0 1.3.13 Office Alarm System

0 (a) General Description

0 An Office Alarm System (OAS) is a Trunk Module Equipment (TME)  
0 frame equipped with an Alarm Cross Connect (AXU) shelf and two  
0 (2) Maintenance Trunk Modules (MTM) to provide alarming functions  
0 for the SCP office.

0 (b) Reference

0 None.

0 (c) Provisioning Considerations:

0 ( i) In each SCP-TP provide one TME equipped with at least two  
0 MTM shelves. Refer to the Office Alarm System of the  
0 Signalling Transfer Point (above) for more information on  
0 the Office Alarms for SCP.

0 2.0 Alarm Provisioning

0 The various alarm configurations, dependent on office type and size,  
0 are shown in this document.

0 2.1 Hardware Provisioning

0

0 2.1.1 Hardware Usage Restrictions

0

0 N/A

0 2.1.2 Hardware Dependencies

0

0 N/A

0 2.1.3 Provisioning Considerations

0

0 Alarm hardware is required for a host office, with hardware  
0 choices dependent on office size and customer preference. Alarm  
0 hardware is optional for a remote office.

0 Figures 1 through 6 on the following pages depict the choices for  
0 alarm configurations. Rules follow to explain options within the  
0 figures. Use the following decision tree to determine which fig-  
0 ures apply to a particular office.

## 0 Rules

0 Req These circuits or panels are minimal requirements to  
0 make an alarm system operate.

0 Rule 1 The NT0X66AA Audible Alarm Panel is optional. They are  
0 orderable per customer requirement.

0 Rule 2 The NT0X63AB Alarm Display Panels are optional. They are  
0 orderable per customer requirement.

0 Rule 3 The NT0X61AB TTP Audible Alarm is optional and is  
0 orderable when TTPs are present in an office.

0 Rule 4 The NT0X64AA Exit Alarm Display is optional and may be  
0 ordered as required to allow exit alarm display at main  
0 exit doors on floors of a multi-floored office. A maxi-  
0 mum of four may be provisioned per office. This maximum  
0 may be extended to 14 with the use of an Audible and  
0 Visual Alarm Extension Unit, NT5X85AA.

0 For remote offices, a maximum of five NT0X64AA can be  
0 provisioned. The Alarm Extension Panel, NT5X92AB must  
0 be provided and mounted on an RSE/RME frame if at least  
0 one NT0X64AA is provided for a remote office.

0 Rule 5 The NT5X85AA Alarm Extension Circuit is optional and is  
0 to be ordered when from three to six NT0X66AA Audible  
0 Alarm Panels are required or (and) when five (four for  
0 OAS Version 1) to 14 NT0X64AA Exit Alarm Display Panels  
0 are required in an office. A maximum of one NT5X85AA  
0 circuit can be provisioned per office.

0 Rule 6 The NT5X86AA Alarm Cutoff Control Circuit is optional  
0 and is to be ordered when from two to six NT0X66AA Audi-  
0 ble Alarm Panels are required in an office.

0 Rule 7 The NT5X86AB Alarm Cutoff Keypunch should be ordered  
0 with the NT5X86AA circuit.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 Rule 8 The NT0X63AC Alarm Control and Display Panel is optional  
0 for a remote office, but is the only alarm system choice  
0 at a remote site. This panel may also be used in a  
0 small host office, replacing the NT0X63AA panel.

0 Rule 9 The following cards may apply to a host or a remote of-  
0 fice, but will be assigned in the host office.

0 Two Dead System Alarm Circuits are required per office,  
0 one on the primary MTM and one on the secondary MTM.  
0 Either two NT3X82AA Dead System Alarm Circuit cards,  
0 used with the NT0X63AA panel, or two NT3X82AB Dead Sys-  
0 tem Alarm Circuit Common Audible cards, used with the  
0 NT0X63AC panel, are to be provided.

0 Either one NT3X83AA Alarm Transfer Circuit or one  
0 NT3X84AA Alarm Sending Circuit is required per office.  
0 The NT3X83AA circuit is used to transfer major/minor  
0 alarms to a remote office receiving circuit; the  
0 NT3X84AA circuit is used to send a dead system alarm  
0 tone to a distance operator position.

0 One NT3X85AA Alarm Grouping Circuit may be provided in  
0 offices that occupy multiple floors. This card should  
0 be located on a different MTM than the MTM used for the  
0 NT3X83AA or NT3X84AA card.

0 For a basic alarm system, provide a minimum of one misc  
0 scan detector card for rows A-F. Provide an additional  
0 NT0X10AA if a remote dist. bay (RDB) is to be provided  
0 and/or if any of equipment rows G,H,J through M are to  
0 be equipped. Provide another NT0X10AA if any rows N,P  
0 through Z,AA,BB are to be equipped. Provide another if  
0 at least one of the rows,CC

0 Remote offices require one NT0X10AA for every 14 scan  
0 points required in the office and one NT2X57AA for every  
0 14 signal distributor points required in the office.

0 Rule 10 One NT0X63AB Alarm Display Panel can be supported from  
0 the NT0X63AC Alarm Panel, per customer requirement.

0 3.0 EAS - Enhanced Alarm System

0 The Enhanced Alarm System will provide immediate alarm indication  
0 (within 2 seconds) of catastrophic loss of power to the DMS-100 PDC's  
0 regardless of whether the software remains operative. The alarm indi-  
0 cation will include the AUDIBLE (Critical Bell) and VISUAL (Critical  
0 Power Plant Lamp). (Provisions made are for the loss of feeders from  
0 the Power Plant only, not the loss of the power board).

0 Remote contact closures for the dead system alarm normally open and  
0 normally closed and the DMS power fail will provide connectivity for  
0 remote alarm scanners. The three (3) contacts are wired out with a  
0 total of four (4) wires, a wire for each contact and a common wire.  
0 No signal, voltage, or ground is supplied from the DMS via these con-  
0 tacts.

0 An internally detected low voltage alarm indication will be given ev-  
0 ery fifteen minutes indicating the power supply batteries are dis-  
0 charging, as long as the conditions exist and the DMS-100 remains  
0 operational. The present alarm indications for loss of power to either  
0 the MTM shelves or ABS will be maintained.

0 A fuse or breaker panel may be required to be provided at the power  
0 board for the TME frames and ABS power feeds if appropriate fuse posi-  
0 tions are not already available at the power board.

0 EAS requires 20 amp fuses or breakers at the power board for the TME  
0 frames and ABS of each PDC. The ABS and MTM must be powered from the  
0 same power board (power plant) as that serving the DMS-100 via the  
0 TME's FSP. The power will come from a fuse or breaker at the power  
0 supply directly to the TME's FSP.

0 The primary and secondary MTM shelves cannot be powered from the same  
0 fuse or breaker.

0 Currently the feed for the FSP (NT0X42) originates at busbar A, and  
0 provides an Alarm Battery Supply (ABS) for the alarm circuits and  
0 lamps in the other frames.

0 The EAS kit requires a feed from both the A feed and the B feed fused  
0 at 5 amps from the PDC FSP (fuse position 13).

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 3.1 HARDWARE PROVISIONING

0

0 3.1.1 HARDWARE USAGE RESTRICTIONS

0

0 EAS can be applied to existing offices with Version 2 office  
0 alarm systems.

0 Remotes utilizing an NT0X40 FSP (RME Frame) can be provided with  
0 the separate ABS feed portion of the EAS System. These can be any  
0 of the following remote products: RSC RSCI RLCM RLCC.

0 3.1.2 HARDWARE DEPENDENCIES

0

0 The following changes will be introduced to support EAS in exist-  
0 ing offices. The Primary and Secondary Alarm MTM shelves will no  
0 longer derive power from the A or B feed of the PDC. They will be  
0 powered from the same power board (Power Plant) as that serving  
0 the DMS-100 via the TME's FSP. The power will come from a fuse or  
0 circuit breaker at the power board directly to the TME's FSP.  
0 This re-powering will in actuality re-power the entire TME Frame.

0 The System Engineer will need to determine if there are enough  
0 fuse or breaker positions available on the customer's power board  
0 before upgrading an existing office with EAS Phase I.

0 The System Engineer will also need to determine if there are two  
0 (2) fuse positions (1 A feed & 1 B feed) available for the  
0 NT0X42XC EAS Kit. Fuse Position 13 on both the A & B feed is the  
0 preferred position. One (1) NT0X42XC EAS Kit is required for  
0 each PDC in the office to be upgraded to EAS.

0 If fuse positions are not available, arrangements must be made to  
0 provide the fuse positions to support EAS.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 A question should be added to NTACCESS asking if EAS will be re-  
0 quired in that particular office (upgrade or initial).

## 0 1.0 Host - Metallic Test Access

0 1.1 Equipment Provisioning0 1.1.1 Metallic Test Access (MTA)0 a) General Description

0 The MTA provides a dc path between the line circuit and test  
0 equipment, such as a LTU or a #14 Local Test Desk (LTD), via the  
0 test access bus. When subscriber lines are tested, the path is  
0 via a digital line and an applique circuit.

0 The MTA can also be used to access subscriber loops, while by-  
0 passing the line card, and to connect a jack to the loop. Simi-  
0 larly, a tone can be transmitted on the subscriber loop while  
0 bypassing the line card.

0 The MTA is used in domestic and international DMS-100 and  
0 DMS-100/200 offices.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) The MTA may be configured in either of two ways:

0 A NT2X46AB minibar switch mounted in a miscellaneous  
0 equipment frame (MIS) in the host office or a Remote Ser-  
0 vice Equipment Frame (RSE) at a Remote Line Module (RLM).  
0 It is used in conjunction with a NT2X50AB driver card  
0 that is mounted in a MTM or RSM.

0 A NT3X09AA or NT3X09BA type driver card are each equipped  
0 with a network of relays that comprise a matrix. The  
0 NT3X09AA card has 8 horizontal connections for test  
0 equipment and 4 vertical connections for LCD. The  
0 NT3X09BA card has 8 horizontal connections for test  
0 equipment and 8 vertical connections for LCD. The  
0 NT3X09AA Remote Metallic Access card is mounted on a RMM  
0 at a RLCM, a IRLCM, a RSC, or an OPM. The NT3X09BA 8X8  
0 metallic test access card is mounted in a MTM in a host

0 RELEASE 28.01  
0 93 12 03  
0

0 office, a RSM at a RLM or a RMM at a RLCM, a IRLCM, a RSC  
0 or an OPM. (Presently NT3X09BA is not applicable to RLCM  
0 and IRLCM for Canadian Offices).

0 ( ii) The NT3X09BA is designed to replace the MTA Unit  
0 (NT2X46AB) and the Remote MTA Card (NT3X09AA) where ap-  
0 plicable. Therefore, new host offices and remote sites  
0 will be engineered with the NT3X09BA card when generally  
0 available. The NT3X09BA card will work as an extension  
0 to an NT2X46AB minibar switch an/or to an NT3X09AA card.

0 ( iii) The NT2X46AB unit has 16 horizontals and 20 verticals.  
0 It can accommodate up to 10 LM's/RLM's/LCM's and up to 16  
0 test circuits.

0 The NT3X09AA card has 8 horizontals and 4 verticals. It  
0 can accommodate up to 2 LCM's and up to 8 test circuits.

0 The NT3X09BA card has 8 horizontals and 8 verticals. It  
0 can accommodate up to 4 LM's/RLM's/LCM's and up to 8 test  
0 circuits.

0 ( iv) The test access network is organized in a grid formation.  
0 See Figure 35.1.

0 Each MTA Unit, NT2X46AB, is assigned to a column, (0 to  
0 63), and up to four rows (0,2,4,6), per column. Note that  
0 only the even rows are assigned on the NT2X46AB units in  
0 order to allow multiplying to columns of NT3X09's.

0 Each NT3X09AA/BA card is assigned to a column, (0 to 63),  
0 and up to eight rows (0 to 7), per column.

0 All verticals on MTA units within a column are multiplied  
0 together.

0 All horizontals from horizontal number two on upwards on  
0 MTA units are multiplied together.

FIGURE 35.1

0 RELEASE 28.01  
0 93 12 03

0 ( v) Currently, one Line Test Unit (LTU) is assigned to hori-  
0 zontal number zero of each minibar switch (NT2X46AB) on a  
0 dedicated basis. Hence, on each NT2X46AB, this LTU will  
0 have test access to up to ten (10) LM's and/or LCM's.

0 For NT3X09BA, one LTU is assigned to horizontal number  
0 zero of the first NT3X09BA card and multiplied to hori-  
0 zontal number zero of the next NT3X09BA card in the next  
0 column. Hence, one dedicated LTU is assigned to two (2)  
0 NT3X09BA cards such that this LTU will have test access  
0 to up to eight (8) LM's and/or LCM's. For every two (2)  
0 NT3X09BA cards, provide one (1) LTU.

0 Each additional LTU can be assigned to horizontal numbers  
0 from two (2) on upwards.

0 ( vi) Provisioning a NT2X46AB MTA.

$$\begin{array}{r}
 \text{MTA} = \frac{\text{No. SMS S/W Sites}}{20} + \frac{\text{No. SMU S/W Sites}}{20} + \\
 \frac{\text{No. SMR}}{20} + \frac{\text{No. LCM}}{10} + \frac{\text{No. LM}}{10}
 \end{array}$$

0 Provisioning a NT3X09BA 8 X 8 Metallic Test Access.

$$\begin{array}{r}
 \text{MTA} = \frac{\text{No. SMS S/W Sites}}{8} + \frac{\text{No. SMU S/W Sites}}{8} + \\
 \frac{\text{No. SMR}}{8} + \frac{\text{No. LCM}}{4} + \frac{\text{No. LM}}{4}
 \end{array}$$

0 ( vii) Intermediate Distribution Frame (IDF) Implementation  
0 (U.S. Application Only)

0 The existing cabling method does not support the testing  
0 of non-integrated SLC 96 subscriber loop carrier systems  
0 using an AT&T test tool called Pair Gain Test Controller  
0 (PGTC).

0 To allow the testing of the universal SLC 96 subscriber  
0 carrier system using a PGTC, the total NT3X09BA multiple  
0 cable length must not exceed the figures shown in Table

0  
0 RELEASE 28.01  
0 93 12 03

0 35.2 of this document. Otherwise, an Intermediate Dis-  
0 tribution Frame (IDF) (i.e. Customer provided) close to  
0 the DMS line-up will be required.

0 The total multiple cable length is the sum of all multi-  
0 ple cables to the distribution frame, both horizontal and  
0 vertical.

0 The overall MTA circuit distance must be calculated based  
0 on the longest metallic path from any PGTC to any uni-  
0 versal SLC 96 Central Office Terminal Channel Unit (COT  
0 CU) in the central office.

0 The MTA multiple cables can be minimized by placing the  
0 TME that house the MTAs close to the cable racks and the  
0 MDF as much as possible.

0 RELEASE 28.01  
0 93 12 03

0 1.1.2 Wideband Test Access

0 a) General Description

0 The Wideband Test Access (WTA) Panel will replace the use of the  
0 Main Distributing Frame (MDF) for metallic cross-connecting of  
0 test circuits (such as the Line Test Unit/Multiline Test Unit  
0 (LTU/MTU)), Metallic Test Access (MTA), and line equipment in DMS  
0 offices.

0 The WTA Panel is a cross-connect panel which will provide the me-  
0 tallic cross-connect capability for the testing of DMS wideband  
0 subscriber services such as ISDN and Datapath as well as existing  
0 voice frequency DMS-100 subscriber services. It is mandatory for  
0 the testing of ISDN and is recommended for the testing of  
0 Datapath service. The existing MDF cabling method will not be  
0 able to support the testing of these services mainly because of  
0 the transmission impairment caused by the excessive switching of-  
0 fice cabling.

0 This method of cross-connecting office wiring for the test cir-  
0 cuits, MTA, and test access cables will drastically reduce the  
0 amount of office cabling resulting from the existing MDF method.

0 This panel will mount on the Miscellaneous Equipment (MIS) Frame  
0 NT0X02AB. With the panel mounted on an MIS frame within the DMS  
0 equipment frame lineups, all the cabling to the MDF will be elim-  
0 inated and this will result in much shorter office wiring for the  
0 testing of subscriber services.

0 b) References

0 c) Provisioning Considerations:

0 ( i) The Wideband Test Access (WTA) Panel will replace the use  
0 of the Main Distributing Frame (MDF) for metallic cross-  
0 connecting of test circuits (such as the Line Test  
0 Unit/Multiline Test Unit (LTU/MTU)), Metallic Test Access  
0 (MTA), and line equipment in DMS offices.

0 The WTA Panel is a cross-connect panel which will provide  
0 the metallic cross-connect capability for the testing of  
0 DMS wideband subscriber services such as ISDN and  
0 Datapath as well as existing voice frequency DMS-100 sub-  
0 scriber services. It is mandatory for the testing of  
0 ISDN and is recommended for the testing of Datapath ser-

0 RELEASE 28.01  
0 93 12 03  
0

0 vice. The existing MDF cabling method will not be able  
0 to support the testing of these services mainly because  
0 of the transmission impairment caused by the excessive  
0 switching office cabling.

0 This method of cross-connecting office wiring for the  
0 test circuits, MTA, and test access cables will dras-  
0 tically reduce the amount of office cabling resulting  
0 from the existing MDF method.

0 ( ii) There are two (2) versions of the WTA Panel:

0 NT7X76AA WTA Panel

0 NT7X76BA WTA Panel (Dedicated LTU/MTU)

0 NT7X76AA will allow the cross-connection of up to 30  
0 NT3X09BA MTA circuits in a matrix of three (3) horizontal  
0 NT3X09BA rows by ten (10) vertical NT3X09BA columns. This  
0 is equivalent to the cross-connection of 24 horizontal  
0 test appearances to 80 vertical appearances. The NT3X09BA  
0 card has 8 horizontals and 8 verticals.

0 NT7X76AA will allow the cross-connection of up to 30  
0 NT3X09AA MTA circuits in a matrix of three (3) horizontal  
0 NT3X09AA rows by ten (10) vertical NT3X09AA columns. This  
0 is equivalent to the cross-connection of 24 horizontal  
0 test appearances to 40 vertical appearances. The NT3X09AA  
0 card has 8 horizontals and 4 verticals.

0 NT7X76BA is similar to NT7X76AA with one exception. The  
0 first horizontal test appearance of the 24 horizontal  
0 test appearances of the NT7X76BA panel is grouped into  
0 five (5) subgroups, each with two (2) horizontal 0's and  
0 16 verticals (if NT3X09BA cards are used for cross-  
0 connection purposes) or 8 verticals (if NT3X09AA cards  
0 are used for cross-connection purposes). Each horizontal  
0 subgroup can have a dedicated LTU/MTU. Hence, up to five  
0 (5) dedicated LTU/MTUs can be connected to NT7X76BA. If  
0 NT3X09BA cards are used, each dedicated LTU/MTU will have  
0 access to 16 verticals or 8 Line Concentrating Modules  
0 (LCMs) within each horizontal subgroup 0. If NT3X09AA  
0 cards are used, each dedicated LTU/MTU will have access  
0 to 8 verticals or 4 LCMs within each horizontal subgroup  
0 0.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 (iii) The NT7X76AA WTA Panel will not be used for the dedicated  
0 LTU/MTU function.

0 The NT7X76BA WTA Panel (Dedicated LTU/MTU)  
0 will be used for the dedicated LTU/MTU function.

0 The NT7X76AA will also be used if the office requires  
0 more than one (1) (horizontal) row of WTA Panels or more  
0 than 24 horizontal test appearances.

- 0 (iv) The number of WTA Panels can be expanded horizontally (in  
0 rows) and/or vertically (in columns) in a matrix.

0 For offices without dedicated LTU/MTUs, only NT7X76AA  
0 would be required for expansion both horizontally and  
0 vertically.

0 For offices with dedicated LTU/MTUs, the first row of WTA  
0 Panels would be of the NT7X76BA type. If connection to  
0 more dedicated LTU/MTUs was required, NT7X76BA Panels  
0 would be used for the second row of WTA Panels. Other-  
0 wise, the NT7X76AA Panel should be used. Our current  
0 standard is to have dedicated LTU/MTUs on the first row  
0 of the matrix of WTA Panels (i.e. NT7X76BA) and not to  
0 have dedicated LTU/MTUs on the second and all subsequent  
0 rows of the matrix of WTA Panels (i.e. NT7X76AA).

- 0 ( v) The WTA Panel will replace the Intermediate Distribution  
0 Frame (IDF) for the testing of the universal SLC 96 sub-  
0 scriber loop carrier system which uses an AT&T test tool  
0 called Pair Gain Test Controller (PGTC).

0 The existing engineering rules for the use of the IDF  
0 should be applied to the use of the WTA Panel. For more  
0 information, see ECM-276 on subject 8X8 Metallic Test Ac-  
0 cess Circuit Pack, NT3X09BA.

- 0 ( vi) The WTA panel will mount on the Miscellaneous Equipment  
0 (MIS) Frame NT0X02AB. With the panel mounted on an MIS  
0 frame within the DMS equipment frame lineups, all the ca-  
0 bling to the MDF will be eliminated and this will result  
0 in much shorter office wiring for the testing of sub-  
0 scriber services.

0 For initial and extension offices requiring new MIS  
0 Frames, the WTA Panels should be mounted on standard  
0 shelf positions 65,51,32,18, and 04 first on the front

0 RELEASE 28.01  
0 93 12 03  
0

0 and then on the back of the MIS Frame. Hence, up to a  
0 maximum of ten (10) WTA Panels can be equipped on one (1)  
0 MIS Frame.

0 For ease of engineering cables, the WTA Panels will be  
0 assigned from the top position down on the MIS Frame.

0 Although a Frame Supervisory Panel (FSP) is not required  
0 for the WTA Panel, an FSP can be mounted in shelf posi-  
0 tion 45 if other devices (which can mount on the MIS  
0 Frame) require an FSP. Hence, if the MIS Frame is not  
0 fully provisioned with WTA Panels, other valid hardware  
0 units can be mounted.

0 For installation on existing MIS Frames in existing of-  
0 fices, the WTA Panels can be mounted on any available  
0 shelf position of the MIS Frame, preferably the top shelf  
0 positions.

- 0 ( vii) To minimize the office wiring required for line testing,  
0 the Maintenance Trunk Modules (MTM) that are provisioned  
0 with NT3X09AA/BA cards and LTU/MTUs should be reduced to  
0 a minimum and placed in the adjacent TME/DCE Frames next  
0 to the MIS Frames containing WTA Panels.

0 The Line Concentrating Equipment Frames (LCE) and ISDN  
0 Line Concentrating Equipment Frames (LCEI) should be  
0 clustered around the MIS Frames containing WTA Panels in  
0 order to minimize the cabling to these panels.

0 Hence, the signal loss caused by office wiring should be  
0 reduced to the minimum that is possible. The signal loss  
0 should be less than one (1) db in most offices.

0 (viii) Discrimination Numbering

0 WTA Panels NT7X76AA/BA will be numbered from 000 on up  
0 (e.g. WTA 000, WTA 001, etc.).

- 0 ( ix) For offices larger than 75,000 lines and requiring more  
0 than three (3) WTA Panels, the straight forward WTA ma-  
0 trix configuration cannot be used due to the software  
0 limitation of a maximum of 32 multiples which can be  
0 datafilled for each horizontal subgroup.

0 RELEASE 28.01  
0 93 12 03  
0

0 The way to solve this problem is to split the total num-  
0 ber of multiples into either groups of 32 (using Method  
0 1) or groups of 31 (using Method 2).

0 WTA Panel Configuration for Offices with Line Size >  
0 75,000

0 Method 1

0 Using Method 1, the multiples can be divided evenly into  
0 two (2) groups of up to 32 multiples within each group.  
0 Each WTA Panel allows the cross-connection of up to ten  
0 (10) multiples except for the fourth panel which will  
0 only have two (2) multiples. Hence, WTA Panels  
0 "B", "C", "D", and "E" will provide cross-connections for  
0 32 multiples.

0 Access to the line circuits is provided via the extended  
0 verticals of WTA Panel "A" as illustrated. Therefore, the  
0 test circuits connected to WTA Panel "A" will have access  
0 to more than 75,000 lines by using the extended vertical  
0 and horizontal connections.

0 WTA Panel Configuration for Offices with Line Size >  
0 75,000

0 Method 2

0 Using Method 2, WTA Panel "A" is connected to WTA Panel  
0 "B" in such a way as to provide for the cross-connections  
0 for the first group of 31 multiples via WTA Panels  
0 "A", "B", "C", and "D" as in a normal matrix configuration.

0 For the second group of 32 multiples via WTA Panels  
0 "F", "G", "H", and "I", the extended verticals are used.

0 Differences Between Methods 1 and 2

0 Method 1 will require one (1) more WTA Panel which is  
0 panel "E" and three (3) more NT3X09BA cards, six (6) in-  
0 stead of three (3), connected to panel "A".

0 Using Method 1, line testing involving the first and sec-  
0 ond groups of 32 multiples will be subjected to the mul-  
0 tiple cabling within the group or a maximum of 32  
0 multiple cables. Using Method 2, line testing involving  
0 the second group of 32 multiples will also involve the

0  
0 RELEASE 28.01  
0 93 12 03

0 first group of 31 multiples or will be subjected to a  
0 maximum of 63 multiple cables.

0 Generally, Method 1 would be preferred over Method 2 due  
0 to the effect on line testing. However, Method 2 may be  
0 worth considering if an LCE expansion is done properly to  
0 reduce the effect of multiple cabling on line testing.

### Method 1

The connections between WTA Panels "A" and "B" and between WTA Panels "A" and "F" are for illustration purposes only. That is, the first group of eight (8) verticals on WTA "A" will be datafilled as extended verticals and connected to the first group of eight (8) horizontal datafilled as extended horizontal on WTA "B". The second group of eight (8) verticals of WTA "A" will be connected to the first group of eight (8) horizontal of WTA "F". Similarly, the third and fourth group of eight (8) verticals on WTA "A" will be connected to the second group of eight (8) horizontal of WTA "B" and "F" respectively. The fifth and sixth group of eight (8) verticals on WTA "A" will be connected to the third group of eight (8) horizontal on WTA "B" and "F" respectively. The actual connections are made from connectors P43 to P44 of WTA "A" to connectors P31 to P42 and P97 to P108 of WTA "B" and "F".

0 WTA Panel Configuration for Offices with Line Size >  
0 75,000

0 Method 2

0 WTA Panel D (to the right of WTA Panel C) and WTA Panels

0 1.1.3 101 Communication Test Line

0 a) General Description

0 The 101 Communication Test Line (CTL) circuit provides a 2-wire  
0 voice and signaling interface between the Trunk Module (TM) and a  
0 Maintenance and Administration Position (MAP) configured as a  
0 Line Test Position (LTP) or a Trunk Test Position (TTP). The Map  
0 may be at the same location as the TM or remote from it.

0 The Circuit is used in all DMS-100 Family offices as an originat-  
0 ing communication trunk or as a terminating type 101 trunk.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual  
0 NTP 297-2101-516 Line Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) There are two versions of the circuit:

0 NT5X30AA Used in North American applications.

0 NT5X30BA Used in International applications.

0 ( ii) Each circuit card contains one CTL circuit, and is  
0 plugged into a 2-wire, 4-wire, or 8-wire TM.

## 0 ( iii) Features:

|                                        | NT5X30AA | NT5X30BA    |
|----------------------------------------|----------|-------------|
| -Impedance                             | 900 Ohms | complex     |
| -Compatibility with Telephone Set      | 500 Type | BT700 Type  |
| Key equipment                          | 1A2      | UK Approved |
| Foreign Exchange carrier channel units | Yes      | No          |
| -Built in ringing supply               | 20 Hz    | 25 Hz       |
| -Forward disconnect (re-ring)          | Yes      | No          |

0 Each card contains transmission and signaling functions  
0 to enable outgoing calls to be originated from a LTP or a  
0 TTP, and for incoming calls to be completed to it.

## 0 ( iv) Applications of NT5X30

## 0 1. 101 Test Line (Terminating)

0 As a minimum requirement provide one circuit per Main-  
0 tenance and Administration Position (MAP) which is to  
0 be used for trunk testing (TTP). Each Trunk to have  
0 access to all such positions.

## 0 2. 101 Communication Trunk (Originations)

## 0 Local Offices:

0 As a minimum requirement provide one circuit for each  
0 MAP which is to be used for general maintenance or  
0 line testing.

## 0 Toll Offices

0 As a minimum requirement provide one circuit for each  
0 MAP which is to be used for general maintenance or  
0 trunk testing.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 MAP/Headset Monitor Interface

0 One interface circuit is required for each headset  
0 provided for service analysis monitors and test mon-  
0 itors at the MAP (See Section 3.6, I/O Devices for  
0 more information).

0 ( v) For NT5X30AA one compromise balance network NT2X77, of  
0 the appropriate type must be provided for each card or-  
0 dered (see Section 3.5 (1.3.1 Analog Trunks) for more in-  
0 formation on the compromised Balance Networks).

0 For NT5X30BA one compromise balance network NT2X77BB must  
0 be provided for each card ordered.

0 1.1.4 Miscellaneous Scan Detector Card

0 a) General Description

0 Scanner circuits enable the DMS Central Control to sense the  
0 state or change of state of external equipment.

0 b) References

0 NTP 297-1001-451 DMS-100 Family Common Customer Data  
0 Schema  
0 NTP 297-2101-451 DMS-100 Local Customer Data Schema  
0 NTP 297-2181-451 DMS-100 International Customer Data  
0 Schema  
0 NTP 297-2301-451 DMS-300 Gateway Customer Data  
0 Schema  
0 Section 3.7 Office Maintenance

0 c) Provisioning Considerations:

0 ( i) Three switch selectable detector modes:

- 0 - loop detector  
0 - ground detector  
0 - battery detector

0 ( ii) Each DMS miscellaneous scan card provides fourteen scan  
0 points configured as two scan circuits known as "Scan  
0 Groups" with seven points per group. In certain applica-  
0 tions software limitations restricts a group to a spe-  
0 cific function and unused points in that group cannot be  
0 assigned to other functions.

0 ( iii) DMS supports a maximum of 1024 scan points (146 scan  
0 groups). This includes seven scan points (one scan  
0 group) associated with each standard alarm card provi-  
0 sioned:

0 NT3X83AA  
0 NT3X84AA  
0 NT3X85AA

0 For more information on the Standard Alarm cards, refer  
0 to Section 3.7, Office Maintenance.

0 ( iv) Miscellaneous Scan Card is NT0X10AA. One slot per card.  
0 Mounts on MTM, OAU, RSM.

0 ( v) For alarms which require scan points, see NTP  
0 297-1001-451 DMS-100 Family Common Customer Data Schema,  
0 Section 034 Alarm Scan Group Table.

0 ( vi) For line features which require scan points, see the Scan  
0 Group Table, Section 127 in the following NTPs:

0 NTP 297-2101-451  
0 NTP 297-2141-451  
0 NTP 297-2151-451  
0 NTP 297-2181-451

0 The quantity of scan points required for line features is  
0 divided by seven (7) to determine the number of scan cir-  
0 cuits or groups required.

0 ( vii) For network management functions which require scan  
0 points, see the Network Management Scan Table, Section  
0 039 in the following NTPs:

0 NTP 297-1001-451  
0 NTP 297-2141-451  
0 NTP 297-2151-451  
0 NTP 297-2181-451  
0 NTP 297-2301-451

0 The quantity of scan points required for network manage-  
0 ment functions is divided by seven (7) to determine the  
0 number of scan circuits or groups required.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 (viii) Each A.P.C. ROTL unit, model 1066-ROTL/52A, comes  
0 equipped with two ROTL test ports.

0 One scan group (four points plus three dedicated spares)  
0 must be provided for each A.P.C. ROTL test port. Provide  
0 one additional scan point per ROTL unit if an alarm  
0 interface is required.

0 ( ix) For more information on the provisioning of Scan  
0 Points, refer to Section 3.7, Office Maintenance.

## 0 2.0 Wideband Test Access (WTA) Panel

0 The Wideband Test Access (WTA) Panel replaces the use of the Main Dis-  
0 tributing Frame (MDF) for metallic cross-connecting of test circuits  
0 (such as the Line Test Unit/Multiline Test Unit (LTU/MTU)), Metallic  
0 Test Access (MTA), and line equipment in DMS offices.

0 The WTA Panel is a cross-connect panel that provides the metallic  
0 cross-connect capability for the testing of DMS wideband subscriber  
0 services such as Datapath and ISDN as well as existing voice frequency  
0 DMS-100 subscriber services. The WTA is recommended for the testing  
0 of Datapath service and is a must when a PGTC (Pair Gain Test Control-  
0 ler) is used in the Central Office for testing. The existing MDF ca-  
0 bling method cannot support the testing of these services mainly  
0 because of the transmission impairment caused by the excessive switch-  
0 ing office cabling. For example, the WTA reduces the cabling needed  
0 in large offices that have non-integrated SLC-96 subscriber carrier  
0 systems that require the use of the Pair Gain Test Controller (PGTC).

0 This method of cross-connecting office wiring for the test circuits,  
0 MTA, and test access cables drastically reduces the amount of office  
0 cabling resulting from the existing MDF method.

0 This panel mounts on the Miscellaneous Equipment (MIS) Frame NT0X02AB.  
0 With the panel mounted on an MIS frame within the DMS equipment frame  
0 lineups, all unnecessary cabling to the MDF is eliminated and this re-  
0 sults in much shorter office wiring for the testing of subscriber ser-  
0 vices.

0 | Not applicable

0 | 2.1.3 PROVISIONING CONSIDERATIONS

0  
0 | 2.4.1 The Wide-band Test Access (WTA) Panel (NT7X76AA/B0233245) was  
0 developed to replace the functionality of the Main Distribution  
0 Frame (MDF) for metallic cross-connecting of the line equipment  
0 to the Metallic Test Access (MTA) and test heads. The DMS-100  
0 test heads include the Line Test Unit (LTU), the Multi-line Test  
0 Unit (MTU), and the Enhanced Services Test Unit (ESTU).

0 | The introduction of the WTA panel drastically reduces the amount  
0 of Central Office wiring necessary to cross-connect the test bus  
0 side of the line cards to the MDF, the Metallic Test Access  
0 (MTA) and the test heads. The panel can be engineered to be  
0 mounted into the Miscellaneous Equipment (MIS) Frame. When the  
0 MIS Frame is engineered into the DMS Equipment frame line-up,  
0 all the equipment cross-connections are completed locally on the  
0 WTA panel, not at the MDF.

0 | The WTA panel also drastically reduces the amount of CO wiring  
0 necessary to support the channel testing of Universal Digital  
0 Loop Carriers (UDLC) using a Pair Gain Controller (PGTC) and the  
0 channel testing of Integrated Digital Loop Carriers (IDLCs) us-  
0 ing the Loop Test Applique. Again the WTA panel can be engi-  
0 neered into the MIS Frame to eliminate unnecessary wiring  
0 between the CO equipment and the MDF.

0  
0 RELEASE 28.01  
0 93 12 03

0 2.4.2 There are two (2) versions of the WTA Panel:

0 NT7X76AA WTA Panel

0 NT7X76BA WTA Panel (Dedicated LTU/MTU)

0 The NT7X76AA/BA allows the cross-connection of up to 30 NT3X09BA  
0 MTA circuits in a matrix of three (3) horizontal NT3X09BA rows  
0 by ten (10) vertical NT3X09BA columns. This is equivalent to  
0 the cross-connection of 24 horizontal test appearances to 80  
0 vertical appearances. The NT3X09BA card has 8 horizontals and 8  
0 verticals.

0 The NT3X09AA is not recommended for use with the WTA panel. The  
0 NT3X09AA has a 4X8 matrix as opposed to the NT3X09BA which has  
0 an 8X8 matrix. An NT3X09AA can be connected to the WTA panel us-  
0 ing the NT3X09BA connectorized cable, but once a WTA horizontal  
0 row has a NT3X09AA, only NT3X09AAs can be connected to that par-  
0 ticular horizontal row. The NT3X09AAs and NT3X09BAs cannot be  
0 mixed on the same row of a WTA panel.

0 The NT7X76BA is similar to NT7X76AA with one exception. The  
0 first horizontal test appearance of the 24 horizontal test ap-  
0 pearances of the NT7X76BA panel is grouped into five (5) sub-  
0 groups, each horizontal 0 with access to 16 verticals when  
0 NT3X09BA cards are used for cross-connection purposes. Each  
0 horizontal subgroup can have a dedicated LTU/MTU. Hence, up to  
0 five (5) dedicated LTU/MTUs can be connected to NT7X76BA. If  
0 NT3X09BA cards are used, each dedicated LTU/MTU has access to 16  
0 verticals or 8 Line Concentrating Modules (LCMs) within each  
0 horizontal subgroup 0.

0 For U.S. applications, the NT7X76BA is the standard WTA panel  
0 for all configurations that require dedicated LTU functionality.

0 2.4.3 The NT7X76BA WTA Panel is only used for the dedicated LTU/MTU  
0 function.

0 When the dedicated LTU/MTU function is used, the vertical ap-  
0 pearances are expanded using the NT7X76BA. The horizontal ap-  
0 pearances can be expanded with the NT7X76AA.

0 The NT7X76AA can also be used if the office requires more than  
0 one (1) (horizontal) row of WTA Panels or more than 24 horizon-  
0 tal test appearances.

0

0 RELEASE 28.01  
0 93 12 03

0 2.4.4 For offices without dedicated LTU/MTUs, only NT7X76AA would be  
0 required for expansion both horizontally and vertically.

0 For offices with dedicated LTU/MTUs, the first row of the WTA  
0 Panel matrix would be of the NT7X76BA type. Our current stand-  
0 ard is to have dedicated LTU/MTUs on the first row of the matrix  
0 of WTA Panels (i.e. NT7X76BA) and not to have dedicated LTU/MTUs  
0 on the second and all subsequent rows of the matrix of WTA Pan-  
0 els (i.e. NT7X76AA). If connection to more dedicated LTU/MTUs  
0 was required, NT7X76BA Panels would be used for the second row  
0 of WTA Panels. Otherwise, the NT7X76AA Panel should be used.

0 2.4.5 The WTA Panel replaces the Intermediate Distribution Frame (IDF)  
0 for the testing of the universal SLC 96 subscriber loop carrier  
0 system which uses an AT&T test tool called Pair Gain Test Con-  
0 troller (PGTC).

0 The location of the WTA shall be selected such that the overall  
0 cable length from the PGTC to the universal SLC 96 COT CU (Cen-  
0 tral Office Terminal Channel Unit), and the total multiple cable  
0 length is less than 2500 feet (see Figure 1 on page 14-28).  
0 'Multiples' are all the open-ended cables connected to the test  
0 signal path; namely, all the open-ended WTA/MTA cables bridged  
0 on the test signal path between the PGTC and the COT CU. Since  
0 the WTA Panel consists of a 3 row x 10 column matrix of WTA to  
0 MTA connectors, and assuming that all 30 connectors are equipped  
0 with cables, the total number of 'multiples' is:  $(10-1) + (3-1)$   
0 = 11. The decrements by one are necessary because one horizontal  
0 and one vertical multiple belong to the test signal path. The  
0 number of multiples will increase if more WTA panels are used.

0 In existing offices, some equipment relocation may be necessary  
0 in order to comply with the cable length restrictions when PGTCs  
0 are used.

0 Referring to the Figure 1 on page 14-28, the PGTC to COT CU ca-  
0 ble length, L, is composed of the following segments:

0 
$$L = (\text{PGTC to MDF}) + (\text{MDF to 2X90}) + (\text{2X90 to APPLIQUE}) +$$
  
0 
$$(\text{APPLIQUE to WTA}) + 2 \times (\text{WTA to MTA}) + (\text{WTA to LCM}) +$$
  
0 
$$(\text{LCM to MDF}) + (\text{MDF to COT CU})$$

0 The PGTC to COT cable length ("L"), must be calculated based on  
0 the longest metallic patch between the PGTC and the furthest  
0 universal SLC 96 COT CU in the central office.

0

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 2.4.6 The WTA panel mounts on the Miscellaneous Equipment (MIS) Frame  
0 NT0X02AB. With the panel mounted on an MIS frame within the DMS  
0 equipment frame lineups, much of the cabling to the MDF can be  
0 eliminated and this results in much shorter office wiring for  
0 the testing of subscriber services.

0 For installation into an existing MIS Frame in an existing of-  
0 fice, the WTA Panel(s) can be mounted on any available shelf po-  
0 sition of the MIS frame, preferably the top shelf position.  
0 Before engineering the Panel(s) into the frame, insure that the  
0 cable trough has adequate room for the necessary WTA Panel cabl-  
0 ing. Remember, the MIS Frame must be in proximity to the MTAs,  
0 test heads, etc..

0 For initial and extension offices requiring new MIS Frames, the  
0 WTA Panels are to be engineered and mounted on standard shelf  
0 positions in the following order:

|   |          |          |
|---|----------|----------|
| 0 | Panel #1 | 65 Front |
| 0 | Panel #2 | 51 Front |
| 0 | Panel #3 | 51 Rear  |
| 0 | Panel #4 | 32 Front |
| 0 | Panel #5 | 32 Rear  |
| 0 | Panel #6 | 18 Front |
| 0 | Panel #7 | 18 Rear  |
| 0 | Panel #8 | 04 Front |

0 Currently WTA cannot be mounted on shelf position 65R because of  
0 the conflict with the ground cable lug. This restriction will be  
0 removed in the future when the workaround is available.

0 Notes:

0 1. A maximum of 8 WTA Panels can be provisioned per NT0X02AB Mis-  
0 cellaneous Frame.

0 2. For ease of engineering cables, the WTA Panels are assigned  
0 from the top of the MIS frame to the bottom.

#### 0 2.4.7 WTA Panel Interconnect Cables:

0 To allow open access to the WTA Panel's connectors, all WTA  
0 panel interconnect cables (e.g. MTA Cables) are to be routed be-  
0 hind the panel(s).

0  
0 RELEASE 28.01  
0 93 12 03

0 2.4.8 Although a Frame Supervisory Panel (FSP) is not required for the  
0 WTA Panel, an FSP can be mounted in shelf position 45F if other  
0 devices (which can mount on the MIS Frame) require an FSP.  
0 Hence, if the MIS Frame is not fully provisioned with WTA Pan-  
0 els, other valid hardware units can be mounted.

0 2.4.9 To minimize the office wiring required for line testing, the  
0 Maintenance Trunk Modules (MTM) that are provisioned with  
0 NT3X09BA cards and LTU/MTUs should be reduced to a minimum and  
0 placed in the adjacent TME Frames next to the MIS Frames con-  
0 taining WTA Panels.

0 The Line Concentrating Equipment Frames (LCE) and should be  
0 clustered around the MIS Frames containing WTA Panels in order  
0 to minimize the cabling to these panels.

0 Hence, the signal loss caused by office wiring should be reduced  
0 to the minimum that is possible. The signal loss should be less  
0 than one (1) db in most offices.

0 2.4.10 Discrimination Numbering

0 WTA Panels NT7X76AA/BA are numbered from 000 on up (e.g. WTA  
0 000, WTA 001, etc.).

0 2.4.11 WTA Panel Configuration for Offices with Line Size > 75,000

0 For offices larger than 75,000 lines and requiring more than  
0 three (3) WTA Panels, the straight forward WTA matrix configura-  
0 tion cannot be used due to the software limitation of a maximum  
0 of 32 multiples eight (8) verticals each which can be datafilled  
0 for each horizontal subgroup i.e. 256 verticals.

0 The way to solve this problem is to split the total number of  
0 multiples into either groups of 32 (using Method 1) or groups of  
0 31 (using Method 2).

0 Method 1

0 Using Method 1, the multiples can be divided evenly into two (2)  
0 groups of up to 32 multiples within each group. Each WTA Panel  
0 allows the cross-connection of up to ten (10) multiples except  
0 for the fourth panel which can only have two (2) multiples.  
0 Hence, WTA Panels "B", "C", "D", and "E" provide cross-connections  
0 for 32 multiples.

0 Access to the line circuits is provided via the extended verti-  
0 cals of WTA Panel "A" P1 to the horizontals of WTA Panel "B" as  
0 illustrated. Therefore, the test circuits connected to WTA  
0 Panel "A" have access to more than 75,000 lines by using the ex-  
0 tended vertical and horizontal connections.

0 The connections between WTA Panels "A" and "B" and between WTA  
0 Panels "A" and "F" are for illustration purposes only. That is,  
0 the first group of eight (8) verticals on WTA "A" are datafilled  
0 as extended verticals and connected to the first group of eight  
0 (8) horizontals datafilled as extended horizontals on WTA "B".  
0 The second group of eight (8) verticals of WTA "A" are connected  
0 to the first group of eight (8) horizontals of WTA "F". Simi-  
0 larly, the third and fourth group of eight (8) verticals on WTA  
0 "A" are connected to the second group of eight (8) horizontals  
0 of WTA "B" and "F" respectively. The fifth and sixth group of  
0 eight (8) verticals on WTA "A" are connected to the third group  
0 of eight (8) horizontals on WTA "B" and "F" respectively. The  
0 actual connections are made from connectors P43 to P44 of WTA  
0 "A" to connectors P31 to P42 and P97 to P108 of WTA "B" and "F".

0 Method 2

0 Using Method 2, WTA Panel "A" is connected to WTA Panel "B" in  
0 such a way as to provide for the cross-connections for the first  
0 group of 29 (32-3) multiples via WTA Panels "A", "B", "C", and "D"

0 RELEASE 28.01  
0 93 12 03  
0

0 as in a normal matrix configuration. Three (3) vertical multi-  
0 ples are used for expansion into the second group.

0 For the second group of 32 multiples via WTA Panels "F", "G",  
0 "H", and "I", the extended verticals from WTA "A" are connected  
0 to the horizontals of WTA "B".

0 The connections between WTA Panels "A" and "F" are for illus-  
0 tration purposes only. That is, the first group of eight (8)  
0 verticals datafilled as extended verticals on WTA "A" is con-  
0 nected to the first group of eight (8) horizontals datafilled as  
0 extended horizontals on WTA "F". Similarly, the second group of  
0 eight (8) verticals on WTA "A" is connected to the second group  
0 of eight (8) horizontals on WTA "F". The third group of eight  
0 (8) verticals on WTA "A" is connected to the third group of  
0 eight (8) horizontals on WTA "F". The actual connections are  
0 made from connectors P43 to P48 on WTA "A" to connectors P31 to  
0 P42 and connectors

0 Differences Between Methods 1 and 2

0 Method 1 requires one (1) more WTA Panel which is panel "E" and  
0 three (3) more NT3X09BA cards, six (6) instead of three (3),  
0 connected to panel "A".

0 Using Method 1, line testing involving the first and second  
0 groups of 32 multiples is subjected to the multiple cabling  
0 within the group or a maximum of 32 multiple cables. Using  
0 Method 2, line testing involving the second group of 32 multi-  
0 ples is also involve the first group of 29 multiples or is sub-  
0 jected to a maximum of 61 multiple cables.

0 Generally, Method 1 would be preferred over Method 2 due to the  
0 effect on line testing. However, Method 2 may be worth consid-  
0 ering if an LCE expansion is done properly to reduce the effect  
0 of multiple cabling on line testing.

0 93 12 03

0 1.0 Host - Maintenance Line Test Cards

0 1.1 Line Test Unit (LTU)/Multi-line Test Unit (MTU)

0 a) General Description

0 These circuits are used to perform DC and AC voltage measurements  
0 as well as resistance, capacitance and frequency measurements on  
0 subscriber loops and line circuits. Connection is DC-metallic  
0 via the DMS Metallic Test Access Network (MTA) and the access re-  
0 lay in the line card.

0 The Multi-line Test Unit (MTU) is to replace the existing Line  
0 Test Unit. The Multi-line Test Unit will perform all of the  
0 functions of the existing LTU with greater speed and accuracy.  
0 In addition it may be used to test Electronic Business Set (EBS)  
0 lines and it may be used for OPM battery maintenance.

0 The LTU is used for North American applications only. The MTU is  
0 applicable to the Canadian Markets only and for ISDN applications  
0 in the U.S. only.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) Applies to DMS-100 and DMS-100/200 offices only.

0 ( ii) Each LTU circuit consists of a pair of interconnected  
0 cards:

0 NT2X10AB Line Test Unit - Analog  
0 NT2X11AC/AD Line Test Unit - Digital Card

0 Each MTU circuit consists of a pair of interconnected  
0 cards:

0 NT2X10BA Multi-line Test Unit - Analog  
0 NT2X11BA Multi-line Test Unit - Digital Card

0 The NT2X11AD provides the feature of supplying battery  
0 voltage to the EBS sets while their line card is being  
0 tested, thus preventing the volume reset of the EBS. The  
0 NT2X11AD is backward compatible with all previous ver-  
0 sions of the NT2X11 and should be ordered for all new ap-

0 RELEASE 28.01  
0 93 12 03  
0

0 plications (for U.S. applications only). Existing offices  
0 using software package NTX106AA should be upgraded to  
0 NT2X11AD circuit packs.

0 The MTU may be added to offices with existing LTU's (for  
0 Canadian applications only). A host office must be  
0 equipped with BCS-19 or later software to support the  
0 MTU. A remote office must be equipped with BCS-21 or  
0 later software. The MTU circuit packs require a -48V SP  
0 connection that the LTU does not require.

0 ( iii) MTU for 2B1Q Lines on a LCME.

0 For every MTA that has a LCME on the vertical there must  
0 be at least one MTU on a horizontal of that MTA. Each MTU  
0 (NT2X10BA and NT2X11BA card set) has two test access  
0 ports; that is two (2) sets of tip and ring. Thus it can  
0 test two 2B1Q lines at the same time. A LTU that has ac-  
0 cess to an MTA that has a LCME on the vertical will NOT  
0 be used to perform any metallic testing on the 2B1Q  
0 lines. Any rover test units (ones shared across MTAs)  
0 that has access to the MTA that has a LCME on it must be  
0 a MTU for it to be used on the LCME.

0 For the U.S. market, the MTUs are to be used for 2B1Q ap-  
0 plications only. No LTUs can be assigned to an MTA that  
0 has an LCME on the vertical. No MTA that has an LCME on  
0 the vertical can be daisy-chained to other MTAs that does  
0 not have an LCME on the vertical.

0 The physical installation of MTUs in MTMs is no different  
0 for 2B1Q than for POTS.

0 ( iv) The LTU analog card and the LTU digital card each occu-  
0 pies one card slot. They are mounted on a Maintenance  
0 Trunk Module (MTM), or a Remote Service Module (RSM) (in  
0 a RLM) or a Remote Maintenance Module (RMM) (in a RLCM,  
0 RSC, OPM).

0 The MTU analog card and the MTU digital card each occu-  
0 pies one card slot. They are mounted on a Maintenance  
0 Trunk Module (MTM), or a Remote Maintenance Module (RMM)  
0 (in a RLCM, RSC, OPM).

0 ( v) Provisioning of Line Test Unit (LTU) utilizing NT2X46AB  
0 MTA.

RELEASE 28.01  
93 12 03

$$LTU = \frac{\text{No. SMS S/W Sites}}{20} + \frac{\text{No. SMU S/W Sites}}{20} +$$

$$\frac{\text{No. SMR}}{20} + \frac{\text{No. LCM}}{10} + \frac{\text{No. LM}}{10} + 1$$

Provisioning of Line Test Unit (LTU utilizing NT3X09BA 8 X 8 Metallic Test Access CP.

$$LTU = \frac{\text{No. SMS S/W Sites}}{16} + \frac{\text{No. SMU S/W Sites}}{16} +$$

$$\frac{\text{No. SMR}}{16} + \frac{\text{No. LCM}}{8} + \frac{\text{No. LM}}{8} + 1$$

( vi) Provisioning of Multi-line Test Unit (LTU):

#### Method 1

It is recommended that one (1) MTU circuit be assigned as a dedicated MTU for two NT3X09BA Metallic Test Access cards. This will serve up to eight (8) LCMs. In addition provision one (1) non-dedicated (rover) MTU circuit per office.

For RLCM and OPM offices provision one (1) dedicated MTU circuit (the rover MTU is not required).

For RSC offices provision as per host office.

$$\# \text{ of MTU Circuits} = \frac{\# \text{ of LCMs}}{8} + 1$$

$$\# \text{ of NT2X10BA/NT2X11BA Pairs} = \frac{\# \text{ of MTU Circuits}}{2}$$

#### Method 2

Telco requirements may dictate that all of the lines in an office be testable in a given time for test. This will

0 RELEASE 28.01  
0 93 12 03

0 require provisioning enough MTU circuits to meet this re-  
0 quirement based on the following formula:

$$\begin{array}{lcl} \text{# MTU} & \text{\# of Lines x Test Hold Time (Secs)} & \\ \text{Circuits} & = \frac{\text{-----}}{3600 * \text{Time-For-Test (Hrs)}} + 1 \end{array}$$

$$\begin{array}{lcl} & \text{\# MTU Circuits} & \\ \text{\# of NT2X10BA/NT2X11BA Pairs} & = \frac{\text{-----}}{2} \end{array}$$

0 Typical Test Hold Times

|                    | Long Diagnostic Test | LIT Test |
|--------------------|----------------------|----------|
| Type 'A' Line Card | 26 secs              | 6-8 secs |
| Type 'B' Line Card | 32 secs              | 6-8 secs |
| EBS Line Card      | 106 secs             | 6-8 secs |

0 3.0 Multi-line Test Unit - Domestic Application

0 The MTU was originally introduced as a NT4X97AA and NT4X98AA,  
0 however, Market needs dictated that it be modified as follows:

0 1. The NT4X97AA/NT4X98AA are now call Metallic Test Units and  
0 are to be used in the International Markets only.

0 2. The NT4X97AA/NT4X98AA were targeted for the US & Canadian  
0 Markets, but this has changed as follows:

0 a. The NT4X98AA PEC has been changed to NT2X10BA and it co-  
0 exists with the NT4X98AA as a product. However the  
0 NT4X98AA is used in International Markets only and the  
0 NT2X10BA is use in US & Candian Markets.

0 b. The NT4X97AA PEC has been changed to NT2X11BA and it co-  
0 exists with the NT4X97AA as a product. However the  
0 NT4X97AA is used in International Markets only and the  
0 NT2X11BA is use in US & Candian Markets.

0 c. The NT2X10BA and NT2X11BA pair are refered to a Multi-  
0 Line Test Units ((MTUs), and the NT4X97AA and NT4X98AA  
0 pair are refered to a Metallic Test Units (MTUs).  
0 |

0 The MTU consists of two circuit packs NT2X10BA and NT2X11BA. The  
0 MTU has two separate tip and ring appearances that time share the  
0 same measurement circuits. This time sharing is transparent to  
0 the system, and as a result, the MTU appears as two separate  
0 measurement circuits.

0 The MTU may be added to offices with existing LTU's. A host of-  
0 fice must be equipped with BCS-19 or later software to support  
0 the MTU. A remote office must be equipped with BCS-21 or later  
0 software. ar;The MTU is assignable to the MTM or RMM shelf as  
0 a functional pair.

| 0 | Description               | Side  | Slot | # Ckt/Crd | Pwr Dis. |
|---|---------------------------|-------|------|-----------|----------|
| 0 | MTU Analog (NT2X10BA)     | Left  | Odd  | 0         | 15       |
| 0 | MTU Controller (NT2X11BA) | Right | Even | 2         | 9        |

0 RELEASE 28.01  
0 93 12 03

0 3.1 HARDWARE PROVISIONING

0

0 3.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The MTU circuit packs require a -48V SP connection that the LTU  
0 does not require.

0 The FSP on all TME frames in the field are arranged to provide  
0 -48V SP to MTM/IMTM shelves in position 65 and 51. Product Change  
0 Kit NT0X82XA extends -48V SP to positions 32, 18 and 04.

0 -48V SP can be provided to a maximum of any four (4) of the five  
0 (5) positions.

0 The MTU circuit packs cannot mount on the Remote Service Module  
0 (RSM).

0 3.1.2 HARDWARE DEPENDENCIES

0

0 The MTU circuit packs will replace the existing LTU circuit packs  
0 NT2X10AB/AC and NT2X11AA/AC/AD.

0

0 3.1.3 PROVISIONING CONSIDERATIONS

0

0 Method 1

0 It is recommended that one (1) MTU circuit be assigned as a dedi-  
0 cated MTU for two NT3X09BA Metallic Test Access cards. This will

0

0  
0 RELEASE 28.01  
0 93 12 03

0 serve up to eight (8) LCMS. In addition provision one (1) non-  
0 dedicated (rover) MTU circuit per office.

0 For RLCM and OPM offices provision one (1) dedicated MTU circuit  
0 (the rover MTU is not required).

0 For RSC offices provision as per host office.

0 # of NT2X10BA/NT2X11BA Pairs = -----  
0 2

## 0 Method 2

0 Telco requirements may dictate that all of the lines in an office  
0 be testable in a given time for test. This will require provi-  
0 sioning enough MTU circuits to meet this requirement based on the  
0 following formula:

0 # of Lines x Test Hold Time (Secs)  
0 # MTU Circuits = ----- + 1  
0 3600 \* Time-For-Test (Hrs)

0 # of MTU Circuits  
0 # of NT2X10BA/NT2X11BA Pairs = -----  
0 2

## 0 MTU for 2B1Q Lines on a LCME. =par

0 For every MTA that has a LCME on the vertical there must be at  
0 least one MTU on a horizontal of that MTA. Each MTU (NT2X10BA  
0 and NT2X11BA card set) has two test access ports; that is two (2)  
0 sets of tip and ring. Thus it can test two 2B1Q lines at the  
0 same time. A LTU that has access to an MTA that has a LCME on  
0 the vertical will NOT be used to perform any metallic testing on  
0 the 2B1Q lines. Any rover test units (ones shared across MTAs)  
0 that has access to the MTA that has a LCME on it must be a MTU  
0 for it to be used on the LCME.

0 No LTUs can be assigned to an MTA that has an LCME on the verti-  
0 cal. No MTA that has an LCME on the vertical can be daisy-  
0 chained to other MTAs that do not have an LCME on the vertical.

0 The physical installation of MTUs in MTMs for 2B1Q is the same as  
0 for POTS.

0 RELEASE 28.01  
0 93 12 03

0 Typical Test Hold Times

|                      | Long Diagnostic Test | LIT Test |
|----------------------|----------------------|----------|
| 0 Type 'A' Line Card | 26 secs              | 6-8 secs |
| 0 Type 'B' Line Card | 32 secs              | 6-8 secs |
| 0 EBS Line Card      | 106 secs             | 6-8 secs |

0 -48V SP Connection

0 The MTU circuit packs require a -48V SP connection that the LTU  
0 does not require. When the MTU is assigned to an MTM shelf, the  
0 -48V SP connection must be supplied by a provisionable local ca-  
0 ble to the TME frame FSP. The -48V SP connection is normally  
0 available to shelves in positions 65 and 51.

0 For Field Applications Only

0 Provide one (1) Product Change Kit NT0X82XA to modify the FSP  
0 NT0X82AB on the TME frame NT0X46AB in the field when required to  
0 add -48V SP to the MTM (NT2X58AC/AN/CA) or IMTM (NT2X58AT) shelf  
0 in position 32 and/or 18 and/or 04. This PC Kit is also required  
0 when an MTM or IMTM shelf requiring -48V SP is being added to po-  
0 sition 51.

0 This Product Change Kit modifies TME frames equipped with one (1)  
0 power feed only.

0 The FSP on all TME frames in the field (without FSP Strapping In-  
0 formation NT0X82WA) are arranged to provide -48V SP to MTM/IMTM  
0 shelves in positions 65 and 51. Product Change Kit NT0X82XA ex-  
0 tends -48V SP to positions 32, 18 and 04. It also modifies the  
0 way the -48V SP will be delivered to shelf position 51 from the  
0 FSP (i.e. wiring information NT0X46WC connects NT7X3746 Cable As-  
0 sembly to terminal block TB3 pin 12B of the FSP). Hence, when  
0 -48V SP is required on shelf positions 51, 32, 18 and 04, provide  
0 one (1) PC Kit NT0X82XA.

0 PC Kit NT0X82XA is only applicable to existing TME frames in the  
0 field which do not have FSP Strapping Information NT0X82WA.

0 For Initial Applications (Initial and Extension Jobs)

0 When frame type is "TME" and only one (1) power source (A or B)  
0 is required, provide one (1) FSP Strapping Information NT0X82WA,  
0 two (2) TB Jumpers A0324131, and one (1) each of Cable Assemblies  
0 NT0X95CL and NT0X8211. NT0X82WA includes FSP options B,C,D,L.

0 RELEASE 28.01  
0 93 12 03

0 Along with the modified FSP, this hardware always provides the  
0 -48V SP to MTM/IMTM shelves in positions 65, 51, 32, 18 and 04.

0 When frame type is "DCE" and two (2) power sources (A and B) are  
0 required, provide one (1) FSP Strapping Information NT0X82WB, one  
0 (1) TB Jumper A0324131, two (2) Cable Assemblies NT0X95CL, and  
0 one (1) Cable Assembly NT7X3406. NT0X82WB includes FSP options  
0 B,E,F,M. Along with the modified FSP, this hardware always pro-  
0 vides the -48V SP to MTM/IMTM shelves in positions 65, 51, 32, 18  
0 and 04.

0 For Initial Applications and Field Applications

0 -48V SP can be provided to a maximum of any four (4) of the five  
0 (5) positions.

0 When -48V SP is required, provision the local cable as follows:

| 0 MTM/IMTM in Shelf Position | PEC      | Qty | Note |
|------------------------------|----------|-----|------|
| 0 65                         | NT0X95BU | 1   | 1,2  |
| 0 65                         | NT0X46WB | 1   | 1,2  |
| 0 51                         | NT7X3746 | 1   | 1,2  |

| 0 04                         | NT0X46WF | 1   | 2    |

0 NOTE:

0 1. Normally provided when these two MTM/IMTM are part of the Version  
0 II Office Alarm System.

0 2. When cable assemblies are to be shipped loose to the field, a  
0 copy of LWJ0X46AB must be requested from Documentation Services  
0 by Customer Engineering to be sent to the job site to provide the  
0 wiring information NT0X46WB/WC/WD/WE/WF specified.

0 When the MTU is assigned to an RMM shelf, provision one (1)  
0 NT6X1438 cable to supply -48V SP power.

0 The following circuit packs require -48V SP power:

0

0 3.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 A host office must be equipped with BCS-19 or later software to  
0 support the MTU. A remote office must be equipped with BCS-21 or  
0 later software.

0 BCS-31 MTU software load must be installed for a MTU to work with  
0 2B1Q lines. If ALT (Automatic Loop Testing) is required, a dedi-  
0 cated MTU must have the ALTUSE field in MTAHORIZ table selected  
0 as YES. Any LTUs that have access to the LCMES on the MTA verti-  
0 cals must have the ALTUSE field selected as NO.

## 0 1.0 Host - Module Shelf

0 1.1 Equipment Provisioning0 1.1.1 Trunk Modules0 a) General Description

0 The Trunk Module provides the interface between analog trunks and  
0 the Network.

0 The TM performs tasks such as digit reception from dial pulse in-  
0 coming trunks, control tasks of dial pulse transmission on outgo-  
0 ing trunks and digital tone distribution.

0 The TM accommodates service circuits such as MF receivers, an-  
0 nouncement trunks, and test circuits either on a dedicated TM or  
0 in common with analog trunks. Each TM has the capacity of inter-  
0 facing 30 analog trunks or device circuits with one 32-channel  
0 2.56 Mb/s speech link to the network. A maximum of five are ac-  
0 commodated in a bay.

0 b) References0 c) Provisioning Considerations:

0 ( i) Each module is contained in a single equipment shelf and  
0 interfaces the network via one speech link.

0 ( ii) Each TM can accommodate up to fifteen analog trunk cards  
0 and handle up to thirty circuits. Since it interfaces  
0 the NET via one speech link (thirty channels), there is  
0 no concentration and therefore is not sensitive to traf-  
0 fic.

## 0 ( iii) TM Types

0 Three basic TM types are specified as dictated by the  
0 TM-to-DF cabling arrangement:

## 0 1. Trunk Module 2 Wire (TM2)

0 - 30 pairs of leads cabled to the DF

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - 4 leads per card slot
- 0 - intended for trunks with 2 leads

0 2. Trunk Module 4 Wire (TM4)

- 0 - 60 pairs of leads cables to the DF
- 0 - 8 leads per card slot
- 0 - intended for trunks with 4 & fewer leads

0 3. Trunk Module 8 Wire (TM8)

- 0 - 120 pairs of leads cabled to the DF
- 0 - 16 leads per card slot
- 0 - intended for trunks with 8 & fewer leads

0 4. International Trunk Module 8 Wire (ITM8)

- 0 - same as the TM8
- 0 - used for International applications

0 These TM arrangements are intended to reduce DF size and  
0 TM-to-DF cable runs and their respective costs by reduc-  
0 ing redundant loads and terminations.

0 The ATM, T8A and T8A (TME) are special versions of the  
0 TM8 shelf. The DMS-300 Gateway offices use the T8A  
0 shelves. The Integrated Business  
0 Services (IBS) use the T8A (TM8) shelves (these shelves  
0 are used to house NT5X25AA cards only).

0 ( iv) TM-DF Association

0 Since DF cabling is arranged on a TM basis, trunks which  
0 terminate on different DF complexes cannot be connected  
0 to the same TM. Therefore, determination of the number  
0 of TM and trunk cards has to be done on a per DF basis.

0 For service reliability it is recommended that a minimum  
0 of two (2) TM8 (or its equivalent) be provided per of-  
0 fice.

0 Trunk Modules are provisioned for total terminations  
0 based on the forecast of analog trunk requirements for  
0 the busy season prior to exhaust.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 ( v) These slots will be provided by new TMs. It should be  
0 noted that empty slots on a TM8 can house cards which can  
0 go on TM4 or TM2 shelves, etc.

0 ( vi) A minimum of two Tm8 shelves or its equivalent should be  
0 provided per DF for service reliability.

0 ( vii) Assignment is restricted to either one NT2X48AA or one  
0 NT2X48AB or two NT1X31AA cards per TM.

0 RELEASE 28.01  
0 93 12 03

0 1.1.2 Maintenance Trunk Module

0 a) General Description

0 The Maintenance Trunk Module is similar to the TM in operation,  
0 however, its primary function is to interface service, test and  
0 maintenance circuits and scanner and signal distributor cards.  
0 There is also a Digital Recorded Announcement Module (DRAM) which  
0 operates like the MTM, however, this shelf is primarily intended  
0 to house Digital Recorded Announcement (DRA) cards. Assignment  
0 restrictions are imposed on certain other cards which function in  
0 pairs.

0 b) References

0 c) Provisioning Considerations:

0 ( i) The principal differences of the MTM from the TM module  
0 are:

- 0 1. fewer provisionable card slots (12 instead of 15)
- 0 2. more powerful 5V supply to handle more complex card func-  
0 tions
- 0 3. cables to the DF on a slot basis, as required, with many  
0 more leads per slot
- 0 4. different Peripheral Software load supports different  
0 circuit types and functions
- 0 5. inter-card bus supports circuits whose function is split  
0 over two cards

0 Each module is contained in a single equipment shelf  
0 and interfaces the network via one speech link.

0 ( ii) Card slots are cabled to the DF only when necessary to  
0 satisfy interface requirements.

0 In an office served by more than one DF, the Telco is ad-  
0 vised for administrative reasons to terminate card slots  
0 of a particular MTM on the same DF.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 ( iii) MTM mounted cards on average have higher power dissi-  
0 pation making it possible to exceed the maximum set for  
0 the shelf. To avoid this, MTM shelves must be provi-  
0 sioned and cards assigned so as to limit card dissipation  
0 to 110 watts per shelf.

0 ( iv) Trunk enable lines control the Trunk Logic Circuit (TLC)  
0 and hence the function of TM and MTM mounted cards (ena-  
0 bles, TLC and circuit per card are closely related).  
0 Thirty (30) enable lines are distributed to the  
0 provisionable slots in a pre-defined cyclic pattern.

0 As a result each card requires one card slot for every  
0 two enable lines it must connect to avoid duplicate con-  
0 nections to the same enable line. The next higher num-  
0 bered slot or slots must be left empty when required. The  
0 exceptions are:

0 a) cards which function in pairs

0 b) slot 16, the last slot in the MTM, can accommodate cards  
0 requiring up to eight enables (not valid for cards  
0 with more than eight circuits and cards which phys-  
0 ically require more than one slot)

0 ( v) A minimum of two MTM shelves must be provided for service  
0 reliability.

| 0 | NT2X95AA | AA   | n     | 1     | an    |
| 0 | NT3X91AA | BB   | p     | 1     | ap    |
| 0 | NT5X25AA | CC   | q     | 1     | aq    |
| 0 | NT5X30AA | DD   | r     | 1     | ar    |

0 To calculate TM8 shelves:

0 Cards Req'd x Slots/card = Slot total

0 Example: a x 1 = aa

0 Total of aa through ar = TM8TOT

0 TM8TOT/15 = TM8 (NT2X52AG)

## 0 KK. AXU Shelf

0 KK.1 If COEO is an initial order, provide one 1 AXU shelf  
0 (NT3X89AA)

0 If COEO is an extension order, provide 0 AXU shelf

## 0 LL. TME Frames

0 LL.1 NTZZ06BA + TM8 + NTZZ06CA + NTZZ06AM = TMETOT

0 TMETOT/4 = TME (TME Frames) (NTZZ06AA), (NTZZ06YA),  
0 (NTZZ06ZA).0 Please note that if an AXU was provided in KK.1, it  
0 shall be mounted on TME 0, Shelf Position 65. This

RELEASE 28.01  
93 12 03

shelf space is not included in the TME frame  
calculation as this shelf can mount in the TME frame  
with four TM8 or MTM shelves.

LL.3 (TME x 5) - TMETOT - AXU = Filler Panels (P0575239)

## 0 1.0 Host - Digital Recorded Announcement

0 1.1 Equipment Provisioning0 1.1.1 Auxiliary Operator Services System (AOSS)0 (a) General Description

0 Currently existing #23 type desks and associated call distribut-  
0 ing equipment provide the directory assistance and intercept op-  
0 erator functions. This equipment will be replaced by the DMS  
0 Auxiliary Operator Services System (AOSS).

0 AOSS will fulfill for Auxiliary Operator Service corresponding  
0 needs to those satisfied by DMS TOPS for Toll Operator Services.

0 AOSS is designed to provide automatic call distribution, call  
0 processing, call detail recording and operator force adminis-  
0 tration functions for auxiliary operator services which do not  
0 require completion to a called party such as directory assistance  
0 and intercept.

0 The AOSS Position consists of modified TOPS furniture designed to  
0 accommodate the AOSS Display Module and a Visual display Unit  
0 (VDU) of an external Information Retrieval System.

0 The AOSS feature will be available with DMS-200 and DMS-100/200.

0 (b) References

0 NTP 297-2271-105 DMS-200 TOPS Auxiliary Operator  
0 Services System General Description

0 (c) Provisioning Considerations

0 ( i) As in the case of TOPS, the AOSS operator force can be  
0 subdivided into a number of Traffic Offices (up to 32)  
0 for administrative purposes. A DMS-200 or DMS-100/200  
0 can serve one or more locations. Each AOSS location is  
0 defined as a Traffic Office or Team.

0 ( ii) The Traffic Office can be colocated with or remoted from  
0 the DMS host office. Positions may be remoted up to 500

0 RELEASE 28.01  
0 93 12 03  
0

0 km. The distance limitation is imposed by acceptable  
0 echo performance requirements.

0 ( iii) The AOSS system is comprised of operator positions, su-  
0 pervisory positions (assistance, in-charge), monitors and  
0 printers, and service circuits.

0 ( iv) If this is the initial installation of the AOSS feature,  
0 and if all the AOSS positions are remote, then the cus-  
0 tomer is responsible for the following:

0 a) Order a minimum quantity of AOSS positions  
0 of each type in the main equipment order.  
0 These positions will be relocated to and  
0 installed at the remote site before "K"  
0 date.

0 b) Order a minimum quantity of AOSS TTYs in  
0 the main equipment order if the TTYs are  
0 being supplied by NTL. These TTYs will be  
0 relocated to and installed at the remote  
0 site before "K" date.

0 c) If the AOSS TTYs are being supplied by the  
0 customer, a minimum quantity shall be made  
0 available to NTL installation personnel at  
0 the beginning of the installation  
0 interval. these TTYs will be relocated to  
0 and installed at the remote site before  
0 "K" date.

0 d) The customer shall designate which remote  
0 site(s) the positions and TTYs shall be  
0 shipped to.

0 e) Floor space adjacent to the switch shall  
0 be made available at the beginning of the  
0 installation interval for AOSS positions  
0 and AOSS TTYs supplied by items a) to c)  
0 shown above. The floor space should be  
0 lighted and have a power source for the  
0 AOSS positions and AOSS TTYs. Contact NTL  
0 Customer Engineering (Building Studies)  
0 for further information.

0 ( v) The following miscellaneous information is required for  
0 each Traffic Office.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 1. If the customer will be using other than an NTL  
0 headset, the customer shall supply to the NTL Cus-  
0 tomer Engineer a complete set of specifications for  
0 the headset.
- 0 2. The floor plan for the AOSS positions shall be sup-  
0 plied to NTL at CI date.
- 0 3. The drilling of the holes in the floor is a customer  
0 responsibility.
- 0 4. The cable rack drawing, ceiling insert drawing, etc.  
0 shall be supplied to NTL at CI date.
- 0 5. For further information, contact the NTL Building  
0 Studies group.
- 0 6. If the AOSS cables are to be terminated on something  
0 other than a distributing frame, a complete set of  
0 drawings defining the unit/frame will be required at  
0 CI date. For further information contact NTL Customer  
0 Engineering.
- 0 7. Unlike earlier vintage TOPS controllers, the new AOSS  
0 Controller Unit will not be equipped with an AC re-  
0 ceptacle. As the Controller does not provide for any  
0 external AC needs, any additional AC requirements  
0 must be accommodated by additional distribution of AC  
0 and provision of necessary receptacles.

0 ( vi) AOSS Position Order

0 The number of AOSS Operator Positions required will be  
0 determined by the customer. They can be ordered in the  
0 console or modular configuration with either AC or DC in-  
0 put. Modular positions will be located on customer sup-  
0 plied furniture.

0 One AOSS In-Charge Position is required per Traffic Of-  
0 fice. It can be ordered in the console or modular con-  
0 figuration with either AC or DC input. Modular positions  
0 will be located on customer supplied furniture. AOSS as-  
0 sistance calls may be handled by this position.

0 The customer may assign the assistance function to any  
0 AOSS Operator Position so that the position will become  
0 an AOSS Assistance Position.

0 RELEASE 28.01  
0 93 12 03  
0

0 The customer may assign the in-charge function to any  
0 AOSS Operator Position so that the position will become  
0 an AOSS In-Charge Position.

0 ( vii) One CRT Stand (IBM) (A0291087) is required for each IBM  
0 Visual Display Unit (VDU) provided by the customer.

0 The Stand will minimize the force necessary to move the  
0 IBM VDU in any horizontal direction on the work station  
0 upper shelf.

0 (viii) Only one AOSS Force Manager Position is required at one  
0 location in a multi-office AOSS configuration. It pro-  
0 vides administrative functions for all Traffic Offices.  
0 The Force Manager's CRT provides the following data on a  
0 Traffic Office basis for all positions in the system and  
0 displays updated information every ten seconds:

0 - number of occupied positions  
0 - number of operator made-busy positions  
0 - number of positions in controlled traffic mode  
0 - number of positions with unsupervised call  
0 - number of positions out of service  
0 - current status of Calls Waiting (CW) queue  
0 - Calls Deflected (CD) threshold value.

0 Similar to TOPS, the Force Manager's modular position  
0 consists of a video monitor and a controller module  
0 equipped with either AC or DC input, for use with the  
0 customer's desk.

0 Order the same Force Manager's hardware as currently be-  
0 ing used for TOPS FM Positions.

0 In future, new PEC codes will be assigned for the new  
0 TOPS FM Positions (AC input and DC input versions). They  
0 will be used for the AOSS FM Positions as well.

0 ( ix) At least one AOSS Operator Position should be permanently  
0 installed in the DMS maintenance area for maintenance and  
0 reload purposes.

0 ( x) For each Traffic Office, the customer shall determine the  
0 AOSS position number series.

0 ( xi) The training feature of AOSS will be provided by simu-  
0 lation of call types through firmware on the module con-

0 RELEASE 28.01  
0 93 12 03  
0

0 troller board. Voice response will be provided by the  
0 trainer on a separate jack. All AOSS Positions will be  
0 equipped with the training feature.

0 ( xii) AOSS TTY Order

0 Traffic Office Manager (TOM) TTY

0 One TOM TTY is required per Traffic Office. It provides  
0 traffic data pertaining to each Traffic Office.

0 Force Manager (FM) TTY

0 One FM TTY is only required at one location in a multi-  
0 office AOSS configuration. It provides traffic data such  
0 as initial position seizures, work volume, average speed  
0 of answer, calls waiting, average work time, average num-  
0 ber of occupied positions.

0 Mechanized Force Administration Data System  
0 (MFADS) Port

0 One MFADS port can be provided per office on an optional  
0 basis. MFADS is a minicomputer system which extracts  
0 force management operational measurements from a pollable  
0 port in every half hour. The system generates service  
0 and force summaries, as well as projections of operators  
0 required to AOSS force managers.

0 Switch Network Analysis Centre (SNAC) TTY

0 The SNAC TTY is optional and is used for recording trou-  
0 ble reports. It terminates on the I/O subsystem and does  
0 not require digital modems and incoming trunk termi-  
0 nations.

0 Specifications for AOSS Teletypewriters

0 The broad specifications and characteristics for the AOSS  
0 Teletypewriters are the same as for the TOPS TTYs shown  
0 in this NTP.

0 (xiii) Directory Assistance System (DAS)

0 The DAS will enable the Telco to automate selected  
0 portions of its Directory Assistance and Intercept ser-  
0 vices.

0  
0 RELEASE 28.01  
0 93 12 03

0 The Telco will obtain the DAS equipment from the vendor.

0 ( xiv) Operator Positions

0 The current AOSS configuration includes both an AOSS con-  
0 sole and a DAS terminal, the associated terminal control-  
0 lers and an AOSS headset. This arrangement will remain  
0 for the Voice Response system.

0 The DAS terminal and associated equipment is provided by  
0 the Telco from the DAS vendor (i.e. IBM, CCI).

0 The AOSS console and associated equipment will be pro-  
0 vided by NTL in the usual manner.

0 In future, the TOPS MP is intended to replace both the  
0 AOSS console and DAS terminals.

0 1.1.2 AOSS Voice Response (AOSSVR) (Canadian Applications Only)

0 (a) General Description

0 The AOSSVR system is an enhancement to the existing basic AOSS  
0 system and is an optional feature. This feature does not affect  
0 the AOSS call type 141 (Rate and Route).

0 This feature effectively encourages the use of only one keyboard  
0 by the AOSS Operator to handle subscriber requests and decreases  
0 average work time by the time taken to recite listing information  
0 and enter billing details.

0 The Voice Response feature will never degrade the performance of  
0 current AOSS since any failure of the VR subsystem or DMS/DAS  
0 datalink will effect a return to pre-Voice Response operations.

0 (b) References

0 | Section 3.2 Software  
0 Section 3.5 Peripheral Modules - Host  
0 Section 3.6 Input/Output

0 (c) Provisioning Considerations

0 ( i) The Telco may purchase an AOSSVR system with either  
0 internal or external ARUs for the automated voice. The  
0 Operator position which includes an AOSS console and a  
0 DAS terminal, though not currently optional, may at some  
0 point be replaced with the TOPS Multipurpose Position  
0 (TOPS MP) which will provide the functional equivalent of  
0 the present two terminal architecture.

0 Figure 33.14 and Figure 33.15 illustrate the system ar-  
0 chitecture with internal and external ARU respectively.

0 With the internal or external ARUs providing the auto-  
0 mated voice, there can be up to two languages, one pri-  
0 mary and the other a secondary language.

0 ( ii) Glossary of Abbreviations for Figure 33.14 and Figure  
0 33.15.

0 1. ARU Audio Response Unit  
0 2. DA Directory Assistance  
0 3. DAS Directory Assistance System

AOSSVR ARU-DAS CONFIGURATION USING VENDOR ARU

0  
0 RELEASE 28.01  
0 93 12 03

0 ( iii) Directory Assistance System (DAS)

0 The DAS will enable the Telco to automate selected  
0 portions of its Directory Assistance and Intercept ser-  
0 vices.

0 The Telco will obtain the DAS equipment from the vendor.

0 ( iv) Digital Multiplex System (DMS) Switch

0 The NTL DMS will enable the Telco to automate the remain-  
0 der of the DA and Intercept services. The facility will  
0 provide Automated Call Distribution (ACD), trunk control,  
0 billing (AMA) and if desired can supply automated speech  
0 via the DRA. The DMS will interface with the DAS via a  
0 point to point datalink.

0 ( v) Operator Positions

0 The current AOSS configuration includes both an AOSS con-  
0 sole and a DAS terminal, the associated terminal control-  
0 lers and an AOSS headset. This arrangement will remain  
0 for the Voice Response system.

0 The DAS terminal and associated equipment is provided by  
0 the Telco from the DAS vendor (i.e. IBM, CCI).

0 The AOSS console and associated equipment will be pro-  
0 vided by NTL in the usual manner.

0 In future, the TOPS MP is intended to replace both the  
0 AOSS console and DAS terminals.

0 ( vi) AOSSVR-DAS Interface

0 The AOSSVR-DAS Interface will include a DAS Gateway  
0 Processor which will allow multiple AOSSVR offices to si-  
0 multaneously connect to DAS.

0 AOSSVR will access this Gateway via a Multiple Protocol  
0 Controller (MPC) card, NT1X89AA, which manages messaging  
0 over a BX.25 datalink.

0 For more information on this card, refer to Input/Output,  
0 Section 3.6 of this NTP.

0 ( vii) Audio Response Unit (ARU)

0 RELEASE 28.01  
0 93 12 03

0 AOSSVR may employ either internal or external Audio Re-  
0 sponse Units (ARU) which playback the Directory Assist-  
0 ance and Intercept database search results to  
0 subscribers.

0 The Telco may employ either of the following two ARU con-  
0 figurations:

0 1. DAS Vendor Supplied External ARU

0 2. DMS Internal AUR - Digital Recorded  
0 Announcement (DRA) Module

0 (viii) DAS Vendor Supplied External ARU

0 The external ARUs will require trunks, as illustrated in  
0 Figure 33.15, in order to carry speech from the DAS to  
0 the DMS calling trunk.

0 These trunks are digital trunks (i.e. DS-1 Interface  
0 Card, NT6X50AA). Number of trunks to be specified by  
0 Telco.

0 If digital trunks are used by Telcos who employ analog  
0 systems (IBM for instance), then the Telco will require  
0 channel banks to perform the digital to analog conver-  
0 sion.

0 For more information on digital trunks, refer to Periph-  
0 eral Modules - Line Equipment, Section 3.5 of this NTP.

0 ( ix) DMS Internal ARU - Digital Recorded Announcement (DRA)  
0 Module

0 The DRA will provide speech from the DMS to the calling  
0 subscriber, controlled entirely by the DMS switch. Figure  
0 33.14 illustrates the architecture for this configura-  
0 tion.

0 This device resides on a Maintenance Trunk Module (MTM) -  
0 DRA, NT2X58CB/AK/AG.

0 For more information on DRA, refer to Digital Recorded  
0 Announcement (DRA) System Provisioning in Peripheral Mod-  
0 ules - Host, Section 3.5 of this NTP.

0 ( x) Software Feature Packaging

0 2.0 Automatic Coin Toll Service (ACTS)

0 2.1 Hardware Provisioning

0

0 2.1.1 Hardware Usage Restrictions

0

0 None identified.

0 2.1.2 Hardware Dependencies

0

0| None identified: refer to section 2.4.

0 2.1.3 Provisioning Considerations

0

0 Automatic Coin Toll Service DRAM Circuit Pack

0

0 The ACTS announcement cp mounts in a standard DRA-MTM and re-  
0 quires a DRA controller. ACTS requires a dedicated DRA-MTM, i.e.  
0 mixing of MCCS DRA announcement or standard office announcement  
0 with the ACTS cp's is not permitted.

0

0 The ACTS DRAM does not broadcast messages. Instead, any one of  
0 several announcements may be directed to 29 time slots available  
0 in each DRAM. It is considered a service circuit in that a par-

0

0 RELEASE 28.01  
0 93 12 03  
0

0 ticular time slot or announcement port is connected to an ACTS  
0 call only when required.

0 The average announcement is approximately 12 seconds in length.  
0 However, the ACTS DRAM will remain connected as long as the coin  
0 detection circuit. Therefore the holding time for DRA provision-  
0 ing should be 38 seconds.

0 One (1) ACTS DRA cp is required on the ACTS DRAM. The slot lo-  
0 cation for the DRA cp should follow the controller cp. Recom-  
0 mended card slot locations are: :ul. :li. for the controller  
0 card slot five (5) :li. for the ACTS DRA circuit pack card slot  
0 six (6). :eul.

0 Assume regular DRA sparing procedures. MTBF (Mean Time Between  
0 Failure) and MTTR (Mean Time To Repair) parameters are not  
0 available for accurate sparing calculations.

#### 0 Coin Detection Circuit (CDC)

0  
0 A coin detection circuit pack physically occupies one card slot  
0 in an MTM.

0 A CDC uses eight time slots and, therefore, four (4) consecutive  
0 card slots are required. A maximum of three (3) CDC circuit  
0 pack's can be mounted in any MTM. the slot assignment being card  
0 slots 05,09 and 13. If desired, the CDC card may be placed on an  
0 MTM with other cards, provided the next three (3) slots following  
0 each CDC pack are empty and that the provisioning rules for these  
0 other packs are followed.

0 Digitone or rotary coin stations may be used, however all  
0 stations MUST be able to provide dual frequency coin deposit  
0 signals to allow detection by the CDC circuit pack.

0 The CDC contains eight (8) coin detection circuits provisionable  
0 for ACTS on each circuit pack.

0 The CDC requires no distributing frame cabling.

0 A 3-port conference circuit will be required for all "recall" ac-  
0 tivity (i.e. overtime notification, intercoin prompt, etc.). The

0  
0 RELEASE 28.01  
0 93 12 03

0 current provisioning of 3-port conference circuits (for TOPS) is  
0 one per position plus five percent. This quantity is sufficient  
0 to handle the ACTS traffic. Therefore, no additional 3-port con-  
0 ference circuits will need to be provisioned.

0 Each NT1X76AE is a two virtual card credit, i.e. 256 kbyte,  
0 double-density cp. When provisioning an ACTS DRA-MTM, the total  
0 allowable virtual card credit limit is eight. The EEPROM  
0 (NT1X79AA) is a 128 kbyte, one (1) virtual card credit, single-  
0 density cp.

0 2.2.3 Sparing Information

0  
0 Assume regular sparing procedures. MTBF (Mean Time Between Fail-  
0 | ure) and MTTR (Mean Time To Repair) for the ACTS DRAM (NT1X76AE)  
0 | and the CDC (NT3X08--) cp's. Parameters are not available for ac-  
0 | curate sparing calculations.

0 2.3 Software Provisioning

0

0 2.3.1 Required Software Packages and Interdependencies

0  
0 The software package for ACTS is NTX208AA or NTX208AB.

0 | The NTX208AB software package contains maintenance related en-  
0 | hancements which are not provided with the NTX208AA package

0 | The NTX208AB enhancement provides telcos the capability of dial-  
0 | ing a seven- digit test number from a coin phone to determine  
0 | whether the coin box is sending the proper signaling to the ACTS  
0 | system. The feature also offers the capability of identifying  
0 | defective coin detection circuits from the MAP without having to  
0 | busy out all the circuits on the affected CDC. Only the circuit  
0 | under test need be busied.

0 | The maintenance enhancement of the NTX208AB package requires the  
0 | provisioning of CDC NT3X08AB. The NT3X08AA CDC will operate  
0 | compatibly with NTX208AB package but this configuration will not  
0 | have the enhanced maintenance capability. To get the full benefit  
0 | from the enhanced maintenance capability of the NTX208AB package,  
0 | all ACTS CDCs must be NT3X08AB.

0 | The NTX208AA package operates compatibly with either NT3X08AA or  
0 | NT3X08AB CDCs. The improved coin toll fraud prevention capability  
0 | of the NT3X08AB CDC card is effective when configured with either  
0 | the NTX208AA software package or the NTX208AB package.

0  
0  
0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 | End Office CDCs

0  
0 The CDCs required for the Improved Coin Service Revenue Col-  
0 lection feature AF1400 in the end office are either NT3X08AA or  
0 NT3X08AB. The use of NT3X08AB provides the improved fraud pre-  
0 vention capability. The improved maintenance functionality of the  
0 NT3X08AB CDC is not implemented in the end office configuration.

0 For ACTS software status, refer to the SMS database.

0 MMCCS and CCIS are not software prerequisites for ACTS operation.

### 0 2.3.2 Software Usage Restrictions

0  
0 None identified.

### 0 2.3.3 Memory Provisioning

0  
0 The ACTS feature requires 3K words of program store.

### 0 2.4 Real Time Impact

0 The ACS feature has no real time impact.

0

0 RELEASE 28.01  
0 93 12 03

0 2.4.1 Digital Recorded Announcement (DRA) System Provisioning

0 a) General Description

0 Digital Recorded Announcement (DRA) system provides recorded  
0 announcement messages. It consists of a Speech Processor, a  
0 Microprocessor Controller and Speech Memory. The permanent  
0 Speech Memory is on NT1X76 PROM cards. Non volatile recordable  
0 Speech Memory is on the NT1X79 EEPROM card. Recordable Speech  
0 Memory is on NT1X77 RAM cards. The Speech Processor and Micro-  
0 processor Controller are both on the NT1X75 DRA Controller Board.  
0 One DRA Controller Board plus one or more (up to a maximum of  
0 eight (8)) PROM, EEPROM and (or) RAM Speech Memory cards are  
0 equipped on a special MTM shelf.

0 b) References

0 Chapter 2 Traffic Criteria and Capacities  
0 Chapter 3, Section 3.3 Operator Services  
0 NTP 297-1001-527 Digital Recorded Announcement Machine  
0 Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) The controller CP can address up to one megabyte (M-  
0 byte) is speech memory (eight cards) and can be config-  
0 ured (by means of switches) to function either as an 8,  
0 16, 24 or 30 circuit (speech channel) interface. The se-  
0 lected quantity represents the number of different an-  
0 nouncements (types) which can be simultaneously connected  
0 to subscribers. All announcements from the source DRA  
0 are confined to the same time switch or Network Sub Group  
0 (NSG) (the one to which the MTM housing the DRA is con-  
0 nected). Circuit assignment is flexible and a given an-  
0 nouncement type can be assigned to more than one circuit.

0 ( ii) One controller card is required per DRA system and can  
0 accommodate up to a maximum of eight DRA ROM and (or) RAM  
0 memory cards. The various types of controller cards are  
0 as follows:

|                                 |          |
|---------------------------------|----------|
| 0 Digital Recorded Announcement | NT1X75AA |
| 0 Controller                    |          |
| 0 Enhanced DRA Controller       | NT1X75BA |
| 0 A-Law DRA controller          | NT1X75DA |

0 RELEASE 28.01  
0 93 12 03  
0

0 ( iii) The NT1X76 card can be either a 128K or 256K EPROM  
0 card. 128K represents about 32 seconds of speech plus  
0 silence, test tone, prompt tone and 32 Special Informa-  
0 tion Tones (SIT). The 32 seconds can be divided into  
0 segments or subphrases as small as 32ms to allow building  
0 of more than 32 seconds of announcements. This is accom-  
0 plished by recording only once standard announcement sub-  
0 phrases required in several announcements such as "We're  
0 sorry" or "The number you have dialed", that may be de-  
0 sired in many announcements.

0 ( iv) The various types of DRA PROM memory cards are as fol-  
0 lows:

0 Digital Recorded Announcement PROM NT1X76AA  
0 Memory  
0 (Standard English Announcements)

0 Digital Recorded Announcement PROM NT1X76BA  
0 Memory  
0 (Standard French Announcements)

0 Digital Recorded Announcement PROM NT1X76AB  
0 Memory  
0 (U.S. Bell Standard Announcements)

0 Digital Recorded Announcement PROM NT1X76AE  
0 Memory  
0 (ACTS Standard Announcements)

0 Digital Recorded Announcement PROM NT1X76CA  
0 Memory  
0 (Standard MCCS English Announcements)

0 RELEASE 28.01  
0 93 12 03

0 Memory  
0 (AOSSVR French Announcements -Part 2)

0 The pre-recorded standard announcements for each card  
0 type can be found in NTP 297-1001-527.

0 If bilingual announcement are required, then both  
0 NT1X76AA and NT1X76BA cards must be associated with the  
0 same DRA controller card.

0 ( v) NT1X77AA DRA Recordable Memory

0 Each RAM card can be used to store messages recorded on-  
0 line. It can hold up to 31 seconds of recording (based  
0 on 4 bits/sample and 8K samples/second). RAM speech mem-  
0 ory is provisioned based on a total recording time in  
0 seconds per DRA system. An announcement can run over two  
0 NT1X77AA cards.

0 ( vi) NT1X79AA DRA Electrically Erasable PROM (EEPROM) Card

0 Electrically Erasable Programmable Real Only Memory  
0 (EEPROM) is used as memory, allowing the customer to re-  
0 cord or rerecord messages. This card can hold up to 31  
0 seconds of recording. EEPROM speech memory is provi-  
0 sioned based on total recording time in seconds per DRA  
0 system. An announcement can run over two NT1X79AA cards  
0 associated with the same controller card. However, it  
0 must not be split over two controllers.

0 ( vii) For AOSS Voice Response, the DRA modules will consist  
0 of a controller card and four (4) double density PROM  
0 speech cards. (AOSSVR is for Canadian applications  
0 only.)

0 Provide one (1) DRA Controller Card, NT1X75BA.

0 If English announcements are required, provide one card  
0 each of NT1X76AF and NT1X76AG.

0 If French announcements are required, provide one card  
0 each of NT1X76BF and NT1X76BG.

0 If both English and French announcements are required,  
0 provide one card each of NT1X76AF, NT1X76AG, NT1X76BF and  
0 NT1X76BG.

0 RELEASE 28.01  
0 93 12 03  
0

0 To determine the maximum number of AOSSVR announcement  
0 cards that may be engineered onto one MTM shelf, use the  
0 following chart. For each of the speech memory cards  
0 supplied for one shelf, add the virtual card credit (128K  
0 - eight bit). The total must not exceed eight (8). For  
0 example, one card each of NT1X76AF, NT1X76AG, NT1X76BF  
0 and NT1X76BG total eight, so no more cards may be added.

0 AOSSVR Speech Memory Card

| 0 | CARD | PEC      | VCARD CREDIT |
|---|------|----------|--------------|
| 0 | ROM  | NT1X76AF | 2            |
| 0 | ROM  | NT1X76AG | 2            |
| 0 | ROM  | NT1X76BF | 2            |
| 0 | ROM  | NT1X76BG | 2            |

0 A DRA Module used for the AOSS Voice Response feature  
0 cannot be used for other applications. Features such as  
0 Mechanized Calling Card Service (MCCS) and Automatic Coin  
0 Toll Service (ACTS) must use different DRA devices.

0 For AOSS Voice Response, the Telco cannot make up his own  
0 customized voice announcements.

0 For more information on AOSSVR, refer to Section 3.3, Op-  
0 erator Services.

0 (viii) One DRA machine is required per Mechanized Credit Card  
0 Service (MCCS) announcement machine. One Enhanced DRA  
0 Controller Card and one MCCS Standard Announcement CP  
0 Card is required per MCCS announcement machine. The DRA  
0 EEPROM card is an optional circuit pack, required only if  
0 the customer wishes to offer voice responses not included  
0 on the MCCS Standard Announcement circuit pack.

0 To determine the maximum number of MCCS announcement  
0 cards that may be engineered onto one MTM shelf, use the  
0 following chart. For each of the speech memory cards  
0 supplied for one shelf, add the virtual card credit (128K  
0 - eight bit). The total must not exceed eight. For ex-  
0 ample, one NT1X76CA plus five NT1X79AA cards total seven,  
0 so one more card may be added if its vcard credit is only  
0 one.

0 RELEASE 28.01  
0 93 12 03

0 CARD PEC VCARD CREDIT  
0 ROM NT1X76CA 2  
0 EEPROM NT1X79AA 1

0 Each MCCS announcement machine has 30 service circuit  
0 ports but one of the 30 is dedicated to maintenance use.  
0 The number of MCCS announcement machines required for  
0 traffic is equal to the number of MCCS announcement ser-  
0 vice circuits required divided by 29 and rounded up to  
0 the next whole number. An additional one MCCS announce-  
0 ment machine is added in order to provide service pro-  
0 tection in the event of failure of one of the MCCS  
0 announcement machines.

0 For more information on the provisioning of the DRA for  
0 the MCCS, refer to Section 3.3 , Operator Services.

0 ( ix) The Automatic Coin Toll Service (ACTS) DRAM will pro-  
0 vide pre-programmed announcements for the initial contact  
0 of time and charges for the call, to quote and collect  
0 overtime charges and to give customer notification of  
0 elapsed time. Each ACTS DRAM requires one Enhanced DRA  
0 Controller Card and one DRA PROM Memory ACTS Standard An-  
0 nouncement Card. To determine the maximum number of ACTS  
0 announcement cards that may be engineered onto one ACTS  
0 DRA MTM, use the following chart. The total virtual card  
0 credit for the DRA must not exceed eight.

0 ACTS Speech Memory Card

0 CARD PEC VCARD CREDIT

0 ROM NT1X76AE 2

0 EEPROM NT1X79AA 1

0 For more information on the provisioning of the DRA for  
0 the ACTS, refer to Section 3.3, Operator Services.

- 0 ( x) The Custom Local Area Signalling Services (called  
0 CLASS in the US) or the Call Management Services (called  
0 CMS in Canada) DRA (hereafter referred to as CLASS DRA)  
0 will provide announcements available for CLASS features  
0 to indicate successful or denied operation.

0 For BCS-27, the NT1X75BA DRAM Controller must be provi-  
0 sioned for all CLASS applications.

0 There are two (2) groups of announcements, Phase 1 CLASS  
0 DRA announcements and Phase 2 CLASS DRA announcements.  
0 If the CLASS/CMS feature is required, at least one group  
0 of announcements (i.e. Phase 1 or Phase 2) must be pro-  
0 vided. The Customer can either have Phase 1 announce-  
0 ments or Phase 2 announcements or both.

0 For more information on the provisioning of the DRA for  
0 the CLASS/CMS feature, refer to the Peripheral Modules  
0 Features in this section.

- 0 ( xi) An announcement type will appear at a network port  
0 over a single time slot connection from an MTM. Network  
0 broadcasting will be used to distribute each announcement  
0 type to the various lines and trunks requesting this ser-  
0 vice.

- 0 ( xii) Grade of Service Objective

0 If not specified by the customer, assume the following  
0 G.O.S. per announcement type:

0 Less than 1% (ABSBH) or 5% (HDBH) of attempts should see  
0 all circuits busy. This assumes that failures overflow  
0 to tone circuits. In a toll office, this applies on a  
0 10HDBH basis.

0 RELEASE 28.01  
0 93 12 03  
0

0 (xiii) The maximum number of simultaneous connections that  
0 can be made to announcements should not exceed 16 plus 8,  
0 16, 24 or 30 for the old network and 32 plus 8, 16, 24 or  
0 30 for the new network for the non deloading option.

0 ( xiv) Each announcement type will be considered as a sepa-  
0 rate trunk group.

0 ( xv) Traffic Capacity Per DRA

0 (1) Without The Network Deloading Option

0 Network deloading is not required if the traffic load  
0 on the DRA does not exceed the traffic limits shown  
0 in Tables T and U, Total DRA Traffic (CCS) For Net-  
0 work (NT0X48) and Total DRA Traffic (CCS) For Network  
0 (NT5X13) respectively, in Chapter 2, for the number  
0 of ports deloaded per NSG equal to 0 for the old and  
0 new network respectively.

0 (2) With The Network Deloading Option

0 Traffic capacities for the DRA with a different num-  
0 ber of ports deloaded per NSG are shown in Tables T  
0 and U for the old and new network respectively.

0 For the non deloading option, if more than one DRA  
0 system is required per office, each should be as-  
0 signed to a different network module.

0 ( xvi) The number of DRA systems to be provisioned will be  
0 established as a function of:

0 (1) Number of Announcements

0 Note that the maximum number of announcements per DRA  
0 system is 30.

0 (2) Total Number of Recording Seconds

0 Note that the recording time available per DRA system  
0 given that all the memory cards are RAM cards is 248  
0 seconds (8 RAM cards x 31 seconds = 248 seconds).

0 (3) Traffic Capacity

0 (a) Traffic load per announcement

0 RELEASE 28.01  
0 93 12 03  
0

- 0 (b) Maximum traffic load per NSG  
0 (c) Grade of service (G.O.S.) objectives

0 (4) Reliability

0 We recommend that our standard offering should be a  
0 single DRA system. However, each DRA system may be  
0 duplicated for reliability/maintenance purposes if  
0 requested by the customer.

0 (xvii) In summary, the number of DRA required per office is  
0 the maximum of one of the three formulas below:

0 1) Total No. of Announcements Required/Office

0 30

0 = No. of DRAs  
0 (round up to next highest integer)

0 2) Total No. of Recording Seconds

0 248 Seconds

0 = No. of DRAs  
0 (round up to next highest integer)

0 3) Total Usage (CCS) For All Announcements

0 Traffic Capacity (CCS) Per DRA

0 = No. of DRAs  
0 (round up to next highest integer)

0 (xviii) The CCC DRA machine will provide digitally recorded  
0 announcements for use during handling of automated credit  
0 card calls.

0 Each CCC announcement machine has thirty service circuit  
0 ports but one of the thirty is dedicated to maintenance  
0 use. The number of CCC announcement machines required  
0 for traffic is equal to the number of CCC announcement  
0 service circuits required divided by twenty-nine and  
0 rounded up to the next whole number. An additional one  
0 CCC announcement machine is added in order to provide  
0 service protection in the event of failure of one of the  
0 CCC announcement machines.

0  
0  
0

RELEASE 28.01  
93 12 03

0 Provide one Enhanced Digital Recorded Announcement Con-  
0 troller CP NT1X75BA per CCC announcement machine.

0 One CCC Standard English Announcement CP, NT1X76AH or one  
0 CCC Standard French Announcement CP, NT1X76BH is required  
0 per CCC announcement machine. If both English and French  
0 announcements are required, then provide NT1X76AH and  
0 NT1X76BH. These circuit packs contain all the voice mes-  
0 sages to support the CCC feature set. The memory used is  
0 double density, Erasable Programmable Read Only Memory  
0 (EPROM).

0 The Custom Announcement CP NT1X79AA is an optional cir-  
0 cuit pack, required only if the customer wishes to office  
0 voice responses not included on the CCC Standard An-  
0 nouncement circuit pack. The number of seconds of re-  
0 cording time required divided by thirty-one seconds is  
0 equal to the number of Custom Announcement CP required  
0 per CCC group.

0 To determine the maximum number of CCC announcement cards  
0 that may be engineered onto one MTM shelf, use the fol-  
0 lowing chart. The total virtual call credit must not ex-  
0 ceed eight.

## 0 CCC SPEECH MEMORY CARD

0 CARD PEC VCARD CREDIT

0 ROM NT1X76AH 2  
0 ROM NT1X76BH 2  
0 EEPROM NT1X79AA 1

0 For more information on the provisioning of the DRA for  
0 CCC, refer to Section 450/33, Operator Services.

0 ( xix) The DRA required per office for CCC feature is as follows:

0 To determine the total CCC announcement service circuit  
0 ports required for each office, use Table V Trunk Capac-  
0 ity Tables (Poisson Theory) of Chapter 2 using the traf-  
0 fic usage in CCS offered to the CCC announcement machine.  
0 The CCS traffic usage can be determined as follows:

$$\begin{array}{l} \text{0 CCC Traffic Usage} = \text{ABSBHA} \times \text{WAHT} \\ \text{0} \\ \text{0} \quad \quad \quad \underline{\hspace{2cm}} \\ \text{0} \quad \quad \quad 100 \end{array}$$

0 where

0 ABSBHA is the total Average Busy Season Busy Hour Attempt  
0 for all 0+, 01+, ANI traffic with an indication of CCC  
0 capable i.e. trunk group = CCC capable + originating sta-  
0 tion is DTMF type. (This will be the sum of all incoming  
0 trunk groups as well as local originating traffic in the  
0 case of DMS-100/200 TOPS.)

0 WAHT is the Weighted Average Holding Time of the CCC an-  
0 nouncement machine of all 0+ and 01+ calls marked as CCC  
0 capable. This is determined by multiplying nineteen sec-  
0 onds (the CCC announcement machine holding time for CCC  
0 calls) the probability that the 0+ or 01+ call marked as  
0 CCC capable is actually a subscriber dialed CCC call.

0 The number of CCC groups is equal to the number of CCC  
0 announcement service circuit ports divided by twenty-  
0 nine. The number of CCC DRAM required is as follows:

$$\begin{array}{l} \text{0 No. of CCC DRAM} = \text{No. of CCC groups} \times \text{No. of} \\ \text{0} \quad \quad \quad \text{DRAM required per group} \end{array}$$

0 The number of DRAM required per group is determined by  
0 the number of Custom Announcement CP required per group.

0 2.4.2 Enhanced DRAM (EDRAM)

0 a) General Description

0 The Enhanced Digital Recorded Announcement Machine (EDRAM) is  
0 a single slot circuit pack DMS peripheral module used for provid-  
0 ing voice messages or instructions to the subscriber, thus reduc-  
0 ing the need for an operator's assistance. Announcements are  
0 stored in digital format in memory using PCM coding so as to al-  
0 low fast and random access of announcements, both in playback or  
0 recording stages.

0 The EDRAM card will replace the existing Digital Recorded An-  
0 nouncement (DRA) Module for providing voice messages and recorded  
0 announcements in all DMS-100 Family switches.

0 The EDRAM provides the equivalent functions and capabilities of  
0 the existing Digital Recorded Announcement (DRA) Module; i.e.  
0 exactly the same duration of announcement time as for the DRA  
0 (4.3 minutes) and 30 announcement channels for announcement  
0 playback/recording.

0 The EDRAM is a stand alone peripheral module (PM), having its own  
0 DS-30 link interface with the network (i.e. having a network port  
0 appearance on the network). It can be plugged into one (1) of  
0 the twelve (12) provisionable trunk card slots on the MTM/DRA  
0 shelf. The DS-30 cable for EDRAM is plugged directly into the  
0 backplane pins at the back of the shelf corresponding to the slot  
0 of the EDRAM.

0 Although the EDRAM can mount onto existing DRA shelves, no new  
0 DRA shelves should be ordered. For new and existing offices,  
0 provision only MTM shelves to mount the EDRAM.

0 The current DRA Module consists of the DRA shelf and circuit  
0 packs. The DRA shelf is a modified version of the Maintenance  
0 Trunk Module (MTM). It must be equipped with the appropriate MTM  
0 controller circuit packs and power converter circuit packs to  
0 provide the basic MTM functions.

0 The announcement functions are provided by the provisionable DRA  
0 controller and announcement cards. Each DRA Module consists of a  
0 DRA controller card (NT1X75\_\_) and up to eight (8) single density  
0 or four double density provisionable announcement memory cards.  
0 Each single density memory card provides 30 seconds of announce-

0 RELEASE 28.01  
0 93 12 03  
0

0 ment capacity; each double density memory card provides 60 sec-  
0 onds of announcement capacity.

0 - NT1X75BA - DRA controller card

0 - NT1X76XX - contains standard factory programmed an-  
0 nouncements in non-alterable memories (EPROM). The an-  
0 nouncements are identified by the "XX" PEC code suffix  
0 and these announcements cannot be altered.

0 - NT1X77AA - provides storage for on-site customer re-  
0 corded announcements in volatile memory (RAM).

0 - NT1X79AA - provides storage for on-site customer re-  
0 corded announcements in non-volatile memory (EEPROM).

0 Each fully equipped DRA Module provides 30 announcement chan-  
0 nels and 4 minutes of announcement time.

0 The single card slot EDRAM Module is equivalent to a fully  
0 equipped DRA Module.

0 The EDRAM will provide a super-set of features that include or  
0 is equivalent to all existing features of the DRA shelf. The  
0 features can be categorized into the following areas:

- 0 -Loader features
- 0 -MTM features
- 0 -DRA features

0 The loader will download the EDRAM application firmware load, and  
0 the specified announcement load from the DMS tape/disk to the  
0 EDRAM memory.

0 The loader will provide management of announcement files. Up to  
0 a maximum of any eight (8) announcement files can be loaded to a  
0 specified EDRAM. Each announcement file corresponds to a version  
0 of NT1X76 card. Hence, announcements no longer need to be iden-  
0 tified by the NT1X76 DRA EPROM PEC code. The factory recorded  
0 announcements on the NT1X76 DRA EPROM cards are replaced with an-  
0 nouncement files on DMS tape that can be downloaded to the EDRAM.  
0 This provides the flexibility of changing announcements at any  
0 time without retrofitting the DRA EPROM cards which contain fac-  
0 tory programmed announcements.

0 The EDRAM will emulate the Maintenance Trunk Module (MTM) fea-  
0 tures required for DRA applications, which includes:

0 RELEASE 28.01  
0 93 12 03  
0

- 0 -Loading and executing PM EXECs
- 0 -Setting up speech connections needed for call processing
- 0 -Performing PM sanity functions such as sending Who-Am-I, I-Am-Here messages to Central Control (CC)
- 0 -Network integrity and parity generation/checking
- 0 -Perform CC instructions through CC-PP primitives execution
- 0 and handle command protocol violation checking
- 0 -PM load checksum tests.

0 The EDRAM will emulate all existing required DRA features,  
0 which includes:

- 0 -On site recording of announcements
- 0 -Playing announcements
- 0 -Configuration query
- 0 -Trunk level diagnostics.

0 The EDRAM is a second generation DRA circuit pack. It intro-  
0 duces the concept of a single circuit pack Peripheral Module (PM)  
0 which has the dual appearance as a PM as well as a trunk. Al-  
0 though it is located on an MTM/DRA shelf, it is directly con-  
0 nected to the network through a DS-30 link. Hence, it will have  
0 two (2) Maintenance & Administration Position (MAP) appearances  
0 on the same hardware. It will appear as a PM, just like the  
0 MTM/DRA, since it is directly connected to the network, and it  
0 will also appear as a trunk, just like other provisionable trunk  
0 cards on the MTM/DRA, since it mounts on the MTM/DRA.

0 The EDRAM has its own pair of DS-30 links for connecting to both  
0 planes of the Network Module (NM), and communicates with the Cen-  
0 tral Control/Central Message Controller (CC/CMC) directly via the  
0 message channel of this DS-30 link.

0 It is to be plugged into any one of the twelve (12) provisionable  
0 trunk slots of the MTM/DRA shelf and uses this shelf for the pur-  
0 poses of housing, logic power, and cable mounting. In order to  
0 keep within the maximum power dissipation of 110 watts per  
0 MTM/DRA shelf, there can be up to a maximum of eleven (11) EDRAM  
0 cards.

0 The DS-30 cable for the EDRAM can be plugged directly into the  
0 pins at the back of the MTM/DRA backplane at the slot correspond-  
0 ing to the position of the EDRAM. The other end of the DS-30 ca-  
0 ble is terminated at the Peripheral Speech Link (PSL) Panel  
0 mounted on the Speech Link Connecting (SLC) Frame or at the En-  
0 hanced Network (ENET) depending on office requirements.

Figure 1. EDRAM System Configuration

b) References

None

c) Provisioning Considerations:

- ( i) The EDRAM will be provisioned using the same provisioning rules as for the existing DRA Module as given in the Engineering Manual and NTP 297-1001-450 entitled DMS-100 Family Provisioning.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 ( ii) The EDRAM Module provides 30 announcement channels and  
0 4.3 minutes of announcement time for announcement  
0 playback/recording.
- 0 ( iii) For each DMS office, provision the number of EDRAM as  
0 required to accommodate the standard announcements.
- 0 ( iv) Depending on the optional recorded announcement fea-  
0 tures ordered by the Customer for his office, provision  
0 additional EDRAM Modules as required. The optional fea-  
0 tures are: Auxiliary Operator Service System Voice Re-  
0 sponse (AOSS VR), Custom Charge Calling (CCC), Automatic  
0 Coin Toll Service (ACTS), Mechanized Calling Card Service  
0 (MCCS), and Automatic Intercept Service (AIS). Since each  
0 of the preceding features requires all 30 announcement  
0 channels of the EDRAM, each feature requires an exclusive  
0 EDRAM Module that cannot be used for other announcements.  
0 For further information, refer to Section 1.3 Cross-  
0 Reference Publications.
- 0 ( v) Other optional features that need additional announce-  
0 ments are Call Forward Remote Activation (CFRA) in  
0 BCS-28, Custom Local Area Signalling Services (CLASS)  
0 features Phase I in BCS-28, and CLASS features Phase II  
0 in BCS-30. For further information, refer to ECM-473 on  
0 subject Residential Enhanced Services and ECM-332 on sub-  
0 ject CLASS - U.S./CMS - Canada.
- 0 ( vi) As a Customer requested option, each EDRAM may be du-  
0 plicated for reliability. It is mostly needed for toll  
0 offices where it is important to get the message sent to  
0 the subscriber.
- 0 (vii) The EDRAM card is to be inserted into one (1) of the  
0 twelve (12) provisionable trunk card slots of the MTM/DRA  
0 shelf. In order to keep within the maximum power dissipa-  
0 tion of 110 watts per MTM/DRA shelf, there can be up to  
0 a maximum of eleven (11) EDRAM cards.
- 0 ( viii) Although the EDRAM can mount onto existing DRA  
0 shelves, no new DRA shelves should be ordered. For new  
0 and existing offices, provision only MTM shelves to mount  
0 the EDRAM.
- 0 ( ix) The EDRAM has its own pair of DS-30 links for connect-  
0 ing to both planes of the Network Module (NM), and commu-  
0 nicates with the Central Control/Central Message

0 RELEASE 28.01  
0 93 12 03

0 Controller (CC/CMC) directly via the message channel of  
0 this DS-30 link.

0 ( x) The DS-30 cable for the EDRAM can be plugged directly  
0 into the pins at the back of the MTM/DRA backplane at the  
0 slot corresponding to the position of the EDRAM. The  
0 other end of the DS-30 cable is terminated at the Periph-  
0 eral Speech Link (PSL) Panel mounted on the Speech Link  
0 Connecting (SLC) Frame or at the Enhanced Network (ENET)  
0 depending on office requirements.

0 ( xi) MECHANICAL DIMENSIONS

0 Height 12.50 in. (317.5 mm)  
0 Width 1.125 in. (29 mm)  
0 Depth 10.00 in. (254 mm)  
  
0 Power 10.0 Watts (from +5V/-5V logic  
0 power)

0 The circuit pack can mount onto one (1) of the twelve  
0 (12) provisionable trunk slots in MTM/DRA shelves. In  
0 order to keep within the maximum power dissipation of 110  
0 watts per MTM/DRA shelf, there can be up to a maximum of  
0 eleven (11) EDRAM cards.

0 ( xii) The addition of this peripheral module should have  
0 minimal impact on memory provisioning. Refer to the  
0 normal memory algorithms.

0 2.4.3 Digital Tone Transceiver

0 a) General Description

0 The Digital Tone Transceiver Circuit Pack (NT3X08AA) functions  
0 as an essential component of the Automatic Coin Toll Service  
0 (ACTS). Its General purpose is to count coin deposits from coin  
0 operated telephones (coin stations) and report the amount col-  
0 lected to the DMS-100 Central Control (CC). Refer to Section 3,  
0 Operations Equipment for more information on ACTS.

0 b) References

0 Chapter 3, Section 3.3 Operator Services

0 c) Provisioning Considerations:

0 ( i) The coin detection circuit pack (CDC - NT3X08AA) will  
0 physically occupy one card slot on a MTM.

0 ( ii) The CDC will use eight time slots and therefore four  
0 (4) consecutive card slots are required. A maximum of  
0 three (3) CDC circuit packs can be housed in any MTM. If  
0 it is desired, the CDC card can be placed on a MTM with  
0 other cards provided the next three slots following the  
0 CDC are empty and provisioning rules for these other  
0 packs are followed.

0 ( iii) Digitone or rotary coin stations may be used, however,  
0 all stations MUST be able to provide dual frequency coin  
0 deposit signals to allow detection by the CDC circuit  
0 pack.

0 ( iv) The CDC contains eight (8) circuits provisionable for  
0 ACTS on each circuit pack.

0 ( v) Mu-law/A-law capability.

0 ( vi) The CDC requires no distributing frame cabling.

0 ( vii) For more information on the CDC card, refer to ACTS in  
0 Section 3.3, Operator Services.

0 3.0 Peripheral Modules Features

0 3.1 Introduction

0 This section describes the line-oriented software features that  
0 require special hardware provisioning to make the feature work.

0 3.2 Features

0 The line-oriented software features included in the Peripheral  
0 Modules Features that require special hardware provisioning con-  
0 siderations are listed below:

0 Custom Local Area Signalling Services (CLASS) or Call Man-  
0 agement Services (CMS)

0 Residential Enhancement Services

0 Enhanced Coin Services

### 0 3.3 Equipment Provisioning

#### 0 3.3.1 CLASS/CMS Feature

##### 0 (a) General Description

0 Custom Local Area Signalling Services or CLASS Features are a set  
0 of line-oriented features which the telephone company can deploy  
0 in their residential or Centrex customer environment to generate  
0 additional revenue. These features operate within a single  
0 switch or transparently between users on different end-office  
0 switches by means of CCS7-based signalling in a multi-node switch  
0 configuration. In the U.S., this feature is called CLASS and in  
0 Canada, the feature is called CMS. In this document, the feature  
0 will be referred to as CLASS.

0 CLASS Features are separated into Phase I and Phase II features.  
0 Phase I features include

- 0 - Automatic Callback (ACB) - allows a calling party to automat-  
0 ically call again the number most recently dialed, whether  
0 that call was answered, unanswered, or busy. If the station  
0 is busy, the user may queue against that station and be re-  
0 called when it becomes idle. The Automatic Callback feature  
0 is very similar to the Ring Again (RAG) feature, but will be  
0 deployed in the Public Network.
- 0 - Automatic Recall (AR) - enables the end user to return his  
0 latest incoming call automatically, regardless of whether the  
0 incoming call was answered, and regardless of whether the end  
0 user knows the identity of the calling party. If the station  
0 is busy, the user may queue against that station and be re-  
0 called when it becomes idle. With two (2) level activation,  
0 the directory number of the last call is voiced back prior to  
0 completing the call.
- 0 - Calling Number Delivery or Calling Number Display (CND) - en-  
0 ables receipt and display of the calling party's directory  
0 number and Date/Time during the ringing cycle. This allows  
0 the end user with a display set to make an informed decision  
0 about answering the call.
- 0 - Calling Number Delivery Blocking (CNDB) - permits the origi-  
0 nating customer, by designating his calling identity as "pri-

0 RELEASE 28.01  
0 93 12 03  
0

0 vate", to prevent his directory number from being transmitted  
0 for Calling Number Delivery. The calling party may change  
0 his DN Suppression default - Suppress DN or not Suppress DN -  
0 to the opposite status.

- 0 - Customer Originated Trace (COT) - enables the called party to  
0 request an automatic trace of the last call received. The  
0 trace record identifies the calling party and other call-  
0 related information. The results of the trace are not pro-  
0 vided directly to the end user, but are made available only  
0 to an authorized agency, such as the telephone company or law  
0 enforcement agency.

0 Note that CLASS features are available only to lines with a line  
0 class code of RES (Residential Enhanced Services). Note that  
0 this does not include ISDN RES lines.

#### 0 Automatic Recall Date and Time Feature (ARDT)

0 This feature provides the date and time voiceback capability for  
0 the Automatic Recall (AR) two-level activation sequence.

#### 0 CLASS Configuration

0 Figure 35.2 illustrates a typical configuration with a CLASS ter-  
0 minal on the DMS. This terminal is equipped with an enhanced  
0 Man-Machine Interface (MMI), such as a Liquid-Crystal Display  
0 (LCD) panel. The terminal could also consist of a standard tele-  
0 phone with a CLASS add-on unit. An integrated telephone set,  
0 such as NTL's MAESTRO, can also be used. The telephone section  
0 of the Customer Premises Equipment (CPE) is loop powered, whereas  
0 the CPE section providing CLASS features is powered by local AC.

0 RELEASE 28.01  
0 93 12 03

0 Figure 35.2 Typical Configuration with a CLASS CPE

0 The transmission of the calling party number to the Customer Premises  
0 Equipment (CPE) is accomplished via asynchronous FSK simplex-mode  
0 transmission at 1200 bits/sec over the 2-wire loop, in accordance with  
0 the Bell 202A standard. A burst of data is transmitted to the CPE  
0 during the silent interval between the first and second ring of the  
0 telephone set, before the incoming call is answered. The data link  
0 terminates at a 202A modem in the CPE, which outputs the calling party  
0 number to the LCD panel.

0 93 12 03  
0

0 (c) Provisioning Considerations

0 ( i) CCS7 Signalling is required when CLASS features are ac-  
0 cessed between nodes. Within the same node, CCS7 Signal-  
0 ling is NOT required. Refer to Section 3.15 for more  
0 information on CCS7 Signalling.

0 ( ii) An optional feature exists called Automatic Recall Date  
0 and Time (ARDT). This feature requires announcements  
0 provided on a pair of CPs; NT1X76JA and NT1X76JB. The  
0 NT1X76AJ and the NT1X76AK cards are required when the  
0 NT1X76JA and NT1X76JB cards are ordered. The NT1X76AJ,  
0 NT1X76AK, NT1X76JA, and NT1X76JB should be assigned to  
0 the same DRA module. In a Class Phase 1 English office,  
0 the NT1X76JA/JB can be assigned to a DRA where the  
0 NT1X76AJ/AK cards are existing and there is room. Other-  
0 wise, in other offices or where the DRAs with NT1X76AJ/AK  
0 cards are filled, an additional set of NT1X76AJ/AK cards  
0 must be ordered.

0 ( iii) LCM Processor Cards, NT6X51AB, are required to support  
0 CND in LCMS. LCM Common CP, NT6X04AB, contains NT6X51AB  
0 and hence can support CND. Only LCMS which contain lines  
0 utilizing the CND feature must be upgraded to use the  
0 NT6X51AB.

0 ( iv) In addition to the LCM Processor Card NT6X51AB, the CLASS  
0 Modem Resource (CMR) card NT6X78AA has been developed to  
0 support the introduction of CND.

0 The CMR card will support software to provide SP  
0 processor - CMR messaging and thus provide CMR sanity  
0 supervision, software downloading,  
0 maintenance/diagnostics, operational measurements and  
0 swact activity.

0 When the CND feature is required, provide two (2) CMR  
0 cards per LGC/LTC/RCC/SMS/SMU module (i.e. one (1) card  
0 per shelf). It is not necessary to equip all the  
0 LGC/LTC/RCC/SMS/SMU in the office with the CMR card. Only  
0 LGC/LTC/RCC/SMS/SMUs that will provide CND to the sub-  
0 scribers that home on these peripherals will require the  
0 CMR card. Any number of LGC/LTC/RCC/SMS/SMUs of a given  
0 DMS may be equipped with CMR cards.

0

0 RELEASE 28.01  
0 93 12 03  
0

- 0 ( v) For Canadian Applications when the NT6X78AA cards are  
0 provisioned into an LGC, LTC, or SMS module,

0 EITHER:

- 0 1. Retrofit the NT6X69AA/NT6X79AA card combination (if  
0 existing) to an NT6X69AB card via the application of  
0 the NT6X12ZY PC Kit.

0 This upgrade kit allows card slot 18 to be provi-  
0 sioned with the CLASS Modem Resource (CMR) card  
0 NT6X78AA which is used for the CND feature. The  
0 power-reduced NT6X78AB replaces NT6X78AA and does not  
0 require this upgrade.

0 OR

- 0 2. Limit the number of NT6X50AA DS-1 cards to four per  
0 shelf (i.e. eight per module).

0 This is required to limit the shelf's overall +5 volt  
0 power requirements to below 55 amps.

- 0 ( vi) There are optional announcements available for CLASS fea-  
0 tures to indicate successful or denied operation.

0 For BCS-27, the NT1X75BA DRAM Controller must be provi-  
0 sioned for all CLASS applications.

0 There are two groups of announcements, Phase 1 CLASS DRA  
0 Announcements and Phase 2 CLASS DRA Announcements. If the  
0 CLASS/CMS feature is required, at least one group of an-  
0 nouncements (i.e. Phase 1 or Phase 2) must be provided.  
0 The Customer can either have Phase 1 announcements or  
0 Phase 2 announcements or both.

- 0 ( vii) Phase 1 CLASS DRA Announcements

0 For the optional Phase 1 CLASS DRA Announcements, the  
0 Customer can either make up his own announcements or he  
0 can order the pre-recorded ones from NT.

0 For provisioning the Digital Recorded Announcement Re-  
0 cordable Memory cards (NT1X77AA/79AA), divide the total  
0 length of the announcements (in seconds) by 31. This de-  
0 termines the number of circuits required for these an-  
0 nouncements. These are the announcements that the  
0 Customer can make up himself.

0  
0 RELEASE 28.01  
0 93 12 03

0 If the Customer chooses to create his own announcements,  
0 and if he wants the Automatic Recall (AR) feature with  
0 the Voice Back Option within NTXA00AA activated, then the  
0 CLASS Phase 1 English Announcements (2) of (2) CP card,  
0 NT1X76AK, and/or the CLASS Phase 1 French Announcements  
0 (2) of (2) CP card, NT1X76BK, must be provided. Other-  
0 wise, if the Voice Back Option is not to be activated,  
0 then NT1X76AK and/or NT1X76BK are optional.

0 If the Customer wants our pre-recorded announcements, the  
0 following DRA cards are available:

| 0 | PEC      | DESCRIPTION                         |
|---|----------|-------------------------------------|
| 0 | NT1X76AJ | CLASS Phase 1 English Announcements |
| 0 |          | (1) of (2) CP                       |
| 0 | NT1X76AK | CLASS Phase 1 English Announcements |
| 0 |          | (2) of (2) CP                       |
| 0 | NT1X76BJ | CLASS Phase 1 French Announcements  |
| 0 |          | (1) of (2) CP                       |
| 0 | NT1X76BK | CLASS Phase 1 French Announcements  |
| 0 |          | (2) of (2) CP                       |

0 The above cards are the approved Telecom Canada Phase 1  
0 CLASS DRA Announcements.

0 If bilingual announcements are required (e.g. French fol-  
0 lowed by English on the same announcement), then the  
0 Phase 1 CLASS DRA Announcement cards must be provisioned  
0 on the same DRA shelf (i.e. NT1X76AJ/AK/BJ/BK).

0 The Phase 1 CLASS DRA Announcement cards are only avail-  
0 able in sets (e.g. NT1X76AJ/AK or NT1X76BJ/BK) and cannot  
0 be provisioned separately. However, the NT1X76AK and  
0 NT1X76BK cards can be ordered separately for the Auto-  
0 matic Recall feature (noted above). The NT1X76AK card  
0 can be ordered separately for the Call Forward Remote Ac-  
0 tivation (CFRA) feature. (See Meridian Business Ser-  
0 vices, Section 3.4, for more information on Residential  
0 Enhanced Services.)

0 If the optional announcements are not selected, confirma-  
0 tion tone can be used for successful feature operation  
0 and fast busy (120 ipm) can be used for denial of feature  
0 operation. This is only applicable to Calling Number De-  
0 livery Blocking (CNDB) and Customer Originated Trace  
0 (COT).

0 RELEASE 28.01  
0 93 12 03  
0

0 (viii) Phase 2 CLASS DRA Announcements

0 For Phase 2 CLASS DRA Announcements, the Digital Recorded  
0 Announcement Recordable Memory cards (NT1X77AA/79AA) can-  
0 not be used.

0 For provisioning, two groups of Phase 2 CLASS DRA An-  
0 nouncements are available:

0 1) Phase 2 CLASS DRA Announcements (List 1-12)

0 2) Phase 2 CLASS DRA Announcements (List 13-31)

0 The following are the Phase 2 CLASS DRA Announcement  
0 (List 1-12) cards:

| 0 | PEC       | DESCRIPTION                         |
|---|-----------|-------------------------------------|
| 0 | NT1X76AP  | CLASS Phase 2 English Announcements |

0 \* The "Personality" card, NT1X76AW, contains only Bell  
0 Canada names and Bell South BCS-29 V0 information. The  
0 "Personality" card, NT1X76BW, contains only Bell Canada  
0 names. It must be determined up front which "Personal-  
0 ity" cards are required by which Customer. When engi-  
0 neering a DMS job (initial or extension) which will  
0 require Phase 2 CLASS DRA Announcements, the onus will be  
0 on the Customer to determine which "Personality" card is  
0 required.

0 The Phase 2 CLASS DRA Announcement cards are only avail-  
0 able in sets (e.g. NT1X76AP/AQ/AR/AS/AT/AU/AV/AW or  
0 NT1X76BP/BQ/BR/BS/BT/BU/BV/BW or NT1X76GA/GB/GC) and can-  
0 not be provisioned separately. Note that the only excep-  
0 tion to this is the "Personality" card (e.g. NT1X76AW)  
0 which will be provisionable with other Customer specific  
0 packs (as highlighted above).

0  
0 RELEASE 28.01  
0 93 12 03

- 0 ( ix) Automatic Recall Date and Time (ARDT) CLASS DRA Announce-  
0 ments

0 The customized announcements require a DRAM with a  
0 NT1X75BA controller card. A set of AR Date and Time  
0 Phrase List PROM Cards NT1X76JA and NT1X76JB are required  
0 for ARDT (English) announcements. Each CP contain two  
0 (2) virtual card credits because they are double density  
0 cards.

0 The following are the AR Date and Time Phrase List PROM  
0 cards:

| 0 | PEC      | CPC      |                             |
|---|----------|----------|-----------------------------|
| 0 | NT1X76JA | B0231819 | Automatic Recall Date/Time  |
| 0 |          |          | Announcements (1) of (2) CP |
| 0 | NT1X76JB | B0231820 | Automatic Recall Date/Time  |
| 0 |          |          | Announcements (2) of (2) CP |

0 The NT1X76AJ and the NT1X76AK cards are required and  
0 should be assigned to the same DRA module as the NT1X76JA  
0 and NT1X76JB cards. In a Class Phase 1 English office,  
0 the NT1X76JA/JB can be assigned to a DRA where the  
0 NT1X76AJ/AK cards are existing and there is room. Other-  
0 wise, in other offices or where the DRAs with NT1X76AJ/AK  
0 cards are filled, an additional set of NT1X76AJ/AK cards  
0 must be ordered.

- 0 ( x) The DRA cards (either recordable or pre-recorded) can  
0 mount on DRA modules (i.e. NT2X58AM, NT2X58CB, NT2X58AK,  
0 NT2X58AG).

0 The DRA module can accommodate one (1) NT1X75BA DRAM Con-  
0 troller card and up to a maximum of eight (8) virtual  
0 card credits (i.e. the addressing range of the NT1X75BA).

0 The DRA Recordable Memory cards (NT1X77AA and NT1X79AA)  
0 each contain one (1) virtual card credit because they are  
0 single density cards.

0 The existing DRA pre-recorded announcement card NT1X76AA  
0 contains one (1) virtual card credit. Currently, this is  
0 the only NT1X76\_\_ card which contains one (1) virtual  
0 card credit. All other NT1X76\_\_ cards contain two (2)  
0 virtual card credits because they are double density  
0 cards.

0 RELEASE 28.01  
0 93 12 03  
0

0 All Phase 1 and Phase 2 CLASS DRA pre-recorded announce-  
0 ment cards (i.e. NT1X76AJ/AK/BJ/BK, NT1X76AP-AW,  
0 NT1X76BP-BW, NT1X76GA-GC, NT1X76GE-GL) each contain two  
0 (2) virtual card credits because they are double density  
0 cards. Hence, a DRA module can accommodate a maximum of  
0 eight (8) single density cards or a maximum of four (4)  
0 double density cards.

0 The two (2) Phase 1 CLASS DRA Announcement cards (Eng-  
0 lish) can be mounted on half of a DRA module. The two  
0 (2) Phase 1 CLASS DRA Announcement cards (French) can be  
0 mounted on half of a DRA module. If both English and  
0 French are required, then the four (4) Phase 1 CLASS DRA  
0 Announcement cards (English and French) can be mounted on  
0 one (1) DRA module.

0 The eight (8) Phase 2 CLASS DRA Announcement (List 1-12)  
0 cards (English) can be mounted on two (2) DRA modules.  
0 The eight (8) Phase 2 CLASS DRA Announcement (List 1-12)  
0 cards (French) can be mounted on two (2) DRA modules.

0 A quantity of five (5) DRA modules may be provisioned on  
0 a TME frame, NT0X46AB, if and only if double density DRA  
0 cards are provisioned on these modules. Any double den-  
0 sity DRA cards (i.e. all NT1X76\_\_ cards with the excep-  
0 tion of NT1X76AA which is a single density card), up to a  
0 maximum of four (4) per module, may be provisioned. Oth-  
0 erwise, only four (4) DRA modules may be provisioned on a  
0 TME frame.

0 Hence, a DMS office requiring both Phase 1 and Phase 2  
0 (List 1-12) pre-recorded CLASS DRA Announcements in Eng-  
0 lish and French can have all twenty (20) double density  
0 DRA cards mounted on five (5) DRA modules and these five  
0 (5) modules could be mounted onto one (1) TME frame.

0 Redundancy of announcements is available as an option in  
0 the U.S. only. If redundancy is provided, ensure that  
0 the announcement MTMs are on different power feeds.

0 The assignment rules for mounting Phase 1 and Phase 2  
0 CLASS DRA Announcement cards onto DRA modules are the  
0 same as the rules pertaining to the existing NT1X76\_\_ DRA  
0 Announcement cards. Cards NT1X76AP/AQ/AR/AS must be  
0 mounted together onto the same DRA module. Cards  
0 NT1X76AT/AU/AV/AW must be mounted together onto the same  
0 DRA module. Similarly, cards NT1X76BP/BQ/BR/BS must be

0  
0 RELEASE 28.01  
0 93 12 03

0 mounted together onto the same DRA module and cards  
0 NT1X76BT/BU/BV/BW must be mounted together onto the same  
0 DRA module. Cards NT1X76GA/GB/GC/+"Personality" Card  
0 must be mounted together onto the same DRA module. The  
0 previous cards within each DRA module can be in any or-  
0 der. (See DRA System Provisioning in this section for  
0 further information on the DRA.)

0 ( xi) Log messages are produced when a subscriber activates the  
0 Customer Originated Trace (COT) feature. If the  
0 customer/telco wants these log messages to be routed to a  
0 dedicated TTY, then a separate I/O port (i.e. one port  
0 off of a NT1X67BC card) is required. Otherwise, these  
0 log messages will be routed along with other log messages  
0 to the customer specified TTY.

0 ( xii) Canadian customers will be able to obtain CLASS Terminals  
0 from NTCL or from outside suppliers. To obtain CLASS  
0 terminals (i.e. an integrated telephone set, such as  
0 MAESTRO) from NTCL, Canadian customers will contact  
0 London Terminal Division.

0 U.S. customers will obtain CLASS terminals from outside  
0 suppliers.

0 3.3.2 Enhanced Coin Services

0 (a) General Description

0 This feature provides per call records of the revenue collected  
0 on coin originated toll calls. The LAMA records required for  
0 this purpose, include information concerning the revenue col-  
0 lected on the call. This is reported as the number of five cent  
0 deposits collected on each call. Records also store the number  
0 of Operator Attached Intervals (OAI) during which the local  
0 switching system was unable to monitor and record collected de-  
0 posits because of circuit blockage or insufficient memory capac-  
0 ity. If tone detection errors are detected within a particular  
0 coin call, this information is also indicated within the LAMA re-  
0 cord. Call code 136 has been assigned by Bellcore for these pur-  
0 poses.

0 Trunk groups that carry the ACTS compatible calls are identified  
0 through Table AMATKOPT. All coin calls going out over the trunks  
0 datafilled in this table with the REVALL option will have LAMA  
0 records generated if coins are collected during the call.

0 A separate pool of CDCs (Coin Detection Circuit) is required to  
0 determine the number of 5¢ deposits collected on each call. A CDC  
0 is connected in a one way speech path during each OAI. Upon com-  
0 pletion of the OAI, the CDCs report on the deposits detected. At  
0 termination of the call, a LAMA billing record is produced indi-  
0 cating the total amount collected.

(b) Reference

Chapter 2 Traffic Criteria and Capacities

(c) Provisioning Considerations

- ( i) This feature requires Coin Detection Circuits (CDC), NT3X08AA. Provision the NT3X08AA circuits based on the following:

$$\text{CCS} = \frac{\text{Total ABSBH toll}}{\text{coin attempts}} \times \frac{\text{average receiver}}{\text{holding time}}$$

Required Look up CCS in the CCS Per Hour  
trunk = Trunk Capacity Table - (Poisson Table)  
circuits

$$\frac{\# \text{ of NT3X08AA}}{\text{circuits}} = \frac{\text{Required trunk circuits}}{8 \text{ trunk circuits per card}}$$

NOTE: The standard default value for the receiver holding time is 38 seconds.

NOTE: Assignment rules for the NT3X08AA are unaffected.

0

0 | Maximum Announcement Members per DRAM/EDRAM

0

0 | Generally, a DRAM/EDRAM can access up to 30 speech channels. Be-  
0 | cause each channel is dedicated to a specific announcement mem-  
0 | ber, this limits the number of announcement members in a  
0 | DRAM/EDRAM to 30 maximum per DRAM/EDRAM.

0 RELEASE 28.01  
0 93 12 03

## 0 Maximum Connections

0  
0 The number of simultaneous connections that can be made to an an-  
0 nouncement channel, is specified by table datafill. The maximum  
0 number of connections may be set to any number the range 1 to  
0 255. Each announcement has its own maximum number of connections  
0 specification parameter. The maximum connections setting for  
0 each broadcast announcement must be set to the minimum needed to  
0 provide the required grade of service, i.e. the minimum number  
0 of connections required to provide the required GOS (Grade Of  
0 Service) for the expected broadcast announcement traffic in the  
0 ABSBH (Average Busy Season Busy Hour).

## 0 Office Parameter Limitations

0  
0 The maximum number of simultaneous connections totalled for all  
0 announcements shall not exceed 80% of the number of CPWAKUPS de-  
0 fined in the Engineered Office Parameter (OFCENG) table. The re-  
0 commended setting for the number of CPWAKUPS is 1000 and the  
0 default setting is 80. Refer to NTP 297-1001-455, Office Parame-  
0 ters Reference Manual, Engineered Office Parameter Table OFCENG  
0 (Forms 237A, etc.) for details.

## 0 Broadcast Announcements

0  
0 Unless an announcement is unique to a subscriber a single an-  
0 nouncement member may be broadcast, by the Switch Network, to  
0 more than one subscriber for the purpose of economising in  
0 DRAM/EDRAM provisioning.

0 For each member of an announcement, table parameters define the  
0 maximum number of broadcast connections, in the range 1 to 255,  
0 which can be made. Announcement broadcasts, are made by placing  
0 copies of the announcement in the Switch Network memory in lo-

0 RELEASE 28.01  
0 93 12 03  
0

0 cations assigned to inward timeslots used for connecting the an-  
0 nouncement to subscribers. The timeslots are dynamically  
0 allocated accross all 64 ports of a Switch Network Sub Group.  
0 This means that any channel on any port has access to any  
0 timeslot. As many as 255 timeslots could be required for a single  
0 broadcast announcement. This means that a single DRAM channel  
0 could consume the timeslot memory capacity equivalent of approxi-  
0 mately 8 Switch Network ports. Refer to the section "Maximum  
0 Broadcast Connections" above.

0 To meet the required grade of service, for all features using  
0 broadcast DRAM announcements, provision must be made for suffi-  
0 cient switch network timeslot memory to be available for the es-  
0 timated number of broadcast connections required, in addition to  
0 the timeslots required for non-broadcast connections. Non-  
0 broadcast connections include connections to Switch Network ports  
0 serving peripherals other than DRAM/EDRAMSs. The technique of  
0 network port deloading is used avoid contention for timeslots and  
0 to ensure compliance with the required grade of service. Deload-  
0 ing is achieved by leaving one or more Switch Network Module  
0 ports unused.

0 To ensure effective provisioning of ports the specification of  
0 the maximum number of connections for a particular announcement  
0 is based on estimates of the corresponding feature's switch usage  
0 penetration and expected feature activation.

0 The demand for a particular announcement to be played to more  
0 than one subscriber simultaneously may be met either by having  
0 multiple members of the announcement each for connection to one  
0 subscriber at a time or by broadcasting one member to multiple  
0 subscribers. The choice of either of these alternatives depends  
0 upon sizing and traffic considerations for each DRAM/EDRAM appli-  
0 cation.

0 Some features use announcements which are assembled at the time  
0 of the call according to individual call conditions, for example,  
0 announcements containing annunciations of the number dialled by  
0 the caller. Such announcements cannot be broadcast and are pro-  
0 hibited from being broadcast by software table data.

0 RELEASE 28.01  
0 93 12 03

## 0 Announcements Using Shared Speech Fragments

0  
0 Additional economies in speech memory usage can be gained by  
0 specifying a speech fragment for use in more than one announce-  
0 ment.

## 0 Announcements Using Variable Speech Fragments

0  
0 Some DRAM application features use variable speech fragments. For  
0 example, in announcements which enunciate (voiceback) the number  
0 dialled by the caller, as in "The number you have reached NNN NNN  
0 is.....". In this example, the variable fragments represent the  
0 enunciated directory number. The speech fragment used for the  
0 variable parts of an announcement is one of a set of enunciations  
0 covering the full range of possible variable selections. For ex-  
0 ample, the set may contain representations of number enunciations  
0 from 0 to 9 with intonation variations of each number.

0 The memory space required for such variable phrases is the sum of  
0 times taken to enunciate all possible phrase alternatives.

## 0| DRAM/EDRAM to Network Sub Group (NSG) Interface Limitation

0  
0| For traffic considerations, the number of DRAM/ECMs which may be  
0| connected to a single Network Sub Group is limited to one (1).

0 5.0 Enhanced DRAM (EDRAM)

0 1.1.1 The Enhanced Digital Recorded Announcement Machine (EDRAM) is  
0 a single slot circuit pack DMS peripheral module used for provid-  
0 ing voice messages or instructions to the subscriber, thus reduc-  
0 ing the need for an operator's assistance. Announcements are  
0 stored in digital format in memory using PCM coding so as to al-  
0 low fast and random access of announcements, both in playback or  
0 recording stages.

0 The EDRAM card will replace the existing Digital Recorded An-  
0 nouncement (DRA) Module for providing voice messages and recorded  
0 announcements in all DMS-100 Family switches.

0 The EDRAM provides the equivalent functions and capabilities of  
0 the existing Digital Recorded Announcement (DRA) Module; i.e.  
0 exactly the same duration of announcement time as for the DRA  
0 (4.3 minutes) and 30 announcement channels for announcement  
0 playback/recording.

0 The EDRAM is a stand alone peripheral module (PM), having its own  
0 DS-30 link interface with the network (i.e. each EDRAM requires  
0 one (1) DS-30 network port appearance on the network). It can be  
0 plugged into one (1) of the twelve (12) provisionable trunk card  
0 slots on the MTM/DRA shelf. The DS-30 cable for EDRAM is plugged  
0 directly into the backplane pins at the back of the shelf corre-  
0 sponding to the slot of the EDRAM.

0 Although the EDRAM can mount onto existing DRA shelves, no new  
0 DRA shelves should be ordered. For new and existing offices,  
0 provision only MTM shelves to mount the EDRAM.

0 1.1.2 The current DRA Module consists of the DRA shelf and circuit  
0 packs. The DRA shelf is a modified version of the Maintenance  
0 Trunk Module (MTM). It must be equipped with the appropriate MTM  
0 controller circuit packs and power converter circuit packs to  
0 provide the basic MTM functions.

0 The announcement functions are provided by the provisionable DRA  
0 controller and announcement cards. Each DRA Module consists of a  
0 DRA controller card (NT1X75\_\_) and up to eight (8) single density  
0 or four double density provisionable announcement memory cards.  
0 Each single density memory card provides 30 seconds of announce-  
0 ment capacity; each double density memory card provides 60 sec-  
0 onds of announcement capacity.

0 - NT1X75BA - DRA controller card

0 RELEASE 28.01  
0 93 12 03  
0

0 - NT1X76XX - contains standard factory programmed announce-  
0 ments in non-alterable memories (EPROM). The announcements  
0 are identified by the "XX" PEC code suffix and these an-  
0 nouncements cannot be altered.

0 - NT1X77AA - provides storage for on-site customer recorded  
0 announcements in volatile memory (RAM).

0 - NT1X79AA - provides storage for on-site customer recorded  
0 announcements in non-volatile memory (EEPROM).

0 Each fully equipped DRA Module provides 30 announcement channels  
0 and 4 minutes of announcement time.

0 The single card slot EDRAM Module is equivalent to a fully  
0 equipped DRA Module.

0 1.1.3 The EDRAM will provide a super-set of features that include or  
0 is equivalent to all existing features of the DRA shelf. The  
0 features can be categorized into the following areas:

- 0 -Loader features
- 0 -MTM features
- 0 -DRA features

0 The loader will download the EDRAM application firmware load, and  
0 the specified announcement load from the DMS tape/disk to the  
0 EDRAM memory.

0 The loader will provide management of announcement files. Up to  
0 a maximum of any eight (8) single density announcement files or  
0 four (4) double density announcement files can be loaded to a  
0 specified EDRAM. Each announcement file corresponds to a version  
0 of NT1X76 card. Hence, announcements no longer need to be iden-  
0 tified by the NT1X76 DRA EPROM PEC code. The factory recorded  
0 announcements on the NT1X76 DRA EPROM cards are replaced with an-  
0 nouncement files on DMS tape that can be downloaded to the EDRAM.  
0 This provides the flexibility of changing announcements at any  
0 time without retrofitting the DRA EPROM cards which contain fac-  
0 tory programmed announcements.

0 The EDRAM will emulate the Maintenance Trunk Module (MTM) fea-  
0 tures required for DRA applications, which includes:

- 0 -Loading and executing PM EXECs
- 0 -Setting up speech connections needed for call processing

0 RELEASE 28.01  
0 93 12 03  
0

- 0 -Performing PM sanity functions such as sending Who-Am-I, I-Am-Here messages to Central Control (CC)
- 0 -Network integrity and parity generation/checking
- 0 -Perform CC instructions through CC-PP primitives execution and handle command protocol violation checking
- 0 -PM load checksum tests.

0 The EDRAM will emulate all existing required DRA features, which includes:  
0

- 0 -On site recording of announcements
- 0 -Playing announcements
- 0 -Configuration query
- 0 -Trunk level diagnostics.

0 | NOTE: One EDRAM CP will provide the same functionality and capacity as one DRA shelf with NT1X76 PROM memory and NT1X77 RAM memory, but not the functionality of NT1X79 non volatile memory since the EDRAM memory is volatile. The functionality of NT1X79 non volatile memory will be provided by EDRAM in BCS-36 with the Feature No. AQ0984 - EDRAM Announcement Up-loading. Until BCS-36, a manual action is required to restore Customer recorded announcements lost due to MTM power converter failure. As an option, on Customer request, non volatile memory NT1X79 can be specified. When the NT1X79 is specified, the DRA shelf is still required and used for NT1X79 only. The first DRA shelf should be fully equipped with NT1X79 CPs before using the next DRA shelf.

0 1.1.4 The EDRAM is a second generation DRA circuit pack. It introduces the concept of a single circuit pack Peripheral Module (PM) which has the dual appearance as a PM as well as a trunk. Although it is located on an MTM/DRA shelf, it is directly connected to the network through a DS-30 link. Hence, it will have two (2) Maintenance & Administration Position (MAP) appearances on the same hardware. It will appear as a PM, just like the MTM/DRA, since it is directly connected to the network, and it will also appear as a trunk, just like other provisionable trunk cards on the MTM/DRA, since it mounts on the MTM/DRA.

0 The EDRAM has its own pair of DS-30 links for connecting to both planes of the Network Module (NM), and communicates with the Central Control/Central Message Controller (CC/CMC) directly via the message channel of this DS-30 link.

0 It is to be plugged into any one of the twelve (12) provisionable trunk slots of the MTM/DRA shelf and uses this shelf for the purposes of housing, logic power, and cable mounting. When all  
0 |

0  
0 RELEASE 28.01  
0 93 12 03

0 twelve (12) slots are equipped with EDRAM cards, the maximum  
0 power dissipation limit of 110 watts per MTM/DRA shelf is not ex-  
0 ceeded.

0 The DS-30 cable for the EDRAM can be plugged directly into the  
0 pins at the back of the MTM/DRA backplane at the slot correspond-  
0 ing to the position of the EDRAM. The other end of the DS-30 ca-  
0 ble is terminated at the Peripheral Speech Link (PSL) Panel  
0 mounted on the Speech Link Connecting (SLC) Frame or at the En-  
0 hanced Network (ENET) depending on office requirements.

0 5.1.2 HARDWARE DEPENDENCIES

0

0 None

0 5.1.3 PROVISIONING CONSIDERATIONS

0

0 2.4.1 The EDRAM will be provisioned using the same provisioning  
0 rules as for the existing DRA Module as given in the Engineering  
0 Manual and NTP 297-1001-450 entitled DMS-100 Family Provisioning.

0 The EDRAM Module provides 30 announcement channels and 4.3 min-  
0 utes of announcement time for announcement playback/recording.

0 For each DMS office, provision the number of EDRAM as required to  
0 accommodate the standard announcements.

0 Depending on the optional recorded announcement features ordered  
0 by the Customer for his office, provision additional EDRAM Mod-  
0 ules as required. The optional features are: Auxiliary Operator  
0 Service System Voice Response (AOSS VR), Custom Charge Calling  
0 (CCC), Automatic Coin Toll Service (ACTS), Mechanized Calling  
0 Card Service (MCCS), and Automatic Intercept Service (AIS). Since  
0 each of the preceding features requires all 30 announcement chan-  
0 nels of the EDRAM, each feature requires an exclusive EDRAM Mod-

0

0

0 RELEASE 28.01  
0 93 12 03

0       ule that cannot be used for other announcements. For further  
0 information, refer to Section 1.3 Cross-Reference Publications.

0       Other optional features that need additional announcements are  
0 Call Forward Remote Activation (CFRA) in BCS-28, Custom Local  
0 Area Signalling Services (CLASS) features Phase I in BCS-28, and  
0 CLASS features Phase II in BCS-30. For further information, re-  
0 fer to ECM-473 on subject Residential Enhanced Services and  
0 ECM-332 on subject CLASS - U.S./CMS - Canada.

0 2.4.2 As a Customer requested option, each EDRAM may be duplicated  
0 for reliability. It is mostly needed for toll offices where it  
0 is important to get the message sent to the subscriber.

0 2.4.3 The EDRAM card is to be inserted into one (1) of the twelve  
0 (12) provisionable trunk card slots of the MTM/DRA shelf. When  
0 all twelve (12) slots are equipped with EDRAM cards, the maximum  
0 power dissipation limit of 110 watts per MTM/DRA shelf is not ex-  
0 ceeded. It derives +5V power from the shelf power converter  
0 (NT2X70), but otherwise, it is independent of the MTM/DRA shelf.

0       Although the EDRAM can mount onto existing DRA shelves, no new  
0 DRA shelves should be ordered. For new and existing offices,  
0 provision only MTM shelves to mount the EDRAM.

0 |       Each EDRAM requires one (1) DS-30 network port appearance on the  
0 network. Each DS-30 network port (link) has 32 channels; 30  
0 voice channels, channel 0 as the message channel, and channel 16  
0 is not used.

0       The EDRAM has its own pair of DS-30 links for connecting to both  
0 planes of the Network Module (NM), and communicates with the Cen-  
0 tral Control/Central Message Controller (CC/CMC) directly via the  
0 message channel of this DS-30 link.

0       The DS-30 cable for the EDRAM can be plugged directly into the  
0 pins at the back of the MTM/DRA backplane at the slot correspond-  
0 ing to the position of the EDRAM. The other end of the DS-30 ca-  
0 ble is terminated at the Peripheral Speech Link (PSL) Panel  
0 mounted on the Speech Link Connecting (SLC) Frame or at the En-  
0 hanced Network (ENET) depending on office requirements.

#### 0 | 2.4.4 VOICE FILE INSTALLATION

0 |       Each EDRAM can be loaded with different voice files controlled by  
0 the voice file names datafilled in the EDRAMINV table. The voice  
0 files can be loaded directly into the EDRAM from the tapes in

0 RELEASE 28.01  
0 93 12 03  
0

0 most situations. Loading EDRAM from tape will increase the load-  
0 ing time because additional time is needed to scan the tape to  
0 locate the specified file, and this scanning time may be as long  
0 as 20 minutes for each file. As the worst case loading and in-  
0 itialization time of the EDRAM (4 double density voice file) is  
0 only 16 minutes, the total tape scanning time may significantly  
0 exceed the actual file loading time.

0 The tape scanning time for an office may be reduced by creating a  
0 voice tape and by copying the voice files to the tape in the same  
0 sequence as the files to be loaded into the EDRAM.

0 For the purpose of reducing EDRAM loading time and to eliminate  
0 the manual activity needed for mounting the tapes, it is recom-  
0 mended to copy all the needed voice files to the disk and to load  
0 EDRAM from the disk.

0 SITUATIONS REQUIRING VOICE FILE LOADING FROM DISK

0 There are situations where the voice files must be loaded via the  
0 DMS IOC Disk or SLM disk, rather than from the voice tapes di-  
0 rectly. The procedure to copy files from SLM tape to SLM disk is  
0 described in NTP 5001-503 and 5001-523. These are the following  
0 situations:

0 \* SuperNode office that does not have a tape drive and the  
0 voice files are delivered on a SLM tape. Like the other pe-  
0 ripheral loads, voice files cannot be loaded from SLM tape to  
0 the EDRAM directly.

0 In this case, the office has to allocate SLM disk space large  
0 enough to hold the needed voice files. Refer to section on  
0 DISK SPACE REQUIREMENTS to find out the size of each file.

0 \* Voice files to be loaded to the same EDRAM are split onto two  
0 (2) different tapes, and the office has only one tape drive.  
0 The likely situation would be bilingual offices (French &  
0 English) that would require AOSS, ACCS Standard and CLASS  
0 phase 1, where voice files from the English tape and the  
0 French tape are to be loaded to the same EDRAM.

0 The office may use one of the following approaches:

- 0 1. Copy all the needed voice files to disk and load from disk.
- 0 2. Copy the needed voice files on one tape to the disk, and load  
0 the EDRAM from both tape and disk.

0  
0 RELEASE 28.01  
0 93 12 03

0 | 3. Make their own voice tape by copying the needed voice files  
0 | to the same tape in the proper sequence, and by loading from  
0 | this tape.

0 | DISK SPACE REQUIREMENTS

0 | The voice files can be copied from SLM tape to the SLM disk. The  
0 | disk space required can be calculated by adding up the size of  
0 | all the required voice files. The following table summarizes the  
0 | disk space requirement versus the feature and language.

## 0 MECHANICAL DIMENSIONS

0 Height 12.50 in. (317.5 mm)

0 Width 1.125 in. (29 mm)

0 Depth 10.00 in. (254 mm)

0 | Power 9.0 Watts (from +5V logic power)

0 The circuit pack can mount onto one (1) of the twelve (12)  
0 provisionable trunk slots in MTM/DRA shelves. It derives +5V  
0 power from the shelf power converter (NT2X70), but otherwise, it  
0 is independent of the MTM/DRA shelf.  
0

0 | NOTE: One EDRAM CP will provide the same functionality and ca-  
0 pacity as one DRA shelf with NT1X76 PROM memory and NT1X77 RAM  
0 memory, but not the functionality of NT1X79 non volatile memory  
0 since the EDRAM memory is volatile. The functionality of NT1X79  
0 non volatile memory will be provided by EDRAM in BCS-36 with the  
0 Feature No. AQ0984 - EDRAM Announcement Up-loading. Until BCS-36,  
0 a manual action is required to restore Customer recorded  
0 announcements lost due to MTM power converter failure. As an op-  
0 tion, on Customer request, non volatile memory NT1X79 can be  
0 specified. When the NT1X79 is specified, the DRA shelf is still  
0 required and used for NT1X79 only. The first DRA shelf should be  
0 fully equipped with NT1X79 CPs before using the next DRA shelf.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 5.2.2 EMI/EARTHQUAKE INFORMATION

0

## 0 EMI/FCC

0  
0 The EDRAM card will comply with EMI requirements as defined by  
0 FCC Rules and Regulations Class A Part 15 Subpart J, when  
0 equipped in a Streamline cabinet.

0 | The introduction of EDRAM will not increase measured EMI emis-  
0 sions on a system level, compared with an equivalent system using  
0 DRAs.

## 0 ESD

0  
0 The EDRAM card will withstand up to 15KV ESD discharge on the  
0 face panel without causing permanent damage to or corruption of  
0 the application/announcement load.

## 0 UL/CSA

0  
0 The EDRAM card will conform to DMS-100 regulatory and safety re-  
0 quirements as specified by CSA or UL. Grounding will comply with  
0 the Isolated System Grounding Rules.

0 5.2.3 SPARING INFORMATION

0  
0 The Mean Time Between Failure (MTBF) of NT1X80AA is 53 years at  
0 40 degrees Celsius.

0 5.3 SOFTWARE PROVISIONING

0

0 5.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0 |

0 The EDRAM application firmware is downloaded from the DMS  
0 tape/disk to the program store segment of the EDRAM on board mem-  
0 ory. The announcement data is sectionalized into eight (8) data  
0 files, each file corresponding to one (1) version of an NT1X76  
0 board. These are also downloaded from DMS tape to the Data Store  
0 segment of the EDRAM on board memory. The EDRAM Firmware Load  
0 and a super-set of all the announcement Load files will reside on  
0 the DMS PM Load tape. These Loads will be released and updated  
0 with the regular BCS release schedule.

0 | The following list is the available provisionable EDRAM Voice  
0 | Files:

0 | NTG301AA EDRAM Voice Files: English Standard

0 | NTXN16AA Enhanced DRAM

0 | NTG305AA EDRAM Voice Files: Superset for SLM 2 Tape

0 | Prerequisites:

0 | NTXN16AA Enhanced DRAM,

0 | NTX942AA DMS - SuperNode System Load Module (SLM) (UPG. by

0 | NTX942AB) or NTX942AB DMS - SuperNode System Load Module (SLM)

0 | (UPG. from NTX942AA)

0 | For BCS-34/35 timeframe, the EDRAM Voice Files are available in  
0 | Canada and Puerto Rico only.

#### 0 5.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 Not applicable.

#### 0 5.3.3 MEMORY PROVISIONING

0  
0 The addition of this peripheral module should have minimal impact  
0 on memory provisioning. Refer to the normal memory algorithms.

#### 0 5.4 REAL TIME IMPACT

0 The loading of this peripheral module will not impact any of the  
0 CPU usage since this new PM will take the same time to load as  
0 the present XPMs.

0 All of the maintenance actions will take the same amount of time  
0 as the ones for the XPMs.

0 Refer to the normal real time algorithms.

0 1.0 Building Block Engineering of MAP

0 The Maintenance Administration Position (MAP) is for the DMS-100 Fam-  
0 ily of switching equipment. Described in the MAP is furniture, jacks,  
0 logic phone, connector blocks, Keyboard Send and Receive (KSR)  
0 Printer, and Video Display Unit (VDU). Optional equipment provisioned  
0 in support of the MAP includes Key Systems and Alarm Panels.

0 1.1.3 PROVISIONING CONSIDERATIONS

0  
0 Maintenance Administration Position (MAP)

0 The Maintenance Administration Position building block concept  
0 deals with a higher level of Product Engineering Code (PEC) or-  
0 dering and simplifies the engineering ordering process. The MAP  
0 provides the man to machine interface for the DMS-100F switching  
0 systems. Each MAP includes the center, shelf, and counter  
0 sections. Optionally a VDU, KSR, Key System, and Lamarche  
0 Inverter can be selected.

0 TPC Administration and Maintenance Interface (TAMI)

0 The TAMI position equipment may be customer supplied. The recom-  
0 mended VDU is a VT100 compatible terminal. The VT100 compatible  
0 terminals available from NT are the DEC VT-420, DEC VT-340, and  
0 the HP 700/44.

0 The printer for the TAMI position may also be required. The  
0 printers which are available from NT (and compatible with the  
0 VT-340 and the VT-420) are the DEC LA75S and the DEC LA424.

0 | DATAPHON (Data Phones / Telephone Sets)

0

0 RELEASE 28.01  
0 93 12 03  
0

0 Data Phones are used in various Data Phone applications such as  
0 in ETAS. With the introduction of modems with auto-dialers, the  
0 requirement for data phones for use with modems has decreased,  
0 but are still in wide use.

0 NTZZ14BA (MAP Furniture with Jacks)

0 The NTZZ14BA includes the MAP furniture center section with the  
0 test trunk jack assembly, counter section, and shelf section.  
0 Optionally available to NTZZ14BA is the Camel colored MAP Chair.

0 VT-420 (Video Display Unit)

0 The VT-420 is a fully functional VDU which comes equipped with a  
0 detached keyboard. This VDU is available in amber, green, or  
0 white. Optionally available to the VT-420 is the Current Loop  
0 Adapter, Terminal Stand, and Data Cord when the VDU is used as a  
0 portable MAP VDU.

0 HP C1007 (HP 700/44) Amber/Green/White (Video Display Unit)

0 The existing NTZZ14JA VDU is MD effective immediately and re-  
0 placed by the three new HP units. The HP 700/44 VDU is available  
0 in amber, green, and white, and is equipped with keyboard. This  
0 VDU is able to perform as the primary MAP VDU, the portable MAP  
0 VDU, and/or as the Remote Terminal (RTIF) for SuperNode applica-  
0 tions. Options to HP C1007 include a terminal stand with casters  
0 and a data cord for the portable MAP VDU option.

0 VT340 (Video Display Unit)

0 The VT340 Video Display Unit is a color video display unit  
0 equipped with keyboard. This VDU is provisionable for the pri-  
0 mary MAP VDU or the portable MAP VDU functions. Options to VT340  
0 include a terminal stand with casters and a data cord for the  
0 portable MAP VDU option.

0 NTZZ14EB LA75+ (MAP Printer (Read-Only))

0 The DEC LA75+ is a complete printer configured for EIA operation.  
0 Options available are a Printer Stand / Paper Catcher, Ribbon  
0 Cartridge, an RS-232 Connection Adapter, a 20MA current loop  
0 adapter, and slave cables.

0 The NTZZ14EB (DEC LA75+) has the following options always pro-  
0 vided: LA75S printer, Printer Stand / Paper Catcher, RS232 Con-  
0 nection adapter, Dec Ribbon Cartridge, and the 20MA current loop

0 RELEASE 28.01  
0 93 12 03  
0

0 adapter. The only option that is provisionable are the slave ca-  
0 bles.

0 NTZZ14EC LA424 (MAP Printer (Read-Only))

0 The DEC LA424 is a complete printer configured for EIA operation.  
0 Options available are a Printer Stand / Paper Catcher, Ribbon  
0 Cartridge, an RS-232 Connection Adapter, a 20MA current loop  
0 adapter, and slave cables.

0 The NTZZ14EC (DEC LA424) has the following options always pro-  
0 vided: LA424 Printer, Printer Stand / Paper Catcher, RS232 Con-  
0 nection adapter, Dec Ribbon Cartridge, and the 20MA current loop  
0 adapter. The only option that is provisionable are the slave ca-  
0 bles.

0 NTZX18AB (Norstar Digital Key Service Module)

0 The NTZX18AB includes the Ash colored Norstar digital Key Service  
0 Module configured to access up to 20 central office lines. In-  
0 cluded is the technical reference set, power supplies, ring gen-  
0 erators and associated required equipment to make a fully  
0 functional key system. The M7234 ash telset and headset are pro-  
0 vided plus one Unity I telset for use as an emergency telephone  
0 (ET). Also, additional Norstar telsets may be provisioned via  
0 conventional methods. The NorStar unit can be provided for ini-  
0 tial jobs as well as extensions.

0 NTZZ14GA (TCS1800 key system)

0 The NTZZ14GA includes the 1A2 Key System requirements. Included  
0 in the building block model is 10 line cards and shelf, 20hz  
0 ringing generators, customer manual, key light transformer, and  
0 fuses. The KSM cross-connection will be direct to the MDF and  
0 not via a BIX module. The NTZZ14GA should be provided only for  
0 extensions to existing jobs which already have this equipment on  
0 site, provide based on the availability of this equipment.

0 NTZZ14HA (LaMarche 500 Watt Inverter)

0 The NTZZ14HA provides one 500 Watt LaMarche Inverter for pro-  
0 tected AC power. Included in the building block model is the  
0 inverter and the direct powering label. This unit will terminate  
0 up to four units with a total maximum power requirement of 500  
0 Watts. The isolation kits must be provisioned separately for of-  
0 fices, and/or modem frames.

0 NORTHERN TELECOM  
0  
0

RELEASE 28.01  
93 12 03

PRACTICE 297-1001-450

0 NOTE: Alarms will be selected as required based on site specific  
0 needs based on conventional product engineering code ordering.

## 0 1.0 Host - Miscellaneous Equipment

0 1.1 Equipment Provisioning0 1.1.1 Miscellaneous TOPS Equipment0 (a) General Description

0 The following miscellaneous TOPS equipment is provisionable in a  
0 TOPS office:

- 0 - Three Port Conference Circuits
- 0 - Digital Modems
- 0 - Attenuator Pads
- 0 - Interface Circuits
- 0 - Headsets and Chairs

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules - Host  
0 Section 3.9 DMS Supernode and Network Subsystems

0 (c) Provisioning Considerations

## 0 ( i) Three Port Conference Circuits (NT1X31AA or NT3X67AA)

0 One Three Port Conference circuit is required for each  
0 TOPS position including In-charge and Assistance. In ad-  
0 dition to this, the conference circuits have to be provi-  
0 sioned for the following functions:

- 0 - service analysis
- 0 - monitor function
- 0 - connections to in-charge/assistance  
0 position for assistance function

0 Since AOSS positions are required to forward calls to  
0 other locations only in the event of emergency calls,  
0 calls to a distant assistance centre, calls for language  
0 assistance or calls to the AOSS Assistance Position and  
0 In-Charge Position, provide a quantity of 3-Port Confer-  
0 ence circuits equal to 10% of the total number of AOSS  
0 positions. There should be a minimum of two (2) per  
0 traffic office.

0 RELEASE 28.01  
0 93 12 03  
0

0 Generally it is the responsibility of the telephone com-  
0 pany to provision the conference circuits for their re-  
0 quirements; i.e. monitor, service analysis etc.

0 If the Telco does not provision the additional conference  
0 circuits required for the above functions, the Northern  
0 Telecom Job Engineer will provide 5% additional confer-  
0 ence circuits for the above mentioned functions.

0 For further information, see Peripheral Modules - Host,  
0 Section 3.5 of this NTP.

0 ( ii) TOPS Digital Modem (NT3X02AA, NT3X03AA)

0 One TOPS control Processor Circuit, NT3X02AA and one TOPS  
0 Digital Signal Processor Circuit, NT3X03AA are required  
0 for each TOPS/AOSS position and TOPS/AOSS TTY.

0 (NOTE: THIS IS NOT REQUIRED FOR THE SNAC TTY)

0 (a) TOPS offices should have a maximum of four pairs  
0 (NT3X02AA, NT3X03AA) of Digital Modem cards per MTM,  
0 providing a maximum of 16 modem circuits per MTM.

0 (b) Combined IBN/TOPS offices should have a maximum of  
0 two pairs (NT3X02AA, NT3X03AA) of digital modem cards  
0 per MTM, providing a maximum of eight circuits per  
0 MTM.

0 (c) In each case modem cards should be spread evenly  
0 across all MTMs to ensure reliability.

0 MBS offices and combined MBS/TOPS offices should have  
0 a maximum of two pairs (NT3X02AA, NT3X03AA) of dig-  
0 ital modem cards per MTM, providing a maximum of 8  
0 modem circuits per MTM.

0 A common pool of spares provisioned at 5% of require-  
0 ments is recommended for hot standby purposes.

0 In each case it is preferred to spread the modem card  
0 pairs evenly across all MTMs to ensure reliability.

0 ( iii) Synchronizable offices equipped with TOPS consoles must  
0 have the NT3X14BC Synchronizable Master Clock Counter  
0 equipped on the CCC frame. If the office is equipped  
0 with an earlier vintage NT3X14 circuit pack, it must be

0 RELEASE 28.01  
0 93 12 03  
0

0 retrofit with a NT3X14BC when the TOPS extension is ap-  
0 plied.

0 For further information, refer to Central Control Complex  
0 of DMS SuperNode and Network Subsystems, Section 3.9 of  
0 this NTP.

0 ( iv) Attenuator Pads are not required for the TOPS MP. Five  
0 attenuator pads are required for each TOPS/AOSS control-  
0 ler unit including any spare controller unit provided.  
0 The four attenuator pad values in the voice transmit and  
0 receive paths of the controller are headset dependent.  
0 For the Venture headset, the attenuator pads total 7 dB  
0 for both receive and transmit; i.e. one pair (coarse and  
0 fine) for the voice transmit connector and one pair for  
0 the voice receive connector. For all other headsets re-  
0 fer to NTP 298-1271-102 Trunking Transmission Guidelines  
0 for the pad value.

0 ( v) TOPS/AOSS Position Interface Circuits

0 Two trunk circuits, digital (i.e. NT6X50AA for DTC or  
0 LTC; NT6X27AA for ITOPS or NT2X35AB for DCM) or analog  
0 (NT2X72AA) are required for each TOPS/AOSS position (with  
0 the exception of the Force Management position which re-  
0 quires only one trunk circuit). The Telco shall decide  
0 whether to order digital or analog trunks.

0 ( vi) TOPS/AOSS TTY Interface Circuits

0 One trunk circuit, digital (i.e. NT6X50AA for DTC or LTC;  
0 NT6X27AA for ITOPS or NT2X35AB for DCM) or analog  
0 (NT2X72AA) is required for each TOPS TTY (with the excep-  
0 tion of the SNAC TTY which requires one I/O port appear-  
0 ance instead). The Telco shall decide whether to order  
0 digital or analog trunks. Each trunk is connected to one  
0 digital modem. The Telco must ensure that the corre-  
0 sponding modem exists at the TTY end.

0 The Switching Network Analysis Centre (SNAC) TTY requires  
0 an I/O port interface.

0 ( vii) The following headsets are available for U.S. applica-  
0 tions as required by the customer:

0 A0319420 Omnidir headset eartip type  
0 A0319015 Omnidir headset earbud type

0 RELEASE 28.01  
0 93 12 03  
0

0 A0319421 Omnidir noise cancelling eartip type  
0 A0319016 Omnidir nose cancelling earbud type

0 The four (4) headsets listed above for U.S. application  
0 are being reclassified and their status should be checked  
0 before ordering. The replacement headset is the  
0 Plantronics Starmate E-Plus Model MH053-1 (TEA01040).

0 The following headsets are available for Canadian appli-  
0 cations as required by the customer:

0 A0242363 Standard Headset QSR2F1  
0 A0242365 Headset e/w 10 ft cord QSR2G1  
0 A0242367 Supervisory Headset e/w 10 ft cord  
0 QSR2H1

0 (viii) The following chairs are available as required by the  
0 customer:

0 OS301/4435 Dark Orange Chair w/o Arms  
0 A0286466 Dark Orange Chair with Arms  
0 OS301/4462 Dark Emerald Chair w/o Arms  
0 OS302/4462 Dark Emerald Chair with Arms  
0 OS301/4436 Crimson Chair w/o Arms  
0 C0057911 Crimson Chair with Arms  
0 OS301/4441 Blue Chair w/o Arms  
0 OS302/4441 Blue Chair with Arms  
0 OS301/4447 Camel Chair w/o Arms  
0 A0288174 Camel Chair with Arms  
0 C0058480 Brown Chair w/o Arms  
0 C0057448 Brown Chair with Arms

0 1.1.2 Meridian Business Services Miscellaneous

0 (a) General Description

0 Detailed below are several miscellaneous provisioning consider-  
0 ations for MBS offices.

0 (b) References

0 Chapter 3, Section 3.9 DMS Supernode and Network Subsystem

0 (c) Provisioning Considerations

0 ( i) All DMS-100 and SL-100 Canadian systems with Meridian  
0 Business Services software are to order a CS03-1315 DOC  
0 Certification Sticker which shows that offices have met  
0 Government of Canada Department of Communications CS03  
0 standards for PBX applications.

0 The CPC code for the sticker is: P0663265.

0 Only one sticker per system is to be ordered. It will go  
0 on the FSP panel of the CCC and will not obscure any ex-  
0 isting labels, logos or indicators.

0 ( ii) Offices equipped with Meridian Business Services should  
0 have a maximum of two pairs (NT3X02AA, NT3X03AA) of dig-  
0 ital modem cards per MTM, providing a maximum of eight  
0 modem circuits per MTM.

0 ( iii) Synchronizable offices equipped with MBS consoles must  
0 have the NT3X14BC Synchronizable Master Clock Counter  
0 equipped on the CCC frame. If the office is equipped  
0 with an earlier vintage NT3X14 circuit pack, it must be  
0 retrofit with a NT3X14BC when the MBS extension is ap-  
0 plied.

0 For further information, refer to Central Control Complex  
0 of DMS SuperNode and Network Subsystems, Section 3.9 of  
0 this NTP.

0 RELEASE 28.01  
0 93 12 03

0 1.1.3 Wideband Test Access

0 a) General Description

0 The Wideband Test Access (WTA) Panel will replace the use of the  
0 Main Distributing Frame (MDF) for metallic cross-connecting of  
0 test circuits (such as the Line Test Unit/Multiline Test Unit  
0 (LTU/MTU)), Metallic Test Access (MTA), and line equipment in DMS  
0 offices.

0 The WTA Panel is a cross-connect panel which will provide the me-  
0 tallic cross-connect capability for the testing of DMS wideband  
0 subscriber services such as ISDN and Datapath as well as existing  
0 voice frequency DMS-100 subscriber services. It is mandatory for  
0 the testing of ISDN and is recommended for the testing of  
0 Datapath service. The existing MDF cabling method will not be  
0 able to support the testing of these services mainly because of  
0 the transmission impairment caused by the excessive switching of-  
0 fice cabling.

0 This method of cross-connecting office wiring for the test cir-  
0 cuits, MTA, and test access cables will drastically reduce the  
0 amount of office cabling resulting from the existing MDF method.

0 This panel will mount on the Miscellaneous Equipment (MIS) Frame  
0 NT0X02AB. With the panel mounted on an MIS frame within the DMS  
0 equipment frame lineups, all the cabling to the MDF will be elim-  
0 inated and this will result in much shorter office wiring for the  
0 testing of subscriber services.

0 b) References

0 c) Provisioning Considerations:

0 ( i) The Wideband Test Access (WTA) Panel will replace the use  
0 of the Main Distributing Frame (MDF) for metallic cross-  
0 connecting of test circuits (such as the Line Test  
0 Unit/Multiline Test Unit (LTU/MTU)), Metallic Test Access  
0 (MTA), and line equipment in DMS offices.

0 The WTA Panel is a cross-connect panel which will provide  
0 the metallic cross-connect capability for the testing of  
0 DMS wideband subscriber services such as ISDN and  
0 Datapath as well as existing voice frequency DMS-100 sub-  
0 scriber services. It is mandatory for the testing of  
0 ISDN and is recommended for the testing of Datapath ser-

0 RELEASE 28.01  
0 93 12 03  
0

0 vice. The existing MDF cabling method will not be able  
0 to support the testing of these services mainly because  
0 of the transmission impairment caused by the excessive  
0 switching office cabling.

0 This method of cross-connecting office wiring for the  
0 test circuits, MTA, and test access cables will dras-  
0 tically reduce the amount of office cabling resulting  
0 from the existing MDF method.

0 ( ii) There are two (2) versions of the WTA Panel:

0 NT7X76AA WTA Panel

0 NT7X76BA WTA Panel (Dedicated LTU/MTU)

0 NT7X76AA will allow the cross-connection of up to 30  
0 NT3X09BA MTA circuits in a matrix of three (3) horizontal  
0 NT3X09BA rows by ten (10) vertical NT3X09BA columns. This  
0 is equivalent to the cross-connection of 24 horizontal  
0 test appearances to 80 vertical appearances. The NT3X09BA  
0 card has 8 horizontals and 8 verticals.

0 NT7X76AA will allow the cross-connection of up to 30  
0 NT3X09AA MTA circuits in a matrix of three (3) horizontal  
0 NT3X09AA rows by ten (10) vertical NT3X09AA columns. This  
0 is equivalent to the cross-connection of 24 horizontal  
0 test appearances to 40 vertical appearances. The NT3X09AA  
0 card has 8 horizontals and 4 verticals.

0 NT7X76BA is similar to NT7X76AA with one exception. The  
0 first horizontal test appearance of the 24 horizontal  
0 test appearances of the NT7X76BA panel is grouped into  
0 five (5) subgroups, each with two (2) horizontal 0's and  
0 16 verticals (if NT3X09BA cards are used for cross-  
0 connection purposes) or 8 verticals (if NT3X09AA cards  
0 are used for cross-connection purposes). Each horizontal  
0 subgroup can have a dedicated LTU/MTU. Hence, up to five  
0 (5) dedicated LTU/MTUs can be connected to NT7X76BA. If  
0 NT3X09BA cards are used, each dedicated LTU/MTU will have  
0 access to 16 verticals or 8 Line Concentrating Modules  
0 (LCMs) within each horizontal subgroup 0. If NT3X09AA  
0 cards are used, each dedicated LTU/MTU will have access  
0 to 8 verticals or 4 LCMs within each horizontal subgroup  
0 0.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 (iii) The NT7X76AA WTA Panel will not be used for the dedicated  
0 LTU/MTU function.

0 The NT7X76BA WTA Panel (Dedicated LTU/MTU)  
0 will be used for the dedicated LTU/MTU function.

0 The NT7X76AA will also be used if the office requires  
0 more than one (1) (horizontal) row of WTA Panels or more  
0 than 24 horizontal test appearances.

- 0 (iv) The number of WTA Panels can be expanded horizontally (in  
0 rows) and/or vertically (in columns) in a matrix.

0 For offices without dedicated LTU/MTUs, only NT7X76AA  
0 would be required for expansion both horizontally and  
0 vertically.

0 For offices with dedicated LTU/MTUs, the first row of WTA  
0 Panels would be of the NT7X76BA type. If connection to  
0 more dedicated LTU/MTUs was required, NT7X76BA Panels  
0 would be used for the second row of WTA Panels. Other-  
0 wise, the NT7X76AA Panel should be used. Our current  
0 standard is to have dedicated LTU/MTUs on the first row  
0 of the matrix of WTA Panels (i.e. NT7X76BA) and not to  
0 have dedicated LTU/MTUs on the second and all subsequent  
0 rows of the matrix of WTA Panels (i.e. NT7X76AA).

- 0 ( v) The WTA Panel will replace the Intermediate Distribution  
0 Frame (IDF) for the testing of the universal SLC 96 sub-  
0 scriber loop carrier system which uses an AT&T test tool  
0 called Pair Gain Test Controller (PGTC).

0 The existing engineering rules for the use of the IDF  
0 should be applied to the use of the WTA Panel. For more  
0 information, see ECM-276 on subject 8X8 Metallic Test Ac-  
0 cess Circuit Pack, NT3X09BA.

- 0 ( vi) The WTA panel will mount on the Miscellaneous Equipment  
0 (MIS) Frame NT0X02AB. With the panel mounted on an MIS  
0 frame within the DMS equipment frame lineups, all the ca-  
0 bling to the MDF will be eliminated and this will result  
0 in much shorter office wiring for the testing of sub-  
0 scriber services.

0 For initial and extension offices requiring new MIS  
0 Frames, the WTA Panels should be mounted on standard  
0 shelf positions 65,51,32,18, and 04 first on the front

0 RELEASE 28.01  
0 93 12 03  
0

0 and then on the back of the MIS Frame. Hence, up to a  
0 maximum of ten (10) WTA Panels can be equipped on one (1)  
0 MIS Frame.

0 For ease of engineering cables, the WTA Panels will be  
0 assigned from the top position down on the MIS Frame.

0 Although a Frame Supervisory Panel (FSP) is not required  
0 for the WTA Panel, an FSP can be mounted in shelf posi-  
0 tion 45 if other devices (which can mount on the MIS  
0 Frame) require an FSP. Hence, if the MIS Frame is not  
0 fully provisioned with WTA Panels, other valid hardware  
0 units can be mounted.

0 For installation on existing MIS Frames in existing of-  
0 fices, the WTA Panels can be mounted on any available  
0 shelf position of the MIS Frame, preferably the top shelf  
0 positions.

- 0 ( vii) To minimize the office wiring required for line testing,  
0 the Maintenance Trunk Modules (MTM) that are provisioned  
0 with NT3X09AA/BA cards and LTU/MTUs should be reduced to  
0 a minimum and placed in the adjacent TME/DCE Frames next  
0 to the MIS Frames containing WTA Panels.

0 The Line Concentrating Equipment Frames (LCE) and ISDN  
0 Line Concentrating Equipment Frames (LCEI) should be  
0 clustered around the MIS Frames containing WTA Panels in  
0 order to minimize the cabling to these panels.

0 Hence, the signal loss caused by office wiring should be  
0 reduced to the minimum that is possible. The signal loss  
0 should be less than one (1) db in most offices.

0 (viii) Discrimination Numbering

0 WTA Panels NT7X76AA/BA will be numbered from 000 on up  
0 (e.g. WTA 000, WTA 001, etc.).

- 0 ( ix) For offices larger than 75,000 lines and requiring more  
0 than three (3) WTA Panels, the straight forward WTA ma-  
0 trix configuration cannot be used due to the software  
0 limitation of a maximum of 32 multiples which can be  
0 datafilled for each horizontal subgroup.

0 RELEASE 28.01  
0 93 12 03  
0

0 The way to solve this problem is to split the total num-  
0 ber of multiples into either groups of 32 (using Method  
0 1) or groups of 31 (using Method 2).

0 WTA Panel Configuration for Offices with Line Size >  
0 75,000

0 Method 1

0 Using Method 1, the multiples can be divided evenly into  
0 two (2) groups of up to 32 multiples within each group.  
0 Each WTA Panel allows the cross-connection of up to ten  
0 (10) multiples except for the fourth panel which will  
0 only have two (2) multiples. Hence, WTA Panels  
0 "B", "C", "D", and "E" will provide cross-connections for  
0 32 multiples.

0 Access to the line circuits is provided via the extended  
0 verticals of WTA Panel "A" as illustrated. Therefore, the  
0 test circuits connected to WTA Panel "A" will have access  
0 to more than 75,000 lines by using the extended vertical  
0 and horizontal connections.

0 WTA Panel Configuration for Offices with Line Size >  
0 75,000

0 Method 2

0 Using Method 2, WTA Panel "A" is connected to WTA Panel  
0 "B" in such a way as to provide for the cross-connections  
0 for the first group of 31 multiples via WTA Panels  
0 "A", "B", "C", and "D" as in a normal matrix configuration.

0 For the second group of 32 multiples via WTA Panels  
0 "F", "G", "H", and "I", the extended verticals are used.

0 Differences Between Methods 1 and 2

0 Method 1 will require one (1) more WTA Panel which is  
0 panel "E" and three (3) more NT3X09BA cards, six (6) in-  
0 stead of three (3), connected to panel "A".

0 Using Method 1, line testing involving the first and sec-  
0 ond groups of 32 multiples will be subjected to the mul-  
0 tiple cabling within the group or a maximum of 32  
0 multiple cables. Using Method 2, line testing involving  
0 the second group of 32 multiples will also involve the

0  
0 RELEASE 28.01  
0 93 12 03

0 first group of 31 multiples or will be subjected to a  
0 maximum of 63 multiple cables.

0 Generally, Method 1 would be preferred over Method 2 due  
0 to the effect on line testing. However, Method 2 may be  
0 worth considering if an LCE expansion is done properly to  
0 reduce the effect of multiple cabling on line testing.

0 93 12 03

0 1.1.4 Miscellaneous Scan Detector Card

0 a) General Description

0 Scanner circuits enable the DMS Central Control to sense the  
0 state or change of state of external equipment.

0 b) References

0 NTP 297-1001-451 DMS-100 Family Common Customer Data  
0 Schema  
0 NTP 297-2101-451 DMS-100 Local Customer Data Schema  
0 NTP 297-2181-451 DMS-100 International Customer Data  
0 Schema  
0 NTP 297-2301-451 DMS-300 Gateway Customer Data  
0 Schema  
0 Section 3.7 Office Maintenance

0 c) Provisioning Considerations:

0 ( i) Three switch selectable detector modes:

- 0 - loop detector  
0 - ground detector  
0 - battery detector

0 ( ii) Each DMS miscellaneous scan card provides fourteen scan  
0 points configured as two scan circuits known as "Scan  
0 Groups" with seven points per group. In certain applica-  
0 tions software limitations restricts a group to a spe-  
0 cific function and unused points in that group cannot be  
0 assigned to other functions.

0 ( iii) DMS supports a maximum of 1024 scan points (146 scan  
0 groups). This includes seven scan points (one scan  
0 group) associated with each standard alarm card provi-  
0 sioned:

0 NT3X82AB  
0 NT3X83AA  
0 NT3X84AA  
0 NT3X85AA

0 For more information on the Standard Alarm cards, refer  
0 to Section 3.7, Office Maintenance.

0 ( iv) Miscellaneous Scan Card is NT0X10AA. One slot per card.  
0 Mounts on MTM, OAU, RSM.

0 ( v) For alarms which require scan points, see NTP  
0 297-1001-451 DMS-100 Family Common Customer Data Schema,  
0 Section 034 Alarm Scan Group Table.

0 ( vi) For line features which require scan points, see the Scan  
0 Group Table, Section 127 in the following NTPs:

0 NTP 297-2101-451  
0 NTP 297-2141-451  
0 NTP 297-2151-451  
0 NTP 297-2181-451

0 The quantity of scan points required for line features is  
0 divided by seven (7) to determine the number of scan cir-  
0 cuits or groups required.

0 ( vii) For network management functions which require scan  
0 points, see the Network Management Scan Table, Section  
0 039 in the following NTPs:

0 NTP 297-1001-451  
0 NTP 297-2141-451  
0 NTP 297-2151-451  
0 NTP 297-2181-451  
0 NTP 297-2301-451

0 The quantity of scan points required for network manage-  
0 ment functions is divided by seven (7) to determine the  
0 number of scan circuits or groups required.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 (viii) Each A.P.C. ROTL unit, model 1066-ROTL/52A, comes  
0 equipped with two ROTL test ports.

0 One scan group (four points plus three dedicated spares)  
0 must be provided for each A.P.C. ROTL test port. Provide  
0 one additional scan point per ROTL unit if an alarm  
0 interface is required.

0 ( ix) For more information on the provisioning of Scan  
0 Points, refer to Section 3.7, Office Maintenance.

0 2.0 Frame Trim

0 2.1 Introduction

0 Trim is applied to the exterior of DMS frames to protect the  
0 equipment within, and also for esthetic reasons.

0 2.2 Features

0 Exterior frame trim includes grilles, panels and doors. Blank  
0 filler faceplates fill empty slots to prevent unintentional ac-  
0 cess to circuitry on adjacent circuit packs.

0 2.3 Equipment Provisioning

0 2.3.1 Frame Trim

0 (a) General Description

0 Basic trim items enclose the frames and provide an esthetic ap-  
0 pearance to the DMS system.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) Trim hardware consists of frame grilles, kick panels,  
0 vertical trim panels and frame doors.

0 ( ii) Door and frame trim is recommended to enhance the appear-  
0 ance of the Central Control Complex and Memory Extension  
0 frames, and to provide protection for equipment in high  
0 activity areas. Trim hardware can also be ordered for the  
0 other frames where applicable.

0 ( iii) Door and trim panels are always provided on the Power  
0 Distribution frames.

0 ( iv) Filler faceplates are provisioned to fill in unused cir-  
0 cuit pack slots.

0 ( v) Rear panels may be provided on LCE frames for esthetic  
0 purposes. They are available for U.S. applications only,  
0 are shipped loose and field installed.

0 ( vi) A Frame Supervisory Panel (FSP) Cover, part number  
0 P0673914, can be provided to protect IOE and MIS frame  
0 FSP's from foreign material. The FSP cover is placed on  
0 top of the FSP and is ventilated to allow air flow  
0 through it.

0 The FSP Cover should be provisioned for all IOE and MIS  
0 frame FSP's in all new offices. It may also be provi-  
0 sioned for existing IOE/MIS FSP's at Telco request.

0  
0 RELEASE 28.01  
0 93 12 03

### 0 3.0 Earthquake Protection

#### 0 3.1 Introduction

0 This feature is an integral part of the frame structure which  
0 minimizes damage to the DMS from earthquake vibration. The fea-  
0 ture is proven by substantial test results providing that the  
0 structure (building) where this equipment is installed meets cer-  
0 tain requirements or is upgraded to meet these requirements. The  
0 basic design is a self support system if adequate anchoring  
0 strength can be achieved from the structure.

#### 0 3.2 Features

0 The earthquake protection methodology depends on two character-  
0 istics: the mechanical construction of the building housing the  
0 DMS equipment, and the location and layout of the equipment  
0 within the building.

##### 0 3.2.1 Building Construction

0 There are several key features of a structure designed to resist  
0 earthquake damage. The floor slab thickness, weight loading on  
0 the floor, and the presence of embedded steel bar, conduit or a  
0 raised floor are important points. Recommended ceiling height  
0 and method of anchoring the DMS frames to the floor are also con-  
0 siderations.

##### 0 3.2.2 Equipment Layout

0 The size and configuration of lineups are restricted by earth-  
0 quake protection considerations. Cable and cable racking methods  
0 are modified. The position of the equipment in the building (ie.  
0 which floor it is on) further impacts the provisioning, since up-  
0 per floors are subject to more motion than lower floors during an  
0 earthquake.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 3.3 Equipment Provisioning

0 3.3.1 Building Requirements

0 (a) General Description

0 Buildings or structures should meet the local building code to  
0 resist the specified seismic load.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) The portion of the building where the equipment  
0 (DMS-100F) is to be installed should meet the local  
0 building code for housing equipment.

0 ( ii) A minimum of 3000 psi concrete compression strength is  
0 required.

0 ( iii) A steel bar reinforced floor is required, and expansion  
0 anchors are recommended.

0 For ATC Seismic Zone 4, top portion of the structure and  
0 Zone 5 to Zone 7 mid to top portion of the structure, a  
0 minimum slab thickness of 5.5 inches is necessary to pro-  
0 vide the holddown strength.

0 For all other ATC Seismic Zones, a minimum slab thickness  
0 of 4.5 inches is required.

0 For metal deck structures with concrete slab on corru-  
0 gated structural steel, the range of concrete slab thick-  
0 ness is between 3-5 inches. To achieve the embedment  
0 depth of expansion anchors, the following method is re-  
0 commended:

0 - Housekeeping pad can be utilized to provide the  
0 required slab thickness for anchors. The overall  
0 size of this pad is determined by the length of  
0 lineup including exterior panels plus a border of

0 RELEASE 28.01  
0 93 12 03  
0

0 3 inches. The thickness is dependent on the base  
0 floor thickness.

- 0 - Dowel at 12 inch spacing with a 12 x 12 grid of  
0 #4 steel bar, with the existing floor cleaned and  
0 roughened prior to casting the concrete is recom-  
0 mended. The dowels should be embedded to 2/3 of  
0 the thickness of the base slab.

- 0 ( iv) Floor loading limit for Non-Central Office installation  
0 is 100 lb/sq. ft. Limit for Central Office installation  
0 is 125 lb/sq. ft.

0 Both floor loading rates are calculated based on a floor  
0 space of 36 inches front aisle and 24 inches rear aisle.  
0 Depending on the overall static loading of the equipment  
0 and the floor space available, the above requirements  
0 could be changed accordingly.

- 0 ( v) Installation of DMS-100F on raised floor in high seismic  
0 zone is not recommended.

0 A separate structural frame to match the height of the  
0 raised floor anchored to the concrete slab should be used  
0 to mount the equipment (DMS-100F). The width of this  
0 structural frame should be larger than the DMS frames.  
0 The minimum width shall be the width of the DMS Base plus  
0 twice the height of the raised floor.

- 0 ( vi) Minimum ceiling height clearance is 10 feet and recom-  
0 mended clearance is 11 feet.

- 0 ( vii) The new NT0X25AV Common Earthquake EMIUniversal F Frame-  
0 work replaces the NT0X25AH EMI Earthquake Framework As-  
0 sembly and NT0X25AA Common Framework Assembly for  
0 Canadian applications.

- 0 (viii) NT0X25AH EMI Earthquake Framework Assembly and NT0X25AJ  
0 Earthquake Protection Mechanical Frame are required ac-  
0 cording to the provisioning table below:

0 RELEASE 28.01  
0 93 12 03

0 For all equipment except LCE frames:  
0

| Bellcore<br>Zone | ATC<br>Zone | Portion of Building Equipment is Installed |             |             |
|------------------|-------------|--------------------------------------------|-------------|-------------|
|                  |             | Ground Level                               | Mid-Section | Top Section |
| 4                | 6, 7        | E                                          | M           | M           |
| 3                | 4, 5        | E                                          | E           | M           |
| 2                | 3           | S                                          | E           | E           |
| 0, 1             | 1, 2        | S                                          | S           | S           |

0 E - NT0X25AH EMI Earthquake Framework Assembly is  
0 required. Minimum lineup is three frames,  
0 and maximum lineup is eight frames.

0 M - NT0X25AJ Earthquake Protection Mechanical  
0 Frame is required with NT0X25AH Framework As-  
0 sembly for equipment. Maximum lineup is  
0 seven frames: six NT0X25AH (three on each  
0 side of NT0X25AJ) and one NT0X25AJ.

0 S - NT0X25AA Common Framework Assembly is re-  
0 quired. No lineup restrictions.

The anchor kit is composed of:

- 1) stud
- 2) cylindrical sleeve
- 3) plastic sleeve
- 4) expansion sleeve
- 5) plug
- 6) washer
- 7) plastic bushing
- 8) load indicating washer
- 9) plain washer

RELEASE 28.01  
93 12 03

In the event that the floor where the equipment is to be installed has an additional layer of non-structural material, such as tiles, etc., on top of the structural slab, the specified anchor embedment has to be increased by the amount of this extra thickness of non-structural material. Longer anchor sleeve and stud have to be ordered as special items for such installation and the hole depth has to be specified for the installation group, if the additional layer is more than 10mm (.39 inches). It is the responsibility of the customer to inform NT Building Studies the thickness of this non-structural layer.

The specification of the anchors for use in installation without non-structural layer of more than 10mm (.39 inches) are:

| Anchor Size | Sleeve Length<br>MM(in.)<br>(A) | Stud Length<br>MM(in.)<br>(B) | Recom'd Hole Depth<br>MM(in.)<br>(C) | *<br>Min. Hole Depth | Sleeve Length above floor after setting the anchor (D)<br>MM (in.) | Torque   |
|-------------|---------------------------------|-------------------------------|--------------------------------------|----------------------|--------------------------------------------------------------------|----------|
| M16         | 44(1.7)                         | 178(7.0)                      | 120(4.7)                             | 89(3.5)              | 10(.39)                                                            | 90 ft-lb |
| M12         | 38(1.5)                         | 150(5.9)                      | 95(3.7)                              | 64(2.5)              | 10(.39)                                                            | 58 ft-lb |
| 3/8" HDK    | -                               | -                             | 40(1.56)                             | -                    | -                                                                  | 16 ft-lb |

Table 38.1

\* Only allowed for 10 percent of the holes.

(Setting torque to be 80% of the torque required)

0 RELEASE 28.01  
0 93 12 03  
0

0 Build-up of leveling shims (isolators) should not  
0 be more than 25 mm (1.00 inch) thick. The floor  
0 flatness within the lineup should not exceed 25 mm  
0 (1.00 inch).

0 The NT Building Study department is to specify the  
0 following for anchor parts ordering and installa-  
0 tion instruction:

- 0 - sleeve length (A)
- 0 - stud length (B)
- 0 - hole depth (C)
- 0 - location, size and quantity of anchors to be in-  
0 stalled
- 0 - sleeve length above floor after setting the an-  
0 chor (D)

0 For Earthquake Protection Mechanical Frame  
0 (NT0X25AJ), a quantity of 6 or 8 washers (P0661219)  
0 is required depending on the number of anchors pro-  
0 visioned. For framework assembly, (NT0X25AH), 4  
0 corner washers (P0660647) and 2 mid-washers  
0 (P0660646) are required.

0 All corner anchors are critical; they must be in-  
0 stalled. In case of the Earthquake Protection Me-  
0 chanical Frame (NT0X25AJ), all six anchors are  
0 critical.

0 Only twenty percent of the non-critical anchors per  
0 lineup is allowed to be left out for ATC Zones  
0 4,5,6 and 7 top floor application, while forty per-  
0 cent of the non-critical anchors per lineup is al-  
0 lowed to be left out for the remaining ATC zones  
0 and floor section.

0 The holes next to the corner holes on the base  
0 should be utilized if a reinforcement steel bar is  
0 encountered when drilling holes for the corner an-  
0 chors. The unused drilled holes, as a result of  
0 hitting reinforcement steel bars, should be patched  
0 up by using either epoxy or non-shrink type of  
0 grout material.

0 The rectangular washer should be sitting close to  
0 the inside edges of the base. There are two types  
0 of rectangular washers, one for the corner holes,

0 RELEASE 28.01  
0 93 12 03  
0

0 one for the middle holes. They have to be ordered  
0 on a per job basis.

0 A minimum of 2-1/2 threads above the nut after  
0 torquing is required.

- 0 ( xi) When the concrete slab is not thick enough to allow in-  
0 stallation of expansion anchors, and housekeeping pad is  
0 not a viable solution, through bolts should be utilized.  
0 This method requires access to the ceiling of the next  
0 floor below. An approval for access to the ceiling of  
0 the next floor below should be obtained from the cus-  
0 tomer.

0 A combination of washers, nuts, threaded rods and  
0 bushings is required.

| 0 | Item # | Part #   | Description            | Qty/Frame |
|---|--------|----------|------------------------|-----------|
| 0 | 1      | P0660644 | Threaded rod (M12)     | 4         |
| 0 | 2      | P0660641 | Nut                    | 8         |
| 0 | 3      | P0660638 | Washer                 | 12        |
| 0 | 4      | P0649172 | Bushing                | 4         |
| 0 | 5      | P0660647 | Rectangular Washer     | 8         |
| 0 | 6      | P0660635 | Load Indicating Washer | 4         |

0 The length of the threaded rod has to be specified  
0 by the NT Building Studies engineer for the job.

0 Only four corner bolts are required per frame. The  
0 minimum torque is 30 ft-lbs. A minimum of 2-1/2  
0 threads above the nut after torquing is required.

- 0 ( xii) Provide one isolation kit (NT0X21AK) per frame.

0 RELEASE 28.01  
0 93 12 03

0 3.3.2 Floor Plan Layout

0 (a) General Description

0 DMS equipment layout considerations are modified when earthquake  
0 protection is required.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) The maximum lineup length should not exceed 8 frames. The  
0 minimum lineup is 3 frames. Whenever an Earthquake Pro-  
0 tection Mechanical Frame (NT0X25AJ) is required, the  
0 lineup length is restricted to a maximum of 7 frames in-  
0 cluding the Earthquake Protection Mechanical Frame  
0 (NT0X25AJ). For lineups of more than 3 equipment frames  
0 and when an Earthquake Protection Mechanical Frame  
0 (NT0X25AJ) is required, the fourth equipment frame and  
0 the subsequent frames should be on the other side of the  
0 Earthquake Protection Mechanical Frame (NT0X25AJ).

0 ( ii) Gaps of 8" minimum are required between lineups in the  
0 longitudinal (side-to-side) direction. This gap should  
0 be the space between the end guards, or the shortest dis-  
0 tance between components on the end panels.

0 ( iii) DMS-100F should be at least one foot from any walls, col-  
0 umns or parts of the building such as pipes and ducts.

0 ( iv) Any foreign equipment which is not earthquake braced  
0 should be the foreign equipment height plus one foot min-  
0 imum away from DMS-100F.

0 ( v) Cables entering or leaving an equipment row must be given  
0 a minimum of 6 inches of slack to allow for relative  
0 motions between equipment rows, and a minimum of 12  
0 inches of slack to allow for relative motions between a  
0 row and foreign cable securement (e.g. pickup cable racks  
0 which are secured to the ceiling). The slack must be  
0 situated at the entry and exit points wherever there will  
0 be a change of relative motion. It is not necessary to  
0 add 12" every time a DF cable crosses a row if it does  
0 not enter that row and is, hence, independent from it.

0 RELEASE 28.01  
0 93 12 03  
0

0 ( vi) Provisionable frames should be loaded from the bottom up  
0 to keep the centre of gravity low.

0 ( vii) The frames are junctioned by six bolts; three along the  
0 top and three along the bottom. In the case of an EMI  
0 office, an EMI gasket is required at each junction. The  
0 torque required is 180 in-lbs (15 ft-lbs).

0 (viii) Shipping plates (8) are required to tie the adjacent up-  
0 rights together. Four shipping plates on the front and  
0 four at the rear of each adjacent frame. They should be  
0 evenly distributed along the upright. Six screws are re-  
0 quired for each plate.

0 ( ix) The quantity of Junctioning Kits depends on the lineup.  
0 It is the number of frames per lineup less one.

0 Code Description

0 NT0X21AX Junctioning Kit

0 ( x) If flexible MCM cable is used, strain relief on both ends  
0 (exit and entry) is required.

0 ( xi) Methods recommended in ED1241-73 for cable rack should be  
0 applied.

0 ( xii) Floor level is defined as follows:

0 Top Floor = Top 45% of the total floors.  
0 Section

0 Mid-Height = The floors below the top  
0 Section section, comprised of 25% of  
0 the total number of floors.

0 Ground Floor = Remaining stories.  
0 (Lower Height  
0 Section)

0 Note: Basement is considered as a floor.

0 For a two storey building, the second floor is top floor  
0 and the first floor is ground floor.

0 RELEASE 28.01  
0 93 12 03  
0

0 (xiii) Flexible conduit (R0044581, 3/4 inch) with a 4 inch slack  
0 should be specified for housing AC wiring. Flexible metal  
0 conduit connector (C0011730, T[B] #255) should be used  
0 for terminating flexible conduit at the square "D" ducts  
0 and gang boxes.

0 (xiv) A Frame Door must be provided for the PDC frame. Doors  
0 for the remaining frames, the end guard and trim panel  
0 assemblies are optional. Applicable PECs are:

0 NT0X21AB Frame Door  
0 NT0X73AA End Guard Assembly  
0 NT0X72AA Trim Panel Assembly

0 (xv) The following equipment should be provided as indicated:

0 NT0X21AH Frame Leveling  
0 - provide 1 per frame  
0 NT0X21AJ Frame Junctoring  
0 - provide 1 per frame join  
0 NT0X21AK Frame Isolation  
0 - provide 1 per frame  
0 NT0X21AL Frame Door Installation  
0 - provide 1 per door  
0 NT0X21AM End Guard Installation  
0 - provide 1 per NT0X73AA  
0 NT0X21AP Trim Panel Installation  
0 - provide 1 per NT0X72AA

0 (xvi) In the case of PDC to power plant cables which are  
0 normally 750 MCM, do not add slack since the cable is too  
0 large and stiff to be affected by the relative motions.  
0 When the PDC is housed in an earthquake frame (NT0X25AH),  
0 these cables must enter from the top of the frame since  
0 the base of the NT0X25AH is solid. It is strongly recom-  
0 mended that no holes be cut in the bottom of the frame as  
0 this would adversely affect the seismic performance of  
0 the frame.

0 For raised floor applications in non-earthquake regions,  
0 it is permissible for the PDC cables to enter from the  
0 bottom, but due to the large bend radius required for  
0 these cables, it is recommended that they enter from the  
0 top.

0 (xvii) The following provisioning table lists the proposed meth-  
0 ods for bracing packaged systems and indicates the seis-

0  
0 RELEASE 28.01  
0 93 12 03

0 mic zones and buildings in which they may be used. The  
0 following sections outline the specific ordering informa-  
0 tion for two of the bracing methods - side post bracing  
0 and overhead bracing.

0 Definition of Floor Level

0 Top Floor = Number of stories x 45% (rounded off to  
0 the nearest one floor down).

0 Mid-Height = Number of stories x 25% (rounded off to  
0 the nearest one floor down).

0 Ground Floor = Remaining stories.

0 Note: Basement is considered as a floor.

0 For a two storey building, the second floor is top  
0 floor and the first floor is ground floor.

0 (xviii) For all the above earthquake protection methods other  
0 than the mechanical frame method, any four anchor lo-  
0 cations are permitted.

0 ( xix) For structures with thin concrete slab on metal deck,  
0 through bolts (M12 or 1/2") have to be used in place of  
0 the anchors called out. Four bolts per frame are re-  
0 quired regardless of the number of anchors specified.

0 ( xx) Side post bracing, consisting of one post which is an-  
0 chored to the floor and the ceiling, is required at each  
0 end of a lineup. Two channels are required along the top  
0 of the frames. The individual frames are anchored to the  
0 floor or bolted to the raised floor. Following are the  
0 applicable PECs:

0 - NT0X21BF 8 Inch Side Post Assembly

0 Includes 2 complete side post assemblies. Pro-  
0 vide one per lineup up to 8 frames. For ceiling  
0 height of 11'-0" or less.

0

0

0

0 Host - Miscellaneous Equipment  
0 Chapter 19

0  
0 RELEASE 28.01  
0 93 12 03

0 - NT0X21BG 4 Inch Side Post Assembly

0 Includes 2 complete side post assemblies. Pro-  
0 vide one per lineup up to 4 frames. May be used  
0 rather than NT0X21BF for short lineup. For ceil-  
0 ing height of 11'-0" or less.

0 - NT0X21BH 8 Inch Side Post Extension  
0 Assembly

0 Provide in addition to NT0X21BF for use with  
0 ceiling height of 11'-0" to 16'-0".

0 - NT0X21BA E/Q Bracing Channel Assembly  
0 (2 frames)

0 Includes a pair of channels to tie together 2  
0 frames.

0 - NT0X21BB E/Q Bracing Channel Assembly  
0 (3 frames)

0 Includes a pair of channels to tie together 3  
0 frames.

0 - NT0X21BC E/Q Bracing Channel Assembly  
0 (4 frames)

0 Includes a pair of channels to tie together 4  
0 frames.

0 - NT0X21BD Channel Splicing Assembly

0 For frame lineups exceeding 4 frames, provide  
0 some combination of NT0X21BA, NT0X21BB and  
0 NT0X21BC joined together with channel splicing  
0 assembly NT0X21BD.

0

0

0 RELEASE 28.01  
0 93 12 03  
0

0 - NT0X21AU Frame Anchor (M10)

0 Provide 4 per frame. Any 4 anchoring locations  
0 are permitted.

0 - P0669646 Washer

0 Provide 1 per anchor.

0 - NT0X21AX Junction Kit

0 Provide 1 per frame junction.

0 ( xxi) Overhead Bracing may be used for a ceiling height of less  
0 than 5 feet from the top of the frames. It is recom-  
0 mended for short lineups with no anticipated future ex-  
0 pansion. Angle steel is used to brace the frame to the  
0 ceiling in the longitudinal and transverse directions.

0 The quantity of braces required is as follows:

| 0 | Number of | Number of           | Number of         |
|---|-----------|---------------------|-------------------|
| 0 | Frames    | Longitudinal Braces | Transverse Braces |
| 0 | 1         | 2                   | 2                 |
| 0 | 2         | 2                   | 2                 |
| 0 | 3         | 2                   | 2                 |
| 0 | 4         | 4                   | 3                 |
| 0 | 5         | 4                   | 4                 |
| 0 | 6         | 4                   | 4                 |
| 0 | 7         | 4                   | 4                 |
| 0 | 8         | 6                   | 4                 |

0 Frame channels, anchors and junctoring are provided in  
0 the same way as with side post bracing.

0 - NT0X21BE E/Q Overhead Brace Assembly

0 Includes one angle brace plus associated hard-  
0 ware. Provide one per transverse or longitudi-  
0 nal bracing point.

0 RELEASE 28.01  
0 93 12 03

0 4.0 Frame Lighting

0 4.1 Introduction

0 Lighting units can be attached to the DMS frames to illuminate  
0 equipment aisles, as an alternative or supplement to building  
0 lighting.

0 4.2 Features

0 Lighting is provided by fluorescent lamp fixtures.

0 4.3 Equipment Provisioning

0 4.3.1 Frame Lighting

0 (a) General Description

0 Standard lighting in the DMS area will be provided by frame-  
0 mounted modular units. One unit will be fastened on each side of  
0 each frame (at the top) and will contain two (2) 15 Watt lamps.  
0 Low intensity lighting, which involves the operation of only the  
0 first units at the end of each line-up, will also serve the emer-  
0 gency lighting requirements.

0 Northern Telecom is evolving to a new preferred method for pro-  
0 viding AC power within the DMS switch. The Commercial AC Free  
0 option utilizes the Center Aisle Lighting concept by placing the  
0 lights off the DMS framework and onto the Integrated Ground  
0 Plane. These lights are isolated from the DMS framework and ref-  
0 erenced to the Integrated Collector Bus (ICB). These lights will  
0 be powered by commercial AC and controlled by low voltage relays  
0 with the switches located in the new end guards introduced in  
0 this document.

0

0

0

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) One unit is fastened on the side of the frame at the top  
0 on all the frame lineups throughout the system.

0 ( ii) Feeds will be from both commercial and protected AC  
0 throughout the office. All units feature isolated  
0 ground. Product Change Kits are available to apply AC  
0 ground isolation in the field upon customer request.

0 ( iii) Product change kits to add positive-locking connectors to  
0 light fixture assemblies may be applied at the request of  
0 NT Marketing.

0 5.1 Introduction

0 5.2 Features

0 None.

0 5.3 Equipment Provisioning

0 5.3.1 End Guards

0 (a) General Description

0 End guards are vertical metal panels which cap the end of a frame  
0 lineup for aesthetic purposes, and which provide a place to mount  
0 utility power receptacles.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) AC outlets can be ordered. One dual AC utility outlet is  
0 to be located at the aisle end guards at both ends of a  
0 line-up fed from commercial AC. The exact number can  
0 only be determined after completion and approval of the  
0 floor plan.

0 ( ii) Product Change Kits are available to apply AC ground iso-  
0 lation in the field, as per customer request.

0 RELEASE 28.01  
0 93 12 03

0 6.3 Equipment Provisioning

0 6.3.1 Frame Appliance Outlets

0 (a) General Description

0 Frame appliance outlets provide AC power; they are located at the  
0 base of DMS frames.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) Order one Frame Appliance Outlet (NT0X07AA) for each bay  
0 that requires a duplex AC receptacle mounted on the bot-  
0 tom front and rear of the bay.

0 ( ii) Order one 3 Inch Grille (NT0X08AJ) per bay requiring AC  
0 outlets.

0 ( iii) A Two Foot Left Hand Powered One Tube Light Fixture As-  
0 sembly (NT0X49AD) and a Two Foot Right Hand Powered One  
0 Tube Light Fixture Assembly (NT0X49AE) must be used when  
0 providing AC at the base of the frame. The normal four  
0 foot light fixtures do not provide the necessary power  
0 distribution function.

0 ( iv) If required, one Rear Frame Door for Bay with AC Outlets  
0 (NT0X71AD) is provided per bay.

0 ( v) If required, one Front Frame Door for Bay with AC Outlets  
0 (NT0X71AE) is provided per bay. Front doors are normally  
0 provided on miscellaneous equipment (MIS) frames only.

0 ( vi) In an office with earthquake protection, the Rear Frame  
0 Door for Bay with AC Outlets (NT0X21AE) may be provided  
0 if required.

0 ( vii) The appliance outlet option can only be implemented into  
0 an initial office, or added into an extension office in  
0 which this option already exists. It is not feasible to

0  
0 RELEASE 28.01  
0 93 12 03

0 add this option into an extension office which does not  
0 already have it.

0 (viii) This option can be applied on every bay, every second  
0 bay, every third bay, etc. (if required, normally pro-  
0 vided on every third bay).

0 ( ix) This option cannot be applied on the Power Distribution  
0 Centre Frame (PDC) or the Maintenance Spare Storage (MSS)  
0 Frame.

0 ( x) Product Change Kits are available to apply the AC ground  
0 isolation feature to appliance outlets in the field, upon  
0 customer request.

0 93 12 03

0 7.0 Electrostatic Discharge (ESD) Protection

0 7.1 Introduction

0 Static electricity charges accumulate on the shoes and clothing  
0 of maintenance personnel. These can discharge to ground whenever  
0 electrical equipment is touched or handled. Equipment malfunction  
0 and even damage can result from these electrostatic discharges  
0 (ESD). Thus, maintenance personnel are equipped with devices to  
0 reduce the build-up of static charges by safely dissipating them  
0 to ground.

0 7.2 Features

0 Electrically conductive floor mats and wrist straps are used to  
0 protect DMS equipment from ESD.

0

0

0 7.3 Equipment Provisioning

0 7.3.1 ESD Mats

0 (a) General Description

0 ESD Mats conduct electric charges which have accumulated on main-  
0 tenance personnel away from the DMS equipment.

0 (b) References

0 NTP 297-1001-010 Electrostatic Discharge  
0 Protection

0 (c) Provisioning Considerations

0 ( i) Two mats will be supplied for each DMS-100 Family instal-  
0 lation site. Installers are to place one mat permanently  
0 in front of the Central Control Complex since this area  
0 receives the highest traffic activity. The second mat is  
0 to be moved around with the work as installation  
0 progresses.

0 ( ii) One mat will be supplied for each RLM site. This mat is  
0 meant to be moved around as required.

0 ( iii) All mats are to be grounded by plugging their ground  
0 cords into receptacles marked "Battery Return" on the DMS  
0 frames.

0 ( iv) On "K" date, these mats will be turned over to the tele-  
0 phone company.

0 ( v) Patlon ESD products will replace ESD protective equipment  
0 currently ordered from Charleswater Inc.

0 Charleswater and Patlon ESD products may be used concur-  
0 rently in a office, however, the ground leads and snaps  
0 are not interchangeable. Therefore when extending an of-  
0 fice equipped with Charleswater Mats provide Mats and  
0 Ground Leads from Patlon as required.

0 RELEASE 28.01  
0 93 12 03

0

0

0 7.3.2 ESD Wrist Straps0 (a) General Description

0 The ESD Wrist Strap conducts static electricity charges away from  
0 the body to a ground point. It reduces the possibility of  
0 fingertip discharges which may damage sensitive equipment.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) It is recommended that ESD wrist straps be used for added  
0 protection along with ESD mats.

0 ( ii) Wrist straps are to be grounded by plugging their ground  
0 cords into the "banana plug" receptacle on the FSP.

0 93 12 03

0 8.0 Electromagnetic Interference (EMI)

0 8.1 Introduction

0 The Federal Communications Commission (FCC) in the United States  
0 has adopted regulations intended to control the interference  
0 caused by digital electronic equipment to radio communications.  
0 The regulations deal with:

- 0 1. Radiation Limits - the maximum allowable field strength of  
0 energy radiated from an affected product and its associated  
0 equipment and cabling.
- 0 2. Conducted Emission Limits - the maximum allowable voltage  
0 fed back to utility power lines.
- 0 3. Labelling requirements for the products affected.
- 0 4. Instruction manual requirements for the products affected.

0 Requirements for EMI compliance differ depending upon the in-  
0 tended location of use.

0 After October 1, 1983 any DMS-100 Family switch manufactured for  
0 the U.S.A. market and operated by other than a telephone company  
0 (i.e. PBX, SL-100 configuration) must be tested and found  
0 compliant with FCC regulations (i.e. must have the EMI option).

0 Apart from the mandatory compliance noted above, the EMI option  
0 is generally available to all our customers.

0 8.2 Features

0 Metal shielding hardware is included with the DMS frames to en-  
0 close them and make them compliant with EMI regulatory require-  
0 ments.

0 8.3 Equipment Provisioning

0 8.3.1 EMI Equipment Option

0 (a) General Description

0 The EMI option consists of metal panels, hardware and filtered  
0 connectors which reduce EMI emissions from DMS equipment.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) A bay with the EMI option does not need frame door or  
0 frame trim panels. Filler face plates and appropriate  
0 filler panels are still required.

0 ( ii) Each frame lineup requires one bay to be equipped with  
0 'straight' hardware. This 'straight' hardware will be  
0 equipped on the first bay of a frame lineup. All subse-  
0 quent bays of a frame lineup will be equipped with 'regu-  
0 lar' hardware.

0 ( iii) If there is a break within a lineup (ie. a column or the  
0 start of a new lineup), the 'straight' hardware must  
0 again be equipped on the first bay.

0 ( iv) If the first frame in a lineup is a Power Distribution  
0 Centre (PDC) frame, then the next bay must have  
0 'straight' hardware. All subsequent bays of a continuous  
0 frame lineup will be equipped with 'regular' hardware.

0 ( v) If an extension is applied to an existing DMS office  
0 which currently does not have the EMI option but will now  
0 have it, only the additional hardware will have the EMI  
0 option. This EMI compliant hardware will have to be pow-  
0 ered by an EMI compliant PDC frame. The EMI compliant  
0 PDC frame must not power non-compliant frames.

0 ( vi) The EMI compliant frames must be grouped separately from  
0 the non-compliant frames in order to preserve the integ-

0 NORTHERN TELECOM  
0  
0

RELEASE 28.01

## 0 9.0 Documentation

0 9.1 Introduction

0 Packages of documentation are provided to the DMS Office to de-  
0 tail system functions, features, structure and configuration.

0 9.2 Features

0 Two packages of documents are normally provided with a job. The  
0 Standard Customer Package contains technical information about  
0 the DMS hardware and software, including general provisioning and  
0 assignment rules used in engineering the office. The Job Related  
0 Customer Package contains specific information on the individual  
0 hardware and software items provided for a given office.

0 9.3 Equipment Provisioning

0 9.3.1 Documentation

0 (a) General Description

0 Documentation is supplied automatically on a per job basis.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) The Standard Customer Package is sent to the site. A copy  
0 is also sent to the telephone company head office only if  
0 it is the first job for that Telco. Updates for this  
0 package are sent to the Telco head office on an automatic  
0 basis without charge if a switch or extension has been  
0 ordered within the past year. It contains the following:

- 0 - General Specification (GS) - contains a de-  
0 scription of hardware functions and features
- 0 - Module Structure List (MS) - a list, including  
0 engineering rules, of the hardware products  
0 which can be configured to make up the system
- 0 - Northern Telecom Practice (NTP) - Descriptive  
0 information about DMS products at the system and  
0 sub-system levels, including hardware and soft-  
0 ware. Also included are detailed Performance  
0 Oriented Practices (POP) for testing and main-  
0 taining the system. Included in the practices  
0 will be information equivalent to Input/Output  
0 Manuals, Data Dictionary and Translation Guide.
- 0 - System Index (SI) - a list of key equipment  
0 structures and provisionin information at the  
0 system level only, and a list of all marketable  
0 products comprising this system.
- 0 - Equipment View (EV) - A simple drawing showing  
0 front and rear views of the equipment.

0  
0 RELEASE 28.01  
0 93 12 03

0 - Intraconnect Schematics (IS) - Block diagrams of  
0 subsystem, frame configuration and the  
0 connectivity between them.

0 - Cabling Assignments (CA) - Tables that list ca-  
0 bles between subsystems, their assignments and  
0 rules for provisioning.

0 ( ii) The Job Related Customer Package is sent to the site plus  
0 the telephone company head office. It contains the fol-  
0 lowing:

0 - Document Index (DI) - An index of documents and  
0 their issues which are included in this package

0 - Office Release Record (ORR) - A record of re-  
0 lease for all products which are supplied in  
0 this office. It lists frames, shelves, panels,  
0 circuit packs and software modules.

0 - Office Software Summary (OSS) - A short de-  
0 scription on each Protel software subsystem in a  
0 particular office.

0 - Job Specifications - The detailed specification  
0 for the office, against which it was manufac-  
0 tured.

0 - Office Records, Floorplan(s), DF Assignments,  
0 etc. - Common Systems Drawings (as required)  
0 which depict equipment which is not part of the  
0 DMS machine but is part of the overall system.

0 10.3 Equipment Provisioning

0 10.3.1 Line Card Storage Chassis

0 (a) General Description

0 The unit provides a chassis for storage of spare line cards and  
0 Bus Interface cards (used on new peripheral line drawers).

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) The line card storage capacity in one extreme is 30  
0 single slot line cards and the other extreme is 10 double  
0 slot line and 10 single slot line cards.

0 ( ii) For the capacities in between use 10 single line cards  
0 and each double slot line card can be replaced by two (2)  
0 single slot line cards.

0 ( iii) In addition to the line cards, the storage chassis will  
0 also store one (1) Bus I/F Card.

0 ( iv) Four (4) Line Card Storage Chassis and 3 single slot  
0 cards may be placed on one (1) shelf in the MSS frame.  
0 Six (6) Line Card Storage Chassis may be placed on one  
0 (1) shelf in the Miscellaneous Storage Cabinet (MSC)  
0 (U.S. only).

0 11.0 Miscellaneous Equipment

0 11.1 Introduction

0 This section describes some miscellaneous DMS equipment, common  
0 systems and other hardware required in the host office. The mis-  
0 cellaneous equipment is not related to maintenance. It can be  
0 mounted on an NT frame or can stand alone. Maintenance equipment  
0 is covered in Section 3.7.

0 The Miscellaneous Equipment Frame (MIS) is a general purpose  
0 equipment frame which is intended to accomodate miscellaneous  
0 DMS, common systems and other hardware required in the host of-  
0 fice. Remote Service Equipment (RSE)/Remote Miscellaneous Equip-  
0 ment (RME) frames are intended for use in remote offices.

0 11.2 Features

0 Multi-fuse Frame Supervisory Panel (FSP) and grounding hardware  
0 is orderable to provide full flexibility in the use of the MIS  
0 frame.

0 11.3 Equipment Provisioning

0 11.3.1 Dial-Up Autoquote Modem Equipment

0 (a) General Description

0 Stand-alone modems are used for the Dial-Up Autoquote (DUAQ) fea-  
0 ture. Provisioning considerations for equipment on the MIS frame  
0 which is associated with these modems follows.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) A total of three (3) UDS 108 modems can be placed on an  
0 NT3X25AA Common Equipment Shelf (CES).

0 ( ii) The UDS 108 modem requires AC power for operation. The  
0 NT0X87AA DC/AC Inverter supplies this AC power and is ca-  
0 bled to an AC input on the CES. Four (4) AC receptacles  
0 are available as power sources on the CES; three (3) for  
0 the modems and one (1) as a power multiple to another  
0 CES. Up to six (6) CES can be multiplied and powered from  
0 one (1) DC/AC Inverter when UDS 108 modems are used. Pro-  
0 vide one (1) DC/AC inverter for every six (6) CES re-  
0 quired.

0 ( iii) The NT3X25BA Terminal Strip Assembly must be mounted in  
0 the MIS frame where the modems are located. It is re-  
0 quired to provide a cross-connect facility between the  
0 Signal Processor CPs and the 108 modems. Provide one (1)  
0 Terminal Strip Assembly for each ten (10) DUAQ circuits.

0 11.3.2 Analog Recorded Announcement Equipment

0 (a) General Description

0 An optional Recorded Announcement machine, supplied by Audichron,  
0 is used on the DMS-100 family. It is housed in the Recorded An-  
0 nouncement Module (RM) mounted on the Miscellaneous Equipment  
0 Frame. Recorded Messages are accessed via RM-mounted play back  
0 amplifiers and 4-wire E&M trunks housed in the Trunk Modules. The  
0 speech channels incoming to a Network from each of these trunks  
0 can be connected in broadcast mode to all outgoing speech chan-  
0 nels within the same Network Sub Group (NSG).

0 (b) References

0 None

0 (c) Provisioning Considerations

- 0 ( i) For new initial offices, the Digital Recorded Announce-  
0 ment Machine should be ordered. However, the analog  
0 Audichron machine remains as an optional offering.
- 0 ( ii) One announcement trunk (NT2X88AA or NT2X72AA) is required  
0 per announcement track utilized.
- 0 ( iii) Each recording track (the RM is available in 6 or 12  
0 track configurations) requires one play-back amplifier to  
0 reproduce its recording.
- 0 ( iv) A single message, depending on its duration, can extend  
0 over several RM tracks up to a maximum of eight.
- 0 ( v) All tracks associated with a single message must termi-  
0 nate via RM play-back amplifiers and E&M trunks, on the  
0 same Trunk Module.
- 0 ( vi) All tracks associated with a single message should be re-  
0 corded on the same RM to ensure track change synchroniza-  
0 tion.
- 0 ( vii) One RM of the appropriate type should be provided for ev-  
0 ery 6 or 12 tracks subject to Consideration ( vi).
- 0 (viii) One RM play-back amplifier card houses one play-back am-  
0 plifier.

0 ( ix) One announcement trunk is required per announcement track  
0 utilized. A single message, depending on its duration,  
0 can therefore extend over several trunk circuits.

0 ( x) Trunk cards may be duplicated for reliability where nec-  
0 essary.

0 11.3.3 Automatic Number Announcer Circuit (ANAC)

0 (a) General Description

0 The function of an automatic number announcement system is to  
0 identify subscriber stations to craftspeople by announcing the  
0 station's telephone number in a clear, spoken voice. Other uses  
0 for automatic number announcements include, but are not limited  
0 to, verification of cross connections, locating lines on a dis-  
0 tributing frame, identification of lines in the event of a cable  
0 cut or throw, and purification of office line records prior to  
0 equipment cutover.

0 Automatic number announcement functions are supported by the  
0 Calling Number Announcement (CNA) feature utilizing channels on  
0 Northern Telecom's proven digital Recorded Announcement Machine  
0 (DRAM) under the control of system software. The CNA channels  
0 may be provided as dial-in, individual craftsperson test channels  
0 or as loudspeaker-driving channels where the number is broadcast  
0 over a loudspeaker mounted on the Distributing Frame.

0 (b) References

0 ED 5690-50 (Peripheral Systems Application of ANAC  
0 Equipment to Multi-Office and SXS System)

0 (c) Provisioning Considerations

0 ( i) The Telco shall determine the proper group combinations  
0 required for the switching office.

0 11.3.4 Cook Division Digital Announcer (CDA)

0 (a) General Description

0 The Cook Division Line Access Digital Announcer is designed for  
0 repetitive message playback applications for use in a Remote Of-  
0 fice environment in a DMS100F application. Its purpose is to  
0 provide announcements instead of a re-order tone for Non-Resident  
0 Codes and Prefixes (i.e. 0-, 0+, and 1+) when the Remote Office  
0 is operating in the Emergency Stand Alone (ESA) mode. The unit  
0 is not designed for applications where a user response is ex-  
0 pected or required. It is a listen only device.

0 These units may be provided for the RLCM, RSC, RLM offices.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) The DA may be provided as a desk top or rack mount unit.  
0 However, only the rack mount units have been approved for  
0 use by Northern Telecom Digital Switching. This unit may  
0 be used as an adjunct announcer to the DMS100F internal  
0 MTM mounted Digital Recorded Announcer Machine (DRAM), in  
0 a Remote Office environment.

0 ( ii) The CDA is compatible with the DMS100F Type "A" & "B"  
0 line cards when the CDA Ring Trip Access option or Remote  
0 Record/Ring Trip Access option is equipped on the CDA.

0 ( iii) Voice messages are recorded on the CDA via a type "G"  
0 handset which interfaces the CDA via a modular jack on  
0 the front panel. The analog voice messages are stored  
0 digitally in solid state (DRAM) memory. When the appro-  
0 priate signals are received from the interface circuits,  
0 the message is converted to analog for output to the line  
0 requesting the message.

0 ( iv) There are two approved versions of the Cook Division Dig-  
0 ital Announcer (CDA) which are: (1) NT7M00 - Single

- 0 (1) NT7M00 - Single Channel/Port  
0 (2) NT7M25 - Four Channel/Port Version. As

0 RELEASE 28.01  
0 93 12 03  
0

0 Where:

0 The Single Channel unit provides one message output  
0 to connected lines.

0 The Four (4) Channel unit provides from one to four  
0 message output depending on the configuration to con-  
0 nected lines.

0 The maximum number of lines which may be connected to the  
0 single channel CDA depends on the resistance of the  
0 lines. For example: A maximum of 150, 600-ohm lines may  
0 be connected to a single CDA using several line expansion  
0 chassis. This holds true for both the Single and Four  
0 Channel CDA.

0 The Cook DA is available in several configurations with  
0 standard features to include: number of channels (1 or  
0 4), message lengths up to 2.13 minutes (128sec), LED dis-  
0 play for operational status, security access, and diag-  
0 nostics. Other available options include features such  
0 as: battery backup, ring trip access, remote record, and  
0 A.C. adapter.

0 ( v) The following hardware and accessories have been approved  
0 by Digital Switching for the Cook Division Digital  
0 Announcer:

| 0 | <u>PEC</u> | <u>DESCRIPTION</u>              |

0 ( vi) CDA System Configuration

0 The single or four channel CDA is mounted in the MIS  
0 frame. The single channel Cook Digital Announcer (CDA)  
0 is composed of a Control Processor Unit (CPU) only. The  
0 following hardware is provisionable on this unit:

- 0 - 1-Line Ring Trip Access Circuit (NT7M08BA)
- 0 - 4-Line Ring Trip Access Circuit (NT7M29BA)
- 0 - Rechargeable Battery Pack (NT7M03BA)
- 0 - Remote Record/Ring Trip Access Circuit (NT7M07BA)
- 0 - Hand Set (212260)
- 0 - 32-Sec Memory Upgrade Kit (NT7M04CA)
- 0 - Three Channel Audio Expansion (3CAE) Chassis Several  
0 Versions
- 0 - Line Expansion Chassis (LEC) Several Versions
- 0 -

0 The four channel CDA is composed of a CPU and a 3 channel  
0 Audio Expansion Chassis (3CAE). This unit may be expanded  
0 by increasing the number of users having simultaneous ac-  
0 cess. The provisionable hardware for the single channel  
0 unit is also provisionable of the multi-channel unit.

0 ( vii) Expanding The Single Channel CDA's Capabilities

0 On extension offices, the single channel CDA may be ex-  
0 panded in two ways:

- 0 1. Expanding the number of lines having simultaneous ac-  
0 cess to the CDA.
- 0 2. Expanding the number of Audio outputs from one (1) to  
0 four (4).

0 Provide the Audio Expansion Chassis to increase the num-  
0 ber of audio inputs from one to four on the single chan-  
0 nel CDA. When expanding the Audio capabilities of the  
0 CDA, consider the following:

- 0 - Provide additional memory, a minimum of 64-seconds is  
0 required for a 4-Channel unit.
- 0 - Provide a 3-Channel Audio Expansion Chassis (3CAE) of  
0 the same color as the Single Channel CDA (SC-CDA) be-  
0 ing expanded
- 0 - Select an 3CAE with or without the 4-Line Ring Trip  
0 Access Circuit (4L-RTA) as required.

0  
0 RELEASE 28.01  
0 93 12 03

0 - Provide the firmware as required for the type of  
0 4-Channel (4C) operation required.

0 The number of users having simultaneous access to the  
0 single channel CDA may be expanded by adding the Line ex-  
0 pansion chassis.

0 (viii) Expanding the Four Channel CDA's Capabilities

0 The number of subscriber lines that can access the CDA  
0 simultaneously can be expanded using the NT7M29 Series  
0 (Line Expansion Kit) in multiples of 4 to 8 lines.

0 11.3.6 MIS Frame Isolated System Grounding (ISG)

0 (a) General Description

0 A new grounding topology is being applied to DMS family systems.  
0 The basic principles of the new grounding system are as follows:

- 0 1. The logic return is to be isolated from the framework  
0 ground overhead busbar.
- 0 2. Individual frame line ups must be electrically isolated  
0 by the use of isolation hardware.

0 (b) References

0 Installation Manual 940 section 01

0 (c) Provisioning Considerations:

0 ( i) U.S. applications will provision modem equipment on a  
0 Miscellaneous Equipment Frame (MIS), dedicated for modem  
0 equipment, and enhanced for ISG.

0 ( ii) A Ground Material Assembly, NT0X9504, which contains a  
0 logic return busbar must be provisioned for each MIS  
0 Frame that is dedicated for modem equipment.

0 ( iii) DC Modem Shelves must be isolated from the equipment  
0 frame and the shelf chassis must be connected to the  
0 logic return busbar. One (1) NT0X0050 Modem Shelf  
0 Grounding Hardware Kit must be provided per DC modem  
0 shelf provisioned to isolate the shelf from the frame and  
0 to connect the chassis to the logic return busbar.

0 ( iv) DC Modem Shelves must be isolated from the equipment  
0 frame and the shelf chassis must be connected to the  
0 logic return busbar. One (1) NT0X0050 Modem Shelf  
0 Grounding Hardware Kit must be provided per DC modem  
0 shelf provisioned to isolate the shelf from the frame and  
0 to connect the chassis to the logic return busbar.

0 AC Modem Shelves must be powered from an inverter that is  
0 mounted on the same frame. The inverter must be isolated  
0 from the framework and its chassis must be connected to  
0 the logic return busbar. Provision one (1) NT0X0009 Cable  
0 assembly for an inverter located in a MIS frame.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 ( v) The Digital Alarm Scanner (DAS) unit must be mounted on a  
0 Dedicated MIS/Modem Frame enhanced for ISG. The DAS unit  
0 must be isolated from the equipment frame and the unit  
0 chassis must be connected to the logic return busbar us-  
0 ing a NT0X9502 cable assembly.
- 0 ( vi) Common Equipment Shelves must be isolated from the equip-  
0 ment frame and the shelf chassis must be connected to the  
0 logic return busbar.
- 0 ( v) Initial Remote offices (RLCM,RLM,RSC) can provide modem  
0 equipment and associated inverters in any RME/RSE frame  
0 only if a logic ground bar (i.e., NT0X0201 or NT0X9548)  
0 is provisioned with the frame. Note that modems, VDU,  
0 printers or other devices connected to modems (through  
0 the EIA connection) must be powered from isolated  
0 DMS-100F supplied inverters.
- 0 ( vi) Isolated System Grounding will initially be applied to  
0 all new host and remote DMS-100F offices.
- 0 ( vii) For all other extensions to offices that use old ground-  
0 ing methods, Isolated System Grounding will not be ap-  
0 plied. The office will be extended using current  
0 grounding methods.
- 0 (viii) Each equipment row must have a Logic Return Busbar (LRB)  
0 provisioned for connection of logic return. If a MIS  
0 frame dedicated to modem equipment (U.S. offices) exists  
0 in a lineup, provision a LRB for that lineup.
- 0 ( ix) For U.S. offices, the MIS frame dedicated for modem  
0 equipment must be switchboard cabled to the same LRB as  
0 the IOE/MTC/CCC frames containing the IOC Modules.
- 0 ( x) All LRB will terminate to the Logic Return Equalizer as-  
0 sembly (LRE).
- 0 ( xi) Each LRE provides termination capabilities for 14 eqpt  
0 rows. A busbar extension plate assembly (NT0X0017) may  
0 be provisioned for each additional 14 equipment rows re-  
0 quired.
- 0 ( xii) MIS frames not being used for modem equipment have no  
0 logic return and thus no connection to the LRB. No pro-  
0 visioning action is required to terminate the logic re-  
0 turn to these frames.

0 RELEASE 28.01  
0 93 12 03  
0

0 (xiii) Provision one (1) NT0X0013 Isolation Hardware in place of  
0 each mounting screw for each piece of miscellaneous  
0 equipment with a non-NT\_X\_\_ Product Engineering Code  
0 (PEC) that is mounted in Miscellaneous Frame (NT0X02AB).

0 ( xiv) The following equipment (which mounts on a Miscellaneous  
0 Frame) have isolation hardware always provided as part of  
0 their stocklist. Any piece of equipment with a NT\_X\_\_ PEC  
0 which mounts on a MIS frame that is not on this list must  
0 have NT0X0013 Isolation Hardware provisioned to accommo-  
0 date ISG. This list will be updated as design documenta-  
0 tion is produced and available.

0                   PEC                   DESCRIPTION

0                   # NT5X69AA - Inactive System Timing Circuit  
0                   NT5X58AA - 1A2 Key Telephone System  
0                   NT5X55AA - 1A2 Key Telephone System Module  
0                   NT5X09AA - Data Set (Modem) Shelf  
0                   NT5X08AA - AC Modem Assy Modified Shelf  
0                   \* NT0X87AA - Inverter Unit  
0                   @ A0367433 - LaMarche 500W Inverter Unit  
0                   NT3X25AA - Common Equipment Shelf

0                   \* For NT0X87AA Inverter Units (on non dedicated MIS  
0 frames for modems) the following hardware must be  
0 ordered:

0                   Qty       CPC           Description  
0                   4 - P0284154 - Metallic Regular Washer  
0                   4 - P0183220 - External Tooth Lock Washer  
0                   4 - P097F813 - Mounting Screws

0                   This hardware replaces the Isolation Hardware  
0 NT0X0013, which is to be discarded.

0                   # The inactive system timing circuit must be pow-  
0 ered from an inverter mounted on the same MIS  
0 frame. The inverter shall be grounded to MIS  
0 framework per normal grounding procedures (i.e.  
0 no NT0X0013 required).

0                   @ For U.S. applications only, provision the  
0 LaMarche inverter on new jobs in lieu of the  
0 NT0X87AA inverter. This LaMarche inverter is de-  
0 signed to be used as an integrated component of  
0 the DMS-100F MIS to provide protected AC to com-  
0 ponents internal and external to the MIS frame.

0 11.3.7 Case/Datatel/Rixon Data Communications Equipment

0 (a) General Description

0 This section contains engineering ordering information for all  
0 approved Case/Datatel/Rixon Data Communications equipment. Case  
0 Rixon is the primary supplier of data communications equipment,  
0 along with UDS. The selection of a data communications equipment  
0 supplier shall be based on customer preference only.

0 (b) References

0 None

0 (c) Provisioning Considerations:

0 ( i) When selecting modems for a particular application, the  
0 modem factors must be taken into account in order to en-  
0 sure application compatibility. The following must be  
0 considered.

0 - the SPEED at which various modems can send and re-  
0 ceive data

0 - the digital interface between the modem and a termi-  
0 nal or host computer

0 - the line protocols available (half duplex, full-  
0 duplex, or multidrop)

0 - the Transmission Protocol (e.g. V.22, BELL-103, V.29,  
0 etc)

0 - the data transmission mode (synchronous or asynchro-  
0 nous)

0 - the various types of telephone lines

0 - the US and international standards for establishing  
0 communications.

0 ( ii) CASE/DATATEL modems are available in a Rack Mount or  
0 Stand Alone configuration. In most cases, each model  
0 number will have two part numbers one for the Rack Mount  
0 unit and one for the Stand Alone unit. Note: The de-

0  
0 RELEASE 28.01  
0 93 12 03

0 description of these products as it will include the model  
0 number and a hyphen "C" or S/A to indicate the modem is a  
0 Rack Mount or Stand Alone configuration, respectively.

0 Rack Mount Modem Configuration

0 Provisioning a rack mounted modem solution with  
0 CASE/DATATEL products requires the RM4200 AC or DC ver-  
0 sion modem shelf and the application specific modems. The  
0 RM4200 shelf is capable of housing up to 16 modems and  
0 DAS units provisionable on the shelf, in any combination  
0 totaling 16 units. If the AC RM4200 DSM is provided,  
0 then protected AC is required.

0 Stand Alone Modem Configuration

0 Modems provisioned in a stand alone configuration may be  
0 housed internal or external to the DMS Line-Up. Stand  
0 Alone modem products may sit on the MAP desktop, or in a  
0 MIS frame on a Common Equipment Shelf (NT3X25AA), or some  
0 other convenient miscellaneous location subject to the  
0 applicable ISG restrictions.

0 The features of a stand alone modem product and its rack  
0 mount version are identical - with the exception of hous-  
0 ing and power requirements.

0 It is recommended that stand alone modems be used only  
0 when the quantity of modems and/or mounting conditions  
0 does not warrant the use of a shelf. Rack mount modem  
0 installations are generally more economical and provide a  
0 tidier installation.

0 NOTES:

- 0 1. The CASE/DATATEL RM4200 Rack Mountable Card Cage  
0 (905-5222-003 -48VDC & 905-5222-001 115VAC) is a 16-Slot  
0 card cage that mounts in a 19", 23", or 26" rack or cabi-  
0 net and houses up to 16 cards total in any combination of  
0 the cards listed in TABLE 38.2. The -48VDC Power Supply

0 RELEASE 28.01  
0 93 12 03  
0

0 accepts dual battery feeds, is redundant, and automat-  
0 ically switches in the event of a failure without loss of  
0 signal.

0 All card modems require (1) one card slot. Public Switch  
0 Telephone Network (PSTN), Private Line (PL), or Digital  
0 Data Service Network (DDS) modem applications may be  
0 intermixed on a single shelf.

0 When using a Stand-Alone or Rack Mounted modem in the  
0 4Wire Dedicated Mode, a 4229 DAS Unit is required. The  
0 DAS Unit performs line conditioning and loopback.

0 It is recommended that rack mounted modems be utilized at  
0 every DMS site to save space and provide a tidier instal-  
0 lations.

0 The RM4200 DSM connects the Modem Cards to the telephone  
0 lines, Data Terminal Equipment (DTE).

0 Note: Direct connection of the RM4200 DSM to Tele-  
0 phone Sets is not a DMS100 approved option. However,  
0 this option can be used with Stand Alone modems.

0 The RM4200 assignable cards and their applications are  
0 shown in Table 38.2 below. The different modem card  
0 types, speeds, and operating modes may be intermixed in a  
0 single RM4200 shelf. However, when the 4229 DAS units  
0 and Private Line (PL) modems are intermixed on a single  
0 shelf, the shelf mounting capacity is reduced by the num-  
0 ber of 4229 units used.

0 2. The RM70 (905-5098-001) is a 16 slot modem housing, used  
0 to mount up to eight (8) Dial-Up modems (Executive 212  
0 Modem Card or R212A Intelligent modem). Mounting adapters  
0 must be provided for 26" mounting.

0 3. The RM90 (905-5139-001) Modem Shelf is a 18 card slot  
0 unit, use by NTI to mount up to nine (9) R96 high speed  
0 modems. Protected AC and mounting adapters must be pro-  
0 vided with this shelf.

0 4. The CASE/DATATEL 4201 12/2400bps Modem (905-5220-001  
0 Stand-Alone & 905-5220-002 Rack Mount) operates full or  
0 half duplex over 3002-Type Private Lines (PL) or half-  
0 duplex only over two-wire PLs and four-wire two-wire  
0 Dial-Up Lines. It provides Synchronous Serial Binary  
0 data transmission and reception at 1200 or 2400 Bits Per  
0 Second (BPS). The modem card mounts on a RM4200 Data Set  
0 Module Shelf -- the stand alone unit mounts on a NT3X25AA  
0 or other miscellaneous locations.

0 6. The CASE/DATATEL 4208 4800bps Modem (905-5227-001 Stand-  
0 Alone & 905-5227-002 Rack Mount) is a 4800 bps  
0 synsynchronous phase shift keyed modem. It operates full-  
0 duplex over four-wire leased lines in "A-mode" and half-  
0 duplex over the DDD network in "B-Mode". The 4208 has an  
0 adaptive automatic equalizer to correct amplitude and  
0 phase distortion. In the B-Mode, a switch selectable  
0 inactivity timer disconnects the modem from the tele-  
0 phone line if it receives neither a valid carrier nor a  
0 Request To Send signal from the terminal. The card ver-  
0 sion mounts in a RM4200 Data Set Shelf -- the stand alone  
0 unit mounts on a NT3X25AA or other miscellaneous lo-  
0 cations.

0 Data Rate..... 4800bps Synchronous

0 Operation:

0 2-Wire..... Half duplex

0 When using this modem in Private  
0 Line (PL) applications special ca-  
0 bles are required.

0 Operating Mode..... Automatic Originate/Answer re-  
0 quires the 801 Automatic Calling  
0 Unit (ACU). However, the 801ACU  
0 is not an approved product at this  
0 time.

0 Modulation.....Frequency Shift Keyed (FSK)

0 DTE Interface..... EIA RS-232D/V.24

0 Telephone Line I/F.. DB25 Male Connector on S/A unit  
0 stamped TEL/LINE

0 Transmit Level:

0 Private Line..... Not Applicable

0 RELEASE 28.01  
0 93 12 03  
0

0  
0 DDD..... 0 to -12 dBm Programmable, -9 dBm  
0 Permissive, -4 dBm Fixed Loss Loop

0 Mechanical:

0 Stand-Alone..... Width 6.8" (56mm), Height 2.2"  
0 (173mm), Depth 11.5" (293mm)

0 Card..... One Card Slot in RM4200 Shelf

0 Power Requirements:

0 Stand Alone..... 93 to 132 Vrms at 57 to 63Hz, 6.7  
0 VA

0 Rack Mount..... 19.6 Vrms at 57 to 63Hz, 6.7 VA

0 8. The CASE/DATATEL 4229 Unit (905-5224-002 Rack Mount &  
0 905-5224-001 Stand-alone) is a voice frequency desk-top  
0 or plug-in module used as standard termination for four  
0 wire private line data channels. The 4229 unit is in-  
0 stalled between a Central Office (CO) and the station  
0 equipment. The functions of this unit are as follows:

- 0 - Adjustable attenuation in the transmit path.
- 0 - Adjustable gain or attenuation in the receive path.
- 0 - Amplitude equalization of the data channel (type  
0 359A/K).
- 0 - Tone activated loopback (2713 Hz) towards the central  
0 office.
- 0 - DC simplex loopback towards the central office.
- 0 - Manual loopback towards the central office

0 The modem card mounts on a RM4200 Data Set Module Shelf  
0 -- the stand alone unit mounts on a NT3X25AA or other  
0 miscellaneous locations.

0 Line Requirements... 4-Wire 3002 Leased or Private  
0 Telephone Lines

0 Line Impedance..... 600 Ohms

0 Operational Mode.... Full Duplex, Point-To-Point

0 RELEASE 28.01  
0 93 12 03  
0

- 0 Input Data Format... Sync or Async; used with all  
0 RM4200 Series 4W FDX, PLL modems
- 0 DTE Interface..... EIA RS-232C, CCITT V.24, V.33 and  
0 ISO 2110
- 0 Telephone Line I/F.. DB25 Male Connector on S/A unit  
0 stamped TEL/LINE
- 0 Mechanical:  
0 Stand-Alone..... Width 8.5" (216mm), Height 3.5"  
0 (90mm), Depth 14.5" (367mm)
- 0 Card..... One Card Slot in RM4200 Shelf
- 0 Power Requirements:  
0 Stand Alone..... 93 to 132 Vrms at 57 to 63Hz, 6.4  
0 VA  
0 Rack Mount..... 19.6 Vr,s at 57 to 63Hz, 6.4 VA
- 0 9. The Executive 212A Modem (905-6836-20 Card & 905-5137-003  
0 Desk) functions as a dual speed full duplex modem for use  
0 on the Dial-Up Network. It operates asynchronously  
0 0-300bps and synchronously or character asynchronously at  
0 1200 bps. The modem card mounts on RM70 Data Set Shelf  
0 -- the stand alone unit mounts on a NT3X25AA or some  
0 other miscellaneous locations.
- 0 10. The R212A Intelligent Modem (905-6836-02 Card &  
0 905-5137-001 Desk) functions as a analog full duplex  
0 asynchronous 0-300bps modem or 1200bps synchronous modem.  
0 The modem operates with Data Terminal Equipment (DTE)  
0 that have an EIA RS-232-C interface. This modem is com-  
0 patible with RIXON and BELL 212A, 103, and 113 modem mod-  
0 els. The R212A features the HAYES Smartmodem limited  
0 format, DTE control of all options and commands, and in-  
0 tegral automatic dialer. The modem card mounts on the  
0 RM70 Data Set Shelf -- the stand alone unit mounts on a  
0 NT3X25AA, or some other miscellaneous location.
- 0 11. The R96 (905-5131-003 Desk & 905-5131-004 Card) modems  
0 are 9600 bps modems with fallback speeds of 7200 and  
0 4800bps, and V.29 compatible. The modem card mounts on  
0 the RM90 Data Set Shelf -- the stand alone unit mounts on  
0 the NT3X25AA or some other miscellaneous location.

0 RELEASE 28.01  
0 93 12 03

0 11.3.8 UDS Data Communications Equipment

0 (a) General Description

0 This section contains engineering ordering information for all  
0 approved Universal Data Systems (UDS) Data Communications equip-  
0 ment. UDS is the primary supplier of data communications equip-  
0 ment along with Case Rixon. The characteristics and operating  
0 parameters of the products (i.e. modem and modem shelves) are de-  
0 fined. This section is to be used in conjunction with other ap-  
0 plicable sections to select the appropriate product for the  
0 application in question.

0 The UDS modem products are applicable to the DMS 100/  
0 200/300/TOPS/IBN/RSC/RLCM/RLM switching products. These modems  
0 have been approved for the US market only.

0 (b) References

0 None

0 (c) Provisioning Considerations:

0 ( i) When selecting modems for a particular application, the  
0 engineer must take into account the modem factors to en-  
0 sure application compatibility. The following must be  
0 considered.

- 0 - the SPEED at which various modems can send and re-  
0 ceive data
- 0 - the digital interface between the modem and a termi-  
0 nal or host computer
- 0 - the line protocols available (half duplex, full-  
0 duplex, or multidrop)
- 0 - the data transmission mode (synchronous or asynchro-  
0 nous)
- 0 - the various types of telephone lines
- 0 - the US and international standards for establishing  
0 communications.

0 UDS modems are available in a Rack Mount or Stand Alone  
0 configuration. In most cases, each model number will  
0 have two part numbers (one for the Rack Mount (RM) and  
0 one of the stand alone). Note the description of these

0 RELEASE 28.01  
0 93 12 03  
0

0 products as it will include RM as an indication of the  
0 modems configuration.

0 ( ii) UDS Rack Mount Modem Configuration

0 Provisioning a rack mounted modem solution with UDS pro-  
0 ducts requires the RM16M modem shelf and the application  
0 specific modems. The RM16M shelf is capable of housing  
0 up to 16 2-wire modems or 8 4-wire private lease line  
0 modems with 8 Auxilliary Data Sets.

0 UDS Stand Mount Modem Configuration

0 Modems provisioned in a stand alone configuration may  
0 housed internal or external to the DMS Line-Up. Stand  
0 Alone modem products may sit on the MAP desktop, or in a  
0 MIS frame on a Common Equipment Shelf (NT3X25AA), or some  
0 other convenient miscellaneous location.

0 The features of a stand alone modem product and its rack  
0 mount version are identical - with the exception of hous-  
0 ing and power requirements.

0 It is recommended that stand alone modems be used only  
0 when the quantity of modems and/or mounting conditions  
0 does not warrant the use of a shelf. Rack mount modems  
0 installations are generally more economical and provide a  
0 tidier installation.

0 Stand alone modem installations require the telco to pro-  
0 vide a RJ-11 or RJ-45 Telephone Jack to be installed near  
0 the modem.

0 ( iii) When modem inputs are connected to the IOC or CMC, then  
0 the location and connectivity of the modem/modem shelf  
0 conform to ISG restrictions.

0 ( iv) The following units are approved for use with the DMS100  
0 Family:

0

0 1. UDS RM16M Modem Shelf

0 RELEASE 28.01  
0 93 12 03  
0

0 Part Number: 62005220

0 The UDS RM-16M shelf is a 23-inch rack mountable housing,  
0 which physically occupies 7 inches of vertical space,  
0 however, an additional 2-inches (1-inch above and below  
0 the shelf) of vertical space is required for cooling. The  
0 shelf will house up to sixteen card modems. Frame Mount-  
0 ing adapters (26") are always provided by the manufac-  
0 turer with the RM-16M 23" shelf.

0 All card modems require (1) one card slot. Public Switch  
0 Telephone Network (PSTN), Private Line (PL), or Digital  
0 Data Service Network (DDS) modem applications may be  
0 intermixed on a single shelf.

0 ddbu using a modem in the 4 Wire Dedicated Mode it re-  
0 quires a 2 wire to 4 Wire conversion circuit. Presently,  
0 this may be provided via one of the following methods:

0 UDS Recommended Method:

- 0 1. Provide the UDS 829-Card (6204-5001) one per Dedi-  
0 cated Modem. Each 829-Card reduces the shelf modem  
0 mounting capacity by one card slot. This is the pre-  
0 ferred configuration for Dedicated Modems when uti-  
0 lizing UDS products.

0 Rixon Alternate Method:

- 0 2. Using Rixon the CR829-L4 Auxiliary Data Set (ADS) and  
0 the RM46A1 (23" Auxiliary Data Set Shelf).

0 It is recommended that rack mounted modems be utilized at  
0 every DMS site, to save space and provide a tidier in-  
0 stallations.

0 The UDS Modem Shelf Power Supplies require DC battery  
0 (-48 <sup>1</sup> -4V) with a maximum input current of 3.0 amps when  
0 shelf is fully loaded.

## 0 2. UDS 108 300BPS Modem

0 Part numbers - Rack Mount: 61035121  
0 Stand alone: 61035119

0 Data Rate.....0-300 bps asynchronous

0 Operation.....Full/Half duplex on 2/4W Private Line

0 Operating Mode.....Originate/Answer

0 Modulation.....Phase Coherent Frequency Shift Keyed  
0 (FSK)

0 Digital Interface...EIA RS-232

0 Analog Connection...6 pin modular jack

0 Mechanical:

0 Stand-Alone.....Width 7", Height 2.25", Depth 9.6",  
0 Wt 2lbs 8ozs

0 Card.....One Card Slot in RM16M Shelf

0 Power Requirements..115 VAC +/- 10%, 47 to 63Hz, 12 Watts

## 0 3. UDS 212A 0-300/1200BPS Modem

0 Part numbers - Rack Mount: 62125086  
0 Stand alone: 62125069

0 Data Rate.....Low Speed: 0-300bps asynchronous  
0 High Speed: 1200bps synchronous  
0 1200bps asynchronous

0 Operation.....PSTN lines 2W full duplex Automatic  
0 Answer

0 Modulation.....Low Speed: Frequency Shift Keying  
0 (FSK)  
0 High Speed: Phased Shift Keying  
0 (PSK)

0 Digital Interface...EIA RS232 and CCITT V.24

0 Telephone Line

0 Interface.....Direct connect via Programmable data  
0 jacks (RJ45S) or Permissive "Voice"

## 0 11. UDS 224AT/D 0-300/1200/2400BPS Modem

0 Part numbers - Rack Mount: 62245032  
0 Stand alone: 62245030

0 NOTE: Modems having the capability of being controled by  
0 the Hayes Command Set is often refered to as "Intelligent  
0 Modems".

0 Data Rate.....Low Speed: 0-300bps Async  
0 Med/High Speed: 12/2400bps Sync  
0 12/2400bps Async

0 Operation.....PSTN or Private Lines 2W full duplex  
0 Automatic Answer/Dial Capability  
0 Hayes Command Set Capability

0 Modulation.....Low Speed: Frequency Shift Keying  
0 (FSK)

0 Medium Speed: Phased Shift Keying  
0 (PSK) on a debit basis

0 High Speed: Quadrature Amplitude  
0 Modulation (QAM) on a quadbit basis

0 Digital Interface...EIA RS232 and CCITT V.24

## 0 Telephone Line

0 Interface.....Direct connect via Programmable data  
0 jacks (RJ45S) or Permissive "Voice"  
0 jacks (RJ11C) in accordance with FCC  
0 Regulation Part 68. Eight (8) Foot  
0 Cable always provided

## 0 Mechanical:

0 Stand-Alone....Width 7", Height 2.25", Depth 9.6" Wt  
0 2lbs 10ozs  
0 Card.....One Card Slot in RM16M Shelf

0 Power Requirements..115 VAC <sup>1</sup>10%, 50 to 60Hz, 4 Watts

## 0 12. UDS EC224A/D Modem

0 Part numbers - Rack Mount: Not Approved  
0 Stand alone: 62245027

0 NOTE: Modems having the capability of being controled by  
0 the Hayes Command Set is often refered to as "Intelligent  
0 Modems".

0 Data Rate.....Low Speed: 0-300bps Async  
0 Med/High Speed: 12/2400bps Sync  
0 12/2400bps Async

0 Operation.....PSTN or Private Lines 2W full duplex  
0 Automatic Answer/Dial Capability,  
0 Hayes Command Set Capability, Error  
0 control (MNP Level 1)

0 Modulation.....Low Speed: Frequency Shift Keying  
0 (FSK)

0 Medium Speed: Phased Shift Keying  
0 (PSK) on a debit basis

0 High Speed: Quadrature Amplitude  
0 Modulation (QAM) on a quadbit basis

0 Digital Interface...EIA RS232 and CCITT V.24

## 0 Telephone Line

0 Interface.....Direct connect via Programmable data  
0 jacks (RJ45S) or Permissive "Voice"  
0 jacks (RJ11C) in accordance with FCC  
0 Regulation Part 68. Eight (8) Foot  
0 Cable always provided

## 0 Mechanical:

0 Stand-Alone....Width 7", Height 2.25", Depth 9.6" Wt  
0 2lbs 10ozs

0 Card.....One Card Slot in RM16M Shelf

0 Power Requirements..115 VAC <sup>1</sup>10%, 50 to 60Hz, 4 Watts

## 0 13. UDS 208A/B 4800BPS Modem

0 Part numbers - Rack Mount: 62085083  
0 Stand alone: 62085064

0 Data Rate.....4800 bps synchronous

0 Operation.....PSTN or PLL 2W half duplex or PLL 4W  
0 FULL duplex, Automatic Answer

0 Modulation.....8-Phase Differential Coherent Phase  
0 Shift Keyed (DPSK)

0 Digital Interface...EIA RS232 and CCITT V.24

0 Telephone Line

0 Interface.....Direct connect in accordance with FCC  
0 Regulation Part 68. Eight (8) Ft. Ca-  
0 ble always provided

0 Mechanical:

0 Stand-Alone.....Width 7", Height 2.25", Depth 9.6",  
0 Wt 2lbs 8ozs

0 Card.....One Card Slot in RM16M Shelf

0 Power Requirements..115 VAC  $\pm 10\%$ , 50 to 60Hz, 10 Watts

## 0 14. UDS D9.6K 2.4K/4.8K/9.6K BPS Modem

0 Part numbers - Rack Mount: 64965007  
0 Stand alone: 64965004

0 Data Rate.....9.6K, 4.8K, or 2.4K bps

0 Operating Modes.....DDS full-duplex multipoint, DDS full  
0 duplex Point-to-Point, 4W full du-  
0 plex, 4W half-duplex or simplex Se-  
0 rial binary, Sync, Async

0 Operating Range.....Wire Gauge Data Rate Distance

| ----- | -----    | -----     |
|-------|----------|-----------|
| 19    | 9.6K bps | 15 miles  |
| 19    | 4.8K bps | 19 miles  |
| 19    | 2.4K bps | 25 miles  |
| 26    | 9.6K bps | 5.5 miles |
| 26    | 4.8K bps | 7 miles   |
| 26    | 2.4K bps | 10 miles  |

0 16. UDS 720 Dialback Unit (DDBU)

0 Part numbers - Rack Mount: 61025082  
0 Stand alone: 61025047

0 a) A DDBU is a device that allows a 4-Wire Private  
0 Leased Line (PLL) modem to operate over 4-Wire Pri-  
0 vate Lease Lines in normal mode, and to operate over  
0 two PSTN (2-Wire) lines in backup mode, where one  
0 PSTN Line is used to transmit data and the other is  
0 used to receive data.

0 b) Backup mode may be established manually using a  
0 standard telephone, automatically on command from the  
0 front panel switch, or automatically on command sent  
0 through a serial ASCII port on the rear of the unit.  
0 Rack mounted units are not approved for use at this  
0 time.

0 Data Rate.....150, 300, 1200, 4800, or 9600 asyn-  
0 chronous

0 Operation.....PSTN lines or Private Line 4W full  
0 duplex Automatic, Manual, or Terminal  
0 Dialing Automatic Answer

0 Digital Interface...EIA RS232 and CCITT V.24

0 Telephone Line  
0 Interface.....Direct connect in accordance with FCC  
0 Regulation Part 68. Eight (8) Foot  
0 Cable always provided

0 Mechanical:  
0 Stand-Alone.....Width 7", Height 2.25", Depth 9.6",

0 17. UDS 829 Auxiliary Data Set (ADS)

0 Part numbers - Rack Mount: 6104-5001  
0 Stand alone: Not Approved

0 The UDS 6104-5001 (A829-L4) Data Line Termination Card  
0 (DLTC) is different from the Rixon C829CR-L4 DLTC, in  
0 that it mounts on the same data set shelf as its associ-  
0 ated modem. Yet, both provide the same functions, such  
0 as:

0 \* four wire (4W) interface between a data set (modem)  
0 and a transmission facility

0 \* Equalization, Gain Adjustment, and Multiple Loop Back  
0 Modes - set via Dip Switches.

0 \* Receive Gain - fine adjusted from the front panel us-  
0 ing a screwdriver.

0 The UDS RM16M data set shelf can accomodate up to sixteen  
0 (16) A829L4 cards. All power is provided by the RM16M  
0 transformer with interface jacks and pins available on  
0 the rear panel of the shelf. The front panel has audio  
0 test jacks to aid in equalization and level setup, a  
0 loopback mode LED, power LED, and a gain control for re-  
0 ceive level decibel range.

0 When assigning the cards to RM16M card slots, keep in  
0 mind that the RM16M has two separate power supplies. One  
0 powers slots 1-8 and ones powers slots 9-16. Therefore,  
0 assign the A829L4 cards or UDS modems in a manner which  
0 equalizes the load on each power supply.

0 TECHNICAL SPECIFICATIONS FOR THE UDS A829L4 AUX. DATA SET

0 Receiver Gain.....20dB loss to 20dB gain, switch se-  
0 lectable in 10 db increments. 0 to  
0 10 dB gain adjust for intermediate  
0 values.

0 Receive Frequency  
0 Response.....100 Hz to 10KHz (+1 dB) 200 Hz to 5  
0 KHz (+0.5 dB)

0 I/O Line Frequency..150, 600, or 1200 KHz, switch se-  
0 lectable

0 RELEASE 28.01  
0 93 12 03

0 11.3.9 DEC VT-320 Series VDU0 (a) General Description

0 The Multinational versions of Digital Equipment Corp. (DEC)  
0 VT-320 Series Video Display Units have been qualified for use in  
0 all DMS 100/200/250/300 RS-232C applications.

0 The VT320 Series Video Display Units are always provided with the  
0 following features:

- 0 - VT-220 Compatibility
- 0 - Bidirectional Printer Port (unapproved application)
- 0 - 15 Programmable Function Keys
- 0 - Modem Support
- 0 - Non-glare Screen
- 0 - DEC423 port

0 (b) References

0 None

0 (c) Provisioning Considerations:

0 ( i) Provide the DEC VT320 Series VDUs as required by the  
0 Telco for use as MAP Terminal, portable MAP Terminal, or  
0 RTIF Terminal in a local or remote environment. If pro-  
0 visioning in a local environment where 20mA Current Loop  
0 Operation is required, then provide one 232CL2 B & B  
0 Electronics of Ottawa, IL RS-232 Current Loop Adapter  
0 per VDU required.

0 The DEC VT320 Series VDUs can be ordered using the fol-  
0 lowing codes:

0 VT320-JA DEC VT320 Series VDU Amber  
0 VT320-GA DEC VT320 Series VDU White  
0 VT320-HA DEC VT320 Series VDU Green  
0 VT2XX-AA VT200 Series Terminal Stand

0 ( ii) The DMS100 hardware required to support this unit is de-  
0 pendent upon the application as follows:

0 MAP Terminal - NT1X67 Cards are required on the IOC or  
0 CMC

0 RELEASE 28.01  
0 93 12 03

0 RTIF Terminal - NT9X26 RTIF I/F PCB

0 Power Source - NT0X87 Inverter Unit (Canadian applica-  
0 tions only) or the LaMarche Inverter  
0 (U.S. applications only).

0 ( iii) DMS100F applications using the VT-320 slave printer port  
0 must be tested prior to employment. This VT-320 capabil-  
0 ity has not been approved for use with the DMS100F.

0 Additionally, these units are conditionally approved for  
0 DMS-100F 20mA application. The units are approved for  
0 20mA applications when used in conjunction with the  
0 232CL2R Current Loop Adapter (CLA).

0 ( iv) The DEC VDU must be powered in accordance with ISG spec-  
0 ifications.

0  
0 RELEASE 28.01  
0 93 12 030 11.3.10 Intecolor Colortrend 220 VDU0 (a) General Description

0 The COLORTREND CT220R Color VDU has been qualified for use in the  
0 DMS100F environment. It joins the DEC VT220 VDU as the only two  
0 approved video display units approved for use with the DMS100  
0 family.

0 The COLORTREND CT220R VDU is manufactured by INTECOLOR CORPO-  
0 RATION in NORCROSS, GA. It has a 14 inch screen which can be  
0 programmed to display in eight (8) foreground colors and eight  
0 (8) background colors. The CT220R is fully compatible with the  
0 DEC VT100 AND VT220 terminals.

0 The CT220R has been approved for the US market only.

0 (b) References

0 None

0 (c) Provisioning Considerations:

0 ( i) For each VDU required order :

| 0 | QTY   | PEC    | DESCRIPTION                |
|---|-------|--------|----------------------------|
| 0 | _____ | _____  | _____                      |
| 0 | 1     | CT220R | COLORTREND CT220R VDU      |
| 0 | 1     | 105121 | COLORTREND CT220R KEYBOARD |

0 The above PECs includes the operator's manual.

0 A programmer's manual for the CT220R can be ordered if  
0 required. To order specify the following:

| 0 | PEC    | DESCRIPTION               |
|---|--------|---------------------------|
| 0 | _____  | _____                     |
| 0 | 999458 | CT220R Programmers Manual |

0 ( ii) Intecolor does not manufacture a terminal stand for the  
0 CT220R. When a terminal stand is required specify the  
0 following:

0 RELEASE 28.01  
0 93 12 03

| 0 | PEC              | DESCRIPTION                                                                                                                                                |

0 12.0 Tellabs 292 Conference/Alerting System

0 12.1 Introduction

0 The Tellabs 292R Conference/Alerting System is a multistation  
0 ringdown telephone conference circuit. It is designed primarily  
0 for use in local emergency reporting and alerting applications,  
0 and in business conferencing applications. The 292R system pro-  
0 vides simultaneous access for up to 60 local stations, either  
0 from a dedicated telephone (i.e, a "master station") or from any  
0 local telephone line via a listed directory number. Conferees are  
0 provided with emergency conference capability at their home or  
0 business telephones with no disruption of normal telephone ser-  
0 vice except during an emergency call. All stations assigned to  
0 the conference network are signaled via a distinctive ringing  
0 format on conference calls. The 292R systems may be used with  
0 any Class 5 or PBX switching system. Services provided by these  
0 systems are typically used by volunteer fire departments,  
0 paramedic teams, airport emergency crews, banks, stores, and fac-  
0 tories with multiple locations, and the like.

0 The 292R system affords a choice of three methods of originating  
0 a conference: Automatic Origination, Manual Origination, or a  
0 combination of the two. The method chosen will depend on telco  
0 requirements.

0 Automatic Conference Origination: A call from any lo-  
0 cal line to a listed emergency-reporting-directory number  
0 causes all stations assigned to the conference network to  
0 ring distinctively. Anyone in the Conference Network may  
0 answer the call and hold up the conference for the pur-  
0 pose of relaying information. The conference can be  
0 maintained until the last conferee goes on-hook, or can  
0 be forced idle after a predetermined timeout interval  
0 (adjustable between 1.5 to 5 minutes).

0 Manual Conference Origination: In this arrangement, the  
0 master station is manned 24 hours per day and emergency  
0 reporting calls are received via a dedicated phone. The  
0 person on duty at the master station goes off-hook on an-  
0 other dedicated phone (for the conference network) caus-  
0 ing all other station with the conference network to ring  
0 distinctively. The duty person provides all conferees  
0 with details and direction regarding the emergency. The  
0 conference network is active as long as the master sta-  
0 tion remains off-hook.

0 RELEASE 28.01  
0 93 12 03  
0

0 Both Automatic and Manual Origination: This option is em-  
0 ployed when the master station can be manned only part of  
0 the time. While the master station is manned manual con-  
0 ferencing is enabled. While the master station is un-  
0 manned, a call to the listed emergency reporting  
0 directory number is transferred to the 291/292 System and  
0 automatic conferencing is enabled. This is done via a  
0 (TELCO PROVIDED) switch at the master station that trans-  
0 fers the fire reporting number from the master station to  
0 the Automatic Conferencing Module.

0 In addition to the operational capabilities previously mentioned  
0 (distinctive ringing on conference calls, automatic and/or manual  
0 conference origination, and compatibility with any conventional  
0 Class 5 or FCC-registered PBX switching system), the 291/292 Sys-  
0 tem provides the following functions related to its installation  
0 and operation:

- 0 \* sleeve-lead, loop-start (Type II E&M signaling inter-  
0 face), or ground-start control of conference access
- 0 \* accommodation of up to three ringing frequencies for har-  
0 monic ringing
- 0 \* ringing timeout to terminate ringing at stations where  
0 conference calls are not answered
- 0 \* timed siren control, either continuous or interrupted, un-  
0 der control of any number of stations
- 0 \* remote-access capability, whereby emergency personnel  
0 away from home or office can call in via an unlisted  
0 number and be connected to a conference in progress
- 0 \* an integral tone oscillator that eliminates the need to  
0 connect to Central Office (i.e., host or remote) tone  
0 sources
- 0 \* individual fusing for all modules in the system
- 0 \* optional supervisory lamp panel available
- 0 \* optional selective signaling for up to 11 groups of  
0 stations; in Central Office applications DTMF (Dual Tone  
0 Multifrequency) telephone sets are required

0 (c) Provisioning Considerations

0 ( i) The following equipment codes are currently available:

| 0 | PEC     | DESCRIPTION                    |
|---|---------|--------------------------------|
| 0 |         |                                |
| 0 | 292BR-1 | 23" 10-Line Conf/Alerting Sys  |
| 0 | 292DR   | 19/23" 10-Line Expansion Shelf |
| 0 | 9293    | 2W ARD Conf Orig Line Ckt      |
| 0 | 9296    | 2W ARD Conf Trk Access Ckt     |
| 0 | 9294    | 2W Conf Amplifier module       |
| 0 | 9121    | Tellabs 292 Tone Supply        |
| 0 | 9132    | Tellabs 292 Ringing Timer      |
| 0 | 9003A   | Telab 292 Ringing Interrupt    |
| 0 | 9133    | Tellabs 292 Long Timer         |
| 0 | 6072    | 1-Digit DTMF Dial Decoder      |
| 0 | 9021    | Tellabs 291/292 Fuse Module    |
| 0 | 9291    | Tellabs 2W ARD Line Ckt        |

0 ( ii) Basic Requirements For All Conferencing Arrangements  
0 (i.e., Automatic Conferencing, Manual Conferencing, or  
0 both):

0 The 292BR-1 System consists of one (1) 292BR mounting as-  
0 sembly, one (1) 80-5033 (Common Equipment Shelf), one (1)  
0 80-5034 (10-Line Station Shelf), and up to five  
0 provisionable 292DRs (10-Line Expansion Shelf).

0 The following modules are provisioned on the Common  
0 Equipment Shelf (80-5033) in all applications:

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - One 9294 2-Wire Conference Amplifier Module
- 0 - One 9121 Tone Supply Module.
- 0 - One 9132 Ringing Timer Module.
- 0 - One 9003A Ringing Interrupter Control Module.
- 0 - Two 9021 Fuse Modules

0 ( iii) Specific Requirements For Automatic Conferencing: One  
0 9296 2-wire Automatic Ringdown (ARD) Trunk Access Module  
0 is required. It is strongly recommended that two 9296's  
0 arranged as a hunt group be provided.

0 In Automatic Conferencing arrangements where two  
0 9296's are used (as recommended), it is also strongly  
0 recommended that one conference telephone location  
0 (typically, the fire station) be supplied with a two  
0 position switch (the telco is responsible for engi-  
0 neering, furnishing, and installing the two position  
0 switch). This switch is used to activate/deactivate  
0 one or the other 9296's and busy out the associated  
0 line circuit in the central office.

0 The benefit of the above arrangement is that one 9296  
0 is always available to initiate a conference. For ex-  
0 ample:

0 If a conference is held up by a caller  
0 failing to go on-hook (e.g, when abandoning  
0 a burning building), the duty fireman need  
0 only set the switch to the other position  
0 which drops the call and readies the system  
0 for another call via the other 9296.

0 Secondly, with only one 9296 active at a time, two  
0 simultaneous fire-reporting calls would result in one  
0 being processed and the other receiving busy tone.

0 Consequence of not providing the above arrangement:

- 0 1. If a conference were held up as described above  
0 the system would be locked-up indefinitely, no  
0 other emergency-reporting calls could be proc-  
0 essed.
- 0 2. If both 9296's are active at the same time, two  
0 simultaneous fire-reporting calls would result in  
0 both calls being connected to the conference,

0 RELEASE 28.01  
0 93 12 03  
0

0 possibly creating confusion between the callers  
0 and the firemen.

0 Provide one SD point for each line connected to a  
0 9296.

0 ( iv) Specific Requirements For Manual Conferencing: One 9293  
0 2-Wire Automatic Ringdown (ARD) Conference Originate Line  
0 Circuit Module and two dialless telephones at each key  
0 location. One phone is used to answer fire-reporting  
0 calls and the other is used to originate the conference  
0 when the duty fireman goes off-hook.

0 ( v) Specific Requirements For Combined Automatic And Manual  
0 Conferencing:

0 1. One 9296 2W ARD Trunk Access Module  
0 NOTE: Provide one SD point for each line connected to  
0 a 9296.

0 2. One 9293 2W ARD Conference Originate Line Circuit  
0 Module

0 3. Two dialless telephones configured as defined in (  
0 iv).

0 ( vi) System Options Common To All Conferencing:

0 \* Remote Access: Provided only when a community siren  
0 is used. At least one 9296 must be provided for slot  
0 3 of the common shelf. However, a maximum of three  
0 (3) 9296's may be provided for the common shelf slots  
0 3 thru 5 to facilitate Remote-Access Call-In for  
0 three users simultaneously.

0 NOTE: Provide one SD point for each line connected to  
0 a 9296.

0 \* Siren Control: The 9133 Long Interval Timer is re-  
0 quired to start the siren and control its duration.  
0 The master station and selected fireman may be pro-  
0 vided with a pushbutton to initiate the siren and  
0 control its duration via the 9133 module. This push-  
0 button must be engineered, furnished, and installed  
0 by the Telco.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 \* DTMF Siren Activation: Provide the 6072 Single Digit  
0 Dual Tone Multifrequency (DTMF) Module and the 9133  
0 Long Interval Timer to allow each conference station  
0 with a DTMF telephone to start a siren and control  
0 its duration.

0 12.3.2 Discrimination Numbering

0 The OPM cabinet is identified using OPE XX discrimination number  
0 where X equals the integers 0-9. The OPE number may be unique  
0 per office or unique per site. The unique per office number must  
0 not conflict with existing RLM, LME, LCE, or RLCM numbers.

0 The internal swinging equipment racks are identified by OPE XX  
0 bay Y where X equals integers 0-9 and bay Y equals bays 0-1.

0 12.3.3 DMS-100 Standard DF Terminal Blocks

0 (a) General Description

0 This document defines the Distributing Frame Terminal Blocks  
0 (DFTB) provisionable from the RTP approved sources (i.e. Northern  
0 Telecom Outside Plant Division (OPD) and Telzon ) and relates  
0 those products to specific applications.

0 A Connectorized Terminal Block (CTB) 8X32 can only be used for  
0 Line and Trunk Module 8-Wire (TM8) applications. Non-  
0 connectorized Terminal Block 8x32 can be used for Line, Trunk  
0 Module 8-Wire (TM8) and Miscellaneous applications.

0 Distribution frame terminal blocks are intended for use as a ter-  
0 minating device on Central Office or PBX distributing frames. A  
0 Terminal Block (TB) has two terminating sides, the Equipment Side  
0 (Termination of DMS-100 equipment) and the Cross Connect Side  
0 (Termination of incoming lines, trunks and miscellaneous cir-  
0 cuits).

0 Terminations on the Equipment Side can be made by using terminal  
0 pins (NON-CONNECTORIZED) or interlocking connectors  
0 (CONNECTORIZED). Connectorized Terminal Blocks (CTB) can be used  
0 with Northern Telecom's DMS-100 connectorized cables for quick  
0 installation. Customers have realized a full 75 to 95% reduction  
0 in installation labor costs. It should be noted CTB'S are used  
0 for lines and trunks (TM8) applications only.

0 Terminations on the Cross Connect Side are made by using only  
0 terminal pins.

0 TERMINAL PIN TYPE

0 There are (3) terminal pin types : Single Post Wire-Wrap (SPWW),  
0 Bifurcated Wire-Wrap (BWW) and Insulation Displacement Bifurcated  
0 (IDV) also called Quick Connect (Q-CONN).

0 SINGLE POST WIRE-WRAP terminal pin is rectangular in shape and  
0 extends from the face of the terminal field for connection of 22  
0 to 26 AWG wire.

0 Single Post Wire-Wrap  
0 \_\_\_\_\_

RELEASE 28.01  
93 12 03

Figure 314.3 Front View of Terminal

BIFURCATED WIRE-WRAP terminal pin is "U" in shape and extends from the face of the terminal field for convenient connection of 22 to 26 AWG wire.

Bifurcated Wire-Wrap

Figure 314.4 Front View of Terminal

INSULATION DISPLACEMENT BIFURCATED (IDV) OR QUICK CONNECT (Q-CONN) terminal pin is "W" in shape. Although this terminal is ordered less than 6" of the time it automatically strips, terminates, and cuts to length the wire applied to it. When a wire is inserted into the termination slot, the insulation is displaced and the exposed conductor is wedged into an electrical connection with the terminal. Simultaneously, the strain relief connection is made and the cutter bar shears the wire to the correct length. IDV or Q-CONN terminals can be used with 22 or 24 AWG wire.

QUICK CONNECT

RELEASE 28.01  
93 12 03

Figure 314.5

#### CONNECTOR TYPE

Up to four interlocking 32 pair TRW or AMP male (plug) ribbon connectors are telephone industry standard offerings on both OPD and TELZON 8X32 CTB'S. The male (plug) connectors are designed to engage spring clips on female (receptable) connectors (standard on Northern Telecom's connectorized line cables). These connectors may be disconnected by using a pointed object and depressing the metal spring of the connector and pulling them apart on at least one end. This latching arrangement eliminates the need for additional locking hardware and safeguards against accidental uncoupling.

Each connector is wired for 32 circuits. When used with Line equipment, one connector represents one Line Sub Group (LSG) or one half of a Line Drawer. A standard CTB with four (4) connectors will then terminate four (4) LSG'S or two (2) Line Drawers.

For Trunk Module 8-Wire (TM8) equipment, one connector represents 4 of 16 wires required for each card slot on a TM8 shelf. A standard CTB with four connectors will then terminate all 16 wires required for each card slot for a total of 240 wires for 15 slots per shelf.

Vendor Equipment Qualification List (VEQL)

#### (c) Provisioning Considerations

0 RELEASE 28.01  
0 93 12 03  
0

0 ( i) If a particular item is not on the VEQL, then a product  
0 introduction request must be submitted to Design  
0 Engineering/Marketing Product Management as outlined in  
0 CEP 207 CPC Code Procedure. If accepted it must be intro-  
0 duced into the DMS-100 Order Capture Process via the OEM  
0 Process so that specific Support/Engineering/Marketing  
0 details are addressed and documented.

0 ( ii) QUANTITY OF TERMINAL BLOCKS

0 The quantity of Terminal Blocks (TB) for an office (D) is  
0 determined by the sum of blocks required for Trunk Cards  
0 (A), Lines (B) and Miscellaneous (C):  $(A + B + C) = (D)$ .

0 ( iii) QUANTITY OF TERMINAL BLOCKS FOR TRUNK CARDS

0 An estimate of required terminal blocks for Trunk Cards  
0 mounted in Maintenance Trunk Module (MTM) Shelves can be  
0 made by using the TRUNK CARD PIN ROW REQUIREMENT CALCU-  
0 LATION TABLE (see next page).

0 --- Enter the Quantity of Trunk Cards mounted in MTM  
0 shelves which require MDF terminations in column (A).

0 --- Select the Block Type Ordered in column (B)  
0 (6X,8X,or 10X..etc). The numbers in the columns rep-  
0 resent the Pin Rows required for each card type per  
0 the Contract Drafting Department 3424.

0 --- Determine the Total Number of Pin Rows Required  
0 for each card type in column (C) by multiplying the  
0 Quantity of Trunk Cards in column (A) by the number  
0 of Pin Rows required in column (B):  $(A \times B) = C$ .

0 --- Determine the Total Number of Pin Rows Required  
0 for all Trunk Cards (D) by adding the Total Number of  
0 Pin Rows Required for each card type together in col-  
0 umn (C).

Total Number of Pin Rows Req. for all cards (D) \_\_\_\_\_

NOTE 1 Provide at least 1 Dedicated Block for NT3X09AA/BA cards.  
The result should be rounded up to the next whole number.

RELEASE 28.01  
93 12 03

--- Determine the Number of Pin Rows on the Type of Block Ordered (E) ( See Example ).

Example:

| Terminal Block | Number of Pin Rows on Block |
|----------------|-----------------------------|
| 8 X 32         | 32                          |
| 10 X 30        | 30                          |

--- Terminal Blocks for Trunk Cards (F) can be determined by using the formula below:

Total Number of Pin Rows Required  
for All Trunk Cards (D) Terminal Blocks  
===== for MTM Trunk  
Cards (F)  
Number of Pin Rows on the Type of  
Block Ordered (E)

The result of the formula should be rounded up to the next whole number.

( iv ) QUANTITY OF TERMINAL BLOCKS FOR LINES

An estimate of required terminal blocks for Lines (LSG'S) can be made by using the LINE SUB GROUP PER BLOCK CALCULATION TABLE.

LINE SUB GROUP PER BLOCK CALCULATION TABLE

|                                     | (A)<br>TERMINAL BLOCK TYPE |      |      |       |
|-------------------------------------|----------------------------|------|------|-------|
|                                     | 8X24                       | 8X30 | 8X32 | 10X30 |
| QUANTITY OF LSG'S<br>PER BLOCK TYPE | 3                          | 3    | 4    | 4     |

--- Select the Block Type Ordered in column (A). The numbers in the columns represent the quantity of LSG'S which can be terminated on one block per the Contract Drafting Department 3424.

Total Number of Pin Rows Required for all Items (D)

```
0 --- Note 1:Provide at least (1) Dedicated Block for
0 Trunk Modules. The result should be rounded up to the
0 next whole number.
```

0 --- Note 3: Provide (1) Dedicated Block for each  
0 unit.

0 --- Terminal Blocks for Miscellaneous Items (F) can  
0 be determined by using the formula below:

**0** The result of the formula should be rounded up to the  
**0** next whole number.

0 Approved sources for connectorized terminal blocks offer  
0 four (4) standard telephone pin configurations. Each pin  
0 configuration has a specific application for Trunks (TM8)  
0 and or Line circuits only.

0           Figures A-F show each configuration's unique pin layout,  
0           circuit and connector number growth patterns. Figures A-D  
0           can be used for line circuit applications and Figures E-F  
0           are only to be used for Trunk (TM8) applications.

## 0

0  
0 RELEASE 28.01  
0 93 12 03

0 For line application the circuits for each connector are  
0 numbered (00)-(31) representing 32 line circuits. Circuit  
0 number growth patterns can be Top to Bottom (See Figure  
0 314.6) or Bottom to Top (See Figure 314.7), with all pat-  
0 terns growing Left to Right (See Figures 314.6-314.9)

0 Connectors and Line Sub Groups (LSG) can be grouped hor-  
0 izontally in rows (See Figures 314.8 and 314.9), with a  
0 growth pattern Bottom to Top (See Figure 314.8) or Top to  
0 Bottom (See Figure 314.9). Also, they can be grouped  
0 vertically in columns, with a growth pattern Left to  
0 Right (See Figures 314.6 and 314.7)

0 The Tip and Ring configuration for each CTB is unique to  
0 the internal wiring and can not be changed. Configura-  
0 tions can be Tip over Ring (See Figures 314.6 and 314.9)  
0 or Tip below Ring (See Figures 314.7 and 314.8).

0 ( viii) TRUNK (TM8) APPLICATIONS

0 For Trunk application the circuits for each connector are  
0 number (00)-(29) representing 30 circuits. Circuit number  
0 growth pattern will always to Left to Right.

0 Connectors for Trunks are grouped horizontally in rows,  
0 with a growth pattern Top to Bottom (See Figure 314.11)  
0 or Bottom to Top (See Figure 314.10)

0 The Tip and Ring Configuration for Trunks can be Tip over  
0 Ring (See Figure 314.11) or Tip below Ring (See Figure  
0 314.10).

0 Figure 314.10 - Trunk (TM8) Application

0 Provision OPD or Telzon CTBs with a block layout as per  
0 Figure 314.10 for TM8'S. Note: Connector growth is from  
0 Bottom to Top and Left to Right circuit number growth,  
0 with a Tip below Ring pin pattern.

0 ( ix) PIN CONFIGURATION FOR NON-CONNECTORIZED TERMINAL BLOCKS

0 Approved sources for Non-Connectorized Terminal Blocks  
0 (Non-CTB'S) offer many standard terminal pair configura-  
0 tions. A Non-CTB has no pin configuration restrictions  
0 like the CTB.

0 These blocks are generally used for terminating miscella-  
0 neous circuits; however, the connectorized 8X32 layout  
0 (Figures A thru F) for Lines and Trunks may be provi-  
0 sioned in conjunction with this block.

## 0 13.0 Building Block Engineering - MIS

0 This document simplifies the provisioning of miscellaneous equipment  
0 on the MIS frame via the development of DMS Building Blocks.

0 Building Blocks included herein are designed with the assumption that  
0 it is an initial MIS installation.

0 The following options and features are NOT covered by this document:

- 0 - Remote Miscellaneous/Service Equipment (RME/RSE) function
- 0 - DMS-250 Terminal Block Assembly (NT3X25BB)
- 0 - Auxiliary Fuse Panel for TOPS

0 13.1 HARDWARE PROVISIONING

## 0 15.0 Wideband Test Access (WTA) Panel

0 The Wideband Test Access (WTA) Panel replaces the use of the Main Dis-  
0 tributing Frame (MDF) for metallic cross-connecting of test circuits  
0 (such as the Line Test Unit/Multiline Test Unit (LTU/MTU)), Metallic  
0 Test Access (MTA), and line equipment in DMS offices.

0 The WTA Panel is a cross-connect panel that provides the metallic  
0 cross-connect capability for the testing of DMS wideband subscriber  
0 services such as Datapath and ISDN as well as existing voice frequency  
0 DMS-100 subscriber services. The WTA is recommended for the testing  
0 of Datapath service and is a must when a PGTC (Pair Gain Test Control-  
0 ler) is used in the Central Office for testing. The existing MDF ca-  
0 bling method cannot support the testing of these services mainly  
0 because of the transmission impairment caused by the excessive switch-  
0 ing office cabling. For example, the WTA reduces the cabling needed  
0 in large offices that have non-integrated SLC-96 subscriber carrier  
0 systems that require the use of the Pair Gain Test Controller (PGTC).

0 This method of cross-connecting office wiring for the test circuits,  
0 MTA, and test access cables drastically reduces the amount of office  
0 cabling resulting from the existing MDF method.

0 This panel mounts on the Miscellaneous Equipment (MIS) Frame NT0X02AB.  
0 With the panel mounted on an MIS frame within the DMS equipment frame  
0 lineups, all unnecessary cabling to the MDF is eliminated and this re-  
0 sults in much shorter office wiring for the testing of subscriber ser-  
0 vices.

## 0 | 15.1 HARDWARE PROVISIONING

0

### 0 | 15.1.1 HARDWARE USAGE RESTRICTIONS

0

0 | Not applicable.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 | 15.1.1.2 HARDWARE DEPENDENCIES

0  
0 | When a WTA Panel is added as an extension to an existing office  
0 | that has:

0 | NT2X52ACs  
0 | NT2X52AGs  
0 | NT2X52APs

0 | TM8 Trunk Module shelves, a NT2X52AU Product Change kit must be  
0 | ordered for each shelf to be connected to the WTA panel. The  
0 | MONTALK trunks cannot be connected to the WTA panel on these  
0 | shelves unless they are retrofitted with this product change kit  
0 | to bring the release of the shelf up to NT2X52AV.

0 | For all new offices using the WTA panel, order the new TM8 shelf,  
0 | NT2X52AV. The NT2X52AV is essentially a NT2X52AG with a NT2X52AU  
0 | product change kit applied to it on the manufacturing shop floor.

## 0 | CIRCUITS PER CARD

0  
0 | Not applicable

## 0 | DISCRIMINATION NUMBERING

0  
0 | Not applicable

0 | 15.1.3 PROVISIONING CONSIDERATIONS

0  
0 | 2.4.1 The Wide-band Test Access (WTA) Panel (NT7X76AA/B0233245) was  
0 developed to replace the functionality of the Main Distribution  
0 Frame (MDF) for metallic cross-connecting of the line equipment  
0 to the Metallic Test Access (MTA) and test heads. The DMS-100  
0 test heads include the Line Test Unit (LTU), the Multi-line Test  
0 Unit (MTU), and the Enhanced Services Test Unit (ESTU).

0 | The introduction of the WTA panel drastically reduces the amount  
0 of Central Office wiring necessary to cross-connect the test bus  
0 side of the line cards to the MDF, the Metallic Test Access  
0 (MTA) and the test heads. The panel can be engineered to be  
0 mounted into the Miscellaneous Equipment (MIS) Frame. When the  
0 MIS Frame is engineered into the DMS Equipment frame line-up,  
0 all the equipment cross-connections are completed locally on the  
0 WTA panel, not at the MDF.

0 | The WTA panel also drastically reduces the amount of CO wiring  
0 necessary to support the channel testing of Universal Digital  
0 Loop Carriers (UDLC) using a Pair Gain Controller (PGTC) and the  
0 channel testing of Integrated Digital Loop Carriers (IDLCs) us-  
0 ing the Loop Test Applique. Again the WTA panel can be engi-  
0 neered into the MIS Frame to eliminate unnecessary wiring  
0 between the CO equipment and the MDF.

0 RELEASE 28.01  
0 93 12 03

0 2.4.2 There are two (2) versions of the WTA Panel:

0 NT7X76AA WTA Panel

0 NT7X76BA WTA Panel (Dedicated LTU/MTU)

0 The NT7X76AA/BA allows the cross-connection of up to 30 NT3X09BA  
0 MTA circuits in a matrix of three (3) horizontal NT3X09BA rows  
0 by ten (10) vertical NT3X09BA columns. This is equivalent to  
0 the cross-connection of 24 horizontal test appearances to 80  
0 vertical appearances. The NT3X09BA card has 8 horizontals and 8  
0 verticals.

0 The NT3X09AA is not recommended for use with the WTA panel. The  
0 NT3X09AA has a 4X8 matrix as opposed to the NT3X09BA which has  
0 an 8X8 matrix. An NT3X09AA can be connected to the WTA panel us-  
0 ing the NT3X09BA connectorized cable, but once a WTA horizontal  
0 row has a NT3X09AA, only NT3X09AAs can be connected to that par-  
0 ticular horizontal row. The NT3X09AAs and NT3X09BAs cannot be  
0 mixed on the same row of a WTA panel.

0 The NT7X76BA is similar to NT7X76AA with one exception. The  
0 first horizontal test appearance of the 24 horizontal test ap-  
0 pearances of the NT7X76BA panel is grouped into five (5) sub-  
0 groups, each horizontal 0 with access to 16 verticals when  
0 NT3X09BA cards are used for cross-connection purposes. Each  
0 horizontal subgroup can have a dedicated LTU/MTU. Hence, up to  
0 five (5) dedicated LTU/MTUs can be connected to NT7X76BA. If  
0 NT3X09BA cards are used, each dedicated LTU/MTU has access to 16  
0 verticals or 8 Line Concentrating Modules (LCMs) within each  
0 horizontal subgroup 0.

0 For U.S. applications, the NT7X76BA is the standard WTA panel  
0 for all configurations that require dedicated LTU functionality.

0 2.4.3 The NT7X76BA WTA Panel is only used for the dedicated LTU/MTU  
0 function.

0 When the dedicated LTU/MTU function is used, the vertical ap-  
0 pearances are expanded using the NT7X76BA. The horizontal ap-  
0 pearances can be expanded with the NT7X76AA.

0 The NT7X76AA can also be used if the office requires more than  
0 one (1) (horizontal) row of WTA Panels or more than 24 horizon-  
0 tal test appearances.

0

0 RELEASE 28.01  
0 93 12 03

0 2.4.4 For offices without dedicated LTU/MTUs, only NT7X76AA would be  
0 required for expansion both horizontally and vertically.

0 For offices with dedicated LTU/MTUs, the first row of the WTA  
0 Panel matrix would be of the NT7X76BA type. Our current stand-  
0 ard is to have dedicated LTU/MTUs on the first row of the matrix  
0 of WTA Panels (i.e. NT7X76BA) and not to have dedicated LTU/MTUs  
0 on the second and all subsequent rows of the matrix of WTA Pan-  
0 els (i.e. NT7X76AA). If connection to more dedicated LTU/MTUs  
0 was required, NT7X76BA Panels would be used for the second row  
0 of WTA Panels. Otherwise, the NT7X76AA Panel should be used.

0 2.4.5 The WTA Panel replaces the Intermediate Distribution Frame (IDF)  
0 for the testing of the universal SLC 96 subscriber loop carrier  
0 system which uses an AT&T test tool called Pair Gain Test Con-  
0 troller (PGTC).

0 The location of the WTA shall be selected such that the overall  
0 cable length from the PGTC to the universal SLC 96 COT CU (Cen-  
0 tral Office Terminal Channel Unit), and the total multiple cable  
0 length is less than 2500 feet (see Figure 1 on page 19-158).  
0 'Multiples' are all the open-ended cables connected to the test  
0 signal path; namely, all the open-ended WTA/MTA cables bridged  
0 on the test signal path between the PGTC and the COT CU. Since  
0 the WTA Panel consists of a 3 row x 10 column matrix of WTA to  
0 MTA connectors, and assuming that all 30 connectors are equipped  
0 with cables, the total number of 'multiples' is:  $(10-1) + (3-1)$   
0 = 11. The decrements by one are necessary because one horizontal  
0 and one vertical multiple belong to the test signal path. The  
0 number of multiples will increase if more WTA panels are used.

0 In existing offices, some equipment relocation may be necessary  
0 in order to comply with the cable length restrictions when PGTCs  
0 are used.

0 Referring to the Figure 1 on page 19-158, the PGTC to COT CU ca-  
0 ble length, L, is composed of the following segments:

0 
$$L = (\text{PGTC to MDF}) + (\text{MDF to 2X90}) + (\text{2X90 to APPLIQUE}) +$$
  
0 
$$(\text{APPLIQUE to WTA}) + 2 \times (\text{WTA to MTA}) + (\text{WTA to LCM}) +$$
  
0 
$$(\text{LCM to MDF}) + (\text{MDF to COT CU})$$

0 The PGTC to COT cable length ("L"), must be calculated based on  
0 the longest metallic patch between the PGTC and the furthest  
0 universal SLC 96 COT CU in the central office.

0

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 2.4.6 The WTA panel mounts on the Miscellaneous Equipment (MIS) Frame  
0 NT0X02AB. With the panel mounted on an MIS frame within the DMS  
0 equipment frame lineups, much of the cabling to the MDF can be  
0 eliminated and this results in much shorter office wiring for  
0 the testing of subscriber services.

0 For installation into an existing MIS Frame in an existing of-  
0 fice, the WTA Panel(s) can be mounted on any available shelf po-  
0 sition of the MIS frame, preferably the top shelf position.  
0 Before engineering the Panel(s) into the frame, insure that the  
0 cable trough has adequate room for the necessary WTA Panel cabl-  
0 ing. Remember, the MIS Frame must be in proximity to the MTAs,  
0 test heads, etc..

0 For initial and extension offices requiring new MIS Frames, the  
0 WTA Panels are to be engineered and mounted on standard shelf  
0 positions in the following order:

|   |          |          |
|---|----------|----------|
| 0 | Panel #1 | 65 Front |
| 0 | Panel #2 | 51 Front |
| 0 | Panel #3 | 51 Rear  |
| 0 | Panel #4 | 32 Front |
| 0 | Panel #5 | 32 Rear  |
| 0 | Panel #6 | 18 Front |
| 0 | Panel #7 | 18 Rear  |
| 0 | Panel #8 | 04 Front |

0 Currently WTA cannot be mounted on shelf position 65R because of  
0 the conflict with the ground cable lug. This restriction will be  
0 removed in the future when the workaround is available.

0 Notes:

- 0 1. A maximum of 8 WTA Panels can be provisioned per NT0X02AB Mis-  
0 cellaneous Frame.
- 0 2. For ease of engineering cables, the WTA Panels are assigned  
0 from the top of the MIS frame to the bottom.

0 2.4.7 WTA Panel Interconnect Cables:

0 To allow open access to the WTA Panel's connectors, all WTA  
0 panel interconnect cables (e.g. MTA Cables) are to be routed be-  
0 hind the panel(s).

0 RELEASE 28.01  
0 93 12 03

0 2.4.8 Although a Frame Supervisory Panel (FSP) is not required for the  
0 WTA Panel, an FSP can be mounted in shelf position 45F if other  
0 devices (which can mount on the MIS Frame) require an FSP.  
0 Hence, if the MIS Frame is not fully provisioned with WTA Panels,  
0 other valid hardware units can be mounted.

0 2.4.9 To minimize the office wiring required for line testing, the  
0 Maintenance Trunk Modules (MTM) that are provisioned with  
0 NT3X09BA cards and LTU/MTUs should be reduced to a minimum and  
0 placed in the adjacent TME Frames next to the MIS Frames containing  
0 WTA Panels.

0 The Line Concentrating Equipment Frames (LCE) and should be  
0 clustered around the MIS Frames containing WTA Panels in order  
0 to minimize the cabling to these panels.

0 Hence, the signal loss caused by office wiring should be reduced  
0 to the minimum that is possible. The signal loss should be less  
0 than one (1) db in most offices.

0 2.4.10 Discrimination Numbering

0 WTA Panels NT7X76AA/BA are numbered from 000 on up (e.g. WTA  
0 000, WTA 001, etc.).

0 2.4.11 WTA Panel Configuration for Offices with Line Size  $\geq$  75,000

0 For offices larger than 75,000 lines and requiring more than  
0 three (3) WTA Panels, the straight forward WTA matrix configura-  
0 tion cannot be used due to the software limitation of a maximum  
0 of 32 multiples eight (8) verticals each which can be datafilled  
0 for each horizontal subgroup i.e. 256 verticals.

0 The way to solve this problem is to split the total number of  
0 multiples into either groups of 32 (using Method 1) or groups of  
0 31 (using Method 2).

0 Method 1

0 Using Method 1, the multiples can be divided evenly into two (2)  
0 groups of up to 32 multiples within each group. Each WTA Panel  
0 allows the cross-connection of up to ten (10) multiples except  
0 for the fourth panel which can only have two (2) multiples.  
0 Hence, WTA Panels "B", "C", "D", and "E" provide cross-connections  
0 for 32 multiples.

0 Access to the line circuits is provided via the extended verti-  
0 cals of WTA Panel "A" P1 to the horizontals of WTA Panel "B" as  
0 illustrated. Therefore, the test circuits connected to WTA  
0 Panel "A" have access to more than 75,000 lines by using the ex-  
0 tended vertical and horizontal connections.

0 The connections between WTA Panels "A" and "B" and between WTA  
0 Panels "A" and "F" are for illustration purposes only. That is,  
0 the first group of eight (8) verticals on WTA "A" are datafilled  
0 as extended verticals and connected to the first group of eight  
0 (8) horizontals datafilled as extended horizontals on WTA "B".  
0 The second group of eight (8) verticals of WTA "A" are connected  
0 to the first group of eight (8) horizontals of WTA "F". Simi-  
0 larly, the third and fourth group of eight (8) verticals on WTA  
0 "A" are connected to the second group of eight (8) horizontals  
0 of WTA "B" and "F" respectively. The fifth and sixth group of  
0 eight (8) verticals on WTA "A" are connected to the third group  
0 of eight (8) horizontals on WTA "B" and "F" respectively. The  
0 actual connections are made from connectors P43 to P44 of WTA  
0 "A" to connectors P31 to P42 and P97 to P108 of WTA "B" and "F".

0 Method 2

0 Using Method 2, WTA Panel "A" is connected to WTA Panel "B" in  
0 such a way as to provide for the cross-connections for the first  
0 group of 29 (32-3) multiples via WTA Panels "A", "B", "C", and "D"

0 RELEASE 28.01  
0 93 12 03

0 as in a normal matrix configuration. Three (3) vertical multi-  
0 ples are used for expansion into the second group.

0 For the second group of 32 multiples via WTA Panels "F", "G",  
0 "H", and "I", the extended verticals from WTA "A" are connected  
0 to the horizontals of WTA "B".

0 The connections between WTA Panels "A" and "F" are for illus-  
0 tration purposes only. That is, the first group of eight (8)  
0 verticals datafilled as extended verticals on WTA "A" is con-  
0 nected to the first group of eight (8) horizontals datafilled as  
0 extended horizontals on WTA "F". Similarly, the second group of  
0 eight (8) verticals on WTA "A" is connected to the second group  
0 of eight (8) horizontals on WTA "F". The third group of eight  
0 (8) verticals on WTA "A" is connected to the third group of  
0 eight (8) horizontals on WTA "F". The actual connections are  
0 made from connectors P43 to P48 on WTA "A" to connectors P31 to  
0 P42 and connectors

0 Differences Between Methods 1 and 2

0 Method 1 requires one (1) more WTA Panel which is panel "E" and  
0 three (3) more NT3X09BA cards, six (6) instead of three (3),  
0 connected to panel "A".

0 Using Method 1, line testing involving the first and second  
0 groups of 32 multiples is subjected to the multiple cabling  
0 within the group or a maximum of 32 multiple cables. Using  
0 Method 2, line testing involving the second group of 32 multi-  
0 ples is also involve the first group of 29 multiples or is sub-  
0 jected to a maximum of 61 multiple cables.

0 Generally, Method 1 would be preferred over Method 2 due to the  
0 effect on line testing. However, Method 2 may be worth consid-  
0 ering if an LCE expansion is done properly to reduce the effect  
0 of multiple cabling on line testing.

## 0 16.0 Miscellaneous Hardware Kits

0 The following PECs have been introduced for U.S. Application only:

0 NT0X58AE : 25 Frame Hardware Kit  
0 NT0X58AF : 50 Frame Hardware Kit  
0 NT0X58AG : 75 Frame Hardware Kit  
0 NT0X58AH : 100 Frame Hardware Kit  
0 NT0X58AJ : 10 Frame EXT. Hardware Kit  
0 NT0X58AK : 10 Frame Remote Hardware Kit  
0 NT0X58AL : 0-2 Frame EXT. Hardware Kit  
0 NT0X58AM : 3-5 Frame EXT. Hardware Kit  
0 NT0X58AN : 5 Frame Remote Hardware Kit  
0 NT0X58AP : 1 Frame RLCM Hardware Kit  
0 A0383689 : Shipping Crate Assembly DMS-100

0 The appropriate Miscellaneous Hardware kit is to be ordered in Section  
0 17 of the Main Equipment List (MEL) by System Application Engineering.

0 The NT0X58-series kits differ from QKM kits in that the designation  
0 labels have been omitted, except for the following:

- 0 - ES-10153 G01 & G02 remain in kits NT0X58AE-AJ
- 0 - ES-10153 G14, G15, G17 & G18 remain in NT0X58AK

0 Only Frame Row, Position, and some PDC Shelf Name labels are included  
0 in kits NT0X58AL-AP.

0 All FSP labels except Frame Row and Position are now being affixed by  
0 Manufacturing. Equipment Application Engineering should provide PDC  
0 designation labels for any frame type (e.g. peripheral) not covered by  
0 these new kits. Refer to ES-10153-RTP Issue 08 or later.

0 16.1.3 PROVISIONING CONSIDERATIONS

0  
0 The appropriate Miscellaneous Hardware kit is to be ordered in  
0 Section 17 of the Main Equipment List (MEL) by System Application  
0 Engineering.

0 All FSP labels except Frame Row and Position are now being af-  
0 fixed by Manufacturing. Equipment Application Engineering should  
0 provide PDC designation labels for any frame type (e.g. periph-  
0 eral) not covered by these new kits. Refer to ES-10153-RTP Issue  
0 08 or later.

0 The A0383689 Shipping Crate Assembly is used when re-deploying  
0 the DMS-100 Frames from one site to another. One (1) Shipping  
0 Crate Assembly is required per frame for re-deployment. The ship-  
0 ping crates are not to be used to ship frames backs to NT.

0 Hardware kits for cabinetized applications are to be ordered  
0 based on the number of cabinets ordered for the initial or exten-  
0 sion order or for RSC-SONET installations. The following kits are  
0 now available:

| Application                      | PEC      | CPC      |
|----------------------------------|----------|----------|
| Domestic 25 Cabinet Initial      | NT0X58BA | B0237132 |
| Domestic 50 Cabinet Initial      | NT0X58BB | B0237133 |

0 Customer Questions.

0 Note: The quantity of spare circuit packs required in an office  
0 can only be determined after an order has been detail  
0 engineered. The customer should specify the quantity of  
0 spares to be provided for each circuit type.

0 All questions pertain to SPARE card quantities:

- 0 1. Quantity of old peripheral line cards and/or Ringing Bus  
0 MUX cards? \_\_\_\_\_
- 0 2. Quantity of old peripheral Bus Interface (NT2X16) cards? \_\_\_\_\_
- 0 3. Quantity of new peripheral single-slot line cards? \_\_\_\_\_
- 0 4. Quantity of new peripheral two-slot line cards? \_\_\_\_\_
- 0 5. Quantity of new peripheral Bus Interface (NT6X54) cards? \_\_\_\_\_
- 0 6. Quantity of DMS circuit packs? \_\_\_\_\_
- 0 7. Quantity of Supernode circuit packs? \_\_\_\_\_
- 0 8. Quantity of Supernode paddle cards? \_\_\_\_\_
- 0 9. Quantity of Supernode power modules? \_\_\_\_\_
- 0 10. Minimum quantity of spares to be provided for each  
0 circuit type? \_\_\_\_\_
- 0 11. Enter specific sparing information on blank lines  
0 below if required.

0 CALCULATIONS

0 Numbers preceded by an octothorpe (#) refer to question numbers  
0 in the Customer Questions section. The calculations are designed  
0 to spread the spare equipment over the storage bays as effi-  
0 ciently as possible.

0 Quantity NT3X55AA:

0 Calculate A = GREATER of: (#1 / 20) {Rounded up},  
0 OR: (#2 / 4 ) {Rounded up}

0 Quantity NT3X55AA = A

0 Quantity NT3X55BA:

0 Calculate B = (#4 / 10) {Rounded up}

0 Calculate C = #3 - (10 \* B)

0 Calculate D = (C / 30) {Rounded up}

0 Calculate E = GREATER of: (B + D),  
0 OR: #5

0 Quantity NT3X55BA = E

0 Quantity NTZZ27BA:

0 Calculate F = (A / 4) {Rounded up}

0 Calculate G = (E / 4) {Rounded up}

0 Calculate H = (#6 - (3 \* E))

0 Calculate J = (H / 20) {Rounded up}

0 Calculate K = (F + G + J)

0 Quantity NTZZ27BA = (K / 5) {Rounded up}

0 Quantity NT0X24BR and NTZZ27CA:

0 Calculate L = GREATER of: (#7 / 26) {Rounded up},  
0 OR: (#8 / 26) {Rounded up},  
0 OR: (#9 / 4) {Rounded up}

0  
0 RELEASE 28.01  
0 93 12 03

0 Calculate  $M = (L / 4)$  {Rounded up}

0 Quantity NT0X24BR =  $(L - M)$

0 Quantity NTZZ27CA = M

0 Quantity of Maintenance Storage Cabinet (MSC) (Newton)  
0 (Holds single and double slot cards) (150 slots total)  
0 (U.S. applications only) A0300464

0 Calculate  $N = (\text{Total spare slots required} / 150)$

0 Quantity A0300464 = N

0 Note: The MSS frame occupies an equipment bay space in the  
0 office line-up. The MSC can be placed away from the  
0 actual switch. Six (6) NT3X55BA Line Card Storage  
0 Chassis may be placed on one (1) MSC shelf.

## 0 18.0 DMS-100 Standard DF Terminal Blocks

0 This document defines the Distributing Frame Terminal Blocks (DFTB)  
0 provisionable from the RTP approved sources (i.e. Northern Telecom  
0 Outside Plant Division (OPD) and Telzon ) and relates those products  
0 to specific applications.

0 18.1 HARDWARE PROVISIONING

0

0 18.1.1 HARDWARE USAGE RESTRICTIONS

0

0 A Connectorized Terminal Block (CTB) 8X32 can only be used for  
0 Line and Trunk Module 8-Wire (TM8) applications. Non-  
0 connectorized Terminal Block 8x32 can be used for Line, Trunk  
0 Module 8-Wire (TM8) and Miscellaneous applications.

0 Distribution frame terminal blocks are intended for use as a ter-  
0 minating device on Central Office or PBX distributing frames. A  
0 Terminal Block (TB) has two terminating sides, the Equipment Side  
0 (Termination of DMS-100 equipment) and the Cross Connect Side  
0 (Termination of incoming lines, trunks and miscellaneous cir-  
0 cuits).

## 0 EQUIPMENT SIDE TERMINATION TYPE

0  
0 RELEASE 28.01  
0 93 12 03

0 Terminations on the Equipment Side can be made by using terminal  
0 pins (NON-CONNECTORIZED) or interlocking connectors  
0 (CONNECTORIZED). Connectorized Terminal Blocks (CTB) can be used  
0 with Northern Telecom's DMS-100 connectorized cables for quick  
0 installation. Customers have realized a full 75 to 95% reduction  
0 in installation labor costs. It should be noted CTB'S are used  
0 for lines and trunks (TM8) applications only.

0 CROSS CONNECT TERMINATION TYPE

0  
0 Terminations on the Cross Connect Side are made by using only  
0 terminal pins.

0 TERMINAL PIN TYPE

0  
0 There are (3) terminal pin types : Single Post Wire-Wrap (SP),  
0 Bifurcated Wire-Wrap (BIF) and Insulation Displacement Bifurcated  
0 (IDV) also called Quick Connect (QC).

0 SINGLE POST WIRE-WRAP terminal pin is rectangular in shape and  
0 extends from the face of the terminal field for connection of 22  
0 to 26 AWG wire.

0 Single Post Wire-Wrap

0 Front View of Terminal

0  
0 BIFURCATED WIRE-WRAP terminal pin is "U" in shape and extends  
0 from the face of the terminal field for convenient connection of  
0 22 to 26 AWG wire.

93 12 03

# INSULATION DISPLACEMENT BIFURCATED (IDV) OR QUICK CONNECT

(QC) terminal pin is "W" in shape. Although this terminal is ordered less than 6% of the time it automatically strips, terminates, and cuts to length the wire applied to it. When a wire is inserted into the termination slot, the insulation is displaced and the exposed conductor is wedged into an electrical connection with the terminal. Simultaneously, the strain relief connection is made and the cutter bar shears the wire to the correct length. IDV or QC terminals can be used with 22 or 24 AWG wire.

## CONNECTOR TYPE

Up to four interlocking 32 pair TRW or AMP male (plug) ribbon connectors are telephone industry standard offerings on both OPD and TELZON 8X32 CTB'S. The male (plug) connectors are designed to engage spring clips on female (receptable) connectors (standard on Northern Telecom's connectorized line cables). These connectors may be disconnected by using a pointed object and depressing the metal spring of the connector and pulling them apart

0 RELEASE 28.01  
0 93 12 03  
0

0 on at least one end. This latching arrangement eliminates the need  
0 for additional locking hardware and safeguards against accidental  
0 uncoupling.

0 Each connector is wired for 32 circuits. When used with Line  
0 equipment, one connector represents one Line Sub Group (LSG) or  
0 one half of a Line Drawer. A standard CTB with four (4) connec-  
0 tors will then terminate four (4) LSG'S or two (2) Line Drawers.

0 For Trunk Module 8-Wire (TM8) equipment, one connector represents  
0 4 of 16 wires required for each card slot on a TM8 shelf. A  
0 standard CTB with four connectors will then terminate all 16  
0 wires required for each card slot for a total of 240 wires for 15  
0 slots per shelf.

#### 0 QUANTITY OF TERMINAL BLOCKS

0  
0 The quantity of Terminal Blocks (TB) for an office (D) is deter-  
0 mined by the sum of blocks required for Trunk Cards (A), Lines  
0 (B) and Miscellaneous (C):  $(A + B + C) = (D)$ .

#### 0 QUANTITY OF TERMINAL BLOCKS FOR TRUNK CARDS

0  
0 An estimate of required terminal blocks for Trunk Cards mounted  
0 in Maintenance Trunk Module (MTM) Shelves and/or Remote Mainte-  
0 nance Module (RMM) can be made by using the TRUNK CARD PIN ROW  
0 REQUIREMENT CALCULATION TABLES.

0  
0 ---  
0 Enter the Quantity of Trunk Cards mounted in MTM and/or RMM  
0 shelves which require MDF terminations in column (A).

0  
0 ---  
0 Select the Block Type Ordered in column (B) (6X, 8X, or  
0 10X..etc). The numbers in the columns represent the Pin Rows  
0 required for each card type per the Contract Drafting Depart-  
0 ment 3424.

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 Determine the Total Number of Pin Rows Required for Cards ---  
0 and/or Modules in column (C) by multiplying the Quantity of  
0 Trunk Cards and/or Modules in column (A) by the number of Pin  
0 Rows required in column (B):(A X B)=C.

0  
0 Determine the Total Number of Pin Rows Required for all Trunk ---  
0 Cards and/or Modules (D) by adding the Total Number of Pin  
0 Rows Required for each card type and/or Modules together in  
0 column (C).

TOTAL NUMBER OF PIN  
ROWS REQUIRED FOR  
ALL ITEMS (D)

NOTE 1 Provide at least 1 Dedicated Block for NT3X09AA/BA cards  
which are part of the stock list for these part numbers.  
The result should be rounded up to the next whole number.

0 RELEASE 28.01  
0 93 12 03

0

0

0 Determine the Number of Pin Rows on the Type of Block Ordered  
0 (E) ( See Example ).

0 Example:

0

0 Terminal Block

0

0 8 X 32

0 10 X 30

Number of Pin  
Rows on Block

32

30

0

0 Terminal Blocks for Trunk Cards and Modules (F) can be deter-  
0 mined by using the formula below:

0 Total Number of Pin Rows Required  
0 for Trunk Cards and/or Modules (D)

0

0 Number of Pin Rows on the Type of  
0 Block Ordered (E)

==== Terminal Blocks  
for Trunk Cards  
and/or Modules  
(F)

0 The result of the formula should be rounded up to the next  
0 whole number.

# 0 QUANTITY OF TERMINAL BLOCKS FOR LINES

0

0 An estimate of required terminal blocks for Lines (LSG'S) can be  
0 made by using the LINE SUB GROUP PER BLOCK CALCULATION TABLE.

0

LINE SUB GROUP PER BLOCK CALCULATION TABLE

0

0 RELEASE 28.01  
0 93 12 03

0 --- Determine the Total Number of Line Sub Groups required  
0 for a Detail Engineered office by multiplying the Total Num-  
0 ber of Line Draws (NT6X05AA or NTB32BA) ordered by (2):

0  
0 
$$\left[ \begin{array}{l} \text{Required number of} \\ \text{NT6X05AA or NTB32BA} \end{array} \right] \times 2 \quad \text{====} \quad \begin{array}{l} \text{Total Number of} \\ \text{Line Sub Groups} \end{array}$$
  
0

0 --- Determine the Total Number of Line Sub Groups required  
0 for a Building Block Engineered office by the following ta-  
0 ble:

## 0 NUMBER OF LINE SUB GROUPS FOR BUILDING BLOCK PECS

0  
0  
0  
0  
0  
0  
0  
0

| BUILDING<br>BLOCK PART<br>NUMBER | NUMBER OF<br>LSG'S |
|----------------------------------|--------------------|
| LCM NTZZ08BA                     | 20                 |
| ISDN 2B1Q LCM NTZZ17HA           | 16                 |

0 --- Terminal Blocks for Lines can be determined by using the  
0 formulas below:

0  
0 
$$\frac{\begin{array}{l} \text{Total Number of Line Sub Group} \\ \text{requirement for office} \end{array}}{\begin{array}{l} \text{Number of Line Sub Groups per} \\ \text{Block Type Ordered} \end{array}} \quad \text{====} \quad \begin{array}{l} \text{Terminal Blocks} \\ \text{For Lines} \end{array}$$
  
0  
0

0 The result of the formula should be rounded up to the  
0 next whole number.

0 93 12 03

## 0 QUANTITY OF TERMINAL BLOCKS FOR MISCELLANEOUS

0  
0 An estimate of required terminal blocks for Miscellaneous items  
0 can be made by using the MISCELLANEOUS PIN ROW REQUIREMENT CALCU-  
0 LATION TABLES.

0 --- Enter the Quantity of Miscellaneous items which require  
0 MDF terminations in column (A).

0 --- Select the Block Type Ordered in column (B) (6X, 8X, or  
0 10X..etc). The numbers in the columns represent the Pin Rows  
0 required for each item type per the Contract Drafting Depart-  
0 ment 3424.

0 --- Determine the Total Number of Pin Rows Required for each  
0 item type in column (C) by multiplying the Quantity of Items  
0 in column (A) by the number of Pin Rows required in column  
0 (B):  $(A \times B) = C$ .

0 --- Determine the Total Number of Pin Rows Required for all  
0 Miscellaneous Items (D) by adding the Total Number of Pin  
0 Rows Required for each item type together in column (C).

TOTAL NUMBER OF PIN ROWS  
REQUIRED FOR ALL ITEMS (D) \_\_\_\_\_

--- Note 4: Provide (1) Dedicated Block for each unit.

0 RELEASE 28.01  
0 93 12 03

0

0 --- Determine the Number of Pin Rows on the Type of Block Or-  
0 dered (E) ( See example in section 2.4.6).

0 --- Terminal Blocks for Miscellaneous Items (F) can be deter-  
0 mined by using the formula below:

|   |                                   |                        |
|---|-----------------------------------|------------------------|
| 0 | Total Number of Pin Rows Required |                        |
| 0 | for all Miscellaneous Items (D)   | Terminal Blocks        |
| 0 | <hr/>                             | ==== for Miscellaneous |
| 0 | Number of Pin Rows on the Type of | Items (F)              |
| 0 | Block Ordered (E)                 |                        |

0 The result of the formula should be rounded up to the next  
0 whole number.

0

0 18.1.4 PIN CONFIGURATION FOR CONNECTORIZED TERMINAL BLOCKS

0

0 Approved sources for connectorized terminal blocks offer four (4)  
0 standard telephone pin configurations. Each pin configuration has  
0 a specific application for Trunks (TM8) and or Line circuits  
0 only.

0 Figures A-F show each configuration's unique pin layout, circuit  
0 and connector number growth patterns. Figures A-D can be used for  
0 line circuit applications and Figures E-F are only to be used for  
0 Trunk (TM8) applications.

## 0 LINE CIRCUIT APPLICATIONS

0  
0 For line application the circuits for each connector are numbered  
0 (00)-(31) representing 32 line circuits. Circuit number growth  
0 patterns can be Top to Bottom (See Figure A) or Bottom to Top  
0 (See Figure B), with all patterns growing Left to Right (See Fig-  
0 ures A-D).

0 Connectors and Line Sub Groups (LSG) can be grouped horizontally  
0 in rows (See Figures C & D), with a growth pattern Bottom to Top  
0 (See Figure C) or Top to Bottom (See Figure D). Also, they can be  
0 grouped vertically in columns, with a growth pattern Left to  
0 Right (See Figures A & B).

0 The Ring and Tip configuration for each CTB is unique to the  
0 internal wiring and can not be changed. Configurations can be  
0 Ring below Tip (See Figures A & D) or Ring above Tip (See Figures  
0 B & C).

## 0 TRUNK (TM8) APPLICATIONS

0  
0  
0  
0

For Trunk application the circuits for each connector are number (00)-(29) representing 30 circuits. Circuit number growth pattern will always to Left to Right.

0  
0  
0

Connectors for Trunks are grouped horizontally in rows, with a growth pattern Top to Bottom (See Figure F) or Bottom to Top (See Figure E).

0  
0

The Ring and Tip Configuration for Trunks can be Ring below Tip (See Figure F) or Ring above Tip (See Figure E).

0 18.7.1 PIN CONFIGURATION FOR NON-CONNECTORIZED TERMINAL BLOCKS

0

0 Approved sources for Non-Connectorized Terminal Blocks  
0 (Non-CTB'S) offer many standard terminal pair configurations. A  
0 Non-CTB has no pin configuration restrictions like the CTB.

0 These blocks are generally used for terminating miscellaneous  
0 circuits; however, the connectorized 8X32 layout (Figures A thru  
0 F) for Lines and Trunks may be provisioned in conjunction with  
0 this block.

0

0 18.7.2 ORDERING TABLE FOR APPROVED BLOCKS

0

0 The following tables have been designed to define block ordering  
0 options for each vendor's blocks.

| 0 COLUMN HEADING | DESCRIPTION                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|---|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 | TERMINAL PATTERN | Four factors define a unique terminal pattern: Frame mount (Horizontal or Vertical), Ring to Tip relationship, LSG or connector growth, and circuit number growth. Each terminal pattern is identified by the letter P followed by a number from 1 to 10. All of the terminal patterns (P1 thru P10) are described below. For NON-CTB's (N/A). |
| 0 | .....P1          | Horizontal Mount.....<br>Ring Below Tip.....<br>LSG growth Left to Right.....<br>Circuit growth Top to Bottom.....                                                                                                                                                                                                                             |
| 0 | .....P2          | Horizontal Mount.....<br>Ring Below Tip.....<br>LSG growth Top to Bottom.....<br>Circuit growth Left to Right.....                                                                                                                                                                                                                             |
| 0 | .....P3          | Horizontal Mount.....<br>Ring Above Tip.....<br>LSG growth Bottom to Top.....<br>Circuit growth Left to Right.....                                                                                                                                                                                                                             |
| 0 | .....P4          | Horizontal Mount.....<br>Ring Above Tip.....<br>LSG growth Left to Right.....<br>Circuit growth Bottom to Top.....                                                                                                                                                                                                                             |

0 HOUSING SIZE Telzon blocks are made with a 6.0 inch (6.0)  
0 or 4.3/4 inch (4.75) housing. OPD blocks only  
0 have one housing size (N/A).

0 FANNING STRIP Telzon blocks can be order with Fanning Strip  
0 numbering 00-31 (0) or 01-32 (1). OPD blocks  
0 can not be ordered with Fanning Strip number-  
0 ing (N/A).

0 FRAME MOUNT How the block is mounted on the MDF Frame  
0 Horizontal (HOR) or Vertical (VERT).

0 1.0 Mechanized Line Testing

0 1.1 Introduction

0 Mechanized line testing is the testing of subscriber loops and  
0 line cards using non-DMS equipment located at a remote site (e.g.  
0 #14 Local Test Desk (LTD), #3 Local Test Cabinet (LTC), Mech-  
0 anized Loop Testing (MLT), etc.). The remote test site works  
0 with the DMS system to gain metallic access to the subscriber  
0 loops. The mechanized line test equipment executes tests on the  
0 loop such as measuring foreign AC and DC voltage, resistance,  
0 etc.

0 Line testing is also provided for the DMS-1R Remote Concentrator  
0 Terminal (RCT) and the DMS-1 Urban Remote Terminal subscriber  
0 lines, either through the Maintenance and Administration Position  
0 or via the above remote test equipment.

0 1.3 Equipment Provisioning

0 1.3.1 Local Test Cabinet

0 (a) General Description

0 The NSD Model 3703-03 is a microprocessor controlled Local Test  
0 Cabinet (hereafter referred to as LTC) designed to test subscriber  
0 line circuits and trunk circuits. The LTC generates all test  
0 tones and test voltages without the aid of external devices. The  
0 LTC can access from one to sixteen test trunks and one MDF test  
0 trunk.

0 The LTC has the capability to test lines and trunks in DMS100F  
0 remote offices and other pair gain devices such as the AT&T  
0 SLC-96. This functionality is achieved via the Digital Remote  
0 Test Unit (DRTU).

0 The DRTU is a remote slave of the LTC. It is mounted in an  
0 equipment frame/Cabinet at the Remote Site. The DRTU to LTC com-  
0 munication is via Dial-up or Dedicated data lines. Refer to Fig-  
0 ure 37.4 for a pictorial representation of LTC to DRTU  
0 configuration.

0 The Local Test Cabinet works into any DMS100F test trunk and  
0 trunks from major switch manufacturers including AT&T/Western  
0 Electric, Automatic Electric, ITT/North, Stromberg Carlson, and  
0 TRW Vidar types. When properly calibrated, the LTC eliminates  
0 the effects of test trunk resistance and capacitance from the  
0 measured values displayed to the user. Busy lead sensing permits  
0 trunk sharing with other test equipment that may be installed in  
0 the office, (e.g., an LRS Loop Test Unit), and thus avoids the  
0 need for additional test trunks.

0 Please note that in Canada, the LTC will be ordered directly from  
0 the Network Service Division (NSD). In the U.S. (NTI), the LTC  
0 will be ordered from NTI.

0 (c) Provisioning Considerations

0 ( i) If the resistance of the metallic loop from test desk to of-  
0 fice exceeds 300 ohms, ensure that the Test Trunk Ringing  
0 Circuit (SD96474-01 or equivalent) and an external Ring  
0 and Tone supply are provided.

0 ( ii) One Incoming Outgoing Test Trunk (NT2X90AB) is required  
0 for each test trunk which interfaces DMS to the #3 LTC.

0 ( iii) The LTC is designed to provide automated tests and  
0 measurements in a wall/desk/frame/MDF mounted configura-  
0 tion. The Model 3703-03 LTC offers an automatic measure-  
0 ment and diagnosis sequence plus a host of specialized  
0 loop test functions.

0 The LTC is available as a Local or Remote configuration.  
0 Two colours are available, Ash and Brown (brown units  
0 preferred for DMS-100F), with additional options to pro-  
0 vide four or sixteen test trunk access.

0 A typical Local Test Cabinet (LTC) consists of a pushbut-  
0 ton (key) control panel, a 5-inch video display (VDU), a  
0 telephone handset, and a 310-type connector for connect-  
0 ing additional test equipment.

0 The following LTC equipment is approved for use with the  
0 DMS-100F.

| NT0J04DF   | 3703-00/01 LTC Spares Kit |

0 The minimum components for LTC operation are:

- 0 - The LTC Mainframe
- 0 - The LTC Front Panel
- 0 - Trunk Access Card
- 0 - Mounting Brackets

0 The optional components for enhanced LTC operation  
0 are:

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - Buzzer Pair Identifier
- 0 - Spares Kit
- 0 - DRTU Model 3704
- 0 - DRTU Access Card
- 0 - MLT Applique Shelf
- 0 - Signature Accessory Card

0 ( iv) The LTC Model 3703-00 & 01 Upgrade Kit provides the  
0 hardware necessary to upgrade an existing unit to the LTC  
0 Model 3703-03 standards.

0 Telcos having a NSD Model 3703-00 or 3703-01 LTC must up-  
0 grade the unit to the Model 3703-03 standards in order to  
0 take advantage of the majority of the LTC features as de-  
0 fined in the General Section.

0 The earlier vintage LTCs may be upgraded using the System  
0 Upgrade Kit (NT0J04BD for Brown units or NT0J04BK for Ash  
0 units). When provisioning the Upgrade Kit the following  
0 information must be included with the order:

- 0 - The serial number of the existing Model
- 0 - The color of the existing Model

0 This information is required because the LTC card cage  
0 will be replaced and the existing serial number used on  
0 the new card cage.

0 The NT0J04BD System Upgrade Kit provides a new LTC card  
0 cage which provides the following features:

- 0 - Trunk Control Keys
- 0 - A Boost Key
- 0 - Four (4) More Ports:
  - 0 - Local EIA RS-232-C
  - 0 - Two (2) Dial-In Ports
  - 0 - Call-Back
- 0 - Four (4) Trunk Connectors Instead Of One (1)

0 ( v) The following software package is required for the Local  
0 Test Cabinet:

0 NTX064AA Automatic Line Insulation Testing (ALIT)

0 1.3.2 Mechanized Loop Testing (MLT)

0 (a) General Description

0 Mechanized Loop Testing (MLT) refers to the interface of the  
0 Western Electric Mechanized Loop Testing System (MLT 1 or MLT 2)  
0 to a DMS-100F Switch. This interface is required so that the  
0 Western Electric MLT 1 or MLT 2 can gain metallic access and test  
0 subscriber lines working out of a DMS-100F. This interface and  
0 test trunk arrangements support all MLT 1 or MLT 2 tests. The  
0 tests run on the subscriber loops include measuring foreign AC  
0 and DC voltage, resistance, etc.

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules

0 (c) Provisioning Considerations

0 ( i) The Western Electric Mechanized Loop Testing System (MLT 1  
0 or MLT 2) will interface to the DMS-100F Switch via a  
0 modified test trunk. A NT2X90AD test multiple will pro-  
0 vide all functions currently supported by previous vin-  
0 tages of the NT2X90 CP and will support the Subscriber  
0 Carrier module loop testing requirements. Subscriber Car-  
0 rier modules refer to the SMS, SMR, and SMU peripheral  
0 modules in a DMS office.

0 ( ii) For DMS offices containing line cards only, the test  
0 multiple CP is the only requirement for mechanized line  
0 testing.

0 ( iii) For DMS offices containing Subscriber Carrier modules  
0 (with or without line cards), in addition to the test  
0 multiple CP, an applique circuit must also be provisioned  
0 to support line testing results to the Mechanized Loop  
0 Testing system (MLT). The applique will provide DC  
0 signals required to report channel test results to the  
0 MLT system.

0 ( iv) For applique requirements in a DMS office, the engineer  
0 should order the NT3J00BA applique shelf and the  
0 NT3J00BB applique circuit pack. The applique shelf will  
0 house ten (10) applique circuit packs. Offices containing  
0 SMS, SMR and SMU peripherals may share applique facili-  
0 ties. The applique CP is required for any interface test

0 RELEASE 28.01  
0 93 12 03  
0

0 multiple CP which utilizes Mechanized Loop Testing (MLT)  
0 on subscriber carrier modules SMU, SMS, and SMR.

0 ( v) An applique circuit pack contains two (2) circuits. Each  
0 circuit will interface one test multiple CP provisioned  
0 for line testing to the remote terminals for loop test-  
0 ing. An applique CP is required for each NT2X90AD test  
0 trunk connecting to a MLT.

0 ( vi) A Signal Distribution circuit, (NT2X57AA) is required  
0 for each applique circuit pack provisioned to operate re-  
0 lays on the CP.

0 ( vii) Access to the subscriber carriers is interfaced via the  
0 DMS metallic test access (MTA). One MTA vertical can ac-  
0 cess one subscriber carrier site. Each site can have a  
0 maximum of ten (10) SLC-96's or ten (10) DMS-1R's.

0 When using the NT2X46AB MTA configuration, if there are  
0 no more than ten (10) SLC-96's per site, one connector  
0 (C01-C10) should be cabled to the DF for every two sites.  
0 One connector can access two MTA verticals. This option  
0 shall only be used for offices having available connec-  
0 tors on existing MTA units.

0 The NT3X09BA MTA configuration shall be used on all ini-  
0 tials and offices adding MTAs. Refer to Section 3.5 Pe-  
0 ripheral Modules for more information.

0 (viii) The applique shelf is mounted in a standard MIS frame  
0 and is seven (7) inches high by twenty six (26) inches  
0 wide. The applique circuit pack is packaged on a double  
0 wide circuit pack. Cards are to be located in odd slots  
0 03 through 21. An NT3J00BC applique power supply is al-  
0 ways provided in slot 01 of the shelf.

0 ( ix) The applique shelf should be fused at 1 1/3 amps with  
0 power terminations at TB1-1 (-48V) and TB1-2 (GRD) using  
0 22 AWG wire.

0 ( x) The applique shelf is cabled to the distributing frame ia  
0 four (4) NT0X26UE 50 pin connectorized cables. These ca-  
0 bles terminate on the following shelf connectors:

0 Connector J1 - cabling circuits 01-06, slots 03,05,07  
0 Connector J2 - cabling circuits 07-12, slots 09,11,13  
0 Connector J3 - cabling circuits 13-18, slots 15,17,19

0  
0 RELEASE 28.01  
0 93 12 03

0 Connector J4 - cabling circuits 19-20, slot 21

0 Leads for each individual circuit are T, R, TT, RR, SD1,  
0 SD2, SD3, SD4.

0 An 812A cable should also be provided from the NT3J00BA  
0 card cage to the DF for the alarm leads (NO,C).

0 ( xi) Provide one (1) Applique CP and one (1) Applique Power  
0 Supply CP as spares (recommended).

0 2.0 Cutover Requirements

0 2.1 Introduction

0 This section describes auxilliary equipment which assists in the  
0 process of transferring telephone service from an existing, oper-  
0 ating facility to new DMS equipment. Connections to the new  
0 equipment are tested and verified before cutting over, to avoid  
0 possible service disruption. The equipment is portable and can  
0 be moved to a new job site after successful cutover.

0 2.2 Features

0 Equipment used to assist in cutting over a new office includes  
0 the Automatic Board to Board Testing unit, which can be used in  
0 transferring service from both DMS and non-DMS existing switches.  
0 The DCM Cutover unit assists in cutting over trunks to DMS trunk  
0 peripherals (both "old" and "new" peripherals).

0 2.3 Equipment Provisioning

0 2.3.1 Automatic Board to Board Testing (ABBT)

0 (a) General Description

0 The Automatic Board to Board Testing Unit (NT5X73AB) is a self-  
0 contained portable unit which checks that DMS translation tables  
0 and Distribution Frame (DF) cross connections match the existing  
0 subscriber line connection of the old system prior to the trans-  
0 fer of service. It should be located near the DF. The ABBT unit  
0 is used between K date and In Service date. After the DMS-100 or  
0 DMS-100/200 office cuts into service, the unit can be used at an-  
0 other job site. It can be used with either new peripherals (LCM)  
0 or old peripherals (LME).

0 (b) References

0 NTP 297-1001-522 Automatic Board-to-Board  
0 Testing Reference Manual

0 (c) Provisioning Considerations

0 ( i) When ABBT is required from a DMS switch to an Automatic  
0 Electric Step by Step (SXS) switch, applique circuit  
0 (NT5X79AA) must be provided to interface between the Au-  
0 tomatic Electric Test Distributor and the ABBT  
0 (NT5X73AB).

0 ( ii) When ABBT is required from a DMS switch to #5 Cross-  
0 bar, SP-1, #1 ESS or North Electric NX1D, software fea-  
0 ture package NTX057AB is required to interface between  
0 the 2-wire outgoing trunk and the ABBT unit.

0 ( iii) The following hardware is required in addition to one  
0 ABBT unit:

- 0 - One Scan Card (plugs into MTM). This is not re-  
0 quired if a block of 7 scan points is already  
0 available.
- 0 - One Signal Distribution Card (plugs into MTM).  
0 This is not required if a block of 14 SD points  
0 is already available.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - One 2W Outgoing Trunk (NT2X83AA), which provides
- 0 two circuits per card.
- 0 - One Floating Battery (Eveready No. 766, 22.5
- 0 volts (variable))
- 0 - One Floating Battery (Eveready No. 731, 6.0
- 0 volts)
- 0 - Five Connectorized cables, length as required.

0 ( iv) When ABBT is required at an RLM site, provide scan card,  
0 SD card, ABBT test unit and applique circuit (if re-  
0 quired) at the remote site, and outgoing trunk at the  
0 host site. Also, channel bank facilities should exist  
0 between the host and the RLM site.

0 ( v) Provide one line drawer cutoff strap for each line drawer  
0 whose line cards are to be held simultaneously cutoff by  
0 this method. Since straps can be re-used, the quantity to  
0 be provided is determined based on the maximum number of  
0 line drawers to be held in this state.

0 ( vi) When testing subscriber loops attached to a SLC-96 Remote  
0 Remote (RT) there are prerequisites/limitations which  
0 must be met to complete the ABBT.

0 The Central Office Terminals (COT) must be reconfigured  
0 using external C.O. repeaters and a DSX patch panel.  
0 Jacks on the DSX will provide a monitor path for the  
0 transmitted PCM signal from COT to SLC-96. Along this  
0 path the regenerated PCM signals from the repeaters will  
0 be transmitted to the appropriate SMS port.

0 ABBT on a Mode I system will require five (5) bridging  
0 repeaters. Mode II systems will require three (3) bridg-  
0 ing repeaters.

0 The reconfigured cabling must appear at the same DSX bay  
0 to facilitate patching from the COT DS-1 link monitor  
0 jacks to the bridging repeater input jacks, and from the  
0 bridging output jacks to the SMS port input jacks.

0 SMS board-to-board testing will require the provisioning  
0 of an applique unit (ES-10233-RTP) in addition to the  
0 regularly ordered equipment. The SMS applique unit con-  
0 tains miscellaneous hardware required to adapt the ABBT  
0 unit (NT5X73AB) to recognize the SMS lines. One (1) SMS  
0 applique unit is required for each ABBT unit that will be  
0 testing the SMS lines.

0  
0 RELEASE 28.01  
0 93 12 03

0 One limitation is that only one "Channel Test" can be  
0 performed at a time per SLC-96 to verify line assign-  
0 ments. Multiple ABBT units cannot be used to test a sin-  
0 gle Remote Terminal or group of RT's which share the same  
0 MTA vertical.

0 ABBT of SLC-96 lines is limited to the verification of  
0 software assignment vs. hardware location. ABBT units  
0 cannot check for party assignment or ground start.

0 2.3.2 DCM Cutover Unit

0 (a) General Description

0 The DCM Cutover Unit (DCU) is used where DMS is replacing an ana-  
0 log switch which interfaces to DS-1 facilities via channel banks.  
0 It allows testing of the new transmission path into DMS, the  
0 trunk interface, and the software translations with minimal ser-  
0 vice disruption. This is accomplished by allowing the traffic to  
0 be tandemed through the DMS machine while still terminating on  
0 the existing switch. After testing, the unit permits the new fa-  
0 cility to be cut into service. The DCM Cutover Unit can be used  
0 with new peripherals (LGC/DTC/LTC) as well as old peripherals  
0 (DCM). It should be located close to the office DSX-1 array.

0 (b) References

0 NTP 297-1001-523 PM Pre Testing and Cutover  
0 Man-Machine Interface Description

0 (c) Provisioning Considerations

- 0 ( i) Each DCM Cutover circuit pack (NT5X67AA) has two Pre-Test  
0 and Cutover circuits. Each circuit can accomodate one  
0 DS-1 (T1) link.
- 0 ( ii) One DCU (NT5X68AA) can accomodate up to twelve DCM  
0 Cutover circuit packs and up to two test DCM DS-1 ports.  
0 Provision the number of DCUs required accordingly.
- 0 ( iii) The number of DCUs required should be no less than the  
0 number of simultaneous test positions required divided by  
0 two (round up to next higher integer). Use this quantity  
0 if greater than that required by Consideration ( ii).
- 0 ( iv) The maximum number of DCUs per DMS is five.
- 0 ( v) For old peripherals (DCMs), provide up to two DCM DS-1  
0 cards (NT2X35AB) equipped on DCMs to serve as Test DCM  
0 Interface for each DCU. These can be re-assigned upon  
0 completion of the cutover procedure.
- 0 ( vi) For new peripherals (LGC/DTC/LTC), provide one DS-1  
0 Interface Card (NT6X50AA) equipped on LGC/DTC/LTC to  
0 serve as test digital interface for each DCU. These can  
0 be re-assigned upon completion of the cutover procedure.

0 ( vii) Provide six patch cords (NE-P6Q1C) for each DCU provided,  
0 to connect it to the DSX-1 array.

0 3.0 Commissioning Requirements

0 3.1 Introduction

0 This section describes facilities and equipment that must be pro-  
0 vided to enable commissioning testing of new DMS equipment.

0 3.2 Features

0 The office load simulator device enables simulated traffic test-  
0 ing to ensure proper operation before an office goes into ser-  
0 vice.

0 Remote offices require certain communication links and terminal  
0 equipment to be in place by specified dates to enable commission-  
0 ing the office.

0 3.3.2 Remote Office Commissioning Requirements

0 (a) General Description

0 Certain equipment and facilities are required to commission Re-  
0 mote offices.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) A data link facility between host and remote must be pro-  
0 vided by the Telco. Dedicated or dial-up modems can be  
0 provided by either Telco or NT.

0 ( ii) Telco-supplied video display terminals for initial of-  
0 fices must be on site by H+6 date.

0 ( iii) The Telco must provide an in-service line (FX to another  
0 switch or to an LM at working host) by K-4 or earlier.  
0 This provides communication with the host and the outside  
0 world during installation.

0 ( iv) Refer to Table 37.1 Test Equipment & Facilities Provided  
0 by Telco, for further details and requirements.

| 0      | types, which are compatible with the DMS switch.             |           |        |                  |

## 0 4.0 DMS-100F/SCCS Interface

0 4.1 Introduction

0 The purpose of the the DMS-100F/Switching Control Centre  
0 System Interface feature is to provide the Bell Operating  
0 Companies (BOC's) with the means of centralizing maintenance  
0 of DMS-100F switches as with other switching systems at  
0 Switching Control Centre (SCC) locations.

0 The interface arrangement between the DMS-100F switch and  
0 the SCC of telephone operating companies will apply equally  
0 to the DMS-100, DMS-200 and DMS-100/200 switches.

0 The DMS-100F/SCCS interface enables telephone operating com-  
0 panies to perform remote maintenance and surveillance from a  
0 centralized location. This results in the ability to perform  
0 maintenance activities, trouble analysis, and emergency re-  
0 covery of DMS-100F switches remotely.

0 The software involved is the NTX210AA (DMS-100F Switching  
0 Control Center System Interface) feature package. This  
0 package is optional and facilitates "centralized mainte-  
0 nance".

0 Feature package NTX210AA supports interaction between a DMS  
0 and an SCCS. The SCCS serves as a computerized maintenance  
0 center, where Bell Operating Company (BOC) personnel can  
0 troubleshoot and correct problems on connected switches.

0 The hardware involved includes a combination of Telco and  
0 NT-provided products as follows: operating companies pro-  
0 vide the Digital Alarm Scanner and must ensure proper wir-  
0 ing. Refer to Figure One (1) for a simplified configuration  
0 connection between a DMS switch and an SCCS. This feature  
0 package does not affect any known internal system controls.

## 0 Telco Provided H/W:

- 0 - Western Electric (WECO) E2A Digital Alarm Scanner (DAS)
- 0 - Optional WECO 59A1 Data Shelf and 202T-R style modems  
0 (See Note below).
- 0 - Optional equipment rack (See note below)

## 0 NT Provided H/W NT40 CPU

- 0 - Optional MIS Frame (See note below).
- 0 - SD Points
- 0 - Optional UDS/Rixon Modem shelf for 202T-R style modems  
0 (See Note below).
- 0 - an NT1X48CA Remote Control Processor Maintenance card
- 0 - an NT1X42AA E2A Telemetry card
- 0 - cabling for these two processors

#### 0 NT Provided H/W DMS Supernode Requirements

- 0 - NT9X26 RTIF PCB

0 NOTE: Optional equipment above may be provided by the  
0 Telco or NT.

### 0 4.3 Equipment Provisioning

#### 0 4.3.1 DMS-100F/SCCS Interface Equipment

##### 0 (a) General Description

0 The DMS-100F/SCCS interface consists of two main areas and  
0 components. the first is Remote Maintenance, which consists  
0 of two primary input/output channels for maintenance and  
0 system log reports. The second is Remote Surveillance which  
0 consists of the E2A telemetry interface.

0 The input/output (I/O) interface to the No. 2 SCCS transmits  
0 interactive commands and responses on the maintenance chan-  
0 nel, and messages on the logging channel.

0 Generally, the I/O interface for remote maintenance consists  
0 of one primary MAP channel and one primary logging channel  
0 configured in the dedicated mode, with one or more I/O de-  
0 vices configured in the dial-up mode for backup.

0 Detailed below are the requirements for the NT40 and DMS  
0 Supernode CPUs.

##### 0 NT40 CPU:

0 a. The E2A telemetry interface consists of a serial  
0 data interface and a discrete contact closure inter-  
0 face. Two new cards mounted on the CPM shelf will  
0 provide the serial interface. SD cards will provide  
0 the discrete contact closure interface.

0 b. This feature provides a modified NT1X48 maintenance  
0 card and a new NT1X42 serial conversion card on the  
0 CPM shelf. Full control over CPU switch and  
0 thumbwheel functions is extended to the SCC for  
0 maintenance and recovery operations. These control  
0 functions are accompanied by comprehensive status  
0 indicators sent to the SCC by the telemetry serial  
0 interface.

0 c. The discrete contact closure interface, as provided  
0 by way of loop closures on SD points, allows the SCC  
0 to receive alarms from the DMS-100F switch. Standard

0 NT2X57AA SD cards (14 SD points per card) are used  
0 for the interface and are provisioned in quantities  
0 to meet the customer's specified SCC requirements.

0 DMS SUPERNODE

0 a. In the DMS SUPERNODE system the NT9X26 performs the  
0 functions of the NT1X48 and NT1X42 pair.

0 b. All other requirements are the same

0 NT Provided H/W & S/W

0 ( i) Existing NT-40 CPUs

0 Existing CCC Frames require one (1) NT3X45DS (Remote  
0 Surveillance and Control Via WECO E2A DAS Unit Prod-  
0 uct Change Kit) if not previously applied.

0 The Product change kit, NT3X45DS (Remote Surveil-  
0 lance and Control via W.E. E2A Scanner Kit) is re-  
0 quired to implement this feature. This kit provides  
0 the following cards:

- 0 - Two (2) each NT1X48CA Remote Control Processor  
0 Maintenance CP
- 0 - Two (2) each NT1X42AA E2A Telemetry Serial  
0 Interface CP

0 The NT1X42AA is inserted between the NT1X48CA and  
0 the Western Electric Digital Alarm Scanner (DAS)  
0 Unit in order to provide an E2A telemetry interface.

0 NOTE: The amount of material and circuit packs pro-  
0 vided by NT3X45DS is sufficient to modify both  
0 planes of one CCC frame.

0 NT3X45EW NT-40 CPU

- 0 - Provide two (2) each NT1X48CA Remote Control  
0 Processor Maintenance CP
- 0 - Provide two (2) each NT1X42AA E2A Telemetry Se-  
0 rial Interface CP
- 0 - Provide Designation Labels for the NT1X48CA and  
0 NT1X42AA

0 DMS SUPERNODE CPU

- 0 - Provide NT9X26 Remote Terminal Interface (RTIF)  
0 CP

0 ( ii) For sparing purposes, provide NT1X48CA and NT1X42AA  
0 as required.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 ( iii) Provide Modems and/or mounting hardware as required.  
0 If NT is to provide the modem, it shall be a 4-wire  
0 private line 202 style modem with reverse channel  
0 capabilities. The 202 modems and the the WECO 48FR1  
0 Data Units require a 829 unit. The 829 unit may be  
0 provided by NT or the Telco per contract.
- 0 ( iv) For alarm purposes, sixteen (16) SD points, config-  
0 ured in the loop closure mode, are required. Dis-  
0 tribution of critical and major alarms over two SD  
0 cards is recommended for redundancy.
- 0 ( v) Three (3) I/O devices are required for the dedicated  
0 MAP channel, dedicated logging channel, and a backup  
0 MAP channel. The SD Points will be configured in  
0 the "Loop Closure Mode". Ideally, these I/O devices  
0 should be assigned to different I/O Terminal Con-  
0 troller cards, NT1X67BD/BC. Since each card con-  
0 tains four (4) circuits, the other circuits can be  
0 assigned to other I/O functions.

0 Telco Provided Hardware.

- 0 ( vi) Customer is to provide one (1) WECO JIP056A DAS  
0 equipped with L3 and L8 (where L3 = 48V operation,  
0 L8 = base unit equipped with DMS-100 hardware, cus-  
0 tom backplane, CPU with four (4) custom EPROMs, one  
0 (1) TM 319 combination card with 64 alarm points and  
0 16 control contact points).

0 A customer-provided Digital Alarm Scanner (DAS) can  
0 be mounted on a Miscellaneous Equipment Frame,  
0 NT0X02AB, equipped with a frame supervisory panel.  
0 There are no restrictions on location of this frame  
0 equipped with the DAS. The DAS must be offset to-  
0 wards the rear of the bay to provide front aisle  
0 clearance.

0 The DAS can be mounted in a customer provided rack,  
0 if desired.

- 0 ( vii) Customer is to provide four (4) WECO 202T 4-wire  
0 private line modems for primary MAP, logging chan-  
0 nel, DAS and backup MAP. Customer shall also pro-  
0 vide one (1) WECO 59A1 Modem Shelf. These modems  
0 and modem shelf may be provided by NT.

0 RELEASE 28.01  
0 93 12 03

0 Customer shall provide one (1) WECO 48FR1 data unit.  
0 One (1) 829 must be provided (by NT or the Customer)  
0 per 48FR1 Data Unit.

0 The 59A1 Modem Shelf and the 202T Modem Shelf can be  
0 mounted on the MIS frame.

0 (viii) Customer shall provide one (1) cable from DAS to MDF  
0 for cross-connection of discrete contact closures to  
0 SD points.

0 Customer shall provide one (1) cable from the TELCO  
0 provided WECO 59A1 to MDF for facility cross-  
0 connection to backup MAP modem.

0 Customer shall provide one (1) cable from the 59A1  
0 to the MDF for 2-wire FX circuits.

0 Customer shall provide three 4-wire facilities to  
0 MDF.

0 Customer shall provide four (4) cables from modems  
0 to MDF for facility cross-connection.

0 Customer shall provide one (1) RS-232 cable from DAS  
0 to modem.

0 Customer shall provide two 2-wire dial-up facilities  
0 (FX or local). NOTE: FX = Foreign Exchange (i.e.  
0 circuits from another switching system).

## 0 5.0 DMS-100F / No. 2 SES Interface

0 5.1 Introduction

0 The No.2 Service Evaluation System (SES) interface allows  
0 the centralized operations system No.2 SES to perform ser-  
0 vice evaluation of calls served by the DMS-100 family  
0 switch. This interface provides an end user perspective for  
0 the Bell operating companies (BOC) who perform service eval-  
0 uation on a centralized basis from a No.2 SES.

0 Two distinct types of service evaluation are performed on  
0 the No.2 SES for the DMS-100 F interface; Incoming Trunk  
0 Service Evaluation (ITSE) and/or Dial Line Service Evalu-  
0 ation (DLSE).

0 ITSE provides for service evaluation of calls coming from an  
0 Inter- Exchange Carrier Point of Prescence (POP) to the ac-  
0 cess tandem. Note that a DMS-100 office would not be able to  
0 perform ITSE functions.

0 DLSE provides for service evaluation of calls originating at  
0 an end office. These can be either intralata and/or  
0 interlata calls. Note that DLSE would not be performed on a  
0 strictly DMS-200 office. However, both may be performed on  
0 a local/toll office. (MAX one ITSE & one DLSE interface per  
0 office ).

### 0 5.3 Equipment Provisioning

#### 0 5.3.1 DMS-100F/No. 2 SES Interface

##### 0 (a) General Description

0 The The DMS-100F interfaces with the No. 2 SES via a dedi-  
0 cated, synchronous 2400 baud data link and one voice link  
0 (trunk) as shown in Figure 37.15. One set of a Data link  
0 and a Voice link is required per each ITSE and DLSE applica-  
0 tions.

Figure 37.15

##### 0 (b) References

0 Chapter 3, Section 3.5 Peripheral Module - Host

##### 0 (c) Provisioning Considerations

- 0 ( i) One data link is required for both DSLE and ITSE  
0 each. Physical requirements for a data link include  
0 one RS232 synchronous BX.25 communication link on  
0 the NT1X89AA Multi-Protocol Controller (MPC) (link 2  
0 or 3) and a 2400 baud synchronous modem compatible  
0 with the far end modem.
- 0 ( ii) SES functionality may not be combined on an MPC with  
0 other features. The MPC mounts on the IOE frame.

0

0 RELEASE 28.01  
0 93 12 03

0 ( iii) A 1-way outgoing trunk must be dedicated for ITSE  
0 and a second trunk must be dedicated for DLSE. These  
0 trunks can be Analog or Digital. For Analog appli-  
0 cations, use NT2X82AA. For Digital applications,  
0 use Digital facilities. These trunks also interface  
0 with the No. 2 SES. (Refer to the Peripheral Modules  
0 - Host, Section 3.5. for more information on Analog  
0 and Digital facilities).

0 ( iv) Each Voice link (trunk), either Analog or Digital  
0 requires a dedicated 3-port conference circuit (see  
0 Peripheral Modules - Host, Section 3.5 for more in-  
0 formation on the 3-port conference circuit).

0 ( v) The SES No. 2 Interface requires the following soft-  
0 ware packages:

0 NTX215AA No. 2 SES Interface  
0 NTX273AA Multi-Protocol Controller

## 0 6.0 Integrated Bit Error Rate Test Facility

0 6.1 Introduction

0 The Integrated Bit Error Rate Test Facility or IBERT is an  
0 optional maintenance feature which can be ordered for test-  
0 ing the data loops in a DMS office (i.e. office with  
0 DATAPATH features).

0 IBERT is necessary to fulfill two distinct requirements:  
0 Datapath bit error rate testing, and Datapath Extension  
0 (DPX) maintenance messaging.

0 In conjunction with Datapath maintenance software, Datapath  
0 bit error rate testing will provide the DMS craftsperson  
0 with the ability to monitor and diagnose from the MAP, the  
0 data transmission quality of a selected Datapath line. Cur-  
0 rent methods of testing Datapath circuits and equipment re-  
0 quires the use of cumbersome external test sets,  
0 inaccessible from a MAP and outside the control of any auto-  
0 mated DMS/SL-100 maintenance process.

0 A Bit Error Rate Test is a test used to measure the trans-  
0 mission quality of a loop. The basic idea of a BERT is to  
0 send a known stream of data over a given loop, and to have  
0 this data reflected back to the sender. The received data is  
0 then compared with the sent data thereby giving a measure of  
0 the transmission quality. By looping back data at different  
0 points in the loop and measuring the quality of transmission  
0 at each point, faults which may exist on the loop can be  
0 isolated.

0 With an external BERT, a piece of test equipment which is  
0 not a part of the DMS, regular methods are used to establish  
0 a connection between a line to be tested and the test equip-  
0 ment. However, an integrated BERT is a resident piece of  
0 equipment in the DMS which is accessed by means of a single  
0 command located at the LTPMAN level of the MAP. The benefits  
0 of this feature are a simpler method of testing Datapath  
0 loops as well as dropping the need for any external test  
0 equipment.

0 The IBERT will also be used as a 64 kbps inband signalling  
0 interface to the Datapath Extension System (DPX) based on  
0 the DE-4E channel bank, providing a maintenance messaging  
0 channel between the DMS/SL-100 central control and the DPX.  
0 This will give the MAP-situated craftsperson the ability to

0 RELEASE 28.01  
0 93 12 03

0 diagnose the DPX card and the associated Data Unit/Data Line  
0 Card (DU/DLC) facility with diagnostics similar to the ex-  
0 isting Datapath maintenance or to test the error rate per-  
0 formance of the entire DS1/DPX/DLC/DU facility.

0 The IBERT can be used to test virtually any type of data  
0 line connected to the DMS which supports the TLINK protocol.  
0 This includes Data Unit, AIM, Data Above Voice, coax elimi-  
0 nator Data Units and loop extended Data Units (those ex-  
0 tended using the Line Interface Unit and Data Terminating  
0 Unit method).

0 Note that the intent of providing an integrated BERT is to  
0 enhance the maintenance capabilities for Datapath. This is  
0 not meant to be used as a tool for networks or speech links  
0 within the DMS. No attempt is made by this feature to pro-  
0 vide a BERT while a data unit is involved in a call with an-  
0 other data unit. For this type of testing, an external BERT  
0 must still be used.

0 6.3 Equipment Provisioning0 6.3.1 Integrated Bit Error Rate Test Facility0 (a) General Description

0 The IBERT will perform the following functions:

- 0 - Transmit standard 511 or 2047-bit data test pattern  
0 at 50 bps to 19.2 kbps asynchronous or 1.2 kbps to  
0 64 kbps synchronous using T-link
- 0 - Transmit standard 511 or 2047-bit data test pattern  
0 at 64 kbps without T-link handshaking
- 0 - Transmit standard 511 or 2047-bit data test pattern  
0 at 56 kbps with a ones density suitable for T-  
0 carrier, without T-link handshaking
- 0 - Receive data in any of the above formats and detect  
0 bit errors and sync losses in the bit stream
- 0 - Count the number of error free seconds and total  
0 number of seconds in a test
- 0 - Derive data timing from the 64 kbps channel rate  
0 with the option to derive clocking from the re-  
0 ceived data stream if the far end uses external  
0 clocking (indicated in T-link handshake)
- 0 - When in T-link mode adapt the data transmission and  
0 reception rate to the far end equipment
- 0 - Allow the MAP user to do the following:
  - 0 - activate a loopback at the line card or set to be  
0 tested
  - 0 - start BERT as one of the following:
    - 0 1. 64 kbps (no T-link handshake)
    - 0 2. 56 kbps (no T-link handshake)
    - 0 3. T-link adaptive data rate

0 RELEASE 28.01  
0 93 12 03

0 4. Default to (1),(2), or (3) according to type  
0 of loopback selected

0 - inject error(s) in the transmitted data pattern

0 - stop BERT

0 - display test results (bit error count, sync loss  
0 count, total number of bits, etc.)

0 - display the operating data rate of the test

0 - support the inband signalling scheme used for DPX  
0 maintenance

0 - on request from DMS/SL-100 send pattern at the  
0 start of the call to put the DPX into maintenance  
0 mode

0 - accept messages from DMS/SL-100 addressed to the  
0 DPX and transmit them on transparently via inband  
0 signalling

0 - detect inband messages from DPX and send them to  
0 the DMS/SL-100

0 A pictorial representation of an Integrated BERT is  
0 shown in Figure 37.9

RELEASE 28.01  
93 12 03

Typical Datapath Bit Error Rate Test Setup

Figure 37.16

The loopbacks labelled A, B and C in the figure are respectively a 64 Kilo-bit loopback at the Data Line Card (DLC), a 64 Kilo-bit loopback at the Data Unit (DU) and a loopback at the RS-232C interface of the Data Unit. These loopbacks correspond respectively to the LOOPBK DLC, LOOPBK DU\_64K and LOOPBK DU commands at the LTPMAN level of the MAP.

As can be seen from the diagram, the 511 bit pattern is sent from the IBERT through the network, out to the line in question and is looped back from wherever the loopback is set (either A, B or C) through the network to the IBERT where it is compared with the pattern that was sent.

0 Optionally, no loopback may be set. This is referred  
0 to as a straight away test. In this case, an external  
0 BERT is connected to the Data Unit being tested. An  
0 external BERT takes care of receiving the bit pattern  
0 sent by the IBERT and sending its own bit pattern  
0 back. This scenario is generally used for verifying  
0 the accuracy of the IBERT. The external BERT would be  
0 used in this case to inject errors into the pattern  
0 sent back to the IBERT so that it can be verified  
0 that in fact the IBERT detected the error and re-  
0 ported it. Note that in this case the external BERT  
0 used must conform to CCITT standards so that it will  
0 generate the same 511 bit pattern used by the IBERT.

0 A list of Datapath products and the loopback points  
0 supported by each is shown in Figure 37.17

| Datapath Product     | Loopback A:<br>DLC Loopback | Loopback B:<br>64kb Loopback | Loopback C:<br>DU Loopback |
|----------------------|-----------------------------|------------------------------|----------------------------|
| Low Speed Data Unit  | DLC cutoff relay            | DU TCM interface             | RS232 interface            |
| High Speed Data Unit | DLC cutoff relay            | DU TCM interface             | V35 interface              |
| Coax Eliminator      | DLC cutoff relay            | DU TCM interface             | Not Supported              |
| AIM/AILC             | AILC cutoff relay           | Not Supported                | RS422 firmware I/F         |
| DPX                  | DLC cutoff relay            | DU TCM interface             | DU RS232/V35 interface     |
| LIU/DTU              | DLC cutoff relay            | LIU TCM interface            | DTU RS232/V35 interface    |

Note: The LIU/DTU combination also supports several other loopbacks including loopbacks within the loop extension data facility. For more information see "Datapath Loop Extension Maintenance", by J. Henderson, FDOC BV1342, October 1985.

#### Datapath Products and Supported Loopback Locations

Figure 37.17

0 A pictorial representation of a DPX Maintenance Mes-  
0 saging setup is shown in Figure 37.18.

0 Typical DPX Maintenance Messaging Setup

0 Figure 37.18

0 To perform maintenance diagnostics on the DPX/DLC/DU facil-  
0 ity shown in Figure 37.18, the craftsperson would post the  
0 associated DU on the MAP and enter the diagnostic command.  
0 The maintenance software recognizing this as a DPX would au-  
0 tomatically connect an available IBERT to the DPX. All  
0 maintenance messages are subsequently sent to the IBERT but  
0 addressed to the far end DPX, DLC, or DU and encoded in the  
0 W78 bulk data transfer format. The IBERT removes the mes-  
0 sages from the bulk data transfer format and passes them on  
0 transparently to the DPX via the inband signalling protocol.  
0 All messages addressed to the DLC or the DU are passed on  
0 transparently by the DPX.

0 In this example the DLC/DU configuration illustrated could  
0 refer to a DLC/low speed DU, DLC/high speed DU, or DLC/coax  
0 eliminator.

0 (c) Provisioning Considerations

0 ( i) The hardware of the Integrated BERT (NT6X99AA) re-  
0 sides in the line drawer (NT6X05AA) of an LCM in a  
0 Host office, in an RSC site, or in an OPM site (or  
0 RLCM) taking the physical space of a two slot line  
0 card. The two vertical slots in the LCM line drawer  
0 must be in the same logical line drawer subgroup  
0 (i.e., in the same line subgroup (LSG)).

0 ( ii) The IBERT must be located in a Line Concentrating  
0 Module (LCM) or Remote Line Concentrating Module  
0 (RLCM) which may or may not be the same LCM or RLCM  
0 as the one which the line it is testing resides.  
0 Even though the IBERT may be located on the same LCM  
0 as the line which it is testing, intraswitching for  
0 the connection is not used. This means that a con-  
0 nection between the IBERT and the line it is testing  
0 will be established through the DMS network. No con-  
0 nection between the IBERT and the line it is testing  
0 in the LCM, without going through the DMS network,  
0 can be established at the present time.

0 ( iii) Although the appearance of the IBERT is that of a  
0 line card, the IBERT is NOT a line card in the  
0 normal sense as there is no subscriber loop or set  
0 associated with it. The only interaction with an  
0 IBERT is achieved from a MAP through the DMS/IBERT  
0 messaging interface.

0 ( iv) While BER testing can be performed by either the  
0 NT6X99AA card, which mounts in an LCM, or by the  
0 NT4X23AA card, which mounts in an MTM, there is a  
0 software problem that prevents the NT4X23AA from  
0 successfully testing Datapath Extension trunks.  
0 Therefore, it is recommended that the NT6X99AA be  
0 used for DMS-100 and DMS-100/200 offices (local and  
0 local/toll applications) and the NT4X23AA be used  
0 for DMS-200 offices (toll applications).

0 RELEASE 28.01  
0 93 12 03

0 ( v) A minimum of one (1) NT6X99AA per LCM or 24 per of-  
0 fice (whichever is larger) should be provisioned for  
0 basic test capability in DMS-100 or DMS-100/200 of-  
0 fices. Higher quantities of test cards will provide  
0 faster office coverage.

0 ( vi) For datapath loop testing, due to a high volume of  
0 messaging traffic, it is recommended that one (1)  
0 IBERT line card (NT6X99AA) be provisioned per LCM  
0 equipped with a data line card.

0 ( vii) For switch bit error rate testing (in NTX881AC) it  
0 is recommended that one (1) IBERT line card  
0 (NT6X99AA) be provisioned per LCM for every LCM in  
0 the office.

0 (viii) Up until BCS-24, the maximum number of IBERT line  
0 cards (NT6X99AA) and DTU BERT Unit (NT4X23AA) cir-  
0 cuits (i.e., 2 circuits per card) allowed in an of-  
0 fice (Host plus all associated remotes) is 64.

0 As of BCS-25, the maximum number of NT6X99A cards  
0 and NT4X23AA circuits allowed in an office is 128.

0 For Canadian applications only, if the IBERT line  
0 card requirement exceeds the above software limita-  
0 tions (of 64 and 128 respectively in an office), it  
0 is permissible to perform the associated tests by  
0 restructuring the associated software data tables  
0 accordingly (i.e. perform the required test for the  
0 first group of 64 or 128 IBERT line cards, restruc-  
0 ture applicable software data tables for the next  
0 group of 64 or 128 IBERT line cards, perform the re-  
0 quired test, and so on).

0 and furnished as NTXP13AA for ENET SuperNode of-  
0 fices.

0 If software package SPD exists in a DMS office prior  
0 to an ENET upgrade, then both NTX885AB and NTXP13AA  
0 are to be provided in the retrofit software load to  
0 provide both Network Module (NM) and ENET coverage.  
0 NTX885AB is to be removed on the next BCS applica-  
0 tion following the upgrade.

0 The above rules are an example of unautomated rules  
0 which are stored in a document entitled "SW Package  
0 Ordering Rules - Not Automated" in the SMS Documen-  
0 tation Menu in CODA.

## 0 7.0 Digital Test Unit BERT

0 7.1 Introduction

0 The Digital Test Unit Bit Error Ratio Test (DTU BERT) Unit  
0 CP, NT4X23AA, is an optional maintenance feature which can  
0 be ordered for the measurement of bit error ratio (BER) and  
0 error-free interval of pseudo random test data.

0 A Bit Error Ratio Test (BERT) is a test used to measure the  
0 transmission quality of a loop. The basic idea of a BERT is  
0 to send a known stream of data over a given loop, and to  
0 have this data reflected back to the sender. The received  
0 data is then compared with the sent data thereby giving a  
0 measure of the transmission quality. By looping back data  
0 at different points in the loop and measuring the quality of  
0 transmission at each point, faults which may exist on the  
0 loop can be isolated.

0 There are available commercial stand alone external semi-  
0 automated BERT instruments, requiring some manual configura-  
0 tion and operation but this is too unwieldy an approach for  
0 long term switch maintenance. Also, since these are not in-  
0 tegrated within DMS, there is no facility for automated path  
0 control or fault sectionalization.

0 The DTU BERT Unit CP is an integrated or resident piece of  
0 equipment in the DMS. Access to this unit will be by means  
0 of a single command located at the TTP level of the MAP. The  
0 benefit of this will be a simpler method of testing loops as  
0 well as dropping the need for any external test equipment.

0 The DTU Based BERT will be capable of performing some BERT  
0 functions available on the IBERT Line Card, NT6X99AA, in-  
0 cluding Data Unit (DU) interface via T-link protocol, but  
0 not the DPX feature.

0 However, initially the DTU BERT Unit CP will only be appli-  
0 cable in a DMS toll or local/toll office. This MAP control-  
0 lable BERT device will ensure data integrity within and  
0 between toll exchanges.

0 7.2 Features

0 None

0 7.3 Equipment Provisioning0 7.3.1 DTU BERT0 (a) General Description

0 The DTU BERT will perform the following functions:

- 0 - Transmit standard 511, 2047 or 32767 bit data test  
0 pattern at 50 bits per second to 19.2 Kbit/s asyn-  
0 chronous or 1.2 Kbit/s to 64 Kbit/s synchronous us-  
0 ing T-link.
- 0 - Transmit standard 511, 2047 or 32767 data test pat-  
0 tern at 64 Kbit/s without T-link handshaking.
- 0 - Transmit standard 511, 2047 or 32767 bit test data  
0 pattern at 64 Kbits with a 1's density suitable for  
0 T-carrier, without T-link handshaking.
- 0 - Transmit standard 511, 2047 or 32767 bit test data  
0 pattern at 56 Kbit/s in 56 Kbit/s data mode (LSB  
0 held marking) without T-link handshaking.
- 0 - Receive data in any of the above formats and detect  
0 bit errors, block errors, sync losses and errored  
0 and error-free seconds.
- 0 - When in T-link mode, derive data timing from the 64  
0 Kbit/s channel rate with the option to derive clock-  
0 ing from the received data stream if the far end  
0 uses external clocking (indicated in T-link hand-  
0 shake).
- 0 - When in T-link mode, the data transmission and re-  
0 ception rate are adaptable to the far end equipment.

0 The DTU Based BERT is capable of performing some  
0 BERT functions available on the IBERT Line Card,  
0 NT6X99AA, including Data Unit (DU) interface via T-  
0 link protocol, but not the DPX feature. It is re-  
0 commended that the NT6X99AA be used for DMS-100 and  
0 DMS-100/200 offices (local and local/toll applica-  
0 tions). For information on IBERT Line Card,

0 NT6X99AA, see ECM274 on subject Integrated Bit Error  
0 Rate Test Facility (IBERT).

0 It is recommended that the DTU BERT Unit CP be used  
0 for DMS-200 offices (toll applications). This MAP  
0 controllable BERT device will ensure data integrity  
0 within and between toll exchanges.

0 A pictorial representation of a DTU BERT Unit CP  
0 Configuration for Datapath BER Testing is shown in  
0 Figure 37.19

RELEASE 28.01  
93 12 03

TYPICAL DATAPATH BIT ERROR RATE TEST SETUP

Figure 37.19

The loopbacks labelled A, B, and C in Figure 37.19 are respectively a 64 Kilo-bit loopback at the Data Line Card (DLC), a 64 Kilo-bit loopback at the Data Unit (DU), and a loopback at the RS-232C interface of the Data Unit.

As can be seen from the diagram, the 2047 bit pattern is sent from the DTU BERT Unit CP through the network, out to the line in question, and is looped back

0  
0 RELEASE 28.01  
0 93 12 03

0 from wherever the loopback is set (either A, B, or C)  
0 through the network to the DTU BERT Unit CP where it  
0 is compared with the pattern that was sent.

0 Optionally, no loopback may be set. This is referred  
0 to as a straight away test. In this case, an external  
0 BERT is connected to the Data Unit being tested. An  
0 external BERT takes care of receiving the bit pattern  
0 sent by the DTU BERT Unit CP and sending its own bit  
0 pattern back. This scenario is generally used for  
0 verifying the accuracy of the DTU BERT Unit CP. The  
0 external BERT would be used in this case to inject  
0 errors into the pattern sent back to the DTU BERT  
0 Unit CP so that it can be verified that in fact the  
0 DTU BERT Unit CP detected the error and reported it.  
0 Note that in this case the external BERT used must  
0 conform to CCITT standards so that it will generate  
0 the same 2047 bit pattern used by the DTU BERT Unit  
0 CP.

0 A pictorial representation of a DTU BERT Unit CP Con-  
0 figuration for T1 Carrier Testing is shown in Figure  
0 37.20

RELEASE 28.01  
93 12 03

TYPICAL T1 CARRIER BIT ERROR RATE TEST SETUP

Figure 37.20

The loopbacks labelled A and B in Figure 37.20 are respectively a loopback at the DTC/LTC/DCM T1 interface card and a loopback at the far end T1 interface card. Or alternatively, at each of the respective locations, a manually configured jacked loopback can be performed at the DSX.

0 (b) References

0 |

0 (c) Provisioning Considerations

0 ( i) The DTU BERT Unit CP, NT4X23AA, is a provisionable  
0 single slot service circuit card which resides in an  
0 MTM or DRA.

0 ( ii) The DTU BERT Unit CP has the following character-  
0 istics:

0 2 circuits/card  
0 2 amperes/card  
0 10 watts/card  
0 1 slot/card

0 ( iii) An MTM may be fully provisioned with DTU BERT cards.

0 ( iv) Up until BCS-24 the maximum number of IBERT Line  
0 Cards (NT6X99AA) and DTU BERT Unit Circuits  
0 (NT4X23AA) (i.e. two circuits per card) allowed in  
0 an office (host plus all associated remotes) is 64.

0 As of BCS-25, the maximum number of NT6X99AA cards  
0 and NT4X23AA circuits allowed in an office is 128.

0 Other than the above restrictions, there are no re-  
0 strictions to the number of DTU cards provisioned in  
0 a DMS switch for data integrity testing.

0 ( v) Simultaneous calls/tests may be made by any number  
0 of DTU BERT circuits.

0 ( vi) While BER testing can be performed by either the  
0 NT6X99AA card, which mounts in an LCM, or by the  
0 NT4X23AA card, which mounts in an MTM, there is a  
0 software problem that prevents the NT4X23AA from  
0 successfully testing Datapath Extension trunks.  
0 Therefore, it is recommended that the the NT6X99AA  
0 be used for DMS-100 and DMS-100/200 offices (local  
0 and local/toll applications) and that the NT4X23AA  
0 be used for DMS-200 offices (toll applications).

0

0 RELEASE 28.01  
0 93 12 03  
0

0 (vii) Determining The Number of DTU BERT Cards

0 The assumption placed on office testing shall be  
0 that an entire office should be tested within 12  
0 hours.

0 12 hours = 720 minutes

0 1 call or test requires 10 minutes.

0 Hence  $720/10 = 72$  calls or tests can be performed  
0 within a twelve hour period by one DTU BERT circuit.

0 (viii) One DTC or LTC can accommodate up to ten (10)  
0 NT6X50AA cards.

0 1 DTC or LTC = 10 NT6X50AA cards  
0 = 20 DS-1 or T1 spans  
0 = 20 calls or tests

0 Hence  $72/20 = 3.6$  DTC or LTC can be tested within a  
0 twelve hour period by one DTU BERT circuit.

0 1 DTU BERT circuit = 3.6 DTC or LTC

0 2 DTU BERT circuits = 1 DTU BERT card  
0 = 7.2; approximately 7 DTC or  
0 LTC

0 Hence one DTU BERT card can test up to seven DTC or  
0 LTC within a twelve hour period.

0 (ix) One DCM can accommodate up to five NT2X35AA/AB  
0 cards.

0 1 DCM = 5 NT2X35AA/AB cards  
0 = 5 DS-1 or T1 spans  
0 = 5 calls or tests

0 Hence  $72/5 = 14.4$ ; approximately 14 DCM can be  
0 tested within a twelve hour period by one DTU BERT  
0 circuit.

0 1 DTU BERT circuit = 14 DCM

0 2 DTU BERT circuits = 1 DTU BERT card  
0 = 28 DCM

0 RELEASE 28.01  
0 93 12 03

0 Hence one DTU BERT card can test up to 28 DCM within  
0 a twelve hour period.

0 (x) A minimum of twelve (12) NT4X23AA CPs should be pro-  
0 visioned for DMS-200 (toll) offices.

## 0 8.0 NSSD Local Test Cabinet

0 The NSSD LTC is a microprocessor controlled Local Test Cabinet  
0 (hereafter referred to as LTC) designed to test subscriber line  
0 circuits and trunk circuits. The LTC generates all test tones  
0 and test voltages without the aid of external devices. The LTC  
0 can access from one to sixteen test trunks and one MDF test  
0 trunk.

0 The LTC has the capability to test lines and trunks in DMS100F  
0 remote offices and other pair gain devices such as the AT&T  
0 SLC-96. This functionality is achieved via the Digital Remote  
0 Test Unit (DRTU).

0 The DRTU is a remote slave of the LTC. It is mounted in an  
0 equipment frame/Cabinet at the Remote Site. The DRTU to LTC com-  
0 munication is via Dial-up or Dedicated data lines. Refer to Fig-  
0 ure 1 for a pictorial representation of LTC to DRTU  
0 configuration.

0 The Local Test Cabinet works into any DMS100F test trunk and  
0 trunks from major switch manufacturers including AT&T/Western  
0 Electric, Automatic Electric, ITT/North, Stromberg Carlson, and  
0 TRW Vidar types. When properly calibrated, the LTC eliminates  
0 the effects of test trunk resistance and capacitance from the  
0 measured values displayed to the user. Busy lead sensing permits  
0 trunk sharing with other test equipment that may be installed in  
0 the office, (e.g., an LRS Loop Test Unit), and thus avoids the  
0 need for additional test trunks.

0 The LTC is designed to provide automated tests and measurements  
0 in a wall/desk/frame/MDF mounted configuration. The NSSD LTC of-  
0 fers an automatic measurement and diagnosis sequence plus a host  
0 of specialized loop test functions. The diagnosis sequence con-  
0 sists of the following:

- 0 \* Measurements of AC volts, DC volts, resistance, and  
0 capacitance between all combinations of tip, ring, and ground
- 0 \* Ringer presence check between all combinations of tip, ring  
0 and ground (shows where ringers are connected)
- 0 \* Microprocessor analysis of the above tests to determine the  
0 condition of the line, which includes automatic recognition  
0 of pair gain and intercept arrangements.
- 0 \* Measurement of the lines physical length.

0 Additional, individually-selectable test functions include:

0 \* Talk/monitor on subscriber's line via built-in handset or  
0 call-back path in remote applications.

0 \* Draw dial tone and dial on subscriber's line

0 \* Ring subscriber

0 \* Check DP or DTMF digits dialed from subscriber's station set

0 \* Apply howler (receiver off-hook) tone

0 \* Permanent signal release

0 \* Coin collect/return

0 \* Control/interrogate AT&T Pair Gain Test Controller in SLC-96,  
0 DMS-1/DMS-1 Urban, and certain other subscriber carrier ar-  
0 rangements

0 \* Activate remote device, pair gain metallic bypass path, or  
0 optional Digital Remote Test Unit (DRTU) slave measurement  
0 unit

0 \* Condition loop.

0 \* LINE ACCESS TEST FUNCTIONS

0 - Automatic test trunk selection based on NNX code.

0 - Supports both normal directory number access and line  
0 equipment number (LEN) access with automatic dialing of  
0 prefix digits.

0 - Handles up to 16 test trunks, (up to four trunks on the  
0 standard unit), and supports any mixture of dial or MDF  
0 shoe trunks.

0 - A special MDF trunk interface provides a full in/out  
0 bridge capability for any type of shoe.

0 - The standard four trunk LTC provides one such interface  
0 while four are available on the 16-trunk unit.

0 \* AUTOMATIC MEASUREMENT AND DIAGNOSIS SEQUENCE

0  
0  
0

0 RELEASE 28.01  
0 93 12 03

0 The Automatic Measurement and Diagnostic Sequence provides a  
0 single-button multi-test sequence that includes:

- 0 - Measurement of AC volts, DC volts, resistance and  
0 capacitance between all combinations of tip, ring, and  
0 ground;
- 0 - ringer presence check;
- 0 - measurement of line length;
- 0 - Analysis via fault algorithm including recognition of  
0 pair gain and intercept arrangements.

0 Note: CRT display shows full discrete results plus  
0 line status message. Site dependent ringer data con-  
0 tained in nonvolatile memory "fine tunes" algorithm for  
0 high accuracy.

0 \* DRAW DIAL TONE. The LTC applies off hook supervision on sub-  
0 scriber line to draw dial tone from central office. Operator  
0 can select either loop start or ground start supervision as  
0 appropriate.

0 \* DIAL ON SUBSCRIBER LINE. Checks CO's ability to receive sub-  
0 scriber dialed digits and complete a call. DP, MF, or DTMF  
0 dialing mode may be selected.

0 \* TALK AND MONITOR. Supplies talk battery when talking toward  
0 the station end of the loop. A high impedance, monitor-only  
0 mode is also selectable for situations where desired.

0 \* CHECK SUBSCRIBER DIGITS. Permits analysis of DP or DTMF dig-  
0 its sent by the subscriber's dial.

0 \* RING SUBSCRIBER. Connects the appropriate ringing signal to  
0 the accessed line.

0 \* CONDITION LOOP. Places one or more of the following loop  
0 conditions on the line for applications where required:

- 0 - reversed tip and ring,
- 0 - shorted tip and ring,
- 0 - ground on tip and ring,

0 RELEASE 28.01  
0 93 12 03

- 0 \* COIN COLLECT/RETURN. Applies coin collect/return voltage to  
0 line. Display indicates whether on not pay station relay op-  
0 erates, if test is successful, and the operating current.
- 0 \* PERMANENT SIGNAL RELEASE (PSR). Frees office line equipment  
0 tied up by a permanent line busy fault condition such as Re-  
0 ceiver Off Hook (ROH). Permanent signal release is applica-  
0 ble only where supported by the central office test trunk.
- 0 \* APPLY HOWLER. Places howler tone on a subscriber line to  
0 signal a permanent receiver off hook (ROH) condition.
- 0 \* ACTIVATE/DEACTIVATE DRTU OR OTHER REMOTE DEVICE. Sets up  
0 3704 Digital Remote Test Unit (DRTU) communication path in  
0 certain common subscriber carrier systems and remote line  
0 concentrators.
- 0 \* INTERROGATE PAIR GAIN TEST CONTROLLER. In SLC96 and DMS-1  
0 arrangements equipped with the AT&T Pair Gain Test Controller  
0 (PGTC), collects and displays the results of digital carrier  
0 channel tests.
- 0 \* CONNECT EXTERNAL JACK. Terminates the accessed line in a  
0 type 310 panel jack for connection of external test equip-  
0 ment. Provides a convenient access point for measuring  
0 level, noise, and other transmission parameters. The external  
0 jack function also enables the Pair ID Buzzer accessory de-  
0 scribed in the following paragraph.
- 0 \* PAIR IDENTIFICATION. A Pair ID Buzzer accessory NT0J04DE  
0 provides audible and visual indications when the accessed  
0 tip/ring pair has been located at the wiring frame.
- 0 \* TEST TRUNK CALIBRATION. Stores in nonvolatile memory the re-  
0 sistance and capacitance characteristics of each individual  
0 test trunk connected to the LTC. Eliminates the effects of  
0 test trunk length on the measurement results displayed to the  
0 user. A Trunk Calibrator accessory NT0J04DA reduces the num-  
0 ber of steps required to obtain calibration values.
- 0 \* REMOTE ACCESS/CONTROL PORTS. Permit LTC control from a re-  
0 mote or local data terminal, or intelligent controller via  
0 dial-up or dedicated operation. Also features call-back ca-  
0 pability for talk/monitor functions, high level ASCII proto-  
0 col, built-in 300/1200 baud modem, and user transparent  
0 log-in security feature.

0 8.1 HARDWARE PROVISIONING0 8.1.1 HARDWARE USAGE RESTRICTIONS

The 4trunk 3Wire access card (NT0J62BA) is required to access up to four trunks on all other switching system. This is due to the fact that these switching systems utilize the 3-wire (Tip, Ring, Sleeve & Gnd) trunk accessing methodologies.

The 4trunk 4Wire access card (NT0J63BA) is required to access up to four trunks on the DMS-100 Product Families and the Western Electric/Bell Technology Product Families. This is due to the fact that these switching systems utilize the 3-wire (Tip, Ring, & Sleeve) trunk accessing methodologies.

The 16trunk 4Wire access card (NT0J64BA) is required to access up to sixteen trunks on the DMS-100 Product Families. This is due to the fact that these switching systems utilize the 4-wire (Tip, Ring, Sleeve & Gnd) trunk accessing methodologies.

0 8.1.2 HARDWARE DEPENDENCIES

When the Digital Remote Test Unit (DRTU) is used at a Remote Office a MLT Applique Shelf (NT3J00BA) card slot is required at the host to mount the DRTU Signature Card (NT3J00BE).

## 0 P AND C SIDE PORT REQUIREMENTS

0  
0 Not Applicable

## 0 DMS BUS PORT REQUIREMENTS

0  
0 Not Applicable

## 0 CIRCUITS PER CARD

0  
0 Not Applicable

## 0 DISCRIMINATION NUMBERING

0  
0 Not Applicable0 8.1.3 PROVISIONING CONSIDERATIONS0  
0 Several configurations of the NSSD Local Test Cabinet exist,  
0 which are Model 3703-00, 3703-01, and 3703-03. The Model  
0 3703-03 is the current version provisioned, and upgrade kits  
0 exist for the earlier vintages. The NSSD LTC Models 3703-00  
0 & 01 were ordered with a single PEC which provided all  
0 available options. The NSSD LTC Model provides increased

0 RELEASE 28.01  
0 93 12 03

0 functionality which is facilitated by ordering multiple PECs  
0 to provide the unit (See Section 2.4.2).

0 The NSSD LTC is available as a Local or Remote configuration  
0 in Brown. Mounting options available are Equipment  
0 Rack/Wall/Desk/MDF mounting. Options allow for 4 or 16 test  
0 trunk access.

0 Please note that in Canada, our customers will be ordering  
0 the LTC directly from the Network Systems Support Division  
0 (NSSD). In the U.S. (NTI), our customers will be ordering  
0 it from NTI. For Canadian jobs, note that we must still  
0 provide the appropriate cables, jack boxes, and test jacks.  
0 Refer to CAX04 cable drawing for cabling information.

#### 0 LTC Model 3703-00/01 Upgrade Kit

0  
0 The LTC Model 3703-00 & 01 Upgrade Kit provides the hardware  
0 necessary to upgrade an existing unit to the LTC Model  
0 3703-03 standards.

0 Telcos having a NSSD Model 3703-00 or 3703-01 LTC must up-  
0 grade the unit to the Model 3703-03 standards in order to  
0 take advantage of the majority of the LTC features as de-  
0 fined in the General Section.

0 The earlier vintage LTCs may be upgraded using the NT0J60AA  
0 System Upgrade Kit. When provisioning the Upgrade Kit the  
0 following information must be included with the order:

0 \* The serial number of the existing Model

0 \* The color of the existing Model

0 This information is required because the LTC card cage will  
0 be replaced and the existing serial number used on the new  
0 card cage.

0 The NT0J60AA System Upgrade Kit provides a new LTC card cage  
0 which provides the following features:

0 \* Trunk Control Keys

0 RELEASE 28.01  
0 93 12 03

- 0 \*
- 0 \* A Boost Key
- 0 \* Four (4) More Ports:
  - 0 Local EIA RS-232-C
  - 0 Two (2) Dial-In Ports
  - 0 Call-Back
- 0 \*
- 0 \* Four (4) Trunk Connectors Instead Of One (1)

## 0 LTC Provisioning

0  
0 The NSSD LTC is an independent-operable unit that supports a  
0 full range of loop testing for existing and recently in-  
0 stalled circuits. A typical Local Test Cabinet (LTC) con-  
0 sists of a pushbutton (key) control panel, a 5-inch video  
0 display (VDU), a telephone handset, and a 310-type connector  
0 for connecting additional test equipment.

0 The LTC is provisioned via several PECs which include:

- 0 \*
- 0 \* Minimum Components for LTC operation
  - 0 - LTC Mainframe (includes front panel and test trunk
  - 0 access option)
  - 0 - Mounting Brackets
- 0 \*
- 0 \* Optional Components for enhanced LTC operation
  - 0 - Buzzer Pair Identifier
  - 0 - Spares Kit
  - 0 - Digital Remote Test Unit (DRTU) Model 3704
  - 0 - DRTU Access Card
  - 0 - MLT Applique Shelf
  - 0 - Signature Accessory Card

0 9.0 Integrated Bit Error Rate Test Facility (IBERT)

0 1. Introduction

0 1.1 The Integrated Bit Error Ratio Test Facility or IBERT is an  
0 optional maintenance feature which can be ordered for test-  
0 ing the data loops in a DMS office (i.e. office with  
0 DATAPATH features).

0 1.2 IBERT is necessary to fulfill two distinct requirements:

0 1) Datapath Bit Error Rate Testing

0 2) and Datapath Extension (DPX) Maintenance Messaging.

0 1.3 Datapath Bit Error Rate Testing

0 1) In conjunction with Datapath maintenance software, it  
0 will provide the DMS craftsperson with the ability to  
0 monitor and diagnose from the MAP, the data transmission  
0 quality of a selected Datapath line. Current methods of  
0 testing Datapath circuits and equipment requires the use  
0 of cumbersome external test sets, inaccessible from a  
0 MAP and outside the control of any automated DMS/SL-100  
0 maintenance process.

0

0

0

0

0

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 2) A Bit Error Rate Test is a test used to measure the  
0 transmission quality of a loop. The basic idea of a  
0 BERT is to send a known stream of data over a given  
0 loop, and to have this data reflected back to the  
0 sender. The received data is then compared with the  
0 sent data thereby giving a measure of the transmission  
0 quality. By looping back data at different points in  
0 the loop and measuring the quality of transmission at  
0 each point, faults which may exist on the loop can be  
0 isolated.

0 3) At present, the only capabilities provided are for an  
0 external BERT. An external BERT is a piece of test  
0 equipment which is not a part of the DMS. Regular meth-  
0 ods are used to establish a connection between a line to  
0 be tested and this external piece of test equipment. An  
0 integrated BERT, i.e. resident piece of equipment in the  
0 DMS, has been developed. The purpose of this feature  
0 will be to provide access to this integrated BERT by  
0 means of a single command located at the LTPMAN level of  
0 the MAP. The benefit of this will be a simpler method  
0 of testing Datapath loops as well as dropping the need  
0 for any external test equipment.

#### 0 1.4 Datapath Extension (DPX) Maintenance Messaging

0 1) The IBERT will also be used as a 64 kbps inband signal-  
0 ling interface to the Datapath Extension System (DPX)  
0 based on the DE-4E channel bank, providing a maintenance  
0 messaging channel between the DMS/SL-100 central control  
0 and the DPX. This will give the MAP-situated  
0 craftsman the ability to diagnose the DPX card and  
0 the associated Data Unit/Data Line Card (DU/DLC) facil-  
0 ity with diagnostics similar to the existing Datapath  
0 maintenance or to test the error rate performance of the  
0 entire DS1/DPX/DLC/DU facility.

0 1.5 The IBERT can be used to test virtually any type of data  
0 line connected to the DMS which supports the TLINK protocol.  
0 This includes Data Unit, AIM, Data Above Voice, coax elimi-  
0 nator Data Units and loop extended Data Units (those ex-  
0 tended using the Line Interface Unit and Data Terminating  
0 Unit method).

0 1.6 Note that the intent of providing an integrated BERT is to  
0 enhance the maintenance capabilities for datapath. This is  
0 not meant to be used as a tool for networks or speech links

0

within the DMS. No attempt is made by this feature to provide a BERT while a data unit is involved in a call with another data unit. For this type of testing, an external BERT must still be used.

0 2. Product Features

## 0 2.1 The IBERT will perform the following functions:

- 0 1) transmit standard 511 or 2047-bit data test pattern at  
0 50 bps to 19.2 kbps asynchronous or 1.2 kbps to 64 kbps  
0 synchronous using T-link
- 0 2) transmit standard 511 or 2047-bit data test pattern at  
0 64 kbps without T-link handshaking
- 0 3) transmit standard 511 or 2047-bit data test pattern at  
0 56 kbps with a ones density suitable for T-carrier,  
0 without T-link handshaking
- 0 4) receive data in any of the above formats and detect bit  
0 errors and sync losses in the bit stream
- 0 5) count the number of error free seconds and total number  
0 of seconds in a test
- 0 6) derive data timing from the 64 kbps channel rate with  
0 the option to derive clocking from the received data  
0 stream if the far end uses external clocking (indicated  
0 in T-link handshake)
- 0 7) when in T-link mode adapt the data transmission and re-  
0 ception rate to the far end equipment
- 0 8) allow the MAP user to do the following:
  - 0 - activate a loopback at the line card or set to be  
0 tested
  - 0 - start BERT as one of the following:
    - 0 1. 64 kbps (no T-link handshake)
    - 0 2. 56 kbps (no T-link handshake)
    - 0 3. T-link adaptive data rate
    - 0 4. default to (1),(2), or (3) according to type of  
0 loopback selected
  - 0 - inject error(s) in the transmitted data pattern
  - 0 - stop BERT

0

0

- display test results (bit error count, sync loss  
count,

0

0

total number of bits, etc.)

0

- display the operating data rate of the test

0 9) support the inband signalling scheme used for DPX main-  
0 tenance

0 - on request from DMS/SL-100 send pattern at the start  
0 of  
0 the call to put the DPX into maintenance mode

0 - accept messages from DMS/SL-100 addressed to the DPX  
0 and  
0 transmit them on transparently via inband signalling

0 - detect inband messages from DPX and send them to the  
0 DMS/SL-100

0 3. Product Description

0 3.1 Datapath Bit Error Rate Testing

0 3.1.1 A pictorial representation of an Integrated BERT is as  
0 follows:

0 Typical Datapath Bit Error Rate Test Setup

0 Figure 1

0  
0 RELEASE 28.01  
0 93 12 03

0 3.1.2 The loopbacks labelled A, B and C are respectively a 64  
0 Kilo-bit loopback at the Data Line Card (DLC), a 64 Kilo-  
0 bit loopback at the Data Unit (DU) and a loopback at the  
0 RS-232C interface of the Data Unit. These loopbacks cor-  
0 respond respectively to the LOOPBK DLC, LOOPBK DU\_64K and  
0 LOOPBK DU commands at the LTPMAN level of the MAP.

0 3.1.3 As can be seen from the diagram, the 511 bit pattern is  
0 sent from the IBERT through the network, out to the line  
0 in question and is looped back from wherever the loopback  
0 is set (either A, B or C) through the network to the IBERT  
0 where it is compared with the pattern that was sent.

0 3.1.4 Optionally, no loopback may be set. This is referred to  
0 as a straight away test. In this case, an external BERT  
0 is connected to the Data Unit being tested. An external  
0 BERT takes care of receiving the bit pattern sent by the  
0 IBERT and sending its own bit pattern back. This scenario  
0 is generally used for verifying the accuracy of the IBERT.  
0 The external BERT would be used in this case to inject er-  
0 rors into the pattern sent back to the IBERT so that it  
0 can be verified that in fact the IBERT detected the error  
0 and reported it. Note that in this case the external BERT  
0 used must conform to CCITT standards so that it will gen-  
0 erate the same 511 bit pattern used by the IBERT.

RELEASE 28.01  
93 12 03

3.1.5 A list of Datapath products and the loopback points supported by each is shown as follows:

| Datapath Product     | Loopback A:<br>DLC Loopback | Loopback B:<br>64kb Loopback | Loopback C:<br>DU Loopback |
|----------------------|-----------------------------|------------------------------|----------------------------|
| Low Speed Data Unit  | DLC cutoff relay            | DU TCM interface             | RS232 interface            |
| High Speed Data Unit | DLC cutoff relay            | DU TCM interface             | V35 interface              |
| Coax Eliminator      | DLC cutoff relay            | DU TCM interface             | Not Supported              |
| AIM/AILC             | AILC cutoff relay           | Not Supported                | RS422 firmware I/F         |
| DPX                  | DLC cutoff relay            | DU TCM interface             | DU RS232/V35 interface     |
| LIU/DTU              | DLC cutoff relay            | LIU TCM interface            | DTU RS232/V35 interface    |

Note: The LIU/DTU combination also supports several other loopbacks including loopbacks within the loop extension data facility. For more information see "Datapath Loop Extension Maintenance", by J. Henderson, FDOC BV1342, October 1985.

#### Datapath Products and Supported Loopback Locations

Figure 2

0 RELEASE 28.01  
0 93 12 03

### 0 3.2 Datapath Extension (DPX) Maintenance Messaging

0 3.2.1 A pictorial representation of a DPX Maintenance Messaging  
0 setup is as follows:

0 Typical DPX Maintenance Messaging Setup

0 Figure 3

0 3.2.2 To perform maintenance diagnostics on the DPX/DLC/DU fa-  
0 cility shown above, the craftsperson would post the asso-  
0 ciated DU on the MAP and enter the diagnostic command. The  
0 maintenance software recognizing this as a DPX would auto-  
0 matically connect an available IBERT to the DPX. All  
0 maintenance messages are subsequently sent to the IBERT  
0 but addressed to the far end DPX, DLC, or DU and encoded  
0 in the W78 bulk data transfer format. The IBERT removes  
0 the messages from the bulk data transfer format and passes  
0 them on transparently to the DPX via the inband signalling  
0 protocol. All messages addressed to the DLC or the DU are  
0 passed on transparently by the DPX.

0 3.2.3 In this example the DLC/DU configuration illustrated could  
0 refer to a DLC/low speed DU, DLC/high speed DU, or  
0 DLC/coax eliminator.

0 9.1.3 PROVISIONING CONSIDERATIONS

0  
0 1.1 The hardware of the Integrated BERT (NT6X99AA) resides in  
0 the line drawer (NT6X05AA) of an LCM in a Host office, in an  
0 RSC site, or in an OPM site (or RLCM) taking the physical  
0 space of a two slot line card. The two vertical slots in  
0 the LCM line drawer must be in the same logical line drawer  
0 subgroup (i.e., in the same line subgroup (LSG)).

0 1.2 The IBERT must be located in a Line Concentrating Module  
0 (LCM) or Remote Line Concentrating Module (RLCM) which may  
0 or may not be the same LCM or RLCM as the one which the line  
0 it is testing resides. Even though the IBERT may be located  
0 on the same LCM as the line which it is testing, intra-  
0 switching for the connection is not used. This means that a  
0 connection between the IBERT and the line it is testing will  
0 be established through the DMS network. No connection be-  
0 tween the IBERT and the line it is testing in the LCM, with-  
0 out going through the DMS network, can be established at the  
0 present time.

0 1.3 Although the appearance of the IBERT is that of a line card,  
0 the IBERT is NOT a line card in the normal sense as there is  
0 no subscriber loop or set associated with it. The only  
0 interaction with an IBERT is achieved from a MAP through the  
0 DMS/IBERT messaging interface.

0 RELEASE 28.01  
0 93 12 03

- 0 1.4 While BER testing can be performed by either the NT6X99AA  
0 card, which mounts in an LCM, or by the NT4X23AA card, which  
0 mounts in an MTM, there is a software problem that prevents  
0 the NT4X23AA from successfully testing Datapath Extension  
0 trunks. Therefore, it is recommended that the NT6X99AA be  
0 used for DMS-100 and DMS-100/200 offices (local and  
0 local/toll applications) and the NT4X23AA be used for  
0 DMS-200 offices (toll applications).
- 0 1.5 A minimum of one (1) NT6X99AA per LCM or 24 per office  
0 (whichever is larger) should be provisioned for basic test  
0 capability in DMS-100 or DMS-100/200 offices. Higher quan-  
0 tities of test cards will provide faster office coverage.
- 0 1.6 For datapath loop testing, due to a high volume of messaging  
0 traffic, it is recommended that one (1) IBERT line card  
0 (NT6X99AA) be provisioned per LCM equipped with a data line  
0 card.
- 0 1.7 For switch bit error rate testing (in NTX881AC) it is recom-  
0 mended that one (1) IBERT line card (NT6X99AA) be provi-  
0 sioned per LCM for every LCM in the office.
- 0 1.8.1 Up until BCS-24 the maximum number of IBERT line cards  
0 (NT6X99AA) and DTU BERT Unit circuits (NT4X23AA) (i.e. 2  
0 circuits per card) allowed in an office (Host plus all as-  
0 sociated remotes) is 64.
- 0 For more information on DTU BERT Unit card (NT4X23AA), see  
0 ECM-352 on subject Digital Test Unit BERT Unit CP,  
0 NT4X23AA.
- 0 1.8.2 As of BCS-25, the maximum number of NT6X99AA cards and  
0 NT4X23AA circuits allowed in an office is 128.
- 0 1.8.3 For Canadian Applications Only
- 0 If the IBERT line card requirement exceeds the above soft-  
0 ware limitations of 64 and 128 respectively in an office,  
0 it is permissible to perform the associated tests by re-  
0 structuring the associated software data tables accord-  
0 ingly (i.e. perform the required test for the first group  
0 of 64 or 128 IBERT line cards, restructure applicable  
0 software data tables for the next group of 64 or 128 IBERT  
0 line cards, perform the required test, and so on).
- 0 1.9 The data rates supported by IBERT are the following:

**0**

0

0 9.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 1. The applicable software is in the following software packages:  
0

0 NTX259AA DATAPATH Extension - DPX

0 \* NTX881AC Switch Bit Error Rate Maintenance  
0 (Upgrade of NTX881AB)

0 \* NTX885AB Switch Path Diagnostics (SPD)  
0 (Upgrade of NTX885AA)

0 \* NTXP13AA ENET Switch Path Diagnostics (SPD)

0 \* When ordering software package NTX881AC, it is recommended  
0 that NTX885AB/NTXP13AA be ordered as well.

0 When ordered by the Customer, the Switch Path Diagnostics  
0 (SPD) software package is to be furnished as NTX885AB for  
0 non-ENET SuperNode and NT-40 offices and furnished as  
0 NTXP13AA for ENET SuperNode offices.

0 If software package SPD exists in a DMS office prior to an  
0 ENET upgrade, then both NTX885AB and NTXP13AA are to be pro-  
0 vided in the retrofit software load to provide both Network  
0 Module (NM) and ENET coverage. NTX885AB is to be removed on  
0 the next BCS application following the upgrade.

0 93 12 03

## 0 1.0 Introduction to Host Network Equipment

0 The Network Module (NM) is the major building block of the net-  
0 work. It establishes and maintains two-way speech and signalling  
0 paths between the Peripheral Modules (PM) lines, trunks, service  
0 circuits and digital carrier facilities for the duration of the  
0 call.

0 The fully duplicated network provides reliability because every  
0 active connection in one plane is backed up by a corresponding  
0 inactive connecting in the other plane. If any channel of the  
0 connection fails, the back-up channel is automatically made ac-  
0 tive, and takes over the call. Several types of network module  
0 are available.

0 There are five types of network module which accomplish the same  
0 switching function but have different internal electronics and  
0 physical configurations. The five network types are as follows:

- 0 A) NT9X05AB 128K Dual Cabinet Enhanced Network (ENET)
- 0 B) NT9X05AD 64K Single Cabinet Enhanced Network (ENET)
- 0 C) NT8X10AA Double Shelf Network (DSNE)
- 0 D) NT0X48 Network (NET)
- 0 E) NTZZ34\_\_ DMS-SuperNode SE (SNSE)

### 0 1.1 Double Cabinet Enhanced Network (128K ENET)

0 The Enhanced Network (ENET) is a single-stage, junctor-less  
0 switching matrix that replaces the junctored network system. The  
0 128K Dual Cabinet Enhanced Network equipped with four ENET  
0 shelves (i.e. one plane per cabinet) provides 128K non-blocking  
0 channels access.

### 0 1.2 Single Cabinet Enhanced Network (64K ENET)

0 The 64K Single Cabinet Enhanced Network provides 64K non-  
0 blocking, junctor-less channels on two planes in a single cabi-  
0 net.

0

0 RELEASE 28.01  
0 93 12 03

0 1.3 Double Shelf Network (DSNE)

0 The DSNE packages one network plane (64 ports) on a single shelf  
0 rather than two shelves as does the NETC frame, and therefore  
0 permits two complete networks per plane in a single bay, doubling  
0 the density of the NETC.

0 1.4 NET

0 The NT0X48 network has a single network module per single bay  
0 frame, and therefore requires 32 frames to accommodate a complete  
0 set of NM.

0 1.5 DMS-SuperNode SE

0 The DMS SuperNode SE (SNSE) is an alternative provisioning option  
0 to the traditional SuperNode, Enhanced Network (ENET) and Link  
0 Peripheral Processor (LPP).

0 The selection of the DMS SuperNode SE is recommended where the  
0 application's projected growth will not exceed any of the follow-  
0 ing characteristics:

0 ! 20 FXPM or 80 DS30 network interfaces for Peripherals Mod.

0 ! 3 Link Peripheral Processors(LPP).

0 ! 2 Application / File Processors(AP/FP).

0 It is normally recommended that applications that exceed these  
0 parameters use the standard SuperNode.

0 The SNSE is intended for end-offices that require an initial ca-  
0 pacity of up to 13,000 subscriber lines. The network can provide  
0 growth potential of 20,000 to 40,000 subscriber lines or 12,000  
0 trunks, depending on the traffic and service mix of an applica-  
0 tion and the required peripheral configuration.

0 The SNSE platform is defined as containing the CM/SLM  
0 functionality, DMS-Bus functionality, LIS and Network  
0 functionality. In essence, SuperNode SE provides DMS-Core,  
0 DMS-Bus, ENET 16K Channels, and a Link Interface Shelf(LIS) in a  
0 single cabinet.

0 All initial jobs requiring Network Modules should be provisioned  
0 with either DSNE or ENET (combinations are not possible).

0  
0 RELEASE 28.01  
0 93 12 03

0 Extensions should be provisioned with DSNE; if ENET is desired, a  
0 complete retrofit to ENET is necessary. (See discussion of ENET  
0 Retrofit, later in this section.)

0 2.0 128K Enhanced Network (Dual Cabinet ENET)

0 In this document ENET refers to the 128K Enhanced Network.

0 In the Junctored Network(JNET) system, each network module (NM) inter-  
0 faces up to 64 DS-30 speech links. This equates to 2K channels per NM.  
0 That is,

0 64 Ports per NM X 32 Channels per port = 2048 Channels

0 The total channel capacity of junctored network system is

0 2K X 32 NM = 64K Channels or 2 way Peripheral Module access

0 (Rule: Minimum junctors required between two NM is 2.)  
0 (64 junctors(ports) Divide by 2 junctors per NM = 32NM)

0 Theoretically 32K simultaneous 2 way paths could be set up across the  
0 network. The network modules have to be interconnected to achieve the  
0 desired network size. The channel delay through the network is vari-  
0 able dependent on the path, and access between one port to another may  
0 be blocked due to congestion in the network or on the junctors.

0 The Enhanced Network (ENET) is a single-stage junctor-less switching  
0 matrix that replaces the junctored network system. By comparison, a  
0 128K Enhanced Network Cabinet (ENC) with four (4) Enhanced Network  
0 (ENET) shelves (i.e. one plane per cabinet) provides 128K channel ac-  
0 cess. This is nominally equivalent to twice the existing capacity of  
0 Junctored Network System(32 NM max). In ENET constant delay between  
0 any two ports on the matrix. Moreover, any port is insured access to  
0 any free ports by its associated cross-point. This makes blocking im-  
0 possible.

0 In the junctored network system, speech links (PM-NET) and message  
0 links (NET-CMC, MS) utilize the DMS DS-30 format. This format consists  
0 of 32 PCM channels each 10 bits wide and operate at 2.56 M-  
0 bits/sec. Each 10 bit channel includes 8 data (speech) bits, one  
0 channel supervision bit and one parity bit.

0 With the introduction of the ENET - ENET to MS and XPM to ENET will  
0 utilize fiber medium. Fiber transmission links were first used in the  
0 DMS-S/N to connect the CM and MS. Each fiber link is the transmission  
0 equivalent of 16 DS-30 copper links in that there is a of total 512  
0 channels in each. Sixteen DS-30 is the speech link compliment of one  
0 XPM.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Also with the introduction of ENET, there is a significant change in  
0 the way that the Message Switch (MS) is provisioned. MS ports and mes-  
0 sage channels are dedicated to specific peripherals. Message links are  
0 nailed up over cross-points for direct access from the DMS-Bus to the  
0 PM.

0 Refer to the following Figure for an overview for the ENET system.

## 0 NETWORK ARCHITECTURE

0 Benefits derived from the non-blocking design of ENET is described in  
0 terms of Full Availability, Switched PCM, the Switching Matrix, Speech  
0 Link Interfaces, and Control Plus Messaging as follows:

## 0 \* Full Availability

- 0 - No traffic penalty for nailed up or wide-band connections.
- 0 - No traffic balancing on speech links is necessary; port  
0 spreads are not required thus Speech Link Connector (SLC)  
0 Frames and Digital Network Interface (DNI) Frames are elimi-  
0 nated for this purpose.
- 0 - No path search required since all possible paths are independ-  
0 ent.
- 0 - Dual plane redundancy is provided for improved reliability.

## 0 \* SWITCHED PCM

0 Switching is performed on 2 K-channel PCM streams which are multi-  
0 plexed from four converted DS-512 sources. Each DS-512 is derived  
0 either from a fiber speech link originating from a fiber XPM  
0 (FXPM) or from up to 16 copper speech links operating in the DS-30  
0 format from conventional PMs.

## 0 \* SWITCHING MATRIX

- 0 - The basic building block of the switching element is a 16 K-  
0 channel (input) x 4 K-channel (output) matrix time switch.  
0 Four such units are combined on each Network Cross-Point CP to  
0 form a 16 K-channel x 16 K-channel time switch. These are  
0 one-way connections and two paths would be required for each  
0 two-way conversation.
- 0 - The 16K PCM inputs to the time switch on each CP are derived  
0 as follows:  
  
0 2K is multiplexed from four DS-512 streams then passed from  
0 the PB behind the cross point CP. This 2K PCM is also distrib-  
0 uted to the cross point CP in the same slot on the other three  
0 shelves, when equipped, via the Vertical Bus (V-Bus).
- 0 - 6K PCM are derived from the other three shelves when equipped  
0 via the upper and lower V-Bus.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - 8K PCM are derived from the corresponding V-Bus array of the  
0 mate cross-point card in the same shelf.
- 0 - The unswitched PCM distributed vertically between the shelves  
0 in the cabinet utilize the V-Bus (or Unswitched Bus). This bus  
0 is implemented via orderable local cables.
- 0 - Eight 2K switched outputs from 16 cross-point CP pairs on a  
0 shelf are combined in the backplane to form the Horizontal Bus  
0 (H-Bus) or (Switched Bus) and makes the shelf a 128K x 32K ma-  
0 trix. One switched PCM from the H-Bus is demultiplexed on  
0 each cross point CP into four DS-512 PCM streams and fed to  
0 the interface PB behind the CP.
- 0 - The four shelves on a single cabinet combine to form a 128K x  
0 128K matrix. This configuration, contained in a single cabi-  
0 net per plane, is nominally equivalent (terminations) to 64 NM  
0 per plane of the current design.
- 0 - Despite its 16K X 16K size, each new cross-point CP adds only  
0 one new 2K PCM input and output to the network.

0 \* SPEECH LINK INTERFACES

- 0 - Three basic types of paddleboard are available i.e. DS-30,  
0 DS-512. and DS-30/DS-512.
- 0 - The DS-512 PB has four (4) DS-512 inputs (i.e. 0.5K Channels  
0 per input) which are utilized on fiber XPMs.
- 0 - The DS-30 PB combines 16 DS-30 copper speech links which are  
0 utilized on Series I Peripherals and non fiber XPMs.
- 0 - The DS-30/DS-512 PB is a new peripheral interface paddle board  
0 to be used only on the 128K ENET(Enhanced NETwork). This pack  
0 can interface 3 DS-512 fiber links and 16 DS-30 copper links.  
0 It combines the functionality of two existing packs. The  
0 NT9X40BA/40BB (4 DS-512) fully utilize the ENET's channel han-  
0 dling capacity. But, it does not provide copper links. On the  
0 other hand, the NT9X41BA (16 DS-30) pack does not fully uti-  
0 lize ENET's channel handling capacity(only 25% utilization of  
0 crosspoints). Using an NT9X45BA results in a 100% utilization  
0 of ENET crosspoints and providing both copper and fiber links.  
0 For example an ENET currently equipped with 4 NT9X41BAs and 3  
0 NTX40BA/BBs requires 7 Crosspoints. This could be reconfigured  
0 with 4 NT9X45BAs and only 4 Crosspoints a savings of 3 Cross-  
0 points cards.

0 RELEASE 28.01  
0 93 12 03

## 0 \* CONTROL &amp; MESSAGING

- 0 - Each ENET shelf is equipped with and controlled by a Motorola  
0 68020 CPU. This processor, equipped with 4 M-bytes of memory,  
0 operates on downloaded SOS-based software. Control is di-  
0 rected by messages sent via the MS over fiber message links.
- 0 - The ENET-to-MS message links now become multi-message channel  
0 facilities. The set of MS message port hardware associated  
0 with a given ENET shelf pair and the peripherals which it  
0 interfaces is referred to as a " MS Port Group ". Each group  
0 consists of at least one (1) MS Port CP (NT9X17AA/AD or DA)  
0 and associated PB. The cards of a port group occupy adjacent  
0 slots on the MS shelf.
- 0 One port group is required on each MS shelf to interface each  
0 ENET shelf. Thus, an office equipped with one pair (i.e.  
0 plane 0, 1) of ENET shelves would require four (4) port  
0 groups.
- 0 - A major deviation from the current NM practice is the method  
0 by which control messages are distributed to peripherals.
- 0 - Peripherals connected to ENET shelves are assigned inde-  
0 pendent message ports on each MS, one (1) port for each  
0 message channel required.
- 0 - The message channels are connected to the message ports  
0 via Nailed-Up connections in the interfacing ENET shelf  
0 and via the DS-512 message link extended between the ENET  
0 shelf and MS.
- 0 - One (1) cross-point CP on each ENET shelf is reserved for  
0 message switching with 0.5K channels assigned to each MS  
0 link. The remaining 1K channels are not available for  
0 speech link access.
- 0 - The MS port requirements are greatly increased with the intro-  
0 duction of ENET making necessary the development of the MS 64  
0 port CP (NT9X17DA). The 64 port CP is used for connection to  
0 ENET. The MS 4 port CP (NT9X17AA/AD) is still used for con-  
0 nection to the IOCs, NM, LPP, FLIS and CM.

0 2.1 HARDWARE PROVISIONING

0

0 2.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The following restriction apply to ENET H/W applications:

0 \* The Enhanced Network must interface to a SuperNode (i.e. Mes-  
0 ssa ge Switch & Computing Module). An NT-40 (i.e. Central Con-  
0 trol Complex) will not support an Enhanced Network.

0 \* The Enhanced Network will not interwork with any previous  
0 version of Network frames.

0 \* The NT9X41BA has 16-Ports numbered 0-15. All ports except  
0 port #1 may be used for Voice or Messaging Links. Port #1 is  
0 valid for Voice Links only. This is a S/W restriction on the  
0 hardware.

0 \* The NT9X45BA has 16 DS-30 ports numbered 0-15 and 3 DS-512  
0 ports. All DS-30 ports except port #1 may be used for Voice  
0 or Messaging Links. Port #1 is valid for Voice Links only.  
0 This is a S/W restriction on the hardware.

0 \* Application of the above restriction prohibits the assign-  
0 ments of the following Peripheral Module (PM) ports to Link  
0 #1 as follows:

- 0 - Single link PMs (e.g. MTMs, TM8s, OAUs, etc.)
- 0 - Port Zero of DCMs and LMs
- 0 - Port Zero and Two of XPMs

0 \* The MSB6, SMR, DTC6 are not ENET ready in that facilities to  
0 equip these units with enhanced messaging (NT6X69AC/MA) are  
0 not available. Therefore, offices equipped with these vin-  
0 tages of XPMs should not be considered for ENET unless an  
0 agreement can be reached with the Telco.

0 \* MS to ENET, ENET to FXPM Distance Restrictions are as fol-  
0 lows:

0

0  
0 RELEASE 28.01  
0 93 12 03

- 0 - MS-9X20BB To ENET-9X40BB  
0 Length: 250ft (1,4), Variance: 25ft (3)
- 0 - MS-9X62BA To ENET-9X40BB  
0 Length: 250ft (1,2), Variance: 25ft (3)
- 0 - ENET-9X40BB To FXPM-6X40DA  
0 Length: 1000m (4), Variance: 200ft
- 0 - ENET-9X40BB To FXPM-6X40GA  
0 Length: 1000m, Variance: 200ft
- 0 - ENET-9X41BA to XPM/PM  
0 Length: 750ft, Variance: 200ft
- 0 - ENET-9X41BA to XPM/PM  
0 Length: 600ft, Variance: 200ft

0 NOTES:

- 0 1. Refer To ECM-626 For MS TO ENET Restrictions
- 0 2. Recommended length limit so that the received optical  
0 power is greater than -26dbm. This optical receive power  
0 is based on the jitter limit of the R94-Hybrid on the  
0 9X20BB/9X40BB in loopback.
- 0 3. The limits placed on the variation in cable length be-  
0 tween either MS and any ENET shelf is required to main-  
0 tain integrity of the ENET Vertical Busses.
- 0 4. This value is base on the link interface CPs having a  
0 R94-Hybred on one end and a G64-Hybred with a 5L78 Clock  
0 recovery hybrid on the other.

0 RELEASE 28.01  
0 93 12 03

0 C. Peripherals which have never been verified with ENET

0 Peripherals which fall under this category include,

0 TM2 Trunk Module 2-Wire  
0 TM4 Trunk Module 4-Wire  
0 T8A Trunk Module 8-Wire with Metallic Test Access  
0 MSB6 Message Switch Buffer #6  
0 \* TOPS TOPS Interfaces

0 Note that the TM2, TM4 and T8A use the same processor as the TM8,  
0 which has been verified. Moreover, these peripherals do not re-  
0 quire hardware changes for compatibility with ENET. The associ-  
0 ated risks are therefore low. In addition, the MSB6 has been  
0 tested in BNR DMS-300 lab, and the risks are known be to low.

0 \* These are not peripheral modules which are connected di-  
0 rectly to the network.

0 Note if APIs/ECMs do not adequately address ENET ineterface re-  
0 quirements for the peripherals to be connected to the ENET, then  
0 the SAE is to flag the issue to PLM/Market primes (with a copy to  
0 Engineering Process Update).

0 For Canadian Applications, when required, the SAE/EAE shall in-  
0 form CS0 Change Application Dept.S895 BRW of this requirement us-  
0 ing 160 SPEC. That is, SAE/EAE shall order this kit through the  
0 160 SPEC.0 \* New applications for DCMs will provide the NT2X31AT which  
0 has a NT2X33AE circuit pack always provided.

0 RELEASE 28.01  
0 93 12 03

0 SERIES II PERIPHERALS

0 Series II peripherals (XPM: e.g. LGC) will interface the ENET us-  
0 ing fiber speech links and require modification.

0 Copper Interface to ENET Only

0 Note that MSB7 will interface the ENET using copper speech links  
0 only.

0 Note that for ENET Retrofit (Upgrade) jobs, the following rules  
0 apply until BCS34 (These rules do not apply for initials or pe-  
0 ripheral extensions). DTCs that do not have exactly 4,8,12 or 16  
0 C-side links can not be fiberized. That is they will interface to  
0 ENET using copper speech links only. Also DO NOT fiberize periph-  
0 erals appearing in table SPECCONN (including DTCs) which have  
0 fewer than 16 C-side links.

0 Fiber Interface

0 The following equipment is required to modify the XPM for fiber  
0 interface (i.e. FXPM) to the ENET:

| 0 PEC      | Description                         | Quantity |
|------------|-------------------------------------|----------|
| 0 NT6X02BU | - Fiber Interface Hardware Assembly | 1        |
| 0 NT6X40CA | - DS-512 XPM Interface CP           | 2        |
| 0 NT6X40DA | - DS-512 Link Paddle Board          | 2        |
| 0 NT6X40FA | - DS-512 XPM Interface CP           | 2        |
| 0 NT6X40GA | - DS-512 Link Paddle Board          | 2        |
| 0 NT6X69AC | - Message Protocol & Tone CP        | 2        |

0 Note 1: The NT6X69AC CP performs the same functions as the  
0 NT6X69MA CP. The NT6X69AC is the ASIC version of  
0 NT6X69MA.

0 Note 2: Upon general availability, the NT6X40FA will replace  
0 the NT6X40CA as the standard DS512 XPM Interface and  
0 the NT6X40GA will replace the NT6X40DA as the standard  
0 DS512 Link Paddle Board.

0  
0 RELEASE 28.01  
0 93 12 03

0 While fiber conversion of the XPMs is not enforced by ENET design,  
0 it becomes the rule because DS-30 copper speech link interface  
0 to the ENET under utilizes Network port capacity by 75%.

0 The NT9X45BA card uses up the XPT card(9X35BA/CA) to its maximum  
0 capacity(ie. 2K Channels), where as the 9X41BA only utilized 1/4  
0 of the XPT capacity.

0 XPM NEW MESSAGING REQUIREMENT FOR ENET

0 The messaging protocol in the Old Messaging card (i.e. NT6X43\_\_)  
0 is not compatible with the Message Switch (MS) messaging protocol.  
0 Hence, XPMs using the NT6X43\_\_ card cannot be supported by  
0 ENET.

0 | Host XPMs in all ENET offices must have the New Messaging card  
0 NT6X69AC or later in order to interface ENET.  
0 |

0 Currently, the SMR, DTC6, and MSB6 modules do not support New  
0 Messaging. Therefore, these modules cannot interface ENET.

## 0 Existing Offices

0 Use Product Change Kit (PC Kit) NT6X02BQ (NT6X02BR for  
0 NT6X02AA/AC modules only) to convert the XPM to the minimum level  
0 required to interface the ENET. The NT6X02BQ PC Kit contains two  
0 (2) NT6X69AC CPs. The NT6X02BR PC Kit makes CPs, which were pre-  
0 viously always provided, provisionable.

0 RELEASE 28.01  
0 93 12 03

## 0 DMS BUS PORT REQUIREMENTS

0  
0 The following equipment is the minimum requirement in the Message  
0 Switch (MS) to interface with the ENET. The NT9X25AA and NT9X25BA  
0 are required, only if a chain of 17DAs is required.

- 0
- 0 - NT9X13DC, MS CPU Processor CP (4 Megabytes)
  - 0 - NT9X17DA, MS 64 Port CP
  - 0 - NT9X20BB, ENET/MS Fiber Interface PB
  - 0 - NT9X25AA, MS Port Expander PB
  - 0 - NT9X25BA, MS Port Expander/Terminator PB
  - 0 - NT9X49CB, MS P-Bus Terminator CP (Tracer Card)

0 To interface with ENET, the MS requires 10 Megabytes of memory.  
0 This is achieved in the following ways:0

| QTY | PEC             | QTY | PEC              | Application     | NOTE |
|-----|-----------------|-----|------------------|-----------------|------|
| 2   | NT9X13DC (4 MB) | 2   | NT9X14BB (6 MB)  | Canadian & U.S. |      |
| 2   | NT9X13DB (1 MB) | 2   | NT9X14DB (24 MB) | Richardson      | 1    |

## 0 NOTE:

0 1 This configuration is non-standard and will not be supported  
0 by the formal design documentation. Earlier releases of NT9X13DB  
0 are not compatible with NT9X25AA/BA, later releases are. Release  
0 numbers are transparent to our documentation and process. Hence,  
0 Richardson will be responsible for keeping track of the proper  
0 type of NT9X13DB CPs for their offices.0 Existing Offices With NT9X01BA/JA SuperNode Cabinet0 Product Change Kit (PC Kit) NT9X04AY converts the MS to the mini-  
0 mum level required to interface the ENET. It removes NT9X49CA  
0 and makes slot position 32F provisionable. It can be applied to  
0 NT9X04AG in order to upgrade the MS to NT9X04AH which is the min-  
0 imum level required to interface the ENET. Other existing PC  
0 Kits can be applied to existing MS Common CP Fills in order to  
0 bring them up to the necessary level.0

0 MS - NT9X04AA NT9X04AD NT9X04AB  
0 MS - NT9X04AB NT9X04AF NT9X04AE  
0 MS - NT9X04AE \* NT9X04AZ NT9X04AG  
0 MS - NT9X04AG \* NT9X04AY NT9X04AH

0 \* NT9X04AE may be upgraded directly to NT9X04AH by applying  
0 NT9X04AY if the external clock interface is not required.

0 The introduction of ENET has increased the number of MS ports re-  
0 quired dramatically. Therefore, a 64 port CP (NT9X17DA) is in-  
0 troduced. The 4-Port CP (NT9X17AA/AD) is retained for use with  
0 IOC, CM, NM, FLIS, and LPP.

0 MS Port Group (Chain)

0 A MS Port Group is a set of one (1) or more adjacent MS Port  
0 cards, DS-512 Interface Paddleboards, and MS Port  
0 Expander/Terminator Paddleboards that are required to support the  
0 DS-512 link to an ENET shelf.

0 One MS Port Group is required per MS for each ENET shelf (per  
0 plane). Because there are two (2) ENET planes, therefore two port  
0 groups are associated with each ENET shelf. Both port groups are  
0 located on MS 0 and, on MS 1.

0 Each MS port group is provisioned as a sum of the following:

0 - 1 port for the ENET Shelf Processor

0 - 1 port for each active message channel Processor associated  
0 with a speech link that terminates on the shelf (i.e. each Series  
0 I peripheral has one (1) Message Channel Processor, Each Series  
0 II peripheral has two (2) Message Channel Processors).

0 Each port group must be assigned a contiguous group of CP slots  
0 on the MS shelf. In order to size the MS Port Group, the distrib-  
0 ution of peripheral types (i.e. Series I \* II) over the ENET  
0 shelf pairs must be known.

0 NOTE: If the DMS office will require more than one (1) equipped  
0 ENET shelf (per plane), the assignment of the NT9X40BA/40BB,  
0 NT9X41BA, and the NT9X45BA Paddleboards (PBs) on the ENET shelves  
0 will directly affect the size of each MS Port Group. Hence, to  
0 optimize the size of the MS Port Group, it may be necessary to  
0 reassign the quantity of NT9X40BA/40BB, NT9X41BA and the  
0 NT9X45BA PBs from one ENET shelf to another in order to avoid  
0 crossing the boundary of message ports which would necessitate

0 RELEASE 28.01  
0 93 12 03  
0

0 the addition of an MS 64 Port Card NT9X17DA and the associated  
0 paddleboards. (This card and the associated paddleboards are ex-  
0 plained later in this section.) Note that any reassignments  
0 would only pertain to new equipment (i.e. initial offices or new  
0 equipment being added into an existing office). Existing  
0 paddleboards on an ENET shelf must not be reassigned during an  
0 extension.

0 For reasons previously discussed consideration should be given to  
0 making allowances for the future growth requirements of the last  
0 incomplete network shelf. RESERVE slots on the MS for the  
0 PROJECTED FUTURE REQUIREMENTS of partially equipped ENET shelves.

0 An MS Port Group will consist of the following types of hardware:

- 0 - NT9X17DA MS 64 Port CP
- 0 - NT9X20BB ENET/MS Fiber Interface PB
- 0 - NT9X25AA MS Port Expander PB
- 0 - NT9X25BA MS Port Expander/Terminator PB

0 ENET will utilize only MS 64 Port CP for network and peripheral  
0 message port assignments.

0 NT9X17DA, MS 64 PORT CP

- 0 - One can connect up to 64 message ports.

0 The following PBs are required to complete each port group  
0 which is expected to consist of between 1 and 4 NT9X17DA cards:

0 NT9X20BB, ENET/MS Fiber Interface PB

- 0 - One required per plane behind the first NT9X17DA CP of each  
0 port group.
- 0 - Interfaces the message link from the Enhanced Network Shelf.

0 NT9X25AA, MS PORT EXPANDER PB

- 0 - One required per plane behind the middle NT9X17DA CP of each  
0 port group if equipped.
- 0 - Expands the bus to accommodate a larger port group beyond  
0 64 channels.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 NT9X25BA, MS PORT EXPANDER/TERMINATOR PB

- 0 - One required per plane behind the last NT9X17DA CP of each  
0 port group if equipped.  
0 - Terminates the bus.

0 RELEASE 28.01  
0 93 12 03

0 Important rules.

0 1) Provide two (2) NT9X17DA MS 64-Port CP and two (2) NT9X20BB  
0 DS-512 ENET/MS Fiber interface PB to interface with an ENET  
0 shelf. An NT9X17DA/NT9X20BB pair is required per MS (per plane)  
0 for each link.

0 2) The NT9X17DA used only with ENET and it requires BCS31 or  
0 higher.

0 3) If the number of message ports required for interfacing with  
0 ENET is greater than 64, provide additional NT9X17DA MS 64-Port  
0 CP in successive higher numbered slots. For each additional  
0 NT9X17DA except the last, provide one (1) NT9X25AA MS Port  
0 Expander PB; for the last NT9X17DA, provide one (1) NT9X25BA MS  
0 Port Terminator PB. This is illustrated as follows:

0 The following figures represent examples of the physical circuit  
0 pack assignments to a MS shelf for ENET-MS port groups of the  
0 four possible capacities. Please note these are examples and the  
0 MS can contain a mixture of ENET-MS port groups of various capac-  
0 ities and circuit pack locations. The NT9X20 and NT9X25 circuit  
0 packs (if required) of an ENET-MS port group must occupy contig-  
0 uous slots on the MS as shown in the examples. The circuit pack  
0 locations shall be the same on the second MS shelf of the Super-  
0 node.

0 For ENET Initial, assign IOCs, EIOCs and LPPs to the highest num-  
0 bered MS slots in descending order starting from slot 29 (i.e.  
0 slots 29, 28, etc.). These slots will contain 4-port cards  
0 (NT9X17AA/AD) in the front and 4-port DS-30 interface  
0 paddleboards (NT9X23AA for IOCs and EIOCs; NT9X23BA for LPPs) in  
0 the rear.

0 In MS Port Group, assign the ENET ports to the lowest numbered MS  
0 slots in ascending order starting from slot 12 (i.e. slots 12,  
0 13, etc.). However, the SAEs and EAEs should anticipate and  
0 plan all future growth on each ENET shelf and provision the MS  
0 cards accordingly, by leaving a spare slot for future expansion  
0 if necessary, as shown below.

#### Cable Length from MS Shelf to ENET Shelf

All fiber optic cables from both MS Shelves (i.e. plane 0 & 1) to any ENET shelf (on either plane) must not deviate in length from each other by more than 25 feet.

All fiber optic cables from an MS Shelf to any pair of ENET shelves in the same plane must not deviate in length from each other by more than 25 feet.

0 ENET 0 00  
0 ENC 0 00 ABS

## 0 ENET RETROFIT (UPGRADE)

0  
0 An ENET retrofit (upgrade) occurs when the switching network of  
0 an existing inservice DMS-SuperNode office changes from a  
0 Junctored Network Module (JNET/NM) implementation to an Enhanced  
0 Network (ENET) implementation.

0 The objectives of ENET Retrofit are as follows:

- 0 1. Reconfigure the MS Shelf to support both JNETs and ENETs tem-  
0 porarily. Note, after the ENET Retrofit the JNETs shall be  
0 removed.

0  
0 RELEASE 28.01  
0 93 12 03

- 0 2. Determine if NT9X69AAs are required to support MS Port Con-  
0 centration. MS Port Concentration is required if:
- 0 a. a insufficient quantity of card slots are available on  
0 the MS to add NT9X17DAs required to Interface ENET,  
0 and/or
- 0 b. the total number of slots required in MS is greater than  
0 18.
- 0 3. The provisioning of the MS slots and ports is the responsi-  
0 bility of the SAE/EAE. The rules for the ENET Retrofits (Up-  
0 grades) with MS Port Concentration are found in ECM-626.
- 0 4. Document the MS shelf configuration Before, During, and After  
0 the ENET Retrofit via the CI and D610 job drawing.
- 0 5. If MS Port Concentration is required define the quantity of  
0 NT9X69AAs required, and report this requirement to Installa-  
0 tion via the CI.
- 0 6. Obtaining the H/W required for MS Port Concentration is the  
0 responsibility of the Installation Staff. Refer to the ap-  
0 propriate section of IM-925/926.

0 2.1.3 PROVISIONING CONSIDERATIONS

0

0 ENET in C42(S/DMS) Cabinet

0

0 The ENET in C42(S/DMS) cabinet is a cost and functionally en-  
0 hanced version of the existing ENET cabinet. The S/DMS cabinet  
0 is 42 inches wide compared with Streamline's width of 28 inches.  
0 This new cabinet supports features such as modified framework  
0 based on Streamline, "horizontal"(through line-up) cabling, and  
0 "hot slide" capability. "Horizontal" cabling meaning, cables run-  
0 ning through a hole in the side of a cabinet and into the next  
0 cabinet(s) in the same lineup. "Hot slide" is the process of mov-  
0 ing an operating cabinet into an existing lineup of equipment.  
0 Note that the S/DMS cabinet is very similar to the existing cabi-  
0 net, items such as packs, shelf assemblies, interconnect cables,  
0 and bulkhead packs do not change. The differences from the exist-  
0 ing ENET cabinet are listed below.

0 1) The Cabinet changes from NT9X0113 to NT9X95AA

0 2) The Kick plate is not required with the S/DMS cabinet.

0 3) Power wiring is optional. If the cabinet is in a Stream-  
0 line lineup, the cables will be equipped to take advantage  
0 of "horizontal" cabling. If the cabinet is in a  
0 non-Cabinetized lineup, power cables will be similar to  
0 existing power cables, so filters will have to be  
0 provisioned.

0 The NT9X05AC has been approved for all applications. All new ini-  
0 tial offices with ENET will specify the NT9X05AC Cabinet. The  
0 NT9X05AB PEC will be A&M and will remain for all existing of-  
0 fices.

0

The NT9X05AB/AC is a 128K Enhanced Network product which is a single cabinet model equipped with a minimum of one shelf and expandable to four shelves (see figure following).

## Enhanced Network Cabinet

where    p = the Plane number 0 or 1  
          CC = the Cabinet number 00  
          SS = the Shelf number 00-03  
                  (assign from top down)

0 RELEASE 28.01  
0 93 12 03

0 New Designation Labels have been developed for the ENET Cabinet  
0 (ENC) and ENET Shelf (ENET) to be applied to the Cabinet and the  
0 PDC as follows:

0 The Exterior Cabinet Door Label will be as follows:

0 P0710504 - Exterior Door Label (Lime Green)  
0 P0711199 - Exterior Door Label (Meridian Aqua)  
0 P0734962 - Exterior Door Label (Streamline Blue)

0 The format of this label is as follows:

0 ENC<plane> <cabinet number> ENET, eg. ENC 0 00 ENET

0 Where plane = 0 or 1  
0 cabinet number = 00

0 ENETShelf Designation Label  
0 P0734961 - ENET Shelf ID Label

0 Locate label beside the Frame Supervisory Panel(FSP).  
0 The label format includes Cabinet Name, Plane, Number, Location,  
0 PEC, and Shelf Name is as follows:

0 -Cabinet Name (ENC) <plane> <cabinet number>  
0 eg. ENC 0 0  
0 where plane = 0 or 1  
0 cabinet number = 0

0 -Location : aann eg. A03, BA34

0 where aa = one or two letters from A through Z,  
0 excluding I and O, and AA through ZZ,  
0 excluding II and OO.  
0 nn = two digits from 01 through 49

0 -PEC Code : NT9X05AC

0 - Shelf Name : ENET <Plane> <Shelf>,  
0 eg. ENET 0 00, ENET 1 00

0 where Plane = 0 or 1  
0 Shelf = 00 through 03

## 0 ENHANCED NETWORK (ENET) SHELF PROVISIONING

0  
0 Network shelves are provisioned based on Speech Link PB needs.  
0 One shelf is required per plane for every 15 Speech Link PB. Each  
0 Enhanced Network Cabinet (ENC) can be equipped with up to four  
0 (4) Enhanced Network (ENET) Shelf assemblies NT9X0801, as re-  
0 quired. One (1) shelf assembly is always provided on the ENC  
0 cabinet with the remaining three (3) shelf assemblies being  
0 provisionable.

0 The ENET Shelf assembly does not have a common circuit pack fill.  
0 All circuit packs are provisionable. ENET Shelf Provisioning is  
0 dependent on the quantity and types of peripherals to be inter-  
0 faced. The assumption is made that peripherals and IOC are first  
0 provisioned according to existing engineering rules. ENET rules  
0 relate to one plane only. See worksheets provided.

0 ENET provisioning is not sensitive to traffic or real time and  
0 therefore is provisioned based on terminations only.

0 NT9X40BA/BB Quad DS-512 Fiber Interface Paddle Board

0 - one (1) required per ENET shelf assembly to interface MS links  
0 (i.e. card slot 8R of ENET shelf).  
0 - one (1) required per four (4) DS-512 speech links. One (1)  
0 NT9X40BA/BB can accommodate four (4) fiber XPMs (FXPMs).

0 NT9X41BA DS-30 Interface Paddle Board

0 - one (1) required per 16 DS-30 links. No messaging ports can be  
0 assigned to link #1 (when counting from link #0 up).

0 NT9X45BA 16DS-30/3DS-512 Interface Paddle Board

0 - Note, No messaging ports can be assigned to link #1 of 16DS-30  
0 links (when counting from link #0 up).  
0 -The DS-30/DS-512 PB is a new peripheral interface paddle board  
0 can be used on the Dual Cabinet Enhanced NETwork. This pack can  
0 interface 3 DS-512 fiber links and 16 DS-30 copper links. It com-  
0 bines the functionality of existing NT9X41BA and NT9X40BA/BB  
0 packs. The NT9X40BA/BB(4 DS-512) fully utilize the ENET's chan-  
0 nel handling capacity. But, it does not provide copper links. On  
0 the other hand, the NT9X41BA (16 DS-30) pack does not fully uti-  
0 lize ENET's channel handling capacity(only 25% utilization of

0 RELEASE 28.01  
0 93 12 03  
0

0 crosspoints). Using an NT9X45BA results in a 100% utilization of  
0 ENET crosspoints and providing both copper and fiber links. For  
0 example an ENET currently equipped with 4 NT9X41BAs and 3  
0 NT9X40BBs requires 7 Crosspoints. This could be reconfigured with  
0 4 NT9X45BAs and only 4 Crosspoints a savings of 3 Crosspoints

0 NT9X35CA 16K x 16K Channel Terminating Cross-point CP  
0 - Used to terminate Horizontal bus (H-bus).  
0 - Minimum 2 per Network Shelf. Maximum 4 per Network Shelf.  
0 - The first Network Shelf always requires four (4) CP.  
0 - One CP, slot 9F, required for MS to Network Shelf messaging.  
0 Slot 9R cannot be equipped with a PB and is therefore NOT  
0 available for speech links to peripherals.  
0 - Other 3 CPs used for speech link interface to peripherals  
0 may be used with DS-30 or DS-512 or DS-30/DS512 PBs.

0 NT9X35BA 16K x 16K Channel Cross-point CP  
0 - One required for each speech link interface PB.  
0 - Maximum 12 per Network Shelf.  
0 - Provisioned in pairs (4K-CH) for the first shelf per plane and  
0 in groups of six CP (12K-CH) for the three subsequent shelves.

0 NT9X13FA CPU CP  
0 - One (1) required per shelf assembly.

0 NT9X30AA +5V 80A Power Converter  
0 - Two (2) required per shelf assembly.

0 NT9X31AA -5V 20A Power Converter  
0 - Two (2) required per shelf assembly.

0 NT9X26AA/AB Remote Terminal Interface  
0 - One (1) required per shelf assembly.

0 NT9X36BA Network Clock & Message Interface Circuit Pack  
0 - Used to interface peripheral Message Channel to the Message  
0 Switch. One (1) required per shelf assembly.

0 NT9X0530 V-Bus Cables  
0 - 16 are required for each shelf assembly added to a cabinet  
0 starting with the second shelf (i.e. shelves 01,02,03 will re-  
0 quire V-Bus cables).

0 NT9X0520 DS-30 Cable Assemblies  
0 - One (1) is required for each NT9X41BA equipped to extend the  
0 DS-30 Speech links to the Bulkhead from the Paddle Board.

0 RELEASE 28.01  
0 93 12 03

0 NT9X0524 DS-30 Cable Assemblies  
0 - One (1) is required for each NT9X45BA equipped to extend the  
0 DS-30 Speech links to the Bulkhead from the Paddle Board.

0 NT9X19AA Filler Face Plate  
0 - Eight (8) are required per shelf assembly.  
0 - Provide as needed for other unequipped card slots.

0 NT9X19BA Filler Face Plate Paddle Board  
0 - Nine (9) are required per shelf assembly.  
0 - Provide as needed for other unequipped PB slots.

0 See the figure below for a depiction of a fully utilized ENET  
0 shelf.

## 0 SPEECH LINK ASSIGNMENT RULES

0  
0 Reallocation of normal grades of service across system components  
0 taking into account the new switching architecture, may result in  
0 improvements to stated capacities of other traffic sensitive com-  
0 ponents. This area requires further study.

0 In Initial offices, the peripheral modules must be assigned to  
0 the Enhanced Network in the following order of preference.

- 0 1) Different ENET shelves where possible or  
0 2) Different halves of the ENET shelf or  
0 3) Odd/Even slots (but not adjacent slots) or  
0 4) Adjacent Slots.

0 DS-30 Speech links (Series I Peripherals)

0 Distribute speech links with messaging form each peripheral type  
0 (i.e. MTM, LM, TM, DCM, DES) as evenly as possible over the  
0 available shelves and DS-30 PBs. Note that Series I peripherals  
0 require 1 messaging link per peripheral.

0 Distribute the remaining speech links by peripheral types as  
0 evenly as possible over PBs. Note that Series I peripherals re-  
0 quire from 1 to 4 speech links.

0 DS-30 Speech links (Series II Peripherals)

0 Distribute speech links with messaging form each peripheral type  
0 as evenly as possible over the available shelves and DS-30 PBs.

0 Distribute the remaining speech links by peripheral types as  
0 evenly as possible over PBs and shelves.

0 DS-512 Speech links

0 Distribute speech links with messaging form each peripheral type  
0 as evenly as possible over the available shelves and DS-512 PBs.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 The telephone company may review and if necessary re-assign the  
0 emergency services to ensure that where possible, all essential  
0 services are not located on the same peripherals which are on the  
0 same ENET shelf, or on the same Paddle Board. The peripherals  
0 with emergency services (police, hospital, fire, etc..) must be  
0 evenly distributed where possible, over ENET shelves and paddle  
0 boards.

0 As previously stated, no rigorous port spreading rules apply to  
0 speech links and respreading is not carried out during exten-  
0 sions. Indeed in ENET offices, no SLC is provided to facilitate  
0 such activity. Peripherals will be cabled directly to the ENET  
0 Shelf, only if fewer than seven (7) NT9X41BA and or NT9X45BA PBs  
0 are on the ENET Shelf.

0 If there are seven (7) or more NT9X41BA and or NT9X45BA PBs on  
0 the ENET Shelf, Speech Link Connector (SLC) frames, Peripheral  
0 Speech Link (PSL) panels, and Network Speech Link (NSL) panels  
0 will be engineered as appropriate. In such a case, if there is  
0 room on an existing SLC frame, the new PSL and NSL panels can be  
0 assigned onto it. Otherwise, new SLC frames will have to be pro-  
0 vided.

0 When SLC Frames/Panels are required, provision PECs and quanti-  
0 ties exactly as documented for JNETs.

0 The NT9X6530 (i.e. left bulkhead panel provides access for 0 to  
0 112 DS-30s) is required, if there are four (4) to seven (7)  
0 NT9X41BA and or NT9X45BA PBs per the corresponding left half of  
0 the shelf (i.e. between card slots 32R-25R). The NT9X6531 (i.e.  
0 right bulkhead panel provides access for 0 to 112 DS-30s) is re-  
0 quired, if there are four (4) to seven (7) NT9X41BA and or  
0 NT9X45BA PBs per the corresponding right half of the shelf (i.e.  
0 between card slots 10R-16R). The DS-30 speech links terminating  
0 on the either half of the shelf will be cross connected at an  
0 SLC. For more information, refer to Bulkhead Provisioning Rules.

0 If any of the above bulkhead panel is used, the number of NSLs  
0 can be calculated using,

0 #of NSLs = {#of NT9X41BA & or 45BAs in one half of the shelf/4}  
0 to be rounded to next higher integer.

0 It is a requirement that each ENET Shelf be fully equipped with  
0 X-Point CPs before another is started. Each X-Point CP need not  
0 have a PB behind it.

0  
0 RELEASE 28.01  
0 93 12 03

## 0 BULKHEAD PROVISIONING RULES

0  
0 Another factor influences where NT9X41BA/45BA CPs are placed on  
0 the shelf. As with the DMS-SuperNode, all copper switchboard ca-  
0 bles leaving the cabinet route via filter bulkheads. Fiber leads  
0 pass through holes in the bulkheads. Each bulkhead serves the  
0 nearest half shelf. Three (3) different pairs can be provi-  
0 sioned;

- 0 1) NT9X6503 Interface Panel Right Fiber Assembly  
0 NT9X6506 Interface Panel Left Fiber Assembly

- 0 - No DS-30 filtering provided  
0 - Intended to be used only for fiber cables  
0 - Will not normally be used

- 0 2) NT9X6520 Filter Bulkhead Panel Left 48 DS-30  
0 NT9X6521 Filter Bulkhead Panel Right 48 DS-30

- 0 - Each provides filtering and connectivity for DS-30 speech  
0 links for up to 3 NT9X41BA/45BA (3 X 16 = 48 DS-30).  
0 - Each provides 13 holes with grommet to access fiber  
0 connections  
0 - Dedicated cabling to individual peripheral modules  
0 - Intended for use in normal ENET applications

- 0 3) NT9X6530 Filter Bulkhead Panel Left, 112 DS-30  
0 NT9X6531 Filter Bulkhead Panel Right, 112 DS-30

- 0 - Each provides filtering and connectivity for DS-30 speech  
0 links for up to 7 NT9X41BA/45BA  
0 - Each provides 13 holes with grommet to access fiber  
0 connections  
0 - Group cabling to peripherals via SLC and normal speech link  
0 cable group facilities  
  
0 - Intended for use where high concentrations of DS-30  
0 result in more than six (6) NT9X41BA/45BA PBs per ENET  
0 shelf.  
0 (e.g. BOC offices with lots of SLC-96s or ENET retrofits  
0 involving significant quantities of Series I  
0 Peripherals).

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Selection of bulkhead types should be based on projected  
0 NT9X41BA/45BA requirement of fully equipped shelves. If the  
0 projected number of NT9X41BA/45BA per shelf exceeds six (6) then  
0 NT9X6530/31 are required else NT9X6520/21 are recommended. In the  
0 majority of new applications the average number of NT9X41BA per  
0 fully equipped shelf is expected to range between two (2) and  
0 four (4). NT9X6530/31 should not be used in preference to  
0 NT9X6520/21. Where fewer than four (4) NT9X41BA are required per  
0 shelf, one NT9X6506 or NT9X6503 can be used in preference to a  
0 NT9X6520 or NT9X6521 but for reasons of flexibility this is not  
0 recommended.

0 From the above discussion, it is assumed that NT9X41BA/45BA would  
0 be distributed evenly over all shelves and half shelves.

## 0 RESET TERMINALS

0  
0 Although each network shelf is equipped with a RTIF PB, separate  
0 reset terminals are not required. Normal RTIF access is from the  
0 CM reset terminal via out-of-band signalling over the message  
0 links.

0 The only difference between NT9X26AA and 26AB is, 26AB has both  
0 RS-232 and current loop. It is NOT a requirement to have 26AB in  
0 MS in SuperNode if ENET has 26AB. Thus, MS can have 26AA and ENET  
0 can have NT9X26AB.

## 0 OFFICE ALARM UNIT PROVISIONING

0  
0 The Office Alarm Unit (OAU) is configured in two (2) MTM shelves.  
0 Messaging links from these shall be assigned to Cross-point CP's,  
0 NT9X35BA or NT9X35CA in the following order of preference:

- 0 1) Different ENET shelves where possible or  
0 2) Odd/Even slots of different Cross-point pairs or  
0 3) Adjacent Cross-point CPs of the same pair or  
0 4) same Cross-point CP.

## 0 ISN CABLING STRUCTURE(ICS) CABINET

0  
0 The NT0X35CC (ICS) mounts on the left and/or right side of a ENC  
0 or S/N cabinet. The ICS provides a larger cabling area for cables  
0 connected between cabinets and frames. Cable is intended to run  
0 down (or up) this cabinet, and enter the large holes in the side  
0 of the SuperNode, ENC, etc. cabinet to reach the connector  
0 bulkheads.

0 The NT0X35CC MUST be provisioned for ALL 64K and 128K ENET in-  
0 stallations. Richardson applications do not require the cabling  
0 cabinets on both 64K and 128K ENET installations.

0 If two ENET cabinets are in the same lineup, the number of  
0 NT0X35CC, ICS cabinets provided is equal to the number of  
0 NT9X05AC ENC Cabinets plus one (1). In the same lineup, one ICS  
0 Cabinet is located on each side of the ENC Cabinets and one ICS  
0 Cabinet is located in between each ENC (See figure below). When  
0 two ENET cabinets are in two different lineups, four (4) cabling  
0 cabinets are required.

0 The number of cabling cabinets required for 64K ENET (NT9X05AD)  
0 must be 2(See figure below).

0 From 64K ENET to 128K ENET upgarde refer to the first fig.

0 If not initially installed with ENET, ICS Cabinets cannot be  
0 added at a later date.

0  
0 2.1.4 OFFICE LAYOUT INFORMATION

0  
0 The S/DMS cabinet will be shipped with the doors, shelves, circuit  
0 packs, FSP, and cooling unit installed. The bus bar will be in-  
0 stalled and appropriate connections will be made at the factory.  
0 The bulkheads form part of the EMC cage around the equipment and  
0 provide a place to mount filter PCBs and optional power filters.  
0 The rear of the cabinet is equipped with two removeable bulkhead  
0 panels near the bottom of the cabinet. When these panels are re-  
0 moved, the cabinet can be installed in, or removed from, a lineup  
0 equipped with horizontal cabling. The cabinet may be slid "FOR-  
0 WARD" only.

0 Refer to ECM 600 for office layout restrictions when this cabinet  
0 is applied in a Streamline lineup.

0 Refer to the following Layout section when this cabinet is ap-  
0 plied in a stand alone lineup.

0 FLOOR LAYOUT

0 A cross aisle trough must be placed from one of the ENC cabinets  
0 to all aisles in the office to accommodate the fiber cables ter-  
0 minating to the ENC.

0 Cabinets and frames should not be mixed in the same line-up. ENC,  
0 DMS-SuperNode and associated SSC and ICS cabinets should be  
0 grouped in separate line-ups.

0 Aisle dimensions have been derived to meet central office envi-  
0 ronmental requirements for floor loading and heat dissipation.  
0 These dimensions are as follows:

0 maintenance or wiring aisles between adjacent line-ups of cabi-  
0 nets, 1.8 m (6'),

0 RELEASE 28.01  
0 93 12 03

0 maintenance or wiring aisles between a cabinet and a frame  
0 line-up, 1.4 m (4' 6").

0 INITIALS & UPGRADES

0 The above floor layout applies to all ENET only offices where all  
0 cabinets can be accommodated in separate line-ups. However, in  
0 certain upgrade situations this may not be possible due to floor  
0 layout constraints. In such cases cabinets may have to be sepa-  
0 rated and (or) included in line-ups with frames.

0 ENC cabinets should be deployed using one of the following meth-  
0 ods (arranged in descending order of preference):

0 1) as an extension to an existing front line-up,  
0 2) as an extension to an existing or planned line-up in the  
0 network growth area provided that aisle spacing requirements are  
0 met or can be met by the removal of existing NET, SLC or DNI  
0 frames.

0 3) as a new line-up at the growth end of the office,

0 4) as an extension to an existing line-up at the growth end of  
0 the office.

0 When Cabinets and frames are placed in the same line-up, the fol-  
0 lowing rules apply:

0 frames and cabinets are not to be interspersed among each other

0 the backs of frames and cabinets are to be aligned,

0 if a frame and a cabinet are to adjoin each other, a gap of 6"  
0 must separate the two.

0 aisle spacing rules for cabinets must be observed

0 | When ENET Cabinet is installed next to SuperNode  
0 Cabinet(NT9X01BA/JA) the NT9X04AX Message Switch Bulk Head Inter-  
0 face kit must be provisioned.

0 Close attention should be paid to the placement of cross-aisle  
0 ducts and cable racks to ensure that speech link and message link  
0 cables are afforded uncongested access to ENC cabinets. It should  
0 be noted that fiber cables which terminate in an ENC cabinet must  
0 route over the top of the same cabinet before entering the ISN  
0 Cabling Structure (ICS) Cabinet. These cables can only approach

0  
0 RELEASE 28.01  
0 93 12 03

0 the ICS Cabinet from one direction which may force looping in the  
0 cable trough. Also they cannot enter the ICS Cabinet directly  
0 from a cable rack or cross-aisle duct.

0 The placement of air conditioning diffusers and return air vents  
0 in the vicinity of cabinets and their respective flow rates must  
0 take into consideration the increased dissipation of these cabi-  
0 nets and their increased air flow rates and different intake and  
0 exhaust positions and patterns.

0 Local engineering support groups should be consulted if a raised  
0 floor application is proposed. However the following should be  
0 noted:

0 Stated earthquake performance may not be guaranteed for certain  
0 building floor and earthquake zone combinations.

0 2.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 End panels are required to complete the EMC enclosure for cabi-  
0 nets located at the end of a lineup. In earthquake installa-  
0 tions, the S/DMS cabinet must be bolted to the floor in four(4)  
0 places through anchor holes provided in the base of the cabinet.  
0 The cooling unit must be removed for access to the bolts. When  
0 the cabinet is bolted in place, the optional leveling feet must  
0 not be installed. Leveling will be accomplished through the use  
0 of non-conductive shims. The bolts must be tightened with a  
0 torque wrench to ensure adequate pretension.

0 For raised floor installations, a sub-structure support between  
0 the concrete sub-floor and the raised floor will be required. A  
0 qualified seismic engineer should be consulted regarding the re-  
0 quired additional bracing.

0 2.2.3 SPARING INFORMATION

0  
0 For U.S. applications use standard sparing algorithms.  
0 For Canadian and other applications the following may be used.

## 0 a) Version 2, C42 Cooling Unit:

0 -----

0 Blowers 660,000 hrs MTBF in its useful life of 10 years.  
0 MTM cards 4,700,000 hrs MTBF  
0 Relay 100,000,000 hrs MTBF

0 Note that the blower's useful life is about 10 years. Around that  
0 time, failures are to be expected. Good practice might dictate  
0 replacement of operating blowers around that time (analagous to  
0 replacing your car's engine belts before they break).

0 Ordering information for Spare Storage Cabinets (SSC) is provided  
0 in ECM-626.

0 Mean Time Before Failure (MTBF) for the ENET Circuit Packs and  
0 related interface Circuit Packs are as follows,

| 0 | PEC      | Failures/<br>0 Millions of hours | MTBF<br>(Years) |
|---|----------|----------------------------------|-----------------|
| 0 | NT9X13FA | 5.0                              | 22              |
| 0 | NT9X30AA | 1.8                              |                 |
| 0 | NT9X31AA | 1.5                              |                 |
| 0 | NT9X35BA | 5.6                              | 20              |
| 0 | NT9X35CA | 5.6                              | 20              |
| 0 | NT9X36BA | 4.2                              | 27              |
| 0 | NT9X40BA | 2.4                              | 47              |
| 0 | NT9X41BA | 1.2                              | 95              |

0 RELEASE 28.01  
0 93 12 03

0 For U.S. applications use standard sparing algorithms.  
0 For Canadian applications the following may be used until formal  
0 provisioning is available through the engineering process.

0 a) ENET & DMS- SuperNode Equipment:

| 0 |             |        | (1)        |
|---|-------------|--------|------------|
| 0 |             | NO.    | ENGINEERED |
| 0 | PEC         | SPARES | INVENTORY  |
| 0 |             |        |            |
| 0 | NT9X13FA    | 1      | 8          |
| 0 | NT9X17DA    | 2      | 16         |
| 0 | NT9X20BB    | 1      | 8          |
| 0 | NT9X25AA    | 1      | 8          |
| 0 | NT9X25BA    | 1      | 8          |
| 0 | NT9X26AB    | 1      | 8          |
| 0 | NT9X30AA    | 1      | 16         |
| 0 | NT9X31AA    | 1      | 16         |
| 0 | NT9X35BA    | 3      | 96         |
| 0 | NT9X35CA    | 1      | 32         |
| 0 | NT9X36BA    | 1      | 8          |
| 0 | NT9X40BA/BB | 4      | 128        |
| 0 | NT9X41BA    | 4      | 128        |
| 0 | NT9X45BA    | 4      | 128        |

0 (1) Spares cover all engineered quantities if no entry.

0 (2) Spares quantity based upon MTBF and 720 Hrs turn around  
0 time unless otherwise noted..

0 b) FXPM Equipment:

|   |          |                    |
|---|----------|--------------------|
| 0 | NT6X40CA | MTBF(years) is 62  |
| 0 | NT6X40DA | MTBF(years) is 127 |
| 0 | NT6X40FA | MTBF(years) is 69  |
| 0 | NT6X40GA | MTBF(years) is 245 |

| 0 | PEC      | Failures/Millions of hours |
|---|----------|----------------------------|
| 0 | NT6X40CA | 1.0                        |
| 0 | NT6X40DA | 0.9                        |
| 0 | NT6X40FA | 1.7                        |
| 0 | NT6X40GA | 0.5                        |

0 RELEASE 28.01  
0 93 12 03  
0

0 Note: Upon general availability, the NT6X40FA will replace  
0 the NT6X40CA as the standard DS512 XPM Interface and  
0 the NT6X40GA will replace the NT6X40DA as the standard  
0 DS512 Link Paddle Board.

0 All ENET offices (U.S. & Canadian) must provide two (2) spare  
0 Quad Fiber cables for use on an emergency basis in the event of a  
0 failure of a job engineered fiber cable. The spares will be used  
0 on a temporary basis until a corrected length fiber cable can be  
0 obtained.

0 The spare fiber cables should be as long as the longest job spec-  
0 ified cable, with a breakout length also equal to the longest  
0 length used in the office.  
0 (eg. NT0X97AK, NT0X97AJ Fiber Cables )

#### 0 2.2.4 POWER FEED AND FUSING REQUIREMENTS

0 Each shelf has four (4) power converters, two at either side of  
0 the shelf, mounted from the front.

0 Logic power distribution to the shelf electronics is from each  
0 power module to the corresponding half of the shelf.

0 Fuses are required as follows for NT9X05AC.

0 For powering from a standard 7' PDC  
0 -----  
0 2 - 20 Amp fuses (for each ENET Shelve)  
0 2 - 10 Amp fuses (for C42 cooling blowers)  
0 1 - 10 Amp Fuse (Alarm Battery Supply (ABS))

0 For powering from a CPDC  
0 -----  
0 2 - 30 Amp fuses (for each ENET Shelve)  
0 2 - 10 Amp fuses (for C42 cooling blowers)  
0 1 - 10 Amp Fuse (Alarm Battery Supply (ABS))

0

0 RELEASE 28.01  
0 93 12 03

0 Plane 0 cabinets are powered from A feed while plane 1 cabinets  
0 are powered from B feed.

0 Refer to CA0X04 issue 01 20 and later for power cable informa-  
0 tion.

0 PDC feeds are connected to the cabinet via EMI feed through  
0 capacitors at the top of the frame. Cable and Drop Length shall  
0 be job engineered.

#### 0 2.2.5 CURRENT DRAIN INFORMATION

0  
0 Input Voltage.....-48VDC  
0 Power Consumption.....4432 watts (+/- 10%) fully equipped  
0 Current Drain.....92.0Amps

#### 0 2.3 SOFTWARE PROVISIONING

0

##### 0 2.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 1)Initial jobs with 64K or 128K ENET require NTXE01AA package. In  
0 addition, offices equipped with 64K or 128K ENET must have  
0 - NTXF71AB - SuperNode Enhanced Messaging.

0 2) The optional packages for ENET (64K or 128K) offices are,

0 - NTXP13AA - Switch Path Diagnostics (SPD).  
0 - NTX738AC - Switch Performance Monitoring System (SPMS).

0 Prior to BCS34, the JNET s/w is part of NTX001AA which is a Com-  
0 mon Basic Software package. From BCS34 onwards, the JNET s/w has  
0 been separated into a new software package called NTXP10AA.

0 For all ENET UPGRADE jobs provision the software packages  
0 NTXP10AA and NTXE01AA effective BCS34 and higher BCSs. It is

0  
0 RELEASE 28.01  
0 93 12 03

0 recommended that NTP10AA be removed in the subsequent BCS up-  
0 grade following the network Upgrade.

0 Example: If an office running with pre BCS34 s/w, with JNET, For  
0 ENET UPGARDE, These steps must be done.

- 0 1) NTP10AA must be ordered for JNET to work.  
0 2) NTXE01AA must be ordered for ENET.  
0 3) NTF71AB must be ordered for SuperNode Enhanced Messaging.

0 Note that, NTP10AA can be removed in the subsequent BCS upgrade  
0 following the network Upgrade.

### 0 2.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 When ordered by the Customer, the Switch Path Diagnostics (SPD)  
0 software package is to be furnished as NTX885AB for non-ENET  
0 SuperNode and NT-40 offices and furnished as NTP13AA for ENET  
0 SuperNode offices.

0 If software package SPD exists in a DMS office prior to an ENET  
0 upgrade, then both NTX885AB and NTP13AA are to be provided in  
0 the retrofit software load to provide both Network Module (NM)  
0 and ENET coverage. NTX885AB is to be removed on the next BCS ap-  
0 plication following the upgrade.

0 The above rules are an example of unautomated rules which are  
0 stored in a document entitled "SW Package Ordering Rules - Not  
0 Automated" in the SMS Documentation Menu in CODA.

### 0 2.3.3 MEMORY PROVISIONING

0  
0 CM Memory must be 6 to 8 megabytes.

0 MS-E(MS Load for ENET) requires 10 megabytes.

0

0 2.4 REAL TIME IMPACT

0 There is not a Real Time improvement or degradation on ENET over  
0 JNET applications (i.e. No impact on DMS-100 Call Processing Ca-  
0 pacity due to JNET/ENET Variance.

### 0 3.0 Single Cabinet Enhanced Network

0 In this document ENET refers to the 64K Enhanced Network.

0 Single Cabinet Enhanced Network is designed to allow a network size of  
0 64K channels duplex with modular growth from 4K to 64K channels.  
0 Growth from 4K to 32K will be in 2K increments; 32K to 64K channels  
0 will be in 16K channels. Network Plane 0 and Plane 1 both will be in  
0 the single cabinet. The NT9X05AD is a 64K Enhanced Network Duplex Cab-  
0 inet and the following diagram gives a pictorial representation of  
0 this cabinet:

### 0 Single Cabinet Enhanced Network

0 where p = the Plane number 0 or 1  
0 C = the Cabinet number 0  
0 SS = the Shelf number 00-01  
0 (assign from top down)  
0 (Shelf 39 & 26 is Plane 0)  
0 (Shelf 13 & 00 is Plane 1)

0  
0 RELEASE 28.01  
0 93 12 03

0 3.1 HARDWARE PROVISIONING

0

0 3.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The following restriction apply to ENET H/W applications:

0 \* The Enhanced Network must interface to a SuperNode (i.e. Mes-  
0 ssa ge Switch & Computing Module). An NT-40 (i.e. Central Con-  
0 trol Complex) will not support an Enhanced Network.

0 \* The Enhanced Network will not interwork with any previous  
0 version of Network frames.

0 \* The NT9X41BA has 16-Ports numbered 0-15. All ports except  
0 port #1 may be used for Voice or Messaging Links. Port #1 is  
0 valid for Voice Links only. This is a S/W restriction on the  
0 hardware.

0 \* The NT9X45BA has 16 DS-30 ports numbered 0-15 and 3 DS-512  
0 ports. All DS-30 ports except port #1 may be used for Voice  
0 or Messaging Links. Port #1 is valid for Voice Links only.  
0 This is a S/W restriction on the hardware.

0 \* Application of the above restriction prohibits the assign-  
0 ments of the following Peripheral Module (PM) ports to Link  
0 #1 as follows:

- 0 - Single link PMs (e.g. MTMs, TM8s, OAUs, etc.)
- 0 - Port Zero of DCMs and LMs
- 0 - Port Zero and Two of XPMs

0 \* The DTC6 is not ENET ready since enhanced messaging  
0 (NT6X69AC/MA) are not available in those facilities. There-  
0 fore, offices equipped with this vintage XPMs should not be  
0 considered for ENET unless an agreement can be reached with  
0 the Telco.

0 \* MS to ENET, ENET to FXPM Distance Restrictions are as fol-  
0 lows:

0

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - MS-9X20BB To ENET-9X40BB  
0 Length: 250ft (1,4), Variance: 25ft (3)
- 0 - MS-9X62BA To ENET-9X40BB  
0 Length: 250ft (1,2), Variance: 25ft (3)
- 0 - ENET-9X40BB To FXPM-6X40DA  
0 Length: 1000m (4), Variance: 200m
- 0 - ENET-9X40BB To FXPM-6X40GA  
0 Length: 1000m, Variance: 200m
- 0 - ENET-9X41BA to XPM/PM  
0 Length: 750ft, Variance: 200ft
- 0 \* The NT9X45BA CANNOT be used in a 192K network. In a 192K  
0 ENET, repeaters are required to expand an ENET, the NT9X45BA  
0 is not equipped to allow this expandability.

0 \* NT9X40BA/41BA/45BA Interchange Capability are as follows:

- 0 - NT9X41 to NT9X40 is to fiberize copper XPMs in in-service  
0 ENET offices. This has been verified in FAST office and  
0 it is allowed.
- 0 - NT9X41 to NT9X45 is for adding 3 more DS-512 ports with-  
0 out loss DS-30 ports and without additional Cross point  
0 cards. This procedure has been verified in FAST office  
0 and in V.0 and it is allowed.
- 0 - NT9X45 to NT9X40 has been verified in FAST office and in  
0 V.0, and it is allowed.
- 0 - NT9X40 to NT9X45 may cause service degradation depending  
0 on the configuration. Hence this is NOT ALLOWED.
- 0 - NT9X40 to NT9X41 is possible, but is of no value. Hence  
0 this is NOT ALLOWED.
- 0 - NT9X45 to NT9X41 is possible, with service degradation  
0 and also is of no value. Hence this is NOT ALLOWED.

0 NOTES:

- 0 1. Refer To ECM-626 For MS TO ENET Restrictions

0  
0 RELEASE 28.01  
0 93 12 03

- 0 2. Recommended length limit so that the received optical  
0 power is greater than -26dbm. This optical receive power  
0 is based on the jitter limit of the R94-Hybrid on the  
0 9X20BB/9X40BB in loopback.
- 0 3. The limits placed on the variation in cable length be-  
0 tween either MS and any ENET shelf is required to main-  
0 tain integrity of the ENET Vertical Busses.
- 0 4. This value is base on the link interface CPs having a  
0 R94-Hybrid on one end and a G64-Hybrid with a 5L78 Clock  
0 recovery hybrid on the other.

0 3.1.2 HARDWARE DEPENDENCIES

0  
0 Same as the current 128K ENET. Refer to ECM 627.

0 93 12 03

## 0 DMS BUS PORT REQUIREMENTS

0  
0 Important rules.

0 1)Provide two (2) NT9X17DA MS 64-Port CP and two (2) NT9X20BB  
0 DS-512 ENET/MS Fiber interface PB to interface with an ENET  
0 shelf. An NT9X17DA/NT9X20BB pair is required per MS (per plane)  
0 for each link.

0 2)The NT9X17DA used only with ENET and it requires BCS31 or  
0 higher.

0 3)If the number of message ports required for interfacing with  
0 ENET is greater than 64, provide additional NT9X17DA MS 64-Port  
0 CP in successive higher numbered slots. For each additional  
0 NT9X17DA except the last, provide one (1) NT9X25AA MS Port  
0 Expander PB; for the last NT9X17DA, provide one (1) NT9X25BA MS  
0 Port Terminator PB.

0 In MS Port Group, assign the ENET ports to the lowest numbered MS  
0 slots in ascending order starting from slot 12 (i.e. slots 12,  
0 13, etc.). However, the SAEs and EAEs should anticipate and  
0 plan all future growth on each ENET shelf and provision the MS  
0 cards accordingly, by leaving a spare slot for future expansion  
0 if necessary.

0 Also refer to ECM 627 and ECM 626 for more detail information.

0

## 0 CABINET MODEL

0  
0 NT9X05AD Enhanced Network Cabinet (ENC)

0 The 64K ENET will be engineered and provisioned the same as the  
0 current 128K ENET, with the exception that the system can config-  
0 ured with the single cabinet for both planes. The shelf position  
0 39 and 26 are Plane 0 and the shelf position 13 and 00 are Plane  
0 1.

0 New Designation Labels have been developed for the ENET Cabinet  
0 (ENC) and ENET Shelf (ENET) to be applied to the Cabinet and the  
0 PDC as follows: This is for the 64K Enhanced Network product.

0 The Exterior Cabinet Door Label will be as follows :  
0 P0735379 - Exterior Door Label (ENET Brown)  
0 P0735380 - Exterior Door Label (ENET Grey)  
0 P0735381 - Exterior Door Label (ENET Blue)

0 The format of this label is as follows:

0 ENC <cabinet number> , eg. ENC 0  
0 cabinet number = 0

0 ENET Shelf Designation Label  
0 P0735382 - ENET Shelf ID Label

0 Locate label beside the Frame Supervisory Panel (FSP). The label  
0 format includes Cabinet Name, Plane, Number, Location, PEC, and  
0 Shelf Name is as follows:

0 - Cabinet Name (ENC) <cabinet number>  
0 eg. ENC 0

0 where cabinet number = 0

0 - Location :aann eg. A03, BA34

0 RELEASE 28.01  
0 93 12 03

0  
0 where aa = one or two letters from A through Z,  
0 excluding I and O, and AA through ZZ,  
0 excluding II and OO.

0 nn = two digits from 01 through 49

0 - PEC Code : NT9X05AD

0 - Shelf Name : ENET <Plane> <Shelf>,  
0 eg. ENET 0 00, ENET 1 01  
0 where Plane = 0 or 1  
0 Shelf = 00 through 01

0 The Power Distribution Centre Labels will be as follows:

0 P0735383 - The Power Distribution Centre Label

0 - NAME ABBREVIATION <Plane> <Shelf, Cabinet> <Function>

0 Where NAME ABBREVIATION = ENC or ENET

0 Plane = 0 or 1  
0 Shelf = 00 through 01  
0 Cabinet = 0  
0 Function = ABS, and B1 through B4

0 where ABS = Alarm Battery Supply  
0 B = Blower Fan

0 eg. ENC 0 00 B1  
0 ENET 0 00  
0 ENC 0 00 ABS

## 0 ENHANCED NETWORK (ENET) SHELF PROVISIONING

0  
0 Network shelves are provisioned based on Speech Link PB needs.  
0 One shelf is required per plane for every 15 Speech Link PB. Each  
0 Single Cabinet Enhanced Network can be equipped with up to four  
0 (4) Enhanced Network (ENET) Shelf assemblies NT9X0801, as re-  
0 quired. The Single Cabinet Enhanced network is always equipped  
0 with two (2) NT9X0801 enhanced network assembly in position 39

0 RELEASE 28.01  
0 93 12 03

0 and 13. The additional shelves are to be mounted on the cabinet  
0 in position 26 and 00 as required. A fully equipped Single Cab-  
0 net Enhanced Network has the capacity of up to 64K channels.

0 The ENET Shelf assembly does not have a common circuit pack fill.  
0 All circuit packs are provisionable.

0 ENET Shelf Provisioning is dependent on the quantity and types of  
0 peripherals to be interfaced. The assumption is made that pe-  
0 ripherals and IOC are first provisioned according to existing en-  
0 gineering rules. ENET rules relate to one plane only.

0 ENET provisioning is not sensitive to traffic or real time and  
0 therefore is provisioned based on terminations only.

0 NT9X40BB Quad DS-512 Fiber Interface Paddle Board

0 - one (1) required per ENET shelf assembly to interface MS links  
0 (i.e. card slot 8R of ENET shelf).

0 - one (1) required per four (4) DS-512 speech links. One (1)  
0 NT9X40BB can accommodate four (4) fiber XPMs (FXPMs).

0 NT9X41BA DS-30 Interface Paddle Board

0 - one (1) required per 16 DS-30 links. No messaging ports can be  
0 assigned to link #1 (when counting from link #0 up).

0 NT9X45BA 16DS-30/3DS-512 Interface Paddle Board

0 The DS-30/DS-512 PB is a new peripheral interface paddle board  
0 can be used on the Single Cabinet Enhanced NETwork. This pack can  
0 interface 3 DS-512 fiber links and 16 DS-30 copper links. It com-  
0 bines the functionality of existing NT9X41BA and NT9X40BB packs.  
0 The NT9X40BB (4 DS-512) fully utilize the ENET's channel handling  
0 capacity. But, it does not provide copper links. On the other  
0 hand, the NT9X41BA (16 DS-30) pack does not fully utilize ENET's  
0 channel handling capacity(only 25% utilization of crosspoints).  
0 Using an NT9X45BA results in a 100% utilization of ENET cross-  
0 points and providing both copper and fiber links. For example an  
0 ENET currently equipped with 4 NT9X41BAs and 3 NT9X40BBs requires  
0 7 Crosspoints. This could be reconfigured with 4 NT9X45BAs and  
0 only 4 Crosspoints a savings of 3 Crosspoints

0 NT9X35CA 16K x 16K Channel Terminating Cross-point CP

0 - Used to terminate Horizontal bus (H-bus).

0 RELEASE 28.01  
0 93 12 03

- 0 - Minimum 2 per Network Shelf. Maximum 4 per Network Shelf.
- 0 - The first Network Shelf always requires four (4) CP.
- 0 - One CP, slot 9F, required for MS to Network Shelf messaging.  
0 Slot 9R cannot be equipped with a PB and is therefore not  
0 available for speech links to peripherals.
- 0 - Other 3 CPs used for speech link interface to peripherals may  
0 be used with DS-30 or DS-512 PB.
- 0 NT9X35BA 16K x 16K Channel Cross-point CP
- 0 - One required for each speech link interface PB.
- 0 - Maximum 12 per Network Shelf.
- 0 - Provisioned in pairs (4K-CH) for the first shelf per plane  
0 and in groups of six CP (12K-CH) for the second shelf.
- 0 NT9X13FA CPU CP
- 0 - One (1) required per shelf assembly.
- 0 NT9X30AA +5V 80A Power Converter
- 0 - Two (2) required per shelf assembly.
- 0 NT9X31AA -5V 20A Power Converter
- 0 - Two (2) required per shelf assembly.
- 0 NT9X26AB Remote Terminal Interface
- 0 - One (1) required per shelf assembly.
- 0 NT9X36BA Network Clock & Message Interface Circuit Pack
- 0 - Used to interface peripheral Message Channel to the Message  
0 Switch
- 0 - One (1) required per shelf assembly.
- 0 NT9X0530 V-Bus Cables
- 0 - 16 V-Bus cables are required between shelf 0 and shelf 1 on  
0 Plane 0 (i.e. between shelf position 39 and 26).

0  
0 RELEASE 28.01  
0 93 12 03

0 - 16 V-Bus cables are required between shelf 0 and shelf 1 on  
0 Plane 1 (i.e. between shelf position 13 and 00).

0 It is not permissible to have V-Bus cables between shelf posi-  
0 tion 26 and shelf position 13.

0 NT9X0520 DS-30 Cable Assemblies

0 - One (1) is required for each NT9X41BA equipped to extend the  
0 DS-30 Speech links to the Bulkhead from the Paddle Board.

0 NT9X19AA Filler Face Plate

0 - Eight (8) are required per shelf assembly.  
0 - Provide as needed for other unequipped card slots.

0 NT9X19BA Filler Face Plate Paddle Board

0 - Nine (9) are required per shelf assembly.  
0 - Provide as needed for other unequipped PB slots.

## 0 SPEECH LINK ASSIGNMENT RULES

0  
0 Reallocation of normal grades of service across system components  
0 taking into account the new switching architecture, may result in  
0 improvements to stated capacities of other traffic sensitive com-  
0 ponents. This area requires further study.

0 As previously stated, no rigorous port spreading rules apply to  
0 speech links and respreading is not carried out during exten-  
0 sions. Indeed in ENET offices, no SLC is provided to facilitate  
0 such activity. Peripherals will be cabled directly to the ENET  
0 Shelf only if fewer than seven (7) NT9X41BA/45BA PBs are on the  
0 ENET Shelf.

0 If there are seven (7) or more NT9X41BA/45BA PBs on the ENET  
0 Shelf, Speech Link Connector (SLC) frames, Peripheral Speech Link  
0 (PSL) panels, and Network Speech Link (NSL) panels will be engi-  
0 neered as appropriate. In such a case, if there is room on an  
0 existing SLC frame, the new PSL and NSL panels can be assigned  
0 onto it. Otherwise, new SLC frames will have to be provided.

0 When SLC Frames/Panels are required, provision PECs and quanti-  
0 ties exactly as documented for JNETs.

0 The NT9X6530 (i.e. left bulkhead panel provides access for 0 to  
0 112 DS-30s) is required, if there are four (4) to seven (7)  
0 NT9X41BA and or 45BA PBs per the corresponding left half of the  
0 shelf (i.e. between card slots 32R-25R). The NT9X6531 (i.e.  
0 right bulkhead panel provides access for 0 to 112 DS-30s) is re-  
0 quired, if there are four (4) to seven (7) NT9X41BA and or 45BA  
0 PBs per the corresponding right half of the shelf (i.e. between  
0 card slots 10R-16R). The DS-30 speech links terminating on the  
0 either half of the shelf will be cross connected at an SLC.

0 If any of the above bulkhead panel is used, the number of NSLs  
0 can be calculated using,

0 # of NSLs = { #of NT9X41BA/45BAs in one half of the shelf / 4 }  
0 to be rounded to next higher integer.

0 It is a requirement that each ENET Shelf be fully equipped with  
0 X-Point CPs before another is started. Each X-Point CP need not  
0 have a PB behind it.

0 RELEASE 28.01  
0 93 12 03

## 0 ISN CABLING STRUCTURE(ICS) CABINET

0  
0 The NT0X35CC (ICS) mounts on the left and/or right side of a ENC  
0 or S/N cabinet. The ICS provides a larger cabling area for cables  
0 connected between cabinets and frames. Cable is intended to run  
0 down (or up) this cabinet, and enter the large holes in the side  
0 of the SuperNode, ENC, etc. cabinet to reach the connector  
0 bulkheads.

0 The NT0X35CC MUST be provisioned for ALL 64K and 128K ENET in-  
0 stallations. Richardson applications do not require the cabling  
0 cabinets on both 64K and 128K ENET installations.

0 The number of cabling cabinets required for 64K ENET (NT9X05AD)  
0 must be 2(See figure below).

0 From 64K ENET to 128K ENET upgrade refer to ECM 627.

0 If not initially installed with ENET, ICS Cabinets cannot be  
0 added at a later date.

0 3.1.4 OFFICE LAYOUT INFORMATION

0  
0 The S/DMS cabinet will be shipped with the doors, shelves, circuit  
0 packs, FSP, and cooling unit installed. The bus bar will be in-  
0 stalled and appropriate connections will be made at the factory.  
0 The bulkheads form part of the EMC cage around the equipment and  
0 provide a place to mount filter PCBs and optional power filters.  
0 The rear of the cabinet is equipped with two removeable bulkhead  
0 panels near the bottom of the cabinet. When these panels are re-  
0 moved, the cabinet can be installed in, or removed from, a lineup  
0 equipped with horizontal cabling. The cabinet may be slid "FOR-  
0 WARD" only.

0 Refer to ECM 627 for office layout restrictions when this cabinet  
0 is applied in a stand alone lineup.

0 Refer to ECM 600 for office layout restrictions when this cabinet  
0 is applied in a Streamline lineup.

0 3.2 PRODUCT/SYSTEM SPECIFICATION

0

0 3.2.1 PHYSICAL CHARACTERISTICS

0

0 POWER/HEAT DISSIPATION

0

0 The following describes the characteristics of the 64K ENET  
0 (NT9X05AD) cabinet:

0 The following values are the typical power dissipation figures  
0 for a fully equipped 64K ENET single cabinet:

0 One (1) ENET Shelf Dissipation ..... 1073W  
0 Four (4) ENET Shelves Dissipation (1073 X 4) . 4293W (approx.)  
0 Fan Consumption ..... 300W  
0 ENC Cabinet Dissipation (4293 + 300) ..... 4593W

0 Refer to CA0X04 issue 01 20 and later for power cable informa-  
0 tion.

0 PDC feeds are connected to the cabinet via EMI feed through  
0 capacitors at the top of the frame. Cable and Drop Length shall  
0 be job engineered.

0

0 3.2.2 EMI/EARTHQUAKE INFORMATION

0

0 End panels are required to complete the EMC enclosure for cabi-  
0 nets located at the end of a lineup. In earthquake installa-

0 RELEASE 28.01  
0 93 12 03

0 tions, the S/DMS cabinet must be bolted to the floor in four(4)  
0 places through anchor holes provided in the base of the cabinet.  
0 The cooling unit must be removed for access to the bolts. When  
0 the cabinet is bolted in place, the optional leveling feet must  
0 not be installed. Leveling will be accomplished through the use  
0 of non-conductive shims. The bolts must be tightened with a  
0 torque wrench to ensure adequate pretension.

0 For raised floor installations, a sub-structure support between  
0 the concrete sub-floor and the raised floor will be required. A  
0 qualified seismic engineer should be consulted regarding the re-  
0 quired additional bracing.

### 0 3.2.3 SPARING INFORMATION

0  
0 For U.S. applications use standard sparing algorithms.

0 For Canadian and other applications the following may be used.

0 a) Version 2, C42 Cooling Unit:  
0 -----

0 Blowers 660,000 hrs MTBF in its useful life of 10 years.  
0 MTM cards 4,700,000 hrs MTBF  
0 Relay 100,000,000 hrs MTBF

0 Note that the blower's useful life is about 10 years. Around that  
0 time, failures are to be expected. Good practice might dictate  
0 replacement of operating blowers around that time (analagous to  
0 replacing your car's engine belts before they break).

0 The spare fiber cables should be as long as the longest job spec-  
0 ified cable, with a breakout length also equal to the longest  
0 length used in the office.  
0 (eg. NT0X97AK, NT0X97AJ Fiber Cables )

0 3.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 Each shelf has four (4) power converters, two at either side of  
0 the shelf, mounted from the front.

0 Logic power distribution to the shelf electronics is from each  
0 power module to the corresponding half of the shelf.

0 Fuses are required as follows for NT9X05AC.

0 For powering from a standard 7' PDC

0 -----  
0 2 - 20 Amp fuses (for each ENET Shelve)  
0 2 - 10 Amp fuses (for C42 cooling blowers)  
0 1 - 10 Amp Fuse (Alarm Battery Supply (ABS))

0 For powering from a CPDC

0 -----  
0 2 - 30 Amp fuses (for each ENET Shelve)  
0 2 - 10 Amp fuses (for C42 cooling blowers)  
0 1 - 10 Amp Fuse (Alarm Battery Supply (ABS))

0 Plane 0 cabinets are powered from A feed while plane 1 cabinets  
0 are powered from B feed.

0 Refer to CA0X04 issue 01 20 and later for power cable informa-  
0 tion.

0 PDC feeds are connected to the cabinet via EMI feed through  
0 capacitors at the top of the frame. Cable and Drop Length shall  
0 be job engineered.

#### 0 4.0 Building Block Engineering - DSNE

0 The purpose of this ECM is to document the provisioning of the  
0 DSNE by the use of Building Block Engineering techniques.

0 The Double Shelf Network building block concept deals with a  
0 higher level of Product Engineering Code (PEC) ordering and sim-  
0 plifies the engineering process. The DSNE is the switching hub  
0 of the DMS-100F switching system and a network has 1920 ports or  
0 64 DS-30 ports providing connections through the DMS-100. The  
0 DSNE frame contains up to two (2) Networks and comes equipped  
0 with the Frame Supervisory Panel, DC Cooling Unit, and Network  
0 module shelf assembly. The Network Common Circuit Packs (CP) and  
0 Double Shelf Network assembly will be provided on an as need ba-  
0 sis.

#### 0 NTZZ07AA (Double Shelf Network Equipment Frame)

0 The NTZZ07AA includes the frame and one (1) Network Module shelf  
0 assembly, Frame Supervisory Panel, and DC Cooling Unit. The frame  
0 is also ISG compliant and contains earthquake framework. Options  
0 to NTZZ07AA include an additional Network Shelf Assembly, up to  
0 two (2) Network Common CP, and interface circuit packs to either  
0 the NT-40 or SuperNode.

0 NTZZ07BA (Network Common Circuit Packs) The NTZZ07BA contains the  
0 common circuit packs required for a Network which is housed in  
0 the DSNE frame. Each NTZZ07BA contains Network Port CP's, Test  
0 Code cp's, Network Control Processor, Network P-side Message  
0 Processor, and Power Converter. This PEC provides a full comple-  
0 ment of network ports circuit packs which allows junctoring at  
0 the DNI.

0 NTZZ07QA (Double Shelf Network W/O Network Ports) The NTZZ07QA  
0 contains the common circuit packs required for a Network which is  
0 housed in the DSNE frame. Each NTZZ07QA contains Test Code cp's,  
0 Network Control Processor, Network P-side Message Processor, and  
0 Power Converter. Network Port circuit packs are provisionable.

0 NTZZ41PA (International Double Shelf Network) The NTZZ41PA con-  
0 tains the common circuit packs required for a Network which is  
0 housed in the DSNE frame. Each NTZZ41PA contains Test Code cp's,  
0 Network Control Processor, Network P-side Message Processor, and  
0 Power Converter. This PEC provides a full complement of network  
0 port circuit packs which allows junctoring at the DNI.

#### 0 NTZZ07CA NT-40 Network Clock Interface

0 RELEASE 28.01  
0 93 12 03

0 The NTZZ07CA contains the circuit pack to provide the interface  
0 from the DSNE to the NT-40. Each NTZZ07CA contains two (2) CP's  
0 (one (1) per Network Plane) and designation labels.

0 NTZZ07DA SuperNode Network Clock Interface

0 The NTZZ07DA contains the circuit pack to provide the interface  
0 from the DSNE to the SuperNode. Each NTZZ07DA contains two (2)  
0 CP's (one (1) per Network Plane) and designation labels.

0 NTZZ07EA (Double Shelf Network Equipment Frame (US))

0 | The NTZZ07EA is MDed and replaced by NTZZ07AA.

0 The NTZZ07EA includes the frame and one (1) Network Module shelf  
0 assembly, Frame Supervisory Panel, and DC Cooling Unit. The frame  
0 is also ISG compliant. Options to NTZZ07EA include an additional  
0 Network Shelf Assembly, up to two (2) Network Common CP, and  
0 interface circuit packs to either the NT-40 or Supernode. This  
0 frame is for US applications only.

0 NTZZ07MA (Network Port CP)

0 The NTZZ07MA includes a quantity of four network port circuit  
0 packs. This PEC is used to equip a NTZZ07NA DSN Common CP for a  
0 two DSN module only (non-DNI) office. This PEC is also used to  
0 extend an office with only one or two DSN modules not junctored  
0 at the DNI. Please note that offices with three or more network  
0 modules of the same vintage, or two or more network modules of  
0 different vintages must be junctored at the DNI.

0 NTZZ07NA (DSN Common CP)

0 The NTZZ07NA does not include any network port circuit packs.  
0 This PEC can be used to provide a single DSN module in a non-DNI  
0 office or two DSN modules in a non-DNI office when equipped with  
0 NTZZ07MA.

0 NTZZ07PA (Earthquake DSNE Frame (US))

0 | The NTZZ07PA is MDed and replaced by NTZZ07AA.

0 The NTZZ07PA includes the frame and one (1) Network Module shelf  
0 assembly, Frame Supervisory Panel, and DC Cooling Unit. The frame  
0 is also ISG compliant. Options to NTZZ07EA include an additional  
0 Network Shelf Assembly, up to two (2) Network Common CP, and

0  
0 RELEASE 28.01

## 0 6.0 DMS SuperNode SE

0 The DMS SuperNode SE(SNSE) is an alternative provisioning option to  
0 the traditional SuperNode, Enhanced Network (ENET) and Link Peripheral  
0 Processor (LPP).

0 The selection of the DMS SuperNode SE is recommended where the appli-  
0 cation's projected growth will not exceed any of the following charac-  
0 teristics:

0 ! 20 FXPM or 80 DS30 network interfaces for Peripherals  
0 Mod.

0 ! 3 Link Peripheral Processors(LPP).

0 ! 2 Application / File Processors(AP/FP).

0 It is normally recommended that applications that exceed these  
0 parameters use the standard SuperNode.

0 The SNSE is intended for end-offices that require an initial ca-  
0 pacity of up to 13,000 subscriber lines. The network can provide  
0 growth potential of 20,000 to 40,000 subscriber lines or 12,000  
0 trunks, depending on the traffic and service mix of an applica-  
0 tion and the required peripheral configuration.

0 The SNSE platform is defined as containing the CM/SLM  
0 functionality, DMS-Bus functionality, LIS and Network  
0 functionality. In essence, SuperNode SE provides DMS-Core,  
0 DMS-Bus, ENET 16K Channels, and a Link Interface Shelf(LIS) in a  
0 single cabinet.

0 The ENET 16K channels provides an effective network switching ca-  
0 pacity of upto 6,000 Erlang (216,000 CCS). The network can be  
0 configured to support a maximum of 27 DS-512 and 16 DS-30 inter-  
0 faces through to 22 DS-512 and 96-DS30 interfaces. The use of an  
0 external SLC allows 21 DS-512 and 112 DS-30 interfaces. The 16K  
0 channel ENET is recommended for all initial SuperNode SE based  
0 offices. In NT-40 retrofit applications requiring JNET or DSN,  
0 the ENET portion of the SNSE is not required. In this case, the  
0 JNET or DSN is located in a separate frame or frames. Up to 7  
0 Network Modules (NM) can normally be provisioned with SNSE. Note  
0 that, existing offices with JNETs are supported for NT40 to  
0 SuperNode SE retrofits.

0 The LIS provides capacity for twelve (12) Application Specific  
0 Units (ASUs) and the Enhanced Network and Interface Unit

The following diagram gives a pictorial representation of this cabinet using both ENET and LIS:

## DMS SuperNode SE Cabinet

0  
0 RELEASE 28.01  
0 93 12 03

0 6.1 HARDWARE PROVISIONING

0

0 6.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The SuperNode SE can support either ENET or JNET configurations.  
0 It cannot support mixed ENET and JNET configurations, because  
0 JNET cannot interwork with ENET.

0 On the SuperNode SE, IMLs can only be provided using DS-30 links.

0 JNET requires two (2) adjacent link interface cards per MS side.

0 LPP requires two (2) link interface cards per MS side.

0 IOC 0, IOC 1, and IMLs must always be on the MS physical card  
0 slot 10 for plane 0 & slot 29 for plane 1.

0 NT9X14DB and NT9X14EA WILL NOT be supported in a mixed configura-  
0 tion.

0 | The memory load image (100% PS + typically 60% DS) CANNOT exceed  
0 50% of the SLM drive capacity (150MB for SLM1A). The memory load  
0 image said above includes MS load memory also.

0 In BCS36, the Ethernet Interface Unit (EIU) will be available for  
0 provisioning on the LIS and ENI shelves.

## 0 Hardware Upgrades

0

0 SuperNode SE will support the following upgrades:

0 FROMTO

0 NT40 Core

SuperNode SE (without ENET)

0 SuperNode SE/JNET

SuperNode SE/16K ENET

0

0  
0 RELEASE 28.01  
0 93 12 03

0 SuperNode SE/MSB7 SuperNode SE/LIU  
0 NT40/DSN/MSB7 SuperNode SE/16K ENET/LIU

0 Upgrade procedures for the above configurations are very similar  
0 to established SuperNode upgrade procedures.

0 The following upgrade procedures will be documented and verified  
0 in the BCS35 timeframe.

| 0 | <u>FROM</u>               | <u>TO</u>                  |
|---|---------------------------|----------------------------|
| 0 | SuperNode SE with LIU/LIS | SuperNode SE with LIU/LIS+ |
| 0 |                           | external SSLPP             |
| 0 | SuperNode SE with         | SuperNode SE with          |
| 0 | LIU/LIS/external SSLPP    | LIU/LIS/external SSLPP+LPP |
| 0 | DMS-10                    | SNSE                       |
| 0 | RSC                       | SNSE                       |

0 The following upgrade procedures will be documented and verified  
0 in the 1994 timeframe.

| 0 | <u>FROM</u>       | <u>TO</u>             |
|---|-------------------|-----------------------|
| 0 | SuperNode SE      | Full SuperNode        |
| 0 | SuperNode SE ENET | SuperNode SE with     |
| 0 |                   | external ENET cabinet |

#### 0 6.1.2 HARDWARE DEPENDENCIES

0  
0 When using "Universal" Loads on the SNSE the Compute Module must  
0 be provisioned with the 96 Meg memory (NT9X14EA).

## 0 DMS BUS PORT REQUIREMENTS

0 Message Switch Configurations

0 The range of port cards and paddle boards that are supported by  
0 the SuperNode SE allows it to be configured with up to 8  
0 Input/Output Controllers (IOC), 2 mandatory Inter-Message-Links  
0 (IML), upto 3 Link Peripheral Processors (LPP), and either a  
0 fully equipped 16K channel Enhanced Network (ENET) or upto 7  
0 junctored Network Modules (JNET/NMs). Note that MSL Cabinet  
0 packaged systems can support upto 10 NMs. Where ENET 16K is  
0 used, the message switch also provides two slots for interfaces  
0 to Application/File Processors(AP/FP) and or Single Shelf LPPs  
0 (SSLPP or FLIS) external to the SNSE cabinet.

0  
0 (OR)

0 Provision one (1) NT9X17DA in slot 15.

0 If the number of message channels required for interfacing with  
0 ENET is less than or equal to 47, provide the NT9X17DA MS 64-Port  
0 CPs in slot 15 and provide NT9X17BB MS 32-Port CP in slot 14.

0 If the number of message channels required for interfacing with  
0 ENET is less than or equal to 63, provide the NT9X17DA MS 64-Port  
0 CPs in two consecutive slots or one (1) NT9X17CA in slot 15.

0 If the number of message channels required for interfacing with  
0 ENET is less than or equal to 127, provide NT9X17CA MS 128-Port  
0 CPs in two consecutive slots. Note that NT9X62CA must always be  
0 provisioned in slots 15R and 14R for this scenario.

0 To Provision Message Switch for internal LIS interface, equip  
0 slots 8F and 31F with NT9X73BA(Rate Adapter CP) and 8R and 31R  
0 with NT9X79BA, F-Bus Extender Paddle Board.

0 To provision Message Switch for up to four (4) JNET modules,  
0 equip slots 11F, 12F, 28F, and 27F with NT9X17AD(4 Port MS Inter-  
0 face card) port cards and 11R, 12R, 28R, and 27R with NT9X23AA (4  
0 Link DS-30 Paddle Boards).

0 To provision Message Switch for up to seven (7) JNET modules in  
0 DMS, and up to ten (10) JNET Modules in MSL applications, equip  
0 slots 11F, 12F, 28F, and 27F with NT9X17BB(32 Port MS Interface  
0 card) port cards and 11R, 12R, 28R, and 27R with NT9X69BA(16 Link  
0 DS-30 Paddle Boards).

#### 0 Synchronization

0 The DMS SuperNode SE supports the following clock configurations:

0 Stratum III  
0 Stratum 2.5  
0 Stratum II

0 The DMS SuperNode SE supports external clock sources such as  
0 Stratum II and Stratum 2.5 with the use of a Remote Oscillator  
0 Shelf (ROS), in the identical manner to SuperNode. For software,  
0 cabling and other related information, refer to ECM-626 DMS  
0 SuperNode(section 1.1.2 - Message Switch).

0  
0 RELEASE 28.01  
0 93 12 03

0 The composite clock for LIS is terminated in the Message Switch  
0 and extended to the LIS via the FBus Cable.

## 0 Link Interface Shelf(LIS) Provisioning

0  
0 For all markets, the LIS shelf (NT9X7204) must be provided with  
0 the SuperNode SE cabinet because the LIS shelf cannot be  
0 retrofitted in a working SuperNode SE office. There are no ex-  
0 ceptions to this rule. If not used, provision NT9X01FB.

0 See the figure below for the Link Interface Shelf that is  
0 equipped with 4 LIU7.

|   |                                |     |     |                  |

0 RELEASE 28.01  
0 93 12 03

|   |                                |     |
|---|--------------------------------|-----|
| 0 |                                |     |
| 0 | 9X19EA Filler Power            | 33F |
| 0 |                                |     |
| 0 | 9X30AA +5V 80A Power Converter | 36F |
| 0 |                                |     |
| 0 |                                |     |

0 Provision NT9X79AAs in slots 7R and 32R in the LIS shelf, if ENI shelf  
0 is provided and equipped with the two LIU7s. Otherwise, provision with  
0 NT9X79BAs with two left FBUS cables NT9X7211 and with two right FBUS  
0 cables NT9X7213.

0 The LIS provides capacity for twelve (12) Application Specific Units  
0 (ASUs) and the Enhanced Network and Interface Unit shelf(ENI) can sup-  
0 port an additional two (2) LIU7s or EIU. The SNSE MS will support an  
0 external SSLPP in addition to the internal LIS. With such a configura-  
0 tion, the number of CCS7 ASUs(LIU7) cannot exceed 24, regardless of  
0 the availability of the 2 LIU7 slots in the ENI shelf. This scenario  
0 is for LIU applications only and any additional ASUs that are consid-  
0 ered for mixing must be factored using the F-BUS, T-BUS and LINK load  
0 factor calculations.

0 For capacity beyond 24 LIUs, external LPP frames must be provided. A  
0 maximum of three (3) LPP frames can be supported by the SuperNode SE.

0 The only Application Specific Unit (ASU) supported in BCS34 is the  
0 LIU7. In BCS36, the Ethernet Interface Unit (EIU) will be available  
0 for provisioning on the LIS and ENI shelves. The NIU will be available  
0 on SNSE's LIS from BCS36.

0 Each Link Interface Unit (LIU) is composed of two circuit packs and  
0 one paddleboard. The first circuit pack is the NTEX22BA IPF Processor  
0 and F-Bus Interface and is provisioned in an even-numbered slot from  
0 8F to 30F. The second circuit pack is the NT9X76AA STP Signalling Ter-  
0 minal and is provisioned in the next highest (odd-numbered) slot (from  
0 9F to 31F). The paddleboard is either an NT9X77AA V.35 Interface or an  
0 NT9X78AA/BA/CA Enhanced DS0A Interface and is provisioned behind the  
0 NT9X76AA (in an odd-numbered slot from 9R to 31R).

0 Up to twelve (12) LIUs may be provisioned per LIS shelf, with the  
0 left-most LIU occupying slots 8F, 9F and 9R, and the right-most LIU  
0 occupying slots 30F, 31F and 31R.

0 Provisioning of LIUs within LIS shelves should be done as follows:

0 LIUs forming a pair should be provisioned in different halves of the  
0 shelf with LIUs being assigned from the sides towards the middle.

0 Refer to Figure.

0 RELEASE 28.01  
0 93 12 03

## 0 Enhanced Network Shelf(ENI) Shelf Provisioning

0  
0 See the figure below for a Enhanced Network Shelf(ENI) Shelf in a  
0 4K ENET configuration without the ASU(LIU7 or EIU).

|   |                                |     |                      |               |

0 For all markets, the ENI shelf (NT9X0810) must be provided with  
0 the SuperNode SE cabinet because the ENI shelf cannot be  
0 retrofitted in a working SuperNode SE office. If it is not cur-  
0 rently used, it is to be engineered with filler circuit packs.

0 The ENET is provisionable in 4K, 8K, 12K and 16K channel config-  
0 urations. Note that 2K channels are reserved for peripheral and  
0 network control processor messaging in all configurations. There-  
0 fore, the number of channels available for subscriber traffic in  
0 all configurations is 2K, 6K, 10K and 14K channels respectively.

### 0 Peripheral Module Interfaces

0 Three basic types of paddleboard are available:

- 0 \* DS-30 (NT9X41BA, copper links only)
- 0 \* DS-512 (NT9X40BB, fiber links only)
- 0 \* DS-30/DS-512 (NT9X45BA, both copper and fiber links).

0 The DS-512 PB has four (4) DS-512 inputs (i.e. 0.5K Channels per  
0 input) which are utilized on fiber XPMs.

0 The DS-30 PB combines 16 DS-30 copper speech links which are uti-  
0 lized on Series I Peripherals and non fiber XPMs. The NT9X41BA  
0 has 16-Ports numbered 0-15. All ports except port #1 may be used  
0 for Voice or Messaging Links. Port #1 is valid for Voice Links  
0 only. This is a S/W restriction on the hardware.

0 The DS-30/DS-512 PB is a new peripheral interface paddle board  
0 which can interface 3 DS-512 fiber links and 16 DS-30 copper  
0 links. It combines the functionality of two existing packs. The  
0 NT9X45BA has 16 DS-30 ports numbered 0-15 and 3 DS-512 ports. All  
0 DS-30 ports except port #1 may be used for Voice or Messaging  
0 Links. Port #1 is valid for Voice Links only. This is a S/W re-  
0 striction on the hardware.

0 The NT9X40BB (4 DS-512) fully utilize the ENET's channel handling  
0 capacity. But, it does not provide copper links. On the other  
0 hand, the NT9X41BA (16 DS-30) pack does not fully utilize ENET's

0 channel handling capacity(only 25% utilization of crosspoints).  
0 Using an NT9X45BA results in a 100% utilization of ENET cross-  
0 points and providing both copper and fiber links.

## 0 ENET Capacity

0 Series II Peripheral Modules (XPMs) MUST be fiberized to achieve  
0 full usage of the ENET capacity. Although up to 192 DS0 messag-  
0 ing is allocated to the ENET-PM ports per plane, the available  
0 card slots in the ENET 16K for the use of the PMs are limited to  
0 maximum of 7 paddle boards in each plane (i.e. 13R-19R in Plane 0  
0 and 23R-29R in Plane 1). Refer table below.

| 16K ENET Maximum PM Port Capacities<br>(per ENET plane) |    |    |    |    |    |    |     |
|---------------------------------------------------------|----|----|----|----|----|----|-----|
| DS512 ports                                             | 27 | 26 | 25 | 24 | 23 | 22 | 21  |
| DS30 ports                                              | 16 | 32 | 48 | 64 | 80 | 96 | 112 |
| NT9X45s                                                 | 1  | 2  | 3  | 4  | 5  | 6  | 7   |
| NT9X40s                                                 | 6  | 5  | 4  | 3  | 2  | 1  | 0   |

0 NOTE:

0 The NT9X40BB is a must in slot 11R for Plane 0 and 21R for Plane  
0 1, if ENI shelf is provisioned. This is not included in the above  
0 table.

0 RELEASE 28.01  
0 93 12 03

0 Speech Link Assignment Rules

0 DS-30 Speech links (Series I Peripherals)

0 Distribute speech links with messaging from each peripheral type  
0 (i.e. MTM, LM, TM, DCM, DES) as evenly as possible over the  
0 available DS-30 PBs. Note that Series I peripherals require 1  
0 messaging link per peripheral.

0 Distribute the remaining speech links by peripheral types as  
0 evenly as possible over PBs. Note that Series I peripherals re-  
0 quire from 1 to 4 speech links.

0 DS-30 Speech links (Series II Peripherals)

0 Distribute speech links with messaging from each peripheral type  
0 as evenly as possible over the available DS-30 PBs. Distribute  
0 the remaining speech links by peripheral types as evenly as pos-  
0 sible over PBs.

0 DS-512 Speech links

0 Distribute speech links with messaging from each peripheral type  
0 as evenly as possible over the available DS-512 PBs.

0 The telephone company may review and if necessary re-assign the  
0 emergency services to ensure that where possible, all essential  
0 services are not located on the same peripherals which are on the  
0 same Paddle Board. The peripherals with emergency  
0 services(police,hospital,fire,etc..) must be evenly distributed  
0 where possible in paddle boards.

0 ASU Provisioning on ENI Shelf.

0 Note that LIU or EIU can ONLY be provisioned on ENI Shelf, only  
0 if ENET is provisioned on SNSE.

0 RELEASE 28.01  
0 93 12 03

0 Speech Link Connecting Frame Provisioning.

0 SuperNode SE can be used with existing external SLC if previously  
0 installed (i.e. NT-40 retrofit). When cabinetized SMSs are used  
0 with SNSE, then SLC is recommended.

0 Peripherals can be cabled directly to the ENET Shelf, only if  
0 fewer than seven (7) NT9X41BA and or NT9X45BA PBs are on the ENET  
0 Shelf.

0 If there are seven (7) NT9X41BA and or NT9X45BA PBs on the ENET  
0 Shelf, Peripheral Speech Link (PSL) panels and Network Speech  
0 Link (NSL) panels will be engineered as appropriate. In such a  
0 case, if there is room on an existing SLC frame, the new PSL and  
0 NSL panels can be assigned onto it. Otherwise, new SLC frames  
0 will have to be provided.

0 Note that Streamline application may not require the SLC.

0 The NT9X6530 (i.e. left bulkhead panel provides access for 0 to  
0 112 DS-30s) is required, if there are four (4) to seven (7)  
0 NT9X41BA and or NT9X45BA PBs per the corresponding left half of  
0 the shelf (i.e. between card slots 29R-21R). The NT9X6531 (i.e.  
0 right bulkhead panel provides access for 0 to 112 DS-30s) is re-  
0 quired, if there are four (4) to seven (7) NT9X41BA and or  
0 NT9X45BA PBs per the corresponding right half of the shelf (i.e.  
0 between card slots 11R-19R). The DS-30 speech links terminating  
0 on the either half of the shelf will be cross connected at an  
0 SLC. For more information, refer to Bulkhead Provisioning Rules.

0 If any of the above bulkhead panel is used, the number of NSLs  
0 can be calculated using,

0 #of NSLs = {#of NT9X41BA & or 45BAs in one half of the shelf/4}  
0 to be rounded to next higher integer.

## 0 Bulkhead Provisioning Rules

0 Another factor influences, where NT9X41BA/45BA CPs are placed on  
0 the shelf. As with the DMS-SuperNode, all copper switchboard ca-  
0 bles leaving the cabinet route via filter bulkheads. Fiber leads  
0 pass through holes in the bulkheads. Each bulkhead serves the  
0 nearest half shelf.

- 0 1) NT9X6520 Filter Bulkhead Panel Left 48 DS-30  
0 NT9X6521 Filter Bulkhead Panel Right 48 DS-30

- 0 - Each provides filtering and connectivity for DS-30 speech
- 0 links for up to 3 NT9X41BA/45BA (3 X 16 = 48 DS-30).
- 0 - Each provides 13 holes with grommet to access fiber
- 0 connections
- 0 - Dedicated cabling to individual peripheral modules
- 0 - Intended for use in normal ENET applications

- 0 2) NT9X6553 CM/SLM Bulkhead Assemblies

- 0 - The NT9X6553 CM/SLM bulkheads have no DS30 connection
- 0 capability.
- 0 - The Bulkhead NT9X6553 is the common CM/SLM bulkhead for
- 0 non-cabinetized, Meridian and cabinetized(Streamline)
- 0 applications.
- 0 - The NT9X6520/21 pair always require the NT9X6553 CM/SLM
- 0 bulkhead for 1 to 48 DS30 links.

- 0 3) NT9X6552 CM/SLM Bulkhead Assemblies

- 0 - The NT9X6552 CM/SLM bulkheads have extra DS30 connection
- 0 capability.
- 0 - The NT9X6520/21 pair always require the NT9X6552 CM/SLM
- 0 bulkhead for 49 to 96 DS30 links.

- 0 4) NT9X6530 Filter Bulkhead Panel Left, 112 DS-30  
0 NT9X6531 Filter Bulkhead Panel Right, 112 DS-30

- 0 - Each provides filtering and connectivity for DS-30 speech
- 0 links for up to 7 NT9X41BA/45BA
- 0 - Each provides 13 holes with grommet to access fiber
- 0 connections
- 0 - Group cabling to peripherals via SLC and normal speech link
- 0 cable group facilities
- 0 - Intended for use where high concentrations of DS-30 result

0  
0 RELEASE 28.01  
0 93 12 03

0 in more than six (6) NT9X41BA/45BA PBs per ENET shelf.  
0 (e.g. BOC offices with lots of SLC-96s or ENET retrofits  
0 involving significant quantities of Series I  
0 Peripherals).

0 - The NT9X6530/31 pair always require the NT9X6553 CM/SLM  
0 bulkhead assemblies.

0 Selection of bulkhead types should be based on projected  
0 NT9X41BA/45BA requirement of fully equipped shelves. If the  
0 projected number of NT9X41BA/45BA per shelf exceeds six (6) then  
0 NT9X6530/31 are required else NT9X6520/21 are recommended. In the  
0 majority of new applications the average number of NT9X41BA and  
0 or NT9X45BA per fully equipped shelf is expected to range between  
0 two (2) and four (4).

0 93 12 03  
0

0 The CM/SLM functions are realized by integrating SuperNode type  
0 CM's and SLM's on a single shelf. The SLM provides the mass stor-  
0 age media for SNSE in terms of Hard Disk and Streaming tape. The  
0 SLM used is the 5 slot SLM1A. This SLM1A is supplied with a  
0 300MByte formatted hard disk drive. The tape drive is the same as  
0 the SuperNode SLMII, having a capacity of 150MBytes.

0 The Computing Module consists of the CPU and the Memory CPs as  
0 used for SuperNode. Normally, the duplicated CPU's are running in  
0 the "sync match" mode of operation. The controlling CPU is called  
0 the "Active" and the mate is called the "Inactive". Each CM CPU  
0 connects to both MS's directly via fiber CMIC links. The memory  
0 size is specific to customer requirements.

0 Provision two NT9X13MA processors to support the CM section of  
0 the SuperNode SE. The NT9X13MA supports 24Mb memory only. The  
0 NT9X14DB 24Mb circuit boards are supported from BCS34. The 24Mb  
0 circuit boards do not function in burst mode.

0 For new jobs at BCS35 and higher, provide the NT9X13MB processor  
0 circuit boards. The NT9X13MB Processor provides ability to func-  
0 tion with either NT9X14EA (96 Meg memory) or NT9X14DB (24 Meg  
0 memory), but not both. That is NT9X14DB and NT9X14EA WILL NOT be  
0 supported in a mixed configuration. Check availability prior to  
0 ordering NT9X14EA.

0 The 96 Meg memory cards are the recommended option on SNSE ini-  
0 tials from BCS35 onwards. The 24 Meg memory will only be avail-  
0 able on SNSE extensions.

0 The NT9X14EA memory boards have the capability to function in  
0 burst mode. Burst mode memory is required to fully utilize the  
0 Series 60 BRISC processor (BRISC not available until BCS36). The  
0 new RTIF NT9X26DB will have to be provisioned with this BRISC  
0 processor.

0 Provision memory circuit packs in pairs, in slots in the follow-  
0 ing order:

- 0 1) 16F and 23F;  
0 2) 15F and 24F;  
0 3) 14F and 25F;  
0 4) 13F and 26F;  
0 5) 12F and 27F.

0 The number of pairs to be provisioned depends on the memory re-  
0 quirement for the office.

0  
0 RELEASE 28.01  
0 93 12 03

0 The DMS SuperNode SE provides card sparing and block sparing ca-  
0 pabilities for memory. Card sparing uses an entire memory circuit  
0 pack for backup; block sparing uses an 8M block, on a circuit  
0 pack for backup. Hence, with 24 Mb memory cards the maximum usa-  
0 ble memory is 96 Mb with card sparing, and 112 Mb with block  
0 sparing.

0 The block sparing capability is recommended for SNSE.

0 The office must be equipped with two (2) RTIF terminals connected  
0 to the NT9X26AB paddleboards on the CM shelf. The RTIF  
0 paddleboards are also required for performing the out-of-band re-  
0 set function between the CM/MS and ENET on the SuperNode SE.

0 | The DEC VT420 terminal in dual mode has been sucessfully tested  
0 as a combined RTIF/MAP terminal, with SNSE.

0 RELEASE 28.01  
0 93 12 03

## 0 FBus Provisioning

0  
0 There are four possible F-Bus configurations available on the  
0 SuperNode SE:

- 0 1) MS to LIS to ENI (with ASU in ENI Shelf)
- 
- 0 2) MS to LIS (with LIS only in SNSE)
- 
- 0 3) MS to ENI (with ASU in ENI and no LIS in SNSE)
- 
- 0 4) MS only (no ASU in ENI and LIS is not equipped in SNSE)

0 All possible configurations and associated paddleboards are shown  
0 in the following diagrams.0 There are two rules that must be adhered to when provisioning F-  
0 Bus paddleboards:

0 RELEASE 28.01  
0 93 12 03

- 0 1) Both physical ends of the F-Bus must be terminated with a  
0 NT9X79BA F-Bus Ext with Terminations paddleboard.
- 0 2) Intermediate extensions require a NT9X79AA F-Bus Extender  
0 paddleboard.

## 0 Inter-MS Link Provisioning

0 To improve the reliability of the DMS-BUS (Message Switch), MS  
0 Inter-links are now a basic provisioning requirement for  
0 SuperNode SE.

0 The Inter-links require the provisioning of two ports for each MS  
0 plane (MS0 and MS1) to be inter-connected to provide a path for  
0 re-routing of FTS (Frame Transport System) messages if normal  
0 messaging paths are blocked due to hardware failure.

0 The links may be setup only as DS30 links for SuperNode SE.

0 This restriction applies in order to maximize the number of  
0 fiber ports for other external connections.

0 For an explanation of the datafill required and the functionality  
0 provided by this feature, refer to NTP-297-1001-451 Table  
0 MSILINV.

0 Two DS-30 IMLs are provided on SuperNode SE between MS0 and MS1  
0 from slot 10 (MS0 card 10) to slot 29 (MS1 card 10). Note that,  
0 on the SuperNode SE, IMLs can only be provided using DS-30 links.

0 IML 0: (MS0 : card 10 port 2 -> MS1 : card 10 port 2)

0 IML 1: (MS0 : card 10 port 3 -> MS1 : card 10 port 3)

0 The SuperNode SE differs from the standard SuperNode in that the  
0 IMLs are in a fixed location. These ports are fixed in order to  
0 simplify the engineering of IMLs and also to fully utilize the  
0 ports on the provisioned NT9X23 or NT9X69 card in MS card slots  
0 10 and 29.

0 RELEASE 28.01  
0 93 12 03

## 0 LIU External Timing Source Generator Provisioning

0  
0 When V.35 paddle boards (NT9X77AA) are used on LIUs, a Timing  
0 Source Generator (TSG) system is not required.

0 When DS-0 paddle boards (NT9X78AA/BA/CA) are used on LIUs, a Tim-  
0 ing Source Generator (TSG) system is required.

0 The DS-0 paddleboards require a timing signal that is supplied by  
0 a Timing Source Generator (TSG). The TSG must be located in or  
0 near the channel bank frame. Each Timing Output Card provides ten  
0 (10) ports. The following TSG equipment is required:

| Description                    | Part Number  |
|--------------------------------|--------------|
| -----                          | -----        |
| DCD-400 Shelf Assembly         | 990-40000-01 |
| Fuse & Alarm Card              | 990-40014-01 |
| Clock Input Card               | 990-40010-01 |
| Stratum 3 Clock                | 990-40013-01 |
| Timing Output Card             | 990-40011-01 |
| Timing Output Card (Hot Spare) | 990-40011-01 |
| Matrix Control Card            | 990-40015-01 |

0 These equipment manufactured by Telecom Solutions.

0 For U.S. applications, the TSG is supplied by the operating com-  
0 pany.

0 C42(S/DMS) Cabinet Provisioning

0  
0 The SNSE is housed in C42 (S/DMS) Cabinet. The S/DMS cabinet is  
0 very similar to the existing cabinet, items such as packs, shelf  
0 assemblies, interconnect cables, and bulkhead packs do not  
0 change. The differences from the previous Supernode type cabinet  
0 are listed below.

0 1) The Cabinet changes from NT9X0113 to NT9X95AA.

0 2) The Kick plate is not required with the S/DMS cabinet.

0 3) Power wiring is optional. If the cabinet is in a Cabine-  
0 tized lineup, the cables will be equipped to take advantage  
0 of "horizontal" cabling. If the cabinet is in a  
0 non-Cabinetized lineup, power cables will be similar to  
0 existing power cables, so filters will have to be  
0 provisioned.

0 Provide one (1) NT9X9532 stand-alone Cabling Interface Kit when  
0 powering the NT9X01MB cabinet in a non-Cabinetized lineup. This  
0 kit includes power cables, filters, and miscellaneous mounting  
0 hardware. Twenty-two (22) white boots are included in the  
0 NT9X9532 stand-alone Cabling Interface Kit.

0 Provide one (1) NT9X9531 Horizontal Power Cabling Interface Kit  
0 when powering the NT9X01MB cabinet in a Cabinetized lineup. This  
0 kit includes power cables, terminal blocks, and miscellaneous  
0 mounting hardware. Always provide two (2) EMI contact  
0 strips(P0714698) when providing the NT9X9531 Horizontal Power Ca-  
0 bling Interface Kit.

0 RELEASE 28.01  
0 93 12 03

0 6.1.4 OFFICE LAYOUT INFORMATION

0  
0 The S/DMS cabinet will be shipped with the doors, shelves, circuit  
0 packs, FSP, and cooling unit installed. The bus bar will be in-  
0 stalled and appropriate connections will be made at the factory.  
0 The bulkheads form part of the Electromagnetic Compatibility(EMC)  
0 cage around the equipment and provide a place to mount filter  
0 PCBs and optional power filters. The rear of the cabinet is  
0 equipped with two removeable bulkhead panels near the bottom of  
0 the cabinet. When these panels are removed, the cabinet can be  
0 installed in, or removed from, a lineup equipped with horizontal  
0 cabling. The cabinet may be slid "FORWARD" only.

0 FLOOR LAYOUT

0 Aisle dimensions are derived to meet the requirements of central  
0 office environment for floor loading and heat dissipation.

0 - An installation which requires multiple cabinet line-ups has  
0 six foot maintenance aisles.

0 - Maintenance aisles between a cabinet line-up and a frame  
0 line-up are 4.5 feet wide.

0 Installations requiring a cabinet to be integrated into a frame  
0 line-up:

0 - Can only be applied to the front most or rear most line-up

0 - Cabinets and frames are aligned to be flush at the rear

0 Note that a mixed frame/cabinet configuration is in violation of  
0 NEBS. The Telco should confer with the Building Studies and In-  
0 stallation departments to confirm that the building floor can  
0 sustain the weight differential and to insure there is sufficient  
0 cooling available to cool the DMS office.

0 Refer to ECM600 for office layout restrictions when this cabinet  
0 is applied in a Cabinetized DMS lineup.

0 Note that, Richardson and other markets floor layout may be dif-  
0 ferent.

0

0 6.1.5 TRAFFIC TABLES

0  
0 For detailed ASU capacity provisioning, refer to,  
0 SEB 92-02-001 LPP and SSLPP Mixed Application Provisioning Rules.

0 6.2 PRODUCT/SYSTEM SPECIFICATION

0

0 6.2.1 PHYSICAL CHARACTERISTICS

0

0 The dimensions of the SuperNode SE cabinet are as follows:

0 \* Footprint: 42 in (1067 mm) wide  
0 23 in (584 mm) deep (base)  
0 28 in (712 mm) deep (with doors)

0 \* Overall: 72 in (1829 mm) high  
0 42 in (1067 mm) wide  
0 28.5 in (724 mm) deep

0 6.2.2 EMI/EARTHQUAKE INFORMATION

0

0 Earthquake framework for the SuperNode SE frame must always be  
0 provided for all MSL market jobs.

0 6.2.3 SPARING INFORMATION

0

0 One Spare Storage Cabinet (SSC) NTRX49AA can hold up to four  
0 Spares Shelves. The spares cabinet has one (1) always provided  
0 Spares Shelf (NT0X25AY); thus three (3) shelves are  
0 provisionable. One Spares Shelf (NT0X25AY) can hold 26 CPs and 4  
0 Power Modules, as well as 26 Paddle Boards.

0 For ALL applications the following may be used.

0

0 RELEASE 28.01  
0 93 12 03

0 Fusing Requirements

0 The SuperNode SE can be powered from a standard PDC or a  
0 Cabinetized PDC. The rules are as follows:

0 Standard PDC

0 Eight (8) - 20A fuses, two for each shelf (MS,LIS,ENI,CM/SLM)  
0 Two (2) - 10A fuses, one for each power feed to the cooling  
0 unit.

0 Cabinetized PDC(CPDC)

0 Eight (8) - 30A fuses, two for each shelf (MS,LIS,ENI,CM/SLM)  
0 Two (2) - 10A fuses, one for each power feed to the cooling  
0 unit.

0 6.2.5 CURRENT DRAIN INFORMATION

0  
0 \* Full Size card slot: 0.5 Amps avg, 0.6 Amps max  
0 \* Paddle board slot: 0.15 Watts avg, 0.20 Watts max  
0 \* CM/SML1A Shelf: 14 Amps, A plus B feed maximum  
0 \* MS Shelf: 20 Amps, A plus B feed maximum  
0 \* LIS Shelf: 20 Amps, A plus B feed maximum  
0 \* ENET/LIU Shelf: 20 Amps, A plus B feed maximum  
0 \* Cooling Unit: 6 Amps, A plus B feed maximum

0  
0 RELEASE 28.01  
0 93 12 03

0 | Prior to BCS34, the JNET s/w is part of NTX001AA which is a Com-  
0 | mon Basic Software package. From BCS34 onwards, the JNET s/w has  
0 | been separated into a new software package called NTXP10AA.

0 | For all ENET UPGRADE jobs provision the software packages  
0 | NTXP10AA and NTXC21AA effective BCS34 and higher BCSs. It is  
0 | recommended that NTXP10AA be removed in the subsequent BCS up-  
0 | grade following the network Upgrade.

0 | Example: If an office running with pre BCS34 s/w, with JNET, For  
0 | SNSE with 16K ENET UPGARDE, These steps must be done.

- 0 | 1) NTXP10AA must be ordered for JNET to work.  
0 | 2) NTXC21AA must be ordered for 16K ENET.  
0 | 3) NTXF71AB must be ordered for SuperNode Enhanced Messaging.

0 | Note that, NTXP10AA can be removed in the subsequent BCS upgrade  
0 | following the network Upgrade.

0 | As an alternative to the selection of the individual software  
0 | packages for the DMS SuperNode SE, the following "Universal"  
0 | loads are available as an alternative option, with BCS35:

0 | For the U.S., either of:  
0 | NTXC57AA DMS100 BCS35 S/W LOAD FOR SNSE ENET SERIES 20  
0 | NTXC58AA DMS100/200 BCS35 S/W LOAD FOR SNSE SERIES 20  
0 | NTXC59AA DMS200 BCS35 S/W LOAD FOR SNSE SERIES 20

0 | For Canada, either of:  
0 | NTXC63AA SMART MANAGEMENT SNSE SERIES 20  
0 | NTXC64AA UNIVERSAL S/W SNSE SERIES 20 FOR TOLL

0 | Note that, when using "Universal" loads on the SuperNode SE, the  
0 | Compute Module must be provisioned with NT9X14EA 96MByte memory  
0 | cards.

0 | The SNSE also require the following software package for the CCS7  
0 | jobs.

0 | NTXN19AA - LIU7 for LPP Based CCS7 Applications (if supported)

0 6.3.3 MEMORY PROVISIONING

0  
0 Provision memory circuit packs in pairs, in slots in the follow-  
0 ing order:

- 0 1) 16F and 23F;  
0 2) 15F and 24F;  
0 3) 14F and 25F;  
0 4) 13F and 26F;  
0 5) 12F and 27F.

0 The number of pairs to be provisioned depends on the memory re-  
0 quirement for the office.

0 The DMS SuperNode SE provides card sparing and block sparing ca-  
0 pabilities for memory. Card sparing uses an entire memory circuit  
0 pack for backup; block sparing uses an 8M block, on a circuit  
0 pack for backup. Hence, with 24 Mb memory cards the maximum usa-  
0 ble memory is 96 Mb with card sparing, and 112 Mb with block  
0 sparing.

0 The block sparing capability is recommended for SNSE.

0 6.4 REAL TIME IMPACT

0 Real time performance information is available from System Engi-  
0 neering, Product Performance group.

0 Series 60 BRISC for SNSE is projected to provide  
0 approximately 2.5 X Series 20 Capacity.

0 8.1.3 PROVISIONING CONSIDERATIONS

0  
0 The following SLC Building Blocks are available:

0 NTZZ21AA: SLC Frame for U.S. and Canadian applications. This  
0 Building Block provides the SLC with the NT0X25AH Universal  
0 framework.

0 NTZZ21BA: SLC Frame for U.S. applications. This Building Block  
0 has been declared Manufacture Discontinued due to the MD status  
0 of the NT0X25AA framework. NTZZ21BA is replaced by NTZZ21AA. Re-  
0 fer to section EMC3-05-004 of the Engineering Manual for refer-  
0 ence information.

0 NTZZ21DA: EQ Frame SLC Building Block. This Building Block has  
0 been declared Manufacture Discontinued since it duplicates the  
0 NTZZ21AA Building Block. NTZZ21DA is replaced by NTZZ21AA. Refer  
0 to section EMC3-05-005 of the Engineering Manual for reference  
0 information.

0 The NT0X25AV framework is A&M and it is replaced by NT0X25AH.

## 0 9.0 DMS-100 Standard DF Terminal Blocks

0 This document defines the Distributing Frame Terminal Blocks (DFTB)  
0 provisionable from the RTP approved sources (i.e. Northern Telecom  
0 Outside Plant Division (OPD) and Telzon ) and relates those products  
0 to specific applications.

0 9.1 HARDWARE PROVISIONING

0

0 9.1.1 HARDWARE USAGE RESTRICTIONS

0

0 A Connectorized Terminal Block (CTB) 8X32 can only be used for  
0 Line and Trunk Module 8-Wire (TM8) applications. Non-  
0 connectorized Terminal Block 8x32 can be used for Line, Trunk  
0 Module 8-Wire (TM8) and Miscellaneous applications.

0 9.1.2 HARDWARE DEPENDENCIES

0 9.1.3 PROVISIONING CONSIDERATIONS

0  
0 Distribution frame terminal blocks are intended for use as a ter-  
0 minating device on Central Office or PBX distributing frames. A  
0 Terminal Block (TB) has two terminating sides, the Equipment Side  
0 (Termination of DMS-100 equipment) and the Cross Connect Side  
0 (Termination of incoming lines, trunks and miscellaneous cir-  
0 cuits).

## 0 EQUIPMENT SIDE TERMINATION TYPE

0

0

0  
0 Host - Network Equipment  
0 Chapter 21

0  
0 RELEASE 28.01  
0 93 12 03

0 Terminations on the Equipment Side can be made by using terminal  
0 pins (NON-CONNECTORIZED) or interlocking connectors  
0 (CONNECTORIZED). Connectorized Terminal Blocks (CTB) can be used  
0 with Northern Telecom's DMS-100 connectorized cables for quick  
0 installation. Customers have realized a full 75 to 95% reduction  
0 in installation labor costs. It should be noted CTB'S are used  
0 for lines and trunks (TM8) applications only.

0 CROSS CONNECT TERMINATION TYPE

0  
0 Terminations on the Cross Connect Side are made by using only  
0 terminal pins.

0

0

0

0

0

0

0 TERMINAL PIN TYPE

0  
0 There are (3) terminal pin types : Single Post Wire-Wrap (SP),  
0 Bifurcated Wire-Wrap (BIF) and Insulation Displacement Bifurcated  
0 (IDV) also called Quick Connect (QC).

0 SINGLE POST WIRE-WRAP terminal pin is rectangular in shape and  
0 extends from the face of the terminal field for connection of 22  
0 to 26 AWG wire.

0 Single Post Wire-Wrap

0 Front View of Terminal

0  
0 BIFURCATED WIRE-WRAP terminal pin is "U" in shape and extends  
0 from the face of the terminal field for convenient connection of  
0 22 to 26 AWG wire.

0 Bifurcated Wire-Wrap

0 NORTHERN TELECOM

0 RELEASE 28.01  
0 93 12 03

0 INSULATION DISPLACEMENT BIFURCATED (IDV) OR QUICK CONNECT

0 (QC) terminal pin is "W" in shape. Although this terminal is or-  
0 dered less than 6% of the time it automatically strips, termi-  
0 nates, and cuts to length the wire applied to it. When a wire is  
0 inserted into the termination slot, the insulation is displaced  
0 and the exposed conductor is wedged into an electrical connection  
0 with the terminal. Simultaneously, the strain relief connection  
0 is made and the cutter bar shears the wire to the correct length.  
0 IDV or QC terminals can be used with 22 or 24 AWG wire.

0 CONNECTOR TYPE

0 Up to four interlocking 32 pair TRW or AMP male (plug) ribbon  
0 connectors are telephone industry standard offerings on both OPD  
0 and TELZON 8X32 CTB'S. The male (plug) connectors are designed to  
0 engage spring clips on female (receptable) connectors (standard  
0 on Northern Telecom's connectorized line cables). These connec-  
0 tors may be disconnected by using a pointed object and de-  
0 pressing the metal spring of the connector and pulling them apart

0 RELEASE 28.01  
0 93 12 03  
0

0 on at least one end. This latching arrangement eliminates the need  
0 for additional locking hardware and safeguards against accidental  
0 uncoupling.

0 Each connector is wired for 32 circuits. When used with Line  
0 equipment, one connector represents one Line Sub Group (LSG) or  
0 one half of a Line Drawer. A standard CTB with four (4) connec-  
0 tors will then terminate four (4) LSG'S or two (2) Line Drawers.

0 For Trunk Module 8-Wire (TM8) equipment, one connector represents  
0 4 of 16 wires required for each card slot on a TM8 shelf. A  
0 standard CTB with four connectors will then terminate all 16  
0 wires required for each card slot for a total of 240 wires for 15  
0 slots per shelf.

#### 0 QUANTITY OF TERMINAL BLOCKS

0  
0 The quantity of Terminal Blocks (TB) for an office (D) is deter-  
0 mined by the sum of blocks required for Trunk Cards (A), Lines  
0 (B) and Miscellaneous (C):  $(A + B + C) = (D)$ .

#### 0 QUANTITY OF TERMINAL BLOCKS FOR TRUNK CARDS

0  
0 An estimate of required terminal blocks for Trunk Cards mounted  
0 in Maintenance Trunk Module (MTM) Shelves and/or Remote Mainte-  
0 nance Module (RMM) can be made by using the TRUNK CARD PIN ROW  
0 REQUIREMENT CALCULATION TABLES.

0  
0 ---  
0 Enter the Quantity of Trunk Cards mounted in MTM and/or RMM  
0 shelves which require MDF terminations in column (A).

0  
0 ---  
0 Select the Block Type Ordered in column (B) (6X, 8X, or  
0 10X..etc). The numbers in the columns represent the Pin Rows  
0 required for each card type per the Contract Drafting Depart-  
0 ment 3424.

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 Determine the Total Number of Pin Rows Required for Cards ---  
0 and/or Modules in column (C) by multiplying the Quantity of  
0 Trunk Cards and/or Modules in column (A) by the number of Pin  
0 Rows required in column (B):(A X B)=C.

0  
0 Determine the Total Number of Pin Rows Required for all Trunk ---  
0 Cards and/or Modules (D) by adding the Total Number of Pin  
0 Rows Required for each card type and/or Modules together in  
0 column (C).

TOTAL NUMBER OF PIN  
ROWS REQUIRED FOR  
ALL ITEMS (D)

NOTE 1 Provide at least 1 Dedicated Block for NT3X09AA/BA cards  
which are part of the stock list for these part numbers.  
The result should be rounded up to the next whole number.

0 RELEASE 28.01  
0 93 12 03

0

0

0 Determine the Number of Pin Rows on the Type of Block Ordered  
0 (E) ( See Example ).

0 Example:

0

0 Terminal Block

0

0 8 X 32

0 10 X 30

Number of Pin  
Rows on Block

32

30

0

0 Terminal Blocks for Trunk Cards and Modules (F) can be deter-  
0 mined by using the formula below:

0 Total Number of Pin Rows Required  
0 for Trunk Cards and/or Modules (D)

0 Number of Pin Rows on the Type of  
0 Block Ordered (E)

==== Terminal Blocks  
for Trunk Cards  
and/or Modules  
(F)

0 The result of the formula should be rounded up to the next  
0 whole number.

# 0 QUANTITY OF TERMINAL BLOCKS FOR LINES

0

0 An estimate of required terminal blocks for Lines (LSG'S) can be  
0 made by using the LINE SUB GROUP PER BLOCK CALCULATION TABLE.

0

0 93 12 03  
0

0 --- Determine the Total Number of Line Sub Groups required  
0 for a Detail Engineered office by multiplying the Total Num-  
0 ber of Line Draws (NT6X05AA or NTB32BA) ordered by (2):

0  
0 
$$\left[ \begin{array}{l} \text{Required number of} \\ \text{NT6X05AA or NTB32BA} \end{array} \right] \times 2 \quad \text{====} \quad \begin{array}{l} \text{Total Number of} \\ \text{Line Sub Groups} \end{array}$$
  
0

0 --- Determine the Total Number of Line Sub Groups required  
0 for a Building Block Engineered office by the following ta-  
0 ble:

0 NUMBER OF LINE SUB GROUPS FOR BUILDING BLOCK PECS  
0

| BUILDING<br>BLOCK PART<br>NUMBER | NUMBER OF<br>LSG'S |
|----------------------------------|--------------------|
| LCM NTZZ08BA                     | 20                 |
| ISDN 2B1Q LCM NTZZ17HA           | 16                 |

0 --- Terminal Blocks for Lines can be determined by using the  
0 formulas below:

0

## 0 QUANTITY OF TERMINAL BLOCKS FOR MISCELLANEOUS

0  
0 An estimate of required terminal blocks for Miscellaneous items  
0 can be made by using the MISCELLANEOUS PIN ROW REQUIREMENT CALCU-  
0 LATION TABLES.

0 --- Enter the Quantity of Miscellaneous items which require  
0 MDF terminations in column (A).

0 --- Select the Block Type Ordered in column (B) (6X, 8X, or  
0 10X..etc). The numbers in the columns represent the Pin Rows  
0 required for each item type per the Contract Drafting Depart-  
0 ment 3424.

0 --- Determine the Total Number of Pin Rows Required for each  
0 item type in column (C) by multiplying the Quantity of Items  
0 in column (A) by the number of Pin Rows required in column  
0 (B):  $(A \times B) = C$ .

0 --- Determine the Total Number of Pin Rows Required for all  
0 Miscellaneous Items (D) by adding the Total Number of Pin  
0 Rows Required for each item type together in column (C).

TOTAL NUMBER OF PIN ROWS  
REQUIRED FOR ALL ITEMS (D)

--- Note 4: Provide (1) Dedicated Block for each unit.

0 RELEASE 28.01  
0 93 12 03

0

0 --- Determine the Number of Pin Rows on the Type of Block Or-  
0 dered (E) ( See example in section 2.4.6).

0 --- Terminal Blocks for Miscellaneous Items (F) can be deter-  
0 mined by using the formula below:

|   |                                   |                        |
|---|-----------------------------------|------------------------|
| 0 | Total Number of Pin Rows Required |                        |
| 0 | for all Miscellaneous Items (D)   | Terminal Blocks        |
| 0 | <hr/>                             | ==== for Miscellaneous |
| 0 | Number of Pin Rows on the Type of | Items (F)              |
| 0 | Block Ordered (E)                 |                        |

0 The result of the formula should be rounded up to the next  
0 whole number.

0

0 9.1.4 PIN CONFIGURATION FOR CONNECTORIZED TERMINAL BLOCKS

0

0 Approved sources for connectorized terminal blocks offer four (4)  
0 standard telephone pin configurations. Each pin configuration has  
0 a specific application for Trunks (TM8) and or Line circuits  
0 only.

0 Figures A-F show each configuration's unique pin layout, circuit  
0 and connector number growth patterns. Figures A-D can be used for  
0 line circuit applications and Figures E-F are only to be used for  
0 Trunk (TM8) applications.

## 0 LINE CIRCUIT APPLICATIONS

0  
0 For line application the circuits for each connector are numbered  
0 (00)-(31) representing 32 line circuits. Circuit number growth  
0 patterns can be Top to Bottom (See Figure A) or Bottom to Top  
0 (See Figure B), with all patterns growing Left to Right (See Fig-  
0 ures A-D).

0 Connectors and Line Sub Groups (LSG) can be grouped horizontally  
0 in rows (See Figures C & D), with a growth pattern Bottom to Top  
0 (See Figure C) or Top to Bottom (See Figure D). Also, they can be  
0 grouped vertically in columns, with a growth pattern Left to  
0 Right (See Figures A & B).

0 The Ring and Tip configuration for each CTB is unique to the  
0 internal wiring and can not be changed. Configurations can be  
0 Ring below Tip (See Figures A & D) or Ring above Tip (See Figures  
0 B & C).

## 0 TRUNK (TM8) APPLICATIONS

0  
0 For Trunk application the circuits for each connector are number  
0 (00)-(29) representing 30 circuits. Circuit number growth pattern  
0 will always to Left to Right.

0 Connectors for Trunks are grouped horizontally in rows, with a  
0 growth pattern Top to Bottom (See Figure F) or Bottom to Top (See  
0 Figure E).

0 The Ring and Tip Configuration for Trunks can be Ring below Tip  
0 (See Figure F) or Ring above Tip (See Figure E).

0 9.7.1 PIN CONFIGURATION FOR NON-CONNECTORIZED TERMINAL BLOCKS

0

0 Approved sources for Non-Connectorized Terminal Blocks  
0 (Non-CTB'S) offer many standard terminal pair configurations. A  
0 Non-CTB has no pin configuration restrictions like the CTB.

0 These blocks are generally used for terminating miscellaneous  
0 circuits; however, the connectorized 8X32 layout (Figures A thru  
0 F) for Lines and Trunks may be provisioned in conjunction with  
0 this block.

0

0 9.7.2 ORDERING TABLE FOR APPROVED BLOCKS

0

0 The following tables have been designed to define block ordering  
0 options for each vendor's blocks.

| 0 COLUMN HEADING | DESCRIPTION                                                                                                                                                                                                           |

|---|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 | TERMINAL PATTERN | Four factors define a unique terminal pattern: Frame mount (Horizontal or Vertical), Ring to Tip relationship, LSG or connector growth, and circuit number growth. Each terminal pattern is identified by the letter P followed by a number from 1 to 10. All of the terminal patterns (P1 thru P10) are described below. For NON-CTB's (N/A). |
| 0 | .....P1          | Horizontal Mount.....<br>Ring Below Tip.....<br>LSG growth Left to Right.....<br>Circuit growth Top to Bottom.....                                                                                                                                                                                                                             |

0 HOUSING SIZE Telzon blocks are made with a 6.0 inch (6.0)  
0 or 4.3/4 inch (4.75) housing. OPD blocks only  
0 have one housing size (N/A).

0 FANNING STRIP Telzon blocks can be order with Fanning Strip  
0 numbering 00-31 (0) or 01-32 (1). OPD blocks  
0 can not be ordered with Fanning Strip number-  
0 ing (N/A).

0 FRAME MOUNT How the block is mounted on the MDF Frame  
0 Horizontal (HOR) or Vertical (VERT).

0 10.0 Network Port Spread

0 This document provides rules for balancing ports of peripheral modules  
0 across all non-ENET networks in both initial and extension offices.

0 The non-ENET networks are:

0 NT8X10AA Double Shelf Network Equipment Frame

0 NT5X13AA/BA Network Frame Planes Combined (retired)

0 NT0X48AA/AG Network Frame - Full (MD'd)

0 NT0X48AB/AH Network Frame - Half (MD'd)

0 NT0X48AC/AJ Network Frame - Quarter (MD'd)

0 RELEASE 28.01  
0 93 12 03

- 0 1. BALANCE the ports of each individual peripheral across all net-  
0 works and network subgroups (NSGs).
- 0 2. BALANCE the total number of ports for each peripheral type across  
0 all networks and NSGs.
- 0 3. BALANCE the total number of MESSAGE PORTS across all networks and  
0 NSGs.
- 0 4. BALANCE the total number of MESSAGE PORTS for each peripheral  
0 type across all networks and NSGs.
- 0 5. The two MESSAGE PORTS of an XPM must be on different networks in  
0 offices with more than one network, or on different NSGs in of-  
0 fices with only one network.
- 0 6. The MESSAGE PORTS of the two LM bays in the same LME must be on  
0 different networks in offices with more than one network, or on  
0 different NSGs in offices with only one network.
- 0 7. If the office has spare ports, spread the spare ports between the  
0 NSGs with DRA/EDRA MTMs, to a maximum of 2 spare ports per NSG  
0 with a DRA/EDRA. BALANCE the remaining spare ports across all  
0 networks and NSGs.
- 0 Note: DRAs (or any other circuit which employs Network  
0 Broadcast) can magnify the traffic on the C-side of  
0 the NM. See DRAM Network Deloading Table in NTP  
0 297-1001-450.
- 0 8. BALANCE A and B powered ports across all networks and NSGs on in-  
0 itial jobs.
- 0 Consider the following additional rules for PM redistributions on  
0 extensions:
- 0 9. Minimize port moves on an extension.
- 0 10. If the links of an MSB7 (NT6X32) are already BALANCED, then its  
0 links must not be moved.
- 0 Note: Because of nailed up connections, MSB7 links are dif-  
0 ficult to move without traffic interruption. Avoid  
0 moving them.
- 0 11. If the links of an MSB6 (NT6X07) are already BALANCED, then its  
0 links must not be moved.

0  
0 RELEASE 28.01  
0 93 12 03

0 Note: Because of nailed up connections, MSB6 links are dif-  
0 ficult to move without traffic interruption. Avoid  
0 moving them.

0 12. When balancing MESSAGE PORTS, it is preferred to only move MES-  
0 SAGE PORTS of XPMs. Avoid moving MESSAGE PORTS for the purpose  
0 of balancing other port types.

0 Note: Speech links on XPMs require much less installer ef-  
0 fort to move.

0 13. Attempt to BALANCE A and B powered ports across all networks and  
0 NSGs, but do not move any port solely for the purpose of balanc-  
0 ing A and B powers.

0 Note: One plane of the network is A powered and the other  
0 is B powered. If one complete power feed fails, it  
0 doesn't matter what the spread of failed PMs is  
0 across the networks. A spread of powers is not a  
0 problem on initial offices, but on extensions it is  
0 not desirable to introduce extra moves to balance  
0 powers.

0 Note to software writer: This may be easier to implement  
0 using a balancing criterion of, for  
0 example, 10.

0 14. When all other rules have been followed, and an equal choice  
0 still exists between a number of links, then it is preferable to  
0 move a link on a PM which already has other links being moved,  
0 rather than moving a link on a PM that has not yet been involved  
0 in the PM redistribution.

0 15. Secondary to Rule 14, it is preferred to move an XPM speech link  
0 rather than other link types.

0 Note: In some cases a PM has to be "busied" to be worked  
0 on. Thus, it is best to minimize the number of PMs  
0 to be worked on.

0 16. The port spreading program provides a user interface which allows  
0 him to specify specific links which he prefers not to move. The  
0 port spreading program will then only relocate these links if it  
0 is absolutely necessary to reach BALANCE, subject to the above  
0 rules.

0

0 RELEASE 28.01

0 93 12 03

0 Note: Nailed up connections as specified in customer tables  
0 (IPML, Speccon etc.) are difficult to move without  
0 causing an interruption of service. This user inter-  
0 face will give the spec writer an opportunity to  
0 avoid such moves.

0 17. If the links of an ISDN Peripheral (residing in frame NT6X01AB)  
0 are already BALANCED, then its links must not be moved.

0 Note: ISDN links may ONLY be relocated with service inter-  
0 ruption.

0 Note: The software written to implement Rules 17, 10, and  
0 11 (restricting unnecessary moves for difficult-to-  
0 move links) should be flexible enough to accept new  
0 PECs as they are identified (i.e., Streamline may  
0 create some new PECs for repackaging of existing pro-  
0 ducts).

0  
0 The word "BALANCED" as used in the above rules means the follow-  
0 ing:

0 (i) On Initials:

0 The network/NSG with the most number of ports minus the  
0 network/NSG with the least number of ports is less than  
0 or equal to one (1).

0 (ii) On Extensions:

0 The network/NSG with the most number of ports minus the  
0 network/NSG with the least number of ports is less than  
0 or equal to:

0 - two (2) for speech ports

0 - one (1) for MESSAGE PORTS

0 - one (1) for OAUs, MTMs (controlling and standby  
0 alarms)

0 - one (1) for DRA/EDRA (circuits which employ Network  
0 Broadcast)

0  
0 RELEASE 28.01  
0 93 12 03

0 Note: On initials there is no problem to balance an office  
0 within 1. However, on extensions, every port moved  
0 costs NT and the Customer in installation hours. The  
0 idea of reducing the balancing on extensions to  
0 within two ports is to significantly reduce the num-  
0 ber of moves. This will not reduce the redundancy or  
0 operation of the office significantly because if  
0 there is a failure of an NSG or Network in one plane,  
0 the other plane is the main provision for redundancy.

0 The only case where balancing across NSGs has an ef-  
0 fect on operation is when an NSG on an 0X48 is fully  
0 provisioned. Time switching is performed more effec-  
0 tively if the NSG is not full. However, even if they  
0 are full, operation is within design constraints of  
0 the network. Therefore this does not hinder us from  
0 using a balancing criterion of 2.

0 Series 1 or first generation peripherals have a sin-  
0 gle message channel on Port 0 Channel 0.

0 Series II or XPM or second generation peripherals  
0 have two messaging channels to the network for reli-  
0 ability; i.e., XPM message channels are Port 0 Chan-  
0 nel 0 and Port 2 Channel 0.

## 0 11.0 DMS-SuperNode

0 The DMS-SuperNode is a technology upgrade for the DMS-100 family of  
0 digital switches. The DMS-SuperNode consists of DMS-Core and DMS-Bus  
0 subsystems. The Central Control Subsystem is superseded by these sub-  
0 systems, designed to give enhanced performance and functionality.

0 The DMS-Core provides the call management and system control functions  
0 of the DMS-SuperNode. This is a duplicated device working in synchro-  
0 nous mode.

0 - It consists of a duplex Computing Module(CM) and a duplex  
0 System Load Module(SLM). SLM is a mass storage system which  
0 will be used to store office images and from which new loads,  
0 or stored images can be booted into the CM.

0 The DMS-Bus is a high speed transaction switch which supports messag-  
0 ing between the DMS-Core, Application processors, Peripheral process-  
0 ors and other elements of the DMS-SuperNode. The DMS-Bus is a  
0 duplicated device working in a loadsharing mode.

0 - It consists of a pair of Message Switches(MS) that provides an  
0 interface to all components.

0 In order to support the higher bandwidths and increased functional  
0 density of the DMS-Core components, optical fiber is utilized to carry  
0 messages between the subsystems. A new fiber based DMS internal link  
0 protocol, DS-512, is introduced to interconnect the DMS-Core CM and  
0 MS.

0 The DMS-SuperNode employs a new cabinet based packaging system. The  
0 C42(S/DMS) SuperNode cabinet is a cost and functionally enhanced ver-  
0 sion of the existing SuperNode cabinet. The S/DMS cabinet is 42 inches  
0 wide compared with Cabinetized DMS's width of 28 inches. This new cab-  
0 inet supports features such as modified framework based on Cabinetized  
0 DMS, "horizontal"(through line-up) cabling, and "hot slide" capabil-  
0 ity. "Horizontal" cabling meaning, cables running through a hole in  
0 the side of a cabinet and into the next cabinet(s) in the same lineup.  
0 "Hot slide" is the process of moving an operating cabinet into an ex-  
0 isting lineup of equipment. The SuperNode incorporates a Frame Super-  
0 visory Panel (FSP), cooling Unit and accommodates four (4) equipment  
0 shelves. The following diagram gives a pictorial representation of  
0 this cabinet:

0 RELEASE 28.01  
0 93 12 03

0 11.1 HARDWARE PROVISIONING

0

0 11.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The DMS-SuperNode supports the same termination capacity as the  
0 CCC (i.e. up to 32 NM's per plane and up to 6 IOC's).

0 The NT9X54AC or NT9X54AD Clock Interface PB is compatible with  
0 NT9X54AB but NOT NT9X54AA. If an existing MS shelf is equipped  
0 with NT9X54AA for an internal clock reference application, this  
0 must be removed and replaced with NT9X54AC/AD, if the mate MS  
0 shelf is being equipped with NT9X54AC/AD.

0 Cabinetized DMS has a port restriction of forty (40) connections  
0 per MS shelf (twenty (20) single port access per bulkhead). In  
0 otherwords, Cabinetized DMS is restricted to 40 Ports per MS  
0 shelf. Therefore the maximum number of NT9X17AA/ADs is 10 per MS  
0 Shelf for Cabinetized(streamline) DMS only.

0 The NT9X62BA will be available for Inter-MS-Link (IML) feature in  
0 BCS35

0 The NT9X10AA 33 MHz 88000 BRISC CPU Circuit Pack does not support  
0 the NT9X14BB 6MB Memory.

## 0 NT40 Upgrade

0  
0 Commissioning Engineering is to supply an IOE frame equipped with  
0 an MTD, IOC, Term-CP and Terminal, to be used when upgrading an  
0 NT40 office to DMS-SuperNode.

0 For U.S. offices, Isolated System Grounding (ISG) will be pro-  
0 vided for all offices receiving a DMS-SuperNode. To be consistent  
0 with the evolving Industry Standards (TA-EOP-000295), it is re-  
0 commended that all DMS-SuperNode office upgrades include ISG. See  
0 ECM-289 for provisioning rules on ISG for initial offices.

0 All DMS-SuperNode offices must be upgraded to BCS 26 S/W and BCS  
0 26 Gating H/W (Reference ECM510 Gating H/W).

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 BRISC

- 0  
0 The prerequisites for BRISC are as follows:
- 0 - NT9X12AC (NT9X12AB on CM, SLM must be replaced)
  - 0 - NT9X14DB (NT9X14BB on CM must be replaced)
  - 0 - NT9X44AB (NT9X44AA must be replaced)
  - 0 - The NT9X26DA is required with the NT9X10AA BRISC CPU.
  - 0 - 250MB tape (DC6250) for scratch purposes.

0  
0 Power and Ground Cabling

0  
0 The power and ground cabling of the S/DMS cabinet depends on the  
0 site configuration. Installations that do not utilize horizontal  
0 cabling, require the power cables entering the cabinet to be fed  
0 through EMC filters. On the other hand, use of S/DMS cabinet in a  
0 Cabinetized DMS lineup do not need the power filters.

0 11.1.3 PROVISIONING CONSIDERATIONS

0  
0 DMS-SuperNode is provisioned to support the office configuration  
0 in four (4) major respects:

- 0 - the DS-30 message links required for NMs, IOCs and LIMs
- 0 - the CM memory required
- 0 - the processor required for the office configuration
- 0 - the SLM required to support storage capacity requirements

0 The Network frame must be modified for use with the  
0 DMS-SuperNode. See ECM261 for provisioning rules on connection  
0 of Network Modules to the DMS-SuperNode.

0 The Input Output Controller (IOC) Modules must be modified for  
0 use with the DMS-SuperNode. See ECM 316 for IOC provisioning  
0 rules. Initial DMS-SuperNode offices must provision IOC shelves  
0 on IOE frames.

0 For office upgrades to the DMS-SupeNode that are currently uti-  
0 lizing the Message Device and Controller (MDC) module for I/O re-  
0 quirements, external (i.e. IOE/MTC) mounted IOC shelves must be  
0 provisioned.

## 0 MS Port Provisioning

0  
0 The MS occupies two (2) planes and two (2) shelves on a  
0 DMS-SuperNode. Message port requirements are calculated as fol-  
0 lows:

0 When provisioning ports on a Message Switch Shelf, a number of  
0 factors need to be considered. (Note that both MS Shelves must  
0 be equipped in exactly the same way.)

0 There are 18 slots available for Network, IOC/EIOC, and LIM con-  
0 nections on each MS Shelf. Note during the upgrade, the Network  
0 slots must be shared between the existing NMs and the new ENET.

0 \* Each NM requires two (2) ports (each must be on an adja-  
0 cent card).

0 \* Each IOC requires one (1) port.

0 \* Each EIOC requires two (2) ports (each must be on a sepa-  
0 rate card).

0 \* Each LIM requires four (4) ports (each pair must be on a  
0 separate card).

0 As an example, for an office that has 5 networks, 3 IOC and 2  
0 LIMs:

0 The number of MS ports req. per plane =  $(5 \times 2) + 3 + (2 \times 4)$   
0 = 21 ports

0 Remember that port circuit packs are provisioned in pairs per MS  
0 plane (i.e. in multiples of four) as noted in section 1.2.2. This  
0 allows Network Module links from the two planes to terminate on  
0 physically different port cards.

0 Each MS 4 Port CP (NT9X17AA/AD) can connect up to four (4) mes-  
0 sage ports.

0 The NT9X17AD is essentially the same circuit pack as NT9X17AA,  
0 and it provides full bandwidth capability and can be used in all  
0 present applications. The NT9X17AD card is based on the existing  
0 NT9X17AA design and is used with the NT9X62BA, SR-512 interface  
0 paddleboard in FLIS applications.

0 RELEASE 28.01  
0 93 12 03

0 With the introduction of ENET, the requirement for MS ports  
0 greatly increases. Therefore, a 64 port CP (NT9X17DA) is intro-  
0 duced. The 4 port CP (NT9X17AA/AD) is retained for use with IOC,  
0 CM, NM and LIM. MS port assignments are first provisioned for  
0 IOCs. This will normally amount to two NT9X17AA/AD and two  
0 NT9X23AA per plane assigned to the highest numbered slots on the  
0 MS shelf. Unused ports from these cannot be used for ENET. How-  
0 ever, the unused ports can be used for Inter-MS -Links.

0 The NT9X17CA, 128 port card is the continuous evolution of the  
0 SuperNode product that provides double the NT9X17DA (64 port  
0 card) capacity. This evolution increases the total number of  
0 ports that can be supported using the DMS-Bus shelf and allows a  
0 much greater fan-out from the DMS-Bus. The NT9X17CA is fully com-  
0 patible with its predecessors in terms of functionality. They can  
0 be inter-changed and co-exist in the Message Switch with proper  
0 commissioning procedures.

0 The NT9X17CA provides 128 independent ports on a single CP. Each  
0 port acts as an independent entity on the T-Bus, being able to  
0 transmit and receive messages identified by its own unique port  
0 address. Each port represents a bi-directional messaging path,  
0 with the T-Bus providing a routing mechanism.

0 The NT9X17CA can be used to support applications which require  
0 more than 64 messaging ports. In situations, where more than 64  
0 ports but less than 128 ports are required, the NT9X17CA can be  
0 used in lieu of the NT9X17DA and therefore eliminate the require-  
0 ment to chain two 9X17DAs. This will reduce the requirement of  
0 the MS port Expander card and hence free up slots on the MS.

#### 0 ENET Interface

0 The following equipment is the minimum requirement in the Message  
0 Switch (MS) to interface with the ENET. The NT9X25AA and NT9X25BA  
0 are required, only if a chain of 17DAs is required.

- 0 - NT9X13DC, MS CPU Processor CP (4 Megabytes)
- 0 - NT9X17DA, MS 64 Port CP
- 0 - NT9X20BB, ENET/MS Fiber Interface PB
- 0 - NT9X25AA, MS Port Expander PB
- 0 - NT9X25BA, MS Port Expander/Terminator PB
- 0 - NT9X49CB, MS P-Bus Terminator CP (Tracer Card)

0

0 RELEASE 28.01  
0 93 12 03

0 To interface with ENET, the MS requires 10 Megabytes of memory.  
0 This is achieved in the following ways:

| QTY                                                                                                     | PEC             | QTY | PEC              | Application     | NOTE |
|---------------------------------------------------------------------------------------------------------|-----------------|-----|------------------|-----------------|------|
| 2                                                                                                       | NT9X13DC (4 MB) | 2   | NT9X14BB (6 MB)  | Canadian & U.S. |      |
| 1) PM Note: New SN DPCCs should not be provided with the NT9X14BB MS memory for BCS-31 and above loads. |                 |     |                  |                 |      |
| 2                                                                                                       | NT9X13DB (1 MB) | 2   | NT9X14DB (24 MB) | Richardson      | 1    |

0 NOTE:

0 1 This configuration is non-standard and will not be supported by the formal design documentation. Earlier releases of NT9X13DB are not compatible with NT9X25AA/BA, later releases are. Release numbers are transparent to our documentation and process. Hence, Richardson will be responsible for keeping track of the proper type of NT9X13DB CPs for their offices.

0 Existing Offices With NT9X01BA/JA

0 Product Change Kit (PC Kit) NT9X04AY converts the MS to the minimum level required to interface the ENET. It removes NT9X49CA and makes slot position 32F provisionable. It can be applied to NT9X04AG in order to upgrade the MS to NT9X04AH which is the minimum level required to interface the ENET. Other existing PC Kits can be applied to existing MS Common CP Fills in order to bring them up to the necessary level.

|    | Existing Level | PC Kit Required | New Common CP Level |
|----|----------------|-----------------|---------------------|
| MS | - NT9X04AA     | NT9X04AD        | NT9X04AB            |
| MS | - NT9X04AB     | NT9X04AF        | NT9X04AE            |
| MS | - NT9X04AE     | * NT9X04AZ      | NT9X04AG            |
| MS | - NT9X04AG     | * NT9X04AY      | NT9X04AH            |

0 \* NT9X04AE may be upgraded directly to NT9X04AH by applying NT9X04AY if the external clock interface is not required.

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 MS Port Group (Chain)

0 A MS Port Group is a set of one (1) or more adjacent MS Port  
0 cards, DS-512 Interface Paddleboards, and MS Port  
0 Expander/Terminator Paddleboards that are required to support the  
0 DS-512 link to an ENET shelf.

0 One MS Port Group is required per MS for each ENET shelf (per  
0 plane). Because there are two (2) ENET planes, therefore two port  
0 groups are associated with each ENET shelf. Both port groups are  
0 located on MS 0 and, on MS 1.

0 Each MS port group is provisioned as a sum of the following:

0 - 1 port for the ENET Shelf Processor

0 - 1 port for each active message channel Processor associated  
0 with a speech link that terminates on the shelf (i.e. each Series  
0 I peripheral has one (1) Message Channel Processor, Each Series  
0 II peripheral has two (2) Message Channel Processors).

0 Each port group must be assigned a contiguous group of CP slots  
0 on the MS shelf. In order to size the MS Port Group, the distrib-  
0 ution of peripheral types (i.e. Series I \* II) over the ENET  
0 shelf pairs must be known.

0 NOTE: If the DMS office will require more than one (1) equipped  
0 ENET shelf (per plane), the assignment of the NT9X40BA, NT9X41BA,  
0 and the NT9X45BA Paddleboards (PBs) on the ENET shelves will di-  
0 rectly affect the size of each MS Port Group. Hence, to optimize  
0 the size of the MS Port Group, it may be necessary to reassign  
0 the quantity of NT9X40BA, NT9X41BA and the NT9X45BA PBs from one  
0 ENET shelf to another in order to avoid crossing the boundary of  
0 message ports which would necessitate the addition of an MS 64  
0 Port Card NT9X17DA and the associated paddleboards. (This card  
0 and the associated paddleboards are explained later in this sec-  
0 tion.) Note that any reassignments would only pertain to new  
0 equipment (i.e. initial offices or new equipment being added into  
0 an existing office). Existing paddleboards on an ENET shelf must  
0 not be reassigned during an extension.

0 For reasons previously discussed consideration should be given to  
0 making allowances for the future growth requirements of the last  
0 incomplete network shelf. Reserve slots on the MS for the  
0 projected future requirements of partially equipped ENET shelves.

0  
0 RELEASE 28.01  
0 93 12 03

0 An MS Port Group will consist of the following types of hardware:

- 0 - NT9X17DA MS 64 Port CP or NT9X17CA MS 128 Port CP
- 0 - NT9X20BB ENET/MS Fiber Interface PB
- 0 - NT9X25AA MS Port Expander PB
- 0 - NT9X25BA MS Port Expander/Terminator PB

0 ENET will utilize MS 64 Port CP or MS 128 Port CP for network and  
0 peripheral message port assignments.

0 NT9X17DA, MS 64 PORT CP

- 0 - One can connect up to 64 message ports.

0 NT9X17CA, MS 128 PORT CP

- 0 - One can connect up to 128 message ports.

0 RELEASE 28.01  
0 93 12 03

0 The following PBs are required to complete each port group.

0 NT9X20BB, ENET/MS Fiber Interface PB

- 0 - One required per plane behind the first NT9X17DA CP or NT9X17CA
- 0 CP of each port group.
- 0 - Interfaces the message link from the Enhanced Network Shelf.

0 NT9X25AA, MS PORT EXPANDER PB

- 0 - One required per plane behind the middle NT9X17DA CP of each
- 0 port group if equipped.
- 0 - Expands the bus to accommodate a larger port group beyond
- 0 64 channels.

0 NT9X25BA, MS PORT EXPANDER/TERMINATOR PB

- 0 - One required per plane behind the last NT9X17DA CP or NT9X17CA
- 0 of each port group if equipped.
- 0 - Terminates the bus.

0 Cable Length from MS Shelf to ENET Shelf

0 All fibre optic cables from both MS Shelves (i.e. plane 0 & 1 to  
0 any ENET shelf (on either plane) must not deviate in length from  
0 each other by more than 25 feet.

0 The front card of each MS Port Group is always an NT9X17DA or  
0 NT9X17CA CP. Behind the MS 64 or MS 128 Port CP in each group,  
0 an NT9X20BB PB is provisioned to allow the physical connection of  
0 the fiber link from the MS Shelf to the ENET. For multiple card  
0 groups, an NT9X25BA PB (to terminate the port group) is located  
0 behind the last card, and an NT9X25AA PB (to extend the port  
0 group) behind any intervening MS 64 or MS 128 Port CPs in the  
0 group.

0 Note that a duplicate port group is provisioned for the other  
0 ENET plane.

0 RELEASE 28.01  
0 93 12 03

0 Provisioning of MS Shelf (DMS-BUS) Slots

0 When provisioning MS shelf slots, refer to the appropriate  
0 scenario:

0 1. ENET Initial:

0 Use rules A and C below.

0 2. ENET Extension:

0 Use rule C below.

0 3. ENET Retrofit (Upgrade) Without MS Port Concentration:

0 Use rule C below.

0 4. ENET Retrofit (Upgrade) With MS Port Concentration:

0 Use rules A, B and C below.

0 Rule A: Assign IOCs, EIOCs and LPPs to the highest numbered MS  
0 slots in descending order starting from slot 29 (i.e. slots 29,  
0 28, etc.). These slots will contain 4-port cards (NT9X17AA/AD)  
0 in the front and 4-port DS-30 interface paddleboards (NT9X23AA  
0 for IOCs and EIOCs; NT9X23BA for LPPs) in the rear.

0 Rule B: Assign the existing network ports to the next highest  
0 available MS slots in descending order. These slots will contain  
0 64-port cards (NT9X17DA) in the front and 16-port DS-30 interface  
0 paddleboards (NT9X69AA) in the rear.

0 Rule C: Assign the ENET ports to the lowest numbered MS slots in  
0 ascending order starting from slot 12 (i.e. slots 12, 13, etc.).  
0 These slots will contain 64-port cards (NT9X17DA) in the front  
0 and fibre interface or port expander or port terminator  
0 paddleboards (NT9X20BB or NT9X25AA or NT9X25BA) in the rear.

## 0 ENET Retrofit (Upgrade)

0 An ENET retrofit (upgrade) occurs when the switching network of  
0 an existing inservice DMS-SuperNode office changes from a Network  
0 Module (NM) implementation to an Enhanced Network(ENET) implemen-  
0 tation. During the upgrade, the Network slots must be shared be-  
0 tween the existing NMs and the new ENET.

0 In network upgrade situations, the existing MS 4 Port CPs  
0 (NT9X17AA/AD) will be used to connect to existing IOC/EIOCs, NMs,  
0 and LIMs. The MS 64 Port CPs (NT9X17DA) will be required to be  
0 provisioned for connection to ENET.

0 It is important to note that for a time during the retrofit, the  
0 MS must interface all IOC/EIOCs, all NM, all LIMs, plus both  
0 planes of the ENET.

### 0 MS Port Concentration

0 Each MS shelf (or DMS-Bus) must have a sufficient number of va-  
0 cant slots to allow the addition of enough 64 port cards to sup-  
0 port both planes of the ENET. If this is not the case, the  
0 existing NM ports must be "concentrated" onto higher density port  
0 cards. This process may involve the relocation of NM, IOC/EIOC,  
0 and LIM ports.

### 0 Addition of Sixteen Port Cards to the MS

0 This procedure replaces some of the MS 4 Port cards and the DS-30  
0 Interface Paddleboards with MS 64 Port cards and 16 DS-30 Port  
0 Interface Paddleboards.

0 Specifically, two or four NT9X17AA/ADs (MS 4 Port CP) and two or  
0 four NT9X23AAs (Four DS-30 Port Interface Paddleboards) are re-  
0 placed with an equivalent number of NT9X17DAs (MS 64 Port CP) and  
0 NT9X69AAs (Sixteen DS-30 Port Interface Paddleboards). Four  
0 sixteen-port slots are sufficient to support both planes of 32  
0 NMs.

0 These sixteen-port packs are considered retrofit packs, and are  
0 removed during the Post-Cutover phase.

0 For Canadian Offices:

0 The SAE/EAE will determine if an MS Port Concentration is re-  
0 quired and the quantity of NT9X17DAs and NT9X69AAs required (but

0  
0 RELEASE 28.01  
0 93 12 03

0 will not order this hardware). He will inform the Job Supervisor  
0 accordingly. The Job Supervisor will obtain this hardware from  
0 the Installation Tool Room as required.

0 For U.S. Offices:

0 The requirement for an MS port concentration will be reported to  
0 installation via the order capture process. Installation will  
0 provide the required NT9X17DA and NT9X69AA.

0 The following contains information on provisioning the MS Shelf  
0 slots, and provides the necessary formula to determine whether  
0 enough vacant slots exist to support an ENET. The number of MS  
0 ports in each of the MS Port Groups is determined as follows:

0 \* one (1) port for the ENET shelf

0 \* one (1) port for each Series I peripheral connected to  
0 that ENET shelf

0 \* two (2) ports for each Series II peripheral connected to  
0 that ENET shelf

0 \* extra ports must also be allocated for any anticipated  
0 future growth.

0 One (1) MS shelf card slot is required for every 64 ports in a  
0 group. One MS 64 Port CP (NT9X17DA) can connect up to 64 message  
0 ports. For an ENET shelf, the longest group required is four (4)  
0 MS 64 Port cards long as shown in previous section.

0

0

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 MS Shelf Slot Requirement Calculation

0 \* Total the number of slots required by each MS Port Group.

0 \* Total the number of slots required to support the exist-  
0 ing NMs, IOC/EIOCs, and LPPs (assuming only MS 4 Port cards).

0 \* If the sum of these two (2) numbers is greater than 18,  
0 then an MS Port Concentration must be performed.

0 Example 1: A Small Office

0 Note that the calculations are done based on one (MS shelf) plane  
0 only.

0 An office contains the following equipment:

0 NM: 12  
0 IOC: 2  
0 EIOC: 1  
0 LPP: 1  
0 FXPM: 40 (Fiberized Series II Peripherals)  
0 PM: 40

0 Assume that ENET shelf 0 supports the 40 FXPMs, and ENET shelf 1  
0 supports the 40 PMs. The number of MS Shelf slots required to  
0 support this equipment using both NMs and ENET is as follows:

0 NM:{12 X 1/4} rounding up to the next integer X 2 slots  
0 = 6 Slots

0 Each NM requires total of two ports. Each port must be on an ad-  
0 jacent slot.(one port out of 4 ports from each slot)

0 IOC:2 port out of 4 ports X 1 slot  
0 = 1/2 Slot

0 Each IOC requires one port out of four ports.

0 EIOC:{1 X 1/4} rounding up to the next integer X 2 slots  
0 = 2 Slots

0 Each EIOC requires total of two ports. Each port must be on an  
0 adjacent slot.(one port out of 4 ports from each slot)

0 LPP:{1 X 2/4} rounding up to the next integer X 2 slots  
0 = 2 Slots

0 Each LPP requires total of four ports. Two ports out of 4 ports  
0 must be on each slot.

0  
0 RELEASE 28.01  
0 93 12 03

0 ENET MS Port Group 0 Pl 0, Sh 0: 2 {ports = 1 + (2 X 40) = 81}  
0 ENET MS Port Group 1 Pl 0, Sh 1: 1 {ports = 1 + (1 X 40) = 41}

0 Two (2) slots can support both IOCs, the EIOC, and the LPP. The  
0 total number of slots required in each MS Shelf to support NM,  
0 IOC, EIOC, LPP and ENET is:  
0 = (existing) + (ENET)  
0 = (6 + 2) + (2 X (2 + 1))  
0 = (8) + (6)  
0 = 14

0 This number is less than 18, so an MS Port Concentration is NOT  
0 required.

0

0 RELEASE 28.01  
0 93 12 03

0 Example 2: A Large Office

0 An office contains the following equipment:

0 NM: 28  
0 IOC: 4  
0 EIOC: 1  
0 LPP: 1  
0 FXPM: 100 (Fiberized Series II Peripherals)  
0 PM: 80

0 Assume that ENET shelf 0 supports 60 FXPMs, and ENET shelf 1 supports 40 FXPMs and 80 PMs. The number of MS Shelf slots required to support this equipment using both NMs and ENET is as follows:

0 NM:{28 X 1/4} rounding up to the next integer X 2 slots  
0 = 14 Slots

0 Each NM requires total of two ports. Each port must be on an adjacent slot.(one port out of 4 ports from each slot)

0 IOC:4 port out of 4 ports X 1 slot  
0 = 1 Slot

0 Each IOC requires one port out of four ports.

0 EIOC:{1 X 1/4} rounding up to the next integer X 2 slots  
0 = 2 Slots

0 Each EIOC requires total of two ports. Each port must be on an adjacent slot.(one port out of 4 ports from each slot)

0 LPP:{1 X 2/4} rounding up to the next integer X 2 slots  
0 = 2 Slots

0 Each LPP requires total of four ports. Two ports out of 4 ports must be on each slot.

0 ENET MS Port Group 0 plane 0, Shelf 0: 2  
0 {ports = 1 + (2 X 60) = 121}

0 ENET MS Port Group 1 plane 0, Shelf 1: 3  
0 {ports = 1 + (2 X 40 + 1 X 80) = 161}

0 Two (2) slots can support the EIOC, the LPP, and up to two (2) IOCs. A third card must be provisioned to support the other two (2) IOCs. The total number of slots required in each MS Shelf to support NM, IOCs, EIOC, LPP and ENET is:

0 = (existing) + (ENET)  
0 = (14 + 2 + 1) + (2 X (2 + 3))  
0 = (17) + (10)

0  
0 RELEASE 28.01  
0 93 12 03

0 = 27

0 This number is greater than 18, so an MS Port Concentration IS  
0 required.

0 Job Drawings

0 For Canadian Offices:

0 If an MS Port Concentration is required, the SAE/EAE shall pre-  
0 pare D610 job drawings such that one will show the interim MS  
0 Port configuration and another drawing will show the final MS  
0 Port configuration for the DMS office. Notes should be added to  
0 the drawings distinguishing the interim and final configurations.

0 For U.S. Offices:

0 If an MS Port Concentration is required, the EAE shall add a note  
0 to the 1001 Specification that will show the slot and port as-  
0 signments of the NT9X17DA and NT9X69AA required for MS port con-  
0 centration.

## 0 CM Provisioning

0  
0 A CM consists of a NT9X0605 Computing Module Shelf Assembly,  
0 NT9X06AF CM Processor Shelf Circuit Packfill, memory circuit  
0 packs, and message links to the MS.

0 Memory provisioning is carried out in a similar fashion for CCC  
0 and DMS-Core. However separate memory is not defined for Program  
0 Store and Data Store. A single memory store expressed in Mega-  
0 bytes (M-bytes) is defined for the CM.

0 The MEMCALC memory sizing tool is available for evaluating CM  
0 memory requirements.

0 In addition to the operational memory provisioned, one extra mem-  
0 ory CP per circuit pack type (i.e. a spare 6 and a 24 Mbyte CP  
0 for mixed memory applications) must be provided per plane to be  
0 assigned as a reliability spare.

0 For retrofits and upgrades, refer to Change Application Procedure  
0 (CAP) 1351.

0 Bulkheads for CM

0 For all applications, provision one (1) NT9X6539 CM Bulkhead  
0 (Right) and one (1) NT9X6540 CM Bulkhead (Left).

0 BRISC

0 The NT9X10AA BRISC CPU will provide a real-time performance gain  
0 of 2.5 times over the NT9X13BC CPU. The NT9X10AA may replace ex-  
0 isting 68020 and 68030 processor cards, provided the correspond-  
0 ing paddleboard is also replaced and a BRISC software load is  
0 utilized.

0 For BRISC offices, provision two (2) NT9X10AA 33 MHz 88000 BRISC  
0 CPU Circuit Packs per SuperNode Computing Module (CM) in shelf  
0 position 13 in slots 19F and 20F, and provision two (2) NT9X26DA  
0 BRISC RTIF Paddleboards per SuperNode Computing Module (CM) in  
0 shelf position 13 in slots 19R and 20R.

0  
0 RELEASE 28.01  
0 93 12 03

## 0 SLM Provisioning

0  
0 SLM II units are a requirement of all offices whose image is ex-  
0 pected to exceed 30 M-bytes during the engineered interval. Since  
0 provisioning SLM II units in an office would impact its IOC based  
0 mass storage needs, it is recommended that for new offices, the  
0 need for SLM II units be established based on image requirements  
0 forecasted out 5 years where possible. In smaller offices SLMs  
0 are considered to be a customer requested option.

0 For U.S. applications, SEB 88-01-002 may be referenced. It con-  
0 tains a detailed formula for calculation of Supernode image size.  
0 The MEMCALC tool also will calculate office image requirements.

0 When the SLM is required, provide two (2) NT9X44AB System Load  
0 Module II per NT9X01JA/JB Dual Plane Combined Core Cabinet  
0 (DPCC). Also provision the associated NT9X07AC SLM Common CP and  
0 NT9X12AB/AC CPU Port CP. SLM II units are provisioned on a SLM  
0 shelf and interfaced to the CM via orderable CM bus extender pad-  
0 dle boards.

0 When SLM is not required, provide one (1) NT9X01FB Filler  
0 Packfill to satisfy cabinet cooling airflow requirements.

0 Device Independent Recording Package(DIRP) is a supported func-  
0 tion on SLM II. The following are the known application using  
0 DIRP and should be supported by SLM II:

0 AMA, CDR, SMDR, OM, JF, KT, TTRF

0 METBCKP, OOS, MS7, DLOG, CRS

0 For the disk storage provisioning for DMS-STP in support of data  
0 access by Signalling Engineering and Administration System(SEAS)  
0 IOC DDUs must be provisioned.

0 The engineering of data storage requirement for SLM II should in-  
0 clude the storage requirement for all office operation, adminis-  
0 tration and maintenance data. In particular, the provisioning of  
0 storage capacity for AMA/CDR data should take into the consider-  
0 ation of busy hour traffic rate, data polling or transfer rate if  
0 applicable, as well as data retention requirement.

0 RELEASE 28.01  
0 93 12 03  
0

0 If additional DDU(s) is required, either SLM or DDU but not both  
0 may be used for recording the same DIRP subsystem data (such as  
0 AMA/CDR). This is to avoid performance fluctuation.

0 In the case of parallel recording, the use of IOC DDUs are recom-  
0 mended over tape drives. This is for better performance in terms  
0 of through-put and storage capacity. Note that the overall  
0 through-put performance using concurrent parallel recording will  
0 be limited to the IOC DDU through-put performance, even though the  
0 SLM II performance is superior.

0 SLM HANDLING CONSIDERATIONS

0 When SLM I is equipped in an office, the combined CM and MS soft-  
0 ware load (image) must be delivered to site in DC 600A compatible  
0 tape cartridges. This would also apply to any commissioning  
0 loads that are supplied.

0 When SLM II is equipped in an office, the combined CM and MS  
0 software load (image) must be delivered to site in DC 600XTD com-  
0 patible tape cartridges. This would also apply to any commis-  
0 sioning loads that are supplied.

0 Blank cartridges must also be provided for scratch purposes. The  
0 different CPC number, Manufacturing part number and the sizes are  
0 given below:

0 CPC A0314597; Manufacturing Part # DC600A; 60MB  
0 CPC A0369779; Manufacturing Part # DC6150; 150MB  
0 CPC A0368760; Manufacturing Part # DC6250; 250MB

0 However Field Commissioning Tapes, Non-Resident Software Tapes  
0 and Peripheral Processor Software tapes must be delivered on the  
0 usual 9 track magnetic tapes. The specification process will au-  
0 tomatically call up the appropriate tape medium when the SLM  
0 software feature package is specified.

0 For Universal Software Load the SLM II is a must for offices run-  
0 ning with BCS33 and later.

0 For non-Universal Software Load the SLM II is required for,

- 0 -- offices running with BRISC Processor.
- 0 -- offices exceeds the SLM I tape capacity of 62Mb.
- 0 -- offices with planned capacity upgrdae.

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 -- etc..

0 Since SLM I is MD'd, new offices will receive SLM II even if they  
0 do not have Universal Software Load.

## 0 Reset Terminal Provisioning

0  
0 Two (2) compatible terminals must be provided in the maintenance  
0 area to serve as local reset terminals. These could be located  
0 close to MAP:00. Suitable furniture must be provided to accommo-  
0 date these terminals. Terminals are powered from inverters which  
0 may be located on the MIS frame.

0 The Reset Terminal Interface (RTIF) (NT9X26AA) of the CM provides  
0 two terminal interfaces. One is a RS-232C and is intended for  
0 local applications while the other supports either RS-232C or  
0 RS-422 and is intended for interfacing to remotely located termi-  
0 nals. Local RTIF terminals connected to an initial DMS-Core must  
0 be connected through back-to-back modems (9600 Baud asynchronous  
0 modem), or approved Current Loop converters. These isolation  
0 methods are required to satisfy ISG requirements, provide power  
0 fault isolation and and prevent cross-linking of terminal grounds  
0 with DMS equipment grounds.

0 The Enhanced Remote Terminal Interface (RTIF) CP (NT9X26AB), of-  
0 fers all the features of the existing NT9X26AA (ie. One RS-232C  
0 terminal interface port and one RS-232C / RS-422 interface port),  
0 plus:

- 0 - 20mA current loop terminal interface port
- 0 - Status lamps indicating processor inactivity and sync

0 Approved VDU terminals, operating in current loop mode, can be  
0 connected directly to the NT9X26AB Enhanced RTIF CP at the cabi-  
0 net bulkhead. In this mode, the back-to-back data units, modems  
0 or Rad current loop converters, which were needed for Isolated  
0 System Ground (ISG) compliance, power fault isolation and pre-  
0 ventation of cross-linking of terminal grounds with DMS equipment  
0 are no longer required.

0 The NT9X26DA RTIF Paddleboard is required for BRISC.

0 An ISG compliant office may be using back to back modems con-  
0 nected to the RS232 connector on a NT9X26AA RTIF paddleboard. If  
0 the NT9X26AA is being changed to a NT9X26AB (or '26DA), it is re-  
0 commended to get rid of the back to back modems and provide a  
0 current loop cable for the RTIF Terminal being used in the of-  
0 fice.

The Low Speed Data Unit with Elastomer Keypad (NT4X25AF) may be used in a non switched arrangement (back-to-back) with the RTIF. Refer to ECM 346 for provisioning details. Since the data unit connects directly to the RTIF in the CM, type D line cards are NOT required for this application. The following figure depicts this arrangement:

## Data Unit

|                 |              |                    |
|-----------------|--------------|--------------------|
| <b>Settings</b> | <b>Baud</b>  | <b>9600</b>        |
|                 | <b>Mode</b>  | <b>Async</b>       |
|                 | <b>SW1</b>   | <b>Slave</b>       |
|                 | <b>SW2-1</b> | <b>Off</b>         |
|                 | <b>SW2-2</b> | <b>Off (slave)</b> |
|                 | <b>SW2-3</b> | <b>Off</b>         |
|                 | <b>SW2-4</b> | <b>Off</b>         |

## Data Unit

```

Off
```

0 Option 2 (U.S. Applications Only)

0 Current Loop converters from Rad Data Communication have been ap-  
0 proved for compliancy with ISG to interface from the SuperNode  
0 with the RTIF.

0 Note - A spare set of converters and power converters must be  
0 provisioned for each site.

0 A Passive RS-232 to Current Loop converter is plugged directly  
0 into the SuperNode bulkhead. This device is connected to an Ac-  
0 tive RS-232 to Current Loop converter by a two (2) pair 20 ma  
0 loop cable. The Active unit (located near the RTIF) is connected  
0 to the RTIF by a short connectorized (female on RAD end, female  
0 on RTIF end) RS-232 cable.

0 The Active unit is powered by a plug in Power Converter which  
0 converts 120V AC to 12V DC.

0 The following figure depicts this arrangement:

|   |              |          |                |
|---|--------------|----------|----------------|
| 0 | Description  | NT CPC   | RAD Part No.   |
| 0 | Active Unit  | A0354166 | MIC-24/CL/A-NF |
| 0 | Passive Unit | A0354167 | MIC-24/CL/P-NF |
| 0 | Power Convtr | A0354168 | MIC-P          |

0  
0 RELEASE 28.01  
0 93 12 03

0

0 See ECM-289 for Isolated System Grounding (ISG) provisioning  
0 guidelines.

0 When required, two additional reset terminals can be equipped at  
0 a remote location and interface to the RTIF via modems and secure  
0 dedicated lines. This equipment must be RS-232C compatible.

0 When required, the RTIF can interface to AT&T E2A equipment asso-  
0 ciated with a Switching Control Centre System (SSC) (US applica-  
0 tions only).

0 The Remote RTIF will be configured as 1200 baud RS232 to a modem  
0 or as 2400 baud RS422 connection to a Data Auxillary Shelf (DAS)  
0 for E2A. The Baud rate is set at initial power up via in-  
0 structions received from the NT9X26-- firmware to either 1200  
0 baud if the E2A Software is not present or 2400 baud if the E2A  
0 Software is present. The Remote RTIF CANNOT be used for BOTH a  
0 remote modem connection, and a DAS connection.

0 Refer to the appropriate VDU ECM for approved RTIF terminals.

## 0 Inter-MS Link Provisioning

0  
0 The two inter-MS links (IMLs) are provisioned if required to connect MS plane 0 to MS plane 1 and provide a path for messages in event of a failure. These links utilize DS-30 links and should be provisioned as follows:

0 For applications NOT using Cabinetized DMS cabinets, and where DS-30 inter-MS links are required, provision two (2) NTEX5022 Inter-MS DS-30 Cable Assemblies. (one NTEX5022 cable per IML)

0 For Cabinetized DMS cabinet applications where DS-30 inter-MS links are required, provision two (2) NTEX5023 Inter-MS DS-30 Cable Assemblies. (one NTEX5023 cable per IML)

0 For applications requiring Inter-MS links, each DS-30 IML can be provisioned on any un-used DS-30 port on either an NT9X23AA or an NT9X23BA or an NT9X69BA paddleboard subject to the following restrictions:

0 The DS-30 ports selected for the two links must be on different paddleboards. That is, if the only free DS-30 ports are on the same paddleboard they cannot both be used for the IMLs; another port must be freed up on another paddleboard in order to equip the second link.

0 The paddleboards and ports selected must be the same on each MS. For example, if port 3 on paddleboards in slots 16 and 17 are selected in MS 0, then port 3 on paddleboards in slots 16 and 17 in MS 1 must be used. The paddleboards and ports selected can be in any slot or port in which DS-30 paddleboards are allowed except port 0 on paddleboards in slots 28 and 29.

0 Provisioning of DS-30 IMLs is currently limited to the SuperNode in non-Cabinetized or Cabinetized DMS cabinets. No requirements have been identified for the support of IMLs on the SL100 products. Hence, this is not currently supported.

0 For Meridian Cabinet applications the IML requirements can be met with a NTNX36AR cable to connector "A" and another to "B" on the NT9X6558 bulkhead if THOSE CONNECTORS ARE NOT BEING UTILIZED. If these connectors are in use, then use the first available "four port" connector on either the left or right bulkhead AND PROVIDE DS30 PADDLE BOARDS, PORT CARDS, AND CABLES AS REQUIRED. The other

0  
0 RELEASE 28.01  
0 93 12 03

0 end of this cable is connected to the same connector designation  
0 on the other plane of the message switch. When using a four port  
0 bulkhead connector, only one NTN36AR cable is needed.

0 Note that, IMLs must be used when NIUs are provisioned on an LPP.

## 0 C42(S/DMS) Cabinet Provisioning

0  
0 The DMS-SuperNode in C42(S/DMS) cabinet is a cost and func-  
0 tionally enhanced version of the existing SuperNode type cabinet.  
0 The S/DMS cabinet is very similar to the existing cabinet, items  
0 such as packs, shelf assemblies, interconnect cables, and  
0 bulkhead packs do not change. The differences from the existing  
0 Supernode cabinet are listed below.

0 1) The Cabinet changes from NT9X0113 to NT9X95AA

0 2) The Kick plate is not required with the S/DMS cabinet.

0 3) Power wiring is optional. If the cabinet is in a Stream-  
0 line lineup, the cables will be equipped to take advantage  
0 of "horizontal" cabling. If the cabinet is in a  
0 non-Cabinetized lineup, power cables will be similar to  
0 existing power cables, so filters will have to be  
0 provisioned.

0 The NT9X01JB has been approved for all applications. All new ini-  
0 tial SuperNode offices will specify the NT9X01JB Cabinet. The  
0 NT9X01JA PEC will be A&M and will remain for all existing of-  
0 fices.

## 0 SuperNode Building Block Definition

0  
0 The SuperNode building block concept deals with a higher level of  
0 Product Engineering Code (PEC) ordering. The memory quantities,  
0 processor series and Network Interface can be selected depending  
0 on the telco desired specifications.

### 0 NTZZ01RA (SuperNode in S/DMS Cabinet)

0 NTZZ01RA contains the SuperNode cabinet NT9X01JB, Frame  
0 Supervisory panel, Cooling Unit, Common Circuit Packfills,  
0 bulkheads, and miscellaneous items that are always provided for a  
0 SuperNode. The existing NTZZ01AA, NTZZ97BA, NTZZ01TA, NTZZ97CA,  
0 NTZZ01AM, and NTZZ97BH will be A&M (Additions and Maintenance)  
0 and are replaced by NTZZ01RA. This NTZZ01RA BB pec is ONLY APPLI-  
0 CABLE to -48V powered installations. CHECK AVAILABILITY PRIOR TO  
0 ORDERING.

### 0 NTZZ01BA (System Load Module (SLM) common CP)

0 The NTZZ01BA contains all the circuit packs and miscellaneous  
0 items that are always provided to the SLM. The SLM II is required  
0 for offices where the office image is greater than 75 MB.  
0 NTZZ97BG will be A&M (Additions and Maintenance) and replaced by  
0 NTZZ01BA. This NTZZ01BA BB is ONLY APPLICABLE to -48V powered in-  
0 stallations.

### 0 NTZZ01CA (4 Port Network and IOC interface)

0 The NTZZ01CA contains the circuit packs for the SuperNode inter-  
0 face to the network modules and the Input/Output Controller mod-  
0 ules (IOC). These circuits will be used for DMS-100F  
0 applications. The NTZZ01CA contains 4 interface circuit  
0 packs.(i.e. 2 for each Message Switch). The NTZZ01CA is used in  
0 Supernode for non-Cabinetized application.

### 0 NTZZ01CB (4 Port Network and IOC interface)

0 The NTZZ01CB is similar to the ZZ01CA, except it has the new  
0 9X17AD 4-Port CP and it must be provisioned on all initial jobs  
0 for BCS34 and above.

### 0 NTZZ01DA (STP Interface)

0 RELEASE 28.01  
0 93 12 03  
0

0 The NTZZ01DA contains the circuit packs for the SuperNode inter-  
0 face to the Link Interface Units (LIU). These circuits will be  
0 used for STP applications. The NTZZ01DA contains 4 interface  
0 circuit packs. (i.e. 2 for each Message Switch). The NTZZ01DA is  
0 used in Supernode for non-Cabinetized application.

0 NTZZ01DB (STP Interface)

0 The NTZZ01DB is similar to the ZZ01DA, except it has the new  
0 9X17AD 4-Port CP and it must be provisioned on all initial jobs  
0 for BCS34 and above.

0 NTZZ01UA (Cabinetized DMS 4 Port & IOC Interface)

0 The NTZZ01UA contains the circuit packs for the SuperNode inter-  
0 face to the network modules and the Input/Output Controller mod-  
0 ules (IOC). These circuits will be used for DMS-100F  
0 applications. The NTZZ01UA contains 4 interface circuit  
0 packs. (i.e. 2 for each Message Switch). The NTZZ01UA is used in  
0 SuperNode for Cabinetized DMS application.

0 NTZZ01UB (Cabinetized DMS 4 Port & IOC Interface)

0 The NTZZ01UB is similar to the ZZ01UA, except it has the new  
0 9X17AD 4-Port CP and it must be provisioned on all initial jobs  
0 for BCS34 and above.

0 NTZZ01VA (Cabinetized 4 Port LIM/LPP Interface)

0 The NTZZ01VA contains the circuit packs for the SuperNode inter-  
0 face to the Link Interface Units (LIU). These circuits will be  
0 used for STP applications. The NTZZ01VA contains 4 interface  
0 circuit packs. (i.e. 2 for each Message Switch). The NTZZ01UA is  
0 used in SuperNode for Cabinetized DMS application.

0 NTZZ01VB (Cabinetized 4 Port LIM/LPP Interface)

0 The NTZZ01VB is similar to the ZZ01VA, except it has the new  
0 9X17AD 4-Port CP and it must be provisioned on all initial jobs  
0 for BCS34 and above.

0 NTZZ01EA (Filler Face Plate)

0 The NTZZ01EA contains the filler face plates required for forced  
0 air cooling when the message port circuit packs are not required.  
0 Each NTZZ01EA contains two (2) filler face plates and two (2) MS  
0 Bus Loader PBs.

0 RELEASE 28.01  
0 93 12 03  
0

0

0 NTZZ01FA (Supernode Series 10 CPU)

0 The NTZZ01FA contains the SuperNode series 10 processor CP. The  
0 SN10 provides approximately 1.4 capacity gain over the NT40. Se-  
0 lection of SuperNode processor is determined by the use of  
0 QUICKCALC or RTCALC programs. New offices should not be engi-  
0 neered using this PEC. If an existing site is configured with a  
0 Series 10 processor, the customer is requested to contact the re-  
0 gional sales representative for details on how to upgrade to a  
0 Series 20 processor or higher for BCS-35 and above loads. See  
0 Section 4.1.2 ECM body for software packaging.

0 NTZZ01GA (Supernode Series 20 CPU)

0 The NTZZ01GA contains the Supernode series 20 processor CP. the  
0 SN20 provides 2.0 to 2.2 capacity gain over the NT40. Selection  
0 of SuperNode processor is determined by the use of QUICKCALC or  
0 RTCALC programs.

0 NTZZ01HA (Supernode Series 30 CPU)

0 The NTZZ01HA contains the SuperNode series 30 processor CP. The  
0 SN30 provides a 1.4 to 1.5 capacity gain over the SN20. Selection  
0 of SuperNode processor is determined by the use of QUICKCALC or  
0 RTCALC programs.

0 NTZZ01JA (Supernode Series 40 CPU)

0 The NTZZ01JA contains the SuperNode series 40 processor CP. The  
0 SN40 provides a 1.7 to 1.8 capacity gain over the SN20. Selection  
0 of SuperNode processor is determined by the use of QUICKCALC or  
0 RTCALC programs.

0

0

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 NTZZ01SA (Supernode BRISC CPU)

0 The NTZZ01SA provides a real time performance gain of 2.5 times  
0 over the SN20. Selection of SuperNode processor is determined by  
0 the use of QUICKCALC or RTCALC programs.

0 NTZZ01KA (Six (6) MByte Memory)

0 The NTZZ01KA contains two (2) Six (6) MByte memory circuit packs  
0 and designation labels for the STP application. Memory require-  
0 ments are determined by use of Memquick or Memcalc programs.

0 NTZZ01LA (24 MByte Memory)

0 The NTZZ01LA contains two (2) 24 MB memory circuit pack and des-  
0 ignation labels for the DMS-100F application. Memory requirements  
0 are determined by use of Memquick or Memcalc programs.

0 NTZZ01MA (Filler Face Plate)

0 The NTZZ01MA contains two (2) Filler Face Plates and designation  
0 labels for the SuperNode Computing Module.

0 NTZZ01NA (Initial Enhanced Network Interface)

0 The NTZZ01NA contains the circuit packs for the initial interface  
0 of SuperNode to the Enhanced Network. Provide one (1) NTZZ01NA  
0 for each ENET shelf (i.e. port group) provisioned. The NTZZ01NA  
0 contains two (2) interface circuit packs.(i.e. 1 for each Message  
0 Switch).

0 NTZZ01PA (Intermediate Enhanced Network Interface)

0 The NTZZ01PA contains the circuit packs for the intermediate  
0 interface of SuperNode to the Enhanced Network. Provision  
0 NTZZ01PA per the worksheets provided in the ENET Building Block  
0 documents. The NTZZ01PA contains two (2) each interface circuit  
0 packs. (i.e. 1 for each Message Switch).

0 NTZZ01QA (Final Enhanced Network Interface)

0 The NTZZ01QA contains the circuit packs for the final interface  
0 of SuperNode to the Enhanced Network. Provide one (1) NTZZ01QA  
0 for each ENET shelf (i.e. port group) provisioned. The NTZZ01QA

0 NTZZ01ZA (Link Interface for FLIS)

0 The NTZZ01ZA contains the circuit packs for the Supernode Cabinet  
0 that is used to Interface Message Switch (0 and 1) to the Single  
0 Shelf LPP(Fiberized LIS(FLIS)).

0 SuperNode Building Block Provisioning

0 NTZZ01CA/UA/CB/UB - 4 Port Network & IOC Interface

0 If NTZZ01CA/UA/CB/UB is required, then provide as follows,

0  $\#NTZZ01CA/UA/CB/UB = \{(\#NM/4) + (\#IOC/8)\}$   
0 to be rounded up to the next integer.  
0 Each NM requires total of two ports. Each port must  
0 be on an adjacent slot.(one port out of 4 ports from each slot)

0 Each IOC requires one port out of four ports.

0 NTZZ01DA/VA/DB/VB - 4 Port LIM/LPP Interface

0 If NTZZ01DA/VA/DB/VB is required, then provide as follows,

0  $\# NTZZ01DA/VA/DB/VB = \{\# \text{ Link Interface Module Cabinets } / 2 \}$   
0 to be rounded up to the next integer.

0 NTZZ01EA - Interface Filler Face Plate

0 Provide NTZZ01EA as follows,

0  $\# NTZZ01EA = 9 - (NTZZ01CA + NTZZ01DA)$

0 NTZZ01ZA Link Interface for FLIS

0 If Single Shelf LPP(Fiberized LIS(FLIS) is provisioned, then  
0 provide (1) one NTZZ01ZA. Also Provision the cables for  
0 Inter\_MS links.

0 93 12 03

0 11.1.4 OFFICE LAYOUT INFORMATION

0  
0 The S/DMS cabinet will be shipped with the doors, shelves, circuit  
0 packs, FSP, and cooling unit installed. The bus bar will be in-  
0 stalled and appropriate connections will be made at the factory.  
0 The bulkheads form part of the Electromagnetic Compatibility(EMC)  
0 cage around the equipment and provide a place to mount filter  
0 PCBs and optional power filters. The rear of the cabinet is  
0 equipped with two removeable bulkhead panels near the bottom of  
0 the cabinet. When these panels are removed, the cabinet can be  
0 installed in, or removed from, a lineup equipped with horizontal  
0 cabling. The cabinet may be slid "FORWARD" only.

0 FLOOR LAYOUT

0 Aisle dimensions are derived to meet the requirements of central  
0 office environment for floor loading and heat dissipation.

0 - An installation which requires multiple cabinet line-ups has  
0 six foot maintenance aisles.

0 - Maintenance aisles between a cabinet line-up and a frame  
0 line-up are 4.5 feet wide.

0 Installations requiring a cabinet to be integrated into a frame  
0 line-up:

0 - Can only be applied to the front most or rear most line-up

0 - Cabinets and frames are aligned to be flush at the rear

0 Note that a mixed frame/cabinet configuration is in violation of  
0 NEBS. The Telco should confer with the Building Studies and In-  
0 stallation departments to confirm that the building floor can  
0 sustain the weight differential and to insure there is sufficient  
0 cooling available to cool the DMS office.

0 Refer to ECM600 for office layout restrictions when this cabinet  
0 is applied in a Cabinetized DMS lineup.

0 Note that, Richardson market floor layout may be different.

0 SWITCHBOARD CABLING RESTRICTIONS

0  
0 RELEASE 28.01  
0 93 12 03

0 Cabling restrictions between the Message Switch and the IOC and  
0 Network frames remain unchanged at 200 feet maximum.

0 RELEASE 28.01  
0 93 12 03

0 INITIAL OFFICES

0 Cabinets and frames will not be mixed in the same line-up. The  
0 cabinets will occupy the front line-up. The second line-up will  
0 contain the IOE frames (and others as convenient) and will have  
0 fronts facing the front of the office.

0 Aisle spacing between the first (cabinet) and second (frame)  
0 line-ups is 4.5 feet.

0 The reset terminals will be located in the equipment room to the  
0 front of the office with convenient visual and physical access to  
0 the IOE equipment.

0 SuperNode Retrofit(Upgrade)

0 There are three possible physical installations in decreasing or-  
0 der of convenience:

0 i) If possible, within the guidelines mentioned for initials, a  
0 new front line-up for the cabinet(s) should be started.

0 ii) Alternatively the existing front line-up can be extended  
0 laterally with the cabinet.

0 iii) The cabinet is temporarily located close to the CCC for in-  
0 stallation and commissioning. Following a successful cutover the  
0 cabinet(s) are relocated into the space vacated by the CCC, MEX  
0 frames.

0 For mixed line-ups the cabinet and frames are aligned to be flush  
0 at the back of the front line-up and should utilize a single cab-  
0 inet only (Combined Core Cabinet).

0 For option (iii) care must be taken to ensure that the  
0 retrofitted frames vacate sufficient space for the DMS-Core cabi-  
0 nets. Note that MSS frames should be considered as relocatable  
0 along with the retrofitted CCC and MEX frames.

0 It is recommended that a per site survey of retrofit sites be  
0 carried out jointly by Building Studies and Installation groups  
0 to ensure a feasible configuration is engineered.

0 RELEASE 28.01  
0 93 12 03

0 11.1.5 TRAFFIC TABLES

0  
0 Not applicable.

0 11.2 PRODUCT/SYSTEM SPECIFICATION0 11.2.1 PHYSICAL CHARACTERISTICS

0  
0 The following describes the characteristics of the NT9X01JB  
0 SuperNode S/DMS cabinet:

0 The -60V version of the unit features the same packaging and  
0 performance as the -48V unit. Presently Germany, is the only coun-  
0 try that requires -60V units.

0 Input Voltage.....-48VDC  
0 Power Consumption.....3525 watts (+/- 10%) fully equipped  
0 Current Drain.....73.0Amps

0 The current drain for CM and MS shelves is 20 amps per shelf

0 Each SLM draws 12.9 amps while running, and 18.7 amps during  
0 spin-up to operating speed.

0 POWER/HEAT DISSIPATION

0 The fully loaded cabinet heat dissipation is up to 3500 watts.

0 MECHANICAL DIMENSIONS

0 Height 72in. Width 42in. Depth 28in.

0 RELEASE 28.01  
0 93 12 03

0 Weight 1400lbs. (Full)

0 11.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 End panels are required to complete the EMC enclosure for cabinets located at the end of a lineup. In earthquake installations, the S/DMS cabinet must be bolted to the floor in four(4) places through anchor holes provided in the base of the cabinet. The cooling unit must be removed for access to the bolts. When the cabinet is bolted in place, the optional leveling feet must not be installed. Leveling will be accomplished through the use of non-conductive shims. The bolts must be tightened with a torque wrench to ensure adequate pretension.

0 For raised floor installations, a sub-structure support between the concrete sub-floor and the raised floor will be required. A qualified seismic engineer should be consulted regarding the required additional bracing.

0 11.2.3 SPARING INFORMATION

0  
0 One Spare Storage Cabinet (SSC) NT9X01FA can hold up to four Spares Shelves. The spares cabinet has one (1) always provided Spares Shelf (NT0X25AY); thus three (3) shelves are provisionable. One Spares Shelf (NT0X25AY) can hold 26 CPs and 4 Power Modules, as well as 26 Paddle Boards. Note that NT9X01FA has a rate chane pending. Use NTRX49AA for new offices.

0 For U.S. applications use standard sparing algorithms.

0 For Canadian and other applications the following may be used.

0 a) Version 2, C42 Cooling Unit:  
0 -----

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Blowers 660,000 hrs MTBF in its useful life of 10 years.  
0 MTM cards 4,700,000 hrs MTBF  
0 Relay 100,000,000 hrs MTBF

0 Note that the blower's useful life is about 10 years. Around that  
0 time, failures are to be expected. Good practice might dictate  
0 replacement of operating blowers around that time (analagous to  
0 replacing your car's engine belts before they break).

0 11.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 Each shelf has four (4) power converters, two at either side of  
0 the shelf, mounted from the front.

0 Logic power distribution to the shelf electronics is from each  
0 power module to the corresponding half of the shelf.

0 Fuses are required as follows for NT9X01JB.

0 For powering from a standard 7' PDC

0 -----  
0 8 - 20 Amp fuses (MS,CM and SLM shelves)  
0 2 - 10 Amp fuses (for C42 cooling blowers)  
0 1 - 10 Amp Fuse (Alarm Battery Supply (ABS))

0 For powering from a CPDC

0 -----  
0 8 - 30 Amp fuses (MS,CM and SLM shelves)  
0 2 - 10 Amp fuses (for C42 cooling blowers)  
0 1 - 10 Amp Fuse (Alarm Battery Supply (ABS))

0 Refer to CA0X04 issue 01 20 and later for power cable informa-  
0 tion.

0 PDC feeds are connected to the cabinet via EMI feed through  
0 capacitors at the top of the frame. Cable and Drop Length shall  
0 be job engineered.

0 11.2.5 CURRENT DRAIN INFORMATION

0  
0 See Section, Physical Characteristics.

0 11.3 SOFTWARE PROVISIONING

0 The existing DMS-100 software is being 'ported' to run on the  
0 DMS-Core. The availability of system features (e.g. toll, tops,  
0 local, IBN etc) is phased over several BCS releases. Each major  
0 system feature will have a DMS-Core Verification Office (V.O.).

0 11.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

## 0 SUPERNODE 20 PRODUCT COMPONENT PACKAGES AND FEATURES

0

0 NTX960AA - DMS SUPERNODE BASIC - Master Package rated MD BCS-28.

0 NTX960AB - DMS SUPERNODE BASIC - Master Package rated MD BCS-28.

0 NTX960AC - DMS SUPERNODE BASIC - Master Package which includes:

0 NTX940AA - COMPUTING MODULE BILGE  
0 NTX941AA - COMPUTING MODULE COMMON BASIC  
0 NTX942AA - SUPERNODE SYSTEM LOAD MODULE  
0 NTX950AA - MESSAGE SWITCH BILGE  
0 NTX951AA - MESSAGE SWITCH COMMON BASIC  
0 NTXF70AA - SUPERNODE SN-20 PROCESSOR

0 NTX960AC is ordered in addition to all other master and feature  
0 packages that would be ordered for an equivalent NT-40. For ex-  
0 ample NTX003AB and NTX960AC are ordered for a Local Enhanced of-  
0 fice equipped with DMS-Core.

## 0 SUPERNODE SERIES 10 PRODUCT COMPONENT PACKAGES

0  
0 Offices provisioning the SuperNode Series 10 will require:

0 NTXD16AB - SuperNode (Series 10) Basic which contains packages

0 Note: The NTXD16AB and NTXF96AA (SN-10) packages are to be  
0 "Napped" (eg. cannot be ordered/delivered) in the BCS-35/36  
0 loads.

0 If an existing site is configured with a Series 10 processor, the  
0 customer is requested to contact the regional sales represen-  
0 tative for details on how to upgrade to a Series 20 processor or  
0 higher for BCS-35 and above loads.

0 NTXF96AA - Basic SuperNode (SN-10)Processor  
0 NTX940AA - Computing Module Bilge  
0 NTX941AA - Computing Module Basic  
0 NTX950AA - Message Switch Bilge  
0 NTX951AA - Message Switch Basic

0 Note - System Load Unit software must be ordered separately on  
0 SuperNode Series 10 Offices (SLM - NTX942AA).

## 0 SUPERNODE SERIES 30 PRODUCT COMPONENT PACKAGES

0  
0 Offices provisioning the SuperNode Series 30 will require:

0 NTXD17AB - DMSCore MC68030-33 MHz (Series 30) Processor Basic  
0 which contains packages

0 NTXF15AA - SuperNode MC68030-33MHz (Series 30)Processor  
0 NTX940AA - Computing Module Bilge  
0 NTX941AA - Computing Module Basic  
0 NTX942AA - SuperNode System Load Module  
0 NTX950AA - Message Switch Bilge  
0 NTX951AA - Message Switch Basic

0 RELEASE 28.01  
0 93 12 03

## 0 SUPERNODE SERIES 40 PRODUCT COMPONENT PACKAGES

0  
0 Offices provisioning the SuperNode Series 40 will require:

0 NTXD18AB - Series 40 Supernode-Basic which contains packages:

0 NTXF16AA - DMS-Core MC68030 40MHz Processor  
0 NTX940AA - Computing Module Bilge  
0 NTX941AA - Computing Module Basic  
0 NTX942AA - SuperNode System Load Module  
0 NTX950AA - Message Switch Bilge  
0 NTX951AA - Message Switch Basic

0 Note: For U.S. applications the SuperNode Series 40 is lim-  
0 ited for deployment and must have RTP Marketing approval prior to  
0 provisioning.

## 0 SUPERNODE SYNCHRONIZATION PACKAGES

0  
0 For offices requiring external clock synchronization to CCS or  
0 DCS standard, provide:

0 NTXF26AA - BITS Composite Master

0 NTXF27AA - Cesium, Loran Composite Master

0 For offices requiring external clock synchronization to  
0 Cesium/Rubidium Stratum I standard, provide the NTXF27AA package.  
0 Note that this package also supports Loran Composite Master clock  
0 source, but the necessary provisionable cable is not yet avail-  
0 able for the latter application.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 SYSTEM LOAD MODULE SOFTWARE

0  
0 SLM II requires software package NTXE54AA.

0 The Device Independent Recording Package(DIRP) on SLM is op-  
0 tional, and it is activated internally by the presence of package  
0 module DIRPSLM in NTXJ44AA - SLM File System.

## 0 BRISC

0  
0 The NT9X10AA 33 MHz 88000 BRISC CPU Circuit Pack is incompatible  
0 with the standard SuperNode BCS loads and requires a BCS load  
0 compiled for the BRISC card. The minimum software release that is  
0 required is BCS-BR33.

0 Software package NTXD25AA is required to support the NT9X10AA  
0 BRISC CPU.

## 0 AFFECTED SOFTWARE TABLES

0  
0 In general, initial office datafill will be accomplished in the  
0 same way for the DMS-Core as for the CCC. There are new data ta-  
0 bles associated with the CM and MS subsystems which are specific  
0 to the new hardware. Datafill of these tables will be detailed  
0 in the data schema associated with the CM and MS.

0 A dump and restore datatool will be available for core upgrades  
0 to transfer CCC data to a DMS-Core. Datatools will also be  
0 available to support DMS-Core to DMS-Core data transfer for BCS  
0 upgrades. Note that even with the CCC to DMS-Core datatools,  
0 some initial datafill of the new tables will be necessary.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 11.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 BCS33 and BCS34 DO NOT support the stand-alone STP. That is, it  
0 is limited to BCS32, and it will be supported with BCS35.

0 11.3.3 MEMORY PROVISIONING0 MS Memory Configuration and Software Loads.

| SOFTWARE | DESCRIPTION                       | MS MEMORY REQUIREMENT |
|----------|-----------------------------------|-----------------------|
| MS-S     | MS LOAD FOR JNET                  | REQUIRES 7MB          |
| MS-E     | MS LOAD FOR JNET/ENET/SSLPP/PH    | REQUIRES 10MB         |
| MS-I     | MS LOAD FOR JNET/ENET/SSLPP/SCPII | REQUIRES 16MB         |

| HARDWARE  | SOFTWARE RELEASE |      |      |
|-----------|------------------|------|------|
|           | MS-S             | MS-E | MS-I |
| 13DB/14BB | YES              | NO   | NO   |
| 13DC/14BB | YES              | YES  | NO   |
| 13DC/14DB | YES              | YES  | YES  |
| 13DD      | YES              | YES  | YES  |

0 1) PM Note: New SN DPCCs should not be provided with the NT9X14BB  
0 MS memory for BCS-31 and above loads. Also, Offices with Base-04  
0 (CSP-03) or higher shall have a minimum of 16M of memory and  
0 there will be only one common MS load.

0 RELEASE 28.01  
0 93 12 03

0 Memory Provisioning in CM

0 24 MByte memory cards are generally available to any SuperNode  
0 office. Provisioning of six (6) MByte memory cards in the Comput-  
0 ing Module (CM) are only available to STP offices. That is The  
0 NT9X14DB must only be the memory card used on the CM, except for  
0 the SuperNode of a non-integrated STP. The non-integrated STP can  
0 use NT9X14BB Memory CP on the CM if the S/W load fits.

0 \* Mixed 6 & 24 MByte systems require a minimum of  
0 BCS 25 and the NT9X13BB Processor CP.

0 \* Pure 24 MByte systems require a minimum of BCS 26,  
0 and NT9X13BC, Processor CP.

0 Note for Mixed memory offices, once a 24 Mbyte CP has been provi-  
0 sioned, no additional 6 Mbyte CP will be provided. In U.S., ref-  
0 erence System Engineering Bulletin (S.E.B 88-01-002) "DMS-100F  
0 Memory Administration Document" for detailed memory provisioning.

0 All offices must equip Memory CP to the following algorithm.  
0 Starting with 24 MByte CP for mixed offices, 1st. Slots 16F and  
0 23F, 2nd. 15F and 24F, 3rd. 14F and 25F, 4th. 13F and 26F, 5th.  
0 12F and 27F, 6th. 11F and 28F, 7th. 10F and 29F, 8th. 9F and 30F,  
0 9th. 8F and 31F, 10th. 7F and 32F.

0 BCS 26 offices (pure 24 Mbyte CP) Memory requirements are rounded  
0 as follows:

- 0 - Round up Memcalc values for Program Store (PS) to the  
0 nearest 8 Mbyte multiple.
- 0 - Add four (4) Mbytes to the Memcalc DS and round up to the  
0 nearest 8 Mbyte multiple.
- 0 - Add the rounded PS + the rounded DS, and then round up to  
0 the nearest 24 Mbyte multiple to determine number of circuit  
0 packs requirement.

0 Note the CP quantities should include a 10% administrative spare  
0 additional to the unrounded Memcalc PS + DS figures. Be sure to  
0 include one (1) 24 Mbyte CP as a reliability spare.

0 BRISC

0 Use of the NT9X10AA BRISC CPU will cause an increase in program  
0 store requirements of about 1.6 times the existing amount for

0 RELEASE 28.01  
0 93 12 03

0 68020 and 68030 processors. Some of this increased requirement  
0 will be offset by the additional memory on the NT9X10AA BRISC CPU  
0 CP.

0 The NT9X10AA BRISC CPU does not support the NT9X14BB 6MB memory  
0 packs. Existing NT9X14BB memory packs must be replaced by an  
0 equivalent amount of memory using NT9X14DB 24MB memory packs.

0 MEMCALC for Series 40 should be used for BRISC offices with soft-  
0 ware loads less than BCS34. MEMCALC for Series 50 should be used  
0 for BRISC offices with software loads BCS34 and greater.

#### 0 11.4 REAL TIME IMPACT

0 The NT9X13JA CPU 68020 20 MHz CP provides from 1.2 to 1.4 times  
0 the capacity of the NT-40 at introduction based on current stand-  
0 ards of benchmarking criteria.

0 The NT9X13BC is the baseline offered MC68020 based circuit pack,  
0 which provides 2.0-2.2 times capacity of the Central Control Com-  
0 plex (NT-40) based on the current standards of benchmarking cri-  
0 teria.

0 The NT9X13GA CPU 68030 33 MHz CP provides 1.4 - 1.5 times the  
0 real time capacity of the current NT9X13BC CPU circuit pack or  
0 2.9 - 3.0 times the capacity of the NT-40 at introduction based  
0 on current standards of benchmarking criteria.

0 The NT9X13HB CPU 68030 40 MHz CP provides 1.7 - 1.8 times the  
0 real time capacity of the current NT9X13BC CPU CP or 3.4 -3.8  
0 times capacity of the NT-40 at introduction based on current  
0 standards of benchmarking criteria.

#### 0 BRISC

0 The NT9X10AA BRISC CPU will provide a real-time performance gain  
0 of 2.5 times over the NT9X13BC CPU. The NT9X10AA may replace ex-  
0 isting 68020 and 68030 processor cards, provided the correspond-  
0 ing paddleboard is also replaced and a BRISC software load is  
0 utilized.

0 1.0 DMS-SuperNode

0 The DMS-SuperNode is a technology upgrade for the DMS-100 family of  
0 digital switches. The DMS-SuperNode consists of DMS-Core and DMS-Bus  
0 subsystems. The Central Control Subsystem is superseded by these sub-  
0 systems, designed to give enhanced performance and functionality.

0 The DMS-Core provides the call management and system control functions  
0 of the DMS-SuperNode. This is a duplicated device working in synchro-  
0 nous mode.

0 - It consists of a duplex Computing Module(CM) and a duplex  
0 System Load Module(SLM). SLM is a mass storage system which  
0 will be used to store office images and from which new loads,  
0 or stored images can be booted into the CM.

0 The DMS-Bus is a high speed transaction switch which supports messag-  
0 ing between the DMS-Core, Application processors, Peripheral process-  
0 ors and other elements of the DMS-SuperNode. The DMS-Bus is a  
0 duplicated device working in a loadsharing mode.

0 - It consists of a pair of Message Switches(MS) that provides an  
0 interface to all components.

0 In order to support the higher bandwidths and increased functional  
0 density of the DMS-Core components, optical fiber is utilized to carry  
0 messages between the subsystems. A new fiber based DMS internal link  
0 protocol, DS-512, is introduced to interconnect the DMS-Core CM and  
0 MS.

0 The DMS-SuperNode employs a new cabinet based packaging system. The  
0 C42(S/DMS) SuperNode cabinet is a cost and functionally enhanced ver-  
0 sion of the existing SuperNode cabinet. The S/DMS cabinet is 42 inches  
0 wide compared with Cabinetized DMS's width of 28 inches. This new cab-  
0 inet supports features such as modified framework based on Cabinetized  
0 DMS, "horizontal"(through line-up) cabling, and "hot slide" capabil-  
0 ity. "Horizontal" cabling meaning, cables running through a hole in  
0 the side of a cabinet and into the next cabinet(s) in the same lineup.  
0 "Hot slide" is the process of moving an operating cabinet into an ex-  
0 isting lineup of equipment. The SuperNode incorporates a Frame Super-  
0 visory Panel (FSP), cooling Unit and accommodates four (4) equipment  
0 shelves. The following diagram gives a pictorial representation of  
0 this cabinet:

0  
0 RELEASE 28.01  
0 93 12 03

0 1.1 HARDWARE PROVISIONING

0

0 1.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The DMS-SuperNode supports the same termination capacity as the  
0 CCC (i.e. up to 32 NM's per plane and up to 6 IOC's).

0 The NT9X54AC or NT9X54AD Clock Interface PB is compatible with  
0 NT9X54AB but NOT NT9X54AA. If an existing MS shelf is equipped  
0 with NT9X54AA for an internal clock reference application, this  
0 must be removed and replaced with NT9X54AC/AD, if the mate MS  
0 shelf is being equipped with NT9X54AC/AD.

0 Cabinetized DMS has a port restriction of forty (40) connections  
0 per MS shelf (twenty (20) single port access per bulkhead). In  
0 otherwords, Cabinetized DMS is restricted to 40 Ports per MS  
0 shelf. Therefore the maximum number of NT9X17AA/ADs is 10 per MS  
0 Shelf for Cabinetized(streamline) DMS only.

0 The NT9X62BA will be available for Inter-MS-Link (IML) feature in  
0 BCS35

0 The NT9X10AA 33 MHz 88000 BRISC CPU Circuit Pack does not support  
0 the NT9X14BB 6MB Memory.

## 0 NT40 Upgrade

0  
0 Commissioning Engineering is to supply an IOE frame equipped with  
0 an MTD, IOC, Term-CP and Terminal, to be used when upgrading an  
0 NT40 office to DMS-SuperNode.

0 For U.S. offices, Isolated System Grounding (ISG) will be pro-  
0 vided for all offices receiving a DMS-SuperNode. To be consistent  
0 with the evolving Industry Standards (TA-EOP-000295), it is re-  
0 commended that all DMS-SuperNode office upgrades include ISG. See  
0 ECM-289 for provisioning rules on ISG for initial offices.

0 All DMS-SuperNode offices must be upgraded to BCS 26 S/W and BCS  
0 26 Gating H/W (Reference ECM510 Gating H/W).

0  
0 RELEASE 28.01  
0 93 12 03

## 0 BRISC

- 0  
0 The prerequisites for BRISC are as follows:
- 0 - NT9X12AC (NT9X12AB on CM, SLM must be replaced)
  - 0 - NT9X14DB (NT9X14BB on CM must be replaced)
  - 0 - NT9X44AB (NT9X44AA must be replaced)
  - 0 - The NT9X26DA is required with the NT9X10AA BRISC CPU.
  - 0 - 250MB tape (DC6250) for scratch purposes.

0  
0 Power and Ground Cabling

0  
0 The power and ground cabling of the S/DMS cabinet depends on the  
0 site configuration. Installations that do not utilize horizontal  
0 cabling, require the power cables entering the cabinet to be fed  
0 through EMC filters. On the other hand, use of S/DMS cabinet in a  
0 Cabinetized DMS lineup do not need the power filters.

0 RELEASE 28.01  
0 93 12 03

0 1.1.3 PROVISIONING CONSIDERATIONS

0  
0 DMS-SuperNode is provisioned to support the office configuration  
0 in four (4) major respects:

- 0 - the DS-30 message links required for NMs, IOCs and LIMs
- 0 - the CM memory required
- 0 - the processor required for the office configuration
- 0 - the SLM required to support storage capacity requirements

0 The Network frame must be modified for use with the  
0 DMS-SuperNode. See ECM261 for provisioning rules on connection  
0 of Network Modules to the DMS-SuperNode.

0 The Input Output Controller (IOC) Modules must be modified for  
0 use with the DMS-SuperNode. See ECM 316 for IOC provisioning  
0 rules. Initial DMS-SuperNode offices must provision IOC shelves  
0 on IOE frames.

0 For office upgrades to the DMS-SupeNode that are currently uti-  
0 lizing the Message Device and Controller (MDC) module for I/O re-  
0 quirements, external (i.e. IOE/MTC) mounted IOC shelves must be  
0 provisioned.

## 0 MS Port Provisioning

0  
0 The MS occupies two (2) planes and two (2) shelves on a  
0 DMS-SuperNode. Message port requirements are calculated as fol-  
0 lows:

0 When provisioning ports on a Message Switch Shelf, a number of  
0 factors need to be considered. (Note that both MS Shelves must  
0 be equipped in exactly the same way.)

0 There are 18 slots available for Network, IOC/EIOC, and LIM con-  
0 nections on each MS Shelf. Note during the upgrade, the Network  
0 slots must be shared between the existing NMs and the new ENET.

0 \* Each NM requires two (2) ports (each must be on an adjacent  
0 card).

0 \* Each IOC requires one (1) port.

0 \* Each EIOC requires two (2) ports (each must be on a separate  
0 card).

0 \* Each LIM requires four (4) ports (each pair must be on a  
0 separate card).

0 As an example, for an office that has 5 networks, 3 IOC and 2  
0 LIMs:

0 The number of MS ports req. per plane =  $(5 \times 2) + 3 + (2 \times 4)$   
0 = 21 ports

0 Remember that port circuit packs are provisioned in pairs per MS  
0 plane (i.e. in multiples of four) as noted in section 1.2.2. This  
0 allows Network Module links from the two planes to terminate on  
0 physically different port cards.

0 Each MS 4 Port CP (NT9X17AA/AD) can connect up to four (4) mes-  
0 sage ports.

0 The NT9X17AD is essentially the same circuit pack as NT9X17AA,  
0 and it provides full bandwidth capability and can be used in all  
0 present applications. The NT9X17AD card is based on the existing  
0 NT9X17AA design and is used with the NT9X62BA, SR-512 interface  
0 paddleboard in FLIS applications.

0 RELEASE 28.01  
0 93 12 03

0 With the introduction of ENET, the requirement for MS ports  
0 greatly increases. Therefore, a 64 port CP (NT9X17DA) is intro-  
0 duced. The 4 port CP (NT9X17AA/AD) is retained for use with IOC,  
0 CM, NM and LIM. MS port assignments are first provisioned for  
0 IOCs. This will normally amount to two NT9X17AA/AD and two  
0 NT9X23AA per plane assigned to the highest numbered slots on the  
0 MS shelf. Unused ports from these cannot be used for ENET. How-  
0 ever, the unused ports can be used for Inter-MS -Links.

0 The NT9X17CA, 128 port card is the continuous evolution of the  
0 SuperNode product that provides double the NT9X17DA (64 port  
0 card) capacity. This evolution increases the total number of  
0 ports that can be supported using the DMS-Bus shelf and allows a  
0 much greater fan-out from the DMS-Bus. The NT9X17CA is fully com-  
0 patible with its predecessors in terms of functionality. They can  
0 be inter-changed and co-existed in the Message Switch with proper  
0 commissioning procedures.

0 The NT9X17CA provides 128 independent ports on a single CP. Each  
0 port acts as an independent entity on the T-Bus, being able to  
0 transmit and receive messages identified by its own unique port  
0 address. Each port represents a bi-directional messaging path,  
0 with the T-Bus providing a routing mechanism.

0 The NT9X17CA can be used to support applications which require  
0 more than 64 messaging ports. In situations, where more than 64  
0 ports but less than 128 ports are required, the NT9X17CA can be  
0 used in lieu of the NT9X17DA and therefore eliminate the require-  
0 ment to chain two 9X17DAs. This will reduce the requirement of  
0 the MS port Expander card and hence free up slots on the MS.

#### 0 ENET Interface

0 The following equipment is the minimum requirement in the Message  
0 Switch (MS) to interface with the ENET. The NT9X25AA and NT9X25BA  
0 are required, only if a chain of 17DAs is required.

- 0 - NT9X13DC, MS CPU Processor CP (4 Megabytes)
- 0 - NT9X17DA, MS 64 Port CP
- 0 - NT9X20BB, ENET/MS Fiber Interface PB
- 0 - NT9X25AA, MS Port Expander PB
- 0 - NT9X25BA, MS Port Expander/Terminator PB
- 0 - NT9X49CB, MS P-Bus Terminator CP (Tracer Card)

0

0 RELEASE 28.01  
0 93 12 03

0 To interface with ENET, the MS requires 10 Megabytes of memory.  
0 This is achieved in the following ways:

| QTY                                                                                                     | PEC             | QTY | PEC              | Application     | NOTE |
|---------------------------------------------------------------------------------------------------------|-----------------|-----|------------------|-----------------|------|
| 2                                                                                                       | NT9X13DC (4 MB) | 2   | NT9X14BB (6 MB)  | Canadian & U.S. |      |
| 1) PM Note: New SN DPCCs should not be provided with the NT9X14BB MS memory for BCS-31 and above loads. |                 |     |                  |                 |      |
| 2                                                                                                       | NT9X13DB (1 MB) | 2   | NT9X14DB (24 MB) | Richardson      | 1    |

0 NOTE:

0 1 This configuration is non-standard and will not be supported  
0 by the formal design documentation. Earlier releases of NT9X13DB  
0 are not compatible with NT9X25AA/BA, later releases are. Release  
0 numbers are transparent to our documentation and process. Hence,  
0 Richardson will be responsible for keeping track of the proper  
0 type of NT9X13DB CPs for their offices.

0 Existing Offices With NT9X01BA/JA

0 Product Change Kit (PC Kit) NT9X04AY converts the MS to the mini-  
0 mum level required to interface the ENET. It removes NT9X49CA  
0 and makes slot position 32F provisionable. It can be applied to  
0 NT9X04AG in order to upgrade the MS to NT9X04AH which is the min-  
0 imum level required to interface the ENET. Other existing PC  
0 Kits can be applied to existing MS Common CP Fills in order to  
0 bring them up to the necessary level.

|      | Existing<br>Level | PC Kit<br>Required | New<br>Common CP<br>Level |
|------|-------------------|--------------------|---------------------------|
| MS - | NT9X04AA          | NT9X04AD           | NT9X04AB                  |
| MS - | NT9X04AB          | NT9X04AF           | NT9X04AE                  |
| MS - | NT9X04AE          | * NT9X04AZ         | NT9X04AG                  |
| MS - | NT9X04AG          | * NT9X04AY         | NT9X04AH                  |

0 \* NT9X04AE may be upgraded directly to NT9X04AH by applying  
0 NT9X04AY if the external clock interface is not required.

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 MS Port Group (Chain)

0 A MS Port Group is a set of one (1) or more adjacent MS Port  
0 cards, DS-512 Interface Paddleboards, and MS Port  
0 Expander/Terminator Paddleboards that are required to support the  
0 DS-512 link to an ENET shelf.

0 One MS Port Group is required per MS for each ENET shelf (per  
0 plane). Because there are two (2) ENET planes, therefore two port  
0 groups are associated with each ENET shelf. Both port groups are  
0 located on MS 0 and, on MS 1.

0 Each MS port group is provisioned as a sum of the following:

0 - 1 port for the ENET Shelf Processor

0 - 1 port for each active message channel Processor associated  
0 with a speech link that terminates on the shelf (i.e. each Series  
0 I peripheral has one (1) Message Channel Processor, Each Series  
0 II peripheral has two (2) Message Channel Processors).

0 Each port group must be assigned a contiguous group of CP slots  
0 on the MS shelf. In order to size the MS Port Group, the distrib-  
0 ution of peripheral types (i.e. Series I \* II) over the ENET  
0 shelf pairs must be known.

0 NOTE: If the DMS office will require more than one (1) equipped  
0 ENET shelf (per plane), the assignment of the NT9X40BA, NT9X41BA,  
0 and the NT9X45BA Paddleboards (PBs) on the ENET shelves will di-  
0 rectly affect the size of each MS Port Group. Hence, to optimize  
0 the size of the MS Port Group, it may be necessary to reassign  
0 the quantity of NT9X40BA, NT9X41BA and the NT9X45BA PBs from one  
0 ENET shelf to another in order to avoid crossing the boundary of  
0 message ports which would necessitate the addition of an MS 64  
0 Port Card NT9X17DA and the associated paddleboards. (This card  
0 and the associated paddleboards are explained later in this sec-  
0 tion.) Note that any reassignments would only pertain to new  
0 equipment (i.e. initial offices or new equipment being added into  
0 an existing office). Existing paddleboards on an ENET shelf must  
0 not be reassigned during an extension.

0 For reasons previously discussed consideration should be given to  
0 making allowances for the future growth requirements of the last  
0 incomplete network shelf. Reserve slots on the MS for the  
0 projected future requirements of partially equipped ENET shelves.

0  
0  
0

0  
0 RELEASE 28.01  
0 93 12 03

0 An MS Port Group will consist of the following types of hardware:

- 0 - NT9X17DA MS 64 Port CP or NT9X17CA MS 128 Port CP
- 0 - NT9X20BB ENET/MS Fiber Interface PB
- 0 - NT9X25AA MS Port Expander PB
- 0 - NT9X25BA MS Port Expander/Terminator PB

0 ENET will utilize MS 64 Port CP or MS 128 Port CP for network and  
0 peripheral message port assignments.

0 NT9X17DA, MS 64 PORT CP

- 0 - One can connect up to 64 message ports.

0 NT9X17CA, MS 128 PORT CP

- 0 - One can connect up to 128 message ports.

0 RELEASE 28.01  
0 93 12 03

0 The following PBs are required to complete each port group.

0 NT9X20BB, ENET/MS Fiber Interface PB

- 0 - One required per plane behind the first NT9X17DA CP or NT9X17CA
- 0 CP of each port group.
- 0 - Interfaces the message link from the Enhanced Network Shelf.

0 NT9X25AA, MS PORT EXPANDER PB

- 0 - One required per plane behind the middle NT9X17DA CP of each
- 0 port group if equipped.
- 0 - Expands the bus to accommodate a larger port group beyond
- 0 64 channels.

0 NT9X25BA, MS PORT EXPANDER/TERMINATOR PB

- 0 - One required per plane behind the last NT9X17DA CP or NT9X17CA
- 0 of each port group if equipped.
- 0 - Terminates the bus.

0 Cable Length from MS Shelf to ENET Shelf

0 All fibre optic cables from both MS Shelves (i.e. plane 0 & 1 to  
0 any ENET shelf (on either plane) must not deviate in length from  
0 each other by more than 25 feet.

0 The front card of each MS Port Group is always an NT9X17DA or  
0 NT9X17CA CP. Behind the MS 64 or MS 128 Port CP in each group,  
0 an NT9X20BB PB is provisioned to allow the physical connection of  
0 the fiber link from the MS Shelf to the ENET. For multiple card  
0 groups, an NT9X25BA PB (to terminate the port group) is located  
0 behind the last card, and an NT9X25AA PB (to extend the port  
0 group) behind any intervening MS 64 or MS 128 Port CPs in the  
0 group.

0 Note that a duplicate port group is provisioned for the other  
0 ENET plane.

0 Provisioning of MS Shelf (DMS-BUS) Slots

0 When provisioning MS shelf slots, refer to the appropriate  
0 scenario:

0 1. ENET Initial:

0 Use rules A and C below.

0 2. ENET Extension:

0 Use rule C below.

0 3. ENET Retrofit (Upgrade) Without MS Port Concentration:

0 Use rule C below.

0 4. ENET Retrofit (Upgrade) With MS Port Concentration:

0 Use rules A, B and C below.

0 Rule A: Assign IOCs, EIOCs and LPPs to the highest numbered MS  
0 slots in descending order starting from slot 29 (i.e. slots 29,  
0 28, etc.). These slots will contain 4-port cards (NT9X17AA/AD)  
0 in the front and 4-port DS-30 interface paddleboards (NT9X23AA  
0 for IOCs and EIOCs; NT9X23BA for LPPs) in the rear.

0 Rule B: Assign the existing network ports to the next highest  
0 available MS slots in descending order. These slots will contain  
0 64-port cards (NT9X17DA) in the front and 16-port DS-30 interface  
0 paddleboards (NT9X69AA) in the rear.

0 Rule C: Assign the ENET ports to the lowest numbered MS slots in  
0 ascending order starting from slot 12 (i.e. slots 12, 13, etc.).  
0 These slots will contain 64-port cards (NT9X17DA) in the front  
0 and fibre interface or port expander or port terminator  
0 paddleboards (NT9X20BB or NT9X25AA or NT9X25BA) in the rear.

## 0 ENET Retrofit (Upgrade)

0 An ENET retrofit (upgrade) occurs when the switching network of  
0 an existing inservice DMS-SuperNode office changes from a Network  
0 Module (NM) implementation to an Enhanced Network(ENET) implemen-  
0 tation. During the upgrade, the Network slots must be shared be-  
0 tween the existing NMs and the new ENET.

0 In network upgrade situations, the existing MS 4 Port CPs  
0 (NT9X17AA/AD) will be used to connect to existing IOC/EIOCs, NMs,  
0 and LIMs. The MS 64 Port CPs (NT9X17DA) will be required to be  
0 provisioned for connection to ENET.

0 It is important to note that for a time during the retrofit, the  
0 MS must interface all IOC/EIOCs, all NM, all LIMs, plus both  
0 planes of the ENET.

### 0 MS Port Concentration

0 Each MS shelf (or DMS-Bus) must have a sufficient number of va-  
0 cant slots to allow the addition of enough 64 port cards to sup-  
0 port both planes of the ENET. If this is not the case, the  
0 existing NM ports must be "concentrated" onto higher density port  
0 cards. This process may involve the relocation of NM, IOC/EIOC,  
0 and LIM ports.

### 0 Addition of Sixteen Port Cards to the MS

0 This procedure replaces some of the MS 4 Port cards and the DS-30  
0 Interface Paddleboards with MS 64 Port cards and 16 DS-30 Port  
0 Interface Paddleboards.

0 Specifically, two or four NT9X17AA/ADs (MS 4 Port CP) and two or  
0 four NT9X23AAs (Four DS-30 Port Interface Paddleboards) are re-  
0 placed with an equivalent number of NT9X17DAs (MS 64 Port CP) and  
0 NT9X69AAs (Sixteen DS-30 Port Interface Paddleboards). Four  
0 sixteen-port slots are sufficient to support both planes of 32  
0 NMs.

0 These sixteen-port packs are considered retrofit packs, and are  
0 removed during the Post-Cutover phase.

0 For Canadian Offices:

0 The SAE/EAE will determine if an MS Port Concentration is re-  
0 quired and the quantity of NT9X17DAs and NT9X69AAs required (but

0 RELEASE 28.01  
0 93 12 03  
0

0 will not order this hardware). He will inform the Job Supervisor  
0 accordingly. The Job Supervisor will obtain this hardware from  
0 the Installation Tool Room as required.

0 For U.S. Offices:

0 The requirement for an MS port concentration will be reported to  
0 installation via the order capture process. Installation will  
0 provide the required NT9X17DA and NT9X69AA.

0 The following contains information on provisioning the MS Shelf  
0 slots, and provides the necessary formula to determine whether  
0 enough vacant slots exist to support an ENET. The number of MS  
0 ports in each of the MS Port Groups is determined as follows:

0 \* one (1) port for the ENET shelf

0 \* one (1) port for each Series I peripheral connected to that  
0 ENET shelf

0 \* two (2) ports for each Series II peripheral connected to  
0 that ENET shelf

0 \* extra ports must also be allocated for any anticipated fu-  
0 ture growth.

0 One (1) MS shelf card slot is required for every 64 ports in a  
0 group. One MS 64 Port CP (NT9X17DA) can connect up to 64 message  
0 ports. For an ENET shelf, the longest group required is four (4)  
0 MS 64 Port cards long as shown in previous section.

0 RELEASE 28.01  
0 93 12 03

0 MS Shelf Slot Requirement Calculation

- 0 \* Total the number of slots required by each MS Port Group.
- 0 \* Total the number of slots required to support the existing  
0 NMs, IOC/EIOCs, and LPPs (assuming only MS 4 Port cards).
- 0 \* If the sum of these two (2) numbers is greater than 18, then  
0 an MS Port Concentration must be performed.

0 Example 1: A Small Office

0 Note that the calculations are done based on one (MS shelf) plane  
0 only.

0 An office contains the following equipment:

0 NM: 12  
0 IOC: 2  
0 EIOC: 1  
0 LPP: 1  
0 FXPM: 40 (Fiberized Series II Peripherals)  
0 PM: 40

0 Assume that ENET shelf 0 supports the 40 FXPMs, and ENET shelf 1  
0 supports the 40 PMs. The number of MS Shelf slots required to  
0 support this equipment using both NMs and ENET is as follows:

0 NM:{12 X 1/4} rounding up to the next integer X 2 slots  
0 = 6 Slots

0 Each NM requires total of two ports. Each port must be on an ad-  
0 jacent slot.(one port out of 4 ports from each slot)

0 IOC:2 port out of 4 ports X 1 slot  
0 = 1/2 Slot

0 Each IOC requires one port out of four ports.

0 EIOC:{1 X 1/4} rounding up to the next integer X 2 slots  
0 = 2 Slots

0 Each EIOC requires total of two ports. Each port must be on an  
0 adjacent slot.(one port out of 4 ports from each slot)

0 LPP:{1 X 2/4} rounding up to the next integer X 2 slots  
0 = 2 Slots

0 Each LPP requires total of four ports. Two ports out of 4 ports  
0 must be on each slot.

0  
0 RELEASE 28.01  
0 93 12 03

0 ENET MS Port Group 0 Pl 0, Sh 0: 2 {ports = 1 + (2 X 40) = 81}  
0 ENET MS Port Group 1 Pl 0, Sh 1: 1 {ports = 1 + (1 X 40) = 41}

0 Two (2) slots can support both IOCs, the EIOC, and the LPP. The  
0 total number of slots required in each MS Shelf to support NM,  
0 IOC, EIOC, LPP and ENET is:  
0 = (existing) + (ENET)  
0 = (6 + 2) + (2 X (2 + 1))  
0 = (8) + (6)  
0 = 14

0 This number is less than 18, so an MS Port Concentration is NOT  
0 required.

0 Example 2: A Large Office

0 An office contains the following equipment:

0 NM: 28  
0 IOC: 4  
0 EIOC: 1  
0 LPP: 1  
0 FXPM: 100 (Fiberized Series II Peripherals)  
0 PM: 80

0 Assume that ENET shelf 0 supports 60 FXPMs, and ENET shelf 1 supports 40 FXPMs and 80 PMs. The number of MS Shelf slots required to support this equipment using both NMs and ENET is as follows:

0 NM:{28 X 1/4} rounding up to the next integer X 2 slots  
0 = 14 Slots

0 Each NM requires total of two ports. Each port must be on an adjacent slot.(one port out of 4 ports from each slot)

0 IOC:4 port out of 4 ports X 1 slot  
0 = 1 Slot

0 Each IOC requires one port out of four ports.

0 EIOC:{1 X 1/4} rounding up to the next integer X 2 slots  
0 = 2 Slots

0 Each EIOC requires total of two ports. Each port must be on an adjacent slot.(one port out of 4 ports from each slot)

0 LPP:{1 X 2/4} rounding up to the next integer X 2 slots  
0 = 2 Slots

0 Each LPP requires total of four ports. Two ports out of 4 ports must be on each slot.

0 ENET MS Port Group 0 plane 0, Shelf 0: 2  
0 {ports = 1 + (2 X 60) = 121}

0 ENET MS Port Group 1 plane 0, Shelf 1: 3  
0 {ports = 1 + (2 X 40 + 1 X 80) = 161}

0 Two (2) slots can support the EIOC, the LPP, and up to two (2) IOCs. A third card must be provisioned to support the other two (2) IOCs. The total number of slots required in each MS Shelf to support NM, IOCs, EIOC, LPP and ENET is:

0 = (existing) + (ENET)  
0 = (14 + 2 + 1) + (2 X (2 + 3))  
0 = (17) + (10)

0 Job Drawings

0 For Canadian Offices:

0 If an MS Port Concentration is required, the SAE/EAE shall pre-  
0 pare D610 job drawings such that one will show the interim MS  
0 Port configuration and another drawing will show the final MS  
0 Port configuration for the DMS office. Notes should be added to  
0 the drawings distinguishing the interim and final configurations.

0 For U.S. Offices:

0 If an MS Port Concentration is required, the EAE shall add a note  
0 to the 1001 Specification that will show the slot and port as-  
0 signments of the NT9X17DA and NT9X69AA required for MS port con-  
0 centration.

## 0 CM Provisioning

0  
0 A CM consists of a NT9X0605 Computing Module Shelf Assembly,  
0 NT9X06AF CM Processor Shelf Circuit Packfill, memory circuit  
0 packs, and message links to the MS.

0 Memory provisioning is carried out in a similar fashion for CCC  
0 and DMS-Core. However separate memory is not defined for Program  
0 Store and Data Store. A single memory store expressed in Mega-  
0 bytes (M-bytes) is defined for the CM.

0 The MEMCALC memory sizing tool is available for evaluating CM  
0 memory requirements.

0 In addition to the operational memory provisioned, one extra mem-  
0 ory CP per circuit pack type (i.e. a spare 6 and a 24 Mbyte CP  
0 for mixed memory applications) must be provided per plane to be  
0 assigned as a reliability spare.

0 For retrofits and upgrades, refer to Change Application Procedure  
0 (CAP) 1351.

0 Bulkheads for CM

0 For all applications, provision one (1) NT9X6539 CM Bulkhead  
0 (Right) and one (1) NT9X6540 CM Bulkhead (Left).

0 BRISC

0 The NT9X10AA BRISC CPU will provide a real-time performance gain  
0 of 2.5 times over the NT9X13BC CPU. The NT9X10AA may replace ex-  
0 isting 68020 and 68030 processor cards, provided the correspond-  
0 ing paddleboard is also replaced and a BRISC software load is  
0 utilized.

0 For BRISC offices, provision two (2) NT9X10AA 33 MHz 88000 BRISC  
0 CPU Circuit Packs per SuperNode Computing Module (CM) in shelf  
0 position 13 in slots 19F and 20F, and provision two (2) NT9X26DA  
0 BRISC RTIF Paddleboards per SuperNode Computing Module (CM) in  
0 shelf position 13 in slots 19R and 20R.

0  
0 RELEASE 28.01  
0 93 12 03

## 0 SLM Provisioning

0  
0 SLM II units are a requirement of all offices whose image is ex-  
0 pected to exceed 30 M-bytes during the engineered interval. Since  
0 provisioning SLM II units in an office would impact its IOC based  
0 mass storage needs, it is recommended that for new offices, the  
0 need for SLM II units be established based on image requirements  
0 forecasted out 5 years where possible. In smaller offices SLMs  
0 are considered to be a customer requested option.

0 For U.S. applications, SEB 88-01-002 may be referenced. It con-  
0 tains a detailed formula for calculation of Supernode image size.  
0 The MEMCALC tool also will calculate office image requirements.

0 When the SLM is required, provide two (2) NT9X44AB System Load  
0 Module II per NT9X01JA/JB Dual Plane Combined Core Cabinet  
0 (DPCC). Also provision the associated NT9X07AC SLM Common CP and  
0 NT9X12AB/AC CPU Port CP. SLM II units are provisioned on a SLM  
0 shelf and interfaced to the CM via orderable CM bus extender pad-  
0 dle boards.

0 When SLM is not required, provide one (1) NT9X01FB Filler  
0 Packfill to satisfy cabinet cooling airflow requirements.

0 Device Independent Recording Package(DIRP) is a supported func-  
0 tion on SLM II. The following are the known application using  
0 DIRP and should be supported by SLM II:

0 AMA, CDR, SMDR, OM, JF, KT, TTRF

0 METBCKP, OOS, MS7, DLOG, CRS

0 For the disk storage provisioning for DMS-STP in support of data  
0 access by Signalling Engineering and Administration System(SEAS)  
0 IOC DDUs must be provisioned.

0 The engineering of data storage requirement for SLM II should in-  
0 clude the storage requirement for all office operation, adminis-  
0 tration and maintenance data. In particular, the provisioning of  
0 storage capacity for AMA/CDR data should take into the consider-  
0 ation of busy hour traffic rate, data polling or transfer rate if  
0 applicable, as well as data retention requirement.

0 RELEASE 28.01  
0 93 12 03

0 If additional DDU(s) is required, either SLM or DDU but not both  
0 may be used for recording the same DIRP subsystem data (such as  
0 AMA/CDR). This is to avoid performance fluctuation.

0 In the case of parallel recording, the use of IOC DDUs are recom-  
0 mended over tape drives. This is for better performance in terms  
0 of through-put and storage capacity. Note that the overall  
0 through-put performance using concurrent parallel recording will  
0 be limited to the IOC DDU through-put performance, even though the  
0 SLM II performance is superior.

0 SLM HANDLING CONSIDERATIONS

0 When SLM I is equipped in an office, the combined CM and MS soft-  
0 ware load (image) must be delivered to site in DC 600A compatible  
0 tape cartridges. This would also apply to any commissioning  
0 loads that are supplied.

0 When SLM II is equipped in an office, the combined CM and MS  
0 software load (image) must be delivered to site in DC 600XTD com-  
0 patible tape cartridges. This would also apply to any commis-  
0 sioning loads that are supplied.

0 Blank cartridges must also be provided for scratch purposes. The  
0 different CPC number, Manufacturing part number and the sizes are  
0 given below:

0 CPC A0314597; Manufacturing Part # DC600A; 60MB  
0 CPC A0369779; Manufacturing Part # DC6150; 150MB  
0 CPC A0368760; Manufacturing Part # DC6250; 250MB

0 However Field Commissioning Tapes, Non-Resident Software Tapes  
0 and Peripheral Processor Software tapes must be delivered on the  
0 usual 9 track magnetic tapes. The specification process will au-  
0 tomatically call up the appropriate tape medium when the SLM  
0 software feature package is specified.

0 For Universal Software Load the SLM II is a must for offices run-  
0 ning with BCS33 and later.

0 For non-Universal Software Load the SLM II is required for,

- 0 -- offices running with BRISC Processor.
- 0 -- offices exceeds the SLM I tape capacity of 62Mb.
- 0 -- offices with planned capacity upgrdae.

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 -- etc..

0 Since SLM I is MD'd, new offices will receive SLM II even if they  
0 do not have Universal Software Load.

## 0 Reset Terminal Provisioning

0  
0 Two (2) compatible terminals must be provided in the maintenance  
0 area to serve as local reset terminals. These could be located  
0 close to MAP:00. Suitable furniture must be provided to accommo-  
0 date these terminals. Terminals are powered from inverters which  
0 may be located on the MIS frame.

0 The Reset Terminal Interface (RTIF) (NT9X26AA) of the CM provides  
0 two terminal interfaces. One is a RS-232C and is intended for  
0 local applications while the other supports either RS-232C or  
0 RS-422 and is intended for interfacing to remotely located termi-  
0 nals. Local RTIF terminals connected to an initial DMS-Core must  
0 be connected through back-to-back modems (9600 Baud asynchronous  
0 modem), or approved Current Loop converters. These isolation  
0 methods are required to satisfy ISG requirements, provide power  
0 fault isolation and and prevent cross-linking of terminal grounds  
0 with DMS equipment grounds.

0 The Enhanced Remote Terminal Interface (RTIF) CP (NT9X26AB), of-  
0 fers all the features of the existing NT9X26AA (ie. One RS-232C  
0 terminal interface port and one RS-232C / RS-422 interface port),  
0 plus:

- 0 - 20mA current loop terminal interface port
- 0 - Status lamps indicating processor inactivity and sync

0 Approved VDU terminals, operating in current loop mode, can be  
0 connected directly to the NT9X26AB Enhanced RTIF CP at the cabi-  
0 net bulkhead. In this mode, the back-to-back data units, modems  
0 or Rad current loop converters, which were needed for Isolated  
0 System Ground (ISG) compliance, power fault isolation and pre-  
0 ventation of cross-linking of terminal grounds with DMS equipment  
0 are no longer required.

0 The NT9X26DA RTIF Paddleboard is required for BRISC.

0 An ISG compliant office may be using back to back modems con-  
0 nected to the RS232 connector on a NT9X26AA RTIF paddleboard. If  
0 the NT9X26AA is being changed to a NT9X26AB (or '26DA), it is re-  
0 commended to get rid of the back to back modems and provide a  
0 current loop cable for the RTIF Terminal being used in the of-  
0 fice.

The Low Speed Data Unit with Elastomer Keypad (NT4X25AF) may be used in a non switched arrangement (back-to-back) with the RTIF. Refer to ECM 346 for provisioning details. Since the data unit connects directly to the RTIF in the CM, type D line cards are NOT required for this application. The following figure depicts this arrangement:

## Data Unit

## Data Unit

RELEASE 28.01  
93 12 03Option 2 (U.S. Applications Only)

Current Loop converters from Rad Data Communication have been approved for compliancy with ISG to interface from the SuperNode with the RTIF.

Note - A spare set of converters and power converters must be provisioned for each site.

A Passive RS-232 to Current Loop converter is plugged directly into the SuperNode bulkhead. This device is connected to an Active RS-232 to Current Loop converter by a two (2) pair 20 ma loop cable. The Active unit (located near the RTIF) is connected to the RTIF by a short connectorized (female on RAD end, female on RTIF end) RS-232 cable.

The Active unit is powered by a plug in Power Converter which converts 120V AC to 12V DC.

The following figure depicts this arrangement:

| Description  | NT CPC   | RAD Part No.   |
|--------------|----------|----------------|
| Active Unit  | A0354166 | MIC-24/CL/A-NF |
| Passive Unit | A0354167 | MIC-24/CL/P-NF |
| Power Convtr | A0354168 | MIC-P          |

0  
0 RELEASE 28.01  
0 93 12 03

0

0 See ECM-289 for Isolated System Grounding (ISG) provisioning  
0 guidelines.

0 When required, two additional reset terminals can be equipped at  
0 a remote location and interface to the RTIF via modems and secure  
0 dedicated lines. This equipment must be RS-232C compatible.

0 When required, the RTIF can interface to AT&T E2A equipment asso-  
0 ciated with a Switching Control Centre System (SSC) (US applica-  
0 tions only).

0 The Remote RTIF will be configured as 1200 baud RS232 to a modem  
0 or as 2400 baud RS422 connection to a Data Auxillary Shelf (DAS)  
0 for E2A. The Baud rate is set at initial power up via in-  
0 structions received from the NT9X26-- firmware to either 1200  
0 baud if the E2A Software is not present or 2400 baud if the E2A  
0 Software is present. The Remote RTIF CANNOT be used for BOTH a  
0 remote modem connection, and a DAS connection.

0 Refer to the appropriate VDU ECM for approved RTIF terminals.

## 0 Inter-MS Link Provisioning

0  
0 The two inter-MS links (IMLs) are provisioned if required to connect MS plane 0 to MS plane 1 and provide a path for messages in event of a failure. These links utilize DS-30 links and should be provisioned as follows:

0 For applications NOT using Cabinetized DMS cabinets, and where DS-30 inter-MS links are required, provision two (2) NTEX5022 Inter-MS DS-30 Cable Assemblies. (one NTEX5022 cable per IML)

0 For Cabinetized DMS cabinet applications where DS-30 inter-MS links are required, provision two (2) NTEX5023 Inter-MS DS-30 Cable Assemblies. (one NTEX5023 cable per IML)

0 For applications requiring Inter-MS links, each DS-30 IML can be provisioned on any un-used DS-30 port on either an NT9X23AA or an NT9X23BA or an NT9X69BA paddleboard subject to the following restrictions:

0 The DS-30 ports selected for the two links must be on different paddleboards. That is, if the only free DS-30 ports are on the same paddleboard they cannot both be used for the IMLs; another port must be freed up on another paddleboard in order to equip the second link.

0 The paddleboards and ports selected must be the same on each MS. For example, if port 3 on paddleboards in slots 16 and 17 are selected in MS 0, then port 3 on paddleboards in slots 16 and 17 in MS 1 must be used. The paddleboards and ports selected can be in any slot or port in which DS-30 paddleboards are allowed except port 0 on paddleboards in slots 28 and 29.

0 Provisioning of DS-30 IMLs is currently limited to the SuperNode in non-Cabinetized or Cabinetized DMS cabinets. No requirements have been identified for the support of IMLs on the SL100 products. Hence, this is not currently supported.

0 For Meridian Cabinet applications the IML requirements can be met with a NTNX36AR cable to connector "A" and another to "B" on the NT9X6558 bulkhead if THOSE CONNECTORS ARE NOT BEING UTILIZED. If these connectors are in use, then use the first available "four port" connector on either the left or right bulkhead AND PROVIDE DS30 PADDLE BOARDS, PORT CARDS, AND CABLES AS REQUIRED. The other

0  
0 RELEASE 28.01  
0 93 12 03

0 end of this cable is connected to the same connector designation  
0 on the other plane of the message switch. When using a four port  
0 bulkhead connector, only one NTN36AR cable is needed.

0 Note that, IMLs must be used when NIUs are provisioned on an LPP.

0 C42(S/DMS) Cabinet Provisioning

0  
0 The DMS-SuperNode in C42(S/DMS) cabinet is a cost and func-  
0 tionally enhanced version of the existing SuperNode type cabinet.  
0 The S/DMS cabinet is very similar to the existing cabinet, items  
0 such as packs, shelf assemblies, interconnect cables, and  
0 bulkhead packs do not change. The differences from the existing  
0 Supernode cabinet are listed below.

0 1) The Cabinet changes from NT9X0113 to NT9X95AA

0 2) The Kick plate is not required with the S/DMS cabinet.

0 3) Power wiring is optional. If the cabinet is in a Stream-  
0 line lineup, the cables will be equipped to take advantage  
0 of "horizontal" cabling. If the cabinet is in a  
0 non-Cabinetized lineup, power cables will be similar to  
0 existing power cables, so filters will have to be  
0 provisioned.

0 The NT9X01JB has been approved for all applications. All new ini-  
0 tial SuperNode offices will specify the NT9X01JB Cabinet. The  
0 NT9X01JA PEC will be A&M and will remain for all existing of-  
0 fices.

## 0 SuperNode Building Block Definition

0  
0 The SuperNode building block concept deals with a higher level of  
0 Product Engineering Code (PEC) ordering. The memory quantities,  
0 processor series and Network Interface can be selected depending  
0 on the telco desired specifications.

### 0 NTZZ01RA (SuperNode in S/DMS Cabinet)

0 NTZZ01RA contains the SuperNode cabinet NT9X01JB, Frame  
0 Supervisory panel, Cooling Unit, Common Circuit Packfills,  
0 bulkheads, and miscellaneous items that are always provided for a  
0 SuperNode. The existing NTZZ01AA, NTZZ97BA, NTZZ01TA, NTZZ97CA,  
0 NTZZ01AM, and NTZZ97BH will be A&M (Additions and Maintenance)  
0 and are replaced by NTZZ01RA. This NTZZ01RA BB pec is ONLY APPLI-  
0 CABLE to -48V powered installations. CHECK AVAILABILITY PRIOR TO  
0 ORDERING.

### 0 NTZZ01BA (System Load Module (SLM) common CP)

0 The NTZZ01BA contains all the circuit packs and miscellaneous  
0 items that are always provided to the SLM. The SLM II is required  
0 for offices where the office image is greater than 75 MB.  
0 NTZZ97BG will be A&M (Additions and Maintenance) and replaced by  
0 NTZZ01BA. This NTZZ01BA BB is ONLY APPLICABLE to -48V powered in-  
0 stallations.

### 0 NTZZ01CA (4 Port Network and IOC interface)

0 The NTZZ01CA contains the circuit packs for the SuperNode inter-  
0 face to the network modules and the Input/Output Controller mod-  
0 ules (IOC). These circuits will be used for DMS-100F  
0 applications. The NTZZ01CA contains 4 interface circuit  
0 packs.(i.e. 2 for each Message Switch). The NTZZ01CA is used in  
0 Supernode for non-Cabinetized application.

### 0 NTZZ01CB (4 Port Network and IOC interface)

0 The NTZZ01CB is similar to the ZZ01CA, except it has the new  
0 9X17AD 4-Port CP and it must be provisioned on all initial jobs  
0 for BCS34 and above.

### 0 NTZZ01DA (STP Interface)

0 RELEASE 28.01  
0 93 12 03

0 The NTZZ01DA contains the circuit packs for the SuperNode inter-  
0 face to the Link Interface Units (LIU). These circuits will be  
0 used for STP applications. The NTZZ01DA contains 4 interface  
0 circuit packs. (i.e. 2 for each Message Switch). The NTZZ01DA is  
0 used in Supernode for non-Cabinetized application.

0 NTZZ01DB (STP Interface)

0 The NTZZ01DB is similar to the ZZ01DA, except it has the new  
0 9X17AD 4-Port CP and it must be provisioned on all initial jobs  
0 for BCS34 and above.

0 NTZZ01UA (Cabinetized DMS 4 Port & IOC Interface)

0 The NTZZ01UA contains the circuit packs for the SuperNode inter-  
0 face to the network modules and the Input/Output Controller mod-  
0 ules (IOC). These circuits will be used for DMS-100F  
0 applications. The NTZZ01UA contains 4 interface circuit  
0 packs. (i.e. 2 for each Message Switch). The NTZZ01UA is used in  
0 SuperNode for Cabinetized DMS application.

0 NTZZ01UB (Cabinetized DMS 4 Port & IOC Interface)

0 The NTZZ01UB is similar to the ZZ01UA, except it has the new  
0 9X17AD 4-Port CP and it must be provisioned on all initial jobs  
0 for BCS34 and above.

0 NTZZ01VA (Cabinetized 4 Port LIM/LPP Interface)

0 The NTZZ01VA contains the circuit packs for the SuperNode inter-  
0 face to the Link Interface Units (LIU). These circuits will be  
0 used for STP applications. The NTZZ01VA contains 4 interface  
0 circuit packs. (i.e. 2 for each Message Switch). The NTZZ01UA is  
0 used in SuperNode for Cabinetized DMS application.

0 NTZZ01VB (Cabinetized 4 Port LIM/LPP Interface)

0 The NTZZ01VB is similar to the ZZ01VA, except it has the new  
0 9X17AD 4-Port CP and it must be provisioned on all initial jobs  
0 for BCS34 and above.

0 NTZZ01EA (Filler Face Plate)

0 The NTZZ01EA contains the filler face plates required for forced  
0 air cooling when the message port circuit packs are not required.  
0 Each NTZZ01EA contains two (2) filler face plates and two (2) MS  
0 Bus Loader PBs.

0 RELEASE 28.01  
0 93 12 03  
0

0

0 NTZZ01FA (Supernode Series 10 CPU)

0 The NTZZ01FA contains the SuperNode series 10 processor CP. The  
0 SN10 provides approximately 1.4 capacity gain over the NT40. Se-  
0 lection of SuperNode processor is determined by the use of  
0 QUICKCALC or RTCALC programs. New offices should not be engi-  
0 neered using this PEC. If an existing site is configured with a  
0 Series 10 processor, the customer is requested to contact the re-  
0 gional sales representative for details on how to upgrade to a  
0 Series 20 processor or higher for BCS-35 and above loads. See  
0 Section 4.1.2 ECM body for software packaging.

0 NTZZ01GA (Supernode Series 20 CPU)

0 The NTZZ01GA contains the Supernode series 20 processor CP. the  
0 SN20 provides 2.0 to 2.2 capacity gain over the NT40. Selection  
0 of SuperNode processor is determined by the use of QUICKCALC or  
0 RTCALC programs.

0 NTZZ01HA (Supernode Series 30 CPU)

0 The NTZZ01HA contains the SuperNode series 30 processor CP. The  
0 SN30 provides a 1.4 to 1.5 capacity gain over the SN20. Selection  
0 of SuperNode processor is determined by the use of QUICKCALC or  
0 RTCALC programs.

0 NTZZ01JA (Supernode Series 40 CPU)

0 The NTZZ01JA contains the SuperNode series 40 processor CP. The  
0 SN40 provides a 1.7 to 1.8 capacity gain over the SN20. Selection  
0 of SuperNode processor is determined by the use of QUICKCALC or  
0 RTCALC programs.

0

0

0 RELEASE 28.01  
0 93 12 03

0 NTZZ01SA (Supernode BRISC CPU)

0 The NTZZ01SA provides a real time performance gain of 2.5 times  
0 over the SN20. Selection of SuperNode processor is determined by  
0 the use of QUICKCALC or RTCALC programs.

0 NTZZ01KA (Six (6) MByte Memory)

0 The NTZZ01KA contains two (2) Six (6) MByte memory circuit packs  
0 and designation labels for the STP application. Memory require-  
0 ments are determined by use of Memquick or Memcalc programs.

0 NTZZ01LA (24 MByte Memory)

0 The NTZZ01LA contains two (2) 24 MB memory circuit pack and des-  
0 ignation labels for the DMS-100F application. Memory requirements  
0 are determined by use of Memquick or Memcalc programs.

0 NTZZ01MA (Filler Face Plate)

0 The NTZZ01MA contains two (2) Filler Face Plates and designation  
0 labels for the SuperNode Computing Module.

0 NTZZ01NA (Initial Enhanced Network Interface)

0 The NTZZ01NA contains the circuit packs for the initial interface  
0 of SuperNode to the Enhanced Network. Provide one (1) NTZZ01NA  
0 for each ENET shelf (i.e. port group) provisioned. The NTZZ01NA  
0 contains two (2) interface circuit packs.(i.e. 1 for each Message  
0 Switch).

0 NTZZ01PA (Intermediate Enhanced Network Interface)

0 The NTZZ01PA contains the circuit packs for the intermediate  
0 interface of SuperNode to the Enhanced Network. Provision  
0 NTZZ01PA per the worksheets provided in the ENET Building Block  
0 documents. The NTZZ01PA contains two (2) each interface circuit  
0 packs. (i.e. 1 for each Message Switch).

0 NTZZ01QA (Final Enhanced Network Interface)

0 The NTZZ01QA contains the circuit packs for the final interface  
0 of SuperNode to the Enhanced Network. Provide one (1) NTZZ01QA  
0 for each ENET shelf (i.e. port group) provisioned. The NTZZ01QA

0 NTZZ01ZA (Link Interface for FLIS)

0 The NTZZ01ZA contains the circuit packs for the Supernode Cabinet  
0 that is used to Interface Message Switch (0 and 1) to the Single  
0 Shelf LPP(Fiberized LIS(FLIS)).

0 SuperNode Building Block Provisioning

0 NTZZ01CA/UA/CB/UB - 4 Port Network & IOC Interface

0 If NTZZ01CA/UA/CB/UB is required, then provide as follows,

0  $\#NTZZ01CA/UA/CB/UB = \{(\#NM/4) + (\#IOC/8)\}$   
0 to be rounded up to the next integer.  
0 Each NM requires total of two ports. Each port must  
0 be on an adjacent slot.(one port out of 4 ports from each slot)

0 Each IOC requires one port out of four ports.

0 NTZZ01DA/VA/DB/VB - 4 Port LIM/LPP Interface

0 If NTZZ01DA/VA/DB/VB is required, then provide as follows,

0  $\# NTZZ01DA/VA/DB/VB = \{\# \text{ Link Interface Module Cabinets } / 2 \}$   
0 to be rounded up to the next integer.

0 NTZZ01EA - Interface Filler Face Plate

0 Provide NTZZ01EA as follows,

0  $\# NTZZ01EA = 9 - (NTZZ01CA + NTZZ01DA)$

0 NTZZ01ZA Link Interface for FLIS

0 If Single Shelf LPP(Fiberized LIS(FLIS) is provisioned, then  
0 provide (1) one NTZZ01ZA. Also Provision the cables for  
0 Inter\_MS links.

0 1.1.4 OFFICE LAYOUT INFORMATION

0  
0 The S/DMS cabinet will be shipped with the doors, shelves, circuit  
0 packs, FSP, and cooling unit installed. The bus bar will be in-  
0 stalled and appropriate connections will be made at the factory.  
0 The bulkheads form part of the Electromagnetic Compatibility(EMC)  
0 cage around the equipment and provide a place to mount filter  
0 PCBs and optional power filters. The rear of the cabinet is  
0 equipped with two removeable bulkhead panels near the bottom of  
0 the cabinet. When these panels are removed, the cabinet can be  
0 installed in, or removed from, a lineup equipped with horizontal  
0 cabling. The cabinet may be slid "FORWARD" only.

0 FLOOR LAYOUT

0 Aisle dimensions are derived to meet the requirements of central  
0 office environment for floor loading and heat dissipation.

0 - An installation which requires multiple cabinet line-ups has  
0 six foot maintenance aisles.

0 - Maintenance aisles between a cabinet line-up and a frame  
0 line-up are 4.5 feet wide.

0 Installations requiring a cabinet to be integrated into a frame  
0 line-up:

0 - Can only be applied to the front most or rear most line-up

0 - Cabinets and frames are aligned to be flush at the rear

0 Note that a mixed frame/cabinet configuration is in violation of  
0 NEBS. The Telco should confer with the Building Studies and In-  
0 stallation departments to confirm that the building floor can  
0 sustain the weight differential and to insure there is sufficient  
0 cooling available to cool the DMS office.

0 Refer to ECM600 for office layout restrictions when this cabinet  
0 is applied in a Cabinetized DMS lineup.

0 Note that, Richardson market floor layout may be different.

0 SWITCHBOARD CABLING RESTRICTIONS

0  
0 RELEASE 28.01  
0 93 12 03

0 Cabling restrictions between the Message Switch and the IOC and  
0 Network frames remain unchanged at 200 feet maximum.

0 RELEASE 28.01  
0 93 12 03

0 INITIAL OFFICES

0 Cabinets and frames will not be mixed in the same line-up. The  
0 cabinets will occupy the front line-up. The second line-up will  
0 contain the IOE frames (and others as convenient) and will have  
0 fronts facing the front of the office.

0 Aisle spacing between the first (cabinet) and second (frame)  
0 line-ups is 4.5 feet.

0 The reset terminals will be located in the equipment room to the  
0 front of the office with convenient visual and physical access to  
0 the IOE equipment.

0 SuperNode Retrofit(Upgrade)

0 There are three possible physical installations in decreasing or-  
0 der of convenience:

0 i) If possible, within the guidelines mentioned for initials, a  
0 new front line-up for the cabinet(s) should be started.

0 ii) Alternatively the existing front line-up can be extended  
0 laterally with the cabinet.

0 iii) The cabinet is temporarily located close to the CCC for in-  
0 stallation and commissioning. Following a successful cutover the  
0 cabinet(s) are relocated into the space vacated by the CCC, MEX  
0 frames.

0 For mixed line-ups the cabinet and frames are aligned to be flush  
0 at the back of the front line-up and should utilize a single cab-  
0 inet only (Combined Core Cabinet).

0 For option (iii) care must be taken to ensure that the  
0 retrofitted frames vacate sufficient space for the DMS-Core cabi-  
0 nets. Note that MSS frames should be considered as relocatable  
0 along with the retrofitted CCC and MEX frames.

0 It is recommended that a per site survey of retrofit sites be  
0 carried out jointly by Building Studies and Installation groups  
0 to ensure a feasible configuration is engineered.

0 RELEASE 28.01  
0 93 12 03

0 1.1.5 TRAFFIC TABLES

0  
0 Not applicable.

0 1.2 PRODUCT/SYSTEM SPECIFICATION0 1.2.1 PHYSICAL CHARACTERISTICS

0  
0 The following describes the characteristics of the NT9X01JB  
0 SuperNode S/DMS cabinet:

0 The -60V version of the unit features the same packaging and  
0 performance as the -48V unit. Presently Germany, is the only coun-  
0 try that requires -60V units.

0 Input Voltage.....-48VDC  
0 Power Consumption.....3525 watts (+/- 10%) fully equipped  
0 Current Drain.....73.0Amps

0 The current drain for CM and MS shelves is 20 amps per shelf

0 Each SLM draws 12.9 amps while running, and 18.7 amps during  
0 spin-up to operating speed.

0 POWER/HEAT DISSIPATION

0 The fully loaded cabinet heat dissipation is up to 3500 watts.

0 MECHANICAL DIMENSIONS

0 Height 72in. Width 42in. Depth 28in.

0 RELEASE 28.01  
0 93 12 03

0 Weight 1400lbs. (Full)

0 1.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 End panels are required to complete the EMC enclosure for cabinets located at the end of a lineup. In earthquake installations, the S/DMS cabinet must be bolted to the floor in four(4) places through anchor holes provided in the base of the cabinet. The cooling unit must be removed for access to the bolts. When the cabinet is bolted in place, the optional leveling feet must not be installed. Leveling will be accomplished through the use of non-conductive shims. The bolts must be tightened with a torque wrench to ensure adequate pretension.

0 For raised floor installations, a sub-structure support between the concrete sub-floor and the raised floor will be required. A qualified seismic engineer should be consulted regarding the required additional bracing.

0 1.2.3 SPARING INFORMATION

0  
0 One Spare Storage Cabinet (SSC) NT9X01FA can hold up to four Spares Shelves. The spares cabinet has one (1) always provided Spares Shelf (NT0X25AY); thus three (3) shelves are provisionable. One Spares Shelf (NT0X25AY) can hold 26 CPs and 4 Power Modules, as well as 26 Paddle Boards. Note that NT9X01FA has a rate chane pending. Use NTRX49AA for new offices.

0 For U.S. applications use standard sparing algorithms.

0 For Canadian and other applications the following may be used.

0 a) Version 2, C42 Cooling Unit:  
0 -----

0

0 Blowers 660,000 hrs MTBF in its useful life of 10 years.  
0 MTM cards 4,700,000 hrs MTBF  
0 Relay 100,000,000 hrs MTBF

0 Note that the blower's useful life is about 10 years. Around that  
0 time, failures are to be expected. Good practice might dictate  
0 replacement of operating blowers around that time (analagous to  
0 replacing your car's engine belts before they break).

0 1.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 Each shelf has four (4) power converters, two at either side of  
0 the shelf, mounted from the front.

0 Logic power distribution to the shelf electronics is from each  
0 power module to the corresponding half of the shelf.

0 Fuses are required as follows for NT9X01JB.

0 For powering from a standard 7' PDC  
0 -----

0 8 - 20 Amp fuses (MS,CM and SLM shelves)  
0 2 - 10 Amp fuses (for C42 cooling blowers)  
0 1 - 10 Amp Fuse (Alarm Battery Supply (ABS))

0 For powering from a CPDC  
0 -----

0 8 - 30 Amp fuses (MS,CM and SLM shelves)  
0 2 - 10 Amp fuses (for C42 cooling blowers)  
0 1 - 10 Amp Fuse (Alarm Battery Supply (ABS))

0 Refer to CA0X04 issue 01 20 and later for power cable informa-  
0 tion.

0 PDC feeds are connected to the cabinet via EMI feed through  
0 capacitors at the top of the frame. Cable and Drop Length shall  
0 be job engineered.

0 1.2.5 CURRENT DRAIN INFORMATION

0  
0 See Section, Physical Characteristics.

0 1.3 SOFTWARE PROVISIONING

0 The existing DMS-100 software is being 'ported' to run on the  
0 DMS-Core. The availability of system features (e.g. toll, tops,  
0 local, IBN etc) is phased over several BCS releases. Each major  
0 system feature will have a DMS-Core Verification Office (V.O.).

0 1.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

0 SUPERNODE 20 PRODUCT COMPONENT PACKAGES AND FEATURES

0

0 NTX960AA - DMS SUPERNODE BASIC - Master Package rated MD BCS-28.

0 NTX960AB - DMS SUPERNODE BASIC - Master Package rated MD BCS-28.

0 NTX960AC - DMS SUPERNODE BASIC - Master Package which includes:

0 NTX940AA - COMPUTING MODULE BILGE  
0 NTX941AA - COMPUTING MODULE COMMON BASIC  
0 NTX942AA - SUPERNODE SYSTEM LOAD MODULE  
0 NTX950AA - MESSAGE SWITCH BILGE  
0 NTX951AA - MESSAGE SWITCH COMMON BASIC  
0 NTXF70AA - SUPERNODE SN-20 PROCESSOR

0 NTX960AC is ordered in addition to all other master and feature  
0 packages that would be ordered for an equivalent NT-40. For ex-  
0 ample NTX003AB and NTX960AC are ordered for a Local Enhanced of-  
0 fice equipped with DMS-Core.

## 0 SUPERNODE SERIES 10 PRODUCT COMPONENT PACKAGES

0  
0 Offices provisioning the SuperNode Series 10 will require:

0 NTXD16AB - SuperNode (Series 10) Basic which contains packages

0 Note: The NTXD16AB and NTXF96AA (SN-10) packages are to be  
0 "Napped" (eg. cannot be ordered/delivered) in the BCS-35/36  
0 loads.

0 If an existing site is configured with a Series 10 processor, the  
0 customer is requested to contact the regional sales represen-  
0 tative for details on how to upgrade to a Series 20 processor or  
0 higher for BCS-35 and above loads.

0 NTXF96AA - Basic SuperNode (SN-10)Processor  
0 NTX940AA - Computing Module Bilge  
0 NTX941AA - Computing Module Basic  
0 NTX950AA - Message Switch Bilge  
0 NTX951AA - Message Switch Basic

0 Note - System Load Unit software must be ordered separately on  
0 SuperNode Series 10 Offices (SLM - NTX942AA).

## 0 SUPERNODE SERIES 30 PRODUCT COMPONENT PACKAGES

0  
0 Offices provisioning the SuperNode Series 30 will require:

0 NTXD17AB - DMSCore MC68030-33 MHz (Series 30) Processor Basic  
0 which contains packages

0 NTXF15AA - SuperNode MC68030-33MHz (Series 30)Processor  
0 NTX940AA - Computing Module Bilge  
0 NTX941AA - Computing Module Basic  
0 NTX942AA - SuperNode System Load Module  
0 NTX950AA - Message Switch Bilge  
0 NTX951AA - Message Switch Basic

0

0 Host - Central Control Equipment

0 RELEASE 28.01  
0 93 12 03

## 0 SUPERNODE SERIES 40 PRODUCT COMPONENT PACKAGES

0  
0 Offices provisioning the SuperNode Series 40 will require:

0 NTXD18AB - Series 40 Supernode-Basic which contains packages:

0 NTXF16AA - DMS-Core MC68030 40MHz Processor  
0 NTX940AA - Computing Module Bilge  
0 NTX941AA - Computing Module Basic  
0 NTX942AA - SuperNode System Load Module  
0 NTX950AA - Message Switch Bilge  
0 NTX951AA - Message Switch Basic

0 Note: For U.S. applications the SuperNode Series 40 is lim-  
0 ited for deployment and must have RTP Marketing approval prior to  
0 provisioning.

## 0 SUPERNODE SYNCHRONIZATION PACKAGES

0  
0 For offices requiring external clock synchronization to CCS or  
0 DCS standard, provide:

0 NTXF26AA - BITS Composite Master

0 NTXF27AA - Cesium, Loran Composite Master

0 For offices requiring external clock synchronization to  
0 Cesium/Rubidium Stratum I standard, provide the NTXF27AA package.  
0 Note that this package also supports Loran Composite Master clock  
0 source, but the necessary provisionable cable is not yet avail-  
0 able for the latter application.

0

0 RELEASE 28.01  
0 93 12 03

## 0 SYSTEM LOAD MODULE SOFTWARE

0  
0 SLM II requires software package NTXE54AA.

0 The Device Independent Recording Package(DIRP) on SLM is op-  
0 tional, and it is activated internally by the presence of package  
0 module DIRPSLM in NTXJ44AA - SLM File System.

## 0 BRISC

0  
0 The NT9X10AA 33 MHz 88000 BRISC CPU Circuit Pack is incompatible  
0 with the standard SuperNode BCS loads and requires a BCS load  
0 compiled for the BRISC card. The minimum software release that is  
0 required is BCS-BR33.

0 Software package NTXD25AA is required to support the NT9X10AA  
0 BRISC CPU.

## 0 AFFECTED SOFTWARE TABLES

0  
0 In general, initial office datafill will be accomplished in the  
0 same way for the DMS-Core as for the CCC. There are new data ta-  
0 bles associated with the CM and MS subsystems which are specific  
0 to the new hardware. Datafill of these tables will be detailed  
0 in the data schema associated with the CM and MS.

0 A dump and restore datatool will be available for core upgrades  
0 to transfer CCC data to a DMS-Core. Datatools will also be  
0 available to support DMS-Core to DMS-Core data transfer for BCS  
0 upgrades. Note that even with the CCC to DMS-Core datatools,  
0 some initial datafill of the new tables will be necessary.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 1.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 BCS33 and BCS34 DO NOT support the stand-alone STP. That is, it  
0 is limited to BCS32, and it will be supported with BCS35.

0 1.3.3 MEMORY PROVISIONING0 MS Memory Configuration and Software Loads.

| SOFTWARE | DESCRIPTION                       | MS MEMORY REQUIREMENT |
|----------|-----------------------------------|-----------------------|
| MS-S     | MS LOAD FOR JNET                  | REQUIRES 7MB          |
| MS-E     | MS LOAD FOR JNET/ENET/SSLPP/PH    | REQUIRES 10MB         |
| MS-I     | MS LOAD FOR JNET/ENET/SSLPP/SCPII | REQUIRES 16MB         |

| HARDWARE  | SOFTWARE RELEASE |      |      |
|-----------|------------------|------|------|
|           | MS-S             | MS-E | MS-I |
| 13DB/14BB | YES              | NO   | NO   |
| 13DC/14BB | YES              | YES  | NO   |
| 13DC/14DB | YES              | YES  | YES  |
| 13DD      | YES              | YES  | YES  |

0 1) PM Note: New SN DPCCs should not be provided with the NT9X14BB  
0 MS memory for BCS-31 and above loads. Also, Offices with Base-04  
0 (CSP-03) or higher shall have a minimum of 16M of memory and  
0 there will be only one common MS load.

0 RELEASE 28.01  
0 93 12 03

0 Memory Provisioning in CM

0 24 MByte memory cards are generally available to any SuperNode  
0 office. Provisioning of six (6) MByte memory cards in the Comput-  
0 ing Module (CM) are only available to STP offices. That is The  
0 NT9X14DB must only be the memory card used on the CM, except for  
0 the SuperNode of a non-integrated STP. The non-integrated STP can  
0 use NT9X14BB Memory CP on the CM if the S/W load fits.

0 \* Mixed 6 & 24 MByte systems require a minimum of  
0 BCS 25 and the NT9X13BB Processor CP.

0 \* Pure 24 MByte systems require a minimum of BCS 26,  
0 and NT9X13BC, Processor CP.

0 Note for Mixed memory offices, once a 24 Mbyte CP has been provi-  
0 sioned, no additional 6 Mbyte CP will be provided. In U.S., ref-  
0 erence System Engineering Bulletin (S.E.B 88-01-002) "DMS-100F  
0 Memory Administration Document" for detailed memory provisioning.

0 All offices must equip Memory CP to the following algorithm.  
0 Starting with 24 MByte CP for mixed offices, 1st. Slots 16F and  
0 23F, 2nd. 15F and 24F, 3rd. 14F and 25F, 4th. 13F and 26F, 5th.  
0 12F and 27F, 6th. 11F and 28F, 7th. 10F and 29F, 8th. 9F and 30F,  
0 9th. 8F and 31F, 10th. 7F and 32F.

0 BCS 26 offices (pure 24 Mbyte CP) Memory requirements are rounded  
0 as follows:

- 0 - Round up Memcalc values for Program Store (PS) to the  
0 nearest 8 Mbyte multiple.
- 0 - Add four (4) Mbytes to the Memcalc DS and round up to the  
0 nearest 8 Mbyte multiple.
- 0 - Add the rounded PS + the rounded DS, and then round up to  
0 the nearest 24 Mbyte multiple to determine number of circuit  
0 packs requirement.

0 Note the CP quantities should include a 10% administrative spare  
0 additional to the unrounded Memcalc PS + DS figures. Be sure to  
0 include one (1) 24 Mbyte CP as a reliability spare.

0 BRISC

0 Use of the NT9X10AA BRISC CPU will cause an increase in program  
0 store requirements of about 1.6 times the existing amount for

0 RELEASE 28.01  
0 93 12 03

0 68020 and 68030 processors. Some of this increased requirement  
0 will be offset by the additional memory on the NT9X10AA BRISC CPU  
0 CP.

0 The NT9X10AA BRISC CPU does not support the NT9X14BB 6MB memory  
0 packs. Existing NT9X14BB memory packs must be replaced by an  
0 equivalent amount of memory using NT9X14DB 24MB memory packs.

0 MEMCALC for Series 40 should be used for BRISC offices with soft-  
0 ware loads less than BCS34. MEMCALC for Series 50 should be used  
0 for BRISC offices with software loads BCS34 and greater.

#### 0 1.4 REAL TIME IMPACT

0 The NT9X13JA CPU 68020 20 MHz CP provides from 1.2 to 1.4 times  
0 the capacity of the NT-40 at introduction based on current stand-  
0 ards of benchmarking criteria.

0 The NT9X13BC is the baseline offered MC68020 based circuit pack,  
0 which provides 2.0-2.2 times capacity of the Central Control Com-  
0 plex (NT-40) based on the current standards of benchmarking cri-  
0 teria.

0 The NT9X13GA CPU 68030 33 MHz CP provides 1.4 - 1.5 times the  
0 real time capacity of the current NT9X13BC CPU circuit pack or  
0 2.9 - 3.0 times the capacity of the NT-40 at introduction based  
0 on current standards of benchmarking criteria.

0 The NT9X13HB CPU 68030 40 MHz CP provides 1.7 - 1.8 times the  
0 real time capacity of the current NT9X13BC CPU CP or 3.4 -3.8  
0 times capacity of the NT-40 at introduction based on current  
0 standards of benchmarking criteria.

#### 0 BRISC

0 The NT9X10AA BRISC CPU will provide a real-time performance gain  
0 of 2.5 times over the NT9X13BC CPU. The NT9X10AA may replace ex-  
0 isting 68020 and 68030 processor cards, provided the correspond-  
0 ing paddleboard is also replaced and a BRISC software load is  
0 utilized.

0  
0 RELEASE 28.01  
0 93 12 03

0 2.0 CCC Frames NT3X45EA and NT3X45EW

0 The CCC consists of a duplicated set of Central Processing Units  
0 (CPUs), Program Store (PS), Data Store (DS) and Central Message Control-  
0 lers (CMCs).

0 The duplicated MDC provided here is capable of interfacing all CPU pe-  
0 ripherals (NET & IOC) as CMC0:00 & CMC1:00. It can additionally  
0 interface directly to a limited number of I/O devices while function-  
0 ing as IOC:00 & IOC:01.

0 Caution: If used to interface Magnetic Tape Drive (MTD) as IOC:00 or  
0 IOC:01 then the CCC and MTC/IOE frames must be located adjacent to  
0 each other.

0 The duplicated CPM accommodates up to 7.75 M-Word of PS memory. No  
0 memory card is required for spare as a spare row of memory devices on  
0 the controller will serve as the "HOT" spare.

0 Program Store serves as a repository for the programs required for  
0 call processing, administration, maintenance, and the operating system.  
0 Data store contains the transient or per call information and the cus-  
0 tomer or office parameters.

0 RELEASE 28.01  
0 93 12 03

0 2.1.3 PROVISIONING CONSIDERATIONS

0 The NT3X45EW is a double bay frame consisting of two (2) identical Central Control Complex (CCC) bays. Each CCC has the following shelf designations;

| CCC bay 0       | CCC bay 1       | shelf<br>pos |
|-----------------|-----------------|--------------|
| NT3X45EW        |                 |              |
| MDC0:00         | MDC0:00         | 65           |
| CPM0:00         | CPM1:00         | 51           |
| FSP             | FSP             | 45           |
| DS0:00          | DS1:00          | 32           |
| FILLER PANEL    | FILLER PANEL    | 18           |
| DC COOLING UNIT | DC COOLING UNIT | 04           |

0 The Central Message & I/O Device Controller, MDC module is located on shelf mounting position 65. The bare shelf assembly does not become an MDC until the CCC is equipped with one (1) NT3X45EV, CCC Common CP. There are two (2) MDC per CCC.

0 The Central Processor & Memory, CPM module is located on shelf mounting position 51. The bare shelf assembly does not become a CPM until the CCC is equipped with one (1) NT3X45EV, CCC Common CP. There are two (2) CPM per CCC.

0 The Data Store, DS module is located on shelf mounting position 32. The bare shelf assembly does not become a DS until the CCC is equipped with one (1) NT3X45EV, CCC Common CP. The DS in position 32 can provide up to 15.75 M-Word of DS memory.

0

0 RELEASE 28.01  
0 93 12 03

0 1.0 Isolated System Grounding (ISG)

0 Presently, in the stocklist of most DMS-100F frames there is a  
0 busbar assembly called a logic return (where shelf logic grounds  
0 are connected) which runs vertically up but electrically isolated  
0 within each frame. This busbar is terminated with a braid con-  
0 nection to another copper busbar located above each frame called  
0 the frame ground. Each overhead frame ground busbar is connected  
0 to an adjacent frame's overhead busbar in an equipment lineup.  
0 Each lineup's frame ground is connected to a local Power Distrib-  
0 ution Center (PDC) where a final connection is made to the Cen-  
0 tral Office (CO) ground.

0 A new grounding topology is being applied to DMS family systems.  
0 The basic principles of the new grounding system are as follows:

- 0 1. The logic return is to be isolated from the framework ground  
0 overhead busbar.
- 0 2. Miscellaneous hardware such as HP MTDs, Digital Alarm Scanner  
0 (DAS) etc. must be electrically isolated from the framework upon  
0 which they are mounted.
- 0 3. Individual frame line ups must be electrically isolated by the  
0 use of isolation hardware.
- 0 4. LCE, RLCM, LME, RLM, ISLM and TME frames have the logic return  
0 referenced to the battery return at the frame.

0

0

0

0

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 5. When ISG is being applied to an office, LCE frames and their associated controller frames (i.e. LGE/LTE/RCE/RCME/SME) must be served by the same PDC frame.

0 Similarly, the MS7E frames and their associated ST7E frames must be powered from the same PDC frame. However, the MS6E frames and the ST6E frames do not need to be powered from the same PDC frame.

0 In an ISDN application, the ISLM and the IAC controller frame must be grouped together on the same PDC frame.

0 In addition, the LTE, LGE, DTE, RCE, SME, RCME, IAC, MS7E and ST7E frame logic returns must be connected to the battery return plate of the same PDC from which they are powered.

0 Also, the CCC, MEX, IOE, MOE, Dedicated MIS, and Supernode frames must all be cabled to the same LRB. This LRB shall be located above the IOE frame, and dedicated to the above mentioned frames only. No other frame type can ever be cabled to this particular LRB. Other frame types in the same lineup must be cabled to a separate LRB. Both of these LRBs must be separately cabled to the LRE.

0 6. Only current loop VDU or printers may be connected directly to the IOC modules. Current loop devices may be powered from non-isolated inverters located in Standard MIS Frames.

0 EIA ports (for VDU or printers) must be connected through modems. No direct connections from VDU or printers to EIA ports are allowed. (Note - If a local EIA modem to modem arrangement is desired, both the DMS modem and the device end modem cannot co-exist in DMS frames. The device modem must be located away from any DMS frame.) The device end modem may be powered from a non-isolated inverter located in a Standard MIS Frame. However, the DMS modem must be powered from an isolated inverter located in a Dedicated MIS/Modem Frame. This Dedicated MIS/Modem Frame can only contain modems and the inverters used to power these modems.

0 RELEASE 28.01  
0 93 12 03

- 0 7. For the isolation of modem equipment, the following provisioning  
0 guidelines must adhere;

0 CANADIAN APPLICATIONS - (Host & Remote Offices)

0 Provision modem shelves on either an Input/Output Equipment Frame  
0 (IOE) or a Modem Equipment Frame (MOE). Refer to ECM 321 for  
0 provisioning guidelines on the Modem Equipment frame. For mount-  
0 ing modems on IOE frames the following rules apply:

0 1) DC Modem Shelves must be isolated from the equipment frame  
0 and the shelf chassis must be connected to the logic return  
0 busbar. One (1) NT4X2591 Data Unit Grounding and Mounting  
0 Hardware Kit must be provided per DC modem shelf provisioned  
0 to isolate the shelf from the frame and to connect the chas-  
0 sis to the logic return busbar. The DC modem shelves must be  
0 fused directly to the PDC.

0 2) AC Modem Shelves must be powered from an inverter that is  
0 mounted on the same frame. The inverter must be isolated  
0 from the framework and its chassis must be connected to the  
0 logic return busbar. Provision one (1) NT0X0009 Cable assem-  
0 bly for an inverter located in position 04 on an IOE frame.  
0 Provision one (1) NT0X4306 Cable Assembly for an inverter lo-  
0 cated in any other position on the IOE Frame.

0  
0 U.S. APPLICATIONS - (Remote Offices)

0 Initial Remote offices (RLCM,RLM,RSC) can provide modem equipment  
0 and associated inverters in any RME/RSE frame only if a logic  
0 ground bar is provisioned with the frame. Note that  
0 modems,VDU,printers or other devices connected to modems (through  
0 the EIA connection) must be powered from isolated DMS-100F sup-  
0 plied inverters. For the modems and inverters in a Remote Of-  
0 fice, apply the same grounding rules that are used in Host  
0 Offices.

0 93 12 03  
0

0 U.S. APPLICATIONS - (Host Offices)

0 Provision modem equipment on a Miscellaneous Equipment Frame  
0 (MIS), NT0X02AB, dedicated for modem equipment, and enhanced for  
0 ISG as follows;

0 | 1) A Ground Material Assembly, NT0X9594, which contains a logic  
0 return busbar must be provisioned for each MIS Frame that is  
0 dedicated for modem equipment.

0 2) DC Modem Shelves must be isolated from the equipment frame  
0 and the shelf chassis must be connected to the logic return  
0 busbar. One (1) NT0X0050 Modem Shelf Grounding Hardware Kit  
0 must be provided per DC modem shelf to isolate the shelf from  
0 the frame and to connect the chassis to the logic return  
0 busbar.

0 3) AC Modem Shelves must be isolated from the equipment frame  
0 and the shelf chassis must be connected to the logic return  
0 busbar. One (1) NT0X0050 Modem Shelf Grounding Hardware Kit  
0 must be provided per AC modem shelf to isolate the shelf from  
0 the frame and to connect the chassis to the logic return  
0 busbar.

0 AC Modem Shelves must be powered from an inverter that is  
0 mounted on the same frame. The inverter must be isolated  
0 from the framework and its chassis must be connected to the  
0 logic return busbar. Provision one (1) NT0X0009 Cable assem-  
0 bly per NT0X87AA inverter or one NTMX1665 isolation kit per  
0 LaMarche inverter located in a MIS frame.

0 4) The Digital Alarm Scanner (DAS) unit must be mounted on a  
0 Dedicated MIS/Modem Frame enhanced for ISG. The DAS unit  
0 must be isolated from the equipment frame and the unit chas-  
0 sis must be connected to the logic return busbar using a  
0 NT0X9502 cable assembly.

0 5) Common Equipment Shelves must be isolated from the equipment  
0 frame and the shelf chassis must be connected to the logic  
0 return busbar. For this purpose, one (1) NT0X0009 cable as-  
0 sembly has been provided in the stocklist of each common  
0 equipment shelf.

0 Common Equipment Shelves must be powered from an inverter  
0 that is mounted on the same frame. The inverter must be iso-  
0 lated from the framework and its chassis must be connected to  
0 the logic return busbar. Provision one (1) NT0X0009 Cable

0  
0 RELEASE 28.01  
0 93 12 03

0 assembly per NT0X87AA inverter or one NTMX1665 isolation kit  
0 per LaMarche inverter located in a MIS frame.

0 RELEASE 28.01  
0 93 12 03

0 8. If a Supernode is equipped with the Enhanced RTIF circuit pack (NT9X26AB) and the 20mA current loop local port is used, an approved 20mA current loop equipped VDT can be cabled directly to the Supernode RTIF. This connection is ISG compliant. (NOTE: The local port of the Enhanced RTIF circuit pack (NT9X26AB) can be used as either a 20mA current loop or RS232C EIA port.)

0 If the Supernode is equipped with the NT9X26AA RTIF circuit pack or the RS232C local port of the NT9X26AB is used, the following paragraph still applies to maintain ISG compliance:

0 RTIF terminals connected to a Supernode via EIA must be connected through back to back modems or RAD units (U.S. Only). In addition, the terminal and the stand alone modem must be powered from an inverter mounted on a MIS frame, See Figure 1.  
0 NT recommends provisioning one (1) inverter for each RTIF terminal, and these inverters shall alternate between A-power and B-power.

0 Figure 1: RTIF Terminal Connection

0 RELEASE 28.01  
0 93 12 03  
0

0 9. Digital Packet Network (DPN) equipment that is colocated with DMS  
0 equipment must conform to the DMS Family grounding requirements:

- 0 - signal ground isolated from framework
- 0 - battery return isolated from framework
- 0 - framework isolated from incidental ground

0 DPN equipment power must be obtained from a source referenced to  
0 the DMS ground window.

0 Also, DPN equipment requires its own separate FBE and LRE.

0 10. Provide cable braid assy NT0X9587 and hardware NT4X0040 for the  
0 NT4X00AF shelf's first DDU if its serving NT1X55DA IOC circuit  
0 pack is in the same frame as the DDU Shelf.

0 Provide cable braid assy NT0X9501 and hardware NT4X0040 for the  
0 NT4X00AF shelf's second DDU if its serving NT1X55DA IOC circuit  
0 pack is in the same frame as the DDU Shelf.

0 When the serving NT1X55DA IOC CP is in a different frame from  
0 the DDU Shelf, refer to CA0X15 item 1AZ.

0 11. The LIM Frame logic ground is to be referenced to the LIM LRB  
0 when it is located in a DMS-100 frame equipment row utilizing  
0 DMS-100 frame style cable troughs. When the LIM is located in a  
0 typical equipment row with Supernode frames only, reference the  
0 logic ground to the LRB which is located above each LIM cabinet.  
0 Provide NT0X0008 ground straps to be used to strap the logic  
0 grounds of each succeeding LIM cabinet to the preceeding LIM cab-  
0 inet beside it.

0 12. For the isolation of SCP equipment, the following provisioning  
0 guidelines must adhere;

0 CANADIAN APPLICATIONS (SCP Offices)

0 1) Service Control Point (SCP) MIS frames containing Lan Inter-  
0 face Units (LIU) and associated modem equipment shall be  
0 treated as a separate equipment lineup with respect to Logic  
0 Return and be referenced to a separate LRB. Each SCP MIS  
0 Frame containing an LIU must have its frame Logic Return Bar  
0 referenced back to the LRB over the MIS frame containing the  
0 modems that serve it. No other equipment may share or be as-

0 RELEASE 28.01  
0 93 12 03  
0

0 sociated with LIU Modems or its LRB. DC-AC inverters used to  
0 power modems and LIU equipment must be located within DMS MIS  
0 frames. MIS frames equipped with LIU and associated modems  
0 must not be used to contain non-LIU equipment.

0 2) All SCP and DNC equipment shall be powered from the same DC  
0 Power Plant. All AC powered equipment and facilities inter-  
0 facing with DMS must conform with ISOX07ZA.

0 3) For raised floor applications, the floor framework shall be  
0 referenced to the Integrated Collector Bus (ICB) from diag-  
0 onal points with at least two (2) #6 Awg cables. For floor  
0 mounted applications, the metallic pedestals associated with  
0 the DNC equipment must be isolated from any incidental con-  
0 tact with ground in accordance with DMS specifications.

0 4) The DNC FBE is local to the DNC equipment and is intended to  
0 serve as a collector point for all DNC cables that must be  
0 connected to the SPG. It is intended to facilitate cabling  
0 whenever the DNC equipment is located away from SPG or quan-  
0 tity of cables to be terminated is large. DMS FBE cables can  
0 not be referenced to the DNC FBE or vice versa since the DNC  
0 operates as a separate entity. However, it may be omitted and  
0 cables taken directly to the SPG if the specific configura-  
0 tion permits.

0 5) All signal interconnections, such as RS232, within DMS or be-  
0 tween DMS and any other equipment must be configured to avoid  
0 metallic connections that form ground loops.

0 6) The ICB is an isolated copper busbar that serves as a ground  
0 reference point for all non-DMS metallic objects that are  
0 within 2 meters (7 ft.) of DMS but originate outside the DMS  
0 area and are not already connected to the SPG. All sections  
0 of cable rack and auxilliary framing shall have all sections  
0 that are located within 7 ft. of DMS electrically connected  
0 to adjacent sections and bonded to the ICB. Bonding between  
0 adjacent sections may be accomplished by using a #6Awg cable  
0 and two hole lug terminated at each end to a paint free,  
0 clean and dry area on each section, or other approved mechan-  
0 ical methods. An oxide inhibiting compound such as Burndy  
0 NO-OX-ID shall be applied to each connection. This bonding  
0 together forms a continuous electrical path. The closest sec-  
0 tion to the ICB shall be connected to the ICB with #6Awg ca-  
0 ble and two hole lugs.

0 RELEASE 28.01  
0 93 12 03  
0

0 13. The preferred method for new installations of Maintenance and Ad-  
0 ministration Positions (MAP) is to locate the MAP in the Common  
0 Bonding Network (IMAP). The alternative installation method is to  
0 locate the MAP in the Isolated Bonding Network (MAP). It is re-  
0 commended that the IMAP be located on the same floor with the DMS  
0 and grounded to the DMS-SPG. When providing MAP/IMAP equipment,  
0 the following provisioning guidelines must adhere:

0 CANADIAN and U.S. APPLICATIONS (MAP/IMAP)

- 0 1) MAP PAC poles must be isolated from foreign grounds such as  
0 walls, ceilings, non-DMS metallic objects. Applies to ISG  
0 and NON-ISG offices.
- 0 2) IMAP PAC poles must be isolated from DMS, referenced to  
0 non-DMS essential or protected A.C. ground through the PAC  
0 pole green wire. Isolation from foreign grounds is not re-  
0 quired. Applies to ISG and NON-ISG offices.
- 0 3) MAP and IMAP PAC poles cannot be fed from two A.C. sources  
0 simultaneously.
- 0 4) IMAP furniture must be isolated from DMS and grounded to the  
0 C.O. Ground Bus when DMS inverters are required when RS-232  
0 communications are used. Applies to ISG and NON-ISG offices.
- 0 5) MAP furniture must be isolated from foreign grounds and  
0 grounded to the DMS SPG. Applies to ISG and NON-ISG offices.
- 0 6) All communication links between IBN and CBN equipment should  
0 be made by using AC coupled subsystems such as back to back  
0 modems, isolation transformers, current loops or fiber optic  
0 links.
- 0 7) IMAP/MAP communication links shall be current loop or modem  
0 to modem. In NON-ISG offices, power for the MAP can be ob-  
0 tained from the DMS inverters or protected AC providing the  
0 feeder for the protected A.C. is referenced to the DMS SPG.  
0 All communication links to and from Isolated Bonding Network  
0 (IBN) equipment shall be A.C. coupled. When modem to modem  
0 connection connects equipment in different buildings, the  
0 modem line should be protected against exposure to power con-  
0 tact or lighting activity.
- 0 8) A.C. power for the MAP shall be obtained from within the IBN  
0 DMS-based inverters preferably located in a MIS frame and  
0 referenced to Framework Bonding Bus (FGB).

0  
0 RELEASE 28.01  
0 93 12 03

0 9) A.C. power for the IMAP shall be obtained from within the  
0 Common Bonding Network (CBN). If the customer requires pro-  
0 tected AC for the IMAP equipment it shall be provided by us-  
0 ing an inverter, or an inverter with AC transfer switch, or a  
0 UPS system. If the inverter is used, the Battery Return (BR)  
0 and -48V lead shall be insulated from any part of the IMAP  
0 CBN unless fed from a power plant dedicated to CBN equipment  
0 or unless the BR bus of the power plant is used as the DMS  
0 SPG.

0 10) The IMAP furniture is to be referenced to a recognized  
0 grounding bus such as the closest Framework Bonding Network  
0 (FBN). This bus shall be located outside of the DMS SPG.  
0 IMAP shall not share the same enclosed floor area with the  
0 MAP. If this is requested by the customer, the 2 meter rule  
0 must be adhered to.

0 11) A PAC pole shall not be fed from two AC power sources  
0 simultaneously unless they originate from the same AC panel  
0 and are controlled by a double pole breaker. For U.S. instal-  
0 lations, the AC wiring of PAC poles and inverters shall be  
0 fixed wiring in accordance with NEC rules for facility wir-  
0 ing.

0 System Application Engineering is to provision the VDU's,  
0 printers, and IMAP/MAP furniture. Building Studies will fur-  
0 nish the PAC pole, conduit, wiring, miscellaneous hardware,  
0 etc.

0 14. COMMERCIAL AC FREE (Canada and U.S. Applications)

0 The Commercial AC Free System is being introduced to allow the  
0 installation and reconfiguration of DMS-100 switching systems in  
0 which no commercially derived AC power is permitted within the  
0 DMS-100 switching system.

0 Commercial AC Free system has three major componets which are:

0 Center Aisle Lighting  
0 Low voltage controlled lighting  
0 Inverter powered end aisle outlets

0 The Center Aisle Lights are isolated from the DMS switching  
0 equipment and controlled by low voltage relays operated by  
0 switches mounted on the end guards. End aisle recepticals are  
0 powered from LaMarche inverters mounted in MIS frames located in  
0 every other lineup. Base outlets are not provided or supported by  
0 AC Free.

0 AC Free can be applied to both ISG and NON-ISG grounded systems.  
0 Existing offices with DMS frame mounted lighting can be converted  
0 to AC Free lighting by removing commercial AC circuits for light-  
0 ing and base outlets, replacing end guard assemblies and install-  
0 ing inverters and MIS frames as required.

0 In an AC Free system no Alternating Current Equipment Ground  
0 (ACEG) conductor, enclosure, raceway, box or fitting containing  
0 an ACEG conductor that is connected to the commercial AC system  
0 shall be allowed to be bonded to any part of the IBN equipment.  
0 Center aisle lighting with low voltage control switching or cus-  
0 tomer provided lighting not connected to the DMS equipment is a  
0 prerequisite for the AC Free option.

0 The recommended configuration for AC outlets is to locate  
0 LaMarche 500 watt inverter in a MIS frame in every odd lineup.  
0 Standard (brown) AC outlets shall be installed on the end guards  
0 of every odd lineup along with optional low voltage control  
0 switch.

0 If the AC Free option is to be provided, the MIS frame and  
0 inverters are to be provisioned by the SAE. The end guards, cen-  
0 ter aisle lighting, low voltage control, switches, outlets, etc.  
0 are to be provisioned by Building Studies.

0 1.1.3 PROVISIONING CONSIDERATIONS

0

0 ISG shall be applied to all new Host and Remote DMS-100F offices.

0 Existing U.S. offices have the option of provisioning ISG or  
0 maintaining the current office grounding method. Refer to the  
0 ISG UPGRADE Section in this ECM for information on upgrading ex-  
0 isting offices to ISG (Isolated System Grounding). Also, refer  
0 to availability reports to identify valid ordering dates.

0 For all other extensions to offices that use old grounding meth-  
0 ods, Isolated System Grounding will not be applied. The office  
0 will be extended using current grounding methods.

0 ISG will initially be applied to non-EMI offices. This document  
0 will be updated when information is available on ISG for EMI of-  
0 fices.

0 Provisioning - Non-ISG Method

0 Prior to the implementation of ISG, DMS frames were equipped with  
0 (always provided) ground straps that tied the logic return ground  
0 to the frame ground. These straps have now been removed from the  
0 frame stocklist and are now provisionable. When ISG is being ap-  
0 plied, these straps do not have to be provisioned. When extending  
0 an office using old grounding methods, these straps must be pro-  
0 visioned per Table A.

0

0 Table A

0 Frames not included above have no Logic Ground Bus Bar assembly  
0 as part of their frame stocklist. As a result, no provisionable  
0 cable assembly is required.

0 \* For U.S. offices, these frames do not require the provisionable  
0 cable assembly when extending a non-ISG office with current  
0| grounding methods. Instead a provisionable switchboard cable is  
0 run from the Logic Ground bus bar assembly in each frame to the  
0 PDC battery return plate. (Refer to item 1GZ in the switchboard  
0 cabling section of this ECM)

0 PROVISIONING - ISG METHOD

0 ISG provisioning is divided into two (2) sections; Logic Return  
0 and Frame Ground Return.

0 1. Logic Return

- 0 i. Each equipment row must have a Logic Return Busbar (LRB) provi-  
0 sioned for connection of logic return. If the following frames  
0 exist in a lineup, provision a LRB for that lineup.

| 0 | ABBR    | DESCRIPTION                                   |
|---|---------|-----------------------------------------------|
| 0 | # MIS   | - Miscellaneous Equipment Frame               |
| 0 | CCC     | - Central Control Complex                     |
| 0 | MEX     | - Memory Extension Frame                      |
| 0 | MTC     | - Mag Tape Center                             |
| 0 | IOE     | - Input Output Eqpt Frame                     |
| 0 | DCE     | - Digital Carrier Eqpt Frame                  |
| 0 | CCC     | - Central Control Complex                     |
| 0 | MEX     | - Memory Extension Frame                      |
| 0 | N6E     | - No. 6 Signalling Frame                      |
| 0 | TAE     | - Test Access Eqpt Frame                      |
| 0 | NETC    | - Network Combined Frame                      |
| 0 | * DTE   | - Digital Trunk Eqpt Frame                    |
| 0 | MS6E    | - Message Switch 6 Eqpt Frame                 |
| 0 | SCSE    | - Simplex Cell Site Eqpt Frame                |
| 0 | DME     | - Data Modem Expansion Frame                  |
| 0 | DSNE    | - Double Shelf Network Frame                  |
| 0 | DPCC    | - Supernode Cabinets                          |
| 0 | SCC     | - Supernode SE Combined Cabinet               |
| 0 | ENET    | - Enhanced Network                            |
| 0 | LIM/LPP | - Link Interface Module/Link Peripheral Proc. |

0 \* (applicable only on DMS-200,DMS-250 offices)

0 # (applicable to U.S. offices on MIS frames dedicated to  
0 modem equipment)

0 The LRB must never be mounted above a PDC frame or above the  
0 first frame of an eqpt row (with the exception of a single frame  
0 line-up).

0 RELEASE 28.01  
0 93 12 03

0 The CCC, MEX, IOE, MOE, Dedicated MIS, and Supernode frames must  
0 all be cabled to the same LRB. This LRB shall be located above  
0 the IOE frame, and dedicated to the above mentioned frames only.  
0 No other frame type can ever be cabled to this particular LRB.  
0 Other frame types in the same lineup must be cabled to a separate  
0 LRB. Both of these LRBs must be separately cabled to the LRE.

0 All LRB will terminate to the Logic Return Equalizer assembly  
0 (LRE).

0 Each LRE provides termination capabilities for 14 eqpt rows. A  
0 busbar extension plate assembly (NT0X0017) may be provisioned for  
0 each additional 14 equipment rows required.

0 ii. The following list of frames require a logic return connection  
0 direct to the LRE assembly.

| 0 | ABBR    | DESCRIPTION                                   |
|---|---------|-----------------------------------------------|
| 0 | LIM/LPP | - Link Interface Module/Link Peripheral Proc. |

0 Only the first LIM cabinet in an equipment row requires a logic  
0 return connection direct to the LRE assembly. For each succeed-  
0 ing LIM cabinet, provide one (1) NT0X0008 ground strap.

0 iii. The following list of frames require a logic return but do not  
0 require a connection to the LRB. Instead, a switchboard cable is  
0 run from the Logic Ground Bus Bar assembly at each frame to the  
0 PDC battery return plate which supplies their power.

| 0 | ABBR  | DESCRIPTION                                |
|---|-------|--------------------------------------------|
| 0 | LTE   | - Line Trunk Equipment Frame               |
| 0 | LGE   | - Line Group Equipment Frame               |
| 0 | * DTE | - Digital Trunk Equipment Frame            |

0 iv. The following list is the remainder of frames which either A)  
0 have no logic return and thus no connection to the LRB or B) have  
0 the logic return referenced to the battery return of the frame  
0 and thus circumvent connection to the LRB. No provisioning  
0 action is required to terminate the logic return to any frame  
0 listed below.

0 (A) FRAMES WITHOUT A LOGIC RETURN

| 0 | ABBR | DESCRIPTION                          |

| 0 | RLM  | - Remote Line Module Eqpt Frame         |

0  
0 2. Framework Ground

0 In each equipment row the framework grounds are consecutively  
0 terminated to the overhead busbars. Each equipment row requires  
0 a switchboard cable to the Framework Bonding Equalizer (FBE)  
0 splice plate assembly in the following arrangement:

0 For equipment rows not containing a PDC, the first overhead  
0 busbar (located above the first frame) in each lineup is  
0 cabled to the FBE splice plate assembly.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 For equipment rows containing a PDC, the overhead busbar  
0 (located above the PDC) is cabled to the FBE splice plate  
0 assembly regardless of location within the equipment lineup.

0 PROVISIONING HARDWARE - HOST OFFICE

0 The following is a list of hardware required for Isolated System  
0 Grounding (ISG):

0 NT0X00BB - ISG Label

0 Provision one (1) per host office. ISG label to be placed at the cen-  
0 ter left hand side of Frame Supervisory Panel (FSP) at Power Distrib-  
0 ution Center - 00 (PDC 00). (Provisioned by Equipment Application  
0 Engineering)

0 NT0X00ZA - Splice Plate Assemblies

0 Provision one (1) per host office. Provides hardware for Logic Return  
0 Equalizer (LRE) and Framework Bonding Equalizer (FBE) Splice Plate As-  
0 semblies.

0 Provide one (1) NT0X00ZA for Digital Packet Network (DPN) equipment  
0 colocated with DMS-100 Family equipment.

0 The DPN LRE and FBE busbars shall be located in close proximity to the  
0 DMS LRE and FBE busbars.

0 The DMS LRE and FBE will mount adjacent to cable trough. The NT0X00ZA  
0 provides capability to terminate 14 equipment rows requiring logic  
0 ground (not every row will require logic ground) and 14 equipment rows  
0 requiring frame ground (every equipment row will require frame  
0 ground). Equipment rows physically broken by a column shall be con-  
0 sidered as separate equipment row with respect to ISG. (Provisioned  
0 by Building Studies Engineering)

0 NT0X00WA - Splice Plate Assembly

0 Provision one (1) per host office equipped with DNC equipment. The  
0 NT0X00WA is an Framework Bonding Equalizer (FBE) specified for DNC  
0 equipment only. The DNC framework and logic ground are tied together  
0 and therefore must be kept separate from DMS equipment grounds. No DMS  
0 equipment ground cables may be referenced to DNC-FBE or vice versa.  
0 The DNC-FBE is to reference the same SPG as associated host office  
0 equipment.

0  
0 RELEASE 28.01  
0 93 12 03

## 0 NT0X0013 - Isolation Hardware

0 Provision Isolation Hardware for each mounting screw required for all  
0 Miscellaneous frame mounted equipment. Quantity will vary with the  
0 number of mounting holes required. Some NT manufactured miscellaneous  
0 equipment have had their stocklist updated to always provide the Iso-  
0 lation Hardware. Review the Miscellaneous Frame Equipment section of  
0 this document for a complete list. (Provisioned by Equipment Applica-  
0 tion Engineering)

## 0 NT0X0015 - Logic Return Busbar Assembly (LRB)

0 One (1) LRB is provisioned per equipment row equipped with frames re-  
0 quiring logic return. Each LRB can terminate up to 10 equipment bays  
0 (maximum five (5) bays on either side of the LRB). LRB assemblies may  
0 be multiplied together in a single equipment row to accommodate longer  
0 line-ups. The furthest point of the logic return run from the LCE  
0 splice plate to the last equipment frame requiring logic shall not ex-  
0 ceed 28.4 MT. LRBs are located at "convenient" locations above each  
0 line-up not above PDC or over first frames in eqpt rows except single  
0 bay lineups. (Provisioned by Building Studies Engineering)

## 0 NT0X0017 - Busbar Hardware (LRE &amp; FBE extension plate assemblies)

0 Provision one (1) NT0X0017 for each additional 14 equipment rows be-  
0 yond the original capacity supplied in NT0X00ZA. (Provisioned by  
0 Building Studies Engineering)

## 0 NT0X0018 - Cable Termination Hardware

0 One (1) NT0X0018 is provisioned for each application as follows;

- 0 - each FBE connection to the first frame/PDC in line up
- 0 - each LRB to LRE connection

0 (Provisioned by Equipment Application Engineering)

0

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 NT0X0042 - Cable Termination Hardware

0 One (1) NT0X0042 is provisioned for each DMS frame (from the Logic  
0 Ground Busbar assembly) to LRB connection requiring logic return.  
0 (Provisioned by Equipment Application Engineering)

## 0 NT0X0043 - Cable Termination Hardware

0 One (1) NT0X0043 is provisioned for each DMS frame (from the Logic  
0 Ground Busbar assembly) to PDC connection requiring logic return.  
0 (Provisioned by Equipment Application Engineering)

## 0 NT0X0020 - Cable Termination Hardware

0 One (1) NT0X0020 is provisioned for each LRB to LRB connection (for  
0 long equipment row application).

0 PROVISIONING HARDWARE - REMOTE OFFICE

0 The following is a list of hardware required for Isolated System  
0 Grounding (ISG):

0 NT0X000A - ISG Label

0 Provision one (1) per remote office. ISG label to be placed at the  
0 center left hand side of Frame Supervisory Panel (FSP) at Power Dis-  
0 tribution Center - 00 (PDC 00/RME 00). (Provisioned by Equipment Ap-  
0 plication Engineering)

0 NT0X0021 - FBE Remote Splice Plate Assembly

0 Provision one (1) per remote office. Provides hardware for Framework  
0 Bonding Equalizer (FBE) Splice Plate Assembly.

0 The DMS FBE will mount adjacent to cable trough. The NT0X0021 pro-  
0 vides capability to terminate six (6) equipment rows requiring frame  
0 ground (every equipment row will require frame ground). Equipment rows  
0 physically broken by a column shall be considered as separate equip-  
0 ment row with respect to ISG. Also, colocated ISG remotes can share a  
0 FBE splice plate assembly. (Provisioned by Building Studies Engineer-  
0 ing)

0 NT0X0013 - Isolation Hardware

0 Provision Isolation Hardware for each mounting screw on all miscella-  
0 neous frame-mounted equipment requiring isolation from framework.  
0 Quantity will vary with the number of mounting holes required. Some  
0 NT manufactured miscellaneous equipment have had their stocklist up-  
0 dated to always provide the Isolation Hardware. Review the Miscella-  
0 neous Frame Equipment section of this document for a complete list.  
0 (Provisioned by Equipment Application Engineering)

0 NT0X0018 - Cable Termination Hardware

0 One (1) NT0X0018 is provisioned for each application as follows;

0 - each FBE connection to the first frame/PDC in line up

0 (Provisioned by Equipment Application Engineering)

0 RELEASE 28.01  
0 93 12 03

0 Digital Carrier Equipment Frame (DCE) Provisioning (NT0X46AB)

0 The Logic ground bus bar assembly has been removed from the stocklist  
0 of the DCE frame and is now a provisionable item. As a result, the  
0 following items must be added to DCE provisioning;

0 NON-ISG APPLICATIONS

| 0 | PEC      | DESCRIPTION                       |
|---|----------|-----------------------------------|
| 0 | NT0X46AB | - Digital Carrier Equipment Frame |
| 0 | NT0X9504 | - Bus Bar Assembly                |
| 0 | NT0X0009 | - Cable Assembly (non-ISG)        |

0 ISG APPLICATIONS

| 0 | PEC      | DESCRIPTION                       |
|---|----------|-----------------------------------|
| 0 | NT0X46AB | - Digital Carrier Equipment Frame |
| 0 | NT0X9504 | - Bus Bar Assembly                |

0 Digital Carrier Module (DCM) and circuit pack provisioning remain un-  
0 changed for ISG or non-ISG.

0 NOTE: If the NT0X46AB equipment frame is configured as a Trunk Module  
0 Equipment Frame (TME), it is not necessary to provision the  
0 preceding equipment.

0 PDC Equalizer Cables

0 Each PDC provides an interface between A and B primary distribution  
0 feeders and up to 150 individual load within the DMS-100F. In non-ISG  
0 systems where more than one (1) PDC is provisioned, the primary dis-  
0 tribution battery return feeders are interconnected with 750 MCM ca-  
0 bles at the PDC to equalize the potential differences. In DMS-100F  
0 offices with ISG the 750 MCM equalizer cables are no longer required.

0 Power Plant Provisioning

0 In Canadian applications, the power plant engineering is subcontracted  
0 to the Power Division by means of a Power Division Subcontract Memo.  
0 The Customer Engineer must specify on this memo whether or not Iso-  
0 lated System Grounding is to be applied to the office. The Power Di-

0  
0 RELEASE 28.01  
0 93 12 03

0 vision is responsible, in an office equipped with ISG, for the cabling  
0 from the DMS-Ground Window to the LRE and FBE plates.

0 SWITCHBOARD CABLING REMARKS

- 0 Item 1GZ - Provide qty (1) NT0X0043 cable termination hardware.
- 0 Item 1HE - For eqpt rows with PDC frames, run from PDC frames. For  
0 eqpt rows without PDC frames, run from first frame in eqpt  
0 row. Provide qty one (1) NT0X0018 cable term hardware.  
0 In Remotes, run from PDC or RME frame.
- 0 Item 1HF - Provide qty one (1) NT0X0018 cable term hardware.
- 0 Item 1HG - Multiple of item 1HF. Provide qty one (1) NT0X0020 cable  
0 term hardware.
- 0 Item 1HH - Maximum cable length 4.60 meters. For a Dedicated MIS or  
0 MOE Frame the maximum cable length is 15.0 meters.  
0 Provide qty one (1) NT0X0042 cable term hardware.
- 0 Item 1JC - Provide qty (1) NT0X0020 cable termination hardware.
- 0 Item 1JD - Provide qty (1) NT0X0020 cable termination hardware.
- 0 Item 1HN,1HP,1HQ,1HR,1HS,1HT,1HU,1HV - These items are for  
0 application of Isolated System  
0 Grounding to Digital Packet  
0 Network equipment located with  
0 DMS equipment.
- 0 Item 1HN - Provide 2 terminal lugs A0297944, 2 screws P0689176 and 2  
0 washers P0183152.
- 0 Item 1HP - Multiple cable of item 1HN. Provide 2 terminal lugs  
0 A0297943, 2 screws P097F814 and 2 washers P0423636.
- 0 Item 1HQ - Provide 2 terminal lugs A0297944, 2 screws P0689176 and 2  
0 washers P0183152.
- 0 Item 1HR - Multiple cable of item 1HQ. Provide 2 terminal lugs  
0 A0297943, 2 screws P097F814 and 2 washers P0423436.
- 0 Item 1HS - Provide one P0594332 and one A0344530 terminal lugs.
- 0 Item 1HT - Provide 2 terminal lugs as follows: A0344530 for LRE  
0 plate, A0297943 for NT9P23AA, A0288200 for NT9P11AA.  
0 Terminate on CONN TP4 PDU NT9P23AA and TB1 (1-4) for PDU  
0 NT9P11AA.

0 RELEASE 28.01  
0 93 12 03  
0

0 Item 1HU - Originate and terminate on CONN PT4 for PDU NT9P23AA and  
0 TB1 (1-4) for PDU NT9P11AA. Provide 2 terminal lugs as  
0 follows: A0297943 for NT9P23AA, A0288200 for NT9P11AA,  
0 A0297943 for AM.

0 Item 1HV - Originate on CONN PT3 and terminate on CONN PT4 for PDU  
0 NT9P23AA and TB1 (1-4) for PDU NT9P11AA. Provide 2  
0 terminal lugs as follows: A0297943 for NT9P23AA, A0288200  
0 for NT9P11AA, A0297943 for AM.

0 Items 1GT & 1GV will be provisioned by Power Engineering.

0 Items 1GZ & 1HE-1HH will be provisioned by Equipment Application  
0 Engineering.

0 SWITCHBOARD CABLING NOTES:

0 1. A) LCE - LGE/LTE/RCME/RCE clusters, ISLE - IAE clusters, MS7E -  
0 ST7E and MS6E - ST6E clusters must be served by the same PDC.  
0 The LGE, LTE, DTE, IAE, RCME, RCE, MS7E, ST7E and ST6E frame  
0 logic return shall be connected to the battery return bus of  
0 the PDC that serves their power.

0 B) Do not run cable per item 1GZ for IDTE and DTE frames in  
0 DMS-250/200 offices (only for DMS-100 and 100/200 offices).  
0 Run per item 1HH instead.

0 2. A) Logic return and framework grounding conductors shall conform  
0 to the following:

0 Logic Return: From Single LR Bus to LRB: #6 AWG  
0 From LRB to LRE: 1/0AWG  
0 From LRE to SPG: 2/0 AWG up to 50 FT  
0 350MCM from 51 to 150 FT  
0 750MCM > 150 FT

0 Framework Ground: Single Conductor from Frame: #6 AWG  
0 From Lineup to FBE: 1/0AWG  
0 From FBE to SPG: 2/0 AWG up to 50 FT  
0 350MCM from 51 to 150 FT  
0 750MCM > 150 FT

0

0 RELEASE 28.01  
0 93 12 03  
0

0 ICB to SPG: 2/0 AWG up to 50 FT  
0 350MCM from 51 to 150 FT  
0 750MCM > 150 FT

0 B) Provide the following hardware;  
0 for 1/0 AWG cable qty 2 A0286794 term lugs  
0 for 2/0 AWG cable qty 2 A0297945 term lugs  
0 for 350 MCM cable qty 2 A0297951 cable lugs  
0 for 750 MCM cable qty 2 A0297954 cable lugs

- 0 3. The Supernode cabinets are equipped to meet EMI specifications.
- 0 4. Supernode cabinets in equipment rows with other DMS-100 frames  
0 are connected using the established rules for grounding regular  
0 DMS-100 frames. An LRB plate mounted above the Supernode cabi-  
0 nets is a requirement for the ERLR10 cable run.
- 0 5. The total cable length of cables ERLR02, ERLR03 and ERLR04 from  
0 the furthest equipment frame (Logic Ground Busbar) requiring  
0 logic return shall not exceed 28.4 meters.
- 0 6. See "PROVISIONING - ISG METHOD item 1. Logic Return" in this ECM  
0 for a list of frames equipped with a Logic Ground Busbar.
- 0 7. The CCC, MEX, IOE, MOE, Dedicated MIS, and Supernode frames must  
0 all be cabled to the same LRB. This LRB shall be located above  
0 the IOE frame, and dedicated to the above mentioned frames only.  
0 No other frame type can ever be cabled to this particular LRB.  
0 Other frame types in the same lineup must be cabled to a separate  
0 LRB. Both of these LRBs must be separately cabled to the LRE.
- 0 8. When cable entry to the Network Module frame is from the top of  
0 the frame all power and ground cables must be shielded with a  
0 screening jacket. Connect ground screening jacket to upright of  
0 cabinet at a point as close to the entry point of these cables as  
0 possible. Provide the screening jacket and grounding hardware  
0 per DPN provisioning rules.
- 0 9. These cables run directly across the back of the frame without  
0 entering the cable trough.
- 0 10. Network Module Signal Ground cable must be shielded with a  
0 screening jacket. Connect ground screening jacket to upright of  
0 cabinet at a point as close to the exit point of signal ground  
0 cable as possible. Provide a ground screen cable jacket and  
0 grounding hardware per DPN provisioning rules.

0  
0 RELEASE 28.01  
0 93 12 03

0 11. When Access Module (AM) is equipped on the same frame as the DIU,  
0 instruct the installer to multiple SIG GRD from AM shelf terminal  
0 PT3 to DIU PDU terminal PT4 for NT9P23AA or TB1 (1-4) for  
0 NT9P11AA.

0 Provide the following material:

0 1 Awg Strd Wire Black per NPS 90508-03 compression connectors as  
0 follows: A0297943 for AM shelf, A0297943 for NT9P23AA, A0288200  
0 for NT9P11AA.

0 12. Only the first LIM cabinet in an equipment row needs to be cabled  
0 directly to the LRE assembly. For each succeeding LIM cabinet in  
0 the lineup, provide one (1) NT0X0008 ground strap. The NT0X0008  
0 shall be used to strap the logic grounds of each succeeding LIM  
0 cabinet to the preceeding LIM cabinet beside it.

0  
0 MISCELLANEOUS FRAME EQUIPMENT

0 The Digital Alarm Scanner (DAS) unit must be mounted on a Dedicated  
0 MIS/Modem Frame enhanced for ISG. The DAS unit must be isolated from  
0 the equipment frame and the unit chassis must be connected to the  
0 logic return busbar.

0 Miscellaneous hardware such as HP MTDs, Digital Alarm Scanner (DAS),  
0 etc. must be electrically isolated from the framework upon which they  
0 are mounted.

0 Provision one (1) NT0X0013 Isolation Hardware in place of each mount-  
0 ing screw for each piece of miscellaneous equipment with a non-NT\_X\_\_  
0 Product Engineering Code (PEC) that is mounted in Miscellaneous Frame  
0 (NT0X02AB).

0 The following equipment (which mounts on a Miscellaneous Frame) have  
0 isolation hardware always provided as part of their stocklist. Any  
0 piece of equipment with a NT\_X\_\_ PEC which mounts on a MIS frame that  
0 is not on this list must have NT0X0013 Isolation Hardware provisioned  
0 to accommodate ISG.

0 (PLEASE NOTE: ALL isolated equipment in a MIS Frame must have one inch  
0 above and below the unit to accomodate the NT0X0013 requirement. This  
0 is to prevent the unit shorting against another unit.)

0 RELEASE 28.01  
0 93 12 03

0 \* For NT0X87AA Inverter Units (on non-dedicated Mis frames)  
0 the following hardware must be ordered:  
0 qty 4 - P0284154 - Metallic Regular Washer  
0 4 - P0183220 - External Tooth Lock Washer  
0 4 - P097F813 - Mounting Screws  
0 This hardware replaces the Isolation Hardware NT0X0013 which is  
0 to be discarded.

0 \* For ISG applications of the LaMarche Inverter, provide one  
0 NTMX1657 (LaMarche Isolation Kit) per inverter installed in  
0 a Non-Modem MIS Frame. This kit provides all the mounting  
0 hardware required, therefore no other isolation kits are  
0 required.

0 # The inactive system timing circuit must be powered from an  
0 inverter mounted on the same MIS frame. The inverter shall be  
0 grounded to MIS framework per normal grounding procedures,  
0 (i.e. No NT0X0013 required). The inactive system timing  
0 circuit shall also be grounded to MIS framework using the  
0 following hardware:  
0 qty 1 - P0284154 - Metallic Regular Washer  
0 1 - P0183220 - External Tooth Lock Washer  
0 4 - P097F813 - Mounting Screws  
0 This hardware replaces the Isolation Hardware NT0X0013 which is  
0 to be discarded.

0 Isolation on cross aisle ducts is always provided as part of the  
0 stocklist for the Cross Aisle Duct Assemblies NT0X75AA, NT0X75AB,  
0 NT0X75AC, NT0X75AD, NT0X75AE, NT0X75AF and NT0X75AG.

0 93 12 030 1.1.6 ISG UPGRADE INFORMATION

0

0 A) An ISG Upgrade refers to upgrading and reconfiguring an existing  
0 office to the new Isolated System Grounding (ISG) method. Proce-  
0 dures are now available to upgrade to ISG the following frames in  
0 a DMS-100F office:

|                |     |       |              |                       |       |
|----------------|-----|-------|--------------|-----------------------|-------|
| 0 NT0X02AA, AB | MIS | Frame | NT3X45AA, CA | CCC                   | Frame |
| 0 NT0X18AA, CB | DNI | Frame | NT3X45AB, CB | MEX                   | Frame |
| 0 NT0X41AB, AK | MEX | Frame | NT3X45DA, DW | CCC                   | Frame |
| 0 NT0X41AC, AJ | CCC | Frame | NT3X45DB     | MEX                   | Frame |
| 0 NT0X42AA     | PDC | Frame | NT3X45EA, EW | CCC                   | Frame |
| 0 NT0X43AA     | IOE | Frame | NT5X12AA, AB | TAE                   | Frame |

0 (PLEASE NOTE: All miscellaneous hardware ordered per an ISG Upgrade is  
0 to be shipped loose to site.)

0

0

0 RELEASE 28.01  
0 93 12 03

0 B) Provide one (1) NT0X00YA, ISG Upgrade Kit Host, for each host of-  
0 fice being upgraded to Isolated System Grounding (ISG). This Kit  
0 contains one (1) NT0X00BB ISG Label.

0 Provide one (1) NT0X00XA, ISG Upgrade Kit Remote, for each remote  
0 office being upgraded to Isolated System Grounding (ISG). This  
0 Kit contains one (1) NT0X00DA ISG Label.

0 C) Provide one (1) NT0X00ZA, LRE & FBE Splice Plate Assembly, for  
0 each host office being upgraded to Isolated System Grounding  
0 (ISG).

0 Provide one (1) NT0X0021, FBE-Remotes Splice Plate Assembly, for  
0 each remote office being upgraded to Isolated System Grounding  
0 (ISG).

0 The NT0X00ZA and NT0X0021 shall be provisioned by Building  
0 Studies Engineering.

0 D) The CCC, MEX, IOE, MOE, Dedicated MIS, and Supernode frames must  
0 all be cabled to the same LRB. This LRB shall be located above  
0 the IOE frame, and dedicated to the above mentioned frames only.  
0 No other frame types can ever be cabled to this particular LRB.  
0 Other frame types in the same lineup must be cabled to a separate  
0 LRB.

0 E) The PDC frames shall be reconfigured and recabled so that the LCE  
0 frames and their associated controller frames (i.e.  
0 LGE/LTE/RCE/RCME/SME/DTE) are powered from the same PDC frame.  
0 Also remove the Equalizer Cables between PDC Battery Return  
0 Busbars.

0 The PDC frames shall be reconfigured and recabled so that the  
0 MS7E frames and their associated ST7E frames are powered from the  
0 same PDC frame. However, the MS6E frames and the ST6E frames do  
0 not need to be powered from the same PDC frame.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 F) The MIS frames shall be reconfigured and recabled so that one (1)  
0 MIS frame can be dedicated for modem equipment. Only modems and  
0 the inverters used to power these modems can be mounted in this  
0 Dedicated MIS Frame. The Dedicated MIS Frame must also be lo-  
0 cated within a 50ft cabling distance of the IOE frames. All other  
0 miscellaneous equipment shall be mounted on Standard MIS Frames.

0 Local MAP VDU and printers must be current loop devices. When  
0 these devices are powered by NT0X87AA inverters, the inverter  
0 must be a dedicated inverter mounted on a Standard MIS Frame. The  
0 inverter shall be grounded to the MIS framework per normal  
0 grounding procedures, (i.e. No NT0X0013 Required).

0 G) The hardware needed to upgrade an existing office shall be or-  
0 dered on a per frame basis. Refer to the ISG UPGRADE TABLES in  
0 the following sections of this ECM for the type of hardware and  
0 cable needed for each frame:

0 Section 3 : ISG UPGRADE TABLES (HOST OFFICE FRAMES)  
0 Section 4 : ISG UPGRADE TABLES (SUPERNODE FRAMES)  
0 Section 5 : ISG UPGRADE TABLES (REMOTE OFFICE FRAMES)

0 2.1.3 PROVISIONING CONSIDERATIONS

0 | The Power Distribution Centers are provisioned through PDC Build-  
0 | ing Blocks.

## 0 PDC Building Block Definition

0  
0 The available PDC Building Blocks are described below. Optional  
0 top or bottom fed PDC's can be selected. Electro Magnetic Inter-  
0 ference (EMI) protection can be optionally provided with the top  
0 feed PDC. The PDC can accommodate up to 150 provisionable fuses  
0 for distribution of power to the DMS-100F frames that are  
0 equipped in the office.

0 | A fully-equipped PDC contains ten (10) standard fuse panels  
0 | equipped for 15 fuses each. For US applications, fully-equipped  
0 | PDC (U.L. Listed) configurations are standard, which are provi-  
0 | sioned through Fully-Equipped PDC Building Blocks or through  
0 | other PDC Building Blocks when the required features cannot be  
0 | provided by Fully-Equipped PDC Building Blocks.

0 NTZZ13AA (PDC Top-Feed) (Replaced by NTZZ13HA)

0 RELEASE 28.01  
0 93 12 03

0 The NTZZ13AA contains four (4) panels for 15 fuses each (total  
0 60) and a filter panel. The remaining required type A and B fuse  
0 panels are provisionable in pairs based on frame calculations. A  
0 fully equipped PDC contains 10 panels equipped for 15 fuses each.  
0 Options to the PDC include an NT0X42AU ISDN fuse panel for Packet  
0 Handler fusing, and an NT0X42AT EMI Logic Return Equalizer Busbar  
0 for the first equipped PDC. All fuses types must be provisioned  
0 separately.

0 NTZZ13BA (PDC Bottom-Feed) (Replaced by NTZZ13JA)

0 The NTZZ13BA contains four (4) panels of 15 fuses each (total 60)  
0 and a filter panel. The remaining required type A and B fuse  
0 panels are provisionable in pairs based on frame calculations. A  
0 fully loaded PDC contains 10 panels each equipped for 15 fuses.  
0 Options to the PDC include an NT0X42AU ISDN fuse panel for Packet  
0 Handler fusing. EMI is not an available option with a bottom fed  
0 PDC. All fuses types must be provisioned separately.

0 NTZZ13CA (A and B Fuse Panels)

0 The NTZZ13CA contains one (1) A and one (1) B type Fuse panel for  
0 assignment to NTZZ13AA, NTZZ13BA, NTZZ13HA, NTZZ13JA and  
0 NTZZ13RA. Both panels have a capacity for 15 fuses each.

0 NTZZ13DA (PDC Top-Feed Fully-Equipped) (Replaced by NTZZ13KA)

0 The NTZZ13DA contains ten (10) panels for 15 fuses each (total  
0 150) and filter panels. There are no available options such as  
0 ISDN Fuse panel or the EMI option. All fuse types must be provi-  
0 sioned separately.

0 NTZZ13EA (PDC Top-Feed, Canadian Applications Only)

0 The NTZZ13EA contains four (4) panels for 15 fuses each (total  
0 60) and a filter panel. The remaining required type A and B fuse  
0 panels are provisionable in pairs based on frame calculations. A  
0 fully equipped PDC contains 10 panels equipped for 15 fuses each.  
0 Options to the PDC include an NT0X42AU ISDN fuse panel for Packet  
0 | Handler fusing, an NT0X42XC Enhanced Alarm Service Upgrade Kit,  
0 and an NT0X42AT EMI Logic Return Equalizer Busbar for the first  
0 equipped PDC. All fuses types must be provisioned separately.

0 NTZZ13FA (A and B Fuse Panels, Canadian Applications Only)

0

0 RELEASE 28.01  
0 93 12 03  
0

0 The NTZZ13FA contains one (1) A and one (1) B type Fuse panel for  
0 assignment to either NTZZ13AA or NTZZ13BA. Both panels have a  
0 capacity for 15 fuses each.

0 | NTZZ13HA (U.L. PDC Top-Feed, US Applications Only)

0 The NTZZ13HA contains four (4) panels for 15 fuses each (total  
0 60) and a filter panel. The remaining required type A and B fuse  
0 panels are provisionable in pairs based on frame calculations. A  
0 fully equipped PDC contains 10 panels equipped for 15 fuses each.  
0 Options to the PDC include an NT0X42AU ISDN fuse panel for Packet  
0 Handler fusing, an NT0X42XC Enhanced Alarm Service Upgrade Kit,  
0 an NT0X42XA/XB Auxiliary Battery Return Panel Kit, and an  
0 NT0X42AT EMI Logic Return Equalizer Busbar for the first equipped  
0 PDC. All fuses types must be provisioned separately.

0 | NTZZ13JA (U.L. PDC Bottom-Feed, US Applications Only)

0 The NTZZ13JA contains four (4) panels of 15 fuses each (total 60)  
0 and a filter panel. The remaining required type A and B fuse  
0 panels are provisionable in pairs based on frame calculations. A  
0 fully loaded PDC contains 10 panels each equipped for 15 fuses.  
0 Options to the PDC include an NT0X42AU ISDN fuse panel for Packet  
0 Handler fusing, an NT0X42XC Enhanced Alarm Service Upgrade Kit  
0 and an NT0X42XA/XB Auxiliary Battery Return Panel Kit. EMI is  
0 not an available option with a bottom fed PDC. All fuses types  
0 must be provisioned separately.

0 | NTZZ13KA (U.L. PDC Top-Feed, Fully-Equipped, US Applications  
0 Only)

0 The NTZZ13KA contains ten (10) panels for 15 fuses each (total  
0 150) and filter panels. Options to the PDC include an NT0X42XC  
0 Enhanced Alarm Service Upgrade Kit and an NT0X42XA/XB Auxiliary  
0 Battery Return Panel Kit. All fuse types must be provisioned  
0 separately.  
0 |

0 | NTZZ13RA (Earthquake U.L. PDC Top-Feed, US Applications Only )

0 The NTZZ13RA contains four (4) panels for 15 fuses each (total  
0 60) and a filter panel. The remaining required type A and B fuse  
0 panels are provisionable in pairs based on frame calculations. A  
0 fully equipped PDC contains 10 panels equipped for 15 fuses each.  
0 Options to the PDC include an NT0X42AU ISDN fuse panel for Packet  
0 Handler fusing, an NT0X42XC Enhanced Alarm Service Upgrade Kit,  
0 an NT0X42XA/XB Auxiliary Battery Return Panel Kit, and an

0  
0 RELEASE 28.01  
0 93 12 03

0 NT0X42AT EMI Logic Return Equalizer Busbar for the first equipped  
0 PDC. All fuses types must be provisioned separately.

0 | NTZZ13TA (Earthquake U.L. PDC Top-Feed Fully-Equipped, US Only)

0 The NTZZ13TA contains ten (10) panels for 15 fuses each (total  
0 150) and filter panels. Options to the PDC include an NT0X42XC  
0 Enhanced Alarm Service Upgrade Kit and an NT0X42XA/XB Auxiliary  
0 Battery Return Panel Kit. All fuse types must be provisioned  
0 separately.

0 NTZZ13UA (PDC Botton-Feed, for International Applications)

0 The NTZZ13UA contains four (4) panels for 15 fuses each (total  
0 60) and a filter panel. The remaining required type A and B fuse  
0 panels are provisionable in pairs based on frame calculations. A  
0 fully equipped PDC contains 10 panels equipped for 15 fuses each.  
0 Options to the PDC include an NT0X42AU ISDN fuse panel for Packet  
0 Handler fusing and an NT0X42XC Enhanced Alarm Service Upgrade  
0 Kit. All fuses types must be provisioned separately.

0 | NTZZ13VA (Earthquake U.L. PDC Bottom-Feed, US Applications Only)

0 The NTZZ13VA contains four (4) panels of 15 fuses each (total 60)  
0 and a filter panel. The remaining required type A and B fuse  
0 panels are provisionable in pairs based on frame calculations. A  
0 fully equipped PDC contains 10 panels each equipped for 15 fuses.  
0 Options to the PDC include an NT0X42AU ISDN fuse panel for Packet  
0 Handler fusing, an NT0X42XC Enhanced Alarm Service Upgrade Kit  
0 and an NT0X42XA/XB Auxiliary Battery Return Panel Kit. EMI is  
0 not an available option with a bottom fed PDC. All fuses types  
0 must be provisioned separately.

0 | NTZZ13WA (Earthquake U.L. PDC Bottom-Feed Fully-Equipped, US  
0 Only)

0 The NTZZ13WA contains ten (10) panels of 15 fuses each (total  
0 150) and a filter panel. Options to the PDC include an NT0X42XC  
0 Enhanced Alarm Service Upgrade Kit and an NT0X42XA/XB Auxiliary  
0 Battery Return Panel Kit. EMI is not an available option with a  
0 bottom fed PDC. All fuses types must All fuse types must be pro-  
0 visioned separately.

0 NTZZ13LA (Cabinetized PDC, for Canadian and US applications)

0 The NTZZ13LA contains one NTRX31AA CPDC and door labels. Addi-  
0 tional equipment required depends on office configuration and

0  
0 RELEASE 28.01  
0 93 12 03

0 must be provisioned per rules in the NTZZ13LA Engineering Manual  
0 section.

0 NTZZ37MA (International Cabinetized PDC)

0 The NTZZ37MA contains one NTRX31AA CPDC and door labels. Addi-  
0 tional equipment required depends on international office config-  
0 uration and must be provisioned per rules in the NTZZ37MA  
0 Engineering Manual section. In NTZZ37MA, one (1) NTRX31AF UK  
0 Insulator Kit must be provisioned for UK markets and may be pro-  
0 visioned on customer request in other markets.

Note 4,5

Note 4,5

Note 5,6

Note 7

Note 1: CCC is a double bay frame and has 2 cooling units

Note 2: MEX does not require cooling units unless 4 modules of store are equipped.

Note 3: DMS-SuperNode cabinet.

Note 4: If Unit Quantity is greater than 1, divide total fuses by 2 and round up to even number.

Note 5: ISDN frames.

Note 6: Up to 5 additional cooling units may be fed off the initial LCEI frame.

Note 7: For standard fuse panels of 4" height. A/RM panels (ISDN) requires 7" height.

0 PDC CUSTOMER QUESTIONS

0 Q1. Are Top Feed PDC's required? (Y/N) \_\_\_\_\_

0 Q2. Are Bottom Feed PDC's required? (Y/N) \_\_\_\_\_

0 Q3. Quantity of ISDN fuse panels required. \_\_\_\_\_

0 Q4. Is Electromagnetic Interference (EMI)  
0 feature (NT0X42AT) required? (Y = 1, N = 0) \_\_\_\_\_  
0 (Only one per office, Top Feed only)

0 Q5. What is the total fuse panels required? \_\_\_\_\_  
0 (Reference Table B quantity)

0 TO DETERMINE TOTAL PDC REQUIREMENTS COMPLETE THE FOLLOWING RULES.

0 R1. Total Fuse panels required =  $Q5 + (2 \times Q3)$  \_\_\_\_\_

0 R2. Total PDC's required =  $R1 / 10$  round up \_\_\_\_\_

0 R3. ISDN equipped PDC's =  $Q3 / 2$  round up \_\_\_\_\_

0 R4. EMI equipped PDC =  $Q4$  \_\_\_\_\_

0 R5. If  $Q1 = Y$  (Top Feed) CONTINUE.  
0 If  $Q1 = N$ , skip to R12.

0 R6. Quantity NTZZ13KA/TA =  $R2 - R3 - R4$  \_\_\_\_\_  
0 - Provide NTZZ13KA For U.S. Non-Earthquake Jobs  
0 - Provide NTZZ13TA For U.S. Earthquake Jobs

0 R7. Quantity NTZZ13HA/RA =  $R3 + R4$  \_\_\_\_\_  
0 - Provide NTZZ13HA For U.S. Non-Earthquake Jobs  
0 - Provide NTZZ13RA For U.S. Earthquake Jobs

0 R8. Quantity NTZZ13CA =  $((R7 \times 6) - (Q3 \times 2)) / 2$  \_\_\_\_\_

0 R9. Quantity NT0X42AU =  $Q3$  \_\_\_\_\_

0 R10. Quantity NT0X42AT =  $R4$  \_\_\_\_\_

0 R11. Quantity NT0X42AH =  $R7 - R10$  \_\_\_\_\_

0 R12. If  $Q2 = Y$  (Bottom Feed) CONTINUE.

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 R13. Quantity NTZZ13JA = R2 \_\_\_\_\_  
0 R14. Quantity NT0X42AU = Q3 \_\_\_\_\_  
0 R15. Quantity NTZZ13CA = ((R2 X 6) - (Q3 X 2)) / 2 \_\_\_\_\_

0 2.1.4 OFFICE LAYOUT INFORMATION

0  
0 Normally, the PDC is located at the non-growth end of an equip-  
0 ment lineup. It may be located in the middle of a lineup upon  
0 customer's request, subject to cable distance versus current ca-  
0 pacity and wire gauge limitations. Several equipment lineups may  
0 share one CPDC, connected by cross-aisle power cabling.

0 The CPDC is normally located at the non-growth end of an equip-  
0 ment lineup, but it can be located in the middle of a lineup if  
0 required. The DMS-100 Cabinetization equipment are restricted to  
0 lineups of no more than eleven (11) 28" cabinets or five (5) 42"  
0 cabinets. Refer to ECM-600 for more details of office layout  
0 rules.

0 2.1.5 TRAFFIC TABLES

0  
0 Not applicable.

0

0 RELEASE 28.01  
0 93 12 03

0 2.2 PRODUCT/SYSTEM SPECIFICATION

0

0 2.2.1 PHYSICAL CHARACTERISTICS

0

0 For information on the physical characteristics of the CPDC, refer to ECM-600 DMS-100 Cabinetized.

0 2.2.2 EMI/EARTHQUAKE INFORMATION

0

0 Non-UL PDC

0 For Isolated System Grounding (ISG) compliant and Electromagnetic  
0 Interference (EMI) protected applications, an Isolated System  
0 Grounding Logic Return Equalizer Bus Bar Assembly, NT0X42AT is  
0 provisioned at position 5 of PDC 00. In this particular case, no  
0 NT0X42AH Filler Panel will be provisioned and the Ground Panel  
0 must be equipped in position 68.

0 Furthermore, for all packaged EMI applications, NT0X42UE Ground  
0 Panel - Top Feed is to be provided for either top or bottom power  
0 cable feed (despite the panel's name).

0 For non-packaged (custom switch) EMI applications, NT0X42UE  
0 Ground Panel - Top Feed is to be provided and power cables run  
0 through the top of the frame only. Bottom cable feed is not  
0 available for these applications.

0 When filtered EMI protection is required, provide one (1) EMI  
0 Rear Cabling Housing Assembly and associated hardware.

0 UL PDC

0 With the implementation of Isolated System Grounding (ISG) for  
0 Electromagnetic Interference (EMI) applications, an isolated system  
0 grounding logic return equalizer bus bar assembly (NT0X42AT)

0

0 RELEASE 28.01  
0 93 12 03  
0

0 is now mountable at position 05 of the U.L. PDC. Only one (1)  
0 NT0X42AT is required per office and should be mounted in U.L. PDC  
0 00.

0 For offices with both EMI and ISG the ground panel(NT0X42UE) must  
0 be mounted in pos 68 of Top Feed U.L. PDC 00. Therefore, no  
0 Filler Panel (NT0X42AH) will be required for PDC 00. The remain-  
0 ing PDC's will require a Filler Panel in pos 05 of PDC 01 and up-  
0 wards.

0 When Electromagnetic Interference (EMI) protection is required,  
0 provide one (1) NT0X42AT ISG/EMI Logical Return Ground Equalizer  
0 Busbar in position 05 of PDC 00 only. Only one (1) NT0X42AT is  
0 required per office and should be mounted in the first PDC.

0 Cabinetized PDC

0 The Cabinetized PDC is now being provided only as EMI-compliant.  
0 Refer to the Engineering Manual sections for NTZZ13LA and  
0 NTZZ37MA for details.

0 2.2.3 SPARING INFORMATION

0  
0| As a recommendation, provide 10% spare fuses.

0 3.0 Power Plant Provisioning (Host and Remote)

0 The DC Power Plant supplies controlled and protected DC power to  
0 DMS-100 frames and equipment. The principal components of a power  
0 plant are as follows:

0 \* Power Board

0 \* Rectifiers

0 \* Batteries

0 The power board assembly is required to provide main control for  
0 the battery plant system and distribute protected DC power. Power  
0 board maximum capacities are not as incremental as rectifiers and  
0 batteries so the power board rating must exceed the ultimate peak  
0 hour amperage drain for the particular office it is being engi-  
0 neered for. Power boards may be housed in either a relay rack or  
0 box framework. Rear and side protective covers should always be  
0 provided to maintain safety for personnel and protect against ac-  
0 cidental contact with protective components of power board.

0 The rectifier is the source of -48V power for the power plant.  
0 They convert commercial AC electrical power to DC voltage and  
0 current demands based on telephone system requirements.  
0 Rectifiers also maintain the batteries at a fully charged state  
0 plus battery recharge following a commercial AC power failure.  
0 Unless otherwise specified by the customer, rectifier redundancy  
0 should always be provided with redundant rectifier capacity being  
0 equal to the largest rectifier in the group.

0 The batteries provide a source of uninterrupted -48V power for  
0 the telephone system in the event the rectifiers fail. Battery  
0 manufacturers size cells in ampere hours. Ampere hours are de-  
0 rived with regard to the number of plates, size and electrolyte.  
0 The typical battery cells presently being used are lead calcium  
0 or lead antimony. Sealed maintenance free batteries are also  
0 available. Sizing of the battery is based on the busy hour drain  
0 and number of hours reserve requested with initial and ultimate  
0 current drains observed.

0 Reference paragraph 2.4 for detailed information pertaining to  
0 the above equipment.

## 0 DISCRIMINATION NUMBERING

0  
0 Not Applicable

0 3.1.3 PROVISIONING CONSIDERATIONS

0  
0 Power board mounted components can vary based on Central Office  
0 requirements. Basic components are:

0 \* Control Panel Assembly equipped with power plant metering,  
0 alarm indicating and sending capability, charger sensing  
0 fuses, etc.

0 \* Distribution fuses required for DMS-100 and other forms of  
0 telephone related equipment.

0 \* Rectifier Termination Panel (power boards 0 - 1600 amps)

0 \* Isolated Return Ground Bar Assembly

0 When engineering an initial power plant, the total peak hour load  
0 imposed on a power board should never exceed 80% of the power  
0 board rating (i.e. 1200A X .80 = 960A). If the ultimate current  
0 drain does exceed 80%, the next incremental rated power board  
0 should be furnished.

0 Power boards can be connected to rectifiers and batteries via ca-  
0 ble or busbar. If the capacity of the power board exceeds 2000  
0 amps, the plant is normally arranged with busbar over the

0 RELEASE 28.01  
0 93 12 03  
0

0 rectifiers and batteries and connected to the busbar riser of the  
0 power board.

0 When provisioning rectifiers, the ultimate busy hour drain must  
0 be taken into account. Rectifier quantity and size should be ar-  
0 ranged for the ultimate plan and provided based on initial,  
0 intermediate or ultimate plans as specified by the customer.  
0 Rectifier redundancy should always be provided with the output of  
0 the redundant rectifier being equal to or greater than the larg-  
0 est rectifier in the group. Another consideration when provi-  
0 sioning rectifiers is the commercial AC input voltage, phase  
0 (single or three) and frequency (50 or 60 Hz).

0 Provisioning of the battery arrangements should take careful con-  
0 sideration. Some basic guides are as follows:

- 0 \* Initial, intermediate and final busy hour drain plan. The  
0 busy hour drain to include switch busy hour amperage plus  
0 customer equipment amps.
- 0 \* Battery provisioning should start with the ultimate Busy Hour  
0 Drain plan and work back to the initial Busy Hour Drain plan.  
0 Engineering can, by this method, observe when additional  
0 strings would be required in plan years other than initial or  
0 ultimate.
- 0 \* The hour reserve is also a prime factor when selecting bat-  
0 tery ampere hour capacity. The following multiplying factors  
0 are to be used to determine battery capacity.

| 0 | Hour Reserve | Multiplying Factor |
|---|--------------|--------------------|
| 0 | =====        | =====              |
| 0 | 3            | 5.3                |
| 0 | 4            | 6.3                |
| 0 | 5            | 7.2                |
| 0 | 6            | 8.1                |
| 0 | 7            | 9.0                |
| 0 | 8            | 9.8                |
| 0 | 9            | 10.6               |
| 0 | 10           | 11.4               |

0 Example: BSHA = 1000A @ 4 Hour Reserve

0 1000A X 6.3 = 6300 Amp Hour Required

0

0 RELEASE 28.01  
0 93 12 03

0 \* After determining the above, consideration of floor space and  
0 number of 24 cell arrangements are to be provisioned.

0 \* Select a battery capacity (in ampere hours) equal to but not  
0 less than the ampere hours determined above. Battery rack re-  
0 quired for support of cell arrangements are also selected, as  
0 dictated by floor plan plus customer preference. Standard  
0 commercial racks are as follows:

- 0 a. (2) Step Rack
- 0 b. (1) Row (2) Tier Rack
- 0 c. (1) Row (3) Tier Rack
- 0 d. (2) Row (2) Tier Rack

0 NOTE: Length of battery rack is determined by size and  
0 arrangement of battery cells.

0 Power engineering shall carefully interpret power information in  
0 NTI CI document to ensure proper battery provisioning and also if  
0 earthquake seismic protection is required. Special attention is  
0 required when Bell Companies request roll steel or fiberglass  
0 type battery stands normally provided by AT&T Technology Company.

#### 0 3.1.4 OFFICE LAYOUT INFORMATION

0  
0 Power equipment should be located per job floor plan or as re-  
0 quested by the customer. If there is any deviation from job  
0 drawings, installation is to mark drawing and return per the JIM  
0 600 process.

#### 0 3.1.5 POWER PLANT CALCULATIONS

0  
0 Power Plant equipment required on a per job basis can be deter-  
0 mined by completing the following table:

0

0 Host - Physical Equipment  
0 Chapter 23

0  
0 RELEASE 28.01  
0 93 12 03

0 Relay rack type power boards and rectifier frames will require  
0 additional top bracing to meet most companies earthquake require-  
0 ments. Battery racks can be specified as earthquake type to meet  
0 or exceed earthquake zones as required. Reference EMI section of  
0 this document for more information pertaining to seismic pro-  
0 tection of power related equipment.

0 3.2.3 SPARING INFORMATION

0  
0 Unless otherwise specified, NTI Power Engineering will provide a  
0 minimum of 2 spare fuses for each size required. One rectifier  
0 and power board spare parts kit will also be furnished if not  
0 otherwise specified on initial jobs.

0 3.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 Please refer to the other sections of this ECM and the referenced  
0 EM Sections. All of this document describes Power Plant Provi-  
0 sioning.

0 3.2.5 CURRENT DRAIN INFORMATION

0  
0 When engineering an initial power plant, the total peak hour load  
0 imposed on a power board should never exceed 80% of the power  
0 board rating (i.e.  $1200A \times .80 = 960A$ ). If the ultimate current  
0 drain does exceed 80%, the next incremental rated power board  
0 should be furnished.

0 4.0 DMS-100 Cabinetized

0 This project was introduced to re-package the existing DMS-100 product  
0 line into 28 inch cabinets. The project is referred to as DMS-100  
0 Cabinetization (Model A). DMS-100 Cabinetized provides a more effec-  
0 tive design for EMI compliance.

0 The project development will be divided into phases. Phase 1 will in-  
0 clude development of cabinetized versions of the PDC, IOE, MIS, LCE,  
0 TME, CPE, DSN, SLC and DNI frames. There will also be development of a  
0 modular FSP prototype, LCE signal connectorization, low voltage con-  
0 trol "AC free", double hole frame ground and enhanced endguard control  
0 with aisle identification card included in Phase 1. Phase 1' intro-  
0 duces the CPCI module and the CLMI ISDN line cabinet. Subsequent  
0 phases will add cabinets and capabilities which will be covered in fu-  
0 ture issues of this ECM.

0 The cabinet will be a unified steel structure that will support four  
0 standard 26 inch wide by 13 inch high DMS-100 shelves and an FSP. The  
0 integral cooling unit (for applications that require cooling) will  
0 mount in the base of the cabinet. Intra lineup cabling can be routed  
0 within the EMI shield horizontally between cabinets. The cabinets will  
0 be light grey with medium blue accent.

## 0 DISCRIMINATION NUMBERING

0

0 4.1.3 PROVISIONING CONSIDERATIONS

0  
0 The equipment included in the DMS-100 Cabinetized project is pri-  
0 marily the DMS-100 product repackaged into cabinets. Building  
0 Block provisioning methods have been incorporated to simplify or-  
0 dering Cabinetized equipment and associated hardware.

0  
0 Cabinetized Line Concentrating Equipment (CLCE)

0  
0 The NTRX30AA Cabinetized LCE is a cabinet module that maintains  
0 the current functionality of the DMS-100 LCE frame. Like the LCE,  
0 it will contain two fully duplicated LCMS, each with ten drawers  
0 providing 640 line card capacity. Each CLCE will utilize a single  
0 backplane for the duplicated controller, processor and power con-  
0 verter cards. This backplane eliminates over 95% of the LCE  
0 wirewrapped connections by use of connectors. All wiring between  
0 the duplicated controller processor and convertor is integrated  
0 into the dual shelf backplane. The line drawer fusing has been  
0 moved to the side of the respective shelf to allow packaging of  
0 the seven foot LCE into a six foot cabinet.

0  
0 Connectorization is provided to a rear bulkhead for DS-30A links,  
0 metallic test access and line drawer tip and ring connections.  
0 The FSP is mounted at the top of the cabinet and contains dupli-  
0 cated ringing generators, a cooling fan unit and equipment for  
0 cabinet power distribution and alarms. A cooling unit is also  
0 mounted in the bottom of the cabinet. To accomodate the cutover  
0 by directory number feature, the +15V and ground is brought out  
0 to a terminal block on an applique panel at the rear of the cabi-  
0 net. The cables from the CLCE line drawers to the bulkhead are  
0 included with the cabinet (Always Provided).

0  
0 RELEASE 28.01  
0 93 12 03

0 The NTRX30AA is always provided in the NTZZ08DB building block.

0 Cabinetized Line Module ISDN (CLMI)

0  
0 The NTRX30BA Cabinetized LMI is a cabinet module that maintains  
0 the current functionality of the DMS-100 LCEI frame. Like the  
0 LCEI, it will contain two fully duplicated LCMEs, each with eight  
0 drawers providing 480 single slot 2B1Q lines.

0 The FSP is mounted at the top of the cabinet and contains dupli-  
0 cated ringing generators, a cooling fan unit and equipment for  
0 cabinet power distribution and alarms. A cooling unit is also  
0 mounted in the bottom of the cabinet. The cables from the CLCE  
0 line drawers to the bulkhead are included with the cabinet (Al-  
0 ways Provided).

0 The NTRX30BA is always provided in the NTZZ33AA building block.

0 Cabinetized Power Distribution Center (CPDC)

0  
0 The NTRX31AA Cabinetized PDC houses equipment required to inter-  
0 face between the -48V office batteries and up to 84 individual  
0 loads within the DMS-100 system. The CPDC will contain power  
0 distribution shelves, an FSP which includes DC distribution fil-  
0 tering and one optional inverter shelf which will serve conven-  
0 ience outlets.

0 The CPDC will provide the capability to use circuit breakers  
0 rather than fuses, connectors in place of bolted connections and  
0 the ability to add CPDC shelves as required. EMI compliance is  
0 achieved at the cabinet level for all input power cabling and at  
0 the system level for all power distribution. The maximum capac-  
0 ity of the CPDC is 200 Amps per feed.

0 The NTRX31AA is always provided in the NTZZ13LA building block.

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 Cabinetized Trunk Module Equipment (CTME)

0  
0 The NTRX32AA CTME is the cabinet module which has the same basic  
0 functions as the DMS-100 TME frame. The cabinet may contain up to  
0 four shelf modules (MTM, DRA, TM8, AXU) which are provisionable  
0 in positions 5, 19, 33 and 47 except the AXU which is restricted  
0 to position 47 only. When an MTM is functioning as the alarm  
0 system (OAU), the shelf should be mounted below the AXU in posi-  
0 tion 33. The NTZZ31BA building block contains one (1) AXU, one  
0 (1) OAU, and the associated hardware required for the office  
0 alarm system. A Meridian cabinet FSP will be utilized in Phase 1  
0 until the new modular FSP is available (Phase 2).

0 The MTM used for the Office Alarm Unit (OAU) on the CTME is to  
0 use the following circuit pack mounting positions:

| 0 PEC                            | 0 SLOT  |
|----------------------------------|---------|

| 0 RESERVED FOR NT0X10AA          | 0 11    |
| 0 RESERVED FOR NT0X10AA          | 0 12    |
| 0 RESERVED FOR NT0X10AA          | 0 13    |
| 0 PROVISIONABLE                  | 0 14    |
| 0 PROVISIONABLE                  | 0 15    |
| 0 PROVISIONABLE                  | 0 16    |

0 The NTRX32AA is always provided in the NTZZ31AA building block.  
0 Personality plates are always provided in the TM8/MTM/DRA build-  
0 ing blocks. Cabling will be via filtered connectors in the rear  
0 EMI bulkheads.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Cabinetized Input Output Equipment (CIOE)

0  
0 The NTRX33AA CIOE will house Data Processing Peripheral (DPP),  
0 Input Output Controller (IOC), Magnetic Tape Drive (MTD), Disk  
0 Drive Units (DDU), and Stratum II and 2.5 Clocks.

0 The basic CIOE will be equipped with a Frame Supervisory Panel  
0 (FSP), a cooling unit (CU), and an Input Output Controller (IOC).  
0 The NTZZ32AA building block comes always provided with one  
0 NTRX33AA, one FSP, and one CU. One (1) NTZZ32EA IOC Package  
0 should be ordered per CIOE. The MTD, DDUs, DPPs and Stratum  
0 equipment is optional and provisionable in building block pack-  
0 ages. The FSP will be in shelf position 60, the IOC in position  
0 19 and the cooling unit in position 00. When provisioned, the  
0 DDU will always be mounted in shelf position 05, the Stratum in  
0 position 05 and the MTD or DPP in position 33. The Phase 1 CIOE  
0 will support only one IOC per cabinet. Personality plates are  
0 always provided in the building block packages.

0 MTD/DPP (NT1X68AC) or DDU (NT1X55DA) controller cards can be as-  
0 signed to only slot 4 or slot 6 of the IOC shelf in the CIOE. The  
0 cables from these slots to the bulkhead are not normally provided  
0 since the MTD/DDU/DPP do not require them. While it is not re-  
0 commended, use of these slots for other devices will require that  
0 cables (4 per slot) be provisioned. Therefore, IOC slots 4 and 6  
0 are reserved for MTD/DPP/DDU controllers only. The MTD,DPP or  
0 DDU connected to these slots must be inside the same Faraday cage  
0 of the CIOE.

0 Shielded cable will be used for DS30 connection to ECORE through  
0 bulkhead. All cable connections from the IOC to MTDs, DDUs and  
0 DPPs will be direct, rather than through the bulkhead. A Meridian  
0 cabinet FSP will be utilized for Phase 1 and the modular FSP will  
0 be included in Phase 2.

## 0 Cabinetized Miscellaneous Equipment (CMIS)

0  
0 The NTRX34AB CMIS accomodates miscellaneous DMS-100 common sys-  
0 tems and other hardware required in a DMS-100 office. The equip-  
0 ment in the CMIS is currently provisionable. The NTRX34AB, CMIS,  
0 has been subdivided into eight (8) 7 inch zones. building block.  
0 Equipment that is working together should be mounted together in  
0 one zone. Equipment that may be mounted is being added in a  
0 phased introduction.

## 0 Available equipment:

0 LaMarche inverter unit - NTZZ18QA  
0 Inactive system timing circuit - NTZZ18LA  
0 DTH/ROTL - NTZZ18PA  
0 Case/Datatel AC shelf rack - NTZZ18MA  
0 Case/Datatel DC shelf rack - NTZZ18NA  
0 Common equipment shelf - NTZZ18YA  
0 Terminal block assembly - NT3X25BA  
0 CMIS Terminal block assembly - NTZZ18ZA  
0 Audible and visual alarm extension unit - NTZZ18VA  
0 Audible alarm cutoff control unit - NTZZ18WA  
0 Audible alarm cutoff key panel - NT5X86AB  
0 Pylon RG-2 ringing generator - Part of NTZZ18VA  
0 Digital Alarm Scanner - NTZZ18XA  
0 Multiple Loop Test Applique Shelf - NTZZ18UA  
0 Cook Digital Announcer - NT5M0N\_\_, NTZZ23

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Internal cables from the CMIS shelves to the cabinet bulkhead are  
0 always provided in the individual unit building block packages.

0 The PDC fusing for the CMIS is identical to the frame version of  
0 the MIS (Four 20 Amp fuses). The LaMarche inverter will be fused  
0 directly at the CPDC.

#### 0 Cabinetized Dual Shelf Network (CDSN)

0  
0 The NTRX35AA CDSN cabinet can contain up to two fully duplicated  
0 dual shelf network modules. All connectors to and from the net-  
0 work module are connected through the bulkhead for EMI pro-  
0 tection. In the top of the cabinet is the FSP which distributes  
0 power, control and alarms to the cabinet. In the base of the  
0 cabinet there is a fan unit for forced air cooling. Personality  
0 plates will be Always Provided for the CDSN.

0 The NTRX35AA CDSN cabinet is always provided in the NTZZ07FA  
0 building block model. The NTZZ07FA can be provisioned with up to  
0 two complete networks, NTZZ07GA or NTZZ07JA. The NTZZ07GA, Net-  
0 work Common CP Kit, should be provisioned for each Network Module  
0 that will be non-junctored at the CDNI. The NTZZ07JA, Network  
0 Common CP Kit, should be provisioned for each Network Module that  
0 will be junctored at the the CDNI.

#### 0 Cabinetized Common Peripheral Equipment (CCPE)

0  
0 The NTRX36AB CCPE cabinet mounts two dual shelf XPM modules and  
0 comes always provided with the ISDN-Ready backplane. All con-  
0 nections to the network and DS1 links shall be through the  
0 bulkhead for EMI protection. The FSP is mounted in the top of the  
0 cabinet and a fan unit is mounted in the base.

0 The NTRX36AB CCPE cabinet is always provided in the NTZZ22CA  
0 building block. Two dual shelf XPM modules can be mounted on the  
0 NTZZ22CA.

0  
0 RELEASE 28.01  
0 93 12 03

0 Cabinetized Speech Link Connection (CSLC)

0  
0 The NTRX37AA CSLC cabinet provides a patch cord cross-connect fa-  
0 cility for interconnecting peripheral equipment and network pe-  
0 ripheral face ports to facilitate network loading administration.

0 Cabinetized equipment will use a single identifier (CSLC) for  
0 both planar and combined cabinets. The discrimination number  
0 will be used to identify the different usage of the cabinet.  
0 Planar cabinets will be CSLC 0-00, CSLC 1-00 and the combined  
0 cabinets will be CSLC 00, CSLC 01, etc.

0 The NTZZ21CA building block comes always provided with the  
0 NTRX37AA.

0 Cabinetized Digital Network Interconnection (CDNI)

0  
0 The NTRX38AA CDNI provides a patch cord junctor cross-connect fa-  
0 cility for interconnecting between the network juncture face  
0 ports of Network Modules in the same plane.

0 Cabinetized equipment will use a single identifier (CDNI) for  
0 both planar and combined cabinets. The discrimination number  
0 will be used to identify the different usage of the cabinet.  
0 Planar cabinets will be CDNI 0-00, CDNI 1-00 and the combined  
0 cabinets will be CDNI 00, CDNI 01, etc.

0 The NTZZ20CA building block comes always provided with the  
0 NTRX38AA.

0 Dual Plane Combined Core (DPCC)

0  
0 Refer to ECM626 for provisioning considerations on  
0 SuperNode(S/DMS) in a Cabinetized office. The SuperNode house

0  
0 RELEASE 28.01  
0 93 12 03

0 one Computing Module (CM), two Message Switch (MS), and one Sys-  
0 tem Load Moduale (SLM) shelf assembly.

0 Enhanced Network (ENET)

0  
0 Refer to ECM627 for provisioning considerations on ENET(S/DMS) in  
0 a Cabinetized office. The ENET houses up to four ENET shelves  
0 per plane. Each shelf provides a nominal switching capacity of  
0 32K channels.

0 Link Peripheral Processor (LPP/LIM)

0  
0 Refer to ECM386 for provisioning considerations on LPP in a  
0 Cabinetized office. Refer to ECM609 for LPP Building Block pro-  
0 visioning. When a LPP (NT9X0113 42" cabinet) is provisioned in a  
0 lineup, one of each of the following EMI endpanels should be pro-  
0 visioned on the cabinet: NTRX73AD, NTRX73AE.

0 Refer to ECM620 for provisioning considerations on LPP in a S/DMS  
0 Cabinet.

0 Cabinetized Miscellaneous Spare Storage (CMSS)

0  
0 The Cabinetized Miscellaneous Spare Storage (CMSS) provides for  
0 storage of spare circuit packs. The storage cabinet can be pro-  
0 visioned with up to four spare storage shelf assemblies which can  
0 hold 0.875, 1.125, or SuperNode size circuit packs.

0 RELEASE 28.01  
0 93 12 03

0 4.1.4 OFFICE LAYOUT INFORMATION

0  
0 The DMS-100 Cabinetized equipment will be restricted to lineups  
0 of no more than eleven (11) 28" cabinets or five (5) 42" cabi-  
0 nets. The first cabinet in each lineup will be a Cabinetized  
0 Power Distribution Center (CPDC). Future growth will be limited  
0 to the end of the lineup on the opposite side of the CPDC.

0 If more than one CSLC exists in an office then the cabinets must  
0 be located directly across one another in separate lineups due to  
0 heavy cabling requirements. The same restriction applies to CDNI  
0 cabinets.

0 No break in a line-up will be allowed when using cabinetized  
0 equipment. If an obstruction exists in a lineup, a new lineup  
0 (with CPDC) must be used, rather than an empty space to  
0 accomodate the obstruction. An empty cabinet may be provisioned  
0 in a line-up for future use as long as it is inside the faraday  
0 cage.

0 Cabinetized equipment will be installed according to whether the  
0 office requires earthquake bracing or not. Building Studies will  
0 order one of the following kits per cabinet:

0 Slab Floor  
0 -----  
0 Earthquake Anchor Kit NTRX2512 (4 Anchors & Isolator Pad)

0 DMS-100 Cabinetized will use the same power and grounding  
0 topology as the Integrated System Ground (ISG) DMS. DMS-100  
0 Cabinetized will require power only from a -48VDC source and  
0 equipment requiring any type of power that cannot be obtained  
0 from this feed will not be used within the DMS-100 Cabinetized.

0 Lighting equipment will be a separate entity from the DMS-100  
0 Cabinetized and will not be provided as an integral part of the  
0 switch. Center aisle lighting is the preferred lighting system  
0 for Cabinetized offices.

0 AC power will be available only for two applications. One as a  
0 customer requested option to power a pair of duplex receptacles,  
0 one at each end of the lineup. Provision one NTRX31AD, LaMarche  
0 Inverter Kit, per CPDC. The other, to provide 115VAC to miscella-  
0 neous equipment mounted in a CMIS cabinet. The NTZZ18QA LaMarche

0 RELEASE 28.01  
0 93 12 03

0 Inverter Unit can power up to four AC-powered units which must be  
0 mounted in the same cabinet as the inverter itself.

0 The following general application rules will impact the  
0 Cabinetized equipment layout:

0 - Dual Plane Core Cabinet (DPCC), CIOE and CMIS (with  
0 modems for the IOC) must be located adjacent to each  
0 other in the same lineup.

0 - There will be no DC coupled signal interconnection  
0 between equipment in separate lineups.

0 - LIU and associated CMIS modem equipment must be  
0 located in a cluster in the same lineup.

0 - LGE and associated LCE equipment must be powered  
0 from the same CPDC.

0 - Cabinetization will conform to corporate standard CS4122.

0 - Cabinets arranged in a cluster will have a #6 AWG  
0 cable "equaliser" run along their base. A #6 AWG  
0 cable will be run from the logic return bus in  
0 each of these cabinets and H-tapped to the #6 AWG  
0 cluster equaliser. #6 to #6 AWG H-Tap will be the  
0 Thomas & Betts 63110.

0 - A #0 AWG logic return collector cable will be run  
0 along the base of each lineup. A #6 AWG cable will  
0 be run from any cluster equalisers in the lineup  
0 and also from any separate equipment logic return  
0 bus not part of a cluster and H-tapped to the  
0 collector cable. The collector cable will terminate  
0 at an EMI feed-thru filter located on the CPDC EMI  
0 bulkhead. #6 to #0 AWG H-Tap will be the Thomas &  
0 Betts 63125.

0 - A #0 AWG cable will be run from the CPDC feed-thru  
0 filter to the DMS system Logic Return Equaliser  
0 Bus (LRE).

0 - All logic return H-taps will be equipped with a  
0 protective cover (Thomas & Betts: HT20CFR).

0

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - Two hole lugs will be used wherever possible to  
0 terminate cable.
- 0 - All Cabinetized equipment will be isolated from  
0 contact with any incidental ground and bonded to  
0 the DMS Single Point Ground. A #0 AWG framework  
0 ground collector cable will be run along the base  
0 of each lineup. A #6 AWG cable will be run from  
0 the ground studs on each cabinet and H-tapped to  
0 the collector cable. The collector cable will  
0 terminate at the ground studs on the bottom of  
0 the CPDC EMI bulkhead. A #0 AWG cable will be  
0 run from the CPDC ground studs to the DMS system  
0 Framework Ground Equaliser Bus (FGE).
- 0 - All power distribution, logic return and ground  
0 cabling will be of the flexible style. Secondary  
0 power distribution cables between cabinets and the  
0 CPDC shall be #8 or #10 AWG and supplied with each  
0 cabinet. All cables will be supplied for maximum  
0 length and cut to length and terminated by the  
0 installer.

#### 0 DMS-100 Cabinetized Cable Racks

0 DMS-100 Cabinetized will use a set of universal cross aisle  
0 trays. These trays will be 3" high by 12" wide. They will be  
0 provisionable in lengths from one to six feet in increments of 4  
0 inches. Cross aisle mounting kits will be utilized to mount the  
0 cross aisle trays to the Cabinetized cable tray (NTNX5511). When  
0 mounting from cabinet to cabinet, a NTNX5512 cross aisle kit  
0 should be used. This kit provides a one inch (in half inch incre-  
0 ments) vertical adjustment to allow leveling of the tray. It also  
0 allows three-fourths of an inch horizontal adjustment for center-  
0 ing. The kit is mounted to the NTNX5511 with standard hardware  
0 using one starwasher to provide frame grounding. Height from  
0 floor to the base of the tray should be approximately eight feet.

0 Though not currently supported, when mounting from Cabinetized  
0 DMS-100 to an existing DMS-100, a NTNX5512 cable cross aisle kit  
0 should be provisioned on the Cabinetized side and a NTNX5528 ca-  
0 ble cross aisle kit should be provisioned on the DMS-100 side. An  
0 isolation strip is provided with this kit to provide isolation  
0 between the two lineups. No lineup to lineup frame isolation is  
0 required when cross aisling from Cabinet to Cabinet.

0

RELEASE 28.01  
93 12 03

When cross aisling from Cabinet to SuperNode is required, the ladder rack should be used for cable handling. When cross aisling from SuperNode to SuperNode, continue to use the current SuperNode cable tray with redesigned oxford grey cross aisle trays.

When cross aisles are required between a Cabinet and a DMS-100 and the cable tray exceeds 10.10 inches, ladder rack should be used for cable handling. If an office requires a cross aisle tray length that exceeds 68.5 inches, ladder rack should be used. No cross aisle trays should be used in a seismic engineered office. Ladder rack should be used for cable handling in earthquake engineered applications.

Refer to the following table for DMS-100 Cabinetized cable handling part numbers:

| FROM DMS-100 CABINETIZED                          |                                  | TO DMS-100 CABINETIZED                                              |

0 RELEASE 28.01  
0 93 12 03

0 DMS-100 Cabinetized Discrimination Numbering

0 Cabinetized equipment is currently not allowed to be mixed with  
0 frame type equipment in an office. Future development may allow  
0 mixed office configurations, so equipment should be numbered to  
0 prevent confusion when the two equipment types eventually coex-  
0 ist. Note that while, for example, LCE 00 and CLCE 00 could both  
0 exist in the same office, the LCMS would require unique number-  
0 ing.

0 Endguard Designation Labels

0 DMS-100 Cabinetized endguards are shipped with a Slipsheet,  
0 P0715815, and a Window Panel, P0727378, that are used to mount  
0 labels for each cabinet position in a lineup. There is a column  
0 on the slipsheet for each position in the lineup to list cabinet  
0 name, cabinet number, and up to four module names and numbers per  
0 cabinet. The slipsheet mounts in a pocket on the endguard along  
0 with the window panel which provides column headings for the  
0 slipsheet.

0 Refer to MS0X60AA, Issue 26 or later, for a list of the  
0 Cabinetized DMS-100 endguard labels. This drawings describes  
0 which and how many labels are on each sheet.

0 4.2 PRODUCT/SYSTEM SPECIFICATION

0

0 4.2.1 PHYSICAL CHARACTERISTICS

0

0 The DMS-100 Cabinetized equipment is 72" high, 28" wide and 28"  
0 deep. The cabinet will have two center-open doors (both front  
0 and rear).

0 All 28" Cabinetized equipment, except the CMIS, is fused using  
0 four (4) 30Amp Circuit Breakers (two A feeds and two B feeds).  
0 The CMIS is fused using two (2) 30Amp Circuit Breakers (one A  
0 feed and one B feed). Cooling units are fused at the FSP rather  
0 than the PDC.

0 S/DMS style cabinets (NT9X95AA framework) are fused per the fol-  
0 lowing chart:

|                          | 10 Amp | 30 Amp |
|--------------------------|--------|--------|
|                          | -----  | -----  |
| 0 SuperNode, LPP (S/DMS) | 1A,1B  | 4A,4B  |
| 0 ENET Plane 0 (S/DMS)   | 2A     | 8A     |
| 0 ENET Plane 1 (S/DMS)   | 2B     | 8B     |

0 4.2.2 EMI/EARTHQUAKE INFORMATION

0

0 DMS-100 Cabinetized requires no additional bracing or stiffening  
0 hardware when applied in an earthquake environment. The cabinet  
0 must be bolted to the floor with four bolts and anchors. For  
0 raised floor installations in active seismic zones, a sub-  
0 structure support between the concrete sub-floor and the raised  
0 flooring is required. (The sub-structure is not provided as part  
0 of this program.) A qualified seismic engineer should be con-  
0 sulted regarding additional bracing on a per job basis.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Building Studies should provide one NTNX2512 kit per cabinet when  
0 Cabinetized equipment is applied in an earthquake configuration.

0 DMS-100 Cabinetized provides EMI compliant functionality when  
0 equipped with shielded cables. The cabinet doors and bulkheads  
0 provide shielding for the equipment to meet EMI standards.

0 4.2.3 SPARING INFORMATION

0  
0 Sparing practices are not impacted by the application of cabi-  
0 nets. Equipment should be spared per existing practices.

0 4.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 Fusing, for cabinets with fusing requirements, is always pro-  
0 vided. Fusing to the central office Power Panel is determined by  
0 Power Engineering based on the maximum current drain per cabinet.  
0 See CURRENT DRAIN INFORMATION.

0 5.0 International DMS-100 Cabinetized

0 This document, in conjunction with ECM-600, describes the provisioning  
0 rules for DMS-100 Cabinetized equipment in G700 Cabinets for use in  
0 the international market where the power supply is 48VDC. This equip-  
0 ment is designed to meet the European Community safety requirements,  
0 including the specific safety requirements for the UK, and global  
0 electromagnetic radiation EN Class A requirements for the European  
0 Community, and Australia.

0 The DMS-100 Cabinetized base product is described in ECM-600 covering  
0 cabinets for use in North America developed in the DMS-100 Global  
0 Cabinetization project Phases 1 - G700 Base Product.

0 This ECM-636 describes the cabinets developed specifically for the  
0 international market as well as the international aspects of the base  
0 cabinets described in ECM-600, developed in the DMS-100 Global  
0 Cabinetization project Phase 3 - UK Base Increment and Phase 5A - EN  
0 Class A Compliancy in G700 cabinets.

The international DMS-100 cabinetized equipment is intended to replace the existing international DMS-100 product lines including frames and Meridian cabinets. To maintain the EMI capability of the cabinetized system, DMS-100 Cabinetized cabinets should not be mixed with frames or Meridian cabinets.

0 NTRX30AA International CLCE

0 The provisioning considerations of ECM-600 are modified for the  
0 international Cabinetized Line Concentrating Equipment (CLCE) as  
0 follows:

- 0 - For each equipped ILCM provide:
- 0 - one (1) NT6X04BB ILCM Common Circuit Pack,
  - 0 - up to ten (10) NT6X05AA Line Drawers, or
  - 0 up to ten (10) NT6X05BA International Line Drawers, or
  - 0 up to ten (10) NT6X05AX Line Drawer Filler Kits,
- 0 - For each international CLCE provide:
- 0 - two (2) NT6X30AB Ringing Generators (UK), or
  - 0 - two (2) NT6X30DA Ringing Generators (China), or
  - 0 - two (2) NT6X30AE Ringing Generators (Australia), and
- 0 |

0 NTRX30AA is always provided in building block NTZZ37LA Interna-  
0 tional CLCE.

0 NTRX30BA International CLMI

0 The provisioning considerations of ECM-600 are modified for the  
0 international Cabinetized Line Module ISDN (CLMI) as follows:

- 0 - For each international CLMI provide:
- 0 - two (2) NT6X30AB Ringing Generators (UK), or
  - 0 - two (2) NT6X30DA Ringing Generators (China), or
  - 0 - two (2) NT6X30AE Ringing Generators (Australia), and
- 0 - one (1) P0733738 Terminal Block Safety Cover  
0 when required.

0 The Terminal Block Safety Cover must be provisioned for UK mar-  
0 kets and may be provisioned on customer request in other markets.

0 NTRX30BA is always provided in building block NTZZ33AA  
0 Cabinetized Line Module ISDN (CLMI) in ECM600.

0 NTRX31AA Cabinetized Power Distribution Center (CPDC)

0 Please refer to ECM631.

0 NTRX32AA Cabinetized Trunk Module Equipment (CTME)

0 The provisioning considerations of ECM-600 are modified for the  
0 international Cabinetized Trunk Module Equipment (CTME) as fol-  
0 lows:

- 0 - For each international CTME provide:  
0 - one (1) NTZZ37RA International CTME AXU/OAU Package  
0 occupying shelf positions 33 and 47, and/or  
0 - For each shelf position 05, 19, 33, and/or 47  
0 - one (1) NTZZ37SA International CTME DRA Package,  
0 - one (1) NTZZ37TA International CTME MTM Package,  
0 - one (1) NTZZ37VA International CTME T8A Package, and/or  
0 - one (1) NTZZ37WA International CTME TM8 Package.

0 Provide safety features as follows:

- 0 - For each CTME, provide as required:  
0 - one (1) P0730668 Terminal Block Cover,  
0 - two (2) P0707195 Latches, and  
0 - two (2) A0368391 Terminal Block Covers.  
0 |

0 The NTRX32AA is always provided in building block NTZZ37QA Inter-  
0 national CTME.

0 For each NTZZ37RA, NTZZ37SA, or NTZZ37TA provide an IMTM Common  
0 CP as follows:

- 0 - For Turkey, provide:  
0 - one (1) NT2X58AY IMTM Common CP,  
0 - For Scopedial in the UK and Spain,  
0 provide:  
0 - one (1) NT2X58BB IMTM Common CP,  
0 - For the Caribbean Expansion Plan (CEP),  
0 provide:  
0 - one (1) NT2X58CL IMTM Common CP, and  
0 - For Mercury DMS-250, provide:  
0 - one (1) NT2X58DB IMTM Common CP.

0 Refer to table A of Engineering Manual section EMB14-01-000 for  
0 the circuit packs which may be provisioned on an international  
0 OAU, IDRA, IMTM, IT8A, or ITM8.

0 NTRX33AA Cabinetized Input Output Equipment (CIOE)

0 The provisioning considerations of ECM-600 are modified for the  
0 international Cabinetized Input Output Equipment (CIOE) as fol-  
0 lows:

- 0 - For each international CIOE provide:
  - 0 - in shelf position 05:
    - 0 - one (1) NTZZ37EM International CIOE
    - 0 DDU Package, or
    - 0 - one (1) NTZZ37FM International CIOE
    - 0 Stratum 2.5 ROS Package, or
    - 0 - one (1) NTZZ37GM International CIOE
    - 0 Stratum II ROS Package,
  - 0 - in shelf position 19:
    - 0 - one (1) NTZZ37CM International CIOE IOC Package,
  - 0 - in each shelf position 33:
    - 0 - one (1) NTZZ37BM International CIOE MTD Package, or
    - 0 - one (1) NTZZ37DM International CIOE DPP Package,

0 Provide safety features as follows:

- 0 - For each CIOE, provide as required:
  - 0 - one (1) P0730668 Terminal Block Cover,
  - 0 - two (2) P0707195 Latches, and
  - 0 - two (2) A0368391 Terminal Block Covers.
- 0 - For CIOE packages , provide as required:
  - 0 - Two (2) P0706920 -48V Stud Covers.

0 The above safety features must be provisioned for UK markets and  
0 may be provisioned on customer request in other markets.

0 The NTRX33AA is always provided in building block NTZZ37AM Inter-  
0 national CIOE.

0 NTRX34AB Cabinetized Miscellaneous Equipment (CMIS)

0 Refer to ECM-655.

0 NTRX35AA Cabinetized Dual Shelf Network (CDSN)

0 The provisioning considerations of ECM-600 are modified for the  
0 international NTRX35AA Cabinetized Dual Shelf Network (CDSN) as  
0 follows:

0 When the CDSN is equipped with one (1) Network Module (2nd net-  
0 work not provided), provide for each CDSN:

- 0 - one (1) NTZZ37YA International CDSN Common CP  
0 (positions 33 and 05), and
- 0 - one (1) NT6X02AB Filler Faceplates  
0 (positions 47 and 19).

0 When the NTZZ37XA is equipped with two (2) Network Module per  
0 plane, provide for each CDSN:

- 0 - two (2) NTZZ37YA International CDSN Common CPs  
0 (positions 33 and 05 for the 1st network, and  
0 positions 47 and 19 for the 2nd network).

0 For each CDSN provide per customer requirements:

- 0 - one (1) NTRX3531 Power & Ground Cover Kit.

0 The Power & Ground Cover Kit must be provisioned for UK markets  
0 and may be provisioned on customer request in other markets.

0 The NTRX35AA is always provided in building block NTZZ37XA Inter-  
0 national CDSN.

0 NTRX37AA Cabinetized Speech Link Connecting (CSLC)

0 The provision rules of ECM-600 apply to the NTRX37AA Cabinetized  
0 Speech Link Connecting (CSLC) in international applications.

0 NTRX37AA is always provided in building block NTZZ21CA  
0 Cabinetized Speech Link Connecting (CSLC).

0 6.1.4 PROVISIONING CONSIDERATIONS

0  
0 The NTRX48AA cabinet houses a dual-shelf Message Switch Buffer 7  
0 (MSB7) module and two STG7 shelves. The MSB7 shelves are con-  
0 nected to each plane of the CDSN Network through the CSLC via  
0 bulkhead DS30 cabling. Each of the MSB7 and STG7 shelves sup-  
0 ports 4 and 16 NT6X66 Signaling Terminal (ST) circuit packs re-  
0 spectively, for a total of 40 STs per cabinet.

0 NT6X66AA and NT6X66CA STs are provisionable for CCS7 and DPNSS7  
0 respectively.

0 In the top of the cabinet is the FSP which distributes power,  
0 control and alarms to the cabinet.

0 The cabinet is forced air cooled with a fan unit integrated into  
0 the base of the cabinet.

## 7.0 Cabinetized Zoned Miscellaneous Equipment

This document describes the provisioning rules for DMS-100 Cabinetized Miscellaneous (CMIS) equipment in C28 Cabinets for use in the international and domestic markets where the power supply is -48VDC. This equipment is designed to meet the European Community safety requirements, including the specific safety requirements for the UK, and global electromagnetic radiation EN Class A requirements for the European Community, and Australia.

The DMS-100 Cabinetized base product is described in ECM-600 covering cabinets for use in North America developed in the DMS-100 Global Cabinetization project.

This ECM describes the CMIS cabinet developed for the international and domestic market as well as the international aspects of the base cabinets.

| DMS-100 C28 Cabinets for International Applications |                                                                           |

### 0 7.1.2 HARDWARE DEPENDENCIES

0

The international DMS-100 cabinetized equipment is intended to replace the existing international DMS-100 product lines including frames and Meridian cabinets. To maintain the EMI capability of the cabinetized system, DMS-100 Cabinetized cabinets should not be mixed with frames or Meridian cabinets.

0 8.0 Cabinetized International Peripheral Equipment

0 SYNOPSIS: This document describes engineering and provisioning  
0 considerations for the Cabinetized International Peripheral Equipment  
0 Fiber ISDN (NTRX46AA) introduced for the European Community and  
0 Australian markets, where the power supply is 48VDC, to meet safety  
0 and global electromagnetic radiation EN Class A requirements.

0 NTRX46AA is a general purpose Common Peripheral Controller Equipment  
0 Frame for international applications which houses two independent dual  
0 shelf modules.

0 Each module may be provisioned as a

- 0 - Line Group Controller Offshore (LGC0), or
- 0 - Digital Trunk Controller Offshore (DTC0).

0 An LGC0 may be provisioned to support

- 0 - copper interface (DS-30) or
- 0 fiber interface (DS-512) to the network,
- 0 - PCM-30 links to RLCM, RSC or OPM,
- 0 - DS-30A interface to LCM.

0 A DTC0 may be provisioned to support

- 0 - copper interface (DS-30) or
- 0 fiber interface (DS-512) to the network,
- 0 - PCM-30 links to other offices,
- 0 - Common Channel Signaling 7 (CCS7).

0 The Dimensions of the CIPE cabinet, DMS-100 C28, are shown in Figure  
0 1.

0  
0 .us NTZZ37AA International CIPE Fiber ISDN (CLG0/CDT0)

0 Building block NTZZ37AA includes NTRX46AA Cabinetized Interna-  
0 tional Peripheral Equipment.

0 The NTZZ37AA Cabinetized International Peripheral Equipment  
0 (CIPE) houses one or two dual shelf XPM modules each configured  
0 as either Line Group Controller Offshore ISDN (LGCO) or Digital  
0 Trunk Controller Offshore ISDN (DTCO).

0 CIPE connects to the network through either DS-30 Trunks (twisted  
0 pairs) or DS-512 trunks (fiber optic cables).

0 CIPE connects to the Line Card Modules (LCMs) via DS-30A trunks  
0 (twisted pairs).

0 CIPE may also interface directly to external PCM-30 trunks (ei-  
0 ther twisted pair or coax).

0 all connections to the network, line card modules, or PCM-30  
0 trunks pass through the bulkhead for EMI protection.

0 9.1.3 PROVISIONING CONSIDERATIONS

0  
0 The NTRX47AA cabinet houses two dual shelf International LGC/DTC  
0 modules where each shelf contains three processor cards.

0 All external connections, with the exception of power, are  
0 through the bulkhead.

0 The CIDC can provide the following interfaces: DS30 or DS512  
0 network interfaces, and PCM30, DS0, or DS30A interfaces. A maxi-  
0 mum of sixteen (16) PCM-30 interfaces may be equipped on the  
0 international version of LGC/DTC versus twenty (20) DS-1 inter-  
0 faces on the North American product. Provision one (1)  
0 NT6X27AC/BB PCM-30 Interface CP for every two PCM-30 interfaces  
0 required.

0 Where fiber interface to the Enhanced Network (ENET) is required,  
0 provide:

0 two (2) NT6X40CA DS-512 Link Control CPs,  
0 two (2) NT6X40DA DS-512 Link Control Paddleboards  
0 two (2) NT6X69LB DS-512 CPP Protocol & Downld CPs, and  
0 one (1) NT6X02BU FXPM Bracket Assembly Kits.

0 or

0 RELEASE 28.01  
0 93 12 03  
0

0 two (2) NT6X40FA DS-512 Link Control CPs,  
0 two (2) NT6X40GA DS-512 Link Control Paddleboards  
0 two (2) NT6X69LB DS-512 CPP Protocol & Downld CPs, and  
0 one (1) NT6X02BU FXPM Bracket Assembly Kits.

0 The NT6X40CA/DA were designed as a functional pair. The same  
0 follows with the NT6X40FA/GA. The paddleboards and circuit packs  
0 cannot be mixed because they do not function in mis-matched  
0 pairs.

0 The NT6X40FA/GA are the latest circuit pack design combination  
0 and should be ordered instead of the NT6X40CA/DA combination when  
0 the packs become generally available.

0 When fiber interface is not required, provide:

0 two (2) NT6X40AC DS30 Network Interface CPs  
0 two (2) NT6X69LA/LB CPP Protocol & Downld CPs.

0 The NT6X69LA may be used for non-fiberised peripherals. It is  
0 recommended that the NT6X69LB be used for jobs when it becomes  
0 available for general use.

0 The XPM (MP/SP) processor complex, always provided with NTRX47AB  
0 Common CP, consists of

0 NT6X45BAs,  
0 NT6X46BBs, and  
0 NT6X47ACs.

0 For each equipped LGC/DTC which supports PCM30 links or for each  
0 equipped LGC module which supports links to an LCM which is  
0 equipped with a PCM30 line drawer such as the NT6X05CA, provide:

0 two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 An Echo Canceller may also be equipped.

0 The DS0 I/F card (NT6X55CA) can be assigned only in slot 1 of  
0 unit 1 of the module.

0 The FSP, which distributes power control and alarms, is located  
0 at the top of the cabinet.

0 This cabinet is forced air cooled by a cooling unit located at  
0 the bottom of the cabinet.

## 0 10.0 DMS-100 CIPE 48VDC/60VDC - EN Class B

0 The NTRX46BA Cabinetized International Peripheral Equipment (CIPE) was  
0 developed in the DMS-100 Global Cabinetization project Phase 4 -  
0 Germany Intelligent Network and EN Class B.

0 The CIPE contains two dual shelf XPM modules configured as either LGCs  
0 (Line Group Controllers) or DTCs (Digital Trunk Controllers).

0 CIPE connects to the network through either DS-30 trunks (twisted  
0 pairs) or DS-512 trunks (fiberoptic cables).

0 CIPE connects to the LCMS (Line Card Modules) via DS-30A trunks  
0 (twisted pairs).

0 CIPE may also interface directly to external PCM-30 trunks (either  
0 twisted pairs or coaxial cables).

0 All connections to the network, line card modules or PCM-30 trunks  
0 pass through the bulkhead for EMI protection.

0 The Modular Supervisory Panel (MSP) that distributes -48VDC or -60VDC  
0 to shelves and contains the cabinet alarms is located at the top of  
0 the cabinet.

0 CIPE is forced air cooled with a -48VDC or -60VDC fan unit integrated  
0 into the base of the cabinet.

0 The following features and options of the NTRX46BA apply to the  
0 Germany Intelligent Network:

- 0 - MSP: -60VDC option,
- 0 - Fan Unit: -60VDC option,
- 0 - Labels: German Language option for some labels,
- 0 - EN Class B requirements:
  - 0 - Molded, shielded inter cabinet cables,
  - 0 - Molded bulkhead-to-backplane signal cables

0 11.0 DMS Common Equipment

0 This ECM describes the following DMS-100 Common Equipment:

0 NT0X07 Frame Common Assembly  
0 NT0X25 Framework Assemblies  
0 NT0X49 Light Fixture Assemblies  
0 NT0X32 EMI Adapters for LCE Frame

0 Standard lighting in the DMS area will be provided by frame-  
0 mounted modular units. One unit will be fastened on each side of  
0 each frame (at the top) and will contain two (2) 15 Watt lamps.  
0 Low intensity lighting, which involves the operation of only the  
0 first units at the end of each line-up, will also serve the emer-  
0 gency lighting requirements.

0 Northern Telecom is evolving to a new preferred method for pro-  
0 viding AC power within the DMS switch. The Commercial AC Free op-  
0 tion utilizes the Center Aisle Lighting concept by placing the  
0 lights off the DMS framework and onto the Integrated Ground  
0 Plane. These lights are isolated from the DMS framework and ref-  
0 erenced to the Integrated Collector Bus (ICB). These lights will  
0 be powered by commercial AC and controlled by low voltage relays  
0 with the switches located in the new end guards introduced in  
0 this document.

## 0 12.0 LaMarche Inverter Provisioning

0 The LaMarche Model A31-500-48V-A6 (A0367433) is a 500-watt DC to  
0 AC inverter designed to provide a protected 120 VAC at 60 Hz sup-  
0 ply from an input source of -48VDC nominal. The inverter is a  
0 solid state transistorized switching supply that utilizes a  
0 ferroresonant filter in delivering a non-distorted sinewave out-  
0 put. The unit can provide 500 Watts with a total harmonic dis-  
0 tortion of less than 5%.

0 This unit is equipped with two dual AC receptacles on the rear  
0 for AC output which will supply power to four (4) devices, the  
0 total of which cannot exceed 500 Watts. The -48VDC input is con-  
0 nected to the unit via a terminal strip (also located on the  
0 rear). Circuit breakers are located on the front panel to supply  
0 the DC input to the inverter and distribute it to the AC outlets.

0 The inverter is enclosed in a rack-mountable case for mounting on  
0 an MIS frame, an IOE frame or an MOE frame. When installing the  
0 unit in one of those frames, ensure sufficient space is available  
0 to allow two inches of cooling space above and below the  
0 inverter.

0 The LaMarche inverter is designed to eventually replace the  
0 NT0X87AA Inverter. The LaMarche unit provides the following  
0 enhancements/regulatory compliances over the existing units:

### 0 Regulatory Compliance

0 \* UL/CSA Listed

0 \* NEC Approved

### 0 Functional Enhancements

0 \* Commercial AC Free System

0 \* Provides up to 500W power output

0 \* Overload Shutdown and Automatic Recovery

### 0 13.0 Global Cabinetization

0 The DMS product has begun the transition from frames to cabinets in  
0 order to comply with international EMI and safety regulations. At the  
0 outset of the project, the cabinets were known as 'Streamline' cabi-  
0 nets. This name is no longer used. The cabinets designed in the first  
0 DMS 100 Cabinetization project are now referred to as DMS-100 Cabinets  
0 (Model A). A number of issues have resulted from the initial design of  
0 the Model A Cabinets. These issues are being addressed by the Global  
0 Cabinetization project. The cabinet designs produced from the later  
0 Global Cabinetization project are known as DMS 100 Cabinets (Model B)  
0 This NTP describes the differences between Model B Cabinets and the  
0 earlier design Model A Cabinets. The improvements provided by Model B  
0 are described in detail, as well as the differences in engineering  
0 rules.

0 The principle focus of this stage of the Global Cabinetization program  
0 is to modify the DMS system power distribution so that it has config-  
0 uration flexibility that, at least, equals the frame-based DMS 100.  
0 This is accomplished by the introduction of a new CPDC that distrib-  
0 utes power external to the EMI shield provided by the system cabinets.  
0 EMI is prevented from being radiated by the externally routed power  
0 cabling by means of External Power Filter Modules fitted in each cabi-  
0 net at the point of entry of the power cables. This power arrangement  
0 is also known as "external power" arrangement. This external power  
0 scheme enables frame-based office extension by cabinetized equipment.  
0 , as well as providing compatibility with the existing cabinetized  
0 equipment (Model A). Model A systems use 'horizontal' (internal) power  
0 arrangement.

0 The Model B product includes a 21 inch wide cabling cabinet known as  
0 the "C21", a 28 inch wide "C28" for the standard cabinet applications  
0 and a 42 inch wide "C42" for SuperNode, ENET and LPP use. Both  
0 Fiberworld Grey and Maple Brown assemblies have been created as part  
0 of this program. Model B C28 cabinets are available in grey only. The  
0 C42 is available in either grey or brown.

## 0 Modular Supervisory Panel

0

0 The MSP provides alarm monitor and control functions for C28 cab-  
0 inets. It is provisioned with modules to provide the capabilities  
0 needed for a specific function. Up to ten Breaker Modules, each  
0 with two breakers, may be provisioned for -48 VDC distribution.  
0 Up to eight Fuse Modules, each with eight breakers, may be pro-  
0 vided for protection of sub-circuits. A total of thirteen Fuse  
0 and Breaker modules may be provisioned. Up to two Talk Battery  
0 Modules may be provided for filtered -48 VDC distribution.

0 |

## 0 Cabinetized Power Distribution Center (CPDC)

0

0 | Secondary power cables for a centralized CPDC (external powering)  
0 | shall be #10 AWG unless specifically required by the customer or  
0 | dictated by the installation (voltage drop) to be #8 AWG or #6  
0 | AWG cable.

0 93 12 03

0 13.1.2 HARDWARE DEPENDENCIES

0  
0 In order to avoid the restrictions in office layout defined for  
0 the original cabinetized product, individual cabinets must be  
0 equipped with Power and Alarm Filter Modules. These have been  
0 made available for the existing CLCE, CLMI, CCPE and CMIS and are  
0 incorporated into the design of all Model B Optimized C28 cabi-  
0 nets. These modules allow overhead filtered power input, under  
0 floor filtered power input as well as through the lineup power-  
0 ing.

0 13.1.3 PROVISIONING CONSIDERATIONS

0  
0 Each Model B cabinet is described in terms of the differences be-  
0 tween the Model B and original Streamline versions (Model A) and  
0 the effect these differences have on provisioning. Items not de-  
0 scribed as different will function as in the original Streamline  
0 product and will be provisioned as before.

0 System Aspects

0  
0 | Provisioning Rules for Extension to Model A Equipment

0 | When Model B Cabinetization equipment becomes generally avail-  
0 | able, the engineering rules for Model A Cabinetization will be-  
0 | come classified as "Retired". That is, Model A will be supported  
0 | for maintenance purposes only. Because of this, extensions to  
0 | Model A equipment, will be made using Model B equipment.

0 | The provisioning rules for extensions to Model A will be re-  
0 | stricted to the cabinet level, that is, the rules for Model B do  
0 | not exploit available shelf space in the existing Model A cabi-  
0 | nets in situations where Model B cabinets are used to extend  
0 | Model B offices.

0 Power Routing Arrangement

0 The standard powering scheme for Model B cabinet systems is the  
0 'external powering' scheme. With this scheme, a cabinet lineup  
0 may receive power from a power distribution center which is not  
0 necessarily in the same lineup. The power distribution center  
0 (PDC) and the cables delivering power to the cabinets from the  
0 CPDC are not enclosed in an EMI shield or cage. EMI which is gen-  
0 erated in the equipment cabinet is filtered from the power supply  
0 cables at the point where the power cables enter each cabinet.

0 Model A cabinetized systems, on the other hand, use the 'horizon-  
0 tal powering' scheme. With this scheme, each cabinet lineup con-

0 RELEASE 28.01  
0 93 12 03

0 tains a CPDC. The CPDC and the cables delivering power to the  
0 equipment cabinets are completely enclosed in the EMI envelope or  
0 cage formed by the cabinet lineup. EMI filters remove EMI from  
0 conductors, such as the battery power feeds to the CPDC, at the  
0 point of entry to the cabinet lineup.

## 0 C28-Type Cabinets

### 0 0 General

0 All C28 Cabinet Products are provisioned as 'Building Blocks'.  
0 C28 Cabinet building blocks, generally, are configured to satisfy  
0 the requirements of all market areas with a minimum of engineer-  
0 ing options.

0 The Standard C28 cabinet building blocks, primarily intended for  
0 the US and CALA, market areas have the following characteristics  
0 selected from the C28 Cabinet design configuration options:

- 0 \* Grey doors with center latch
- 0 |
- 0 \* External Power arrangement
- 0 \* -48V Power

0 The above characteristics satisfy the requirements of all market  
0 areas, however, where a cabinet building block contains equipment  
0 providing functionality, such as ringing generation in the CLCE,  
0 does not satisfy the requirements of all market areas, a second  
0 building block of the same product is provided. Generally, where  
0 two building blocks are provided for the same product type, one  
0 covers the US (domestic) market and any other compatible market  
0 while the other(s) cover overseas (international) markets and  
0 specific countries within a market area for which the domestic  
0 building block is not compatible.

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Cabinetized LCE (CLCE)

0 There are two CLCE building blocks:

0 \* Cabinetized LCE (Model B) (domestic)

0 \* Cabinetized LCE Int. (Model B) (international)

0 The above building blocks differ only in that the ringing genera-  
0 tors are always provided in the CLCE intended for domestic appli-  
0 cation. For the CLCE intended for international application the  
0 ringing generators are provisionable to permit the selection of  
0 ringing generators to be compatible with the country of applica-  
0 tion.

0 Each CLCE building block contains an EMI filter adapter to filter  
0 lines at the EMI bulkhead. Line connectors 78 pin D-sub at the  
0 bulkhead, interface with 64 pin Key Telephone connectors on the  
0 customer distributing frame. A total of 40 tip and ring connector  
0 interfaces are available on the CLCE, each corresponding to one  
0 Line Subgroup of 32 lines.

0 An MSP provides 3 Circuit Breaker Modules (six total breakers), 2  
0 Fuse Modules, 2 Talk Battery Modules and an Alarm Module. This  
0 MSP provides the normal functions of power distribution and  
0 alarms within the cabinet. Low profile duplicated Ringing Genera-  
0 tors with ANI Coin are mounted horizontally across the top of the  
0 MSP.

0 The CLCE building blocks contain up to 2 LCMS (Line Concentration  
0 Modules). The LCMS are provisionable

0 Cabinetized Line Module ISDN (CLMI)

0 There are two CLMI building blocks:

0 \* Cabinetized Line Module ISDN (domestic)

0 \* Cabinetized Line Module ISDN (international)

0 The above building blocks differ only in that the ringing genera-  
0 tors are always provided in the CLMI intended for domestic appli-  
0 cation. For the CLMI intended for international application, the  
0 ringing generators are provisionable to permit the selection of  
0 ringing generators to be compatible with the country of applica-  
0 tion.

0 RELEASE 28.01  
0 93 12 03  
0

0 The Model B CLMI building blocks contain EMI filter adapters to  
0 filter lines at the EMI bulkhead. Line connectors, 78 pin D-sub,  
0 at the bulkhead, interface with 64 pin Key Telephone connectors  
0 on the customer distributing frame. A total of 32 tip and ring  
0 connector interfaces are available on the CLMI, each correspond-  
0 ing to one Line Subgroup of 30 lines.

0 The same MSP that is used on the Model B CLCE are used on the  
0 Model B CLMI, as well as the low profile Ringing Generators.

#### 0 Cabinetized Power Distribution Center CPDC

0 The CPDC building block is a single building block which is suit-  
0 able for application in all market areas. The CPDC building block  
0 supports only 'External' power arrangements and supports for 48V  
0 power supply systems.

0 For the External power arrangement, the CPDC and its power dis-  
0 tribution cables, do not generate EMI, and are, therefore, not  
0 enclosed in a Faraday cage. The cabinets generating EMI are indi-  
0 vidualy supplied with power from the CPDC. EMI is filtered from  
0 the power cables at the point of entry to the cabinets. This ca-  
0 pability is the most important feature difference between the  
0 Model B cabinet system and the Model A system. The capability of  
0 centralizing the CPDC enables it to supply more than one cabinet  
0 lineup while EMI suppression of the whole system complies with at  
0 least EN Class A standards. The capability of centralizing the  
0 CPDC enables flexibility of layout similar to that of the DMS-100  
0 Family frame based systems. Safety covers for all points requir-  
0 ing hazard protection and Enhanced Alarm System support are  
0 standard features. Secure 2 hole bolted joints are used for all  
0 power connections.

0 The Centralized CPDC supports up to thirty-seven (37) cabinets in  
0 four lineups. The CPDC is not an EMI violator and is located out-  
0 side the Faraday cage formed by the cabinet lineup. Power is pro-  
0 vided to each cabinet individually via External Power Filter  
0 Modules. The Model B CPDC does not support power distribution  
0 internally, within the lineup.

0 The CPDC has provides one (1) to four (4) CB (Circuit Breaker)  
0 panels which may be connected in one of two possible configura-  
0 tions.

0 | \* Single Feed (Standard Configuration)

0 RELEASE 28.01  
0 93 12 03  
0

0 | \* Multiple Feed (Alternate Configuration)

0 | Single Feed - two (2) -48V inputs (A and B feeds) from the Cen-  
0 | tral Office Power Plant are fed to all installed CB Panels.

0 | Multiple Feed - two (2) -48V inputs (A and B feeds) are fed to  
0 | each CB Panel, i.e. a maximum of four A and B power feed pairs  
0 | are taken from the Central Office Power Plant; one pair feeds  
0 | each CB panel.

0 | In the Single Feed configuration the Power Plant feeds to the  
0 | CPDC are fused at 600 amps at the Power Plant. Each feed may be  
0 | loaded to a maximum of 400 amps.

0 | In the Multiple Feed configuration the Power Plant feeds to each  
0 | CPDC CB Panel are fused at a maximum of 225 amps and may be  
0 | loaded to a maximum of 150 amps.

0 | A maximum of 160 circuit breakers may be provided on four panels  
0 | of 40 breakers each (20 "A" Feed and 20 "B" Feed). Out of the 40  
0 | breakers on the first panel, 36 are available for assignment. On  
0 | additional shelves, 36 breakers are available where individual  
0 | feeds are provided and 38 are available if single cabinet feed is  
0 | used. The breakers are equally divided between A and B feeds.

0 | A maximum of four breaker panels may be supplied per CPDC. Any  
0 | mix of the following may be used:

- 0 | \* NTRX02CA for applications using C28-type cabinets. Provides  
0 | forty 30 Amp circuit breakers per panel.  
0 | \* NTRX02CD for applications using C42-type cabinets. Provides  
0 | thirty-four 30 Amp and six 10 Amp breakers per panel.

0 Cabinetized TME

0 | There is one Model B CTME building block. It is configured like  
0 | the frame-based TME and uses all currently available TME  
0 | provisionable hardware. Due to the limited bulkhead space avail-  
0 | able for connectors, a maximum of twenty lineups may be config-  
0 | ured when using the Model B CTME. This CTME supports the Enhanced  
0 | Alarm System as an optional provisionable feature. External EMI  
0 | protection for the service and trunk circuits to the distributing  
0 | frame is provided via filtered connectors at the rear EMI  
0 | bulkhead. The MSP is used on the Model B CTME.

0 RELEASE 28.01  
0 93 12 03

## 0 Cabinetized IOE (CIOE)

0 One CIOE building block is specified for application in all mar-  
0 ket areas currently identified for Model B applications.

0 The CIOE houses the following equipment:

0 \* Data Processing Peripheral (DPP) in shelf position 33

0 \* Input/Output Controller (IOC) in shelf position 19

0 \* Mag Tape Drive (MTD) in shelf position 33

0 \* 5.25"/8" Disk Drive Unit (DDU) in shelf position 05

0 \* Stratum Clock in shelf position 05

0 Shielded cables are used for the DS30 connection to SuperNode  
0 through the Bulkhead. Either filtered connectors or shielded ca-  
0 bles are used for EMI protection on external connections to ter-  
0 minals or other devices. Cable connections between the MTD, DDU  
0 or DPP and IOC shelf are made within the EMI envelope formed by  
0 the CIOE.

## 0 Optimized CMIS

0 One CMIS building block is defined for application in all Market  
0 areas in which Model B cabinetized systems are required.

0 The Model B CMIS serves the same function as the frame-based MIS  
0 and accommodates both DMS and outside vendor equipment. EMC  
0 compliant and non-EMC compliant equipment will be housed by using  
0 three basic types of functional cabinets: Totally EMI Shielded  
0 CMIS, Partially EMI Shielded CMIS and Non-Shielded CMIS. CMIS  
0 interconnections are achieved by using generic fully terminated  
0 cables.

0 The Totally EMI Shielded CMIS provides full EMI containment and  
0 contains only Non-EMI compliant provisionable equipment that is  
0 supplied and managed by Northern Telecom. Bulkhead personality  
0 plates and filters are provisioned to supply the same degree of  
0 EMI protection as the other Model B C28-type cabinets.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 The Partially Shielded CMIS will be split as half Shielded and  
0 half Non-Shielded. The Shielded half houses only NT-supplied and  
0 controlled equipment. Only EMI-compliant equipment is provided in  
0 the Non-Shielded half of the cabinet and no bulkhead personality  
0 plates or filters are used. The customer is responsible for  
0 equipment in the Non-Shielded half of the cabinet. No equipment  
0 has currently been identified for use in the Non-Shielded area.  
0 The two halves of the cabinet are separated by an EMI barrier.

0 The Non-Shielded Open CMIS is provided to mount customer-supplied  
0 EMI-Compliant equipment, although the option will exist for NT to  
0 provide EMI-Compliant equipment in this cabinet, when necessary.  
0 However, support is given only for equipment for which rules for  
0 provisioning in the non-shielded housing are provided in the En-  
0 gineering Manual. For this reason, the customer will be consid-  
0 ered responsible for overall cabinet and individual equipment EMI  
0 if non supported equipment is mounted in the CMIS. No bulkhead  
0 personality plates or filters are used on this cabinet version.

0 To accommodate the variety of equipment needed in a CMIS, the Op-  
0 timized CMIS is divided into eight, seven inch high, zones, high.  
0 In the Partially Shielded CMIS, one zone is used to mount the EMI  
0 Barrier. Each piece of equipment occupies one or more zones.  
0 Ideally, one personality plate is associated with each piece of  
0 equipment, however, by grouping functionality in one cabinet,  
0 some equipment with a high number of connectors may use the per-  
0 sonality plate associated with other equipment. Empty space may  
0 be provided above and below equipment per the manufacturer's  
0 specifications. All CMIS equipment complies with system ISG  
0 guidelines.

#### 0 Cabinetized DSN

0 The Model B CDSN contains two fully duplicated dual shelf network  
0 modules, the MSP and a cooling unit. All connectors to and from  
0 the network module are connected through the bulkhead for EMI  
0 protection.

#### 0 Cabinetized CPE

0 The Model B CCPE is the cabinetized version of both the base Com-  
0 mon Peripheral Controller frame and the ISDN CPE frame. This cab-  
0 inet is both ISDN-ready, using the NT6X0226 backpanel, and  
0 fiber-ready as an interface to ENET. All connections to the net-  
0 work and DS-1 links are through the bulkhead for EMI protection.

0 RELEASE 28.01  
0 93 12 03

0 The MSP is mounted in the top of the cabinet and a C-feed module  
0 is provisionable for ISDN applications.

#### 0 Cabinetized SLC

0 Provisioning for the Model B SLC is unchanged from the Model A  
0 CSLC. All Model B enhancements are included in the base ordering  
0 code.

#### 0 Cabinetized DNI

0 Provisioning for the Model B DNI is basically the same as for the  
0 original CDNI. EMI protection is provided via bulkhead filtering.  
0 When the DNI is provided, make allowance for two cabinets, side  
0 by side.

#### 0 Cabinetized MSS

0 Two CMSS building blocks are provided:

0 \* Cabinetized MSS (BROWN)

0 \* Cabinetized MSS (Grey)

0 The CMSS (BROWN) building block is used for initial installations  
0 and extensions to frame based systems colored brown

0 The CMSS (GREY) building block is used in extensions and initial  
0 installations of EMI compliant cabinetized systems. Such systems  
0 are colored grey.

0 The CMSS provides shelves for storage of standard DMS-size cir-  
0 cuit packs, SuperNode-size packs and MSP-size packs. In addition  
0 to the two shelf-types originally used (DMS and SuperNode size  
0 shelves), the MSP card cage is provisioned, when needed. A util-  
0 ity tray for technician tools may be provisioned.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 C42-TYPE CABINETS

0  
0 Dual Plane Combined Cabinet (DPCC)

0 The DPCC NT9X01JB provides the same functionality as the DPCC  
0 NT9X01JA. The NT9X01JB supports both horizontal and external  
0 power cabling and is EMI compliant. The DPCC provides two Mes-  
0 sage Switch shelves, one Computing Module shelf, one System Load  
0 Module, a cooling unit and an FSP, all in a standard C42 cabinet.

## 0 Enhanced Network (ENET)

0 Two packages of the ENET are contained in a standard C42 cabinet.  
0 The NT9X05AC is a 128K channel network duplex contained in two  
0 cabinets. Plane 0 is mounted in one cabinet and Plane 1 in the  
0 other. The network can grow from 2K to 128K channels. This is  
0 equivalent to 64 Double Shelf Networks. The NT9X05AD is a 64K  
0 channel duplex in one cabinet (both planes in the same cabinet),  
0 with half the capacity of the NT9X05AC.

0 Each cabinet has four identical shelves, each shelf having 2 to  
0 16 crosspoint cards, equivalent to 16 Double Shelf Networks. The  
0 cabinet has a cooling unit and FSP, supports both horizontal and  
0 external power feed and is EMC protected.

## 0 Link Peripheral Processor (LPP)

0 The Model B LPP is packaged in the C42 cabinet and retains the  
0 same functionality as the LPP NT9X70BA. The benefits provided by  
0 the Model B power arrangement are the only significant improve-  
0 ment. The Model B LPP is backward compatible and can now be in-  
0 stalled in a cabinetized lineup, allowing the use of non-filtered  
0 power cabling.

0 RELEASE 28.01  
0 93 12 03

## 0 SuperNode Service Enhanced (SNSE)

0 The SNSE is intended for small Class 5 offices and remote appli-  
0 cations and provides the functionality of a SuperNode, ENET and  
0 LPP in a single cabinet. The single C42 cabinet contains a  
0 Compute/SLM shelf, a 16K ENET shelf, a Link Interface Shelf and a  
0 Message Switch shelf. The ENET can be expanded in increments of  
0 2K up to the 16K maximum and can accommodate both fiber and me-  
0 tallic inputs from the associated peripherals.

## 0 Single Shelf LPP C42 Cabinet

0 Single Shelf LPP C42 Cabinet (NTEX01AB) provides a housing, for  
0 a SuperNode office, requiring only a relatively small number of  
0 Link Interface Units (LIUs). Up to two 'Fiberized' Link Interface  
0 Shelves (LISS) may be provisioned. The NTEX01AB contains a maxi-  
0 mum of twenty- four LIUs.

0 The Single Shelf LIS does not require a Local Message Switch for  
0 inter LIU and LIU to Message Switch communication as does an LIS  
0 mounted in an LPP. A special FBUS controller and associated fiber  
0 interface paddleboard enable direct connection between the con-  
0 taining LIS and the SuperNode Message Switch.

## 0 Extensions

0  
0 Equipment enclosed in Model B cabinets may be used for extending  
0 existing Model A Streamline offices.

0 Because Model A offices use the horizontal power arrangement  
0 there are some restrictions when extending using Model B cabinets  
0 which use the 'external power' or external power arrangement. The  
0 Model A CPDC has the capability of powering 1 to 3 standard, i.e.  
0 external power, Model B cabinets in addition to the 'horizontal  
0 power' or internal power cabinets in the associated Model A cabi-  
0 net lineup. This means that a Model A lineup can be extended by a  
0 maximum of 3 powered Model B cabinets, on condition that the  
0 power rating of the CPDC at the end of the lineup is not ex-  
0 ceeded. Model B extensions requiring more than three cabinets,  
0 should be installed in a separate additional lineup or lineups.

0 RELEASE 28.01  
0 93 12 03  
0

0 The additional lineup(s) require at least one Model B CPDC to be  
0 provisioned.

0 In instances where an extension to either a Model A or Model B  
0 office contain CMIS or CIOE which include modems, special core  
0 cluster grounding arrangements are required. For details refer to  
0 ECM 283.

0  
0 13.1.4 Office Layout Information

0  
0 The central capability provided by the Model B versions of  
0 cabinetized equipment is functionally equivalent to the frame  
0 based product in terms of office layout. Using the Model B Cen-  
0 tralized CPDC, the previous limit of eleven cabinets per lineup  
0 is removed. The term "Centralized CPDC" does not mean that it  
0 must be positioned in the center of a lineup, but rather that it  
0 is able to distribute power to more than one lineup. A single  
0 Model B CPDC can power up to thirty-seven frames/cabinets in up  
0 to four lineups. Power supplies are routed outside the EMI  
0 shields formed by the cabinet lineups. Filter modules are used to  
0 allow connections to penetrate the EMI barriers of each cabinet  
0 while retaining EMI compliance. Alarm and frame/logic ground ca-  
0 bling can be routed either inside or outside the EMI shield. When  
0 routed outside, e.g. between cabinet lineups, EMI filters are  
0 used at exit and entry points.

0 Model B cabinets are backward compatible with the original C28  
0 cabinet and will allow extension of existing Model A Cabinetized  
0 offices. The External Power Filter Module extends the capability  
0 to use existing RMEs or CPDCs to derive power and alarms.  
0

0 \* All CLCE and CLMI cabinets must be powered by the same CPDC  
0 that powers the associated CCPE. The cabinets no longer need  
0 to be in the same lineup as their controllers but must be  
0 powered from the same CPDC as their controllers.

0 \* With the introduction of External Power Filter and Alarms,  
0 breaks in lineups due to columns or future additions are al-  
0 lowed. This increases flexibility in engineering Hot Slide  
0 offices.

0 RELEASE 28.01  
0 93 12 03

- 0 \* Restrictions in location of NT9X95-style cabinets in a lineup  
0 do not apply to Model B Externally Powered offices (external  
0 powering scheme).
- 0 \* In a lineup with no C28 cabinets, the maximum number of C42  
0 (NT9X95) cabinets is five. This limit is imposed by the  
0 Centralized CPDC maximum power capacity of 400 Amps.
- 0 \* Provisioning CSLCs and CDNIs is the same as the in the provi-  
0 sioning of a frame-based DMS office. Allow for two CSLCs, one  
0 for Plane 0 and one for Plane 1. Provide two cabinets to ac-  
0 commodate CDNI. When there is more than one CSLC or CDNI,  
0 they should be located across from each other in separate  
0 lineups. Multiple CSLC/CDNIS should not be in the same lineup  
0 due to heavy cabling required.
- 0 \* Additional cabinets should be added to the growth end of a  
0 lineup. Cabinets cannot be added to the non-growth end of a  
0 lineup, nor can they be added between the CPDC and the non-  
0 growth end of the lineup in instances where the CPDC not lo-  
0 cated at the non-growth end.
- 0 \* Frame ground bus and logic return bus must be extended as the  
0 lineup grows.
- 0 \* When adding cabinets to a DMS-100 frame office, the cabinets  
0 must be located in separate lineups.
- 0 \* If cabinets (which are ISG compliant) are added to a non-ISG  
0 frame office, consideration will have to be given to ISG in-  
0 tegrity.
- 0 The system is free of all commercially-derived sources of AC  
0 power. This is accomplished by using low voltage light control  
0 for the Center Aisle Lighting and inverter-derived power for the  
0 AC convenience outlets on the endguards.

0 13.2 PRODUCT/SYSTEM SPECIFICATION

0

0 13.2.1 PHYSICAL CHARACTERISTICS

0

0 Dimensions and weights of the Model B cabinets are as follows:

0 - C21 Cabinet with cosmetic panel:  
0 20.7" wide, 28" deep, 72" high; weight 180 lb.

0 - C28 Cabinet with cosmetic panel:  
0 28.5" wide, 28.4" deep, 72" high  
0 weight for major components:  
0 doors.....25 lb. each  
0 bulkheads.....14 lb. each  
0 endpanels.....13 lb. each  
0 loaded shelf.....61 lb. each  
0 empty shelf.....27 lb. each  
0 cooling unit.....20 lb.  
0 MSP.....15 lb.  
0 Overhead cable trough...30 lb.  
0 C28 Cabinet Assy.....250 lb.

0 - C42 Cabinet (dimensions & weights approximate)  
0 41.9" wide, 28" deep, 72" high

0 SuperNode Shelf: 12.9" high  
0 36.13" wide  
0 22.26" deep

0 Cooling Unit: 9.62" high  
0 36.13" wide  
0 22.26" deep

0 FSP: 4.9" high  
0 36.13" wide  
0 22.26" deep

0 C42 with four empty shelves, FSP, cooling unit  
0 bulkheads and bulkhead PCs, shelf cable trays,  
0 logic return bars and power cabling: 800 lb.

0 RELEASE 28.01  
0 93 12 03

0  
0 Same as above with complete set of circuit packs  
0 and a set of four doors: 1400 lb.

0 weight for major components:  
0 doors.....40 lb. each  
0 bulkheads.....23 lb. each  
0 endpanels.....25 lb. each  
0 loaded shelf.....180 lb. each  
0 empty shelf.....70 lb. each  
0 cooling unit.....65 lb.  
0 FSP.....21 lb.  
0 Overhead cable trough...51 lb.  
0 Cabling Cabinet .....180 lb. (complete)

0 13.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 All Model B cabinets provide both primary and secondary holes for  
0 anchoring the cabinets to the floor during installation. The cab-  
0 inets use 12mm anchors in all seismic (earthquake) zones. The  
0 cabinets use leveling feet in all non-seismic zones.

0 Model B cabinets are EMI compliant.

0 13.2.3 SPARING INFORMATION

0  
0 Not applicable.

0 13.2.4 ISG REQUIREMENTS

0  
0 Isolated System Grounding (ISG) for Cabinetization Model B is  
0 outlined in this section. Refer to ECM-289, Isolated System

0 RELEASE 28.01  
0 93 12 03  
0

0 Grounding (ISG), for a detailed description of ISG. As with a  
0 frame office, the various grounds (frame, logic, battery return)  
0 in a Cabinetization office are also kept separate until the Cen-  
0 tral Office (CO) Ground Window. Only the additional requirements  
0 and differences for Cabinetization Model B are outlined in this  
0 section. For any items not mentioned in this section, the same  
0 ISG rules as stated in ECM-289 and other individual documents ap-  
0 ply (e.g. DDU, inverters, modems, etc.).

0 The CPDC in a Model B Cabinetization office is provisioned in the  
0 Centralized Power mode. The ISG requirements for the Centralized  
0 Power mode is outlined in the following sections. In a  
0 Cabinetization Model A office only the Integrated Power scenario  
0 is available (CPDC at the end of each lineup). Extensions to  
0 Model a Model A lineup using Model B cabinets are restricted to a  
0 maximum of three (3) cabinets owing to restrictions inherent in  
0 the CPDC when used in the horizontal configuration. In the hori-  
0 zontal configuration, the CPDC can supply a maximum of three ex-  
0 ternally powered cabinets on condition that the total number of  
0 cabinets supplied by the CPDC is within the capacity of the CPDC.

0 In a Cabinetization Model B office the Centralized Power must be  
0 used. An extension to a Model A using Model B cabinets must,  
0 therefore, use mixed power modes. The Model A cabinets use the  
0 Integrated Power mode.(Horizontal Power arrangement). Model B  
0 cabinet extensions use the external power arrangement that is  
0 characteristic of the Centralized Power configuration.

#### 0 Integrated Power (Horizontal Power)

0  
0 The power arrangement referred to as Integrated Power which is  
0 used with Model A Cabinets is the arrangement in which each  
0 line-up contains a CPDC and Model A equipment cabinets. The CPDC  
0 is, preferably, located at the start of the line-up. All the  
0 cabinets in each line-up are physically bolted together, to allow  
0 power and ground cables to traverse Horizontally within the  
0 line-up via a passage-way in the side walls. This arrangement  
0 provides an EMI-compliant, self-enclosed cabinet line- up.

0 Integrated MAP (IMAP) shall be the only topology used for mainte-  
0 nance and administration positions. Refer to ECM-289 for ISG  
0 rules on IMAP.

0 RELEASE 28.01  
0 93 12 03  
0

0 1. Framework Ground (FG)

- 0 \* A Framework Ground stud or reference point is located at  
0 the bottom of each cabinet, so that the cabinets can be  
0 bonded to the FG collector. This FG stud or reference  
0 point is identified with the international ground symbol.
- 0 \* A No.0 AWG Framework Ground collector cable shall be run  
0 internal to each line-up along the base of the cabinet.  
0 A No.6 AWG cable shall be run from each cabinet's FG stud  
0 and C-tapped to the FG collector cable. The FG collector  
0 cable shall terminate at the ground plate at the bottom  
0 of the CPDC EMI bulkhead.
- 0 \* A No.0 AWG cable shall be run from the CPDC ground plate  
0 to the Framework Bonding Equalizer (FBE).
- 0 \* The cable from the FBE to the CO Ground Window shall be  
0 the same as frame ISG rules.
- 0 \* Two-hole lugs shall be used wherever possible to termi-  
0 nate cables.

0 2. Logic Ground (LG)

- 0 \* DPCC, CIOE, and associated dedicated CMIS cabinets must  
0 be located in the same line-up. These cabinets are re-  
0 ferred to as the Core Cluster.
- 0 \* LGE and associated LCE equipment must be located in the  
0 same line-up.
- 0 \* LIU equipment and associated CMIS modems must be located  
0 in the same line-up.
- 0 \* There shall be no dc-coupled signal interconnections be-  
0 tween equipment in separate line-ups.
- 0 \* A No.0 AWG Logic Return collector cable shall be run  
0 along the base of the cabinets, and shall terminate at  
0 the EMI feed-through filter located on the CPDC bulkhead.  
0 For any cabinet requiring a logic return termination, a  
0 No.6 AWG cable shall be run from the LR bus of the equip-  
0 ment and C-tapped to this LR collector cable. The cabi-

0  
0 RELEASE 28.01  
0 93 12 03

0 nets requiring a logic return termination are the same as  
0 their functional counterpart in a frame office.

0 \* Core cluster cabinets shall have a No.6 AWG Core Cluster  
0 Equalizer cable run along their base, and C-tapped to the  
0 LR collector cable. A No.6 AWG cable shall be run from  
0 the LR bus of each core cluster cabinet, and C-tapped to  
0 this Core Cluster Equalizer cable.

0 \* No.0 AWG cable shall be run from the CPDC EMI feed-  
0 through filter to the Logic Return Equalizer (LRE).

0 \* The cable from the LRE to the CO Ground Window shall be  
0 the same as frame ISG rules.

0 \* All LR C-taps shall be equipped with a protective cover  
0 to insulate the taps from any incidental contact with FG,  
0 etc.

0 \* Two-hole lugs shall be used wherever possible to termi-  
0 nate cables.

### 0 3. Battery Return (BR)

0 | \* Power filter modules for Model B are available to support  
0 | 16,13,12,9 and 5 power type connections. These include  
0 | battery, battery return, and logic return connections.  
0 | The terminals can support up to 6 AWG cable, however, 10  
0 | AWG is recommended to facilitate installability.

0 | Dedicated tooling is used for the Filtered Terminal  
0 | Blocks. This tooling is flexible in that filtered termi-  
0 | nal blocks of 1 to 13 positions can be produced.

0 | Power filter kits designed to fit specific Model A cabi-  
0 | nets supply the required number of connection points for  
0 | each application.

### 0 Centralized Power (External Power)

0  
0 | The second scenario is referred to as Centralized Power. Central-  
0 | ized power is used in Model B systems and for Model B extensions

0  
0 RELEASE 28.01  
0 93 12 03

0 | to Model A systems. This is when the CPDC is located in one of  
0 the line-ups central to the equipment line-ups. The CPDC can  
0 power up to 37 cabinets.

0 Integrated MAP (IMAP) shall be the only topology used for mainte-  
0 nance and administration positions. Refer to ECM-289 for ISG  
0 rules on IMAP.

0 1. Framework Ground (FG)

0 \* A No.0 AWG Framework Ground collector cable shall be run  
0 external to each line-up. A No.6 AWG cable shall be run  
0 from each cabinet's FG stud and C-tapped to the FG col-  
0 lector cable. The FG collector cable shall terminate at  
0 the Framework Bonding Equalizer (FBE).

0 \* A No.0 AWG cable shall be run from the Framework Ground  
0 stud of the CPDC to the Framework Bonding Equalizer  
0 (FBE).

0 \* The cable from the FBE to the CO Ground Window shall be  
0 the same as frame ISG rules.

0 \* Two-hole lugs shall be used wherever possible to termi-  
0 nate cables.

0 2. Logic Ground (LG)

0 \* DPCC, CIOE, and associated dedicated CMIS cabinets must  
0 be located in the same line-up. These cabinets are re-  
0 ferred to as the Core Cluster.

0 \* CLCE or CLMI and their associated controllers (either  
0 CCPE or CIPE) must be powered from the same CPDC.

0 \* The LPP and associated CMIS modems must be located in the  
0 same line-up.

0 \* There shall be no dc-coupled signal interconnections be-  
0 tween equipment in separate line-ups.

0 \* A No.0 AWG Logic Return collector cable shall be run ex-  
0 ternal to each line-up. For any cabinet requiring a  
0 logic return termination, a No.6 AWG cable shall be run  
0 from the LR bus of the equipment and C-tapped to this LR  
0 collector cable. The cabinets requiring a logic return  
0 termination are the same as their functional counterpart

0 RELEASE 28.01  
0 93 12 03

0 in a frame office. The LR collector cable shall termi-  
0 nate at the system Logic Return Equalizer (LRE).

- 0 \* Core cluster cabinets shall have a No.6 AWG cable run  
0 from their respective LR bus, and C-tapped to a LR col-  
0 lector spaced at 15cm intervals above CIOE 00.

- 0 \* The LPP and associated CMIS cabinets shall have a No.6  
0 AWG cable run from their respective LR bus, and C-tapped  
0 to a LR collector spaced at 15cm intervals above the LPP.

- 0 \* No.0 AWG cable shall be run from the CPDC Frame Ground  
0 (FG) plate to the Logic Return Equalizer (LRE).

- 0 \* The cable from the LRE to the CO Ground Window shall be  
0 the same as frame ISG rules.

- 0 \* All LR C-taps shall be equipped with a protective cover  
0 to insulate the taps from any incidental contact with FG,  
0 etc.

- 0 \* Two-hole lugs shall be used wherever possible to termi-  
0 nate cables.

### 0 3. Battery Return (BR)

- 0 \* For any cabinet requiring a battery return termination, a  
0 No.6 AWG cable shall be run from the LR bus of the equip-  
0 ment to the Battery Return plate of the CPDC. The cabi-  
0 nets requiring a battery return termination are the same  
0 as their functional counterpart in a frame office.

0 1.0 Remote Line Concentrating Module (RLCM)

0 1.1 Introduction

0 The RLCM (Figure 312.1) is essentially a Line Concentrating Mod-  
0 ule (LCM) operating in a location remote from the controlling  
0 DMS-100 host office through DS1-rate links.

0 The RLCM has a capacity of 640 lines, and its design is based on  
0 that of the LCM in the host office. This approach ensures both  
0 commonality of hardware and features and feature sets for the  
0 RLCM lines and allows total integration of RLCM maintenance and  
0 administration with the host.

0 The RLCM frame can accommodate one Line Concentrating Module  
0 (LCM), one Remote Maintenance Module (RMM), one Host Interface  
0 Equipment (HIE) shelf, one Frame Supervisory Panel (FSP), and two  
0 Ringing Generators. The LCM interfaces with the subscriber lines  
0 via line cards.

0 The Remote Line Concentrating Cabinet (RLCC) is a repackaged ver-  
0 sion of the Remote Line Concentrating Module (RLCM) Frame for U.S.  
0 Offices only. The cabinet is design to meet all earthquake zone  
0 requirements without external bracing. However when the RLCC is  
0 mounted on raised floors, under floor bracing is required.

0 Note: RLCC, RLCM 100C and RLCM C are used interchangeably in  
0 reference to the Remote Line Concentrating Cabinet. In this doc-  
0 ument the acronym used to refer to the Remote Line Concentrating  
0 Cabinet is RLCC.

0 The RLCC uses the following modules:

- 0 - Remote Maintenance Module (RMM): Same as used on the  
0 existing RLCM Frame
- 0 - Host Interface Equipment (HIE): Same as used on the  
0 existing RLCM Frame
- 0 - Line Concentrating Equipment (LCE): The DMS-100F LCE  
0 shelves do not meet space requirements, therefore,  
0 the Meridian SL-100F LCE shelves (NTNX2802) are used.  
0 The heat baffles are removed from the Meridian LCE  
0 shelves, therefore cooling fans are used and fused  
0 from the FSP.

0 93 12 03

0 - Frame Supervisory Panel (FSP): The RLCC uses the  
0 Meridian SL-100F FSP (NTNX26AA) which includes LCE  
0 fuses but does not include repeaters.

0 - Fan Cooling Unit (FCU): The FCU will be essentially  
0 the same as used on the Meridian SL-100F but will use  
0 a nonmetallic fiber filter in place of the metal  
0 mesh filter. The FCU is used because the baffles  
0 were removed from the LCE.

0 Refer to Figure 312.1 below which provides a picto-  
0 rial comparison of the RLCM and RLCC.

0 NOTE: In this Remote Line Concentrating Module sec-  
0 tion, RLCM also refers to RLCC unless otherwise  
0 stated.

0

0

0

0

0

0 1.2 Features0 1.2.1 Line Features

0 The RLCM supports all current line features that are supported by  
0 host LCM's. This includes POTS, IBN stations, IBN consoles,  
0 DATAPATH and IBN Business Sets.

0  
0 1.2.2 Intra-Calling

0 Calls which both originate and terminate within an RLCM can be  
0 made without using the DS-1 links to the host office, except dur-  
0 ing the call set-up stage. After such a call has been determined  
0 to terminate within the RLCM, channels internal to the RLCM will  
0 be utilized. If an idle channel is not available, the connection  
0 via the host office network is made and maintained for the dura-  
0 tion of the call.

0  
0 1.2.3 Emergency Stand Alone

0 The Emergency Stand Alone (ESA) option provides POTS service be-  
0 tween subscribers connected to the same LCM controlled by the  
0 same HIE shelf in the event of loss of all DS-1 signalling chan-  
0 nels to the host office.

0 For ESA, a specially equipped HIE shelf and a specially equipped  
0 RMM are required for each LCM having ESA.

0  
0 1.2.4 RLCM With Unique RLCM/LCM Numbering Option

0 With this option, the RLCM/LCM numbering can be unique per site  
0 or per office (i.e. host and all remote sites).

0 RELEASE 28.01  
0 93 12 03

0 If the RLCM/LCM numbering is unique per site, then the numbering  
0 will start with RLCM 00 LCM 00 0.

0 If the RLCM/LCM numbering is unique per office, then the number-  
0 ing will be contiguous to the LCE/LCM's in the host office.

0 If the remote site already has RLM's, then the RLCM/LCM numbering  
0 will be contiguous to the RLM frame/RLM bay number of this site.

0 Once the numbering option has been chosen, it cannot be changed  
0 at a subsequent extension.

0 If the Line Equipment Numbers (LEN) (i.e. for LM, RLM, LCM) will  
0 be unique per office, in order to have sequential (contiguous)  
0 LEN numbers for the host office and each remote site, the cus-  
0 tomer may reserve groups of numbers for future growth in the host  
0 and each remote site (i.e. gaps are allowed in the numbering).

0  
0 1.2.5 RLCM Off RSC

0 The RLCM can be connected to the P-side of an RCC of the RSC. The  
0 Remote-Off-Remote configurationn allows several smaller sites to  
0 be remotod off the site served by the RCC. This facilitates the  
0 conversion of small offices to DMS-100 and with intraswitching  
0 the usage of DS-1 facilities is kept to a minimum. The same fea-  
0 tures that are provided for an RLCM off a Line Trunk Controller  
0 (LTC) (such as intraswitching, ESA, RMM and carrier maintenance)  
0 are supported on a RLCM off an RSC. Refer to the Remote Switch-  
0 ing Center section for more information.

0 RELEASE 28.01  
0 93 12 03

0 1.2.7 Remote Maintenance Module (RMM)

0 (a) General Description

0 The RMM provides maintenance and service functions for the LCM.  
0 It is based on the host Maintenance Trunk Module (MTM).

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) The RMM has fourteen (14) provisionable slots to ac-  
0 commodate service circuit requirements.

0 ( ii) Only one RMM can mount on one RLCM frame.

0 ( iii) An RMM module is composed of a shelf assembly (a card  
0 cage, an entity without any circuit packs) and one set of  
0 common circuit packs.

0 ( iv) The RMM Shelf Assembly, NT6X1301, is always provided on  
0 the RLCM frame.

0 ( v) The RMM Common Circuit Packs, NT6X13\_\_, contain the fixed  
0 by design circuit packs which are supplied only if the  
0 RMM module is required on the frame.

0 The following RMM CPs are to be ordered for the following  
0 applications:

| <u>RMM CP</u> | <u>APPLICATION</u> |
|---------------|--------------------|
| NT6X13AB      | Domestic           |
| NT6X13BA      | Turkey, China      |
| NT6X13DA      | CEP                |
| NT6X13EA      | SL-100 UK          |

0 ( vi) The RMM module can be shared between RLCM's in the same  
0 site, and RLCM's and RSC's in the same site as long as  
0 there is no ESA option required.

0 ( vii) If the ESA option is required, then each RLCM requires  
0 its own dedicated RMM module along with the traffic pro-  
0 visioned digitone receiver circuits mounted on it. The

0  
0 RELEASE 28.01  
0 93 12 03

0 other service circuits mounted on the RMM module can be  
0 shared between RLCM's in the same site, and RLCM's and  
0 RSC's in the same site (i.e., they need not be duplicated  
0 on every RMM module).

0 (viii) The present RSM in an RLM site can be shared by a co-  
0 located RLCM and/or RSC as long as there is no need for  
0 digitone receivers.

0 1.2.8 Host Interface Equipment (HIE)

0 (a) General Description

0 The RLCM connects to the host office through its Host Interface  
0 Equipment (HIE) shelf assembly. The HIE shelf contains the fol-  
0 lowing components:

- 0 \* Ringing Generators
- 0 \* Link Control Cards
- 0 \* DS1 Interface Cards (Domestic)
- 0 \* PCM-30 Interface Cards (International)
- 0 \* Power Converters

0 (b) References

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 ( i) An HIE shelf is composed of a shelf assembly (a card  
0 cage, an entity without any circuit packs) and one set of  
0 common circuit packs. The HIE Shelf Assembly is always  
0 provided with the RLCM frame. The HIE Common Circuit  
0 Packs, NT6X11AB, contain the fixed by design circuit  
0 packs which are supplied only if the HIE shelf is re-  
0 quired on the frame. NT6X11BB HIE Common Circuit Packs  
0 are for International applications except China and  
0 SL-100 UK. NT6X11KA is equipped for China and NT6X11EB  
0 for SL-100 UK.

0 | The minimum packfill for BCS-32 and BCS-33 is NT6X11AA  
0 for an RLCM (with HIE shelf).

0 | Effective with BCS-33, an RLCM with ESA must be provi-  
0 sioned with one NT6X47AC CP per shelf (in new offices),  
0 or with the addition of a second NT6X47AB CP per shelf.

0 ( ii) Each equipped HIE shelf requires one NT6X11AB.

0 ( iii) DS1 Interface Circuit Pack, NT6X50AA, is required to  
0 interface with the DS1 links from the LGC or LTC module  
0 in the host office.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 PCM-30 Interface Circuit Pack, NT6X27AB, is required to  
0 interface with the PCM-30 links from the ILGC module in  
0 the host office.

0 ( iv) NT6X50AA mounts on the Host Interface Equipment Shelf.

0 Minimum NT6X50AA = 2, maximum = 3.

0 Two NT6X50AA cards are contained in one NT6X11AB.

0 Each NT6X50AA card accommodates two (2) DS1 links.

0 Minimum number of DS1 links per RLCM to the host is two  
0 (2), maximum is six (6). The number of links is  
0 engineerable based on traffic requirements.

0 ( v) NT6X27AB mounts on the Host Interface Equipment Shelf.

0 Minimum NT6X27AB = 2, maximum = 3.

0 Two NT6X27AB cards are contained in one International  
0 RMM.

0 Each NT6X27AB card accommodates two (2) PCM-30 links.

0 Minimum number of PCM-30 links per IRLCM to the host is  
0 two (2), maximum is six (6). The number of links is  
0 engineerable based on traffic requirements.

0 ( vi) Two (2) DS-1 circuit packs (4 DS-1 links) are always pro-  
0 vided in the HIE shelf. All RLCM DS-1 links must access  
0 the same LGC or LTC module in the host office.

0 Two (2) PCM-30 circuit packs (4 PCM-30 links) are always  
0 provided in the HIE shelf. All RLCM DS-1 links must ac-  
0 cess the same ILGC module in the host office.

0 ( vii) It is recommended to assign the HIE (C-side) message  
0 links, 0 and 1, to ports on different LGA/LTA at the host  
0 office (i.e. assign message link 0 to LGA/LTA shelf array  
0 0 and assign message link 1 to LGA/LTA shelf array 1).

0 (viii) Two message ports belonging to two separate remotes are  
0 allowed in the same DS-1/PCM-30 Interface card on the  
0 LGC/ILGC or LTC module of the host office.

0

0  
0 RELEASE 28.01  
0 93 12 03

- 0 ( ix) Ringing generators are required to provide analog ring-  
0 ing. Business Set and Data Unit do not require analog  
0 ringing.
- 0 ( x) Ringing Generators contain frequency circuits that gener-  
0 ate ringing signals to subscriber line cards on the LCA  
0 shelves. Superimposed and Frequency Selective Ringing  
0 are supported.
- 0 ( xi) The ringing generators also contain ANI/Coin generator  
0 circuits. These circuits check for two or four-party ANI  
0 and for coin presence in Prepay coin telephones. They  
0 also produce voltages required for ANI and coin control  
0 (<sup>1</sup> 48V DC and <sup>1</sup> 130V DC). The ringing generators monitor  
0 ANI/Coin voltages and ring bus outputs for failure.
- 0 ( xi) Ringing type and level are set by means of a switch on  
0 the Ringing Generator.

0 RELEASE 28.01  
0 93 12 03

0 1.2.9 Frame Supervisory Panel (FSP)

0 (a) General Description

0 The FSP provides talk jacks, fuse alarm features, and power control for the RLCM frame. The FSP contains 48V distribution breakers to the Ring Generators (RG-0, RG-1) in the HIE and various converters in the RLCM frame.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) There are two versions of the FSP which can mount on the RLCM frame only. One version is ordered if the FSP is required to provide the power distribution function for the RLCM frame. Otherwise the other version is provided.

0 For the RLCC, one MSL-100 FSP NTNX26AA is always provided.

0 ( ii) FSP NT6X25AA is the FSP without the power distribution function.

0 Hence, with this FSP, a PDC or equivalent is required.

0 FSP NT6X25BA is the FSP equipped with the power distribution function.

0 This FSP requires 2 feeds, one A feed and one B feed.

0 ( iii) Provide one Alarm Battery Supply NT6X14WA when FSP NT6X25BA is required.

0 ( iv) If the FSP will be required to provide the power distribution function for the RLCM frame, then the FSP can optionally house one QPP519 Fault Locate and Order Wire Access circuit pack and up to six QRY18 series office repeaters.

0 The RLCC FSP includes fusing for line drawers but no provision for mounted repeater cards. Repeaters must be mounted external to the RLCC.

0 RELEASE 28.01  
0 93 12 03  
0

0 For each QPP519 provide one (1) QFB127\* or QFB128\* fault  
0 locate filter. The QFB127 is a Dual Amplified type and  
0 the QFB128 is a Single passive Type. The following fil-  
0 ter types are available:

|   |       |          |          |
|---|-------|----------|----------|
| 0 | * = A | 832Hz    | G = 1722 |
| 0 |       | B 928Hz  | H = 2008 |
| 0 |       | C 1048Hz | J = 2193 |
| 0 |       | D 1206Hz | K = 2413 |
| 0 |       | E 1340Hz | L = 2680 |
| 0 |       | F 1508Hz | M = 3017 |

0 Each DS-1 line requires one appropriate QRY18 type office  
0 repeater.

0 The following is a list of QRY18 series office repeaters:

- 0 (a) QRY18A, Office Repeater powering the line repeater  
0 (provides DC power to the line).
- 0 (b) QRY18B1, Office Repeater powering the line repeater  
0 with error monitor feature.
- 0 (c) QRY18C, Office Repeater without power.
- 0 (d) QRY18D1, Office Repeater without power, but with er-  
0 ror monitor feature.
- 0 (e) QRY18F, Office Repeater with -130V only.
- 0 (f) QRY18G1, Office Repeater with -130V and with error  
0 monitor feature.

0 Both QRY18F and QRY18G1 have -48V input and generate  
0 -130V output for the DS-1 line.

0 Usually the host office supplies the power and fault lo-  
0 cate facilities.

0 For short distances, there is no need for power from the  
0 RLCM (for details refer to NTP 368-2111-160N).

0  
0 RELEASE 28.01  
0 93 12 03

0 Normally the customer will specify which type of QRY18  
0 office repeater is required since they engineer the  
0 transmission facilities.

0 For more details, refer to NTP 368-2111-160N Span Engi-  
0 neering Information and NTP 368-2111-103N Span Terminal  
0 Equipment. The above NTP's are for North American appli-  
0 cations.

0 1.2.10 Line Concentrating Module (LCM)

0 (a) General Description

0 The LCM in the RLCM allow the connection of up to 640 subscriber  
0 lines. Within the RLCM the LCM connects from two to six DS-1 C-  
0 side links to its 640 analog subscriber lines.

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations

0 ( i) See LCM Provisioning in Section 3.5.

0 ( ii) RLCM's with the ESA option require a minimum of two line  
0 cards per RLCM bay in order to demonstrate the intra  
0 calling option with ESA.

0 ( iii) The RLCC uses the MSL-100 LCE shelves. These shelves are  
0 the same as DMS-100 LCE shelves except the heat baffle is  
0 omitted and fuse holders are moved to the FSP.

## Remote Office Equipment Chapter 24

Page 24-16

0 RELEASE 28.01  
0 93 12 03

0 2.0 Remote Switching Center (RSC)

0 2.1 Introduction

0 (i) The RSC is available in two (2) basic configurations  
0 (i.e. Mono RSC (Figure 312.5) and Dual RCC (Figure  
0 312.6)). These configurations are defined as follows:

0 \* The MONO RSC is comprised of a Remote Controller  
0 Equipment (RCE) Frame. Also required, but custom  
0 provisioned, are the Line Concentration Equipment  
0 (LCE) Frames and Remote Miscellaneous Equipment (RME)  
0 Frames.

0 \* The Dual RSC is comprised of two (2) Remote Control-  
0 ler Equipment (RCE) Frames. Also required, but cus-  
0 tom provisioned, are the Line Concentration Equipment  
0 (LCE) Frames and Remote Miscellaneous Equipment (RME)  
0 Frames and/or Power Distribution Center (PDC) Frames.

0 The Dual RCC configuration consists of two RCC pe-  
0 ripheral modules which are colocated no further than  
0 200 meters apart. Each is connected on the  
0 controller-side (C-side) to an LGC or LTC. Both  
0 LGC/LTCs must be on the same DMS-100 switch. The two  
0 RCCs are interconnected on the C-side by a minimum of  
0 two DS-1 links, known as interlinks. These interlinks  
0 carry inter-RCC calls when the RCCs are in the normal  
0 and ESA modes.

0 (ii) REMOTE CONTROLLER EQUIPMENT FRAME (RCE)

0 The controller side (C-side) interfaces to the host over  
0 DS-1 links to a LGC/LTC. (Note: Software translations  
0 will require from 3 to 16 ports to interface to an RSC.)  
0 Hardware facilitates a host interface requirement of from  
0 2 to 16 DS-1 links, with a third link reserved. All DS-1  
0 links from a RSC must terminate on the same LGC/LTC. The  
0 number of RSC's off of the same host LGC/LTC is one. It  
0 can be a maximum of two if the RSC's host LCM's only.

0 The peripheral side (P-side) of a RCC consists of 20  
0 ports that can currently support LCMs (each 2 to 6 DS-30A  
0 links), DS-1 trunks and Remote Maintenance Modules (each  
0 1 DS-30A link). Peripheral interfaces include RLCM/OPM  
0 (each 2 to 6 DS-1 links).

0  
0 RELEASE 28.01  
0 93 12 03

0 The RCE Frame contains a maximum of two (2) Remote Main-  
0 tenance Modules (RMM). Each RMM occupies one (1) shelf  
0 in the RCE frame. At least one RMM shelf is recommended  
0 at each site to provide service circuits and diagnostic  
0 tests. The RMM shelf can be shared between co-located  
0 RSCs at the same site, provided they share the same host.  
0 The RMM can be shared with a co-located RLCM at the same  
0 site, provided they share the same host as the RSC and  
0 only if the RLCM does not have the emergency stand alone  
0 feature option specified.

0 (iii) Line Concentrating Equipment Frame (LCE)

0 The LCE frame at the remote site contains the same Line  
0 Concentrating Modules (LCM), ringing generators and line  
0 drawer cutoff straps as provisioned in the host. Each LCM  
0 will serve up to 640 subscribers. The LCM will interface  
0 to the RCC module via DS-30A links (each 2 to 6).

0 (iv) Remote Miscellaneous Equipment (RME) Frame

0 The RME Frame (NT0X02AB) will serve as frame space for  
0 power fuse panels, spare circuit pack cages or other  
0 Telco defined misc frame space.

### 0 2.2.2 Trunking Features

0 If software feature package NTX152AA/AB RSC Digital Trunking is  
0 specified then the RSC must interface to a host LTC.

0 The RSC supports limited trunking. Specifically, local (non  
0 toll) interoffice trunking (EAS), Private Branch Exchange (PBX),  
0 Direct Inward/Outward Dial (DID/DOD) Trunking.

#### 0 TRUNKING CHARACTERISTICS

- 0 - DS-1 Trunking Only
- 0 - Multi-Frequency (MF), Dial Pulse (DP), Dual Tone Multi-  
0 Frequency (DTMF), Wink Start, Delay Dial and Immediate  
0 Dial Supervision
- 0 - Trunks may have Local Call Detail Recording (LCDR) and/or  
0 Multi-Unit Message Rate (MUMR) recorded at the host (non-  
0 functional during ESA)
- 0 - up to 48 members/trunk group
- 0 - 8 trunk groups Maximum to a total of 4 NT6X50AA DS-1 I/F  
0 CPs for trunks (192 trunks) per RCC
- 0 - RSCs supporting trunks will require a LTC at the Host Of-  
0 fice

#### 0 TRUNKING CHARACTERISTICS NOT SUPPORTED

- 0 - Revertive Pulsing
- 0 - Common Channel Signaling
- 0 - Cut Through Dialing
- 0 - Coin or ANI Signalling
- 0 - Echo Suppressors
- 0 - Toll, Toll Completing, Intertoll and their associated  
0 billing
- 0 - Tandem through RSC

0 Offices that received Software Package NTX152AA RSC Digital  
0 Trunking (currently rated A&M) must provide, on a one-to-one ded-  
0 icated span basis, one span back to the host for every span ter-  
0 minating on the P-side for trunking (from the RSC to other CDOs).  
0 In addition, the dedicated spans back to the host must terminate  
0 on the same controller (LTC) as the host-RSC DS-1 links.

0

0

0 RELEASE 28.01  
0 93 12 03

### 0 2.2.3 Electromagnetic Interference

0 When the EMI option is specified for a RSC, all power equipment  
0 must reside in a Power Distribution Center (PDC) Frame. The RME  
0 may not be equipped with power fuse panels when the EMI option is  
0 specified.

### 0 2.2.4 Remote Off Remote Feature

0 This feature provides for connecting an RLCM/OPM to the P-side of  
0 an RCC of the RSC which will provide the same features that are  
0 available to an LCM off the RCC. The Remote-Off-Remote  
0 configurationn allows several smaller sites to be remotod off the  
0 site served by the RCC. This facilitates the conversion of small  
0 offices to DMS-100, and with intraswitching the usage of DS-1 fa-  
0 cilities is kept to a minimum. The same features that are pro-  
0 vided for an RLCM off a Line Trunk Controller (LTC) (such as  
0 intraswitching, ESA, RMM and carrier maintenance) are supported  
0 on a RLCM off an RCC.

0 The Remote Off Remote feature is software only and the hardware  
0 required for the RLCM and RSC has been defined in previous  
0 sections. The maximum number of RLCMs, OPMS or combination of  
0 the two supported off the same RCC is five (5), provided there  
0 are no LCMS subtending off the RSC.

0 This feature is also compatible with the dual RCC. Each RLCM or  
0 OPM must still home on only one RCC. The number of remotes sup-  
0 ported by two RCCs in a dual RCC configuration is twice that sup-  
0 ported by a single RCC. As is true now, loss can be inserted at  
0 the line card when either or both RSCs are in a remote-off-remote  
0 configuration.

### 0 Intraswitching

0 Intraswitching provides the capability of switching calls at a  
0 remote location without requiring transmission back to the host.  
0 Both the RCC and the RLCM have line to line intraswitching capa-  
0 bilities which operate as follows:

0 For intraswitched line to line calls a loss of 0dB is in-  
0 serted. This loss value is valid for up to 100 miles on a

0 RELEASE 28.01  
0 93 12 03

0 line to line call. This feature supports a maximum distance  
0 on intraswitched calls of 100 miles. Therefore, for intra-  
0 switching purposes the RCC and the RLCM must be within a  
0 distance of 100 miles from the host LTC.

0 Furthermore, the RLCM must be within 50 miles of the host  
0 RCC because an intraswitched call at the RLCM level could be  
0 blocked and then an attempt is made to intraswitch at the  
0 RCC level. This would result in a path of 100 miles (2 X  
0 50) and is within the 100 mile limit. The same situation  
0 occurs if a call is made between two RLCMs on the same RCC  
0 (See Typical Remote-Off-Remote Configuration diagram).

0  
0 2.2.5 RSC With Intra-Calling Option

0 Calls which both originate and terminate within one RSC (includ-  
0 ing subtending RLCM's) can be made without using the DS-1 links  
0 to the host office, except during the call set-up stage. After  
0 such a call has been determined to terminate within the RSC,  
0 channels internal to the RCC will be utilized. If an idle chan-  
0 nel is not available, the connection via the host office network  
0 is made and maintained for the duration of the call. RLCM must  
0 be within 50 miles of the host RCC.

0  
0 2.2.6 RSC With Unique LCE/LCM Numbering Option

0 With this option, the LCE/LCM numbering can be unique per site or  
0 per office (i.e. host and all remote sites).

0 If the LCE/LCM numbering is unique per site, then the numbering  
0 will start with LCE 00 LCM 00 0.

0 If the LCE/LCM numbering is unique per office, then the numbering  
0 will be contiguous to the LCE/LCM's in the host office.

0 If the remote site already has RLM's, then the LCE/LCM numbering  
0 will be contiguous to the RLM frame/RLM bay number of this site.

0

0 RELEASE 28.01  
0 93 12 03

0 Once the numbering option has been chosen, it cannot be changed  
0 at a subsequent extension.

0 If the Line Equipment Numbers (LEN) (i.e. for LM, RLM, LCM) will  
0 be unique per office, in order to have sequential (contiguous)  
0 LEN numbers for the host office and each remote site, the cus-  
0 tomer may reserve groups of numbers for future growth in the host  
0 and each remote site (i.e. gaps are allowed in the numbering).

0  
0 2.2.7 Emergency Stand Alone (ESA)

0 The ESA software feature (NTX149AA) (lines only) in the RSC pro-  
0 vides sufficient intelligence in the RSC to allow continued lim-  
0 ited POTS service for intraswitched calls when the message DS-1  
0 links to the host LGC/LTC are out of service.

| 0 SUPPORTED SYSTEMS | NOT SUPPORTED SYSTEMS |
|---------------------|-----------------------|
|---------------------|-----------------------|

|                                  |                         |
|----------------------------------|-------------------------|
| 0 -POTS calls (Intra-RSC)        | -IBN Attendant Consoles |
| 0 -IBN Station calls (Intra-RSC) | -Datapath               |

| 0 primary numbers                | -Feature Activation     |

0 Up to 16 directory numbers or prefixes may be datafilled for spe-  
0 cial routing during ESA. Up to eight (8) prefixes or special  
0 numbers may be datafilled per IBN customer group for special  
0 routing during ESA. Calls in progress are taken down during  
0 entry to and exit from ESA. Billing info is lost for calls dur-  
0 ing ESA takeover. Local coin calls are free during ESA. No addi-  
0 tional hardware is required for operation of the ESA feature.

0 ESA for both lines and trunks (NTX149AB) is scheduled for avail-  
0 ability in BCS23.

0 When both RSCs in a dual RCC configuration are in ESA mode, line  
0 and trunk intracalling within each RSC and line and trunk inter-  
0 switching between the RCCs via the DS1 interlinks are supported.  
0 If either RSC in a dual RCC configuration loses communication  
0 with the host, the customer will be given the option of having  
0 both RSCs enter ESA or of having one in ESA and the other in  
0 normal operation with interswitching not supported. Support for  
0 a dual RCC configuration with one RSC in ESA mode and the other

0  
0 RELEASE 28.01  
0 93 12 03

0 RSC in normal operation with full interswitch capabilities cannot  
0 be provided currently.

0  
0 2.2.8 RSC Alarms

0 The Remote Alarm Panel (NT0X63AC) may now be provided for a RSC  
0 Site.

0  
0 2.2.9 Remote Miscellaneous Equipment (RME) Frame (NT0X02AB)

0 The hardware which normally mounts on the RSE frame when used in  
0 conjunction with the old RLM equipment is also valid for use with  
0 the RSC except for the following:

0 1. Metallic Test Access (MTA), NT2X46AB.

0 For use with the RSC, this item has been replaced by the  
0 RMTA, NT3X09AA which mounts on the RMM on the RCE frame.

0 2. Remote Service Module (RSM), NT2X58AE.

0 For use with the RSC, this item has been replaced by the  
0 RMM which mounts on the RCE frame.

0 See Section 3.12, Remote Service Equipment (RSE) Frame  
0 Summary for hardware which can mount on the RME frame.

0  
0 2.2.10 Summary of I/O Devices Associated with Remote Sites

0 MAPs at the Remote Site will connect to the Host via dedicated  
0 facilities external to the RSC or via dial up facilities through  
0 the RSC.

0 If a Remote MAP, a Printer or TTY are required at the Remote  
0 Site, I/O ports must be provided at the Host.

0  
0 RELEASE 28.01  
0 93 12 03

0 Note that a VDU for initial Remote Sites must be on site and op-  
0 erational through a dedicated trunk facility to the Host, (FX  
0 line) by (H + 6) date to meet commissioning requirements.

0 2.3.2 Remote Maintenance Module (RMM)0 (a) General Description

0 The RMM provides maintenance and service functions for the LCM.  
0 It is based on the host Maintenance Trunk Module (MTM). Each RMM  
0 connects to the RCC through a DS30A link. Each RMM requires one  
0 P-Side port on the RCC.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) The RMM has fourteen (14) provisionable slots to accommo-  
0 date service circuit requirements.

0 ( ii) An RCE frame can house up to two (2) RMM shelves.

0 ( iii) An RMM module is composed of a shelf assembly (a card  
0 cage, an entity without any circuit packs) and one set of  
0 common circuit packs.

0 The first RMM Shelf Assembly, NT6X1301, is always pro-  
0 vided on the RCE frame. The second RMM Shelf Assembly is  
0 provisionable by ordering Remote Control Maintenance  
0 Product Change Kit NT6X10AB.

0 ( iv) The RMM Common Circuit Packs, NT6X13AB, contain the fixed  
0 by design circuit packs which are supplied only if the  
0 RMM module is required on the frame.

0 Each equipped RMM module requires one NT6X13AB.

0 The RMM shelf can be shared between co-located RSCs at  
0 the same site provided they share the same host.

0 ( v) The RMM can be shared between co-located RLCMs at the  
0 same site, provided they share the same host as the RSC  
0 and only if the RLCM does not have the ESA feature option  
0 specified.

0 ( vi) The present RSM in an RLM site can be shared by a  
0 colocated RLCM and/or RSC as long as there is no need for  
0 digitone receivers.

0  
0 RELEASE 28.01  
0 93 12 03

- 0 (vii) At least one RMM shelf is recommended at each site to  
0 provide service circuits and diagnostic tests.
- 0 (viii) Slots 13-16 are currently wired together to allow the op-  
0 eration of DRAM circuitry in these slots when the DRA  
0 software becomes available for remotes. The NT2X10AB,  
0 NT2X11AA Line Test Unit (LTU) pair is not operational in  
0 these slots because of the DRA wiring and therefore  
0 should not be provisioned in slots 13-16. All other ap-  
0 plicable RMM CPs are allowed in slots 13-16, however,  
0 these slots should be reserved whenever possible to allow  
0 for the future DRA application.
- 0 (ix) The total -48V power consumption of the provisionable  
0 circuit packs in the RMM must not exceed 110 Watts.

#### 0 2.3.4 Remote Cluster Controller (RCC)

##### 0 (a) General Description

0 The RCC provides a master controller for all units at the RSC,  
0 and is in turn controlled by the host LTC. The RSC is a dual-  
0 shelf peripheral module (PM) similar in configuration to the  
0 LGC/LTC, and using many of the same components. The 20 C-side  
0 RCC ports provide an interface via 2 to 16 DS-1 links to matching  
0 DS-1 interfaces in the host office LGC/LTC.

##### 0 (b) References

0 Chapter 2 Traffic Criteria and Capacities

##### 0 (c) Provisioning Considerations

0 ( i) The RCC module is made up of two (2) Remote Controller  
0 Array (RCA) shelves. The two (2) RCA shelves act as the  
0 remote controller for the LCM's in the RSC site.

0 Two RSC's can share one LCE frame (i.e. of the 2 LCMs on  
0 the same LCE frame, one RCC module can accommodate one  
0 LCM while the other RCC module can accommodate the other  
0 LCM).

0 The RCC Common Circuit Packs, NT6X12CA, contain the fixed  
0 by design circuit packs which are supplied only if the  
0 RCC module is required on the frame. Each equipped RCC  
0 module requires one NT6X12CA.

0 ( ii) The maximum cabling distance between the RCC and the LCM  
0 is 50 feet.

0 ( iii) One pair of NT6X48AA cards can provide an interface for  
0 up to 10 LCM and RMM ports (links). Hence, the periph-  
0 eral face of the RCC module can accommodate up to a maxi-  
0 mum of 20 DS30A ports.

0 DS-30A ports 0 & 1 (found on the NT6X48AA CP equipped in  
0 the RCC) are reserved for control of the RMM shelf. Thus  
0 all RSCs equipped with RMM shelf(s) and interfacing to  
0 LCM must be configured with four (4) (two per RCA shelf)  
0 DS-30A LCM Interface CP (NT6X48AA).

0 ( iv) LGC/LTC P-SIDE CONFIGURATION

0 RELEASE 28.01  
0 93 12 03  
0

0 When provisioning the p-side of an LGC/LTC, the p-side  
0 ports can be configured for a maximum of two (2) RSCs if  
0 the following conditions are met:

- 0 1) 2 RSCs from a single configuration
- 0 2) 1 RSC from a dual configuration and 1 RSC from a sin-  
0 gle configuration
- 0 3) Traffic, Real Time and software Nodal requirements do  
0 not exceed the recommended engineering limits.
- 0 4) All DS-1 links from a RCC must terminate on the same  
0 LGC/LTC.
- 0 5) :TC required when CDO/PBX Trunking is required.

0 In addition, the remaining p-side ports can be configured  
0 for two RLCMs or OPMs if the Traffic, Real Time and soft-  
0 ware Nodal requirements do not exceed the recommended en-  
0 gineering limits.

0 Offices with BCS22 software or earlier can support up to  
0 a maximum of 18 P-side datafilled software nodes, where  
0 a node is defined as host LCMs, RSC LCMs, RCC, RLCM, OPM,  
0 RMMs, ESA processor (for RLCM/OPMs) and dummy software  
0 nodes. In BCS 23, this node limit is raised to a maximum  
0 of 62 p-side nodes.

0 All the DS1 links from one RCC module must terminate onto  
0 the same LGC or LTC module in the host office.

0 Taking into account the restrictions for assigning RCC  
0 ports to LGC/LTCs the remaining LGC/LTC ports can be used  
0 to provision host LCMs, RLCMs, or OPMs as Host LGC/LTC  
0 capacity permits. However, consideration should be given  
0 to RSC growth.

0 ( v) RSC P-SIDE CONFIGURATION

0 When provisioning the p-side of an RSC, the p-side ports  
0 can be configured for the following maximums if the Traf-  
0 fic, Real Time and software Nodal requirements do not ex-  
0 ceed the recommended engineering limits:

- 0 1) Maximum of 9 LCMs (using 2 ports per LCM)
- 0 2) Maximum of 4 DS1s for PBX Trunking and 4 DS1s for CDO  
0 Trunking

0 RELEASE 28.01  
0 93 12 03

0 3) Maximum of 18 DS1s for any combination of RLCMs and  
0 OPMS

0 4) Any combination of the above not to exceed the stated  
0 individual maximums

0 Although PBX trunking can utilize both Fixed or Dynamic  
0 Trunking, it is highly recommended that PBX Trunking use  
0 Fixed Trunking (nailed up or Static Trunking) to the Host  
0 LGC/LTC when a large percentage of the PBX traffic is go-  
0 ing to the host. This decreases the loading effect of RCC  
0 DS1 trunks to the Host when compared to Dynamic Trunking.  
0 Fixed trunking does not operate in the ESA mode.

0 Dynamic Trunking is applicable when a large percentage of  
0 the PBX traffic is intra office traffic at the RCC and  
0 does not go to the host. Therefore, the intra office  
0 traffic utilizes the C-side channels of the RCC.

0 ( vi) The RCC must have (an) unequipped C-side DS1 (NT6X50)  
0 port(s). It must also must have 1 megabyte of SP memory  
0 (NT6X46AC or NT6X46BA) and 4 megabyte of MP memory ( 2  
0 NT6X47AB).

0 For dual RCCs, there is a requirement for additional Sig-  
0 nal Processor (SP) and Master Processor (MP) memory that  
0 is applicable to XPMs generically. The following up-  
0 grades are required:

0 SP Memory: NT6X46BA (1 Meg.) or NT6X46AC (which is an  
0 upgraded NT6X46AB to 1 Meg.)

0 MP Memory: Each RCA shelf, which is part of a dual RCA  
0 configuration, will require two NT6X47ABs  
0 as part of the common CP fill in BCS-26  
0 (V0). All RSCs will require the second  
0 NT6X47AB as of BCS-27.

0 ( vii) Verify Real Time limitations by doing a real time calcu-  
0 lation based on "Guidelines for New Peripheral Capacity  
0 Estimates".

0 (viii) Enhanced Office Recovery (NTXA66AA) is an optional soft-  
0 ware feature that improves the present office recovery  
0 time of extended peripheral modules (XPM). Extended XPM  
0 Diagnostics (NTXA67AA) as an optional software feature  
0 that enhances the present diagnostics of XPMs.

0  
0 RELEASE 28.01  
0 93 12 03

0 These features are applicable to any RCC which contains  
0 both enhanced messaging (NT6X69/79 pair or the NT6X69 CP)  
0 and enhanced memory (NT6X46AC or NT6X46BA CP). The XPM  
0 Processor CP (NT6X45BA or BB) is also required. Provide  
0 four (4) XPM Processor CP per RCC module.

0 | ( ix) For BCS-32/33, the minimum packfill for both RCC and Dual  
0 RCC is NT6X12CA/AD, for both new and existing offices.

0 2.3.6 Subscriber Carrier Module-100S Remote (SMS-R)

0 (a) General Description

0 The Subscriber Carrier Module-100S Remote(SMS-R) module provides  
0 a direct digital interface between the SLC-96 Remote Terminal(RT)  
0 and the RSC. The SMS-R module is mounted in an Subscriber Main-  
0 tenance Equipment(SME) frame which is co-located in the same Re-  
0 mote Switching Center(RSC) office. Refer to Figure 312.7 for a  
0 diagram of the SMS-R system.

0 The RSC is widely used as a Central Office(CO) replacement in  
0 areas where the existing office is serving SLC-96 systems. Cur-  
0 rently the SLC-96 interface to the RSC is through the Central Of-  
0 fice Terminal(COT) and the Line Concentrating Module(LCM). The  
0 SMS-R fullfills the requirement for a direct digital interface  
0 between the SLC-96 and RSC.

0 The SMS-R is connected to the RCC via DS-30A links. The SMS-R  
0 connects directly to the SLC-96 via DS-1 links. The number of  
0 DS-1 links used depends upon the SLC-96 mode of operation. There  
0 are three(3) operating modes for the SLC-96: Mode I, II, and III.

0 - MODE I is a non-concentrating mode in which the SLC-96 sup-  
0 ports up to 96 subscriber lines. Assuming a standard Mode I  
0 configuration, each SLC-96 connects to the SMS-R via five(5)  
0 DS-1 links, one (1) of which is used as a protection link. In  
0 a standard Mode I configuration, each SMS-R serves four(4)  
0 Mode I SLC-96s. Thus, in Mode I operation, up to 384 sub-  
0 scriber lines are served by each SMS-R.

0 It is possible for the SMS-R to serve five(5) Mode I SLC-96s  
0 by eliminating the protection links.

0 - MODE II is a concentrating mode(2:1 concentration) in which  
0 SLC-96 typically connects to the SMS-R through three(3) DS-1  
0 links, one(1) serving as a protection link. In a standard  
0 Mode II configuration, each each SMS-R serves Six(6) mode II  
0 SLC-96s. Thus, in mode II operation, up to 576 subscriber  
0 lines are served by each SMS-R.

0 - MODE III is a non-concentrating mode in which a SLC-96, typi-  
0 cally, connects to a SMS-R through three(3) DS-1 links. One(1)  
0 of the three links is a protection link. Each SMS-R can serve  
0 six(6) mode III SLC-96s. In mode III the SLC-96 shelves are  
0 equipped only with coin and D4 Single Circuit Channel Units.

0 RELEASE 28.01  
0 93 12 03  
0

0 Thus, in Mode III operation, up to 288 subscriber lines are  
0 served by each SMS-R.

0 - The SMS-R is capable of serving a mixture of SLC-96s in dif-  
0 ferent modes. For example, one SLC-96 with all shelves in Mode  
0 I could be served along with a SLC-96 with all its shelves in  
0 Mode II. However, the SMS-R is not capable of serving Split  
0 Mode SLC-96s. For example, a SLC-96 with two shelves in Mode  
0 I and two shelves in Mode III.

0 The SMS-R is dedicated to supporting SLC-96 RTs. It does not  
0 support LCMS,RLCMS, switched digital trunk services or ISDN  
0 lines. No provision is made to facilitate future enhancement to  
0 enable the SMS-R to be located remotely from the RSC.

0 The SMS-R supports the following features:

0 -Plain Ordinary Telephone Service(POTS)

0 -single party

0 -multi party

0 -two-party ANI and ONI

0 -four(4) or Eight(8) party ONI

0 -Coin Features

0 -coin first(CCF)

0 -dial tone first(CDF)

0 -coin semi-post pay(CSP)

0 -PBX Line

0 -loop start

0 -ground start(Special Plain Ordinary Telephone Service  
0 (SPOTS))

0 -Custom Calling Services

0 -speed calling

0 -call waiting

0 -three-way calling

0 -call forwarding

0 -Ringing

0 -Bridged Ringing
