printed and AUFALSE returned to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LCCB's owner field.
<i>Good Data</i> =	LCCB index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 6 Error Code: BADSUPVSTAT

Error Code:	BADSUPVSTAT
Error Description:	Bad suspected pvc status. The audit has found an LCCB whose receiving window size or sending window size is 0. If either of these is 0, no packets can be transmitted or received properly. Recover the LCCB and request a routine port conditioning of the PVC.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling function which

	recovers the LCCB to the free linked list. Since this is a PVC, a routine port conditioning is requested to reset up the call.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's receiving window size "iwsze_rcv".
<i>Bad Data</i> =	LCCB's sending window size "iwsze_send".
<i>Good Data</i> =	LCCB index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 7 Error Code: BADTSCOUNT

Error Code:	BADTSCOUNT
Error Description:	The PBG aggregate throughput count (PSpbgstat[].aggr_tpc) is inconsistent with the throughput class of LCCBs associated with this PSpbgstat[] entry. The throughput class of the LCCBs that have the PSlccb[].loc_tpc_act and/or the PSlccb[].rem_tpc_act fields set to DBYES, should agree with the count in PSpbgstat[].aggr_tpc. The index to the PSpbgstat[] array is the PBG number found in PSlccb[].rem_pbg and/or PSlccb[].loc_pbg fields. Only the larger throughput classes between the sending (PSlccb[].vc_tpc[PSCED]) and the receiving (PSlccb[].vc_tpc[PSCING]) directions is included in PSpbgstat[].aggr_tpc.
Possible Error Effect:	Incorrect overflow treatment could be applied. If PSpbgstat[].aggr_tpc is greater than the real count, calls could be blocked or charged premium when they shouldn't be. If PSpbgstat[].aggr_tpc is smaller than the real count, calls could be allowed or not charged premium when they should be.
Corrective Action Taken:	The audit will correct the PSpbgstat[].aggr_tpc field to the throughput class collected from the LCCBs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the PSpbgstat[] array entry.
<i>Bad Data</i> =	PSpbgstat[].aggr_tpc.
<i>Good Data</i> =	The throughput class data collect from the LCCBs.
<i>Logical Index</i> =	The index into PSpbgstat[].
<i>Dump</i> =	NA.

Table 8 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The remote and/or the local PBG number of an LCCB is out of range (PSlccb[].rem_pbg and/or PSlccb[].loc_pbg > PSPBGMAX).
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The LCCB is recovered to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSlccb[].loc_pbg.
<i>Bad Data</i> =	PSlccb[].rem_pbg.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 9 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	An LCCB, in use for an X.75 (protocol for inter-network packet switching between international gateway packet switches) or X.75' (protocol for inter-switch packet switching network within the same switch network, but by switches of different manufacturers), has the huntflag bit set (lccbptr->huntflag) while the logical channel number field, lcn, (lccbptr->lcn) is out of range.
Possible Error Effect:	If this LCCB was used correctly and the lcn field got corrupted, we will lose this call else it is a waste of resource as this LCCB should be on the free list.
Corrective Action Taken:	The huntflag field is disabled (set to PSDISABLED).

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's huntflag field (lccbptr->huntflag).
<i>Bad Data =</i>	LCCB's lcn field (lccbptr->lcn).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	LCCB's cpstate field (lccbptr->cpstate).
<i>Dump 1 =</i>	The layer 3 data of type PSL3DATA associated with this LCCB.
<i>Dump 2 =</i>	LCCB's protstate field (lccbptr->protstate).
<i>Dump 3 =</i>	The al_phcn field of the ALCB associated with this LCCB (PSalcb[lccbptr->alcb_index].al_phcn).

Table 10 Error Code: BDLINK

Error Code:	BDLINK
Error Description:	The audit has found an LCCB on the free linked list or billing list of LCCBs that has a non-null buffer descriptor (BD) field. On the free or billing linked list, there should not be any BDs attached to the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's qdsetup_index (BD field).
<i>Bad Data =</i>	LCCB's mptmbd (modem pool TM BD field).
<i>Good Data =</i>	PSNULLOFF - Valid null value for the BD fields.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	(PSOFFSET) the LCCB's rctl_bfr field (BD). (PSOFFSET) the LCCB's ictrl_bfr field (BD). (PSOFFSET) the LCCB's intrpt_bfr field (BD).

Table 11 Error Code: BDPCR

Error Code:	BDPCR
Error Description:	The audit has found an LCCB on the free linked list or billing list of LCCBs that has a non-null BD field in either the holding buffer or retransmission buffer arrays. On the free or billing linked list, there should not be any BDs attached to the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's holding buffer element (hold_buf[]).
<i>Bad Data =</i>	LCCB's retransmission buffer element (retran_buf[]).
<i>Good Data =</i>	Index into the buffer array that is non-null.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 12 Error Code: BILLFLG

Error Code:	BILLFLG
Error Description:	An LCCB in use for an X.75' trunk has its billflg enabled.
Possible Error Effect:	A customer may be billed incorrectly.
Corrective Action Taken:	The field is corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's billflg.
<i>Bad Data =</i>	The value in the LCCB's billflg (PSENABLED).
<i>Good Data =</i>	PSDISABLED.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 13 Error Code: BLINK

Error Code:	BLINK
Error Description:	BD linkage is corrupted. The audit has found an LCCB linked to an ALCB for a VC call with a protocol state (protstate) that must have a BD linked to the LCCB, but the qdsetup index BD field is null.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's protocol state (protstate).
<i>Bad Data =</i>	LCCB's qdsetup index (XACs BD).
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 14 Error Code: CHALLOC

Error Code:	CHALLOC
Error Description:	The audit found an LCCB linked to an ALCB that has an modem pool terminal maintenance (MPTM) or inter-switch (IT) PHC type but the channel type "chantype" is not a non-virtual type.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The call is torn down and associated resources (such as, the LCCB are returned to the appropriate idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's DCDB's PH channel type "phctype" - write protect data indicating IT or MPTM call type.
<i>Bad Data =</i>	LCCB's channel type - "chantype".
<i>Good Data =</i>	PSNVC TYPE - valid value for non-VC type for the LCCB's channel type.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	(Size PSOFFSET) LCCB's modem pool terminal maintenance BD value.

Table 15 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit has found an LCCB where the COUNT of retransmission buffers and the hold buffers is greater than PSBFRIND.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which will return the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's count of retransmission buffers.
<i>Bad Data =</i>	LCCB's count of hold buffers.
<i>Good Data =</i>	PSBFRIND - maximum value for total buffer counts.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 16 Error Code: CURWFLG

Error Code:	CURWFLG
Error Description:	The audit has found an LCCB whose receiving window size or sending window size is out of range.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to recover the LCCB. Since this is a PVC, a routine port conditioning will be requested to reset up the call.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's receiving window size "r_ wsize".
<i>Bad Data =</i>	LCCB's sending window size "s_ wsize".
<i>Good Data =</i>	LCCB index.

<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 17 Error Code: CURWFLG

Error Code:	CURWFLG
Error Description:	The audit found an LCCB whose receiving window size or sending window size is out of range.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to recover the LCCB. Since this is a PVC, a routine port conditioning will be requested to reset up the call.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's receiving window size "r_ wsize".
<i>Bad Data</i> =	LCCB's sending window size "r_ wsize".
<i>Good Data</i> =	LCCB index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 18 Error Code: DFLG

Error Code:	DFLG
Error Description:	The huntflag should be disabled. The audit has found an LCCB whose data control data block's (DCDB) write protected huntgroup flag is NOT set but the LCCB's flag is enabled.
Possible Error Effect:	Prints a report and corrects the LCCB's field.
Corrective Action Taken:	The audit will report the error and set the LCCB's huntflag to PSDISABLED.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's logical channel number.
<i>Bad Data</i> =	LCCB's "huntflag" value.
<i>Good Data</i> =	PSDISABLED - valid value the huntflag should have.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 19 Error Code: DISP

Error Code:	DISP
Error Description:	Disabled pointer. Write protected hunt group flag is set but the LCCB's logical channel number "lcn" is within the multi-line hunt group value.
Possible Error Effect:	Prints a report and corrects the LCCB's field.
Corrective Action Taken:	The audit will report the error and set the LCCB's hunt flag to PSENABLED.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Highest LCN value of hunted range.
<i>Bad Data</i> =	LCCB's LCN field.
<i>Good Data</i> =	Lowest LCN of huntable range (HiPVC+1).
<i>Logical Index</i> =	LCCB's cpstate.
<i>Dump</i> =	LCCB's protstate.
	LCCB's PH channel number.

Table 20 Error Code: E_BIT

Error Code:	E_BIT
Error Description:	The audit has found an LCCB on the free linked list or billing list of LCCBs that has either the huntflag, mcp_tear or mcp_touch bit enabled. On the free or billing linked list, there should not be any of these fields set.
Possible Error Effect:	Prints a report and recovers the LCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's huntflag.
<i>Bad Data</i> =	LCCB's modem pool call processing tear bit. Indicating that the MPCP call is

	being torn down.
<i>Good Data</i> =	LCCB's modem pool call processing touch bit. Audit had previously seen the mcp_tear bit set and is timing the transient state.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 21 Error Code: EPITIME

Error Code:	EPITIME
Error Description:	An LCCB is in cpstate PSA_NO, but has no timer assigned to it.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's cpstate field.
<i>Bad Data</i> =	tgret.
<i>Good Data</i> =	LCCB index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 22 Error Code: HD_CELL

Error Code:	HD_CELL
Error Description:	The specified headcell's first or last elements are out of range.
Possible Error Effect:	Prints an error report and continues.
Corrective Action Taken:	AUFALSE is returned and the headcell is nulled. The linked list owned by the headcell is rebuilt.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Starting range for the first/last headcell element.
<i>Bad Data</i> =	Ending range for the first/last headcell element.
<i>Good Data</i> =	Null value of the first and last.
<i>Logical Index</i> =	headcell index.
<i>Dump</i> =	headcell dump or PSRHEADCELL type.

Table 23 Error Code: IMPID

Error Code:	IMPID
Error Description:	Invalid modem pool timing index. The audit has found an LCCB linked to an ALCB and there is a modem pool terminal maintenance BD offset but there isn't any timer pending.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which will return the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's modem pool "mptmbd" BD offset.
<i>Bad Data</i> =	LCCB's timacc[] MPTM element.
<i>Good Data</i> =	PST3NULL - valid null value for the timer array index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	The LCCB.

Table 24 Error Code: INV

Error Code:	INV
Error Description:	Write protected huntgroup flag is set but the high 2w information in the DCDB write protected data and the high incoming values are both 0.
Possible Error Effect:	Prints a report and recovers the LCCB's.
Corrective Action Taken:	The audit will report the error and return AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	hihunt - either high incoming that is 0.

<i>Good Data</i> =	PH channel number.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	l3data information: DMPS_LCN pvc_h_lcn = High pvc assigned LCN range, DMPS_LCN l_lcn_in = Low incoming assigned LCN range, DMPS_LCN h_lcn_in = High incoming assigned LCN range, DMPS_LCN l_lcn_2w = Low 2 way assigned LCN range, DMPS_LCN h_lcn_2w = High 2 way assigned LCN range, DMPS_LCN l_lcn_out = Low outgoing assigned LCN range, DMPS_LCN h_lcn_out = High outgoing assigned LCN range, DMBOOL mhgflg = MLHG indicator.

Table 25 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	An LCCB with an invalid cpstate field is queued on a DCCB. LCCBs queued on DCCBs should have the PSlccb[].cpstate field set to PSA_N0.
Possible Error Effect:	The conditional notification call associated with this LCCB entry will fail.
Corrective Action Taken:	The LCCB will be removed from the queue and recovered to the free linked list. Note that before removing the LCCB from the queue, the audit checks if the DCCB queue linked list is corrupted. If that is the case, the audit will call the queue recovery function to step through the PSlccb[] array and reconstruct the queue. Therefore, no errors are introduced by removing the LCCB from the queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	DCCB index.
<i>Bad Data</i> =	PSlccb[].cpstate.
<i>Good Data</i> =	PSA_N0.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 26 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	The audit has found an LCCB on the free linked list or billing list of LCCBs that has a non-null value in the timacc[] timer array used by X.25 Access processor (XAC). On the free or billing linked list, there should not be any timers on for the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's index into the timacc[] array that is non-null.
<i>Bad Data</i> =	LCCB's tim value in the timacc[] array.
<i>Good Data</i> =	PST3NULL - valid null value for the timacc[] field.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 27 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED

Error Description:	The PH audit has found an LCCB on the free or billing linked list with the alcb_index field not null.
Possible Error Effect:	Prints a report and corrects the LCCB's alcb_index field.
Corrective Action Taken:	The LCCB alcb_index field is set to PSALCBNULL and the audit continues.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's owner (free linked or billing linked list).
<i>Bad Data</i> =	LCCB's alcb_index field.
<i>Good Data</i> =	PSALCBNULL - the valid null field for the alcb_index.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 28 Error Code: LNK_CONFIG

Error Code:	LNK_CONFIG
Error Description:	The PH audit has found an LCCB on no linked lists (linked to an ALCB) with either the forward lccb index field or back lccb index field is not null. Since this is not on a linked list, these fields must be null.
Possible Error Effect:	Prints a report and corrects the faulty fields.
Corrective Action Taken:	The error report is printed and then the forward and backward lccb index fields are nulled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's linked list forward pointer (fdlccb_ind).
<i>Bad Data</i> =	LCCB's linked list backward pointer (bklccb_ind).
<i>Good Data</i> =	PSLCCBNULL - Valid null value of linkage fields.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 29 Error Code: LNK2ALST

Error Code:	LNK2ALST
Error Description:	The PH audit has found an LCCB on no linked lists (linked to an ALCB) whose alcb_index or lcn field is out of range.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE to the calling functions which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's alcb_index field.
<i>Bad Data</i> =	LCCB's logical channel number (lcn). The slot number of the LCCB's ALCB's lccb_index array.
<i>Good Data</i> =	PSHMAXALCB - Maximum value of alcb_index field.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 30 Error Code: LOGCHAN

Error Code:	LOGCHAN
Error Description:	The PH audit has found an LCCB on the free linked list with the logical channel number (lcn) field not zero.
Possible Error Effect:	Prints a report and zeroes the LCCB's lcn field.
Corrective Action Taken:	The LCCB lcn field is zeroed out and the audit continues.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LCCB's lcn field.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 31 Error Code: MASTER_LINK

Error Code:	MASTER_LINK
Error Description:	The PH audit has found an LCCB on no linked lists (linked to an ALCB) and fails

	the point to point back check between LCCB and the ALCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The error report is printed and then AUFALSE is returned to recover the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's alcb_index field.
<i>Bad Data =</i>	The LCCB that the LCCB's ALCB is pointing to.
<i>Good Data =</i>	LCCB's logical channel number (lcn). The slot number of the LCCB's ALCB's lccb_index array.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 32 Error Code: MEMBER

Error Code:	MEMBER
Error Description:	The audit found a member error in the linked list of the specified audit.
Possible Error Effect:	Prints an error report and corrects the linked list.
Corrective Action Taken:	Return AUFALSE to calling function which rebuilds the linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Linked list null value.
<i>Logical Index =</i>	AUcount, the current element number.
<i>Dump =</i>	AULNK.

Table 33 Error Code: NMTIML

Error Code:	NMTIML
Error Description:	No marked timer was located. The audit found an LCCB linked to an ALCB for a VC with a protocol state (protstate) that requires a timer pending. Both the timacc[] array and the return from PST3query should indicate a timer and they don't.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's protocol state (protstate).
<i>Bad Data =</i>	LCCB's timacc[] VC element (timer tag).
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 34 Error Code: ORCOUNTS

Error Code:	ORCOUNTS
Error Description:	The audit has found an LCCB where the number of non-null elements in the holdbuffer array does not match the "hb_qd" count recorded in the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LCCB's "hb_qd" count (IPs count of buffers that are being held).
<i>Good Data =</i>	Audits count of the non-null values in the hold buffer array.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 35 Error Code: OWNER

Error Code:	OWNER
Error Description:	The PSlccb[].qdccb_own field is out of range. This field should be set to a valid

	DCCB index in which the LCCB is queued.
Possible Error Effect:	The condition notification call associated with this LCCB entry will fail.
Corrective Action Taken:	The audit recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	PSlccbf].qdccb_own.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 36 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The PH audit found an LCCB on the free linked or billing linked list with the forward or backward LCCB pointers of the linked list out of range.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The error report is printed and AUFALSE is returned to the calling function which the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	PSLCCBNUL - the valid null field for the forward or backward pointers.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	AULNK.

Table 37 Error Code: PPAUD_CH

Error Code:	PPAUD_CH
Error Description:	PVC audit error on channel type. The audit found an LCCB linked to an ALCB of a PVC type but the channel type is bad.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The call is torn down and associated resources (such as, the LCCB are returned to the appropriate idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's logical channel number (LCN) indicating that this is a PVC call.
<i>Bad Data</i> =	LCCB's channel type - "chantype".
<i>Good Data</i> =	PSPVC_TYPE - valid value for permanent virtual call (PVC) type for the LCCB's channel type.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 38 Error Code: QUAR

Error Code:	QUAR
Error Description:	The audit found an LCCB with its quarantine bit set.
Possible Error Effect:	Prints out a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE to the calling function which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LCCB's quarantine bit value (quar_bit).
<i>Good Data</i> =	DBNO - valid value for the quarantine bit indicating no problems.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 39 Error Code: R_COUNTS

Error Code:	R_COUNTS
Error Description:	The audit found an LCCB where the number of non-null elements in the holdbuffer array plus the retransmission buffer does not match the value of the LCCB's rtb_qd (retransmission count) and LCCB's shold_qd (hold buffer count).

Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's "rtb_qd" (retransmission count).
<i>Bad Data =</i>	LCCB's "shold_qd" count (IPs count of buffers that are being held).
<i>Good Data =</i>	Audits count of the non-null values in the retransmission buffer and hold buffer.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 40 Error Code: R_CSTATE

Error Code:	R_CSTATE
Error Description:	Range check on CP state. The audit found an LCCB linked to an ALCB for a VC call with an out of range "cpstate" value.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LCCB's "cpstate" state value.
<i>Good Data =</i>	PSA F6 - Maximum "cpstate" value.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 41 Error Code: RETRYTIME

Error Code:	RETRYTIME
Error Description:	A timer was not found when retrying to send or hold a buffer. The audit found an LCCB where there is more than one buffer marked in the retransmission array or the holdbuffer array which indicates there is at least one BD attached to the LCCB but there isn't any timer pending for this LCCB. There must be a timer for any BD on an LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Audit's count of hold buffer BDs.
<i>Bad Data =</i>	Audit's count of retransmission BDs.
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 42 Error Code: SPTIME

Error Code:	SPTIME
Error Description:	Suspect PVC timer. The audit has found an LCCB linked to an ALCB for a PVC call with a "cpstate" that requires a timer pending. No timer is indicated, so the LCCB will be recovered.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's cpstate state value.
<i>Bad Data =</i>	tqret - local value used internally for debugging.
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	The LCCB.

Table 43 Error Code: STATE

Error Code:	STATE
Error Description:	The audit found an LCCB linked to an ALCB with an invalid state field.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LCCB's protocol state (protstate).
<i>Good Data =</i>	PSMAX_VCSTATE - Maximum protstate value.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 44 Error Code: STATE_SET

Error Code:	STATE_SET
Error Description:	The queued incoming field (PSlccb[].qd_incom) of an LCCB is not PSNULLOFF. This field should only be used when the internal circuit state (PSlccb[].cpstate) is PSA_N0.
Possible Error Effect:	The condition notification call associated with this entry will fail.
Corrective Action Taken:	The LCCB is recovered to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	PSlccb[].qd_incom.
<i>Bad Data =</i>	PSlccb[].cpstate.
<i>Good Data =</i>	PSNULLOFF.
<i>Logical Index =</i>	LCCB's logical channel number (PSlccb[].lcn).
<i>Dump =</i>	NA.

Table 45 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	The audit found an LCCB linked to an ALCB of a non-virtual call type that has both the XAC protocol state field and the IP "cpstate" field indicating states where no timers are pending. This LCCB configuration must have a timer and one of the two state fields must be in a state requiring a timer.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and return AUFALSE which recovers LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's protocol state "protstate" (for XAC).
<i>Bad Data =</i>	LCCB's cpstate (for IP).
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 46 Error Code: STUCK

Error Code:	STUCK
Error Description:	The audit found an LCCB that is currently waiting for PVC data from the SMP for update of the completed PVC information (pvcw4data is PSENABLE), however there are no timers pending. Since the "wait for data" state is considered a transient state by audits, there must be a timer to trigger some resultant action but the audits did not find one pending.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's logical channel number (lcn).
<i>Bad Data =</i>	LCCB's protocol state "protstate" (for XAC).
<i>Good Data =</i>	LCCB's ALCBs PH channel number ("al_phcn").
<i>Logical Index =</i>	LCCB index.

<i>Dump</i> =	NA.

Table 47 Error Code: TID

Error Code:	TID
Error Description:	Timer index is invalid. The audit found an LCCB linked to an ALCB. There is a BD offset in "qdsetup_index" but no timer is pending.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's "qdsetup" BD offset.
<i>Bad Data</i> =	LCCB's "protstate".
<i>Good Data</i> =	LCCB's timacc[PST3VC].
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	The LCCB.

Table 48 Error Code: TIDBAD

Error Code:	TIDBAD
Error Description:	Timer index bad. The audit found an LCCB linked to an ALCB with a timer tag value in the tim[] array however, PST3query has no record of any actual timers pending for this LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's "cpstate".
<i>Bad Data</i> =	LCCB's "protstate".
<i>Good Data</i> =	LCCB's ALCB's PH channel number ("al_phcn").
<i>Logical Index</i> =	Logical PH number.
<i>Dump</i> =	LCCB's tim array - "tim[PSTIMTAGS]".

Table 49 Error Code: TIME_EXC

Error Code:	TIME_EXC
Error Description:	A timer is executing. The audit found an LCCB on the free linked list or billing list of LCCBs that has a recorded timer when PST3_query is called to inquire information for the timers for this LCCB. For LCCBs on a billing or free linked list, there should not be any timers on for the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	tqret - local value used internally for debugging.
<i>Good Data</i> =	PSTNULLTE - valid null value for the PSte_query function for no timer.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 50 Error Code: TIMEORDER

Error Code:	TIMEORDER
Error Description:	The audit found an LCCB linked to an ALCB with a timer tag value in the PVC timer slot of the timacc[] array however, the protstates is not S1 or S2, or the pvcw4data field is DBNO and should be DBYES.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Timer tag of the PVC slot of timacc[] array.
<i>Bad Data</i> =	LCCB's protocol state "protstate".
<i>Good Data</i> =	LCCB's pvcw4data that should be DBYES.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 51 Error Code: TIMEOUT

Error Code:	TIMEOUT
Error Description:	An LCCB with no active timer is queued on a DCCB.
Possible Error Effect:	The condition notification call associated with this entry will fail.
Corrective Action Taken:	The LCCB is recovered to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	DCCB index.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 52 Error Code: TIMERLST

Error Code:	TIMERLST
Error Description:	The audit found an LCCB on the free linked list or billing list of LCCBs that has a non-null value in the tim[] timer array used by interprocessor communications (IP). On the free or billing linked list, there should not be any timers on for the LCCB.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's index into the tim[] array that is non-null.
<i>Bad Data</i> =	LCCB's tim value in the tim[] array.
<i>Good Data</i> =	PST3NULL - valid null value for the tim[] field.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	NA.

Table 53 Error Code: TIMESTAMP

Error Code:	TIMESTAMP
Error Description:	The audit found an LCCB linked to an ALCB. There is at least one BD in either ictl_bfr, intrpt_bfr, or rctl_bfr but there is no timer pending. Whenever a BD is linked to an LCCB, there must be timer therefore the LCCB will be recovered.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB's "ictl_bfr" BD offset.
<i>Bad Data</i> =	LCCB's "intrpt_bfr" BD offset.
<i>Good Data</i> =	PSNULLOFF - valid null BD offset.
<i>Logical Index</i> =	LCCB index.
<i>Dump</i> =	(PSOFFSET size) - LCCB's "rctl_bfr" BD offset.

Table 54 Error Code: TPID

Error Code:	TPID
Error Description:	A timer pending invalid. The audit has found an LCCB linked to an ALCB for a VC call with a "cpstate" that requires a timer pending. No timer is indicated, so the LCCB will be recovered.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's "cpstate" state value.
<i>Bad Data =</i>	tgret.
<i>Good Data =</i>	LCCB index.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 55 Error Code: TRANCK

Error Code:	TRANCK
Error Description:	The audit found an LCCB whose modem pool call is presently being torn down. Audits will time this transient state for at least 5 minutes. No audit sees this condition 5 minutes later so the LCCB will be torn down.
Possible Error Effect:	Prints a report and recovers the LCCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LCCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	PH channel number.
<i>Bad Data =</i>	LCCB's modem pool call touch bit that audit sets and will interrogate 5 minutes later to see if it is set and needs to tear the LCCB down.
<i>Good Data =</i>	Logical PH number.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 56 Error Code: TYPE

Error Code:	TYPE
Error Description:	The audit found an LCCB linked to an ALCB of a VC type but the channel type is found bad.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The call is torn down and associated resources (such as, the LCCB are returned to the appropriate idle list).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB's logical channel number.
<i>Bad Data =</i>	LCCB's channel type - "chantype".
<i>Good Data =</i>	PSVC TYPE - valid value for virtual call (VC) type for the LCCB's channel type.
<i>Logical Index =</i>	LCCB index.
<i>Dump =</i>	NA.

Table 57 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up.
Possible Error Effect:	Single process purges the audit process.
Corrective Action Taken:	Return audit complete, wait for next go around.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	AUrunning, audit ID that was running at the time of the interrupt.
<i>Dump =</i>	NA.

LCCB-C

Software Release: 5E13 only

1. LOGICAL CHANNEL CONTROL BLOCK (LCCB) AUDIT

Logical channel control blocks (LCCBs, entries in `PSlccb[ ]`) are used to represent layer 3 protocol data for a single user.

2. DATA STRUCTURES

For details on the fields contained in the structures mentioned in the error descriptions below, refer to the *5ESS®* Translations Data Manual (235-600-1xx) and the *5ESS®* Dynamic Data Manual (235-600-2xx).

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	An LCCB's <i>huntflag</i> is set incorrectly based on the layer 3 data <i>mhgflag</i> and/or the <i>lcn</i> value.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit sets <code>LCCB.huntflag</code> to the opposite of it's current value (either <code>PSDISABLED</code> or <code>PSENABLED</code>).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	A value of "1" indicates that the <i>huntflag</i> was <code>PSENABLED</code> but the layer 3 data <i>mhgflag</i> was <code>DBNO</code> . A value of "2" indicates that <i>huntflag</i> was <code>PSDISABLED</code> but the layer 3 data <i>mhgflag</i> was <code>DBYES</code> and the <i>lcn</i> value was in-range to be hunted and either was not a member of route selection or was routable.
<i>Bad Data =</i>	<code>LCCB.huntflag</code> .
<i>Good Data =</i>	The layer 3 data <i>mhgflag</i> value.
<i>Logical Index =</i>	The LCCB index (index into <code>PSlccb[]</code>).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	The ALCB (indexed by <code>LCCB.alcb_index</code>).
<i>Dump 3 =</i>	The DCDB (indexed by <code>ALCB.al_phcn</code>).
<i>Dump 4 =</i>	The DCCB (indexed by <code>ALCB.al_phcn</code>).
<i>Dump 5 =</i>	The layer 3 data structure.

Table 2 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	An LCCB is not configured properly based on the list it is linked to. For the idle and billing list (<i>owning_ll</i> = <code>PSFREELCCB</code> or <code>PSBILLLCCB</code>) this means that unused fields are not set to the expected default values (for example, the LCCB owns BDs or timers). For LCCBs linked to a DCCB (<i>owning_ll</i> = <code>PSDCCBQ</code>) the <i>lcn</i> or <i>alcb_index</i> fields are not null. In all other cases, the LCCB is not linked to an ALCB. Either <i>alcb_index</i> or <i>lcn</i> are out of range or <code>ALCB.lccb_index[lcn]</code> does not indicate the LCCB being audited.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in

	loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.owning_ll.
<i>Bad Data =</i>	LCCB.lcn.
<i>Good Data =</i>	LCCB.alcb_index.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	The ALCB if LCCB.alcb_index is in range (< PSHMAXALCB).

Table 3 Error Code: BAD_FAILED

Error Code:	BAD_FAILED
Error Description:	An LCCB is internally inconsistent (for example, the current protocol state may require a timer but no timer is present).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	Varies based on the nature of the inconsistency. Some errors are corrected in-line, others require that the LCCB be reinitialized and linked to the idle list. The value in "bad data" can be used to determine which type of recovery was done.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.lcn.
<i>Bad Data =</i>	A value indicating the nature of the error.
<i>Good Data =</i>	LCCB.alcb_index.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3 =</i>	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4 =</i>	The DCCB (indexed by ALCB.al_phcn).

Table 4 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	An entry in PSpgbstat[] contains incorrect counts of LCNs (<i>aggr_lcn</i>) and/or TPCs (<i>aggr_tpc</i>) according to the actual LCCB usage.
Possible Error Effect:	Hunting based on packet business group (PBG) usage may not be done correctly.
Corrective Action Taken:	The audit corrects the bad counts.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index into PSpgbstat[].
<i>Bad Data =</i>	The <i>aggr_lcn</i> value.
<i>Good Data =</i>	The <i>chk_lcn</i> value.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	The PSpgbstat[] entry (which includes the good and bad TPC counts).

Table 5 Error Code: BILLFLG

Error Code:	BILLFLG
Error Description:	The LCCB.billflg != PSDISABLED for an LCN associated with an X.75' trunk (DCDB.phctype = PST_X75P).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit sets LCCB.billflg to PSDISABLED.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	DCDB.phctype.
<i>Bad Data</i> =	LCCB.lcn.
<i>Good Data</i> =	LCCB.alcb_index.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 6 Error Code: BLNKINQUE

Error Code:	BLNKINQUE
Error Description:	The list of BDs in the circular list LCCB.hold_buff[] should not have any holes in it but it does.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Index of the hole in <i>hold_buff</i> [].
<i>Bad Data</i> =	LCCB.hold_top.
<i>Good Data</i> =	LCCB.hb_qd.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 7 Error Code: CALL_ID

Error Code:	CALL_ID
Error Description:	An LCCB's <i>lcn</i> value indicates that it is a PVC but the <i>chantype</i> value != PSPVC_TYPE.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.lcn.
<i>Bad Data</i> =	LCCB.chantype.
<i>Good Data</i> =	Layer 3 data <i>pvc_h_lcn</i> .
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).
<i>Dump 5</i> =	The layer 3 data structure.

Table 8 Error Code: CONV_BAD

Error Code:	CONV_BAD
Error Description:	An LCCB is associated with an active PBG (<i>loc_tpc_act</i> and/or <i>rem_tpc_act</i> = DBYES) but the value in LCCB.vc_tpc[PSCED or PSCING] is invalid.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such

	as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.vc_tpc[PSCED]
<i>Bad Data =</i>	LCCB.vc_tpc[PSCING]
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump =</i>	The LCCB.

Table 9 Error Code: INDEX

Error Code:	INDEX
Error Description:	Either at least one of an LCCB's <i>loc_pbg</i> or <i>rem_pbg</i> are out of range (> PSPBGMAX) or the PBG value is 0 but the corresponding TPC active bit (<i>loc_tpc_act</i> or <i>rem_tpc_act</i>) is set to DBYES.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.loc_pbg.
<i>Bad Data =</i>	LCCB.rem_pbg.
<i>Good Data =</i>	PSPBGMAX.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump =</i>	The LCCB.

Table 10 Error Code: INDRANGE_BAD

Error Code:	INDRANGE_BAD
Error Description:	An LCCB is linked to an ALCB (using <i>alcb_index</i> and <i>lcn</i>) but the ALCB contains invalid indexes to write protected data such as the DCDB and ALDB (ALCB.al_phcn and ALCB.aldb_index).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.lcn.
<i>Bad Data =</i>	ALCB.al_phcn.
<i>Good Data =</i>	LCCB.alcb_index.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	The associated ALCB.

Table 11 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	An LCCB headcell (element of PSlccbhd[]) is not empty (at least one of <i>first</i> or <i>last</i> is not PSLCCBNUL) but at least one of <i>first</i> or <i>last</i> is not a valid LCCB index ($\geq$ PSHMAXLCCB).
Possible Error Effect:	Varies depending on the list. If it is the idle list, LCCBs cannot be allocated (leading to layer 3 setup failures). If it is the billing list, packet billing data may be lost.
Corrective Action Taken:	The audit rebuilds the list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The headcell's <i>first</i> index.

<i>Bad Data</i> =	The headcell's <i>last</i> index.
<i>Good Data</i> =	The D-channel value associated with this list (as would appear in LCCB.qdccb_own if applicable).
<i>Logical Index</i> =	Index into the headcell array.
<i>Dump</i> =	NA.

Table 12 Error Code: INVUSAGE

Error Code:	INVUSAGE
Error Description:	An LCCB is marked as huntable (LCCB.huntflag = PSENABLED) on X.75 or X.75 prime trunk but the LCCB.lcn indicates that it is not huntable.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit sets LCCB.huntflag to PSDISABLED.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.lcn.
<i>Bad Data</i> =	LCCB.huntflag.
<i>Good Data</i> =	DCDB.phctype.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).
<i>Dump 5</i> =	The layer 3 data structure.

Table 13 Error Code: LIST

Error Code:	LIST
Error Description:	Either not all of the entries in LCCB.retran_buff[] starting at LCCB.retran_top and going for LCCB.rtb_qd+LCCB.shold_qd are set or some entries outside that range are set.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Index of the bad value in LCCB.retran_buff[].
<i>Bad Data</i> =	LCCB.retran_top.
<i>Good Data</i> =	LCCB.rtb_qd+LCCB.shold_qd.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 14 Error Code: LISTEND_BAD

Error Code:	LISTEND_BAD
Error Description:	An LCCB headcell contains the index of an LCCB that is not owned by that headcell or whose <i>bklccb_ind</i> or <i>fdlccb_ind</i> field is not consistent with the LCCB being at the end of the list.
Possible Error Effect:	Varies depending on the list. If it is the idle list, LCCBs cannot be allocated (leading to layer 3 setup failures). If it is the billing list, packet billing data may be lost.
Corrective Action Taken:	The audit rebuilds the list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The headcell's <i>first</i> index.
<i>Bad Data</i> =	The headcell's <i>last</i> index.

<i>Good Data</i> =	The D-channel value associated with this list (as would appear in LCCB.qdccb_own if applicable).
<i>Logical Index</i> =	Index into the headcell array.
<i>Dump 1</i> =	The LCCB indexed by the headcell's <i>first</i> value.
<i>Dump 2</i> =	The LCCB indexed by the headcell's <i>last</i> value.

Table 15 Error Code: LNKIALST

Error Code:	LNKIALST
Error Description:	An LCCB is not properly linked in a list or linked to no list. Either <i>fdlccb_ind</i> or <i>bklccb_ind</i> is out of range ($> \text{PSHMAXLCCB}$ and $\neq \text{PSLCCBNULL}$) or is null but the LCCB is not at the end of the list according to the headcell or indexes an LCCB which either does not point back (using <i>bklccb_ind</i> or <i>fdlccb_ind</i> respectively) or which contains different owner information (in <i>owning_ll</i> or <i>qdccb_own</i>).
Possible Error Effect:	If the owning list is the LCCB idle list, LCCBs cannot be allocated. Otherwise, a set of LCCBs cannot be allocated which could lead to layer 3 setup failures.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.owning_ll.
<i>Bad Data</i> =	LCCB headcell <i>first</i> LCCB index.
<i>Good Data</i> =	LCCB headcell <i>last</i> LCCB index.
<i>Logical Index</i> =	The LCCB index (index into <i>PSlccb[]</i>).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The LCCB indexed by <i>fdlccb_ind</i> if it's in range ($< \text{PSHMAXLCCB}$).
<i>Dump 3</i> =	The LCCB indexed by <i>bklccb_ind</i> if it's in range ($< \text{PSHMAXLCCB}$).
<i>Dump 4</i> =	The LCCB headcell's <i>first</i> LCCB if it's in range ($< \text{PSHMAXLCCB}$).
<i>Dump 5</i> =	The LCCB headcell's <i>last</i> LCCB if it's in range ($< \text{PSHMAXLCCB}$).

Table 16 Error Code: LS_RANGE_BAD

Error Code:	LS_RANGE_BAD
Error Description:	Either LCCB.retran_top is out of range ($\geq \text{PSBFRIND}$) or LCCB.rtb_qd+LCCB.shold_qd is $> \text{PSBFRIND}$.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.retran_top.
<i>Bad Data</i> =	LCCB.rtb_qd.
<i>Good Data</i> =	LCCB.shold_qd.
<i>Logical Index</i> =	The LCCB index (index into <i>PSlccb[]</i>).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 17 Error Code: OWNER

Error Code:	OWNER
Error Description:	An LCCB contains an invalid value in LCCB.owning_ll or checks specific to the owning linked list value failed. Specifically, if the <i>owning_ll</i> value is PSNOLCCBLST, one or more of the associated linkage fields (<i>fdlccb_ind</i> , <i>bklccb_ind</i> or <i>qdccb_own</i>) are not set to the appropriate default value. In the case of value PSCCBQ, the <i>qdccb_own</i> field is out of range ($\geq \text{PSMAXCHN}$).

Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.owning_ll.
<i>Bad Data =</i>	LCCB.fdlccb_ind.
<i>Good Data =</i>	LCCB.bklccb_ind.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	If the headcell index is in range, the headcell.

Table 18 Error Code: QUAR

Error Code:	QUAR
Error Description:	An LCCB's quarantine field has been set (LCCB.quar_bit = DBYES) indicating that the data in it is invalid.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.owning_ll.
<i>Bad Data =</i>	LCCB.alcb_index.
<i>Good Data =</i>	LCCB.lcn.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump =</i>	The LCCB.

Table 19 Error Code: QUE

Error Code:	QUE
Error Description:	One or both of LCCB.hold_top and LCCB.hb_qd are of out of range ($\geq$ PSBFRIND or $>$ PSBFRIND respectively).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.hold_top.
<i>Bad Data =</i>	LCCB.hb_qd.
<i>Good Data =</i>	PSBFRIND.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3 =</i>	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4 =</i>	The DCCB (indexed by ALCB.al_phcn).

Table 20 Error Code: TIMERLNK

Error Code:	TIMERLNK
Error Description:	An LCCB contains the index of a timer (in LCCB.tim[] or LCCB.timacc[]) but the timer is not linked back.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit sets the timer index field to PSTNULLTE.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	A value indicating the subarray of timer elements in the LCCB.
<i>Bad Data</i> =	A value indicating the nature of the bad linkage.
<i>Good Data</i> =	Index into the timer subarray.
<i>Logical Index</i> =	Index of the timer element.
<i>Dump</i> =	The LCCB.

Table 21 Error Code: TRANS_FAILED

Error Code:	TRANS_FAILED
Error Description:	An LCCB has been marked for modem pool teardown (LCCB.mcp_tear = DBYES) for more than 5 minutes.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.lcn.
<i>Bad Data</i> =	LCCB.alcb_index.
<i>Good Data</i> =	ALCB.al_phcn.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 22 Error Code: TYPE

Error Code:	TYPE
Error Description:	Based on the PH channel type (from DCDB.phctype where the DCDB is indexed by ALCB.al_phcn), an LCCB has an invalid <i>chantype</i> or other data (such as <i>mptmbd</i> != PSNULLOFF for phctype = PSDP_MP or ALCB.aldb_index = PSALDBNULL for non-trunk, non-modem pool cases).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.lcn.
<i>Bad Data</i> =	LCCB.chantype.
<i>Good Data</i> =	DCDB.phctype.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 23 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	If the LCCB headcell is in range (< PSNUMLCCBHD), the audit will rebuild that list of LCCBs. If the LCCB index is in range (< PSHMAXLCCB), the audit unlinks the LCCB

	from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSNUMLCCBHD.
<i>Bad Data</i> =	Index into LCCB headcell array (PSrlccbhd[]). May be out of range.
<i>Good Data</i> =	PSHMAXLCCB.
<i>Logical Index</i> =	The LCCB index. Note that this value may be out of range ($\geq$ PSHMAXLCCB).
<i>Dump 1</i> =	The LCCB headcell if the index is in range ($<$ PSNUMLCCBHD), otherwise NA.
<i>Dump 2</i> =	The LCCB if the LCCB index is in range ($<$ PSHMAXLCCB), otherwise NA.

LCCB-D

Software Release: 5E14 and later

1. LOGICAL CHANNEL CONTROL BLOCK (LCCB) AUDIT

Logical channel control blocks (LCCBs, entries in PSlccb[]) are used to represent layer 3 protocol data for a single user.

2. DATA STRUCTURES

For details on the fields contained in the structures mentioned in the error descriptions below, refer to the 5ESS[®] Translations Data Manual (235-600-1xx) and the 5ESS[®] Dynamic Data Manual (235-600-2xx).

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	An LCCB's <i>huntflag</i> is set incorrectly based on the layer 3 data <i>mhgflg</i> and/or the <i>lcn</i> value.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit sets LCCB.huntflag to the opposite of it's current value (either PSDISABLED or PSENABLED).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	A value of "1" indicates that the <i>huntflag</i> was PSENABLED but the layer 3 data <i>mhgflg</i> was DBNO. A value of "2" indicates that <i>huntflag</i> was PSDISABLED but the layer 3 data <i>mhgflg</i> was DBYES and the <i>lcn</i> value was in-range to be hunted and either was not a member of route selection or was routable.
<i>Bad Data =</i>	LCCB.huntflag.
<i>Good Data =</i>	The layer 3 data <i>mhgflg</i> value.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3 =</i>	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4 =</i>	The DCCB (indexed by ALCB.al_phcn).
<i>Dump 5 =</i>	The layer 3 data structure.

Table 2 Error Code: BADUSE

Error Code:	BADUSE
Error Description:	An LCCB is not configured properly based on the list it is linked to. For the idle and billing list (<i>owning_ll</i> = PSFREEELCCB or PSBILLLCCB) this means that unused fields are not set to the expected default values (for example, the LCCB owns BDs or timers). For LCCBs linked to a DCCB (<i>owning_ll</i> = PSDCCBQ) the <i>lcn</i> or <i>alcb_index</i> fields are not null. In all other cases, the LCCB is not linked to an ALCB. Either <i>alcb_index</i> or <i>lcn</i> are out of range or ALCB.lccb_index[lcn] does not indicate the LCCB being audited.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in

	loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.owning_ll.
<i>Bad Data =</i>	LCCB.lcn.
<i>Good Data =</i>	LCCB.alcb_index.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	The ALCB if LCCB.alcb_index is in range (< PSHMAXALCB).

Table 3 Error Code: BAD_FAILED

Error Code:	BAD_FAILED
Error Description:	An LCCB is internally inconsistent (for example, the current protocol state may require a timer but no timer is present).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	Varies based on the nature of the inconsistency. Some errors are corrected in-line, others require that the LCCB be reinitialized and linked to the idle list. The value in "bad data" can be used to determine which type of recovery was done.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.lcn.
<i>Bad Data =</i>	A value indicating the nature of the error.
<i>Good Data =</i>	LCCB.alcb_index.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3 =</i>	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4 =</i>	The DCCB (indexed by ALCB.al_phcn).

Table 4 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	An entry in PSpgbstat[] contains incorrect counts of LCNs (<i>aggr_lcn</i>) and/or TPCs (<i>aggr_tpc</i>) according to the actual LCCB usage.
Possible Error Effect:	Hunting based on packet business group (PBG) usage may not be done correctly.
Corrective Action Taken:	The audit corrects the bad counts.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index into PSpgbstat[].
<i>Bad Data =</i>	The <i>aggr_lcn</i> value.
<i>Good Data =</i>	The <i>chk_lcn</i> value.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	The PSpgbstat[] entry (which includes the good and bad TPC counts).

Table 5 Error Code: BILLFLG

Error Code:	BILLFLG
Error Description:	The LCCB.billflg != PSDISABLED for an LCN associated with an X.75' trunk (DCDB.phctype = PST_X75P) or internal LCN for INET.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit sets LCCB.billflg to PSDISABLED.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	DCDB.phctype.
<i>Bad Data</i> =	LCCB.lcn.
<i>Good Data</i> =	LCCB.alcb_index.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 6 Error Code: BLNKINQUE

Error Code:	BLNKINQUE
Error Description:	The list of BDs in the circular list LCCB.hold_buff[] should not have any holes in it but it does.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Index of the hole in <i>hold_buff</i> [].
<i>Bad Data</i> =	LCCB.hold_top.
<i>Good Data</i> =	LCCB.hb_qd.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 7 Error Code: CALL_ID

Error Code:	CALL_ID
Error Description:	An LCCB's <i>lcn</i> value indicates that it is a PVC but the <i>chantype</i> value != PSPVC_TYPE.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.lcn.
<i>Bad Data</i> =	LCCB.chantype.
<i>Good Data</i> =	Layer 3 data <i>pvc_h_lcn</i> .
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).
<i>Dump 5</i> =	The layer 3 data structure.

Table 8 Error Code: CONV_BAD

Error Code:	CONV_BAD
Error Description:	An LCCB is associated with an active PBG (<i>loc_tpc_act</i> and/or <i>rem_tpc_act</i> = DBYES) but the value in LCCB.vc_tpc[PSCED or PSCING] is invalid.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such

	as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.vc_tpc[PSCED]
<i>Bad Data =</i>	LCCB.vc_tpc[PSCING]
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump =</i>	The LCCB.

Table 9 Error Code: INDEX

Error Code:	INDEX
Error Description:	Either at least one of an LCCB's <i>loc_pbg</i> or <i>rem_pbg</i> are out of range (> PSPBGMAX) or the PBG value is 0 but the corresponding TPC active bit (<i>loc_tpc_act</i> or <i>rem_tpc_act</i>) is set to DBYES.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.loc_pbg.
<i>Bad Data =</i>	LCCB.rem_pbg.
<i>Good Data =</i>	PSPBGMAX.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump =</i>	The LCCB.

Table 10 Error Code: INDRANGE_BAD

Error Code:	INDRANGE_BAD
Error Description:	An LCCB is linked to an ALCB (using <i>alcb_index</i> and <i>lcn</i>) but the ALCB contains invalid indexes to write protected data such as the DCDB and ALDB (ALCB.al_phcn and ALCB.aldb_index).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LCCB.lcn.
<i>Bad Data =</i>	ALCB.al_phcn.
<i>Good Data =</i>	LCCB.alcb_index.
<i>Logical Index =</i>	The LCCB index (index into PSlccb[]).
<i>Dump 1 =</i>	The LCCB.
<i>Dump 2 =</i>	The associated ALCB.

Table 11 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	An LCCB headcell (element of PSlccbhd[]) is not empty (at least one of <i>first</i> or <i>last</i> is not PSLCCBNUL) but at least one of <i>first</i> or <i>last</i> is not a valid LCCB index ($\geq$ PSHMAXLCCB).
Possible Error Effect:	Varies depending on the list. If it is the idle list, LCCBs cannot be allocated (leading to layer 3 setup failures). If it is the billing list, packet billing data may be lost.
Corrective Action Taken:	The audit rebuilds the list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The headcell's <i>first</i> index.

<i>Bad Data</i> =	The headcell's <i>last</i> index.
<i>Good Data</i> =	The D-channel value associated with this list (as would appear in LCCB.qdccb_ own if applicable).
<i>Logical Index</i> =	Index into the headcell array.
<i>Dump</i> =	NA.

Table 12 Error Code: INVUSAGE

Error Code:	INVUSAGE
Error Description:	An LCCB is marked as huntable (LCCB.huntflag = PSENABLED) on X.75 or X.75 prime trunk but the LCCB.lcn indicates that it is not huntable.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit sets LCCB.huntflag to PSDISABLED.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.lcn.
<i>Bad Data</i> =	LCCB.huntflag.
<i>Good Data</i> =	DCDB.phctype.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).
<i>Dump 5</i> =	The layer 3 data structure.

Table 13 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	Multiple line hunt group (MLHG) flag is set to DBYES for internal INET LCN.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit sets PSL3DATA.mhgflg to DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.lcn.
<i>Bad Data</i> =	LCCB.huntflag.
<i>Good Data</i> =	PSL3DATA.mhgflg.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).
<i>Dump 5</i> =	The layer 3 data structure.

Table 14 Error Code: LIST

Error Code:	LIST
Error Description:	Either not all of the entries in LCCB.retran_buf[] starting at LCCB.retran_top and going for LCCB.rtb_qd+LCCB.shold_qd are set or some entries outside that range are set.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Index of the bad value in LCCB.retran_buf[].
<i>Bad Data</i> =	LCCB.retran_top.
<i>Good Data</i> =	LCCB.rtb_qd+LCCB.shold_qd.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).

<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 15 Error Code: LISTEND_BAD

Error Code:	LISTEND_BAD
Error Description:	An LCCB headcell contains the index of an LCCB that is not owned by that headcell or whose <i>bkcccb_ind</i> or <i>fdcccb_ind</i> field is not consistent with the LCCB being at the end of the list.
Possible Error Effect:	Varies depending on the list. If it is the idle list, LCCBs cannot be allocated (leading to layer 3 setup failures). If it is the billing list, packet billing data may be lost.
Corrective Action Taken:	The audit rebuilds the list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The headcell's <i>first</i> index.
<i>Bad Data</i> =	The headcell's <i>last</i> index.
<i>Good Data</i> =	The D-channel value associated with this list (as would appear in LCCB.qdcccb_own if applicable).
<i>Logical Index</i> =	Index into the headcell array.
<i>Dump 1</i> =	The LCCB indexed by the headcell's <i>first</i> value.
<i>Dump 2</i> =	The LCCB indexed by the headcell's <i>last</i> value.

Table 16 Error Code: LNKIALST

Error Code:	LNKIALST
Error Description:	An LCCB is not properly linked in a list or linked to no list. Either <i>fdcccb_ind</i> or <i>bkcccb_ind</i> is out of range ($> \text{PSHMAXLCCB}$ and $\neq \text{PSLCCBNULL}$) or is null but the LCCB is not at the end of the list according to the headcell or indexes an LCCB which either does not point back (using <i>bkcccb_ind</i> or <i>fdcccb_ind</i> respectively) or which contains different owner information (in <i>owning_ll</i> or <i>qdcccb_own</i>).
Possible Error Effect:	If the owning list is the LCCB idle list, LCCBs cannot be allocated. Otherwise, a set of LCCBs cannot be allocated which could lead to layer 3 setup failures.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.owning_ll.
<i>Bad Data</i> =	LCCB headcell <i>first</i> LCCB index.
<i>Good Data</i> =	LCCB headcell <i>last</i> LCCB index.
<i>Logical Index</i> =	The LCCB index (index into <i>PSlcccb[]</i>).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The LCCB indexed by <i>fdcccb_ind</i> if it's in range ($< \text{PSHMAXLCCB}$).
<i>Dump 3</i> =	The LCCB indexed by <i>bkcccb_ind</i> if it's in range ($< \text{PSHMAXLCCB}$).
<i>Dump 4</i> =	The LCCB headcell's <i>first</i> LCCB if it's in range ($< \text{PSHMAXLCCB}$).
<i>Dump 5</i> =	The LCCB headcell's <i>last</i> LCCB if it's in range ($< \text{PSHMAXLCCB}$).

Table 17 Error Code: LS_RANGE_BAD

Error Code:	LS_RANGE_BAD
Error Description:	Either LCCB.retran_top is out of range ($\geq \text{PSBFRIND}$) or LCCB.rtb_qd+LCCB.shold_qd is $> \text{PSBFRIND}$.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	LCCB.retran_top.
<i>Bad Data</i> =	LCCB.rtb_qd.
<i>Good Data</i> =	LCCB.shold_qd.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 18 Error Code: OWNER

Error Code:	OWNER
Error Description:	An LCCB contains an invalid value in LCCB.owning_ll or checks specific to the owning linked list value failed. Specifically, if the <i>owning_ll</i> value is PSNOLCCBLST, one or more of the associated linkage fields (<i>fdlccb_ind</i> , <i>bklccb_ind</i> or <i>qdccb_own</i>) are not set to the appropriate default value. In the case of value PSCCBQ, the <i>qdccb_own</i> field is out of range ($\geq$ PSMAXCHN).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.owning_ll.
<i>Bad Data</i> =	LCCB.fdlccb_ind.
<i>Good Data</i> =	LCCB.bklccb_ind.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	If the headcell index is in range, the headcell.

Table 19 Error Code: QUAR

Error Code:	QUAR
Error Description:	An LCCB's quarantine field has been set (LCCB.quar_bit = DBYES) indicating that the data in it is invalid.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.owning_ll.
<i>Bad Data</i> =	LCCB.alcb_index.
<i>Good Data</i> =	LCCB.lcn.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump</i> =	The LCCB.

Table 20 Error Code: QUE

Error Code:	QUE
Error Description:	One or both of LCCB.hold_top and LCCB.hb_qd are out of range ($\geq$ PSBFRIND or $>$ PSBFRIND respectively).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	LCCB.hold_top.
<i>Bad Data</i> =	LCCB.hb_qd.
<i>Good Data</i> =	PSBFRIND.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 21 Error Code: TIMERLNK

Error Code:	TIMERLNK
Error Description:	An LCCB contains the index of a timer (in LCCB.tim[] or LCCB.timacc[]) but the timer is not linked back.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit sets the timer index field to PSTNULLTE.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	A value indicating the subarray of timer elements in the LCCB.
<i>Bad Data</i> =	A value indicating the nature of the bad linkage.
<i>Good Data</i> =	Index into the timer subarray.
<i>Logical Index</i> =	Index of the timer element.
<i>Dump</i> =	The LCCB.

Table 22 Error Code: TRANS_FAILED

Error Code:	TRANS_FAILED
Error Description:	An LCCB has been marked for modem pool teardown (LCCB.mcp_tear = DBYES) for more than 5 minutes.
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.lcn.
<i>Bad Data</i> =	LCCB.alcb_index.
<i>Good Data</i> =	ALCB.al_phcn.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 23 Error Code: TYPE

Error Code:	TYPE
Error Description:	Based on the PH channel type (from DCDB.phctype where the DCDB is indexed by ALCB.al_phcn), an LCCB has an invalid <i>chantype</i> or other data (such as <i>mptmbd</i> != PSNULLOFF for phctype = PSDP_MP or ALCB.aldb_index = PSALDBNULL for non-trunk, non-modem pool cases).
Possible Error Effect:	The protocol stack associated with the LCCB is corrupted. This may result in loss of layer 3, dropped frames or other problems varying according to conditions.
Corrective Action Taken:	The audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LCCB.lcn.

<i>Bad Data</i> =	LCCB.chantype.
<i>Good Data</i> =	DCDB.phctype.
<i>Logical Index</i> =	The LCCB index (index into PSlccb[]).
<i>Dump 1</i> =	The LCCB.
<i>Dump 2</i> =	The ALCB (indexed by LCCB.alcb_index).
<i>Dump 3</i> =	The DCDB (indexed by ALCB.al_phcn).
<i>Dump 4</i> =	The DCCB (indexed by ALCB.al_phcn).

Table 24 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	If the LCCB headcell is in range (< PSNUMLCCBHD), the audit will rebuild that list of LCCBs. If the LCCB index is in range (< PSHMAXLCCB), the audit unlinks the LCCB from any list it is in and from any owning ALCB, sets all fields to default values and links it to the idle list. Associated resources such as timers may also be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSNUMLCCBHD.
<i>Bad Data</i> =	Index into LCCB headcell array (PSrlccbhd[]). May be out of range.
<i>Good Data</i> =	PSHMAXLCCB.
<i>Logical Index</i> =	The LCCB index. Note that this value may be out of range ($\geq$ PSHMAXLCCB).
<i>Dump 1</i> =	The LCCB headcell if the index is in range (< PSNUMLCCBHD), otherwise NA.
<i>Dump 2</i> =	The LCCB if the LCCB index is in range (< PSHMAXLCCB), otherwise NA.

LCGREP

Software Release: 5E10 and later

1. LINE CONCENTRATOR REPORT INHIBIT MASK (LCGREP) AUDIT

Peripheral control (PC) scanning detects input signals from the switching periphery in the switching module (SM). These input signals include line and trunk originations, digit collection, service request signals, and other supervision signals. Two types of scanning are audited: control interface (CI) scanning and summary scanning. Control interface scanning is described in the scan mask audit (SCNMSK). Summary scanning detects input signals from line concentrators (grids) connected to the line unit or line group controllers (LGCs) for integrated services line units (ISLUs). Refer to Figure 1. The line unit contains from four to eight grid circuits for LU1, 16 half-grids for LU2, and 20 for LU3. Each circuit controls a maximum of 64 customer lines (32 for LU2, and LU3). Scanning detects when a customer's line goes off-hook.

The line concentrator report inhibit mask audit (LCGREP) checks summary scanning and ensures that line originations are not being ignored. The line concentrator scan mask audit (LCSMSK) also checks summary scanning.

The audit detects errors in the line concentrator report inhibit mask array (Cllcgrep). Each bit in Cllcgrep corresponds to a group of eight lines in a grid. If a bit is set, a report for that group is entered on the report queue but has not been completely processed. This prevents queuing other reports for the same group. A single bit error in Cllcgrep may cause origination failures (no dial tone) for all eight lines in the affected group.

This audit is part of the peripheral control audits subgroup.

2. DATA STRUCTURES

The data structures verified by this audit are the line concentrator report inhibit mask array (Cllcgrep), the group service data block relation (rlGSDB), and the line concentrator touch bit array (Sllcgtch).

Figure 1 (LCGREP-1) Summary Scanning

3. AUDIT CHECKS

The LCGREP audit steps through the Cllcgrep array. Using line unit and grid information, the audit calculates a key and retrieves the rIGSDB tuple with that key. The information in the tuple, along with the information in the Sllcgtch array, is used to audit the Cllcgrep array.

- (a) The audit compares each bit in Cllcgrep against each bit in Sllcgtch for one of four conditions:
- Both bits are not set. This is the desired condition because it enables reporting.
 - The bit in Cllcgrep is not set, and the bit in Sllcgtch is set. This condition is an error.

- The bit in Cllcgrep is set, and the bit in Sllcgtch is not set. This condition is temporary and will be changed by setting the Sllcgtch bit.
- Both bits are set. In this case, the corresponding rIGSDB tuple is checked to see whether it is on an idle list. If the rIGSDB tuple is on an idle list, this condition is an error because reports have been inhibited for at least 30 seconds and there is no queued job to allow further reports.

- (b) The Cllcgrep and Sllcgtch arrays allow the audit to infer activity. If there is no activity for 30 seconds and no queued report, the audit concludes that errors occurred and zeroes the Cllcgrep and Sllcgtch bits.

The Cllcgrep array is not used by integrated services line unit (ISLU) and remote ISLU (RISLU) operational software. Consequently, any entries in the arrays corresponding to these unit types are not audited.

4. ERROR HANDLING

If any of the conditions are in error, bits in the Cllcgrep and Sllcgtch arrays are zeroed.

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: INHHDW

Error Code:	INHHDW
Error Description:	Status of the group in hardware does not match the software status.
Possible Error Effect:	The tuple associated with this bit will be invalidly used. consequently cause unnecessary ROP output.
Corrective Action Taken:	The hardware will be overwritten to match the software.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Line unit number.
<i>Bad Data =</i>	Data from hardware read.
<i>Good Data =</i>	Value of corresponding Cllcgrep[] element.
<i>Logical Index =</i>	The value of our loop cursor.
<i>Dump =</i>	NA.

Table 2 Error Code: INHSTATE

Error Code:	INHSTATE
Error Description:	The audited bit is not a valid bit yet it's "bitval" is not 0.
Possible Error Effect:	The tuple associated with this bit will be invalidly used. consequently cause unnecessary ROP output.
Corrective Action Taken:	The bit will be set to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Indication of bit validity.
<i>Bad Data =</i>	The Cllcgrep[element] value.
<i>Good Data =</i>	The Cllcgrep[element] value after it is corrected.
<i>Logical Index =</i>	The value of AUCursor.
<i>Dump =</i>	NA.

Table 3 Error Code: RISTUK

Error Code:	RISTUK
Error Description:	Bits in Cllcgrep are stuck set, inhibiting origination reports.
Possible Error Effect:	Affected customers cannot originate.
Corrective Action Taken:	The erroneous bit(s) are cleared to allow originations to be reported.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Address of the element in Cllcgreg.
<i>Bad Data</i> =	Value of bitval.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Number of the affected group.
<i>Dump</i> =	riGSDB tuple corresponding to the bit in error.

Table 4 Error Code: TIMESTAMP

Error Code:	TIMESTAMP
Error Description:	The operating systems (OSDS) ITIME (OSnow) seems to have moved backwards. Possible corruption of the global variable, AULcgtim, used for transient timing may have occurred.
Possible Error Effect:	The will cause the LCGREP audit not to run on this invocation of the audit. The LCGREP audit should not run faster than every 30 seconds.
Corrective Action Taken:	AULcgtim will be updated with the current OSDS ITIME (OSnow) and the audit will not run until the next invocation of the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the transient timing variable (AULcgtim).
<i>Bad Data</i> =	The difference in time between current ITIME (OSnow) and the transient timing variable (AULcgtim).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	Content of the current OSDS ITIME (OSnow).
<i>Dump 2</i> =	Content of the transient timing variable (AULcgtim).

Table 5 Error Code: TMUT

Error Code:	TMUT
Error Description:	The touch bits have been mutilated. Bits in Sllcgtch were found set with the corresponding bits in Cllcgreg found cleared.
Possible Error Effect:	The LCGREP audit will not operate correctly.
Corrective Action Taken:	The mutilated touch bits are zeroed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the element in Sllcgtch.
<i>Bad Data</i> =	Value of touchbit.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Number of the affected group.
<i>Dump</i> =	NA.

Table 6 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up after taking a reset.
Possible Error Effect:	Causes resets and/or asserts.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Line unit number (0-7).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	AUcursor.
<i>Dump</i> =	NA.

LCSMSK

Software Release: 5E10 and later

1. LINE CONCENTRATOR SCAN MASK AUDIT (LCSMSK)

Peripheral control (PC) scanning detects input signals from the switching periphery in the switching module (SM). These input signals include line and trunk originations, digit collection, service request signals, and other supervision signals. Two types of scanning are audited: control interface (CI) scanning and summary scanning. Control interface scanning is described in the scan mask audit (SCNMSK). Summary scanning detects input signals from line concentrators (grids) connected to the line unit or line group controllers (LGCs) for integrated services line units (ISLUs) and remote ISLUs (RISLU). Refer to Figure 1. The line unit contains from four to eight grids for LU1 (16 half-grids for LU2, 20 for LU3); each grid controls a maximum of 64 customer lines (32 for LU2 and LU3). Scanning detects when a customer's line goes off-hook. The line concentrator scan mask audit (LCSMSK) and the line concentrator report inhibit mask audit (LCGREP) check summary scanning.

The LCSMSK audit detects errors in the line concentrator scan mask array (Cllcsmask). Each bit in Cllcsmask corresponds to a circuit that controls 64 customer lines for LU1 (32 for LU2, LU3, ISLU and RISLU). When a bit in Cllcsmask enables scanning, the corresponding circuit is scanned for changes. A single bit error in Cllcsmask may cause call origination failures (no dial tone) for all lines terminating at the affected circuit.

This audit is part of the peripheral control audits subgroup. It runs in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The data structures verified by this audit are the line concentrator scan mask array (Cllcsmask), the switch maintenance equipment status table relation (RLSMEST), and the line concentrator scan mask copy (Sllcsmask).

The audit checks the ISLU/RISLU common controller (CC) duplex failure array (SMccdupfail) and the ISLU common data (CD) configuration array (PCiscdconfig).

Figure 1 (LCSMSK-1) Summary Scanning

3. AUDIT CHECKS

LCSMSK audit calls the bit mask driver (DRBMSK) to step through the Cllcsmk array. The DRBMSK driver calculates the corresponding GRID/LGC circuit key, retrieves the rSMEST tuple with that key, and calls a semantic check function to perform the following checks for each bit in Cllcsmk:

- The audit uses the information in the rSMEST tuple to predict the state of the Cllcsmk bit.
- The audit verifies the predicted state of the Cllcsmk bit.
- The audit verifies each bit in Sllcsmk against Cllcsmk to find inconsistencies.

- (d) If the line unit is unequipped, the corresponding bits in Cllcsmsk[] are checked to make sure they are set to "inhibit".
- (e) For ISLU/RISLU, if the CC is duplex failed (SMccdupfail[]) or the CC is being restored (PCiscdconfig[]), the audit skips further checking on this line unit. Otherwise, the unified control interface (UCI) hardware register in the ISLU common controller (CC) is checked for agreement with the Cllcsmsk[] array and rISMEST for the ISLU LGCs in-service/OOS status.

4. ERROR HANDLING

If an inconsistency exists between Cllcsmsk and rISMEST, both Cllcsmsk and Sllcsmsk are changed to agree with rISMEST. If an inconsistency exists between Cllcsmsk and Sllcsmsk, Sllcsmsk is changed to agree with Cllcsmsk.

If the UCI IS/OOS bit disagrees with the rISMEST and/or Cllcsmsk[] for ISLU/RISLU LGC circuits, the audit will write the UCI hardware bit to agree with rISMEST and update the Cllcsmsk[] bit. If the Cllcsmsk[] bits for an unequipped LU are not marked "inhibit," the audit will update them.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: ALWOOS

Error Code:	ALWOOS
Error Description:	The LGC UCI hardware register bit indicates that the LGC in question is active when the rISMEST tuple for the LGC indicates OOS or ACTIVE/CAMPON.
Possible Error Effect:	Operational and maintenance code will access this LGC improperly and report errors.
Corrective Action Taken:	The LGC UCI bit is written to zero.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LGC UCI register.
<i>Bad Data</i> =	Data in LGC UCI register.
<i>Good Data</i> =	Corrected data in LGC UCI register.
<i>Logical Index</i> =	AUcursor.
<i>Dump</i> =	Copy of corresponding rISMEST tuple.

Table 2 Error Code: READSMEST

Error Code:	READSMEST
Error Description:	The rISMEST tuple for an RISLU/ISLU CC circuit calculated for this equipped RISLU/ISLU was not found (no match from DB read).
Possible Error Effect:	The system has lost resources, data problems.
Corrective Action Taken:	The CKTDATA audit is scheduled in elevated mode (related audit) to insert the missing rISMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of Cllcsmsk[].
<i>Bad Data</i> =	Circuit name of RISLU/ISLU CC.
<i>Good Data</i> =	Line unit number.
<i>Logical Index</i> =	AUcursor.
<i>Dump</i> =	NA.

Table 3 Error Code: SALW (1)

Error Code:	SALW (1)
Error Description:	A bit in Cllcsmsk[] says that scanning is allowed for a grid when the maintenance information in the corresponding rISMEST tuple says scanning

	should not be allowed.
Possible Error Effect:	PC foreground is scanning a grid that it shouldn't. This causes extra work for the system and may result in CI interrupts. These in turn could cause system initializations.
Corrective Action Taken:	The incorrect bit in Clcsmask[] is reset to inhibit scanning.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of element of Clcsmask[] containing error.
<i>Bad Data</i> =	Value of element of Clcsmask containing error.
<i>Good Data</i> =	Value of element of Clcsmask with the single bit in error corrected.
<i>Logical Index</i> =	Number of bit in Clcsmask[].
<i>Dump</i> =	Copy of corresponding rSMEST tuple.

Table 4 Error Code: SALW (2)

Error Code:	SALW (2)
Error Description:	For an ISLU LGC, the LGC UCI hardware bit does not indicate active (1) for an active LGC so marked in rSMEST.
Possible Error Effect:	The hardware equipage status for the LGC is wrong and will cause operational and maintenance failures.
Corrective Action Taken:	The LGC UCI hardware bit is written to active (1).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LGC UCI hardware register.
<i>Bad Data</i> =	Data in LGC UCI hardware register.
<i>Good Data</i> =	Corrected data in LGC UCI hardware register.
<i>Logical Index</i> =	Number of bit in Clcsmask[].
<i>Dump</i> =	Copy of corresponding rSMEST tuple.

Table 5 Error Code: SICPY

Error Code:	SICPY
Error Description:	The corresponding bits in Slcsmask[] and Clcsmask[] are unequal, but the bit in Clcsmask[] apparently has the right value. The SI copy of Clcsmask[] is incorrect.
Possible Error Effect:	The integrity monitor will assert periodically (and frequently).
Corrective Action Taken:	The SI copy is corrected to correspond with Clcsmask[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of Slcsmask[].
<i>Bad Data</i> =	Value of element of Slcsmask[] containing error.
<i>Good Data</i> =	Value of element of Clcsmask with the single bit in error corrected.
<i>Logical Index</i> =	AUcursor.
<i>Dump</i> =	NA.

Table 6 Error Code: SINH (1)

Error Code:	SINH (1)
Error Description:	A bit in Clcsmask[] says that scanning is inhibited for a grid when the maintenance information in the corresponding rSMEST tuple says scanning should be allowed.
Possible Error Effect:	PC foreground isn't scanning a grid that it should. This causes call processing failures.
Corrective Action Taken:	The incorrect bit in Clcsmask[] is reset to allow scanning.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of element of Clcsmask[] containing error.
<i>Bad Data</i> =	Value of element of Clcsmask[] containing error.
<i>Good Data</i> =	Value of element of Clcsmask with the single bit in error corrected.
<i>Logical Index</i> =	Number of bit in Clcsmask[].
<i>Dump</i> =	Copy of corresponding rSMEST tuple.

Table 7 Error Code: SINH (2)

Error Code:	SINH (2)

Error Description:	For an unequipped LGC on an equipped ISLU, the corresponding LGC UCI hardware bit should be zero and is not.
Possible Error Effect:	Operational and maintenance software may try to access this unequipped LGC by accident.
Corrective Action Taken:	The corresponding LGC UCI bit is written to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of LGC UCI register.
<i>Bad Data</i> =	Data in LGC UCI register.
<i>Good Data</i> =	Corrected data in LGC UCI register.
<i>Logical Index</i> =	Number of bit in Cllcsmsk[].
<i>Dump</i> =	Copy of corresponding rSMEST tuple.

Table 8 Error Code: SMEST

Error Code:	SMEST
Error Description:	The rSMEST tuple for an ISLU CD circuit calculated for this equipped ISLU was not found (no match from DB read).
Possible Error Effect:	The system has lost resources, data problems.
Corrective Action Taken:	The CKTDATA audit is scheduled in elevated mode (related audit) to insert the missing rSMEST tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of Cllcsmsk[].
<i>Bad Data</i> =	Circuit name of ISLU CD.
<i>Good Data</i> =	Line unit number.
<i>Logical Index</i> =	AUcursor.
<i>Dump</i> =	NA.

Table 9 Error Code: UNEQUIP

Error Code:	UNEQUIP
Error Description:	The Cllcsmsk[] bit for an unequipped line unit is not zero (inhibit).
Possible Error Effect:	Operational and maintenance code may try to access the circuit corresponding to this bit by accident.
Corrective Action Taken:	The Cllcsmsk bit is set to zero.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of Cllcsmsk[].
<i>Bad Data</i> =	Value of element of Cllcsmsk[] containing error.
<i>Good Data</i> =	Corrected value of element of Cllcsmsk.
<i>Logical Index</i> =	AUcursor.
<i>Dump</i> =	Copy of corresponding rSMEST tuple.

19. LD - LG

LDATBLF

Software Release: 5E10 and later

1. BUSY LAMP FIELD (LDATBLF) AUDIT

Integrated services digital network (ISDN) attendant (ISAT) features provides business customers subscribing to ISDN service with one or more switch-based features used to serve calls requiring assistance. The only hardware required for ISAT features is the ISDN attendant console, itself. All control functions are done by the switch and by the console through the D-channel.

The direct station selection (DSS) busy lamp field (BLF) attendant feature provides customers with a display of the status of a maximum of 100 monitored directory numbers (DNs) simultaneously. The status of each monitored DN is indicated by a lamp on the hundreds group controller (HGC). When a lamp is lit, the DN is busy.

The status of monitored DN's is stored in an array of bits in the RLLDAT_BLF relation. The LDATBLF audit runs in all switching modules (SMs) in segmented mode only.

2. DATA STRUCTURES

The RLLDAT_BLF relation is used in three separate ISAT monitored call scenarios: ISAT monitored multi-line hunt groups (MLHGs), ISAT monitored PODS/analog DN's, and ISAT monitored MCA/shared DN's. The data structures involved in these three scenarios are shown in Figures 1, 2, and 3 respectively.

In all three scenarios, there exists a one-to-one relationship between the rLLDAT_BLF dynamic tuple and an rLMONI_BLF static tuple. The RLMONI_BLF relation contains the hundreds group identifier (hgid) associated with the lamps the rLLDAT_BLF tuple monitors.

For the ISAT monitored MLHG scenario, the RLRT_MHG static relation is used to contain the MLHG which is being monitored (grpnum) as well as the group DN (grp_noc and grp_loc) which maps to the Hundreds Group Identifier in RLMONI_BLF. The actual members status of the MLHG are stored in either RLLNSTAT (small groups) or RLLGLNSTAT (large groups) dynamic relations in a bit map (gmflg[]). These relations have an implied linkage with RLRT_MHG.

The PODS and Analog DN scenario representations are very similar. In both cases, the DN is stored in the static relation RLFC_LINE (noc and digits) which maps to the RLMONI_BLF hundreds group identifier. In addition, the port stored in RLFC_LINE (gport) has an implied linkage to RLPORTLA. If this is a PODS monitored call, the RLPORTLA will be a D-channel, and will have an implied linkage to RLDSLEQUIP where rLPORTLA.port.member equals rLDSLEQUIP.dsl.

For the MCA/Shared DN scenario, the monitored DN will be stored in the RLIS_LINE static relation (noc and loc) and will map to the hundreds group identifier stored in RLMONI_BLF. The RLIS_LINE logical termination index (ltm_idx) is the key for a corresponding rLTMSTAT dynamic tuple which contains the status of all call appearances associated with the DN. In addition, RLIS_LINE contains the logical port for the DN (lport) which is also stored in the logical port to physical port static relation RLLPT_PT. The RLLPT_PT relation contains the physical port (gport) by which the rLPORTLA tuple associated with this DN may be accessed. Lastly, for the port and party in RLLPT_PT, there may exist a corresponding RLFC_LINE tuple provided that the monitored DN is a primary DN. If the DN is a secondary only DN (a secondary DN for which there exists no primary DN), there will be no corresponding RLFC_LINE static tuple.

In all three scenarios, the noc from either RLRT_MHG, RLFC_LINE, or RLIS_LINE is used to obtain the correct RLLDAT_BLF status bit position which corresponds to the lamp on the HGC for this monitored DN.

* For small groups, this will be an rILNSTAT tuple. For large groups, this will be an rLGLNSTAT tuple.

Figure 1 (LDATBLF-1) ISAT Monitored MHLG Scenario

Figure 2 (LDATBLF-2) PODS and Analog ISAT Monitored Scenario

Figure 3 (LDATBLF-3) MCA/Shared DN ISAT Monitored DN Scenario

3. AUDIT CHECKS

The LDATBLF audit uses the DRSTATIC driver, and for each rLSTAT_BLF tuple, the audit makes the following checks: If the LDATBLF audit is entered:

KEY = Check for corruption of the rLSTAT_BLF tuple's key.

LOSTTUP = Check for missing rLSTAT_BLF tuple(s).

If this rLSTAT_BLF status bit is associated with an ISAT monitored MLHG:

BADIDLE = Check the idlecount field for the rLSTAT/rLGLNSTAT tuple.

CL = For this rLRT_MHG tuple, read the corresponding rIMONI_BLF tuple.

NOTIDLE = Check the lamp state for the DN associated with a monitored MLHG.

PPKEY = Check for a missing rILNSTAT or rILGLNSTAT tuple for this monitored MLHG.

RANGE = Check hunt type for this small or large monitored MLHG.

TYPE = Check the hunt type valid for this small or large monitored MLHG.

If this is a PODS or ANALOG DN:

LGKEY = Obtain the rIORTLA tuple for this monitored Analog or PODS DN.

NOPCBLA = This analog or PODS port is owned by a process; try to obtain the corresponding rIPCBLA tuple.

If this is a PODS call:

HTYPE = For this tuple in RLFC_LINE read the corresponding tuple in RLMONI_BLF which has a key (hgid) corresponding to the locdn (noc and digits) obtained from RLFC_LINE.

INV_STATE = For a PODS B-channel rIORTLA tuple obtain the corresponding D-channel rIORTLA tuple.

STATUS = Check the lamp state for this monitored Analog or PODS port.

If this is an MCA/Shared DN call:

NOORTLA = Access the rIORTLA tuple for this ISDN monitored port.

TRKG = For this tuple in RLIS_LINE read the corresponding tuple in RLMONI_BLF.

If the port for this DN is out of service:

TLAMP = Check the lamp state for this OOS monitored ISDN port is correct.

If the port for this DN is not out of service:

DYN_STAT = Obtain the rILTMSTAT tuple containing the call appearances for this ISDN monitored port for this ltm_idx in RLIS_LINE.

LAMP = Check the lamp state for this in-service monitored ISDN port is correct.

PORT = For this tuple in RLIS_LINE obtain the corresponding tuple in RLPT_PT.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: BADIDLE

Error Code:	BADIDLE
Error Description:	The value of the idle count (idlecount) in the rILNSTAT tuple (if bad data equals 1) or rILGLNSTAT tuple (if bad data equals 2) does not agree with the actual number of idle members of this MLHG.

Possible Error Effect:	The lamp status for this monitored multi-line hunt group may be incorrect on the hundreds group controller associated with this attendant console.
Corrective Action Taken:	The correct value of the idle count will be inserted in the rLNSTAT or rLGLNSTAT tuple.
Manual Action Required:	None, unless the rIRT_MHG.htype is RTH_ISAT or RTH_MUPH. These are invalid hunt types for monitored MLHGs, since ISAT and MUPH MLHGs are not monitorable. Use ODBE to change the hunt type for this group to a valid monitorable hunt type.
Dump Description:	
<i>Error Address =</i>	The address of the rLNSTAT tuple (if bad data equals 1) or rLGLNSTAT tuple (if bad data equals 2).
<i>Bad Data =</i>	Valid values are: 1 = The dynamic tuple is rLNSTAT. 2 = The dynamic tuple is rLGLNSTAT.
<i>Good Data =</i>	The correct value of the idle count based on the contents of the gmflg[] array status map.
<i>Logical Index =</i>	The key of the rLNSTAT or rLGLNSTAT tuple.
<i>Dump =</i>	The contents of the rLNSTAT tuple (if bad data equals 1) or rLGLNSTAT tuple (if bad data equals 2) which contained the wrong idlecount.

Table 2 Error Code: CL

Error Code:	CL
Error Description:	There is a Multiline Hunt Group that is marked as monitored in the RLRT_MHG static relation (monitor = DBYES), however, there is not a corresponding tuple in the RLMONI_BLF static relation.
Possible Error Effect:	This multi-line hunt group cannot be monitored at the attendant's console, and the lamp associated with this monitored MLHG cannot be audited.
Corrective Action Taken:	None.
Manual Action Required:	There are two solutions available: 1 = The multi-line hunt group must be marked not monitored (rIRT_MHG.monitor set to DBNO), or 2 = The corresponding tuple of the static relation rMONI_BLF must be inserted. The group number for the monitored MLHG may be obtained from the key (rIRT_MHG.grpnum) field of this audit dump. If the group should not be monitored then, using ODBE, set the monitor bit (rIRT_MHG.monitor) in the rIRT_MHG tuple to DBNO. If the group is monitored, then the rMONI_BLF tuple must be inserted into the database. To insert the tuple, the key (rMONI_BLF.hgid) must be calculated from the Normalized Office Code (NOC) and the Local Directory Number (LOC DN), in binary, from the rIRT_MHG.grp_noc and rIRT_MHG.grp_loc fields respectively. The LOC and NOC can be obtained from the audit dump information. The RLMONI_BLF key (rMONI_BLF.hgid) can be calculated as follows: $rMONI\_BLF.hgid = ((rIRT\_MHG.grp\_noc \ll 8) \mid ((rIRT\_MHG.grp\_loc / 1000) \ll 4) \mid ((rIRT\_MHG.grp\_loc / 100) \% 10)) .$

	Once the key of the rIMONI_BLF tuple has been calculated for this monitored MLHG, the tuple may be inserted into the database using ODBE and the population rules for this relation.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the multi-line hunt group.
<i>Dump</i> =	The contents of the rLRT_MHG tuple.

Table 3 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	While trying to audit the status of a lamp corresponding to a DN associated with an ISDN-related call, the rLTMSTAT dynamic tuple, for a given rIIS_LINE static tuple, could not be accessed. There is a relationship such that, for every rIIS_LINE static tuple, a corresponding rLTMSTAT dynamic tuple should exist, which contains all call appearances associated with the ISDN monitored port represented in the rIIS_LINE tuple.
Possible Error Effect:	There is a static-to-dynamic data inconsistency, such that the sub-addresses in an rLTMSTAT dynamic tuple cannot be accessed by call processing in order to monitor the status of the hundreds group controller's lamp associated with this DN. In addition, the LDATBLF audit cannot determine what the correct state of the lamp should be in order to audit the lamp's state, and further auditing of this DN must be aborted for now.
Corrective Action Taken:	The LTMSTAT audit is scheduled as a related audit in order to insert the missing rLTMSTAT tuple, as necessary.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address where the rLTMSTAT tuple was expected to be.
<i>Bad Data</i> =	The key of the rLTMSTAT tuple.
<i>Good Data</i> =	The key of the associated rIIS_LINE static tuple.
<i>Logical Index</i> =	The key of the associated rIIS_LINE static tuple.
<i>Dump 1</i> =	The rLTMSTAT tuple data that was obtained.
<i>Dump 2</i> =	The corresponding rIIS_LINE static tuple, for which an associated rLTMSTAT dynamic tuple should exist.

Table 4 Error Code: HTYPE

Error Code:	HTYPE
Error Description:	There is a DN that is marked as monitored in the RLFC_LINE static relation (busymon = DBYES). However, there is not a corresponding rIMONI_BLF static tuple with Hundreds Group Identifier (hgid) for the DN in RLFC_LINE (locdn and digits) to provide the index for accessing the rLDATE_BLF dynamic tuple.
Possible Error Effect:	This DN cannot be monitored at the hundreds group controller, and the lamp associated with this DN cannot be audited.
Corrective Action Taken:	None.
Manual Action Required:	Two solutions are available: 1 = The corresponding rRFC_LINE tuple must be marked not monitorable (rRFC_LINE.busymon = DBNO), or 2 = The corresponding tuple of the RLMONI_BLF static relation must be inserted. The port for the monitored DN may be obtained from the key (rRFC_LINE.port) field of this audit dump. If the group should not be monitored then, using ODBE, set the monitor bit (rRFC_LINE.busymon) in the rRFC_LINE tuple to DBNO.

	If the group is monitored, then the rIMONI_BLF tuple must be inserted into the database. To insert the tuple, the key (rIMONI_BLF.hgid) must be calculated from the normalized office code (NOC) and the local directory number (LOC DN), in binary, from the rIFC_LINE.noc and rIFC_LINE.digits fields respectively. The LOC and NOC can be obtained from the audit dump information. The RLMONI_BLF key (rIMONI_BLF.hgid) can be calculated as follows: Using ODBE, read the rINOCODE tuple with key (rINOCODE.nxx) equal to the NOC for this DN (rIFC_LINE.noc). This tuple will provide the actual NOC for use in obtaining the key for RLMONI_BLF. This actual NOC is specified by rINOCODE.noc where rINOCODE.nxx = rIFC_LINE.noc. Using the NOC obtained from the rINOCODE.noc field, calculate the RLMONI_BLF key as follows: <pre> rIMONI_BLF.hgid = ((rINOCODE.noc << 8) ((rIFC_LINE.digits / 1000) << 4) ((rIFC_LINE.digits / 100) % 10)). </pre> Once the key of the rIMONI_BLF tuple has been calculated for this monitored DN, the tuple may be inserted into the database using ODBE and the population rules for this relation.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the rIFC_LINE tuple.
<i>Dump</i> =	The contents of the rIFC_LINE tuple.

Table 5 Error Code: KEY

Error Code:	KEY
Error Description:	This rILDAT_BLF tuple's key has become corrupted.
Possible Error Effect:	Use of this tuple might propagate errors, since the wrong bits for lamps associated with monitored DNs are being marked.
Corrective Action Taken:	The correct value of the key will be inserted in the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rILDAT_BLF tuple having the wrong key.
<i>Bad Data</i> =	The value of the wrong key.
<i>Good Data</i> =	The correct value of the key.
<i>Logical Index</i> =	The correct value of the key.
<i>Dump</i> =	The contents of the rILDAT_BLF tuple with the wrong key.

Table 6 Error Code: LAMP

Error Code:	LAMP
Error Description:	The lamp associated with this ISDN monitored port (as expressed in rILDAT_BLF.status[]) was found to be in the wrong state. For multiple call appearance (MCA) monitored calls, all sub-indexes in the rILTMSTAT tuple (bu_stat[]) must be marked busy for the lamp status bit in the rILDAT_BLF tuple to be correctly marked busy (1 for LAMP ON). Otherwise, the bit should be idle (0 for LAMP OFF).
Possible Error Effect:	The status of the lamp associated with this DN may be incorrect.
Corrective Action Taken:	The bit in the rILDAT_BLF tuple that corresponds to this lamp's DN will be set to the correct state and the hardware state of the lamp refreshed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The incorrect status of the bit.

<i>Good Data</i> =	The value to which it is corrected.
<i>Logical Index</i> =	The key of the rLDDAT_BLF tuple.
<i>Dump 1</i> =	The rLDDAT_BLF tuple.
<i>Dump 2</i> =	The rLIS_LINE static tuple.
<i>Dump 3</i> =	The associated rLTMSTAT tuple.
<i>Dump 4</i> =	The associated rLPORTLA tuple.

Table 7 Error Code: LGKEY

Error Code:	LGKEY
Error Description:	The rLPORTLA dynamic tuple for this Analog or PODS DN could not be accessed to determine the port's state. For the port in RLFC_LINE (port) there should be a corresponding rLPORTLA tuple with rLPORTLA.port = rLFC_LINE.port.
Possible Error Effect:	A data inconsistency with the RLPORTLA and/or RLDDAT_BLF relations exists such that the DN associated with the port cannot be monitored, nor its lamp status audited.
Corrective Action Taken:	The LDDATBLF audit will skip auditing this DN for now, and the PORTLA audit will be scheduled as related audit to try to correct the inconsistency.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The value of the (wrong) key in the rLPORTLA tuple.
<i>Good Data</i> =	0 for an analog port, and 1 for a PODS port.
<i>Logical Index</i> =	The correct value of the key.
<i>Dump 1</i> =	The contents of the rLPORTLA tuple.
<i>Dump 2</i> =	The contents of the corresponding rLFC_LINE tuple.
	In case of a PODS port (GOOD DATA is 1), the rLPORTLA tuple corresponds to B-channel.

Table 8 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	A tuple in the RLDDAT_BLF relation, which corresponds to an rLMONI_BLF static tuple, is missing. For every dynamic tuple in RLDDAT_BLF there must exist a corresponding tuple in RLMONI_BLF where rLMONI_BLF.index = rLDDAT_BLF.index.
Possible Error Effect:	The DNs in the hundreds group specified by the rLMONI_BLF tuple, which are in this SM, cannot be monitored.
Corrective Action Taken:	An attempt will be made to insert the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	GLSUCCESS if the insertion of the rLDDAT_BLF tuple was successful.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The contents of the rLMONI_BLF static tuple.

Table 9 Error Code: NOPCBLA

Error Code:	NOPCBLA
Error Description:	According to data in the rLPORTLA tuple for a PODS or analog port, this port is owned by a call process. However the associated rLPCBLA tuple for this process could not be accessed. In this instance, rLPORTLA.proc_cplr.st_headk - DBSFPCBAL = rLPCBLA.procnum where procnum = the process number of a live call process.
Possible Error Effect:	There is no process associated with a port in use. Since the dynamic data associated with a process and port is in an illegal state, no further auditing by LDDATBLF can take place for this rLDDAT_BLF tuple until the data is recovered to known idle states. Also, this port cannot be used by any other process unless recovered to an idle state.

Corrective Action Taken:	Related audits PCBLA and PORTLA are scheduled to recover data to know consistent states.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Valid values are: 1 = PODS related ports. 2 = ANALOG related ports.
<i>Bad Data =</i>	The key of the rIPCBLA tuple that was found.
<i>Good Data =</i>	The key of the rIPCBLA (process) that was expected.
<i>Logical Index =</i>	The key of the rIORTLA tuple (port name) for which there was no corresponding rIPCBLA tuple (process).
<i>Dump 1 =</i>	The rIORTLA dynamic tuple (D-channel for PODS).
<i>Dump 2 =</i>	The corresponding rIFC_LINE static tuple.
<i>Dump 3 =</i>	The corresponding rIPCBLA tuple (if found by the audit) whose process number did not match the value stored in the rIORTLA tuple.

Table 10 Error Code: NOPORTLA

Error Code:	NOPORTLA
Error Description:	No rIORTLA tuple can be found for a corresponding tuple in the RLLPT_PT static relation. For ISDN monitorable ports, it should exist that rIORTLA.port = rIORTLA.port.
Possible Error Effect:	The audit needs the status of the port from the rIORTLA tuple to complete its checking of rILDAT_BLF data. Also, an inconsistency exists between the RLPORTLA and RLLPT_PT relations which may cause call processing failures and asserts.
Corrective Action Taken:	The PORTLA audit will be scheduled to verify the existence of the rIORTLA tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	rIORTLA port field.
<i>Good Data =</i>	port field from rIORTLA tuple.
<i>Logical Index =</i>	rIIS_LINE lead_in port field.
<i>Dump =</i>	The contents of the rIIS_LINE tuple.

Table 11 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	The bit in the rILDAT_BLF tuple (status[]) that corresponds to the status of this MLHG was set incorrectly. For monitored MLHGs, the lamp should be on, when all members in the group (DNs) are busy (idlecount in RLLNSTAT or RLLGLNSTAT set to 0). Otherwise, the lamp should be off.
Possible Error Effect:	The status of the lamp on the hundreds group controller which monitors this MLHG will be incorrect.
Corrective Action Taken:	The lamp status bit in the rILDAT_BLF tuple that corresponds to this MLHG will be corrected to reflect the state of the group (ON = all members busy, otherwise, OFF if at least one member is idle.)
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rILDAT_BLF tuple having the wrong bit.
<i>Bad Data =</i>	Valid values are: 1 = The dynamic tuple is rILNSTAT. 2 = The dynamic tuple is rILGLNSTAT.
<i>Good Data =</i>	The correct status of the bit.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	The contents of the rILDAT_BLF tuple. The contents of the rILNSTAT tuple (if

bad data equals 1) or rLGLNSTAT tuple (if bad data equals 2).

Table 12 Error Code: PORT

Error Code:	PORT
Error Description:	There is a rLIS_LINE static tuple with an lport attribute that does not match any static tuple in the RLLPT_PT relation. It should exist that for every tuple in RLIS_LINE there should exist a corresponding tuple in RLLPT_PT, where rLPT_PT.lport = rLIS_LINE.lead_lport.
Possible Error Effect:	This is an ODD inconsistency which may result in call processing failures and asserts. If the port associated with this data is monitored, the lamp state can not be maintained by call processing, nor audited by this audit. This error will fire each time the LDATBLF audit runs until the data inconsistency is fixed.
Corrective Action Taken:	None.
Manual Action Required:	Two solutions are available: 1 = The corresponding tuple of the static relation rLPT_PT must be inserted. 2 = The corresponding rLIS_LINE tuple lead_lport field should be modified to agree with an lport field in the corresponding rLPT_PT tuple. If insertion of the corresponding RLLPT_PT entry is desired, the following rules apply: rLIS_LINE.lead_port = rLPT_PT.lport = rIGROUP_PORT.lport = rIPORT_GROUP.lport, rLPT_PT.lpt_type = LPT_ISDN, rLPT_PT.port = rIPORTLA.port. These fields may be examined and manipulated using ODBE.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	lport field of buffer used to read RLLPT_PT.
<i>Good Data</i> =	return code from DB primitive used to read RLLPT_PT.
<i>Logical Index</i> =	lead_port attribute of the rLIS_LINE tuple.
<i>Dump</i> =	The contents of the rLIS_LINE tuple.

Table 13 Error Code: PPKEY

Error Code:	PPKEY
Error Description:	The tuple in the dynamic hunting data relation RLLNSTAT or RLLGLNSTAT has the wrong key (grpnum). It should exist that for every rLGLNSTAT/rLNSTAT tuple there exists a corresponding tuple in RLRT_MHG where rLRT_MHG.grpnum = rLXLNSTAT.grpnum. - If the bad data equals 1, the rLNSTAT tuple has wrong key. - If the bad data equals 2, the rLGLNSTAT tuple has wrong key.
Possible Error Effect:	A static-to-dynamic inconsistency exists between RLRT_MHG and RLLNSTAT/RLLGLNSTAT relations such that no routing may take place on this group, nor, if monitored, no lamp status update can be made.
Corrective Action Taken:	The rLNSTAT and rLGLNSTAT audits will be scheduled as related audits to insert the rLNSTAT/rLGLNSTAT dynamic tuples, if missing, and correct the key, if it was corrupted.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Valid values are: 1 = The RLLNSTAT relation. 2 = The RLLGLNSTAT relation.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the corresponding rIRT_MHG tuple.
<i>Dump</i> =	The contents of the rIRT_MHG tuple.

Table 14 Error Code: RANGE

Error Code:	RANGE
Error Description:	There is an MLHG that is marked as monitored (monitor = DBYES). However, the hunt type (rIRT_MHG.htype) of this hunt group is not included in the cases that this audit considers valid. ISDN Attendant "ISAT" (RTH_ISAT) and multi-position hunt group "MUPH" (RTH_MUPH) MLHGs are not monitorable. This error will for this MLHG every time the LDATBLF audit runs until fixed.
Possible Error Effect:	The lamp for this MLHG can not be monitored by a lamp at the hundreds group controller by call processing, nor audited, because an ODD inconsistency exists where a non-monitorable hunt type is marked as monitored.
Corrective Action Taken:	None.
Manual Action Required:	The MLHG should be marked not monitored for ISAT and MUPH hunt types (rIRT_MHG.htype must not be RTH_ISAT or RTH_MUPH). Either change the hunt type in the rIRT_MHG static tuple to a legal monitorable hunt type, or change the group so that it is not monitorable (rIRT_MHG.monitor = DBNO).
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The key of the MLHG.
<i>Dump</i> =	The contents of the rIRT_MHG tuple.

Table 15 Error Code: STATUS

Error Code:	STATUS
Error Description:	The bit in the rLDAT_BLF tuple that corresponds to the DN for this Analog or PODS port (status[]) is incorrect. These are the rules: (1) If the port is in-service/idle, (rPORTLA.bsc_state = TMIS and rPORTLA.proc_cplr.st_headk = 0) the status bit should be idle (0) and the lamp OFF. (2) If the port is in-service/busy, (rPORTLA.bsc_state = TMIS and rPORTLA.proc_cplr.st_headk != 0), and the process owning the port is required to mark the BLF lamp to busy (rPCBLA.priority = RTFC), the status bit should be busy (1) and the lamp ON. (3) If, for PODS, the B-channel is OOS, (rPORTLA.bsc_state = TMOOS) and the D-channel is OOS/BLOCKED, (rPORTLA.list = TMLTDCHOOS) the status bit should be idle (0) and the lamp OFF. (4) If, for PODS, the B-channel is OOS, and the D-channel is In-service, this is treated as a transient case, and not audited by the LDATBLF audit. If things stay transient for too long, recovery is provided by the PORTLA audit. When this occurs, the PORTLA audit fires TRANCK and BTRANCK errors. This case is listed here just for clarification. (5) If, for PODS, the B-channel is OOS, and the D-channel is OOS, but

	not on the OOS/BLOCKED list, the status bit should be busy (1) and the lamp ON. (6) For PODS, if a B-channel is OOS BLOCKED on a multipoint DSL which is busy lamp field (BLF) busy/monitorable, the BLF feature is not supported by call processing. For this case, the associated status bit should be idle (0) and the lamp OFF. (7) For any PODS/analog instance where the process owning the port is not a call process (testing/maintenance processes, for example) the BLF feature is not supported. For this case, the status bit should be idle (0) and the lamp OFF. (8) If for analog, the port is OOS, the status bit should be busy (1) and the lamp ON.
Possible Error Effect:	The status of the dynamic data for the light monitoring this DN on the attendant console's hundreds group controller will be incorrect. The lamp on the customers attendant console no longer correctly reflects the status of this DN.
Corrective Action Taken:	The bit in the rLDATE_BLF tuple that corresponds to this DN will be set to the correct state, and the hardware state of the lamp refreshed.
Manual Action Required:	If this error continues to roll out of an SM for the same RLDATE_BLF key, check the RLFC_LINE ltm_idx fields in the ODD. They should be populated with all unique values (no duplicates) except when the field is 0 (meaning that the DN is not monitored). Also, the number of non-zero entries should correspond to the number of attendant consoles on the SM. In addition, the RLMONI_BLF index fields should all be unique for a given SM.
Dump Description:	
<i>Error Address =</i>	Address of the rLDATE_BLF tuple.
<i>Bad Data =</i>	The status of the LDAT bit for this DN.
<i>Good Data =</i>	If the port was busy when the error occurred, the program ID of the system process which created the terminal process owning the port (OSbpcb[rIPCBLA.procnum].progi) will be dumped. Otherwise, the state the LDAT bit was corrected to will be dumped.
<i>Logical Index =</i>	The key of the rLDATE_BLF tuple.
<i>Dump 1 =</i>	The contents of the rLDATE_BLF tuple.
<i>Dump 2 =</i>	The contents of the corresponding rLFC_LINE tuple.
	Note: The following two dumps allow you to determine what type of call data was found incorrect. If only the D-channel rPORTLA tuple is dumped, this means analog. If both the D and B rPORTLAs are dumped, this means PODS.
<i>Dump 3 =</i>	The rPORTLA tuple (D-channel for PODS, or ANALOG.)
<i>Dump 4 =</i>	The B-channel rPORTLA tuple (PODS only.)
	If a process owned this monitored port when the error was found, the following data will be dumped:
<i>Dump 5 =</i>	The rIPCBLA tuple where (D-Channel) rPORTLA.proc_cplr.st_headk - DBSFPCBLA = (key) rIPCBLA.procnum.

Table 16 Error Code: TLAMP

Error Code:	TLAMP
Error Description:	The bit in the rLDATE_BLF tuple that corresponds to this DN associated with an OOS ISDN port is incorrect. For lamps associated with DNs for MCA monitored ports, if the port is OOS, but not BLOCKED, the status bit should be busy (1) and the lamp ON. If the port is OOS BLOCKED, the status bit should be idle (0) and the lamp OFF.
Possible Error Effect:	The status of this DN on the hundreds group controller will be incorrect until the

	audit runs. This means that the user may unknowingly miss incoming calls.
Corrective Action Taken:	The bit in the rLDAT_BLF tuple that corresponds to this DN will be set to busy and the lamp ON if the port is OOS but not BLOCKED. Otherwise, the bit should be idle and the lamp OFF if the port is OOS/BLOCKED.
Manual Action Required:	If the busymon fields in the rLIS_LINE and rLFC_LINE tuples do not match, they should be corrected so that they both are DBYES or DBNO. These tuples are dumped when this error fires, and their keys are available from their respective dumps.
Dump Description:	
<i>Error Address</i> =	Not an address; the value of the list attribute of the corresponding rIORTLA tuple, indicates the status of the port.
<i>Bad Data</i> =	Status of the rLDAT_BLF bit: 0 = DBNO for not busy. 1 = DBYES for busy.
<i>Good Data</i> =	The value to which it is corrected.
<i>Logical Index</i> =	The key of the rLDAT_BLF tuple.
<i>Dump 1</i> =	The contents of the rLDAT_BLF tuple before it is corrected.
<i>Dump 2</i> =	The corresponding rLIS_LINE tuple.
<i>Dump 3</i> =	The corresponding rIORTLA tuple.
<i>Dump 4</i> =	If the corresponding rLFC_LINE static tuple was obtained, it will also be dumped.

Table 17 Error Code: TRKG

Error Code:	TRKG
Error Description:	There is a DN that is marked as monitored in the rLIS_LINE tuple. However, there is not a corresponding rIMONI_BLF tuple to provide the index for accessing the rLDAT_BLF tuple.
Possible Error Effect:	An ODD inconsistency between RLFC_LINE and RLMONI_BLF relations exists. A DN is not monitored, yet it is marked as monitored in RLIS_LINE.
Corrective Action Taken:	None.
Manual Action Required:	The corresponding rLIS_LINE tuple (which is dumped when this error fires) must be marked not monitorable (rLIS_LINE.busymon = DBNO). Then, using recent change, create a monitored DN, if desired.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The contents of the rLIS_LINE tuple.

Table 18 Error Code: TYPE

Error Code:	TYPE
Error Description:	There is a MLHG that is marked as monitored (monitor = DBYES). However, the hunt type (rIRT_MHG.htype) of this hunt group is not included in the cases that call processing (RTA) considers valid. ISAT (RTH_ISAT) and MUPH (RTH_MUPH) MLHGs are not monitorable. This error will for this MLHG every time the LDATBLF audit runs until fixed.
Possible Error Effect:	The lamp for this MLHG can not be monitored by a lamp at the hundreds group controller by call processing, nor audited, because an ODD inconsistency exists where a non-monitorable hunt type is marked as monitored.
Corrective Action Taken:	None.
Manual Action Required:	The MHLG should be marked not monitored for ISAT and MUPH hunt types (rIRT_MHG.htype must not be RTH_ISAT or RTH_MUPH). Either change the hunt type in the rIRT_MHG static tuple (which is dumped when this error fires, and whose key is the group number of the monitored MLHG) to a legal monitorable hunt type, or change the group so that it is not monitorable (rIRT_MHG.monitor = DBNO).

Dump Description:	
<i>Error Address</i> =	NA
<i>Bad Data</i> =	NA
<i>Good Data</i> =	Valid values are: 1 = Associated with an rLNSTAT (small MLHG) tuple. 2 = Associated with an rLGLNSTAT (large MLHG) tuple.
<i>Logical Index</i> =	The key of the MHLG.
<i>Dump</i> =	The contents of the rIRT_MHG tuple.

LGLNSTAT

Software Release: 5E10 and later

1. LARGE LINE STATUS (LGLNSTAT) AUDIT

To process a call, the RTA routing process in the switching module (SM) and in a remote switching module (RSM) must determine which ports are available for terminating calls. Information about the types of hunted ports is kept on bit maps. A bit map is included in each tuple in the large line status relation (RLLGLNSTAT), which contains information about large multiline hunt groups (between 64 and 2015 lines per group) of hunted lines. The RLLGLNSTAT relation resides in the SM, but it may also reside in an RSM. During stand-alone operation the tuples for other ports that the RSM contains are inserted into RLLGNSTAT; when the RSM leaves stand-alone operation, these tuples are deleted.

The large line status audit (LGLNSTAT) checks the dynamic relation rLGLNSTAT for extra tuples. It also performs a check on the status bits for each group. For information about smaller groups of hunted lines refer to the line status audit (LSTAT). For information about groups of hunted trunks, refer to the trunk status audit (TKSTAT) and the large trunk status audit (LGTKSTAT).

This audit is part of the Routing and Terminal Allocation audits subgroup.

2. DATA STRUCTURES

The data structures checked by the LGLNSTAT audit are the multi-line hunt group information relation (RLRT_MHG) and the large line status relation (RLLGLNSTAT). Figure 1 illustrates the two relations.

The new paragraph RLRT_MHG relation is a static (write-protected) relation that contains information about all multiline hunt groups. This information includes a key (grpnum), the hunt type, the hunting SM number, and the type of group (local or global) it is. Both RLRT_LGMEM and RLLGMEM are relations that contain information about each MLHG member port equipage. The RLRT_LGMEM relation resides on the designated hunting module, SM/ORM/RSM. The RLLGMEM relation is created only on the RSM/ORM with standalone capability. The large line status audit steps through RLLGLNSTAT and verifies it against the information contained in the RLRT_MHG and either the RLRT_LGMEM or RLLGMEM.

SM & RSM*

AM

*IN AN RSM ENVIRONMENT, THE rLGLNSTAT RESIDES
IN BOTH THE HUNTING SM AND THE RSM.

Figure 1 (LGLNSTAT-1) Large Line Status Audit

3. AUDIT CHECKS

The LGLNSTAT audit uses the static driver (DRSTATIC) to step through the RLLGLNSTAT relation and sequentially retrieve tuples. The DRSTATIC driver invokes a semantic check function that performs the following checks:

- (a) The audit verifies each rLGLNSTAT tuple against the corresponding rRT_MHG tuple by using the key (group number) of rLGLNSTAT to read rRT_MHG relation. The audit looks specifically for extra rLGLNSTAT tuples.
- (b) The audit performs a Boolean check between the following bit arrays: port available flag (PORTAVAIL), stop hunt flag (STOPHUNT), make busy flag (MAKEBUSY) and the group member flag (GMFLG). A boolean check uses the boolean operators AND, NOT, and OR. The check is as follows:

If the PORTAVAIL flag is 1 AND NOT the MAKEBUSY flag

OR

The STOPHUNT flag is 1

Then the GMFLAG should be 1

- (c) The audit checks the hunt type. Only RTH_LGREG, RTH_LGCIR, RTH_LGUCD, PTH_PSLGUCD, and RTH_PPLMHG are valid.
- (d) The audit ensures that the module number is correct for the tuple.
- (e) The audit verifies that busy/idle statuses are busy for large MLHG members that are not equipped with ports.

4. ERROR HANDLING

Excess tuples, tuples not in the appropriate module, and tuples with the wrong hunt types, are deleted from the database. Boolean checks, that pass, are further checked for the group member flag for 1. If it is not 1, the group member flag is set to 1. Status bit checks, that fail for non-equipped members, are connected by the LGLNSTAT audit.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ASSOC_TUP

Error Code:	ASSOC_TUP
Error Description:	While auditing an rLGLNSTAT tuple, a DAGETLGMEM did not find the associate rLGMEM tuple. Since during Stand Alone RLLGMEM relation is audited against static RLGROUP_PORT/RLPSGP_PRT relation, audit should believe dynamic rLGMEM tuple and delete dynamic rLGLNSTAT tuple.
Possible Error Effect:	Incorrect use of data resources for multi-line hunt groups.
Corrective Action Taken:	The extra rLGLNSTAT tuple deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLGMEM tuple.
<i>Bad Data =</i>	The key of the extra rLGLNSTAT tuple.
<i>Good Data =</i>	0.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 2 Error Code: E_BIT

Error Code:	E_BIT
Error Description:	The busy/idle status in a tuple of the relation RLLGLNSTAT is inconsistent with the corresponding member equipage tuple bit map. The nonequipped member should be marked busy. If the KEY field of the dump is 1 (SM Stand Alone) then an rLGLNSTAT tuple is inconsistent with an rLGMEM tuple, or if it is 0 then the rLGLNSTAT tuple is inconsistent with an rIRT_LGMEM tuple.
Possible Error Effect:	Failure in terminating to an invalidly marked idle members.
Corrective Action Taken:	The audit set the nonequipped members to correct status, busy.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLGLNSTAT tuple having the wrong busy/idle status.
<i>Bad Data =</i>	The array containing the members busy/idle status.
<i>Good Data =</i>	The array containing the members equipage information.
<i>Logical Index =</i>	This is not a key. Verification of busy/idle status is with rLGMEM tuple if this dump is 1, or else with rIRT_LGMEM tuple if this dump is 0.
<i>Dump =</i>	NA.

Table 3 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The group number for this tuple is not assigned.
Possible Error Effect:	An assert will fire if this tuple is not found after trying to retrieve it.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Calculated grpnum of this tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Calculated grpnum of this tuple.
<i>Dump</i> =	NA.

Table 4 Error Code: GMFLG

Error Code:	GMFLG
Error Description:	The Boolean check between the status flag bits (portavail, makebusy, and stophunt) has passed, but a gmflg status bit(s) was found to be zero (not set) when it should be set to 1. There are five possible combinations for this error to occur.
Possible Error Effect:	If this group member is picked by RTA for routing, the erroneous status data will propagate further inconsistencies.
Corrective Action Taken:	The gmflg status bit(s) is set to 1.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLGLNSTAT tuple.
<i>Bad Data</i> =	Erroneous word in the gmflg bit array.
<i>Good Data</i> =	Corrected word in the gmflg bit array.
<i>Logical Index</i> =	Group member of this tuple.
<i>Dump</i> =	NA.

Table 5 Error Code: KEY

Error Code:	KEY
Error Description:	The tuple of the relation rLGLNSTAT has wrong key.
Possible Error Effect:	Use of this tuple might propagate errors.
Corrective Action Taken:	The correct value of the key will be inserted in the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLGLNSTAT tuple having the wrong key.
<i>Bad Data</i> =	The value of the wrong key.
<i>Good Data</i> =	The correct value of the key.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 6 Error Code: MKBUSY

Error Code:	MKBUSY
Error Description:	The group is of the hunt type RTH_PSLGUCD but the makebusy[] or stophunt[] fields are not zero.
Possible Error Effect:	The group may not be hunted correctly.
Corrective Action Taken:	The fields are set to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLGLNSTAT tuple.
<i>Bad Data</i> =	The erroneous makebusy[] value.
<i>Good Data</i> =	The erroneous stophunt[] value.
<i>Logical Index</i> =	grpnum of the tuple.
<i>Dump</i> =	NA.

Table 7 Error Code: ODDLOSTUP

Error Code:	ODDLOSTUP

Error Description:	The audit has found an inconsistency between the static relations RLRT_LGMEM and RLRT_MHG. Current SM is the hunting SM of the multi-line hunt group (MLHG) as indicated by the field in rIRT_MHG tuple and therefore the key of this tuple is used to access the MLHG member equipage tuple in the RLRT_LGMEM relation but no matching tuple is found and the audit cannot continue to do checks.
Possible Error Effect:	Audit continues to the next tuple of the RLLGLNTAT relation.
Corrective Action Taken:	Audit report an error.
Manual Action Required:	Verify tuples rIRT_MHG and rIRT_LGMEM in the ODD, using the rIRT_MHG tuple key found in the "KEY" field of the audit report. Corresponding tuple rIRT_LGMEM with the same key should exist on the same SM. Correct any inconsistencies found.
Dump Description:	
<i>Error Address =</i>	The address of the rIRT_MHG tuple.
<i>Bad Data =</i>	The key of rIRT_LGMEM tuple returned from data base.
<i>Good Data =</i>	The hunt module of multi-line hunt group.
<i>Logical Index =</i>	The key of rIRT_MHG tuple used to access rIRT_LGMEM tuple.
<i>Dump =</i>	The contents of the rIRT_MHG tuple.

Table 8 Error Code: PCRID

Error Code:	PCRID
Error Description:	The tuple should not exist in this processor. In the AM, only tuples from global hunt groups should be present. In an RSM, only tuples from local hunt groups on that RSM should be present except during stand-alone operation when tuples from global hunt groups are allowed.
Possible Error Effect:	More than one processor could route calls to this group.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rLGLNSTAT tuple.
<i>Bad Data =</i>	Module number for local group; 0 if global.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	grpnum of this tuple.
<i>Dump =</i>	NA.

Table 9 Error Code: RELQKEY

Error Code:	RELQKEY
Error Description:	The tuple of the relation rLGMEM has wrong key.
Possible Error Effect:	Use of this tuple might propagate errors.
Corrective Action Taken:	The correct value of the key will be inserted in the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLGMEM tuple having the wrong key.
<i>Bad Data =</i>	The value of the wrong key.
<i>Good Data =</i>	The correct value of the key.
<i>Logical Index =</i>	This is not a key but the hunt module of the multi-line hunt group.
<i>Dump =</i>	NA.

Table 10 Error Code: TYPE

Error Code:	TYPE
Error Description:	The group is of the wrong hunt type to have a tuple in this relation.
Possible Error Effect:	An assert will fire if this group's hunt type is not of the type used in rLGLNSTAT (that is RTH_LGREG, RTH_LGCIR, RTH_LGUCD, RTH_PLREG, or RTH_PPLMHG) and the tuple could not be retrieved.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rLGLNSTAT tuple.
<i>Bad Data =</i>	Hunt type of the group.
<i>Good Data =</i>	NA.

LGMEM

Software Release: 5E10 and later

1. MULTILINE HUNT LARGE GROUP MEMBER STATUS (LGMEM) AUDIT

To process a call during the stand-alone (SA) condition, the routing and terminal allocation (RTA) routing process in the remote switching module (RSM) and in the optically remote module (ORM) must determine which ports are available for terminating calls. Information about a large (up to 2016 members) multi-line hunt group (MLHG) is kept on bit maps, with each bit representing a member of the MLHG. The bit map is included in each tuple in the MLHG status relation (RLLGMEM). When a member is populated for a MLHG, the corresponding bit must be set to "1" to indicate the member is active. If the member is not active, the bit must be set to "0". The relation RLLGMEM is created during the SA condition in a RSM/ORM for all global MLHG members for which that switching module (SM) is the hunting SM and for all global members that have ports in that SM.

The MLHG member status (LGMEM) audit checks tuples in the dynamic relation RLLGMEM for extra tuples. It also performs a check on the status bit for each group. The LGMEM audit verifies with the static relations RLGROUPOUT/RLPSGRP_PRT that each MLHG member set to "1" is a valid active member.

This audit is scheduled only during the SA mode.

2. DATA STRUCTURES

The data structures checked by the LGMEM audit are the group and member number to port relation (RLGROUPOUT), and the packet switching multiline/trunk group and member number to packet switching port relation (RLPSGRP_PRT). The RLGROUPOUT and RLPSGRP_PRT relations are static (write-protected) relations that contain information about all global MLHG ports. For every member of the global MLHG, a rLGROUPOUT/rLPSGRP_PRT tuple must exist in the SM which owns the port, in the designated hunting SM, and in the designated routing SM. The rLPSGRP_PRT is populated only for RTH_PSUCD and RTH_PSLGUCD hunt types (packet switching ports), while rLGROUPOUT is populated for all other MLHG hunt types.

3. AUDIT CHECKS

The LGMEM audit uses the static driver (DRSTATIC) to step through the RLLGMEM relation and sequentially retrieve tuples. The DRSTATIC driver invokes a semantic check function that verifies each rLGMEM tuple against the rLGROUPOUT/rLPSGRP_PRT tuples by using the key (group number) of rLGMEM to read the static relations. The audit looks specifically for members that are marked as active in the RLLGMEM relation, but for which there is no corresponding tuple in the static relation.

4. ERROR HANDLING

Excess tuples, tuples for which all members are not active, are deleted from the relation. Bits that are set to "1" (active), for which there are no MLHG members associated with it, are corrected to "0" (not active). If a tuple of the member status relation contains an invalid data in its key, the key is corrected.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The group number for this tuple is not assigned.
Possible Error Effect:	An ASSERT will fire if this tuple is not found after trying to retrieve it.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Calculated grpnum of this tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Calculated grpnum of this tuple.
<i>Dump</i> =	rLGMEM tuple.

Table 2 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	Audit cannot find static rLRTMHG tuple using dynamic rLGMEM key.
Possible Error Effect:	An error will report if this tuple is not found.
Corrective Action Taken:	The dynamic rLGMEM tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLRT MHG tuple.
<i>Bad Data</i> =	The key of rLGMEM tuple.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 3 Error Code: INVMEM

Error Code:	INVMEM
Error Description:	The corresponding member in the dynamic relation RLLGMEM was incorrectly initialized to valid ("1").
Possible Error Effect:	Initialization was wrong and calls will fail to that member.
Corrective Action Taken:	The member will be set to invalid ("0").
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLGMEM tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	0 (invalid member).
<i>Logical Index</i> =	grpnum of this tuple.
<i>Dump</i> =	rLGMEM tuple.

Table 4 Error Code: LGKEY

Error Code:	LGKEY
Error Description:	A DAGETLGMEM macro returns a pointer whose key does not match the tuple buffer key of rLGMEM tuple.
Possible Error Effect:	Use of this tuple might propagate errors.
Corrective Action Taken:	The correct value of the key will be inserted in the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLGMEM tuple having the wrong key.
<i>Bad Data</i> =	The key value of pointer to tuple.
<i>Good Data</i> =	The key value of tuple buffer pointer.
<i>Logical Index</i> =	The correct value of the key.
<i>Dump</i> =	NA.

Table 5 Error Code: MEMBAD

Error Code:	MEMBAD
Error Description:	The status of SM indicate normal and this dynamic tuple rLGMEM should not exist in this situation.
Possible Error Effect:	Incorrect busy/idle status may exist for this multi-line hunt group.
Corrective Action Taken:	The dynamic rLGMEM tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLGMEM tuple buffer.
<i>Bad Data</i> =	The key of rLGMEM tuple.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 6 Error Code: TYPE

Error Code:	TYPE
Error Description:	The group is of the wrong hunt type as indicated in rIRT_MHG tuple for the group number in RLLGMEM relation.
Possible Error Effect:	An error will report if this group's hunt type is not of the type in rIMEM tuple (that is, RTH_LGREG, RTH_LGCIR, RTH_LGUCD, RTH_PSLGUCD, RTH_PPLMHG, or RTH_MUPH).
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLGMEM tuple.
<i>Bad Data</i> =	Hunt type of the group.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	grpnum of rLGMEM tuple used to access rIRT_MHG tuple.
<i>Dump</i> =	rIRTMHG tuple

LGSFSTAT

Software Release: 5E10 and later

1. LARGE SIMULATED FACILITY STATUS (LGSFSTAT) AUDIT

Simulated facility groups (SFGs) provide customers with the appearance of dedicated trunks without requiring the local switching office to designate specific hardware for each customer. Simulated facility groups thus increase the efficiency of the network while maintaining all the customer's features and needs. The simulated groups allow customers with private branch exchange (PBX) or centrex features status lights for each group; when the group is completely busy, the busy lamp status flag lights. Another feature, the make-busy key, allows the customers to give the appearance of a busy trunk group; this is done, for example, when a conference call needs to be placed at a specific time.

The large simulated facility status audit (LGSFSTAT) verifies the existence and consistency of the data in large (more than 96 trunks) simulated facility groups. For information about small trunk groups (1-96 trunks), refer to the simulated facility status audit (SFSTAT).

The LGSFSTAT audit is part of the routing and terminal allocation (RTA) audits subgroup. It runs in the communications module processor (CMP) in the initialization and segmented modes.

2. DATA STRUCTURES

This audit checks several fields in the large simulated facility group relation (RLLGSFSTAT), including the key, idle count, and group busy lamp fields. The RLLGSFSTAT relation has one tuple per simulated facility group. Each tuple contains one bit, a busy/idle flag, per member. The audit verifies the information in RLLGSFSTAT with information in the static simulated facility group relation (RLRT_SFG). The data structures of the LGSFSTAT audit are shown in Figure 1 .

The LGSFSTAT audit checks several fields in the dynamic relation RLLGSFSTAT and the static relation RLRT_SFG. These fields support the integrated services digital network (ISDNs) busy and warning lamps. The data structures of the LGSFSTAT audit are shown in Figure 2 .

Figure 2 (LGSFSTAT-2) Data Structures of the LGSFSTAT Audit

3. AUDIT CHECKS

The audit calls the static driver (DRSTATIC) to step through the RLLGSFSTAT relation and perform a dynamic-to-static existence check based on the key (trunk group number) fields of rLGSFSTAT and rIRT_SFG to ensure that a tuple in RLRT_SFG exists for each tuple in RLLGSFSTAT. If the office is equipped with the busy lamp, the audit performs the following semantic checks.

- During the existence check, the audit counts the number of idle bits. When the semantic check function is invoked, the audit compares its idle bit count with the automatic count made by call processing. Unlike the trunk status and its TKSTAT, LGTKSTAT, and TRKOWNER, this check of the idle counts is unconditional whether or not an analog console is associated with this simulated facilities group.
- If there is an analog console associated with this simulated facilities group, the audit checks that the status of the make-busy key, the idle count and the busy lamp are consistent. If the make-busy key is pressed, the lamp should be on, regardless of the idle count.

- (c) If there is an ISDN attendant console associated with the simulated facilities group, the audit checks that the busy lamp and make-busy key of this console are consistent with the idle count. If the ISDN attendant console is equipped with a warning lamp, this lamp's state is checked against the idle count and the preset value in the simulated facilities group information relation `rIRT_TRKG`. If the make-busy key is pressed, the busy and warning lamps should be on regardless of the idle count.

4. ERROR HANDLING

If the dynamic-to-static existence check fails because the audit finds no static tuple corresponding to the tuple in `RLLGSFSTAT`, the audit deletes the tuple in `RLLGSFSTAT`.

If the semantic check fails, the audit initializes the `rLGSFSTAT` tuple. The audit corrects counts busy lamp errors.

The audit corrects ISDN attendant console busy and warning lamp for inconsistencies if a simulated facilities group is equipped with such lamps.

When running in keep alive mode, stuck bits are detected and idled, the idle count [count of available simulated facility (SF) members left in this group] is updated (incremented) to account for all bits that were found stuck, and subsequently idled. Any analog busy lamps, and/or ISDN attendant busy or warning lamps are refreshed, as needed, to correspond to the new count of available SF members in the group.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	A count of the idle group members did not equal the stored idle count.
Possible Error Effect:	Measurements would be in error for this group. Possible mishandling of the group busy lamp, if equipped.
Corrective Action Taken:	The idle count was corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	RLLGSFSTAT tuple address.
<i>Bad Data =</i>	Idle count field.
<i>Good Data =</i>	Correct count of idle members.
<i>Logical Index =</i>	Group number.
<i>Dump =</i>	RLLGSFSTAT tuple.

Table 2 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The group number for this tuple is not assigned.
Possible Error Effect:	An assert will fire if this tuple is not found after trying to retrieve it.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Group number not in static relation <code>RLRT_SFG</code> .
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Group number not in static relation <code>RLRT_SFG</code> .
<i>Dump =</i>	lgsfstat tuple that was deleted.

Table 3 Error Code: ISDNTGBWL

Error Code:	ISDNTGBWL
Error Description:	The <code>isdntgbwl</code> field, which indicates if this SFG is associated with an ISDN attendant console busy and possible warning lamp, is a dynamic duplicate of the

	isdntgbwl field stored in static data (rIRT_SFG), but did not match the corresponding field stored in the RLRT_SFG static relation.
Possible Error Effect:	Call processing will be unable to determine if an ISDN attendant console is associated with this SFG, and will be unable to perform manipulations on the busy lamp, warning lamp, and make-busy key for this console.
Corrective Action Taken:	The dynamic representation of this data (rISFSTAT) was corrected to match its static counterpart in rIRT_SFG.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLGSFSTAT tuple.
<i>Bad Data =</i>	The isdntgbwl field found in the rLGSFSTAT tuple.
<i>Good Data =</i>	The isdntgbwl field found in the rIRT_SFG static tuple.
<i>Logical Index =</i>	The key (SF group number) of the rLGSFSTAT tuple.
<i>Dump =</i>	The rLGSFSTAT tuple.

Table 4 Error Code: LAMP

Error Code:	LAMP
Error Description:	This simulated facility group's analog and/or ISDN attendant console group busy lamp was found to be in the wrong state.
Possible Error Effect:	Bad group status information was presented to the attendant.
Corrective Action Taken:	The lamp state was corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of RLLGSFSTAT tuple.
<i>Bad Data =</i>	Lamp state as found (0 - OFF; 1 - ON).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	SF group number.
<i>Dump =</i>	RLLGSFSTAT tuple.

Table 5 Error Code: RANGE

Error Code:	RANGE
Error Description:	The idle count (rLGSFSTAT.idle_count) which is the count of idle SFG members could not be audited because the hunt type in the RLRT_SFG static relation (rIRT_SFG.hunt_type) was not marked properly (where rIRT_SFG.grpnum = rLGSFSTAT.grpnum). For small SFGs, the hunt type must be marked RTH_LGSFG. This error will fire until fixed by the CRAFT.
Possible Error Effect:	The count of idle members may become corrupt causing customers to get reorder treatment and call failures.
Corrective Action Taken:	None.
Manual Action Required:	Using ODBE, read the RLRT_SFG relation with key set to the key which dumped as "good data" with this error code message. Modify the hunt_type field to RTH_LGSFG.
Dump Description:	
<i>Error Address =</i>	The address of the rLGSFSTAT tuple.
<i>Bad Data =</i>	The hunt_type field found in the rIRT_SFG static tuple.
<i>Good Data =</i>	The group number (rIRT_SFG.grpnum) of the rIRT_SFG static tuple.
<i>Logical Index =</i>	The key (SF group number) of the rLGSFSTAT tuple (rLGSFSTAT.grpnum).
<i>Dump =</i>	Nothing dumped.

Table 6 Error Code: SFGBL

Error Code:	SFGBL
Error Description:	The sfgbl field, which indicates if this SFG is associated with an analog console busy lamp, is a dynamic duplicate of the sfgbl field stored in static data (rIRT_SFG), but did not match the corresponding field stored in the RLRT_SFG static relation.
Possible Error Effect:	Call processing will be unable to determine if an analog console is associated with this SFG, and will be unable to perform manipulations on the busy lamp and make-busy key for this console.
Corrective Action Taken:	The dynamic representation of this data (rISFSTAT) was corrected to match its static counterpart in rIRT_SFG.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLGSFSTAT tuple.
<i>Bad Data</i> =	The sfqbl field found in the rLGSFSTAT tuple.
<i>Good Data</i> =	The sfqbl field found in the rIRT_SFG static tuple.
<i>Logical Index</i> =	The key (SF group number) of the rLGSFSTAT tuple.
<i>Dump</i> =	The rLGSFSTAT tuple.

Table 7 Error Code: TLAMP

Error Code:	TLAMP
Error Description:	This simulated facility group's threshold warning lamp was found to be in the wrong state.
Possible Error Effect:	Bad group status information was presented to the attendant.
Corrective Action Taken:	The lamp state was corrected, and the hardware state of the lamp was refreshed.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of RLLGSFSTAT tuple.
<i>Bad Data</i> =	Lamp state as found (0 - OFF; 1 - ON).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	SF group number.
<i>Dump</i> =	NA.

Table 8 Error Code: TYPE

Error Code:	TYPE
Error Description:	The group is of the wrong hunt type to have a tuple in this relation.
Possible Error Effect:	An assert will fire if this group's hunt type is not of the type used in RLLGSFSTAT (that is, RTH_LGSFG) and the tuple could not be retrieved.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Hunt type of group as shown in RLRT_SFG.
<i>Logical Index</i> =	Group number.
<i>Dump</i> =	LGSFSTAT tuple that was deleted.

Table 9 Error Code: WARNTRESH

Error Code:	WARNTRESH
Error Description:	The warnthresh field indicates the customer selected value for the number of idle members a customer has still available when an ISDN attendant console warning lamp (is equipped) will light. This is a dynamic duplicate of the warnthresh field stored in the RLRT_SFG static relation.
Possible Error Effect:	Call processing will be unable to determine if an ISDN attendant console warning lamp should be ON or OFF, and the lamp may become stuck in an incorrect state, giving the customer incorrect SF group status.
Corrective Action Taken:	The dynamic representation of this data (rSFSTAT) was corrected to match its static counterpart in rIRT_SFG.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLGSFSTAT tuple.
<i>Bad Data</i> =	The warnthresh field found in the rLGSFSTAT tuple.
<i>Good Data</i> =	The warnthresh field found in the rIRT_SFG static tuple.
<i>Logical Index</i> =	The key (SF group number) of the rLGSFSTAT tuple.
<i>Dump</i> =	The rLGSFSTAT tuple.

LGTKSTAT

Software Release: 5E10 and later

1. LARGE TRUNK STATUS (LGTKSTAT) AUDIT

The large trunk status audit (LGTKSTAT) checks the dynamic relation RLLGTKSTAT for extra tuples. To process a call, the RTA routing process in the communications module processor (CMP) and in a switching module (SM) must determine which ports are available for terminating calls. In the CMP, the RLLGTKSTAT relation contains tuples for all global ports that exist in more than one SM. During normal operation, when this relation resides in an SM it contains only tuples for local port groups that exist in that SM. During stand-alone operation, these tuples are deleted.

For information about smaller trunk groups, refer to the trunk status audit (TKSTAT). For information about groups of hunted lines, refer to the line status audit (LNSTAT) and the large line status audit (LGLNSTAT).

This audit is part of the routing and terminal allocation audits subgroup.

2. DATA STRUCTURES

The data structures checked by the LGTKSTAT audit are the large trunk status relation (RLLGTKSTAT) and the trunk group information relation (RLRT_TRKG). Figure 1 illustrates the two relations. The RLRT_TRKG relation is a static (write-protected) relation that contains information about all hunted trunks. This information includes a key (group number), the type of trunk group (two-way or incoming, and so forth), the module (CMP or SM) that controls it, and the hunt type. The LGTKSTAT audit steps through the RLLGTKSTAT relation and verifies it against the information contained in the RLRT_TRKG relation. The RLRT_TRKG relation is also used in the trunk status audit (TKSTAT), the trunk group information audit (RTTRKG), the trunk queue audit (TKQUE), and the trunk owner audit (TKOWNER).

SM & RSM*

AM

*In an RSM environment, the RLLGTKSTAT resides in both the AM and RSM.
 But in the RSM, the linkage between RLGTKSTAT and RLGRP_TGC does not exist.

Figure 1 (LGTKSTAT-1) Large Trunk Status Audit

3. AUDIT CHECKS

The LGTKSTAT audit calls the static driver (DRSTATIC) to check the correspondence between the RLLGTKSTAT and RLRT_TRKG relations and then performs the following checks:

- The audit verifies each rLGTKSTAT tuple against the corresponding rIRT_TRKG tuple by using the key (group number) of the rLGTKSTAT tuple to read the RLRT_TRKG relation. The audit looks specifically for extra rLGTKSTAT tuples.
- The audit checks the group type (RTTOWAY) and hunt type (RTH_LGBWD, RTH_LGFWD, RTH_LGUCD, RTH_LGGUCD, RTH_LGBGUCD, RTH_PLBLIN, or RTH_PLFLIN) of the rIRT_TRKG tuple.
- In the CMP, the audit also checks the link to the group trunk group controls relation (RLGRP_TGC).
- The audit ensures that the module number is correct for the tuple.
- If there is an analog console busy lamp associated with a trunk group, the audit compares its idle bit count with the automatic count made by call processing. In addition to the idle count (idle number of trunks), it checks that the status of the make busy key and busy lamp are consistent. If the make-busy key is processed, the lamp should be on regardless of the idle count.

If there is an ISDN attendant console busy lamp associated with a trunk group, the audit checks that the busy lamp and make-busy key of this console are consistent with the idle count (idle number of trunks). If the ISDN attendant console is equipped with a warning lamp, this lamp's state is checked against the idle count and the preset value in the trunk group information relation RLRT_TRKG. If the make-busy key is pressed, the busy and warning lamps should be on regardless of the idle-count.

4. ERROR HANDLING

Excess tuples, tuples not in the appropriate module, and tuples with wrong hunt types are deleted from the relation. If a linkage check fails, the audit zeroes the tuple and the tuple is reconstructed. The audit corrects counts and lamp errors.

The audit corrects ISDN attendant console busy lamp and warning lamp inconsistencies if a trunk group is equipped with such lamps.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BADIDLE2

Error Code:	BADIDLE2
Error Description:	In the process of calculating the idle count (number of idle trunk members in the group as expressed by the number of bit positions in rLGTKSTAT.gmflg[] which are marked as "1"), the global trunk group tuple buffer AUtrkgbuf has been found with an invalid hunt type for this group (AUtrkgbuf.htype). This tuple buffer is used to store a local copy of the corresponding rIRT_TRKG static tuple associated with the rLGTKSTAT dynamic tuple under audit (where $rIRT\_TRKG.grpnum = rLGTKSTAT.grpnum$).
Possible Error Effect:	The idle count, console busy lamp and console warning lamp data (rLGTKSTAT.idle_count, rLGTKSTAT.tgbl_on, and rLGTKSTAT.tgwl_on) cannot be audited for correctness. Should these fields become corrupted, the customer would not receive proper trunk group status from the status lamps on

	the console monitoring this group.
Corrective Action Taken:	Audit processing is aborted for this group, the RTTRKG audit is scheduled, and in the process, the contents of the AUtrkgbuf global buffer are reinitialized.
Manual Action Required:	If this error continues to fire, it indicates that an ODD inconsistency exists. Using ODBE, examine the corresponding rIRT_TRKG static tuple for this group (where the key rIRT_TRKG.grpnum = rLGTKSTAT.grpnum). The key for the rIRT_TRKG static tuple is dumped as the logical key when this audit error fires. Once the rIRT_TRKG static tuple has been obtained, examine the hunt type (rIRT_TRKG.htype). It should reflect one of the legal LARGE LINEAR hunting algorithm hunt types. The legal LARGE LINEAR hunt types are listed in the RLRT_TRKG relation population rules, and are identified as RTH_LGXXX, where XXX denotes the particular hunting method (FW for forward, BW for backward, etc.) Using ODBE, correct the hunt type in RLRT_TRKG to match one of the LARGE LINEAR hunt types listed in the population rules.
Dump Description:	
<i>Error Address</i> =	The rITKSTAT tuple address.
<i>Bad Data</i> =	The hunt type that was found in the global trunk group tuple buffer (AUtrkgbuf.htype).
<i>Good Data</i> =	The trunk group number (key) that was found in the global trunk group tuple buffer (AUtrkgbuf.grpnum) for which there should exist a corresponding rIRT_TRKG static tuple, and rLGTKSTAT dynamic tuple.
<i>Logical Index</i> =	Group number (key) found in the rLGTKSTAT dynamic tuple (rLGTKSTAT.grpnum).
<i>Dump</i> =	The contents of the rLGTKSTAT dynamic tuple.

Table 2 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	A count of the idle group members did not equal the stored idle count.
Possible Error Effect:	Measurements would be in error for this group. Possible mishandling of the group busy and warning lamps(emif equipped).
Corrective Action Taken:	The idle count was corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rLGTKSTAT tuple address.
<i>Bad Data</i> =	idle_count field.
<i>Good Data</i> =	Correct count of idle members.
<i>Logical Index</i> =	Group number.
<i>Dump</i> =	rLGTKSTAT tuple.

Table 3 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The group number for this tuple is not assigned.
Possible Error Effect:	An assert will fire if this tuple is not found after trying to retrieve it.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Calculated grpnum of this tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Calculated grpnum of this tuple.
<i>Dump</i> =	rLGTKSTAT tuple.

Table 4 Error Code: LAMP

Error Code:	LAMP
Error Description:	This trunk group's analog and/or ISDN attendant console group busy lamp was found to be in the wrong state.
Possible Error Effect:	Bad group status information was presented to the attendant.
Corrective Action Taken:	The lamp state was corrected.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Address of RLLGTKSTAT tuple.
<i>Bad Data</i> =	Lamp state as found (0 = OFF; 1 = ON).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Group number.
<i>Dump</i> =	rLGTKSTAT tuple.

Table 5 Error Code: PCRID

Error Code:	PCRID
Error Description:	The tuple should not exist in this processor. In the CMP, only tuples from global trunk groups should be present. In an SM, only tuples from local trunk groups on that SM should be present except during stand-alone operation when tuples from global trunk groups are allowed.
Possible Error Effect:	More than one processor could route calls to this group.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLGTKSTAT tuple.
<i>Bad Data</i> =	Module number for local group; 0 if global.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	grpnum of this tuple.
<i>Dump</i> =	NA.

Table 6 Error Code: TYPE

Error Code:	TYPE
Error Description:	The group is of the wrong hunt type to have a tuple in this relation.
Possible Error Effect:	An assert will fire if this group's hunt type is not of the type used in rLGTKSTAT (that is, RTH_LGFWD, RTH_LGBWD, RTH_LGUCD, RTH_LGGUCD, RTH_LGBGUCD, RTH_PLFLIN, or RTH_PLBLIN) and the tuple could not be retrieved.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLGTKSTAT tuple.
<i>Bad Data</i> =	Hunt type of the group.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	grpnum of this tuple.
<i>Dump</i> =	NA.

Table 7 Error Code: TLAMP

Error Code:	TLAMP
Error Description:	This trunk group's ISDN attendant console threshold warning lamp was found to be in the wrong state.
Possible Error Effect:	Bad group status information was presented to the attendant.
Corrective Action Taken:	The lamp state was corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of RLLGTKSTAT tuple.
<i>Bad Data</i> =	Lamp state as found (0 - OFF; 1 - ON).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Group number.
<i>Dump</i> =	RLLGTKSTAT tuple.

20. LH - LP

LINE

Software Release: 5E10 and later

1. LINE CONCENTRATOR (LINE) AUDIT

The line unit consists of a line concentrator and customer interface hardware that includes channel circuits, high-level service circuits, and control circuits. The line unit can terminate as many as 512 customer lines. It is divided into two service groups, each of which can accommodate 32 active calls. The line concentration hunts through a path to select a channel for a call when a customer originates. Through a series of A-links and B-links, the line concentrator provides concentration ratios of 10:1, 8:1, 6:1, or 4:1 customer lines to channel circuits, depending on the office configuration. There is one B-link for each channel circuit; in a fully equipped line unit, as many as eight B-links may terminate on one A-link. Only one channel circuit may be connected to the A-link at a time, however. The line concentrator (LINE) audit ensures the consistency of the software controlling the A-links, B-links, and channel circuits. The LINE audit is part of the peripheral control audits subgroup. It operates at execution level B in the operating system for distributed switching-switching module (OSDS-SM) environment in the initialization and segmented modes.

2. DATA STRUCTURES

The data structures verified by the LINE audit are the A-link allocation map, the B-link allocation map, the channel circuit relation (RLCHAN), the circuit data block common area relation (RLCDBCOM), and the channel control block common area relation (RLCCBCOM). The channel circuit relation defines the mapping between channel circuits and crosspoints. It tells whether each channel is busy or idle; if the channel is busy, RLCHAN tells which crosspoints form the path. The circuit data block common area (RLCDBCOM) relation defines the allocation of the circuit to processes, idle lists, and out-of-service lists. Figure 1 illustrates these data structures and linkages among them.

NOTE: A-LINK MAPS TO EIGHT B-LINKS.
 B-LINK CORRESPONDS TO CHANNEL CIRCUIT.
 EACH CHANNEL CIRCUIT HAS AN rCHAN TUPLE
 AND AN rCDBCOM TUPLE.
 rCCBCOM HAS HEAD CELLS FOR rCDBCOM
 TUPLES.

—————> = One-to-many linkage
 ————— = Nonstandard linkage

Figure 1 (LINE-1) Line Concentrator Linkages

3. AUDIT CHECKS

After determining the type of line units the switching module has (model LU1, LU2, or LU3), the audit performs two phases of semantic checks: the A-link phase and the B-link phase.

- A-link phase - The audit checks the peripheral control line unit service group array to determine whether the line unit is equipped. If it is not equipped, the audit checks the next line unit.
- (a) The audit obtains each entry in the A-link allocation map and checks the traffic busy/idle status of the A-link.
 - (b) The audit computes the eight possible B-link names that may connect on the A-link. It checks the maintenance status of each B-link. If the maintenance status is busy, the audit ignores it and proceeds to the next B-link.
 - (c) For each B-link, the audit obtains the channel number for the B-link within the specified service group. The audit calculates the circuit name and checks the appropriate rICHAN tuple to ensure that the channel traffic status and B-link status are the same (there is a one-to-one correspondence between B-links and channel circuits).
 - (d) The audit then determines whether the channel terminates on the proper A-link. If it does, the audit checks the busy/idle status of the rICHAN tuple and stores the count of the crosspoints that are busy. If the channel does not terminate on the proper A-link, the audit proceeds to the next channel.
 - (e) The audit checks the A-link traffic status against the busy count. A busy A-link should have a busy count of one. An idle A-link should have a busy count of zero.
- B-link phase - The audit checks the peripheral control line unit service group array to determine whether the line unit is equipped. If it is not equipped, the audit checks the next line unit.
- (a) If the line unit is equipped, the audit obtains each entry in the B-link allocation map and checks the traffic and maintenance busy/idle statuses of the B-link.
 - (b) The audit calculates the channel name for each B-link for accessing rCDBCOM and obtains the channel key for accessing rICHAN.
 - (c) The audit accesses the rCDBCOM tuple for the channel and checks the status of the channel circuit. If the channel circuit is unequipped or out of service, the rICHAN tuple should be vacant or busy, respectively, and the B-link should be marked busy. If the channel circuit is in service, the audit checks the consistency among rCDBCOM, rICHAN, and the B-link map based on the traffic busy/idle status in rCDBCOM.

4. ERROR HANDLING

The A-link phase of the LINE audit handles the following errors. If the A-link status does not agree with the busy count, an error is reported and the A-link status is set to idle. If the A-link status is idle and the busy count is greater than zero, the B-link status is set to idle and the corresponding rCDBCOM tuple is quarantined.

The B-link phase of the LINE audit handles the following errors. If a channel circuit is marked unequipped or out of service (as in the case for growth) in an rCDBCOM tuple and the B-link status or rICHAN tuple is not vacant or is

marked idle, respectively, an error is reported and the B-link allocation map or rICHAN tuple is set busy. If the busy/idle status of the B-link in the rICHAN tuple does not agree with the B-link allocation map status or the B-link is in an invalid state (for example, maintenance busy and traffic idle), an error is reported and the B-link status and the rICHAN tuple are set to idle. If the rICHAN tuple indicated that the status was busy, the corresponding rCDBCOM tuple is quarantined to ensure error confinement and recovery by the circuit data audit (CKTDATA).

The LINE audit schedules the CKTDATA and CHAN audits as related audits when it detects errors.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ALINK

Error Code:	ALINK
Error Description:	The traffic busy/idle status of an A-link is inconsistent with the traffic busy/idle status of the corresponding channel circuits.
Corrective Action Taken:	Idle the A-link map traffic status bit. Idle the corresponding B-link. Quarantine the rCDBCOM tuple of the channel circuit corresponding to the B-link.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of an rICHAN tuple which could connect to the A-link in a LU1/LU2/LU3 line unit.
<i>Bad Data</i> =	A-link status.
<i>Good Data</i> =	Count of busy first stage crosspoints.
<i>Logical Index</i> =	Logical key of the rICHAN tuple mentioned under ERROR ADDRESS. All of the following dumps are printed in one dump call. Within this large dump, the mini dumps are separated by the hex string FACE.
<i>Dump 1</i> =	Line unit number.
<i>Dump 2</i> =	A-link map for the line unit.
<i>Dump 3</i> =	B-link map for the line unit.
<i>Dump 4</i> =	rICHAN tuples which can connect to the A-link in a LU1/LU2/LU3 line unit.

Table 2 Error Code: ASSOC_CDB

Error Code:	ASSOC_CDB
Error Description:	An rCDBCOM tuple associated with a B-link appears to be lost or has been corrupted.
Possible Error Effect:	The status of the B-link cannot be verified. Possible lost call processing resource.
Corrective Action Taken:	Schedule the CKTDATA audit as a related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rCDBCOM tuple.
<i>Bad Data</i> =	Key of rCDBCOM tuple at DA supplied address.
<i>Good Data</i> =	Calculated rCDBCOM tuple key.
<i>Logical Index</i> =	Calculated channel circuit name.
<i>Dump</i> =	rCDBCOM tuple.

Table 3 Error Code: ASSOC_TUP

Error Code:	ASSOC_TUP
Error Description:	An rICHAN tuple associated with a B-link appears to be lost or has been corrupted.
Possible Error Effect:	The status of the B-link cannot be verified. Possible lost call processing resource.
Corrective Action Taken:	Schedule the CHAN audit as a related audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rICHAN tuple.
<i>Bad Data</i> =	Key of rICHAN tuple at DA supplied address.
<i>Good Data</i> =	Calculated rICHAN tuple key.

<i>Logical Index</i> =	Calculated channel circuit name.
<i>Dump</i> =	rICHAN tuple.

Table 4 Error Code: BLINK

Error Code:	BLINK
Error Description:	The busy/idle status of a B-link is inconsistent with the busy/idle status of the corresponding channel circuit (rICHAN) or circuit data (rCDBCOM) status. Another possible cause is that the B-link was found to be in the illegal state "MTCE busy - TRAFFIC idle".
Possible Error Effect:	Available B-links may not be used by call processing due to the incorrect map.
Corrective Action Taken:	Idle the B-link map status bit, and quarantine the rCDBCOM tuple if not on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rICHAN tuple.
<i>Bad Data</i> =	B-link traffic status.
<i>Good Data</i> =	rICHAN status bit.
<i>Logical Index</i> =	Logical key of the rICHAN tuple. Each dump is separated by a marker (FACE).
<i>Dump 1</i> =	Line unit.
<i>Dump 2</i> =	B-link map.
<i>Dump 3</i> =	rICHAN tuple.
<i>Dump 4</i> =	rCDBCOM tuple.

Table 5 Error Code: OOS_BLINK

Error Code:	OOS_BLINK
Error Description:	A channel circuit is out-of-service or unequipped, but the B-link map is idle.
Possible Error Effect:	An out-of-service channel may be allocated to a call.
Corrective Action Taken:	Busy the B-link map.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rCDBCOM tuple.
<i>Bad Data</i> =	B-link status.
<i>Good Data</i> =	AUBLNKBUSY (1).
<i>Logical Index</i> =	Logical key of rICHAN tuple. Each dump is separated by a marker (FACE).
<i>Dump 1</i> =	Line unit.
<i>Dump 2</i> =	PCblunit[] for this line unit.
<i>Dump 3</i> =	Dump of the rCDBCOM tuple.

Table 6 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to clean up after taking a reset.
Possible Error Effect:	Causes resets and/or asserts.
Corrective Action Taken:	None.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Line unit number (0-7).
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	AUcursor.
<i>Dump</i> =	NA.

LKBDST

Software Release: 5E10 and later

1. LINK AND BAND STATUS (LKBDST) AUDIT

The LKBDST audit is run automatically several times a day (depending on the number of equipped nodes). It can also be run manually, as described under the AUD:LKBDST listing in the Input Messages manual (235-600-700). The purpose of the audit is to detect and correct any discrepancies between basic link and band status data stored on the central processor and the nodes.

2. DATA STRUCTURES

This information is maintained by both the central processor and the nodes. It includes:

- link state
- node state
- internal link and mate link status (indicating whether or not the link or its mate are carrying traffic)
- route switch status (reflecting band status)
- other node parameters and indicators

If the link is of type CCS7 and has virtual links assigned, the data checked includes only ECIS6 data (that is, point code routing data, CCS7 node parameters, and CCS7 link status data are not checked). If the node is a private branch exchange (PBX) type, the data includes per node data and per link data.

3. AUDIT CHECKS

In automatic mode, each equipped node (other than RPC nodes) is audited in sequence until all nodes in the office have been checked. Each time LKBDST executes, one node is audited. Upon the next invocation, the audit continues with the next node. A node is skipped if it is out-of-service. In manual mode, either a specific node or all nodes can be audited.

The central processor sends a query to the node being audited. The node responds by sending the basic link and band status data to the central processor to be compared with its version of the data. From one to three messages are required.

The data audited is both correctable and non-correctable. Correctable data includes:

- link states
- route switch status

If a correctable error is found, the central processor sends another message to the node containing the correct data. Any one error causes all correctable data to be updated. If the node is a PBX type, all D-channel (DCHN) and special access data channel (SADC) links may be restarted.

Non-correctable data includes:

- link status
- mate link status

- node states

If anon-correctable error is found, the node is restarted (that is, it is diagnosed and downloaded).

The audit usually completes 15 minutes to two hours after it is started, depending on the number of nodes in the office and on how busy it is at the time.

NOTE: If the audit is executing manually on all nodes, the audit aborts if more than two nodes must be restarted. This is to avoid removing a large number of nodes from service at one time.

4. ERROR HANDLING

Output messages are found in the Output Messages manual (235-600-750). If the audit is running manually or if the detailed (DETL) option was selected, up to 16 detailed reports are provided. If more than 16 errors are found, a modified form of the raw data report shows the number of errors found as well as the number corrected.

LLCB-A

Software Release: 5E10 - 5E11

1. LOGICAL LINK CONTROL BLOCK (LLCB) AUDIT

The LLCB audit is part of the switch maintenance audits subgroup. It runs in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The LLCB audit uses the packet switching logical link control block array (PSllcb), the D-channel control block (PSdccb), and the internal frame descriptor array (PSifd).

3. AUDIT CHECKS

The audit makes linkage checks within the PSllcb array and with PSdccb and PSifd. It makes semantic checks to ensure the correctness of data in PSllcb.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: ACPTRBAD

Error Code:	ACPTRBAD
Error Description:	The audit found a bad ALCB pointer. A LAPD LLCB is on the timing or timeout list, but its ALCB index is out of range.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPD LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's alcb_index field.
<i>Good Data =</i>	PSALCBNULL, the alcb_index value is greater than this.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 2 Error Code: BADIDLE2

Error Code:	BADIDLE2
Error Description:	The audit found a LAPB or LAPD LLCB with IFDs that have been monitored by the audits for at least 2 audit cycles and have not moved, yet the LLCB is not in peer busy state (the "peer-busy" bit is not set). This is a potential stuck condition that may put the PH in overload where the IFDs holding BDs are not moving therefore tying up these resources.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LLCB and all related data structures to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's timer type "ttype".
<i>Bad Data =</i>	LLCB's frame age counter "frmag_cnt".
<i>Good Data =</i>	LLCB's channel number "dchan".
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	LLCB being audited.

Table 3 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	The audit found a RRL or LAN LLCB whose owner field is invalid.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAN or RRL LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's owner field.
<i>Good Data =</i>	PSLLNOLST - the highest valid owner value.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 4 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	Flow Control LLCBs are those LLCBs that fall with the range of PSSLSIX-PSSLLEIX, and whose type field has a value of PSL_FLWCTRL. For an FCCB LLCB, the phctype field did not match the same field found in DCDB accessed through the dchan field of this LLCB which serves as an index to PSdcbd[] array.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit will correct the phctype field of this LLCB to be equal to the phctype field value found in DCDB accessed through the dchan field of this LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's dchan field.
<i>Bad Data =</i>	LLCB's phctype field.
<i>Good Data =</i>	The value of phctype field found in DCDB accessed through the dchan field of this LLCB.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 5 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	The OCstrt_time[] array holds time stamps for busy channels and is used for the LAPB and LAPD LLCBs. When audit counted all the non-null entried in the OCstrt_time[] and checked it against the global counter, <i>OCbusy_cnt</i> , there was a mismatch.
Possible Error Effect:	The PH can potentially be in overload forever. Any non-zero value in the global counter <i>OCbusy_cnt</i> will force the PH to be in overload.
Corrective Action Taken:	The audit corrects the <i>OCbusy_cnt</i> counter with the count of non-zero entried in the OCstrt_time[] array it calculated.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	The value found in <i>OCbusy_cnt</i> .
<i>Good Data =</i>	The value found in au_count, local variable to hold the count of non zero entries of the OCstrt_time[] array.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 6 Error Code: BDLINK

Error Code:	BDLINK
Error Description:	The audit found a LAPD LLCB on timing or on the timeout list, but it is not linked to any DCCB or any of the field(s), dchan, tix or sapi i is(are) bad.
Possible Error Effect:	Prints out a report and recover the LLCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which will return the LAPD LLCB to the free linked list.

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's type field.
<i>Bad Data =</i>	LLCB's sapi_i field. Although in this field we have chosen to dump the sapi_i value as bad data, value of tix and/or dchan could also be bad. And they are dumped in "DUMP" field.
<i>Good Data =</i>	PSLLCBNULL - the valid null value for this field. Actually for valid link, the values of dchan, tix and sapi_i should be within range and should have such values that they form a link with LLCB.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	The value of tix and dchan. This combined with "BAD DATA" (sapi_i) will determine which value(s) is(are) bad.

Table 7 Error Code: BLINK

Error Code:	BLINK
Error Description:	"Blocked IFD link". The audit found a LLCB whose "blocked" IFD field is out of range.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's IFD blocked field (blocked).
<i>Good Data =</i>	PSIFDNULL - valid null value for blocked field.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 8 Error Code: BUSYCHAN

Error Code:	BUSYCHAN
Error Description:	The OCstr_ttime[] array holds time stamps for busy channels and is used for the LAPB and LAPD LLCBs. The audit found that for the current LLCB being audited, the entry in the OCstr_ttime[] array has a valid timer value, that is not null and less than PSTMAX, but the own_busy bit is not set.
Possible Error Effect:	The PH can potentially be in overload forever as this field directly interfaces with the global <i>OCbusy_cnt</i> counter.
Corrective Action Taken:	The audit corrects the OCstr_ttime[] array entry to null, and returns AUFALSE to recover this LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index to the OCstr_ttime[] array. This is derived by subtracting PSSLLSIX value from the LLCB index dumped in the logical key field below.
<i>Bad Data =</i>	LLCB's own_busy field.
<i>Good Data =</i>	Value found in the OCstr_ttime[] array for this LLCB.
<i>Logical Index =</i>	LLCB index, the LLCB being audited.
<i>Dump =</i>	The LLCB being audited.

Table 9 Error Code: COUNTS

Error Code:	COUNTS
Error Description:	The audit found a LAN LLCB with stuck IFDs linked to it. The audit found no movement of IFDs from the LLCB for two audit cycles.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAN LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB timer type ("ttype").
<i>Bad Data =</i>	LLCB's frame age counter. This is bumped each time the audit finds non-moving IFDs. The maximum value is PSIFDMXCTR or 2.
<i>Good Data =</i>	LLCB's owner.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	LLCB's state.

Table 10 Error Code: DCHAN

Error Code:	DCHAN
Error Description:	The LLCB audit found a LAPB LLCB on timing or timeout with the DCCB indicated in the LLCB's dchan field is NOT pointing to this LLCB.
Possible Error Effect:	Prints out a report and recovers the LLCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which will recover the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The starting address of this LLCB.
<i>Bad Data =</i>	Any of the values of dchan, tix or sapi_i are bad for this LLCB. Value of sapi_i is dumped here. Values of dchan and tix are dumped in "DUMP".
<i>Good Data =</i>	Any valid value of DCCB index combined with the tix value of 0 and sapi_i value of PSKT (2) to give a valid link for this LLCB with DCCB.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	The value of tix and dchan. The combination of these values with sapi_i value will determine which values are bad.

Table 11 Error Code: DRLPTR

Error Code:	DRLPTR
Error Description:	"Data ready link PTR". The audit found a LLCB whose "ready" IFD field is out of range.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's IFD ready field (ready).
<i>Good Data =</i>	PSIFDNULL - valid null value for ready field.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 12 Error Code: HEAD

Error Code:	HEAD
Error Description:	The audit found a LLCB (the IFD headcell) whose IFD linkages are bad. The check that the first IFD's owner is this LLCB, and the first IFD's back field is PSIFDNULL, and the last IFD's owner is this LLCB, and the last IFD's back field is PSIFDNULL has failed.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which causes the LLCB to be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	PSIFDNULL - valid null value for the back or forward IFD fields.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	AULNK defined in au/AUaps/AUextern.h (all sized as unsigned short): • "back" element's back field, • "back" struct.'s owner field, • "back" struct.'s next field, • current element being audited, • current element on this linked list, • current element's back field,

	• current element's owner, • data element null value, • head cell null value, • headcell's first element, • headcell's last element, • "next" element on this linked list, • next element's back field, • next element's owner field. NOTE: 0xaa is the default value and indicates either the field is not used or the values are out of range and the data cannot be read and so is filled with 0xaa.

Table 13 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	The LLCB audit found a LAPB LLCB on no linked list whose forward and/or backward LLCB fields are not null.
Possible Error Effect:	Prints an error report and corrects the fields.
Corrective Action Taken:	The audit reports the error and sets the forward and backward LLCB fields to null.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's forward field (forw .llcb).
<i>Bad Data =</i>	LLCB's back field (back .llcb).
<i>Good Data =</i>	PSTLNULL - valid null field values.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 14 Error Code: IDLE_LINKED

Error Code:	IDLE_LINKED
Error Description:	The audit found a LAPD LLCB on no linked list and either the forward LLCB pointer or the back LLCB pointer is not null. There should be no LLCBs linked to this LLCB.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPD LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's forward LLCB pointer.
<i>Bad Data =</i>	LLCB's back LLCB pointer.
<i>Good Data =</i>	PSTLNULL, the valid null value for these fields.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 15 Error Code: IDLE_OWNER

Error Code:	IDLE_OWNER
Error Description:	"Error in no list owner". The audit found a intra-PH with its owner not set to no linked list.
Possible Error Effect:	Prints an error report and recovers the intra-PH LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which sets the intra-PH LLCB back to its default values.

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's owner field.
<i>Good Data =</i>	PSLLNOLST - valid owner for the Intra-PH LLCB.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 16 Error Code: IL_PTYPE

Error Code:	IL_PTYPE
Error Description:	LAN LLCB is defined as an LLCB falling within the range of PSPLLSIX - PSPLLEIX. For a LAN LLCB, which is not an intra-ph LLCB, that is LLCB equal to PSINPHLL for PH processors; the type field was found not to be PSL PKTBUS, which is an error.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit reports the error and sets the LLCB back to its default values.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's type field.
<i>Good Data =</i>	PSL PKTBUS - valid value for type field for the LAN LLCBs.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 17 Error Code: INDEX

Error Code:	INDEX
Error Description:	"Invalid PH channel index". The audit found a LAPD LLCB whose "phctype" does not match the write protected D-channel data block's (DCDB) "phctype" field.
Possible Error Effect:	Prints an error report and corrects the LLCB's "phctype".
Corrective Action Taken:	The audit reports the error and sets the LLCB's "phctype" to the DCDB's "phctype" field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's phctype field.
<i>Good Data =</i>	DCDB's phctype field (write protected data).
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 18 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	The OCstrt_time[] array holds time stamps for busy channels and is used for the LAPB and LAPD LLCBs. Audit found that for the current LLCB being audited, the entry in the OCstrt_time[] array does not have a null value(OCTNULL) and is out of range, that is, greater than PSTMAX.
Possible Error Effect:	The channel cannot be busy for more than 1 second. This channel will be released in one second.
Corrective Action Taken:	The audit corrects the OCstrt_time[] array entry to null value, updates the own_busy field of the LLCB to DBNO and returns AUFALSE to recover this LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index to the OCstrt_time[] array. This is derived by subtracting PSSLLSIX value from the LLCB index dumped in the Logical Key field.
<i>Bad Data =</i>	Value found in the OCstrt_time[] array for this LLCB.
<i>Good Data =</i>	LLCB's own_busy field.
<i>Logical Index =</i>	LLCB index, the LLCB being audited.
<i>Dump =</i>	NA.

Table 19 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	The audit has found a resource recovery list LLCB where there is no IFD on the RRL LLCB but the owner is not PSLLNOST. There are no IFDs there should not be any timers and the LLCB should be on no linked list.
Possible Error Effect:	Prints out a report and recovers the RRL LLCB.
Corrective Action Taken:	The audit returns AUFALSE which will recover the LLCB and set the RRL LLCB to default values.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's d channel (dchan).
<i>Bad Data =</i>	LLCB's owner field.
<i>Good Data =</i>	LLCB's state.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 20 Error Code: INVOWNER

Error Code:	INVOWNER
Error Description:	The audit found a RRL or Intra-PH LLCB with an invalid owner field.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's owner.
<i>Good Data =</i>	LLCB index (NA here).
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 21 Error Code: INVOWNER2

Error Code:	INVOWNER2
Error Description:	The audit has found an invalid owner field for LAPD LLCB.
Possible Error Effect:	Prints out a report and recovers the LLCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which will recover the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's owner.
<i>Good Data =</i>	LLCB index.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 22 Error Code: IPBID

Error Code:	IPBID
Error Description:	"Invalid peer busy indicator". The audit found a LAPB LLCB with an inconsistent "peerbusy" field for its state.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPB LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's state field.
<i>Bad Data =</i>	LLCB's peer_busy field.
<i>Good Data =</i>	The expected peer_busy value for this state.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 23 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	The audit found a D-channel index field is not null. Neither LAN nor RRL LLCBs should be linked to D-channel control blocks (DCCBs).
Possible Error Effect:	Prints an error report and nulls the field.

Corrective Action Taken:	The audit corrects the LLCB's dchan field to its null value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's dchan field (D-channel).
<i>Good Data =</i>	PSMAXCHN - the correct dchan null value.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 24 Error Code: LNK_CONFIG

Error Code:	LNK_CONFIG
Error Description:	The audit found a LAN LLCB that was not on timing, but its forward LLCB pointer or back LLCB pointer is not null.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAN LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB forward pointer to next LLCB.
<i>Bad Data =</i>	LLCB back pointer to previous LLCB.
<i>Good Data =</i>	PSTLNULL - the correct LLCB pointer null value.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 25 Error Code: LNK2ALST

Error Code:	LNK2ALST
Error Description:	The LLCB audit found a LAPB LLCB on timing but has either an out of range ALCB or the ALCB indicated in the LLCB is not pointing to this LLCB.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's alcb_index.
<i>Bad Data =</i>	LLCB's ALCB's llcb_index.
<i>Good Data =</i>	PSALCBNULL - null ALCB value.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 26 Error Code: LNK2ILST

Error Code:	LNK2ILST
Error Description:	The audit found a LAPB or LAPD LLCB on either the free linked list or NO list where either the ALCB index field or the D-channel field is not null. This LLCB should not be linked to any DCCBs or have any ALCBs linked to it.
Possible Error Effect:	Prints an error report and corrects the erroneous fields.
Corrective Action Taken:	The audit reports the error and sets the alcb_index and dchan (D channel) fields to null values.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's pointer to D channel (dchan).
<i>Bad Data =</i>	LLCB's ALCB pointer (alcb_index).
<i>Good Data =</i>	PSALCBNULL - the valid null value for the alcb_index field.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 27 Error Code: LNKIALST

Error Code:	LNKIALST
Error Description:	The audit found a resource recovery list LLCB or LAN LLCB whose ALCB index field is not null. There should not be any ALCBs linked to RRL or LAN LLCBs.
Possible Error Effect:	Prints an error report and nulls the field.
Corrective Action Taken:	The audit corrects the LLCB's alcb_index field to its null value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.

<i>Bad Data</i> =	LLCB's alcb index.
<i>Good Data</i> =	PSALCBNULL - the correct ALCB index null value.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 28 Error Code: LNKILST

Error Code:	LNKILST
Error Description:	"Link to IFD idle list". The audit found a LLCB with the first and last IFD fields null but the ready or blocked fields are NOT null.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE to recover the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB's ready IFD.
<i>Bad Data</i> =	LLCB's blocked IFD.
<i>Good Data</i> =	LLCB index.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 29 Error Code: LPSTATE

Error Code:	LPSTATE
Error Description:	The audit has found a LAPD LLCB not in multiframe establish or timer recovery state and the peer_busy bit is set. These are the only valid states for the bit to be set.
Possible Error Effect:	Prints out a report and correct the peer_busy field.
Corrective Action Taken:	The audit will report the error and set peer_busy bit to DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB's owner (indicates on timing or no link list).
<i>Bad Data</i> =	LLCB's state.
<i>Good Data</i> =	dchan - the channel the LLCB is on.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 30 Error Code: MAINT_STATE

Error Code:	MAINT_STATE
Error Description:	The audit found a LAPB LLCB with an out of range state field.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPB LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LLCB's state field.
<i>Good Data</i> =	LLCB index.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 31 Error Code: MASTER_LINK

Error Code:	MASTER_LINK
Error Description:	The audit found a LAPB LLCB on no linked list and the point-to/point-back checks to the DCCB failed.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPB LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB's D-channel value (dchan).
<i>Bad Data</i> =	LLCB's DCCB's llcb index.
<i>Good Data</i> =	LLCB index (NA here).
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 32 Error Code: MASTER_OWN

Error Code:	MASTER_OWN
Error Description:	The audit found a LAPB LLCB on no linked list and the D-channel field is out of range.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPB LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's D-Channel field (dchan).
<i>Good Data =</i>	PSMAXCHN, one or more than the maximum valid value.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 33 Error Code: MEMBER

Error Code:	MEMBER
Error Description:	The audit found a member error in the linked list of the specified audit.
Possible Error Effect:	Prints an error report and corrects the linked list.
Corrective Action Taken:	Returns AUFALSE to calling function which rebuilds the linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Linked list null value.
<i>Logical Index =</i>	AUcount, the current element number.
<i>Dump =</i>	AULNK defined in au/AUps/AUextern.h (all sized as unsigned short): • "back" element's back field, • "back" struct.'s owner field, • "back" struct.'s next field, • current element's owner, • current element on this linked list, • current element's back field, • current element being audited, • data element null value, • head cell null value, • headcell's first element, • headcell's last element, • "next" element's owner field, • "next" element on this linked list, • "next" element's back field. NOTE: 0xaa is the default value and indicates either the field is not used or

the values are out of range and the data cannot be read and so is filled with 0xaa.

Table 34 Error Code: NO_OWN_TS

Error Code:	NO_OWN_TS
Error Description:	"No owner is indicated for timing specified". The audit found an EDSL channel that does not have a timer pending.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAN LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's owner field.
<i>Good Data =</i>	PSTMAX - One greater than the maximum value of the owner field.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 35 Error Code: NOACCBLK

Error Code:	NOACCBLK
Error Description:	"No accurate block IFD field". The audit found a LLCB where the point-to-point-back checks fail between the "blocked" IFD and the LLCB.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's IFD blocked field (blocked).
<i>Bad Data =</i>	Blocked IFD's LLCB field (should equal this LLCB).
<i>Good Data =</i>	LLCB index.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 36 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	The audit found a LAN or RRL LLCB with its own busy bit set. Neither LAN nor RRL LLCBs should have the own_busy bit set.
Possible Error Effect:	Prints an error report and corrects the field.
Corrective Action Taken:	The audit reports the error and sets the "own_busy" bit to DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's own_busy value.
<i>Good Data =</i>	DBNO - valid value for the own_busy bit.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 37 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	The audit found an unused LLCB without the required fields nulled.
Possible Error Effect:	Prints an error report and nulls the LLCB.
Corrective Action Taken:	The LLCB is zeroed out and returns from the function for more corrective actions.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's DCHAN (pointer to parent DCCB).
<i>Bad Data =</i>	LLCB's ALCB index.
<i>Good Data =</i>	LLCB index (not applicable here).
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	(All sized as unsigned short.)
	• LLCB's owner.

	• LLCB's back pointer to the previous LLCB. • LLCB's forward pointer to the next LLCB.

Table 38 Error Code: NULL3LINK

Error Code:	NULL3LINK
Error Description:	Flow control LLCBs are those LLCBs that fall with the range of PSSLLSIX-PSSLLEIX, and whose type field has a value of PSL_FLWCTRL. FCCB LLCBs are never attached to an ALCB, hence the alcb_index field of this LLCB should always be null (such as, PSHMAXALCB). A non null alcb_index field for this LLCB was found.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit reports the error and returns the LLCB back to its free list. A routine port condition of the PH involved will be scheduled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The dchan field of the LLCB.
<i>Bad Data =</i>	LLCB's alcb_index field.
<i>Good Data =</i>	PSHMAXALCB - valid value for alcb_index field for this FCCB LLCB.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 39 Error Code: NULL4LINK

Error Code:	NULL4LINK
Error Description:	For an LLCB linked to the free list, that is the owner field of this LLCB has a value of PSLLFRLST, the type field was found not to be PSL_NULL, which is an error.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit reports the error and returns the LLCB back to its free list. A routine port condition of the PH involved will be scheduled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's owner field.
<i>Bad Data =</i>	LLCB's type field.
<i>Good Data =</i>	LLCB's dchan field.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 40 Error Code: ONE2ONE

Error Code:	ONE2ONE
Error Description:	The audit found a LAPD LLCB on the timing or timeout list and has a valid ALCB index; however, the ALCB is not pointing to the LLCB.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPD LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's ALCB index field (alcb_index).
<i>Bad Data =</i>	LLCB's ALCB's llcb_index field.
<i>Good Data =</i>	LLCB index (NA here).
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 41 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	The audit found a LLCB with either its next LLCB pointer or previous LLCB pointer out of range or not the expected null value.
Possible Error Effect:	Prints an error report and recovers the LLCB.

Corrective Action Taken:	The audit reports the error and returns AUFALSE which causes the LLCB to be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Starting range that the LLCB can reside in.
<i>Bad Data</i> =	Ending range that the LLCB can reside in.
<i>Good Data</i> =	nullval - valid null value that the next or previous LLCB pointer can have.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	AULNK defined in au/AUps/AUextern.h (all sized as unsigned short): • "back" element's back field, • "back" struct.'s owner field, • "back" struct.'s next field, • current element being audited, • current element on this linked list, • current element's back field, • current element's owner, • data element null value, • head cell null value, • headcell's first element, • headcell's last element, • "next" element on this linked list, • "next" element's back field, • "next" element's owner field. NOTE: 0xaa is the default value and indicates either the field is not used or the values are out of range and the data cannot be read and so is filled with 0xaa.

Table 42 Error Code: OWNER

Error Code:	OWNER
Error Description:	The audit found a LAPB LLCB with an invalid owner field.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPB LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LLCB's owner field.
<i>Good Data</i> =	LLCB index.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 43 Error Code: OWNLINK

Error Code:	OWNLINK

Error Description:	The audit found a LLCB whose owner field is invalid while checking the LLCB on a free, timer or timeout linked list.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's owner field.
<i>Good Data =</i>	LLCB index.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 44 Error Code: PARENT

Error Code:	PARENT
Error Description:	The LLCB audit found a LAPB LLCB on timing or timeout list whose "dchan" field is out of range.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit will report the error and returns AUFALSE which recovers the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's starting address.
<i>Bad Data =</i>	LLCB's D-channel (dchan).
<i>Good Data =</i>	Any value between 0 and 127 will be a good data.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 45 Error Code: PKT_TYPE

Error Code:	PKT_TYPE
Error Description:	At the point we are reporting the error, we are expecting only LAPB, LAPD and flow control LLCBs determined from the type field and the function we are in. But we found an LLCB whose type field does not indicate it to be LAPB, LAPD or flow control LLCB.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	Since this LLCB has to be either LAPB, LAPD or flow control LLCB, its type must have been set incorrectly. The audit reports the error and returns the LLCB back to its free list. A routine port condition of the PH involved will be scheduled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's type field.
<i>Good Data =</i>	LLCB's dchan field.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 46 Error Code: PNT2PNT

Error Code:	PNT2PNT
Error Description:	Flow control LLCBs are those LLCBs that fall with the range of PSSLLSIX-PSSLLEIX, and whose type field has a value of PSL_FLWCTRL. For an FCCB LLCB, the point to point back check using the dchan field failed. The check involved getting an index in to the PSfccb[] array using the dchan field and checking the value of the LLCB index found at that array index in the PSfccb[] array to be equal to the index of the of the LLCB being audited.
Possible Error Effect:	Any EOC channels using this FCCB LLCB for its work may fail as this FCCB LLCB has not been initialized properly or has been corrupted.
Corrective Action Taken:	The audit reports the error and returns the LLCB back to its free list. A routine port condition of the PH involved will be scheduled.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The dchan field of the LLCB.

<i>Bad Data</i> =	The value of LLCB index found in the PSfccb[] array.
<i>Good Data</i> =	The LLCB index, that we should have found in the PSfccb[] array.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 47 Error Code: POINT2POINT

Error Code:	POINT2POINT
Error Description:	The audit has found a LAN LLCB whose D-channel index field is not null. This LLCB should not be linked to D-channel control blocks (DCCBs).
Possible Error Effect:	Prints out a report and nulls the field.
Corrective Action Taken:	The audit will correct the LLCB's dchan field to its null value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LLCB's dchan field (D-channel).
<i>Good Data</i> =	PSMAXCHN - the correct dchan null value.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 48 Error Code: PRC

Error Code:	PRC
Error Description:	"Pointer corrupted". The audit found a LLCB whose first IFD, last IFD, ready IFD or blocked IFD is out of range.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB's first IFD.
<i>Bad Data</i> =	LLCB's last IFD.
<i>Good Data</i> =	PSRIFDS - One more than maximum value the IFD value can be.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	(All sized as unsigned short.)
	• LLCB's IFD ready field. • LLCB's IFD blocked field.

Table 49 Error Code: PSTATUS

Error Code:	PSTATUS
Error Description:	The audit found a LAN or RRL LLCB with its peer_busy bit set. Neither LAN nor RRL LLCBs should have the peer_busy bit set.
Possible Error Effect:	Prints an error report and corrects the field.
Corrective Action Taken:	The audit reports the error and sets the "peer_busy" bit to DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB's state.
<i>Bad Data</i> =	LLCB's peer_busy value.
<i>Good Data</i> =	DBNO - valid value for the own_busy bit.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 50 Error Code: QUAR

Error Code:	QUAR
Error Description:	The audit found a LAN or RRL LLCB with its quarantine bit set.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAN or RRL LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.

<i>Bad Data</i> =	LLCB's quarantine bit value (quar_bit).
<i>Good Data</i> =	DBNO - valid value for the quarantine bit indicating no problems.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 51 Error Code: QUAR_INV

Error Code:	QUAR_INV
Error Description:	The audit found a LAPB/LAPD LLCB with its quarantine bit set.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPB/LAPD LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LLCB's quarantine bit value (quar_bit).
<i>Good Data</i> =	DBNO - valid value for the quarantine bit indicating no problems.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	None.

Table 52 Error Code: RPTRBAD

Error Code:	RPTRBAD
Error Description:	The audit found a LLCB where the point-to/point-back checks failed between the ready IFD and the LLCB.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB's IFD ready field (ready).
<i>Bad Data</i> =	Ready IFD's llcb field (should equal this LLCB).
<i>Good Data</i> =	LLCB index.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 53 Error Code: RRLINK

Error Code:	RRLINK
Error Description:	The audit found a resource recovery list LLCB whose owner is not on timing; specifically the owner is found to be NO LIST.
Possible Error Effect:	Prints an error report and recovers the RRL LLCB.
Corrective Action Taken:	The audit returns AUFALSE which recovers the LLCB and puts the RRL LLCB back on timing.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA. This field is used to dump values of "dchan" field of this LLCB.
<i>Bad Data</i> =	LLCB's owner field.
<i>Good Data</i> =	NA. This field is used to dump value of "state" field of this LLCB.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 54 Error Code: SAPIBAD

Error Code:	SAPIBAD
Error Description:	The audit has found a LAPB or LAPD LLCB either on timing or timeout list whose sapi_i field is out of range.
Possible Error Effect:	Prints out a report and recovers the LLCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which will recover the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB's starting address.
<i>Bad Data</i> =	LLCB's sapi_i field.
<i>Good Data</i> =	PSPKT value.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 55 Error Code: STATE

Error Code:	STATE
Error Description:	The audit found a LAPD LLCB's state field out of range.
Possible Error Effect:	Prints an error report and recovers the LAPD LLCB.
Corrective Action Taken:	The audit reports the error and returns the LAPD LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's state field.
<i>Good Data =</i>	PSDS_SXTGI - maximum state value.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 56 Error Code: STATE_SET

Error Code:	STATE_SET
Error Description:	The audit found an intra-PH with its state not set to 0.
Possible Error Effect:	Prints an error report and recovers the intra-PH LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which sets the intra-PH LLCB back to its default values.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LLCB's state field.
<i>Good Data =</i>	LLCB index.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 57 Error Code: STUCKBUSY

Error Code:	STUCKBUSY
Error Description:	The audit found a LAPB LLCB in a S5, S6, S7, S9, S12 or S15 state and its "own_busy" bit is set to DBYES. This bit should not be set while in any of these states.
Possible Error Effect:	Prints an error report and corrects the LLCB field.
Corrective Action Taken:	The audit reports the error and calls PSL2CLRBUSY to clear the "own_busy" bit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's state.
<i>Bad Data =</i>	LLCB's own_busy field.
<i>Good Data =</i>	DBNO - the valid value of the "own_busy" bit.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	NA.

Table 58 Error Code: TIMERLST

Error Code:	TIMERLST
Error Description:	The audit found a LAPB LLCB in a state other than S1, S5 or S8 but it is not on timing. The owner field of the LLCB must indicate that it currently has a timer running.
Possible Error Effect:	Prints an error report and recovers the LAPB LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPB LLCB to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's state.
<i>Bad Data =</i>	LLCB's owner field (index into timer array).
<i>Good Data =</i>	PSTMAX - One more than the maximum value that owner field should have.
<i>Logical Index =</i>	LLCB index.
<i>Dump 1 =</i>	The LLCB.
<i>Dump 2 =</i>	If LLCB.alcb_i is in range, the associated ALCB's al_rst_state field will be dumped.

Table 59 Error Code: TIX

Error Code:	TIX
Error Description:	The audit has found a LAPB or LAPD LLCB either on timing or timeout list whose <i>tix</i> field is out of range.
Possible Error Effect:	Prints out a report and recovers the LLCB.
Corrective Action Taken:	The audit will report the error and return AUFALSE which will recover the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB's starting address.
<i>Bad Data</i> =	LLCB's <i>tix</i> field.
<i>Good Data</i> =	Any value between 0 and 7 (inclusive).
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 60 Error Code: TYPE

Error Code:	TYPE
Error Description:	"Invalid PH channel index". The audit found a LAPB LLCB whose "phctype" does not match the write protected D-channel data block's (DCDB) "phctype" field.
Possible Error Effect:	Prints an error report and corrects the LLCB's "phctype".
Corrective Action Taken:	The audit reports the error and sets the LLCB's "phctype" to the DCDB's "phctype" field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LLCB's phctype field.
<i>Good Data</i> =	DCDB's phctype field (write protected data).
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	NA.

Table 61 Error Code: UNAVAIL

Error Code:	UNAVAIL
Error Description:	This is an intra-ph LLCB but the type field was found not to be PSL_INTRAPH, which is an error.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit reports the error sets the LLCB back to its default values.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LLCB's type field.
<i>Good Data</i> =	PSL_INTRAPH - valid value for type field for the intra-PH LLCBs.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 62 Error Code: UNEQUAL

Error Code:	UNEQUAL
Error Description:	For an RRL LLCB, the type field was found not to be PSL_RRL, which is an error.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit reports the error sets the LLCB back to its default values.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LLCB's type field.
<i>Good Data</i> =	PSL_RRL - valid value for type field for the RRL LLCBs.
<i>Logical Index</i> =	LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 63 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	The audit found a LAPB/LAPD LLCB on the free linked list with either the first

	IFD, last IFD, ready IFD or blocked IFD not null.
Possible Error Effect:	Prints an error report and recovers the LLCB.
Corrective Action Taken:	The audit reports the error and returns AUFALSE which recovers the LAPB/LAPD to the free linked list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB's first IFD.
<i>Bad Data =</i>	LLCB's last IFD.
<i>Good Data =</i>	PSIFDNULL - null IFD field value.
<i>Logical Index =</i>	LLCB index.
<i>Dump =</i>	(All sized as unsigned short.)
	• LLCB's IFD ready field. • LLCB's IFD blocked field.

LLCB-B

Software Release: 5E12 only

1. LOGICAL LINK CONTROL BLOCK (LLCB) AUDIT

The LLCB audit checks logical link control blocks.

2. DATA STRUCTURES

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description."

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description."

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: ACT_LNK

Error Code:	ACT_LNK
Error Description:	A non-idle LLCB (LLCB.type != PSL_NULL) has non-null LLCB to LLCB linkage fields (LLCB.forw llcb != PSLLCBNULL or LLCB>back llcb != PSLLCBNULL).
Possible Error Effect:	The LLCB may be linked in the idle list in which case it could be reallocated.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB.type.
<i>Bad Data =</i>	LLCB.forw llcb.
<i>Good Data =</i>	LLCB.back llcb.
<i>Logical Index =</i>	The LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 2 Error Code: ALCBIND

Error Code:	ALCBIND
Error Description:	An LLCB.alcb_index field is out of range (!= PSALCBNULL and ≥ PSHMAXALCB).
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt.
Corrective Action Taken:	The audit idles the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB.type.
<i>Bad Data =</i>	LLCB.alcb_index.
<i>Good Data =</i>	PSHMAXALCB.
<i>Logical Index =</i>	The LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 3 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	The LLCB contains the index of an IFD which is not owned by the LLCB (IFD.client != PSICLLCB or IFD.clientidx != the LLCB index).

Possible Error Effect:	Frames may be dropped or their contents corrupted.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	An index indicating which IFD list owned by the structure under audit was in error.
<i>Bad Data</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Good Data</i> =	The number of IFD lists owned by the structure under audit.
<i>Logical Index</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump 1</i> =	IFD linkage information for this list.
<i>Dump 2</i> =	The LLCB.

Table 4 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The audit was unable to retrieve IFD linkage information for the IFD list being audited.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The top 16 bits contain the number of IFD lists owned by this structure. The lower 16 bits contain an index indicating which list is currently being audited.
<i>Bad Data</i> =	A value used internally for debugging.
<i>Good Data</i> =	The top 16 bits contain the IFD list owner type. The bottom 16 bits contain the IFD list owner index.
<i>Logical Index</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump</i> =	The LLCB.

Table 5 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	The global counter OCbusy_cnt did not equal the audit's count of non-null entries in OCstr_time[].
Possible Error Effect:	The PH can potentially be in overload forever.
Corrective Action Taken:	The audit sets OCbusy_cnt equal to the value calculated by the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The value of OCbusy_cnt.
<i>Good Data</i> =	The value calculated by the audit.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 6 Error Code: BUSYCHAN

Error Code:	BUSYCHAN
Error Description:	The audit found an in-use OCstr_time[llcb_index] entry where the LLCB.own_busy field was DBNO.
Possible Error Effect:	The PH may invalidly go into overload since each non-null entry in OCstr_time[] contributes to an overload control counter.
Corrective Action Taken:	The audit sets the OCstr_time[] array entry to OCTNULL and idles the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.own_busy.
<i>Good Data</i> =	OCstr_time[LLCB index].
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 7 Error Code: DCHAN

Error Code:	DCHAN
Error Description:	An LLCB.dchan field is out of range ($\geq$ PSMAXCHN) for a non-idle LLCB.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is

	corrupt.
Corrective Action Taken:	The audit idles the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.dchan.
<i>Good Data</i> =	PSMAXCHN.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 8 Error Code: HEAD

Error Code:	HEAD
Error Description:	An IFD list owned by this LLCB is invalid. Either the <i>ready</i> or <i>blocked</i> indexes are not null (PSIFDNULL) and not valid ($\geq$ PSRIFDS).
Possible Error Effect:	IFDs may be owned when they should not be, possibly contributing to resource overloads which may in turn cause frames to be dropped.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	An index indicating which IFD list owned by the structure under audit was in error.
<i>Bad Data</i> =	The top 16 bits contain the IFD list owner type. The bottom 16 bits contain the IFD list owner index.
<i>Good Data</i> =	The number of IFD lists owned by the structure under audit.
<i>Logical Index</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump 1</i> =	IFD linkage information for this list.
<i>Dump 2</i> =	The LLCB.

Table 9 Error Code: INV_IDLE

Error Code:	INV_IDLE
Error Description:	An idle LLCB (LLCB.type = PSL_NULL) is not linked to the LLCB idle list or appears to own other resources.
Possible Error Effect:	The LLCB and/or the resources it owns are not available for use. If enough resources are lost, call setups may be denied or packets dropped or the PH could go into overload.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The LLCB idle list head (PSrlcbhd).
<i>Bad Data</i> =	A boolean flag indicating if there were linkage problems.
<i>Good Data</i> =	OCstr_t_time[LLCB index].
<i>Logical Index</i> =	The LLCB index.
<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The LLCB indexed by LLCB.fow_ llcb (if it is in range).
<i>Dump 3</i> =	The LLCB indexed by LLCB.back_ llcb (if it is in range).

Table 10 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	An OCstr_t_time[LLCB index] entry was out of range ($\neq$ OCTNULL and $\geq$ OCTMAX).
Possible Error Effect:	PH overloads may persist longer than they should.
Corrective Action Taken:	The audit sets the OCstr_t_time[] entry to OCTNULL and recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	The OCstr_t_time[] entry.
<i>Good Data</i> =	LLCB.own_busy.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 11 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	The LLCB free list headcell contains invalid or inconsistent data. One of the following is true: • PSrllcbhd.first is out of range ($\geq$ PSMAXLLCB) and not null ($\neq$ PSLLCBNULL). • PSrllcbhd.last is out of range ($\geq$ PSMAXLLCB) and not null ($\neq$ PSLLCBNULL). • PSrllcbhd.first is in range ($<$ PSMAXLLCB) but PSrllcbhd.last is not, or vice versa.
Possible Error Effect:	LLCBs can not be allocated.
Corrective Action Taken:	The audit rebuilds the LLCB idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSrllcbhd.first.
<i>Bad Data</i> =	PSrllcbhd.last.
<i>Good Data</i> =	PSMAXLLCB
<i>Logical Index</i> =	NA.
<i>Dump</i> =	None.

Table 12 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	A flow control LLCB is linked to a DCCB using the DCCB.teib[].sapi2llcb[] fields or a non-flow control LLCB is linked to the FCCB.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB and the DCCB or FCCB are both corrupt.
Corrective Action Taken:	The audit recovers the LLCB to the idle list. Related audits will recover the related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.dchan (flow control) or the FCCB's LLCB index (non-flow control).
<i>Good Data</i> =	LLCB.tix (flow control) or LLCB.dchan (non-flow control).
<i>Logical Index</i> =	The LLCB index.
<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The DCDB indexed by LLCB.dchan.
<i>Dump 3</i> =	The DCCB indexed by LLCB.dchan.

Table 13 Error Code: LISTEND_BAD

Error Code:	LISTEND_BAD
Error Description:	Both indexes in the LLCB idle list head (PSrllcbhd.first and PSrllcbhd.last) are in range ($<$ PSMAXLLCB) but at least one of the LLCBs is not idle (LLCB.type $\neq$ PSL_NULL) or not at the end of the list (first LLCB.back_llcb $\neq$ PSLLCBNULL or last LLCB.forw_llcb $\neq$ PSLLCBNULL).
Possible Error Effect:	LLCBs can not be allocated.
Corrective Action Taken:	The audit rebuilds the LLCB idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSrllcbhd.first.
<i>Bad Data</i> =	PSrllcbhd.last.
<i>Good Data</i> =	PSLLCBNULL.
<i>Logical Index</i> =	PSL_NULL.
<i>Dump 1</i> =	The first LLCB.
<i>Dump 2</i> =	The last LLCB.

Table 14 Error Code: NONNULL

Error Code:	NONNULL

Error Description:	An IFD list owned by this LLCB is invalid. Although the "first" and "last" IFD indexes are null, either the <i>ready</i> or <i>blocked</i> indexes are not null (PSIFDNULL).
Possible Error Effect:	IFDs may be owned when they should not be, possibly contributing to resource overloads which may in turn cause frames to be dropped.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	An index indicating which IFD list owned by the structure under audit was in error.
<i>Bad Data</i> =	The top 16 bits contain the IFD list owner type. The bottom 16 bits contain the IFD list owner index.
<i>Good Data</i> =	The number of IFD lists owned by the structure under audit.
<i>Logical Index</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump 1</i> =	IFD linkage information for this list.
<i>Dump 2</i> =	The LLCB.

Table 15 Error Code: NULL3LINK

Error Code:	NULL3LINK
Error Description:	A flow control LLCB may own an ALCB (LLCB.alcb_index != PSALCBNULL).
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt. It may also be holding resources which should be available for other kinds of links.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.alcb_index.
<i>Good Data</i> =	LLCB.dchan.
<i>Logical Index</i> =	The LLCB index.
<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The DCDB indexed by LLCB.dchan.
<i>Dump 3</i> =	The DCCB indexed by LLCB.dchan.

Table 16 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	A flow control LLCB is not correctly linked to the FCCB or a non-flow control LLCB is not correctly linked to the DCCB.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type (flow control) or LLCB.dchan (non-flow control).
<i>Bad Data</i> =	LLCB.dchan (flow control) or LLCB.tix (non-flow control).
<i>Good Data</i> =	FCCB's LLCB index (flow control) or LLCB.sapi_i (non-flow control).
<i>Logical Index</i> =	The LLCB index.
<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The DCDB indexed by LLCB.dchan.
<i>Dump 3</i> =	The DCCB indexed by LLCB.dchan.

Table 17 Error Code: PHCTYPE

Error Code:	PHCTYPE
Error Description:	The LLCB.phctype field is not equal to the associated D channel's PH channel type (LLCB.phctype != PSdcbd[LLCB.dchan].phctype).
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit sets LLCB.phctype = DCDB.phctype.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.phctype.
<i>Good Data</i> =	DCDB.phctype.
<i>Logical Index</i> =	The LLCB index.

<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The DCDB indexed by LLCB.dchan.
<i>Dump 3</i> =	The DCCB indexed by LLCB.dchan.

Table 18 Error Code: PT2PT

Error Code:	PT2PT
Error Description:	An LLCB contains the index of an ALCB (LLCB.alcb) but the ALCB.llcb_index != the LLCB's index.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.alcb_index.
<i>Good Data</i> =	ALCB.llcb_index.
<i>Logical Index</i> =	The LLCB index.
<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The ALCB.

Table 19 Error Code: QUAR

Error Code:	QUAR
Error Description:	An LLCB.quar_bit field was set (= DBYES).
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt. It was first detected outside of the audit at which time the quarantine bit was set.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.dchan.
<i>Good Data</i> =	LLCB.alcb_index.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 20 Error Code: READ

Error Code:	READ
Error Description:	The audit was unable to retrieve IFD list information for the LLCB.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The number of IFD lists owned by the LLCB.
<i>Bad Data</i> =	A value used internally for debugging.
<i>Good Data</i> =	The maximum number of IFD lists which can be owned.
<i>Logical Index</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump</i> =	The LLCB.

Table 21 Error Code: STATE

Error Code:	STATE
Error Description:	There is an internal inconsistency between LLCB.state and the timers associated with the LLCB or the LLCB state is invalid.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt.
Corrective Action Taken:	Depending on the specific error, the audit either recovers the LLCB to a valid state or recovers it to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	An internal value indicating the error type.
<i>Good Data</i> =	LLCB.dchan.

<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 22 Error Code: STUCK

Error Code:	STUCK
Error Description:	An LLCB has been holding IFDs for a longer time than is allowed based on LLCB.frmag_cnt.
Possible Error Effect:	The IFDs are not available for other users. If enough IFDs were lost, packets could be dropped and the PH could go into overload.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.frmag_cnt.
<i>Good Data</i> =	LLCB.dchan.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 23 Error Code: TIMERLNK

Error Code:	TIMERLNK
Error Description:	A timer index in an LLCB is out of range or indexes a timer which is not owned by the LLCB or is of an unexpected type.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit sets the timer index field in the LLCB to the null value (PSNULLTE) or takes other special recovery based on the timer type.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	An internal value used to indicate which timer index in the LLCB was being checked.
<i>Bad Data</i> =	An internal value used to indicate the type of error.
<i>Good Data</i> =	An internal value indicating which entry in an array of timers (as indicated by the <i>Error Address</i> value) was being checked.
<i>Logical Index</i> =	The timer element index.
<i>Dump</i> =	The LLCB.

Table 24 Error Code: TIMESTAMP

Error Code:	TIMESTAMP
Error Description:	An LLCB which should not be throttled by overload control has a non-null (!= OCTNULL) value in the associated OCstr_t_time[LLCB index] entry.
Possible Error Effect:	The PH could erroneously go into overload.
Corrective Action Taken:	The audit sets OCstr_t_time[LLCB index] = OCTNULL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.phctype.
<i>Bad Data</i> =	OCstr_t_time[LLCB index].
<i>Good Data</i> =	LLCB.dchan.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 25 Error Code: TYPE

Error Code:	TYPE
Error Description:	The LLCB.type field is out of range ($\geq$ PSL_MAX).
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LLCB.type.
<i>Good Data</i> =	PSL_MAX.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 26 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	If the index of the last LLCB being audited is valid, the audit recovers that LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	PSMAXLLCB.
<i>Logical Index</i> =	Index of the last LLCB audited.
<i>Dump</i> =	The last LLCB audited (if the index is valid).

LLCB-C

Software Release: 5E13 and later

1. LOGICAL LINK CONTROL BLOCK (LLCB) AUDIT

The LLCB audit checks logical link control blocks.

2. DATA STRUCTURES

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description."

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description."

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: ACT_LNK

Error Code:	ACT_LNK
Error Description:	A non-idle LLCB (LLCB.type != PSL_NULL) has non-null LLCB to LLCB linkage fields (LLCB.forw llcb != PSLLCBNULL or LLCB>back llcb != PSLLCBNULL).
Possible Error Effect:	The LLCB may be linked in the idle list in which case it could be reallocated.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB.type.
<i>Bad Data =</i>	LLCB.forw llcb.
<i>Good Data =</i>	LLCB.back llcb.
<i>Logical Index =</i>	The LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 2 Error Code: ALCBIND

Error Code:	ALCBIND
Error Description:	An LLCB.alcb_index field is out of range (!= PSALCBNULL and ≥ PSHMAXALCB).
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt.
Corrective Action Taken:	The audit idles the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB.type.
<i>Bad Data =</i>	LLCB.alcb_index.
<i>Good Data =</i>	PSHMAXALCB.
<i>Logical Index =</i>	The LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 3 Error Code: BADLINK

Error Code:	BADLINK
Error Description:	The LLCB contains the index of an IFD which is not owned by the LLCB (IFD.client != PSICLLCB or IFD.clientidx != the LLCB index).

Possible Error Effect:	Frames may be dropped or their contents corrupted.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	An index indicating which IFD list owned by the structure under audit was in error.
<i>Bad Data</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Good Data</i> =	The number of IFD lists owned by the structure under audit.
<i>Logical Index</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump 1</i> =	IFD linkage information for this list.
<i>Dump 2</i> =	The LLCB.

Table 4 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The audit was unable to retrieve IFD linkage information for the IFD list being audited.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The top 16 bits contain the number of IFD lists owned by this structure. The lower 16 bits contain an index indicating which list is currently being audited.
<i>Bad Data</i> =	A value used internally for debugging.
<i>Good Data</i> =	The top 16 bits contain the IFD list owner type. The bottom 16 bits contain the IFD list owner index.
<i>Logical Index</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump</i> =	The LLCB.

Table 5 Error Code: BDCOUNT

Error Code:	BDCOUNT
Error Description:	The global counter OCbusy_cnt did not equal the audit's count of non-null entries in OCstr_t_time[].
Possible Error Effect:	The PH can potentially be in overload forever.
Corrective Action Taken:	The audit sets OCbusy_cnt equal to the value calculated by the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The value of OCbusy_cnt.
<i>Good Data</i> =	The value calculated by the audit.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 6 Error Code: BUSYCHAN

Error Code:	BUSYCHAN
Error Description:	The audit found an in-use OCstr_t_time[llcb_index] entry where the LLCB.own_busy field was DBNO.
Possible Error Effect:	The PH may invalidly go into overload since each non-null entry in OCstr_t_time[] contributes to an overload control counter.
Corrective Action Taken:	The audit sets the OCstr_t_time[] array entry to OCTNULL and idles the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.own_busy.
<i>Good Data</i> =	OCstr_t_time[LLCB index].
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 7 Error Code: DCHAN

Error Code:	DCHAN
Error Description:	An LLCB.dchan field is out of range ($\geq$ PSMAXCHN) for a non-idle LLCB.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is

	corrupt.
Corrective Action Taken:	The audit idles the LLCB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB.type.
<i>Bad Data =</i>	LLCB.dchan.
<i>Good Data =</i>	PSMAXCHN.
<i>Logical Index =</i>	The LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 8 Error Code: HEAD

Error Code:	HEAD
Error Description:	An IFD list owned by this LLCB is invalid. Either the <i>ready</i> or <i>blocked</i> indexes are not null (PSIFDNULL) and not valid ($\geq$ PSRIFDS).
Possible Error Effect:	IFDs may be owned when they should not be, possibly contributing to resource overloads which may in turn cause frames to be dropped.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	An index indicating which IFD list owned by the structure under audit was in error.
<i>Bad Data =</i>	The top 16 bits contain the IFD list owner type. The bottom 16 bits contain the IFD list owner index.
<i>Good Data =</i>	The number of IFD lists owned by the structure under audit.
<i>Logical Index =</i>	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump 1 =</i>	IFD linkage information for this list.
<i>Dump 2 =</i>	The LLCB.

Table 9 Error Code: INV_IDLE

Error Code:	INV_IDLE
Error Description:	An idle LLCB (LLCB.type = PSL_NULL) is not linked to the LLCB idle list or appears to own other resources.
Possible Error Effect:	The LLCB and/or the resources it owns are not available for use. If enough resources are lost, call setups may be denied or packets dropped or the PH could go into overload.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The LLCB idle list head (PSRlcbhd).
<i>Bad Data =</i>	A boolean flag indicating if there were linkage problems.
<i>Good Data =</i>	OCstr_t_time[LLCB index].
<i>Logical Index =</i>	The LLCB index.
<i>Dump 1 =</i>	The LLCB being audited.
<i>Dump 2 =</i>	The LLCB indexed by LLCB.fow_ llcb (if it is in range).
<i>Dump 3 =</i>	The LLCB indexed by LLCB.back_ llcb (if it is in range).

Table 10 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	An OCstr_t_time[LLCB index] entry was out of range ($\neq$ OCTNULL and $\geq$ OCTMAX).
Possible Error Effect:	PH overloads may persist longer than they should.
Corrective Action Taken:	The audit sets the OCstr_t_time[] entry to OCTNULL and recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	LLCB.type.
<i>Bad Data =</i>	The OCstr_t_time[] entry.
<i>Good Data =</i>	LLCB.own_busy.
<i>Logical Index =</i>	The LLCB index.
<i>Dump =</i>	The LLCB being audited.

Table 11 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	The LLCB free list headcell contains invalid or inconsistent data. One of the following is true: • PSrllcbhd.first is out of range ($\geq$ PSMAXLLCB) and not null ($\neq$ PSLLCBNULL). • PSrllcbhd.last is out of range ($\geq$ PSMAXLLCB) and not null ($\neq$ PSLLCBNULL). • PSrllcbhd.first is in range ($<$ PSMAXLLCB) but PSrllcbhd.last is not, or vice versa.
Possible Error Effect:	LLCBs can not be allocated.
Corrective Action Taken:	The audit rebuilds the LLCB idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSrllcbhd.first.
<i>Bad Data</i> =	PSrllcbhd.last.
<i>Good Data</i> =	PSMAXLLCB
<i>Logical Index</i> =	NA.
<i>Dump</i> =	None.

Table 12 Error Code: IS_NOTUSED

Error Code:	IS_NOTUSED
Error Description:	A flow control LLCB is linked to a DCCB using the DCCB.teib[].sapi2llcb[] fields or a non-flow control LLCB is linked to the FCCB.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB and the DCCB or FCCB are both corrupt.
Corrective Action Taken:	The audit recovers the LLCB to the idle list. Related audits will recover the related data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.dchan (flow control) or the FCCB's LLCB index (non-flow control).
<i>Good Data</i> =	LLCB.tix (flow control) or LLCB.dchan (non-flow control).
<i>Logical Index</i> =	The LLCB index.
<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The DCDB indexed by LLCB.dchan.
<i>Dump 3</i> =	The DCCB indexed by LLCB.dchan.

Table 13 Error Code: LISTEND_BAD

Error Code:	LISTEND_BAD
Error Description:	Both indexes in the LLCB idle list head (PSrllcbhd.first and PSrllcbhd.last) are in range ($<$ PSMAXLLCB) but at least one of the LLCBs is not idle (LLCB.type $\neq$ PSL_NULL) or not at the end of the list (first LLCB.back_llcb $\neq$ PSLLCBNULL or last LLCB.forw_llcb $\neq$ PSLLCBNULL).
Possible Error Effect:	LLCBs can not be allocated.
Corrective Action Taken:	The audit rebuilds the LLCB idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	PSrllcbhd.first.
<i>Bad Data</i> =	PSrllcbhd.last.
<i>Good Data</i> =	PSLLCBNULL.
<i>Logical Index</i> =	PSL_NULL.
<i>Dump 1</i> =	The first LLCB.
<i>Dump 2</i> =	The last LLCB.

Table 14 Error Code: NONNULL

Error Code:	NONNULL

Error Description:	An IFD list owned by this LLCB is invalid. Although the "first" and "last" IFD indexes are null, either the <i>ready</i> or <i>blocked</i> indexes are not null (PSIFDNULL).
Possible Error Effect:	IFDs may be owned when they should not be, possibly contributing to resource overloads which may in turn cause frames to be dropped.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	An index indicating which IFD list owned by the structure under audit was in error.
<i>Bad Data</i> =	The top 16 bits contain the IFD list owner type. The bottom 16 bits contain the IFD list owner index.
<i>Good Data</i> =	The number of IFD lists owned by the structure under audit.
<i>Logical Index</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump 1</i> =	IFD linkage information for this list.
<i>Dump 2</i> =	The LLCB.

Table 15 Error Code: NULL3LINK

Error Code:	NULL3LINK
Error Description:	A flow control LLCB may own an ALCB (LLCB.alcb_index != PSALCBNULL).
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt. It may also be holding resources which should be available for other kinds of links.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.alcb_index.
<i>Good Data</i> =	LLCB.dchan.
<i>Logical Index</i> =	The LLCB index.
<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The DCDB indexed by LLCB.dchan.
<i>Dump 3</i> =	The DCCB indexed by LLCB.dchan.

Table 16 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	A flow control LLCB is not correctly linked to the FCCB or a non-flow control LLCB is not correctly linked to the DCCB.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type (flow control) or LLCB.dchan (non-flow control).
<i>Bad Data</i> =	LLCB.dchan (flow control) or LLCB.tix (non-flow control).
<i>Good Data</i> =	FCCB's LLCB index (flow control) or LLCB.sapi_i (non-flow control).
<i>Logical Index</i> =	The LLCB index.
<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The DCDB indexed by LLCB.dchan.
<i>Dump 3</i> =	The DCCB indexed by LLCB.dchan.

Table 17 Error Code: PHCTYPE

Error Code:	PHCTYPE
Error Description:	The LLCB.phctype field is not equal to the associated D channel's PH channel type (LLCB.phctype != PSdcbd[LLCB.dchan].phctype).
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit sets LLCB.phctype = DCDB.phctype.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.phctype.
<i>Good Data</i> =	DCDB.phctype.
<i>Logical Index</i> =	The LLCB index.

<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The DCDB indexed by LLCB.dchan.
<i>Dump 3</i> =	The DCCB indexed by LLCB.dchan.

Table 18 Error Code: PT2PT

Error Code:	PT2PT
Error Description:	An LLCB contains the index of an ALCB (LLCB.alcb) but the ALCB.llcb_index != the LLCB's index or the LLCB should not own any ALCBs based on LLCB.phctype.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.alcb_index.
<i>Good Data</i> =	ALCB.llcb_index.
<i>Logical Index</i> =	The LLCB index.
<i>Dump 1</i> =	The LLCB being audited.
<i>Dump 2</i> =	The ALCB (PSalcb[LLCB.alcb_index]).
<i>Dump 3</i> =	The DCDB (PSdccb[LLCB.dchan]).
<i>Dump 4</i> =	The DCCB (PSdccb[LLCB.dchan]).

Table 19 Error Code: QUAR

Error Code:	QUAR
Error Description:	An LLCB.quar_bit field was set (= DBYES).
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt. It was first detected outside of the audit at which time the quarantine bit was set.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.dchan.
<i>Good Data</i> =	LLCB.alcb_index.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 20 Error Code: READ

Error Code:	READ
Error Description:	The audit was unable to retrieve IFD list information for the LLCB.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The number of IFD lists owned by the LLCB..
<i>Bad Data</i> =	A value used internally for debugging.
<i>Good Data</i> =	The maximum number of IFD lists which can be owned.
<i>Logical Index</i> =	The top 16 bits contain PSICLLCB. The bottom 16 bits contain the LLCB index.
<i>Dump</i> =	The LLCB.

Table 21 Error Code: STATE

Error Code:	STATE
Error Description:	There is an internal inconsistency between LLCB.state and the timers associated with the LLCB or the LLCB state is invalid.
Possible Error Effect:	Varies according to conditions. The protocol stack associated with this LLCB is corrupt.
Corrective Action Taken:	Depending on the specific error, the audit either recovers the LLCB to a valid state or recovers it to the idle list.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	An internal value indicating the error type.
<i>Good Data</i> =	LLCB.dchan.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 22 Error Code: STUCK

Error Code:	STUCK
Error Description:	An LLCB has been holding IFDs for a longer time than is allowed based on LLCB.frmag_cnt.
Possible Error Effect:	The IFDs are not available for other users. If enough IFDs were lost, packets could be dropped and the PH could go into overload.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.type.
<i>Bad Data</i> =	LLCB.frmag_cnt.
<i>Good Data</i> =	LLCB.dchan.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 23 Error Code: TIMERLNK

Error Code:	TIMERLNK
Error Description:	A timer index in an LLCB is out of range or indexes a timer which is not owned by the LLCB or is of an unexpected type.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit sets the timer index field in the LLCB to the null value (PSNULLTE) or takes other special recovery based on the timer type.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	An internal value used to indicate which timer index in the LLCB was being checked.
<i>Bad Data</i> =	An internal value used to indicate the type of error.
<i>Good Data</i> =	An internal value indicating which entry in an array of timers (as indicated by the <i>Error Address</i> value) was being checked.
<i>Logical Index</i> =	The timer element index.
<i>Dump</i> =	The LLCB.

Table 24 Error Code: TIMESTAMP

Error Code:	TIMESTAMP
Error Description:	An LLCB which should not be throttled by overload control has a non-null (!= OCTNULL) value in the associated OCstr_t_time[LLCB index] entry.
Possible Error Effect:	The PH could erroneously go into overload.
Corrective Action Taken:	The audit sets OCstr_t_time[LLCB index] = OCTNULL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	LLCB.phctype.
<i>Bad Data</i> =	OCstr_t_time[LLCB index].
<i>Good Data</i> =	LLCB.dchan.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 25 Error Code: TYPE

Error Code:	TYPE
Error Description:	The LLCB.type field is out of range ($\geq$ PSL_MAX).
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit recovers the LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LLCB.type.

<i>Good Data</i> =	PSL_MAX.
<i>Logical Index</i> =	The LLCB index.
<i>Dump</i> =	The LLCB being audited.

Table 26 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	If the index of the last LLCB being audited is valid, the audit recovers that LLCB to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	PSMAXLLCB.
<i>Logical Index</i> =	Index of the last LLCB audited.
<i>Dump</i> =	The last LLCB audited (if the index is valid).

LLMIDCU**Software Release:** 5E10 - 5E11**1. LOGICAL LINK MAP INTEGRATED DIGITAL SERVICE UNIT (IDCU) - (LLMIDCU) AUDIT**

The LLMIDCU audit will performs the dynamic to static and the semantic checks of the Logical Link Map data structure rLLM_IDCU.

2. DATA STRUCTURES

The data structure being audited by LLMIDCU audit is the rLLM_IDCU. This structure holds the information about the status of the IDCU Embedded Operational Channel (EOC) and the Terminal Maintenance Channel (TMC). The structure fields and a brief description of them is as follows:

e_sw	= Indicates if EOC switch is in progress.
e_inhsw	= Indicates if EOC is allowed to switch.
e_p_inh	= Indicates if primary EOC is in service.
e_p_link	= Internal circuit name of a primary EOC.
e_p_ph	= PH information for primary EOC.
e_p_chan	= PH channel information for primary EOC.
e_m_inh	= Indicates if mate EOC is in service.
e_m_link	= Internal circuit name of mate EOC.
e_m_ph	= Contains PH information for mate EOC.
e_m_chan	= Contains PH channel information for mate EOC.
t_sw	= Indicates if TMC switch is in progress.
t_inhsw	= Indicates if TMC is allowed to switch.
t_p_inh	= Indicates if primary TMC is in service.
t_p_link	= Internal circuit name of primary TMC.
t_p_ph	= PH information for primary TMC.
t_p_chan	= PH channel information for primary TMC.
t_m_inh	= Indicates if mate TMC is in service.
t_m_link	= Internal circuit name of mate TMC.
t_m_ph	= PH information for mate TMC.
t_m_chan	= PH channel information for mate TMC.
e_rcvb	= Indicates if EOC messages are received on both primary and mate EOC.
t_rcvb	= Indicates if TMC messages are received on both primary and mate TMC.

e_rcvb_tmr = EOC "receive both" timer.

t_rcvb_tmr = TMC "receive both" timer.

e_v120rexmt = Indicates that an EOC path switch has occurred.

3. AUDIT CHECKS

The LLMIDCU audit will perform the dynamic to static and the semantic checks of the rLLM_IDCU tuples.

EXTRATUP = Dynamic to static check of the rLLM_IDCU tuples.

LLM_CKT = Audit the EOC/TMC circuit name in the rLLM_IDCU tuple.

SMEST = Verify that the rSMEST tuples exist for an EOC/TMC circuit.

LLM_SW = Audit the rLLM_IDCU.llm_sw field.

LLM_RCVB = Audit the rLLM_IDCU.e_rcvb and rLLM_IDCU.t_rcvb fields.

LLM_STAT = Audit the rLLM_IDCU.t_p_inh, rLLM_IDCU.t_m_inh, rLLM_IDCU.e_p_inh and rLLM_IDCU.e_m_inh fields.

ODDLOSTTUP = Verify that the rIDSLEQUIP tuple exists for the EOC/TMC circuits.

LLM_DSLEQ = Verify that the PH information is consistent between the rLLM_IDCU and the rIDSLEQUIP tuples.

4. ERROR HANDLING

The general audit error handling mechanism is to print the error code and load the circuit EOC/TMC on the MRA recovery queue.

The audit produces the following error code(s).

Table 1 Error Code: LLM_CKT

Error Code:	LLM_CKT
Error Description:	The EOC or TMC circuit name in the rLLM_IDCU tuple could not be calculated.
Possible Error Effect:	The EOC/TMC at fault will not be usable by call processing or maintenance.
Corrective Action Taken:	The audit will load the calculated circuit on the MRA recovery queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLLM_IDCU tuple at fault.
<i>Bad Data</i> =	The EOC/TMC circuit name as it appears in the rLLM_IDCU tuple.
<i>Good Data</i> =	The loop control 0-3, it tells which of the EOC/TMC was at fault as follows.
	0 = Implies that the primary EOC circuit in the rLLM_IDCU tuple is bad.
	1 = Implies that the primary TMC circuit in the rLLM_IDCU tuple is bad.
	2 = Implies that the mate EOC circuit in the rLLM_IDCU tuple is bad.
	3 = Implies that the mate TMC circuit in the rLLM_IDCU tuple is bad.
<i>Logical Index</i> =	The rLLM_IDCU.idt_rdt key field.
<i>Dump</i> =	The contents of the rLLM_IDCU tuple.

Table 2 Error Code: LLM_DSLEQ

Error Code:	LLM_DSLEQ
Error Description:	The rIDSLEQUIP.dsl_group field does not match the PH information in the rLLM_IDCU tuple.
Possible Error Effect:	The EOC/TMC will not be usable by call processing or maintenance.
Corrective Action Taken:	The audit will load the circuit on the MRA queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLLM_IDCU tuple.
<i>Bad Data =</i>	The rIDSLEQUIP.dsl_group field.
<i>Good Data =</i>	The rIDSLEQUIP.member field.
<i>Logical Index =</i>	The contents of a local loop variable. The value of 0 means it is the primary EOC circuit. Valid values are: 1 = It is the primary TMC circuit. 2 = It is the mate EOC circuit. 3 = It is the mate TMC circuit.
<i>Dump1 =</i>	The contents of the rLLM_IDCU tuple.
<i>Dump2 =</i>	The contents of the rIDSLEQUIP tuple.

Table 3 Error Code: LLM_RCVB

Error Code:	LLM_RCVB
Error Description:	The rLLM_IDCU.e_rcvb or rLLM_IDCU.t_rcvb fields state that there is no switch in progress but the rSMEST tuple associated with this circuit is validly busy.
Possible Error Effect:	The switch of the EOC/TMC will not be possible since it is stuck in this state.
Corrective Action Taken:	The audit will load the circuit at fault on the MRA queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLLM_IDCU tuple.
<i>Bad Data =</i>	The contents of the "llm_rcvb" field.
<i>Good Data =</i>	The rSMEST.stat_act field. The value of 0 means busy and 1 means idle.
<i>Logical Index =</i>	The contents of a local loop variable. The value of 0 means it is the EOC switch that was stuck, 1 means it was the TMC switch that was stuck.
<i>Dump1 =</i>	The contents of the rLLM_IDCU tuple.
<i>Dump2 =</i>	The contents of the rSMEST tuple.

Table 4 Error Code: LLM_STAT

Error Code:	LLM_STAT
Error Description:	The IS/OOS status of the EOC/TMC does not match the IS/OOS status of the rSMEST tuple.
Possible Error Effect:	The EOC/TMC will not be usable by call processing or maintenance.
Corrective Action Taken:	The audit will load the circuit on the MRA queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLLM_IDCU tuple.
<i>Bad Data =</i>	The "llm_stat" field from the rLLM_IDCU tuple.
<i>Good Data =</i>	The "bas_stat" field from the rSMEST tuple. Valid values are: 1 = Active. 2 = Stand_by. 4 = OOS.
<i>Logical Index =</i>	The contents of a local loop variable. Valid values are: 0 = It is the primary EOC circuit.

	1 = It is the primary TMC circuit. 2 = It is the mate EOC circuit. 3 = It is the mate TMC circuit.
<i>Dump1</i> =	The contents of the rLLM_IDCU tuple.
<i>Dump2</i> =	The contents of the rSMEST tuple.

Table 5 Error Code: LLM_SW

Error Code:	LLM_SW
Error Description:	The "llm_sw" but states that there is a switch in progress but the rSMEST tuple associated with this circuit is not busy.
Possible Error Effect:	The switch of the EOC/TMC will not be possible since it is stuck in this state.
Corrective Action Taken:	The audit will reset the bits at fault and the circuit will be loaded on the MRA queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLLM_IDCU tuple.
<i>Bad Data</i> =	The contents of the "llm_sw" field.
<i>Good Data</i> =	The "stat_act" field from the rSMEST tuple. Valid values are: 0 = Busy. 1 = Idle.
<i>Logical Index</i> =	The contents of a local loop variable. Valid values are: 0 = It is the EOC switch that was stuck. 1 = It was the TMC switch that was stuck.
<i>Dump1</i> =	The contents of the rLLM_IDCU tuple.
<i>Dump2</i> =	The contents of the rSMEST tuple.

Table 6 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit could not find an rDSLEQUIP tuple in the database with the EOC/TMC circuit name.
Possible Error Effect:	The EOC/TMC will not be usable by call processing or maintenance.
Corrective Action Taken:	The audit will load the circuit on the MRA queue.
Manual Action Required:	The user should investigate the missing static rDSLEQUIP tuple in the database.
Dump Description:	
<i>Error Address</i> =	The address of the rLLM_IDCU tuple.
<i>Bad Data</i> =	The return from the database read function. 0 means a successful read, any other value implies a failure in the database read.
<i>Good Data</i> =	The EOC/TMC circuit name. This is the key used in reading the missing rDSLEQUIP tuple.
<i>Logical Index</i> =	The contents of a local loop variable. Valid values are: 0 = It is the primary EOC circuit. 1 = It is the primary TMC circuit. 2 = It is the mate EOC circuit. 3 = It is the mate TMC circuit.
<i>Dump1</i> =	The contents of the rLLM_IDCU tuple.

<i>Dump2</i> =	The contents of the rSMEST tuple.

Table 7 Error Code: SMEST

Error Code:	SMEST
Error Description:	The rSMEST tuple for a given circuit is missing from the database.
Possible Error Effect:	The maintenance of the circuit will not be possible.
Corrective Action Taken:	The audit will schedule the CKTDATA audit which will delete the rSMEST tuple from the database. No corrective action will be taken by this audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLLM_IDCU tuple at fault.
<i>Bad Data</i> =	The circuit name of the missing rSMEST tuple.
<i>Good Data</i> =	For which EOC/TMC circuit's rSMEST tuple is missing. Valid values are: 0 = Primary EOC's. 1 = Primary TMC's. 2 = Mate EOC. 3 = Mate TMC.
<i>Logical Index</i> =	The rLLM_IDCU.idt_rdt key field.
<i>Dump</i> =	The contents of the rLLM_IDCU tuple.

LLMRDT

Software Release: 5E12 and later

1. LOGICAL LINK MAP REMOTE DIGITAL TERMINAL (LLMRDT) AUDIT

The TR-303 interface on a digital networking unit-synchronous optical network (SONET) (DNU-S) feature provides the capability to assign a TR-303 remote digital terminal (RDT) to digital signal level 1 (DS1) facilities terminating on a DNU-S. The data for the active EOC and TMC data link names for a given TR-303 RDT is stored in the RLLLM_RDT relation. Data in this relation is audited by the LLMRDT audit which runs in routine and elevated segmented modes.

2. DATA STRUCTURES

For details on the fields contained in the RLLLM_RDT relation, refer to the 5ESS® Translations Data Manual (235-600-1xx) and the 5ESS® Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

The general audit error handling mechanism is to print the error code and load the circuit EOC/TMC on the MRA recovery queue.

The audit produces the following error code(s).

Table 1 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	The rISMEST tuple for a given circuit is missing from the database.
Possible Error Effect:	The maintenance of the circuit will not be possible.
Corrective Action Taken:	The audit will schedule the CKTDATA audit which will delete the rISMEST tuple from the database. No corrective action will be taken by this audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLLLM_RDT tuple at fault.
<i>Bad Data =</i>	The circuit name of the missing rISMEST tuple.
<i>Good Data =</i>	The data for which EOC/TMC circuit's rISMEST tuple is missing Valid values are: 0 = Primary EOC's. 1 = Primary TMC's. 2 = Mate EOC. 3 = Mate TMC.
<i>Logical Index =</i>	The rLLLM_RDT.rdt_unit key field.
<i>Dump =</i>	The contents of the rLLLM_RDT tuple.

Table 2 Error Code: LLM_CKT

Error Code:	LLM_CKT
Error Description:	The EOC or TMC circuit name in the rLLLM_RDT tuple could not be calculated.

Possible Error Effect:	The EOC/TMC at fault will not be usable by call processing or maintenance.
Corrective Action Taken:	The audit will load the calculated circuit on the MRA recovery queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLLM_RDT tuple at fault.
<i>Bad Data =</i>	The EOC/TMC circuit name as it appears in the rLLM_RDT tuple.
<i>Good Data =</i>	The loop control 0-3, it tells which of the EOC/TMC was at fault as follows: 0 = Implies that the primary EOC circuit in the rLLM_RDT tuple is bad. 1 = Implies that the primary TMC circuit in the rLLM_RDT tuple is bad. 2 = Implies that the mate EOC circuit in the rLLM_RDT tuple is bad. 3 = Implies that the mate TMC circuit in the rLLM_RDT tuple is bad.
<i>Logical Index =</i>	The rLLM_RDT.rdt_unit key field.
<i>Dump =</i>	The contents of the rLLM_RDT tuple.

Table 3 Error Code: LLM_DSLEQ

Error Code:	LLM_DSLEQ
Error Description:	The rIDSLEQUIP.dsl_group field does not match the rLLM_RDT.ph field or the rIDSLEQUIP.member field does not match the rLLM_RDT.chan field.
Possible Error Effect:	The EOC/TMC will not be usable by call processing or maintenance.
Corrective Action Taken:	The audit will load the circuit on the MRA queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLLM_RDT tuple.
<i>Bad Data =</i>	The rIDSLEQUIP.dsl_group field.
<i>Good Data =</i>	The rIDSLEQUIP.member field.
<i>Logical Index =</i>	The contents of a local loop variable. Valid values are: 0 = The primary EOC circuit. 1 = The primary TMC circuit. 2 = The mate EOC circuit. 3 = The mate TMC circuit.
<i>Dump 1 =</i>	The contents of the rLLM_RDT tuple.
<i>Dump 2 =</i>	The contents of the rIDSLEQUIP tuple.

Table 4 Error Code: LLM_RCVB

Error Code:	LLM_RCVB
Error Description:	The rLLM_RDT.e_rcvb or rLLM_RDT.t_rcvb fields state that there is no switch in progress but the rSMEST tuple associated with this circuit is validly busy.
Possible Error Effect:	The switch of the EOC/TMC will not be possible since it is stuck in this state.
Corrective Action Taken:	The audit will load the circuit at fault on the MRA queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLLM_RDT tuple.
<i>Bad Data =</i>	The contents of the "llm_rcvb" field.
<i>Good Data =</i>	The rSMEST.stat_act field. Valid values are: 0 = Busy. 1 = Idle.
<i>Logical Index =</i>	The contents of a local loop variable. Valid values are: 0 = The EOC switch was stuck.

	1 = The TMC switch was stuck.
<i>Dump 1 =</i>	The contents of the rLLM_RDT tuple.
<i>Dump 2 =</i>	The contents of the rSMEST tuple.

Table 5 Error Code: LLM_STAT

Error Code:	LLM_STAT
Error Description:	The IS/OOS status of the EOC/TMC does not match the IS/OOS status of the rSMEST tuple.
Possible Error Effect:	The EOC/TMC will not be usable by call processing or maintenance.
Corrective Action Taken:	The audit will load the circuit on the MRA queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLLM_RDT tuple.
<i>Bad Data =</i>	The "llm_stat" field from the rLLM_RDT tuple.
<i>Good Data =</i>	The "bas_stat" field from the rSMEST tuple. Valid values are: 1 = Active. 2 = Stand by. 4 = OOS.
<i>Logical Index =</i>	The contents of a local loop variable. Valid values are: 0 = The primary EOC circuit. 1 = The primary TMC circuit. 2 = The mate EOC circuit. 3 = The mate TMC circuit.
<i>Dump 1 =</i>	The contents of the rLLM_RDT tuple.
<i>Dump 2 =</i>	The contents of the rSMEST tuple.

Table 6 Error Code: LLM_SW

Error Code:	LLM_SW
Error Description:	The "llm_sw" but states that there is a switch in progress but the rSMEST tuple associated with this circuit is not busy.
Possible Error Effect:	The switch of the EOC/TMC will not be possible since it is stuck in this state.
Corrective Action Taken:	The audit will reset the bits at fault and the circuit will be loaded on the MRA queue.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLLM_RDT tuple.
<i>Bad Data =</i>	The contents of the "llm_sw" field.
<i>Good Data =</i>	The "stat_act" field from the rSMEST tuple. Valid values are: 0 = Busy. 1 = Idle.
<i>Logical Index =</i>	The contents of a local loop variable. Valid values are: 0 = The EOC switch was stuck. 1 = The TMC switch was stuck.
<i>Dump 1 =</i>	The contents of the rLLM_RDT tuple.

<i>Dump 2 =</i>	The contents of the rISMEST tuple.

Table 7 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit could not find an rICKTDATA tuple in the database with the TR303 RDT circuit name (rname).
Possible Error Effect:	The TR303 RDT will not be usable by call processing or maintenance.
Corrective Action Taken:	None.
Manual Action Required:	Office personnel should investigate the missing static rICKTDATA tuple in the database.
Dump Description:	
<i>Error Address =</i>	The address of the rLLM_RDT tuple.
<i>Bad Data =</i>	The return from the database read function. Valid values are: 0 = A successful read. Any other value implies a failure in the database read.
<i>Good Data =</i>	The TR303 RDT circuit name (rname). This is the key used in reading the missing rICKTDATA tuple.
<i>Logical Index =</i>	The TR303 RDT unit number (rdt_unit). This is the key used in reading the rLLM_RDT tuple.
<i>Dump 1 =</i>	The contents of the rLLM_RDT tuple.
<i>Dump 2 =</i>	The contents of the rUNIT2RDT tuple.

Table 8 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit could not find an rDSLEQUIP tuple in the database with the EOC/TMC circuit name.
Possible Error Effect:	The EOC/TMC will not be usable by call processing or maintenance.
Corrective Action Taken:	The audit will load the circuit on the MRA queue.
Manual Action Required:	Office personnel should investigate the missing static rDSLEQUIP tuple in the database.
Dump Description:	
<i>Error Address =</i>	The number 1, for error code identification.
<i>Bad Data =</i>	The return from the database read function. Valid values are: 0 = A successful read. Any other value implies a failure in the database read.
<i>Good Data =</i>	The EOC/TMC circuit name. This is the key used in reading the missing rDSLEQUIP tuple.
<i>Logical Index =</i>	The contents of a local loop variable. Valid values are: 0 = The primary EOC circuit. 1 = The primary TMC circuit. 2 = The mate EOC circuit. 3 = The mate TMC circuit.
<i>Dump 1 =</i>	The contents of the rLLM_RDT tuple.
<i>Dump 2 =</i>	The contents of the rISMEST tuple.

Table 9 Error Code: SMEST

Error Code:	SMEST
Error Description:	The rISMEST tuple for a given circuit is missing from the database.
Possible Error Effect:	The maintenance of the circuit will not be possible.

Corrective Action Taken:	The audit will schedule the CKTDATA audit which will delete the rSMEST tuple from the database. No corrective action will be taken by this audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The identification number of the error code.
<i>Bad Data</i> =	The circuit name of the missing rSMEST tuple.
<i>Good Data</i> =	The data for which EOC/TMC circuit's rSMEST tuple is missing. Valid values are: 0 = Primary EOC's. 1 = Primary TMC's. 2 = Mate EOC. 3 = Mate TMC.
<i>Logical Index</i> =	The rLLM_RDT.rdt_unit key field.
<i>Dump</i> =	The contents of the rLLM_RDT tuple.

Table 10 Error Code: SEMANTIC

Error Code:	SEMANTIC
Error Description:	Semantic data (rdt_unit, tsp_utype, tsp_unit, or rtnum fields) is corrupted in the rLLM_RDT tuple.
Possible Error Effect:	None.
Corrective Action Taken:	The audit will correct the semantic data in the rLLM_RDT tuple using the static data in the rUNIT2RDT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLLM_RDT tuple at fault.
<i>Bad Data</i> =	The circuit name of the missing rSMEST tuple.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	The rLLM_RDT.rdt_unit key field.
<i>Dump 1</i> =	The contents of the rLLM_RDT tuple.
<i>Dump 2</i> =	The contents of the rUNIT2RDT tuple.

Table 11 Error Code: ODD_DATA

Error Code:	ODD_DATA
Error Description:	The rUNIT2RDT tuple for a given circuit is missing from the database.
Possible Error Effect:	The TR303 RDT will not be usable by call processing or maintenance.
Corrective Action Taken:	None.
Manual Action Required:	Office personnel should investigate the missing static rUNIT2RDT tuple in the database.
Dump Description:	
<i>Error Address</i> =	The address of the rLLM_RDT tuple at fault.
<i>Bad Data</i> =	The address of the RLUNIT2RDT relation.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	The rLLM_RDT.rdt_unit key field.
<i>Dump</i> =	The contents of the rLLM_RDT tuple.

LMDB

Software Release: 5E10 and later

1. LINK MANAGEMENT DATA BLOCK (LMDB)

Link manager data blocks (LMDBs), elements of QLlmbd[], are used to represent quad linked packet switched (QLPS) network link information. They represent the state of the link and also contain per-network QLPS endpoint information.

2. DATA STRUCTURES

The following data is used by the LMDB audit:

- (1) QLlcb[] - QLPS logical link blocks
- (2) QLlmbd[] - QLPS link manager data blocks
- (3) QLTIMER - QL timer data structure.

3. AUDIT CHECKS

The following checks are performed by the LMDB audit:

ZAP	= A reset was taken during the audit.
BADRANGE_INDEX	= Check of out-of-range lcb index in LMDB.
ONE2ONE	= Check for invalid LMDB linkage.
OUTOFRANGE	= Check for out-of-range LMDB requester.
INV_TIMER	= Check for out-of-service LMDB having a non-idle timer.
TIME_EXC	= Check for ACT or AVL LMDB having a five second timer.
GBGTIMER	= Check for invalid timer type in LMDB entry.
STATE	= Check for LMDB invalid out-of-range state.
BADIDLE	= Check softswitch flag against running of softswitch timer.
MISSING	= Endpoint existence checks.

4. ERROR HANDLING

Different recovery is taken depending upon the error reported. Refer to the "Corrective Action Taken" section of the individual error.

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADIDLE

Error Code:	BADIDLE
Error Description:	The softswitch flag associated with a QLPS (quad linked packet switch) network is set (QLImdb[network].soft = DBYES), but the softswitch timer associated with the network is not running (QLImdb[network].timer[QLTSSTIMER] is idle).
Possible Error Effect:	The QLPS network appears to be in softswitch when it is not and may be degraded.
Corrective Action Taken:	The audit clears the softswitch flag QLImdb[network].soft = DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Link manager's state (QLLMDB.state).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Index of the QLLMDB (index into QLImdb[]).
<i>Dump =</i>	QLLMDB without the endpoint map (QLImdb[].llcb_ix[]).

Table 2 Error Code: BADRANGE_INDEX

Error Code:	BADRANGE_INDEX
Error Description:	An entry in a QLPS network link manager's llcb_ix[] field is out-of-range (that is, is not QLLIXNULL and is not a valid index into QLlcb[]).
Possible Error Effect:	The endpoint associated with this entry (that is, the endpoint whose number is the index into QLLMDB.llcb_ix[]) can not be used. This may degrade the QLPS network.
Corrective Action Taken:	The audit clears the entry (QLLMDB.llcb_ix[] = QLLIXNULL). If this endpoint should be up, level 3 checks detects that it is not and causes the endpoint to be reestablished.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index into QLLMDB.llcb_ix[].
<i>Bad Data =</i>	Contents of QLLMDB.llcb_ix[].
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Index of the QLLMDB (index into QLImdb[]).
<i>Dump =</i>	QLLMDB without the endpoint map (QLImdb[].llcb_ix[]).

Table 3 Error Code: GBGTIMER

Error Code:	GBGTIMER
Error Description:	An active QLPS network link manager (QLLMDB.state = QLMOOSAVL or QLMACT) has an invalid timer type in one of its QLLMDB.timer[] entries (QLTIMER.type != QLNULL and QLTIMER.type ≥ QLTNL2TYPES).
Possible Error Effect:	If the bad type is masking what should be a pending timer, the link protocol does not work correctly. Otherwise, operational code may assert on the invalid value.
Corrective Action Taken:	The audit idles the bad timer entry (sets QLTIMER.type = QLNULL).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index into QLLMDB.timer[].
<i>Bad Data =</i>	Invalid timer type (QLLMDB.timer[].type).
<i>Good Data =</i>	Link manager's state (QLLMDB.state).
<i>Logical Index =</i>	Index of the QLLMDB (index into QLImdb[]).
<i>Dump =</i>	QLLMDB without the endpoint map (QLImdb[].llcb_ix[]).

Table 4 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	An out-of-service QLPS network link manager (QLLMDB.state = QLMOOSL1) has a non-idle timer. That is, QLLMDB.timer[timer_index] is not idle (QLTIMER.type != QLNULL or QLTIMER.count != QLNULL).
Possible Error Effect:	If the timer times out, it is likely to cause asserts.
Corrective Action Taken:	The audit idles the timer (sets QLTIMER.type = QLNULL and QLTIMER.count = QLNULL).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index into the timer array (QLLMDB.timer[]).
<i>Bad Data =</i>	Non-idle timer's type (QLTIMER.type).

<i>Good Data</i> =	Link manager's state (QLLMDB.state).
<i>Logical Index</i> =	Index of the QLLMDB (index into QLLmdb[]).
<i>Dump</i> =	QLLMDB without the endpoint map (QLImdb[].llcb_ix[]).

Table 5 Error Code: MISSING

Error Code:	MISSING
Error Description:	On a message handler (MH) or quad gateway processor (QGP), one of the following cases is true. The value dumped in the error address field of the audit report can be used to distinguish the two cases: SMQEPOSDS or SMQEPCCS: A QLPS network endpoint should be equipped according to SMqlendpts[network][endpoint], but the endpoint is not established. That is, QLLmdb[network].llcb_ix[endpoint] contains a null (QLLIXNULL) or invalid ($\geq$ QLNLLCBS) QLCB logical link control block (QLLCB) index. SMQEPNULL: A QLPS network endpoint should not be equipped according to SMqlendpts[network][endpoint], but the endpoint appears to be established. That is, QLLmdb[network].llcb_ix[endpoint] contains a valid QLLCB index.
Possible Error Effect:	QLPS network connectivity from the processor on which the audit is running to the endpoint identified in the error report is incorrect. The QLPS network may be degraded.
Corrective Action Taken:	Recovery depends on the value dumped in the error address field of the audit report: SMQEPOSDS or SMQEPCCS: The audit requests that the endpoint be established. SMQEPNULL: The audit sets the QLLmdb[network].llcb_ix[endpoint] = QLLIXNULL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The endpoint type.
<i>Bad Data</i> =	QLLCB index from QLLMDB.llcb_ix[endpoint] (index into QLLmdb[]).
<i>Good Data</i> =	Network number (index into QLLmdb[]).
<i>Logical Index</i> =	Endpoint index (index into QLLMDB.llcb_ix[]).
<i>Dump</i> =	QLLMDB without the endpoint map (QLImdb[].llcb_ix[]).

Table 6 Error Code: ONE2ONE

Error Code:	ONE2ONE
Error Description:	Either a QLPS network link manager is using endpoint 0, or has an invalid linkage to some other endpoint. That is, one of the following is true: - QLLMDB.llcb_ix[0] is a valid QLLCB (QLPS logical link control block) index. - QLLMDB.llcb_ix[endpoint] is a valid QLLCB index, but the associated QLLCB does not point back (QLLCB.network != QLLMDB index or QLLCB.far_end != endpoint).
Possible Error Effect:	If the QLLMDB owns a QLLCB on endpoint 0, the QLLCB and any associated resources are effectively lost to the system. This could prevent a valid endpoint from coming up and so degrade the QLPS network. If the linkage from a QLLMDB to a QLLCB for a valid endpoint is broken, the

	endpoint may not be able to communicate with the QLPS network. The QLPS network may be degraded.
Corrective Action Taken:	If a QLLCB is linked to the QLLMDB for endpoint 0 (that is, QLLCB.network = QLLMDB.index and QLLCB.far_end = 0), the audit releases the QLLCB and any associated resources. In all cases, the audit clears the endpoint entry being checked (QLLMDB.llcb_ix[endpoint] = QLLIXNULL).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Endpoint index (index into QLLMDB.llcb_ix[]).
<i>Bad Data =</i>	QLLCB index from QLLMDB.llcb_ix[endpoint] (index into QLLlcb[]).
<i>Good Data =</i>	Logical link's endpoint (QLLCB.far_end).
<i>Logical Index =</i>	Index of the QLLMDB (index into QLLmdb[]).
<i>Dump 1 =</i>	QLLCB.
<i>Dump 2 =</i>	QLLMDB without the endpoint map (QLImdb[]).llcb_ix[]).

Table 7 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	A QLPS network link manager's requester field is out-of-range (QLLMDB.requester ≥ QLREQMAX).
Possible Error Effect:	Operational code may assert on the out-of-range value.
Corrective Action Taken:	The audit sets QLLMDB.requester to the default value (QLNONE).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Invalid requester (QLLMDB.requester).
<i>Good Data =</i>	Link manager's state (QLLMDB.state).
<i>Logical Index =</i>	Index of the QLLMDB (index into QLLmdb[]).
<i>Dump =</i>	QLLMDB without the endpoint map (QLImdb[]).llcb_ix[]).

Table 8 Error Code: STATE

Error Code:	STATE
Error Description:	An QLPS network link manager is in an invalid state (QLLMDB.state is out-of-range).
Possible Error Effect:	The QLPS network pipe associated with the QLLMDB is not usable. The QLPS network may be degraded. It is also likely that asserts fire.
Corrective Action Taken:	The audit invokes error handling code to take down the QLPS network pipe associated with this QLLMDB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	QLLMDB requester field.
<i>Bad Data =</i>	Bad QLPS network link manager state (QLLMDB.state).
<i>Good Data =</i>	Number of loopback retries (QLLMDB.retry).
<i>Logical Index =</i>	Index of the QLLMDB (index into QLLmdb[]).
<i>Dump =</i>	QLLMDB without the endpoint map (QLImdb[]).llcb_ix[]).

Table 9 Error Code: TIME_EXC

Error Code:	TIME_EXC
Error Description:	A QLPS network link manager is in an active or available state (QLLMDB.state = QLMACT or QLMOOSAVL), but does not have a five second timer (QLLMDB.timer[QLT5SECTIMER].type is not valid).
Possible Error Effect:	The QLPS network pipe associated with the QLLMDB may be stuck in an inappropriate protocol state and so not handle QLPS traffic correctly. The QLPS network may be degraded.
Corrective Action Taken:	The audit starts the five second timer.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	type in the five second timer (QLLMDB.timer[QLT5SECTIMER].type).
<i>Bad Data =</i>	count in the five second timer (QLLMDB.timer[QLT5SECTIMER].count).
<i>Good Data =</i>	Link manager's state (QLLMDB.state).

<i>Logical Index</i> =	Index of the QLLMDB (index into QLImdbf[]).
<i>Dump</i> =	QLLMDB without the endpoint map (QLImdbf[]..llcb_ix[]).

Table 10 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit takes this error as a result of a write-protect violation, out-of-range read, or invalid operation by foreground or any audit system process.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit is reentered to clean up any data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	In the MH or QGP, this is the base level loop index (that is, an indicator of what code was executing).
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Index of the last QLLMDB audited (index into QLImdbf[]).
<i>Dump</i> =	QLLMDB without the endpoint map (QLImdbf[]..llcb_ix[]).

LNKDATA

Software Release: 5E11 and later

1. LINK STATUS DATA (LNKDATA) AUDIT

LNKDATA audit steps through the RLAPC_INFO (adjacent point code information) relation. For each tuple in the RLAPC_INFO relation, the audit makes sure the existence of rLNK_STAT (link status) tuple. Any missing tuple will be inserted by the audit. It also checks the dynamic RLLNK_STAT and RLLS_STAT (link set status) relations against the static relations RLAPC_INFO and RLDSLEQUIP for the correctness of semantic data.

2. DATA STRUCTURES

For details on the fields contained in the RLLNK_STAT relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx).

For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BAD_FAILED

Error Code:	BAD_FAILED
Error Description:	Port in-service, but marked failed in the RLLNK_STAT relation.
Possible Error Effect:	Status of links in missing link set tuple cannot be changed. Change over and change back do not occur properly. Link cannot be inhibited or uninhibited. Other link status changes do not occur properly.
Corrective Action Taken:	Audit calls signaling link message function.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rLNK_STAT tuple.
<i>Bad Data =</i>	Failed in RLLNK_STAT.
<i>Good Data =</i>	Port.
<i>Logical Index =</i>	Key of RLLNK_STAT.
<i>Dump =</i>	NA.

Table 2 Error Code: BAD_LINK_DATA

Error Code:	BAD_LINK_DATA
Error Description:	The tuple with key dltpor from the RLLNK_STAT relation was not found in the RLLNKP_LS relation.
Possible Error Effect:	Signaling link selection (SLSs) fields are not assigned to links correctly, so message signal unit (MSU) traffic may not be distributed correctly.
Corrective Action Taken:	None.
Manual Action Required:	Investigate office-dependent data (ODD) relation RLLNKP_LS.
Dump Description:	
<i>Error Address =</i>	Address of the rLNK_STAT tuple.
<i>Bad Data =</i>	0 or 1 (to distinguish the two occurrences of this error).
<i>Good Data =</i>	NA.

<i>Logical Index</i> =	dltpor value from rILNK_STAT tuple.
<i>Dump</i> =	rILNK_STAT tuple.

Table 3 Error Code: BAD_LNK_STAT_AVAIL

Error Code:	BAD_LNK_STAT_AVAIL
Error Description:	Link inhibited, blocked, or failed, but marked available in the RLLNK_STAT relation.
Possible Error Effect:	Traffic routed to link is lost.
Corrective Action Taken:	Audit corrects available.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rILNK_STAT tuple.
<i>Bad Data</i> =	Avail in RLLNK_STAT.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of RLLNK_STAT.
<i>Dump</i> =	Tuple in error from RLLNK_STAT.

Table 4 Error Code: BAD_SDLCO

Error Code:	BAD_SDLCO
Error Description:	The port for this link set member does not have an associated terminal process. The value of sdlco_ack should be DBNO, but it is not.
Possible Error Effect:	Signaling data link connection order messages are improperly processed.
Corrective Action Taken:	The audit corrects sdlco_ack.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rILNK_STAT tuple.
<i>Bad Data</i> =	Value of sdlco_ack in RLLNK_STAT.
<i>Good Data</i> =	0 (DBNO).
<i>Logical Index</i> =	lnk_indx (key) of RLLNK_STAT.
<i>Dump</i> =	NA.

Table 5 Error Code: BAD_STPH

Error Code:	BAD_STPH
Error Description:	Signaling terminal protocol handler (STPH) in the RLLNK_STAT relation is not equal to dsl_group in the RLDSLEQUIP relation.
Possible Error Effect:	Incorrect STPH is given to the signaling message handler (SMH).
Corrective Action Taken:	Audit corrects value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rILNK_STAT tuple.
<i>Bad Data</i> =	stph in RLLNK_STAT.
<i>Good Data</i> =	dsl_group in RLDSLEQUIP.
<i>Logical Index</i> =	Key of RLLNK_STAT.
<i>Dump</i> =	NA.

Table 6 Error Code: CCNON

Error Code:	CCNON
Error Description:	In order to set the norm_sls field, the audit must invoke a common channel signaling (CCS) function. However, this function was not able to provide the norm_sls needed to construct or check the tuple.
Possible Error Effect:	SLSs fields are not assigned to link correctly. Therefore, MSU traffic may not be distributed correctly.
Corrective Action Taken:	The audit tries again the next time it runs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rILS_STAT tuple.
<i>Bad Data</i> =	Return from the CCS function call.
<i>Good Data</i> =	One of the following: 1 = Indicates call made for a missing rILNK_STAT tuple.

	2 = Indicates call made for an existing rLNK_STAT tuple.
<i>Logical Index</i> =	lsnum(key) of rLS_STAT.
<i>Dump</i> =	NA.

Table 7 Error Code: CHNUM_BAD

Error Code:	CHNUM_BAD
Error Description:	The chnum (channel number) field of this rLNK_STAT tuple differs from the logical channel value derived from the member field of the corresponding rDSLEQUIP tuple.
Possible Error Effect:	It is impossible to identify the correct protocol handler (PH) channel corresponding to this link.
Corrective Action Taken:	The audit corrects the chnum field.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLNK_STAT tuple.
<i>Bad Data</i> =	Value of chnum in RLLNK_STAT.
<i>Good Data</i> =	Logical channel value derived from member in corresponding rDSLEQUIP tuple.
<i>Logical Index</i> =	lnk_indx (key) of rLNK_STAT tuple.
<i>Dump</i> =	NA.

Table 8 Error Code: CPRIOR

Error Code:	CPRIOR
Error Description:	The priority field of an rLNK_STAT tuple differs from the priority field in the corresponding rLNKP_LS tuple.
Possible Error Effect:	A link that should be carrying traffic is not doing so, or one that should not be carrying traffic is doing so.
Corrective Action Taken:	The priority field of the rLNK_STAT tuple is corrected to that from the rLNKP_LS tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLNK_STAT tuple.
<i>Bad Data</i> =	Priority field of rLNK_STAT tuple.
<i>Good Data</i> =	Priority field of rLNKP_LS tuple.
<i>Logical Index</i> =	lnk_indx (key) field of rLNK_STAT tuple.
<i>Dump</i> =	rLNK_STAT tuple.

Table 9 Error Code: DLTPORT_BAD

Error Code:	DLTPORT_BAD
Error Description:	Dltport in the RLLNK_STAT relation is not equal to sdlport in the RLLS_LNK relation.
Possible Error Effect:	Incorrect data about STPH could be transmitted to the SMH.
Corrective Action Taken:	Audit corrects value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLNK_STAT tuple.
<i>Bad Data</i> =	dltport in RLLNK_STAT.
<i>Good Data</i> =	sdlport in RLLS_LNK.
<i>Logical Index</i> =	Key of RLLNK_STAT.
<i>Dump</i> =	NA.

Table 10 Error Code: LNKISET_BAD

Error Code:	LNKISET_BAD
Error Description:	Value of link index of member of array lnkiset in the RLLS_STAT relation not equal to lnkindx of same member of same lsnum of the RLAPC_INFO relation.
Possible Error Effect:	Link status changes do not occur properly.
Corrective Action Taken:	Audit corrects value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLS_STAT tuple.

<i>Bad Data</i> =	Link index in RLLS_STAT.
<i>Good Data</i> =	Link index in RLAPC_INFO.
<i>Logical Index</i> =	Key of RLLS_STAT.
<i>Dump</i> =	Tuple in error from RLLS_STAT.

Table 11 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	The tuple with key lkindx from the RLAPC_INFO relation was not found in dynamic relation RLLNK_STAT.
Possible Error Effect:	Data for link is not inserted in dynamic data. Status of link cannot be changed. Change over and change back do not occur properly. Other link status changes do not occur properly.
Corrective Action Taken:	Audit tries to construct and insert missing tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIAPC_INFO tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	lkindx from RLAPC_INFO
<i>Logical Index</i> =	apcindx (key) of RLAPC_INFO
<i>Dump</i> =	NA.

Table 12 Error Code: NORM1_SLS_BAD

Error Code:	NORM1_SLS_BAD
Error Description:	The norm_sls field of an rLNK_STAT tuple differs from the norm_sls field in the corresponding rLNKP_LS tuple.
Possible Error Effect:	SLSs fields are not assigned to link correctly, so MSU traffic may not be distributed correctly.
Corrective Action Taken:	The norm_sls field of the rLNK_STAT tuple is corrected to that from the rLNKP_LS tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLNK_STAT tuple.
<i>Bad Data</i> =	norm_sls field of rLNK_STAT tuple.
<i>Good Data</i> =	norm_sls field of rLNKP_LS tuple.
<i>Logical Index</i> =	lnk_indx (key) field of rLNK_STAT tuple.
<i>Dump</i> =	rLNK_STAT tuple.

Table 13 Error Code: NORM2_SLS_BAD

Error Code:	NORM2_SLS_BAD
Error Description:	The norm_sls field of an rLNK_STAT tuple differs from the norm_sls field returned by the CCS function.
Possible Error Effect:	SLSs fields are not assigned to link correctly. Therefore, MSU traffic may not be distributed correctly.
Corrective Action Taken:	None. The function has already put the correct norm_sls into the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLNK_STAT tuple.
<i>Bad Data</i> =	norm_sls field of the rLNK_STAT tuple.
<i>Good Data</i> =	norm_sls field returned by the function.
<i>Logical Index</i> =	lnk_indx (key) field of the rLNK_STAT tuple.
<i>Dump</i> =	NA.

Table 14 Error Code: NO_1DSLEQUIP

Error Code:	NO_1DSLEQUIP
Error Description:	Tuple with key st_dlt from the RLLS_LNK relation is not found in the RLDSLEQUIP relation.
Possible Error Effect:	Data for link is not inserted in dynamic data. Status of link cannot be changed. Change over and change back do not occur properly. Other link status changes do not occur properly.
Corrective Action Taken:	None.

Manual Action Required:	Investigate ODD (office-dependent data) relation RLDSLEQUIP.
Dump Description:	
<i>Error Address</i> =	Address of rILS_LNK tuple.
<i>Bad Data</i> =	member in RLLS_LNK (second half of key to RLLS_LNK).
<i>Good Data</i> =	St_dlt in RLLS_LNK.
<i>Logical Index</i> =	lsum in RLLS_LNK (first half of key to RLLS_LNK).
<i>Dump</i> =	NA.

Table 15 Error Code: NO_1LS_LNK

Error Code:	NO_1LS_LNK
Error Description:	Tuple with keys lsum and member from the RLAPC_INFO relation not found in static relation RLLS_LNK.
Possible Error Effect:	Data for link is not inserted in dynamic data. Status of link cannot be changed. Change over and change back do not occur properly. Other link status changes do not occur properly.
Corrective Action Taken:	None.
Manual Action Required:	Investigate ODD relation RLLS_LNK.
Dump Description:	
<i>Error Address</i> =	Address of rLAPC_INFO tuple.
<i>Bad Data</i> =	lsum in RLAPC_INFO.
<i>Good Data</i> =	member in RLAPC_INFO.
<i>Logical Index</i> =	Key of RLAPC_INFO.
<i>Dump</i> =	NA.

Table 16 Error Code: NO_2DSLEQUIP

Error Code:	NO_2DSLEQUIP
Error Description:	Tuple with key st_dlt from the RLLS_LNK relation is not found in the RLDSLEQUIP relation.
Possible Error Effect:	During selective initialization, the dynamic data may not be populated correctly resulting in inability to change the status of the link.
Corrective Action Taken:	None.
Manual Action Required:	Investigate ODD relation RLDSLEQUIP.
Dump Description:	
<i>Error Address</i> =	Address of rILS_LNK tuple.
<i>Bad Data</i> =	member in RLLS_LNK (second half of key to RLLS_LNK).
<i>Good Data</i> =	st_dlt in RLLS_LNK.
<i>Logical Index</i> =	lsum in RLLS_LNK (first half of key to RLLS_LNK).
<i>Dump</i> =	NA.

Table 17 Error Code: NO_2LS_LNK

Error Code:	NO_2LS_LNK
Error Description:	Tuple with keys lsum and member from the RLAPC_INFO relation is not found in static relation RLLS_LNK.
Possible Error Effect:	Status of link cannot be changed. Change over and change back do not occur properly. Other link status changes do not occur properly.
Corrective Action Taken:	None.
Manual Action Required:	Investigate ODD relation RLLS_LNK.
Dump Description:	
<i>Error Address</i> =	Address of RLAPC_INFO.
<i>Bad Data</i> =	lsum in RLAPC_INFO (first half of key to RLLS_LNK).
<i>Good Data</i> =	member in RLAPC_INFO (second half of key to RLLS_LNK).
<i>Logical Index</i> =	Key of RLAPC_INFO.
<i>Dump</i> =	NA.

Table 18 Error Code: NO_MATCH_LS_STAT

Error Code:	NO_MATCH_LS_STAT
Error Description:	Tuple in static data does not exist in the dynamic relation, RLLS_STAT.
Possible Error Effect:	Status of links in missing link set tuple cannot be changed. Change over and change back do not occur properly. Link cannot be inhibited or uninhibited. Other link status changes do not occur properly.
Corrective Action Taken:	Related audit runs and inserts tuple in the RLLS_STAT relation.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Link set number in RLAPC_INFO.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of RLAPC_INFO.
<i>Dump</i> =	NA.

Table 19 Error Code: NO_PORTLA

Error Code:	NO_PORTLA
Error Description:	Port derived from dltport of the RLLNK_STAT relation not found in dynamic relation RLPORTLA.
Possible Error Effect:	Status of port cannot be verified. Link cannot be activated.
Corrective Action Taken:	Related audit corrects RLPORTLA.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLLNK_STAT tuple.
<i>Bad Data</i> =	dltport in RLLNK_STAT.
<i>Good Data</i> =	Port derived from dltport.
<i>Logical Index</i> =	Key of RLLNK_STAT.
<i>Dump</i> =	NA.

Table 20 Error Code: SLC_BAD

Error Code:	SLC_BAD
Error Description:	slc in the RLLNK_STAT relation not equal to slc in the RLAPC_INFO relation.
Possible Error Effect:	SMH receives incorrect routing data.
Corrective Action Taken:	Audit corrects value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLLNK_STAT tuple.
<i>Bad Data</i> =	slc in RLLNK_STAT.
<i>Good Data</i> =	slc in RLAPC_INFO.
<i>Logical Index</i> =	Key of RLLNK_STAT.
<i>Dump</i> =	NA.

LNKSLS-A

Software Release: 5E11 - 5E13

1. SIGNALING LINK SELECTION (LNKSLS) AUDIT

The LNKSLS audit steps through the RLLS_GRP (link set group relation) and checks the data in the RLLNK_STAT (link state relation) and RLLS_STAT (link set status relation).

2. DATA STRUCTURES

For details on the fields contained in the RLLS_GRP, RLLNK_STAT and RLLS_STAT relations refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: AVAIL_BAD_LS_STAT

Error Code:	AVAIL_BAD_LS_STAT
Error Description:	The cur_status field in the NMslsc7buff[] entry has an incorrect value.
Possible Error Effect:	An incorrect signaling link (SL) status could be reported to the network management center.
Corrective Action Taken:	The audit sets the cur_status field in NMslsc7buff[] opposite from the avail attribute in rLS_STAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Starting address of the tuple containing the error in NMslsc7buff[].
<i>Bad Data =</i>	cur_status field in NMslsc7buff[].
<i>Good Data =</i>	avail attribute in rLS_STAT tuple.
<i>Logical Index =</i>	Index to NMslsc7buff[].
<i>Dump =</i>	NA.

Table 2 Error Code: BAD_CONGEST

Error Code:	BAD_CONGEST
Error Description:	One of the congestion indicators (cong1, cong2, or cong3) is not consistent with the cg field in the rLNK_STAT tuple.
Possible Error Effect:	An incorrect SL status could be reported to the network management center.
Corrective Action Taken:	The audit corrects the congestion field (cong1, cong2, or cong3) in NMslsc7buff[], depending on the value of the cg attribute in the rLNK_STAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Starting address of the tuple containing the error in NMslsc7buff[].
<i>Bad Data =</i>	Congestion value. The three bit values obtained by combining the bit values of cong1, cong2, and cong3 fields in NMslsc7buff[]. For example, if bit0 is set, then cong1 in NMslsc7buff[] is DBYES.
<i>Good Data =</i>	Value of cg field in rLNK_STAT tuple.
<i>Logical Index =</i>	Index to NMslsc7buff[].

<i>Dump</i> =	NA.

Table 3 Error Code: BAD_DDTBL

Error Code:	BAD_DDTBL
Error Description:	Unable to retrieve the gsml field from the RL GSM OPC relation.
Possible Error Effect:	The slsid field in both NMslsc7buff[] and NMslc7buff[] cannot be audited.
Corrective Action Taken:	None.
Manual Action Required:	Populate the rLGSM OPC table.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The key field (Gl_pcrld) to read relation RL GSM OPC.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 4 Error Code: BAD_FAILED

Error Code:	BAD_FAILED
Error Description:	The slfail field in NMslc7buff[] does not agree with the failed attribute in the rLNK_STAT tuple.
Possible Error Effect:	An incorrect SL status could be reported to the network management center.
Corrective Action Taken:	The audit sets the slfail field in NMslc7buff[] to agree with the failed attribute in the rLNK_STAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Starting address of the tuple containing the error in NMslc7buff[].
<i>Bad Data</i> =	slfail field in NMslc7buff[].
<i>Good Data</i> =	Failed attribute in the rLNK_STAT tuple.
<i>Logical Index</i> =	Index to NMslc7buff[].
<i>Dump</i> =	NA.

Table 5 Error Code: BAD_LINK_DATA

Error Code:	BAD_LINK_DATA
Error Description:	The audit cannot read static relation APC_INFO with key retrieved from rLS_STAT (apci attribute) and rLNK_STAT (slc attribute), or the audit cannot read (static) relation LNKP_LS with key from rLNK_STAT (attribute dltport). Good data is used to differentiate between the two cases.
Possible Error Effect:	The possible error effects are: 1 = If only the slc attribute is wrong, incorrect updates may be sent to the protocol handler (PH) during traffic diversion. If either the slc or the apci is wrong, then operational code is not able to map link set to APC (adjacent point code). 2 = If the dltport attribute is wrong, operational code is not able to access data about link from static relation LNKP_LS.
Corrective Action Taken:	The audit takes a longer route to read rAPC_INFO and rLNKP_LS. First it reads rLS_LNK (using link set number and index into the lnkiset array), and then rLNKP_LS and rAPC_INFO. If the audit cannot successfully read rLS_LNK, it assumes that the link index in the lnkiset array is bad and zeroes it to audit the next link index. If the link index does not match with lnkidx in rAPC_INFO, the audit sets the link index in the lnkiset array to the value of lnkidx in rAPC_INFO and proceeds with the rest of the checks.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLS_STAT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Corresponds to the Possible Error Effects as follows:

	1 = audit cannot read rIAPC_INFO.
	2 = audit cannot read rILNKP_LS.
<i>Logical Index</i> =	Logical key (link set number) of rILS_STAT.
<i>Dump</i> =	Contents of rILS_STAT and rILNK_STAT tuples.

Table 6 Error Code: CHANGE_OVER

Error Code:	CHANGE_OVER
Error Description:	The error is due to one of the following: 1 = The value of the laco field within one tuple of NMslc7buf[] is not DBNO when the deloaded attribute in rILNK_STAT tuple has the value of DBNO. 2 = The value of the lmco field within one tuple of NMslc7buf[] is not DBNO when the deloaded attribute in rILNK_STAT tuple has the value of DBNO. 3 = Neither the laco field nor the lmco field within one tuple of NMslc7buf[] has the value of DBYES when the deloaded attribute in rILNK_STAT tuple is DBYES, the norm_sls attribute in the rILNK_STAT tuple equals zero, and the sls attribute in rILNK_STAT tuple is zero.
Possible Error Effect:	An incorrect SL status could be reported to the network management center.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = The audit corrects the laco field in NMslc7buf[] to the value of DBNO. 2 = The audit corrects the lmco field in NMslc7buf[] to the value of DBNO. 3 = The audit sets the laco field to the value of DBYES and the lmco field to the value of DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Starting address of the tuple containing the error in NMslc7buf[].
<i>Bad Data</i> =	Corresponds to the Error Description and Corrective Action as follows: 1 = laco field in NMslc7buf[]. 2 = lmco field in NMslc7buf[]. 3 = laco field in NMslc7buf[].
<i>Good Data</i> =	Corresponds to the Error Description as follows: 1 = Indicates that the laco field in NMslc7buf[] is incorrect. 2 = Indicates that the lmco field in NMslc7buf[] is incorrect. 3 = Indicates that the laco field in NMslc7buf[] is incorrect.
<i>Logical Index</i> =	Index to NMslc7buf[].
<i>Dump</i> =	NA.

Table 7 Error Code: LINKISET_ERROR

Error Code:	LINKISET_ERROR
Error Description:	The link index in lnlkiset array of rILS_STAT is bad. There are three cases; good data is used to differentiate between them. The audit cannot read rILNK_STAT, link index in lnlkiset array does not agree with lnlindx in rIAPC_INFO, or audit

	cannot read static relation LS_LNK.
Possible Error Effect:	Operational code is not able to access link data or may access data for the wrong link. Traffic diversion for the link in question may not be done at all or may be done incorrectly.
Corrective Action Taken:	For the first two cases (good data 1 or 2), the audit sets the link index in Inksset to agree with the Inkindx in rIAPC_INFO. In the last case, the audit zeroes the link index in Inksset.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Index into Inksset array (0-7).
<i>Bad Data</i> =	Link index (contents of Inksset array).
<i>Good Data</i> =	Valid values are: 1 = Audit cannot read rLNK_STAT using link index from Inksset array. 2 = Link index (of Inksset) does not match with Inkindx in static data in rIAPC_INFO. 3 = Audit cannot find rLS_LNK tuple using link set number and position into Inksset array as a key.
<i>Logical Index</i> =	Logical key (link set) of rLS_STAT.
<i>Dump</i> =	NA.

Table 8 Error Code: LINK_SLS

Error Code:	LINK_SLS
Error Description:	A link set is marked unavailable, but some of its links carry signaling link selections (SLSs), or a link that is marked available does not carry its normal SLSs. Good data is used to differentiate between the two cases.
Possible Error Effect:	Links may be carrying bogus traffic, or traffic for the link could be lost.
Corrective Action Taken:	The audit sends the STRM_SP (signaling traffic and route management system process) a message to do SLS correction. Message sent is type MGSS7TRM with msubtype attribute set to CCS7DSC. If the link set is marked unavailable and carries SLSs, the sls field for the link is set to zero.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Index into Inksset array (0-7).
<i>Bad Data</i> =	Link index (contents of Inksset).
<i>Good Data</i> =	Valid values are: 1 = Link set is marked unavailable but one of its links carries SLSs. 2 = A link is marked available but does not carry all its normal SLSs.
<i>Logical Index</i> =	Logical key (link set) of rLS_STAT.
<i>Dump</i> =	Contents of rLNK_STAT tuple.

Table 9 Error Code: LS_STAT_NO

Error Code:	LS_STAT_NO
Error Description:	The link set contained in static relation LS_GRP is not in dynamic relation LS_STAT.
Possible Error Effect:	Operational code is not able to access dynamic data about link set or any link in the link set. No traffic diversion for the missing link or the missing link set can be performed.
Corrective Action Taken:	This audit reports the error and has related audit, LSDATA, insert the missing link set into rLS_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.

<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key (link set number) of rLS_STAT.
<i>Dump</i> =	NA.

Table 10 Error Code: MEMBER_BAD

Error Code:	MEMBER_BAD
Error Description:	The member field in NMslc7buff[] does not agree with the index into the lnkiset[] attribute in the rLS_STAT tuple.
Possible Error Effect:	An incorrect SL status could be reported to the network management center.
Corrective Action Taken:	The audit sets the member field in NMslc7buff[] to agree with the index into the lnkiset[] attribute in the rLS_STAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Starting address of the tuple containing the error in NMslc7buff[].
<i>Bad Data</i> =	member field in NMslc7buff[].
<i>Good Data</i> =	Index into the lnkiset[] attribute in the rLS_STAT tuple.
<i>Logical Index</i> =	Index to NMslc7buff[].
<i>Dump</i> =	NA.

Table 11 Error Code: MLINK_LNK_STAT

Error Code:	MLINK_LNK_STAT
Error Description:	A link index exists in static data (rAPC_INFO) data, but does not exist in dynamic rLNK_STAT.
Possible Error Effect:	Traffic diversion for that link is not performed.
Corrective Action Taken:	The audit reports the error and has related audit, LNKDATA, insert the tuple in rLNK_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLS_STAT tuple.
<i>Bad Data</i> =	Missing link index tuple.
<i>Good Data</i> =	Index into lnkiset array (0-7).
<i>Logical Index</i> =	Logical key (link set) of rLS_STAT.
<i>Dump</i> =	Contents of rLS_STAT tuple.

Table 12 Error Code: NO_PORTLA

Error Code:	NO_PORTLA
Error Description:	The port derived from dltport of rLNK_STAT was not found in the dynamic relation rPORTLA.
Possible Error Effect:	The status of the port cannot be verified. Links cannot be activated.
Corrective Action Taken:	A related audit corrects rPORTLA.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLNK_STAT tuple.
<i>Bad Data</i> =	dltport in rLNK_STAT.
<i>Good Data</i> =	Port derived from the TMDLTPORT[] macro.
<i>Logical Index</i> =	Index to NMslc7buff[]
<i>Dump</i> =	NA.

Table 13 Error Code: RDATA_BAD

Error Code:	RDATA_BAD
Error Description:	Data in lnkiset array does not match with static data of rAPC_INFO. There are three cases; good data is used to differentiate them. The link set number, the link index, or the position into lnkiset array does not match with static data in rAPC_INFO.
Possible Error Effect:	Operational code is not able to access link data or may access data for the wrong link. Traffic diversion for the link in question may not be done at all or may be done incorrectly.
Corrective Action Taken:	The audit sets the lnkiset data to agree with static data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLS_STAT.

<i>Bad Data</i> =	Depending on good data, the bad link set number, the bad link index, or the bad index into the lnkiset array.
<i>Good Data</i> =	Valid values are: 1 = The link set number does not match with the lsnum attribute in rIAPC_INFO. 2 = Index in lnkiset does not match with the lnkindx attribute in rIAPC_INFO. 3 = Into lnkiset array does not match with the member attribute in rIAPC_INFO.
<i>Logical Index</i> =	Logical index (link set) of rILS_STAT.
<i>Dump</i> =	Contents of rILS_STAT tuple, and contents of rILNK_STAT tuple.

Table 14 Error Code: SDATA_CON_ERR

Error Code:	SDATA_CON_ERR
Error Description:	Static to static inconsistency. There are three cases; good data is used to differentiate between them. The audit cannot read the LNKP_LS tuple using the st_dlt attribute from static relation LS_LNK as key, the audit cannot read APC_INFO tuple using attribute apci from rILS_GRP and slc from LNKP_LS, or the member attribute in rILS_LNK does not match with the member attribute in rIAPC_INFO.
Possible Error Effect:	Operational code is not able to access link data or may access data for the wrong link. Traffic diversion for the link in question may not be done at all or may be done incorrectly.
Corrective Action Taken:	None.
Manual Action Required:	Resolve the office-dependent data (ODD) inconsistencies.
Dump Description:	
<i>Error Address</i> =	If <i>Good Data</i> is 1, then <i>Error Address</i> is the st_dlt attribute of rILS_LNK. If <i>Good Data</i> is 2, then <i>Error Address</i> is the apci of rILS_GRP. If <i>Good Data</i> is 3, then <i>Error Address</i> is the member value of rIAPC_INFO.
<i>Bad Data</i> =	If <i>Good Data</i> is 1, then <i>Bad Data</i> is NA. If <i>Good Data</i> is 2, then <i>Bad Data</i> is the slc attribute of rILNK_LS. If <i>Good Data</i> is 3, then <i>Bad Data</i> is the index into lnkiset array (0-7).
<i>Good Data</i> =	Valid values are: 1 = Audit cannot read rILNKP_LS using st_dlt of rILS_LNK. 2 = Audit cannot read rIAPC_INFO tuple. 3 = Member attribute of rILS_LNK does not match the member attribute of rIAPC_INFO.
<i>Logical Index</i> =	Logical key (link set) of rILS_STAT
<i>Dump</i> =	NA.

Table 15 Error Code: SLSID_BAD

Error Code:	SLSID_BAD
Error Description:	The error is due to one of the following: 1 = One entry field (slsid) for NMslsc7buf[] is incorrect. 2 = One entry field (slsid) for NMslc7buf[] is incorrect.
Possible Error Effect:	An incorrect slsid could be reported to the network management center.
Corrective Action Taken:	Corresponds the Error Description as follows: 1 = The audit corrects the slsid field in the NMslsc7buf[].

	2 = The audit corrects the slsid field in NMslsc7buf[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Corresponds the Error Description as follows: 1 = Starting address of the tuple containing the error NMslsc7buf[]. 2 = Starting address of the tuple containing the error NMslsc7buf[].
<i>Bad Data</i> =	Corresponds the Error Description as follows: 1 = slsid field in NMslsc7buf[]. 2 = slsid field in NMslsc7buf[].
<i>Good Data</i> =	Corresponds the Error Description as follows: 1 = indicates that the slsid in NMslsc7buf[] is incorrect. 2 = indicates that the slsid in NMslsc7buf[] is incorrect.
<i>Logical Index</i> =	Corresponds the Error Description as follows: 1 = Isnum attribute in the rLS_STAT tuple. 2 = lnk_indx attribute in the rLNK_STAT tuple.
<i>Dump</i> =	Correct slsid.

Table 16 Error Code: SLS_CLINK

Error Code:	SLS_CLINK
Error Description:	All SLSs are not carried by links in link set, or SLSs are carried by more than one link in link set. Good data differentiates between the two cases.
Possible Error Effect:	The possible error effects are: 1 = Traffic for link set is lost. 2 = The wrong link can be carrying traffic and may be carrying more than its share of traffic.
Corrective Action Taken:	The audit sends the STRM_SP (signaling traffic and route management system process) a message to do SLS correction. Message sent is type MGSS7TRM with msubtype attribute set to CCS7DSC.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLS_STAT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Corresponds to Possible Error Effects as follows: 1 = All SLSs are not carried by links in link set. 2 = SLSs are carried by more than one link within the link set.
<i>Logical Index</i> =	Logical key (link set) of rLS_STAT.
<i>Dump</i> =	Contents of rLS_STAT tuple, and contents of array holding SLSs for each link index.

Table 17 Error Code: SLS_EXTRA

Error Code:	SLS EXTRA
Error Description:	The error is due to one of the following: 1 = An extra entry in NMslsc7buf[] is found. 2 = An extra entry in NMslc7buf[] is found.
Possible Error Effect:	The extra SLS or SL could be reported to the network management center.
Corrective Action Taken:	The audit deletes the extra entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 1 = Starting address of the tuple containing the error NMslsc7buf[]. 2 = Starting address of the tuple containing the error NMslc7buf[].
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 1 = slsid field in NMslsc7buf[]. 2 = slsid field in NMslc7buf[].
<i>Good Data =</i>	Corresponds to the Error Description as follows: 1 = Indicates that an extra entry to NMslsc7buf[] is found. 2 = Indicates that an extra entry to NMslc7buf[] is found.
<i>Logical Index =</i>	Corresponds to the Error Description as follows: 1 = Index to NMslsc7buf[]. 2 = Index to NMslc7buf[].
<i>Dump =</i>	NA.

LNKSLS-B

Software Release: 5E14 and later

1. SIGNALING LINK SELECTION (LNKSLS) AUDIT

The LNKSLS audit steps through the RLLS_GRP (link set group relation) and checks the data in the RLLNK_STAT (link state relation) and RLLS_STAT (link set status relation).

2. DATA STRUCTURES

For details on the fields contained in the RLLS_GRP, RLLNK_STAT and RLLS_STAT relations refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: AVAIL_BAD_LS_STAT

Error Code:	AVAIL_BAD_LS_STAT
Error Description:	The cur_status field in the NMslsc7buff[] entry has an incorrect value.
Possible Error Effect:	An incorrect signaling link (SL) status could be reported to the network management center.
Corrective Action Taken:	The audit sets the cur_status field in NMslsc7buff[] opposite from the avail attribute in rLS_STAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Starting address of the tuple containing the error in NMslsc7buff[].
<i>Bad Data =</i>	cur_status field in NMslsc7buff[].
<i>Good Data =</i>	avail attribute in rLS_STAT tuple.
<i>Logical Index =</i>	Index to NMslsc7buff[].
<i>Dump =</i>	NA.

Table 2 Error Code: BAD_CONGEST

Error Code:	BAD_CONGEST
Error Description:	One of the congestion indicators (cong1, cong2, or cong3) is not consistent with the cg field in the rLNK_STAT tuple.
Possible Error Effect:	An incorrect SL status could be reported to the network management center.
Corrective Action Taken:	The audit corrects the congestion field (cong1, cong2, or cong3) in NMslsc7buff[], depending on the value of the cg attribute in the rLNK_STAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Starting address of the tuple containing the error in NMslsc7buff[].
<i>Bad Data =</i>	Congestion value. The three bit values obtained by combining the bit values of cong1, cong2, and cong3 fields in NMslsc7buff[]. For example, if bit0 is set, then cong1 in NMslsc7buff[] is DBYES.
<i>Good Data =</i>	Value of cg field in rLNK_STAT tuple.
<i>Logical Index =</i>	Index to NMslsc7buff[].

<i>Dump</i> =	NA.

Table 3 Error Code: BAD_DDTBL

Error Code:	BAD_DDTBL
Error Description:	Unable to retrieve the gsml field from the RL GSM OPC relation.
Possible Error Effect:	The slsid field in both NMslsc7buff[] and NMslc7buff[] cannot be audited.
Corrective Action Taken:	None.
Manual Action Required:	Populate the rLGSM_OPC table.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The key field (Gl_pcrld) to read relation RL GSM OPC.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 4 Error Code: BAD_FAILED

Error Code:	BAD_FAILED
Error Description:	The slfail field in NMslc7buff[] does not agree with the failed attribute in the rLNK_STAT tuple.
Possible Error Effect:	An incorrect SL status could be reported to the network management center.
Corrective Action Taken:	The audit sets the slfail field in NMslc7buff[] to agree with the failed attribute in the rLNK_STAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Starting address of the tuple containing the error in NMslc7buff[].
<i>Bad Data</i> =	slfail field in NMslc7buff[].
<i>Good Data</i> =	Failed attribute in the rLNK_STAT tuple.
<i>Logical Index</i> =	Index to NMslc7buff[].
<i>Dump</i> =	NA.

Table 5 Error Code: BAD_LINK_DATA

Error Code:	BAD_LINK_DATA
Error Description:	The audit cannot read static relation APC_INFO with key retrieved from rLS_STAT (apci attribute) and rLNK_STAT (slc attribute), or the audit cannot read (static) relation LNKP_LS with key from rLNK_STAT (attribute dltport). Good data is used to differentiate between the two cases.
Possible Error Effect:	The possible error effects are: 1 = If only the slc attribute is wrong, incorrect updates may be sent to the protocol handler (PH) during traffic diversion. If either the slc or the apci is wrong, then operational code is not able to map link set to APC (adjacent point code). 2 = If the dltport attribute is wrong, operational code is not able to access data about link from static relation LNKP_LS.
Corrective Action Taken:	The audit takes a longer route to read rAPC_INFO and rLNKP_LS. First it reads rLS_LNK (using link set number and index into the lnkiset array), and then rLNKP_LS and rAPC_INFO. If the audit cannot successfully read rLS_LNK, it assumes that the link index in the lnkiset array is bad and zeroes it to audit the next link index. If the link index does not match with lnkidx in rAPC_INFO, the audit sets the link index in the lnkiset array to the value of lnkidx in rAPC_INFO and proceeds with the rest of the checks.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLS_STAT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Corresponds to the Possible Error Effects as follows:

	1 = audit cannot read rIAPC_INFO.
	2 = audit cannot read rILNK_LS.
<i>Logical Index</i> =	Logical key (link set number) of rILS_STAT.
<i>Dump</i> =	Contents of rILS_STAT and rILNK_STAT tuples.

Table 6 Error Code: CHANGE_OVER

Error Code:	CHANGE_OVER
Error Description:	The error is due to one of the following: 1 = The value of the laco field within one tuple of NMslc7buf[] is not DBNO when the deloaded attribute in rILNK_STAT tuple has the value of DBNO. 2 = The value of the lmco field within one tuple of NMslc7buf[] is not DBNO when the deloaded attribute in rILNK_STAT tuple has the value of DBNO. 3 = Neither the laco field nor the lmco field within one tuple of NMslc7buf[] has the value of DBYES when the deloaded attribute in rILNK_STAT tuple is DBYES, the norm_sls attribute in the rILNK_STAT tuple equals zero, and the sls attribute in rILNK_STAT tuple is zero.
Possible Error Effect:	An incorrect SL status could be reported to the network management center.
Corrective Action Taken:	Corresponds to the Error Description as follows: 1 = The audit corrects the laco field in NMslc7buf[] to the value of DBNO. 2 = The audit corrects the lmco field in NMslc7buf[] to the value of DBNO. 3 = The audit sets the laco field to the value of DBYES and the lmco field to the value of DBNO.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Starting address of the tuple containing the error in NMslc7buf[].
<i>Bad Data</i> =	Corresponds to the Error Description and Corrective Action as follows: 1 = laco field in NMslc7buf[]. 2 = lmco field in NMslc7buf[]. 3 = laco field in NMslc7buf[].
<i>Good Data</i> =	Corresponds to the Error Description as follows: 1 = Indicates that the laco field in NMslc7buf[] is incorrect. 2 = Indicates that the lmco field in NMslc7buf[] is incorrect. 3 = Indicates that the laco field in NMslc7buf[] is incorrect.
<i>Logical Index</i> =	Index to NMslc7buf[].
<i>Dump</i> =	NA.

Table 7 Error Code: DBREAD

Error Code:	DBREAD
Error Description:	The audit attempts to read an rIAPC_STAT tuple using rILS_STAT.apci as the key. The read fails.
Possible Error Effect:	Certain network management checks cannot be done.

Corrective Action Taken:	The audit continues checking the rLS_STAT tuple and schedules the APCIAPC audit to correct the rIAPC_STAT error.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	rLS_GRP.Isnum (link set number).
<i>Bad Data =</i>	rIAPC_STAT.apci (adjacent point code index).
<i>Good Data =</i>	rLS_STAT.apci (adjacent point code index).
<i>Logical Index =</i>	rLS_STAT.Isnum (key of tuple which has the error).
<i>Dump 1 =</i>	Contents of rLS_STAT tuple.
<i>Dump 2 =</i>	Contents of rIAPC_STAT tuple.

Table 8 Error Code: LINKSET_ERROR

Error Code:	LINKSET_ERROR
Error Description:	The link index in Inkiset array of rLS_STAT is bad. There are three cases; good data is used to differentiate between them. The audit cannot read rLNK_STAT, link index in Inkiset array does not agree with Inkindx in rIAPC_INFO, or audit cannot read static relation LS_LNK.
Possible Error Effect:	Operational code is not able to access link data or may access data for the wrong link. Traffic diversion for the link in question may not be done at all or may be done incorrectly.
Corrective Action Taken:	For the first two cases (good data 1 or 2), the audit sets the link index in Inkiset to agree with the Inkindx in rIAPC_INFO. In the last case, the audit zeroes the link index in Inkiset.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index into Inkiset array (0-7).
<i>Bad Data =</i>	Link index (contents of Inkiset array).
<i>Good Data =</i>	Valid values are: 1 = Audit cannot read rLNK_STAT using link index from Inkiset array. 2 = Link index (of Inkiset) does not match with Inkindx in static data in rIAPC_INFO. 3 = Audit cannot find rLS_LNK tuple using link set number and position into Inkiset array as a key.
<i>Logical Index =</i>	Logical key (link set) of rLS_STAT.
<i>Dump =</i>	NA.

Table 9 Error Code: LINK_SLS

Error Code:	LINK_SLS
Error Description:	A link set is marked unavailable, but some of its links carry signaling link selections (SLSs), or a link that is marked available does not carry its normal SLSs. Good data is used to differentiate between the two cases.
Possible Error Effect:	Links may be carrying bogus traffic, or traffic for the link could be lost.
Corrective Action Taken:	The audit sends the STRM_SP (signaling traffic and route management system process) a message to do SLS correction. Message sent is type MGSS7TRM with msbtype attribute set to CCS7DSC. If the link set is marked unavailable and carries SLSs, the sls field for the link is set to zero.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Index into Inkiset array (0-7).
<i>Bad Data =</i>	Link index (contents of Inkiset).
<i>Good Data =</i>	Valid values are: 1 = Link set is marked unavailable but one of its links carries SLSs. 2 = A link is marked available but does not carry all its normal SLSs.

<i>Logical Index</i> =	Logical key (link set) of rLS_STAT.
<i>Dump</i> =	Contents of rLNK_STAT tuple.

Table 10 Error Code: LS_STAT_NO

Error Code:	LS_STAT_NO
Error Description:	The link set contained in static relation LS_GRP is not in dynamic relation LS_STAT.
Possible Error Effect:	Operational code is not able to access dynamic data about link set or any link in the link set. No traffic diversion for the missing link or the missing link set can be performed.
Corrective Action Taken:	This audit reports the error and has related audit, LSDATA, insert the missing link set into rLS_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key (link set number) of rLS_STAT.
<i>Dump</i> =	NA.

Table 11 Error Code: MEMBER_BAD

Error Code:	MEMBER_BAD
Error Description:	The member field in NMslc7buff[] does not agree with the index into the Inkiset[] attribute in the rLS_STAT tuple.
Possible Error Effect:	An incorrect SL status could be reported to the network management center.
Corrective Action Taken:	The audit sets the member field in NMslc7buff[] to agree with the index into the Inkiset[] attribute in the rLS_STAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Starting address of the tuple containing the error in NMslc7buff[].
<i>Bad Data</i> =	member field in NMslc7buff[].
<i>Good Data</i> =	Index into the Inkiset[] attribute in the rLS_STAT tuple.
<i>Logical Index</i> =	Index to NMslc7buff[].
<i>Dump</i> =	NA.

Table 12 Error Code: MLINK_LNK_STAT

Error Code:	MLINK_LNK_STAT
Error Description:	A link index exists in static data (rIAPC_INFO) data, but does not exist in dynamic rLNK_STAT.
Possible Error Effect:	Traffic diversion for that link is not performed.
Corrective Action Taken:	The audit reports the error and has related audit, LNKDATA, insert the tuple in rLNK_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLS_STAT tuple.
<i>Bad Data</i> =	Missing link index tuple.
<i>Good Data</i> =	Index into Inkiset array (0-7).
<i>Logical Index</i> =	Logical key (link set) of rLS_STAT.
<i>Dump</i> =	Contents of rLS_STAT tuple.

Table 13 Error Code: NO_PORTLA

Error Code:	NO_PORTLA
Error Description:	The port derived from dltport of rLNK_STAT was not found in the dynamic relation rIORTLA.
Possible Error Effect:	The status of the port cannot be verified. Links cannot be activated.
Corrective Action Taken:	A related audit corrects rIORTLA.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLNK_STAT tuple.
<i>Bad Data</i> =	dltport in rLNK_STAT.
<i>Good Data</i> =	Port derived from the TMDLTPORT[] macro.

<i>Logical Index</i> =	Index to NMslc7buff[]
<i>Dump</i> =	NA.

Table 14 Error Code: RDATA_BAD

Error Code:	RDATA_BAD
Error Description:	Data in Inkiset array does not match with static data of rIAPC_INFO. There are three cases; good data is used to differentiate them. The link set number, the link index, or the position into Inkiset array does not match with static data in rIAPC_INFO.
Possible Error Effect:	Operational code is not able to access link data or may access data for the wrong link. Traffic diversion for the link in question may not be done at all or may be done incorrectly.
Corrective Action Taken:	The audit sets the Inkiset data to agree with static data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rILS_STAT.
<i>Bad Data</i> =	Depending on good data, the bad link set number, the bad link index, or the bad index into the Inkiset array.
<i>Good Data</i> =	Valid values are: 1 = The link set number does not match with the lsnum attribute in rIAPC_INFO. 2 = Index in Inkiset does not match with the lkindx attribute in rIAPC_INFO. 3 = Into Inkiset array does not match with the member attribute in rIAPC_INFO.
<i>Logical Index</i> =	Logical index (link set) of rILS_STAT.
<i>Dump</i> =	Contents of rILS_STAT tuple, and contents of rILNK_STAT tuple.

Table 15 Error Code: SDATA_CON_ERR

Error Code:	SDATA_CON_ERR
Error Description:	Static to static inconsistency. There are three cases; good data is used to differentiate between them. The audit cannot read the LNKP_LS tuple using the st_dlt attribute from static relation LS_LNK as key, the audit cannot read APC_INFO tuple using attribute apci from rILS_GRP and slc from LNKP_LS, or the member attribute in rILS_LNK does not match with the member attribute in rIAPC_INFO.
Possible Error Effect:	Operational code is not able to access link data or may access data for the wrong link. Traffic diversion for the link in question may not be done at all or may be done incorrectly.
Corrective Action Taken:	None.
Manual Action Required:	Resolve the office-dependent data (ODD) inconsistencies.
Dump Description:	
<i>Error Address</i> =	If <i>Good Data</i> is 1, then <i>Error Address</i> is the st_dlt attribute of rILS_LNK. If <i>Good Data</i> is 2, then <i>Error Address</i> is the apci of rILS_GRP. If <i>Good Data</i> is 3, then <i>Error Address</i> is the member value of rIAPC_INFO.
<i>Bad Data</i> =	If <i>Good Data</i> is 1, then <i>Bad Data</i> is NA. If <i>Good Data</i> is 2, then <i>Bad Data</i> is the slc attribute of rILNK_LS. If <i>Good Data</i> is 3, then <i>Bad Data</i> is the index into Inkiset array (0-7).
<i>Good Data</i> =	Valid values are: 1 = Audit cannot read rILNKP_LS using st_dlt of rILS_LNK. 2 = Audit cannot read rIAPC_INFO tuple. 3 = Member attribute of rILS_LNK does not match the member attribute of

	rlAPC_INFO.
<i>Logical Index</i> =	Logical key (link set) of rLS_STAT
<i>Dump</i> =	NA.

Table 16 Error Code: SLSID_BAD

Error Code:	SLSID_BAD
Error Description:	The error is due to one of the following: 1 = One entry field (slsid) for NMslsc7buf[] is incorrect. 2 = One entry field (slsid) for NMslc7buf[] is incorrect.
Possible Error Effect:	An incorrect slsid could be reported to the network management center.
Corrective Action Taken:	Corresponds the Error Description as follows: 1 = The audit corrects the slsid field in the NMslsc7buf[]. 2 = The audit corrects the slsid field in NMslc7buf[].
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Corresponds the Error Description as follows: 1 = Starting address of the tuple containing the error NMslsc7buf[]. 2 = Starting address of the tuple containing the error NMslc7buf[].
<i>Bad Data</i> =	Corresponds the Error Description as follows: 1 = slsid field in NMslsc7buf[]. 2 = slsid field in NMslc7buf[].
<i>Good Data</i> =	Corresponds the Error Description as follows: 1 = indicates that the slsid in NMslsc7buf[] is incorrect. 2 = indicates that the slsid in NMslc7buf[] is incorrect.
<i>Logical Index</i> =	Corresponds the Error Description as follows: 1 = lsum attribute in the rLS_STAT tuple. 2 = lnc_idx attribute in the rLNK_STAT tuple.
<i>Dump</i> =	Correct slsid.

Table 17 Error Code: SLS_CLINK

Error Code:	SLS_CLINK
Error Description:	All SLSs are not carried by links in link set, or SLSs are carried by more than one link in link set. Good data differentiates between the two cases.
Possible Error Effect:	The possible error effects are: 1 = Traffic for link set is lost. 2 = The wrong link can be carrying traffic and may be carrying more than its share of traffic.
Corrective Action Taken:	The audit sends the STRM_SP (signaling traffic and route management system

	process) a message to do SLS correction. Message sent is type MGSS7TRM with msubtype attribute set to CCS7DSC.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rLS_STAT tuple.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	Corresponds to Possible Error Effects as follows: 1 = All SLSs are not carried by links in link set. 2 = SLSs are carried by more than one link within the link set.
<i>Logical Index =</i>	Logical key (link set) of rLS_STAT.
<i>Dump =</i>	Contents of rLS_STAT tuple, and contents of array holding SLSs for each link index.

Table 18 Error Code: SLS_EXTRA

Error Code:	SLS_EXTRA
Error Description:	The error is due to one of the following: 1 = An extra entry in NMslsc7buf[] is found. 2 = An extra entry in NMslc7buf[] is found.
Possible Error Effect:	The extra SLS or SL could be reported to the network management center.
Corrective Action Taken:	The audit deletes the extra entry.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 1 = Starting address of the tuple containing the error NMslsc7buf[]. 2 = Starting address of the tuple containing the error NMslc7buf[].
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 1 = slsid field in NMslsc7buf[]. 2 = slsid field in NMslc7buf[].
<i>Good Data =</i>	Corresponds to the Error Description as follows: 1 = Indicates that an extra entry to NMslsc7buf[] is found. 2 = Indicates that an extra entry to NMslc7buf[] is found.
<i>Logical Index =</i>	Corresponds to the Error Description as follows: 1 = Index to NMslsc7buf[]. 2 = Index to NMslc7buf[].
<i>Dump =</i>	NA.

LNKUSE

Software Release: 5E10 and later

1. TIME SLOT INTERCHANGE LINK USAGE (LNKUSE) AUDIT

The LNKUSE audit checks the TSI link type (RLLNK_USE) and the peripheral interface data bus (RLPIDB) relations looking for vacant channel data block (RLCHDB) relations or vacant TSDB general data (RLTSDB) relations. The audit runs only in SM-2000 processors.

In the case of digital networking unit - synchronous optical network (SONET) (DNU_S) facilities, the LNKUSE audit checks the virtual peripheral interface data bus (VPIDB_F) relation looking for vacant rCHDB tuples.

2. DATA STRUCTURES

The LNKUSE audit uses seven data structures: RLLNK_USE, RLCHDB, RLVPIDB_F, RLTSDB, RLPIDB, RLLNK_PLI and RLPICB. The RLLNK_USE relation resides only in SM-2000 processors and contains TSI link type information. The two rLLNK_USE fields used in the audit are link [TSI link (key)] and use (link usage).

The RLVPIDB_F relation resides only in SM-2000 processors and is used to map virtual peripheral interface data bus to a DNU_S facility number.

3. AUDIT CHECKS

The LNKUSE audit uses the DRSTATIC driver to traverse rCHDB tuples and network rITSDB tuples.

The audit first checks for the existence of the rCHDB and rITSDB (both network and peripheral) head cells.

For the RLLNK_USE relation, static to dynamic checks are made between the RLLNK_USE and the RLCHDB relation or between the RLLNK_USE and the RLTSDB relation, depending on whether the time slot is a loop time slot or not.

For the RLVPIDB_F relation, static to dynamic checks are made between the RLVPIDB_F and the RLCHDB relation. For each rVPIDB_F buffer, there should be 24 rCHDB tuples representing time slots on a DNU_S facility. The corresponding rPLI_LNK tuple is read to obtain the peripheral link number of the DNU_S facility. The RLPLI_LNK relation maps from the TSI end of the peripheral link to the physical link position on the peripheral unit.

The TSI link and link time slot are converted to the TSI time slot. A check is made to determine if this is a loop time slot. A check for a valid rCHDB tuple is performed for loop time slot links. If the time slot is used for diagnostics, the time slot is skipped.

If the link is connected to a network link interface (NLI) a check is made to determine if there is a valid rITSDB. The TSI Time Slot is converted to a network time slot.

For the peripheral interface data bus relation (RLPIDB) part of the LNKUSE audit, a static to dynamic check from the RLPIDB relation to the RLCHDB relation is made for loop channels. For each rPIDB tuple, all the associated time slots are checked.

ODDLOSTTUP = Check for associated rPICB tuple from rPIDB tuple.

4. ERROR HANDLING

For all vacant rCHDB tuples and rITSDB tuples found and most of the checks mentioned above, an audit error message is printed, the tuple is zeroed out and the zeroed tuple is inserted into the database.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not

found below.

The audit produces the following error code(s).

Table 1 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit has successfully read an rPIDB tuple. However, the corresponding rPICB tuple was not found in the database when using the peripheral interface control bus (PICB) attribute (rPIDB.picb) of the RLPIDB relation as a key (rPICB.picb) to the RLPICB relation. This error will continue to print out until fixed by the CRAFT.
Possible Error Effect:	May cause asserts and/or interrupts by various application programs.
Corrective Action Taken:	None.
Manual Action Required:	Either the picb attribute (rPIDB.picb) is not correct and must be updated to the correct value, or a rPICB tuple must be inserted into the database. The key (rPICB.picb) of the rPICB tuple can be obtained from the <i>Bad Data</i> field and the peripheral interface data bus (PICB) number can be obtained from the logical key field of this dump.
Dump Description:	
<i>Error Address</i> =	Address of rPICB tuple.
<i>Bad Data</i> =	rPICB.picb
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of the rPICB tuple.
<i>Dump</i> =	rPICB tuple.

Table 2 Error Code: RC_CONFIG

Error Code:	RC_CONFIG
Error Description:	The two global parameters Glpts_sps and Glnts_sps are not set properly according to the static relation rLNK_USE. This error will continue to print in the ROP until Glpts_sps and Glnts_sps are correctly set.
Possible Error Effect:	The switch may not detect signaling from the user or network due to error in Glpts_sps and Glnts_sps. This is only applied to SM2000.
Corrective Action Taken:	This requires the manual action to correct Glpts_sps and Glnts_sps.
Manual Action Required:	If rLNK_USE is in operational state, the corresponding bit in Glpts_sps(for PLI and DX) and Glnts_sps(for NLI) should be set to 1 for signaling purpose. Please see rLNK_USE population rule for detail about Glpts_sps and Glnts_sps.
Dump Description:	
<i>Error Address</i> =	1 for PLI or DX, 2 for NLI.
<i>Bad Data</i> =	Value of Glpts_sps.
<i>Good Data</i> =	Value of Glnts_sps.
<i>Logical Index</i> =	Logical key of rLNK_USE.
<i>Dump</i> =	Dump of rLNK_USE tuple.

LNSTAT

Software Release: 5E10 and later

1. LINE STATUS (LNSTAT) AUDIT

To process a call, the routing and terminal allocation (RTA) routing process in the switching module (SM), optical remote switching module (ORM), or a remote switching module (RSM) must determine which ports are available for terminating calls. Information about the types of hunted ports is kept on bit maps. A bit map is included in each tuple in the line status relation (RLLNSTAT), which contains information about small and average multi-line hunt groups (MLHGs) (up to 63 lines per group) of hunted lines. The RLLNSTAT relation resides in the SM, but it may also reside in an RSM or ORM. In any SM type, the RLLNSTAT relation contains tuples for all multiline hunt group ports that exist in that SM/ORM/RSM. In the SM, designated as the hunting SM, the rLNSTAT relation contains tuples for all global and local MLHG ports belonging to that hunting SM. During the stand-alone operation, the tuples for other ports that the RSM/ORM contains, are inserted into rLNSTAT; when the RSM/ORM leaves the stand-alone operation, these tuples are deleted.

The line status audit (LNSTAT) checks tuples in the dynamic relation RLLNSTAT for extra tuples. It also performs a check on the status bits for each group. For information about larger groups of hunted lines, refer to the large line status audit (LGLNSTAT). For information about groups of hunted trunks, refer to the trunk status audit (TKSTAT) and the large trunk status audit (LGTKSTAT).

This audit is part of the RTA audits subgroup. In the SM/ORM/RSM modules, the audit operates in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented mode.

2. DATA STRUCTURES

The data structures checked by the LNSTAT audit are the MLHG information relation (RLRT_MHG), the line status relation (RLLNSTAT), the static MLHG member information relation (RLRT_MEM), and the MLHG member status dynamic relation (RLMEM) or RSM/ORM in the standalone operation. Figure 1 illustrates the four relations. The RLRT_MHG relation is a static (write-protected) relation that contains information about all MLHGs. This information includes a key (grpnum), the hunt type, the hunting SM number, and the type of group (local or global) it is. Both RLRT_MEM and RLMEM relations contain information about each MLHG member port equipage. The RLRT_MEM relation resides on the designated hunting module, SMORM/RSM. The RLMEM relation is created only on the RSM/ORM, with standalone capability. The line status audit steps through the RLLNSTAT relation and verifies it against the information contained in the rLRT_MHG and either the rLRT_MEM or rLMEM.

SM & RSM*

AM

*IN AN RSM ENVIRONMENT, THE rLNSTAT RELATION
RESIDES IN BOTH THE HUNTING SM AND THE RSM.

Figure 1 (LNSTAT-1) Line Status Audit

3. AUDIT CHECKS

The LNSTAT audit uses the static driver (DRSTATIC) to step through the rLNSTAT relation and sequentially retrieve tuples. The DRSTATIC driver invokes a semantic check function that performs the following checks:

- (a) The audit verifies each rLNSTAT tuple against the corresponding rIRT_MHG tuple by using the key (group number) of rLNSTAT to read the rIRT_MHG relation. The audit looks specifically for extra rLNSTAT tuples.
- (b) The audit performs a Boolean check between the following bit arrays: port available flag (PORTAVAIL), stop hunt flag (STOPHUNT), make busy flag (MAKEBUSY), and the group member flag (GMFLG). A boolean check uses the Boolean operators AND, NOT, and OR. The check is as follows:

If the PORTAVAIL flag is 1 and not the MAKEBUSY flag or the STOPHUNT flag is 1, then the GMFLAG should be 1.

- (c) The audit checks the hunt type. Only RTH_REGULAR, RTH_UCD, RTH_CIRCULAR, RTH_PSUCD, RTH_ISAT and RTH_PPSMHG are valid.

- (d) The audit ensures that the module number is correct for the tuple.
- (e) The audit verifies that the busy/idle status are busy for MLHG members that are not equipped with ports.

4. ERROR HANDLING

Excess tuples, tuples not in the appropriate module, and tuples with wrong hunt types are deleted from the relation. Boolean checks that pass, are further checked for the group member flag to be 1. If it is not 1, the group member flag is set to 1. Status bit checks that fail for nonequipped members are corrected by the LNSTAT audit.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ASSOC_TUP

Error Code:	ASSOC_TUP
Error Description:	While auditing an rLNSTAT tuple, a DAGETMEM did not find the associate rLGMEM tuple. Since during stand alone RLMEM relation is audited against static RLGROUP_PORT relation, audit should believe dynamic rLGMEM tuple and delete dynamic rLNSTAT tuple.
Possible Error Effect:	Incorrect use of data resources for MLHGs.
Corrective Action Taken:	The extra rLNSTAT tuple deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLMEM tuple.
<i>Bad Data =</i>	The key of the extra rLNSTAT tuple.
<i>Good Data =</i>	0.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 2 Error Code: E_BIT

Error Code:	E_BIT
Error Description:	The busy/idle status in a tuple of the relation rLNSTAT is inconsistent with the corresponding member equipage tuple bit map. The nonequipped member should be marked busy. If the KEY field of the dump is 1 (SM stand alone) then an rLNSTAT tuple is inconsistent with an rLMEM tuple, or if it is 0 then the rLNSTAT tuple is inconsistent with an rIRT MEM tuple.
Possible Error Effect:	Failure in terminating to an invalidly marked idle members.
Corrective Action Taken:	The audit set the nonequipped members to correct status, busy.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the rLNSTAT tuple having the wrong busy/idle status.
<i>Bad Data =</i>	The array containing the members busy/idle status.
<i>Good Data =</i>	The array containing the members equipage information.
<i>Logical Index =</i>	This is not a key. Verification of busy/idle status is with rLMEM tuple if this dump is 1, or else with rIRT MEM tuple if this dump is 0.
<i>Dump =</i>	NA.

Table 3 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The group number for this tuple is not assigned.
Possible Error Effect:	An assert will fire if this tuple is not found after trying to retrieve it.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.

<i>Bad Data</i> =	Calculated grpnum of this tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Calculated grpnum of this tuple.
<i>Dump</i> =	rLNSTAT tuple.

Table 4 Error Code: MKBUSY

Error Code:	MKBUSY
Error Description:	The group is of the hunt type RTH_PSUCD but the makebusy[] or stophunt[] fields are not zero.
Possible Error Effect:	The group may not be hunted correctly.
Corrective Action Taken:	The fields are set to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLNSTAT tuple.
<i>Bad Data</i> =	The erroneous makebusy[] value.
<i>Good Data</i> =	The erroneous stophunt[] value.
<i>Logical Index</i> =	grpnum of the tuple.
<i>Dump</i> =	NA.

Table 5 Error Code: GMFLG

Error Code:	GMFLG
Error Description:	The boolean check between the status flag bits (portavail, makebusy, and stophunt) has passed, but a gmflg status bit(s) was found to be zero (not set) when it should be set to 1. There are five possible combinations for this error to occur.
Possible Error Effect:	If this group member is picked by RTA for routing, the erroneous status data will propagate further inconsistencies.
Corrective Action Taken:	The gmflg status bit(s) is set to 1.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLNSTAT tuple.
<i>Bad Data</i> =	Erroneous word in the gmflg bit array.
<i>Good Data</i> =	Corrected word in the gmflg bit array.
<i>Logical Index</i> =	Group member of this tuple.
<i>Dump</i> =	NA.

Table 6 Error Code: KEY

Error Code:	KEY
Error Description:	The tuple of the relation rLNSTAT has wrong key.
Possible Error Effect:	Use of this tuple might propagate errors.
Corrective Action Taken:	The correct value of the key will be inserted in the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLNSTAT tuple having the wrong key.
<i>Bad Data</i> =	The value of the wrong key.
<i>Good Data</i> =	The correct value of the key.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 7 Error Code: ODDLOSTUP

Error Code:	ODDLOSTUP
Error Description:	The audit has found an inconsistency between the static relations RLRT_MEM and RLRT_MHG. Current SM is the hunting SM of the MLHG as indicated by the field in rIRT_MHG tuple and therefore the key of this tuple is used to access the MLHG member equipage tuple in RLRT_MEM relation but no matching tuple is found and the audit cannot continue to do checks.
Possible Error Effect:	Audit continue to the next tuple of RLLGLNTAT relation.
Corrective Action Taken:	Audit report an error.
Manual Action Required:	Verify tuples rIRT_MHG and rIRT_MEM in the ODD, using the rIRT_MHG tuple key found in the "KEY" field of the audit report. Corresponding tuple rIRT_MEM

	with the same key should exist on the same SM. Correct any inconsistencies found.
Dump Description:	
<i>Error Address</i> =	The address of the rIRT_MHG tuple.
<i>Bad Data</i> =	The key of rIRT_MEM tuple returned from the database.
<i>Good Data</i> =	The hunt module of MLHG.
<i>Logical Index</i> =	The key of rIRT_MHG tuple used to access rIRT_MEM tuple.
<i>Dump</i> =	The contents of the rIRT_MHG tuple.

Table 8 Error Code: PCRID

Error Code:	PCRID
Error Description:	The tuple should not exist in this processor. In the AM, only tuples from global hunt groups should be present. In an RSM, only tuples from local hunt groups on that RSM should be present except during stand-alone operation when tuples from global hunt groups are allowed.
Possible Error Effect:	More than one processor could route calls to this group.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLNSTAT tuple.
<i>Bad Data</i> =	Module number for local group; 0 if global.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	grpnum of this tuple.
<i>Dump</i> =	rLNSTAT tuple.

Table 9 Error Code: RELQKEY

Error Code:	RELQKEY
Error Description:	The tuple of the relation RLMEN has wrong key.
Possible Error Effect:	Use of this tuple might propagate errors.
Corrective Action Taken:	The correct value of the key will be inserted in the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rIMEM tuple having the wrong key.
<i>Bad Data</i> =	The value of the wrong key.
<i>Good Data</i> =	The correct value of the key.
<i>Logical Index</i> =	This is not a key but the hunt module of the Multiline Hunt Group.
<i>Dump</i> =	NA.

Table 10 Error Code: TYPE

Error Code:	TYPE
Error Description:	The group is of the wrong hunt type to have a tuple in this relation.
Possible Error Effect:	An assert will fire if this group's hunt type is not of the type used in rLNSTAT (that is, RTH_REGULAR, RTH_CIRCULAR, RTH_UCD, RTH_PRREG, or RTH_PPSMHG) and the tuple could not be retrieved.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLNSTAT tuple.
<i>Bad Data</i> =	Hunt type of the group.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	grpnum of this tuple.
<i>Dump</i> =	rLNSTAT tuple.

LOGINID

Software Release: 5E10 and later

1. LOGIN IDENTIFIER (LOGINID) AUDIT

The LOGINID audit runs in both the automatic call distributor management information system (ACD/MIS) and the operator services position system (OSPS). Both the ACD/MIS and OSPS features are similar. Both features are used to present queued calls to agents that are logged into the 5ESS[®] switch. In the OSPS feature, the operator would log into the 5ESS[®] switch through a basic services terminal (BST) and handle requests for operator services. In the ACD/MIS feature, the operator would log into the 5ESS[®] switch through an integrated services digital network (ISDN) position having full business and residential customer services (BRCS) features. In both features, calls are routed to available agent positions for processing. In addition, supervisors are able to monitor all agent activities. Each agent is part of a serving team that is capable of handling certain types of calls.

The RLLOGINID relation contains tuples that define both OSPS and ACD/MIS operators in the 5ESS[®] office. The purpose of the LOGINID audit is to ensure the integrity of the dynamic rLOGINID tuples defined in the RLLOGINID relation. The LOGINID audit runs in the communications module processor (CMP) in the operational kernel process (OKP) environment. The audit runs in segmented mode and is part of the OPAMBACD software package.

2. DATA STRUCTURES

Each tuple of the RLLOGINID relation contains information about the agent's ID, the agent's position number, the position type, and the position's associated port if it is an OSPS position. The RLLOGINID relation is an indexed compaction access relation that is keyed by the internal operator ID field, *intopid*. Each tuple in the RLLOGINID relation has a corresponding static tuple in the RLOLOGINID relation. For agent positions currently logged into the 5ESS[®] switch, there will also be a corresponding dynamic rISTQDB tuple representing the serving team assigned to that agent. The data structures used in the LOGINID audit are shown in Figure 1.

Figure 1 (LOGINID-1) LOGINID Data Structures

3. AUDIT CHECKS

The LOGINID audit uses the DRINDEX audit driver to traverse through each tuple in the RLLOGINID relation. For each tuple, the LOGINID audit will make the following checks: If the LOGINID audit is entered:

- BADTESTPOS** = Check to make sure that an rLOGINID tuple representing an agent position currently logged into the 5ESS® switch has a corresponding rISTQDB tuple.
- LOGBID** = Check to see if the internal operator ID matches the ID contained in the rISTQDB tuple.
- NOTZERO** = Check to make sure that the *gbport* field is zero for an rLOGINID tuple representing an

ACD/MIS agent position currently logged into the 5ESS[®] switch.

- R_PORT** = Check to make sure that the *gbport* field of an rLOGINID tuple representing an OSPS agent position currently logged into the 5ESS[®] switch matches the value defined in the corresponding rISTQDB tuple.
- TYPE** = Check to make sure that the *pos_type* field of an rLOGINID tuple representing an agent position currently logged into the 5ESS[®] switch matches the value defined in the corresponding rISTQDB tuple.
- UNEQUAL** = Check to make sure that the *intopid* field in the rLOGINID tuple matches the value defined in its corresponding static rILOGINID tuple.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found here.

The audit produces the following error code(s).

Table 1 Error Code: BADTESTPOS

Error Code:	BADTESTPOS
Error Description:	The audit was unable to obtain a pointer to the corresponding rISTQDB tuple for an rLOGINID tuple representing an agent position logged into the 5ESS [®] switch.
Possible Error Effect:	Call processing may not function properly for this agent position.
Corrective Action Taken:	The rLOGINID tuple is idled to represent an undefined position.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLOGINID tuple.
<i>Bad Data</i> =	The value of the <i>posnum</i> field obtained from the invalid rISTQDB tuple pointer.
<i>Good Data</i> =	The value of the <i>posnum</i> field obtained from the rLOGINID tuple.
<i>Logical Index</i> =	The logical key of the rLOGINID tuple.
<i>Dump</i> =	The rLOGINID tuple.

Table 2 Error Code: LOGBID

Error Code:	LOGBID
Error Description:	The audit found an rLOGINID tuple in which the internal operator ID, <i>intopid</i> does not match the corresponding rISTQDB operator ID field of <i>opr_id</i> .
Possible Error Effect:	Call processing may not function properly for this agent position.
Corrective Action Taken:	The rLOGINID tuple is idled out since there is no valid rISTQDB.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLOGINID tuple.
<i>Bad Data</i> =	The value of the <i>opr_id</i> field in the rISTQDB tuple.
<i>Good Data</i> =	The value of the <i>posnum</i> field in the rLOGINID tuple.
<i>Logical Index</i> =	The logical key of the rLOGINID tuple.
<i>Dump 1</i> =	The rLOGINID tuple.
<i>Dump 2</i> =	The rISTQDB tuple.

Table 3 Error Code: NOTZERO

Error Code:	NOTZERO
Error Description:	The audit found an rLOGINID tuple that represents an ACD/MIS agent position currently logged into the 5ESS [®] switch whose corresponding <i>gbport</i> field is not zero.
Possible Error Effect:	Call processing may not function properly for this agent position.
Corrective Action Taken:	The <i>gbport</i> field in the rLOGINID tuple is set to zero.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLOGINID tuple.
<i>Bad Data</i> =	The value of the <i>gbport.member</i> field in the rLOGINID tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The logical key of the rLOGINID tuple.
<i>Dump</i> =	The rLOGINID tuple.

Table 4 Error Code: R_PORT

Error Code:	R_PORT
Error Description:	The audit found an rLOGINID tuple that represents an OSPS agent position currently logged into the 5ESS [®] switch whose corresponding <i>gbport</i> field does not match the value defined in its associated rISTQDB tuple.
Possible Error Effect:	Call processing may not function properly for this agent position.
Corrective Action Taken:	The <i>gbport</i> field in the rLOGINID tuple is updated to the value defined in the corresponding rISTQDB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLOGINID tuple.
<i>Bad Data</i> =	The value of the <i>gbport.member</i> field in the rLOGINID tuple.
<i>Good Data</i> =	The value of the <i>gbport.member</i> field in the rISTQDB tuple.
<i>Logical Index</i> =	The logical key of the rLOGINID tuple.
<i>Dump 1</i> =	The rLOGINID tuple.
<i>Dump 2</i> =	The rISTQDB tuple.

Table 5 Error Code: TYPE

Error Code:	TYPE
Error Description:	The audit found an rLOGINID tuple that represents an agent position currently logged into the 5ESS [®] switch whose position type field, <i>pos_type</i> , did not match the value defined in the corresponding rISTQDB tuple.
Possible Error Effect:	Call processing may not function properly for this agent position.
Corrective Action Taken:	The <i>pos_type</i> field in the rLOGINID tuple is updated to the value defined in the associated rISTQDB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLOGINID tuple.
<i>Bad Data</i> =	The value of the <i>pos_type</i> field in the rLOGINID tuple.
<i>Good Data</i> =	The value of the <i>pos_type</i> field in the rISTQDB tuple.
<i>Logical Index</i> =	The logical key of the rLOGINID tuple.
<i>Dump 1</i> =	The rLOGINID tuple.
<i>Dump 2</i> =	The rISTQDB tuple.

Table 6 Error Code: UNEQUAL

Error Code:	UNEQUAL
Error Description:	The audit found an inconsistency in the values of the internal operator field, <i>intopid</i> , between the dynamic rLOGINID tuple and its corresponding static rOLOGINID tuple.
Possible Error Effect:	Call processing may not function properly for this agent position.
Corrective Action Taken:	The offending rLOGINID tuple is deleted. The related OLOGINID audit will be scheduled to run to reinsert a corrected rLOGINID tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLOGINID tuple.
<i>Bad Data</i> =	The value of the <i>intopid</i> field in the rLOGINID tuple.
<i>Good Data</i> =	The value of the <i>intopid</i> field in the rOLOGINID tuple.
<i>Logical Index</i> =	The logical key of the rLOGINID tuple.
<i>Dump</i> =	The rLOGINID tuple.

LOOPDB

Software Release: 5E10 and later

1. LOOP DATA BLOCK (LOOPDB) AUDIT

Design alternatives for operator actions (OA) data included using the stack or creating a new area or areas for them and linking them from the position data block. The loop data block relation (RLLOOPDB) contains all per call information such as position display and lamp status.

This audit is part of the Operator Services Position System (OSPS) audits subgroup. It operates in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented mode only.

2. DATA STRUCTURES

The data structure checked by the LOOPDB audit is the loop data block relation (RLLOOPDB). Figure 1 illustrates the layout of RLLOOPDB and shows the items checked by this audit. The RLLOOPDB is owned by the position data block (RLPOSDB) relation and the database head cells relation (RLDB_HEADC).

rlLOOPDB

Figure 1 (LOOPDB-1) Data Structures

3. AUDIT CHECKS

This audit verifies the linkages to RLPOSDB and RLDB_HEADC by calling the indirect access sequential key driver (DRINASEK). The DRINASEK driver then invokes the semantic check function to perform the following checks:

- (1) The audit verifies that when the busy/idle state is idle, the tuple is linked to the idle list.
- (2) The audit verifies that when the busy/idle state is busy, the tuple is linked to the busy list.
- (3) The audit verifies that the loop number field (loopno) is within the valid range (0-1).

4. ERROR HANDLING

The audit reports errors when any linkage check or semantic check fails. The audit zeroes the linkage areas of the erroneous tuples and links them to the appropriate idle list.

The audit schedules the position data block audit (POSDB) as a related audit.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	The rLOOPDB is not busy when it should be.
Possible Error Effect:	The rLOOPDB will be lost to the system.
Corrective Action Taken:	The corresponding rLOOPDB is returned to the correct idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLOOPDB.
<i>Bad Data</i> =	Actual owner's invalid physical key.
<i>Good Data</i> =	Expected owner's physical key.
<i>Logical Index</i> =	rLOOPDB number.
<i>Dump</i> =	rLOOPDB.

Table 2 Error Code: NOTIDLE

Error Code:	NOTIDLE
Error Description:	The rLOOPDB is not idle when it should be.
Possible Error Effect:	The rLOOPDB will be lost to the system.
Corrective Action Taken:	The corresponding rLOOPDB is returned to the correct idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLOOPDB.
<i>Bad Data</i> =	Actual owner's invalid physical key.
<i>Good Data</i> =	Expected owner's physical key.
<i>Logical Index</i> =	rLOOPDB number.
<i>Dump</i> =	rLOOPDB.

Table 3 Error Code: PSTATUS

Error Code:	PSTATUS
Error Description:	The LOOPNO range has a invalid status.
Possible Error Effect:	If LOOPNO is invalid, operators may get indications for calls that are not really there.
Corrective Action Taken:	The corresponding position terminal process will traverse the call and purge it from the system.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLOOPDB.
<i>Bad Data</i> =	LOOPNO value.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	rLOOPDB.

LPRTACCS

Software Release: 5E10 and later

1. LOCAL PORT TO ACCS DATA BLOCK (LPRTACCS) AUDIT

The local port to the automated calling card service data block audit performs the static to dynamic (lost tuple) checks for the RLACCSDB relation. It runs in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented mode.

2. DATA STRUCTURES

Figure 1 illustrates the basic audit structure. Figure 2 illustrates the layout of the local port to ACCS data block.

Figure 1 (LPRTACCS-1) Audit Structure Chart

LPORT
ACCSDb_KEY

Figure 2 (LPRTACCS-2) Audited Fields in the LPRTACCS Tuple

3. AUDIT CHECKS

The audit driver AUdrstatic steps through the rLPRTACCS tuples, calling the static to dynamic check function for tuples that exist. The static to dynamic function makes an existence check (lost tuple) for the RLACCSDb relation. In addition, it checks that the lport attributes match.

4. ERROR HANDLING

When a rACCSDb tuple doesn't exist, one is created and initialized. When an inconsistency is detected in the lport attributes, the audit reports an error and corrects the inconsistency. Any errors found result in the ACCSDb audit being scheduled as a related audit.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	An rACCSDb does not exist for a port when it should.
Possible Error Effect:	This will cause lost resources.
Corrective Action Taken:	The rACCSDb tuple will be inserted into the data base.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rACCSDb.
<i>Bad Data =</i>	NA.

<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of rIACCSDB.
<i>Dump</i> =	NA.

Table 2 Error Code: R_PORT

Error Code:	R_PORT
Error Description:	The lport attribute in rIACCSDB does not match the lport in rILPRTACCS.
Possible Error Effect:	This will cause lost resources.
Corrective Action Taken:	The lport is initialized to the static relation.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	address of rIACCSDB.
<i>Bad Data</i> =	lport in rIACCSDB.
<i>Good Data</i> =	lport in rILPRTACCS.
<i>Logical Index</i> =	logical key of rILPRTACCS.
<i>Dump</i> =	NA.

LPRTPOS

Software Release: 5E10 and later

1. POSITION TO LOCAL PORT MAPPING (LPRTPOS) AUDIT

The terminal maintenance subsystem must know the status of ports to properly maintain resources. The position to local port mapping relation (RLLPRT_POS), a static relation in the SMs, performs existence checks on the position data block (RLPOSDB) relation, and the toll and assistance position data block (RLTAPOSDB) relation.

This audit is part of the Operator Services Position System (OSPS) audits subgroup. It is part of the OSPS SM directory assistance automatic call handling (OPSMDAAC) loadable package. It operates in the OSDS-M environment in the segmented mode only.

2. DATA STRUCTURES

The data structures checked by the LPRTPOS audit are the position-to-local port mapping relation (RLLPRT_POS), the position data block relation (RLPOSDB), and the toll and assistance position data block relation (RLTAPOSDB). Figure 1 shows the relationships between the three relations. The structure of LPRT_POS has been changed to identify the type of position (POSDB or TAPOSDB).

Figure 1 (LPRTPOS-1) Linkages of rLPRTPOS

3. AUDIT CHECKS

To verify the linkages in RLLPRT_POS, the audit calls the static driver (DRSTATIC). The driver calls the static-to-dynamic existence check function to perform the following checks:

- (a) If the position type is a basic services terminal (BST), the audit verifies that a corresponding tuple exists in the dynamic RLPOSDB relation.
- (b) If the position is a BST, the audit verifies the lbport attribute of the rIPOSDB tuple with the lbport attribute of the rLPRT_POS tuple.
- (c) If the position is a video display terminal (VDT), the audit verifies that a corresponding tuple exists in the dynamic RLTAPOSDB relation.
- (d) If the position is a VDT, the audit verifies the lbport attribute of the rTAPOSDB tuple with the lbport attribute of the rLPRT_POS tuple.

The LPRT_POS audit calls the AUdrstatic() driver to step through each rLPRT_POS tuple. The driver calls

AUslprtpos() to perform the static to dynamic checks.

4. ERROR HANDLING

All errors result in output messages. If a rIPOSDB is lost, a tuple will be created and initialized. An inconsistency found in the lbport attributes of either RLPOSDB or RLTAPOSDB will be connected from RLLPRT_POS.

The audit schedules the position data block audit (POSDB) and the toll and assistance position data block audit (TAPOSDB) as related audits.

The audit generates the following error codes and those produced by the DRSTATIC driver. Refer to the driver description for the DRSTATIC error codes.

Upon detection of errors in either the syntactic or semantic data, AUrectup() is called to recover the bad tuple. The recovery is done by AURposdb(). Whenever an error is found in a POSDB relation, the RLPOSDB contents will be printed and the related audits will be scheduled to run.

When a missing RLPOSDB or a RLTAPOSDB tuple is detected, the audit will insert it.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	An rIPOSDB does not exist for a port when it should.
Possible Error Effect:	This will cause lost resources.
Corrective Action Taken:	The rIPOSDB tuple will be inserted into the data base.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIPOSDB.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key of rIPOSDB.
<i>Dump 1 =</i>	NA.

Table 2 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	An rITAPOSDB does not exist for a port when it should.
Possible Error Effect:	This will cause lost resources.
Corrective Action Taken:	The rITAPOSDB tuple will be inserted into the data base.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rITAPOSDB.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key of rITAPOSDB.
<i>Dump 1 =</i>	NA.

Table 3 Error Code: PORT_TM

Error Code:	PORT_TM
Error Description:	An rITAPOSDB tuple has a different lbport value than the lbport field in rLLPRT_POS.
Possible Error Effect:	This will cause call information to go to the wrong port.
Corrective Action Taken:	The lbport field in the rITAPOSDB tuple will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rITAPOSDB.

<i>Bad Data</i> =	lbport in rIAPOSDB.
<i>Good Data</i> =	lbport in rILPRT_POS.
<i>Logical Index</i> =	lbport in rILPRT_POS.
<i>Dump 1</i> =	NA.

Table 4 Error Code: R_PORT

Error Code:	R_PORT
Error Description:	An rIPOSDB tuple has a different lbport value than the lbport field in rILPRT_POS.
Possible Error Effect:	This will cause call information to go to the wrong port.
Corrective Action Taken:	The lbport field in the rIPOSDB tuple will be corrected.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIPOSDB.
<i>Bad Data</i> =	lbport in rIPOSDB.
<i>Good Data</i> =	lbport in rILPRT_POS.
<i>Logical Index</i> =	lbport in rILPRT_POS.
<i>Dump 1</i> =	NA.

21. LQ - MO

LSCMDB

Software Release: 5E10 and later

1. LARGE SHARED CALL MODEL DATA BLOCK (LSCMDB) AUDIT

The LSCMDB audit insures the internal consistency of the RLLSCMDB relation and performs linkage checks between the RLLSCMDB relation and the RLDB_HEADC and RLCLDB relations.

2. DATA STRUCTURES

The RLLSCMDB relation is a dynamic indexed sequential relation that is used to save per call information for all the shared associated terminals in the key system group. When the rLSCMDB tuple is busy it is linked to an rCLDB tuple. All idle rLSCMDB tuples are linked to an idle list that indicates a specified tuple in the RLDB_HEADC relation.

3. AUDIT CHECKS

The LSCMDB audit is invoked through audit control which calls the LSCMDB audit entry function. The function invokes the indexed sequential driver (DRINASEK) to step through all tuples in the RLLSCMDB relation in a sequential manner.

If all the linkage and semantic checks pass then the driver steps to the next tuple and continues another cycle. If any checks fail, recovery is started.

The following is a list of semantic checks that are performed:

- (a) Since RLLSCMDB is only used by large shared key system groups, the rLSCMDB.lrg_grp field must be set to indicate a large group.
- (b) If the rLSCMDB tuple is on the idle link list, then the linkage to the rCLDB tuple should be null.

The following checks are only made if the rLSCMDB tuple is on the busy list:

- (a) The terminal process one field in the rLSCMDB should be associated with a live process.
- (b) If the bridge bit in the rLSCMDB tuple is set to DBNO then the terminal process two array in the rLSCMDB tuple should be null.
- (c) If the bridge bit in the rLSCMDB tuple is set to DBYES then the terminal process two array in the rLSCMDB tuple should contain at least one live process.

4. ERROR HANDLING

When an error is detected either in the semantic check or in the linkage checking routine, a failure return is returned back to the indexed sequential driver. If the rLSCMDB tuple is linked onto the idle list, the rIADB is unlinked from that list. If the rLSCMDB tuple is mutilated in such a way that it cannot be unlinked from the list the indexed sequential driver will patch the list. Recovery is performed on the rLSCMDB tuple that was found in error or any rLSCMDB tuples that were left hanging as a result of a list being patched.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BDPID

Error Code:	BDPID
Error Description:	For an inactive bridge/conference there is a PID of the TP of a bridged party which is non-null.
Possible Error Effect:	The call will have an incorrect path.
Corrective Action Taken:	The tuple is reinitialized and returned to the idle list, purging the call.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLSCMDB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of rLSCMDB tuple.
<i>Dump</i> =	The contents of the rLSCMDB tuple.

Table 2 Error Code: DEADPID

Error Code:	DEADPID
Error Description:	The OSPID of the TP of the terminal actively on the call is not an active process for this module.
Possible Error Effect:	The rLSCMDB tuple is connected to a dead process and cannot be used for other calls.
Corrective Action Taken:	Process owning the rLSCMDB will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLSCMDB tuple.
<i>Bad Data</i> =	Process number of tp1 for rLSCMDB.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of rLSCMDB tuple.
<i>Dump</i> =	The contents of the rLSCMDB tuple.

Table 3 Error Code: FPID_DEAD

Error Code:	FPID_DEAD
Error Description:	The bridge bit is set to DBYES and the process (tp2) is not null, but tp2 is not an active process.
Possible Error Effect:	Lost resources.
Corrective Action Taken:	The rLSCMDB tuple will be put on an idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLSCMDB tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The logical key to the rLSCMDB tuple.
<i>Dump</i> =	The contents of the rLSCMDB tuple.

Table 4 Error Code: GRPINFO

Error Code:	GRPINFO
Error Description:	All tuples in RLLSCMDB are used for large key system groups; therefore, all tuples in this relation should reflect this in the "lrg_grp" field. This rLSCMDB tuple contains garbage in its lrg_grp field.
Possible Error Effect:	The rLSCMDB tuple may contain other erroneous data.
Corrective Action Taken:	The audit will idle the rLSCMDB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLSCMDB tuple.
<i>Bad Data</i> =	Owner link of rLSCMDB tuple.
<i>Good Data</i> =	0
<i>Logical Index</i> =	Logical key of rLSCMDB tuple.
<i>Dump</i> =	The contents of the rLSCMDB tuple.

Table 5 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	The rLSCMDB tuple is on an invalid list.
Possible Error Effect:	The rLSCMDB tuple is in a limbo condition which is unusable by call

	processing.
Corrective Action Taken:	The audit will idle the rLSCMDB tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLSCMDB tuple.
<i>Bad Data</i> =	Owner link of rLSCMDB tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of rLSCMDB tuple.
<i>Dump</i> =	The contents of the rLSCMDB tuple.

Table 6 Error Code: LIVEPID

Error Code:	LIVEPID
Error Description:	The TP (tp2) is null when the bridge bit is set to DBYES. The TP should not be null.
Possible Error Effect:	Lost resources.
Corrective Action Taken:	The rLSCMDB tuple will be put on an idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLSCMDB tuple.
<i>Bad Data</i> =	The process number for tp2.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	The logical key to the rLSCMDB tuple.
<i>Dump</i> =	The contents of the rLSCMDB tuple.

Table 7 Error Code: PID

Error Code:	PID
Error Description:	When the rLSCMDB is busy, the PID should not be null. However, in this case the PID of tp1 is null.
Possible Error Effect:	Incorrect call path.
Corrective Action Taken:	The rLSCMDB tuple will be placed on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLSCMDB tuple.
<i>Bad Data</i> =	Contents of tp1 field in rLSCMDB tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of rLSCMDB tuple.
<i>Dump</i> =	The contents of the rLSCMDB tuple.

Table 8 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	An idle rLSCMDB tuple has a nonzero linkage in one of its link blocks.
Possible Error Effect:	Resource is linked to a rLSCMDB tuple on the idle list and could be unusable by call processing.
Corrective Action Taken:	The rLSCMDB tuple will be placed on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLSCMDB tuple.
<i>Bad Data</i> =	Nonzero value of linkage.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of the rLSCMDB tuple.
<i>Dump</i> =	The contents of the rLSCMDB tuple.

LSDATA

Software Release: 5E11 and later

1. LINK SET STATUS (LSDATA) AUDIT

LSDATA audit will audit data in the dynamic relation RLLS_STAT against the data in the dynamic relations RLLNK_STAT and RLPORTLA and the static relation RLLS_GRP. The dynamic relation RLPCBLA is used to verify whether a port is owned; and the dynamic relation rLPORTLA is used to find the status of a port. The static relation RLLNKP_LS is used to check the priority of the link. The audit is driven from the RLLS_GRP static relation.

2. DATA STRUCTURES

For details on the fields contained in the RLLS_STAT relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: AA_DATA_BAD

Error Code:	AA_DATA_BAD
Error Description:	Auto_alloc in rLS_STAT not equal to auto_alloc in rLS_GRP.
Possible Error Effect:	Master control center (MCC) pages may display incorrect information.
Corrective Action Taken:	The audit corrects the value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rLS_STAT tuple.
<i>Bad Data =</i>	Auto_alloc in rLS_STAT.
<i>Good Data =</i>	Auto_alloc in rLS_GRP.
<i>Logical Index =</i>	Isnum (key) of rLS_STAT.
<i>Dump =</i>	NA.

Table 2 Error Code: ACC_LSINDEX

Error Code:	ACC_LSINDEX
Error Description:	The rLS_STAT.acclsindx is the message transfer part (MTP) accounting link set index. It does not equal rLS_GRP.Isnum in the tuple whose rLS_GRP.Isnum equals rLS_STAT.Isnum.
Possible Error Effect:	The protocol handler (PH) does not account for this link set. Incorrect billing may result.
Corrective Action Taken:	The audit sets rLS_STAT.acclsindx equal to rLS_GRP.acclsindx.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rLS_STAT tuple.
<i>Bad Data =</i>	rLS_STAT.acclsindx.
<i>Good Data =</i>	rLS_GRP.acclsindx.
<i>Logical Index =</i>	rLS_STAT.Isnum.
<i>Dump =</i>	Contents of rLS_STAT tuple.

Table 3 Error Code: ACT_CNT_BAD

Error Code:	ACT_CNT_BAD
Error Description:	Count of active links in rLS_STAT not equal to count as taken from rPORTLA and rPCBLA.
Possible Error Effect:	If active link is less than verified, another link to replace down link is not activated. If active link is greater than verified, link in link set may be activated unnecessarily.
Corrective Action Taken:	Audit notifies signaling link management (SLM).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rLS_STAT tuple.
<i>Bad Data =</i>	actnum in rLS_STAT.
<i>Good Data =</i>	Count determined from rPORTLA and rPCBLA.
<i>Logical Index =</i>	Key of rLS_STAT.
<i>Dump =</i>	NA.

Table 4 Error Code: APCI_CON_ERR

Error Code:	APCI_CON_ERR
Error Description:	The APCI in dynamic rLS_STAT has been verified against APCI in static rLS_GRP, but when used to read static rAPCI_APC, no match is found.
Possible Error Effect:	The signaling link does not come into service.
Corrective Action Taken:	None.
Manual Action Required:	Investigate the population of these relations.
Dump Description:	
<i>Error Address =</i>	Address of rLS_STAT tuple.
<i>Bad Data =</i>	apci from rLS_STAT.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	lsnum (key) of rLS_STAT.
<i>Dump =</i>	NA.

Table 5 Error Code: AVAIL_BAD_LS_STAT

Error Code:	AVAIL_BAD_LS_STAT
Error Description:	Availability of link set improperly marked in rLS_STAT.
Possible Error Effect:	If available and marked unavailable, link set might not be carrying its normal traffic. If unavailable and marked available, traffic is lost.
Corrective Action Taken:	Audit corrects availability.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rLS_STAT tuple.
<i>Bad Data =</i>	Availability of link set in rLS_STAT.
<i>Good Data =</i>	Correct availability.
<i>Logical Index =</i>	Key of rLS_STAT.
<i>Dump =</i>	NA.

Table 6 Error Code: BAD2_AVAIL

Error Code:	BAD2_AVAIL
Error Description:	The avail flag in the MCC table CClsmmcstat[] is marked wrong, as determined from the data calculated for the link sets for this protocol.
Possible Error Effect:	The MCC pages may display incorrect information.
Corrective Action Taken:	The MCC table CClsmmcstat[] is corrected to reflect the correct avail flag for this link set and protocol.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CClsmmcstat[] table entry.
<i>Bad Data =</i>	Original avail flag value.
<i>Good Data =</i>	avail flag value of link set as determined by the audit.
<i>Logical Index =</i>	Key of rLS_STAT.
<i>Dump =</i>	NA.

Table 7 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	The multistate flag in the MCC table CCIsMccstat[] is marked wrong, as determined from the data calculated for the link sets for this protocol.
Possible Error Effect:	The MCC pages may display incorrect information.
Corrective Action Taken:	The MCC table CCIsMccstat[] is corrected to reflect the correct multistate flag for this link set and protocol.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of CCIsMccstat[] table entry.
<i>Bad Data =</i>	Original multistate flag value.
<i>Good Data =</i>	Multistate flag value of link set as determined by the audit.
<i>Logical Index =</i>	Key of rILS_STAT.
<i>Dump =</i>	NA.

Table 8 Error Code: BAD_APCI

Error Code:	BAD_APCI
Error Description:	Apci in rILS_STAT not equal to apci in rILS_GRP.
Possible Error Effect:	Change over and change back do not occur properly.
Corrective Action Taken:	Audit corrects value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rILS_STAT tuple.
<i>Bad Data =</i>	apci in rILS_STAT.
<i>Good Data =</i>	apci in rIAPC_INFO.
<i>Logical Index =</i>	Key of rILS_STAT.
<i>Dump =</i>	NA.

Table 9 Error Code: BAD_CONGEST

Error Code:	BAD_CONGEST
Error Description:	Congestion of link set improperly marked in rILS_STAT.
Possible Error Effect:	Traffic is not routed over the link set.
Corrective Action Taken:	Audit corrects congestion status.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rILS_STAT tuple.
<i>Bad Data =</i>	Congestion of link set in rILS_STAT.
<i>Good Data =</i>	Correct congestion.
<i>Logical Index =</i>	Key of rILS_STAT.
<i>Dump =</i>	NA.

Table 10 Error Code: BAD_PHYS_CNT

Error Code:	BAD_PHYS_CNT
Error Description:	Count of physical links in rILS_STAT not equal to nlinks in rILS_GRP.
Possible Error Effect:	Incorrect number of active links in link set.
Corrective Action Taken:	Send signaling link management (SLM) a message to activate or deactivate links to increase or decrease, respectively, the number of links in the link set.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rILS_STAT tuple.
<i>Bad Data =</i>	Count of physical links available as read from rILS_STAT.
<i>Good Data =</i>	nlinks in rILS_GRP.
<i>Logical Index =</i>	Key of rILS_STAT.
<i>Dump =</i>	Tuple in error from rILS_STAT.

Table 11 Error Code: CONGESTION

Error Code:	CONGESTION
Error Description:	The congestion level for a link set stored in CCIs_info array does not match the congestion level for the same link set stored in RLLS_STAT.
Possible Error Effect:	Actions in the PH might be inconsistent with local congestion status, that is, transfer controlled messages might be sent when they are not needed, and vice versa.

Corrective Action Taken:	The congestion level in the array is set to the same as the congestion level in the relation for the link set.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rLS_STAT tuple.
<i>Bad Data</i> =	Congestion level stored in CCls_info[rLS_STAT.lsnun].
<i>Good Data</i> =	rLS_STAT.cg.
<i>Logical Index</i> =	rLS_STAT.lsnun.
<i>Dump</i> =	NA.

Table 12 Error Code: INT_DATA_BAD

Error Code:	INT_DATA_BAD
Error Description:	Internal in rLS_STAT is not equal to internal in rLS_GRP.
Possible Error Effect:	The signaling link does not come into service.
Corrective Action Taken:	The audit corrects the value in dynamic rLS_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rLS_STAT tuple.
<i>Bad Data</i> =	Internal in rLS_STAT.
<i>Good Data</i> =	Internal in rLS_GRP.
<i>Logical Index</i> =	lsnum (key) of rLS_STAT.
<i>Dump</i> =	NA.

Table 13 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	The link set state in the MCC table CCls_mccstat[] is marked wrong, as determined from the data calculated for the link sets for this protocol.
Possible Error Effect:	The MCC display may show the incorrect state of the link set.
Corrective Action Taken:	The MCC table CCls_mccstat[] is corrected to the correct state for this link set and protocol.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of CCls_mccstat[] table entry.
<i>Bad Data</i> =	Original link set state value.
<i>Good Data</i> =	State of link set as determined by the audit.
<i>Logical Index</i> =	Key of rLS_STAT.
<i>Dump</i> =	NA.

Table 14 Error Code: LNKS_MISSING

Error Code:	LNKS_MISSING
Error Description:	The CCls_mccstat[] table was missing a valid link set for this common channel signaling (CCS) protocol that exists in static rLS_GRP.
Possible Error Effect:	The MCC table would not be accurate; link set display would be erroneous.
Corrective Action Taken:	The audit inserts the missing link set into the MCC table in the appropriate position for this protocol. The MCC pages are be updated.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of static rLS_GRP.
<i>Bad Data</i> =	-1 failure return form CCfindls.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of rLS_GRP.
<i>Dump</i> =	NA.

Table 15 Error Code: LS_STAT_NO

Error Code:	LS_STAT_NO
Error Description:	Tuple in static data does not exist in dynamic rLS_STAT.
Possible Error Effect:	Status of links in missing link set tuple cannot be changed. Change over and change back do not occur properly. Link cannot be inhibited or uninhibited. Other link status changes do not occur properly.
Corrective Action Taken:	Audit inserts tuple in rLS_STAT.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	Address of rILS_GRP tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Link set number in rILS_GRP.
<i>Logical Index</i> =	Key of rILS_GRP.
<i>Dump</i> =	NA.

Table 16 Error Code: LSNUM_BAD

Error Code:	LSNUM_BAD
Error Description:	The CCacclsidx_Is[] holds accounting link set information for message transfer part (MTP). An CCacclsidx_Is[] entry whose index equals rILS_GRP.acclsidx does not equal the key of the rILS_GRP tuple (rILS_GRP.Isnum).
Possible Error Effect:	Incorrect translation occur while attempting to populate the counts message sent to the administration module (AM). All counts are lost for that index value due to the incorrect translations.
Corrective Action Taken:	The audit sets CCacclsidx_Is[rILS_GRP.acclsidx] equal to rILS_GRP.Isnum.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	CCacclsidx_Is[rILS_GRP.acclsidx].
<i>Good Data</i> =	rILS_GRP.Isnum.
<i>Logical Index</i> =	rILS_STAT.acclsidx.
<i>Dump</i> =	NA.

Table 17 Error Code: NO2_LNKP_LS

Error Code:	NO2_LNKP_LS
Error Description:	Port derived from dltport of rILNK_STAT not found in static relation RLLNKP_LS. This error results from trying to check the priority of a stand-by port.
Possible Error Effect:	Status of port cannot be verified. Link cannot be activated or deactivated.
Corrective Action Taken:	None.
Manual Action Required:	Investigate office-dependent data (ODD) relation RLLNKP_LS.
Dump Description:	
<i>Error Address</i> =	Address of rILNK_STAT tuple.
<i>Bad Data</i> =	Port from rIORTLA.
<i>Good Data</i> =	dltport in rILNK_STAT.
<i>Logical Index</i> =	Key of rILNK_STAT.
<i>Dump</i> =	NA.

Table 18 Error Code: NON_NULL

Error Code:	NON_NULL
Error Description:	An entry in CCacclsidx_Is[] is not in use because its index does not equal rIDX_DPCS.acclsidx from any rILS_GRP tuple. The entry should be set to its null value (0) but is not.
Possible Error Effect:	Incorrect translation occur while attempting to populate the counts message sent to the AM. All counts are lost for that index value due to the incorrect translations.
Corrective Action Taken:	The audit sets the CCacclsidx_Is[] entry to zero.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	CCacclsidx_Is[index].
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Index.
<i>Dump</i> =	NA.

Table 19 Error Code: NOT_ENOUGH_ACT_LINKS

Error Code:	NOT_ENOUGH_ACT_LINKS
Error Description:	The number of active links less than the number which should be active.
Possible Error Effect:	Not enough links active per requirements.
Corrective Action Taken:	Audit notifies signaling link management (SLM) to activate a link.
Manual Action Required:	None.

Dump Description:	
<i>Error Address</i> =	Address of rILS_GRP tuple.
<i>Bad Data</i> =	alnks in rILS_GRP.
<i>Good Data</i> =	Active link count determined from rIPCBLA, rIORTLA, and rILNKP_LS.
<i>Logical Index</i> =	Key of rILS_GRP.
<i>Dump</i> =	NA.

Table 20 Error Code: NO_LNK_STAT

Error Code:	NO_LNK_STAT
Error Description:	Link index in rILS_STAT lnkiset array not found in rILNK_STAT.
Possible Error Effect:	Status of link cannot be changed.
Corrective Action Taken:	Related audit inserts tuple into RLLNK_STAT.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rILS_STAT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	Link index in lnkiset in rILS_STAT.
<i>Logical Index</i> =	Key of rILS_STAT.
<i>Dump</i> =	Tuple in error from rILS_STAT.

Table 21 Error Code: NO_PORTLA

Error Code:	NO_PORTLA
Error Description:	Port derived from dltport of rILNK_STAT not found in dynamic relation RLPORTLA.
Possible Error Effect:	Status of port cannot be verified. Link cannot be activated.
Corrective Action Taken:	Related audit corrects rIORTLA.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rILNK_STAT tuple.
<i>Bad Data</i> =	dltport in rILNK_STAT.
<i>Good Data</i> =	Port derived from dltport.
<i>Logical Index</i> =	Key of rILNK_STAT.
<i>Dump</i> =	NA.

Table 22 Error Code: SDATA_CON_ERR

Error Code:	SDATA_CON_ERR
Error Description:	The network and the adjacent point code (APC) have been verified against the global parameter and rIAPCI_APC, respectively, but when used to read static rIGSM_OPC, no match was found.
Possible Error Effect:	The signaling link does not come into service.
Corrective Action Taken:	None.
Manual Action Required:	Investigate the population of these relations and the global parameter for this switching module (SM).
Dump Description:	
<i>Error Address</i> =	Address of rILS_STAT tuple.
<i>Bad Data</i> =	Network for the APC.
<i>Good Data</i> =	APC used in read.
<i>Logical Index</i> =	lsum (key) of rILS_STAT.
<i>Dump</i> =	NA.

Table 23 Error Code: SELECT_BIT_BAD

Error Code:	SELECT_BIT_BAD
Error Description:	The link selection bit in the dynamic rILS_STAT does not match the link selection bit in the static rILS_GRP for a link set number.
Possible Error Effect:	The sls distribution in the link set is incorrect. The sls distribution in the combined link sets having this link set as a member also is incorrect.
Corrective Action Taken:	The audit corrects the dynamic data to match the static data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rILS_STAT tuple.
<i>Bad Data</i> =	lnk_sel from rILS_STAT tuple.
<i>Good Data</i> =	lnk_sel from rILS_GRP tuple.

<i>Logical Index</i> =	Isnum (key) from RLIs_stat tuple.
<i>Dump</i> =	NA.

Table 24 Error Code: SMLCG_INC

Error Code:	SMLCG_INC
Error Description:	The global counter for the number of ITU-T signaling system number 7 link sets in congestion (NMsmc7lcg) is a negative value.
Possible Error Effect:	The NMCCS_CONG discrete may be set incorrectly.
Corrective Action Taken:	The LSLINK audit corrects this problem.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	NMsmc7lcg.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 25 Error Code: TOO_MANY_ACT_LINKS

Error Code:	TOO_MANY_ACT_LINKS
Error Description:	The number of active links exceeds the number which should be active.
Possible Error Effect:	Too many links active per requirements.
Corrective Action Taken:	Audit notifies SLM to deactivate a link.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rILS_GRP tuple.
<i>Bad Data</i> =	alnks in rILS_GRP.
<i>Good Data</i> =	Active link count determined from rIPCBLA, rIORTLA, and rILNKP_LS.
<i>Logical Index</i> =	Key of rILS_GRP.
<i>Dump</i> =	NA.

Table 26 Error Code: TO_GSM_DATA_BAD

Error Code:	TO_GSM_DATA_BAD
Error Description:	to_gsm in rILS_STAT is not equal to gsm in rIGSM_OPC.
Possible Error Effect:	Signaling link does not come into service.
Corrective Action Taken:	Audit corrects the value in dynamic RLIs_stat.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rILS_STAT tuple.
<i>Bad Data</i> =	to_gsm rILS_STAT.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Isnum (key) of rILS_STAT.
<i>Dump</i> =	NA.

Table 27 Error Code: TYPE1

Error Code:	TYPE1
Error Description:	The audit cannot find a network type for this SM.
Possible Error Effect:	The signaling link does not come into service.
Corrective Action Taken:	None.
Manual Action Required:	Investigate the population of global parameters for networks.
Dump Description:	
<i>Error Address</i> =	Address of rILS_STAT tuple.
<i>Bad Data</i> =	SM number for which there is no network type.
<i>Good Data</i> =	Adjacent point code (APC).
<i>Logical Index</i> =	Isnum (key) of rILS_STAT.
<i>Dump</i> =	NA.

LSLINK

Software Release: 5E11 and later

1. LINK SET LINKAGE DATA (LSLINK) AUDIT

LSLINK audit step through the dynamic relation RLLS_STAT (link set status). For each tuple in the RLLS_STAT relation, the audit checks the linkage with the RLDPC_STAT (destination point code status) relation. It also checks the semantic data in the RLLS_STAT relation against RLDPC_STAT and RLLS_GRP (link set group data) relations.

2. DATA STRUCTURES

For details on the fields contained in the RLLS_STAT relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BAD_HEAD_TAIL

Error Code:	BAD_HEAD_TAIL
Error Description:	The link set is marked unavailable in rLS_STAT, but owns dpcis.
Possible Error Effect:	Traffic toward destinations is be lost.
Corrective Action Taken:	Audit sends signaling traffic and route management (STRM) a message to do route correction.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rLS_STAT tuple.
<i>Bad Data =</i>	Incorrect head dpci of rLS_STAT tuple.
<i>Good Data =</i>	Incorrect tail dpci of rLS_STAT tuple.
<i>Logical Index =</i>	Key of rLS_STAT tuple.
<i>Dump =</i>	NA.

Table 2 Error Code: SMLCG_INC

Error Code:	SMLCG_INC
Error Description:	The NMsmc7lcg counter does not contain the correct number of congested link sets.
Possible Error Effect:	The NMCCS_CONG discrete could be set incorrectly.
Corrective Action Taken:	The audit sets NMsmc7lcg to the correct value.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Value of NMsmc7lcg.
<i>Good Data =</i>	Correct number of congested link sets.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

Table 3 Error Code: TUP_NOT_ZERO

Error Code:	TUP_NOT_ZERO

Error Description:	All fields except the key field in an unused tuple are not 0.
Possible Error Effect:	Incorrect data may be accessed.
Corrective Action Taken:	All fields except the key field are set to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rILS_STAT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of rILS_STAT tuple.
<i>Dump</i> =	Dummy tuple of rILS_STAT.

Table 4 Error Code: ZERO_TUP_BAD

Error Code:	ZERO_TUP_BAD
Error Description:	All fields in the tuple with the key of 0, except the key field and the ls_dpc field, are not 0.
Possible Error Effect:	Incorrect data may be accessed.
Corrective Action Taken:	All fields except the key field and ls_dpc field are set to 0.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rILS_STAT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of rILS_STAT tuple.
<i>Dump</i> =	Zero tuple of rILS_STAT.

LSTAB

Software Release: 5E11 and later

1. LINK SET ROUTING DATA TABLE (LSTAB) AUDIT

LSTAB audit checks switching module processor (SMP) copy of the protocol handler (PH) dynamic data array CCsmstph_ht[][CCNO_LINKS] against data in the dynamic relations RLLNK_STAT and RLLS_STAT. The audit is driven from RLLS_STAT.

2. DATA STRUCTURES

For details on the fields contained in the RLLNK_STAT and RLLS_STAT relations, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: CON_AVAIL_BAD

Error Code:	CON_AVAIL_BAD
Error Description:	The avail in rLNK_STAT for the linkindex does not match avail for the lsnm for the same linkindex in rLS_STAT.
Possible Error Effect:	Unknown.
Corrective Action Taken:	The related audits LNKDATA, LNKSLs, and LSData run.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rLNK_STAT tuple.
<i>Bad Data</i> =	Avail in rLNK_STAT.
<i>Good Data</i> =	Avail in rLS_STAT.
<i>Logical Index</i> =	Key of rLNK_STAT tuple.
<i>Dump</i> =	rLS_STAT tuple.

Table 2 Error Code: NO_LNK_STAT

Error Code:	NO_LNK_STAT
Error Description:	The link index from the llnkset array in rLS_STAT does not exist in the dynamic relation rLNK_STAT.
Possible Error Effect:	Unknown.
Corrective Action Taken:	The related audits LNKDATA, LNKSLs, and LSData run.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	rLS_STAT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	linkindex from llnkset array in rLS_STAT.
<i>Logical Index</i> =	Key of rLS_STAT tuple.
<i>Dump</i> =	rLS_STAT tuple.

Table 3 Error Code: SEG_ERROR

Error Code:	SEG_ERROR

Error Description:	There were errors in a segment of the SMP copy of PH dynamic data array.
Possible Error Effect:	Unknown.
Corrective Action Taken:	The audit requests that the corrected segment be transmitted to all PHs.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	SMP copy of PH dynamic data array.
<i>Bad Data</i> =	Number of bad tuples in this segment of the SMP copy.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 4 Error Code: SLC_AVAIL_BAD

Error Code:	SLC_AVAIL_BAD
Error Description:	The avail for the slc of the lnum in the SMP copy of the PH dynamic data array does not equal avail from rLNK_STAT for the same lnum.
Possible Error Effect:	Unknown.
Corrective Action Taken:	The audit calls to correct SMP copy.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	SMP copy of the PH dynamic data array.
<i>Bad Data</i> =	Avail in SMP copy.
<i>Good Data</i> =	lnum from rLS_STAT (first index into array).
<i>Logical Index</i> =	slc from rLNK_STAT (second index into array).
<i>Dump</i> =	rLNK_STAT tuple.

Table 5 Error Code: SLC_CHNUM_BAD

Error Code:	SLC_CHNUM_BAD
Error Description:	The chnum for the slc of the lnum in the SMP copy of the PH dynamic data array does not equal chnum from rLNK_STAT for the same lnum.
Possible Error Effect:	It is impossible to identify the correct PH channel corresponding to this link.
Corrective Action Taken:	The audit calls to correct the SMP copy.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	SMP copy of the PH dynamic data array.
<i>Bad Data</i> =	chnum in SMP copy.
<i>Good Data</i> =	lnum from rLS_STAT (first index into array).
<i>Logical Index</i> =	slc from rLNK_STAT (second index into array).
<i>Dump</i> =	rLNK_STAT tuple.

Table 6 Error Code: SLC_STPH_BAD

Error Code:	SLC_STPH_BAD
Error Description:	The stph for the slc of the lnum in the SMP copy of the PH dynamic data array does not equal stph from rLNK_STAT for the same lnum.
Possible Error Effect:	Unknown.
Corrective Action Taken:	The audit calls to correct SMP copy.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	SMP copy of the PH dynamic data array.
<i>Bad Data</i> =	stph in SMP copy.
<i>Good Data</i> =	lnum from rLS_STAT (first index into array).
<i>Logical Index</i> =	slc from rLNK_STAT (second index into array).
<i>Dump</i> =	rLNK_STAT tuple.

Table 7 Error Code: SLS_CHNUM_BAD

Error Code:	SLS_CHNUM_BAD
Error Description:	The chnum for the sls of the lnum in the SMP copy of the PH dynamic data array does not equal chnum from rLNK_STAT for the same lnum.
Possible Error Effect:	It is impossible to identify the correct PH channel corresponding to this link.
Corrective Action Taken:	The audit calls to correct the SMP copy.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	SMP copy of the PH dynamic data array.

<i>Bad Data</i> =	chnum in SMP copy.
<i>Good Data</i> =	lsum from rLS_STAT (first_index into array).
<i>Logical Index</i> =	Position of sls bit set to 1 (second_index into array).
<i>Dump</i> =	rLNK_STAT tuple.

Table 8 Error Code: SLS_STPH_BAD

Error Code:	SLS_STPH_BAD
Error Description:	The stph for the sls of the lsum in the SMP copy of the PH dynamic data array does not equal stph from rLNK_STAT for the same lsum.
Possible Error Effect:	Unknown.
Corrective Action Taken:	The audit calls to correct SMP copy.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	SMP copy of the PH dynamic data array.
<i>Bad Data</i> =	stph in SMP copy.
<i>Good Data</i> =	lsum from rLS_STAT (first_index into array).
<i>Logical Index</i> =	Position of sls bit set to 1 (second_index into array).
<i>Dump</i> =	rLNK_STAT tuple.

Table 9 Error Code: TRANS_FAILED

Error Code:	TRANS_FAILED
Error Description:	The corrected segment of the SMP copy of the PH dynamic data array was not successfully transmitted to all PHs.
Possible Error Effect:	Unknown.
Corrective Action Taken:	When audits LSTAB, DPCTAB and TABDPC complete, audit LSTAB asks for a checksum to be done by the PHs. If the checksums do not match, the PHs ask for a refresh of their dynamic data array.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	SMP copy of PH dynamic data array.
<i>Bad Data</i> =	Return value of transmission.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

LTMSTAT

Software Release: 5E10 and later

1. LOGICAL TERMINATION STATUS (LTMSTAT) AUDIT

The flexible call offering feature allows each direct number to have up to 16 call appearances. The busy/idle status of call appearances for custom and standard electronic key telephone sets (EKTS) are maintained by LTMSTAT tuple. The busy/idle bits are constantly updated by call processing. The main purpose of this audit is to clear out the sticking busy status bits so that call appearance can be reused.

2. DATA STRUCTURES

The data structure checked by the LTMSTAT audit is the logical termination status relation (RLLTMSTAT). Each LTMSTAT tuple contains the key (logical termination index) and 16 subaddress bits to indicate the busy/idle status of 16 call appearances of particular direct number.

3. AUDIT CHECKS

The LTMSTAT audit is part of ISDNBRCS package. It operates in the operating system for distributed switching-switching module (OSDS-SM) environment in the initialization and segmented modes. The LTMSTAT audit calls DRINASEK driver to step through the tuple and validate the key of the tuple. The following semantic checks are performed by this audit:

- (1) Perform dynamic-to-static existence check between LTMSTAT and IS_LINE relation. Every LTMSTAT tuple should have the corresponding IS_LINE tuple populated.
- (2) Verify the 16 busy/idle status bits contained at LTMSTAT are consistent with those indicated by subaddress bits of BRCSDB (BRCS data block used by ISDN BRCS call processing).
- (3) If the LTMSTAT tuple represents the Direct Number (DN) associated with analog shared DN key system group, the PORTLA and ADB (analog data blocks) are used for determining the status of LTMSTAT.

4. ERROR HANDLING

If any inconsistency is encountered by the LTMSTAT audit, the busy/idle status bits will be updated to reflect the current status of call appearance.

Key	16 subaddress bits
	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Logical Termination Index:

- 0 = idle
- 1 = busy

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: BADFLAG

Error Code:	BADFLAG
Error Description:	LTMSTAT audit expects the TEDB should have ISDN BRCS feature, but brcs_flag in the TEDB is not set.
Possible Error Effect:	This may cause application codes to reference wrong set of data or features.
Corrective Action Taken:	TEDB audit is requested as related audit to verify brcs_flag.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	DBNO (brcs_flag is not set in the TEDB).
<i>Good Data =</i>	DBYES (brcs_flag should be set in the TEDB).
<i>Logical Index =</i>	LTMSTAT key (ltm_index).
<i>Dump =</i>	rLTMSTAT tuple.

Table 2 Error Code: BRCSLINK

Error Code:	BRCSLINK
Error Description:	The rIBRCSDB tuple linked to rIDALB tuple has key error.
Possible Error Effect:	The user may not be able to use the BRCS data subscribed.
Corrective Action Taken:	As a recovery action, related audits will run and recover the data back to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Key of rLTMSTAT tuple.
<i>Good Data =</i>	Key of rIBRCSDB tuple.
<i>Logical Index =</i>	Address of rLTMSTAT tuple.
<i>Dump =</i>	Logical key in rLTMSTAT state. rLTMSTAT tuple.

Table 3 Error Code: BU_STAT

Error Code:	BU_STAT
Error Description:	Inconsistency was found between the busy/idle call appearance status in the LTMSTAT tuple and in the BRCSDB tuples related to it.
Possible Error Effect:	Calls may not be able to be established on certain call appearances, and may appear to exist when they do not. Calls that are established may be lost.
Corrective Action Taken:	LTMSTAT bu_stat attribute is overwritten with correct call appearance status.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The customer state (DMCSTATE) of the associated process is dumped instead of a tuple address. The customer state corresponds to the custat field in a related rIPCBLA tuple.
<i>Bad Data =</i>	LTMSTAT bu_stat attribute value.
<i>Good Data =</i>	Correct value for bu_stat attribute.
<i>Logical Index =</i>	LTMSTAT key.
<i>Dump 1 =</i>	rLTMSTAT tuple.
<i>Dump 2 =</i>	rIDALB tuple.
<i>Dump 3 =</i>	rIBRCSDB tuple.
<i>Dump 4 =</i>	rTEDB tuple.
<i>Dump 5 =</i>	rIDPB tuple.

Table 4 Error Code: DALBLINK

Error Code:	DALBLINK
Error Description:	A TEDB was found without a DALB linked to it, but the LTMSTAT has call appearances marked as being busy.
Possible Error Effect:	Calls may be invalid set up, or may not be set up correctly, or may be torn down. Communication to the customer premise equipment associated with this TEDB is questionable.
Corrective Action Taken:	Idle out all call appearance bits in the bu_stat attribute of the LTMSTAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	LTMSTAT bu_stat attribute.

<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LTMSTAT key.
<i>Dump 1</i> =	rLTMSTAT tuple.
<i>Dump 2</i> =	rDPB tuple.
<i>Dump 3</i> =	rTEDB tuple.

Table 5 Error Code: DPB_LINK

Error Code:	DPB_LINK
Error Description:	The key of DPB (D-channel port) is not the same as that indicated at RLLPT_PT relation.
Possible Error Effect:	CPE may not be able to communicate with switch through D-channel.
Corrective Action Taken:	This may be DPB is not initialized or key error in DPB. If error continues, then it may be an ODD error in FCPORT_TYPE which does not indicate analog shared DN feature.
Manual Action Required:	If it is an ODD problem, the manual action is required to set up analog shared DN bit in FCPORT_TYPE.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Port in DPB.
<i>Good Data</i> =	Port name in LPT_PT.
<i>Logical Index</i> =	LTMSTAT key (ltm_index).
<i>Dump 1</i> =	rLTMSTAT tuple.
<i>Dump 2</i> =	rDPB tuple.

Table 6 Error Code: KEY

Error Code:	KEY
Error Description:	The key value of PCBLA (pcbla_ptr→procnum) is not equal to the llnk field of dalb_lnk for the DALB (dalb_ptr→dalb_lnk.llnk-DBSFPCBLA) associated with the rLTMSTAT tuple being audited.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	Related audits are scheduled from the recovery function to correct the problem.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the dalb_ptr.
<i>Bad Data</i> =	The procnum field of rPCBLA tuple (pcbla_ptr→procnum).
<i>Good Data</i> =	The correct key value of rdalb tuple. (dalb_ptr→dalb_lnk.llnk-DBSFPCBLA).
<i>Logical Index</i> =	NA.
<i>Dump 1</i> =	rDALB tuple.
<i>Dump 2</i> =	rPCBLA tuple.
<i>Dump 3</i> =	rLTMSTAT tuple.

Table 7 Error Code: LTMPORT

Error Code:	LTMPORT
Error Description:	No IS_LINE tuple exists for this LTMSTAT tuple, but the tuple is NOT idle.
Possible Error Effect:	Calls may be invalid set up, or may not be set up correctly, or may be torn down. Communication to the customer premise equipment associated with this LTMSTAT is questionable.
Corrective Action Taken:	Idle out all call appearance bits in the bu_stat attribute of the LTMSTAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	LTMSTAT bu_stat attribute.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LTMSTAT key.
<i>Dump</i> =	rLTMSTAT tuple.

Table 8 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	A rIDSLEQUIP or rIS_TERM tuple is missing in the ODD.
Possible Error Effect:	Not able to determine if this is a Custom or Standard CPE.
Corrective Action Taken:	None.

Manual Action Required:	Need to insert the missing rIDSLEQUIP or rLIS_TERM tuple. - Insert a rIDSLEQUIP tuple using the port field from RLLPT_PT as the key. - Insert a rLIS_TERM tuple using the lead_lport and lead_termno fields from RLIS_LINE as the key.
Dump Description:	
<i>Error Address</i> =	Address of the rLTMSTAT tuple.
<i>Bad Data</i> =	Relation Identifier of either RIDSLEQUIP or RLIS_TERM.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of the rLTMSTAT tuple.
<i>Dump 1</i> =	Contents of the rLTMSTAT tuple.
<i>Dump 2</i> =	Contents of the rLIS_LINE tuple if Bad Data is referring to RLIS_TERM.

Table 9 Error Code: OWNLINK

Error Code:	OWNLINK
Error Description:	A DPB did not have a TEDB linked to it, when it should have.
Possible Error Effect:	Switch cannot communicate with customer premise equipment.
Corrective Action Taken:	Schedule DPB audit to link a TEDB to the DBP.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	DPB owner linkage.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LTMSTAT key.
<i>Dump 1</i> =	rLTMSTAT tuple.
<i>Dump 2</i> =	rDPB tuple.

Table 10 Error Code: PORT

Error Code:	PORT
Error Description:	An inconsistency was found for the port name in the LTMSTAT tuple. An attempt to convert the port name from logical port to physical port was unsuccessful.
Possible Error Effect:	Attempts to make calls on call appearances related to this tuple may not be successful. Existing calls may be torn down.
Corrective Action Taken:	LTMSTAT call appearance bits are idled.
Manual Action Required:	The logical port name was gotten from the static RLIS_LINE relation. The read of LPT_PT to retrieve the physical port name failed. The LPT_PT relation should be investigated and corrected.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	The lead_lport value in the RLIS_LINE relation is derived from LTMSTAT tuple index.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LTMSTAT key.
<i>Dump</i> =	rLTMSTAT tuple.

Table 11 Error Code: STATE_IDLE

Error Code:	STATE_IDLE
Error Description:	The LTMSTAT for analog shared key system group should be idle but it is being marked as busy.
Possible Error Effect:	This error will block user from originating or terminating to this line.
Corrective Action Taken:	Idle out all call appearance bits in the bu_stat attribute of the LTMSTAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	0x8000.
<i>Good Data</i> =	Zero.
<i>Logical Index</i> =	LTMSTAT key.

<i>Dump 1 =</i>	rLTMSTAT.
<i>Dump 2 =</i>	rPORTLA for lead port.

Table 12 Error Code: STATE_SET

Error Code:	STATE_SET
Error Description:	The LTMSTAT for analog shared key system group should be busy but it is not being marked as busy.
Possible Error Effect:	User may have another call which is not consistent with the current shared key system group.
Corrective Action Taken:	Busy out all call appearance bits in the bu_stat attribute of the LTMSTAT tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Zero.
<i>Good Data =</i>	0x8000 (busy subaddress).
<i>Logical Index =</i>	LTMSTAT key.
<i>Dump 1 =</i>	rLTMSTAT.
<i>Dump 2 =</i>	rPORTLA for lead port.

Table 13 Error Code: TEDBLINK

Error Code:	TEDBLINK
Error Description:	LTMSTAT audit expects the TEDB should have right key, but key in the TEDB is error or TEDB is not initialized.
Possible Error Effect:	This may cause application codes to reference wrong set of data or features in TEDB.
Corrective Action Taken:	TEDB audit is requested as related audit to verify TEDB key.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Key of TEDB.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	LTMSTAT key (ltm_index).
<i>Dump =</i>	The rLTMSTAT and rTEDB tuples.

Table 14 Error Code: TWOLINKS

Error Code:	TWOLINKS
Error Description:	The DALB tuple is not properly linked to TEDB.
Possible Error Effect:	The calls will be torn down. If application is accessing DALB, assert will fire.
Corrective Action Taken:	Not applicable for this audit but TEDB and DALB audit will recover the error tuples back to idle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	Zero.
<i>Good Data =</i>	Not applicable.
<i>Logical Index =</i>	LTMSTAT key.
<i>Dump =</i>	rLTMSTAT tuple.

Table 15 Error Code: TYPE

Error Code:	TYPE
Error Description:	A port name could not be found when reading FC_PORTYP.
Possible Error Effect:	Calls may be invalid set up, or may not be set up correctly, or may be torn down. Communication to the customer premise equipment associated with this LTMSTAT is questionable.
Corrective Action Taken:	Idle out all call appearance bits in the bu_stat attribute of the LTMSTAT tuple.
Manual Action Required:	The port name lpt_buf was gotten from LPT_PT. When this information was used to read FC_PORTTYP, no match was found. FC_PORTTYP should be investigated and corrected.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	FC_PORTTYP.port.member.

<i>Good Data</i> =	NA.
<i>Logical Index</i> =	LTMSTAT key.
<i>Dump</i> =	rlTLMSTAT tuple.

LTSBPORT

Software Release: 5E10 and later

1. LINE TIME SLOT BRIDGING PORT (LTSBPORT) AUDIT

The LTSBPORT audit verifies the static rLTSBPORT tuple to dynamic rLTSBSTAT tuple existence. It runs segmented in the operating system for distributed switching-switching module (OSDS-SM) environment, and during a selective init.

2. DATA STRUCTURES

The RLLTSLBPORT relation and RLLTSBSTAT relation both are indirect access non-sequential key static relations. The dynamic rLTSBSTAT tuple maintains the current busy/idle status of the two ports that are assigned as a bridged group. The static RLLTSLBPORT relation contains the port information of the group.

3. AUDIT CHECKS

The following checks are performed in the static-to-dynamic function:

- (a) For every rLTSBPORT tuple with a specific attribute indicating that this is a lead port, an associate dynamic rLTSBSTAT tuple should exist.
- (b) If there is not an associate rLTSBSTAT tuple, the audit checks to see if a recent change is in progress.
- (c) If no recent change activity is active, the audit attempts to insert the associate tuple. If it is successful, the audit is completed. Otherwise an assert is reported.

4. ERROR HANDLING

The LTSBPORT audit schedules LTSBSTAT as a related audit if an error occurs.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	There is a tuple missing in the dynamic RLLTSBSTAT relation; the corresponding static tuple is in the RLLTSLBPORT relation.
Possible Error Effect:	Application codes will ASSERT and calls originated for this LTSB group will be rejected.
Corrective Action Taken:	The tuple is created and initialized.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rLTSBPORT tuple.
<i>Bad Data =</i>	0--Missing rLTSBSTAT.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key of lost tuple.
<i>Dump =</i>	rLTSBPORT tuple.

LTSBSTAT

Software Release: 5E10 and later

1. LINE TIME SLOT BRIDGING STATUS (LTSBSTAT) AUDIT

The LTSBSTAT audit verifies the dynamic rLTSBSTAT tuple to static rLTSBPORT tuple existence, and maintains consistency of the bridged LTSB ports by applying the keep alive mechanism. The audit runs segmented in the operating system for distributed switching-switching module (OSDS-SM) environment.

2. DATA STRUCTURES

The RLLTSBSTAT relation contains the busy/idle status of the two ports that are assigned as a bridged group. For each rLTSBSTAT tuple there must be a corresponding rLTSBPORT tuple with a specific attribute indicating that it is the lead port of the group. The RLLTSBPORT relation and RLLTSBSTAT relation both are indirect access, non-sequential key relations.

3. AUDIT CHECKS

The LTSBSTAT entry function checks to see if recent change is in progress and if so, the audit completes by returning to audit control. The following checks are performed in the dynamic-to-static function:

- (a) The rLTSBSTAT key verification is checked against the key gotten from a dynamic access (DA) subsystem macro.
- (b) For every rLTSBSTAT tuple, there must be a corresponding rLTSBPORT tuple with a specific attribute indicating a lead port.
- (c) If there is a corresponding rLTSBPORT tuple, a specific attribute should indicate the port as lead.
- (d) If any of the checks fail, the audit attempts to delete the extra rLTSBSTAT tuple. If it is successful, the audit is completed. Otherwise an assert is reported.

The keep alive audit function performs the following for the lead port and the non-lead port of the bridged group:

- (a) Check to see if the call status indicates idle and if so, returns without any further checks.
- (b) If the call status indicates busy and the keep alive (KA) bit is set to DBNO, the KA bit sets to DBYES.
- (c) If the call status indicates busy and the KA bit is set to DBYES, set the status bit to idle and the KA bit to DBNO.

4. ERROR HANDLING

The LTSBSTAT audit schedules LTSBPORT as a related audit if an error occurs.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The rLTSBSTAT tuple should not be populated at this SM, because the

	corresponding static rLTSPORT tuple does not exist.
Possible Error Effect:	LTSP calls originated may be erroneously accepted or rejected.
Corrective Action Taken:	The rLTSPSTAT tuple will be deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad rLTSPSTAT tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Logical key of rLTSPSTAT tuple.
<i>Dump</i> =	rLTSPSTAT tuple.

Table 2 Error Code: KEY

Error Code:	KEY
Error Description:	An Invalid key value is found in the rLTSPSTAT tuple.
Possible Error Effect:	Incorrectly used resources.
Corrective Action Taken:	A key error will be reported and corrected by the LTSPSTAT audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of bad rLTSPSTAT tuple.
<i>Bad Data</i> =	The error key.
<i>Good Data</i> =	Correct key value.
<i>Logical Index</i> =	Logical key of rLTSPSTAT tuple.
<i>Dump</i> =	rLTSPSTAT tuple.

MALLOC

Software Release: 5E10 and later

1. MEMORY ALLOCATION BLOCK (MALLOC) AUDIT

For a TR303 remote terminal (RT) on integrated digital carrier unit (IDCU) the rIMALLOC tuple is used as an extra storage area for messages that have not been decoded. The rIMALLOC tuple is linked to the rIRTLB tuple when used and the rIDB_HEADC tuple when not needed.

The MALLOC audit maintains the integrity of these linkages.

2. DATA STRUCTURES

The rIMALLOC tuple is linked to the idle list (rIDB_HEADC) or the application process that is decoding the message (rIRTLB). The link_owner field is used to determine the correct linkage.

The dynamic data structures for EOC/TMC message processing on TR303 RT are shown in Figure 1 .

Figure 1 (MALLOC-1) Dynamic Data Structures for EOC/TMC Message Processing on TR30 RT

3. AUDIT CHECKS

The MALLOC audit invokes the DRINASEK driver to make the linkages and semantic checks for each rIMALLOC tuple. The MALLOC audit uses the following error codes. This listing gives a basic indication of the order of the checks. For details regarding each error code see the comment blocks given. For each tuple, the MALLOC audit makes the following checks:

MEMBAD = Check member linkage to rRTLB or rIDB_HEADC.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: MEMBAD

Error Code:	MEMBAD
Error Description:	This rIMALLOC tuple is not linked to the owner indicated by the flag (rIMALLOC.link owner).
Possible Error Effect:	The messages for this channel could be incomplete.
Corrective Action Taken:	This rIMALLOC tuple will be recovered.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of rIMALLOC tuple.
<i>Bad Data =</i>	Key of owner tuple (rIRTLB or rIDB_HEADC).
<i>Good Data =</i>	Flag for owner field (1 for rIRTLB or 0 for rIDB_HEADC).
<i>Logical Index =</i>	Key of rIMALLOC (rIMALLOC.malloc_id)
<i>Dump =</i>	Contents of rIMALLOC tuple.

MATESM

Software Release: 5E10 and later

1. MATE SWITCHING MODULE (MATESM) AUDIT

The MATESM audit is part of the Terminal Maintenance audits subgroup. It is part of the integrated services digital network packet (ISDNPCKT) loadable package. It runs in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented and nonsegmented modes.

2. DATA STRUCTURES

The MATESM audit uses the terminal maintenance mate switching module array (TMmatesm) and the switching module port table relation (RLSMPORTBL).

3. AUDIT CHECKS

The audit checks the TMmatesm array against the RLSMPORTBL relation.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ODDLOSTTUP

Error Code:	ODDLOSTTUP
Error Description:	The audit has gotten a bad return from DBfrdtup() when reading the rLSMPORTBL relation.
Possible Error Effect:	The ODD could be bad.
Corrective Action Taken:	None.
Manual Action Required:	Office personnel should check the rLSMPORTBL relation. The key to the relation is printed in <i>Good Data</i> .
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Return value from DBfrdtup().
<i>Good Data</i> =	The key used to read the relations.
<i>Logical Index</i> =	The index to the TMmatesm[] array.
<i>Dump 1</i> =	The TMmatesm[] array element.
<i>Dump 2</i> =	The rLSMPORTBL tuple.

Table 2 Error Code: WRONGLIST

Error Code:	WRONGLIST
Error Description:	The TMmatesm[] array does not agree with the rLSMPORTBL relation. One indicates the inter-SM nailup is present and the other says no.
Possible Error Effect:	The inter-SM nailup could be out of order.
Corrective Action Taken:	TMmatesm[] is updated to agree with rLSMPORTBL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	NA.
<i>Bad Data</i> =	Indicator found in TMmatesm[].
<i>Good Data</i> =	Indicator derived from rLSMPORTBL.
<i>Logical Index</i> =	The index to the TMmatesm[] array.
<i>Dump 1</i> =	The TMmatesm[] array element.
<i>Dump 2</i> =	The rLSMPORTBL tuple.

Table 3 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit has been entered by audit control to clean up after a reset.
Possible Error Effect:	Causes resets and or asserts.
Corrective Action Taken:	The audit is restarted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	NA.

MCB

Software Release: 5E10 and later

1. MESSAGE CONTROL BLOCK (MCB) AUDIT

Processes communicate primarily through a message mechanism provided by operating system for distributed switching (OSDS). A sending process prepares a message in a message buffer and then invokes OSDS by means of a message communication primitive, which transmits the message. The name of the receiving process is given as a parameter in the message communication primitive.

To deliver a message to a process, OSDS links a data structure called a message control block to a list owned by the process control block of the receiving process. The message control block contains linkage items, a message header, and the message text. Each message control block in the list owned by a process control block represents a pending message. A fixed number of message control blocks is provided by OSDS per processor.

The MCB audit runs in the OSDS kernel process (OKP) and switch maintenance kernel process (SMKP) environments in the administrative module (AM), in the switching module (SM) and the communications module processor (CMP).

2. DATA STRUCTURES

The fields checked by this audit are the llink, the rlink, and th mowner. In addition to the MCBs themselves (OSmcb[]), the audit verifies and uses the following global data:

- The array of process control blocks (OSbpcb[]) any of which may own a list of MCBs (attached using PCB.msg0 and PCB.msgn).
- The global indexes OSffmcb and OSlfmcb which indicate the first and last members of the doubly linked MCB idle list.

Figure 1 illustrates how message control blocks are linked into per-process message lists and how these lists are linked to a process control block.

Figure 1 (MCB-1) Per-Process Message Linkage

3. AUDIT CHECKS

The MCB audit does not use any audit driver. All error codes associated with this audit are described. The following list gives a basic indication of the order of the checks. For details regarding each error code, see the comment blocks given.

If the audit is being (re)entered:

ZAP = Check for system interrupt handling.

If the audit is verifying the idle list:

LNK2ALST = Range check OSIfmcb.
 ALNK2QUE = Semantic check of OSIfmcb.
 BLNKINQUE = Semantic check of OSffmcb.
 LNKIALST = Range check idle MCB's llink field.
 PT2PT = Point-to/point-back check between MCBs.
 BADOWNER = Check idle MCB's mowner field.

If the audit is verifying an MCB list attached to a PCB:

LNK2ALST = Range check PCB.msgn.
 ALNK2QUE = Semantic check PCB.msgn.
 BLNKINQUE = Semantic check PCB.msg0.
 LNKIALST = Range check MCB.llink.
 PT2PT = Point-to/point-back check between MCBs.
 BADOWNER = Check MCB's mowner field.

If the audit is looking for lost MCBs:

INVOWNER = Range check potentially lost MCB's mowner field.
 INV = Check for lost MCBs.

4. ERROR HANDLING

See driver error codes (DRERRCDS), located in the Audit Drivers section of this document, for additional error code(s) not shown here.

The audit produces the following error code(s).

Table 1 Error Code: ALNK2QUE

Error Code:	ALNK2QUE
Error Description:	An index to the last element in a list of MCBs (OSIfmcb if the free list is being checked, otherwise PCB.msgn for some non-idle PCB) indicates an MCB which either has an incorrect owner (not OSNULL for the free list, different from the PCB number in all other cases) or has a non-null (not OSNULL) rlink field.
Possible Error Effect:	The list may not be accessed correctly. For the free list this could mean lost MCBs (leading to overload situations) or non-idle MCBs being taken for new processes (affecting the process to which they rightfully belong). For MCB lists attached to PCBs this problem could cause the owning process to lose messages or falsely believe it has messages which actually belong to

	the idle list or other processes. In practice, because of defensive checks in OS, this condition is much more likely to result in asserts from OS which schedule the MCB audit in the directed mode. It is also likely that MCB "INV" errors will be seen along with this one.
Corrective Action Taken:	If this is the free list of MCBs and the audit is running in segmented mode, it will escalate to directed mode and rebuild the list. If the audit is already running in directed mode, it will rebuild the list right away. The list will be rebuilt by verifying OSffmcb (index to the first free MCB) and, if it is ok, verifying the list from the top down as far as possible. If the list is attached to a PCB, the associated process will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the MCB.
<i>Bad Data =</i>	The owner of the list we're trying to access (either OSNULL or a PCB index).
<i>Good Data =</i>	Contents of the MCB's mowner field.
<i>Logical Index =</i>	The MCB's index (= OSIfmcb in the free list case, = PCB.msgn otherwise).
<i>Dump 1 =</i>	The MCB.
<i>Dump 2 =</i>	The owning PCB or nothing, if the free list was being checked.

Table 2 Error Code: BADOWNER

Error Code:	BADOWNER
Error Description:	An MCB's mowner field shows a different owner than the owner of the list it was found in. Note that the MCBs rlink field has already been verified (PT2PT) and its llink has been checked to be in range (BLINKINQUE/LNKIALST).
Possible Error Effect:	If the owning list belongs to a PCB then the associated process could erroneously receive a message. Regardless of where the MCB was found, it is possible that it actually belongs on a list belonging to some process in which case that process will be missing a message. If the MCB was found on the free list, than INV errors are also likely to show up.
Corrective Action Taken:	If this is the free list of MCBs, just relink the list around the bad message and let an INV error fire, to put it back on the idle list, if that's where it really belongs. If the list is attached to a PCB, the associated process will be purged. Although the offending MCB may actually belong somewhere else and the remaining MCBs on this list are ok, this list is still corrupted and can not be trusted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the MCB.
<i>Bad Data =</i>	Contents of the MCB's mowner field.
<i>Good Data =</i>	The owner of the list the MCB was found in (either OSNULL or a PCB index).
<i>Logical Index =</i>	The MCB's index (= OSIfmcb in the free list case, = PCB.msgn otherwise).
<i>Dump =</i>	The MCB.

Table 3 Error Code: BLNKINQUE

Error Code:	BLNKINQUE
Error Description:	While traversing a list (bottom up) an MCB was found with its llink field = OSNULL but was not the first MCB in the list, according to the list owner. Specifically, if the MCB was found on the free list, it was not indicated by OSffmcb (index to the first free MCB).

	If the MCB was found on a list belonging to a PCB, it was not indicated by the PCB's msg0 field (index to the first MCB belonging to the process).
Possible Error Effect:	The list is either broken, or the list owner's index to the first element is corrupt. This could have any of the effects of an ALNK2QUE, LNKIALST or PT2PT error.
Corrective Action Taken:	If this is the free list of MCBs and the audit is running in segmented mode, escalate to the directed mode and rebuild the list. If the audit is already running in the directed mode, then rebuild the list right away. The list will be rebuilt by verifying OSffmcb (index to the first free MCB) and, if it is ok, verifying the list from the top down as far as possible. If the list is attached to a PCB, the associated process will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the MCB.
<i>Bad Data</i> =	Index of the MCB, the list's owner says is first on the list.
<i>Good Data</i> =	The owner of the list the MCB was found in (either OSNULL or a PCB index).
<i>Logical Index</i> =	The MCB's index.
<i>Dump 1</i> =	The MCB.
<i>Dump 2</i> =	The owning PCB or nothing if the free list was being checked.
<i>Dump 3</i> =	The owning PCB or nothing if the free list was being checked.

Table 4 Error Code: INV

Error Code:	INV
Error Description:	An MCB has been found which is not linked to any PCB or the free list.
Possible Error Effect:	The MCB is lost and inaccessible to the system. If enough MCBs became lost, overload could occur and OS performance would be severely affected.
Corrective Action Taken:	The MCB is cleared and linked to the idle list. In particular, its mowner field is set to OSNULL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the MCB.
<i>Bad Data</i> =	0 (Indicates that the audit did not find the MCB on any list).
<i>Good Data</i> =	1 (Indicates that the audit should have found the MCB on some list).
<i>Logical Index</i> =	The MCB's index.
<i>Dump</i> =	The MCB.

Table 5 Error Code: INVOWNER

Error Code:	INVOWNER
Error Description:	An MCB has been found which the audit did not see on any list. Before taking an INV error, the audit will verify that the MCB is truly lost. For example, if the audit were running in the segmented mode, the MCB may have changed lists while the audit took a timebreak. In this case, the audit would not have seen the MCB before now. The audit uses the MCB's mowner field to determine which list to check. This error says that the mowner field is out of range (not OSNULL and not a PCB index).
Possible Error Effect:	The MCB is effectively lost and inaccessible to the system. If enough MCBs became lost, overload could occur and OS performance would be severely affected.
Corrective Action Taken:	If possible, the MCB is unlinked from the list its in (the linkages of the MCBs it points to are reset). In any case, the MCB is cleared and linked to the idle list. In particular, its mowner field is set to OSNULL.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the MCB.
<i>Bad Data</i> =	Contents of the MCB's mowner field.
<i>Good Data</i> =	OSNULL.
<i>Logical Index</i> =	The MCB's index.
<i>Dump</i> =	The MCB.

Table 6 Error Code: LNK2ALST

Error Code:	LNK2ALST
Error Description:	Either the tail of an MCB list was null when the head was not or the tail of an MCB list is out of range. The list owner ("Good Data" below) is either a PCB or the free list (OSNULL). If it is a PCB, the out of range value is the PCB's "msgn" field. If the owner is the free list, the out of range value is the last free MCB index (OSfmcmb).
Possible Error Effect:	If the owner of the list is a PCB, that process may fail to receive its messages. The results of this depend on the process and message types. If the free list is involved, this could result in lost MCBs which could, eventually, lead to OSDS MCB overloads.
Corrective Action Taken:	If the MCB list belongs to a PCB, that process will be purged. Otherwise, if the audit is running segmented, it will escalate to directed mode. If the audit is already running in directed mode it will attempt to rebuild the idle list from the top (OSfmcmb) down.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	NA.
<i>Bad Data =</i>	The out of range MCB index.
<i>Good Data =</i>	The list owner (a PCB index or OSNULL for the idle list).
<i>Logical Index =</i>	OSNULL.
<i>Dump =</i>	The PCB (if any) which owns the list.

Table 7 Error Code: LNKIALST

Error Code:	LNKIALST
Error Description:	While traversing a list, an MCB was found with an out of range llink field (not OSNULL and not an MCB index).
Possible Error Effect:	The list is broken. For the free list, this could mean lost MCBs (leading to overload situations). For MCB lists attached to PCBs, this problem could cause the owning process to lose messages. In practice, because of defensive checks in OS, this condition is much more likely to result in asserts from OS which schedule the MCB audit in the directed mode. It is also likely that MCB "INV" errors will be seen along with this one.
Corrective Action Taken:	If this is the free list of MCBs and the audit is running in segmented mode, it will escalate to the directed mode and rebuild the list. If the audit is already running in the directed mode, it will rebuild the list right away. The list will be rebuilt by verifying OSfmcmb (index to the first free MCB) and, if it is ok, verifying the list from the top down as far as possible. It will then link this segment (top down) with the segment (bottom up) that the audit has already checked. If the list is attached to a PCB, the associated process will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the MCB.
<i>Bad Data =</i>	The MCB's llink field.
<i>Good Data =</i>	OSMCBNUM (llink should have been OSNULL or less than this value).
<i>Logical Index =</i>	The MCB index.
<i>Dump =</i>	The MCB.

Table 8 Error Code: PT2PT

Error Code:	PT2PT
Error Description:	While traversing a list, an MCB was found whose llink field contained the index of an MCB whose rlink field was not equal to the first MCB's index.

Possible Error Effect:	The list is broken. For the free list, this could mean lost MCBs (leading to overload situations) or non-idle MCBs being taken for new processes (affecting the process to which they rightfully belong). For MCB lists attached to PCBs, this problem could cause the owning process to lose messages or falsely believe it has messages which actually belong to the idle list or other processes. In practice, because of defensive checks in OS, this condition is much more likely to result in asserts from OS which schedule the MCB audit in the directed mode. It is also likely that MCB "INV" errors will be seen along with this one.
Corrective Action Taken:	If this is the free list of MCBs and the audit is running in the segmented mode, the audit will escalate to the directed mode and rebuild the list. If the audit is already running in directed mode, it will rebuild the list right away. The list will be rebuilt by first verifying OSffmcb (index to the first free MCB) and, if it is ok, verifying the list from the top down as far as possible. If the list is attached to a PCB, the associated process will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the MCB.
<i>Bad Data =</i>	The MCB's llink field.
<i>Good Data =</i>	The rlink field of the MCB indexed by "BAD DATA."
<i>Logical Index =</i>	The MCB's index.
<i>Dump =</i>	The MCB.

Table 9 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit will take this error as the result of a write protection violation, out of range read, or invalid operation by foreground or any audit system process.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit will idle the last MCB it was looking at (if any), abort and be restarted in directed mode. Otherwise it will just be restarted in directed mode.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the MCB (if any).
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Index of the MCB (if any).
<i>Dump =</i>	The MCB (if any).

MDB

Software Release: 5E10 and later

1. MODEL DATA BLOCK (MDB) AUDIT

Model Data Blocks are used by any BRCS feature to define the associated models (MFAR1, MFAR2, and so forth) of a BRCS call. The model data block audit verifies the semantic data and linkages of the model data block relation. It runs segmented and during selective initializations.

2. DATA STRUCTURES

The RLLMDB relation is a dynamic indexed sequential relation that is used to record FEX model data for BRCS calls. When the rIMDB tuple is busy it is linked to an rICLDB tuple involved in a stable call. All idle rIMDB tuples are linked to an idle list represented by a specific tuple in the RLCLDB relation.

A representation of the general scenario is shown in Figure 1 .

Some rIMDB tuples may be used for call park feature models. For this scenario, the **model_id** will be marked PARK_FM, and only one rICLDB tuple will be linked off of RLPCBLA. This rICLDB tuple serves as the owner of the rIMDB park feature model tuple. Although more than one rIMDB tuple may be linked off of RLCLDB, for call park there will usually be only one RLMDDB. For cases where there are more than one RLMDDB linked off of RLCLDB, the call park feature model rIMDB tuple will usually be the first one on the list.

All parked calls are represented by an entry in the RLPARK_LOT dynamic relation. This relation contains a tuple entry for each DN on a given SM that has a call parked against it. This relation is hashed. Tuple entries are created as calls get parked, and are subsequently deleted as calls get unparked. Each tuple contains data related to the parked DN. This data includes **locdn** (key) which is the parked DN, **park_pid** which is the call park terminal process, and **touch** which is the keep alive touch bit.

Call park processes and RLPARK_LOT table entries need not reside on the same SM. For instances where the RLPARK_LOT table entry and the call park process reside on the same SM, there exists an implied linkage between the **pk_dn** field represented in the RLMDDB PARK_DATA feature data block and the **locdn** (key) field in RLPARK_LOT, between **pk_mod** in the RLMDDB PARK_DATA feature data block and **park_pid.pcrd** in RLPARK_LOT, and between **park_pid.procno** in RLPARK_LOT and rIPCBLA.procnum in the associated rIPCBLA tuple.

All of these implied linkages are audited by the MDB audit for cases where the call park terminal process and RLPARK_LOT table entries are local to the same SM, and by call park keep alive for cases where this data resides on different SMs. A **parked** bit in RLPCBLA indicates if the rIPCBLA tuple is being used for a call park process, and is always marked DBYES for call park feature models.

A representation of the call park feature model scenario is shown in Figure 2 .

Figure 1 (MDB-1) Data Structures of MDB Audit

Figure 2 (MDB-2) Data Structures of the MDB Audit for Call Park Feature Model Scenario

3. AUDIT CHECKS

The MDB audit steps through the RLMDb relation using the DRINASEK audit driver, verifying linkages with rCLDB.

4. ERROR HANDLING

If linkage or semantic errors are detected, the RLMDb is recovered to the idle list, and any associated terminal processes are purged. Related audits are run to recover other data structures.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ASSOC_TUP

Error Code:	ASSOC_TUP
Error Description:	An associated RLPARK_LOT relation table entry could not be accessed. For rIMDB tuples used as call park feature models, (rIMDB.spdb.model_id = PARK_FM), if the park feature model data block indicates that a RLPARK_LOT table entry should exist on this SM (rIMDB.feats_data.pk_mod = GI_pcrd) then a corresponding rIPARK_LOT tuple should exist where rIPARK_LOT.locdn = rIMDB.feats_data.pk_dn.
Possible Error Effect:	Possible failures or asserts when call processing attempts to use this rIMDB tuple to park a call.
Corrective Action Taken:	The rIMDB tuple is recovered to an idle state along with the rCLDB and rPCBLA tuples, if accessible. Any process found associated with the rIMDB tuple will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIMDB tuple found in error.
<i>Bad Data =</i>	NA
<i>Good Data =</i>	The status of the parked bit in RLPCBLA (DBYES or DBNO).
<i>Logical Key =</i>	The logical key of the rIMDB tuple (rIMDB.mdb_id).
<i>Dump 1 =</i>	The contents of the rIMDB tuple.
<i>Dump 2 =</i>	The contents of the PARK_DATA feature data block union in the rIMDB tuple ((PARK_DATA)rIMDB.feats_data).

Table 2 Error Code: CAMPSTATE

Error Code:	CAMPSTATE
Error Description:	The MDB does not find entry on the camp-on list.
Possible Error Effect:	The process would be in a stuck state.
Corrective Action Taken:	The corresponding process is purged from the system and the mdb is returned to idle.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of mdb.
<i>Bad Data =</i>	State.
<i>Good Data =</i>	NA.
<i>Logical Key =</i>	mdb key.
<i>Dump 1 =</i>	rIMDB tuple.
<i>Dump 2 =</i>	rPCBLA tuple.

Table 3 Error Code: NOPCBLA

Error Code:	NOPCBLA
Error Description:	For a given rIMDB tuple which is associated with a call park feature model (rIMDB.spdb.model_id == PARK_FM), the corresponding rPCBLA tuple for the call park terminal process could not be accessed. A relationship exists such that for every rIMDB tuple associated with a PARK feature model, there should exist a corresponding rPCBLA tuple, where rPCBLA.procnum = rCLDB.clpcm.st_ownd - DBSFCLDB, for the rCLDB tuple which is the PARK_FM rIMDB tuple's owner (rCLDB.cldb_id = rIMDB.mdcldm.st_ownd - DBSFMDB).
Possible Error Effect:	An rIMDB tuple cannot be used, and is a lost resource. This may cause possible call failures if the system exhausts the number of available rIMDB tuples.
Corrective Action Taken:	The rIMDB tuple is recovered to an idle state, and the CLDB and PCBLA related audits will be scheduled to recover any related data.
Manual Action Required:	None.
Dump Description:	

<i>Error Address</i> =	Address of the rIMDB tuple.
<i>Bad Data</i> =	Logical key of the rIPCBLA tuple found.
<i>Good Data</i> =	Logical key of the rIPCBLA tuple that was marked in the rICLDB tuple found linked to the rIMDB tuple under audit.
<i>Logical Key</i> =	The logical key of the rIMDB tuple.
<i>Dump 1</i> =	The contents of the rIMDB tuple.
<i>Dump 2</i> =	The contents of the rICLDB tuple.
<i>Dump 3</i> =	The contents of the SPDB union in the rIMDB tuple.

Table 4 Error Code: OUTOFRANGE

Error Code:	OUTOFRANGE
Error Description:	A tuple of the model data block dynamic relation "mdb_tag" is out-of-range.
Possible Error Effect:	Incorrect use of resources vital to BRCS call processing.
Corrective Action Taken:	The dynamic tuple is zeroed, and recovered to the correct idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIMDB tuple.
<i>Bad Data</i> =	Value of mdb_tag.
<i>Good Data</i> =	NA.
<i>Logical Key</i> =	Key of rIMDB tuple.
<i>Dump 1</i> =	rIMDB tuple.
<i>Dump 2</i> =	Owning rICLDB tuple.

Table 5 Error Code: PCRID

Error Code:	PCRID
Error Description:	The SM marked in the PARK_DATA feature data block union in the rIMDB tuple ((PARK_DATA)rIMDB.feats_data.pk_mod) is either out of range or not in operation. This field should be in the legal range of SM values (between GL1STSM and GLLASTSM inclusive) and should reference an SM that is equipped and in operation.
Possible Error Effect:	The RLPARK_LOT table entry for the rIMDB tuple cannot be accessed. Calls cannot be parked or unparked against the DN marked in the feature data block ((PARK_DATA)rIMDB.feats_data.pk_dn).
Corrective Action Taken:	The rIMDB tuple is recovered to an idle state along with the rICLDB and rIPCBLA tuples, if accessible. Any process found associated with the rIMDB tuple will be purged.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of rIMDB tuple found in error.
<i>Bad Data</i> =	The SM represented in pk_mod in the PARK_DATA feature data block union.
<i>Good Data</i> =	NA.
<i>Logical Key</i> =	The logical key (rIMDB.mdb_id) of the rIMDB tuple.
<i>Dump 1</i> =	The contents of the rIMDB tuple.
<i>Dump 2</i> =	The contents of the PARK_DATA feature data block union in the rIMDB tuple ((PARK_DATA)rIMDB.feats_data).

Table 6 Error Code: TAG

Error Code:	TAG
Error Description:	A tuple of the model data block dynamic relation "mdb_tag" is incorrect.
Error Effect:	Incorrect use of resources vital to BRCS call processing.
Corrective Action Taken:	The dynamic tuple is zeroed, and recovered to the correct idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIMDB tuple.
<i>Bad Data</i> =	Value of mdb_tag.
<i>Good Data</i> =	Value of associated rICLDB tag.
<i>Logical Key</i> =	Key of rIMDB tuple.
<i>Dump 1</i> =	rIMDB tuple.
<i>Dump 2</i> =	rICLDB tuple.

Table 7 Error Code: WRONGLIST

Error Code:	WRONGLIST
Error Description:	A tuple of the model data block dynamic relation is linked to an incorrect list.
Possible Error Effect:	Lost resources vital to BRCS call processing.
Corrective Action Taken:	The dynamic tuple is recovered to the correct idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIMDB tuple.
<i>Bad Data</i> =	Key of incorrect list.
<i>Good Data</i> =	Key of correct idle list.
<i>Logical Key</i> =	Key of rIMDB tuple.
<i>Dump 1</i> =	rIMDB tuple.
<i>Dump 2</i> =	Owning rCLDB tuple.

MDRQ

Software Release: 5E10 and later

1. MESSAGE DETAIL RECORDING QUEUE (MDRQ) AUDIT

Message detail recording (MDR) of private facility calls using the revenue accounting office provides automated message accounting (AMA) records, on a per outgoing call basis, on private facilities selected by the customer. Records may be requested for WATS facilities (by band) for foreign exchange lines, TIE trunks, tandem TIE trunks, CCSA access lines, ETS trunks, and so on. The per call information allows customers to perform such tasks as cost accounting and engineering.

The MDR information is stored in the RLMDRQ relation, and is audited by the MDRQ audit. The MDRQ audit runs in routine and elevated segmented modes.

2. DATA STRUCTURES

The MDRQ audit checks rIMDRQ tuples to determine if the tuples are validly marked busy or idle. The audit makes these checks based on the following data:

- mdrqkey* = The logical key of rIMDRQ tuples.
- mdrqlnk.st_ownk* = Owner linkage field to the RLDB_HEADC idle list head cell. Idle rIMDRQ tuples should have this field marked to DBMDRQIDLE + DBSFDB_HEA. For busy rIMDRQ tuples, this field should always be DBMDRQBUSY + DBSFDB_HEA.
- ap_id* = Site identifier. For busy rIMDRQ tuples, this value should not be zero. For idle rIMDRQ tuples, this value should be zero.

3. AUDIT CHECKS

For each tuple in the RLMDRQ relation, the MDRQ audit makes the following checks: IF the MDRQ audit get entered:

- NOTZERO = Check that the site identifier (rIMDRQ.ap_id) is zero for idle rIMDRQ tuples.
- NOTBUSY = Check that the site identifier (rIMDRQ.ap_id) is not zero for busy rIMDRQ tuples.
- BUSYIDLE = Check that all rIMDRQ tuple are linked to a busy list or idle list head cell (rIMDRQ.mdrqlnk.st_ownk - DBSFDB_HEA == DBMDRQIDLE or DBMDRQBUSY).

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this document, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	An rIMDRQ tuple was found unlinked to a busy list or idle list head cell. All rIMDRQ tuples must be linked to a busy or idle list head cell in the RLDB_HEADC relation (rIMDRQ.mdrqlnk.st_ownk - DBSFDB_HEA == DBMDRQIDLE or DBMDRQBUSY).

Possible Error Effect:	Possible exhaustion of MDR resources, and incorrect measurements data provided to customers.
Corrective Action Taken:	The rIMDRQ tuple is recovered to the RLDB_HEADC idle list (rIMDRQ.mdrqlnk.st_ownk set to DBMDRQIDLE + DBSFDB_HEA).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIMDRQ tuple.
<i>Bad Data =</i>	The rIMDRQ tuple's head cell linkage (rIMDRQ.mdrqlnk.st_ownk - DBSFDB_HEA).
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	The key of the rIMDRQ tuple (rIMDRQ.mdrqkey).
<i>Dump =</i>	The contents of the rIMDRQ tuple.

Table 2 Error Code: NOTBUSY

Error Code:	NOTBUSY
Error Description:	An rIMDRQ tuple was found linked to a busy list head cell, but the site identifier was not marked to any given value. All rIMDRQ tuples linked to the busy list head cell in the RLDB_HEADC relation (rIMDRQ.mdrqlnk.st_ownk - DBSFDB_HEA == DBMDRQBUSY) must have the site identifier (rIMDRQ.ap_id) marked to a non-zero value.
Possible Error Effect:	Possible exhaustion of MDR resources, and incorrect measurements data provided to customers.
Corrective Action Taken:	The rIMDRQ tuple is recovered to the RLDB_HEADC idle list (rIMDRQ.mdrqlnk.st_ownk set to DBMDRQIDLE + DBSFDB_HEA).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIMDRQ tuple.
<i>Bad Data =</i>	The contents of the RLMDRQ site identifier (rIMDRQ.ap_id).
<i>Good Data =</i>	The owner linkage to the RLDB_HEADC head cell relation (rIMDRQ.mdrqlnk.st_ownk - DBSFDB_HEA).
<i>Logical Index =</i>	The key of the rIMDRQ tuple (rIMDRQ.mdrqkey).
<i>Dump =</i>	The contents of the rIMDRQ tuple.

Table 3 Error Code: NOTZERO

Error Code:	NOTZERO
Error Description:	An rIMDRQ tuple was found linked to a idle list head cell, but the site identifier was not marked to zero. All rIMDRQ tuples linked to the idle list head cell in the RLDB_HEADC relation (rIMDRQ.mdrqlnk.st_ownk - DBSFDB_HEA == DBMDRQIDLE) must have the site identifier (rIMDRQ.ap_id) marked to zero.
Possible Error Effect:	Possible exhaustion of MDR resources, and incorrect measurements data provided to customers.
Corrective Action Taken:	The rIMDRQ tuple is recovered to the RLDB_HEADC idle list (rIMDRQ.mdrqlnk.st_ownk set to DBMDRQIDLE + DBSFDB_HEA).
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIMDRQ tuple.
<i>Bad Data =</i>	The contents of the RLMDRQ site identifier (rIMDRQ.ap_id).
<i>Good Data =</i>	The owner linkage to the RLDB_HEADC head cell relation (rIMDRQ.mdrqlnk.st_ownk - DBSFDB_HEA).
<i>Logical Index =</i>	The key of the rIMDRQ tuple (rIMDRQ.mdrqkey).
<i>Dump =</i>	The contents of the rIMDRQ tuple.

MELNK-A**Software Release:** 5E12 only**1. MCTSI-BASED ETHERNET LINK (MELNK) AUDIT**

The MELNK audit is responsible for checking dynamic data maintained by the ethernet link fault recovery system process (ELSP). This data includes the maintenance status of MELNKs and MCTSI-based ethernet pipes (MEPIPEs). It also includes dynamic copies of information found in the static relations RLENETPIPE and RLENETLINK. Consistency between related dynamic data structures and consistency with static ODD are both verified. All audited data is SM-2000 SMP-resident. Other software mechanisms are used to ensure that the SMP-resident data is consistent with MEPIPE/MELNK status data stored in the SM-2000 message handler.

2. DATA STRUCTURES

The following static data is used by the MELNK audit:

RLENETPIPE = Database relation containing MEPIPE data.

RLENETLINK = Database relation containing MELNK data.

Glprtc = Global parameter identifying the global billing SM.

The following dynamic data is checked by the MELNK audit:

SMelstat[] = Dynamic data maintained by ELSP for MEPIPEs and MELNKs.

SMelmcsc = Data related to ELSP's MCTSI/MH escalation strategy.

SMelmrbuf = Buffer for data about in progress manual MELNK remove/restore requests.

3. AUDIT CHECKS

The MELNK audit makes the following checks:

ACTION = Check MEPIPE/MELNK maintenance and recovery action data.

AVAIL_CNT = Check the number of equipped child MELNKs for an MEPIPE.

BADTYPE = Check the MEPIPE/MELNK recovery timer types.

BILLFLG = Check the value of the DDRTCDELNK data delivery key.

DYN_STAT = Check for consistency between MEPIPE/MELNK static data and dynamic copies of that data.

INV_STATE = Check for valid MEPIPE/MELNK maintenance states.

INV_TIMER = Check existence of valid timer indexes for MEPIPE/MELNK maintenance actions.

LNKS_MISSING = Check that a child MELNK is being restored when MEPIPE is in the INIT state.

LNK_CONFIG = Check manual request buffer for consistency with MELNK dynamic data.

MISSTUP = Check MEPIPE/MELNK equipage state in dynamic data against static data (when there is no MEPIPE/MELNK tuple in static data).

PARENT	= Check MEPIPE/MELNK parent/child relationships.
PORT_BAD	= Check for incorrect MELNK active port counts.
STATE_VAR	= Check state of ELSP's MCTSI/MH escalation/recovery strategy.
STATUS_BAD	= Check the value of the DDMELNK data delivery key.
STUCK	= Check for stuck out-of-service MEPIPE/MELNK states.
TID	= Check for existence of unexpected timer indexes.
TIMERLST	= Check for existence of a pending timer for each valid timer index.
UNEQUIP	= Check MEPIPE/MELNK equipage state in dynamic data against static data (when there is an MEPIPE/MELNK tuple in static data).
ZAP	= Check for system interrupt handling.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: ACTION

Error Code:	ACTION
Error Description:	Error is due to one of the following: 0 = The MELNK action is set to SMELASSW but the MEPIPE action does not match. 1 = The MELNK action is invalid. 2 = The MELNK recovery action is invalid. 3 = The MEPIPE action is invalid. 4 = The MEPIPE recovery action is invalid.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 2 = The audit clears the MELNK recovery action and recovery count fields.

	3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. 4 = The audit clears the MEPIPE recovery action and recovery count fields.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2, 3 or 4 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 and 1 = MELNK action (SMelstat[mepipe].elnk[melnk].action). 2 = MELNK recovery action (SMelstat[mepipe].elnk[melnk].rcvy_act). 3 = MEPIPE action (SMelstat[mepipe].action). 4 = MEPIPE recovery action (SMelstat[mepipe].rcvy_act).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MEPIPE action (SMelstat[mepipe].action). 1 and 2 = MELNK state (SMelstat[mepipe].elnk[melnk].state). 3 and 4 = MEPIPE state (SMelstat[mepipe].state).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 2 Error Code: AVAIL_CNT

Error Code:	AVAIL_CNT
Error Description:	The audit did not find the expected number of equipped child MELNKs.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit re-initializes MEPIPE (and child MELNK) dynamic data based on information derived from static ODD. If this information indicates that the MEPIPE should be equipped, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with SMP-resident static and dynamic data.
Manual Action Required:	None.

Dump Description:	
<i>Error Address =</i>	0 = The MEPIPE is not in the INIT state. 1 = The MEPIPE is in the INIT state.
<i>Bad Data =</i>	The number of equipped MELNKs found in MELNK dynamic data.
<i>Good Data =</i>	The number of equipped MELNKs found in MEPIPE dynamic data (SMelstat[mepipe].eq elnks).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 3 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	Error is due to one of the following: 0 = The MELNK recovery timer type field is invalid. 1 = The MEPIPE recovery timer type field is invalid.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 1 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0 or 1 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows:

	0 = The MELNK recovery timer type (SMelstat[mepipe].elnk[melnk].rcvy_ttype). 1 = The MEPIPE recovery timer type (SMelstat[mepipe].rcvy_ttype).
<i>Good Data</i> =	Corresponds to the Error Description as follows: 0 = The MELNK recovery timer index (SMelstat[mepipe].elnk[melnk].rcvy_timer). 1 = The MEPIPE recovery timer index (SMelstat[mepipe].rcvy_timer).
<i>Logical Index</i> =	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump</i> =	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 4 Error Code: BILLFLG

Error Code:	BILLFLG
Error Description:	Error is due to one of the following: 0 = The value of the DDRTCDELNK data delivery (DD) key is inconsistent with MELNK status (ACTIVE). 1 = The value of the DDRTCDELNK DD key is inconsistent with MELNK status (DEGRADED). 2 = The value of the DDRTCDELNK DD key is inconsistent with MELNK status (OOS).
Possible Error Effect:	Status information that controls whether real time billing data should be sent to the global billing SM is incorrect. Billing data may be inappropriately buffered (or not buffered) in an originating SM's real time billing memory (RTBM).
Corrective Action Taken:	The audit corrects the DD key.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Corresponds to the Error Description as follows: 0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data</i> =	The incorrect value of the DD key. Corresponds to the Error Description as follows: 0 and 1 = DDOFFNORMAL. 2 = DDNORMAL.
<i>Good Data</i> =	The correct value of the DD key. Corresponds to the Error Description as follows: 0 and 1 = DDNORMAL. 2 = DDOFFNORMAL.
<i>Logical Index</i> =	A four byte value indicating the MEPIPE and MELNK numbers associated with

	the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 5 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	Error is due to one of the following: 0 = The MEPIPE is in a valid equipped state and there is a tuple in the RLENETPIPE relation, but there is an inconsistency between static and dynamic data (related to MHEIB and/or hub addresses). 1 = The MELNK is in a valid equipped state and there is a tuple in the RLENETLINK relation, but there is an inconsistency between static and dynamic data (related to far end internet protocol [IP] and hardware [HW] addresses, protocol information, or MELNK service type). 2 = Static data in the RLENETLINK relation indicates that this MELNK should be simplex but dynamic data does not agree.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit re-initializes MEPIPE (and child MELNK) dynamic data based on information derived from static ODD. If this information indicates that the MEPIPE should be equipped, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with SMP-resident static and dynamic data. 1 = The audit re-initializes MELNK dynamic data based on information derived from static ODD. If this information indicates that the MELNK should be equipped, the audit asks ELSP to restore it to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with SMP-resident static and dynamic data. 2 = The audit corrects the dynamic data and then asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = MEPIPE state (SMelstat[mepipe].state).

	1 = Identification of data found to be inconsistent: 1 = Far-end IP address. 2 = Far-end HW address. 3 = Protocol/service data. 4 = Far-end IP address and protocol/service data. 5 = Far-end HW address and protocol/service data. 2 = MELNK address number (SMelstat[mepipe].elnk[melnk].addrnum).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = Not applicable. 1 = MELNK state (SMelstat[mepipe].elnk[melnk].state). 2 = Correct MELNK address number (SMEL0ADDR).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1 =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2 =</i>	Corresponds to the Error Description as follows: 0 = Contents of RLENETPIPE tuple. 1 and 2 = Contents of RLENETLINK tuple.

Table 6 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	Error is due to one of the following: 0 and 2 = The MEPIPE state is invalid. 1 = The MELNK state is invalid.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit re-initializes MEPIPE (and child MELNK) dynamic data based on information derived from static ODD. If this information indicates that the MEPIPE should be equipped, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with SMP-resident static and dynamic data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows:

	0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data</i> =	Corresponds to the Error Description as follows: 0 and 2 = MEPIPE state (SMelstat[mepipe].state). 1 = MELNK state (SMelstat[mepipe].elnk[melnk].state).
<i>Good Data</i> =	Corresponds to the Error Description as follows: 0 = Not applicable. 1 = MEPIPE state (SMelstat[mepipe].state). 2 = Number of equipped child MELNKs (SMelstat[mepipe].eq_elinks).
<i>Logical Index</i> =	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1</i> =	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2</i> =	Corresponds to the Error Description as follows: 0 = Contents of RLENETPIPE tuple. 1 = Contents of RLENETLINK tuple. 2 = Not applicable.

Table 7 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	Error is due to one of the following: 0 = An MELNK action is in progress without a valid index for an associated timer. 1 = An MELNK recovery timer should be pending but there is no valid timer index. 2 = An MEPIPE action is in progress without a valid index for an associated timer. 3 = An MEPIPE recovery timer should be pending but there is no valid timer index. 4 = An MCTSI/MH long term recovery timer should be pending but there is no valid timer index. 5 = An MCTSI/MH short term recovery timer should be pending but there is no valid timer index.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using

	asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 2 and 3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. 4 and 5 = The audit causes ELSP to exit MCTSI/MH recovery and re-initialize the associated data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2, 3, 4 or 5 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action timer (SMelstat[mepipe].elnk[melnk].timer). 1 = MELNK recovery timer (SMelstat[mepipe].elnk[melnk].rcvy_timer). 2 = MEPIPE action timer (SMelstat[mepipe].timer). 3 = MEPIPE recovery timer (SMelstat[mepipe].rcvy_timer). 4 = MCTSI/MH long-term recovery timer index (SMelmcesc.longt_tid). 5 = MCTSI/MH short-term recovery timer index (SMelmcesc.shortt_tid).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action (SMelstat[mepipe].elnk[melnk].action). 1 = MELNK recovery timer type (SMelstat[mepipe].elnk[melnk].rcvy_ttype). 2 = MEPIPE action (SMelstat[mepipe].action). 3 = MEPIPE recovery timer type (SMelstat[mepipe].rcvy_ttype). 4 and 5 = MCTSI/MH recovery/escalation state (SMelmcesc.state).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with

	the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	Corresponds to the Error Description as follows: 0, 1, 2 and 3 = The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data). 4 and 5 = The contents of SMelmcesc (MCTSI/MH recovery/escalation data).

Table 8 Error Code: LNKS_MISSING

Error Code:	LNKS_MISSING
Error Description:	The MEPIPE is in the INIT state but the audit did not find any child MELNK being restored.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The audit then asks ELSP to restore the MEPIPE and all child MELNKs to service.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	MEPIPE state (SMelstat[mepipe].state).
<i>Bad Data =</i>	Number of child MELNKs that are being restored (0).
<i>Good Data =</i>	Number of equipped child MELNKs (SMelstat[mepipe].eq_elinks).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 9 Error Code: LNK_CONFIG

Error Code:	LNK_CONFIG
Error Description:	Error is due to one of the following: 0 = MELNK dynamic data indicates that a manual request is in progress but ELSP's manual request buffer is idle. 1 = MELNK dynamic data indicates that no manual request is in progress, but ELSP's manual request buffer indicates that there should be.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit clears the MELNK's manual request indicator.

	1 = The audit clears the usage indicator in the manual request buffer.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Corresponds to the Error Description as follows: 0 or 1 = The number of the Error Description associated with this error report.
<i>Bad Data</i> =	The manual request buffer usage indicator (SMelmrbuf.in_use).
<i>Good Data</i> =	Corresponds to the Error Description as follows: 0 = MELNK manual request indicator (SMelstat[mepipe].elnk[melnk].man_req). 1 = Not applicable.
<i>Logical Index</i> =	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump</i> =	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 10 Error Code: MISSTUP

Error Code:	MISSTUP
Error Description:	Error is due to one of the following: 0 = The MEPIPE is in an equipped state, but the associated RLENETPIPE tuple is not present. 1 = No RLENETLINK tuple exists for the MELNK, but MELNK dynamic data is not consistent with an unequipped MELNK. 2 = The MEPIPE is in the unequipped state, but other dynamic MEPIPE data is not consistent with an unequipped MEPIPE.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 2 = The audit updates dynamic data to indicate that the MEPIPE and child MELNKs are not equipped. 1 = The audit updates dynamic data to indicate that the MELNK is not equipped.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Corresponds to the Error Description as follows: 0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data</i> =	Corresponds to the Error Description as follows:

	0 = MEPIPE state (SMelstat[mepipe].state). 1 = MELNK state (SMelstat[mepipe].elnk[melnk].state). 2 = Number of equipped child MELNKs (SMelstat[mepipe].eq_elinks).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 and 1 = The UNEQ state. 2 = MEPIPE state (SMelstat[mepipe].state).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 11 Error Code: PARENT

Error Code:	PARENT
Error Description:	Error is due to one of the following: 0 = An MELNK is in a state that requires an ACTIVE parent MEPIPE, but the MEPIPE is not ACTIVE. 1 = An MELNK is in the out-of-service family-of-equipment (OOSFE) state, but the parent MEPIPE is ACTIVE. 2 = The MEPIPE state is not consistent with the number of manually removed child MELNKs. If all child MELNKs are in the OOSMAN state, the MEPIPE should also be OOSMAN. 3 = The MEPIPE is in a stable OOS state, but a child MELNK is in the out-of-service due to fault recovery (OOSFLT) state. This state should not have been preserved when the MEPIPE went OOS.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 2 and 3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually

	removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2 or 3 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 and 1 = MELNK state (SMelstat[mepipe].elnk[melnk].state). 2 and 3 = MEPIPE state (SMelstat[mepipe].state).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 and 1 = MEPIPE state (SMelstat[mepipe].state). 2 = Number of child MELNKs in the OOSMAN state. 3 = Number of child MELNKs in the OOSFLT state.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 12 Error Code: PORT_BAD

Error Code:	PORT_BAD
Error Description:	The error is due to one of the following: 1 = Incorrect in-service port count for an ACTIVE MELNK. 2 = Incorrect in-service port count for a DEGRADED MELNK. 3 = Incorrect in-service port count for an OOS MELNK.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service.

Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	MELNK state (SMelstat[mepipe].elnk[melnk].state).
<i>Bad Data =</i>	Actual MELNK in-service port count (SMelstat[mepipe].elnk[melnk].act_ports).
<i>Good Data =</i>	Expected MELNK in-service port count.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 13 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	Error is due to one of the following: 0 = ELSP's MCTSI/MH recovery strategy is in an invalid state. 1 = ELSP's MCTSI/MH recovery strategy is active, even though there is an in-service MELNK and the safe interval timer is not running. 2 = ELSP's MCTSI/MH recovery strategy is active, even though all MELNKs are manually removed from service.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit causes ELSP to exit MCTSI/MH recovery and re-initialize the associated data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	MCTSI/MH recovery/escalation state (SMelmcesc.state).
<i>Good Data =</i>	Not applicable.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1 =</i>	Corresponds to the Error Description as follows: 0 and 2 = The contents of SMelmcesc (MCTSI/MH recovery/escalation data). 1 = The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2 =</i>	Corresponds to the Error Description as follows: 0 and 2 = Not applicable. 1 = The contents of SMelmcesc (MCTSI/MH recovery/escalation data).

Table 14 Error Code: STATUS_BAD

Error Code:	STATUS_BAD
Error Description:	The value of the DDMELNK data delivery (DD) key is incorrect.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed.
Corrective Action Taken:	The audit corrects the DD key.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Not applicable.
<i>Bad Data =</i>	Incorrect value of the DDMELNK key.
<i>Good Data =</i>	Correct value of the DDMELNK key.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[0] (MEPIPE/MELNK dynamic data for MEPIPE 0).

Table 15 Error Code: STUCK

Error Code:	STUCK
Error Description:	Error is due to one of the following: 0 = An MELNK is stuck in the stable OOSFLT state without a recovery timer running. 1 = An MEPIPE is stuck in the stable OOSFLT or OOSL1 state without a recovery timer running.
Possible Error Effect:	MELNK functionality is lost while the MEPIPE/MELNK is stuck in an OOS state. Since no automatic recovery action is pending, recovery will be delayed until the problem is corrected or a manual MELNK restore is requested.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The audit then asks ELSP to restore the MELNK to service. 1 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0 or 1 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK state (SMelstat[mepipe].elnk[melnk].state). 1 = MEPIPE state (SMelstat[mepipe].state).

<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MEPIPE state (SMelstat[mepipe].state). 1 = Last MEPIPE recovery action (SMelstat[mepipe].rcvy_act).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1 =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2 =</i>	The contents of SMelmcesc (MCTSI/MH recovery/escalation data).

Table 16 Error Code: TID

Error Code:	TID
Error Description:	Error is due to one of the following: 0 = No MELNK action requiring a timer is pending but a timer is apparently running. 1 = No MELNK recovery timer should be pending but a timer is apparently running. 2 = No MEPIPE action requiring a timer is pending but a timer is apparently running. 3 = No MEPIPE recovery timer should be pending but a timer is apparently running. 4 = ELSP's MCTSI/MH recovery strategy is in the short-term recovery state but there is apparently a long-term recovery timer running. 5 = ELSP's MCTSI/MH recovery strategy is not active, but there is apparently at least one MCTSI/MH recovery timer running.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 2 and 3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in

	the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. 4 = The long term recovery timer is canceled. 5 = The audit causes ELSP to exit MCTSI/MH recovery and re-initialize the associated data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2, 3, 4 or 5 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action timer (SMelstat[mepipe].elnk[melnk].timer). 1 = MELNK recovery timer (SMelstat[mepipe].elnk[melnk].rcvy_timer). 2 = MEPIPE action timer (SMelstat[mepipe].timer). 3 = MEPIPE recovery timer (SMelstat[mepipe].rcvy_timer). 4 = MCTSI/MH recovery long-term timer index (SMelmcesc.longt_tidx). 5 = MCTSI/MH recovery short-term timer index (SMelmcesc.shortt_tidx).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action (SMelstat[mepipe].elnk[melnk].action). 1 = MELNK recovery timer type (SMelstat[mepipe].elnk[melnk].rcvy_ttype). 2 = MEPIPE action (SMelstat[mepipe].action). 3 = MEPIPE recovery timer type (SMelstat[mepipe].rcvy_ttype). 4 = MCTSI/MH recovery/escalation state (SMelmcesc.state). 5 = MCTSI/MH long-term recovery timer index (SMelmcesc.longt_tidx).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	Corresponds to the Error Description as follows: 0, 1, 2 and 3 = The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data). 4 and 5 = The contents of SMelmcesc (MCTSI/MH recovery/escalation data).

Table 17 Error Code: TIMERLST

Error Code:	TIMERLST
Error Description:	Error is due to one of the following: 0 = An MELNK action requiring a timer is pending but no timer is running. 1 = An MELNK recovery timer should be pending but no timer is running. 2 = An MEPIPE action requiring a timer is pending but no timer is running. 3 = An MEPIPE recovery timer should be pending but no timer is running. 4 = A long-term recovery timer should be pending but no timer is running. 5 = A short-term recovery timer should be pending but no timer is running.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 2 and 3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. 4 and 5 = The audit causes ELSP to exit MCTSI/MH recovery and re-initialize the associated data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2, 3, 4 or 5 = Indicates error description, error effect, corrective action and dump.
<i>Bad Data =</i>	Timer tag value of the missing timer.
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action (SMelstat[mepipe].elnk[melnk].action). 1 = MELNK recovery timer type (SMelstat[mepipe].elnk[melnk].rcvy_ttype).

	2 = MEPIPE action (SMelstat[mepipe].action). 3 = MEPIPE recovery timer type (SMelstat[mepipe].rcvy_ttype). 4 and 5 = MCTSI/MH recovery/escalation state (SMelmcesc.state).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	Corresponds to the Error Description as follows: 0, 1, 2 and 3 = The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data). 4 and 5 = The contents of SMelmcesc (MCTSI/MH recovery/escalation data).

Table 18 Error Code: UNEQUIP

Error Code:	UNEQUIP
Error Description:	Error is due to one of the following: 0 = An MELNK is in the unequipped state but there is an associated tuple in RLENETLINK. 1 = An MEPIPE is in the unequipped state but there is an equipped child MELNK.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit re-initializes MEPIPE (and child MELNK) dynamic data based on information derived from static ODD. If this information indicates that the MEPIPE should be equipped, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with SMP-resident static and dynamic data. 1 = The audit updates dynamic data to indicate that the MEPIPE and all child MELNKs are unequipped.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0 or 1 = Indicates error description, error effect, corrective action and dump.
<i>Bad Data =</i>	MELNK state (SMelstat[mepipe].elnk[melnk].state).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = Not applicable.

	1 = MEPIPE state (SMelstat[mepipe].state).
<i>Logical Index</i> =	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1</i> =	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2</i> =	Corresponds to the Error Description as follows: 0 = Contents of RLENETLINK tuple. 1 = Not applicable.

Table 19 Error Code: ZAP

Error Code:	ZAP
Error Description:	This error occurs as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	Re-initialize all data that could have made the audit cause a system reset.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Not applicable.
<i>Bad Data</i> =	Not applicable.
<i>Good Data</i> =	Not applicable.
<i>Logical Index</i> =	Not applicable.
<i>Dump</i> =	Not applicable.

MELNK-B

Software Release: 5E13 and later

1. MCTSI-BASED ETHERNET LINK (MELNK) AUDIT

The MELNK audit is responsible for checking dynamic data maintained by the ethernet link fault recovery system process (ELSP). This data includes the maintenance status of MELNKs and MCTSI-based ethernet pipes (MEPIPEs). It also includes dynamic copies of information found in the static relations RLENETPIPE and RLENETLINK. Consistency between related dynamic data structures and consistency with static ODD are both verified. All audited data is SM-2000 SMP-resident. Other software mechanisms are used to ensure that the SMP-resident data is consistent with MEPIPE/MELNK status data stored in the SM-2000 message handler.

2. DATA STRUCTURES

The following static data is used by the MELNK audit:

RLENETPIPE = Database relation containing MEPIPE data.

RLENETLINK = Database relation containing MELNK data.

Glprtc = Global parameter identifying the global billing SM.

The following dynamic data is checked by the MELNK audit:

SMelstat[] = Dynamic data maintained by ELSP for MEPIPEs and MELNKs.

SMelmcsc = Data related to ELSP's MCTSI/MH escalation strategy.

SMelmrbuf = Buffer for data about in progress manual MELNK remove/restore requests.

For details on the fields contained in the RLENETPIPE and RLENETLINK relations, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx).

3. AUDIT CHECKS

For details on the specific data fields checked by this audit, refer to the specific error code explanation in the **ERROR HANDLING** section of this audit description.

4. ERROR HANDLING

The audit produces the following error code(s).

Table 1 Error Code: ACTION

Error Code:	ACTION
Error Description:	Error is due to one of the following: 0 = The MELNK action is set to SMELASSW but the MEPIPE action does not match. 1 = The MELNK action is invalid. 2 = The MELNK recovery action is invalid. 3 = The MEPIPE action is invalid.

	4 = The MEPIPE recovery action is invalid.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 2 = The audit clears the MELNK recovery action and recovery count fields. 3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. 4 = The audit clears the MEPIPE recovery action and recovery count fields.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2, 3 or 4 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 and 1 = MELNK action (SMelstat[mepipe].elnk[melnk].action). 2 = MELNK recovery action (SMelstat[mepipe].elnk[melnk].rcvy_act). 3 = MEPIPE action (SMelstat[mepipe].action). 4 = MEPIPE recovery action (SMelstat[mepipe].rcvy_act).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MEPIPE action (SMelstat[mepipe].action). 1 and 2 = MELNK state (SMelstat[mepipe].elnk[melnk].state). 3 and 4 = MEPIPE state (SMelstat[mepipe].state).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The

	MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 2 Error Code: AVAIL_CNT

Error Code:	AVAIL_CNT
Error Description:	The audit did not find the expected number of equipped child MELNKs.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit re-initializes MEPIPE (and child MELNK) dynamic data based on information derived from static ODD. If this information indicates that the MEPIPE should be equipped, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with SMP-resident static and dynamic data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	0 = The MEPIPE is not in the INIT state. 1 = The MEPIPE is in the INIT state.
<i>Bad Data =</i>	The number of equipped MELNKs found in MELNK dynamic data.
<i>Good Data =</i>	The number of equipped MELNKs found in MEPIPE dynamic data (SMelstat[mepipe].eq elnks).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 3 Error Code: BADTYPE

Error Code:	BADTYPE
Error Description:	Error is due to one of the following: 0 = The MELNK recovery timer type field is invalid. 1 = The MEPIPE recovery timer type field is invalid.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service.

	1 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0 or 1 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = The MELNK recovery timer type (SMelstat[mepipe].elnk[melnk].rcvy_ttype). 1 = The MEPIPE recovery timer type (SMelstat[mepipe].rcvy_ttype).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = The MELNK recovery timer index (SMelstat[mepipe].elnk[melnk].rcvy_timer). 1 = The MEPIPE recovery timer index (SMelstat[mepipe].rcvy_timer).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 4 Error Code: BILLFLG

Error Code:	BILLFLG
Error Description:	Error is due to one of the following: 0 = The value of the DDRTCDELNK data delivery (DD) key is inconsistent with MELNK status (ACTIVE). 1 = The value of the DDRTCDELNK DD key is inconsistent with MELNK status (DEGRADED). 2 = The value of the DDRTCDELNK DD key is inconsistent with MELNK status (OOS).
Possible Error Effect:	Status information that controls whether real time billing data should be sent to the global billing SM is incorrect. Billing data may be inappropriately buffered (or not buffered) in an originating SM's real time billing memory (RTBM).
Corrective Action Taken:	The audit corrects the DD key.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	The incorrect value of the DD key. Corresponds to the Error Description as follows: 0 and 1 = DDOFFNORMAL.

	2 = DDNORMAL.
<i>Good Data =</i>	The correct value of the DD key. Corresponds to the Error Description as follows: 0 and 1 = DDNORMAL. 2 = DDOFFNORMAL.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 5 Error Code: DYN_STAT

Error Code:	DYN_STAT
Error Description:	Error is due to one of the following: 0 = The MEPIPE is in a valid equipped state and there is a tuple in the RLENETPIPE relation, but there is an inconsistency between static and dynamic data (related to MHEIB and/or hub addresses). 1 = The MELNK is in a valid equipped state and there is a tuple in the RLENETLINK relation, but there is an inconsistency between static and dynamic data (related to far end internet protocol [IP] and hardware [HW] addresses, protocol information, or MELNK service type). 2 = Static data in the RLENETLINK relation indicates that this MELNK should be simplex but dynamic data does not agree.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit re-initializes MEPIPE (and child MELNK) dynamic data based on information derived from static ODD. If this information indicates that the MEPIPE should be equipped, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with SMP-resident static and dynamic data. 1 = The audit re-initializes MELNK dynamic data based on information derived from static ODD. If this information indicates that the MELNK should be equipped, the audit asks ELSP to restore it to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with SMP-resident static and dynamic data. 2 = The audit corrects the dynamic data and then asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows:

	0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = MEPIPE state (SMelstat[mepipe].state). 1 = Identification of data found to be inconsistent: 1 = Far-end IP address. 2 = Far-end HW address. 3 = Protocol/service data. 4 = Far-end IP address and protocol/service data. 5 = Far-end HW address and protocol/service data. 2 = MELNK address number (SMelstat[mepipe].elnk[melnk].addrnum).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = Not applicable. 1 = MELNK state (SMelstat[mepipe].elnk[melnk].state). 2 = Correct MELNK address number (SMEL0ADDR).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1 =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2 =</i>	Corresponds to the Error Description as follows: 0 = Contents of RLENETPIPE tuple. 1 and 2 = Contents of RLENETLINK tuple.

Table 6 Error Code: INV_STATE

Error Code:	INV_STATE
Error Description:	Error is due to one of the following: 0 and 2 = The MEPIPE state is invalid. 1 = The MELNK state is invalid.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit re-initializes MEPIPE (and child MELNK) dynamic data based on information derived from static ODD. If this information indicates that the MEPIPE should be equipped, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with

	SMP-resident static and dynamic data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 and 2 = MEPIPE state (SMelstat[mepipe].state). 1 = MELNK state (SMelstat[mepipe].elnk[melnk].state).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = Not applicable. 1 = MEPIPE state (SMelstat[mepipe].state). 2 = Number of equipped child MELNKs (SMelstat[mepipe].eq_elinks).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1 =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2 =</i>	Corresponds to the Error Description as follows: 0 = Contents of RLENETPIPE tuple. 1 = Contents of RLENETLINK tuple. 2 = Not applicable.

Table 7 Error Code: INV_TIMER

Error Code:	INV_TIMER
Error Description:	Error is due to one of the following: 0 = An MELNK action is in progress without a valid index for an associated timer. 1 = An MELNK recovery timer should be pending but there is no valid timer index. 2 = An MEPIPE action is in progress without a valid index for an associated timer. 3 = An MEPIPE recovery timer should be pending but there is no valid timer index. 4 = An MCTSI/MH long term recovery timer should be pending but there is no valid timer index. 5 = An MCTSI/MH short term recovery timer should be pending but there is no valid timer index.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.

Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 2 and 3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. 4 and 5 = The audit causes ELSP to exit MCTSI/MH recovery and re-initialize the associated data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2, 3, 4 or 5 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action timer (SMelstat[mepipe].elnk[melnk].timer). 1 = MELNK recovery timer (SMelstat[mepipe].elnk[melnk].rcvy_timer). 2 = MEPIPE action timer (SMelstat[mepipe].timer). 3 = MEPIPE recovery timer (SMelstat[mepipe].rcvy_timer). 4 = MCTSI/MH long-term recovery timer index (SMelmcesc.longt_tidx). 5 = MCTSI/MH short-term recovery timer index (SMelmcesc.shortt_tidx).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action (SMelstat[mepipe].elnk[melnk].action). 1 = MELNK recovery timer type (SMelstat[mepipe].elnk[melnk].rcvy_ttype). 2 = MEPIPE action (SMelstat[mepipe].action). 3 = MEPIPE recovery timer type (SMelstat[mepipe].rcvy_ttype). 4 and 5 = MCTSI/MH recovery/escalation state (SMelmcesc.state).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The

	MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	Corresponds to the Error Description as follows: 0, 1, 2 and 3 = The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data). 4 and 5 = The contents of SMelmcesc (MCTSI/MH recovery/escalation data).

Table 8 Error Code: LNKS_MISSING

Error Code:	LNKS_MISSING
Error Description:	The MEPIPE is in the INIT state but the audit did not find any child MELNK being restored.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The audit then asks ELSP to restore the MEPIPE and all child MELNKs to service.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	MEPIPE state (SMelstat[mepipe].state).
<i>Bad Data =</i>	Number of child MELNKs that are being restored (0).
<i>Good Data =</i>	Number of equipped child MELNKs (SMelstat[mepipe].eq_elnks).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 9 Error Code: LNK_CONFIG

Error Code:	LNK_CONFIG
Error Description:	Error is due to one of the following: 0 = MELNK dynamic data indicates that a manual request is in progress but ELSP's manual request buffer is idle. 1 = MELNK dynamic data indicates that no manual request is in progress, but ELSP's manual request buffer indicates that there should be.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit clears the MELNK's manual request indicator. 1 = The audit clears the usage indicator in the manual request buffer.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0 or 1 = The number of the Error Description associated with this error report.

<i>Bad Data =</i>	The manual request buffer usage indicator (SMelmrbuf.in_use).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK manual request indicator (SMelstat[mepipe].elnk[melnk].man_req). 1 = Not applicable.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 10 Error Code: MISSTUP

Error Code:	MISSTUP
Error Description:	Error is due to one of the following: 0 = The MEPIPE is in an equipped state, but the associated RLENETPIPE tuple is not present. 1 = No RLENETLINK tuple exists for the MELNK, but MELNK dynamic data is not consistent with an unequipped MELNK. 2 = The MEPIPE is in the unequipped state, but other dynamic MEPIPE data is not consistent with an unequipped MEPIPE.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 2 = The audit updates dynamic data to indicate that the MEPIPE and child MELNKs are not equipped. 1 = The audit updates dynamic data to indicate that the MELNK is not equipped.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = MEPIPE state (SMelstat[mepipe].state). 1 = MELNK state (SMelstat[mepipe].elnk[melnk].state). 2 = Number of equipped child MELNKs (SMelstat[mepipe].eq_elinks).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 and 1 = The UNEQ state. 2 = MEPIPE state (SMelstat[mepipe].state).

<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 11 Error Code: PARENT

Error Code:	PARENT
Error Description:	Error is due to one of the following: 0 = An MELNK is in a state that requires an ACTIVE parent MEPIPE, but the MEPIPE is not ACTIVE. 1 = An MELNK is in the out-of-service family-of-equipment (OOSFE) state, but the parent MEPIPE is ACTIVE. 2 = The MEPIPE state is not consistent with the number of manually removed child MELNKs. If all child MELNKs are in the OOSMAN state, the MEPIPE should also be OOSMAN. 3 = The MEPIPE is in a stable OOS state, but a child MELNK is in the out-of-service due to fault recovery (OOSFLT) state. This state should not have been preserved when the MEPIPE went OOS.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 2 and 3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2 or 3 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows:

	0 and 1 = MELNK state (SMelstat[mepipe].elnk[melnk].state).
	2 and 3 = MEPIPE state (SMelstat[mepipe].state).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 and 1 = MEPIPE state (SMelstat[mepipe].state). 2 = Number of child MELNKs in the OOSMAN state. 3 = Number of child MELNKs in the OOSFLT state.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 12 Error Code: PORT_BAD

Error Code:	PORT_BAD
Error Description:	The error is due to one of the following: 1 = Incorrect in-service port count for an ACTIVE MELNK. 2 = Incorrect in-service port count for a DEGRADED MELNK. 3 = Incorrect in-service port count for an OOS MELNK.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	MELNK state (SMelstat[mepipe].elnk[melnk].state).
<i>Bad Data =</i>	Actual MELNK in-service port count (SMelstat[mepipe].elnk[melnk].act_ports).
<i>Good Data =</i>	Expected MELNK in-service port count.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).

Table 13 Error Code: STATE_VAR

Error Code:	STATE_VAR
Error Description:	Error is due to one of the following: 0 = ELSP's MCTSI/MH recovery strategy is in an invalid state.

	1 = ELSP's MCTSI/MH recovery strategy is active, even though there is an in-service MELNK and the safe interval timer is not running. 2 = ELSP's MCTSI/MH recovery strategy is active, even though all MELNKs are manually removed from service.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	The audit causes ELSP to exit MCTSI/MH recovery and re-initialize the associated data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows:
	0, 1 or 2 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	MCTSI/MH recovery/escalation state (SMelmcesc.state).
<i>Good Data =</i>	Not applicable.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1 =</i>	Corresponds to the Error Description as follows:
	0 and 2 = The contents of SMelmcesc (MCTSI/MH recovery/escalation data).
	1 = The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2 =</i>	Corresponds to the Error Description as follows:
	0 and 2 = Not applicable.
	1 = The contents of SMelmcesc (MCTSI/MH recovery/escalation data).

Table 14 Error Code: STATUS_BAD

Error Code:	STATUS_BAD
Error Description:	The value of the DDMELNK data delivery (DD) key is incorrect.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed.
Corrective Action Taken:	The audit corrects the DD key.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Not applicable.
<i>Bad Data =</i>	Incorrect value of the DDMELNK key.
<i>Good Data =</i>	Correct value of the DDMELNK key.
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	The contents of SMelstat[0] (MEPIPE/MELNK dynamic data for MEPIPE 0).

Table 15 Error Code: STUCK

Error Code:	STUCK
Error Description:	Error is due to one of the following:

	0 = An MELNK is stuck in the stable OOSFLT state without a recovery timer running. 1 = An MEPIPE is stuck in the stable OOSFLT or OOSL1 state without a recovery timer running.
Possible Error Effect:	MELNK functionality is lost while the MEPIPE/MELNK is stuck in an OOS state. Since no automatic recovery action is pending, recovery will be delayed until the problem is corrected or a manual MELNK restore is requested.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The audit then asks ELSP to restore the MELNK to service. 1 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0 or 1 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK state (SMelstat[mepipe].elnk[melnk].state). 1 = MEPIPE state (SMelstat[mepipe].state).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MEPIPE state (SMelstat[mepipe].state). 1 = Last MEPIPE recovery action (SMelstat[mepipe].rcvy_act).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1 =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2 =</i>	The contents of SMelmcesc (MCTSI/MH recovery/escalation data).

Table 16 Error Code: TID

Error Code:	TID
Error Description:	Error is due to one of the following: 0 = No MELNK action requiring a timer is pending but a timer is apparently running. 1 = No MELNK recovery timer should be pending but a timer is apparently running. 2 = No MEPIPE action requiring a timer is pending but a timer is apparently running.

	3 = No MEPIPE recovery timer should be pending but a timer is apparently running. 4 = ELSP's MCTSI/MH recovery strategy is in the short-term recovery state but there is apparently a long-term recovery timer running. 5 = ELSP's MCTSI/MH recovery strategy is not active, but there is apparently at least one MCTSI/MH recovery timer running.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service. 2 and 3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. 4 = The long term recovery timer is canceled. 5 = The audit causes ELSP to exit MCTSI/MH recovery and re-initialize the associated data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2, 3, 4 or 5 = The number of the Error Description associated with this error report.
<i>Bad Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action timer (SMelstat[mepipe].elnk[melnk].timer). 1 = MELNK recovery timer (SMelstat[mepipe].elnk[melnk].rcvy_timer). 2 = MEPIPE action timer (SMelstat[mepipe].timer). 3 = MEPIPE recovery timer (SMelstat[mepipe].rcvy_timer). 4 = MCTSI/MH recovery long-term timer index (SMelmcesc.longt_tidx).

	5 = MCTSI/MH recovery short-term timer index (SMelmcesc.shortt_tidx).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action (SMelstat[mepipe].elnk[melnk].action). 1 = MELNK recovery timer type (SMelstat[mepipe].elnk[melnk].rcvy_ttype). 2 = MEPIPE action (SMelstat[mepipe].action). 3 = MEPIPE recovery timer type (SMelstat[mepipe].rcvy_ttype). 4 = MCTSI/MH recovery/escalation state (SMelmcesc.state). 5 = MCTSI/MH long-term recovery timer index (SMelmcesc.longt_tidx).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	Corresponds to the Error Description as follows: 0, 1, 2 and 3 = The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data). 4 and 5 = The contents of SMelmcesc (MCTSI/MH recovery/escalation data).

Table 17 Error Code: TIMERLST

Error Code:	TIMERLST
Error Description:	Error is due to one of the following: 0 = An MELNK action requiring a timer is pending but no timer is running. 1 = An MELNK recovery timer should be pending but no timer is running. 2 = An MEPIPE action requiring a timer is pending but no timer is running. 3 = An MEPIPE recovery timer should be pending but no timer is running. 4 = A long-term recovery timer should be pending but no timer is running. 5 = A short-term recovery timer should be pending but no timer is running.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.
Corrective Action Taken:	Corresponds to the Error Description as follows: 0 and 1 = The audit re-initializes MELNK dynamic data that is not derived from static ODD, ensuring that the MELNK is in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MELNK in the OOSMAN state (because it was manually removed) or the OOSFE state (because the parent MEPIPE was removed due to hardware errors), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MELNK to service.

	2 and 3 = The audit re-initializes all MEPIPE (and child MELNK) dynamic data that is not derived from static ODD, ensuring that the MEPIPE and MELNK(s) are in a stable out-of-service state. The OOSMAN (manually removed) state is preserved. If this data initialization leaves the MEPIPE in the OOSMAN state (because all child MELNKs were manually removed), the audit asks ELSP to initiate an MEPIPE/MELNK status audit to ensure data consistency between the SMP and MH. Otherwise, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. 4 and 5 = The audit causes ELSP to exit MCTSI/MH recovery and re-initialize the associated data.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0, 1, 2, 3, 4 or 5 = Indicates error description, error effect, corrective action and dump.
<i>Bad Data =</i>	Timer tag value of the missing timer.
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = MELNK action (SMelstat[mepipe].elnk[melnk].action). 1 = MELNK recovery timer type (SMelstat[mepipe].elnk[melnk].rcvy_ttype). 2 = MEPIPE action (SMelstat[mepipe].action). 3 = MEPIPE recovery timer type (SMelstat[mepipe].rcvy_ttype). 4 and 5 = MCTSI/MH recovery/escalation state (SMelmcsc.state).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump =</i>	Corresponds to the Error Description as follows: 0, 1, 2 and 3 = The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data). 4 and 5 = The contents of SMelmcsc (MCTSI/MH recovery/escalation data).

Table 18 Error Code: UNEQUIP

Error Code:	UNEQUIP
Error Description:	Error is due to one of the following: 0 = An MELNK is in the unequipped state but there is an associated tuple in RLENETLINK. 1 = An MEPIPE is in the unequipped state but there is an equipped child MELNK.
Possible Error Effect:	MEPIPE/MELNK maintenance data is incorrect or inconsistent. As a result, incorrect status may be reported and/or displayed. Attempts to configure the MELNKs may fail. MEPIPE/MELNK data problems may be reported using asserts and REPT TRBL output messages. If an MEPIPE or MELNK is out-of-service, recovery may be delayed until the problem is corrected.

Corrective Action Taken:	Corresponds to the Error Description as follows: 0 = The audit re-initializes MEPIPE (and child MELNK) dynamic data based on information derived from static ODD. If this information indicates that the MEPIPE should be equipped, the audit asks ELSP to restore the MEPIPE and all child MELNKs to service. Otherwise, the audit just refreshes MH-resident data to ensure consistency with SMP-resident static and dynamic data. 1 = The audit updates dynamic data to indicate that the MEPIPE and all child MELNKs are unequipped.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Corresponds to the Error Description as follows: 0 or 1 = Indicates error description, error effect, corrective action and dump.
<i>Bad Data =</i>	MELNK state (SMelstat[mepipe].elnk[melnk].state).
<i>Good Data =</i>	Corresponds to the Error Description as follows: 0 = Not applicable. 1 = MEPIPE state (SMelstat[mepipe].state).
<i>Logical Index =</i>	A four byte value indicating the MEPIPE and MELNK numbers associated with the error. The MEPIPE number is reported in the most significant two bytes and may be SMELNULLEPIPE (0x3) if the error is not associated with a specific MEPIPE. The MELNK number is reported in the least significant two bytes and may be SMELNULLELNK (0xf) if the error is not associated with a specific MELNK.
<i>Dump 1 =</i>	The contents of SMelstat[mepipe] (MEPIPE/MELNK dynamic data).
<i>Dump 2 =</i>	Corresponds to the Error Description as follows: 0 = Contents of RLENETLINK tuple. 1 = Not applicable.

Table 19 Error Code: ZAP

Error Code:	ZAP
Error Description:	This error occurs as a result of a write protect violation, out-of-range read, or invalid operation by audit code.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	Re-initialize all data that could have made the audit cause a system reset.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Not applicable.
<i>Bad Data =</i>	Not applicable.
<i>Good Data =</i>	Not applicable.
<i>Logical Index =</i>	Not applicable.
<i>Dump =</i>	Not applicable.

MEM

Software Release: 5E10 and later

1. MULTILINE HUNT GROUP MEMBER STATUS (MEM) AUDIT

To process a call during the stand alone (SA), the routing and terminal allocation (RTA) routing process in the remote switching module (RSM) and in the optically remote module (ORM) must determine which ports are available for terminating calls. Information about a small (up to 64 members) multi-line hunt group (MLHG) is kept on bit maps, with each bit representing a member of the MLHG. The bit map is included in each tuple in the MLHG status relation (RLMEM). When a member is populated for a MLHG, the corresponding bit must be set to "1" to indicate that the member is active. If the member is not active, the bit must be set to "0". The relation RLMEM is created during the SA condition in a RSM/ORM for all global MLHG members for which that switching module (SM) is the hunting SM and for all global members that have ports in that SM.

The MLHG member status audit (MEM) checks tuples in the dynamic relation RLMEM for an extra tuple. It also performs a check on the status bit for each group. The MEM audit verifies with the static relations RLGROUP_PORT/RLPSGRP_PRT that for each MLHG member that is set to "1", is a valid active member.

In the RSM/ORM, the audit operates in the operating system for distributed switching-switching module (OSDS-SM) environment in the segmented mode. This audit is scheduled only during the SA mode.

2. DATA STRUCTURES

The data structures checked by the MEM audit are the group and member number to the port relation (RLGROUP_PORT), and the packet switching multiline/trunk group and member number to the packet switching port relation (RLPSGP_PRT).

The RLGROUP_PORT and RLPSGP_PRT relations are static (write-protected) relations that contain information about all global MLHG ports. For every member of the global MLHG, a rIGROUP_PORT/rIPSGP_PRT tuple must exist in the SM which owns the port, in the designated hunting SM, and in the designated routing SM. The rIPSGP_PRT is populated only for RTH_PSUCD and RTH_PSLGUCD hunt types (packet switching ports), while rIGROUP_PORT is populated for all other MLHG hunt types.

3. AUDIT CHECKS

The MEM audit uses the static driver (DRSTATIC) to step through the RLMEM relation and sequentially retrieve tuples. The DRSTATIC driver invokes a semantic check function that verifies each rIMEM tuple against the rIGROUP_PORT/rIPSGP_PRT tuples by using the key (group number) of rIMEM to read the static relations. The audit looks specifically for members that are marked as active in the RLMEM relation, but for which there is no corresponding tuple in the static relation.

4. ERROR HANDLING

Excess tuples, tuples for which all members are not active, are deleted from the relation. Bits that are set to "1" (active) for which there are no MLHG members associated with it, are corrected to "0" (not active). If a tuple of the member status relation contains an invalid data in its key, the key is corrected.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: EXTRATUP

Error Code:	EXTRATUP

Error Description:	All members of audited rMEM tuple are invalid (0) and therefore the tuple should not exist.
Possible Error Effect:	An ASSERT will fire if this tuple is not found after trying to retrieve it.
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of pointer to actual tuple.
<i>Bad Data</i> =	Key of the bad tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Key of the bad tuple.
<i>Dump</i> =	rMEM tuple.

Table 2 Error Code: INVLIST

Error Code:	INVLIST
Error Description:	Audit cannot find static rRTMHG tuple using dynamic rMEM key.
Possible Error Effect:	An error will report if this tuple is not found.
Corrective Action Taken:	The dynamic rMEM tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rRT MHG tuple.
<i>Bad Data</i> =	The key of rMEM tuple.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 3 Error Code: INVMEM

Error Code:	INVMEM
Error Description:	The corresponding member in the dynamic relations rMEM was incorrectly initialized to valid ("1").
Possible Error Effect:	Initialization was wrong and calls will fail to that member.
Corrective Action Taken:	The member will be set to invalid ("0").
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rMEM tuple.
<i>Bad Data</i> =	NA.
<i>Good Data</i> =	0 (invalid member).
<i>Logical Index</i> =	grpnum of this tuple.
<i>Dump</i> =	rMEM tuple.

Table 4 Error Code: KEY

Error Code:	KEY
Error Description:	A DAGETMEM macro returns a pointer whose key does not match the tuple buffer key of rMEM tuple.
Possible Error Effect:	Use of this tuple might propagate errors.
Corrective Action Taken:	The correct value of the key will be inserted in the tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the rLMEM tuple having the wrong key.
<i>Bad Data</i> =	The key value of pointer to tuple.
<i>Good Data</i> =	The key value of tuple buffer pointer.
<i>Logical Index</i> =	The correct value of the key.
<i>Dump</i> =	The contents of the rMEM tuple with the wrong key.

Table 5 Error Code: MEMBAD

Error Code:	MEMBAD
Error Description:	The status of SM indicate normal and this dynamic tuple rMEM should not exist in this situation.
Possible Error Effect:	Incorrect busy/idle status may exist for this Multiline Hunt Group.
Corrective Action Taken:	The dynamic rLGEM tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rMEM tuple buffer.

<i>Bad Data</i> =	The key of rILGMEM tuple.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 6 Error Code: TYPE

Error Code:	TYPE
Error Description:	The group is of the wrong hunt type as indicated in rIRT_MHG tuple for the group number in rIMEM relation.
Possible Error Effect:	An error will report if this group's hunt type is not of the type used in rIMEM (that is, RTH_REGULAR, RTH_CIRCULAR, RTH_UCD, RTH_PSUCD, RTH_PPSMHG, or RTH_ISAT).
Corrective Action Taken:	The tuple is deleted.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIMEM tuple.
<i>Bad Data</i> =	Hunt type of the group.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	grpnum of rIMEM tuple used to access rIRT_MHG tuple.
<i>Dump</i> =	rIRTMHG tuple.

MEMMAN-A

Software Release: 5E10 - 5E12

1. MEMORY MANAGEMENT (MEMMAN) AUDIT

The software demand paging (SDP) package, a database memory manager, allocates memory within the write-protected office-dependent database (ODD), disk ODD, and the unprotected database based on the availability information stored in bit maps. The SDP bit maps keep track of the space within the ODD, disk ODD, and unprotected database. Each bit corresponds to a block of memory. The runtime access dictionary entries contain pointers (block IDs) to data pages in the ODD, disk ODD, and unprotected database, and to head tables of relations. One access dictionary entry is allocated for each version of a relation in the database. Each entry contains access information for the associated relation version, including a head table index and information about the relation. In Figure 1, for example, the block ID of the entry for relation 1 points to a data page in the ODD; relation 1 is therefore a static one-level indexed relation. The data pages for static two-level indexed, static hash, and static sequential relations such as relation 2 also reside in the ODD. Dynamic relations have their head tables in the ODD and their data pages in unprotected memory. Relation 3 is a dynamic hash or dynamic indexed relation. The indexed head table contains indices that define the data pages that make up the relation version. Relation 4 is a static three-level indexed relation. The head table has indices to all the intermediate data pages (IDPs). The IDPs have indices to data pages.

Memory management of the ODD must ensure that no data pages are lost to the system. The memory management audit (MEMMAN) verifies that the software demand paging package record of memory block usage corresponds to the actual memory blocks in use. If SDP has an unused memory block marked as used, the block is unavailable or lost. If SDP has a used memory block marked as unused, it may overwrite the existing data with new data. The audit detects these inconsistencies and corrects the SDP bit map and internal ODD free lists as appropriate. It also performs several checks on the transaction dictionary blocks because the local log pages of update transactions are in the ODD.

The MEMMAN audit is part of the Data Base audits subgroup. It runs in the OKP and operating system for distributed switching-switching module (OSDS-SM) environments in the segmented mode.

2. DATA STRUCTURES

The memory used to store relations is organized into units called *blocks* and *pages*. A block contains 256 contiguous bytes of memory (note that the term "block" has a different meaning when used in this context than when used synonymously with "tuple" as in an access dictionary block). A page is a set of 1, 2, 4, 8, 16, 32, or 64 contiguous blocks. All the data pages that make up a given relation have the same number of blocks. The number of blocks per page is contained in the access dictionary. This information is used by the audit in conjunction with the relation's head table (if any) to determine which blocks are used by the relation.

The MEMMAN audit checks eight bit maps and two dictionaries to ensure the consistency of availability information about the ODD. The eight bitmaps are divided into two sets, one set for the memory ODD and another for the DISK ODD. The memory ODD includes the static ODD and the dynamic database. Each set has two bitmaps which are complements of each other that are used by the audit to note relation ownership of each block. Another bit map in each set, maintained by SDP, contains one bit per block that stores the allocated/available status for each block. SDP uses this bit map to allocate and deallocate blocks for use as head tables or data pages. In addition, the memory ODD portion of the audit creates two bitmaps that audit the free page lists built into the free ODD pages. Figure 1, shows the layout of system memory, including the ODD. The MEMMAN audit initializes two audit-owned bit maps based on information in the access dictionary and another two bit maps for the memory ODD free page list audit. All these bit maps are checked for consistency with each other and the actual available memory space.

The two dictionaries used by the MEMMAN audit are the runtime access dictionary and the transaction dictionary. The access dictionary contains information about all the relations within ODD. There is an access block in the access dictionary for each version of each relation; it provides the block ID of a head table in ODD. The head table

contains an array of block IDs that point to data pages. The transaction dictionary manages all transactions; the transactions are used primarily by the Recent Change/Verify and Maintenance subsystems.

3. AUDIT CHECKS

The steps of the MEMMAN audit are as follows.

- (a) In its first real-time segment, the audit initializes its four relation ownership bit maps (two relating to the memory ODD and two relating to the disk ODD). The first bit map of each set is initialized to zeros and the second to ones. The first and second bit maps are thus one's complements of each other; this setup provides an internal consistency check for the audit.
- (b) The audit uses the head table pointer of the current access dictionary block to locate the associated head table. It then uses the head table to determine which data pages or IDPs are used to store the associated relation. The number of blocks per page for the relation is in the access dictionary. This information allows the audit to determine which blocks are used to store the relation. Next, the audit compares this block usage information with the block usage information contained in the SDP bit map. There are two possible results: the status of a used block claimed by the audit agrees with the bit map, or the audit claims that a block is used and the bit map claims that it is unused. The second case is an error and the audit simply marks the bit in the SDP bit map to show the block as used. It is also possible that the bit map claims that a block is used when it is not, but the audit cannot determine this until all the access blocks have been read through. During this processing, the audit marks its bit maps for blocks that are found to be used.
- (c) The audit then performs garbage collection. Garbage results from purged processes not cleaned up by the transaction manager or other database audits. Garbage may also result from pages lost because of interrupted transactions. After processing all the access blocks, the audit compares its auxiliary bit maps to the SDP bit map. If a bit is found to be marked as used in the SDP bit map but not in the auxiliary bit map, the audit clears the bit in the SDP bit map.
- (d) The next phase of the audit concerns auditing the integrity of the free lists. The free lists are organized as follows: Each free page of a given size is placed into a linked list of other pages of that size. The forward and previous links to other blocks on the list are stored within the ODD at the page's physical location. SDP maintains a list of the head blocks of each size's list. Blocks are allocated and freed according to a Buddy Block strategy in which adjacent blocks may be coalesced or split depending on the block size requested and the current block distribution. The audit checks that each page is assigned to the appropriate list, that the linkages are consistent and that every block of memory is accounted for.
- (e) The audit then checks the usage of the tuple cache pages. These are pages of the ODD seized by the tuple cache manager to provide space for temporary copies of tuples in memory prior to committal of a transaction. The audit verifies that the internal cache bitmaps are consistent with the contents of the cache.
- (f) The audit checks the global office parameters by marking them according to information in the ODD. The audit performs the checks on one access block per real-time segment. When comparing the auxiliary and SDP bit maps, it processes two bytes of the bit map per segment. The state of the audit is saved before taking a segment break to allow the audit to resume at the correct point when control returns from OSDs.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ABID

Error Code:	ABID
Error Description:	The MEMMAN audit finds an out-of-range block ID (trn_log).
Possible Error Effect:	This update transaction loses its local log.
Corrective Action Taken:	None.
Manual Action Required:	Run the TRNDC audit.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Transaction ID.
<i>Dump</i> =	NA.

Table 2 Error Code: ALIGNMENT

Error Code:	ALIGNMENT
Error Description:	A free page begins on an illegal boundary for its page size. For example, a 2-block page cannot begin at block 1 but may begin at block 2 or 4.
Possible Error Effect:	Memory fragmentation.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the page in error. The removed pages are subsequently reclaimed during garbage collection. The corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the byte in the free page bitmap where the misalignment was detected.
<i>Bad Data</i> =	Incorrect block ID stored in the pages to/from link.
<i>Good Data</i> =	Block ID of the last good page on the list.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 3 Error Code: BUDDY

Error Code:	BUDDY
Error Description:	The buddy page for any given available page is also free. The buddy page is defined as one which is: - the same size (for example, both 256 bytes, 512 bytes, and so on). - adjacent (for example, block 0 and block 1 for 256 byte pages). - properly aligned (for example, block 0 and block 1, block 2 and block 3, but not block 1 and block 2) to a given page. This is an error condition because it violates the constraints of the memory management algorithms.
Possible Error Effect:	This can unnecessarily fragment office-dependent data (ODD) memory. For example, if two 8K buddies exist on the 8K free list and a request for a 16-Kbyte page is made, and no page exists on the 16K free list, new memory is allocated for the ODD section before the request is satisfied. If new memory cannot be allocated, then the request cannot be satisfied.
Corrective Action Taken:	Free buddies are coalesced and put on the free lists for their combined page size.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the free page bitmap where the free buddy was located.
<i>Bad Data</i> =	Block ID of the free page's buddy.
<i>Good Data</i> =	Block ID of the original free page.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512

	list, and so forth.
<i>Dump</i> =	NA.

Table 4 Error Code: CHBKAU

Error Code:	CHBKAU
Error Description:	The audit of the tuple cache bit map (DBchbkmp) has found a cache block incorrectly marked as used. This bit map is used to mark tuple caching blocks as used or not (1 - used, 0 - not in use).
Possible Error Effect:	The cache block is unavailable for use. This is a loss of resource.
Corrective Action Taken:	The appropriate bit (which is in error) representing a cache block is set to zero (marking it as free).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of four byte section of the cache block bit map which contains the error (part of the area pointed to by DBchbkmp).
<i>Bad Data</i> =	Four byte section of cache block bit map containing error.
<i>Good Data</i> =	Four byte section of cache block bit map containing error.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	32 cache blocks corresponding to the 4 byte section of DBchbkmp which had the bad status.

Table 5 Error Code: CNVACCBID

Error Code:	CNVACCBID
Error Description:	An access dictionary block ID of any relation in the RODD is detected by MEMMAN as not being converted by the ODD BST PROCESS.
Possible Error Effect:	Since this was caught and converted by the MEMMAN audit, it has been corrected. This would only be a warning.
Corrective Action Taken:	The access dictionary block ID is converted.
Manual Action Required:	None. See Corrective Action Taken .
Dump Description:	
<i>Error Address</i> =	Address of the invalid access dictionary block ID the RODD relation.
<i>Bad Data</i> =	The invalid access dictionary block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The whole access dictionary entry for the RODD relation that has had its access dictionary block ID converted.

Table 6 Error Code: CNVHDBID

Error Code:	CNVHDBID
Error Description:	A head table block ID of a two-level or a three-level indexing relation in the RODD is detected by MEMMAN as not being converted by the ODD BST process.
Possible Error Effect:	Since this was caught and converted by the MEMMAN audit, it has been corrected. This would only be a warning.
Corrective Action Taken:	The head table block ID is converted.
Manual Action Required:	None. See Corrective Action Taken .
Dump Description:	
<i>Error Address</i> =	Address of the invalid head table block ID of a 2 or a 3-level indexing relation.
<i>Bad Data</i> =	The invalid head table block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The whole access dictionary entry for the two-level or three-level indexing relation that has had its head table block ID converted.

Table 7 Error Code: CNVIPBID

Error Code:	CNVIPBID
Error Description:	An intermediate page block ID of a three-level indexing relation in the RODD is detected by MEMMAN as not being converted by the ODD BST PROCESS.
Possible Error Effect:	Since this was caught and converted by the MEMMAN audit, it has been corrected. This would only be a warning.

Corrective Action Taken:	The intermediate page block ID is converted.
Manual Action Required:	None. See Corrective Action Taken .
Dump Description:	
<i>Error Address</i> =	Address of the invalid intermediate page block ID of a three-level indexing relation.
<i>Bad Data</i> =	The invalid intermediate page block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The whole access dictionary entry for the three-level indexing relation that has had its intermediate page converted.

Table 8 Error Code: CONFLICT

Error Code:	CONFLICT
Error Description:	A data page is marked as being in use in the official software demand paging (SDP) bitmap, and is also marked as being available on one of the free lists.
Possible Error Effect:	The memory management code ensures that the same block ID will never be allocated twice. However, the list is corrupt and the code will fire an assert and fail the request should there be an attempt to seize an already seized block.
Corrective Action Taken:	The free list is terminated at the entry immediately preceding the page in conflict, and the remainder of the list that is legitimately free is restored to the free list during garbage collection. The corrective action for this error can cause an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the SDP bitmap in which the block is found to be set as in use.
<i>Bad Data</i> =	Block ID of the block in conflict.
<i>Good Data</i> =	Block ID of the last good block in the free list.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 9 Error Code: DATABID

Error Code:	DATABID
Error Description:	An out-of-range data page block ID of a memory-resident relation is detected by MEMMAN.
Possible Error Effect:	This may cause the loss of a data page for a memory resident relation.
Corrective Action Taken:	None.
Manual Action Required:	A DB manual action assert is fired along with this audit error report to help find out which relation has lost a data page.
Dump Description:	
<i>Error Address</i> =	Address of the invalid data page block ID of a memory-resident relation.
<i>Bad Data</i> =	Invalid data page block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry for the memory-resident relation that has lost a data page. NOTE: Any bad block ID of one of the pages on the free list will trigger a MEMMAN DATABID error. However, since the pages on the free list are not associated with a relation, there will be no access dictionary entry and therefore no dump will be provided.

Table 10 Error Code: DISKBID

Error Code:	DISKBID
Error Description:	An out-of-range data page block ID for a disk relation is detected by MEMMAN.
Possible Error Effect:	This may cause the loss of a data page of a disk relation.
Corrective Action Taken:	None.
Manual Action Required:	A DB manual action assert is fired with this audit error report to help find out

	what disk relation has lost a data page.
Dump Description:	
<i>Error Address</i> =	Address of the out-of-range data page block ID on the head table for a disk relation.
<i>Bad Data</i> =	Invalid block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry for the disk relation that lost a data page.

Table 11 Error Code: DUPLI

Error Code:	DUPLI
Error Description:	The free page list for pages of a certain size contains a page with a block ID that is also claimed as part of the free page list for pages of a different size.
Possible Error Effect:	The memory management code ensures that the same block ID will never be allocated twice. However the list is corrupt, and the code will fire an assert and fail the request should there be an attempt to seize an already seized block.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the duplicated page, and the remainder of the list is restored to the free list during garbage collection. The corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the free page bitmap where the duplicate was located.
<i>Bad Data</i> =	Block ID of the duplicated block.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 12 Error Code: GRBG

Error Code:	GRBG
Error Description:	The database SDP system incorrectly believes that a data page is in use.
Possible Error Effect:	If too many data pages are believed to be seized, recent change will not be able to make updates.
Corrective Action Taken:	The data page is marked as being free in the bit map maintained by the software demand paging system.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	Corrected byte of the SDP bit map.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 13 Error Code: HEADBID

Error Code:	HEADBID
Error Description:	An out-of-range head Table block ID is found in the access dictionary.
Possible Error Effect:	This causes the loss of a relation, and it may also cause DB to assert.
Corrective Action Taken:	This head table block ID is zeroed out in the access dictionary.
Manual Action Required:	A DB manual action assert is fired with this error code to catch the attention of maintenance personnel. The manual action assert dump and the audit error dump should be used to figure out which relation is bad.
Dump Description:	
<i>Error Address</i> =	Address of the head table block ID in the access dictionary.
<i>Bad Data</i> =	Out-of-range block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry to show the relation ID, and so forth.

Table 14 Error Code: IPBID

Error Code:	IPBID
Error Description:	An out-of-range intermediate page block ID of a three-level indexing relation is detected by MEMMAN.
Possible Error Effect:	This may cause the loss of several data pages for a three-level indexing relation.
Corrective Action Taken:	None.
Manual Action Required:	A DB manual action assert is fired along with this audit error report to catch the attention of maintenance personnel to find out which three-level indexing relation has lost an intermediate page.
Dump Description:	
<i>Error Address</i> =	Address of the invalid intermediate page block ID of a three-level indexing relation.
<i>Bad Data</i> =	Invalid intermediate page block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry for the three-level indexing relation that has lost an intermediate page.

Table 15 Error Code: LINKS

Error Code:	LINKS
Error Description:	The <i>from</i> link in a free page list element is incorrect.
Possible Error Effect:	Some free page list elements may be inaccessible. This contributes to memory fragmentation.
Corrective Action Taken:	The free list is terminated at the entry immediately preceding the element in error, and the remainder of the list is restored to the free list during garbage collection. The corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the free list element.
<i>Bad Data</i> =	Incorrect block ID stored in the from link
<i>Good Data</i> =	Block ID of the last good page on the list.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 16 Error Code: LOGNULL

Error Code:	LOGNULL
Error Description:	The MEMMAN audit finds an inconsistent update transaction entry.
Possible Error Effect:	Either this update transaction loses its local log, or this transaction is not an update transaction.
Corrective Action Taken:	None.
Manual Action Required:	Run TRNDC audit.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Transaction ID.
<i>Dump</i> =	NA.

Table 17 Error Code: LOOP

Error Code:	LOOP
Error Description:	The free page list contains two references to the same block ID for the same size free page, causing a cycle.
Possible Error Effect:	Any free pages of the same size that would have followed the cycling page are now inaccessible and thus unavailable for allocation.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the cycling page, and the remainder of the list is restored to the free list during garbage collection.

	This corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the free page bitmap where the cycle occurs.
<i>Bad Data</i> =	Block ID of the page in error.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 18 Error Code: MVER

Error Code:	MVER
Error Description:	The database SD) system believes that a data page is free when the data page is actually in use.
Possible Error Effect:	If the data page is allocated for another relation, the two relations will overwrite each other on the same data page.
Corrective Action Taken:	The data page is marked as being seized in the bit map maintained by the software demand paging system.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	Corrected byte of the SDP bit map.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 19 Error Code: SIZE

Error Code:	SIZE
Error Description:	The page size that is stored within a free page is not consistent with the free list on which the page is found.
Possible Error Effect:	The memory management code ensures that the same block ID will never be allocated twice. However, the list is corrupt and the code will fire an assert and fail the request should there be an attempt to seize an already seized block.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the corrupted list entry, and the remainder of the list is restored to the free list during garbage collection. The corrective action for this error will cause an UNCLAIMED report during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the page with the mismatched size.
<i>Bad Data</i> =	Incorrect page size, as found within the page.
<i>Good Data</i> =	Correct page size as appropriate for the list.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 20 Error Code: TPBKAU

Error Code:	TPBKAU
Error Description:	The audit of the tuple block bit map (DBtpbkmp) has found a tuple block incorrectly marked as used. This bit map is used to mark tuple blocks as used or not (1 - used, 0 - not in use).
Possible Error Effect:	The tuple block is unavailable for use. This is a loss of resource.
Corrective Action Taken:	The appropriate bit (which is in error) representing a tuple block is set to zero (marking it as free).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of four byte section of the tuple block bit map which contains the error (part of the area pointed to by DBtpbkmp).
<i>Bad Data</i> =	Four byte section of tuple block bit map containing error.
<i>Good Data</i> =	Four byte section corrected.

<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 21 Error Code: UNCLAIMED

Error Code:	UNCLAIMED
Error Description:	The database SDP system bitmap has one or more blocks marked as free that do not appear on the free page lists.
Possible Error Effect:	Pages that are not on the free lists will never be put to use. The blocks are then unusable. If too many free pages are not on the free lists, the ODD may have to be grown unnecessarily, or possibly recent change updates may be blocked.
Corrective Action Taken:	The blocks are placed on the appropriate free lists.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect available audit bit map byte.
<i>Bad Data</i> =	Contents of the incorrect byte of the available bit map.
<i>Good Data</i> =	Contents of what the available bit map byte should be.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 22 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to perform recovery after a system interrupt (such as write protect, out-of-range read, and so forth.)
Possible Error Effect:	May cause further resets, audits and or asserts.
Corrective Action Taken:	None, all data that would have caused the reset is reinitialized on the next invocation of the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

MEMMAN-B

Software Release: 5E13 only

1. MEMORY MANAGEMENT (MEMMAN) AUDIT

The software demand paging (SDP) package, a database memory manager, allocates memory within the write-protected office-dependent database (ODD), disk ODD, and the unprotected database based on the availability information stored in bit maps. The SDP bit maps keep track of the space within the ODD, disk ODD, and unprotected database. Each bit corresponds to a block of memory. The runtime access dictionary entries contain pointers (block IDs) to data pages in the ODD, disk ODD, and unprotected database, and to head tables of relations. One access dictionary entry is allocated for each version of a relation in the database. Each entry contains access information for the associated relation version, including a head table index and information about the relation. In Figure 1, for example, the block ID of the entry for relation 1 points to a data page in the ODD; relation 1 is therefore a static one-level indexed relation. The data pages for static two-level indexed, static hash, and static sequential relations such as relation 2 also reside in the ODD. Dynamic relations have their head tables in the ODD and their data pages in unprotected memory. Relation 3 is a dynamic hash or dynamic indexed relation. The indexed head table contains indices that define the data pages that make up the relation version. Relation 4 is a static three-level indexed relation. The head table has indices to all the intermediate data pages (IDPs). The IDPs have indices to data pages.

Memory management of the ODD must ensure that no data pages are lost to the system. The memory management audit (MEMMAN) verifies that the software demand paging package record of memory block usage corresponds to the actual memory blocks in use. If SDP has an unused memory block marked as used, the block is unavailable or lost. If SDP has a used memory block marked as unused, it may overwrite the existing data with new data. The audit detects these inconsistencies and corrects the SDP bit map and internal ODD free lists as appropriate. It also performs several checks on the transaction dictionary blocks because the local log pages of update transactions are in the ODD.

The MEMMAN audit is part of the Data Base audits subgroup. It runs in the OKP and operating system for distributed switching-switching module (OSDS-SM) environments in the segmented mode.

2. DATA STRUCTURES

The memory used to store relations is organized into units called *blocks* and *pages*. A block contains 256 contiguous bytes of memory (note that the term "block" has a different meaning when used in this context than when used synonymously with "tuple" as in an access dictionary block). A page is a set of 1, 2, 4, 8, 16, 32, or 64 contiguous blocks. All the data pages that make up a given relation have the same number of blocks. The number of blocks per page is contained in the access dictionary. This information is used by the audit in conjunction with the relation's head table (if any) to determine which blocks are used by the relation.

The MEMMAN audit checks eight bit maps and two dictionaries to ensure the consistency of availability information about the ODD. The eight bitmaps are divided into two sets, one set for the memory ODD and another for the DISK ODD. The memory ODD includes the static ODD and the dynamic database. Each set has two bitmaps which are complements of each other that are used by the audit to note relation ownership of each block. Another bit map in each set, maintained by SDP, contains one bit per block that stores the allocated/available status for each block. SDP uses this bit map to allocate and deallocate blocks for use as head tables or data pages. In addition, the memory ODD portion of the audit creates two bitmaps that audit the free page lists built into the free ODD pages. Figure 1, shows the layout of system memory, including the ODD. The MEMMAN audit initializes two audit-owned bit maps based on information in the access dictionary and another two bit maps for the memory ODD free page list audit. All these bit maps are checked for consistency with each other and the actual available memory space.

The two dictionaries used by the MEMMAN audit are the runtime access dictionary and the transaction dictionary. The access dictionary contains information about all the relations within ODD. There is an access block in the access dictionary for each version of each relation; it provides the block ID of a head table in ODD. The head table

contains an array of block IDs that point to data pages. The transaction dictionary manages all transactions; the transactions are used primarily by the Recent Change/Verify and Maintenance subsystems.

3. AUDIT CHECKS

The steps of the MEMMAN audit are as follows.

- (a) In its first real-time segment, the audit initializes its four relation ownership bit maps (two relating to the memory ODD and two relating to the disk ODD). The first bit map of each set is initialized to zeros and the second to ones. The first and second bit maps are thus one's complements of each other; this setup provides an internal consistency check for the audit.
- (b) The audit uses the head table pointer of the current access dictionary block to locate the associated head table. It then uses the head table to determine which data pages or IDPs are used to store the associated relation. The number of blocks per page for the relation is in the access dictionary. This information allows the audit to determine which blocks are used to store the relation. Next, the audit compares this block usage information with the block usage information contained in the SDP bit map. There are two possible results: the status of a used block claimed by the audit agrees with the bit map, or the audit claims that a block is used and the bit map claims that it is unused. The second case is an error and the audit simply marks the bit in the SDP bit map to show the block as used. It is also possible that the bit map claims that a block is used when it is not, but the audit cannot determine this until all the access blocks have been read through. During this processing, the audit marks its bit maps for blocks that are found to be used.
- (c) The audit then performs garbage collection. Garbage results from purged processes not cleaned up by the transaction manager or other database audits. Garbage may also result from pages lost because of interrupted transactions. After processing all the access blocks, the audit compares its auxiliary bit maps to the SDP bit map. If a bit is found to be marked as used in the SDP bit map but not in the auxiliary bit map, the audit clears the bit in the SDP bit map.
- (d) The next phase of the audit concerns auditing the integrity of the free lists. The free lists are organized as follows: Each free page of a given size is placed into a linked list of other pages of that size. The forward and previous links to other blocks on the list are stored within the ODD at the page's physical location. SDP maintains a list of the head blocks of each size's list. Blocks are allocated and freed according to a Buddy Block strategy in which adjacent blocks may be coalesced or split depending on the block size requested and the current block distribution. The audit checks that each page is assigned to the appropriate list, that the linkages are consistent and that every block of memory is accounted for.
- (e) The audit then checks the usage of the tuple cache pages. These are pages of the ODD seized by the tuple cache manager to provide space for temporary copies of tuples in memory prior to committal of a transaction. The audit verifies that the internal cache bitmaps are consistent with the contents of the cache.
- (f) The audit checks the global office parameters by marking them according to information in the ODD. The audit performs the checks on one access block per real-time segment. When comparing the auxiliary and SDP bit maps, it processes two bytes of the bit map per segment. The state of the audit is saved before taking a segment break to allow the audit to resume at the correct point when control returns from OSDs.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ABID

Error Code:	ABID
Error Description:	The MEMMAN audit finds an out-of-range block ID (trn_log).
Possible Error Effect:	This update transaction loses its local log.
Corrective Action Taken:	None.
Manual Action Required:	Run the TRNDC audit.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Transaction ID.
<i>Dump</i> =	NA.

Table 2 Error Code: ALIGNMENT

Error Code:	ALIGNMENT
Error Description:	A free page begins on an illegal boundary for its page size. For example, a 2-block page cannot begin at block 1 but may begin at block 2 or 4.
Possible Error Effect:	Memory fragmentation.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the page in error. The removed pages are subsequently reclaimed during garbage collection. The corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the byte in the free page bitmap where the misalignment was detected.
<i>Bad Data</i> =	Incorrect block ID stored in the pages to/from link.
<i>Good Data</i> =	Block ID of the last good page on the list.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 3 Error Code: ARRAY-ENTRY-BAD

Error Code:	ARRAY-ENTRY-BAD
Error Description:	Tuples in the ODD data dictionary relations must have corresponding entries in runtime data dictionaries dbrelidx and/or dbdrlidx. A runtime dictionary entry could not be located or was found on another location for the ODD data dictionary relation identified in the error address.
Possible Error Effect:	Failed or incomplete transactions or initializations or a possible overwrite has occurred.
Corrective Action Taken:	The faulty runtime data dictionary has been updated to contain the missing ODD data dictionary information followed by this report.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Relation ID of the ODD data dictionary relation in error.
<i>Bad Data</i> =	Key of the mismatched ODD data dictionary relation tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 4 Error Code: BUDDY

Error Code:	BUDDY
Error Description:	The buddy page for any given available page is also free. The buddy page is defined as one which is: - the same size (for example, both 256 bytes, 512 bytes, and so on). - adjacent (for example, block 0 and block 1 for 256 byte pages). - properly aligned (for example, block 0 and block 1, block 2 and block 3,

	but not block 1 and block 2) to a given page.
	This is an error condition because it violates the constraints of the memory management algorithms.
Possible Error Effect:	This can unnecessarily fragment office-dependent data (ODD) memory. For example, if two 8K buddies exist on the 8K free list and a request for a 16-Kbyte page is made, and no page exists on the 16K free list, new memory is allocated for the ODD section before the request is satisfied. If new memory cannot be allocated, then the request cannot be satisfied.
Corrective Action Taken:	Free buddies are coalesced and put on the free lists for their combined page size.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the free page bitmap where the free buddy was located.
<i>Bad Data</i> =	Block ID of the free page's buddy.
<i>Good Data</i> =	Block ID of the original free page.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 5 Error Code: CHBKAU

Error Code:	CHBKAU
Error Description:	The audit of the tuple cache bit map (DBchbkmp) has found a cache block incorrectly marked as used. This bit map is used to mark tuple caching blocks as used or not (1 - used, 0 - not in use).
Possible Error Effect:	The cache block is unavailable for use. This is a loss of resource.
Corrective Action Taken:	The appropriate bit (which is in error) representing a cache block is set to zero (marking it as free).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of four byte section of the cache block bit map which contains the error (part of the area pointed to by DBchbkmp).
<i>Bad Data</i> =	Four byte section of cache block bit map containing error.
<i>Good Data</i> =	Four byte section of cache block bit map containing error.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	32 cache blocks corresponding to the 4 byte section of DBchbkmp which had the bad status.

Table 6 Error Code: CNVACCBID

Error Code:	CNVACCBID
Error Description:	An access dictionary block ID of any relation in the RODD is detected by MEMMAN as not being converted by the ODD BST PROCESS.
Possible Error Effect:	Since this was caught and converted by the MEMMAN audit, it has been corrected. This would only be a warning.
Corrective Action Taken:	The access dictionary block ID is converted.
Manual Action Required:	None. See Corrective Action Taken .
Dump Description:	
<i>Error Address</i> =	Address of the invalid access dictionary block ID the RODD relation.
<i>Bad Data</i> =	The invalid access dictionary block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The whole access dictionary entry for the RODD relation that has had its access dictionary block ID converted.

Table 7 Error Code: CNVHDBID

Error Code:	CNVHDBID
Error Description:	A head table block ID of a two-level or a three-level indexing relation in the RODD is detected by MEMMAN as not being converted by the ODD BST process.

Possible Error Effect:	Since this was caught and converted by the MEMMAN audit, it has been corrected. This would only be a warning.
Corrective Action Taken:	The head table block ID is converted.
Manual Action Required:	None. See Corrective Action Taken .
Dump Description:	
<i>Error Address =</i>	Address of the invalid head table block ID of a 2 or a 3-level indexing relation.
<i>Bad Data =</i>	The invalid head table block ID.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	The whole access dictionary entry for the two-level or three-level indexing relation that has had its head table block ID converted.

Table 8 Error Code: CNVIPBID

Error Code:	CNVIPBID
Error Description:	An intermediate page block ID of a three-level indexing relation in the RODD is detected by MEMMAN as not being converted by the ODD BST PROCESS.
Possible Error Effect:	Since this was caught and converted by the MEMMAN audit, it has been corrected. This would only be a warning.
Corrective Action Taken:	The intermediate page block ID is converted.
Manual Action Required:	None. See Corrective Action Taken .
Dump Description:	
<i>Error Address =</i>	Address of the invalid intermediate page block ID of a three-level indexing relation.
<i>Bad Data =</i>	The invalid intermediate page block ID.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	NA.
<i>Dump =</i>	The whole access dictionary entry for the three-level indexing relation that has had its intermediate page converted.

Table 9 Error Code: CONFLICT

Error Code:	CONFLICT
Error Description:	A data page is marked as being in use in the official software demand paging (SDP) bitmap, and is also marked as being available on one of the free lists.
Possible Error Effect:	The memory management code ensures that the same block ID will never be allocated twice. However, the list is corrupt and the code will fire an assert and fail the request should there be an attempt to seize an already seized block.
Corrective Action Taken:	The free list is terminated at the entry immediately preceding the page in conflict, and the remainder of the list that is legitimately free is restored to the free list during garbage collection. The corrective action for this error can cause an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Byte in the SDP bitmap in which the block is found to be set as in use.
<i>Bad Data =</i>	Block ID of the block in conflict.
<i>Good Data =</i>	Block ID of the last good block in the free list.
<i>Logical Index =</i>	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump =</i>	NA.

Table 10 Error Code: DATABID

Error Code:	DATABID
Error Description:	An out-of-range data page block ID of a memory-resident relation is detected by MEMMAN.
Possible Error Effect:	This may cause the loss of a data page for a memory resident relation.
Corrective Action Taken:	None.
Manual Action Required:	A DB manual action assert is fired along with this audit error report to help find out which relation has lost a data page.
Dump Description:	

<i>Error Address</i> =	Address of the invalid data page block ID of a memory-resident relation.
<i>Bad Data</i> =	Invalid data page block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry for the memory-resident relation that has lost a data page. NOTE: Any bad block ID of one of the pages on the free list will trigger a MEMMAN DATABID error. However, since the pages on the free list are not associated with a relation, there will be no access dictionary entry and therefore no dump will be provided.

Table 11 Error Code: DICTCORRUPT

Error Code:	DICTCORRUPT
Error Description:	A runtime version and an ODD version of the access dictionary exists. Every entry in the runtime version must have a corresponding entry in the ODD version. An entry in the runtime version is missing its corresponding ODD entry. The static ODD relations DBODDACC and DBRODDAC represent the ODD version. Either one of these relations is missing a tuple for the relation ID provided in the dump error address or the runtime entry for this relation is corrupt.
Possible Error Effect:	A faulty processor initialization, an overwrite of the runtime data dictionary entry, or some activity that corrupted a tuple in the static ODD access specific relations has occurred corrupting the data contained in the runtime version of the access dictionary or its corresponding static ODD tuple.
Corrective Action Taken:	None.
Manual Action Required:	Identify the missing data using the relation ID provided in the error address. Determine if this tuple resides in the appropriate ODD access relation. If it does not exist it should be added using the information provided in the <i>Good Data</i> section of the Dump Description. If it does exist then the entry in the runtime version of the access dictionary (dbdoddacc) is corrupt.
Dump Description:	
<i>Error Address</i> =	Relation ID of the corrupt data dictionary relation.
<i>Bad Data</i> =	Key of the corrupt data dictionary relation.
<i>Good Data</i> =	Expected data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 12 Error Code: DICTINCONS

Error Code:	DICTINCONS
Error Description:	Specific data dictionary information requires corresponding tuples in multiple static ODD data dictionary relations. An inconsistency between those data dictionary relations has been detected. A tuple in one data dictionary relation is missing its corresponding tuple in one of the other data dictionary relations.
Possible Error Effect:	Static ODD corruption.
Corrective Action Taken:	None.
Manual Action Required:	Restore consistency across data dictionary relations. Using the information provided in the Good Data section of the Dump Description determine if the missing tuple(s) exists in the same dictionary relation on another processor. If so, insert that missing tuple into the static ODD on the processor where the inconsistency occurred.
Dump Description:	
<i>Error Address</i> =	Relation ID of the data dictionary relation where the inconsistency exists.
<i>Bad Data</i> =	Key of the data dictionary relation tuple not found.
<i>Good Data</i> =	Expected tuple data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 13 Error Code: DICTLINKERR

Error Code:	DICTLINKERR
Error Description:	The ODD data dictionaries are constructed using linked lists. Corruption has been detected in one of these linked lists.
Possible Error Effect:	Any event that could corrupt a linked list.
Corrective Action Taken:	None.
Manual Action Required:	The static ODD data dictionary relation containing the corruption is identified in the error address portion of this assert. The key of the tuple where the corruption was detected is provided in the bad data portion of this assert. Examine the tuple(s) positioned just prior to and immediately following the failing tuple to determine the proper link values. Refer to Figure 2.
Dump Description:	
<i>Error Address</i> =	Relation ID of the data dictionary relation where the inconsistency exists.
<i>Bad Data</i> =	Key of the data dictionary relation tuple not found.
<i>Good Data</i> =	Expected tuple data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 14 Error Code: DISKBID

Error Code:	DISKBID
Error Description:	An out-of-range data page block ID for a disk relation is detected by MEMMAN.
Possible Error Effect:	This may cause the loss of a data page of a disk relation.
Corrective Action Taken:	None.
Manual Action Required:	A DB manual action assert is fired with this audit error report to help find out what disk relation has lost a data page.
Dump Description:	
<i>Error Address</i> =	Address of the out-of-range data page block ID on the head table for a disk relation.
<i>Bad Data</i> =	Invalid block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry for the disk relation that lost a data page.

Table 15 Error Code: DUPLI

Error Code:	DUPLI
Error Description:	The free page list for pages of a certain size contains a page with a block ID that is also claimed as part of the free page list for pages of a different size.
Possible Error Effect:	The memory management code ensures that the same block ID will never be allocated twice. However the list is corrupt, and the code will fire an assert and fail the request should there be an attempt to seize an already seized block.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the duplicated page, and the remainder of the list is restored to the free list during garbage collection. The corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the free page bitmap where the duplicate was located.
<i>Bad Data</i> =	Block ID of the duplicated block.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 16 Error Code: GRBG

Error Code:	GRBG
Error Description:	The database SDP system incorrectly believes that a data page is in use.
Possible Error Effect:	If too many data pages are believed to be seized, recent change will not be able to make updates.
Corrective Action Taken:	The data page is marked as being free in the bit map maintained by the software

	demand paging system.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	Corrected byte of the SDP bit map.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 17 Error Code: HEADBID

Error Code:	HEADBID
Error Description:	An out-of-range head Table block ID is found in the access dictionary.
Possible Error Effect:	This causes the loss of a relation, and it may also cause DB to assert.
Corrective Action Taken:	This head table block ID is zeroed out in the access dictionary.
Manual Action Required:	A DB manual action assert is fired with this error code to catch the attention of maintenance personnel. The manual action assert dump and the audit error dump should be used to figure out which relation is bad.
Dump Description:	
<i>Error Address</i> =	Address of the head table block ID in the access dictionary.
<i>Bad Data</i> =	Out-of-range block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry to show the relation ID, and so forth.

Table 18 Error Code: IPBID

Error Code:	IPBID
Error Description:	An out-of-range intermediate page block ID of a three-level indexing relation is detected by MEMMAN.
Possible Error Effect:	This may cause the loss of several data pages for a three-level indexing relation.
Corrective Action Taken:	None.
Manual Action Required:	A DB manual action assert is fired along with this audit error report to catch the attention of maintenance personnel to find out which three-level indexing relation has lost an intermediate page.
Dump Description:	
<i>Error Address</i> =	Address of the invalid intermediate page block ID of a three-level indexing relation.
<i>Bad Data</i> =	Invalid intermediate page block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry for the three-level indexing relation that has lost an intermediate page.

Table 19 Error Code: LINKS

Error Code:	LINKS
Error Description:	The <i>from</i> link in a free page list element is incorrect.
Possible Error Effect:	Some free page list elements may be inaccessible. This contributes to memory fragmentation.
Corrective Action Taken:	The free list is terminated at the entry immediately preceding the element in error, and the remainder of the list is restored to the free list during garbage collection. The corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the free list element.
<i>Bad Data</i> =	Incorrect block ID stored in the from link
<i>Good Data</i> =	Block ID of the last good page on the list.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 20 Error Code: LOGNULL

Error Code:	LOGNULL
Error Description:	The MEMMAN audit finds an inconsistent update transaction entry.
Possible Error Effect:	Either this update transaction loses its local log, or this transaction is not an update transaction.
Corrective Action Taken:	None.
Manual Action Required:	Run TRNDC audit.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Transaction ID.
<i>Dump</i> =	NA.

Table 21 Error Code: LOOP

Error Code:	LOOP
Error Description:	The free page list contains two references to the same block ID for the same size free page, causing a cycle.
Possible Error Effect:	Any free pages of the same size that would have followed the cycling page are now inaccessible and thus unavailable for allocation.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the cycling page, and the remainder of the list is restored to the free list during garbage collection. This corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the free page bitmap where the cycle occurs.
<i>Bad Data</i> =	Block ID of the page in error.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 22 Error Code: MVER

Error Code:	MVER
Error Description:	The database SD) system believes that a data page is free when the data page is actually in use.
Possible Error Effect:	If the data page is allocated for another relation, the two relations will overwrite each other on the same data page.
Corrective Action Taken:	The data page is marked as being seized in the bit map maintained by the software demand paging system.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	Corrected byte of the SDP bit map.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 23 Error Code: SIZE

Error Code:	SIZE
Error Description:	The page size that is stored within a free page is not consistent with the free list on which the page is found.
Possible Error Effect:	The memory management code ensures that the same block ID will never be allocated twice. However, the list is corrupt and the code will fire an assert and fail the request should there be an attempt to seize an already seized block.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the corrupted list entry, and the remainder of the list is restored to the free list during garbage collection.

	The corrective action for this error will cause an UNCLAIMED report during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the page with the mismatched size.
<i>Bad Data</i> =	Incorrect page size, as found within the page.
<i>Good Data</i> =	Correct page size as appropriate for the list.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 24 Error Code: TPBKAU

Error Code:	TPBKAU
Error Description:	The audit of the tuple block bit map (DBtpbkmp) has found a tuple block incorrectly marked as used. This bit map is used to mark tuple blocks as used or not (1 - used, 0 - not in use).
Possible Error Effect:	The tuple block is unavailable for use. This is a loss of resource.
Corrective Action Taken:	The appropriate bit (which is in error) representing a tuple block is set to zero (marking it as free).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of four byte section of the tuple block bit map which contains the error (part of the area pointed to by DBtpbkmp).
<i>Bad Data</i> =	Four byte section of tuple block bit map containing error.
<i>Good Data</i> =	Four byte section corrected.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 25 Error Code: UNCLAIMED

Error Code:	UNCLAIMED
Error Description:	The database SDP system bitmap has one or more blocks marked as free that do not appear on the free page lists.
Possible Error Effect:	Pages that are not on the free lists will never be put to use. The blocks are then unusable. If too many free pages are not on the free lists, the ODD may have to be grown unnecessarily, or possibly recent change updates may be blocked.
Corrective Action Taken:	The blocks are placed on the appropriate free lists.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect available audit bit map byte.
<i>Bad Data</i> =	Contents of the incorrect byte of the available bit map.
<i>Good Data</i> =	Contents of what the available bit map byte should be.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 26 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to perform recovery after a system interrupt (such as write protect, out-of-range read, and so forth.)
Possible Error Effect:	May cause further resets, audits and or asserts.
Corrective Action Taken:	None, all data that would have caused the reset is reinitialized on the next invocation of the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

MEMMAN-C

Software Release: 5E14 and later

1. MEMORY MANAGEMENT (MEMMAN) AUDIT

The software demand paging (SDP) package, a database memory manager, allocates memory within the write-protected office-dependent database (ODD), disk ODD, and the unprotected database based on the availability information stored in bit maps. The SDP bit maps keep track of the space within the ODD, disk ODD, and unprotected database. Each bit corresponds to a block of memory. The runtime access dictionary entries contain pointers (block IDs) to data pages in the ODD, disk ODD, and unprotected database, and to head tables of relations. One access dictionary entry is allocated for each version of a relation in the database. Each entry contains access information for the associated relation version, including a head table index and information about the relation. In Figure 1, for example, the block ID of the entry for relation 1 points to a data page in the ODD; relation 1 is therefore a static one-level indexed relation. The data pages for static two-level indexed, static hash, and static sequential relations such as relation 2 also reside in the ODD. Dynamic relations have their head tables in the ODD and their data pages in unprotected memory. Relation 3 is a dynamic hash or dynamic indexed relation. The indexed head table contains indices that define the data pages that make up the relation version. Relation 4 is a static three-level indexed relation. The head table has indices to all the intermediate data pages (IDPs). The IDPs have indices to data pages.

Memory management of the ODD must ensure that no data pages are lost to the system. The memory management audit (MEMMAN) verifies that the software demand paging package record of memory block usage corresponds to the actual memory blocks in use. If SDP has an unused memory block marked as used, the block is unavailable or lost. If SDP has a used memory block marked as unused, it may overwrite the existing data with new data. The audit detects these inconsistencies and corrects the SDP bit map and internal ODD free lists as appropriate. It also performs several checks on the transaction dictionary blocks because the local log pages of update transactions are in the ODD.

The MEMMAN audit is part of the Data Base audits subgroup. It runs in the OKP and operating system for distributed switching-switching module (OSDS-SM) environments in the segmented mode.

2. DATA STRUCTURES

The memory used to store relations is organized into units called *blocks* and *pages*. A block contains 256 contiguous bytes of memory (note that the term "block" has a different meaning when used in this context than when used synonymously with "tuple" as in an access dictionary block). A page is a set of 1, 2, 4, 8, 16, 32, or 64 contiguous blocks. Page size bitmaps keep track of page IDs, which are page sizes identified by the block ID of the first block of the page. All the data pages that make up a given relation have the same number of blocks. The number of blocks per page is contained in the access dictionary. This information is used by the audit in conjunction with the relation's head table (if any) to determine which blocks are used by the relation.

The MEMMAN audit checks eight bit maps and two dictionaries to ensure the consistency of availability information about the ODD. The eight bitmaps are divided into two sets, one set for the memory ODD and another for the DISK ODD. The memory ODD includes the static ODD and the dynamic database. Each set has two bitmaps which are complements of each other that are used by the audit to note relation ownership of each block. Another bit map in each set, maintained by SDP, contains one bit per block that stores the allocated/available status for each block. SDP uses this bit map to allocate and deallocate blocks for use as head tables or data pages. In addition, the memory ODD portion of the audit creates two bitmaps that audit the free page lists built into the free ODD pages. Figure 1, shows the layout of system memory, including the ODD. The MEMMAN audit initializes two audit-owned bit maps based on information in the access dictionary and another two bit maps for the memory ODD free page list audit. All these bit maps are checked for consistency with each other and the actual available memory space.

The two dictionaries used by the MEMMAN audit are the runtime access dictionary and the transaction dictionary. The access dictionary contains information about all the relations within ODD. There is an access block in the

access dictionary for each version of each relation; it provides the block ID of a head table in ODD. The head table contains an array of block IDs that point to data pages. The transaction dictionary manages all transactions; the transactions are used primarily by the Recent Change/Verify and Maintenance subsystems.

The MEMMAN audit checks that used block IDs have their associated page ID marked in the official page size bitmap.

Figure 1 (MEMMAN-1) Layout of Memory

Figure 2 (MEMMAN-2) Dictionary Link Diagram

3. AUDIT CHECKS

The steps of the MEMMAN audit are as follows.

- In its first real-time segment, the audit initializes its four relation ownership bit maps (two relating to the

memory ODD and two relating to the disk ODD). The first bit map of each set is initialized to zeros and the second to ones. The first and second bit maps are thus one's complements of each other; this setup provides an internal consistency check for the audit.

- (b) The audit uses the head table pointer of the current access dictionary block to locate the associated head table. It then uses the head table to determine which data pages or IDPs are used to store the associated relation. The number of blocks per page for the relation is in the access dictionary. This information allows the audit to determine which blocks are used to store the relation. Next, the audit compares this block usage information with the block usage information contained in the SDP bit map. There are two possible results: the status of a used block claimed by the audit agrees with the bit map, or the audit claims that a block is used and the bit map claims that it is unused. The second case is an error and the audit simply marks the bit in the SDP bit map to show the block as used. It is also possible that the bit map claims that a block is used when it is not, but the audit cannot determine this until all the access blocks have been read through. During this processing, the audit marks its bit maps for blocks that are found to be used.
- (c) The audit then performs garbage collection. Garbage results from purged processes not cleaned up by the transaction manager or other database audits. Garbage may also result from pages lost because of interrupted transactions. After processing all the access blocks, the audit compares its auxiliary bit maps to the SDP bit map. If a bit is found to be marked as used in the SDP bit map but not in the auxiliary bit map, the audit clears the bit in the SDP bit map.
- (d) The next phase of the audit concerns auditing the integrity of the free lists. The free lists are organized as follows: Each free page of a given size is placed into a linked list of other pages of that size. The forward and previous links to other blocks on the list are stored within the ODD at the page's physical location. SDP maintains a list of the head blocks of each size's list. Blocks are allocated and freed according to a Buddy Block strategy in which adjacent blocks may be coalesced or split depending on the block size requested and the current block distribution. The audit checks that each page is assigned to the appropriate list, that the linkages are consistent and that every block of memory is accounted for.
- (e) The audit then checks the usage of the tuple cache pages. These are pages of the ODD seized by the tuple cache manager to provide space for temporary copies of tuples in memory prior to committal of a transaction. The audit verifies that the internal cache bitmaps are consistent with the contents of the cache.
- (f) The audit checks the global office parameters by marking them according to information in the ODD. The audit performs the checks on one access block per real-time segment. When comparing the auxiliary and SDP bit maps, it processes two bytes of the bit map per segment. The state of the audit is saved before taking a segment break to allow the audit to resume at the correct point when control returns from OSDs.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ABID

Error Code:	ABID
Error Description:	The MEMMAN audit finds an out-of-range block ID (trn_log).
Possible Error Effect:	This update transaction loses its local log.
Corrective Action Taken:	None.
Manual Action Required:	Run the TRNDC audit.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	NA.

<i>Logical Index</i> =	Transaction ID.
<i>Dump</i> =	NA.

Table 2 Error Code: ALIGNMENT

Error Code:	ALIGNMENT
Error Description:	A free page begins on an illegal boundary for its page size. For example, a 2-block page cannot begin at block 1 but may begin at block 2 or 4.
Possible Error Effect:	Memory fragmentation.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the page in error. The removed pages are subsequently reclaimed during garbage collection. The corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the byte in the free page bitmap where the misalignment was detected.
<i>Bad Data</i> =	Incorrect block ID stored in the pages to/from link.
<i>Good Data</i> =	Block ID of the last good page on the list.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 3 Error Code: ARRAY-ENTRY-BAD

Error Code:	ARRAY-ENTRY-BAD
Error Description:	Tuples in the ODD data dictionary relations must have corresponding entries in runtime data dictionaries dbrelidx and/or dbdrlidx. A runtime dictionary entry could not be located or was found on another location for the ODD data dictionary relation identified in the error address.
Possible Error Effect:	Failed or incomplete transactions or initializations or a possible overwrite has occurred.
Corrective Action Taken:	The faulty runtime data dictionary has been updated to contain the missing ODD data dictionary information followed by this report.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Relation ID of the ODD data dictionary relation in error.
<i>Bad Data</i> =	Key of the mismatched ODD data dictionary relation tuple.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 4 Error Code: BUDDY

Error Code:	BUDDY
Error Description:	The buddy page for any given available page is also free. The buddy page is defined as one which is: - the same size (for example, both 256 bytes, 512 bytes, and so on). - adjacent (for example, block 0 and block 1 for 256 byte pages). - properly aligned (for example, block 0 and block 1, block 2 and block 3, but not block 1 and block 2) to a given page. This is an error condition because it violates the constraints of the memory management algorithms.
Possible Error Effect:	This can unnecessarily fragment office-dependent data (ODD) memory. For example, if two 8K buddies exist on the 8K free list and a request for a 16-Kbyte page is made, and no page exists on the 16K free list, new memory is allocated

	for the ODD section before the request is satisfied. If new memory cannot be allocated, then the request cannot be satisfied.
Corrective Action Taken:	Free buddies are coalesced and put on the free lists for their combined page size.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the free page bitmap where the free buddy was located.
<i>Bad Data</i> =	Block ID of the free page's buddy.
<i>Good Data</i> =	Block ID of the original free page.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 5 Error Code: CHBKAU

Error Code:	CHBKAU
Error Description:	The audit of the tuple cache bit map (DBchbkmp) has found a cache block incorrectly marked as used. This bit map is used to mark tuple caching blocks as used or not (1 - used, 0 - not in use).
Possible Error Effect:	The cache block is unavailable for use. This is a loss of resource.
Corrective Action Taken:	The appropriate bit (which is in error) representing a cache block is set to zero (marking it as free).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of four byte section of the cache block bit map which contains the error (part of the area pointed to by DBchbkmp).
<i>Bad Data</i> =	Four byte section of cache block bit map containing error.
<i>Good Data</i> =	Four byte section of cache block bit map containing error.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	32 cache blocks corresponding to the 4 byte section of DBchbkmp which had the bad status.

Table 6 Error Code: CNVACCBID

Error Code:	CNVACCBID
Error Description:	An access dictionary block ID of any relation in the RODD is detected by MEMMAN as not being converted by the ODD BST PROCESS.
Possible Error Effect:	Since this was caught and converted by the MEMMAN audit, it has been corrected. This would only be a warning.
Corrective Action Taken:	The access dictionary block ID is converted.
Manual Action Required:	None. See Corrective Action Taken .
Dump Description:	
<i>Error Address</i> =	Address of the invalid access dictionary block ID the RODD relation.
<i>Bad Data</i> =	The invalid access dictionary block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The whole access dictionary entry for the RODD relation that has had its access dictionary block ID converted.

Table 7 Error Code: CNVHDBID

Error Code:	CNVHDBID
Error Description:	A head table block ID of a two-level or a three-level indexing relation in the RODD is detected by MEMMAN as not being converted by the ODD BST process.
Possible Error Effect:	Since this was caught and converted by the MEMMAN audit, it has been corrected. This would only be a warning.
Corrective Action Taken:	The head table block ID is converted.
Manual Action Required:	None. See Corrective Action Taken .
Dump Description:	
<i>Error Address</i> =	Address of the invalid head table block ID of a 2 or a 3-level indexing relation.
<i>Bad Data</i> =	The invalid head table block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.

<i>Dump</i> =	The whole access dictionary entry for the two-level or three-level indexing relation that has had its head table block ID converted.

Table 8 Error Code: CNVIPBID

Error Code:	CNVIPBID
Error Description:	An intermediate page block ID of a three-level indexing relation in the RODD is detected by MEMMAN as not being converted by the ODD BST PROCESS.
Possible Error Effect:	Since this was caught and converted by the MEMMAN audit, it has been corrected. This would only be a warning.
Corrective Action Taken:	The intermediate page block ID is converted.
Manual Action Required:	None. See Corrective Action Taken .
Dump Description:	
<i>Error Address</i> =	Address of the invalid intermediate page block ID of a three-level indexing relation.
<i>Bad Data</i> =	The invalid intermediate page block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	The whole access dictionary entry for the three-level indexing relation that has had its intermediate page converted.

Table 9 Error Code: CONFLICT

Error Code:	CONFLICT
Error Description:	A data page is marked as being in use in the official software demand paging (SDP) bitmap, and is also marked as being available on one of the free lists.
Possible Error Effect:	The memory management code ensures that the same block ID will never be allocated twice. However, the list is corrupt and the code will fire an assert and fail the request should there be an attempt to seize an already seized block.
Corrective Action Taken:	The free list is terminated at the entry immediately preceding the page in conflict, and the remainder of the list that is legitimately free is restored to the free list during garbage collection. The corrective action for this error can cause an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the SDP bitmap in which the block is found to be set as in use.
<i>Bad Data</i> =	Block ID of the block in conflict.
<i>Good Data</i> =	Block ID of the last good block in the free list.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 10 Error Code: DATABID

Error Code:	DATABID
Error Description:	An out-of-range data page block ID of a memory-resident relation is detected by MEMMAN.
Possible Error Effect:	This may cause the loss of a data page for a memory resident relation.
Corrective Action Taken:	None.
Manual Action Required:	A DB manual action assert is fired along with this audit error report to help find out which relation has lost a data page.
Dump Description:	
<i>Error Address</i> =	Address of the invalid data page block ID of a memory-resident relation.
<i>Bad Data</i> =	Invalid data page block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry for the memory-resident relation that has lost a data page. NOTE: Any bad block ID of one of the pages on the free list will trigger a MEMMAN DATABID error. However, since the pages on the free

	list are not associated with a relation, there will be no access dictionary entry and therefore no dump will be provided.

Table 11 Error Code: DICTCORRUPT

Error Code:	DICTCORRUPT
Error Description:	A runtime version and an ODD version of the access dictionary exists. Every entry in the runtime version must have a corresponding entry in the ODD version. An entry in the runtime version is missing its corresponding ODD entry. The static ODD relations DBODDACC and DBRODDAC represent the ODD version. Either one of these relations is missing a tuple for the relation ID provided in the dump error address or the runtime entry for this relation is corrupt.
Possible Error Effect:	A faulty processor initialization, an overwrite of the runtime data dictionary entry, or some activity that corrupted a tuple in the static ODD access specific relations has occurred corrupting the data contained in the runtime version of the access dictionary or its corresponding static ODD tuple.
Corrective Action Taken:	None.
Manual Action Required:	Identify the missing data using the relation ID provided in the error address. Determine if this tuple resides in the appropriate ODD access relation. If it does not exist it should be added using the information provided in the <i>Good Data</i> section of the Dump Description. If it does exist then the entry in the runtime version of the access dictionary (dbdoddacc) is corrupt.
Dump Description:	
<i>Error Address</i> =	Relation ID of the corrupt data dictionary relation.
<i>Bad Data</i> =	Key of the corrupt data dictionary relation.
<i>Good Data</i> =	Expected data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 12 Error Code: DICTINCONS

Error Code:	DICTINCONS
Error Description:	Specific data dictionary information requires corresponding tuples in multiple static ODD data dictionary relations. An inconsistency between those data dictionary relations has been detected. A tuple in one data dictionary relation is missing its corresponding tuple in one of the other data dictionary relations.
Possible Error Effect:	Static ODD corruption.
Corrective Action Taken:	None.
Manual Action Required:	Restore consistency across data dictionary relations. Using the information provided in the Good Data section of the Dump Description determine if the missing tuple(s) exists in the same dictionary relation on another processor. If so, insert that missing tuple into the static ODD on the processor where the inconsistency occurred.
Dump Description:	
<i>Error Address</i> =	Relation ID of the data dictionary relation where the inconsistency exists.
<i>Bad Data</i> =	Key of the data dictionary relation tuple not found.
<i>Good Data</i> =	Expected tuple data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 13 Error Code: DICTLINKERR

Error Code:	DICTLINKERR
Error Description:	The ODD data dictionaries are constructed using linked lists. Corruption has been detected in one of these linked lists.
Possible Error Effect:	Any event that could corrupt a linked list.
Corrective Action Taken:	None.
Manual Action Required:	The static ODD data dictionary relation containing the corruption is identified in the error address portion of this assert. The key of the tuple where the corruption was detected is provided in the bad data portion of this assert. Examine the

	tuple(s) positioned just prior to and immediately following the failing tuple to determine the proper link values. Refer to Figure 2.
Dump Description:	
<i>Error Address</i> =	Relation ID of the data dictionary relation where the inconsistency exists.
<i>Bad Data</i> =	Key of the data dictionary relation tuple not found.
<i>Good Data</i> =	Expected tuple data.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 14 Error Code: DISKBID

Error Code:	DISKBID
Error Description:	An out-of-range data page block ID for a disk relation is detected by MEMMAN.
Possible Error Effect:	This may cause the loss of a data page of a disk relation.
Corrective Action Taken:	None.
Manual Action Required:	A DB manual action assert is fired with this audit error report to help find out what disk relation has lost a data page.
Dump Description:	
<i>Error Address</i> =	Address of the out-of-range data page block ID on the head table for a disk relation.
<i>Bad Data</i> =	Invalid block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry for the disk relation that lost a data page.

Table 15 Error Code: DUPLI

Error Code:	DUPLI
Error Description:	The free page list for pages of a certain size contains a page with a block ID that is also claimed as part of the free page list for pages of a different size.
Possible Error Effect:	The memory management code ensures that the same block ID will never be allocated twice. However the list is corrupt, and the code will fire an assert and fail the request should there be an attempt to seize an already seized block.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the duplicated page, and the remainder of the list is restored to the free list during garbage collection. The corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the free page bitmap where the duplicate was located.
<i>Bad Data</i> =	Block ID of the duplicated block.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 16 Error Code: GRBG

Error Code:	GRBG
Error Description:	The database SDP system incorrectly believes that a data page is in use.
Possible Error Effect:	If too many data pages are believed to be seized, recent change will not be able to make updates.
Corrective Action Taken:	The data page is marked as being free in the bit map maintained by the software demand paging system.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	Corrected byte of the SDP bit map.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 17 Error Code: HEADBID

Error Code:	HEADBID
Error Description:	An out-of-range head Table block ID is found in the access dictionary.
Possible Error Effect:	This causes the loss of a relation, and it may also cause DB to assert.
Corrective Action Taken:	This head table block ID is zeroed out in the access dictionary.
Manual Action Required:	A DB manual action assert is fired with this error code to catch the attention of maintenance personnel. The manual action assert dump and the audit error dump should be used to figure out which relation is bad.
Dump Description:	
<i>Error Address</i> =	Address of the head table block ID in the access dictionary.
<i>Bad Data</i> =	Out-of-range block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry to show the relation ID, and so forth.

Table 18 Error Code: IPBID

Error Code:	IPBID
Error Description:	An out-of-range intermediate page block ID of a three-level indexing relation is detected by MEMMAN.
Possible Error Effect:	This may cause the loss of several data pages for a three-level indexing relation.
Corrective Action Taken:	None.
Manual Action Required:	A DB manual action assert is fired along with this audit error report to catch the attention of maintenance personnel to find out which three-level indexing relation has lost an intermediate page.
Dump Description:	
<i>Error Address</i> =	Address of the invalid intermediate page block ID of a three-level indexing relation.
<i>Bad Data</i> =	Invalid intermediate page block ID.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	Whole access dictionary entry for the three-level indexing relation that has lost an intermediate page.

Table 19 Error Code: LINKS

Error Code:	LINKS
Error Description:	The <i>from</i> link in a free page list element is incorrect.
Possible Error Effect:	Some free page list elements may be inaccessible. This contributes to memory fragmentation.
Corrective Action Taken:	The free list is terminated at the entry immediately preceding the element in error, and the remainder of the list is restored to the free list during garbage collection. The corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the free list element.
<i>Bad Data</i> =	Incorrect block ID stored in the from link
<i>Good Data</i> =	Block ID of the last good page on the list.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 20 Error Code: LOGNULL

Error Code:	LOGNULL
Error Description:	The MEMMAN audit finds an inconsistent update transaction entry.
Possible Error Effect:	Either this update transaction loses its local log, or this transaction is not an update transaction.
Corrective Action Taken:	None.
Manual Action Required:	Run TRNDC audit.
Dump Description:	

<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Transaction ID.
<i>Dump</i> =	NA.

Table 21 Error Code: LOOP

Error Code:	LOOP
Error Description:	The free page list contains two references to the same block ID for the same size free page, causing a cycle.
Possible Error Effect:	Any free pages of the same size that would have followed the cycling page are now inaccessible and thus unavailable for allocation.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the cycling page, and the remainder of the list is restored to the free list during garbage collection. This corrective action for this error causes an UNCLAIMED error report to occur during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Byte in the free page bitmap where the cycle occurs.
<i>Bad Data</i> =	Block ID of the page in error.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	Index which represents the page size on the list. 0 for the 256 list, 1 for the 512 list, and so forth.
<i>Dump</i> =	NA.

Table 22 Error Code: MVER

Error Code:	MVER
Error Description:	The database SD) system believes that a data page is free when the data page is actually in use.
Possible Error Effect:	If the data page is allocated for another relation, the two relations will overwrite each other on the same data page.
Corrective Action Taken:	The data page is marked as being seized in the bit map maintained by the software demand paging system.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	Corrected byte of the SDP bit map.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 23 Error Code: NOT_IN_PGTBL

Error Code:	NOT_IN_PGTBL
Error Description:	A page ID associated with a used block ID is not marked in the appropriate page size table.
Possible Error Effect:	Possibility of shared data pages and/or bad block ID.
Corrective Action Taken:	The appropriate bits which are incorrectly cleared in the page size tables are set to one.
Manual Action Required:	Contact customer technical support immediately to investigate the possibility of shared data pages and/or bad block IDs. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.
Dump Description:	
<i>Error Address</i> =	Address of the block ID location in the page size table.
<i>Bad Data</i> =	Block ID.
<i>Good Data</i> =	Contents of the block ID location in the page size table.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 24 Error Code: SIZE

Error Code:	SIZE
Error Description:	The page size that is stored within a free page is not consistent with the free list on which the page is found.
Possible Error Effect:	The memory management code ensures that the same block ID will never be allocated twice. However, the list is corrupt and the code will fire an assert and fail the request should there be an attempt to seize an already seized block.
Corrective Action Taken:	The list is terminated at the entry immediately preceding the corrupted list entry, and the remainder of the list is restored to the free list during garbage collection. The corrective action for this error will cause an UNCLAIMED report during garbage collection.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the page with the mismatched size.
<i>Bad Data</i> =	Incorrect page size, as found within the page.
<i>Good Data</i> =	Correct page size as appropriate for the list.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 25 Error Code: TPBKAU

Error Code:	TPBKAU
Error Description:	The audit of the tuple block bit map (DBtpbkmp) has found a tuple block incorrectly marked as used. This bit map is used to mark tuple blocks as used or not (1 - used, 0 - not in use).
Possible Error Effect:	The tuple block is unavailable for use. This is a loss of resource.
Corrective Action Taken:	The appropriate bit (which is in error) representing a tuple block is set to zero (marking it as free).
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of four byte section of the tuple block bit map which contains the error (part of the area pointed to by DBtpbkmp).
<i>Bad Data</i> =	Four byte section of tuple block bit map containing error.
<i>Good Data</i> =	Four byte section corrected.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 26 Error Code: UNCLAIMED

Error Code:	UNCLAIMED
Error Description:	The database SDP system bitmap has one or more blocks marked as free that do not appear on the free page lists.
Possible Error Effect:	Pages that are not on the free lists will never be put to use. The blocks are then unusable. If too many free pages are not on the free lists, the ODD may have to be grown unnecessarily, or possibly recent change updates may be blocked.
Corrective Action Taken:	The blocks are placed on the appropriate free lists.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect available audit bit map byte.
<i>Bad Data</i> =	Contents of the incorrect byte of the available bit map.
<i>Good Data</i> =	Contents of what the available bit map byte should be.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 27 Error Code: WRONG_PGTBL

Error Code:	WRONG_PGTBL
Error Description:	A page ID associated with a used block ID is marked in a page size table it should not be marked in.
Possible Error Effect:	Possibility of shared data pages and/or bad block ID.
Corrective Action Taken:	The appropriate bits which are incorrectly marked in the page size tables are set to zero.
Manual Action Required:	Contact customer technical support immediately to investigate the possibility of

	shared data pages and/or bad block IDs. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual.
Dump Description:	
<i>Error Address</i> =	Address of the block ID location in the page size table.
<i>Bad Data</i> =	Block ID.
<i>Good Data</i> =	Contents of the block ID location in the page size table.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

Table 28 Error Code: ZAP

Error Code:	ZAP
Error Description:	The audit was entered to perform recovery after a system interrupt (such as write protect, out-of-range read, and so forth.)
Possible Error Effect:	May cause further resets, audits and or asserts.
Corrective Action Taken:	None, all data that would have caused the reset is reinitialized on the next invocation of the audit.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the incorrect SDP bit map byte.
<i>Bad Data</i> =	Incorrect byte of the SDP bit map.
<i>Good Data</i> =	NA.
<i>Logical Index</i> =	NA.
<i>Dump</i> =	NA.

MMGR

Software Release: 5E10 and later

1. MEMORY MANAGER (MMGR) AUDIT

The operating system memory manager (MMGR) administers all memory allocation requests and manipulates the memory management resources accordingly. The resources managed by the MMGR include those associated with the administrative modules main memory (segments and pages) and swap space on disk. In order to ensure continuous operating system operation, it is essential that these resources be protected from loss and corruption. The memory manager audits are designed to ensure the integrity of memory manager resources and prevent their permanent loss.

There are six MMGR audits, numbered 1, 2, 3, 4, 5, and 9. The first three audits are designed to run in order and repeatedly. For example, a lost page table is recovered by running the MMGR 2 audit, followed by the MMGR 1 audit, followed by the MMGR 2 audit, each audit in correcting mode. A similar sequence is required for the recovery of lost pages. Therefore, each of the MMGR 2 and MMGR 3 audits should be rerun only after the MMGR 1 audit has run. The routine scheduling of the MMGR audits follows this sequence. Also, the first three audits should all be allowed or all be inhibited.

The MMGR 1 audit:

- Validates the list of free segment descriptor table entries (SDEs).
- Recovers lost SDEs that are not allocated and not on the free list.
- For each SDE for an in-memory segment, validates the linkages to its page table and the page descriptor entries (PDEs) associated with its pages.

The MMGR 2 audit:

- Validates the list of free page tables.
- Recovers lost page tables that are not validly linked to an SDE and are not on the free list.

The MMGR 3 audit:

- Validates the list of free pages.
- Recovers lost pages that are not linked to a segment and are not on the free list.

The MMGR 4 audit:

- Detects and completes an interrupted breakdown of a segment.
- Releases the segment with its associated page table and pages.

The MMGR 5 audit:

- Detects old IO locked segments. A segment slotted for release but locked in memory for an IO job is saved until the job completes and the segment is unlocked. It is possible that under certain conditions this segment may never be unlocked. After 30 minutes, it is assumed that the segment is forgotten.

The MMGR 9 audit:

- Compacts disk swap space.
- Rearranges allocated swap space to provide a large free space consisting of contiguous blocks. This audit is run only when manually invoked, usually in response to repeated REPT:MMGR004 output messages. These messages signal that the available free swap space fragmented into sets of contiguous free blocks too small to satisfy a request and that an attempt has been made to compact the swap space cheaply.

The compaction done by the audit, however, is not cheap. While this compaction is running, the memory manager is not able to swap supervisor processes into memory. As a result, the only supervisor processes that run during this interval are those already in memory. The real-time interval varies with system activity, usually several seconds.

1.1 Requesting the MMGR Audits

Although the MMGR 1 through 5 audits are scheduled to run routinely, they can be requested by using the following input message. The MMGR 9 audit is run only when invoked manually.

```
AUD:MMGR=a[:b|:c|:b,c];
```

where,

a = Specifies member number of the audit. Valid values are:

1	= Segment descriptor table audit.
2	= Page table audit.
3	= Page descriptor table audit.
4	= Segment release audit.
5	= Segment unlock audit.
9	= Swap space compaction audit.

b = Indicates whether audit should correct errors. Valid values are:

CORR	= Audit should correct errors (default).
NCG	= Audit should not correct errors.

c = Type of report generated. Valid values are:

DETL	= Generates a raw data report for each error found followed by an audit completion message (default). A limited number of reports are generated.
SUM	= Generates only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

1.2 Interpreting AUD:MMGR Output Messages and Error Reports

The AUD MMGR output message reports any errors found during the execution of MMGR audits. For a detailed description of these errors, refer to the AUD:MMGR output message in the Output Messages manual (235-600-750).

Table 1 lists the MMGR audit error messages and their associated categories.

The MMGR audit uses six error categories:

- Category 0 - Used only for the swap space compaction audit (AUD:MMGR9).
- Category 1 - Resets page table (PGT), PDE, and SDE status flags, corrects global free accounts, and corrects SDE structure values.
- Category 2 - Adds unreferenced PDEs/PGTs to free lists.
- Category 3 - Corrects global pointers and counts, releases SDEs and associated resources, corrects PDE structure values.
- Category 4 - Rebuilds SDE, PGT, and PDE free lists. For segments with invalid page entries, page overlaps, and for segment overlaps, the condition is cleared and associated killable processes are terminated.
- Category 5 - Assigned to messages which are not currently in use. It has no real meaning at this time.

Table 1 MMGR AUDIT ERROR MESSAGES

Category	Error Number	Meaning
0	1	Indicates that the MMGR 9 audit has completed the compaction of swap space. Not a real error.
0	2	The MMGR 9 audit was invoked in noncorrecting mode which prevents the audit from doing anything.
0	3	The MMGR 9 audit was unable to move a particular segment. Therefore, it was unable to complete the swap space compaction.
3	10	One or more of the following globals contain incorrect values: pointer to first segment descriptor, pointer to last segment descriptor, number of segment descriptors.
3	20	One or more of the following globals contain incorrect values: pointer to first page table, pointer to last page table, number of page tables.
3	30	One or more of the following globals contain incorrect values: pointer to first page descriptor, pointer to last page descriptor, number of page descriptors.
4	101	The SDE free list contains an invalid link.
4	102	An SDE free list member is allocated.
1	103	The global count of free SDEs contains an incorrect value.
4	104	The SDE free list is circular.
1	105	The on-free-list bit is not set in an SDE that is on the free list.
3	106	An SDE with zero status and not linked to any page table is not on the free list.
1	107	An SDE with non-zero status is not marked allocated.
1	108	An SDE is linked to an empty page table.
1	109	A page table linked to an SDE is not marked allocated.
1	110	An SDE contains an invalid page table pointer.
3	112	The PDE for a page linked to an SDE does not contain the correct segment index.
3	113	The PDE for a page linked to an SDE does not contain the correct page index.
1	114	The in-memory page count in an SDE is incorrect.
1	115	The PDE for a page linked to an SDE is not marked allocated.
4	116	The page table for a segment contains an invalid page address. No process that has this segment in its address space is nonkillable.
4	118	A segment contains the same physical page of memory at two different virtual addresses. No process that has this segment in its address space is nonkillable.
4	120	Two or more in-memory segments contain the same physical page of memory. No process that has the segment(s) in its address space is nonkillable.
4	122	Two or more in-memory segments have the same page table and, therefore, contain the same pages of memory. No process that has the segment(s) in its address space is nonkillable.

4	201	The list of free page tables contains an invalid link.
4	202	A page table on the free list is allocated.
1	203	The global count of free page tables contains an incorrect value.
4	204	The linked list of free page tables is circular.
1	205	The on-free-list bit is not set in a page table that is on the free list.
2	206	A page table is neither linked to an SDE nor is on the free list.
4	301	The list of free pages contains an invalid link index.
4	302	The PDE for a page on the free list is allocated.
1	303	The global count of free pages contains an incorrect value.
4	304	The free page list is circular.
1	305	The on-free-list bit is not set in the PDE for a page that is on the free list.
2	306	A page is not linked to an SDE nor is on the free list.
3	401	The breakdown (release) of a segment did not complete.
3	501	A segment has been IO-locked for 30 minutes or more.

1.3 Responding to MMGR Audit Reports

All the MMGR audits are correcting audits. Unless run in noncorrecting mode, they correct all the errors they find with the exception of those in category 5.

The errors in category 5 involve corruption of memory segments accessed by nonkillable processes. The only way to remove these errors is a level 2 or above phase. This severe recovery action may not be desirable for an application or at all periods of time. Therefore, it is recommended that, in the database audit records, the error threshold be set at 1 (a single such error), and the recovery action be set to RPTAIM (report the audit results to ASM). The AIM process can then choose a recovery appropriate to the current conditions. It may ignore the error, call a phase 2, or postpone a phase to a convenient time.

MODHBLF

Software Release: 5E10 and later

1. SWITCHING MODULE LINK HEADER BUSY LINE FIELD (MODHBLF) AUDIT

The switching module link header busy line field (MODHBLF) relation, RLMODH_BLF, contains one tuple for a given routing module for each 100's group being actively monitored by one or more attendant console.

The MODHBLF audit verifies the idle and busy list linkages for the RLMODH_BLF relation. The MODHBLF audit cycles through the dynamic relation RLMODH_BLF, one tuple at a time using the DRINASEK audit driver. For each tuple, the linkages to the idle or the busy list are checked since the tuple must be linked to one of these lists. When the tuple is on the busy list, linked to a rIMODM_BLF tuple, the owner linkage is verified. If the tuple is on the idle list (linked to rIDBHEADC), the owner linkage is expected to be zero. In addition, the key stored within the tuple will be checked for correctness. If any of the checks fail an error will be printed, and the RLMODH_BLF tuple will be placed on the idle list.

The MODHBLF audit resides in the AUatfeat module. It will run in the OSDS-M environment.

2. DATA STRUCTURES

For details on the fields contained in the RLMODH_BLF relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

The MODHBLF audit verifies owner-member linkages between the RLMODH_BLF and RLMODM_BLF relations or between the RLMODH_BLF and RLDBHEADC, the tuple must be on one of these lists. The audit also checks for a corresponding RLREPLY_BLF for each RLMODH_BLF relation.

4. ERROR HANDLING

The semantic function checks the owner of the rIMODH_BLF tuple. If the owner is the idle tuple of RLDBHEADC, a check is made to determine if the setmember field in RLMODH_BLF is not zero. If it is not zero, an error is printed and the idle function is called to return the correct idle list to the driver and schedule the MODHBLF and DB_HEADC audits.

The setowner linkage is also checked and if the tuple is on the busy list, the head and tail keys are checked for non-zero. If either is equal to zero, an error is printed and the idle function is called, which will return the correct idle list to the driver for idling. The MODHBLF and DB_HEADC audits will be scheduled.

If the associated rIREPLY_BLF tuple is not present, the audit calls the idle function to return to the driver the correct idle list on which to idle the rIMODH_BLF tuple.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: ALINK

Error Code:	ALINK
Error Description:	The hgid in the associated rIREPLYBLF tuple is not consistent with what is in rIMODH_BLF.
Possible Error Effect:	The rIREPLYBLF tuple has been garbaged and may show invalid status for this monitored 100's group.

Corrective Action Taken:	Report the error on the ROP and return to the driver to put the tuple on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIMODH_BLF.
<i>Bad Data</i> =	hgid of rIREPLYBLF.
<i>Good Data</i> =	Key of rIMODH_BLF.
<i>Logical Index</i> =	Logical Key of rIMODH_BLF.
<i>Dump</i> =	rIMODH_BLF tuple.

Table 2 Error Code: BDLINK

Error Code:	BDLINK
Error Description:	This tuple is not on the idle list, the owner linkage is zero but the member linkage is also zero.
Possible Error Effect:	The rIMODH_BLF tuple has been garbaged, you cannot trust the data in this tuple.
Corrective Action Taken:	Report the error on the ROP and return to the driver to put the tuple on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIMODH_BLF.
<i>Bad Data</i> =	Member linkage to rIMODH_BLF.
<i>Good Data</i> =	Owner linkage.
<i>Logical Index</i> =	Logical key of rIMODH_BLF.
<i>Dump</i> =	rIMODH_BLF tuple.

Table 3 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	A rIMODH_BLF is supposed to be idle but is not linked to the rIDBHEADC idle list.
Possible Error Effect:	The rIMODH_BLF is in a limbo condition, unusable by call processing.
Corrective Action Taken:	The audit idles the rIMODH_BLF tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIMODH_BLF.
<i>Bad Data</i> =	Owner link of rIMODH_BLF.
<i>Good Data</i> =	Physical key of idle head cell.
<i>Logical Index</i> =	Logical key of rIMODH_BLF.
<i>Dump</i> =	rIMODH_BLF tuple.

Table 4 Error Code: PTR1

Error Code:	PTR1
Error Description:	The pointer to the associated rIREPLYBLF tuple is invalid.
Possible Error Effect:	The MODH_BLF audit will get the wrong data.
Corrective Action Taken:	Report the error on the ROP and return to the driver to put the tuple on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of the rIMODH_BLF.
<i>Bad Data</i> =	Key of rIREPLYBLF.
<i>Good Data</i> =	Owner linkage.
<i>Logical Index</i> =	Logical key of rIMODH_BLF.
<i>Dump</i> =	rIMODH_BLF tuple.

Table 5 Error Code: ZERO_LINK

Error Code:	ZERO_LINK
Error Description:	A rIMODH_BLF is in the idle state but some of its linkages involved in the idle list mappoint are nonzero.
Possible Error Effect:	A resource is linked to a rIMODH_BLF on the idle list and may be unusable by call processing.
Corrective Action Taken:	The audit idles the rIMODH_BLF tuple linkages involved.

Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	Address of rIMODH_BLF.
<i>Bad Data</i> =	Nonzero value of linkage.
<i>Good Data</i> =	0.
<i>Logical Index</i> =	Logical key of rIMODH_BLF.
<i>Dump</i> =	rIMODH_BLF tuple.

MODMBLF

Software Release: 5E10 and later

1. SWITCHING MODULE LINK MEMBER BUSY LINE FIELD (MODMBLF) AUDIT

The RLMODM-BLF relation contains one tuple for each attendant console residing module actively requesting 100's group busy lamp feature status in the 100's group DCP routing module.

The switching module link member busy line field (MODMBLF) audit verifies setmember linkages between the RLMODMBLF and the busy RLMODHBLF relations or between RLMODMBLF and the idle RLMODHBLF relation.

The MODMBLF audit cycles through the dynamic relation RLMODM_BLF on a tuple-by-tuple basis. For each tuple the audit will ensure the correctness of the linkages to the RLMODH_BLF. In addition, the key stored within the tuple will be checked for correctness. If any of the checks fails an error will be printed, and the rIMODM_BLF tuple will be placed on the idle list.

The MODMBLF audit cycles through the dynamic relation RLMODM_BLF on a tuple-by-tuple basis. For each tuple the audit will ensure the correctness of the linkages to the RLMODH_BLF. In addition, the key stored within the tuple will be checked for correctness. If any of the checks fails an error will be printed, and the rIMODM_BLF tuple will be placed on the idle list.

The MODMBLF audit resides in the AUatfeat module. It will run in the OSDS-M environment, will be part of the BASE package.

2. DATA STRUCTURES

For details on the fields contained in the RLMODM_BLF relation, refer to the Translations Data Manual (235-600-1xx) and the Dynamic Data Manual (235-600-2xx). For details on the specific data fields checked by this audit, refer to the error code explanations in the **ERROR HANDLING** section of this audit description.

3. AUDIT CHECKS

The MODMBLF audit calls the audit driver, AUdrinasek using the interface function. The driver performs the linkage checks and calls the idle function to place the tuple on the proper idle list if an error is found. If no error is found the next tuple is audited.

4. ERROR HANDLING

The MODMBLF audit calls the AUdrinaek driver to check the linkages to the busy and idle rIMODHBLF tuples.

When the setowner linkage is checked and the rIMODMBLF tuple is linked to the busy tuple of the RLMODHBLF relation or is linked to an idle tuple of the rIMODHBLF tuple and an error is found, the idle function will be called and the rIMODHBLF tuple will be recovered to the idle list.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

22. MP - N

MPHDATA

Software Release: 5E10 and later

1. MSU PATH DATA (MPHDATA) AUDIT

The metallic service units (MSUs) provide a collection of functions that may be shared among a number of switching modules (SMs).

Metallic interconnection buses (MTIBs) interconnect one MSU to another MSU in a different SM. Since the MTIBs are global to all SMs, they are allocated from the communications module processor (CMP). The MSU path data relation (RLMPHDATA), which resides in the CMP, is used to globally allocate the MTIBs. The MPHDATA audit ensures the integrity of RLMPHDATA.

This audit is part of the peripheral control audits subgroup. It runs in the CMP in the segmented mode.

2. DATA STRUCTURES

The metallic service unit path data relation (rIMPHDATA) contains information about the status of the metallic interconnection bus. Figure 1 shows the relationship between rIMPHDATA and the administrative module equipment status table relation (RLCPEST). The RLCPEST relation contains the in-service or out-of-service status of the MTIB. It is audited by the CPEST audit.

Figure 1 (MPHDATA-1) Metallic Path Data Relation

3. AUDIT CHECKS

The metallic service unit path data audit uses the dynamic linkage driver (DRLINK) to step through the

RLMPHDATA relation. The DRLINK driver calls a semantic check function to perform the following audit checks: If the rIMPHDATA tuple is idle (op_status = AUMPHIDLE):

IDLE_BUSY = Check if all fields are set to an idle state.

If the rIMPHDATA tuple is busy:

TIMESTAMP = Check if a metallic connection has been up to long.

MOD_1CONN = Check if a rIMUMTIB tuple exists associated with the mod_1conn field.

MOD_2CONN = Check if a rIMUMTIB tuple exists associated with the mod_2conn field.

BUSYIDLE = Check if a valid process owns this rIMPHDATA tuple.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: BUSYIDLE

Error Code:	BUSYIDLE
Error Description:	The operational status (op_status) of the rIMPHDATA tuple is busy (not AUMPHIDLE) but the owner pid field (pid_owner) is null (OSnullpid).
Possible Error Effect:	The rIMPHDATA tuple will be lost to the system and may lead to degradation of metallic testing.
Corrective Action Taken:	The audit will reinitialize (idle) the rIMPHDATA tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIMPHDATA tuple found in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (mtibid) of the rIMPHDATA tuple in error.
<i>Dump =</i>	rIMPHDATA tuple found in error.

Table 2 Error Code: IDLE_BUSY

Error Code:	IDLE_BUSY
Error Description:	The operational status (op_status) of the rIMPHDATA tuple is idle (AUMPHIDLE) but either the time stamp field (timestamp) is not set to 0, the owning process identification (pid_owner) is not set to OSnullpid, the queueing process identification (queproc) is not set to OSnullpid, the module 1 connect field (mod_1conn) is not set to 0, the module 2 connect field is not set to 0, the queue bit (quefor) is not set to DBNO, or the queueing module connect field (qmod_conn2) is not set to 0.
Possible Error Effect:	Varies according to conditions.
Corrective Action Taken:	The audit will reinitialize (idle) the rIMPHDATA tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIMPHDATA tuple found in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (mtibid) of the rIMPHDATA tuple in error.
<i>Dump =</i>	rIMPHDATA tuple found in error.

Table 3 Error Code: MOD_1CONN

Error Code:	MOD_1CONN
Error Description:	The operational status (op_status) of the rIMPHDATA tuple is busy (not AUMPHIDLE) but the module connect one field (mod_1conn) is either idle or contains an SM that does not contain a MSU that is connected to a MTIB.
Possible Error Effect:	The rIMPHDATA tuple will be lost to the system and may lead to degradation of metallic testing.
Corrective Action Taken:	The audit will reinitialize (idle) the rIMPHDATA tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIMPHDATA tuple found in error.
<i>Bad Data =</i>	The module connect one field (mod_1conn) from the rIMPHDATA tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (mtibid) of the rIMPHDATA tuple in error.
<i>Dump =</i>	rIMPHDATA tuple found in error.

Table 4 Error Code: MOD_2CONN

Error Code:	MOD_2CONN
Error Description:	The operational status (op_status) of the rIMPHDATA tuple is busy (not AUMPHIDLE) but the module connect two field (mod_2conn) is either idle or contains an SM that does not contain a MSU that is connected to a MTIB.
Possible Error Effect:	The rIMPHDATA tuple will be lost to the system and may lead to degradation of metallic testing.
Corrective Action Taken:	The audit will reinitialize (idle) the rIMPHDATA tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIMPHDATA tuple found in error.
<i>Bad Data =</i>	The module connect two field (mod_2conn) from the rIMPHDATA tuple.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (mtibid) of the rIMPHDATA tuple in error.
<i>Dump =</i>	rIMPHDATA tuple found in error.

Table 5 Error Code: TIMESTAMP

Error Code:	TIMESTAMP
Error Description:	The timestamp field (timestamp) in the rIMPHDATA tuple indicates that the metallic connection associated has been up for longer than 3 hours.
Possible Error Effect:	The rIMPHDATA tuple will be lost to the system and may lead to degradation of metallic testing.
Corrective Action Taken:	The audit will reinitialize (idle) the rIMPHDATA tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	Address of the rIMPHDATA tuple found in error.
<i>Bad Data =</i>	NA.
<i>Good Data =</i>	NA.
<i>Logical Index =</i>	Logical key (mtibid) of the rIMPHDATA tuple in error.
<i>Dump 1 =</i>	rIMPHDATA tuple found in error.
<i>Dump 2 =</i>	Current time in the system (OSnow).

MSALWSG

Software Release: 5E10 and later

1. MEASUREMENTS ALLOW STUDY GROUP (MSALWSG) AUDIT

The MSALWSG audit verifies the extra tuples in the dynamic relation RLms_alwsg and also does data comparisons between the dynamic RLMS_ALWSG tuple and the static measurements line unit study (RLMS_LUSDY) tuple. This dynamic relation is used for the integrated switch line unit/line unit (ISLU/LU) load administration measurements feature. This feature will assist the telephone companies in effective load administration and load balancing. It will provide traffic usage counts on all operational switch groups (SG) and line group controllers (LGC) on telephone company specified operational LUs and ISLUs. The counts will be generated in the switching modules (SMs) and reported on two new sections of the 30-minute traffic report (TRFC30); section 144 will report usage on per-LGC basis and section 145 will report usage on per-SG basis. A new recent change/verify view will be provided to enable the telephone company to specify the LUs and ISLUs to be studied. This will be part of the BASE package.

2. DATA STRUCTURES

The primary data structure for this audit is the RLMS_ALWSG relation. This relation identifies switching module (SM) line units (LUs) [integrated switch line units (ISLUs)] allowed for study. This is a dynamic copy of the static relation RLMS_LUSDY.

3. AUDIT CHECKS

The MSALWSG audit invokes the DRSTATIC driver to step through the rIMS_ALWSG tuples. It also uses the following error codes. This listing gives a basic indication of the order of the checks. For details regarding each error code, see the comment blocks given below.

EXTRATUP = Check to see if an extra tuple of the relation exists.

GRBG = Check if the "ids" [LU (RISLU/ISLU) identifier] field is consistent with the corresponding field in the static relation RLMS_LUSDY.

KEY = Check the key of the relation.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The audit did not find a static tuple of type rIMS_LUSDY when it tried to access that tuple from dynamic rIMS_ALWSG tuple. This means that this dynamic tuple is an extra tuple.
Possible Error Effect:	The result will be erroneous which will cause erroneous identification of non-existent LUs/ISLUs.
Corrective Action Taken:	The audit will report the error and will delete the extra dynamic tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the dynamic tuple buffer.
<i>Bad Data =</i>	0. There is no bad data.
<i>Good Data =</i>	0. There is no good data.
<i>Logical Index =</i>	The value of the key field of the extra dynamic tuple.

<i>Dump</i> =	The extra dynamic tuple of type rIMS_ALWSG.

Table 2 Error Code: KEY

Error Code:	KEY
Error Description:	The key field - line unit type and the study group number of the current dynamic tuple rIMS_ALWSG does not match the same field in the static tuple of type rIMS_LUSDY.
Possible Error Effect:	The dynamic tuple has wrong information. This can lead to identification of the wrong line unit type and study group number allowed for study.
Corrective Action Taken:	The audit will report the error and will correct the line unit type and the study group number field of the dynamic tuple from the static tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the dynamic tuple buffer.
<i>Bad Data</i> =	The line unit type and the study group number of the dynamic tuple being audited.
<i>Good Data</i> =	The key field of the dynamic tuple buffer.
<i>Logical Index</i> =	The line unit type and the study group number of the dynamic tuple being audited.
<i>Dump</i> =	The dynamic tuple of type rIMS_ALWSG being audited.

Table 3 Error Code: GRBG

Error Code:	GRBG
Error Description:	The LU (ISLU) identifier of the current dynamic tuple rIMS_ALWSG does not match the same field in the static tuple of type rIMS_LUSDY.
Possible Error Effect:	The dynamic tuple has wrong information. This can lead to false identification of SMs and LUs (ISLUs).
Corrective Action Taken:	The audit will report the error and will correct the LU (ISLU) identifier field of the dynamic tuple from the static tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The address of the dynamic tuple buffer.
<i>Bad Data</i> =	The wrong line unit of the dynamic tuple.
<i>Good Data</i> =	0. There is no good data.
<i>Logical Index</i> =	The value of the key field of the dynamic tuple.
<i>Dump</i> =	The dynamic tuple of type rIMS_ALWSG being audited. The static tuple rIMS_LUSDY.

MSGBUF

Software Release: 5E10 and later

1. MESSAGE BUFFER (MSGBUF) AUDIT

The message buffer (MSGBUF) audit verifies the allocation of the units carrying messages among the active operating system processes. MSGBUF has two audits (called members); one is called the message buffer queue audit and the other is called the message buffer extender block audit. In most cases, the audit corrects the errors it finds.

MSGBUF is routinely initiated by SIM at intervals that depend on the number of other audits scheduled. Either member can also be initiated by the user.

Only one member of MSGBUF can be requested at a time. If you want to run both members, input two requests.

The MSGBUF audit is a frequency-group audit that runs in the correcting mode.

1.1 Requesting MSGBUF Audits

To request an audit of the message buffers, use the following input message.

```
AUD:MSGBUF=a[:b|:c|:b,c];
```

where:

a	= The member number of the audit. Valid values are:
1	= Specifies a message buffer queue audit;
2	= Specifies a message buffer extender block audit.
b	= Indicates whether audit should correct errors. Valid values are:
CORR	= Audit should correct errors (default).
NCG	= Audit should not correct errors.
c	= Indicates what type of report. Valid values are:
DETL	= Generates a raw data report for each error found and an audit completion message (default). Only a limited number of raw data reports are generated.
SUM	= Generates only an audit completion message when the audit terminates. Raw data reports are not created for any errors found.

To interpret system responses to the AUD:MSGBUF input message, refer to the APP:AUD appendix in the Appendixes section of the Input Messages manual (235-600-700).

1.2 Interpreting AUD MSGBUF Output Messages and Error Reports

The MSGBUF audit prints an output message after each audit. It is produced by the system integrity output formatter and includes the information requested by the input message. For more detailed information about the

AUD:MSGBUF output message, refer to the Output Messages manual (235-600-750).

If MSGBUF found an error, a code number is output. Table 1 gives the error numbers and their meanings.

For the message buffer queue audit (error number series 100):

- Category 0 - Errors corrected by updating a field in either a message buffer, a message extender, or a process dispatcher control table entry (DCTE).
- Category 1 - Errors corrected by: removing a message from a queue and returning it to the original sender or requeueing it, or terminating a process.
- Category 2 - Not used.
- Category 3 - Not used.
- Category 4 - Not used.
- Category 5 - Errors corrected by rebuilding a process message queue.

For the message buffer extender block audit (error number series 200):

- Category 0 - Errors corrected by updating a field in a message buffer, freeing a message or returning a message to the original sender, or invalid data returned to an audit fault message.
- Category 1 - Error corrected by returning message to original sender.
- Category 2 - Error corrected by freeing a nonqueued message
 - owned by supervisor process,
 - owned by kernel-audit process,
 - owned by the kernel,
 - in response to audit-fault message.
- Category 3 - Errors corrected by faulting a process or terminating a killable process.
- Category 4 - Not used.
- Category 5 - Not used.

Table 1 MSGBUF AUDIT ERROR MESSAGES

Category	Error Number	Meaning
5	110	Bad message queue head pointer.
5	111	Bad message queue link pointer.
5	112	Allocation bit not set in message extender.
0	113	Bad on-queue bit in message extender.
0	114	Allocation bit not set in message header.
1	115	Bad message-to field in message and bad message owner in message extender.
0	116	Bad message owner in message extender.
0	117	Bad message-to field in message.
5	118	Message queue out of order.
1	119	Old audit fault message queued to a nonkillable process.
1	120	Old audit fault message queued to a killable process.
1	121	Old queued message (except an old queued audit fault message or an old acknowledgement

		message queued to a supervisor process).
5	122	Process has a circular message queue.
5	123	Bad message queue tail pointer.
0	124	Bad message queue block count in process DCTE.
2	125	Old acknowledgement message queued to a nonkillable supervisor process.
2	126	Old acknowledgement message queued to a killable supervisor process.
0	200	Allocated message with an invalid owner field.
2	201	Old allocated message.
0	214	Allocation bit not set in message header.
1	216	Queued message with an invalid owner.
3	219	Old audit fault message queued to a nonkillable process.
3	220	Old audit fault message queued to a killable process.
1	221	Old queued message (except an old queued audit fault message).
0	270	Dequeued message with an invalid owner field.
3	271	Old dequeued audit fault message owned by a nonkillable process.
3	272	Old dequeued audit fault message owned by a killable process.
2	273	Old dequeued message (except an audit fault message).
3	274	Over nine old nonqueued messages (excluding audit fault messages) owned by a killable process.
0	290	Audit fault message response has an invalid message status.
0	291	Invalid status for a message pointer in an audit fault message.

1.3 Responding to AUD MSGBUF Error Reports

The MSGBUF audit corrects most errors it finds. Errors that are not corrected and the action that should be taken are listed in Table 2 .

Table 2 SPECIAL ERROR MESSAGES

Error Number	Action To Be Taken
119	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because the error indicates that a process has probably mishandled an audit fault message. It is likely that errors 201 and 273 will not be corrected if any of these errors occur.
120	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because the error indicates that a process has probably mishandled an audit fault message. It is likely that errors 201 and 273 will not be corrected if any of these errors occur.
121	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because the error indicates that a process may be having problems in processing its messages.
125	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because the error indicates that a process has probably mishandled an acknowledgement message.
126	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because the error indicates that a process has probably mishandled an acknowledgement message.
200	The error indicates a problem in the ownership of a message. This may occur if a breakdown happens in a process termination. Run the process administration audit (PROAD 1) to complete the process termination. Refer to the AUD:PROAD input message in the Input Messages manual (235-600-700).
201	Refer to the TECHNICAL ASSISTANCE of the INTRODUCTION section of the Audits manual, because the error indicates that a process may be having problems in processing its messages.
216	The error indicates a problem in the ownership of a message. This may occur if a breakdown happens in a process termination. Run the process administration audit (PROAD 1) to complete the process termination. Refer to the AUD:PROAD input message in the Input Messages manual (235-600-700).
219	This error indicates an error in a queued audit fault message found by the message extender audit. Run the message queue audit (MSGBUF 1). Refer to the AUD:MSGBUF input message in the Input Messages manual (235-600-700). If the error is not found and corrected, then run the message extender audit (MSGBUF 2) again. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual. It is likely that errors 201 and 273 will not be corrected if this error occurs.
220	This error indicates an error in a queued audit fault message found by the message extender audit. Run the message queue audit (MSGBUF 1). Refer to the AUD:MSGBUF input message in the Input Messages manual (235-600-700). If the error is not found and corrected, then run the message extender audit (MSGBUF 2) again. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual. It is likely that errors 201 and 273 will not be corrected if this error occurs.
221	This error indicates an error in a queued message found by the message extender audit. Run the message queue audit (MSGBUF 1) and if the error is not found and corrected, then run the message

	extender audit (MSGBUF 2) again. Refer to the AUD:MSGBUF input message in the Input Messages manual (235-600-700).
270	This error indicates a problem in the ownership of a message. This may occur if a breakdown happens in a process termination. Run the process administration audit (PROAD 1) to complete the process termination. Refer to the AUD:PROAD input message in the Input Messages manual (235-600-700).
271	Refer to the TECHNICAL ASSISTANCE of the INTRODUCTION section of the Audits manual, because this error indicates that a process has probably mishandled an audit fault message. It is likely that errors 201 and 273 will not be corrected if this error occurs.
272	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because this error indicates that a process has probably mishandled an audit fault message. It is likely that errors 201 and 273 will not be corrected if this error occurs.
273	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because this error indicates that a process may be having problems in processing its messages.
274	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because the error indicates that a process may be having problems in processing its messages.
290	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because this error indicates that a process has probably mishandled an audit fault message. It is likely that errors 201 and 273 will not be corrected if this error occurs.
291	Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Audits manual, because this error indicates that a process has probably mishandled an audit fault message. It is likely that errors 201 and 273 will not be corrected if this error occurs.

MSLUSDY

Software Release: 5E10 and later

1. MEASUREMENTS LINE UNIT STUDY (MSLUSDY)

The MSLUSDY audit performs static to dynamic existence checks between the static rIMS_LUSDY and the dynamic measurements allow study group (rIMS_ALWSG) tuples. This static relation is used for the integrated switch line unit/line unit (ISLU/LU) load administration measurements feature. This feature will assist the telephone companies in effective load administration and load balancing. This capability will provide traffic usage counts on all operational switch groups (SG) and line group controllers (LGC) on telephone company-specified operational LUs and ISLUs. The counts will be generated in the switching modules (SM) and reported on two new sections of the 30-minute traffic report (TRFC30); section 144 will report usage on per-LGC basis and section 145 will report usage on per-SG basis. A new recent change/verify view will be provided to enable the telephone company to specify the LUs and ISLUs to be studied. This feature will be part of the BASE package.

2. DATA STRUCTURES

The primary data structure for this audit is the RLMS_LUSDY relation. This relation identifies SM and line units (LU) [integrated switch line units (ISLUs)] allowed for study.

3. AUDIT CHECKS

The MSLUSDY audit invokes the DRSTATIC driver to step through the rIMS_LUSDY tuples.

LOSTTUP = Check to see if the tuple of a dynamic relation is lost.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: LOSTTUP

Error Code:	LOSTTUP
Error Description:	The audit did not find a dynamic tuple of type rIMS_ALWSG when it tried to access that tuple from static rIMS_LUSDY tuple. There is a missing tuple from the dynamic relation.
Possible Error Effect:	This will cause lost resources as there will be reduced number of rIMS_ALWSG tuples.
Corrective Action Taken:	The audit will report the error and will insert the lost dynamic tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the static tuple buffer.
<i>Bad Data =</i>	0. There is no bad data.
<i>Good Data =</i>	0. There is no good data.
<i>Logical Index =</i>	The value of the key field of the static tuple.
<i>Dump =</i>	The static tuple of type rIMS_LUSDY.

MSMWIDA

Software Release: 5E10 and later

1. MESSAGE SERVICES MESSAGE WAITING INDICATOR DATA (MSMWIDA) AUDIT

The message services message waiting indicator data (MSMWIDA) audit verifies the RLMSMWIDA relation, used for the inter switch voice message (ISVM) feature. The ISVM allows voice message (VM) providers to expand their current intra-switch customer base to potential VM customers by other switches within the same local access transport area (LATA). As such, the crux of the feature is to provide switch support for the necessary inter-switch signaling. The feature does not seek to change or modify existing VM systems, or their interface to the 5ESS[®] switch.

2. DATA STRUCTURES

The primary data structure for this audit is the RLMSMWIDA relation. It is a dynamic, indirect access sequential keyed relation which contains call history information associated with a message waiting indicator (MWI) act/deact request. All idle rLMSMWIDA tuples must be linked with owner-member linkages to the idle list owned by rIDB_HEADC tuple, as shown in Figure 1. All busy rLMSMWIDA tuples must be linked one-to-one to rIDB_HEADC tuples. The global parameter Glapisvm indicates the number of rLMSMWIDA tuples to be populated during initialization.

Figure 1 ((MSMWIDA-1) Owner-member Linkage with rIDB_HEADC Tuple

3. AUDIT CHECKS

The MSMWIDA audit invokes the DRINASEK driver to step through the RLMSMWIDA relation, verifying linkages with the relation RLDB_HEADC.

4. ERROR HANDLING

If linkage errors are detected, the rIMSMWIDA tuple is recovered to the idle list of rIDB_HEADC after all fields (except the key) are zeroed.

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes.

MSQ

Software Release: 5E10 and later

1. MESSAGE QUEUE (MSQ) AUDIT

The switch software provides a mechanism for reporting output messages based on their priority. This mechanism, the message queue, consists of several head cell lists. Each message scheduled by the system has a priority. The system assigns the message to the appropriate head cell list based on its priority. All messages pass through the message queues to the human/machine interface subsystem, which prints or logs them appropriately. The system uses the message queues to print the most important messages first. The only time the queues are circumvented is when they are being audited. When the queues are being audited, the system passes messages directly to the human/machine interface subsystem for assignment to their destinations, without regarding their priorities.

The audit runs in the OSDS kernel process (OKP) environment in the administrative module (AM), the switching module (SM) and the communications module processor (CMP).

2. DATA STRUCTURES

Each processor contains a message queue relation (RLMSQ). The MSQ audit verifies linkages within the RLMSQ relation, and also makes checks between this relation and the data base head cell relation (RLDB_HEADC). The message queue relations contain several lists of messages. There is a separate list for each priority of message. Refer to Figure 1. The priority of a message is essentially its alarm status, which prints in the priority of action field on the output message. Refer to the Output Messages manual, 235-600-750. The message queue relation therefore contains separate lists for messages with critical, major, minor, manual, and automatic alarms. It also contains queues for various priorities of unalarmed messages and an idle list.

The tuples of the message queue relation may not be large enough to contain the text of an entire output message. Some messages require two tuples (see Figure 1 for an example). In this case, the tuples are linked by a one-to-one linkage ("mate" linkage). But no message will ever require more than two tuples.

In addition to the RLMSQ and RLDB_HEADC relations, the MSQ audit uses the global indicator SImsqlock. The audits uses SImsqlock to stabilize the queues during auditing.

Figure 1 (MSQ-1) Message Queue Lists

3. AUDIT CHECKS

The MSQ audit invokes the DRLINK driver to check the relation's linkages.

For each tuple, the MSQ audit makes the following checks after the driver has verified the linkages:

IDLE_LINK = Check if the tuple should be on the idle list.

MATELINK = Check whether or not a mate tuple should be linked.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this document, for any error codes not found.

The audit produces the following error code(s).

Table 1 Error Code: IDLE_LINK

Error Code:	IDLE_LINK
Error Description:	The length field in the OSMSGHEAD field of the output message is zero and the rIMSQ.mate.link field is empty (0), indicating an idle tuple, but the tuple was not on the idle list.
Possible Error Effect:	RLMSQ tuples may be lost to the system. This could result in delayed printing, logging of output messages, or even lost messages.
Corrective Action Taken:	The audit reinitializes the rIMSQ tuple and links it on to the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The rIMSQ tuple's address.
<i>Bad Data</i> =	Owner linkage from the rIMSQ tuple to the owning rIDB HEADC tuple.
<i>Good Data</i> =	Idle list head cell key.
<i>Logical Index</i> =	Logical key of the rIMSQ tuple.
<i>Dump</i> =	The rIMSQ tuple.

Table 2 Error Code: MATELINK

Error Code:	MATELINK
Error Description:	Either the length field in the OSMSGHEAD field of the output message was greater than the maximum allowable for a single tuple and the rIMSQ.mate.link field was 0, or the length was less than the maximum allowable for one tuple but the rIMSQ.mate.link field was not 0. That is, either the length indicated that a mate tuple should be linked but it wasn't, or the length indicated that no mate was necessary but one was there.
Possible Error Effect:	An incorrect message length field would result in the following: (a) The output message being truncated when sent to HMsip for printing. (b) The message length being too long for OSsendmsg to handle.
Corrective Action Taken:	The audit reinitializes the message queue block and puts it on the idle list.
Manual Action Required:	None.
Dump Description:	
<i>Error Address</i> =	The rIMSQ tuple's address.
<i>Bad Data</i> =	Message length from the rIMSQ tuple.
<i>Good Data</i> =	Message length from the mate tuple (if any).
<i>Logical Index</i> =	Logical key of the rIMSQ tuple.

<i>Dump 1</i> =	The rMSQ tuple.
<i>Dump 2</i> =	The mate rMSQ tuple (if any).

MSSGCNT

Software Release: 5E10 and later

1. MEASUREMENTS SWITCH GROUP COUNT (MSSGCNT) AUDIT

The MSSGCNT audit verifies the extra tuples in the dynamic relation RLMS_SGCNT and also does data comparisons between the dynamic rLMS_SGCNT tuple and the static measurements switch group equipped (rLMS_SGEQ) tuple. This dynamic relation is used for the integrated switch line unit/line unit (ISLU/LU) load administration measurements feature. This feature will assist the telephone companies in effective load administration and load balancing. It will provide traffic usage counts on all operational switch groups (SG) and line group controllers (LGC) on telephone company-specified operational LUs and ISLUs. The counts will be generated in the switching modules (SMs) and reported on two new sections of the 30-minute traffic report (TRFC30); section 144 will report usage on per-LGC basis and section 145 will report usage on per-SG basis. A new recent change/verify view will be provided to enable the telephone company to specify the LUs and ISLUs to be studied. This will be part of the BASE package.

2. DATA STRUCTURES

The primary data structure for this audit is the RLMS_SGCNT relation. This relation counts the number of operational switch groups (SGs) or line group controllers (LGCs) on a line unit (LU) or remote integrated switch line unit (RISLU) or integrated switch line unit (ISLU). This is dynamic copy of the static relation RLMS_SGEQ.

3. AUDIT CHECKS

The MSSGCNT audit invokes the DRSTATIC driver to step through the rLMS_SGCNT tuples. This listing gives a basic indication of the order of the checks.

- EXTRATUP = Check to see if an extra tuple of the relation exists.
- GRBG = Check if the "lu_sgcnt" [number of SGs (LGCs) equipped on LU (RISLU/ISLU)] field is consistent with the corresponding field in the static relation RLMS_SGEQ).
- KEY = Check the key of the relation.

4. ERROR HANDLING

See Driver Error Codes (DRERRCDS), located in the Audit Drivers section of this manual, for any error codes not found below.

The audit produces the following error code(s).

Table 1 Error Code: EXTRATUP

Error Code:	EXTRATUP
Error Description:	The audit did not find a static rLMS_SGEQ tuple when it tried to access that tuple from dynamic rLMS_SGCNT tuple. This means that this dynamic tuple is an extra tuple.
Possible Error Effect:	The number of operational SGs (LGCs) on a LU (RISLU/ISLU) will be erroneous.
Corrective Action Taken:	The audit will report the error and will delete the extra dynamic tuple.
Manual Action Required:	None.
Dump Description:	
<i>Error Address =</i>	The address of the dynamic tuple buffer.
<i>Bad Data =</i>	0. There is no bad data.
<i>Good Data =</i>	0. There is no good data.
<i>Logical Index =</i>	The value of the key field of the extra dynamic tuple.
