0 Figure 312.7 SMS-R System Block Diagram

0 Automatic node and link maintenance of SMS-R and SLC-96RTs is in-  
0 tegrated with the host RSC maintenance which is in turn inte-  
0 grated with the host central office maintenance functions.

0 Loop testing is provided for SLC-96 subscriber lines. Tests may  
0 be performed through the MAP at the Host Office, or from Remote  
0 Test Desks (eg., MLT 1 or 2, Local Test Cabinet, LTD, (CALRS for  
0 Canadian offices)).

0 Bypass Testing refers to the use of the Metallic Test Pair con-  
0 necting the DMS-100 Test Equipment to either SLC-96 line card or  
0 the subscriber loop. This connection is established through the  
0 Channel Test Unit. There are two(2) Bypass Test configurations  
0 for the SMS-R SLC-96 subsystem:

0

0 RELEASE 28.01  
0 93 12 03  
0

0 1) Termination to the Metallic Test Access(MTA) in the  
0 DMS-100 or DMS-100/200 central office from the SLC-96  
0 at the Maintenance Trunk Module(MTM).

0 2) Termination to the MTA in the RCC-RMM(Remote Maintenance  
0 Module) from the SLC-96.

0 Bypass testing can be performed from the MAP position or from Remote  
0 Test Desks.

0 Mechanized Line Testing refers to testing subscriber loops and  
0 line cards using Non-DMS equipment located at a Remote  
0 site(eg., #14 Local Test Desk(LTD), #3 Local Test  
0 Cabinet(LTC), Mechanized Loop Testing(MLT), etc.). The Remote Test  
0 site works with the DMS system to gain metallic access to the  
0 subscriber loops. The Remote site executes tests on the loop  
0 such as measuring foreign AC and DC voltage, resistance, etc.

0 Refer to NTP 297-2101-516 for more information on line testing.

0 The Digital Remote Test Unit (DRTU) is a measurement device located  
0 at the carrier remote terminal and it functions as a slave  
0 measurement device controlled by a Local Test Cabinet. A spare  
0 carrier channel is used as a two way communication path linking  
0 the DRTU and the central office test unit. All measurement results  
0 are displayed at the repair service center. Only metallic line test  
0 and communications circuit pack modules are included in the DRTU.

0 (c) Provisioning Considerations

0 ( i) Up to two NT6X02PD SMS-R modules can mount in a Subscriber  
0 Module Equipment (SME) frame (NT6X01AA).

0 ( ii) One (1) DC cooling unit(NT3X90AC) is required per SME  
0 frame for forced cooling requirements.

0 ( iii) A maximum of ten(10) DS-1 cards (NT6X85AB) are provisioned  
0 per SMS-R module. A maximum of ten(10) NT6X85AB  
0 CPs are provisioned when Mode I SLC-96s are used. A max-

0 RELEASE 28.01  
0 93 12 03

0 imum of nine(9) NT6X85AB CP's are provisioned when Mode  
0 II and Mode III SLC-96s are used.

- 0 ( iv) There is a distance limit of 100 miles from the host Cen-  
0 tral Office (CO) to the SLC-96 with repeaters located ap-  
0 proximately every 6,000 ft.

0 One(1) repeater is required to be co-located with the  
0 SMS-R module.

- 0 ( v) Provide two (2) NT6X69AC, CPP Msg Protocol & Tone CP, per  
0 SMS-R module.

- 0 ( vi) Provide two (2) NT8X18BA DS-30A C-side I/F CPs per SMS-R  
0 module. Each NT8X18BA provides ports for up to 8 DS-30A  
0 C-Side Links. In the SMS-R a minimum of 2 and a maximum  
0 of 4 ports can be used. The maximum permissible length  
0 of the DS-30A Links between the RCC and the SMS-R is 50  
0 ft.

0 The SMS-R is connected to the RCC P-Side via 2 to 4  
0 DS-30A links. Each SMS-R shelf has one(1) dedicated  
0 channel for messaging per DS-30A link, thereby, leaving a  
0 minimum of 60 voice channels to interface with the RCC.  
0 Up to 120 voice channels are available when the SMS-R is  
0 provisioned with four DS-30A links. Links are provi-  
0 sioned according to carried traffic.

0 All traffic tables are based on the following:

- 0 1) 5 CCS per loop  
0 2) Maximum 4% blocking (HD G.O.S.)  
0 3) CCS per SLC-96 line assumes 100% fill  
0 4) Mode I (384 Subscriber lines)  
0 Mode II (576 Subscriber lines)  
0 Mode III(288 Special Subscriber lines)  
0 5) Based on infinite sources (SLC Lines)(Loops)  
0 to SMS-R DS-30 Channels.

0  
0 RELEASE 28.01  
0 93 12 03

0 CONCENTRATION RATIOS

0 The SMS-R has concentration capabilities, which are de-  
0 termined by the provisioning of DS-30A ports. The con-  
0 centration ratio may be calculated using the following  
0 formulae:

0 FOR MODE I & II

0 CONCENTRATION RATIO = (NO. OF SLC-96s / SMS-R) X 96  
0 -----  
0 (NO. OF DS-30A LOOPS) X 30

0 FOR MODE III

0 CONCENTRATION RATIO = (NO. OF SLC-96s / SMS-R) X 48  
0 -----  
0 (NO. OF DS-30A LOOPS) X 30

0 A physical maximum of 9 SMS-Rs can be connected to an RCC  
0 assuming that the minimum number of C-Side Links are used  
0 on each SMS-R and that 2 RCC P-Side Links are dedicated  
0 to RMM interface. The practical maximum number of SMS-R  
0 may be less than 9. However, there is a possibility that  
0 the consumption of RCC and Line Trunk Controller or LGC  
0 Real-Time by high traffic SMS-Rs may impose a practical  
0 limit of less than 9 SMS-Rs off an RCC.

- 0 ( vii) Maximum current consumption per SMS-R, including all  
0 provisionable packs, should be limited to 50 Amps. A  
0 module can handle 55 Amps but will only function for 8  
0 hours in power sharing mode.

0  
0 RELEASE 28.01  
0 93 12 03

## 0 3.0 Small Remote Unit (SRU)

0 3.1 Introduction

0 (i) The SRU is a 240-line remote capable of handling all call  
0 types (including ISDN) and merges the remote maintenance  
0 and host interface deployment capabilities of the Remote  
0 Line Concentrating Module (RLCM). It can be used for  
0 customer premiss applications and can be provisioned with  
0 an internal AC power supply and battery back-up. Up to  
0 six (6) PCM-30/DS1 host links can be used.

## 0 3.2 Features

### 0 3.2.1 SRU Features

0 The Small Remote Unit (SRU) is a cabinetized DMS-100 remote whose  
0 hardware and software are based on the DMS Series-II peripherals. The  
0 SRU is a hybrid product, merging the LCME subscriber ISDN access capa-  
0 bility with the remote maintenance and host interface deployment capa-  
0 bilities of the Remote Line Concentrating Module (RLCM).

0 The SRU provides remote access for up to 240 subscriber lines. It  
0 communicates with a DMS-100 Host using PCM30 or DS1 links. The service  
0 provided by the SRU on the subscriber lines can be a mix of POTS,  
0 Centrex, and ISDN. The SRU does not support a Trunk interface.

0 The SRU's most significant feature is that it is intended to be lo-  
0 cated in a customer premises environment. The design objectives are  
0 to make full use of the existing DMS-100 hardware. The major elements  
0 housed in the SRU cabinet are:

- 0 - Duplicated SRU control units, LCME based.
- 0 - Up to 4 2B1Q Line Drawers.
- 0 - Host Interface using PCM30 or DS1 links.
- 0 - Remote Maintenance Unit.
- 0 - Duplicated Ringing.
- 0 - Frame Supervisory Panel.
- 0 - Cooling Unit (fans).
- 0 - AC to DC rectifier (optional).
- 0 - Battery Charging Unit and batteries (optional).
- 0 - EMI terminations.

0 The SRU is packaged in a cabinet.

0 The SRU is compatible with the Australian, U.K., and other interna-  
0 tional markets as well as domestic markets.

0 Note: Software is currently unavailable for the SRU to function in  
0 the domestic market. Domestic market software for the SRU will be  
0 available at a later date.

RELEASE 28.01  
93 12 03

Figure 312.8: DMS view of SRU.

0 3.3 Equipment Provisioning

0 3.3.1 SRU Provisioning

0 (a) General Description

0 The SRU integrates into the overall DMS architecture in the same  
0 manner as a Remote (ie IRLCM) (ref. Figure 312.8). The SRU can  
0 be provisioned to provide:

- 0 - Cabinetized SRU for end User premises (AC powered  
0 (rectifier) with or without battery back-up).
- 0 - Cabinetized SRU for Telco premises (DC powered without  
0 battery back-up).

0 The SRU consists of six (6) basic functional blocks; these are:

- 0 - the Host Interface Unit (HIU)
- 0 - duplicated SRU Control Units (SRU)
- 0 - Ringing Unit
- 0 - Line Drawers
- 0 - Remote Maintenance Unit (RMU)
- 0 - Power Supply Unit (PSU)

NTP 297-1001-451 Customer Data Schema  
NTP 297-1001-310 Table Editor

#### (c) Provisioning Considerations

- ( i) The SRU meets the same host to remote distance requirements as the existing IRLCM remote, ie., 150 miles. Three (3) factors have to be considered in order to extend the host to remote distance to 500 miles. They are:

**ECHO:** A loss has to be inserted in the transmission path in order to reduce echo. For countries with less than 6dB loss, echo cancellor devices are required. For countries with a loss of greater than 6 dB, ie., UK, echo will not be a problem.

**PROPAGATION TIME:** The messaging time on the links increases as the host to remote distance increases. This reduces the number of Call Attempts per Second that the remote can handle.

0 RELEASE 28.01  
0 93 12 03  
0

0 TRANSMISSION ERRORS: As the distance between host and remote  
0 increases, the quality of the transmission  
0 media becomes very important. Every errored  
0 message has to be re-transmitted and re-  
0 sults in reduced call processing capacity.

0 ( ii) PCM30 Line Drawer is not supported.

0 PCM30 repeaters and Lightning arrestor are not housed in  
0 the SRU cabinet. There is also no backup rectifier.

0 (iii) The SRU cabinet has a front door to allow access to the  
0 equipment installed inside. Opening of the front door re-  
0 veals a frame. This frame contains a Cooling unit, Ser-  
0 vice & Interface, LCME & FSP shelves. An optional  
0 Battery Charging Unit (BCU) and a Rectifier is mounted on  
0 the right hand side inside the SRU cabinet. Battery  
0 strings are mounted in two trays at the bottom of the SRU  
0 Cabinet. Each Battery string consists of four Batteries.  
0 Above the Battery trays, a connector field is provided.  
0 Basic functions of each equipment are described below.

0 - Cooling Unit: This contains an air filter and fans to  
0 force air cool the SRU equipment.

0 - Service & Interface Shelf: This contains the circuit  
0 packs for the Host Interface Unit (HIU), the Remote  
0 Maintenance Unit (RMU), one of SRU Control Unit (SCU)  
0 and two Ringing Generators.

0 - SCU Shelf. This shelf contains the other SCU and con-  
0 tains four (4) line Drawers.

0 - Frame Supervisory Panel: This contains the power dis-  
0 tribution and a visual power frame fail indicator.

0 - Battery Charge Unit. This unit provides the capabil-  
0 ity to charge each battery string either under the  
0 control of the craftperson, or automatically by the  
0 system.

0 - Rectifier: This provides AC to DC power conversion.

0 - Batteries: Two battery strings can be housed in the  
0 SRU cabinet, to provide power backup. Each battery  
0 string is good for two hours.

0  
0 RELEASE 28.01  
0 93 12 03

0 All external connections to the SRU are made at the con-  
0 nector field located in front and just below the Cooling  
0 Unit and behind the protective cover. The connector  
0 field contains 3 areas. The first, for PCM30/DS1 con-  
0 nection to the Host; the second, for Tip-Ring pairs, each  
0 connector having 25 pair; the third, for either an AC in-  
0 let or with -48 vdc A and B feeds. In addition a Frame  
0 Ground connection is provided.

0 The Cabinetized SRU for Telco premises need not be  
0 equipped with battery back-up, a Rectifier (Telco to pro-  
0 vide -48 Vdc power), or a RMU as the Remote Maintenance  
0 Unit packs can be provided by the MTM (if co-located with  
0 a DMS).

0 RELEASE 28.01  
0 93 12 03  
0

0 This card provides two (2) 2.048 Mbits/s PCM30 interface  
0 between the host and the SRU. Total of six (6) PCM30  
0 interface ports are provided by the SRU. The SRU re-  
0 quires a minimum of two (2) PCM30 links to the host.  
0 These links are designated as primary links and must ter-  
0minate on a different PCM30 card on the SRU and the Host.  
0 Therefore, provide a minimum of two (2), maximum of three  
0 (3) NT6X27BA CPs for the SRU (depending on traffic re-  
0quirements). NOTE: The NT6X27AC is to be used until the  
0 NT6X27BA is available.

0 DS1 INTERFACE CARD (NT6X50AB)

0 This card provides two (2) 1.544 Mbits/s DS1 interface  
0 between the host and the SRU. Total of six (6) DS1  
0 interface ports are provided by the SRU. The SRU re-  
0quires a minimum of two (2) DS1 links to the host. These  
0 links are designated as primary links and must terminate  
0 on a different DS1 card on the SRU and the host. There-  
0fore, provide a minimum of two (2), maximum of three (3)  
0 NT6X50AB CPs for the SRU (depending on traffic require-  
0ments).

0 The LCME portion of the SRU requires two (2) message  
0 channels to the Host. These channels occupy ch#16 on  
0 each primary PCM30 link. When a Remote Maintenance  
0 Equipment (optional) is provided, it also requires a mes-  
0sage channel on each of the primary PCM30 links, other-  
0wise these channels are available for call processing.  
0 Failure of one of the primary PCM30 links results in the  
0 LCME portion of the SRU to go into TAKEOVER and force the  
0 LCME and RMU to use the remaining primary PCM30 link.

0 PCM30 LINK CONTROL CARD (NT6X73BA)

0 This card acts as the messaging interface and provides  
0 data rate conversion between the SCU, RMU, and the PCM30.  
0 It also acts as the clock source for the SRU.

0 DS1 LINK CONTROL CARD (NT6X73AA)

0 This card acts as the messaging interface and provides  
0 data rate conversion between the SCU, RMU, and the DS1.  
0 It also acts as the clock source for the SRU.

0 Provide two (2) PCM30 or two (2) DS1 Link Control Cards  
0 per SRU.

0 RELEASE 28.01  
0 93 12 03

0 ( v) SRU Control Unit (SCU)

0 The SRU Control Unit (SCU) is based on the existing ISDN  
0 LCM Controller (LCME). There are two SRU Control Units,  
0 and each SCU consists of a processor (NTBX34), two  
0 digroup controller (NTBX35) and a new power converter  
0 (NT8X99). There is a total of four (4) circuit packs per  
0 SCU.

0 In normal operation each SCU handles service for the  
0 lines in its own two line drawers. In the event one SCU  
0 fails, the remaining working SRU will handle service to  
0 all the lines. Each SCU unit requires +15 Vdc and +5 Vdc  
0 for power, and is power spared from the other SCU unit.

0 Always provide one (1) SRU Common CP Fill NT8X95AQ per  
0 SRU. The NT8X95AQ provides two (2) NTBX34CA, four (4)  
0 NTBX35CA, two (2) NT0X50AC and two (2) NT8X99AB circuit  
0 packs; half in SCU-0, half in SCU-1. The function of  
0 each of these cards are outlined below.

0 LCME Processor (NTBX34CA)

0 This card is responsible for processing associated with  
0 scanning the line cards for calls, setting up call con-  
0 nections through the digroup controller card (NTBX35) and  
0 DMS-X messaging with the Host. This card also carries  
0 out background tasks for diagnostics.

0 LCME Diagroup Controller (NTBX35CA)

0 This card provides time switching for external and inter-  
0 nal channel assignments, and provides digital loop around  
0 paths. It also interface with the Link Control Card (LCC)  
0 and the Line Drawers.

0 LCME Power converter (NT8X99AB)

0 This circuit pack provides +5v dc to the NTBX34 and the  
0 two NTBX35s for its own SCU, and provides +15v dc to the  
0 Line Drawers and has the capability to power the mate SCU  
0 for power redundancy.

0 This pack also contains the Ring, ANI and Coin  
0 detector/multiplexer circuit, and in addition, has iso-  
0 lating diodes for serving the Line Drawer voltage needs.

0 RELEASE 28.01  
0 93 12 03  
0

0 ( vi) Ringing Unit.

0 Two Ringing Generators (RG) NT6X60 are used in the SRU.  
0 The NT6X60 Ringing Generators do not provide ANI and COIN  
0 voltages for Subscriber lines. For North American appli-  
0 cation, a domestic RG board is to be used to provide  
0 ANI/COIN (future).

0 Provide 0, 1, or 2 Ringing Generators per SRU to be used  
0 with POTS line cards.

0 Provide the NT6X60EA Ringing Generator for Australian ap-  
0 plications.

0 Provide the NT6X60GA Ringing Generator for U.K. applica-  
0 tions.

0 No Ringing Generators are needed when the SRU is in-  
0 stalled with ISDN line cards only.

0 ( vii) Line Drawer (NTBX32BA)

0 This is a 2B1Q Enhanced Line Drawer, which provides the  
0 means to house a 2B1Q Bus Interface Card (NTBX36), a  
0 Point of Use Power Supply (PUPS) (NTBX71) and up to 60  
0 application specific line Cards. Provide up to four (4)  
0 Line Drawers (depending on the need). Refer to the Engi-  
0 neering Manual for more information on configuring line  
0 cards on the NTBX32BA line drawers.

0 2B1Q Bus Interface Card (NTBX36)

0 The 2B1Q Bus Interface Card (BIC) provides interface be-  
0 tween the SCU and up to 60 line Cards. The principal  
0 functions of the BIC are to scan line cards for change in  
0 state, communicate with the LCME processor (NTBX34), D-  
0 channel multiplexing/demultiplexing & time switching,  
0 PUPS voltage supervision, ringing voltages control, and  
0 activity switching.

0 PUPS (NTBX71)

0 The Point of Use Power Supply (PUPS) occupies 4 line card  
0 slots in a two-by-two configuration. The PUPS converts  
0 the -48v Battery to +5v supply, which in turn is used to  
0 power the line Cards.

0 Line Cards

0 RELEASE 28.01  
0 93 12 03

0 Line card that can be housed in the Line Drawer depends  
0 on the type of service required and the country in which  
0 the SRU will be used. POTS, CENTREX and ISDN lines  
0 should be equally divided between the Line Drawers.

0 Following is a list line cards that is used in the  
0 Australian and United Kingdom markets. Further details  
0 regarding each card may be obtained from the Engineering  
0 Manual, section EMA14-03-000.

| Line Type | Australia  | UK                   |
|-----------|------------|----------------------|
| -----     | -----      | --                   |
| A         | * NT6X93EA | NT6X98AA             |
| B         | -          | -                    |
| C         | NT6X21BC   | NT6X21BC (p-phone)   |
|           | -          | NT6X71AB (Data path) |
|           | -          | NT6X76AC (AIM LC)    |
| ISDN      | NTBX26AA   | NTBX26AA (T I/F)     |
|           | NTBX27AA   | NTBX27AA (U I/F)     |

0 \* 6X93EA is to be used if the World Line Card is not  
0 available on time.

#### 0 (viii) Remote Maintenance Unit (RMU)

0 The RMU is based on the existing Remote Maintenance Mod-  
0 ule (RMM) that is used in the IRLCM/RLCM/RSC. The RMU,  
0 like the RMM, is a modified cost -reduced Trunk Module  
0 (TM). The RMU supports line maintenance, Scan points and  
0 Battery Charge Unit (BCU). The BCU is optional on the  
0 SRU. The Remote Maintenance Unit (RMU) consists of the  
0 following circuit packs:

##### 0 RMM Control Card (NT6X74)

0 This card provides processor, memory and I/O functions.

##### 0 Metallic Test Unit (NT4X97AA & NT4X98BB)

0 These cards are used to perform maintenance tests on the  
0 subscriber loops or the line cards. Provide one of each  
0 circuit pack (per SRU) if Metallic Testing is required.

##### 0 Miscellaneous Scan Detector Card (NT0X10AA)

0 There are 14 scan detector circuits on this card, each of  
0 which may be configured as a loop, ground or battery de-

0 RELEASE 28.01  
0 93 12 03  
0

0 tector. Provide one (1) (per SRU) if scan points are re-  
0 quired.

0 Metallic Test access card (NT3X09BA) - Optional with BCU

0 This card provides 8 by 8 two wire metallic matrix for  
0 cross connection between the test equipment, test card,  
0 line and line card. Provide one (1) NT3X09BA (per SRU)  
0 if MTA is required.

0 Group Codec card (NT2X59) & Test Trunk card (NT2X90)

0 These packs can be provisioned on the RMU.

0 The following PECs for the Group Codec card can be pro-  
0 vided for the following markets:

| PEC      | Market<br>Application |
|----------|-----------------------|
| -----    | -----                 |
| NT2X59AA | Domestic              |
| NT2X59BA | Turkey                |
| NT2X59CA | U.K.                  |
| NT2X59DA | CEP*                  |

0 \* The CEP (Caribbean Expansion Plan) CODEC was developed for  
0 Offshore markets. The NT2X59DA is used in the Australian  
0 market as well.

0 ( ix ) Power Supply Unit.

0 The SRU can be powered from external -48v DC supply. For  
0 reliability, both A & B feed are provided. DC power to  
0 each DC/DC converter in the SRU is controlled by the  
0 Frame Supervisory Panel, NT8X96AB, using circuit break-  
0 ers.

0 Optionally the SRU may be powered from 240 Volt AC main.  
0 Provide one (1) NT5C06CA Rectifier for the AC input.  
0 Batteries can also be housed in the SRU. This is done to  
0 provide power backup in the event either the AC power or  
0 rectifier fails. Provide A0376779 YUASA Batteries (quan-  
0 tity of 8) if this option is requested. Each string of  
0 batteries (quantity of 4) provide two hours of back-up  
0 power.

0 RELEASE 28.01  
0 93 12 03  
0

0 Where batteries are equipped then a Battery Charging Unit  
0 (BCU), NT8X02AA, shall also be provided. The BCU enables  
0 the batteries to be either automatically charged or under  
0 the control of a craftsman. The batteries provide  
0 power back-up for up to 4 hours (two hours per string).

0 Frame Supervisory Panel (NT8X96AB)

0 This unit provides -48v dc distribution to the equipment  
0 used in the SRU, provides Talk Battery filter and de-  
0 tection of DC/DC power converter failures. The FSP has 6  
0 circuit breakers. The FSP provides the Automatic Recovery  
0 from Low Battery (ARLB) feature (through the NT6X36AF  
0 ARLB FSP Alarm Card CP) which prevents the circuit break-  
0 ers on the FSP from tripping in case of low battery sup-  
0 ply. This eliminates the need for a craftsman to  
0 manually re-set the breakers on site.

0 Battery Charging Unit (NT8X02AA)

0 This unit enables the system and craftsman with the  
0 ability to charge, determine the status of each battery  
0 string and also provides low voltage disconnect. Provide  
0 one unit when batteries are provided.

0 ( x ) Administration, Maintenance and Operations

0 The SRU is an integral part of the host DMS-100 Office.  
0 It is centrally administered and maintained by the  
0 DMS-100 system from the MAP located at the host site. MAP  
0 access from a remote SRU site by using a dial up proce-  
0 dure currently established for DMS remotes, using modem  
0 on a working line.

0 For the SRU, the DMS supports integrated administration  
0 and maintenance consistent with that for the LCME, but  
0 with the following additional facilities:

0 Remote maintenance and diagnostics  
0 Monitor SRU Alarms.  
0 Carrier Alarms

0 ( xi) Traffic Engineering

0 Traffic engineering rules for SRU are different from that  
0 of the LCME, as the number of lines and p-side channels  
0 is different. The SRU provides up to 180 p-side channels

0 RELEASE 28.01  
0 93 12 03

0 for call processing. Out of these channels, 2 are used by  
0 the SRU Control Unit and 2 by the RME. It must be noted  
0 that the SRU design is limited to maximum of 6 PCM-30  
0 links to the host.

0 The following table presents approximate LCME line drawer  
0 load service for ISDN only, and mix service applications  
0 for the SRU.

|   | No of lines |      |         | PCM-30 links req'd | ccs achieved   |
|---|-------------|------|---------|--------------------|----------------|
|   | ISDN        | POTS | CENTREX | (@8ccs for ISDN)   | (with 6 links) |
|   | -----       | ---- | -----   | -----              | -----          |
| 0 | 240 (100%)  | 0    | 0       | 7                  | 6.44           |
| 0 | 216 (90%)   | 0    | 0       | 6                  | 7.76           |
| 0 | 192 (80%)   | 0    | 0       | 6                  | 9.41           |

|   | No of lines |           |          | PCM-30 links req'd |
|---|-------------|-----------|----------|--------------------|
|   | ISDN        | POTS      | CENTREX  |                    |
|   | -----       | ----      | -----    | -----              |
| 0 | 216 (90%)   | 12 (5%)   | 12 (5%)  | 6                  |
| 0 | 192 (80%)   | 24 (10%)  | 24 (10%) | 6                  |
| 0 | 168 (70%)   | 48 (20%)  | 24 (10%) | 6                  |
| 0 | 144 (60%)   | 72 (30%)  | 24 (10%) | 5                  |
| 0 | 120 (50%)   | 96 (40%)  | 24 (10%) | 5                  |
| 0 | 96 (40%)    | 120 (50%) | 24 (10%) | 4                  |
| 0 | 72 (30%)    | 144 (60%) | 24 (10%) | 4                  |
| 0 | 48 (20%)    | 168 (70%) | 24 (10%) | 3                  |
| 0 | 24 (10%)    | 192 (80%) | 24 (10%) | 3                  |
| 0 | 0 (0%)      | 216 (90%) | 24 (10%) | 2                  |

0 The above calculations are based upon the following assumptions,

- 0 - nailed connections on 10% ISDN lines
- 0 - 5% blocking (Grade of Service = 0.05)
- 0 - Traffic rate for ISDN = 8ccs
- 0 - Traffic rate for POTS = 6ccs
- 0 - Traffic rate for CENTREX = 6ccs

#### 0 ( xii) Software

0 The SRU software is be based on the existing LCME soft-  
0 ware. The base package for the SRU is:

0 NTXH96AA SRU BASIC

0 The SRU BASIC (NTXH96AA) software package needs the fol-  
0 lowing software packages in order to function:

0  
0 RELEASE 28.01  
0 93 12 03

0 NTX001AA COMMON BASIC  
0 NTX146AA REMOTE LINE CONCENTRATING MODULE (RLCM)  
0 NTX147AB OUTSIDE PLANT MODULE MAINTENANCE(UPGRADE OF NTX147AA)  
0 NTX270AA NEW PERIPHERAL MAINTENANCE PACKAGE  
0 NTX274AA DTC 30 CARRIER MAINTENANCE  
0 NTX750AB ISDN BASIC ACCESS  
0 NTX901AA LOCAL FEATURES I  
0 NTX941AA CM COMMON

0 The DMS-100 Data Schema NTP has been updated to include an inventory  
0 table that references the SRU. The Data Schema uniquely identifies  
0 the SRU. For general information relating to tables and table con-  
0 trol, refer to NTP 297-1001-451 and NTP 297-1001-310.

0 ESA capability is not provided.

0 Intraswitching is not supported.

0 Software is currently unavailable for domestic applications. The cur-  
0 rent software only supports installations for Australia and the United  
0 Kingdom (UK).

0 There is no degradation on CC real-time as compared to a LCME working  
0 through LGCI.

0 | 3.3.2 BCS Gating Hardware

0 (a) General Description

0 BCS Required Hardware is defined as the modification necessary to  
0 load the BCS software into the DMS-100. This ECM lists, in table  
0 form, all the equipment gating to BCS 26-34.

0 ANY OFFICE THAT IS UPGRADING A BCS MUST MEET THE MINIMUM HARDWARE  
0 REQUIREMENTS. HARDWARE MINIMUMS ARE BASED ON ADDITIONS TO THE  
0 PREVIOUS BCS HARDWARE REQUIREMENTS.

0 All other hardware is feature hardware. The feature related  
0 hardware information and details on BCS Gating hardware should be  
0 obtained from Advanced Provisioning Information (API) or Engi-  
0 neering Change Memorandum (ECM) documents on the feature. This  
0 feature related hardware should be ordered in the appropriate  
0 specs.

0 (c) Provisioning Considerations

0 BCS26 & 27 Gating Hardware

0 In the table, terms used are defined as:

| 0 Terms in Table | Associated PEC                    |
|------------------|-----------------------------------|
| 0 Ext. SP Mem    | NT6X46AC or NT6X46BA - SEE NOTE   |
| 0 Ext. MP Mem    | 2nd NT6X47AB per shelf - SEE NOTE |

0 NOTE: The NT6X46AC circuit pack (cp) will be used to up-  
0 date existing modules. This cp (NT6X46AC) will be ordered  
0 via a Product Change (PC) kit. The PC kit will change  
0 the PEC of the base modules and make several other cir-  
0 cuit pack slots provisionable. (The slots are being made  
0 provisionable to eliminate the need for additional PC  
0 kits and base module PECs when the circuit packs change  
0 PECs due to upcoming features.) The NT6X46BA will be  
0 used on new modules. These new modules will contain  
0 provisionable slots for changing cp's.

0 The second NT6X47AB (MP Memory CP) will be a  
0 provisionable card on the new and updated modules. There-  
0 fore, the second NT6X47AB will be ordered as a line  
0 item.)

0 RELEASE 28.01  
0 93 12 03  
0

0 BCS28 & 29 Gating Hardware

0 In the table, terms used are defined as:

| 0 Terms in Table    | Associated PEC                         |
|---------------------|----------------------------------------|
| 0 Ext. SP Mem       | NT6X46AC or NT6X46BA - SEE NOTE        |
| 0 Ext. MP Mem       | 2nd NT6X47AB per shelf or - SEE NOTE   |
| 0                   | NT6X47AC                               |
| 0 New Msg           | NT6X69AA & 79AA or NT6X69AB - SEE NOTE |
| 0                   | or NT6X69AC                            |
| 0 XPM Processor CP  | NT6X45BA - SEE NOTE                    |
| 0 Ext. LCM Proc. CP | NT6X51AB - SEE NOTE                    |

0 NOTE: The NT6X46AC circuit pack (cp) will be used to up-  
0 date existing modules. This cp (NT6X46AC) will be ordered  
0 via a Product Change (PC) kit. The PC kit will change  
0 the PEC of the base modules and make several other cir-  
0 cuit pack slots provisionable. (The slots are being made  
0 provisionable to eliminate the need for additional PC  
0 kits and base module PECs when the circuit packs change  
0 PECs due to upcoming features.) The NT6X46BA will be  
0 used on new modules. These new modules will contain  
0 provisionable slots for changing cp's.

0 The second NT6X47AB (MP Memory CP) will be a  
0 provisionable card on the new and updated modules. There-  
0 fore, the second NT6X47AB will be ordered as a line item.  
0 One NT6X47AC can be used in place of two NT6X47AB circuit  
0 packs.

0 The NT6X69AA and NT6X79AA or NT6X69AB cp can be used to  
0 update existing modules. These cp will be ordered via PC  
0 Kit. The PC kit will change the PEC of the base modules  
0 and make the card slots provisionable. The NT6X69AC is  
0 to be used for all New Messaging updates and replaces all  
0 the previous New Msg circuit packs.

0 For Canadian applications, the provisionable NT6X45BA  
0 circuit pack will be required for BCS-28 for XPM Super  
0 Charging.

0 For Canadian applications, the NT6X51AB circuit pack will  
0 be required for BCS-28 for XPM Super Charging. NT6X51AB  
0 is an "Always Provided" circuit pack on the LCM Common CP  
0 fill. It is part of NT6X04AB LCM Common CP (i.e. per-  
0 taining to LCM, RSC, RLCM) and NT8X04AB LCM Common CP

0 RELEASE 28.01  
0 93 12 03  
0

0 (i.e. pertaining to OPM). In Canada, Change Application  
0 Dept. 1955 BRW will field upgrade existing LCM modules as  
0 required (i.e. Systems Application Engineering will NOT  
0 retrofit NT6X51AA to NT6X51AB via product change kit).  
0 However, after Change Application field upgrades an of-  
0 fice, System Application Engineering will update the of-  
0 fice records accordingly.

0 BCS30 & 31 Gating Hardware

0 In the table, terms used are defined as:

| 0 Terms in Table | Associated PEC                     |
|------------------|------------------------------------|
| 0 Ext. SP Mem    | NT6X46AC or NT6X46BA - SEE NOTE    |
| 0 Ext. MP Mem    | 2nd NT6X47AB or one (1) - SEE NOTE |
| 0                | NT6X47AC per shelf                 |

0 NOTE: The NT6X46AC circuit pack (cp) will be used to up-  
0 date existing modules. This cp (NT6X46AC) will be ordered  
0 via a Product Change (PC) kit. The PC kit will change  
0 the PEC of the base modules and make several other cir-  
0 cuit pack slots provisionable. (The slots are being made  
0 provisionable to eliminate the need for additional PC  
0 kits and base module PECs when the circuit packs change  
0 PECs due to upcoming features.) The NT6X46BA will be  
0 used on new modules. These new modules will contain  
0 provisionable slots for changing cp's.

0 For U.S. applications only, the second NT6X47AB (MP  
0 Memory CP) pair can be provisioned card on updated mod-  
0 ules. The second NT6X47AB CP pair will be ordered as a  
0 line item on modules where the existing module already  
0 contained one (1) NT6X47AB CP pair. The one (1) NT6X47AC  
0 is provisionable on new modules and has the memory capac-  
0 ity equivalent of two (2) NT6X47AB. Existing modules can  
0 be updated via a change kit which replaces the NT6X47ABs  
0 with the NT6X47ACs.

0 For Canadian applications only, one (1) NT6X47AC pair  
0 will be provisioned on new modules and will replace  
0 NT6X47AB on existing modules. The second NT6X47AB is not  
0 to be provisioned for Canadian jobs.

0 BCS32 Gating Hardware

0 RELEASE 28.01  
0 93 12 03  
0

0 Effective BCS-32, all IACs in an office must be replaced  
0 with LGCI/LTCI or LGC/LTC modules with ISDN capabilities  
0 prior to accepting a BCS-32 or above load.

0 BCS33 Gating Hardware

0 Effective with BCS33, the old messaging/small memory con-  
0 figuration will no longer be supported on new BCS loads  
0 for any XPM except DTC6, MSB6, and MSB7.

0 The following terms used in the table below are defined  
0 as follows:

| 0 Terms in Table | Associated PEC                                  |
|------------------|-------------------------------------------------|
| 0 -----          | -----                                           |
| 0 Ext. MP Mem    | 2nd NT6X47AB or one<br>0 NT6X47AC per shelf     |
| 0 New Msg        | NT6X69AB, NT6X69AC, or<br>0 NT6X69AA & NT6X79AA |
| 0 Ext. SP Mem    | NT6X46AC, NT6X46BA, or NT6X46BB                 |
| 0 4M MS Proc     | NT9X13DC                                        |
| 0 6M Memory      | NT9X14BB                                        |

0 The second NT6X47AB (MP Memory CP) can be provided when  
0 upgrading existing DTC modules. A NT6X02EQ change kit  
0 will be used on existing DTCs to replace the NT6X47AB CPs  
0 with NT6X47AC CPs.

0 The NT6X47AC CP will be provisioned on new DTC modules  
0 and RLCM/OPM modules with ESA.

0 The NT6X69AC (Msg Protocol & Tone CP) will be provisioned  
0 on new DTC and SMR modules. DTC and SMR modules with old  
0 messaging, NT6X43AA, will be upgraded with the NT6X69AC,  
0 via a Product Change (PC) Kit, to meet new messaging re-  
0 quirements. DTC modules being upgraded to new messaging  
0 must upgrade the Signal Processor Memory CP with the  
0 NT6X46AC or NT6X46BB via PC Kits. New modules will be  
0 provisioned with the NT6X46BB CP. Existing DTC modules  
0 may have been provisioned with the NT6X46BA.

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 NT6X69AA & NT6X79AA or NT6X69AB, Msg Protocol & Tone CP,  
0 satisfies the new messaging requirement on existing DTC  
0 modules.

0 NT9X13DC, MS CPU Processor CP (4Meg), and NT9X14BB, 6MB  
0 Memory, must be provisioned on the Message Switch (MS)  
0 when ENET hardware and/or software (NTXE01AA) is being  
0 ordered or upgraded to BCS33. Refer to ECM493 and  
0 ECM331. The NT9X13DC and NT9X14BB must also be provi-  
0 sioned for all FLIS applications in BCS33 and beyond.  
0 Refer to ECM612.

0 Refer to the appropriate API/ECM document for further  
0 provisioning rules.

0 Refer to ECM441, XPM Power Provisioning, to ensure that  
0 the correct NT2X70, Power Converter CP, is provisioned in  
0 upgraded XPMs.

0 The following terms used in the table below are defined  
0 as follows:

| Terms in Table | Associated PEC |
|----------------|----------------|
| -----          | -----          |
| Unified Proc   | NTMX77AA       |
| XPM+ Term PB   | NTMX71AA       |
| EISP           | NTBX01AB       |
| 4M MS Proc     | NT9X13DC       |
| 6M Memory      | NT9X14BB       |

0 The NTMX77AA (Unified Processor), NTMX71AA (XPM Plus Ter-  
0 minator Paddleboard), and NTBX01AB (Enhanced ISP) must be  
0 provisioned on all RCCI modules going to BCS34.

0 NT9X13DC, MS CPU Processor CP (4Meg), and NT9X14BB, 6MB  
0 Memory, must be provisioned on the Message Switch (MS)  
0 for DMS Packet Handler applications in BCS34.

0 The following tables list the hardware gating and MINIMUM  
0 packfill level required for BCS 32-34 on a per module ba-  
0 sis:

TABLE 4: BCS Requirements for LCM/RLCM/OPM

0 RELEASE 28.01  
0 93 12 03

0 3.3.3 ISDN Remote Switching Center (RCCI)

0 (a)

0 General Description

0 The ISDN RSC (RCCI) is part of the ongoing evolution of ISDN. The  
0 objective is to support ISDN both on new shipments and on  
0 retrofit of existing >in-service> RSCs. The NT6X1022 Change kit  
0 allows an existing NT6X12CA RCC to be converted to an RCCI. The  
0 additional equipment which must be added to the current RSC in-  
0 cludes an ISDN version of the LCM and RCC (LCMI and RCCI) and a  
0 Packet Handler. The RCCI will support ISDN Basic Rate Access  
0 (BRA), basic Emergency Stand Along (ESA) service, single or dual  
0 Universal Tone Receiver (UTR) (single UTR only when CLASS Modem  
0 Resource card is required), delivery of calling number to  
0 500/2500 sets (CND under CLASS) and all terminals and features  
0 supported by the existing RSC base as of BCS-28.

0 All call processing features available for ISDN loops on host pe-  
0 ripherals will be supported for the RCCI, in addition to the  
0 non-ISDN services currently available on the RCC. Host loop main-  
0 tenance features will be provided for ISDN loops on an RCCI and  
0 all standard maintenance features will be supported.

0 ISDN Basic Rate Interface (BRI) Services supported on RCCI are as  
0 follows:

- 0 o Stimulus signaling
- 0 o Functional signaling
- 0 o All supplementary services as offered to host lines
- 0 o Intraswitching of BRI calls
- 0 o Dynamic trunks - intra to BRI lines
- 0 o ESA - basic call set-up with either stimulus
- 0 or functional signalling is provided.
- 0 o Packet handler service during ESA can optionally be provided.

0 Primary Rate Interface (PRI) is not currently supported.

0 Several software enhancements to the RCCI were implemented in  
0 BCS-31. No reconfiguration nor additional hardware is required  
0 for these capabilities. The following list summarizes these  
0 BCS-31 enhancements:

- 0 - software added to have RCCI recognize and handle ISDN termi-  
0 nals and nodes while in ESA.

0  
0 RELEASE 28.01  
0 93 12 03

- 0 - software added to have CC download ISDN terminal information  
0 to RCCI so that it is prepared to handle ISDN calls while in  
0 ESA mode.
- 0 - capability to intraswitch ISDN BRI calls on RCCI.
- 0 - support for Dual RCC with ISDN (DRCCI) during ESA or non-ESA  
0 conditions and trunks from RCCI during ESA. (Either one or  
0 both RSCs in DRCCI may support ISDN loops.)
- 0 - provides RCCI support of LCME and support for AMI U-loop  
0 linecard and 2B1Q ISDN U-loop linecard.
- 0 - provides RCCI support of Digital Test Access (DTA).

0 Figure 316.8 illustrates the general architecture of the RCCI.

Figure 316.8 : DMS ISDN Architecture

In addition to RCC base functionality, the RCCI will support the following to provide ISDN functionality:

0 RELEASE 28.01  
0 93 12 03  
0

- 0 o collection of both D and concentrated B channels from
- 0 LCMI/LCME via DS-30A ports.
- 0 o provision of front end Q.931 processing of D-Channels in ISP.
- 0 o routing D-Channels to D-Channel Handler.
- 0 o routing Bd and Bb packet data to P-side located packet han-
- 0 dler via intraswitched C-side channels or to host located
- 0 packet handler via C-side host umbilicals.
- 0 o routing switched B channels, if host destined via host
- 0 umbilicals or if not via intraswitching.
- 0 o handling all digit collection for CC.
- 0 o physically terminating DCH via DS-1 slots on P-side.

0 D-channels are multiplexed 4:1 and together with Bd and Bb links  
0 destined for the Packet Handler (PH) (if PH interface is from the  
0 P-side) are connected to the P-side using the intra switching ca-  
0 pability of the RCCI.

0 The DMS-100 Packet Handler can be co-located with the RCCI or co-  
0 located at the host DMS-100. The physical location of the Packet  
0 Handler is largely a tradeoff of ESA functionality and system  
0 cost. Links to the Packet Handler can be via one of the follow-  
0 ing:

- 0 o P-side links off host XPM (not routed via network)
- 0 o nailed up network connections terminating via DTC/DTCIs.
- 0 o P-side links off RCCI.

0 The host XPM can be an LTC, LTCI, LGC or LGCI. The host XPM has  
0 the following capabilities:

- 0 o terminates DS-1 umbilicals from RCCI and switches them
- 0 through to the network (non-concentrating).
- 0 o optionally can terminate LCMS directly. The host LGC/LTC need
- 0 NOT be upgraded to an LGCI/LTCI unless it supports a separate
- 0 LCMI in addition to the RCCI.
- 0 o must be LTC or LTCI if there are trunks off of the RCCI.

0 An RCCI with remote trunking that requires interface to a host  
0 LTCI is not available at this time.

0 The DS-1 umbilical for the RCCI must support 64Kbps clear chan-  
0 nels. The RCCI host umbilical restrictions are essentially the  
0 same as those for the RSC. The maximum distance is 100 miles. The  
0 intervening transmission network may be whatever the operating  
0 company chooses (e.g. copper, fiber, digital radio, etc.). Extended  
0 Super Frame format and Bipolar Coding with 8 Zeros Suppression  
0 (B8ZS) are required to support 64K clear channels.

0 RELEASE 28.01  
0 93 12 03

0 A Dual RCCI configuration is not yet available.

0 The NT6X10AE Offshore Remote Controller Equipment Frame (RCEI) is  
0 based on the domestic NT6X10AD ISDN RCE, adapted for Offshore  
0 markets. For remote applications it supports POTS, Centrex and  
0 limited ISDN services on standard International and ISDN Line  
0 Concentrating Modules (LCMs). PCM30 trunks link the RCEI to the  
0 host peripheral controller.

0 (b) References

0 Section 3.12 Peripheral Modules - Remotes  
0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 ( i) The RCCI is currently available as new equipment only.  
0 Upgrades of existing RSC to RCCI are not supported.

0 ( ii) The NT6X10AD ISDN Remote Controller Equipment (RCEI)  
0 Frame is equipped with NT6X12DA RCCI Common CP, and pro-  
0 visioned with NT6X50AB DS-1 Interface CP, NTB02AA D-  
0 Channel Handler CP, and NT6X48AA DS-30A LCM Interface CP  
0 as required.

0 Engineering for the RCCI must take several factors into  
0 account:

- 0 o number of C-side ports
- 0 o number of P-side ports and slots (DS-30A & DS-1)
- 0 o number of DS-1 slots (incl. DCH)
- 0 o Speech Bus bandwidth
- 0 o MP,SP and ISP real time

0 The RCCI has 20 accessible P-side ports shared between  
0 DS-30A, DS-1 and optional PH interface. DCH use 1 P-side  
0 port and 1 DS-1 slot per DCH. The basic rules are:

0  $\lceil \text{DS-30A ports} \rceil + \lceil \text{DS-1 ports} \rceil + \lceil \text{DCH} \rceil \leq 19$   
0 (excl. RMM)

0  $\lceil \text{DS-1 slots} \rceil \leq 10$  (with each DCH using one slot)

0 Due to power limitations, use of NT6X78AA CLASS CMR  
0 will add the following rule:

0  $\lceil \text{DS-1 cards (C-side)} \rceil + \lceil \text{DS-1 cards (P-side)} \rceil \leq 10$  max

0 RELEASE 28.01  
0 93 12 03  
0

0 Each DCH occupies a single P-side port and consumes one  
0 P-side DS-1 slot on the RCCI. The number of DCHs required  
0 depends on the number of D terminals per loop, user  
0 packet throughput on each D-channel and the stat mux ra-  
0 tio used in the DCH.

0 Each provisioned DCH reduces the number of available P-  
0 side DS-1 slots by one.

0 If there is no Bd, then 31 channels can be used for mux'd  
0 D-channels, meaning a D-Channel Handler can support a  
0 maximum of 124 lines. Typically, a DCH will support about  
0 108 D-channels. The RCCI supports a maximum of ten (9  
0 active + 1 hot spare) provisionable DCHs.

0 The number of LCMI/LCMEs that can be supported by the  
0 available P-side DS-30A ports will depend on the number  
0 of ISDN loops per LCMI/LCME, the number of provisioned B  
0 packet channels and circuit switched B channel traffic  
0 levels. A minimum of two DS-30A links are required per  
0 LCMI/LCME.

0 ( iii) The RSC supports both (AMI) LCMIs and (2B1Q) LCMEs. The  
0 LCME does not support the AMI U-loop linecard nor coin  
0 lines.

0 ( iv) The 2B1Q requires the Multiline Test Unit (MTU) for the  
0 line test function. If 2B1Q lines home on the RCCI, the  
0 RMM must be equipped with an MTU pair. Refer to section  
0 3.5 for more information on the MTU.

0 ( v) The NT6X78AA CLASS Modem Resource (CMR) card is provided  
0 to support Custom Local Area Signaling Services (CLASS)/  
0 Call Management Services (CMS). When the CMR card is  
0 equipped, the RCCI is limited to one (1) Universal Tone  
0 Receiver card. Dual UTRs can be supported if the CMR  
0 card is not required.

0 If the CMR card is present, a maximum of ten NT6X50AB  
0 DS-1 cards can be supported, thereby limiting C-side and  
0 P-side to a maximum of 20 DS-1 ports in the RCCI.

0 ( vi) The Remote Maintenance Module (RMM) datafill will be  
0 identical to the current RCC. Ports 0 and 1 will be re-  
0 served for RMM use.

0 RELEASE 28.01  
0 93 12 03  
0

0 ( vii) Preliminary Real Time data indicates that the RCCI is not  
0 limited by Real Time constraints for any level of traf-  
0 fic.

0 (viii) The RCCI is available in a 7-foot shrouded frame for EMI  
0 applications. EMI and earthquake compliance is unchanged  
0 from that provided for the RSC.

0 ( ix) ISDN Packet Services on a RCCI are the same as those on a  
0 host LTCI, making use of the same Packet Handler (PH) at  
0 the host. If ESA is needed, either a complete remote PH  
0 or a remote access module may be deployed. If the avail-  
0 ability benefits afforded by ESA are not required, the  
0 RCCI can use the PH deployed at the host. There are  
0 three ways the RCCI can be linked to the host PH for pro-  
0 visioned packet data services:

- 0 o direct P-side DS-1 port off RCCI
- 0 o nailed up via host umbilical but looped back in
- 0 host XPM and routed out on DS-1 links to PH
- 0 o nailed up via host umbilical and host network

0 Remote deployment of a DMS-100 Packet Handler at the re-  
0 mote location maximizes the remote's ESA functionality  
0 but a more cost effective option is to deploy only a re-  
0 mote Access Module (AM). The remote AM is recommended  
0 only under the following circumstances:

- 0 o majority of packet traffic is local to the
- 0 remote.
- 0 o ESA is required for packet services.
- 0 o reduced connectivity in ESA is acceptable.

0 During ESA, the Access Module will maintain all calls lo-  
0 cal to that AM and will allow the set-up of new calls lo-  
0 cal to that AM, provided that the link to the AM remains  
0 intact.

0 ( x) Extended Super Frame (ESF) must be used when the Packet  
0 Handler is host located or when a high percentage of the  
0 circuit switched data traffic is host bound.

0 | ( xi) NT6X10AE Offshore Remote Controller Equipment Frame

0 | Unlike its domestic equivalent, the Offshore RCEI frame  
0 houses only one (1) Remote Maintenance Module (RMM)

0  
0 RELEASE 28.01  
0 93 12 03

0 shelf. The Remote Cluster Controller shelf is abbrevi-  
0 ated >PRCC> (PCM-30 Remote Cluster Controller).

0 Note that the following features are NOT supported on the  
0 Offshore RCEI:

- 0 - P-side PCM-30 links
- 0 - ISDN Primary Rate Interface (PRI)
- 0 - Emergency Standalone (ESA) - planned for a future BCS
- 0 - Intraswitched calls (all calls must be switched via  
0 the host office; this must be taken into account when  
0 provisioning host links)
- 0 - Dual RCC
- 0 - Remote off remote
- 0 - Data Unit line cards

0 In BCS-31, ISDN Basic Rate Interface (BRI) is not sup-  
0 ported. This restriction is removed in BCS-32, at which  
0 time LCMI and LCME modules may be interfaced to the PRCC.  
0 Line Drawer 00, slot 00 must not be datafilled.

0 All PCM30 links from a PRCC must terminate on the same  
0 host PLGC. Only the PLGC peripheral type can terminate  
0 PRCC host links.

0 (xii) The Offshore versions of the Common Peripheral Controller  
0 Equipment Frame and Remote Controller Equipment Frame are  
0 provisioned the same as their domestic counterparts (sub-  
0 ject to the usage restrictions). The primary difference  
0 is the use of PCM-30 interfaces instead of DS-1 inter-  
0 faces.

0 A maximum of sixteen (16) PCM-30 interfaces may be  
0 equipped on the PLGC/PDTC versus twenty (20) DS-1 inter-  
0 faces on the North American product.

0 Provision one (1) NT6X27AC PCM-30 Interface CP for every  
0 two PCM-30 interfaces required.

0

0 | Certain other circuit pack vintages are different between  
0 | domestic and Offshore products; refer to the Engineering  
0 | Manual sections for details.

0 4.0 Building Block ENGINEERING - RLCM

0 The purpose of this ECM is to document the DMS Building Block approach  
0 for capturing the provisioning of the Remote Line Concentrating Module  
0 (RLCM) and IRLCM.

0 There are three (3) components to this ECM,

- 0 RLCM Customer Questions
- 0 RLCM Calculations
- 0 Engineering Manual Sections

0 RLCM Customer Questions - Worksheet of Telco inputs derived at the  
0 time of order capture. Inputs from this section will be abbreviated  
0 with a 'Q', a number and a letter (for example, Q1a represents Question  
0 1, subsection a).

0 RLCM Calculations - Worksheet of provisioning algorithms driven from  
0 the results of RLCM Customer Questions. Inputs from this section will  
0 be abbreviated with a 'C', a number and a letter (for example, C1a re-  
0 presents Calculation 1, subsection a).

0 Engineering Manual Section - Detailed description of the provisioning  
0 guidelines adjusted for Building Block Engineering.

## 0 P AND C SIDE PORT REQUIREMENTS

0  
0 The RLCM requires a minimum of two and a maximum of six DS-1  
0 links to the host. The two minimum links are the primary links.  
0 Each DS-1 interface card (NT6X50AA) connects two DS-1 links be-  
0 tween the RLCM and the host XPM. All DS-1 links must terminate on  
0 the same host peripheral. For reliability, the primary links  
0 should terminate on different NT6X50AA interface cards at the  
0 host and on the RLCM.

0 The IRLCM requires a minimum of four and a maximum of six PCM-30  
0 links. Four are always provided by the HIE Common CP  
0 NT6X11BA/BB/BC/EA/ EB/KA. If more than four PCM-30 links are re-  
0 quired, provide 1 additional PCM-30 NT6X27BB Interface Pack.

## 0 RLCM CALCULATIONS

0  
0 C4. RLCM Requirement

0 a. Quantity of RLCM = R29 from ECM 497 \_\_\_\_\_

0 C5. Choose link configuration for RLCM(s)

0 Calculations C5 a thru f has been deleted.

0 g. Links per RLCM (ABSBH) = R34 from ECM 497 \_\_\_\_\_

0 h. Links per RLCM (HDBH) = R35 from ECM 497 \_\_\_\_\_

0 i. Links per RLCM = R36 from ECM 497 \_\_\_\_\_

0 j. Host Links per RLCM = R37 from ECM 497 \_\_\_\_\_

0 C6 a. Total NT2X90--s needed

0 (Q7a+Q7b+Q7c+Q7d+Q7e+Q7f+Q7g) =  
0 (Enter Quantity) \_\_\_\_\_

0 b. Total NT0X10--s needed  
0 (Q8a+Q8b+Q8c+Q8d+Q8e+Q8f+Q8g)/14 =  
0 (Round Up, Enter Quantity) \_\_\_\_\_

0 c. Total NT2X57--s needed  
0 (Q9a+Q9b+Q9c+Q9d+Q9e+Q9f)/14 =  
0 (Round Up, Enter Quantity) \_\_\_\_\_

0 C7. Remote Maintenance Module

0 For Canadian applications, a choice of RMM - Standard layout  
0 or RMM - Custom layout is available. For U.S. applications,  
0 the RLCM frame is always provided with a standard RMM layout.  
0 The Standard RMMs are always provided with a basic complement  
0 of circuits used for remote testing, plus a number of free  
0 slots available to be provisioned per office requirements.  
0 The following calculations are used to assist in provisioning  
0 these slots.

0 a. Extra NT2X90-- provisioning : C6a - (2\*C4a) = \_\_\_\_\_

0  
0 RELEASE 28.01  
0 93 12 03

0 b. Extra NT0X10-- provisioning : C6b - (1\*C4a) = \_\_\_\_\_

0 c. Extra NT2X57-- provisioning : C6c - (1\*C4a) = \_\_\_\_\_

0 Note: C6a+C6b+C6c cannot exceed 2 free slots per RLCM  
0 (Canadian standard RMM) or 4 free slots per RLCM  
0 (U.S. standard RMM)

0 RLCM PROVISIONING

0  
0 1a. For Canadian applications provide a quantity of NTZZ16AC  
0 RLCM frames = C4a.

0 For International applications provide a quantity of of  
0 NTZZ41RA frames = C4a.

0 For CALA and Canadian applications that require a a specific  
0 number of Line Drawers provide a quantity of NTZZ16LA frames  
0 = C4a.

0 1b. For U.S. offices, provide a quantity of NTZZ16ED RLCM frames  
0 = C4a. Each NTZZ16ED requires one NTZZ16HA either one  
0 NT0X25AA Common Framework or one NT0X25AH Earthquake Common  
0 Framework.

0 2a. If Question 5a.1 is Y, provide one NTZZ16BA per NTZZ16AC or  
0 NTZZ16ED and provide a RME frame.

0 NTZZ15AA RME w/PDC (Canadian offices)  
0 NTZZ15CA RME w/PDC (US non-earthquake offices)

0 2b. If Question 5a.2 is Y, provide one NTZZ16BA per NTZZ16AC or  
0 NTZZ16ED and provide a PDC frame.

0 NTZZ13AA PDC Top Feed (Canadian offices)  
0 NTZZ13BA PDC Bottom Feed (Canadian offices)  
0 NTZZ13HA PDC Top Feed (US non-earthquake offices)  
0 NTZZ13JA PDC Bottom Feed (US non-earthquake offices)

0 3. If Question 5b is Yes, provide one NTZZ16CA per NTZZ16AC or  
0 NTZZ16ED.

0  
0 RELEASE 28.01  
0 93 12 03

- 0 4. If Question 6 is Yes, provide one NTZZ16DB per NTZZ16AC or  
0 NTZZ16ED or NTZZ16LA.
- 0 . If Question 6 is Yes, and this is for the CHINA market then  
0 provide one NTZZ41UA per NTZZ41RA.
- 0 . If Question 6 is Yes, and this is for the CEP market then  
0 provide one NTZZ41VA per NTZZ41RA.
- 0 . If Question 6 is Yes, and this is for the MURCURY market then  
0 provide one NTZZ41WA per NTZZ41RA.
- 0 5. Extra RMM circuit pack provisioning
- 0 a. Provide quantity of NT2X90--s specified in C6a + one (1)  
0 NT2X77AA per NT2X90-- provided.
- 0 b. Provide quantity of NT0X10--s specified in C6b.
- 0 c. Provide quantity of NT2X57--s specified in C6c.
- 0 6. If Calculation 5i equals 5 or 6, provide one NT6X50AA.
- 0 7. If Question 10a is Yes, provide one NTZZ16FA RMM - Standard.  
0 If Question 10a is No, provide one NT6X13AB RMM - Custom
- 0 8. For U.S. offices, provide a quantity of NT6X05AA line drawers  
0 equal to Q11a.
- 0 9. If Question 10c is YES, provide one NTZZ41KA RMM.
- 0 10 If Question 10d is YES, provide one NTZZ41SA RMM.
- 0 11 If Question 10e is YES, provide one NTZZ41TA RMM.
- 0 12 For CALA applications, provide a quantity of NT6X05AA Line  
0 Drawers equal to Q12a.

0 (Round Up, Enter Quantity) \_\_\_\_\_

0 C7. Remote Maintenance Module

0 For Canadian applications, a choice of RMM - Standard layout  
0 or RMM - Custom layout is available. For U.S. applications,  
0 the RLCM frame is always provided with a standard RMM layout.  
0 The Standard RMMs are always provided with a basic complement  
0 of circuits used for remote testing, plus a number of free  
0 slots available to be provisioned per office requirements.  
0 The following calculations are used to assist in provisioning  
0 these slots.

0 a. Extra NT2X90-- provisioning : C6a - (2\*C4a) = \_\_\_\_\_

0  
0 RELEASE 28.01  
0 93 12 03

0 b. Extra NT0X10-- provisioning : C6b - (1\*C4a) = \_\_\_\_\_

0 c. Extra NT2X57-- provisioning : C6c - (1\*C4a) = \_\_\_\_\_

0 Note: C6a+C6b+C6c cannot exceed 2 free slots per RLCM  
0 (Canadian standard RMM) or 4 free slots per RLCM  
0 (U.S. standard RMM)

0 RLCM PROVISIONING

0  
0 1a. For Canadian applications provide a quantity of NTZZ16AC  
0 RLCM frames = C4a.

0 For International applications provide a quantity of of  
0 NTZZ41RA frames = C4a.

0 For CALA and Canadian applications that require a a specific  
0 number of Line Drawers provide a quantity of NTZZ16LA frames  
0 = C4a.

0 1b. For U.S. offices, provide a quantity of NTZZ16ED RLCM frames  
0 = C4a. Each NTZZ16ED requires one NTZZ16HA either one  
0 NT0X25AA Common Framework or one NT0X25AH Earthquake Common  
0 Framework.

0 2a. If Question 5a.1 is Y, provide one NTZZ16BA per NTZZ16AC or  
0 NTZZ16ED and provide a RME frame.

0 NTZZ15AA RME w/PDC (Canadian offices)  
0 NTZZ15CA RME w/PDC (US non-earthquake offices)

0 2b. If Question 5a.2 is Y, provide one NTZZ16BA per NTZZ16AC or  
0 NTZZ16ED and provide a PDC frame.

0 NTZZ13AA PDC Top Feed (Canadian offices)  
0 NTZZ13BA PDC Bottom Feed (Canadian offices)  
0 NTZZ13HA PDC Top Feed (US non-earthquake offices)  
0 NTZZ13JA PDC Bottom Feed (US non-earthquake offices)

0 3. If Question 5b is Yes, provide one NTZZ16CA per NTZZ16AC or  
0 NTZZ16ED.

0  
0 RELEASE 28.01  
0 93 12 03

- 0 4. If Question 6 is Yes, provide one NTZZ16DB per NTZZ16AC or  
0 NTZZ16ED or NTZZ16LA.
- 0 . If Question 6 is Yes, and this is for the CHINA market then  
0 provide one NTZZ41UA per NTZZ41RA.
- 0 . If Question 6 is Yes, and this is for the CEP market then  
0 provide one NTZZ41VA per NTZZ41RA.
- 0 . If Question 6 is Yes, and this is for the MURCURY market then  
0 provide one NTZZ41WA per NTZZ41RA.
- 0 5. Extra RMM circuit pack provisioning
- 0 a. Provide quantity of NT2X90--s specified in C6a + one (1)  
0 NT2X77AA per NT2X90-- provided.
- 0 b. Provide quantity of NT0X10--s specified in C6b.
- 0 c. Provide quantity of NT2X57--s specified in C6c.
- 0 6. If Calculation 5i equals 5 or 6, provide one NT6X50AA.
- 0 7. If Question 10a is Yes, provide one NTZZ16FA RMM - Standard.  
0 If Question 10a is No, provide one NT6X13AB RMM - Custom
- 0 8. For U.S. offices, provide a quantity of NT6X05AA line drawers  
0 equal to Q11a.
- 0 9. If Question 10c is YES, provide one NTZZ41KA RMM.
- 0 10 If Question 10d is YES, provide one NTZZ41SA RMM.
- 0 11 If Question 10e is YES, provide one NTZZ41TA RMM.
- 0 12 For CALA applications, provide a quantity of NT6X05AA Line  
0 Drawers equal to Q12a.

## 0 6.0 Remote Line Concentrating Module (RLCM)

0 The Remote Line Concentrating Module (RLCM) is a DMS-100F remote. The  
0 RLCM is based on the Line Concentrating Module (LCM). The RLCM pro-  
0 vides an interface for up to 640 remote subscribers and is packaged in  
0 a single DMS-100F frame. The following modules make up the RLCM (See  
0 Figure 1):

- 0 \* Frame Supervisory Panel (FSP)
- 0 \* Remote Maintenance Module (RMM)
- 0 \* Host Interface Equipment (HIE)
- 0 \* Line Concentrating Module (LCM)

### 0 Frame Supervisory Panel (FSP)

0 The FSP contains power control and alarm circuits which provide  
0 interfaces between the Power Distribution Center (PDC) and other  
0 DMS100F equipment frames. Office Repeaters, Filler Face Plates,  
0 and Fault Locator circuits are provisionable to the FSP.

### 0 Line Concentrating Module (LCM)

0 The LCM is a two-shelf configuration housing 640 subscriber line  
0 cards in 10 line drawers (5 per shelf).

### 0 Remote Maintenance Module (RMM)

0 The RMM provides the LCM with access to test and service circuits  
0 at the remote site (thereby reducing the load on the RLCM-TO-HOST  
0 DS1 Links). The RMM C-Side interfaces the LCM via a pair of  
0 DS30A links, one to each Link Control Card (LCC) in the HIE. The  
0 RMM shelf can accommodate up to 14 test/service circuits which are  
0 selected from a variety of types to meet the office requirements.

### 0 Host Interface Shelf (HIE)

0 The HIE equipment is required to enable the RLCM to support C-  
0 Side Links. The HIE provides a two-way interface between the  
0 Host office DS1-Links (Located in a LGC or LTC) and DS30A-Links  
0 (Located in the RLCM).

0 The RLCM supports all of the existing line features now supported  
0 at the host. Other available RLCM features include:

0 Intra-Switching An optional software feature allowing  
0 all calls originating and terminating  
0 within the RLCM to be switched without  
0 using the DS1 links to the host.

0 Emergency Stand Alone An optional feature providing the RLCM  
0 with the intelligence to continue ser-  
0 vice for intra-switched traffic in the  
0 event of a loss of communication with  
0 the host.

0 P AND C SIDE PORT REQUIREMENTS

0

0 The RLCM requires a minimum of two and a maximum of six DS-1  
0 links to the host. The two minimum links are the primary links.  
0 Each DS-1 interface card (NT6X50AA) connects two DS-1 links be-  
0 tween the RLCM and the host XPM. All DS-1 links must terminate on  
0 the same host peripheral. For reliability, the primary links  
0 should terminate on different NT6X50AA interface cards at the  
0 host and on the RLCM.

0 6.1.3 PROVISIONING CONSIDERATIONS

0  
0 When provisioning the RLCM one must consider the five major  
0 options, where the frame PEC (NT6X14AA) is common to all applica-  
0 tion. These options are: FSP, RMM Packfill, HIE Packfill, LCM  
0 Packfill, and Miscellaneous Equipment.

## 0 RLCM FSP Provisioning

0  
0 The Frame Supervisory Panel (FSP) NT6X25AA/BA is provisioned in  
0 the RLCM frame based on the number of DMS frames to occupy the  
0 RLCM Remote Office.

0  
0 RELEASE 28.01  
0 93 12 03

0 Provide the NT6X25AA FSP when the RLCM and other frames such as a  
0 RME are to be provided or Retrofit the RLCM frame with a NT6X25AA  
0 FSP when the office is extended with another frame. A PDC frame  
0 or RME frame equipped with PDC hardware and a NT6X1429 Intercon-  
0 nect Cable is required when provisioning the NT6X25AA FSP.

0 Provide the NT6X25BA for single frame installations and office  
0 growth expectations do not exceed the single frame limit. A  
0 NT6X1430 Interconnect cable is also required with this FSP.

0 The RLCM FSP (NT6X25AA/BA) must be equipped with RLCM to Host Of-  
0 fice interface cards, a minimum of two (2) and a maximum of six  
0 (6) DS-1 links may be provisioned. The required number of links  
0 is based on Traffic requirements (See ECM-350 for Traffic Provi-  
0 sioning). the host office.

#### 0 RLCM RMM Provisioning

0  
0 The Remote Maintenance Module (RMM) card cage is always provided  
0 with the frame PEC. However, the engineer must provision the ap-  
0 propriate circuit pack fill and test/service circuits specific to  
0 the Market where the RLCM shall be installed. Refer to the chart  
0 below for Market to packfill association:

0 93 12 03

0 There are fourteen (14) provisionable slots on the RMM. Refer  
0 to Table A section EMA14-01-000 for RMM provisionable circuit  
0 packs. Note: A NT2X48AB/CC pack is required if ESA is provi-  
0 sioned. One (1) NT0X10AA Scan Card should always be provided  
0 to support the reporting of Circuit Breaker 8 tripped or the  
0 loss of Talk Battery A.

#### 0 RLCM HIE Provisioning

0  
0 The Host Interface Equipment (HIE) shelf card cage is always pro-  
0 vided with the NT6X14AA RLCM frame PEC. However, the engineering  
0 must provision the HIE Circuit Packfill and certain other special  
0 application cards based on the Market where the office shall be  
0 installed as follows:

\* Replaced by the NT6X47AC for BCS-33 and later.

0  
0 RELEASE 28.01  
0 93 12 03

0 In International RLCMs, two (2) DS-1 circuit packs (4 DS-1) links are  
0 always provided in the HIE shelf. An additional PCM-30 circuit pack is  
0 provisionable in the HIE shelf.

0 In US or Canadian RLCMs, Two (2) DS-1 circuit packs (4 DS-1) links are  
0 always required and provisionable. An additional DS-1 pack is also  
0 provisionable.

0 All RLCM DS-1 Links must access the same LGC/LTC/RCC module in the  
0 Host Office.

0 It is recommended to assign the HIE (C-side) message links, 0 and 1,  
0 to ports on different LGA/LTA at the host office (i.e. assign message  
0 link 0 to LGA/LTA shelf array 0 and assign message link 1 to LGA/LTA  
0 shelf array 1).

0 At a Telco's request, the NT2X70AZ PC Kit may be provisioned to modify  
0 the NT6X11AA/BA/EA/ HIE with the NT2X70AE Power Converter.

#### 0 LCM Provisioning

0  
0 The Line Concentrating Module (LCM) in the RLCM is the same as  
0 provisioned in a DMS100 Central Office (CO). The LCM is a two-  
0 shelf configuration where the shelves are always provided with  
0 the RLCM frame PEC (NT6X14AA). However, the engineer must pro-  
0 vision the appropriate circuit packfill, Line Drawers, and Line  
0 Cards.

0 \* Circuit PackFills, and Line Drawers

0 \* US and Canadian Market

0 Refer to the appropriate BCS GATING HARDWARE ECM for the cor-  
0 rect LCM Packfill to be provisioned.

0 \* Line Cards

0 The Line cards are common to all markets. The maximum line  
0 capacity in an RLCM is 640 lines. All of the DMS100 LCM line  
0 card types are also provisionalbe in the RLCM according to  
0 existing LCM provisioning rules.

0 7.0 Building Block/Detailed RSCI Engineering

0 The ISDN RSC (RCCI) is part of the ongoing evolution of ISDN. The  
0 objective is to support ISDN both on new shipments and on  
0 retrofit of existing "in-service" RSCs. The NT6X1022 Change kit  
0 allows an existing NT6X12CA RCC to be converted to an RCCI. The  
0 additional equipment which must be added to the current RSC in-  
0 cludes an ISDN version of the LCM and RCC (LCMI and RCCI) and a  
0 Packet Handler. The RCCI will support ISDN Basic Rate Access  
0 (BRA), basic Emergency Stand Alone (ESA) service, single or dual  
0 Universal Tone Receiver (UTR)(single UTR only when CLASS Modem  
0 Resource card is required), delivery of calling number to  
0 500/2500 sets (CND under CLASS) and all terminals and features  
0 supported by the existing RSC base as of BCS-28.

0 All call processing features available for ISDN loops on host pe-  
0 ripherals will be supported for the RCCI, in addition to the  
0 non-ISDN services currently available on the RCC. Host loop main-  
0 tenance features will be provided for ISDN loops on an RCCI and  
0 all standard maintenance features will be supported.

0 ISDN Basic Rate Access (BRA) Services supported on RCCI are as  
0 follows:

- 0 \* stimulus signaling
- 0 \* functional signaling
- 0 \* All supplementary services as offered to host lines
- 0 \* Intraswitching of BRA calls
- 0 \* Dynamic trunks - intra to BRA lines
- 0 \* ESA - basic call set-up with either stimulus or functional  
0 signalling is provided.
- 0 \* Packet handler service during ESA can optionally be provided.

0 Primary Rate Access (PRA) is not part of the RCCI program. Noth-  
0 ing in the RCCI architecture would preclude the addition of PRA  
0 at a later date. The PRA links can be homed to the host.

0 Several software enhancements to the RCCI were implemented in  
0 BCS-31. No reconfiguration nor additional hardware is required  
0 for these capabilities. The following list summarizes these  
0 BCS-31 enhancements:

- 0 \* software added to have RCCI recognize and handle ISDN termi-  
0 nals and nodes while in ESA.

0

0  
0 RELEASE 28.01  
0 93 12 03

- 0 \* software added to have CC download ISDN terminal information  
0 to RCCI so that it is prepared to handle ISDN calls while in  
0 ESA mode.
  - 0 \* capability to intraswitch ISDN BRA calls on RCCI.
  - 0 \* support for Dual RCC with ISDN (DRCCI) during ESA or non-ESA  
0 conditions and trunks from RCCI during ESA. (Either one or  
0 both RSCs in DRCCI may support ISDN loops.)
  - 0 \* provides RCCI support of LCME and support for AMI U-loop  
0 linecard and 2B1Q ISDN U-loop linecard.
  - 0 \* provides RCCI support of Digital Test Access (DTA).
- 0 Refer to Figure 1 for general ISDN architecture of the RCCI.

0 7.1 HARDWARE PROVISIONING

0

0 7.1.1 HARDWARE USAGE RESTRICTIONS

0

0 In addition to RCC base functionality, the RCCI will support the  
0 following to provide ISDN functionality:

0 \* The collection of both D and concentrated B channels from  
0 LCMI/LCME via DS-30A ports.

0 \* Provisioning of the front end Q.931 processing of D-Channels  
0 in ISP.

0 \* Routing the D-Channels to the D-Channel Handler.

0 \* Routing the Bd and Bb packet data to the P-side located  
0 packet handler via intraswitched C-side channels or to host  
0 located packet handler via C-side host umbilicals.

0 \* Routing switched B channels, if host destined via host  
0 umbilicals or if not via intraswitching.

0 \* handling all digit collection for CC.

0 \* physically terminating DCH via DS-1 slots on P-side.

0 Functions provided by the D-Channel Handler include:

0 - terminates signaling frames and routes them to ISP.

0 - statistically multiplexes packet frames and sends them to  
0 the packet handler (stat. mux ratio up to 64:1).

0 - reflects user to user loop around frames back towards  
0 user.

0 The DMS-100 Packet Handler can be co-located with the RCCI or co-  
0 located at the host DMS-100. The physical location of the Packet  
0 Handler is largely a tradeoff of ESA functionality and system

0

0 RELEASE 28.01  
0 93 12 03

0 cost. Links to the Packet Handler can be via one of the follow-  
0 ing:

- 0 \* P-side links off host XPM (not routed via network)
- 0 \* nailed up network connections terminating via DTC/DTCIs.
- 0 \* P-side links off RCCI.

0 The host XPM can be a LTC, LTCI, LGC or LGCI. The host XPM has the  
0 following capabilities:

- 0 \* terminates DS-1 umbilicals from RCCI and switches them  
0 through to the network (non-concentrating).
- 0 \* optionally can terminate LCMs directly. The host LGC/LTC need  
0 NOT be upgraded to a LGCI/LTCI unless it supports a separate  
0 LCME/LCMI in addition to the RCCI.
- 0 \* must be LTC or LTCI if there are trunks off of the RCCI.

0 The DS-1 umbilical for the RCCI must support 64Kbps clear chan-  
0 nels. The RCCI host umbilical restrictions are essentially the  
0 same as those for the RSC. The maximum distance is 100 miles. The  
0 intervening transmission network may be whatever the operating  
0 company chooses (e.g. copper, fiber, digital radio, etc.). Extended  
0 Super Frame format and Bipolar Coding with 8 Zeros Suppression  
0 (B8ZS) are required to support 64K clear channels.

0 The NT6X45 circuit pack requires new firmware to support 64Kbps  
0 clear channels to the host. This is provided by the NT6X45BC  
0 pack.

0 The RCCI is limited to the use of one Universal Tone Receiver  
0 (UTR) only when the CLASS Modem Resource card is required. Dual  
0 UTRs can be supported if that pack is not required.

0 If circuit pack NT6X78-- (CLASS Modem Resource) is present, a max-  
0 imum of ten NT6X50AB DS-1 cards can be supported, thereby limit-  
0 ing C-side and P-side to a maximum of 20 DS-1 ports in a RCCI.

0 The Remote Maintenance Module (RMM) datafill will be identical to  
0 the current RCC. Ports 0 and 1 will be reserved for RMM use.

0 The LCME does not support the AMI U-loop linecard nor coin lines  
0 at this time.

0 The 2B1Q requires the Multiline Test Unit (MTU) for the line test  
0 function. If 2B1Q lines home on the RCCI, the RMM must be

0 RELEASE 28.01  
0 93 12 03  
0

0 equipped with an MTU pair (NT2X10BA/NT2X11BA). Refer to ECM-389  
0 for details.

0 Extended Super Frame (ESF) must be used when the Packet Handler  
0 is host located or when a high percentage of the circuit switched  
0 data traffic is host bound.

0 If this section is inapplicable or the information is unavail-  
0 able, use one of the following:

0 Not applicable.

0 This information is unavailable at this time.

#### 0 7.1.2 HARDWARE DEPENDENCIES

0  
0 The RCCI makes use of two new circuit packs developed for the  
0 CPCI; the NTB02AA D-Channel Handler and the NTB01AA ISDN Signal-  
0 ing Pre-Processor. The DCH will be mounted in DS-1 card slots and  
0 the ISP will utilize a spare slot on the RCC shelf (slot 16).  
0 Free DS-1 slots must be available to accept the provisionable DCH  
0 packs, with a minimum of two and an anticipated maximum of ten  
0 (nine active and one spare).

0 The Frame Supervisory Panel must supply a combined A/B power feed  
0 (C power) for use by the DCH packs. There are also other wiring  
0 changes to the frame required to distribute the C power and to  
0 provide ISP/DCH signal interconnection.

0 Specific varieties of common control circuit packs must be used  
0 to minimize the current demand placed on the central power con-  
0 verter. Refer to the Engineering Manual sections for specific  
0 packs.

0 RCCI XPM Plus modules must be equipped with the NTB01AB Enhanced  
0 ISDN Signal Pre-Processor. The NTB01AB is part of the NT6X12DE  
0 and NT6X12ZE kits.

0

0

0 RELEASE 28.01  
0 93 12 03

0 7.1.3 PROVISIONING CONSIDERATIONS

0  
0 The hardware design approach taken for the RCCI is to retrofit  
0 the existing RSC equipment with D-Channel Handler capability. The  
0 basic design changes which must be made to provide ISDN BRA on  
0 the RCCI are:

- 0 \* Application of frame level wiring and FSP modifications.
- 0 \* Installation of ISDN Signalling Pre-Processor (ISP) CP  
0 (NTBX01AA).
- 0 \* Installation of a provisionable number of D-Channel Handler  
0 (DCH) CPs (NTBX02AA)
- 0 \* Change C-side DS-1 cards to clear channel (NT6X50AB)
- 0 \* Change P-side DS-1 cards to clear channel (NT6X50AB) for P-  
0 Side Packet Handler connection (if used)
- 0 \* Add LCMI/LCME

0 LCMI/LCME Provisioning

0  
0 Provisioning information for the LCMI and LCME has been provided  
0 in ECM616. The LCMI or LCME used for the RCCI will be provisioned  
0 per the rules published in that ECM.

0 The C-side and P-side ports for the RCCI must be provisioned  
0 based on traffic considerations. Refer to ECM497 for port provi-  
0 sioning guidelines, and then configure the required equipment per  
0 the Engineering Manual. The information in the RCCI Provisioning  
0 section provides generic rules for provisioning an RCCI. Specific  
0 configuration will be based on the office configuration and re-  
0 quirements.

0  
0 RELEASE 28.01  
0 93 12 03

## 0 RCCI Provisioning

0  
0 The NT6X1022 Product Change kit provides the capability to up-  
0 grade an existing RCC with NT6X12CA packfill to RCCI (with  
0 NT6X12AD). In order to apply this kit, the existing RCC must  
0 first be brought to NT6X12CA packfill level. This is accomplished  
0 using existing kits as described in ECM-618. The NT6X12CA RCC is  
0 converted to an RCCI by applying Product Change kit NT6X1022.  
0 This kit provides materials and circuit packs required for the  
0 RCCI and also provides instructions for using some of the circuit  
0 packs from the existing RCC in the new RCCI.

0 When this conversion is made, installers will move traffic from  
0 the existing RCC to a temporary RCC (supplied by Installation)  
0 and will then convert the RCC using the NT6X1022 kit. The FSP and  
0 ISDN Remote Controller Array shelves for the RCCI are included in  
0 the kit. After they have been mounted, existing circuit packs  
0 from the RCC will be relocated as follows:

| 0 CP PEC   | RCC Slot | Action             | RCCI Slot |
|------------|----------|--------------------|-----------|
| 0 -----    | -----    | -----              | -----     |
| 0 NT6X47AB | 11       | Move to            | 11        |
| 0 NT6X46BA | 12       | Move to            | 12        |
| 0 NT6X44AA | 15       | Move to            | 15        |
| 0 NT6X92BB | 16       | Move to            | 14        |
| 0 NT6X69AB | 17       | Move to            | 17        |
| 0 NT6X72AA | 19       | Return to customer |           |
| 0 NT0X50AA | 23       | Move to            | 24        |

0 Additional required circuit packs and mounting locations are pro-  
0 vided as part of the kit. All provisionable NT6X50AAs on the RCC  
0 must be replaced with NT6X50ABs for RCCI applications. Refer to  
0 the Engineering Manual insert for details of NT6X1022 contents  
0 and mounting locations.

0 RCCI packfill NT6X12DC is introduced as the replacement for  
0 NT6X12DA for all new RCCI orders. When this packfill is applied,  
0 the slots where the NT6X69-- (slot 17), NT6X46-- (slot 12) and  
0 NT6X47-- (slots 10 and 11) packs mount become provisionable. This  
0 allows the latest versions of these packs to be provided. Refer  
0 to the Engineering Manual section for NT6X10AD for details.

0 If there is an LCME subtending the RCCI, NT6X46BB circuit packs  
0 must be provided with the NT6X12DC packfill. Existing NT6X46BA

0 RELEASE 28.01  
0 93 12 03

0 packs may be used if there is no LCME subtending but are not to  
0 be provided for new orders.

0 Product Change kit NT6X12ZB allows an existing NT6X12DA packfill  
0 to be upgraded to NT6X12DC in the field. This kit makes slots  
0 10,11,12 and 17 on the RCCI shelves provisionable. Refer to the  
0 Engineering Manual section for NT6X10AD for provisioning details.

0 Refer to the Engineering Manual for RCCI (NT6X10AD) provisioning  
0 rules.

0 Refer to ECM 282 for details of RSC engineering. The ISDN RSC  
0 will use the same equipment as the standard RSC except as de-  
0 scribed above.

0 Engineering for the RCCI must take several factors into account:

- 0 \* number of C-side ports
- 0 \* number of P-side ports and slots (DS-30A and DS-1)
- 0 \* number of DS-1 slots (incl. DCH)
- 0 \* Speech Bus bandwidth
- 0 \* MP, SP and ISP real time

0 Refer to the Engineering Manual section for provisioning informa-  
0 tion.

0 For the RCCI application, a new Frame Supervisory Panel (FSP) is  
0 required to supply a "C Power Feed" for use by D-Channel Han-  
0 dlers. This FSP is the NT0X28EC, which is Always Provided on the  
0 RCEI frame.

0 The RCCI has 20 accessible P-side ports shared between DS-30A,  
0 DS-1 and optional PH interface. DCH use 1 P-side port and 1 DS-1  
0 slot per DCH. The basic rules are:

0 # DS-30A ports + # DS-1 ports + # DCH <= 19 (excl. RMM)

0 # DS-1 slots <= 9 (with each DCH using one slot)

0 Due to power limitations, use of NT6X78-- CLASS CMR will add  
0 the following rule:

0 DS-1 cards (C-side) + DS-1 cards (P-side) <= 10 maximum

0 D-channels are multiplexed 4:1 and together with Bd and Bb links  
0 destined for the PH (if PH interface is from the P-side) are con-

0 RELEASE 28.01  
0 93 12 03

0 nected to the P-side using the intra switching capability of the  
0 RCCI.

0 Each DCH occupies a single P-side port and consumes one P-side  
0 DS-1 slot on the RCCI. The number of DCHs required depends on the  
0 number of D terminals per loop, user packet throughput on each  
0 D-channel and the stat mux ratio used in the DCH.

0 Refer to ECM465 and ECM497 for DCH and link provisioning informa-  
0 tion.

0 Each provisioned DCH reduces the number of available P-side DS-1  
0 slots by one.

0 The number of LCMIs that can be supported by the available P-side  
0 DS-30A ports will depend on the number of ISDN loops per LCMI,  
0 the number of provisioned B packet channels and circuit switched  
0 B channel traffic levels.

#### 0 RCEI Labels

0  
0 The following labels should be provisioned for all RCEI applica-  
0 tions:

0 RCEI FSP Shelf labels: Order one of each P0715228 and  
0 P0715229

0 RCEI PDC Frame labels: Order one of each P0715232, P0715233  
0 and P0715234

0 RCEI FSP Frame labels: Order one of each P0715235 and  
0 P0715236

#### 0 D-Channel Handler Provisioning

0  
0 The 16Kbps D-channels from each ISDN line are time division mul-  
0 tiplexed (TDM) 4:1 by the LCMI and are presented to the RCCI as a

0 RELEASE 28.01  
0 93 12 03

0 single 64Kbps channel. These channels consume capacity on the  
0 DS-30A links from the LCMI.

0 At the DCH, D-channels having a "Service Access Point Identifier"  
0 (SAPI) indicating packet data are statistically multiplexed and  
0 routed on DS-1 links to the PH. Messages with SAPI 0 frames are  
0 routed to the ISP. Each DCH has 32 channels which are used as  
0 follows:

0 1 for messaging to ISP  
0 X for incoming 4:1 TDM D-channels  
0 Y for outgoing stat mux'd packet data (Bd)

0 If there is no Bd, then 31 channels can be used for multiplexed  
0 (mux'd) D-channels, meaning a D-Channel Handler can support a  
0 maximum of 124 lines. Typically, a DCH will support about 108 D-  
0 channels.

0 Refer to ECM 616 for information regarding Packet Handler provi-  
0 sioning.

#### 0 7.1.4 OFFICE LAYOUT INFORMATION

0  
0 ISDN Packet Services on a RCCI are the same as those on a host  
0 LTCI, making use of the same Packet Handler (PH) at the host. If  
0 ESA is needed, either a complete remote PH or a remote access  
0 module may be deployed. If the availability benefits afforded in  
0 ESA are not required, the RCCI can use the PH deployed at the  
0 host. There are three ways the RCCI can be linked to the host PH  
0 for provisioned packet data services:

- 0 \* direct P-side DS-1 port off RCCI
- 0 \* nailed up via host umbilical but looped back in host XPM and  
0 routed out on DS-1 links to PH
- 0 \* nailed up via host umbilical and host network

0 Remote deployment of a DMS-100 Packet Handler at the remote lo-  
0 cation maximizes the remote's ESA functionality but a more cost  
0 effective option is to deploy only a remote Access Module (AM).

0 RELEASE 28.01  
0 93 12 03

0 The remote AM is recommended only under the following circum-  
0 stances:

- 0 \* majority of packet traffic is local to the remote.
- 0 \* ESA is required for packet services.
- 0 \* reduced connectivity in ESA is acceptable.

0 During ESA, the Access Module will maintain all calls local to  
0 that AM and will allow the set-up of new calls local to that AM,  
0 provided that the link to the AM remains intact.

#### 0 7.1.5 TRAFFIC TABLES

##### 0 \* RCCI Characteristics

0 RCCI traffic information is provided in ECM465 and ECM497 and  
0 should be referenced for all applications of the RCCI.

##### 0 \* LCMI Characteristics

0 The LCMI supports up to a maximum of 160 AMI U-linecards or  
0 192 S/T-linecards from a single LCMI. The LCMI also supports  
0 up to eighteen DS-30As for connection to the RCCI and these  
0 links can carry both B- and D-channel traffic. The LCMI will  
0 support eight line drawers containing a maximum of 48 Type  
0 A,B or C linecards OR 24 Type D or S/T linecards OR 20  
0 0-linecards per drawer. Different line types can be mixed  
0 within the same physical drawer as long as ISDN line types  
0 are not mixed with other line types within the same logical  
0 drawer.

##### 0 \* D-channel Characteristics

0 The D-Channel Handler function is an integrated part of the  
0 RCCI, handling the termination of D-channel messages from BRA  
0 terminals. The RCCI supports a maximum of nine (8 active + 1  
0 hot spare) provisionable DCHs. Each DCH typically supports  
0 108 D-channels. The D-channels are multiplexed 4:1 onto DS-0  
0 channels on these links. A minimum of two DS-30A links are  
0 required per LCMI.

0

0 7.2 PRODUCT/SYSTEM SPECIFICATION

0

0 7.2.1 PHYSICAL CHARACTERISTICS

0

0 7.2.2 CHARACTERISTICS

0  
0 The Remote Controller Equipment ISDN Frame physical specifica-  
0 tions are as follows:

0

0 - RCE Frame ISDN (RCEI)

0  
0 Input Voltage..... 48Vdc  
0 Power Consumption..... watts  
0 Current Drain.....23 Amps D.C. Fully Equipped  
0 Thermal Dissipation..... BTU/hr  
0 Fusing Requirements.....3 each 20 amp Fuses

0 MECHANICAL DIMENSIONS

0 Weight \_\_\_\_\_ Depth \_\_\_\_\_

0

0

0 7.2.3 EMI/EARTHQUAKE INFORMATION

0  
0 Refer to ECM-125 For RSCI EMI requirements.

0 7.2.4 SPARING INFORMATION

0  
0 Standard sparing algorithms shall apply.

0 7.3 SOFTWARE PROVISIONING

0

0 7.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 The CC memory requirements for the RCCI are identical to those  
0 already established for the LGCI.

0 7.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 The base software for the RCCI will include support for eighteen  
0 (18) LCMI C-side links, messaging, DCH maintenance and processing  
0 via the ISP and intraswitching for ISDN lines.

0 The following software packages will be required in addition to  
0 the base RSC software:

0 NTX750AB - ISDN Base Package

0  
0 RELEASE 28.01  
0 93 12 03

0 NTXJ00AA - ISDN on RSC (includes BCS-31 enhancements)

0 NTXJ00AA has been replaced by NTXJ00AB effective BCS-34 and  
0 later.

0 NTXJ00AB - ISDN on RSC (Replaces NTXJ00AB Effective in  
0 BCS-34)

0 Optional Package:

0 NTX143AA includes Extended Super Frame capability

0 NTXR34AA - XPM Plus (Product Life Upgrade) Basic(RATE CHANGE  
0 PENDING)

0 Note:

0 - NTRX34AA is MD'ed effect BCS-35 and replaced by  
0 NTRX34AB.

0 - The above package is optional for Non-XPM Plus jobs  
0 and always required for XPM Plus Jobs.

0 7.3.3 MEMORY PROVISIONING

0  
0 Not applicable.

0 7.4 REAL TIME IMPACT

0 Refer to ECM 497 for real time calculations

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 8.0 Building Block/Detail RSC-SONET

0 The RSCS is a cabinetized Remote Switching Center based on the Remote  
0 Cluster Controller 2 (RCC2), a new controller with more P-side ports  
0 than the standard RCC. The RCC2 shelf mounts in the CRSC cabinet. The  
0 RCC2 will replace the RCC and the RCCI for new systems (BCS-33).

0 RCC2 key characteristics

- 0 - 54 P-Side ports (instead of 20) which can be a mix of DS1s,  
0 DS30As and DCHs. A maximum of 46 DS1s, 32 DS30As or 10 DCHs  
0 may be provided in various combinations. Restrictions on  
0 mixing these interfaces will be detailed in this ECM.
- 0 - Handles ISDN 2B1Q and POTS traffic

0 The RCC2 shelf utilizes a Quad Carrier circuit pack which mounts four  
0 DS1 "packlets". Each packlet provides two DS1 interfaces so each slot  
0 with a Quad Carrier provisioned may have up to eight DS1s.

0 The RSCS may be deployed in single or multi- cabinet configurations.  
0 The single cabinet configuration consists of the CRSC cabinet powered  
0 by the office power board. The multi-cabinet configuration may con-  
0 sist of:

- 0 - one or two CRSC Cabinets (Mono RCC2 or Dual RCC2)
- 0 - CPDC, CMIS and CMSS Cabinets as needed
- 0 - One CEXT cabinet per two CRSC cabinets
- 0 - up to 5 Line Cabinets (CLCEs) (in Mono RCC2)

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 The Remote Switching Center - SONET (RSCS) shall be introduced in two  
0 (2) phases. The plan announced earlier has been changed to combine  
0 Phases 2 and 3. The current plan is as follows:

0 - Phase I (BCS-33):

- 0 o Single cabinet configuration with a maximum of 480
- 0 lines mounted in the integral LCME (2B1Q, POTS, MDC).
- 0 Standard RMM provides maintenance and service circuits.
- 0 Supports all current RSC and RSCI features.
- 0 Maximum of 16 C-side and 52 P-side ports.
- 0 o Multi-cabinet configuration with CPDC and provisionable
- 0 CEXT, which extends the capabilities of the CRSC by
- 0 providing increased mounting flexibility. A CMIS
- 0 may be provisioned for miscellaneous equipment.
- 0 Additional lines can be housed in CLCEs.
- 0 o P-side Interlinks for Dual RSCS.
- 0 o OPM/RLCM off RCC2
- 0 - maximum of seven OPM+RLCM equipped with ESA

0 Notes: If Coin Lines are required an LCM must be  
0 provisioned to support them. This LCM can  
0 be in a separate CLCE/LCE or in the CRSC  
0 with a provisionable LCM.

0 This ECM covers provisioning of the CRSC  
0 and CEXT only. Refer to ECM-600 for  
0 provisioning of CLCE, ECM-655 for CMIS,  
0 and ECM-631 for CPDC provisioning. Provide  
0 NTRX49AA Cabinetized Miscellaneous Spare  
0 Storage for spares storage in RSC-S  
0 applications.

0 - Phase I Enhancements (BCS-34)

- 0 o SMSR support
- 0 o Downloadable firmware support for NTMX77AA

0 - Phase II (Schedule To Be Determined)

- 0 o Cabinetized LCME (CLMI)
- 0 o RLCM to RSCS upgrades (in Conversions program)
- 0 o RSC to RSCS upgrades (in Conversions program)
- 0 o full fiberization (OC-3 interface card)
- 0 o Fiber multiplex interface (STS-1) (BCS-38)
- 0 o Cabinetized Direct SONET Interface (CDSI) (BCS-38)
- 0 o Development of Fiber Interface Module (FIM) and RMM2

0 - Other Developments

- 0 o Products and services for International Markets

0  
0 RELEASE 28.01  
0 93 12 03

0 Phase II developments are being Gated separately and the provisioning  
0 and configuration rules for SMS-R are included herein.

0 The SONET RSC default color will be FiberWorld Grey. Codes for provid-  
0 ing DMS brown equipment are included herein.

0 Extended Distance Capability

0 A RSC-SONET can be upgraded to operate beyond the present 100 mile  
0 (150 mile in Canada) distance limit by changing the messaging protocol  
0 used by the remote and the host. These modifications increase the al-  
0 lowable signal delay to 6.5 milliseconds (one way), which provides the  
0 capability of about 500 miles from the host. This is useful both for  
0 remotes situated more than 100 miles from the host and for fiber ring  
0 applications where the transmission delay is increased without in-  
0 creasing the actual distance. The increase is provided by changing the  
0 DMSX messaging protocol to HDLC. The Extended Distance Capability  
0 (EDC) is intended for use over any physical transmission medium, pro-  
0 vided that no existing RSC-S specification (for example, jitter or Bit  
0 Error Rate) is violated. The RSC-S with EDC must be hosted by an XPM  
0 PLUS-equipped peripheral that is equipped with the HDLC messaging  
0 packs (NTMX76AA).

0 RSC-SONET EDC is introduced for domestic applications in BCS-35 and  
0 international applications in BCS-36.

0 Cabinetized RSC with Provisionable LCM

0 The LCM in CRSC project introduces a version of the Cabinetized Remote  
0 Switching Center (CRSC) which has the originally-equipped LCME re-  
0 placed by one LCM. This change increases the number of POTS lines that  
0 may be equipped in a single cabinet to 640 and provides for COIN/ANI  
0 support in single cabinet configurations. Connectors for line cabling  
0 have been changed to accomodate the additional lines. All other provi-  
0 sioning information for the CRSC remains unchanged. Refer to the Engi-  
0 neering Manual sections for details.

0 8.1 HARDWARE PROVISIONING

0

0 8.1.1 HARDWARE USAGE RESTRICTIONS

0

0 RSCS Hardware Usage Restrictions are as follows:

- 0 - The Maximum Cable Distance Between the RCC2 Shelf located  
0 on the CRSC Cabinet and the EXT shelf located on the CEXT  
0 Cabinet is 20 feet.
- 0 - The maximum distance from the host to the farthest remote  
0 off the RCC2 when using DMSX messaging (NTZZ12XA packfill  
0 with NT6X69 messaging CP) is 100 miles for U.S. applications  
0 and 150 miles for Canadian applications. The RCC2 shelf may  
0 be equipped for HDLC messaging (NTZZ12ZA packfill with  
0 NTMX76AA messaging CP) to achieve greater distances. This  
0 configuration has the following additional restrictions:
  - 0 o The EDC RSC-S is limited to 5 milliseconds  
0 transmission delay to its host XPM PLUS. Together  
0 with switching delays, this limitation gives up to  
0 6.5 ms delay from the subscriber line to the host  
0 network.
  - 0 o Bit Error Rate (BER) on the host link should be  
0 better than  $(10 \exp -9)$  for data service and  
0  $(10 \exp -6)$  for voice only service.
  - 0 o Only B8ZC DS-1 protocol is supported. ZCS is not  
0 supported.
  - 0 o Firmware patching for the NTMX76 is not  
0 supported.
  - 0 o To improve voice quality, a 6 db loss is inserted  
0 in the remote line card on each connection going  
0 through the host to offset echo.

0

0 RELEASE 28.01  
0 93 12 03

- 0 - Max 10 LCMS and 2 LCMEs are provisionable on the P-Side  
0 links of the RCC2. In combination, no more than ten (10)  
0 LCMS and LCMEs may be provided (For ex.:2 LCMEs + 8 LCMS).  
0 If ten (10) LCMS are provided, no RMMs can be used due to  
0 the limits defined in the Software Restrictions section.  
0 LCMS in RLCM/OPMS remoted from the RCC2 must be included  
0 in the ten maximum. Refer to Software Restrictions section  
0 for details.
- 0 - CDO or PBX trunks may be assigned only on the first  
0 20 P-Side T1 links on RCC2. These links are physically  
0 located in slots 12:0-3, 16:0-3 and 14:0-1. However, a  
0 maximum of ten DS1s for CDO/PBX trunks or SMS-R Special  
0 connections are currently supported.
- 0 - Connection to the Packet Handler is from the RCC2  
0 C-side as part of the host links and then a host  
0 XPM. Rules in this ECM support this configuration  
0 only. Support for P-side connection will be added  
0 at a later date.
- 0 - The RCC2 P-Side Ports may be allocated as follows:
  - 0 o The first two interlinks in a Dual configuration  
0 must be Port 0 (Slot 12:0) and Port 8 (Slot 16:0).  
0 Subsequent interlinks may use any DS-1 ports and  
0 do not require dynamic trunking capability.
  - 0 o DS-1s are allowed on links 0-21 and 24-47.
  - 0 o DS-30A Links may be defined on Links 22 thru 53,  
0 where links 22 and 23 are reserved for the Remote  
0 Maintenance Module (RMM).
  - 0 o DS-30A Links are to be assigned beginning with  
0 port 53 and descending.
  - 0 o DS1 Trunking to CDO/PBX facilities and SMS-R  
0 Special connections is limited to a total of  
0 10 DS1s due to a limited number of Call Header  
0 Blocks (CHBs).
  - 0 o A maximum of nine SMS-R modules may be hosted by a  
0 single RCC2 shelf. Each SMS-R may home a maximum of  
0 six Remote Concentrator Units (RCSs/SLC-96s). An RCC2  
0 with this configuration would not be able to support  
0 anything else due to XPM nodal limits.

0 RELEASE 28.01  
0 93 12 03

0  
0 o When the RCC2 shelf is NOT equipped with an EISP pack  
0 (requires BCS-35 or higher), the NTMX8947 strapping  
0 kit must be applied. If the EISP is subsequently added,  
0 the straps must be removed.

#### 0 RCC2 and EXT Slot to P-Side DS1 Port Assignments

| Port # | Shelf                                | Slot    | Usable for Dynamic Trunk? |
|--------|--------------------------------------|---------|---------------------------|
| -----  | -----                                | ----    | -----                     |
| 0-1    | RCC2                                 | 12:0    | Yes                       |
| 2-3    | RCC2                                 | 12:1    | Yes                       |
| 4-5    | RCC2                                 | 12:2    | Yes                       |
| 6-7    | RCC2                                 | 12:3    | Yes                       |
| 8-9    | RCC2                                 | 16:0    | Yes                       |
| 10-11  | RCC2                                 | 16:1    | Yes                       |
| 12-13  | RCC2                                 | 16:2    | Yes                       |
| 14-15  | RCC2                                 | 16:3    | Yes                       |
| 16-17  | RCC2                                 | 14:0    | Yes                       |
| 18-19  | RCC2                                 | 14:1    | Yes                       |
| 20-21  | RCC2                                 | 14:2    | No                        |
| 22-23  | Reserved for RMM. No DS1 assignment. |         |                           |
| 24-25  | EXT                                  | 4(23):0 | No                        |
| 26-27  | EXT                                  | 4(23):1 | No                        |
| 28-29  | EXT                                  | 4(23):2 | No                        |
| 30-31  | EXT                                  | 4(23):3 | No                        |
| 32-33  | EXT                                  | 6(21):0 | No                        |
| 34-35  | EXT                                  | 6(21):1 | No                        |
| 36-37  | EXT                                  | 6(21):2 | No                        |
| 38-39  | EXT                                  | 6(21):3 | No                        |
| 40-41  | EXT                                  | 8(19):0 | No                        |
| 42-43  | EXT                                  | 8(19):1 | No                        |
| 44-45  | EXT                                  | 8(19):2 | No                        |
| 46-47  | EXT                                  | 8(19):3 | No                        |

0 Note: Numbers in parenthesis are for the  
0 right half of the Extension shelf.  
0 Note: Check Table H for port interactions.  
0 Use of some DS1 ports disables DS30A ports.

#### 0 C-Side Port Assignments

0 C-side interfaces are provided by the packlets in slots 9 and 19  
0 on the RCC2 shelf. Specific port assignments are as follows:

RELEASE 28.01  
93 12 03

| slot | packlet | ports | slot | packlet | ports |
|------|---------|-------|------|---------|-------|
| 9    | : 0     | 0,1   | 19   | : 0     | 2,3   |
| 9    | : 1     | 4,5   | 19   | : 1     | 6,7   |
| 9    | : 2     | 8,9   | 19   | : 2     | 10,11 |
| 9    | : 3     | 12,13 | 19   | : 3     | 14,15 |

### DCH Port Assignments

Assignment of a D Channel Handler to a slot uses a specific port for the DCH traffic. This slot/port relationship is as follows: (Numbers in parenthesis are for the right side of the EXT shelf.)

| DCH shelf/slot | Port used | DCH shelf/slot | Port used |
|----------------|-----------|----------------|-----------|
| RCC2/12        | 1         | EXT/7(20)      | 12        |
| RCC2/14        | 17        | EXT/8(19)      | 13        |
| RCC2/16        | 9         | EXT/4(23)      | 14        |
| EXT/3(24)      | 10        | EXT/6(21)      | 15        |
| EXT/5(22)      | 11        | EXT/9(18)      | 18        |

### DS-30A Port Assignments

Each NTMX74AA DS-30A Interface pack includes the capability of supporting all thirty-two available DS-30A interfaces. In the event of circuit pack failure, the surviving NTMX74AA will take over support of all thirty-two DS-30A ports. However, in normal operation, ports are distributed across both circuit packs as follows:

NTMX74AA in slot 13:

Ports 53,52,49,48,45,44,41,40,37,36,33,32,29,28,25 and 24

NTMX74AA in slot 15:

Ports 51,50,47,46,43,42,39,38,35,34,31,30,27,26,23 and 22

### RMM Provisioning and Configuration

Due to limitations imposed by cabling through a bulkhead, the RMMs in RSC-SONET applications must conform to specific restrictions. The standard RMM layout described in the provisioning section meets these restrictions. Customized RMM layouts must configure slots 3-10 with the allowed packs. Slots 11-16 can mount any provisionable RMM pack but all existing RMM circuit pack mounting rules in Section 14 of the Engineering Manual also apply to an RMM in an RSC-S application. Slots 3-6 can mount ONLY the packs shown below. Slots 7-10 can mount ONLY the packs shown,

0 RELEASE 28.01  
0 93 12 03

0 used for the indicated function ONLY. Any card requiring con-  
0 nection to the Distributing Frame must mount in slots 11-16.  
0 There is no mandatory requirement for any of these packs to be  
0 present but, if used, they must use the indicated positions.

0 The capability of provisioning RMM shelves in the CMIS provides  
0 options for RSC-S configurations. The first RMM at a RSC-S site  
0 will mount in the CRSC. Subsequent RMMs can mount either on the  
0 CEXT (if it is present) or on a CMIS. If office requirements dic-  
0 tate the need for a CEXT to mount DCHs or DS1 ports, the RMM  
0 shelf position provides the logical location for the second RMM.  
0 If the CEXT is not needed for capacity or if additional RMMs are  
0 needed, they can be mounted on a CMIS. Refer to ECM-655 for de-  
0 tails of provisioning RMM shelves on the CMIS.

0 The RMM in the CRSC is currently powered from an "A" feed. The  
0 RMM in the CEXT is powered from a "B" feed. An RMM in a CMIS may  
0 be configured as either "A" or "B" powered. If the telco requires  
0 two or more RMMs and wants them powered from different feeds but  
0 the office does not require a CEXT, the CMIS must be used and the  
0 powering requirement specified in a note so that Equipment Engi-  
0 neering can properly configure the power.

0 When provisioning a custom RMM layout, slots must be used as fol-  
0 lows:

| RMM SLOT | CIRCUIT PACK ALLOWED             |
|----------|----------------------------------|
| -----    | -----                            |
| 3        | NT2X10BA                         |
| 4        | NT2X11BA                         |
| 5        | NT0X10AA                         |
| 6        | NT3X09BA                         |
| 7        | NT2X90AD for MONTALK             |
| 8        | NT2X90AD for MONTACK             |
| 9        | NT2X90AD for VERIFICATION 90     |
| 10       | NT2X90AD for VERIFICATION 90     |
| 11       | FULLY PROVISIONABLE WITHIN RULES |
| 12       | FULLY PROVISIONABLE WITHIN RULES |
| 13       | FULLY PROVISIONABLE WITHIN RULES |
| 14       | FULLY PROVISIONABLE WITHIN RULES |
| 15       | FULLY PROVISIONABLE WITHIN RULES |
| 16       | FULLY PROVISIONABLE WITHIN RULES |

0 Internal cabling from the RMM to the bulkhead connects slots 5  
0 and 6 to connector C00 on the shelf 19 bulkhead, slots 11 and 12  
0 to C01, slots 13 and 14 to C02 and slots 15 and 16 to C03 (all on  
0 the shelf 19 bulkhead).

0 RELEASE 28.01  
0 93 12 03

0 The resistor networks associated with DCHs have been made an Al-  
0 ways Provided part of the RCC2 and CEXT shelves and no longer  
0 need to be provisioned. Rules for providing these resistor net-  
0 works have been removed from this document.

#### 0 8.1.2 HARDWARE DEPENDENCIES

0  
0 Not Applicable

#### 0 P AND C SIDE PORT REQUIREMENTS

0  
0 The RSC-S has a minimum of two and a maximum of sixteen DS-1  
0 ports to the host on its C-side. A maximum of fifty-four P-side  
0 ports may be provisioned, consisting of DS30A, DCH and DS-1  
0 interfaces in various combinations. Refer to ECM-497 for traffic  
0 provisioning information and to Table H in the Engineering Manual  
0 for physical assignment locations and valid interface mix data.

#### 0 DMS BUS PORT REQUIREMENTS

0  
0 The RSCS does not connect to the DMS Bus.

#### 0 CIRCUITS PER CARD

0  
0 The NTMX81AA packlet contains two DS-1 circuits.  
0 The NTMX74AA pack contains thirty-two DS30A ports.  
0 The NTMX87AA Quad Carrier mounts four packlets.

0 RELEASE 28.01  
0 93 12 03

## 0 DISCRIMINATION NUMBERING

0  
0 The following frame numbering procedure must be used in RSC-SONET  
0 offices:

## 0 LINE MODULE FRAME NUMBERING IN SONET RSC OFFICES

0 1) The frame numbering of an RSCS office must conform to  
0 a specific numbering scheme due to software tables that  
0 contain LCM/LCME information. The following rules should  
0 be observed when numbering these frames:

0 A) All types of frames in an office that contain  
0 an LCM or LCME must be uniquely numbered. For  
0 example, CRSC 00 and CLCE 00 cannot reside in  
0 the same office.

0 B) The frames in an office that contain line modules  
0 (whether configured or not) must be numbered  
0 according to their priority on the following list:

| 0 | NUMBERING |            |
|---|-----------|------------|
| 0 | PRIORITY  | FRAME TYPE |
| 0 | -----     |            |
| 0 | 1         | LCEI *     |
| 0 | 2         | LCE *      |
| 0 | 3         | CRSC       |
| 0 | 4         | CEXT       |
| 0 | 5         | CLMI *     |
| 0 | 6         | CLCE       |

0 \* May now be used but special consideration required.  
0 LCEI and CLMI require check of LTID availability.  
0 See Software Usage Restrictions section. LCE requires  
0 mix of frames and cabinets using Vertical Power option.

0 C) On a conversion of any office to an RSCS, existing  
0 frames should not be renumbered (hence their higher  
0 priority in the above list). No frames should be  
0 renumbered on an extension of an existing RSCS.

## 0 EXAMPLES

0 RELEASE 28.01  
0 93 12 03

0 Example of initial RSCS with (2) CRSC,(1) CEXT  
0 and (3) CLCE:

0 CRSC 00  
0 CRSC 01  
0 CEXT 02  
0 CLCE 03  
0 CLCE 04  
0 CLCE 05

### 0 8.1.3 PROVISIONING CONSIDERATIONS

0 The RSCS may be deployed in a Single Cabinet Configuration by  
0 providing the CRSC only and powering it from the Power Board. A  
0 kit containing power cable, filter adapters, straps, etc. must be  
0 provisioned for this application to equip the CRSC. This kit is  
0 NTMX8943.

0 The RSCS also may be provisioned in a Multi-Cabinet Configuration  
0 consisting of the CRSC, CPDC, CLCE, CMIS, MCSS, and CEXT Cabi-  
0 nets.

0 While the preferred configuration for RSC-S offices is  
0 cabinetized, it is now permissible to mix LCEs, PDC/RMEs, MIS and  
0 CPCE frames with the CRSC and CEXT. The CRSC and CEXT will re-  
0 quire an external power filter module kit (NTMX8943) when using a  
0 7' frame (i.e. PDC or RME) for power. Cables for connecting  
0 lines in frames to the CRSC are available in the Cable Assembly  
0 drawings. Refer to the appropriate CA drawing for details.

0 RELEASE 28.01  
0 93 12 03  
0

0 If the RSC-S requires Extended Distance Capability, it may be  
0 equipped with the EDC packfill (NTZZ12ZA), which includes the  
0 HDLC messaging circuit pack (NTMX76AA). The host XPM for a RSC-S  
0 with EDC must also be equipped for HDLC messaging (NTMX76 instead  
0 of NT6X69) and must utilize the Unified Processor (XPM PLUS). Re-  
0 fer to ECM-678 for details of provisioning XPM PLUS. The host DS1  
0 interfaces must be 64Kb clear channel (NT6X50AB). NTZZ12ZA in-  
0 cludes the EISP packs.

0 The RSC-S may also be equipped for Extended Distance Capability  
0 by using the NTZZ12XB packfill and provisioning the NTMX76AA  
0 packs. The EISP packs are provisionable with this packfill but  
0 must be present for all pre-BCS35 applications. The EISP packs  
0 become optional (based on ISDN support) in BCS-35. If EISP packs  
0 are NOT equipped, the NTMX8947 kit must be applied to properly  
0 strap the backplane.

#### 0 Cabinetized RSC with Provisionable LCM

0 This product is intended mainly for applications similar to the  
0 existing RLCM. The CRSC with LCM provides all the RLCM capabili-  
0 ties and adds remote off remote and remote CDO/PBX trunking capa-  
0 bilities.

#### 0 Building Block Provisioning

0 The NTZZ46CA CRSC with LCM Building Block provides the NTMX89CA  
0 cabinet and the equipment required for base applications in gray.  
0 The labels and minimum host links are included in the Building  
0 Block. The LCM module, line drawers, line cards, ringing genera-  
0 tors, RMM service circuits, DCHs, P-side interfaces and addi-  
0 tional host links are provisioned based on office requirements.  
0 Refer to the NTZZ46CA Engineering Manual section for additional  
0 details.

0 The NTZZ46DA CRSC with LCM Building Block provides the NTMX89CA  
0 cabinet and the equipment required for base applications in  
0 brown. The labels and minimum host links are included in the  
0 Building Block. The LCM module, line drawers, line cards, ringing  
0 generators, RMM service circuits, DCHs, P-side interfaces and ad-  
0 ditional host links are provisioned based on office requirements.  
0 Refer to the NTZZ46DA Engineering Manual section for additional  
0 details.

## 0 Remote Cluster Controller 2 (RCC2)

0  
0 Provisioning the RCC2 is described below in terms of Always Pro-  
0 vided (AP) CPs and Provisionable (PROV) CPs.

0 Slots 12, 14 and 16 may be equipped with a D-Channel Handler  
0 (BX02AA) or PCM Quad Carrier CP (MX87AA). The MX87AA may be  
0 equipped with up to four "packlets" which may be dual DS-1  
0 (MX81AA) or a filler plate (MX83AA). An additional packlet type  
0 for International support is planned for a future phase.

0 Unequipped provisionable slots (5,7,12,14,16,22,23) must be  
0 equipped with filler plates.

RCC2 Unit 0 Physical Layout

RCC2: XXX  
UNIT: 1

0 RELEASE 28.01  
0 93 12 03

# 0 Provisioning Host Interface

0  
0 The C-Side interface is provided via up to sixteen DS1 links.  
0 These links provide up to 384 Channels for host traffic. The two  
0 Quad Carrier packs and packlets are Provisionable based on traf-  
0 fic requirements. Refer to the Engineering Manual section for de-  
0 tails.

0 The host peripheral module must be equipped with Common Circuit  
0 Pack Fills per BCS-33 standards. The host controller must be a  
0 LTC/LTCI if the RCC2 terminates CDO or PBX trunks and may be a  
0 LGC/LGCI if the RCC2 terminates lines only. The ISDN capability  
0 of LTCI and LGCI controllers is not required by the RCC2. The  
0 host peripheral must utilize clear channel DS-1s (NT6X50AB) in  
0 order to support ISDN connections to the Packet Handler via the  
0 host umbilical.

## 0 The Extension (EXT) Shelf

0  
0 The Extension Layout is as follows:

0

0 RELEASE 28.01  
0 93 12 03

0 Note: The Extension Shelf is actually two functional modules  
0 on a single card cage, where slots 1-13 constitute mod-  
0 ule zero and slots 14-26 make up module one.

0 Each module is further broken down into two logical  
0 units (0 & 1) which provide redundancy. Each module on  
0 the EXT shelf is provisioned independently. The left  
0 module is provisioned in support of the first RCC2  
0 shelf and the right module is provisioned to support  
0 the second RCC2 shelf.

0 Like slots 12, 14, and 16 on the RCC2 Shelf, the EXT  
0 shelf slots 4, 6, 8, 19, 21, and 23 may be equipped  
0 with a D-Channel Handler (BX02AA) or PCM Quad Carrier  
0 CP (MX87AA).

0 Provisionable slots not equipped with a circuit pack  
0 must be equipped with the NT0X50AA Filler Face Plate.

0 EXT Shelf Left Side Physical Layout

## EXTENSION SHELF LAYOUT

Provision the EXT shelf to increase the number of DS1s assignable on the RCC2 by a maximum of 24 or the number of D-Channel Handlers which may be assigned on the RSC-S to 10.

0  
0 RELEASE 28.01  
0 93 12 03

0 The following PECs and quantities are provisionable on the EXT:

| 0 Qty     | 0 Pack                                   |
|-----------|------------------------------------------|
| 0 ---     | 0 ----                                   |
| 0 0 to 3  | 0 Quad PCM Carrier (NTMX87AA)            |
| 0 0 to 12 | 0 Dual DS-1 Packlet (NTMX81AA)           |
| 0 0 to 12 | 0 Packlet Face Plate (NTMX83AA)          |
| 0 0 to 10 | 0 D-Channel Handler for ISDN (NTBX02AA)  |
| 0 0 to 10 | 0 Filler Face Plate (NT0X50AA) Per Side. |

## 0 P-Side Port Provisioning

0  
0 The RCC2 offers a maximum of 54 P-Side Ports for use with local  
0 and remote lines, trunking, DCHs and RMMs. The hardware require-  
0 ment to support the 54 ports is greater than the physical capac-  
0 ity of the RCC2 so the Extension (EXT) shelf was developed.

0 The RCC2 and EXT shelves are housed in different cabinets and  
0 linked via a cable limited to 20 feet in length. Provisioning the  
0 EXT Shelf enables the assignment of up to 46 DS-1 P-Side ports  
0 at a cost of DS-30A ports or up to 10 DCH Ports at a cost of  
0 DS-1 Ports.

0 Since RCC2 physical maximum (i.e. 54 p-side ports) is exceeded by  
0 the combined individual maximums, balancing the allocation of  
0 these ports must be performed to fit the combined individual max-  
0 imums into the shelf.

0 RELEASE 28.01  
0 93 12 03

## 0 TABLE H: RSC-SONET PROVISIONING AND CONFIGURATION TABLE

0  
0 Table Z1 has been renamed TABLE H (to avoid confusion with an-  
0 other TABLE Z) and incorporated into the Engineering Manual. Re-  
0 fer to Section EMA14-08-000 for RSC-SONET Provisioning and  
0 Configuration.

## 0 RSCS Service Circuits

0  
0 The RSCS can support up to two (2) Remote Maintenance Modules  
0 (RMM) within the CRSC and CEXT. Additional RMMs may be mounted in  
0 a CMIS. Refer to ECM-655 for details. Detailed below are the RMM  
0 Circuit Packs:

0 The following packs are required for all RMMs used with the RCC2:

## 0 NT6X13AB RMM Always Provided Circuit Packs

0 -----  
0 NT6X74AA - Control Card  
0 NT2X59AA - Group Codec  
0 NT2X06AA - 5V @ 40A Power Converter  
0 NT2X09AA - +-5V, +-12V @ 8A Power Converter

## 0 RMM Provision As Required CPs

0 -----  
0 NT2X90AD - INC/OG Test Trunk (Required For Metallic Testing)

0 In order for this CP to function it must be equipped with a Bal-  
0 ance Network. Provision either NT2X77AA/AB/AC/AD or NT2X80AA.

0 NT3X09BA - Remote Metallic Test Access  
0 -Required for MTU  
0 -Interfaces up to four LCMs or LCME  
0 -Contains eight test ports  
0 NT0X10AA - Scan (SC) Point Card  
0 -14 SC Points Per Card  
0 NT2X10BA/NT2X11BA - MTU  
0 NT2X57AA - Signal Distribution (SD) Card  
0 -14 SD Points Per Card

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 RMM Optional - Provision As Required CPs  
0 -----

0 NT3X04AA - AECO Local Test Board Interface

0 RSCS Subscriber Lines

0  
0 The RSCS supports POTS, MDC and ISDN subscriber lines via the Al-  
0 ways Provided LCME modules in the CRSC and CEXT, CLCE cabinets  
0 and LCE frames. LCMs must be provisioned if coin lines are re-  
0 quired. LCMes can support NT6X18 line card types only if they are  
0 not configured as high voltage lines (Coin,ANI,etc.).

0 Phase 1 limits ISDN modules to the CRSC and CEXT only. Ten (10)  
0 LCMs max are provisionable in five (5) CLCE cabinets or LCE  
0 frames for a Mono RSCS configuration (see Software Restrictions  
0 for a Dual RCC2) for Phase 1. All line card types with the excep-  
0 tion of coin lines are provisionable in the ISDN line drawer. The  
0 ISDN line card cannot be mounted in a POTS line drawer/LCM.

0 RSCS Miscellaneous Equipment

0  
0 Limitations placed on this equipment were not completed in time  
0 to make this release. Refer to ECM-655 for CMIS provisioning.

0 Provision the NTRX49AA per Telco requirements for Spare Card  
0 storage. Note: An NTMX87 must be provisioned as required to  
0 store spare DS1 packets.

0 8.1.4 OFFICE LAYOUT INFORMATION

0 RELEASE 28.01  
0 93 12 03

0 Either the CPDC or the PDC/RME may be used to power RSC-S  
0 lineups. The standalone CRSC configuration is available for sin-  
0 gle cabinet applications. The CPDC must be the first cabinet in  
0 any lineup it powers. Therefore, when providing a standalone  
0 CRSC in an office that will ultimately grow to require additional  
0 cabinets (CLCE, CEXT, etc.), space should be left for the CPDC to  
0 be the first cabinet in the lineup.

0 Fully cabinetized RSC-S lineups will not exceed eleven cabinets.  
0 As office configurations are determined, this restriction will be  
0 reviewed.

0 When using a PDC or RME frame to power a CRSC or CEXT, an ex-  
0 ternal power kit (NTMX8943) must be provided for each CRSC/CEXT  
0 cabinet.

0 CRSC and CEXT cabinets must be located so that the DS60 cables  
0 between them do not exceed twenty feet in length. Since one CEXT  
0 can support two CRSCs, in Dual configurations, each CRSC would  
0 need to be within 20 feet of the CEXT (assuming both CRSCs re-  
0 quire CEXT facilities).

0 The availability of power filter kits makes it possible to power  
0 two or more lineups from one CPDC, rather than using one CPDC per  
0 lineup. When using power filter kits (vertical power option),  
0 the number of CPDCs required is based on the number of circuit  
0 breakers required to power equipment, not the number of lineups.  
0 Vertical powering is to be used for all new RSC-S offices.

#### 0 8.1.5 TRAFFIC TABLES

0 The traffic rules and tables for RSC-SONET have been incorporated  
0 into the Simplified Traffic rules. Refer to ECM-497 for RSC-SONET  
0 traffic provisioning rules and tables. These rules include doc-  
0 umentation for the SMS-R.

0 The following provisioning considerations were previously imbed-  
0 ded in the traffic calculations for RSC-SONET. Since traffic  
0 rules have been consolidated in ECM-497, the following consider-  
0 ations are now documented as follows:

0

0 RELEASE 28.01  
0 93 12 03  
0

- 0 1. The number of links required and number of DCHs needed  
0 for an application are determined by using the worksheets  
0 in ECM-497. Both the RSC-SONET and its subtending LCMs,  
0 LCMes, SMS-Rs and remotes are covered in ECM-497. After  
0 the number of DS30As, DS1s and DCHs has been determined  
0 in ECM-497, the RSC-SONET Provisioning and Configuration  
0 Table (in Engineering Manual as TABLE H ) describes the  
0 equipment required and mounting locations.
- 0 2. CLASS Modem Resource Circuit Packs:  
0 If the RSC-SONET is to support Calling Number Delivery,  
0 two CLASS Modem Resource circuit packs must be mounted  
0 in each CRSC. Refer to the Engineering Manual section  
0 for the CRSC (either detail or Building Block) for  
0 mounting position.
- 0 3. Warning Labels:  
0 Warning labels are available in both French and English.  
0 Refer to the Engineering Manual section for the CRSC  
0 (either detail or Building Block) for ordering codes.
- 0 4. Standalone CRSC:  
0 The NTMX8943 kit is available for applications when ONLY  
0 the CRSC is required and it is to be powered from the  
0 office power board. Provide one kit for the CRSC when this  
0 configuration is required.
- 0 5. Standard RMM:  
0 An RMM for typical remote applications has been  
0 assembled for use when exact customer requirements  
0 have not been specified. In addition to the RMM  
0 packfill, it contains the following:

| Slot Card PEC            | Slot Card PEC    |
|--------------------------|------------------|
| 3 NT2X10BA               | 9R NT2X77AA      |
| 4 NT2X11BA               | 10 NT2X90AD      |
| 5 NT0X10AA               | 10R NT2X77AA     |
| 6 NT3X09BA               | 11 NT2X90AD      |
| 7 NT2X90AD               | 11R NT2X77AA     |
| 7R NT2X77AA              | 12 NT3X09BA      |
| 8 NT2X90AD               | 13 NT2X57AA      |
| 8R NT2X77AA              | 14 NT2X57AA      |
| 9 NT2X90AD               | 15 NT0X10AA      |
| NT6X1438 (-48V SP Strap) | 16 Provisionable |

0 Provide the Standard RMM as required when it  
0 satisfies office requirements. Otherwise, the

0 RELEASE 28.01  
0 93 12 03  
0

0 NT6X13AB RMM shelf can be supplied and equipped  
0 as needed, subject to the restrictions described  
0 previously due to bulkhead cabling. One RMM may  
0 be provisioned in each CRSC, one in each CEXT  
0 and up to four RMMs may mount in a CMIS.

0 6. Total Quantity of DCHs Required: (Previously R131)  
0 The total quantity of DCHs required equals the  
0 number needed for support of LCMEs plus one spare.

0 7. Total Quantity of DS30As Required: (Previously R132)  
0 The total quantity of DS30As required equals the  
0 number needed for interface to LCMS, LCMEs and  
0 SMS-Rs plus two (for dedicated RMM ports).

0 8. Quantity of Extension shelves required (Previously R133)  
0 is determined by referring to Column D in the RSC-SONET  
0 Provisioning and Configuration Table (Table TABLE H ) for  
0 the row selected for a specific configuration.

0 9. Quantity of Quad Carriers required for the Extension  
0 Shelf (Previously R134) is determined by referring to  
0 Column D in the RSC-SONET Provisioning and Configuration  
0 Table (Table TABLE H ) for the row selected for a  
0 specific configuration.

0 10. Quantity of Quad Carriers required for the Main  
0 Shelf (Previously R135) is determined by referring to  
0 Column G in the RSC-SONET Provisioning and Configuration  
0 Table (Table TABLE H ) for the row selected for a  
0 specific configuration. One Quad Carrier is required  
0 for each different slot used (slots 12, 14 and 16). A  
0 maximum of three Quad Carriers will be needed.

0 11. Quantity of CEXT cabinets required (Previously R138):  
0 One CEXT is required if an Extension Shelf is needed.  
0 (One CEXT can support both halves of a Dual RCC2.)

0 12. Quantity of EXT packfills required (Previously R139):  
0 Column D of Table TABLE H specifies the requirement  
0 for an Extension Shelf. In a Dual RCC2, if both RCC2s  
0 use a configuration requiring an EXT shelf, two EXT  
0 packfills are needed. Otherwise, the requirement  
0 equals the number in Column D for the row used.

0 13. Quantity of DS1 packets required for host interface  
0 (Previously R140):

0 RELEASE 28.01  
0 93 12 03  
0

0 Calculations in ECM-497 determine the number of  
0 host links needed for each RCC2 controller. The  
0 number of DS1 packlets needed equals the number  
0 of links divided by two and rounded up.

0 14. Quantity of DS1 packlets required for P-side interface  
0 (Previously R141):

0 Calculations in ECM-497 determine the number of  
0 host links needed for each remote and DS1s needed  
0 for SMS-R Special connections. The P-side DS-1  
0 interface for an RCC2 equals the sum of the ports  
0 for RLCMs, OPMS, CDO/PBX trunks, SMS-R Specials  
0 and, in a Dual configuration, Interlinks. The  
0 number of DS1 packlets needed equals this number  
0 of links divided by two and rounded up.

0 15. Quantity of RCC2 Shelf packfills required (Previously R142):  
0 One required for Mono RCC2; two required for a Dual RCC2.

0 16. Quantity of EXT Shelf fillers required  
0 (Previously R143/R143a):  
0 Provide fillers as needed to cover unequipped EXT shelf.  
0 Filler kits are available for both left and right sides.

0 17. Quantity of LCME packfills needed (Previously R144):  
0 ECM-497 calculates the number of LCMEs required. Each  
0 LCME requires one packfill. Each CRSC can mount one  
0 LCME and the CEXT can mount one so there is a maximum  
0 of two LCMEs in a Mono configuration and three in a Dual.

0 18. Quantity of Enhanced Line Drawers (Previously R145):  
0 Provide eight Enhanced Line Drawers for each LCME  
0 packfill equipped.

0 19. Quantity of Universal Tone Receivers (Previously R147):  
0 The Always Provided pair of UTRs will handle the vast  
0 majority of offices. If UTR traffic exceeds 765 CCS,  
0 provide the second pair. See CRSC Engineering Manual  
0 section for assignment location.

0 20. Packlet fillers required (Previously R156):  
0 Provide fillers for each unequipped position on every  
0 Quad Carrier provisioned.

0  
0  
0

0 RELEASE 28.01  
0 93 12 03

0 8.2 PRODUCT/SYSTEM SPECIFICATIONS

0

0 8.2.1 PHYSICAL CHARACTERISTICS

0  
0 The issue of Circuit Protection and Grounding must be addressed  
0 as follows:

0 -Circuit Protection

0 Any wire or wire pair other than battery supply or ground which  
0 is connected to the RSCS and leaves the building must be pro-  
0 tected against lightning by suitable arrestors.

0 DS1 input and output ports will be protected against the follow-  
0 ing conditions:

- 0 - Shorts to ground, input to output, and across the pair.
- 0 - DC voltages: +/- 100 VDC with respect to ground, and
- 0 +/- 60 VDC between the leads.
- 0 - AC voltage to 110 VAC 50/60 Hz with respect to ground

0 - Grounding

0 All RSCS configurations will incorporate the grounding systems as  
0 specified in the DMS-100F Technical Specification. Grounding  
0 methods will comply with Isolated System Grounding rules.

0 - Fuses

0 In the RCC2 shelf there are fuses on individual packs. Their  
0 value will be added once the design is complete.

0 BATTERY FEED FROM THE FSP

0 - RCC2 Shelf

0 Max current from -48V feed is 8.1A

0 RCC2 power requirement is 340 Watts.

0  
0 RELEASE 28.01  
0 93 12 03

## 0 NTMX89AA - Cabinetized Remote Switching Center

0  
0 Input Voltage..... -48VDC  
0 Power Consumption.....1142 Watts (worst case)  
0 Current Drain.....25 Amps (at -42VDC)  
0 Thermal Dissipation.....3897 BTU/hour (worst case)  
0 CPDC Requirements.....(3) 20 Amp Breakers on "A" Feed  
0 .....(3) 20 Amp Breakers on "B" Feed  
0 NOTE: 30 Amp Breakers will be used until 20 Amp  
0 Breakers are available for the CPDC.

## 0 MECHANICAL DIMENSIONS

0 Height 72" Width 28.5"  
0 Weight 810 lb. Depth 28.5"

## 0 NTMX88AA - CRSC Extension Cabinet

0 RELEASE 28.01  
0 93 12 03

0 8.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 All EMI/Earthquake requirements are integral to the cabinet. An-  
0 chors for earthquake applications are supplied by providing the  
0 NTRX2512 Earthquake Anchor kit for each cabinet. Earthquake an-  
0 choring equipment is normally supplied by Building Studies.

0 8.2.3 SPARING INFORMATION

0  
0 The CMSS Cabinet shall be supplied to house spare circuit packs.  
0 Standard sparing algorithms apply.

0 The following packs are considered critical spares for the RCC2  
0 and EXT shelves:

0 RCC2 : NTMX72AA, NTMX73AA, NTMX74AA, NTMX75AA,  
0 NTMX77AA, NTMX81AA, NTMX87AA, NT6X92BB,  
0 NT6X69AC or NTMX76AA, NTB01AB  
0 Also, if provisioned : NT6X78AB  
0 NTB02AA

0 EXT : NTMX79AA  
0 Additional NTMX81AA, NTMX87AA and NTB02AA  
0 should be provided if used on the EXT shelf.

0 FSP : NT6X36AA, NT6X36AB

0 8.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 The fusing for both the CRSC and CEXT is as follows:

0 CPDC Requirements (3) 20 Amp Breakers on "A" Feed  
0 (3) 20 Amp Breakers on "B" Feed  
0 NOTE: 30 Amp Breakers will be used until 20 Amp

0 RELEASE 28.01  
0 93 12 03

0 Breakers are available for the CPDC.

0 8.2.5 CURRENT DRAIN INFORMATION

0  
0 Power information for both the CRSC and CEXT is as follows:

0 Power Consumption 1142 Watts (worst case)  
0 Current Drain 25 Amps (at -42VDC)

0 8.3 SOFTWARE PROVISIONING

0 NOTE: The existing RSC-SONET software accomodates the versions of  
0 the CRSC with provisionable LCM.

0 8.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 Software packages specifically required for the Phase 1 RSCS are  
0 as follows:

- 0 - NTXP92AA
- 0 - NTX750AB is required at the host for all RSC-SONET applications  
0 (both ISDN and non-ISDN) for BCS-33 only.
- 0 - NTXJ00AB is required for all applications for BCS-33 only.
- 0 - Neither NTX750 nor NTXJ00 is a prerequisite for NTXP92 for  
0 BCS-34 or later. With BCS-34 or later, these packages  
0 will be ordered only when ISDN is needed.
- 0 - NTX145AA Basic RSC Features must also be included in the load for  
0 all RSC-SONET applications (both ISDN and non-ISDN).
- 0 - NTXR42AA Firmware Downloading is required in BCS-34 as a  
0 prerequisite for NTXP92AA.

0 RELEASE 28.01  
0 93 12 03

0  
0 Optional Packages :

- 0 - NTXR71AA RSC-S Extended Distance Capability
- 0 - NTXA85AB Basic SMS-R Features (Mono & Dual RCC/RCC2)
- 0 - NTXA86AA SMS-R Special Services (Including SPOTS)
- 0 - NTXE38AB CLASS - Calling Number Delivery on SMS-R  
0 (NTXE38 requires CMR card in host RCC2)
- 0 - NTXR34-- XPM Plus Basic (Limited Availability in BCS-34)  
0 (NTXR34AA is replaced by NTXR34AB in BCS-35.)

0 Software previously required for RSC is also applicable to RSC-S.

0 Refer to Software Management System (SMS) for interdependencies.

0 8.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 Prior to BCS-35, the RSC-S software requires the presence of the  
0 EISP packs for all applications. With BCS-35 or higher, the EISP  
0 is required only when the RSC-S is to support ISDN. If the EISP  
0 is not equipped, the NTMX8947 EISP Strapping kit must be applied.

0 Because of restrictions imposed by software structuring,  
0 RSC-SONET hardware configurations will need to be checked against  
0 the following software limits. Any configuration exceeding these  
0 limits is invalid.

0 For the office configuration, determine total software ports and  
0 terminals as follows:

0 PORTS

- 0 -----
- 0 1 . Add one port for each RMM required.  
0 Include RMMs in RLCM/OPMs homing on RCC2.
  - 0 2 . Add sixteen ports for each RCC2 required.
  - 0 3 . Add eight ports for each LCM required.  
0 Include LCMs in RLCM/OPMs homing on RCC2.
  - 0 4 . Add nineteen ports for each LCME required.
  - 0 5 . Add fifty-four ports for each RCC2 shelf if

0 RELEASE 28.01  
0 93 12 03

0 part of a Dual configuration.

- 0 6. Add four ports for each SMS-R subtending the RCC2.

0 IF BCS-33,  $1+2+3+4+5+6 < \text{or} = 159$  (per RCC2)

0 IF BCS-34,  $1+2+3+4+5+6 < \text{or} = 259$  (per RCC2)

0 TERMINALS:

0 -----

- 0 6 . Add 641 terminals for each LCM.  
0 Include LCMs in RLCM/OPMs homing on RCC2.  
0 7 . Add 513 terminals for each LCME.  
0 8 . Add 31 terminals for each RMM.  
0 Include RMMs in RLCM/OPMs homing on RCC2.  
0 9 . Add 641 terminals for the RCC2 itself.  
0 10. Add one terminal for each B channel used for voice  
0 in an LCME.  
0 11. Add 31 terminals for PRA if RSC-S is handling ISDN.  
0 (i.e. if at least one ISDN line card is equipped)  
0 12. Add 589 terminals for each SMS-R homing on the RCC2.

0  $6+7+8+9+10+11+12 < \text{or} = 7055$  (per RCC2 in BCS-33)

0  $6+7+8+9+10+11+12 < \text{or} = 7884$  (per RCC2 in BCS-34)

0  $6+7+8+9+10+11+12 < \text{or} = 8676$  (per RCC2 in BCS-35)

0 In addition to this limit, there are a limited number of  
0 Logical Terminal Identifiers (LTIDs) available for the  
0 ISDN B channels. (LTIDs for D channels draw on a different  
0 resource.) The following maximums must not be exceeded:

0 BCS-33: maximum of 972 ISDN loops per RCC2  
0 maximum of 960 ISDN B channel LTIDs

0 BCS-34/35: maximum of 972 ISDN loops per RCC2  
0 maximum of 1024 ISDN B channel LTIDs

0 EXAMPLES:

0 For RCC2 with 2 LCMEs, 2 RMMs and 8 LCMs in BCS-33:

|          |                  |            |                |
|----------|------------------|------------|----------------|
| 0 Ports: | 16 for the RCC2  | Terminals: | 641 for RCC2   |
| 0        | 2 for the RMMs   |            | 62 for RMMs    |
| 0        | 64 for the LCMs  |            | 5128 for LCMs  |
| 0        | 38 for the LCMEs |            | 1026 for LCMEs |
| 0        |                  |            | 31 for PRA     |
| 0        |                  |            | 167 B channels |
| 0        | ----             |            | ----           |

0 RELEASE 28.01  
0 93 12 03  
0

0 120 (within limit) 7055 (within limit)  
0 Only 167 B channels could be used since  
0 more would exceed the software limit.

0 For RCC2 with 0 LCMEs, 0 RMMs and 10 LCMS in BCS-33:

|                          |                         |
|--------------------------|-------------------------|
| 0 Ports: 16 for the RCC2 | Terminals: 641 for RCC2 |
| 0 0 for RMM              | 0 for RMMs              |
| 0 80 for the LCMS        | 6410 for LCMS           |
| 0 00 for LCME            | 0 for LCME              |
| 0 ----                   | ----                    |
| 0 96 (within limit)      | 7051 (within limit)     |

0 Due to the limit in CC and XPM software on the maximum number of  
0 nodes during ESA warm exit, if the maximum of nine SMS-Rs with  
0 six RCSs each are defined on an RCC2, no other P-side nodes  
0 (LCMS, LCMEs, etc.) may be defined.

0 As indicated by the previous checks, the maximum number of P-side  
0 modules that may be supported off an RCC2 is limited in some  
0 cases by the software structures, rather than the physical ports  
0 or channel capacity. This is particularly true for those config-  
0 urations supporting ISDN lines. The following tables provide the  
0 information needed to determine if a particular P-side configura-  
0 tion can be supported.

0 Table 1 lists the static resources used by each P-side module and  
0 Table 2 shows the maximum for each category, based on BCS level.  
0 Table 3 lists the maximums for the host XPM supporting an RCC2.  
0 Tables 4-6 show the number of Logical Terminal Identifiers  
0 (LTIDs) available for support of ISDN lines when using various  
0 mixes of P-side equipment. Table 4 is for BCS-35, Table 5 is for  
0 BCS-34 and Table 6 is for BCS-33.

0 For a configuration to be valid, it must be within the limits  
0 given in the appropriate table.

RELEASE 28.01  
93 12 03

**Table 1: RCC2 Static Resource Usage**

| Entity            | Ports | TID | Nodes | Msg_Lk | LCD | W.Exit |
|-------------------|-------|-----|-------|--------|-----|--------|
| Self              | 16    | 641 | 1     | 0      | 0   | 2      |

0  
0 RELEASE 28.01  
0 93 12 03

0 8.3.3 MEMORY PROVISIONING

0  
0 The Unified Processor Pack in the RCC2 shelf is equipped with 8M  
0 of memory. Expansion of the memory to 16 megabytes will also be  
0 possible.

0 8.3.4 Operational Measurements

0  
0 Basic OMs for the XPM have been applied to the RCC2.

0 8.3.5 Logs/Tools

0  
0 Existing PM Logs are updated to reflect the RSCS. Resident tools  
0 are updated for the CC/XPM as well.

0 8.4 REAL TIME IMPACT

0 The RCC2 combines the Master Processor and Signal Processor func-  
0 tions of the RCC/RCCI into the Unified Processor hardware. The  
0 Unified Processor is capable of handling 1.6 times the call at-  
0 tempts of the existing MP and SP hardware at the recommended en-  
0 gineering level of 80%, assuming the RCC is not equipped with per  
0 trunk signaling trunks. The real time cost at the host XPM is  
0 the same as for the RCC/RCCI hardware configuration. Refer to SEB  
0 91-05-001 (Issue 02 or later) for additional information.

0 Real time impact of SMS-R off RCC2 is included in PRTCALC Version  
0 2G.

0

0 RELEASE 28.01  
0 93 12 03

0 9.0 Detailed/Building Block Engineering - RSC

0 The RCE frame contains a two (2) shelf Remote Control Cluster (RCC)  
0 module which is an LTC type peripheral. The controller side (C-Side)  
0 interfaces to the host over DS-1 links to an LGC/LTC.

0 NOTE:

0 Software Translations require from 3 to 16 ports to interface to  
0 an RSC. Hardware facilitates a host interface requirement of  
0 from 2 to 16 DS-1 links, with a third link reserved.)

0 The peripheral side (P-Side) of an RCC consists of 20 ports that cur-  
0 rently support LCMs (each 2 to 6 DS-30A links), DS-1 trunks (8 Max)  
0 and two(2) Remote Maintenance Modules (each 1 DS-30A link).

0 The RCE Frame contains a maximum of two (2) Remote Maintenance Modules  
0 (RMM). Each RMM occupies one (1) shelf in the RCE frame. At least  
0 one RMM shelf is required at each site to provide service circuits and  
0 diagnostic tests. The RMM shelf can be shared between co-located  
0 RSCs, provided they share the same host. The RMM can be shared with a  
0 co-located RLCM, provided they share the same host as the RSC and only  
0 if the RLCM does not have the Emergency Stand Alone (ESA) feature op-  
0 tion specified.

0 9.1 HARDWARE PROVISIONING

0

0 9.1.1 HARDWARE USAGE RESTRICTIONS

0  
0 There are RSC usage restrictions on the Host LGC/LTC and the RSC  
0 P-Side Port Configuration as follows:

- 0 1. LGC/LTC P-SIDE CONFIGURATION  
0 2. RSC P-SIDE CONFIGURATION  
0 3. SOFTWARE NODAL REQUIREMENTS  
0 4. Enhanced Office Recovery

0 \* LGC/LTC P-SIDE CONFIGURATION

0

0 RELEASE 28.01  
0 93 12 03  
0

0 When provisioning the P-Side of an LGC/LTC, the P-Side ports  
0 can be configured for a maximum of two (2) RSCs if the fol-  
0 lowing conditions are met:

- 0 1. 2 RSCs from a Mono RSC configuration
- 0 2. 1 RSC from a dual configuration and 1 RSC from a single  
0 configuration
- 0 3. Traffic, Real Time and software Nodal requirements do not  
0 exceed the recommended engineering limits.
- 0 4. All DS-1 links from a RCC must terminate on the same  
0 LGC/LTC.
- 0 5. LTC required when CDO/PBX Trunking is required.

0 In addition, the remaining P-Side ports can be configured for  
0 two RLCMs or OPMS if the Traffic, Real Time and software  
0 Nodal requirements do not exceed the recommended engineering  
0 limits.

0 \* RSC P-SIDE CONFIGURATION

0 The P-Side of an RSC can be configured for the following max-  
0 imums if the Traffic, Real Time and software Nodal require-  
0 ments do not exceed the recommended engineering limits:

- 0 1. Maximum of 9 LCMs (using 2 ports per LCM)
- 0 2. Maximum of 8 DS1s assigned to CDO/PBX Trunking Functions;  
0 DS1s may be assigned to the CDO and or PBX function in  
0 any combination not to exceed eight (8).
- 0 3. Maximum of 18 DS1s for any combination of RLCMs and OPMS
- 0 4. Any combination of the above not to exceed the stated in-  
0 dividual maximums

0 \* SOFTWARE NODAL REQUIREMENTS

0 A host LGC/LTC can support a maximum software datafilling of  
0 18 Peripheral Side (P-Side) software nodes with BCS 22. In  
0 BCS 23 and later, the capacity increases to 62 P-Side nodes.

0 A node is defined as follows:

0  
0 RELEASE 28.01  
0 93 12 03

0 Host LCMs, RSC LCMs, RMMs, RCCs, RLCMs, OPMs, ESA  
0 processors (for the RLCM or OPM), and dummy software  
0 nodes.

0 An example of counting software nodes follows;

0 A host LGC configured with two (2) host LCMs, one (1)  
0 RLCM, one (1) OPM and one (1) RSC (remotes configured  
0 below) would constitute a total of 15 software nodes.

0 - The host LCM would constitute two (2) software nodes.

0 - An RLCM configured with one (1) RMM and ESA processor  
0 would constitute three (3) software nodes.

0 - An OPM configured with one (1) RMM would constitute two  
0 (2) software nodes.

0 - An RSC configured with one (1) RCC, two (2) RMMs and five  
0 (5) LCMs would constitute eight (8) software nodes.

0 \* Enhanced Office Recovery

0 The feature NTXA66AA - Enhanced Office Recovery has been in-  
0 corporated into the DMS-100 Basic S/W Package - NTX001.  
0 Therefore, the NT6X45BA and later LGC Processors are required  
0 to support Enhanced Office Recovery Feature.

0 9.1.2 HARDWARE DEPENDENCIES REQUIREMENTS

0

0 Refer to Section 3. Provisioning Information

0 9.1.3 PROVISIONING CONSIDERATIONS

0

## 0 GENERAL RSC PROVISIONING

0

0 The RSC may be provisioned with the following Hardware (H/W),  
0 where specific quantities are restrained by Traffic, REAL-TIME,  
0 and Capacity issues unique to the service mix required:

0 RCE FRAME One per Mono RSC, two per Dual RSC, two Mono RSCs  
0 may be located on/in the same floor/building. The  
0 RCE consists of one Remote Maintenance Module  
0 (RMM) Card Cage, one double shelf Remote Custer  
0 Controller (RCC),

0 LCE FRAME Line Concentration Equipment (LCE) is provisioned  
0 in the RSC as follows:

0 \* Max 5 LCEs (9 LCMS) per Mono RSC, Max 10 LCEs  
0 (18 LCMS) per Dual RSC. A maximum of 5,760  
0 Lines per Mono RSC or 11,520 per Dual RSC. The  
0 exact quantities provisionable according to a  
0 specific service mix are limited by Traffic,  
0 REAL TIME, and Capacity issues (Refer to  
0 ECM-497).

0

0

0 RELEASE 28.01  
0 93 12 03  
0

0 \* The LCE may consist of two LCM, each LCM may  
0 have up to 10 Line Drawers, each line drawer  
0 may house up to 64 Line Card.

0 PDC Frame The Power Distribution Center (PDC) frame is re-  
0 quired in the RSC when the total number of fuses  
0 needed exceeds 56. Otherwise provide the RME  
0 frame below.

0 RME Frame The Remote Miscellaneous Equipment (RME) Frame is  
0 provisioned in sufficient quantities to house  
0 equipment as follows:

0 Power Distribution Equipment consisting of:

0 \* Max 2 each Fuse Panel A and B  
0 \* PDC Frame, Frame Supervisory Panel (FSP)  
0 \* Frame fuses not to exceed 56.  
0 \* Miscellaneous Frame Grounding hardware

0 Miscellaneous Frame Mounted Equipment such as:

0 \* MIS Frame, Frame Supervision Panel (FSP)  
0 \* Inverter  
0 \* Common Equipment Shelf  
0 \* Modem Shelves  
0 \* etc, Refer to MIS/RME Frame Engr Manual Sec-  
0 tion

0 REMOTES RLCMs and OPMs 256/640 REMOTES may home on the RSC  
0 via 2-6 DS30A ports. Up to five (5) REMOTES may be  
0 connected to a Mono RSC, 10 for a Dual RSC.

0 MISC EQPT Other miscellaneous equipment provisionable is as  
0 follows: Maintenance Tools and Alarm Panels.

0 MONO RSC

0 The Mono RSC is comprised of a Remote Controller Equipment (RCE)  
0 Frame. Also required but custom provisioned are the Line Concen-  
0 trating Equipment (LCE) Frames, Remote Miscellaneous Equipment  
0 (RME) Frames, Remote VDU, Remote Printer, Modems, Alarm Panel,  
0 Inverter, and Maintenance Tools.

0 RELEASE 28.01  
0 93 12 03

## 0 DUAL RSC

## 0 Dual RCC Memory

0 Minimum Dual RCC processor memory requirements are as follows:

0 \* The RCC must have 1 megabyte of SP memory (NT6X46AC or  
0 NT6X46BA).

0 \* The RCC must have 4 megabyte of MP memory via 2 NT6X47ABs per  
0 shelf or 1 NT6X47AC per shelf.

0 For dual RCCs, there is a requirement for additional Signal  
0 Processor (SP) and Master Processor (MP) memory that is applica-  
0 ble to XPMs generically. The following upgrades are required:

## 0 UPGRADE DESCRIPTION

0 SP Memory NT6X46BA (1 Meg.) or NT6X46AC (which is an up-  
0 graded NT6X46AB to 1 Meg.)

0 MP Memory Each RCA shelf, which is part of a dual RCA con-  
0 figuration, will require two NT6X47ABs per shelf  
0 in BCS 26 (V0). All RSCs will require the 4mb of  
0 MP Memory via a two NT6X47AB per shelf or one  
0 NT6X47AC per shelf. This became a requirement as  
0 of BCS27.

0 Refer to Figure 1 and 2 for a block diagram of a typical Mono-RSC  
0 and Dual-RSC deployment, respectively.

## 0 HOST INTERFACE MODULE REQUIREMENTS

0 The RSC must be connected to a LTC peripheral module when Commu-  
0 nity Dial Office (CDO) and/or Private Branch Exchange (PBX) traf-  
0 fic is routed to the RSC.

0 Trunking Features for RSCs are available in BCS-22 and later.

0 If software feature package NTX152AA/AB RSC Digital Trunking is  
0 specified then the RSC must interface to a host LTC.

0

0 RELEASE 28.01  
0 93 12 03

0 The RSC supports limited trunking. Specifically, local (non  
0 toll) interoffice trunking (EAS), Private Branch Exchange (PBX),  
0 Direct Inward/Outward Dial (DID/DOD) Trunking.

0 ECD 024-00317 started 891215 released 900605 introduced the fol-  
0 lowing:

|   |          |                                  |
|---|----------|----------------------------------|
| 0 | NT6X12AG | REMOTE CLUSTER CONTROLLER        |
| 0 | NT6X12AH | NT6X50AB UPGRADE KIT             |
| 0 | NT6X1201 | REMOTE CONTROL ARRAY SHELF ASSY  |
| 0 | P0713149 | RSC DESIGNATION STRIP            |
| 0 | P0713576 | RSC DESIGNATION LABEL (NT6X45BC) |

0 to add NT6X45BC, NT6X46BB, NT6X47AC, NT6X50AB, NT6X69AC, and  
0 NT6X72AB in the RSC packfill. Also, to realize a Cost Improve-  
0 ment and to reduce RCC power consumption.

0 The ECD introduces the NT6X12AG packfill for the RCC (NT6X10AC)  
0 which has the following circuit packs.

| 0 | PEC      | SLOT(S) | NOTE |
|---|----------|---------|------|
| 0 | -----    |         |      |
| 0 | NT6X50AA | 1-5     | 1    |
| 0 | NT6X50AB | 1-5     | 1    |
| 0 | NT6X48AA | 6-7     | 2    |
| 0 | NT6X45BC | 8       | 3    |
| 0 | NT0X50AA | 9-10    |      |
| 0 | NT6X47AC | 11      |      |
| 0 | NT6X46BB | 12      |      |
| 0 | NT6X45BC | 13      | 3    |
| 0 | NT0X50AA | 14      |      |
| 0 | NT6X44AA | 15      |      |
| 0 | NT6X92BB | 16      |      |
| 0 | NT6X69AC | 17      | 4    |
| 0 | NT0X50AA | 18      |      |
| 0 | NT6X72AB | 19      | 5    |
| 0 | NT6X50AA | 20-23   | 1    |
| 0 | NT6X50AB | 20-23   | 1    |
| 0 | NT0X50AA | 24      |      |
| 0 | NT2X70AD | 25      | 6    |
| 0 | NT2X70AE | 25      | 6    |

0 Note:

- 0 1. Either a NT6X50AA or a NT6X50AB may be provisioned for  
0 these slots. The slots that are not equipped with ei-  
0 ther pack are provisioned with NT0X50AAs.

0 RELEASE 28.01  
0 93 12 03  
0

0 2. These packs are provisionable. NT0X50AAs are used for  
0 non-provisioned slots.

0 3. NT6X45BCs must be used in slots 8 and 13 when an  
0 NT6X50AB is provisioned for the messaging link in slot  
0 20. Otherwise the existing NT6X45 may be used.

0 For offices with BCS 29 or lower, a software patch is  
0 necessary to install the NT6X45BC. Contact TAS for  
0 proper patches and installation of patches. A patch is  
0 not needed for offices with BCS 30 or higher.

0 4. The pack is required in an ENET office. It may be used  
0 upon availability in place of the NT6X69AB in a  
0 non-ENET office. The NT6X69AB may be used in a  
0 non-ENET office.

0 5. The pack replaces the NT6X72AA upon availability. The  
0 NT6X72AA may be used if the NT6X72AB is not yet avail-  
0 able.

0 6. Equip with either NT2X70

0 TRUNKING CHARACTERISTICS

0 \* DS-1 Trunking Only

0 \* Multi-Frequency (MF), Dial Pulse (DP), Dual Tone Multi-  
0 Frequency (DTMF), Wink Start, Delay Dial and Immediate Dial  
0 Supervision

0 \* Trunks may have Local Call Detail Recording (LCDR) and/or  
0 Multi-Unit Message Rate (MUMR) recorded at the host (non-  
0 functional during ESA)

0 \* up to 48 members/trunk group

0 \* 8 trunk groups Maximum to a total of 4 NT6X50AA DS-1 I/F CPs  
0 for trunks (192 trunks) per RCC

0 \* RSCs supporting trunks will require a LTC at the Host Office

|---|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 | Coin or ANI Signalling   | Definition Pending                                                                                                                                                                                                                                                                                                                                        |
| 0 | Common Channel Signaling | System which makes use of an independent signaling network for the transmission of telephony messages related to groups of speech circuits.                                                                                                                                                                                                               |
| 0 | Cut Through Dialing      | The Cut Through Dialing feature allows the DMS-100 to process calls in cut through mode which allows the digits dialed by the originator to directly control the selection of routes used to complete the call.                                                                                                                                           |
| 0 | Echo Suppressors         | Hardware used to attenuate echos on trunks over substantial distances.                                                                                                                                                                                                                                                                                    |
| 0 | Revertive Pulsing        | Pulsing over a trunk in reverse direction. That is, from the terminating office instead of from the originating office. When the incoming office trunk is seized, it sends open or group pulses to the office that originated the call. The originating office counts the pulses and opens the trunk when the correct number of pulses has been received. |
| 0 | Tandem through RSC       | Tandem through RSC is defined as follows:<br><br>* Calls that originate one RSC and terminate on the another RSC of which both RSC's home off the same host.<br><br>* Calls that come into the RSC on the P-Side Trunks and Tandem through back to the Host or another Remote.                                                                            |

0

0  
0 RELEASE 28.01  
0 93 12 03

0 \* EAS Trunks originating from one  
0 RSC and terminate on another  
0 RSC of which both RSCs home off  
0 of the same Host.

0 Toll Long Distance calls made outside of  
0 the local serving area that termi-  
0 nate to a long distance carrier.  
0 Also, the associated billing of  
0 Toll, Toll Completing, and Inter-  
0 toll transactions is not supported.

0 Toll Completing (TC) A trunk function identifying a  
0 trunk circuit capable of interfacing  
0 with a toll connecting trunk  
0 facility in a TC application.

0 InterToll (IT) A trunk function abbreviation re-  
0 ferring to a type of trunk circuit  
0 used to interface with an intertoll  
0 office trunk.

0 Offices that received Software Package NTX152AA RSC Digital  
0 Trunking (currently rated A&M) must provide, on a one-to-one ded-  
0 icated span basis, one span back to the host for every span ter-  
0 minating on the P-Side for trunking (from the RSC to other CDOs).  
0 In addition, the dedicated spans back to the host must terminate  
0 on the same controller (LTC) as the host-RSC DS-1 links.

0 In order to support RSC, the host office controller must be  
0 equipped with the following common circuit pack fills or later  
0 (refer to ECM 373):

0

0

0

## 0 HOST/RSC C-SIDE PORTS/LINKS

0 The following is a table of valid host LGC/LTC P-Side links that  
0 can be used for LGC/LTC to RCC links versus the number of LGC/LTC  
0 C-Side links (network ports).

| 0 No. of     |  |                                                   |
|--------------|--|---------------------------------------------------|
| 0 Ntwk ports |  | Valid LGC/LTC P-Side links                        |
| 0 (C-Side)   |  | (links to peripherals)                            |
| 0            |  |                                                   |
| 0 3          |  | 0,1,2                                             |
| 0 4          |  | 0,1,2,3,4                                         |
| 0 5          |  | 0,1,2,3,4,5                                       |
| 0 6          |  | 0,1,2,3,4,5,6                                     |
| 0 7          |  | 0,1,2,3,4,5,6,7                                   |
| 0 8          |  | 0,1,2,3,4,5,6,7,8,9                               |
| 0 9          |  | 0,1,2,3,4,5,6,7,8,9,10                            |
| 0 10         |  | 0,1,2,3,4,5,6,7,8,9,10,11                         |
| 0 11         |  | 0,1,2,3,4,5,6,7,8,9,10,11,12                      |
| 0 12         |  | 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14                |
| 0 13         |  | 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15             |
| 0 14         |  | 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16          |
| 0 15         |  | 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17       |
| 0 16         |  | 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19 |

0 For example: If you had a host LTC/LGC with 10 Network links you  
0 could have an RCC with 4 C-Side links connected to  
0 LGC/LTC P-Side links 9,11,3,6. (or 0,1,2,3) etc.

0 In other words, you can select any or all of the  
0 valid links in the list to go to an RCC.

0 The P-Side links available for assignment to the RCC increases  
0 with the number of network ports. Sequential assignment of links  
0 from the LGC/LTC to the RCC is not a technical requirement. Thus,  
0 the LGC/LTC assignment of P-Side links to an RCC can follow any  
0 order within the valid LGC/LTC window of P-Side links constrained  
0 by the number of network ports.

0 DS-1 links on the RCC (C-Side) interfacing to the host LGC/LTC  
0 must be assigned in circuit order as follows:

0 C-SIDE PORT: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14,  
0 15.

0  
0 RELEASE 28.01  
0 93 12 03

0 The RCC (C-Side) message links, 0 and 2 may be assigned to the  
0 same LGA/LTA, however, this method shall be used by special re-  
0 quest only. Standard Engineering Practice is to assign RCC C-  
0 Side Ports to port on different LGA/LTA at the host office (i.e.  
0 assign message link 0 to LGA/LTA shelf array 0 and assign message  
0 link 2 to LGA/LTA shelf array 1).

#### 0 Dual RCC InterLinks

0 For the Dual RCC configuration, links 1 and 3 must be configured  
0 as inter-RCC links (1 and 3 on the C-Side of one RCC must be con-  
0 nected to links 1 and 3 on the interconnected RCC). Additional  
0 interlinks may be provisioned as well, to a maximum of 14 inter-  
0 links.

0 Currently, the RSC requires that links 0, 1 and 2 be configured as  
0 links to the host. This must be changed to allow either single  
0 or dual RCC configurations. As part of the dual RCC development,  
0 the capability for any RCC to be configured with only links 0 and  
0 2 serving as links to the host will be included in BCS-24.

#### 0 RSC P-SIDE PORTS

0 The RSC has 20 peripheral side (P-Side) ports in Mono-RSC config-  
0 uration via the one RCE Frame RCC Module or 40 P-Side Ports in  
0 the Dual-RSC configuration. The following equipment may be con-  
0 nected to these ports:

0 LCMs Up to five (5) LCE Frames (09 LCMs) in a Mono-RSC  
0 or ten (10) LCE Frames (18 LCMs) in a Dual Config-  
0 uration. Each LCM may have from 2 to 6 DS-30A  
0 Links/P-SIDE Ports.

0 DS-1 Trunks DS-1 Trunks refer to CDO/PBX Connections. A total  
0 of eight (8) DS-1 Links/P-SIDE Ports may be as-  
0 signed. These ports may be used in any combina-  
0 tion not to exceed eight (eg 8-CDO 0-PBX, 4-CDO  
0 4-PBX, etc.).

0 RMMs The RSC may contain a maximum of two (2) Remote  
0 Maintenance Modules (RMM) in a Mono-RSC or four  
0 (4) in a Dual-RSC. Each RMM requires one (1)  
0 DS-30A link. P-SIDE Port zero (0 & 1) are dedi-  
0 cated to RMMs on each RCC. Each RMM occupies one  
0 (1) shelf in the RCE frame. At least one RMM

0 RELEASE 28.01  
0 93 12 03  
0

0 shelf is always required at each site to provide  
0 service circuits and diagnostic tests.

0 The RMM shelf can be shared in the RSC when it is  
0 configured in a Dual RCEs or co-located RCEs con-  
0 figuration, provided they share the same host. The  
0 RMM can be shared with a co-located RLCM, provided  
0 they share the same host as the RSC and only if  
0 the RLCM does not have the Emergency Stand Alone  
0 (ESA) feature option specified.

0 REMOTES Via the Remote-Off-Remote feature the following  
0 Remotes may be connected to the RSC with 2 to 6  
0 DS-1 Links: RLCM, RLCC, and OPM256/640.

## 0 DETAILED RSC PROVISIONING

0 Refer to ECM-497 to provision the RSC based on Traffic,  
0 REAL-TIME, and RSC Capacity. The following components should be  
0 derived from ECM-497 (Refer to Engr Manual Section EMA2-15-000  
0 for RCC P-Side and C-Side Ports PEC assignments):

- 0 \* RSC Configuration Required (e.g. Mono, Co-Located, Dual,  
0 etc.).
- 0 \* Quantity of RCCs Required.
- 0 \* Quantity of LCMs Required. Refer to ECM-425 to equip LCE  
0 frames and to Provision PECs.
- 0 \* Quantity of Links per LCM Required.
- 0 \* Quantity of C-Side Links To Host Required.
- 0 \* Quantity of RCC InterLinks Required for Dual RSC applica-  
0 tions.

0

0

0 RELEASE 28.01  
0 93 12 03

## 0 REMOTE CONTROLLER FRAME

0 The RCE frame hardware is provisioned via the Engineering Manual  
0 Section EMA2-15-000 for Detailed Engineering. The following mod-  
0 ules reside on the RCE frame:

## 0 MODULE DESCRIPTION

0 RMM Remote Maintenance Module (RMM) which houses the ser-  
0 vice and diagnostic circuits. One RMM Card Cage is al-  
0 ways provided at shelf position 51, a second optional  
0 RMM may be provisioned at shelf position 65. The RMM  
0 has 14 provisionable card slots. Slot 10 must always be  
0 equipped with an NT0X10 Scan Card. The always provided  
0 slots are populated via common PEC. One fully config-  
0 ured RMM is always required in the RSC.

0 RCC Remote Cluster Controller (RCC) is the brains of the  
0 RSC. It is a two shelf module. Each shelf is called a  
0 Remote Controller Array (RCA). Circuits provisionable  
0 on the RCC are DS-1s, DS-30A, Shelf Power Card, CLASS  
0 Modem Resource CP, Universal Tone Receivers (UTR), and  
0 Labels.

0 CU Cooling Unit (CU) is always required when provisioning  
0 the RCE Frame.

## 0 RCC UPGRADE KITS

0 The following RCC upgrade scenarios exist:

## 0 \* NT6X12AB TO NT6X12AD w/NT6X02ZJ (US Only)

0 In order to upgrade existing RCC modules NT6X12AB to  
0 NT6X12AD, use the PC Kit NT6X02ZJ. This kit contains two (2)  
0 NT6X46AC circuit packs for expanding the processor memory and  
0 two (2) new designation strips.

0 This upgrade kit changes slots 8 and 13 to provisionable  
0 slots for NT6X45AF cards. Also, slot 10 is changed to allow  
0 for the provisioning of the second NT6X47AB (The first  
0 NT6X47AB (slot 11) remains AP).

0

0 RELEASE 28.01  
0 93 12 03  
0

0 For U.S. offices, provide one (1) NT6X02ZJ, Product Change  
0 Kit, for each existing RCC module NT6X12AB to be upgraded to  
0 NT6X12AD.

0 In Canada, Change Application Dept. 1955 BRW will field up-  
0 grade existing peripheral modules as required (i.e. Systems  
0 Application Engineering will not order this kit). However,  
0 after Change Application field upgrades an office, Systems  
0 Application Engineering will update the office records ac-  
0 cordingly.

0 \* NT6X12AB TO NT6X12AE (Canadian Only)

0 Canadian Change Application Dept. 1955 BRW will field upgrade  
0 existing NT6X12AB modules to the NT6X12AE vintage as re-  
0 quired. However, after Change Application field upgrades an  
0 office, Systems Application Engineering will update the of-  
0 fice records accordingly.

0 \* NT6X12AC TO NT6X12CA w/NT6X02ZF PC-Kit

0 In order to upgrade existing RCC modules NT6X12AC to  
0 NT6X12CA, use the Product Change Kit NT6X02ZF. It contains  
0 four (4) NT6X45BA circuit packs to replace the existing four  
0 (4) NT6X45AF cards. It also contains four (4) new designation  
0 labels.

0 \* NT6X12AD TO NT6X12AF w/NT6X12ZY PC Kit

0 In order to upgrade existing RCC modules NT6X12AD to  
0 NT6X12AF, use the Product Change Kit NT6X12ZY. It contains  
0 two (2) NT6X69AB circuit packs to replace the existing two  
0 (2) each NT6X69AA and NT6X79AA cards. It also contains two  
0 (2) new designation labels.

0 This upgrade kit allows card slot 18 to be provisioned with  
0 the CLASS Modem Resource (CMR) card NT6X78AA which is used  
0 for the CND feature. The power-reduced NT6X78AB replaces  
0 NT6X78AA.

0 For more information concerning upgrading the host process-  
0 ors, refer to ECM 373.

0 \* NT6X12AE TO NT6X12CA w/NT6X12ZY (Canadian Only)

0 In order to upgrade existing Canadian RCC modules NT6X12AE to  
0 NT6X12CA, use the Product Change Kit NT6X12ZY. It contains

0 RELEASE 28.01  
0 93 12 03

0 two (2) NT6X69AB circuit packs to replace the existing two  
0 (2) NT6X69AA and two (2) NT6X79AA cards. It also contains  
0 two (2) new designation labels.

0 This upgrade kit allows card slot 18 to be provisioned with  
0 the CLASS Modem Resource (CMR) card NT6X78AA which is used  
0 for the CND feature. The power-reduced NT6X78AB replaces  
0 NT6X78AA.

0 For more information concerning upgrading the host process-  
0 ors, refer to ECM 373.

0 \* NT6X12AD TO NT6X12AG w/NT6X12ZC

0 This PC Kit provides information required for upgrading the  
0 NT6X12AD Packfill to a NT6X12AG Packfill.

0 \* NT6X12CA TO NT6X12AG w/NT6X12ZD

0 This pc kit provides information required for upgrading the  
0 NT6X12CA packfill to a NT6X12AG Packfill.

0 \* NT6X12AF TO NT6X12CA w/NT6X12ZZ

0 This pc kit provides information required for upgrading the  
0 NT6X12AF packfill to a NT6X12CA packfill.

0 \* NT6X12AH NT6X50AH Upgrade Kit

0 This kit is designed for NT6X12CA and earlier RCC Common Cir-  
0 cuit Pack Fills. It upgrades the existing NT6X45 to the  
0 NT6X45BC vintage and replaces the NT6X50AA in the RCC Slot 20  
0 with a NT6X50AB. The remaining NT6X50ABs must be provisioned  
0 as required.

## 0 SUBSCRIBER LINE CIRCUITS

0 The LCE frame at the remote site contains the same Line Concen-  
0 trating Modules (LCM), ringing generators and line drawer cutoff  
0 straps as provisioned in the host. Each LCM will serve up to 640  
0 subscribers. The LCM will interface to the RCC module via DS-30A  
0 links (each 2 to 6).

0 For provisioning LCEs, refer to ECM 425.

0

0 RELEASE 28.01  
0 93 12 03

0 Canadian offices will maintain current individual ordering of LCE  
0 on NT6X03AA equipment for the entire RSC application.

0 An RCC Module must be provisioned with four (4) DS-30A LCM Inter-  
0 face CP (NT6X48AA) (i.e. a CP in card slot 6 & 7). The ports  
0 from each LCM must be spread evenly across both circuit packs.

0 DS-30A ports 0 & 1 (found on the NT6X48AA CP equipped in card  
0 slot 07 of the RCC) are reserved for control of the RMM shelf.  
0 Thus all RSCs equipped with RMM shelf(s) and interfacing to LCM  
0 must be configured with four (4) DS-30A LCM Interface CP  
0 (NT6X48AA).

0 The RSC supports all current line features that are supported by  
0 host LCM's. This includes POTS, IBN stations, IBN consoles,  
0 DATAPATH and IBN Business Sets.

0 The dual RCC configuration supports the same subscriber line fea-  
0 ture set provided by the current RSC except when in ESA mode.

#### 0 RME/PDC FRAME PROVISIONING

0 The RME Frame is provisioned in the RSC to house Power Distrib-  
0 ution equipment and/or other miscellaneous assemblies. The RME  
0 may serve as RSC's power distribution center, if the total number  
0 of fuses does not exceed 56.

0 When extending an office equipped an RME frame configured as a  
0 PDC, provision one NT0X58DA (ABS Alarm Kit) to convert from a 10  
0 Amp fuse to a 20 Amp fuse. This change is always required on a  
0 one time basis when extending an office.

0 The RME may not serve as the RSC power distribution center, if  
0 the office is engineered for Electromagnetic Interference (EMI).  
0 This is due to an inability to equip the RME with EMI-Shielding.

#### 0 Remote Miscellaneous Equipment (RME) Frame

0 The RME Frame (NT0X02AB) will serve as frame space for the power  
0 distribution fuse panels, spare circuit pack cages or other Telco  
0 defined miscellaneous frame space.

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 OTHER MISCELLANEOUS H/W PROVISIONING

0 A tool kit (NT0X58AD - RLCM/RSC maintenance tool kit) is now  
0 available for RSC and RLCM offices. Provisioning information is  
0 similar to the tool kits currently ordered for host offices.

0 The Remote Alarm Panel (NT0X63AC) may now be provided for a RSC  
0 Site.

0 Standard sparing algorithms shall apply.

## 0 BUILDING BLOCK PROVISIONING - RSC

0  
0 RSC BUILDING BLOCK DEFINITIONS

0 The following Building Block PECs in conjunction with Detailed  
0 PEC may be used to provision a DMS-100 Remote Switching Center  
0 (RSC):

0 \* NTZZ03GA - DS-1 P-Side Interface

0 NTZZ03GA contains P-Side DS-1s to be mounted on the RCC in  
0 slot positions 1 thru 5 as required.

0 \* NTZZ12AB - Remote Controller Equipment (RCE) Frame Canadian

0 NTZZ12AB contains the RCE frame, one RMM Card Cage and space  
0 available for a second, 80% of required equipment for the  
0 RCC, and a fan cooling unit.

0 \* NTZZ12HC - Remote Controller Equipment (RCE) Frame US Appli-  
0 cations

0 NTZZ12HC contains the RCE frame, one RMM Card Cage and space  
0 available for a second, and a fan cooling unit. Provisionable  
0 to this unit are the Framework Common or Earthquake, RCC  
0 electronics, RMM Service circuits, RMM Shelf in position 65,  
0 and local cables.

0 \* NTZZ12YB - Remote Cluster Controller (RCC) US Applications

0 RELEASE 28.01  
0 93 12 03  
0

0 NTZZ12YB contains 100% of RCC required circuits.  
0 Provisionable on in conjunction with this PEC are the C & P-  
0 Side DS-1s and CMR CP,

0 \* NTZZ12BB - Remote Maintenance Module (RMM) Standard

0 NTZZ12BB contains 6-I/O Tst Ckts, 28-each Signal Distribution  
0 and Scan Ckts, 4-Odd/Even LTU Pairs, and 2 8X8 RMTAs.

0 \* NTZZ12CB - Remote Maintenance Module (RMM) Custom

0 \* NTZZ12DA - DS-1 C-Side Interface

0 \* NTZZ15DA - Remote Maintenance Equipment Frame (US)

0 \* NTZZ15AA - Remote Maintenance Equipment Frame W/PDC  
0 (Canadian)

0 \* NTZZ15BA - Remote Maintenance Equipment Frame (Canadian)

0 The following Building Block PECs are provisionable on the  
0 NTZZ15AA/BA/DA as applicable:

- 0 - NTZZ12GA - RME Power Distrib. Module
- 0 - NTZZ15CB - UL RME Power Distrib. Module
- 0 - NTZZ18BA - Inverter
- 0 - NTZZ14HA - LaMarche Inverter
- 0 - NTZZ18CA - Metallic Test Access Unit
- 0 - NTZZ18DA - Alarm Extension Panel
- 0 - NTZZ14GA - 1A2 Key System

## 0 BUILDING BLOCKS QUESTIONNAIRE

### 0 ECM-497 IMPORTS

0 Refer to the following ECMs to provision equipment as defined:

#### 0 1. ECM-497 - Simplified Traffic Provisioning

##### 0 a. RCCs/RCEs

##### 0 b. RCC C-Side Port Utilizations

- 0 1) Qty of host links
- 0 2) Qty of Dual RCC interlinks

0 RELEASE 28.01  
0 93 12 03  
0

0 3) Total C-side links

0 c. RCC P-Side Port Utilizations

0 1) Links Per Local LCM Nodes

0 2) Links Per Local CDO/PBX Nodes

0 3) Links Per Remotes Off Remote (i.e.

0 a) RLCMS 2-6 Max

0 b) RLCCs 2-6 Max

0 c) OPMS 2-6 Max

0 4) Total peripheral links (P-Side)

0 d. Total\_UTR\_CCS

0 2. ECM-619 - Building Block Engineering/LCE

0 Use this document for LCE required/provisionable PECs and  
0 their corresponding configuration rules.

0 3. ECM-631 - Building Block Engineering/PDC

0 Use this document for PDC required/provisionable PECs and  
0 their corresponding configuration rules.

0 4. ECM-125 - DMS Common Equipment STD & EMI

0 Use this document to provision ancilliary equipment for  
0 all frames provisioned in the RSC (e.g. frame doors, trim  
0 panels, grilles, etc.).

0 5. ECM-607 - Building Block Engineering/MAP

0 Use this document for MAP VDUs, Printers, and other re-  
0 lated equipment PECs.

0 The other standard equipment provisionable with the RSC may be provi-  
0 sioned using this Building Blocks ECM.

0 - RMMS

0 - RSC Power Distribution

0 RSC PROVISIONING CALCULATIONS

0 Calculation Description

0 The naming convention of calculations variables expressed in this  
0 section are derived as follows:

0 If Quantity of 2.4.3.2.1.Q1 > 1, then RSC = Dual else  
0 RSC = Mono. Where 2.4.3.2.1. = section number, Q of Q1  
0 = Question, and 1 = of Q1 = the first question in the  
0 section (1.).

0 RCE Frame

0 The RCE Frame requirements are calculated below are arranged from  
0 the top down (i.e. RCE FR, RMM-51, RMM-65, RCC Module, RCC Module  
0 feature specifics).

0 \*\*\*\*\*

0 NOTE: In the Rules/Calculations below, the NTZZ12CB has been  
0 changed FROM: NTZZ12CB TO: NTZZ12CC and all requirements for  
0 the NT6X1435 Cable have been REMOVED:

0 \*\*\*\*\*

## 0 LINE Frame

0 Line frames shall be provisioned for the RSC per ECM-619. In-  
0 cluded in this ECM is all question and calculations necessary to  
0 completely provision the line frame, shelves, circuits, and aux-  
0 iliary equipment. The result of calculations performed in  
0 ECM-619 are required here for RSC Power Distribution Center cal-  
0 culations.

0 9.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 - ELECTROMAGNETIC INTERFERENCE (EMI)

0 When the EMI option is specified for a RSC, all power  
0 equipment must reside in a Power Distribution Center  
0 (PDC) Frame. The RME may not be equipped with power fuse  
0 panels when the EMI option is specified. Reference all  
0 EMI hardware provisioning information in ECM-125.

0 - EARTHQUAKE INFORMATION

0 When provisioning the RSC for an Earthquake environment  
0 provision according to the following Market variables:

0 — Canadian Market - Provide the Universal Framework  
0 (NT0X25AH) for all frame types.

0 — U.S. Market - Provide the Earthquake Framework  
0 (NT0X25AH) for all frame types.

0 — Other framing requirements are defined by the Build-  
0 ing Studies organizations.

## 0 Dual RCC Software

0  
0 The following software information is provided for the Dual RCC  
0 feature only; for further software information on RSCs, refer to  
0 the appropriate NTPs and General Feature Descriptions.

### 0 Dual RCC ESA (DESA)

0  
0 Dual RCC ESA increases the line capacity from a maximum of 5,760  
0 lines to 11,520 lines while in ESA. The two RCCs coordinate their  
0 individual resources with one another by utilizing interprocessor  
0 messages over the digital links that connect the RCCs. The number  
0 of digital links between RCCs is engineered according to traffic  
0 characteristics, but a minimum of two is required.

0 This feature provides the capability for a line subscriber origi-  
0 nating off of an RCC to call a subscriber terminating off of the  
0 mate RCC while in DESA. When it is not possible to process a re-  
0 quest, because the call is destined for lines reached through the  
0 host or because features require host resources not available at  
0 either RCC, the subscriber will be connected to reorder tone.

0 Interswitching of calls while in ESA is possible since all calls  
0 between subscribers subtending one Remote Cluster Controller or  
0 its spouse (e.g., the other RCC) are completely processed within  
0 the dual configuration.

0 An emergency call (such as 0 or 911) that normally terminates at  
0 the host can be routed to a special termination specified in Ta-  
0 ble ESAPXLA. The TELCO can specify alternate routing, on a per  
0 RCC basis, for up to sixteen entries for POTS and a maximum of  
0 eight entries for each IBN customer group.

0 Automatic activation of dual ESA call control will occur whenever  
0 both RCCs have entered ESA and at least one messaging interlink  
0 is serviceable. Should only one RCC enter ESA, then interlink  
0 call processing will not be activated. Only intracalling will be  
0 possible.

0 RELEASE 28.01  
0 93 12 03  
0

0 An RCC will enter ESA when it has the correct datafill and can no  
0 longer message to the CC over its C-Side host links. This may be  
0 due to faults on its host links, or because the LTC/LGC is out of  
0 service for some reason.

0 The two RCCs in a Dual configuration communicate via the Inter-  
0 links. When an RCC in a Dual configuration enters ESA, it que-  
0 ries the other RCC as to whether or not the conditions for Dual  
0 ESA (DESA) are present. If DESA conditions are not present then  
0 the mate can be forced into ESA (BCS 27). If DESA conditions are  
0 present, then DESA is entered and interswitching can proceed. The  
0 conditions for DESA are:

- 0 1. Each RCC is in ESA.
- 0 2. DS1 Frame Synchronization is verified on the Interlinks.
- 0 3. Each RCC can message to the other via the Interlinks.

0 During ESA the host DMS switch will continually try to reestab-  
0 lish communications with both RCCs. Upon restoration of commu-  
0 nications, the host will exit the RCCs from ESA. If both RCCs  
0 are in a system or C-Side busy state and Office Parameter  
0 ESAEXIT is not zero, the system will automatically initiate  
0 ESA exit. Otherwise, manual exit will be necessary.

0 Exit from ESA will result in all intra- and intercalls being  
0 dropped. Typically, it will take approximately eight minutes  
0 to fully restore call processing per each RCC after exiting  
0 ESA.

#### 0 Dual RCC ESA Force Down Option

0 The Force Down Option is chosen via a flag in the IRLNKINV TABLE,  
0 where the interlinks are datafilled. If the flag is "y", then  
0 whenever one RCC in the Dual configuration enters ESA, the other  
0 also enters ESA. When an RCC enters Force Down, it sends a PM189  
0 info log to the CC with the text "FORCE DOWN", and simulates link  
0 faults on its host messaging links (C-Side link numbers 0 and 2).  
0 If these links are posted at the Carrier level of the Maintenance  
0 and Administration Position (MAP), they will show Remote Carrier  
0 Group Alarms (RCGAs).

0 RELEASE 28.01  
0 93 12 03  
0

0 If for some reason the RCCs can no longer message over the Inter-  
0 links during DESA with one RCC in Force Down, then the RCC which  
0 is in Force Down will start a timer. If Interlink messaging is  
0 not restored before the timer expires, then that RCC will stop  
0 simulating link faults, and exit ESA. If Interlink messaging is  
0 restored before the timer expires, then the timer is cancelled,  
0 and DESA is re-established. If after the timer expires and the  
0 RCC exits ESA, Interlink communication is restored, then the RCC  
0 will be forced into ESA again.

0 The reason for the timer is to avoid exiting Force Down due to  
0 bouncing interlinks. The amount of time that the RCC waits is  
0 determined by the office parameter RSC\_ESAENTRY\_BADLINK in table  
0 OFCENG, which is used to filter bouncing host links for ESA entry  
0 and defaults to 30 seconds.

### 0 9.3.2 SOFTWARE USAGE RESTRICTIONS

0

#### 0 Dual RCC Interlink Restrictions

0  
0 Interlinks can only be assigned in Table IRLNKINV if the port is  
0 not already equipped as a C-Side link, or allocated for dynamic  
0 trunks.

0 Each member of a trunk group in an RSC must belong to the same  
0 RCC. Also, Table IRLNKINV (interlink table) must be datafilled  
0 to establish a dual relationship between two RCCs before their  
0 route entries can be datafilled in Table ESARTE to use each other's  
0 trunk groups.

0 There will not be any Automatic Number Identification (ANI) out-  
0 pulsed for a line terminating on an Emergency Service Bureau  
0 (ESB) trunk on the spouse RCC.

0 Additionally, the office must be configured with package NTX152AB  
0 for trunk interswitching calls to work.

0 RELEASE 28.01  
0 93 12 03

## 0 POTS Call Limitations

- 0  
0 Dual RCC S/W adheres to the following limitations for POTS calls:
- 0 1. Only one Home Numbering Plan Area code will be supported  
0 per dual RCC configuration while in ESA mode.
  - 0 2. Billing information is not recorded while in ESA.
  - 0 3. No custom calling features are supported while in ESA.
  - 0 4. No dial tone speed measurements are taken while in ESA.
  - 0 5. Equal access features are not supported while in ESA.
  - 0 6. Foreign exchange calls are not supported while in ESA.
  - 0 7. All calls will be dropped during ESA entry and exit.

## 0 Dual RCC IBN Call Limitations

- 0  
0 Dual RCC S/W adheres to the following limitations for POTS calls:
- 0 1. Network Class Of Service is not supported for IBN lines.
  - 0 2. Custom calling features are not supported. EBS and Data  
0 Unit feature keys will not operate, flash is not recog-  
0 nized, no action will be taken when feature keys are  
0 pressed, and conferencing is not supported.
  - 0 3. All calls will be dropped during ESA entry and exit.

0  
0 RELEASE 28.01  
0 93 12 03

## 0 POTS/IBN Call Unsupported Services

0  
0 The following POTS/IBN line services are not supported in a Dual  
0 ESA mode:

- 0 1. Automatic lines (AUL) originating on one RCC and termi-  
0 nating on the spouse.
- 0 2. Calls originating on one RCC and terminating to a hunt  
0 group on the spouse. For BCS25 the originating sub-  
0 scriber will only be capable of terminating on the spouse  
0 if the group member that was associated to the DN by CC  
0 static data is idle (i.e. the group is not searched).

## 0 POTS/IBN Call Supported Services

0  
0 The following POTS/IBN line services are supported in a Dual ESA  
0 mode:

- 0 1. Basic line-to-line dialling: A subscriber can make calls  
0 to any other subscriber serviced within the dual RCC con-  
0 figuration.
- 0 2. Invalid termination is routed to reorder.
- 0 3. POTS Line Services Supported in a Dual ESA Mode of opera-  
0 tion are the same as those supported for a single RCC  
0 configuration while in ESA.
- 0 4. Supported Customer Services While in a Dual ESA Mode

0 In addition to the IBN customer group services sup-  
0 ported on a per RCC basis, five more are also sup-  
0 ported on a dual RCC configuration basis which are:

0

0  
0 RELEASE 28.01  
0 93 12 03

- 0 a. Only the treatments strip and translate (SRPXL A); and  
0 strip, second dial tone and translate (SRPDXLA) are  
0 supported using table ESAPXLA.
- 0 b. Direct outward dialling with or without second dial  
0 tone for terminating on a POTS line.
- 0 c. Denied incoming call for a station.
- 0 d. Termination to the primary directory number of a Mul-  
0 tiple Appearance Directory Number (MADN) group.
- 0 e. Origination by all lines within a MADN group.

0 5. Supported POTS Line Types While in a Dual ESA Mode

- 0 a. Single party flat rate.
- 0 b. Two party flat rate.
- 0 c. Four party flat rate without ANI.
- 0 d. Eight party flat rate without ANI.
- 0 e. Multi-party flat rate without ANI.
- 0 f. Individual message rate lines are treated as single  
0 party flat rate.
- 0 g. Coin dialtone first service with coin returned.
- 0 h. Coin coin first service with coin returned.
- 0 i. Semi-postpay coin service with no coin refund while  
0 in ESA.
- 0 j. Cutoff on disconnect option - cutoff relay is oper-  
0 ated for 300 milliseconds.
- 0 k. PBX message rate lines treated as PBX flat rate.

0 6. Supported IBN Line Types while in a Dual ESA Mode

0  
0 RELEASE 28.01  
0 93 12 03

0

0

a. Standard 500 and 2500 sets.

0

0

0

0

b. An IBN supported electronic business set is treated like a 2500 set with the primary directory number (PDN) as the directory number. Only the PDN and RELEASE keys are supported.

0

0

c. Only the primary directory number is supported for a data unit (i.e., no modem pool).

0

d. Attendant consoles are not supported.

## 0 Emergency Stand Alone (ESA)

0

0

0

0

0

The ESA software feature (NTX149AA) (lines only) in the RSC provides sufficient intelligence in the RSC to allow continued limited POTS service for intraswitched calls when the message DS-1 links to the host LGC/LTC are out of service, such as:

0

0

0

0

0

0

0

| SUPPORTED SYSTEMS             | NON-SUPPORTED SYSTEMS  |
|-------------------------------|------------------------|
| POTS calls (Intra-RSC)        | IBN Attendant Consoles |
| IBN Station calls (Intra-RSC) | Datapath               |
| IBN Business Set's            | Station features       |
| primary numbers               | Feature Activation     |

0

0

0

0

0

0

0

Up to 16 directory numbers or prefixes may be datafilled for special routing during ESA. Up to eight (8) prefixes or special numbers may be datafilled per IBN customer group for special routing during ESA. Calls in progress are taken down during entry to and exit from ESA. Billing info is lost for calls during ESA takeover. Local coin calls are free during ESA. No additional hardware is required for operation of the ESA feature.

0

0

ESA for both lines and trunks (NTX149AB) is scheduled for availability in BCS23.

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 Dual RCC ESA

0  
0 When both RSCs in a dual RCC configuration are in ESA mode, line  
0 and trunk intracalling within each RSC and line and trunk inter-  
0 switching between the RCCs via the DS1 interlinks are supported.  
0 If either RSC in a dual RCC configuration loses communication  
0 with the host, the customer will be given the option of having  
0 both RSCs enter ESA or of having one in ESA and the other in  
0 normal operation with interswitching not supported. Support for  
0 a dual RCC configuration with one RSC in ESA mode and the other  
0 RSC in normal operation with full interswitch capabilities cannot  
0 be provided currently.

## 0 NTX381AA Feature Remote-off-Remote

0  
0 \* General

0 This feature is currently available at BCS-23 in feature  
0 package NTX381AA and is compatible with the dual RCC. How-  
0 ever, each RLCM or OPM must still home on only one RCC. The  
0 number of remotes supported by two RCCs in a dual RCC config-  
0 uration is twice that supported by a single RCC. As is true  
0 now, loss can be inserted at the line card when either or  
0 both RSCs are in a remote-off-remote configuration.

0  
0 \* RLCM/OPM Off RSC

0 The Remote Off Remote feature provides for connecting an  
0 RLCM/OPM to the P-Side of an RCC which will provide the same  
0 features that are available to an LCM off the RCC.

0 The Remote-off-Remote configuration allows several smaller  
0 sites to be remotated off the site served by the RCC. This fa-  
0 cilitates the conversion of small offices to DMS-100, and  
0 with intraswitching the usage of DS-1 facilities is kept to a  
0 minimum. The same features that are provided for an RLCM off  
0 a Line Trunk Controller (LTC) (such as intraswitching, ESA,

0 RELEASE 28.01  
0 93 12 03  
0

0 RMM, and carrier maintenance) are supported on a RLCM off an  
0 RCC.

0 \* Intraswitching

0 Intraswitching provides the capability of switching calls at  
0 a remote location without requiring transmission back to the  
0 host. Both the RCC and the RLCM have line to line intra-  
0 switching capabilities which operate as follows:

0 1. For intraswitched line to line calls a loss of 0dB is in-  
0 serted. This loss value is valid for up to 100 miles on a  
0 line to line call. This feature supports a maximum dis-  
0 tance on intraswitched calls of 100 miles. Therefore, for  
0 intraswitching purposes the RCC and the RLCM must be  
0 within a distance of 100 miles from the host LTC.

0 2. Furthermore, the RLCM must be within 50 miles of the host  
0 RCC because an intraswitched call at the RLCM level could  
0 be blocked and then an attempt is made to intraswitch at  
0 the RCC level. This would result in a path of 100 miles  
0 (2 X 50) and is within the 100 mile limit. The same sit-  
0 uation occurs if a call is made between two RLCMs on the  
0 same RCC (See Typical Remote-Off-Remote Configuration di-  
0 agram).

0 \* Emergency Stand Alone (ESA) Issues

0 Both the RCC and the RLCM have ESA capabilities. Entry into  
0 ESA occurs when communication to the host node is lost. Se-  
0 veral points are of special importance when considering RCC  
0 and RLCM ESA entrance and exit:

0 - It is the breaking of the PM's message links or the ina-  
0 bility of a host processor to return the ESA looparound  
0 message that triggers ESA entrance. Both the CC and the  
0 RCC (when in ESA mode) can return the looparound message.  
0 So as long as the RLCM can talk to either of these it  
0 does not enter ESA.

0 - The RLCM cannot exit ESA if the RCC is still in ESA. This  
0 is because the RLCM ESA exit involves a system Return to  
0 Service (RTS) of the RLCM and this cannot be handled by  
0 the RCC resident software.

0 - The RLCM\_ESAENTRY\_BADCSIDE timeout control in table  
0 OFCENG, has to be long enough to prevent the RLCM from

0  
0 RELEASE 28.01  
0 93 12 03

0 entering ESA while its C-Side modules (CC-LTC-RCC) are  
0 performing a restart.

0 \* Software Interdependencies

0 The RSC Remote Off Remote feature is provided in feature  
0 package NTX381AA. Package NTX381AA requires the following  
0 packages :

0 9.3.3 MEMORY PROVISIONING

0  
0 Refer to MEMCALC for Host Office Memory Requirements as they re-  
0 late to the Host Based Remote Switching Center (RSC) software.

0 9.4 REAL TIME IMPACT

0 Refer to MEMCALC for Real Time provisioning requirements.

0

0

0

0

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 10.0 International RSC-S Provisioning

0 The International Remote Switching Center - SDH (RSC-S ) provides remote lines from medium to large size remotes (240 lines single RSC-S configuration up to 8000 lines dual RSC-S configuration).

0 (SDH stands for Synchronized Digital Hierarchy).

0 The International RSC-S configuration terminates in the host to Line Group Controller with up to 16 PCM-30 links.

0 The CRSC cabinet consists of a Frame Supervisory Panel (FSP), a Line Concentrating Module Enhanced (LCME), a Remote Maintenance Module (RMM), a one shelf (main shelf) Remote Cluster Controller (RCC2), and a Cooling Unit (CU). A single CRSC cabinet can support up to 480 lines (maximum 216 ISDN lines).

0 The extension cabinet (CEXT) will be used to expand the capacity of the CRSC. It consists of a Frame Supervisory Panel (FSP), a Line Concentrating Module Enhanced (LCME), a Remote Maintenance Module (RMM), a RCC2 Extension Shelf (EXT), and a Cooling Unit (CU).

0 One CEXT can support 2 CRSC cabinets.

0 Both the CRSC and the CEXT use the "Streamline" cabinet.

0 The International RSC-S hardware differs from the North American RSC-S as follows:

- 0 - PCM30 Packlet,
- 0 - New coaxial Bulkhead,
- 0 - Coaxial cabling,
- 0 - Inclusion of International LCME and RMM.

0 The RSC-S default color will be FiberWorld Grey. Codes for providing DMS brown equipment will be added as soon as available.

0 The issue04 of this ECM introduces brown door kit, frame fail lamp and cable trough.

0 RELEASE 28.01  
0 93 12 03

0 The International Remote Switching Center - SDH (RSC-S) shall be in-  
0 troduced in three (3) phases. These phases and a tentative schedule  
0 are detailed as follows:

0 Phase 1 (V.O. BCS-34) :

|                                                              | General Availability | Market |
|--------------------------------------------------------------|----------------------|--------|
| 0 - Basic CRSC with RCC2+ shelf                              | 3Q92/BCS-35          | UK     |
| 0 - CEXT with EXT shelf                                      | 3Q92/BCS-35          | UK     |
| 0 - ESA                                                      | 3Q92/BCS-35          | UK     |
| 0 + labelled -"CPM" in the Commercial Specification (Ref. 1) |                      |        |

0 Phase 2 (V.O. BCS-35) :

|                           |             |    |
|---------------------------|-------------|----|
| 0 - Metering RSC-S        | 1Q93/BCS-36 | UK |
| 0 - Dual RSC-S (P-side)   | 1Q93/BCS-36 | UK |
| 0 - 800 Km Host to Remote | 1Q93/BCS-36 | UK |

0 Phase 3 (V.O. BCS-36) :

|                       |             |        |
|-----------------------|-------------|--------|
| 0 - Int'l POTS RSC-S  | 3Q93/BCS-37 | T.B.D. |
| 0 - DFI Capability    | 3Q93/BCS-37 | T.B.D. |
| 0 - Remote off Remote | 3Q93/BCS-37 | T.B.D. |

0 It should be noted that the Int'l roll-out is one BCS later than the  
0 domestic RSC-S roll-out and the hardware introduction is to be syn-  
0 chronized with the BCS release. This plan addresses hardware roll-  
0 outs for Phase 1 only (i.e. BCS-34). Phase 2 and 3 which will be  
0 funded by separate DA's (Development Agreements) will be covered in  
0 separate stand-alone plans later.

0 10.1 HARDWARE PROVISIONING

0

0 10.1.1 HARDWARE USAGE RESTRICTIONS

0

0 International RSC-S Hardware Usage Restrictions are as follows:

- 0 - The Maximum Cable Distance Between the RCC2 Shelf located  
0 on the CRSC Cabinet and the EXT shelf located on the CEXT  
0 Cabinet is 20 feet.
- 0 - The RSC-S Maximum Distance from the Host to the farthest  
0 remote off the RCC2 is 150 miles.
- 0 - Max 10 LCMs and 2 LCMEs are provisionable on the P-Side  
0 links of the RCC2. (P-Side links not functional in Phase I)
- 0 - CDO or PBX trunks may be assigned only on the first  
0 20 P-Side PCM30 links on RCC2. (P-Side links not functional  
0 in Phase I).
- 0 - Connection to the Packet Handler is from the RCC2  
0 C-side. Rules in this NTP support this configuration  
0 only. Support for P-side connection will be added  
0 when the ECM for RCC2 is produced.
- 0 - The RCC2 P-Side Ports may be allocated as follows:  
0 (P-Side links not functional in Phase I)
  - 0 - PCM30s are allowed on links 0-21 and 24-47.
  - 0 - DS-30A Links may be defined on Links 22 thru 53,  
0 where links 22 and 23 are reserved for the Remote  
0 Maintenance Module (RMM).
  - 0 - PCM30 Trunking to CDO/PBX facilities is limited to a  
0 combined total of 8 PCM30s. These PCM30s may be  
0 allocated between CDO/PBX in any numerical  
0 configuration not to exceed 8.

0

0 10.1.2 HARDWARE DEPENDENCIES

0  
0 The NTMX82AA requires a communication path using the NT6X27BA  
0 circuit pack to communicate with a host peripheral (LGC0).

0 DISCRIMINATION NUMBERING

0  
0 Not Applicable

0

0 RELEASE 28.01  
0 93 12 03

0 10.1.3 PROVISIONING CONSIDERATIONS

0  
0 The International RSC-S may be deployed in a Single Cabinet Con-  
0 figuration by providing the CRSC only and powering it from the  
0 Power Board. A kit containing power cable, filter adapters,  
0 straps, etc. must be provisioned for this application to equip  
0 the CRSC Offshore. This kit is NTMX8943.

0 The International RSC-S also may be provisioned in a Multi-  
0 Cabinet Configuration consisting of the CRSC, CPDC, CLCE, CMIS,  
0 MCSS, and CEXT Cabinets.

0 The introduction of the RSC-S Office Conversions will allow flex-  
0 ibility for the International market. The new equipment must be  
0 fully installed and commissioned before the conversion process  
0 begins. As part of the RSC-S conversions process, development was  
0 undertaken at BNR to support the System Level Interconnect re-  
0 quirements necessary for the standard International RSC office  
0 conversion to RSC-S using both the cabinets and 7ft frames. The  
0 CA Drawings will support all the interconnect cables developed  
0 for the RSC-S conversions.

0 The CRSC cabinet would be required in all applications. The CEXT  
0 cabinet would only be needed if the CRSC could not carry the re-  
0 quired amount of ports needed for the office. The CRSC cabinet  
0 will conserve floor space and offer international LCM POTS and  
0 ISDN with the option of using existing LCE and LCEI 7ft frames.

0 Also, the CRSC and CEXT will accept power from existing PDC as  
0 well as a newly installed CPDC cabinet. The NTMX89 and NTMX88  
0 products will require an external power filter module kit  
0 (NTMX8943) when using a 7ft PDC frame for powering.

0 All RSC-S configurations will comply with the ISG rules for  
0 Grounding (ref. DSZX16CA, ISZX16CA, 'Cabinetized DMS-100 Family  
0 Power and Grounding' documents).

## 0 Remote Cluster Controller Offshore2 (RCC2)

0  
0 Provisioning the RCC2 is described below in terms of Always Pro-  
0 vided (AP) CPs and Provisionable (PROV) CPs.

0 Slots 12, 14 and 16 may be equipped with a D-Channel Handler  
0 (BX02AA) or PCM Quad Carrier CP (MX87AA). The MX87AA may be  
0 equipped with up to four "packlets" which may be dual PCM30  
0 (MX82AA) or a filler plate (MX83AA).

0 Unequipped provisionable slots (4,5,7,12,14,16,22-24) must be  
0 equipped with filler plates.

## 0 RCC2 Unit 0 Physical Layout

0 RELEASE 28.01  
0 93 12 03

# 0 Provisioning Host Interface

0  
0 The C-Side interface is provided via up to sixteen PCM30 links.  
0 These links provide up to 512 Channels for host traffic.  
0 The two Quad Carrier packs and the first PCM30 packet on each  
0 are Always Provided using building block NTZZ37JA.  
0 Additional PCM30 packets for C-Side links are Provisionable.

0 The host peripheral module must be equipped with Common Circuit  
0 Pack Fills per BCS-33 standards. The host controller must be a  
0 LTCI if the RCC2 terminates CDO or PBX trunks and may be a LGCI  
0 if the RCC2 terminates lines only. The ISDN capability of LTCI  
0 and LGCI controllers is not required by the RCC2.

## 0 The Extension (EXT) Shelf

0  
0 The Extension Layout is as follows:

0

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Note:

0 The Extension Shelf is actually two functional modules on a  
0 single card cage, where slots 1-13 constitute module zero and  
0 slots 14-26 make up module one.

0 Each module is further broken down into two logical units (0 &  
0 1) which provide redundancy. Each module on the EXT shelf is  
0 provisioned independently. The left module is provisioned in  
0 support of the first RCC2 shelf and the right module is provi-  
0 sioned to support the second RCC2 shelf.

0 Like slots 12, 14, and 16 on the RCC2 Shelf, the EXT shelf  
0 slots 4, 6, 8, 19, 21, and 23 may be equipped with a D-Channel  
0 Handler (BX02AA) or PCM Quad Carrier CP (MX87AA).

0 Provisionable slots not equipped with a circuit pack must be  
0 equipped with the NT0X50AA Filler Face Plate.

## 0 RSC-S Service Circuits

0  
0 Please refer to the Engineering Manual Inserts.

## 0 RSC-S Subscriber Lines

0  
0 The RSC-S supports POTS, MDC and ISDN subscriber lines via the  
0 Always Provided LCME modules in the CRSC and CEXT and the CLCE  
0 Cabinets. LCMS must be provisioned if coin lines are required.  
0 LCMEs can support NT6X18 line card types only if they are not  
0 configured as high voltage lines (Coin,ANI,etc.).

0 Phase 1 limits ISDN modules to the CRSC and CEXT only. Ten (10)  
0 LCMS max are provisionable in five (5) CLCE cabinets for a Mono  
0 RSC-S configuration for Phase 1. (double this for a Dual RCC2 in  
0 Phase 2) All line card types with the exception of coin lines are  
0 provisionable on the ISDN line drawer. The ISDN line card cannot  
0 be mounted in a POTS line drawer/LCM.

## 0 RSC-S Miscellaneous Equipment

0  
0 Limitations placed on this equipment was not completed in time to  
0 make this release. Refer to API-251 for CMIS provisioning.

0 Provision the MCSS per Telco requirements for Spare Card storage.

0 Note:  
0 An NTMX87 must be provisioned as required to store spare PCM30  
0 packets.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 10.1.4 OFFICE LAYOUT INFORMATION

0  
0 The CPDC will be used to power RSC-S lineups for all applications  
0 except the standalone CRSC configuration. The CPDC must be the  
0 first cabinet in any lineup it powers. Therefore, when providing  
0 a standalone CRSC in an office that will ultimately grow to re-  
0 quire additional cabinets (CLCE,CEXT,etc.), space should be left  
0 for the CPDC to be the first cabinet in the lineup.

0 RSC-S lineups will not exceed eleven cabinets. As office config-  
0 urations are determined, this restriction will be reviewed.

0 CRSC and CEXT cabinets must be located so that the DS60 cables  
0 between them do not exceed twenty feet in length. Since one CEXT  
0 can support two CRSCs, in Dual configurations, each CRSC would  
0 need to be within 20 feet of the CEXT (assuming both CRSCs re-  
0 quire CEXT facilities).

0 See above, the Section on Provisioning Considerations, also.

0 10.2 PRODUCT/SYSTEM SPECIFICATION

0

0 10.2.1 PHYSICAL CHARACTERISTICS

0

0 The issue of Circuit Protection and Grounding must be addressed  
0 as follows:

0 - Circuit Protection

0 Any wire or wire pair other than battery supply or ground which  
0 is connected to the RSC-S and leaves the building must be pro-  
0 tected against lightning by suitable arrestors.

0 PCM30 input and output ports will be protected against the fol-  
0 lowing conditions:

0 1. Shorts to ground, input to output, and across the pair.

0 2. DC voltages: +/- 100 VDC with respect to ground, and  
0 +/- 60 VDC between the leads.

0 3. AC voltage to 110 VAC 50/60 Hz with respect to ground

0 - Grounding

0 All RSC-S configurations will incorporate the grounding systems  
0 as specified in the DMS-100F Technical Specification. Grounding  
0 methods will comply with Isolated System Grounding rules.

0 - Fuses

0 In the RCC2 shelf there are fuses on individual packs. Their  
0 value will be added once the design is complete.

0 10.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 All EMI/Earthquake requirements are integral to the cabinet.

0 10.2.3 SPARING INFORMATION

0  
0 The MCSS Cabinet shall be supplied to house spare circuit packs.  
0 Standard sparing algorithms apply.

0 The following packs are considered critical spares for the RCC2  
0 and EXT shelves:

0 RCC2 : NTMX72AA, NTMX73AA, NTMX74AA, NTMX75AA,  
0 NTMX77AA, NTMX82AA, NTMX87AA, NT6X92CA/BB,  
0 NT6X69LB, NTB01AB  
0 Also, if provisioned : NT6X78AA  
0 NTB02AA

0 EXT : NTMX79AA  
0 Additional NTMX82AA, NTMX87AA and NTB02AA  
0 should be provided if used on the EXT shelf.

0 11.0 Small Remote Unit

0 The Small Remote Unit (SRU) is a cabinetized DMS-100 remote whose  
0 hardware and software are based on the DMS Series-II peripherals. The  
0 SRU is a hybrid product, merging the LCME subscriber ISDN access capa-  
0 bility with the remote maintenance and host interface deployment capa-  
0 bilities of the Remote Line Concentrating Module (RLCM).

0 The SRU provides remote access for up to 240 subscriber lines. It  
0 communicates with a DMS-100 Host using PCM30 links. The service pro-  
0 vided by the SRU on the subscriber lines can be a mix of POTS,  
0 Centrex, and eventually ISDN to be delivered via the SRU Phase2 pro-  
0 gram. The SRU does not support a Trunk interface.

0 The SRU's most significant feature is that it is intended to be lo-  
0 cated in a customer premises environment. The design objectives are  
0 to make full use of the existing DMS-100 hardware. The major elements  
0 housed in the SRU cabinet are:

- 0 - Duplicated SRU control units, LCME based.
- 0 - Up to 4 2B1Q Line Drawers.
- 0 - Host Interface using PCM30 or DS1 links.
- 0 - Remote Maintenance Unit.
- 0 - Duplicated Ringing.
- 0 - Frame Supervisory Panel.
- 0 - Cooling Unit (fans).
- 0 - AC to DC rectifier (optional).
- 0 - Battery Charging Unit and batteries (optional).
- 0 - EMI terminations.

0 The SRU is packaged in a cabinet.

0 The SRU is currently engineerable for the U.K. market only.

0 Note:

0 Software is currently unavailable for the SRU to function in the do-  
0 mestic market. Domestic market software for the SRU may be available  
0 at a later date. Additionally, software is currently unavailable to  
0 provide the ISDN-BRI functionality for the SRU. ISDN-BRI is the key  
0 deliverable for the SRU Phase 2 program, currently in the early plan-  
0 ning stages. This program's Gate 0A is planned for 2Q 1993.

RELEASE 28.01  
93 12 03

FIGURE 1: DMS view of SRU.

## 11.1 HARDWARE PROVISIONING

### 11.1.1 HARDWARE USAGE RESTRICTIONS

The SRU meets the same host to remote distance requirements as the existing IRLCM remote, ie., 150 miles. Three (3) factors

0 RELEASE 28.01  
0 93 12 03

0 have to be considered in order to extend the host to remote dis-  
0 tance to 500 miles. They are:

0 ECHO: A loss has to be inserted in the transmission path in or-  
0 der to reduce echo. For countries with less than 6dB loss,  
0 echo cancellor devices are required. For countries with a  
0 loss of greater than 6 dB, ie., UK, echo will not be a prob-  
0 lem.

0 PROPAGATION TIME: The messaging time on the links increases as  
0 the host to remote distance increases. This reduces the num-  
0 ber of Call Attempts per Second that the remote can handle.

0 TRANSMISSION ERRORS: As the distance between host and remote in-  
0 creases, the quality of the transmission media becomes very  
0 important. Every errored message has to be re-transmitted and  
0 results in reduced call processing capacity.

0 PCM30 Line Drawer is not supported.

0 PCM30 repeaters and Lightning arrestor are not housed in the  
0 SRU cabinet. There is also no backup rectifier.

0 Please note that for British Telecom (UK market) applications, NT  
0 has worked with the customer to demonstrate extended range ap-  
0 plications with the SRU. This is based on the BT Transmission  
0 Plan and is not applicable to other customers. Upto approxi-  
0 mately 1000 miles has been demonstrated for BT. The UK pre-  
0 pared Engineering Guidelines for ACD indicated positive BER  
0 results for improved SRU capability with upto 10mSec transit  
0 delay. Also, for Centrex applications testing was performed to  
0 demonstrate the current level of extended range performance  
0 (using typical traffic rate figures).

0 11.1.3 PROVISIONING CONSIDERATIONS

0  
0 The SRU integrates into the overall DMS architecture in the same  
0 manner as a Remote (ie IRLCM) (ref. Figure 1). The SRU can be  
0 provisioned to provide:

- 0 - Cabinetized SRU for end User premises (AC powered (rectifier)  
0 with or without battery back-up).

RELEASE 28.01  
93 12 03

- Cabinetized SRU for Telco premises (DC powered without battery back-up).

The SRU consists of six (6) basic functional blocks; these are:

- the Host Interface Unit (HIU)
- duplicated SRU Control Units (SRU)
- Ringing Unit
- Line Drawers
- Remote Maintenance Unit (RMU)
- Power Supply Unit (PSU)

FIGURE 2: SRU Architecture.

The SRU cabinet has a front door to allow access to the equipment installed inside. Opening of the front door reveals a frame. This frame contains a Cooling unit, Service & Interface, LCME & FSP shelves. An optional Battery Charging Unit (BCU) and a Rectifier is mounted on the right hand side inside the SRU cabinet. Battery strings are mounted in two trays at the bottom of the SRU Cabinet. Each Battery string consists of four Batteries. Above the Battery trays, a connector field is provided. Basic functions of each equipment are described below.

- Cooling Unit: This contains an air filter and fans to force air cool the SRU equipment.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - Service & Interface Shelf: This contains the circuit packs for  
0 the Host Interface Unit (HIU), the Remote Maintenance Unit  
0 (RMU), one of SRU Control Unit (SCU) and two Ringing Genera-  
0 tors.
- 0 - SCU Shelf. This shelf contains the other SCU and contains four  
0 (4) line Drawers.
- 0 - Frame Supervisory Panel: This contains the power distribution  
0 and a visual power frame fail indicator.
- 0 - Battery Charge Unit. This unit provides the capability to  
0 charge each battery string either under the control of the  
0 craftperson, or automatically by the system.
- 0 - Rectifier: This provides AC to DC power conversion.
- 0 - Batteries: Two battery strings can be housed in the SRU cabi-  
0 net, to provide power backup. Each battery string is good for  
0 two hours.

0 All external connections to the SRU are made at the connector  
0 field located in front and just below the Cooling Unit and behind  
0 the protective cover. The connector field contains 3 areas. The  
0 first, for PCM30 connection to the Host; the second, for Tip-Ring  
0 pairs, each connector having 25 pair; the third, for either an AC  
0 inlet or with -48 vdc A and B feeds. In addition a Frame Ground  
0 connection is provided.

0 The Cabinetized SRU for Telco premises need not be equipped with  
0 battery back-up, a Rectifier (Telco to provide -48 Vdc power), or  
0 a RMU as the Remote Maintenance Unit packs can be provided by the  
0 MTM (if co-located with a DMS).

0

0

0

0

0

FIGURE 3: Small Remote Unit (NT8X95AB) Equipment Location

Host Interface Unit

The Host Interface Unit (HIU) provides the interface from the SRU to the DMS100 host. The HIU is power spared from both SRU Control Units (SCU) - it gets power from both SCUs. The HIU requires +5Vdc, +12Vdc, and -12Vdc for the power. The HIU consists of up to three (3) NT6X27 packs and two (2) NT6X73 packs.

0 RELEASE 28.01  
0 93 12 03

0 PCM30 INTERFACE CARD (NT6X27BB)

0 This card provides two (2) 2.048 Mbits/s PCM30 interface between  
0 the host and the SRU. Total of six (6) PCM30 interface ports are  
0 provided by the SRU. The SRU requires a minimum of two (2) PCM30  
0 links to the host. These links are designated as primary links  
0 and must terminate on a different PCM30 card on the SRU and the  
0 Host. Therefore, provide a minimum of two (2), maximum of three  
0 (3) NT6X27BB CPs for the SRU (depending on traffic requirements).

0 The LCME portion of the SRU requires two (2) message channels to  
0 the Host. These channels occupy ch#16 on each primary PCM30  
0 link. When a Remote Maintenance Equipment (optional) is pro-  
0 vided, it also requires a message channel on each of the primary  
0 PCM30 links, otherwise these channels are available for call  
0 processing. Failure of one of the primary PCM30 links results in  
0 the LCME portion of the SRU to go into TAKEOVER and force the  
0 LCME and RMU to use the remaining primary PCM30 link.

0 PCM30 LINK CONTROL CARD (NT6X73BA)

0 This card acts as the messaging interface and provides data rate  
0 conversion between the SCU, RMU, and the PCM30. It also acts as  
0 the clock source for the SRU.

0 Provide two (2) PCM30 Link Control Cards per SRU.

0 SRU Control Unit (SCU)

0  
0 The SCU is based on the existing ISDN LCM Controller (LCME).  
0 There are two SRU Control Units, and each SCU consists of a  
0 processor (NTBX34), two digroup controller (NTBX35) and a new  
0 power converter (NT8X99). There is a total of four (4) circuit  
0 packs per SCU.

0 In normal operation each SCU handles service for the lines in its  
0 own two line drawers. In the event one SCU fails, the remaining  
0 working SRU will handle service to all the lines. Each SCU unit  
0 requires +15 Vdc and +5 Vdc for power, and is power spared from  
0 the other SCU unit.

0

0 RELEASE 28.01  
0 93 12 03

0 Always provide one (1) SRU Common CP Fill NT8X95AQ per SRU. The  
0 NT8X95AQ provides two (2) NTB34CA, four (4) NTB35CA, two (2)  
0 NT0X50AC and two (2) NT8X99AB circuit packs; half in SCU-0, half  
0 in SCU-1. The function of each of these cards are outlined be-  
0 low.

0 LCME Processor (NTB34CA)

0 This card is responsible for processing associated with scanning  
0 the line cards for calls, setting up call connections through the  
0 digroup controller card (NTB35) and DMS-X messaging with the  
0 Host. This card also carries out background tasks for diagnos-  
0 tics.

0 LCME Diagroup Controller (NTB35CA)

0 This card provides time switching for external and internal chan-  
0 nel assignments, and provides digital loop around paths. It also  
0 interface with the Link Control Card (LCC) and the Line Drawers.

0 LCME Power converter (NT8X99AB)

0 This circuit pack provides +5v dc to the NTB34 and the two  
0 NTB35s for its own SCU, and provides +15v dc to the Line Drawers  
0 and has the capability to power the mate SCU for power redun-  
0 dancy.

0 This pack also contains the Ring, ANI and Coin  
0 detector/multiplexer circuit, and in addition, has isolating di-  
0 odes for serving the Line Drawer voltage needs.

0 Ringing Unit.

0  
0 Two Ringing Generators (RG) NT6X60 are used in the SRU. The  
0 NT6X60 Ringing Generators do not provide ANI and COIN voltages  
0 for Subscriber lines.

0 Provide 0, 1, or 2 Ringing Generators per SRU to be used with  
0 POTS line cards.

0 Provide the NT6X60GA Ringing Generator for U.K. applications.

0 RELEASE 28.01  
0 93 12 03

0 Provide the NT6X60EA Ringing Generator for Australian applica-  
0 tions.  
0 No Ringing Generators will be required when the SRU is installed  
0 with ISDN line cards only (following Phase 2 completion).

0 Line Drawer (NTBX32BA)

0  
0 This is a 2B1Q Enhanced Line Drawer, which provides the means to  
0 house a 2B1Q Bus Interface Card (NTBX36), a Point of Use Power  
0 Supply (PUPS) (NTBX71) and up to 60 application specific line  
0 Cards. Provide up to four (4) Line Drawers (depending on the  
0 need). Refer to the Engineering Manual for more information on  
0 configuring line cards on the NTBX32BA line drawers.

0 2B1Q Bus Interface Card (NTBX36)

0 The 2B1Q Bus Interface Card (BIC) provides interface between the  
0 SCU and up to 60 line Cards. The principal functions of the BIC  
0 are to scan line cards for change in state, communicate with the  
0 LCME processor (NTBX34), D-channel multiplexing/demultiplexing &  
0 time switching, PUPS voltage supervision, ringing voltages con-  
0 trol, and activity switching.

0 PUPS (NTBX71)

0 The Point of Use Power Supply (PUPS) occupies 4 line card slots  
0 in a two-by-two configuration. The PUPS converts the -48v Battery  
0 to +5v supply, which in turn is used to power the line Cards.

0 Line Cards

0 Line card that can be housed in the Line Drawer depends on the  
0 type of service required and the country in which the SRU will be  
0 used. POTS, CENTREX and ISDN lines should be equally divided be-  
0 tween the Line Drawers.

0 Following is a list line cards that is used in the Australian and  
0 United Kingdom markets. Further details regarding each card may  
0 be obtained from the Engineering Manual, section EMA14-03-000.

| 0 ISDN      | NTBX26AA  | NTBX26AA (T I/F)     |
| 0           | NTBX27AA  | NTBX27AA (U I/F)     |

0 The NT6X17BA is currently available for all POTS applications on the  
0 SRU.

0 (NT6X17BA: World Line Card Type 'A')

0 Note: ISDN capability has not yet been delivered for the SRU.

0 Note: ISDN capability is planned for SRU Phase 2 program (ISDN-BRI)

0 Note: NT6X76AD Hayes Supported Asynchronous Line Cards is to  
0 replace NT6X76AC AILC.

0 Note: NT6X71BA Single Slot Data Line Card replaces NT6X71AB  
0 for offices with BCS-32 or higher.

#### 0 Remote Maintenance Unit (RMU)

0  
0 The RMU is based on the existing Remote Maintenance Module (RMM)  
0 that is used in the IRLCM/RLCM/RSC. The RMU, like the RMM, is a  
0 modified cost -reduced Trunk Module (TM). The RMU supports line  
0 maintenance, Scan points and Battery Charge Unit (BCU). The BCU  
0 is optional on the SRU. The Remote Maintenance Unit (RMU) con-  
0 sists of the following circuit packs:

##### 0 RMM Control Card (NT6X74)

0 This card provides processor, memory and I/O functions.

##### 0 Metallic Test Unit (NT4X97AA & NT4X98BB)

0 These cards are used to perform maintenance tests on the sub-  
0 scriber loops or the line cards. Provide one of each circuit  
0 pack (per SRU) if Metallic Testing is required.

##### 0 Miscellaneous Scan Detector Card (NT0X10AA)

0 RELEASE 28.01  
0 93 12 03

0 There are 14 scan detector circuits on this card, each of which  
0 may be configured as a loop, ground or battery detector. Provide  
0 one (1) (per SRU) if scan points are required.

0 Metallic Test access card (NT3X09BA) - Optional with BCU

0 This card provides 8 by 8 two wire metallic matrix for cross con-  
0 nection between the test equipment, test card, line and line  
0 card. Provide one (1) NT3X09BA (per SRU) if MTA is required.

0 Group Codec card (NT2X59) & Test Trunk card (NT2X90)

0 These packs can be provisioned on the RMU.

0 The following PECs for the Group Codec card can be provided for the  
0 following markets:

| 0 | PEC      | Market      |
|---|----------|-------------|
| 0 | -----    | Application |
| 0 | -----    | -----       |
| 0 | NT2X59AA | Domestic    |
| 0 | NT2X59BA | Turkey      |
| 0 | NT2X59CA | U.K.        |
| 0 | NT2X59DA | CEP*        |

0 \* The CEP (Caribbean Expansion Plan) CODEC was developed for  
0 Offshore markets. The NT2X59DA is used in the Australian  
0 market as well.

0 Power Supply Unit.

0 The SRU can be powered from external -48v DC supply. For reli-  
0 ability, both A & B feed are provided. DC power to each DC/DC  
0 converter in the SRU is controlled by the Frame Supervisory  
0 Panel, NT8X96AB, using circuit breakers.

0 Optionally the SRU may be powered from 240 Volt AC main. Provide  
0 one (1) NT5C06CA-1 Rectifier for the AC input. Batteries can  
0 also be housed in the SRU. This is done to provide power backup  
0 in the event either the AC power or rectifier fails. Provide  
0 A0376779 YUASA Batteries (quantity of 8) if this option is re-

0 RELEASE 28.01  
0 93 12 03

0 requested. Each string of batteries (quantity of 4) provide two  
0 hours of back-up power.

0 Where batteries are equipped then a Battery Charging Unit (BCU),  
0 NT8X02AA, shall also be provided. The BCU enables the batteries  
0 to be either automatically charged or under the control of a  
0 craftsperson. The batteries provide power back-up for up to 4  
0 hours (two hours per string).

0 Frame Supervisory Panel (NT8X96AB)

0 This unit provides -48v dc distribution to the equipment used in  
0 the SRU, provides Talk Battery filter and detection of DC/DC  
0 power converter failures. The FSP has 6 circuit breakers. The FSP  
0 provides the Automatic Recovery from Low Battery (ARLB) feature  
0 (through the NT6X36AF ARLB FSP Alarm Card CP) which prevents the  
0 circuit breakers on the FSP from tripping in case of low battery  
0 supply. This eliminates the need for a craftsperson to manually  
0 re-set the breakers on site.

0 Battery Charging Unit (NT8X02AA)

0 This unit enables the system and craftsperson with the ability to  
0 charge, determine the status of each battery string and also pro-  
0 vides low voltage disconnect. Provide one unit when batteries  
0 are provided.

0 Administration, Maintenance and Operations

0  
0 The SRU is an integral part of the host DMS-100 Office. It is  
0 centrally administered and maintained by the DMS-100 system from  
0 the MAP located at the host site. MAP access from a remote SRU  
0 site by using a dial up procedure currently established for DMS  
0 remotes, using modem on a working line.

0 For the SRU, the DMS supports integrated administration and main-  
0 tenance consistent with that for the LCME, but with the following  
0 additional facilities:

0 Remote maintenance and diagnostics  
0 Monitor SRU Alarms.  
0 Carrier Alarms

0 RELEASE 28.01  
0 93 12 03

## 0 Traffic Engineering

0  
0 Traffic engineering rules for SRU are different from that of the  
0 LCME, as the number of lines and p-side channels is different.  
0 The SRU provides up to 180 p-side channels for call processing.  
0 Out of these channels, 2 are used by the SRU Control Unit and 2  
0 by the RME. It must be noted that the SRU design is limited to  
0 maximum of 6 PCM-30 links to the host.

0 The following table presents approximate LCME line drawer load  
0 service for ISDN only, and mix service applications for the SRU.

|   | No of lines |      |         | PCM-30 links req'd | ccs achieved   |
|---|-------------|------|---------|--------------------|----------------|
|   | ISDN        | POTS | CENTREX | (@8ccs for ISDN)   | (with 6 links) |
|   | -----       | ---- | -----   | -----              | -----          |
| 0 | 240 (100%)  | 0    | 0       | 7                  | 6.44           |
| 0 | 216 (90%)   | 0    | 0       | 6                  | 7.76           |
| 0 | 192 (80%)   | 0    | 0       | 6                  | 9.41           |

|   | No of lines |           |          | PCM-30 links req'd |
|---|-------------|-----------|----------|--------------------|
|   | ISDN        | POTS      | CENTREX  |                    |
|   | -----       | ----      | -----    | -----              |
| 0 | 216 (90%)   | 12 (5%)   | 12 (5%)  | 6                  |
| 0 | 192 (80%)   | 24 (10%)  | 24 (10%) | 6                  |
| 0 | 168 (70%)   | 48 (20%)  | 24 (10%) | 6                  |
| 0 | 144 (60%)   | 72 (30%)  | 24 (10%) | 5                  |
| 0 | 120 (50%)   | 96 (40%)  | 24 (10%) | 5                  |
| 0 | 96 (40%)    | 120 (50%) | 24 (10%) | 4                  |
| 0 | 72 (30%)    | 144 (60%) | 24 (10%) | 4                  |
| 0 | 48 (20%)    | 168 (70%) | 24 (10%) | 3                  |
| 0 | 24 (10%)    | 192 (80%) | 24 (10%) | 3                  |
| 0 | 0 (0%)      | 216 (90%) | 24 (10%) | 2                  |

0 The above calculations are based upon the following assumptions,

- 0 - nailed connections on 10% ISDN lines
- 0 - 5% blocking (Grade of Service = 0.05)
- 0 - Traffic rate for ISDN = 8ccs
- 0 - Traffic rate for POTS = 6ccs
- 0 - Traffic rate for CENTREX = 6ccs

0

0 RELEASE 28.01  
0 93 12 03

0 11.1.4 OFFICE LAYOUT INFORMATION

0  
0 The SRU requires a minimum of 54" clearance at the front.

0 The maximum floor loading requirement is 4.5 kN applied with 50mm  
0 disc at a point.

0 For CPE installation, cables can be run down a wall and along ei-  
0 ther side of the SRU (behind the cover). For central office use,  
0 the pagoda top can be removed and the cables run to the top EMI  
0 bulkhead. Since the extra space at front in the case of wall in-  
0 stallation is needed in order to pull the SRU cabinet forward to  
0 be able to access the rear, leave enough cable slack so this can  
0 be done without disconnecting any cables, thereby minimizing ser-  
0 vice impact.

0 Though Installation Engineering recommends that the SRU not be  
0 placed against a wall, it accepts that this is sometimes a cus-  
0 tomer requirement. In such a situation, it is necessary that  
0 guidelines be followed to minimise the risk of outage during  
0 maintenance or upgrade.

0 When space limitation dictate that an SRU be positioned against a  
0 wall, the cabinet requires a minimum of 54" (1.37 m) of clearance  
0 at the front. Otherwise (when not positioned against a wall), the  
0 SRU cabinet requires only 27" (0.69 m) of clearance.

0 11.1.5 TRAFFIC TABLES

0  
0 RELEASE 28.01  
0 93 12 03

0 The DMS-100 Data Schema NTP has been updated to include an inven-  
0 tory table that references the SRU. The Data Schema table OPMINV  
0 uniquely identifies the SRU in data fill.  
0 For general information relating to tables and table control, re-  
0 fer to NTP 297-1001-451 and NTP 297-1001-310.

0 ESA capability is not provided.

0 Intraswitching is not supported.

#### 0 11.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 Software is currently unavailable for domestic applications. The  
0 current software only supports PCM-30 installations, A-LAW envi-  
0 ronment.

#### 0 11.3.3 MEMORY PROVISIONING

0  
0 None.

#### 0 11.4 REAL TIME IMPACT

0 There is no degradation on CC real-time as compared to a LCME  
0 working through LGCI.

0

0

0 RELEASE 28.01  
0 93 12 03

0 12.0 Remote Line Concentrating Cabinet (RLCC)

0 The Remote Line Concentrating Cabinet (RLCC) is a repackaged version  
0 of the Remote Line Concentrating Module (RLCM) Frame. The cabinet is  
0 design to meet all earthquake zone requirements without external brac-  
0 ing. However when the RLCC is mounted on raised floors, under floor  
0 bracing is required.

0 Note: RLCC, RLCM 100C and RLCM C are used interchangeably in refer-  
0 ence to the Remote Line Concentrating Cabinet. In this document the  
0 acronym used to refer to the Remote Line Concentrating Cabinet is  
0 RLCC.

0 The RLCC uses the following modules:

0 \* Remote Maintenance Module (RMM): Same as used on the existing  
0 RLCM Frame

0 \* Host Interface Equipment (HIE): Same as used on the existing RLCM  
0 Frame

0 \* Line Concentrating Equipment (LCE): The DMS-100F LCE shelves do  
0 not meet space requirements, therefore, the Meridian SL-100F LCE  
0 shelves (NTNX2802) are used. The heat baffles are removed from  
0 the Meridian LCE shelves, therefore cooling fans are used and  
0 fused from the FSP.

0 \* Frame Supervisory Panel (FSP): The RLCC uses the Meridian SL-100F  
0 FSP (NTNX26AA) which includes LCE fuses but does not include  
0 repeaters.

0 \* Fan Cooling Unit (FCU): The FCU will be essentially the same as  
0 used on the Meridian SL-100F but will use a nonmetallic fiber filter  
0 in place of the metal mesh filter.

0 Refer to Figure 1 below which provides a pictorial comparison of  
0 the RLCM and RLCC.

## 0 12.1 HARDWARE PROVISIONING

### 0 12.1.1 HARDWARE USAGE RESTRICTIONS

0 RLCC restrictions are in the area of Trunk/Service circuit provi-  
0 sioning and assignments. These packs are restricted to card  
0 slots as illustrated in Figure 2. Note: Figure 2 does not re-  
0 flect all provisionable circuits, it reflects only Truck/Service  
0 Circuits.

|   | 3    | 4    | 5    | 6    | 7    | 8    | 9    | 10   | 11   | 12   | 13   | 14   | 15   | 16   |

0 Figure 2. RMM Trunk Pack Assignment Chart

### 0 12.1.2 HARDWARE DEPENDENCIES

0 The RLCC consists of one Frame Supervisory Panel (FSP), one Fan  
0 Cooling Unit (FCU), one Remote Maintenance Module (RMM), one Host  
0 Interface Equipment shelf (HIE) and two Line Concentrating Equip-  
0 ment (LCE) shelves. Refer to Figure 1 for shelf locations. All

0  
0 RELEASE 28.01  
0 93 12 03

0 connections for external cabling is located on a bulkhead in the  
0 rear of the cabinet.

0 MODULE DESCRIPTION

0 LCE The RLCC uses the MSL-100 LCE shelves NTNX2802. These  
0 shelves are the same as DMS-100 LCE shelves except the  
0 heat baffle is omitted and fuse holders are moved to  
0 the FSP.

0 HIE The RLCC uses the DMS-100 HIE Module NT6X1108.

0 RMM RLCC uses the DMS-100 RMM Module NT6X1301 (See Figure  
0 2).

0 FSP RLCC uses the MSL-100 FSP NTNX26AA. This FSP includes  
0 fusing for line drawers but no provision for mounting  
0 repeater cards. Repeaters must be mounted external to  
0 the RLCC.

0 FCU The RLCC uses a Fan Cooling Unit NTNX27AA because the  
0 baffels were removed from the LCE. The Fan Cooling  
0 Unit is not present in the frame mounted RLCM but is  
0 required for the RLCC. The FCU is the same as NTNX27AA  
0 except that a polyester filter is used.

0 Bulkhead The RLCC bulkhead is the same as MSL-RLCM except an ad-  
0 ditional connector is required for the bulkhead con-  
0 nections.

0 P AND C SIDE PORT REQUIREMENTS

0  
0 The RLCC requires a minimum of two and a maximum of six DS-1  
0 links to the host. The two minimum links are the primary links.  
0 Each DS-1 interface card (NT6X50AA) connects two DS-1 links be-  
0 tween the RLCC and the host XPM. All DS-1 links must terminate on  
0 the same host peripheral. For reliability, the primary links  
0 should terminate on different NT6X50AA interface cards at the  
0 host and on the RLCC.

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 DMS BUS PORT REQUIREMENTS

0

## 0 CIRCUITS PER CARD

0

## 0 DISCRIMINATION NUMBERING

0

0 12.1.3 PROVISIONING CONSIDERATIONS

0

0 The RLCC is a cabinetized version of the frame mounted DMS-100  
0 RLCM which enables installation in earthquake zones without addi-  
0 tional bracing and simplifies EMI protection.

0 The RLCC consists of existing DMS and MSL modules and circuit  
0 packs mounted in an Earthquake and EMI protected cabinet. The  
0 RLCC is built in the same basic cabinet design as the MSL100 and  
0 DMS100 TOPS-MPC (NTNX25) and complies with earthquake zone re-  
0 quirements without additional frame bracing. However, in raised  
0 floor applications, additional bracing is required between the  
0 actual floor and the raised floor.

0 Additional framing or paneling is not required for EMI pro-  
0 tection. The RLCC can be provided with all EMI protection in-  
0 cluded or with all EMI protection except for line filters (power  
0 filtering is always included). Filter adapters are readily field  
0 installable.

0 The RLCC is intended for use on customer premises where EMI pro-  
0 tection is required to comply with FCC Regulation, Part 15, Subpart  
0 J for Class A computing devices. The functionality of the present

0

0

0 RELEASE 28.01  
0 93 12 03

0 DMS-100 RLCM is maintained except that the RLCC does not have the  
0 capability to install repeater cards in the Frame Supervisory  
0 Panel and the RLCC is equipped with a Fan Cooling Unit.

0 The RLCC RMM provisioning is standardized to a greater degree to  
0 simplify engineering and installation and all cabling is  
0 conectorized at the bulkhead.

0 of ECM 350.

0 12.2 PRODUCT/SYSTEM SPECIFICATION

0

0 12.2.1 PHYSICAL CHARACTERISTICS

0  
0 The RLCC cabinet physical specifications are:

0 Height - 72 inches (excludes mounting feet)  
0 Width - 28.5 inches  
0 Depth - 28.25 inches  
0 Weight - 925 pounds

0

0  
0 RELEASE 28.01  
0 93 12 03

0 The maximum current drain for a cabinet is 20 amps for the "A"  
0 side and 17 amps for the "B" side. The maximum heat dissipation  
0 for one cabinet is 1360 watts/hour.

0 The RLCC complies with the ISG grounding requirements. The Per-  
0 sonal Hazard Ground (PHG) is cabled from the bulkhead to the  
0 ground reference point.

0 A cabinet requires four 20 amp fuses which mount in the FSP. The  
0 "A" and "B" sides of the RLCC cabinet are cabled to the power  
0 source.

#### 0 12.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 The RLCC Cabinet by design meets the requirements of all earth-  
0 quake zones. However, if the RLCC is installed in a raised floor  
0 environment earthquake bracing is required between the actual  
0 floor and the raised floor.

0

0 12.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 The RLCC utilizes the same software as the RLCM. The following is  
0 a list of software packages and the interdependencies for the  
0 RLCC:

0 \* NTX146AB - Remote Line Concentrating Module

0 requires - NTX901AA

0 \* NTX154AA - RLCM ESA Operation (Lines and Trunks)

0 requires - NTX146AA

0 requires - NTX901AA

0 \* NTX146AA - Remote Line Concentrating Module

0 requires - NTX901AA

0 \* NTX156AA - Intra RLCM Calling

0 requires - NTX146AA

0 requires - NTX901AA

0 12.3.3 MEMORY PROVISIONING

0  
0 Not Applicable

0 12.4 REAL TIME IMPACT

0 The real time requirements for the RLCC are identical to the  
0 RLCM.

0 Processing is distributed over the Central Processing Unit (CPU)  
0 and the Peripheral Processors (PP) in the peripheral modules.  
0 Real Time is one of the measurements that is utilized to deter-  
0 mine the loading characteristics of these devices for specific  
0 applications. Real Time is the amount of time required for these  
0 processors to perform a function such as establish a call or ac-  
0 tivate a feature. For a detailed calculation of CPU real time,  
0 use the REAL::TIME program issue 3E\_1 or later. Refer to the Real  
0 Time Manual for more details on REAL::TIME and operational in-  
0 structions. For a detailed calculation of PP real time, use the  
0 PRTCALC program issue 4A or later. Refer to the PRTCALC Manual  
0 for details on PRTCALC and its' operational instructions. To  
0 measure the CPU real time for an inservice switch, use the ACTIV-  
0 ITY TOOL. Refer to SEB 86-11-005 for more details on the ACTIVITY  
0 TOOL and operational instructions. To measure the PP real time  
0 for an inservice switch, use the NEW PERIPHERAL ACTIVITY and PER-  
0 FORMANCE TOOL for the new peripherals. Refer to the Real Time  
0 Manual for more details on the NEW PERIPHERAL ACTIVITY and PER-  
0 FORMANCE TOOL.

0 12.4.1 CPU Real Time

0  
0 Typically, the CPU has a maximum of 83% or 2,988,000 ms available  
0 for call processing and the remaining 17% or 612,000 ms is for  
0 overhead. Refer to the following SEBs for a complete listing of  
0 CPU call timings:

0 SEB 88-09-004 - For the NT40 Processor

0  
0 RELEASE 28.01  
0 93 12 03

0 SEB 88-10-002 - For the DMS Core Processor

0 12.4.2 PP Real Time

0  
0 The new peripherals consist of the Line Concentrating Module  
0 (LCM), Remote Line Concentrating Module (RLCM), Outside Plant  
0 Module (OPM), Line Group Controller (LGC), Line Trunk Controller  
0 (LTC), Digital Trunk Controller (DTC), the Remote Cluster Con-  
0 troller (RCC) and the Subscriber Carrier Modules (SCM).

0 Processing in these devices is performed by the Signal Processor  
0 (SP) and the Master Processor (MP) except in the LCM, RLCM and  
0 the OPM. Separate studies must be performed for the SP and the  
0 MP to determine the limiting processor. The limiting processor is  
0 the processor with the higher percentage of occupancy. The real  
0 time is divided into overhead, maintenance, buffer and call proc-  
0 essing areas.

0 12.4.3 Call Timing

0  
0 There is NO additive for the LCM/RLCM call timings in a CLASS en-  
0 vironment.

0 The following call timings are typical BCS24 timings. These  
0 timings are reflected in the call processing allocation area.  
0 (measurements in milliseconds)

|                | ORIG    | RLCC | TERM    |
|----------------|---------|------|---------|
|                | Attempt |      | Attempt |
|                | =====   |      | =====   |
| 0 POTS         | 535     |      | 535     |
| 0 MDC w/o MADN | 535     |      | 535     |

0 Refer to SEB 88-11-003 for a complete listing of BCS 27 call  
0 timings for the new peripherals.

0 1.0 OPM Engineering

0 The Outside Plant Module (OPM) is a reconfigured Remote Line Con-  
0 centration Module (RLCM) packaged in an environmentally con-  
0 trolled cabinet. The cabinet consists of a main compartment  
0 which houses the electronics, an Environmental control system,  
0 and batteries. The cabinet is also equipped with an end compart-  
0 ment containing the cable/wire termination, protection, and  
0 cross-connection facility.

0 The OPM cabinet is configured such that it has two equipment rows  
0 (ROW A & B). Each row has two bays (BAY 0 & 1) where the BAY 0s  
0 are on the Left and Bay 1s are on the right as you view the cabi-  
0 net from the front doors. The bays in the front row (Row 'A')  
0 are hinged to allow access to the equipment in the rear (Row  
0 'B').

0 The OPM is available in two configurations:

0 OPM-640 - This unit has a maximum Subscriber Line Capacity of 640  
0 Lines. (Refer to FIGURES 1 & 2).

0 OPM-256 - This unit may be provisioned with a maximum of 256  
0 lines, which may be upgraded to a maximum of 576 subscriber  
0 lines. This lower maximum line capacity is due to the ability to  
0 provision Fiber or Channel Bank shelves in lieu of the additional  
0 lines. (Refer to FIGURES 3 & 4).

0 The Line Concentration Module (LCM) is identical to the host LCM  
0 supporting up to ten (10) line drawers at 64 line cards per  
0 drawer. The OPM LCM supports all of the line features available  
0 at the host. This includes POTS, Party Lines, Coin Lines, IBN  
0 stations, Business Sets, Data Units, Attendant Consoles and  
0 DataPath. Intra-Switching and Emergency Stand-Alone, are also  
0 available with the OPM.

0 The Extended LCM Processor, NT6X51AB, is being introduced to in-  
0 crease processor memory from 64KB to 256KB and to increase 'on-  
0 board' diagnostics. Existing LCM modules can be upgraded with  
0 the use of the NT6X04ZZ processor change kit.

0 The Host Interface Equipment (HIE) module houses the circuitry  
0 required to communicate with the host during normal operation and  
0 to support the OPM during the Emergency Stand Alone mode. Commu-  
0 nication with the host is via a minimum of 2 to a maximum of 6  
0 DS-1 links. Two DS-1 PCBs are always provided. The number of  
0 links required is traffic dependent. Optionally, Northern  
0 Telecom office repeaters may be provisioned and mounted in the  
0 Frame Supervisory Panel (FSP).

0 The NT2X70AE Power Converter is now provisionable on the OPM. The  
0 NT2X70AE combines increased current (50 Amps) with an  
0 electrostatically- shielded faceplate. Existing power converters  
0 can be telco optionally upgraded with the use of the NT2X70AZ  
0 product change kit.

0 Environmental Control equipment is provided to control the envi-  
0 ronment inside the OPM cabinet. This equipment includes air in-  
0 lets, air filters, fans, heaters and air outlets designed to  
0 protect the OPM's internal circuitry from extreme outdoor condi-  
0 tions such as extreme heat, cold and heavy dust areas.

0

0 1.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The OPM may be equipped with any one of the following options  
0 without restrictions. However, when equipping the OPM with two  
0 (2) options some restrictions apply. Refer to the following  
0 charts to define which of any two (2) options that may be pro-  
0 vided on the OPM at one time.

0 1.1.2 HARDWARE DEPENDENCIES

0  
0 When Fiber Mounting Hardware is provisioned:

0 1) NT0X10AA is required in slot 07 of the RMM shelf.

0 2) The QRY18 (Office Repeater Circuitry) and QPP519 (Fault  
0 Locate/Order Wire Circuitry) are not required in the OPM FSP  
0 (NT6X25BB/BC).

0 3) NT6X2582 AC Circuit Breaker Kit is required for the NT6X25BB  
0 FSP. The NT6X2582 AC-Circuit Breaker Kit is applicable on the  
0 NT8X01BA OPM Only. The NT8X01BB/BC OPM are equipped with a new  
0 FSP NT6X25BC which has the Circuit Breaker Always Provided.

0 When Channel Bank Mounting Hardware is provisioned:

0 1) NT0X10AA is required in slot 07 of the RMM shelf.

0 2) The QRY18 (Office Repeater Circuitry) and QPP519 (Fault  
0 Locate/Order Wire Circuitry) are not required in the OPM FSP  
0 (NT6X25BB/BC).

0 3) NT6X2582 AC Circuit Breaker Kit is required for the NT6X25BB  
0 FSP. The NT6X2582 AC-Circuit Breaker Kit is applicable on the  
0 NT8X01BA OPM Only. The NT8X01BB/BC OPM are equipped with a new  
0 FSP NT6X25BC which has the Circuit Breaker Always Provided.

0

0 P AND C SIDE PORT REQUIREMENTS

0  
0 The OPM requires a minimum of three (3) and a maximum of six (6)  
0 DS-1 links to the Host Office.

0 When the FMT-6 Fiber Interface is provisioned in the OPM, a  
0 matching configuration is required for the Host Office end. Con-

0  
0 RELEASE 28.01  
0 93 12 03

0 tact the Transmission Networks Division of Northern Telecom for  
0 ordering and provisioning the FMT-6 Fiber Interface in the Host  
0 Office.

0

## 0 DISCRIMINATION NUMBERING

0  
0 The OPE number may be unique per office or per site. The unique  
0 per office number must not conflict with existing RLM, LME, LCE,  
0 or RLCM numbers. The internal swinging equipment racks are iden-  
0 tified by OPE XX bay Y where X equals integers 0-9 and bay Y  
0 equals bays 0-1.

0 RELEASE 28.01  
0 93 12 03  
0

0 1.1.3 PROVISIONING CONSIDERATIONS

0  
0 The OPE number may be unique per office or per site. The unique  
0 per office number must not conflict with existing RLM, LME, LCE,  
0 or RLCM numbers. The internal swinging equipment racks are iden-  
0 tified by OPE XX bay Y where X equals integers 0-9 and bay Y  
0 equals bays 0-1.

0 When provisioning the OPM the engineer must now select the de-  
0 sired cabinet color (Initials Only). The available colors are:

0 Maple Brown  
0 Grey-Green  
0 Ivory

0 Next select the desired mounting configuration. The choices are  
0 Indoor and two (2) styles of Outdoor Mounting (Concrete Pad or  
0 Railroad Ties). The recommended OPM mounting surface is on a  
0 concrete pad, located above local flood plains.  
0 NOTE: For all OPM installations engineered in the U.S., a Request  
0 For Schedule (RFS) for advance shipment of the mounting hardware  
0 and template should be initiated by the Systems Application Engi-  
0 neer (SAE) as soon as the OPM mounting arrangement is identified.  
0 An advance ship note must be placed in the appropriate Equipment  
0 Specification and referenced against the material.

0 Hardware requirements for the various OPM mounting configurations  
0 are as follows:

0 1) Outdoor Concrete Pad Mounting

0 - Provide One (1) NT0X1934 mounting template and one (1) NT0X1935  
0 mounting hardware kit - to facilitate construction of the pad by  
0 the telco. The concrete pad must be completed prior to the in-  
0 stallation date of the OPM.

0 2) Outdoor Railroad Tie Mounting

0 - Provide one (1) NT0X1929 mounting plate assembly and one (1)  
0 NT0X1935 mounting hardware kit per Telco specifications. Advance

0  
0 RELEASE 28.01  
0 93 12 03

0 shipment is not required in this application. This is a Non-  
0 Preferred Outdoor Mounting Arrangement.

0 3) Indoor OPM Mounting

0 - Mounting hardware required for indoor mounting of the OPM is  
0 coordinated through the NT Building Studies Engineering (BSE)  
0 function.

0 Provide one (1) Installers Assembly Kit per Telco specifications.  
0 This kit is used for installation purposes. There is a choice  
0 between two kits, 4-Pin or 5-Pin, depending on the type of termi-  
0 nation scheme ordered for the End Compartment.

0

0 HOST INTERFACE EQUIPMENT (HIE)

0

0 Provision one(1) Host Interface Equipment Module (HIE) for each  
0 OPM ordered. The HIE module mounts in Bay 0 shelf position 05.

0 Provision two(2) NT6X60CA Ringing Generator Modules per HIE to  
0 mount in positions 01 & 05 for analog ringing. If no Ringing  
0 Generators (NT6X60CA) are to be ordered, then provision two(2)  
0 Filler Face Plates (NT0X50AH) to be mounted in the empty posi-  
0 tion.

0 Provision one(1) NT6X47AC (Master Processor Memory CP) in pos 14,  
0 one(1) NT6X45AF (LGC/DTC Processor) in pos 15, and one(1)  
0 NT6X75AA (ESA Clock and Tone Card) in pos 16, when the Emergency  
0 Stand-Alone(ESA) option is required. Also provide one NT2X48AB  
0 in the RMM Shelf when ESA is required.

0 For Canadian Applications - provide one NT8X01WA (Wiring Option)  
0 on the HIE when ESA Operation is required.

0 Provide two (1) NT6X50AA, DS-1 Interface, in position 19-20 of  
0 each OPM HIE. If the Telco prefers, provide instead two (2)  
0 NT6X50AB, DS-1 Interface, in position 19-20 of each OPM HIE.

0

0

0 RELEASE 28.01  
0 93 12 03  
0

0 Provide one (1) NT6X50AA/AB, DS-1 Interface, in position 21 of  
0 each OPM HIE when the DS-1 links 5 and 6 are required to the  
0 Host. This NT6X50 CP MUST be the same vintage as already ordered  
0 for position 19-20.

0 Provision one(1) NT0X50AA Filler Face Plate for pos 13-16,& 21 of  
0 the HIE shelf, when these positions are unequipped. Provision  
0 one(1) NT0X50AG in pos 09 of the HIE shelf.

0 HIE Shelves may exist with the NT6X11AA packfill which specified  
0 the NT2X70AA (Power Pack) in Slots 22 & 25. Provision a NT2X70AZ  
0 Conversion Kit to replace the NT2X70AAs with NT2X70AEs which will  
0 make the NT6X11AA effectively a NT6X11AB.

0

0 LINE CONCENTRATING MODULE

0  
0 OPM-640 is capable of terminating up to 640-Lines. Provide one  
0 (1) NT8X04AB LCM Common CP in Bay 0, Sh Pos 19 for each OPM-640  
0 ordered.

0 OPM-256 is capable of terminating up to 576-Lines where a  
0 256-Line capacity is provisioned standard and the remaining  
0 320-Line capacity is provisioned optionally (See Restrictions in  
0 Section 2.2). The 320-Line addition is a field installed option  
0 which consists of an additional shelf and wiring only - all other  
0 components must be provisioned separately. Provisioning lines  
0 for the OPM-256 is accomplished as follows:

0 1) 256-Line Capacity

0 - Provide one (1) NT8X04BA LCM-C Common CP in Bay 0, Sh Pos 33  
0 for each OPM-256 ordered. Provision up to four (4) Line Drawers  
0 (NT6X05AA) as required to house Telco specified quantity of line  
0 cards. Also provision either a 4-Pin Stubless Protection Scheme,  
0 or a 5-Pin Stubless Protection Scheme, or a 5-Pin With 50ft Stub  
0 Protection Scheme per Telco specifications.

0 2) 320-Line Addition

0

0  
0 RELEASE 28.01  
0 93 12 03

0 - Provide the 256-576 Line Upgrade kit in shelf position 19 with  
0 the appropriate stub option for field upgrades as follows:  
0 NT8X09AB (4-Pin Stubless), NT8X09AC (5-Pin Stubless), or NT8X09AD  
0 (5-Pin with 50 ft. Stub). These kits include the shelf and the  
0 required hardware and wiring to install the shelf. Provide up to  
0 five (5) Line Drawers (NT6X05AA), plus one NT8X04BB CP Fill per  
0 320-Line addition.

0 Provision one(1) NT6X05AX Line Drawer Filler Panel for each une-  
0 quipped line drawer position in shelf position 33 or 19 as appli-  
0 cable. Refer to Host LCM Provisioning rules for line card  
0 provisioning.

## 0 REMOTE MAINTENANCE MODULE (RMM)

0  
0 Provision one(1) NT6X13AB (RMM Common CP) in bay 1 shelf position  
0 05 for each OPM ordered. The RMM Common CP provides the circuitry  
0 necessary to enable basic RMM functions. However, thirteen  
0 (13) slots remain open which may be filled with eleven (11) different  
0 service/maintenance circuits.

0 The service/maintenance detailed in the chart below are  
0 provisionable on the OPM-256 with specific card slot assignments.

0 PLEASE NOTE: The character ' X ' in each column of the chart indicates  
0 an invalid slot assignment for the pack. The numbers (1  
0 thru 9) indicate the valid slot assignment for the pack and the  
0 corresponding note number which defines the provisioning rule(s).  
0 Slot Assignments as detailed below are specific to the OPM-256.  
0 RMM Slot Assignments are different in other Remote Office applications  
0 including OPM-640:

0 1) One MTU pair (NT2X10BA and NT2X11BA) is Always Required in  
0 slots 03 and 04. However, when the MTU is provisioned certain  
0 restrictions apply - see Item 2 below.

0 2) One (1) NT3X09BA is Always Required in slot 05 on all OPM-256  
0 systems for Battery Diagnostics and Line Testing. After

0  
0 RELEASE 28.01  
0 93 12 03

0 standard assignments the NT3X09BA has one Horizontal Con-  
0 nection Left which may be used in one of three (3) ways:

0 a) For the third optional NT2X90AD assignable to slots 7, 10,  
0 and 13 thru 16, or

0 b) For an optional NT3X04AA assignable to slots 13 thru 16, or

0 c) For the second test multiple on a MTU pair  
0 (NT2X10BA/NT2X11BA).

0 3) One (1) NT3X09AA is Always Required in slot 06 on all OPM-256  
0 systems for Battery Control.

0 4) The NT0X10AA is provisionable in Slots 07, 08, and 13-16 as  
0 follows:

0 a) One (1) NT0X10AA is Always Required in slot 07 when the  
0 NT0X1978/79 is provisioned. Otherwise, provide one NT0X50AC  
0 in slot 07.

0 b) One (1) NT0X10AA Scan Card is Always Required in slot 08  
0 for the Alarm Detection. This CP is pre-wired to internal  
0 OPM-256 circuitry.

0 c) Additional NT0X10AAs may be provisioned in Slots 13-16 per  
0 Telco specifications.

0 5) The NT2X57AA is optional, provisionable slots are 13-16 per  
0 Telco specifications for an external device.

0 6) A Maximum of three (3) NT2X90ADs is optionally provisionable  
0 as follows (Note: Certain restrictions apply, refer to Item 2  
0 above for restrictions):

0 a) One in slot 9 for LTP/Talk Monitor function

0 b) One in slot 10 for Operator Verification function

0 c) One in slot 13, 14, 15, or 16 for a Telco Specified func-  
0 tion.

0

0 RELEASE 28.01  
0 93 12 03

0 If the restrictions per Item 2 above and Item 7 below are not  
0 in conflict, three NT2X90ADs may be provisioned on the  
0 OPM-256.

0 7) A maximum of four (4) NT2X48ABs (Digitone Receiver (DTR)) is  
0 provisionable on the OPM-256 given the following restrictions:

0 a) Only one NT2X90AD is provided in Slot 9 or 10.

0 b) Three NT2X48ABs may be provided if NT2X90ADs are provided  
0 in slots 9 and 10.

0 c) Calculate DTRs as follows:

0 Holding Time Divided by 100 (HT/100)

0 For Example: .079 divided by 100 = DTRs Required

0 NOTE: .079 is the average holding time for a 7-digit call. The  
0 NT2X48AB is a two slot card which occupies the assigned slot  
0 and the next slot.

0 A minimum of one NT2X48AB is Always Required when the ESA op-  
0 tion is provided. The NT2X48AB (Digitone Receiver) is a two  
0 slot card which occupies the assigned slot and the slot below  
0 it. This card is provisionable in slots 10 thru 15.

0 8) One NT3X04AA is optionally provisionable in Slots 13 thru 16  
0 for the Automate Electric (AE) #1 Local Test Desk (#1LTD)  
0 Interface. The specific slot used and/or the validity of its'  
0 use is dependent upon the restrictions defined in Items 2 & 7  
0 above.

0 RELEASE 28.01  
0 93 12 03

## 0 FRAME SUPERVISORY PANEL (FSP)

0  
0 The OPM FSP is located in Bay 1 Row A immediately above the RMM  
0 shelf at shelf position 19.

0 If any Fiber Shelf Mounting Kit is provided, do not provide the  
0 Office Repeaters or the Fault Locate/Order Wire Access CPs.

0 If NT0X1978/79 Fiber Shelf or Channel Bank Shelf is provided,  
0 provide the Additional AC-Circuit Breakers Kit (NT6X2582) on the  
0 NT6X25BB OPM FSP.

0 The NT6X2582 AC-Circuit Breaker Kit is applicable on the NT8X01BA  
0 OPM Only. The NT8X01BB/BC OPM are equipped with a new FSP  
0 NT6X25BC which has the Circuit Breaker Always Provided.

0 When the Fiber Shelf Mounting Kit (NT0X1979) is provided, it  
0 voids UL Approval of the entire OPM, because it is not a UL Ap-  
0 proved component.

## 0 1) Provisioning Fault Locate/Order Wire Access CP

0 Provision one(1) QPP519A or QPP519B for slot 01 of the FSP when  
0 the Fault Signal Loopback Feature is used. Provision one (1)  
0 Fault Locate Filter QFB127\_ or QFB128\_ for each QPP519\_ CP provi-  
0 sioned. Refer to the Engineering Manual Section of this ECM for  
0 required type and frequency per Telco requirements.

## 0 2) Provisioning Office Repeaters

0 Provision one(1) QRY18\_ Office Repeater for each DS-1 link to the  
0 Host. Refer to the Engineering Manual Section of the ECM for re-  
0 quired type per Telco requirements. Provision one(1) NT0X50AJ  
0 (Filler Face Plate) for each unequipped position 02-07 in the  
0 FSP.

## 0 3) Provisioning Additional AC-Circuit Breakers

0 When Telco requirements specify the provisioning of one of the  
0 optional Mounting Kits for the FMT-150B (NTs Fiber Shelf),  
0 DDM-1000 (AT&Ts Fiber Shelf), or the DE-4E Channel Bank Shelf and

0  
0 RELEASE 28.01  
0 93 12 03

0 the NT6X25BB FSP is installed, then provide one NT6X2582 AC Cir-  
0 cuit Breaker Kit.

## 0 BATTERY CHARGING UNIT (BCU)

0  
0 Always Provision one(1) NT8X03AC Battery Charger Common CP Kit in  
0 Bay 1, Sh Pos 32.

0 Battery Strings shall be provisioned in the OPM for Battery  
0 Backup. Refer to the Engineering Manual Section of this ECM for  
0 provisioning information on the available battery options and  
0 their required hardware.

0

## 0 END COMPARTMENT ACCESS

0  
0 The End Compartment must be provisioned per Telco specifications.  
0 The End Compartment has two columns (Left and Right). The Left  
0 Hand Column (LHC) provides up to 750 protected terminations for  
0 the LCM (Lines), HIE (DS-1 Links), and RMM (Special Service) cir-  
0 cuitry. The Right Hand Column (RHC) is provisioned for Outside  
0 Plant Pair terminations. However, protector blocks are not  
0 provisionable on the RHC.

0 The following components must be considered:

0 1) Left Hand Column (LHC) for protected circuit terminations.

0 Provision the Protector Block Assembly kit which contains the  
0 Telco specified Protector Block type, 16-BIX Connectors and  
0 Retainers for 4-Pin and 5-Pin w/o Stub arrangements only. The  
0 choices are:

0 NT8X08BB - 4-Pin Stubless Protector Block Assembly  
0 NT8X08BE - 5-Pin Protector Block Kit w/50' Stub Option  
0 NT8X08BF - 5-Pin Protector Block Kit  
0 NT8X0804 - 5-Pin Protector Block Cable Stub

0

0 RELEASE 28.01  
0 93 12 03

0 2) Provisioning Protector Modules

0 Protectors are provisioned on a one (1) per Outside Plant Pair  
0 basis, where Outside Plant Pairs = (No. of Lines + 96 Service  
0 Circuits + Telco Required Spares). The following protector mod-  
0 ules are available. Provision the appropriate protector modules  
0 based on the type of Protection Scheme ordered for the OPM (i.e.  
0 4-Pin or 5-Pin).

0 303M-08S1GA -Protector Module Gas Tube 5Pin  
0 QMP12A4 -Protector Module Solid State 4Pin W/ Heat Coil  
0 QMP11A5 -Protector Module Solid State 4Pin W/O Heat Coil  
0 303M-12A1GA -Protector Module Solid State 5Pin W/ Heat Coil  
0 303M-11A1GO -Protector Module Solid State 5Pin W/O Heat Coil

0 3) Provisioning BIX Connectors (QCB1B) and BIX Retainers (QRE3A)

0 A sufficient quantity of BIX Connectors/Retainers required to  
0 terminate the OPM Internal Circuitry in the LHC for 4/5-Pin  
0 Stubless configurations is always provided in the Protector Block  
0 Kits for the for the Initial 256 lines and the 320 Line Upgrade  
0 Kits.

0 In order to use the End Compartment as a cross-connect facility  
0 for outside plant pairs, additional BIX Connectors/Retainers must  
0 be provisioned. Each Bix Connector can terminate up to 25 pairs,  
0 and one Bix Retainer is required for every Bix Connector. The LHC  
0 can mount an additional 29 BIX Connectors/Retainers capable of  
0 terminating up to 725 outside plant pairs.

0 If more than 725 outside plant pairs need to be terminated, pro-  
0 vision the NT0X2005 Right Hand Column (RHC). The RHC can mount  
0 an additional 41 BIX Connectors/Retainers capable of terminating  
0 up to 1025 outside plant pairs.

0 Provision BIX/MPC Tools as required if the Installation Kit  
0 (NT8X0176) is not provisioned. Refer to Engineering Manual Sec-  
0 tion in this ECM for ordering information.

## 0 OPTIONAL SHELVES

0  
0 The optionally provisionable equipment shelves for the OPM-256  
0 are as follows:

0 When adding the 320-Line Upgrade option ensure that the existing  
0 protector blocks match those originally provided. Line Drawers  
0 and Line Cards shall be shipped loose for field installation.

0 If any one of shelf options number 1 thru 6 is selected it auto-  
0 matically prohibits the use of any other shelf option from the  
0 first six in the same OPM Cabinet. However, item #7 may be pro-  
0 vided in conjunction with any shelf option numbered 1 thru 6.

0 1) NT8X09AB - 4-Pin Stubless Protector Assy 256-576 Line Upgrade  
0 Kit

0 4-Pin Stubless Protector Modules were Always Provided (AP) on the  
0 NT8X01BA (OPM-256). Now they are optionally provisionable on the  
0 NT8X01BB/BC (OPM-256).

0 Provide this shelf option at shelf position 19 of OPE 0 for field  
0 installation only. This kit contains the shelf and all required  
0 hardware and wiring to install the unit in the OPM. This option  
0 kit is provisionable for the OPM equipped with the 4-Pin stubless  
0 option only.

0 2) NT8X09AC - 5-Pin Stubless Protector Assy 256-576 Line Upgrade  
0 Kit

0 Provide this option for the NT8X01BA/BB (OPM-256 Cabinet) when  
0 the 256-576 Line upgrade is required and the cabinet was ori-  
0 ginally ordered with the 5-Pin Protector Module without 50 foot  
0 stub.

0 3) NT8X09AD - 5-Pin W/50' Stub Protector Assy 256-576 Line Up-  
0 grade Kit

0 Provide this shelf option for the OPM-256 when the 256-576 Line  
0 upgrade is required and the cabinet was originally ordered with  
0 the 5-Pin Protector Module with 50 foot stub.

0  
0 RELEASE 28.01  
0 93 12 03

0

0 4) NT0X1978 - NT Fiber Shelf FMT-150B Mounting Kit

0 When the Telco specifies Fiber interface to the host then provide  
0 either Item #4 or 5. This option provides the mounting hardware  
0 and required wiring only. The actual fiber shelf must be pro-  
0 vided by the Telco. This option is provisionable on the OPM-256  
0 only.

0 5) NT0X1979 - AT&T Fiber Shelf DDM-1000 Mounting Kit

0 When the Telco specifies Fiber interface to the host then provide  
0 either Item #4 or 5. This option provides the mounting hardware  
0 and required wiring only. The actual fiber shelf must be pro-  
0 vided by the Telco. This option is provisionable on the OPM-256  
0 only.

0 6) NT0X1980/81/82 - DE-4E Channel Bank Hardware Mounting Kits

0 When the Telco specifies T1 interface to the host then provide  
0 one of these pecs. This option provides the mounting hardware  
0 and required wiring only. The actual DE-4E Channel Bank Shelf  
0 (NT4S42CA) must be provided by the Telco. This option is  
0 provisionable on the OPM-256 only.

0 7) NT0J42AA - Digital Remote Test Unit (DRTU)

0 The Digital Remote Test Unit (DRTU) is provisionable on the  
0 OPM-256 and the OPM-640. The unit is provisioned in OPM Bay 0  
0 Row 'B' shelf position 05 to serve as a slave loop measurement  
0 device for the Host office Local Test Cabinet.

0

0 TELCO RESPONSIBILITIES.

0

0 The Customer Engineer must insure that the TELCO is aware of the  
0 following items they are responsible for providing/completing:

0  
0 RELEASE 28.01  
0 93 12 03

- 0  
0 - Site preparation.  
0 - Mounting pad construction.  
0 - Cabinet mounting.  
0 - Interfacing of outside cables.  
0 - Installation of Bix Covers.  
0 - Minimum of two(2) DS-1 lines.  
0 - FX Line for communication between OPM and Host equipment.  
0 - Temporary storage for Test equipment at OPM site.  
0 - Ground Tent(8 FT.X 8 FT.X 6 FT. HIGH), Pelsue Model 6508B se-  
0 ries or equivalent, with built-in ventilation/heater ports.  
0 - 500 type telephone sets.  
0 - 500 type ring party and tip party telephone sets.  
0 - Hand telephone set with alligator clips.  
0 - Engineer and Furnish the Telco provided optional equipment  
0 (e.g. FMT-150B, DDM-1000).

## 0 2.0 International Outside Plant Module (IOPM)

0 The INTL Outside Plant Module (IOPM) is a reconfigured INTL Remote  
0 Line Concentrating Module (IRLCM) packaged in an environmentally-  
0 controlled cabinet.

0 The main structural difference between the IOPM and the domestic OPM  
0 lies in its size. Extra space has been provided for PCM-30 repeaters(  
0 and potentially other future applications) by creating an Auxiliary  
0 Compartment at the rear which is equivalent to the size of the entire  
0 domestic OPM cabinet.

0 The main traffic capacity difference between the OPM and IOPM is that  
0 the OPM can support 640 lines whereas the IOPM can support a maximum  
0 of 550 lines only - due to thermal constraints.

0 The IOPM offers optional ESA(Emergency Stand-Alone) capability. It is  
0 connected to the host ILGC via 2-6 PCM-30 links.

0 The IOPM is a repackaged IRLCM but contains additional equipment such  
0 as AC inlet equipment, rectifiers, batteries, pairs termination, pairs  
0 protection, and environmental control equipment.

0 The IOPM is presently being marketed for the Caribbean Expansion  
0 Project (CEP). In future, the IOPM may be developed for other Inter-  
0 national markets.

0 The IOPM is composed of 3 compartments:

- 0 - MAIN COMPARTMENT
- 0 - END ACCESS COMPARTMENT
- 0 - AUXILIARY COMPARTMENT

### 0 2.1 HARDWARE PROVISIONING

0

#### 0 2.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The IOPM, NT8X40AA, is designed to withstand outside temperatures  
0 between 0 and 45 degrees Celcius and therefore should not be pro-  
0 visioned for conditions outside this temperature range. It is

0  
0 RELEASE 28.01  
0 93 12 03

0 presently only to be provisioned for the CEP(Caribbean Expansion  
0 Project).

0 2.1.2 HARDWARE DEPENDENCIES

0  
0 Not Applicable.

0 2.1.3 PROVISIONING CONSIDERATIONS

0  
0 This section will cover the basic provisioning guidelines for the  
0 IOPM. Detailed provisioning rules are included in the attached  
0 Engineering Manual Inserts.

0 To order the IOPM, order one NT8X40AA(IOPM).

0 ILCM

0  
0 The IOPM contains one (1) ILCM Common CP Kit and up to ten (10)  
0 Line Drawers. The NT6X04BB contains the NT6X51AB upgraded LCM  
0 Processor.

0 For Bay 0 (Main Compartment) order one ILCM packfill(NT6X04BB).  
0 Order line cards and line drawers(NT6X05BA), as required (Refer-  
0 ence Engineering Manual section EMA2-07-000).

0 Due to thermal constraints, a maximum of 550 line cards can be  
0 provisioned. The line card provisioning algorithm to be followed  
0 is outlined in the attached Engineering Manual Insert  
0 (NT8X40AA).Take note that only the even slots are to be filled in  
0 the top-most line sub-groups - i.e. 11, 13, 15, 17, 19.

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 HIE

0  
0 Order also one HIE packfill, NT6X11BB, and corresponding  
0 provisionable cards as follows:

| 0 | QTY | PEC      | DESCRIPTION       | REASON                       |
|---|-----|----------|-------------------|------------------------------|
| 0 | 2   | NT6X60AA | RinginG Generator | (if analog ringinG required) |
| 0 | 1   | NT6X47AB | Master Proc. Mem. | (when ESA required)          |
| 0 | 1   | NT6X45BA | LGC/DTC Processor | ( " " " )                    |
| 0 | 1   | NT6X75DA | ESA Clock/Tone CP | ( " " " )                    |
| 0 | 1   | NT6X27AB | PCM-30 I/F CP     | (when PCM30 links required)  |
| 0 | 2   | NT2X70AE | Power Converter   |                              |

## 0 RMM

0  
0 Order also one RMM packfill, NT6X13DA, and corresponding  
0 provisionable cards as follows:

| 0 | QTY | PEC      | DESCRIPTION       | REASON                       |
|---|-----|----------|-------------------|------------------------------|
| 0 | 1   | NT4X98BB | MTU Analog        |                              |
| 0 | 1   | NT4X97AA | MTU Ctrlr.        |                              |
| 0 | 1   | NT3X09BA | Remote MTA        |                              |
| 0 | 1   | NT3X09AA | Remote MTA        |                              |
| 0 | 1   | NT0X10AA | PCM-30 I/F CP     | (when PCM30 links 5,6 req'd) |
| 0 | 1   | NT2X90AC | I/C,O/G Test Trk  | (LTP/Talk Mon. & Oper.Ver.)  |
| 0 | 1   | NT2X48CC | Digitone Receiver | (when ESA required)          |
| 0 | 1   | NT0X10AA | PCM-30 I/F CP     | (when PCM30 links required)  |

0 Also order one RMM Cable Assembly(NT6X1438) to provide -48VSP  
0 supply needed by the MTU.

0 RELEASE 28.01  
0 93 12 03

## 0 POWER SUPPLY

0  
0 BATTERY

0 Order Battery Charger packfill(NT8X03AA) when battery back-up re-  
0 quired. Order YUASA batteries(A0323985), battery  
0 trays(P0661751), retainer bars(P0661753), screws(P097F813), cable  
0 assemblies as specified in the attached Engineering Manual in-  
0 serts.

0 Extended outside plant termination facilities are available by  
0 provisioning the right hand BIX mounting column and up to 41  
0 green BIX connectors or terminations for an additional 1025  
0 pairs.

0 For Bay 2 (Auxiliary Compartment) order Coax. Cable Connectors.

## 0 220 VAC POWER

0 Two 220 volt AC power configurations are available for the IOPM:  
0 a 3-wire, 220 VAC phase-to-phase configuration; and a 2-wire sin-  
0 gle phase configuration. Selection is determined by the cus-  
0 tomer. For the 3-wire configuration, provision the following:  
0 NT8X40WA Wiring For 3 Wire 220 Volts Phase to Phase Power  
0 P0703366 IOPM AC Power Schematic Label 3 Wire  
0 NT8X0123 IOPM AC Power Cable Assembly (H1)  
0 NT8X0124 IOPM AC Power Cable Assembly (H0)  
0 For the 2-wire configuration, provision the following:  
0 NT8X40WB Wiring For 2 Wire 220 Volts Single Phase Power  
0 P0711201 IOPM AC Power Schematic Label 2 Wire  
0 A0319292 Jumper (provision qty 2)

0

0

0

0

## 0 MISCELLANEOUS

0  
0 Discrimination Numbering - The IOPM cabinet is identified using  
0 a OPE XX discrimination number where XX equals the integers  
0 00-09. The OPE numbers may be unique per office or unique per  
0 site. The unique per office number must not conflict with exist-  
0 ing ILCE or IRLCM numbers.

0 The internal swinging equipment racks are identified by OPE XX  
0 bay Y where XX equals integers 00-09 and bay Y equals bays 0-1.

0 RELEASE 28.01  
0 93 12 03

0 Telco Responsibilities

0 The Customer Engineer must ensure that the Telco is aware of their responsibility for providing/completing the following items:

- 0 1) Site Preparation.
- 0 2) Mounting Pad Construction.
- 0 3) Cabinet Mounting.
- 0 4) Interfacing of outside cables.
- 0 5) Installation of BIX covers.
- 0 6) Minimum of two PCM-30 lines.
- 0 7) FX line for communication between IOPM and Host.
- 0 8) Transportation of IOPM line drawers, batteries and test equipment to IOPM site.
- 0 9) Temporary storage for test equipment at IOPM site.
- 0 10) 24 Awg wire.
- 0 11) Ground tent (8ft. x 8ft. x 6ft. high), Pelsue Model 6510B Series or equivalent, with built in ventilation/heater ports.
- 0 12) 2 - 500 type telephone sets.
- 0 13) 2 - 500 type ring party and tip party telephone sets.
- 0 14) 1 - hand telephone set with alligator clips.
- 0 15) Providing, installing and servicing PCM-30 repeaters.
- 0 16) Providing, installing and servicing cables from repeaters to PCM-30 patch panel.
- 0 (Reference) IM925-Section 14)

0 2.1.4 OFFICE LAYOUT INFORMATION

0

0 MOUNTING

0  
0 The recommended IOPM mounting surface is on a concrete pad lo-  
0 cated above local flood plains. One (1) NT0X1970 mounting tem-  
0 plate and one (1) NT0X1935 mounting hardware kit must be  
0 provisioned to facilitate construction of the pad by the Telco.  
0 The concrete pad must be completed prior to the installation date  
0 of the IOPM. For all offices engineered in Canada, the mounting  
0 kit NT0X1970 will be merchandise-ordered and the NT0X1935 will be  
0 shipped loose with the IOPM. The Customer Engineer must ensure  
0 that the Telco is aware of this requirement.

0 2.1.5 TRAFFIC TABLES

0  
0 Refer To ECM 382 For Traffic Capacity Tables. The IOPM will pro-  
0 vide the same traffic capacity as the IRLCM.

0 The total traffic capacity of a DMS-100 with all IOPM lines shall  
0 be equal to that of a DMS-100 with all co-located lines.

0 RELEASE 28.01  
0 93 12 03

0 2.2 PRODUCT/SYSTEM SPECIFICATION

0

0 2.2.1 PHYSICAL CHARACTERISTICS

0

0 POWER/HEAT DISSIPATION

0

0 Below is a breakdown of power dissipation on individual parts of  
0 the IOPM.

0 AC POWER SYSTEM (GENERAL)

0 In normal operation, the IOPM will be powered from commercial  
0 110/220 V AC, 110V only operation will not be provided for.

0 Commercial 110/220 V AC cables will enter the IOPM cabinet  
0 through a sealed cable entrance port mounted in the base of the  
0 compartment.

0 The IOPM will not provide space for the mounting of an AC KWHour  
0 meter. If, in a particular installation AC power metering is re-  
0 quired, the KWHour meter must be mounted elsewhere.

0 Within the IOPM's main compartment, the commercial and emergency  
0 power cables will terminate on individual lightning  
0 arrester/disconnection boxes, the two power sources will be ca-  
0 bled to the main breaker panel.

0 The breaker panel will contain an AC source/Emergency Generator  
0 switch and a series of resettable breakers for the individual AC  
0 loads in the IOPM. The switch allows manual selection between  
0 commercial AC and the emergency generator inlet.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 One 110V parallel blade "U" ground utility receptacle will be  
0 provided inside the main compartment.

0 A pair of rectifiers(NT-J2427B-1) will condition the AC inlet  
0 power, producing -52 V DC. The rectifier pair has the capacity  
0 for powering the IOPM at its full traffic capacity (8ccs/Line).  
0 In the event of one rectifier failing, the remaining rectifier  
0 will be capable of powering the IOPM at reduced traffic levels.

0 EMERGENCY POWERING

0 The IOPM provides for the attachment of an emergency generator  
0 through a plug located on the righthand side of the cabinet. The  
0 emergency generator plug will allow the attachment of a 110/220 V  
0 generator to supply power to the IOPM during commercial AC fail-  
0 ure. The standard emergency generator plug will be a Russell-  
0 Stollens 100A unit. Packaging allowances will be made to allow a  
0 variety of other plug styles.

0 HIE SHELF LOAD

0 Figures are given for both 8 ccs/line(worst case) and 5  
0 ccs/line(average).

| 0                            | 5 ccs/Line | 8 ccs/Line |

## 0 TOTAL AC POWER LOAD

| 0 |                             | 5 ccs/Line | 8 ccs/Line |
|---|-----------------------------|------------|------------|
| 0 | -52V load on rectifiers     | 1250 W     | 1600 W     |
| 0 | Rectifier inefficiency(10%) | 125 W      | 160 W      |
| 0 | AC Panel Load               | 50 W       | 50 W       |
| 0 |                             | <hr/>      | <hr/>      |
| 0 |                             | 1425 W     | 1810 W     |

## 0 BATTERY CAPACITY

0 The IOPM's back-up batteries are sized, in the event of loss of  
0 AC power, to provide the energy required to support the IOPM for  
0 8 hours at a traffic level of approximately 5 ccs/Line. At 5  
0 ccs/Line, the -52V DC load of the IOPM is approximately 25A. For  
0 8 hours of back-up power, this requires  $8 \times 25A = 200$  A-hours. A  
0 total of 8 strings of YUASA batteries are provisionable to obtain  
0 this capacity.

0 2.2.2 EMI/EARTHQUAKE INFORMATION

0 2.2.3 SPARING INFORMATION

0  
0 Spare circuit packs are provisioned per standard rules. The fol-  
0 lowing equipment may be ordered as required per the Telco.

0 NT0X1914 Filter Assembly (primary and secondary)  
0 NT8X06AB Environmental Control Unit  
0 NT8X06BA Booster Fan Unit  
0 J2427B-1 Rectifier  
  
0 QFF1A 1 1/3A fuse  
0 QFF1C 3A fuse  
0 QFF1J 7 1/2A Fuse

0 2.3 SOFTWARE PROVISIONING

0

0 2.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 The following software packages are required for the IOPM:

0 NTX651AA INTL RLCM Basic  
0 NTX652AA INTL RLCM Intra-Switching  
0 NTX653AA INTL RLCM Emergency Stand-Alone  
0 NTX147AB OPM Maintenance Enhanced

0

0 93 12 03

## 0 1.0 TOPS Engineering

0 1.1 HARDWARE PROVISIONING

0

0 1.1.1 HARDWARE USAGE RESTRICTIONS

0

## 0 TOPS MP

0

0 The standard TOPS MP line-up will be as follows:

0

0

0

0

0

0

0

Figure 9: Standard TOPS MP Line-up

0

0

\* A 30 inch Empty Space between the AAE and PCE Cabinets  
is required for EMI and Earthquake requirements.

0

0

TOPS MP - IBM DA requires TOPS MP equipped with the TOPS Message  
Switch (TMS).

0

0

TOPS MP - IBM DA keyboards are currently available for English  
applications only.

0

0

0

The maximum allowable number of operators depends on the office  
configuration. Refer to the Real Time section of this ECM for ad-  
ditional information.

0

0

While the IBM protocol does not provide for monitoring a DA call,  
the DMS allows for monitoring an operator. When monitoring a DA

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 call, the supervisor receives a duplicate display of the billing  
0 screen of the operator position being monitored.

0 The IBM protocol does provide a list status field but it does not  
0 provide the listing detail required by the Extended Bellcore AMA  
0 Format (EBAF). Currently, DA or Intercept calls handled by the  
0 IBM vendor cannot fully populate the Listing Status fields for  
0 EBAF conforming AMA.

0 The ARUs used for TOPS MP - IBM DA are associated with the IBM  
0 DAS. The organization providing the ARUs must be notified of the  
0 number of DA operators to be served at 95% utilization and the  
0 ratio of traffic requiring call completion to traffic not requir-  
0 ing call completion. Call completion requires special ARUs capa-  
0 ble of performing the call completion function.

0 Dual HSDA is not available for TOPS MP with IBM DA.

0 In an integrated TMS configuration, there must NOT be an HSDA  
0 card in slot 8 of the TPC. Otherwise, the TPC will attempt to  
0 send search requests on the wrong HSDA card.

0 Dual HSDA is compatible with NTN61AB/AC/AD/AE/AF TPC packfills.

0  
0 TOPS MPX

0  
0 The TOPS MPX position is a dedicated Directory Assistance/ Inter-  
0 cept position. Toll and Assistance operation and ORDB access are  
0 not available from a TOPS MPX position at this time.

0 The TOPS Message Switch is required for all applications using  
0 TOPS MPX equipment.

0 The MPX positions require a timing signal which will be supplied  
0 by a Telco-provided Time Source Generator (TSG). The TSG should  
0 be located in or near the channel bank frame. Each Timing Output  
0 Card provides ten (10) ports. The following TSG equipment is re-  
0 quired:

| 0 Description | Part Number |
|---------------|-------------|
| 0 -----       | -----       |

0 Remote Office - Traffic Operator Position Equip.

| 0 | Matrix Control Card            | 990-40015-01 |

0 (Equipment manufactured by Telecom Solutions.)

0 The Force Management function must be implemented using TOPS MP  
0 equipment or Customer provided TOPS 4 equipment.

0 No Alternate Billing calls are currently handled by MPX posi-  
0 tions.

#### 0 TOPS QMS

0  
0 The TOPS QMS software feature (NTXR50AA) that provides for an ex-  
0 ternal MIS system must have the external MIS equipment provided  
0 by the Customer.

#### 0 1.1.2 HARDWARE DEPENDENCIES

0

#### 0 TOPS MP POSITION CONTROLLER EQUIPMENT (PCE)

0  
0 The PCE Cabinet consists of the following Always Provided equip-  
0 ment:

|   |   |                                      |
|---|---|--------------------------------------|
| 0 | 1 | SL-100 Cabinet                       |
| 0 | 1 | PCE EMI Bulkhead Assembly            |
| 0 | 1 | Frame Supervisory Panel (FSP)        |
| 0 | 4 | TOPS Position Controller (TPC) Shelf |

0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

0 RELEASE 28.01  
0 93 12 03  
0

0 Assemblies  
0 1 Cooling Unit (CU)

0 Associated PCE equipment includes the following:

0 PCE - allows an administrator to print  
0 Printer logs, help screens or program panels  
0 for TPC shelves.

0 TAMI - TPC Administration and Maintenance In-  
0 terface. This interface is a VT100  
0 compatible terminal connected to a TPC  
0 (via modems) which allows an administrator  
0 to perform maintenance or administrative  
0 functions as required. The TAMI (VDU) may  
0 be located remotely or locally. In either  
0 case an autoanswer, autodial modem will  
0 be required for the VDU).

0 - The TAMI position equipment may be customer  
0 supplied. The VDU is a VT100 compatible  
0 terminal with a Case or UDS standalone  
0 212 A/D compatible modem. The TAMI position  
0 equipment may also include a printer. If  
0 the customer requires NT to supply the TAMI  
0 position equipment, refer to ECM 607 for the  
0 terminal and printer, and ECM 633 for a modem.

0 Wicat - each CBT unit provides training for up to 16  
0 Computer operator positions and the dimensions for the  
0 Based unit are 44"(H) x 22.1"(W) x 31.8"(D). A  
0 Training cartridge tape will be used to load the TOPS  
0 (CBT) MP training S/W onto the CBT unit's hard disk  
0 Unit drive. A Wicat VDU will be used for  
0 administration on the CBT units.

0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

0 93 12 03  
0

0 1 End Panel Assy, Left  
0 1 Modem Shelf  
0 1 Power Distribution Panel  
0 1 4" Filler Panel  
0 1 Hazard Plate Assy

0 Auxiliary Access Equipment:

0 Modem - One (1) Modem Shelf will be Always Provided on the  
0 Shelf AAE Cabinet. This is for TAMI modems.  
0 Up to four (4) additional modem shelves may be provisioned for  
0 access to the DMS, DA, and ORDB. Some or all of these accesses  
0 may be through the TMS.  
0 Each modem shelf is supplied with two power supplies. Up to  
0 16 UDS modem cards may be mounted on a UDS modem shelf.

0 Power - One (1) Power Distribution Panel (PDP) will be  
0 Distrib- Always Provided on the AAE Cabinet. The PDP will  
0 bution power PCEs, the UDS Modem Shelf & the Alarm  
0 Panel Battery Supply (ABS). The PDP can accomodate  
0 (PDP) up to 15 fuses for the A power feed and up to  
0 15 fuses for the B power feed. The PDP fuse are  
0 physically designated 00-29 with fuse 00 being the  
0 first A power fuse and fuse 15 being the first B  
0 power fuse. The UDS Modem shelf will come prewired  
0 for power. Each will be fused by 2 5A fuses(fuses  
0 are always provided as part of the PDP and are  
0 F11-F13 and F26-F28). The ABS will be supplied  
0 via one (1) 10A fuse on the PDP labeled FABS. (The  
0 10A fuse will be supplied as part of the PDP  
0 stocklist.) The FABS fuse is prewired to the  
0 bulkhead such that only the bulkhead connections  
0 are required from AAE to PCEs.

0 Dual HSDA requires a 12-port alarm CP in the PDP.  
0 The alarm CP which is included with the PDP does  
0 not provide enough ports for Dual HSDA. Provision  
0 a 12-port alarm CP for Dual HSDA (field application  
0 only). Refer to the AAE Engineering Manual Section  
0 for details.

## 0 TOPS MP POSITIONS

0  
0 Since all TOPS Multipurpose Positions (operator or administration  
0 (in-charge, assistance, or force manager)) have the same hardware  
0 requirements, all TOPS Multipurpose Positions are available as a  
0 Modular or Integrated Position. The components of each type of  
0 Operator Position are as follows:

0 Modular TOPS MP Operator Position0 Qty./Position

0 1 TOPS MP Terminal Base Unit (NT0M90SA)  
0 1 Monitor (NT0M92FA)  
0 1 Gnd. Bar (NTNX5305)(1 per 128 positions)  
  
0 EITHER 1 Keyboard (NT0M36AE) - English Universal Keyboard  
0 OR 1 Keyboard (NT0M36AA) - French Universal Keyboard  
0 OR 1 Keyboard (NT0M36AH) - IBM DA English Keyboard  
0 \*\*\* Keyboard NT4X81DA is now Manufacture Discontinued. \*\*\*  
0 EITHER 2 Modular Headset Jack Assembly - 7.25 feet (NTNX5303)  
0 OR 2 Modular Headset Jack Assembly - 6.5 feet (NTNX5306)  
0 OR 2 Modular Headset Jack Assembly - 10 feet (NTNX5308)

0 Integrated TOPS MP Operator Position0 Qty./Position

0 1 TOPS MP Terminal Base Unit (NT0M90SA)  
0 1 Monitor (NT0M92FA)  
0 1 Gnd. Bar (NTNX5305)(1 per 128 positions)  
  
0 EITHER 1 Keyboard (NT0M36AE) - English Universal Keyboard  
0 OR 1 Keyboard (NT0M36AA) - French Universal Keyboard  
0 OR 1 Keyboard (NT0M36AH) - IBM DA English Keyboard  
  
0 \*\*\* Keyboard NT4X81DA is now Manufacture Discontinued. \*\*\*  
0 1 TOPS MP Adjustable Desk (A0343403)  
0 (Eng Code, NPS50684-01L01)

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 NOTE : The TOPS MP Adjustable Desk will come equipped with  
0 a headset jack assembly.

0 The CUSTOMER IS RESPONSIBLE for providing PRIVACY PANELS and/or  
0 CHAIRS for TOPS MP Positions. If required to match the TOPS MP  
0 furniture, the customer may order these from Herman Miller.

0 TOPS MP Position Description

0 Controller - The NT0M90SA Controller includes the digital  
0 (NT0M90SA) telephony circuit board which is compatible  
0 with all previous TOPS MP equipment. This  
0 controller provides improved noise performance  
0 when used with the NTNX62AB HSLI pack. When used  
0 with the NTNX62AA, performance equals that of  
0 previous controllers.

0 Change Kit - This change kit upgrades an existing NT0M90NA  
0 (NT0M96QE) controller to NT0M90SA.

0 Monitor - The video monitor provides a high resolution  
0 (NT0M92FA) display of eight different shades of grey.  
0 The screen consists of 29 lines of text with  
0 90 characters per line and a 12" diagonal  
0 screen.

0 Ground Bar - The Ground Bar Assembly provides a  
0 Assembly junction point for furniture grounds and one (1)  
0 (NTNX5305) system single point ground. Provide one Ground Bar  
0 Assembly for up to 128 positions.

0 Keyboard - The keyboard consists of 126 keys which are  
0 (NT0M36AE) configured to provide an efficient operator  
0 interface. The keys are designed using Hall-  
0 effect solid state switches. Keys on the  
0 keyboard are as follows:

0 57 typewriter keys  
0 34 call processing keys  
0 8 softkeys  
0 27 keys available for future applications

0  
0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

0 93 12 03  
0

0 (Note: All key caps are provided as part of the  
0 keyboard stocklist as no specially engraved  
0 key caps are possible.)

0 Keyboard - French version of the NT0M36AE keyboard  
0 (NT0M36AA) described above.

0 Keyboard - IBM DA (English) version of the TOPS MP  
0 (NT0M36AH) keyboard.

0 Keyboard NT4X81DA is Manufacture Discontinued.

0 Keyboard - Upgrades NT4X81DA keyboard to NT0M36AE  
0 Change Kit equivalence for Directory Assistance/  
0 (NT0M36AF) ORDB use. Application of NT0M36AF to an  
0 NT4X81DA keyboard produces an NT4X81DB  
0 (B0229511) keyboard which is functionally  
0 the same as NT0M36AE but uses different  
0 artwork.

0 Keyboard - Upgrades NT0M36AE Keyboard to NT0M36AH  
0 Change Kit for IBM DA use.  
0 (NT0M36AK)

0 The customer must provide headsets that meet the generic require-  
0 ments in the Proposed Generic Requirements for Telephone Headsets  
0 used at Bell Operating Companies (BOC) Operator Consoles, Issue  
0 1, August 1986, TA-EOP-000314, published by Bell Communications  
0 Research (Bell Core).

0 A TOPS MP Position will require approximately 25 square feet of  
0 office space (with NTI furniture, without privacy panels).

0 A TOPS MP Position will require approximately 28 square feet of  
0 office space (with NTI furniture and customer provided privacy  
0 panels).

0 Attenuation pads are not required for TOPS MP. Also, no optional  
0 key caps are orderable with TOPS MP.

0 A Computer Based Training (CBT) Unit is to be provided per the  
0 customer's request and NTI's Building Studies Engineer shall de-  
0 termine the location of this unit. The CBT Unit must be located  
0 within 100' of all associated PCEs.

0 RELEASE 28.01  
0 93 12 03

## 0 TOPS MP DIRECTORY ASSISTANCE APPLICATION

0  
0 The equipment described in this section is required in addition  
0 to the basic office configuration described elsewhere in this  
0 ECM. The main components of the DA system are the TOPS MP  
0 facility, the DMS-200 host office, the Announcement Recording Unit  
0 (ARU) facility and the Directory Assistance System / Computerized  
0 (DAS/C or Gateway), a vendor-supplied database. These facilities  
0 must be connected by voice or data links to provide DA service.  
0 Refer to Figure 3 or Figure 4 for TOPS MP DA without TMS or Fig-  
0 ure 7 for TOPS MP DA with TMS for the layout of the components of  
0 the TOPS MP DA system.

0 The NTNX62AB HSLI CP is required for the Directory Assistance ap-  
0 plication. While the NTNX62AB is the standard HSLI and is cur-  
0 rently supplied for all applications, offices previously using  
0 the NTNX62AA for Toll and Assistance service must convert to  
0 NTNX62AB when adding Directory Assistance service.

0 In an integrated TMS configuration, access to the DA database is  
0 through an HSDA in slot 13 (of the TPC). This HSDA requires two  
0 modems in the AAE, which connect to the TMS. The TMS connects to  
0 the DA database.

0 For access to DA in a standalone (no TMS) configuration, each TPC  
0 requires an HSDA CP in slot 13, and two modems in the AAE. These  
0 modems connect to the DA database.

0 For access to DA in a Dual HSDA configuration, each TPC requires  
0 an HSDA CP in slot 8, and two modems in the AAE. These modems  
0 connect to the DA database.

0 The DA application requires additional memory and this is pro-  
0 vided by an additional NTNX63AA CP mounted on each TPC shelf.  
0 Provide one (1) NTNX63AA in slot 5 of TPC shelves NTNX61AA -  
0 NTNX61AD. Refer to the Engineering Manual section. The NTNX61AE  
0 and NTNX61AF are equipped with sufficient memory (one NTNX63AB)  
0 for all current applications.

0 RELEASE 28.01  
0 93 12 03

## 0 TOPS MP OPERATOR REFERENCE DATABASE

0  
0 If TMS is not used, database access for ORDB requires a High  
0 Speed Data Access circuit pack and its associated modem. This  
0 NTNX66AA HSDA pack mounts in slot 8 of the TPC shelf being con-  
0 figured for ORDB and the UDS D56 modem required for the HSDA pack  
0 mounts on shelf 42 of the AAE cabinet. Refer to the Engineering  
0 Manual section for details of configuring the necessary HSDA and  
0 D56 modem. This HSDA pack and modem provide ORDB access for all  
0 four operator positions supported by the TPC. The HSDA pack pro-  
0 vides two V.35 ports but only one (Port 1) is used for the ORDB  
0 application and therefore only one (1) UDS D56 modem (per HSDA in  
0 slot 8) is required. If TMS is used, access to ORDB is through  
0 the HSDA in slot 13, which connects to the TMS. The TMS connects  
0 to the ORDB database.

0 The NTNX62AB HSLI CP is required for the Operator Reference Data-  
0 base application. While the NTNX62AB is the standard HSLI and is  
0 currently supplied for all applications, offices previously using  
0 the NTNX62AA for Toll and Assistance service must convert to  
0 NTNX62AB when adding Operator Reference Database service.

0 TOPS MP Operator positions for IBM DA are provisioned the same as  
0 for Directory Assistance via CCI except for the keyboard. Provide  
0 the NT0M36AH (English) keyboard for new IBM DA offices. Existing  
0 NT0M36AE keyboards may be upgraded for IBM DA applications with  
0 the NT0M36AK change kit.

The following diagram shows the topology of a TOPS MP integrated TMS configuration.

0        The following diagram shows the topology of TOPS MP dual HSDA  
0        configuration.

0 RELEASE 28.01  
0 93 12 03  
0

0 A brief description of the components used for TOPS MPX is pro-  
0 vided for reference.

0 Token Ring: The token ring refers to the type of Local Area  
0 Network (LAN) which is used to group the MPX  
0 terminals so that information from databases, etc.  
0 can be shared within the group, without each  
0 position requiring a dedicated link. Operates  
0 at 4Mb/s.

0 Multistation Access Unit (MAU): Passive component in the token  
0 ring which interconnects up to eight MPX positions  
0 to form a star connection to the LAN. The MAUs are  
0 cabled together to form the token ring. The MAUs  
0 will mount in a MIS frame using two  
0 adapters per three MAUs.

0 BIX Block: One BIX block will be provided for each Token Ring  
0 to provide a connection point for the distribution  
0 of voice and data signals. The BIX block will mount  
0 in a MIS frame using one mounting plate for  
0 each two BIX blocks. The BIX block provides both  
0 connectorized input and output connections.

0 Data Set Unit (DSU): 56Kb/s standalone modem is used to convert  
0 V.35 interface to 4-wire for both the IBM DA links  
0 and the datalinks to the DMS. The data set unit  
0 cable will be job-engineered in length (minimum of  
0 four feet; maximum of nine feet).

0 MIS Frame equipment: The voice/data signals from operator  
0 positions will be cabled to a MIS frame which  
0 contains the MAUs and BIX blocks. This MIS frame  
0 should be provided without a Frame Supervisory  
0 Panel (FSP) since no power is required. A fully  
0 equipped MIS frame will support four Token Rings.  
0 The BIX block for each Token Ring will be  
0 connected to the outside world via four  
0 non-shielded 25 pair cables (one each Voice  
0 Transmit, Voice Receive, Data Transmit, Data Receive)  
0 and one shielded 25 pair cable (clock for Timing  
0 Source Gen.) If cabled via the Distributing Frame,  
0 terminations for the maximum of 100 pairs should  
0 be provided. The 25 pair TSG cable must be  
0 terminated on the Timing Source Generator rather  
0 than a DSX or DF for the purpose of grounding the  
0 shield.

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-18

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 Operator positions: The number of each position type required  
0 depends on the specific office configuration.

0 | -Type 1 position (now called "Database Gateway" position):  
0 Provides standard voice access to the  
0 DMS and a 56Kb/s datalink to the IBM Directory  
0 Assistance database. Information to/from the DA  
0 database is shared with other positions in the  
0 token ring via the Multistation Access Unit. There  
0 must be two Type 1 positions in each token ring  
0 for redundant IBM DA access.

0 | -Type 2 position (now called "DMS Gateway" position):  
0 Provides standard voice access to the  
0 DMS. A 56Kb/s datalink to DMS is shared with  
0 other positions in the token ring via the  
0 Multistation Access Unit. Two positions in  
0 each cluster of four must be Type 2  
0 positions for redundant configurations.

0 | -Type 3 position (now called "Operator" position):  
0 Provides standard voice access to the DMS.  
0 Additional information is accessible via the  
0 Token Ring.

0 Three port conference circuits: Each TOPS MPX position requires  
0 one three port conference circuit at the DMS. This  
0 is the same requirement as for other TOPS MP  
0 applications.

0 Power Strip: Each TOPS MPX position requires one power strip  
0 to supply AC power to the monitor, controller and  
0 modem. This strip uses a twist-lock connector  
0 on the power cord so a matching outlet must be  
0 provided. A power strip with a straight blade  
0 connector is available but the twist-lock type  
0 is the standard type.

0 TOPS MPX PS2 Bracket Assy: A bracket assembly required for the  
0 TOPS MPX positions. One bracket is required per  
0 TOPS MPX Type 1, Type 2 and Type 3 position. This  
0 bracket is included in the current MPX position  
0 building blocks. The bracket must be provided  
0 separately if positions are provisioned without  
0 building blocks.

0 RELEASE 28.01  
0 93 12 03

## 0 HOST AND REMOTE OPERATOR CENTRALIZATION

0  
0 OC data links are required between the host DMS200 and the remote  
0 DMS200. These OC data links must be assigned to a DCM at both of-  
0 fices. Each link must be assigned to the first circuit of slot 0  
0 on the DCM. Only one data link may be assigned per DCM. The other  
0 circuits on the DCM may be used for the connection of OC voice  
0 links or other type trunk circuits. A minimum of two OC  
0 datalinks are required per remote office and a maximum of four OC  
0 datalinks can be assigned per OC remote office. Each pair of OC  
0 datalinks has a traffic capacity equal to 50 positions. A host OC  
0 can be assigned a maximum of 15 remote OC offices.

## 0 TOPS QMS

0  
0 The TOPS QMS External MIS feature, if provided, requires one or  
0 more EMPC circuit packs on the IOC shelf.

0 The TOPS QMS Senior Operator feature requires a TOPS loop-around  
0 trunk for each Senior Operator established. This may require ad-  
0 ditional trunks or T1 connections in the TOPS office.

0 lows.

## 0 NTZZ29AA Position Controller Equipment Cabinet

0 Provide one PCE for each four TPC shelves required.

0 NTZZ29AA = Qty of NTZZ29VA/4 (round up).

## 0 NTZZ29BA Auxiliary Access Equipment Cabinet

0 Provide one AAE for each four PCE cabinets required.

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-21

0 RELEASE 28.01  
0 93 12 03

0 NTZZ29BA = Qty of NTZZ29AA/4 (round up).

0 NTZZ29CB Modular TOPS MP Position

0 Provide one for each TOPS MP position required including In-  
0 charge, Assistant and Force Manager positions. These positions  
0 do not include a desk for mounting the position equipment,  
0 headset jacks or keyboards. These items must be provisioned  
0 separately.

0 NTZZ29CB = Qty of Modular TOPS MP positions required.

0 The NTZZ29CA is no longer available for ordering.

0 NTZZ29CA Modular TOPS MP Position (MD, Do not order)

0 Provide one for each TOPS MP position required including In-  
0 charge, Assistant and Force Manager positions. These positions  
0 do not include a desk for mounting the position equipment or  
0 keyboards. These must be provisioned separately.

0 NTZZ29CA = Qty of Modular TOPS MP positions required.

0 NTZZ29ZA Headset Jack Assembly 6.5 Foot

0 Provide one for each TOPS MP position required for which the  
0 TOPS MP controller to headset jack location is 6.5 feet or  
0 less.

0 NTZZ29ZA = Qty of Modular TOPS MP positions required for  
0 which the TOPS MP controller to headset jack location is 6.5  
0 feet or less.

0 NTZZ36AA Integrated Headset Jack Assembly 10 Foot

0 Provide one for each TOPS MP position required for which the  
0 TOPS MP controller to headset jack location is greater than  
0 6,5 feet but less than or equal to 10 feet.

0 NTZZ36AA = Qty of Modular TOPS MP positions required for  
0 which the TOPS MP controller to headset jack location is  
0 greater than 6.5 feet but less than or equal to 10 feet.

0 NTZZ29DA Integrated TOPS MP Position.

0 Provide one for each TOPS MP position required including In-  
0 charge, Assistant and Force Manager positions. The keyboard

0 Remote Office - Traffic Operator Position Equip.

0 and the desk equipped with headset jacks must be provisioned  
0 separately.

0 NTZZ29DA = Qty of Integrated TOPS MP positions required.

0 NT0M36AE English Universal Keyboard

0 Provide one for each TOPS MP position required including In-  
0 charge, Assistant and Force Manager positions. This is the  
0 standard English language keyboard.

0 NT0M36AE = Qty of TOPS MP positions (NTZZ29CB or NTZZ29DA)  
0 required.

0 NT0M36AA French Universal Keyboard

0 Provide one for each TOPS MP position required including In-  
0 charge, Assistant and Force Manager positions. This is the  
0 standard French language keyboard.

0 NT0M36AA = Qty of TOPS MP positions (NTZZ29CB or NTZZ29DA)  
0 required.

0 NT0M36AH English IBM DA Keyboard

0 Provide one for each TOPS MP position required including In-  
0 charge, Assistant and Force Manager positions. This is the  
0 keyboard for positions providing IBM DA service.

0 NT0M36AH = Qty of TOPS MP IBM DA positions (NTZZ29CB and  
0 NTZZ29DA) required.

0 NP154 Integrated TOPS MP Position Desk

0 Provide one for each NTZZ29DA provided.

0 NP154 = NTZZ29DA.

0 NTNX5305 Ground Bar

0 Provide one for a maximum of 128 positions.

0 NTNX5305 = NTZZ29CB or NTZZ29DA/128.

0 NTZZ29KA Computer Based Training System

0 Provide one for each Computer Based Training required.

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-23

0 RELEASE 28.01  
0 93 12 03

0 NTZZ29KA = Number of Computer Based Training Systems re-  
0 quired by the Customer.

0 NTZZ29VA 4 Operator TPC Shelf (SCSI)

0 Provide one for each four operator positions required in-  
0 cluding In-Charge, Assistant and Force Manager positions.

0 NTZZ29VA = Number of positions/4, round up.

0 NTZZ29MA UDS Modem Shelf Assembly

0 Provide up to four NTZZ29MA per AAE based on office features  
0 and PCE configuration. For a non-TMS office with the ORDB fea-  
0 ture, provide one NTZZ29MA per AAE. For a non-TMS office with  
0 the DA feature, provide one NTZZ29MA per AAE in a line-up with  
0 1 or 2 PCE and provide two NTZZ29MA per AAE in a line-up with  
0 3 or 4 PCE. For a non-TMS office with both the ORDB and DA  
0 feature, provide two NTZZ29MA per AAE in a line-up with 1 or 2  
0 PCE and three NTZZ29MA per AAE in a line-up with 3 or 4 PCE.  
0 The TOPS MP TA feature has no NTZZ29MA provisioning require-  
0 ment in a non-TMS office.

0 For an integrated TMS office provide one NTZZ29MA per AAE in  
0 a line-up with 1 or 2 PCE and provide two NTZZ29MA per AAE in  
0 a line-up with 3 or 4 PCE. The NTZZ29MA provisioning in a TMS  
0 office includes the TOPS MP TA, TOPS MP DA and TOPS MP ORDB  
0 features capability.

0 For a dual HSDA office (field application only), provide  
0 three NTZZ29MA per AAE in a line-up with 1 or 2 PCE, and pro-  
0 vide four NTZZ29MA per AAE in a line-up with 3 or 4 PCE.

0 NTZZ29MA = NTZZ29BA for a non-TMS office with the ORDB fea-  
0 ture only.

0 NTZZ29MA = NTZZ29AA/2 (round up) for a non-TMS office with  
0 the DA feature only.

0 NTZZ29MA = NTZZ29BA + ((NTZZ29AA/2 (round up))) for a non-TMS  
0 office with both the ORDB and DA features.

0 The presence of the TA feature in addition to the ORDB or  
0 the DA feature does not effect the calculations.

0 NTZZ29MA = NTZZ29AA/2 (round up) for a TMS office.

0  
0  
0

Remote Office - Traffic Operator Position Equip.  
Chapter 26

0 RELEASE 28.01  
0 93 12 03

0 NTZZ29MA = NTZZ29AA/2 (round up) + 2 for a dual HSDA office.

0 NTZZ29NA Modem Filler Assembly

0 Provide one for each unequipped UDS Modem Shelf mounting lo-  
0 cation on NTZZ29BA.

0 NTZZ29NA = (NTZZ29BA \* 3) - NTZZ29MA.

0 62125086 UDS 212A Modem Card

0 Provide one for each NTZZ29VA TPC for TAMI access.

0 62125086 = NTZZ29VA

0 64565007 UDS 56kbps DSU Card

0 Provide up to four 64565007 per NTZZ29VA based on office  
0 features and NTZZ29AA configuration. For a non-TMS office with  
0 the ORDB feature, provide one 64565007 per NTZZ29VA. For a  
0 non-TMS office with the DA feature, provide two 64565007 per  
0 NTZZ29VA. For a non-TMS office with both the ORDB and DA fea-  
0 ture, provide three 64565007 per NTZZ29VA.

0 For an integrated TMS office provide two 64565007 per  
0 NTZZ29VA.

0 For a dual HSDA office (field application only), provide  
0 four 64565007 per NTZZ29VA.

0 64565007 = NTZZ29VA for a non-TMS office with the ORDB fea-  
0 ture only.

0 64565007 = NTZZ29VA \* 2 for a non-TMS office with the DA  
0 feature only.

0 64565007 = NTZZ29VA \* 3 for a non-TMS office with both the  
0 ORDB and DA features.

0 The presence of the TA feature in addition to the ORDB or  
0 the DA feature does not effect the calculations.

0 64565007 = NTZZ29VA \* 2 for a TMS office.

0 64565007 = NTZZ29VA \* 4 for a dual HSDA office.

0 NT0X91AG TOPS MP AAE Alarm CP (12-port)

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-25

0 RELEASE 28.01  
0 93 12 03

0 Provide one NT0X91AG per NTZZ29BA for offices being upgraded  
0 to support Dual HSDA. Field application only.

0 NTZZ29TA High Speed Data Access

0 Provide one per NTZZ29VA for non-TMS offices with ORDB only,  
0 non-TMS offices with DA only or TMS offices. Provide two per  
0 NTZZ29VA for non-TMS offices with both ORDB and DA. Provide  
0 two per NTZZ29VA for dual HSDA offices.

0 NTZZ29TA = NTZZ29VA for non-TMS offices with ORDB only,  
0 non-TMS offices with DA only or TMS offices.

0 NTZZ29TA = NTZZ29VA \* 2 for non-TMS offices with both ORDB  
0 and DA.

0 NTZZ29TA = NTZZ29VA \* 2 for dual HSDA offices.

0 TOPS MP offices provisioned as TOPS MP TA only offices which  
0 add the DA or ORDB feature must provide enough NTZZ29TA to re-  
0 place any existing NTNX62AA HSDA.

0 TOPS MP offices provisioned as non-TMS offices which convert  
0 to TMS for any reason must provide enough NTZZ29TA to replace  
0 any existing NTNX62AA HSDA.

0 NTZZ29UA High Speed Line Access

0 Provide one for each TOPS MP position required including the  
0 In-Charge, Assistant and Force Manager positions.

0 NTZZ29UA = Number of TOPS MP positions required (NTZZ29CA  
0 and NTZZ29DA).

0 NT0X50AA Filler Face Plate

0 Provide one for each unequipped NTZZ29TA and NTZZ29UA slot  
0 position on the NTZZ29VA. Provide 14 NT0X50AA for any une-  
0 quipped TPC positions on a PCE cabinet (NTZZ29AA).

0 
$$\text{NT0X50AA} = ((\text{NTZZ29VA} * 6) - (\text{NTZZ29TA} + \text{NTZZ29UA})) +$$
  
0 
$$(((\text{NTZZ29AA} * 4) - \text{NTZZ29VA})) * 14)$$

0 NT0X50AE Filler Face Plate

0 Provide four NT0X50AE for each unequipped TPC position on a  
0 PCE cabinet (NTZZ29AA).

0 Remote Office - Traffic Operator Position Equip.

0 RELEASE 28.01  
0 93 12 03

0  $NT0X50AE = ((NTZZ29AA * 4) - NTZZ29VA) * 4$

0 NTNX54BA Aluminum Shield CP

0 Provide one NTNX54BA for each unequipped TPC position on a  
0 PCE cabinet (NTZZ29AA).

0  $NTNX54BA = (NTZZ29AA * 4) - NTZZ29VA$

0 A0355018 Modular (Teledapt) Adapter

0 Provide one per 8 TOPS MP position required.

0  $A0355018 = TOPS MP positions (NTZZ29CA or NTZZ29DA)/8$  (round  
0 up).

0 P0696402 Floor Mounting Template

0 Provide one per new TOPS MP office.

0  $P0696402 = One per new TOPS office.$

0 P0696219 Aisle Line-up Label

0 Provide one per two line-ups of PCE 0-7 and AAE 0-1.

0  $P0696219 = Number of line-ups/2.$

0 The following equipment items and provisioning are for informa-  
0 tion on provisioning Canadian jobs. For U.S. jobs this equipment  
0 is provisioned by the Building Studies Engineers.

0 NTNX55AA Cabinet Top Cable Trough

0 Provide one for each NTZZ29AA and NTZZ29BA.

0  $NTNX55AA = Qty of NTZZ29AA + NTZZ29BA - 1$

0 NTZZ29EA Cable Trough Cover Plates

0 Provide one for the gap between adjacent NTNX55AA.

0  $NTZZ29EA = Qty of NTZZ29AA + NTZZ29BA - 1$

0 NTZZ29FA Cable Trough End Plates (Canadian only)

0

0 RELEASE 28.01  
0 93 12 03  
0

0 Provide one for each line-up. A line-up is an NTZZ29BA and  
0 from one to four NTZZ29AA.

0 NTZZ29FA = Qty of NTZZ29BA.

0 NTZZ29GA Cabinet Concrete EQ Floor Anchors Zone 1-3

0 Provide one for each NTZZ29AA or NTZZ29BA to be mounted on a  
0 concrete floor in an earthquake office in zone 1-3

0 NTZZ29GA = Qty of NTZZ29AA + NTZZ29BA in an office with a  
0 concrete floor in earthquake zone 1-3.

0 NTZZ29HA Cabinet Concrete EQ Floor Anchors Zone 4-7

0 Provide one for each NTZZ29AA or NTZZ29BA to be mounted on a  
0 concrete floor in an earthquake office in zone 4-7

0 NTZZ29HA = Qty of NTZZ29AA + NTZZ29BA in an office with a  
0 concrete floor in earthquake zone 4-7.

0 NTZZ29JA Cabinet Concrete Non-EQ Floor Anchors

0 Provide one for each NTZZ29AA or NTZZ29BA to be mounted on a  
0 concrete floor in a non-earthquake office.

0 NTZZ29JA = Qty of NTZZ29AA + NTZZ29BA in an office with a  
0 concrete floor in a non-earthquake office.

0 NTNX2531 Right End Panel

0 Provide one for each PCE line-up. A line-up is one to four  
0 NTZZ29AA and a NTZZ29BA.

0 NTNX2531 = NTZZ29AA/4 (round up).

0 NTNX2532 Left End Panel

0 Provide one for each PCE line-up. A line-up is one to four  
0 NTZZ29AA and a NTZZ29BA.

0 NTNX2532 = NTZZ29AA/4 (round-up)

0 NTNX2544 Adjacent Frame Attachment Hardware

0 Chapter 26

0 RELEASE 28.01  
0 93 12 03  
0

0 Provide four for each adjacent cabinet in a non-earthquake  
0 office and six for each adjacent frame in an earthquake of-  
0 fice.

0  $NTNX2544 = ((NTZZ29AA - ((NTZZ29AA/4 \text{ round down}) * 4) - 1) * 4) + (((NTZZ29AA/4 \text{ round down}) * 3) * 4)$  for non-earthquake  
0 offices.  
0

0  $NTNX2544 = ((NTZZ29AA - ((NTZZ29AA/4 \text{ round down}) * 4) - 1) * 6) + (((NTZZ29AA/4 \text{ round down}) * 3) * 6)$  for earthquake of-  
0 fices.  
0

0 **NTNX2545 Adjacent Frame Attachment Hardware EMI**

0 Provide one for each adjacent cabinet.

0  $NTNX2545 = (NTZZ29AA - ((NTZZ29AA/4 \text{ round down}) * 4) - 1) +$   
0  $((NTZZ29AA/4 \text{ round down}) * 3).$

0 **NTNX56AA Cabinet Raised Floor Anchor**

0 Provide four for each cabinet mounted on a raised floor.

0  $NTNX56AA = (NTZZ29AA + NTZZ29BA) * 4$  for cabinets mounted on  
0 a raised floor.

0 **NTNX56BA Furniture Concrete Floor Anchor**

0 Provide four for each Integrated TOPS MP position (NTZZ29DA)  
0 mounted on a concrete floor.

0  $NTNX56BA = NTZZ29DA * 4$  for concrete floor mounted Inte-  
0 grated TOPS MP positions.

0 **NTNX56CA Furniture Raised Floor Anchor.**

0 Provide four for each Integrated TOPS MP position (NTZZ29DA)  
0 mounted on a raised floor.

0  $NTNX56CA = NTZZ29DA * 4$  for raised floor mounted Integrated  
0 TOPS MP position.

0 **NT0M36AF NT4X81DA Keyboard Upgrade PC Kit**

0 Provide one NT0M36AF for each NT4X81DA keyboard requiring  
0 upgrade to a NT0M36AE keyboard for CCI DA, ORDB or both.

0  
0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

0 RELEASE 28.01  
0 93 12 03

0 NT0M36AK NT0M36AE Keyboard Upgrade PC Kit

0 Provide one NT0M36AK for each NT0M36AE keyboard requiring  
0 upgrade to a NT0M36AH keyboard for IBM DA, ORDB or both.

0 20000019-01 Wicat Computer Based Training System

0 Provide the customer specified quantity of CBT for training  
0 TOPS MP operators. One system can connect up to 16 TOPS MP po-  
0 sitions for training purposes.

0 940-001-001T Wicat Cabinet (Brown)

0 Provide one per each 20000019-01 Wicat CBT provided.

0 Wicat CBT Spare Circuit Boards

0 Provide any or all of the circuit boards listed below as  
0 spare if the Customer requires spare circuit boards for the  
0 Wicat CBT.

0 810-030-002 ICI Board

0 810-167-001 2MB Memory Board

0 810-220-001 PCM Audio Delivery Board

0 909-005-003 SCSI Hard Disk Drive

0 917-022-001 SCSI Host Interface

0 917-163-001 12.5 MHz CPU Board With 1MB Memory

0 919-003-001 SCSI Cartridge Tape Drive

0 TOPS MP Position Labels

0 Provide two sets of the following labels, choosing the range  
0 of position numbers to suit job requirements. The second set  
0 allows the customer to label spares when replacing failed  
0 equipment.

0 P0709162 TOPS Position Numbering Label (Pos 0000-0071)

0 P0709163 TOPS Position Numbering Label (Pos 0072-0143)

0 P0709164 TOPS Position Numbering Label (Pos 0144-0215)

## 0 TOPS MPX PROVISIONING

0  
0 TOPS MPX Position Type Calculation.

0 A. Quantity of positions required.

0 Range = 0 - 1024

0 B. Cluster size required.

0 Range = 4

0 C. Maximum positions per token ring.

0 Range = 16, 20. Default = 16

0 D. Redundant or non-redundant Type 2 positions

0 Range = redundant, non-redundant Default = redundant

0 For position availability reasons, non-redundant Type 2 po-  
0 sitions are not recommended, and are not supported by this  
0 document.

0 E. Growth by cluster or even growth

0 Range = cluster, even. Default = cluster

0 F.  $A/C = \text{Quantity of Token Rings required (round Up)}$

0 \*\*\*\*\*

0 IF using "Growth by cluster" (see item E) Proceed with item G-U.

0 IF using "Even growth" (see item E) Skip to item V-FF.

0 \*\*\*\*\*

0 G.  $A/4$  (round down) = FC (full clusters)

0 H.  $A - (FC * 4) = RP$

0 J. If  $RP > 0$ , then  $TR2QTY = 1$

0  
0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

0 RELEASE 28.01  
0 93 12 03

0 If  $RP = 0$ , then  $TR2QTY = 0$

0 K.  $FC/F$  (round down) =  $MIN\_C$

0 L.  $FC - (F * MIN\_C) = RC$

0 M.  $RC = TR1QTY$

0 N.  $F - TR1QTY - TR2QTY = TR3QTY$

0 P.  $TR1SIZE = (MIN\_C * 4) + 4$

0  $TR2SIZE = (MIN\_C * 4) + RP$

0  $TR3SIZE = (MIN\_C * 4)$

0 Q. Refer to Table C using the value of  $TR1SIZE$  to determine the  
0 quantity of Type 1, Type 2 and Type 3 positions required. The  
0 Type 1 position quantity from the table shall become  $TR1TYPE1$ ,  
0 the Type 2 position quantity from the table shall become  
0  $TR1TYPE2$  and the Type 3 position quantity from the table shall  
0 become  $TR1TYPE3$ . Repeat this process for the value of  $TR2SIZE$ ,  
0 creating  $TR2TYPE1$ ,  $TR2TYPE2$  and  $TR2TYPE3$  values. Repeat the  
0 process once more with the value of  $TR3SIZE$  to create the val-  
0 ues for  $TR3TYPE1$ ,  $TR3TYPE2$  and  $TR3TYPE3$ .

0 R. Total Type 1 position quantity =  $(TR1TYPE1 * TR1QTY) +$   
0  $(TR2TYPE1 * TR2QTY) + (TR3TYPE1 * TR3QTY)$

0 S. Total Type 2 position quantity =  $(TR1TYPE2 * TR1QTY) +$   
0  $(TR2TYPE2 * TR2QTY) + (TR3TYPE2 * TR3QTY)$

0 T. Total Type 3 position quantity =  $(TR1TYPE3 * TR1QTY) +$   
0  $(TR2TYPE3 * TR2QTY) + (TR3TYPE3 * TR3QTY)$

0 U.  $A_{must} = R + S + T$ .

0 \*\*\*\*\*

0 When using "Even growth" (see item E), proceed with item V-FF.

0 \*\*\*\*\*

0 V.  $A/F$  (round down) = Minimum positions per ring ( $MIN\_P$ ).

0 W.  $A - (MIN\_P * F) = XP$ .

0  
0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

Page 26-33

0  
0 RELEASE 28.01  
0 93 12 03

0 X.  $TR1QTY = F - XP.$

0 Y.  $TR2QTY = XP.$

0 Z.  $TR1SIZE = MIN\_P.$

0 AA.  $TR2SIZE = MIN\_P + 1.$

0 BB. Refer to TABLE C with TR1SIZE to determine the Type 1, Type  
0 2 and Type 3 position quantities required. The quantity of  
0 Type 1 positions shall be the value of TR1TYPE1, the quan-  
0 tity of Type 2 positions shall be the value of TR1TYPE2 and  
0 the quantity of Type 3 positions shall be the value of  
0 TR1TYPE3. Repeat this process for TR2SIZE with the Type 1,  
0 Type 2 and Type 3 position quantities becoming the values of  
0 TR2TYPE1, TR2TYPE2 and TR2TYPE3 respectively.

0 CC. Total Type 1 position quantity =  $(TR1TYPE1 * TR1QTY) +$   
0  $(TR2TYPE1 * TR2QTY).$

0 DD. Total Type 2 position quantity =  $(TR1TYPE2 * TR1QTY) +$   
0  $(TR2TYPE2 * TR2QTY).$

0 EE. Total Type 3 position quantity =  $(TR1TYPE3 * TR1QTY) +$   
0  $(TR2TYPE3 * TR2QTY).$

0 FF.  $A\ must = CC + DD + EE.$

0 Please note that these calculations do not address non-redundant  
0 Type 2 position calculations as that configuration is not sup-  
0 ported by this document.

0 For a list of equipment items and provisioning rules for TOPS  
0 MPX, refer to the NTN51BA and TOPS\_MPX Engineering Manual  
0 Sections.

## 0 MPC PROVISIONING

0  
0 Each MPC or EMPC used for DMS to DAS/C access will require one  
0 (1) 9600 baud modem. Refer to ECM 633 for appropriate modem or-  
0 dering information (See Case R96).

0  
0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

0 RELEASE 28.01  
0 93 12 03  
0

0 The call control links from the DMS to the DAS are provided via  
0 either Multi-Protocol Controllers (MPCs) or Enhanced Multi-  
0 Protocol Controllers (EMPCs). The MPCs or EMPCs are mounted on  
0 IOC shelves and are provisioned based on traffic. Each MPC is ca-  
0 pable of handling 9000 Busy Hour Calls and each EMPC can handle  
0 18000 BHC. A maximum of sixteen MPCs or EMPCs is allowed per ap-  
0 plication. The total DA traffic should be divided by 9000 to de-  
0 termine how many MPCs are required, or by 18000 when using EMPCs.  
0 The number of MPCs/EMPCs should be doubled to provide redundancy  
0 and spread over as many IOCs as possible to minimize the impact  
0 of an IOC failure. Refer to ECM 482 for additional information  
0 about EMPC link provisioning and ECM 468 for a diagram showing  
0 system configuration.

0 The MultiProtocol Converters (MPC/EMPC) used for the datalink  
0 from the DMS to the DA database must be provisioned based on  
0 traffic. Each MPC/EMPC CP will use only one port.

0 LET BHC = total Busy Hour Calls requiring DA access  
0 N = preliminary Number of MPCs/EMPCs required  
0 TC = Total MPC CPs required

0 
$$N = BHC / 9,000 \quad (\text{Round Up}) \text{ MPC}$$

0 - or -

0 
$$N = BHC / 18,000 \quad (\text{Round Up}) \text{ EMPC}$$

0 
$$TC = N * 2$$

0 The preliminary number of MPCs/EMPCs is doubled to provide the  
0 necessary redundancy. In applications requiring more than eight  
0 MPCs/EMPCs for traffic, it is not possible to provide "N \* 2" re-  
0 dundancy, due to the limit of sixteen (maximum) MPCs/EMPCs per  
0 application. In such a configuration sparing should be based on  
0 the concept that no single point failure should degrade capacity.  
0 The MPCs/EMPCs should be spread over as many IOCs as possible and  
0 spares provisioned based on the number of MPCs/EMPCs that would  
0 be lost if the most heavily loaded IOC were to be lost. For exam-  
0 ple, if an office needed twelve MPCs and had four IOCs, three  
0 MPCs/EMPCs per IOC (12 total) would carry the traffic. By provi-  
0 sioning four MPCs/EMPCs per IOC the loss of any individual IOC  
0 would still leave twelve working MPCs/EMPCs. When possible, "N \*  
0 2" sparing shall be provisioned.

0 RELEASE 28.01  
0 93 12 03

## 0 ARU TRUNK PROVISIONING

0  
0 Directory Assistance/Intercept/ARU Trunk Provisioning

- 0 1. Calculate the quantity of DA/Intercept trunks required based  
0 on traffic requirements. Use standard CCS method.

0  $BHC \times HT/100 = CCS$  (Refer to the Poisson trunk capacity  
0 tables in NTP 297-1001-450)

0 Locate the CCS value in the table under the appropriate GOS  
0 to determine the number of trunks required.

- 0 2. Calculate the quantity of ARU trunks required based on  
0 DA/Intercept traffic requirements. Use standard CCS method.

0  $BHC \times HT/100 = CCS$  (Refer to the Poisson trunk capacity  
0 tables in NTP 297-1001-450)

0 Locate the CCS value in the table under the appropriate GOS  
0 to determine the number of trunks required.

0 Average ARU Holding Times are as follows:

0 - Calls not eligible for auto call completion = 12 sec.

0 - Calls eligible for auto call completion,  
0 call completion declined = 25 sec.

0 - Calls eligible for auto call completion,  
0 call completion accepted = 45 sec.

0 - Intercept calls = 12 sec.

- 0 3. Calculate the number of DA/Intercept DS1s required.

0  $DA/Intercept \text{ trunks required (Step 1)} / 24 = DS1s \text{ required}$

- 0 4. Calculate the number of ARU DS1s required.

0  $ARU \text{ trunks required (Step 2)} / 24 = DS1s \text{ required}$

- 0 5. Calculate the number of DTC required based on DTC real  
0 time capacity

0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

0 RELEASE 28.01  
0 93 12 03  
0

0  
0 DA/Intercept BHC x 90 ms / 612,000 ms = Number of DTC  
0 required.

- 0 6. Spread the DA/Intercept DS1s evenly over the number of  
0 required DTC. Spread the ARU DS1s evenly over the number of  
0 required DTC. Calculate the the number of attempts per DTC  
0 using the following formulas:

0 DA/Intercept trunks:  $28 \text{ CCS} \times 100 / \text{Holding time} = \text{Attempts}$   
0  $\text{per trunk} \times 24 \text{ trunks per DS1} \times \text{number}$   
0  $\text{of DS1} = \text{attempts per DTC}.$

0 ARU trunks :  $36 \text{ CCS} \times 100 / \text{Holding time} = \text{Attempts per}$   
0  $\text{trunk} \times 24 \text{ trunks per DS1} \times \text{number of DS1} =$   
0  $\text{attempts per DTC}.$

0 (36 CCS is used for the ARU trunks rather than 28 CCS  
0 because of the extremely low overhead associated with ARU  
0 connections.)

- 0 7. If any of the DTCs has attempts equal to more than 13,600,  
0 then add one or more DTC and recalculate attempts per DTC.  
0 Enough DTC must be provided to achieve attempts less than or  
0 or equal to 13,600.

0 Example :

0 (The numbers used are for this example only)

0 DA/Intercept BHC = 86,000  
0 DA/Intercept HT = 42 sec  
0 ARU HT = 14 sec

- 0 1. Total DA/Intercept trunks required = 1290 (Based on 28 CCS  
0 per trunk).  
0 2. Total ARU trunks required = 336 (Based on 28 CCS per trunk).  
0 3. DA/Intercept DS1s =  $1290/24 = 54 \text{ DS1s}$   
0 4. ARU DS1s =  $336/24 = 14 \text{ DS1s}$

0 (Note the total DS1s required divided by the DTC physical  
0 capacity of 20 DS1s = 4 DTC are required based on traffic).

0 RELEASE 28.01  
0 93 12 03

0 5.  $86000 \times 90 \text{ ms} / 612000 \text{ ms} = 13 \text{ DTC}$  (Based on real time  
0 capacity).

0 6. DS1s spread evenly over the 13 DTC =

0 DTC 1- 1 ARU DS1  $((36 \times 100 / 14) \times 24) \times 1 = 6172$   
0 11 4 DA/Intc DS1  $((28 \times 100 / 42) \times 24) \times 4 = 6400$   
0 Total attempts 12572

0 DTC 12 1 ARU DS1  $((36 \times 100 / 14) \times 24) \times 1 = 6172$   
0 5 DA/Intc DS1  $((28 \times 100 / 42) \times 24) \times 5 = 8000$   
0 Total attempts 14172

0 DTC 13 2 ARU DS1  $((36 \times 100 / 14) \times 24) \times 2 = 12344$   
0 5 DA/Intc DS1  $((28 \times 100 / 42) \times 24) \times 5 = 8000$   
0 Total attempts 20344

0 DTC 1-11 are well within the 13,600 attempts per DTC limit.  
0 DTC 12 and DTC 13 exceed this limit. A DTC must be added and  
0 the DS1s re-spread over 14 DTC.

0 DTC 1-11 remain the same.

0 DTC 12 is configured the same as DTC 1-11.

0 DTC 13 and 14 are configured with:

0 1 ARU DS1  $((36 \times 100 / 14) \times 24) \times 2 = 6172$   
0 3 DA/Intc DS1  $((28 \times 100 / 42) \times 24) \times 2 = 3200$   
0 Total attempts 9372

0 \*\*\*\*\*  
0 \* 14 DTC are required to accomdate the 68 DS1s for the \*  
0 \* DA/Intc/ARU trunks for this example \*  
0 \*\*\*\*\*

| 20      | 2      | 10     | 8      |

0 TABLE C

0 The table is based on four position cluster size.

0  
0 RELEASE 28.01  
0 93 12 03

0 Positions must be provisioned for the MPX system to obtain the proper  
0 mix of position types to provide database access facilities for each  
0 token ring. Table A reflects token rings limited to sixteen positions,  
0 redundant Type 2 positions be provided four position cluster size and  
0 growth by clusters. The technical limitation is a maximum of twenty  
0 positions per ring. If a ring must be arranged for more than sixteen  
0 positions, the seventeenth and eighteenth positions must be Type 2 and  
0 the nineteenth and twentieth should be Type 3. When a token ring grows  
0 to more than sixteen positions, additional positions shall be added to  
0 that ring until the maximum of twenty positions is reached before add-  
0 ing to the next token ring. Provisioning from the table will minimize  
0 the number of Type 2 positions needed. Table A provides the most re-  
0 liable operational configuration as it includes redundant Type 2 posi-  
0 tions. This document does not support non-redundant Type 2  
0 provisioning information.

RELEASE 28.01  
93 12 03

0 Table A is arranged in columns, with Token Rings (TR) 0-5 subdivided  
0 to show how many Type 1,2 and 3 positions are required to provision  
0 the total number of positions indicated in the leftmost column. The  
0 columns labeled "M" indicates that three MAUs are required and the  
0 columns labeled "B" indicates that one BIX block is required for each  
0 Token Ring.

TABLE A : MPX Position Provisioning

Since a single TOPS Message Switch can support a maximum of ninety-six (96) positions, configurations for more than 96 operators will require more than one TMS. To maintain as balanced a traffic load as possible, operator positions should be evenly spread over available TMSs. For example, to configure an office for 100 operators, the configuration specified in Table A for fifty operators should be provided twice, to balance the traffic evenly on the two TOPS Message Switches.

To illustrate how Table A should be interpreted and implemented, the following example is provided. An office requires 26 MPX operator positions. For 26 positions, Table A states:

| QTY<br>MPX<br>POS | TR 0      | TR 1      | TR 2      | TR 3      | TR 4      | TR 5      |
|-------------------|-----------|-----------|-----------|-----------|-----------|-----------|
|                   | 1 2 3 M B | 1 2 3 M B | 1 2 3 M B | 1 2 3 M B | 1 2 3 M B | 1 2 3 M B |
| 26                | 2 8 4 3 1 | 2 6 4 3 1 |           |           |           |           |

For 26 positions, two rings are required. There will be two Type 1 positions in each ring, eight Type 2 positions in the first ring and six in the second, and four Type 3 positions in each ring. Each ring will have three MAUs and one BIX block.

0  
0 RELEASE 28.01  
0 93 12 03

0 This example office would be configured as follows:

| 0 | Ring #0 |           | Ring #1   |
|---|---------|-----------|-----------|
| 0 |         | (1)Type 1 | (1)Type 1 |
| 0 | MAU     | (2)Type 2 | (4)Type 2 |
| 0 |         | (1)Type 3 | (3)Type 3 |
| 0 |         | (1)Type 1 | (1)Type 1 |
| 0 | MAU     | (4)Type 2 | (2)Type 2 |
| 0 |         | (1)Type 3 | (1)Type 3 |
| 0 |         | (0)Type 1 | (0)Type 1 |
| 0 | MAU     | (2)Type 2 | (0)Type 2 |
| 0 |         | (2)Type 3 | (0)Type 3 |

0 EXAMPLE Configuration

# 0 TOPS MPX NOTES

0  
0 Note 1:

0 Force Management functions will be implemented using TOPS 4 or  
0 TOPS MP equipment. Provide one TOPS 4 or TOPS MP Force Manager  
0 position for each TOPS MPX Host or Standalone office. Refer to  
0 the Engineering Manual for details. The customer may provide this  
0 equipment. If NT must provide an MP Force Manager position for  
0 TOPS MPX, a TOPS MP position, a PCE, AAE, and all other associ-  
0 ated hardware must be ordered

0 Note 2:

0 The position numbering labels shall be provided per the position  
0 numbering information in the TOPS\_NUMB mnemonic. If these numbers  
0 overlap two or more labels, all the necessary labels shall be or-  
0 dered.

## 0 TOPS QMS

0  
0 Force management Basic Statistics are provided to devices QTADS,  
0 QFADS and QMFADS. These devices replace the TADS, FADS and MFADS  
0 of the TOPS ACD. The QTADS, QFADS and QMFADS hardware require-  
0 ments are the same the TADS, FADS and MFADS. This hardware in-  
0 cludes a DMODEM circuit (NT3X02AA, NT3X03AA), a BELL108 or  
0 BELL202 compatible modem and a TTY. The QTADS, QFADS and QMFADS  
0 can co-exist in an office during the transition period from TOPS  
0 ACD to TOPS QMS. TOPS QMS queue information can only be reported  
0 to the QTADS, QFADS or QMFADS devices.

0 The FMCRT (Force Manager) provisioning rules remain the same. The  
0 Force Manager position must be a TOPS MP position or a Customer  
0 provided TOPS 4 position. A TOPS MPX position cannot serve as a  
0 Force Manger position. Only one Force Manager can be provisioned  
0 per TOPS office.

0 The new external MIS system can replace the FMCRT, QTADS, QFADS  
0 and QMFADS, can be used in parallel with those devices, or not  
0 implemented at all. The link for sending the statistics to the  
0 external MIS system is an X.25 link. This link is implemented via  
0 an Enhanced Multi-Protocol Controller (EMPC) mounted on an  
0 Input/Output Controller shelf in the TOPS host office. One EMPC  
0 port is required per link. An EMPC can provide up to two 56 Kbps  
0 ports. An appropriate modem must be provided per link based on  
0 the speed of the link and the interface requirements of the ex-  
0 ternal MIS system. The limit of one application per EMPC applies  
0 to these links allowing only one port of any EMPC to be used for  
0 this feature. The TOPS QMS MIS is limited to 16 links. The ex-  
0 ternal MIS system shall be provided by the customer.

0 The following information provides a calculation for determining  
0 the quantity of EMPC links required for an external MIS system.

0 The following calculation determines the average rate at which  
0 message data buffers are transmitted per minute by the toll  
0 switch to the MIS device.

0 Average msg bytes/call \* HDBH call attempts  
0 ----- = Buffers/min.  
0 8192 bytes \* 60

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-47

0 RELEASE 28.01  
0 93 12 03  
0

0 Average message bytes/call = average position event msgs/call  
0 \* 45 bytes + average queue  
0 event/call \* 26

0 As there are typically two queue event messages and three posi-  
0 tion event messages per call, assume 187 average msg bytes/call  
0 if specific message counts are not available.

0 Once HDBH data buffers/minute have been calculated, compare the  
0 data rate with the transmission rate of the selected EMPC port.  
0 An EMPC card transmitting at 56 Kbs can send 52.5 buffers/minute.  
0 A .8 Erlang adjustment for link overhead changes the rated capac-  
0 ity of the EMPC card to 42 buffers/minute.

0 Percentage of link utilization can be computed using the follow-  
0 ing formula:

0 Buffers/minute  
0 ----- \* 100 = % link utilization on EMPC port  
0 42 minutes

0 If % utilization is greater than 100% for one link, links shall  
0 be added to reduce the link utilization below 100% per link.

0 An additional link shall be provisioned to protect against loss  
0 of data during a single link failure. All links share the data  
0 traffic load under normal operating conditions.

0 The above computations do not take into account encoding of Force  
0 Management messages and messages generated by non-call events.

0 Each Senior Operator established under the TOPS QMS software fea-  
0 ture requires a TOPS loop-around trunk.

0 1.1.4 OFFICE LAYOUT INFORMATION

0  
0 The standard TOPS MP line-up will be as follows:

0 Figure 13: Standard TOPS MP Line-up

0 \* A 30 inch Empty Space between the AAE and PCE Cabinets  
0 is required for EMI and Earthquake requirements.

0 TOPS MPX positions must be located within 1200 feet of the MIS  
0 frame. The distance from the furthest position to the channel  
0 bank and Timing Source Generator (TSG) must not exceed 1500 feet.

0 The cables from each BIX block may be run via the Distributing  
0 Frame to the outside world. Terminations for 100 pairs per Token  
0 Ring must be provided for this configuration. Termination of the  
0 TSG cables should be done at the TSG to allow grounding directly  
0 on the Timing Source Generator.

0 BIX blocks are used to terminate voice and data (not token ring)  
0 signals from the MPX positions. BIX blocks and MAUs mount on an  
0 MIS frame. Signals are cabled from this MIS frame to a channel  
0 bank (a distributing frame may be used between the MIS frame and  
0 the channel bank). Mounting hardware and adapter brackets are  
0 required to mount MAUs and BIX blocks in the MIS frame. Refer to  
0 the MIS Engineering Manual Section for provisioning details.

0 RELEASE 28.01  
0 93 12 03

0 TR0 = Token Ring #0 MAU = Multistation Access Unit  
0 TR1 = Token Ring #1  
0 BIX Block = NTNX5103 (B0231179)

0 Note 1: MAUs and BIX Blocks will mount as shown on the front  
0 and back of the MIS frame. Equipment for Token Rings  
0 (TR) 2 and 3 will mount on the back.

0 Note 2: Using 16 position Token Rings, one MIS frame can  
0 accommodate 64 positions. Using 20 position Rings,  
0 one MIS frame can serve 80 positions.

0 Note 3: Provide two P0709734 adapters for each group of MAUs  
0 (maximum of three MAUs per two P0709734).

0 The mounting positions for MAUs and BIX equipment on the MIS frame are  
0 as follows:

|       | FRONT | BACK  |
|-------|-------|-------|
|       | ----- | ----- |
| 0 MAU | 74    | 71    |
| 0 MAU | 69    | 66    |
| 0 MAU | 63    | 60    |

#### 0 1.1.5 TRAFFIC TABLES

0

#### 0 TOPS MP AND TOPS MPX POSITIONS

0  
0 Complete Half-Hourly Force Capacity Tables are included in NTP  
0 297-2281-750. Generally, the number of positions required will  
0 be based upon telco estimates but the Tables are available for  
0 reference.

## 0 TOPS TMS

0  
0 The TOPS MPX system requires the TOPS Message Switch (TMS) for  
0 operation. Provisioning of the TMS is not based on traffic but on  
0 the number of operator positions required. Provisioning the mix  
0 of MPX position types specified in this ECM (based on number of  
0 positions) and provisioning the TMS as described in ECM 468  
0 (based on number of positions), ensures that adequate channels  
0 are available so that traffic will not affect system performance.

0 1.2 PRODUCT/SYSTEM SPECIFICATION

0

0 1.2.1 PHYSICAL CHARACTERISTICS

0

## 0 FRAME AND LOGIC GROUNDING

0  
0 The Frame Ground is separate from the Logic Ground to conform to  
0 Isolated System Grounding (ISG) principles.

#### POWER FEED AND FUSING REQUIREMENTS

The power requirements of TOPS MP equipment follows:

|                               | <u>Maximum Current Drain</u>   | <u>Fusing</u> |
|-------------------------------|--------------------------------|---------------|
| PCE Cabinet (-48V DC)         | 11 A (A Feed)<br>11 A (B Feed) | 20 A<br>20 A  |
| TOPS MP Position (115 AC)     | 0.85 A                         |               |
| CBT Unit (115 AC)             | 12.0 A                         |               |
| CBT VDU (115 AC)              | 1.0 A                          |               |
| AAE Frame                     | 3 A (A Feed)<br>3 A (B Feed)   | 5 A<br>5 A    |
| Alarm Battery (ABS) (-48V DC) | 6 A                            | 10 A          |

The PCE Cabinet is powered by 2 power feeds (one A & one B), with each feed fused at 20 A. (Fuses are always provided as part of the PDP stocklist.) The power source for the PCE Cabinet will be a Power Distribution Panel (PDP) in the AAE Cabinet. The AAE cabinet must be provided for both Local and Remote configured TOPS MP offices. The AAE will also supply ABS to the PCE cabinets.

The customer is required to provide the AC power for the TOPS MP System.

Remote Office - Traffic Operator Position Equip.

0  
0 RELEASE 28.01  
0 93 12 03

0 A dedicated and protected AC power source shall be provided for  
0 the TOPS Multipurpose Positions, the CBT unit, the Printer used  
0 with the PCE Cabinet or a Local TAMI. The TOPS MP Monitor will  
0 have a twist lock plug which will require a twist lock power re-  
0 ceptacle. Any equipment not powered by the dedicated AC power  
0 source must t be located at least 7 feet from the TOPS MP  
0 Equipment and if this 7 feet requirement cannot be met, barriers  
0 to separate this equipment from the TOPS MP equipment must be in-  
0 stalled. This is necessary to eliminate the possibility of elec-  
0 trical shock due to grounding potential differences. Reference  
0 the TOPS MP Power and Grounding Requirements NTP 297-2281-156.

## 0 TOPS MPX

0  
0 The components used for TOPS MPX have the following physical  
0 characteristics:

| 0 | Component     | Dimensions (HxWxD)    | Weight   |
|---|---------------|-----------------------|----------|
| 0 | -----         | -----                 | -----    |
| 0 | (*) C/D PS/2  | 4" X 16" X 15.6"      | 21 lb.   |
| 0 | NTNX51FB PS/2 | 6.5" X 17.2" X 15.5"  | 33 lb.   |
| 0 | Monitor 8512  | 10.75" X 12.4" X 15"  | 23 lb.   |
| 0 | Monitor 9518  | 13.6" X 13.9" X 15.4" | 28.6 lb. |
| 0 | MAU           | 17.6" X 8" X 2.66"    | 5.5 lb.  |
| 0 | MAU Housing   | 23" X 12" X 4"        | 4 lb.    |
| 0 | DSU           | 2" X 8" X 10"         | 1 lb.    |
| 0 | Keyboard      | 2" X 20.5" X 10"      | 7 lb.    |

0 | \* "C/D" PS/2 refers to NTNX51CB/CC/CD/DB/DC/DD.

## 0 CURRENT DRAIN INFORMATION

0 AC power must be supplied for TOPS MPX positions. Protected AC  
0 shall be used for this application.

0 Power consumption for the TOPS MPX components is as follows:

| 0 | Component     | Power Consumption   |
|---|---------------|---------------------|
| 0 | -----         | -----               |
| 0 | C/D PS/2      | 1.7 Amps at 120 VAC |
| 0 | Monitor 8512  | 400 mA at 120 VAC   |
| 0 | DSU           | 400 mA at 120 VAC   |
| 0 | NTNX51FB PS/2 | 70W (#)             |
| 0 | Monitor 9518  | 72W                 |

0 | # Does not include plug-in cards.

0

0 1.2.2 EMI/EARTHQUAKE INFORMATION

0

0 A 30" empty space between the AAE and PCE frames is required  
0 for EMI and Earthquake requirements.

0 1.2.3 SPARING INFORMATION

0

## 0 TOPS MP

0

0 Sparing guidelines call for a minimum of one spare for each  
0 provisionable circuit pack.

0 Provide one or more UDS Modem Shelf Spare Power Supply per Cus-  
0 tomer request as a spare power supply for the UDS modem shelves  
0 mounted in the AAE cabinet.

## 0 TOPS MPX

0

0 The TOPS MPX positions are normally spared by ordering a complete  
0 position of each type or multiples of each type. The quantities  
0 are determined by the Customer. If required by the customer, the  
0 PS2 bases, monitor, keyboard, and plug-in cards can be ordered  
0 separately for spares. Refer to the Engineering Manual for part  
0 numbers.

0 1.3 SOFTWARE PROVISIONING

0

0 1.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

0 The following software for TOPS MP applications may be ordered,  
0 based on office configuration requirements.

0 Packaging information is accurate at time of publication but, due  
0 to changes often made in packaging, should be checked in the  
0 Software Management System (SMS) database.

0 TOPS MP SOFTWARE

0

0 For offices with BCS24 or later order the following S/W Packages  
0 as required (if extending an existing TOPS 3 or 4 office to in-  
0 clude TOPS MP, replace the existing TOPS packages with the fol-  
0 lowing as TOPS MP Packages contain all required TOPS 3 and 4  
0 packages):

0 NTX704AA - TOPS Multipurpose Position Standard

0 NTX706AA - TOPS MP Remote (Remote OC)

0 NTXA60AA - TOPS Closedown

0 NTX873AA - Host TOPS MP OC Data-Link Handling

0 NTX039AA - Host OC Data-Link Handling

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-59

0  
0 RELEASE 28.01  
0 93 12 03

0 The following packages/features are applicable to TOPS MP trans-  
0 lations:

0 NTX724AA TOPS MP Interface

0 For Software interdependencies, refer to the SMS database.

0 TOPS MP DIRECTORY ASSISTANCE

0  
0 The following software master packages are required for TOPS MP  
0 Directory Assistance applications.

0 TOPS MP CCI DIRECTORY ASSISTANCE MASTER PACKAGE

0  
0 NTNX708AA - TOPS MP - Toll and Directory Assistance Operation  
0 NTNX709AA - TOPS MP - Toll and Directory Assistance  
0 Operation/Remote

0 TOPS MP IBM DIRECTORY ASSISTANCE MASTER PACKAGE

0  
0 NTXD39AA : Host OC and SA applications (Master Package)  
0 NTXD40AA : Remote OC applications (Master Package)

0 Refer to the SMS database for package contents and interdependen-  
0 cies.

0

## 0 TOPS QMS FEATURE PACKAGES

0  
0 NTXP41AA TOPS Host Queue Management System

0 NTXP42AA TOPS Remote Queue Management System

0 NTXR48AA QMS: Call And Agent Manager

0 NTXR50AA TOPS QMS External MIS Interface

0 Either of NTXP41AA and NTXR48AA or NTXP42AA and NTXR48AA is re-  
0 quired to implement the TOPS QMS feature in a TOPS office.  
0 NTXR50AA is optional based on the Customer requirement for and  
0 provision of an external MIS.

0 The packages listed above are provisioned in addition to the re-  
0 quired appropriate TOPS master software package.

0 Refer to the SMS database for software package inter-  
0 dependencies.

0 1.3.2 SOFTWARE USAGE RESTRICTIONS

0

## 0 TPC SOFTWARE

0  
0 Dual HSDA requires BCS 34 or higher. The Dual HSDA feature is  
0 included with the standard TPC software. No additional software  
0 packages need to be ordered for Dual HSDA.

0 The SCSI TPC shelf requires a BCS 33 TPC load for operation. Any  
0 existing TOPS MP jobs for which NTN61AF TPC shelves are added  
0 shall have BCS 33 TPC software loads.

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-62

0 RELEASE 28.01  
0 93 12 03

0 The TPC is a 68000 based system that controls up to four TOPS MP  
0 positions. It handles the distribution of voice and data from  
0 the CC and manages the screen display of each of its positions.

0 A twenty megabyte hard disk and a five and a quarter inch floppy  
0 disk are available on each TPC. The hard disk contains all the  
0 required software and data files to control the operator posi-  
0 tions and the interface to the DMS200 CC. Some floppy disks con-  
0 taining a copy of the load on the hard disk are also shipped with  
0 each TPC. These installation disks can be used to reconfigure  
0 the hard disk in case the TPC fails to start up during installa-  
0 tion.

0 Software upgrades are also shipped on floppy disks. To incorpo-  
0 rate the software upgrades, one must first disable all the MPs on  
0 the TPC from call processing using the BSY command at the MAP and  
0 TAMI. Secondly, one must insert the appropriate floppy disk in  
0 the drive and power on the TPC. The TPC will automatically boot  
0 from the floppy disk and copy the required files on to the hard  
0 disk.

0 It is mandatory to connect the TAMI terminal to the TPC before  
0 TPC installation and TPC software upgrades are begun. The TPC can  
0 then out- put messages on the TAMI indicating progress and re-  
0 quest the user to insert the next floppy disk.

## 0 DATALINKS

0  
0 In the TOPS 4 system data communication between the CC and posi-  
0 tions is via asynchronous links. The CC transmits data to the  
0 position at 300 baud and receives data from the position at the  
0 same rate.

0 In the TOPS MP system data communication between the CC and the  
0 TPC is also over asynchronous links, but the CC transmits data to  
0 the TPC at 1200 baud and receives data from TPC at 300 baud.

0 The data channels of the TOPS system are connected through the  
0 switching network to digital modems (NT3X02/NT3X03). These modem  
0 circuits provide the necessary D/A or A/D conversion for process-  
0 ing the data signals. One digital modem circuit is required for

0  
0 RELEASE 28.01  
0 93 12 03

0 each TOPS operator position unless a TMS configuration is used.  
0 Digital modems are not required with the TMS.

## 0 RESTRICTIONS

0  
0 TOPS offices should have a maximum of four pairs (NT3X02AA,  
0 NT3X03AA) of digital modem cards per MTM, providing a maximum of  
0 16 modem circuits per MTM.

0 Combined IBN/TOPS offices should have a maximum of two pairs  
0 (NT3X02AA,NT3X03AA) of digital modem cards per MTM, providing a  
0 maximum of eight circuits per MTM.

0 In each case it is preferred to spread modem card pair evenly  
0 across all MTMs to ensure reliability.

0 Hosts and remotes with different versions of TOPS software can be  
0 incompatible. The existing procedure for updating Operator Cen-  
0 tralization (OC) software is that the host must be updated before  
0 the remote. This procedure will apply in TOPS MP as well as TOPS  
0 4. Also, the host cannot have any inservice TOPS MP positions un-  
0 til the remote is upgraded to TOPS MP software.

0 A TOPS MP remote cannot communicate with a TOPS 4 host because  
0 the host is not able to tell the remote what kind of position it  
0 has. The remote will not know whether to send TOPS 4 or TOPS MP  
0 commands.

0 A TOPS 4 remote cannot communicate with a TOPS MP host because if  
0 a TOPS MP position is associated with an OC call, the remote will  
0 not be able to send TOPS MP commands to the position. If there  
0 are no TOPS MP positions on the host this configuration does  
0 work.

0 Therefore, the procedure for upgrading OC offices to TOPS MP is  
0 to first update the software in the host without adding any in-  
0 service TOPS MP positions, second, update the software in all the  
0 remotes, and third, put the TOPS MP positions on the host into  
0 service.

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-64

0 RELEASE 28.01  
0 93 12 03

0 TOPS CC software changes that add or change fields on the TOPS  
0 position screen will require parallel changes in the TPC soft-  
0 ware.

0 Operator calls handled at TOPS MP positions can only be monitored  
0 by TOPS MP Assistance positions. Operator calls handled at TOPS  
0 4 positions can only be monitored by TOPS 4 Assistance positions.

0 To enable an MP for call processing, it must be first returned to  
0 service at the TPC using the TAMI terminal and then at the CC us-  
0 ing the MAP.

0 All MPs connected to the TPC must be disabled from call process-  
0 ing before attempting software upgrades. To disable an MP from  
0 call processing, it must be first busied at the CC using the MAP  
0 and then at the TPC using the TAMI terminal.

0 TAMI baud rate must be reset to 1200 BAUD after a power hit un-  
0 less it is already at 1200 baud. The TPC always boots up in RE-  
0 MOTE mode (1200 BAUD).

0 Once the TPC is configured completely with all the required  
0 datafill, accessing TAMI to perform TPC maintenance is necessary  
0 only when there are problems in the TPC. The TAMI shall not be  
0 accessed while CALL PROCESSING is enabled, as some performance  
0 degradation may result.

#### 0 DRAM ASSIGNMENT RESTRICTIONS

0  
0 Mechanized Calling Card Service (MCCS), provided in feature  
0 NTX171CA, requires at least one dedicated DRAM. The same DRAM is  
0 used for the Exchange Alternate Billing Service (EABS) feature  
0 (NTX825AA).

0 This DRAM is designated as MCCS type in Table ANNS and its con-  
0 troller card is dedicated to the CLLI for the MCCS type DRAM in  
0 Table DRAMS. Since the controller is dedicated in software to  
0 MCCS type announcements, the other cards on that DRAM cannot be  
0 used for any other type of announcement.

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-65

0  
0 RELEASE 28.01  
0 93 12 03

## 0 TOPS MPX

0  
0 The TOPS MPX system currently supports only IBM Directory Assist-  
0 ance service. Toll and Assistance operation and ORDB are planned  
0 as future offerings.

0 The TOPS MPX system is designed to permit operation with differ-  
0 ent vendors for DA and Intercept services but the initial version  
0 of MPX must use the IBM DAS. Dual vendor operation is currently  
0 possible only where MPX positions provide the IBM service and  
0 TOPS MP positions are used to provide non-IBM service.

0 Call Completion will not be supported by the initial version of  
0 TOPS MPX.

0 In order to provide adequate billing records for DA calls, DMS  
0 features should include phase one or higher of the Expanded  
0 Bellcore AMA Format (EBAF).

## 0 THREE PORT CONFERENCE CIRCUITS

0  
0 Three port conference circuits are required in the DMS200 TOPS  
0 offices (both Host and Remote) on a one per position basis plus  
0 five percent spare. Through BCS33, a 2048 entry limit of the  
0 fixed CLLI table in software translations for three port confer-  
0 ence circuits limited the number of three port conference cir-  
0 cuits in an office to 682 (682 conference circuits x three ports  
0 each = 2046 entries). This limit would only allow provisioning of  
0 one three port conference circuit per position up to 682 posi-  
0 tions. As the TOPS position maximum is 1024 per office, three  
0 port conference circuit provisioning limits the number of TOPS  
0 positions to 682 or less in pre-BCS34 offices. A feature has been  
0 added in BCS34 to add a second fixed CLLI group dedicated to  
0 three port conference circuits. The second fixed CLLI group adds  
0 another 2048 entries. This increases the maximum number of three  
0 port conference circuits in a DMS 100 office to 1364. This allows  
0 the 1024 TOPS position maximum to be provisioned based on the re-  
0 quirement for one three port conference circuit per TOPS position

0  
0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

0 RELEASE 28.01  
0 93 12 03

0 plus five percent spare. This added feature is included in the  
0 NTX001AA Common Basic software package in BCS34 and later.

### 0 1.3.3 MEMORY PROVISIONING

0  
0 Refer to the MEMCALC program for the memory impact of all TOPS  
0 MP, TOPS MPX and TMS features.

### 0 1.4 REAL TIME IMPACT

0 TOPS MP provides no Central Control (CC) Real Time increase over  
0 TOPS 4 (Reference the CROSS-REFERENCE SECTION for SEA or SEB doc-  
0 umentation on Real Time).

0 TOPS MP Directory Assistance timings are estimated below. For  
0 customer dialed 0-,411 or 555-1212 from a non-coin station, a TOPS  
0 operator is attached and connection established to an external  
0 ARU. This example includes AMA billing.

| 0 | Standalone | Host OC   | Remote OC |
|---|------------|-----------|-----------|
| 0 | -----      | -----     | -----     |
| 0 | 75ms/Call  | 50ms/Call | 85ms/Call |

0 An additional 15ms/Call is required if either the standalone or  
0 remote office is equipped with an internal ARU.

0 When a customer dials a changed number, the call is routed to an  
0 intercept trunk within the DMS-200 TOPS equipped office and con-  
0 nected to an external ARU.

| 0 | Standalone | Host OC  | Remote OC |
|---|------------|----------|-----------|
| 0 | -----      | -----    | -----     |
| 0 | 45ms/Call  | See Note | 45ms/Call |

0 Note: Host OC has no timing in this example. A call from the  
0 Remote OC office would route directly to the ARU that  
0 is connected to the Remote OC office. No inter-office  
0 facilities would be utilized between the Host and Remote  
0 offices. (Reference SEA 87-09-004)

0 Remote Office - Traffic Operator Position Equip.

0  
0 RELEASE 28.01  
0 93 12 03

0 The maximum number of TOPS Message Switches that can be served by  
0 a DMS 100/200 is physically limited by the number of network  
0 ports available in the DMS. The practical limit however is im-  
0 posed by DMS real time capacity. Refer to TABLE B for the maximum  
0 number of operators allowed using various office configurations.

# Assumptions for TABLE B:

- Operator utilization 95%
- CC CP Occupancy 70%
- Average Work Time/DA Call 18 sec.
- Average Processing Time/DA Call, NT40:
  - o Stand Alone (SA) system 70 msec.
  - o Host Operator Centralization (HOC) 25 msec.
  - o Remote Operator Centralization (ROC) 75 msec.
- Average Processing Time/DA Call, Supernode(68020 at 20Mhz):
  - o Stand Alone system 35 msec.
  - o Host Operator Centralization 12.5 msec.
  - o Remote Operator Centralization 37.5 msec.
- Average Processing Time/DA Call, Supernode(68030 at 33Mhz):
  - o Stand Alone system 23.3 msec.
  - o Host Operator Centralization 8.3 msec.
  - o Remote Operator Centralization 25 msec.
- Average Work Time 18 sec.
- Operator Call Rate 190 calls/hr.
- 100% Directory Assistance calls

| SYSTEM                  | CONFIG | CC CP OCC<br>(Calls/hr.) | APT<br>(ms) | MAX NO.<br>OPERATORS |

0

0  
0 TABLE B: Operator Maximums

0 The Real Time impact imposed by TOPS MPX is identical to that of  
0 TOPS MP Directory Assistance using the CCI database.

0 Timings are estimated below. For customer dialed 0-,411 or  
0 555-1212 from a non-coin station, a TOPS operator is attached and  
0 connection established to an external ARU. This example includes  
0 AMA billing.

| 0 Standalone  | 0 Host OC   | 0 Remote OC   |
|---------------|-------------|---------------|
| 0 -----       | 0 -----     | 0 -----       |
| 0 37.5ms/Call | 0 25ms/Call | 0 42.5ms/Call |

0 An additional 15ms/Call is required if either the standalone or  
0 remote office is equipped with an internal ARU.

0 When a customer dials a disconnected number, the call is routed to  
0 an intercept trunk within the DMS-200 TOPS equipped office and  
0 connected to an external ARU.

| 0 Standalone  | 0 Host OC  | 0 Remote OC   |
|---------------|------------|---------------|
| 0 -----       | 0 -----    | 0 -----       |
| 0 22.5ms/Call | 0 See Note | 0 22.5ms/Call |

0 Note: Host OC has no timing in this example. A call from the  
0 Remote OC office would route directly to the ARU that  
0 is connected to the Remote OC office. No inter-office  
0 facilities would be utilized between the Host and Remote  
0 offices. (Reference latest issue of SEB 88-10-002)

0 2.0 Automatic Coin Toll Service (ACTS)

0 2.1 Hardware Provisioning

0

0 2.1.1 Hardware Usage Restrictions

0

0 None identified.

0 2.1.2 Hardware Dependencies

0

0| None identified: refer to section 2.4.

0 2.1.3 Provisioning Considerations

0

0 Automatic Coin Toll Service DRAM Circuit Pack

0

0 The ACTS announcement cp mounts in a standard DRA-MTM and re-  
0 quires a DRA controller. ACTS requires a dedicated DRA-MTM, i.e.  
0 mixing of MCCS DRA announcement or standard office announcement  
0 with the ACTS cp's is not permitted.

0

0 The ACTS DRAM does not broadcast messages. Instead, any one of  
0 several announcements may be directed to 29 time slots available  
0 in each DRAM. It is considered a service circuit in that a par-

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-71

0 RELEASE 28.01  
0 93 12 03  
0

0 ticular time slot or announcement port is connected to an ACTS  
0 call only when required.

0 The average announcement is approximately 12 seconds in length.  
0 However, the ACTS DRAM will remain connected as long as the coin  
0 detection circuit. Therefore the holding time for DRA provision-  
0 ing should be 38 seconds.

0 One (1) ACTS DRA cp is required on the ACTS DRAM. The slot lo-  
0 cation for the DRA cp should follow the controller cp. Recom-  
0 mended card slot locations are: :ul. :li. for the controller  
0 card slot five (5) :li. for the ACTS DRA circuit pack card slot  
0 six (6). :eul.

0 Assume regular DRA sparing procedures. MTBF (Mean Time Between  
0 Failure) and MTTR (Mean Time To Repair) parameters are not  
0 available for accurate sparing calculations.

#### 0 Coin Detection Circuit (CDC)

0  
0 A coin detection circuit pack physically occupies one card slot  
0 in an MTM.

0 A CDC uses eight time slots and, therefore, four (4) consecutive  
0 card slots are required. A maximum of three (3) CDC circuit  
0 pack's can be mounted in any MTM. the slot assignment being card  
0 slots 05,09 and 13. If desired, the CDC card may be placed on an  
0 MTM with other cards, provided the next three (3) slots following  
0 each CDC pack are empty and that the provisioning rules for these  
0 other packs are followed.

0 Digitone or rotary coin stations may be used, however all  
0 stations MUST be able to provide dual frequency coin deposit  
0 signals to allow detection by the CDC circuit pack.

0 The CDC contains eight (8) coin detection circuits provisionable  
0 for ACTS on each circuit pack.

0 The CDC requires no distributing frame cabling.

0 A 3-port conference circuit will be required for all "recall" ac-  
0 tivity (i.e. overtime notification, intercoin prompt, etc.). The

0  
0 RELEASE 28.01  
0 93 12 03

0 current provisioning of 3-port conference circuits (for TOPS) is  
0 one per position plus five percent. This quantity is sufficient  
0 to handle the ACTS traffic. Therefore, no additional 3-port con-  
0 ference circuits will need to be provisioned.

0 Each NT1X76AE is a two virtual card credit, i.e. 256 kbyte,  
0 double-density cp. When provisioning an ACTS DRA-MTM, the total  
0 allowable virtual card credit limit is eight. The EEPROM  
0 (NT1X79AA) is a 128 kbyte, one (1) virtual card credit, single-  
0 density cp.

0 2.3 Software Provisioning

0

0 2.3.1 Required Software Packages and Interdependencies

0  
0 The software package for ACTS is NTX208AA or NTX208AB.

0 | The NTX208AB software package contains maintenance related en-  
0 | hancements which are not provided with the NTX208AA package

0 | The NTX208AB enhancement provides telcos the capability of dial-  
0 | ing a seven- digit test number from a coin phone to determine  
0 | whether the coin box is sending the proper signaling to the ACTS  
0 | system. The feature also offers the capability of identifying  
0 | defective coin detection circuits from the MAP without having to  
0 | busy out all the circuits on the affected CDC. Only the circuit  
0 | under test need be busied.

0 | The maintenance enhancement of the NTX208AB package requires the  
0 | provisioning of CDC NT3X08AB. The NT3X08AA CDC will operate  
0 | compatibly with NTX208AB package but this configuration will not  
0 | have the enhanced maintenance capability. To get the full benefit  
0 | from the enhanced maintenance capability of the NTX208AB package,  
0 | all ACTS CDCs must be NT3X08AB.

0 | The NTX208AA package operates compatibly with either NT3X08AA or  
0 | NT3X08AB CDCs. The improved coin toll fraud prevention capability  
0 | of the NT3X08AB CDC card is effective when configured with either  
0 | the NTX208AA software package or the NTX208AB package.

0 | End Office CDCs

0  
0 | The CDCs required for the Improved Coin Service Revenue Col-  
0 | lection feature AF1400 in the end office are either NT3X08AA or  
0 | NT3X08AB. The use of NT3X08AB provides the improved fraud pre-

0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26

Page 26-77

0  
0 RELEASE 28.01  
0 93 12 03

0 | vention capability. The improved maintenance functionality of the  
0 NT3X08AB CDC is not implemented in the end office configuration.

0 For ACTS software status, refer to the SMS database.

0 MMCCS and CCIS are not software prerequisites for ACTS operation.

0 2.3.2 Software Usage Restrictions

0  
0 None identified.

0 2.3.3 Memory Provisioning

0  
0 The ACTS feature requires 3K words of program store.

0 2.4 Real Time Impact

0 The ACS feature has no real time impact.

0 RELEASE 28.01  
0 93 12 03

### 0 3.0 Traffic Operator Position System

0 The TOPS MP system supercedes the TOPS 03/04 product line and provides  
0 improvements and additional features not previously available.

0 Phase I of TOPS MP supports all the current features of TOPS 04 plus  
0 provides the basis for Directory Assistance (DA) support and future  
0 feature development. A DMS-200 office may support both TOPS MP and  
0 TOPS 04 but service monitoring must be performed by like equipment  
0 (i.e. TOPS MP monitors must monitor TOPS MP positions and TOPS 04  
0 monitors must monitor TOPS 04 positions). The exception to this moni-  
0 toring is the Force Manager Position. A TOPS MP Force Manager is able  
0 to monitor TOPS 03/04 as well as TOPS MP and a TOPS 03/04 Force Man-  
0 ager is able to monitor TOPS MP as well as TOPS 03/04. The TOPS Multi-  
0 purpose positions provide an improved Man-Machine Interface (MMI) over  
0 the TOPS 04 positions by allowing a more flexible position which will  
0 allow the same controller/ terminal configuration for:

- 0 - Traffic Operator Position
- 0 - In-Charge Position
- 0 - Assistance Operator Position
- 0 - Force Manager Position

0 The TOPS MP system introduction was done in phases as follows:

- 0 - Phase I - supports Toll and Assist (TA) traffic offices
- 0 - Phase II - supports TA and Directory Assistance (DA) offices

### 0 Directory Assistance Feature

0 Directory Assistance is an optional feature for the TOPS MP system  
0 that allows the Operator to access a vendor-supplied database for Di-  
0 rectory Assistance information. The equipment required to implement  
0 the DA feature is primarily for use in accessing this database. Di-  
0 rectory assistance with Computer Consoles, Inc. (CCI) as the database  
0 vendor was the first application of directory assistance on the TOPS  
0 MP.

0 TOPS MP - IBM Directory Assistance is an optional package for the TOPS  
0 MP system and will be offered in addition to the CCI Directory Assist-  
0 ance capability which is already available.

0 IBM DA is an optional software product for TOPS MP with the  
0 TOPS Message Switch (TMS). The only hardware change required for  
0 this access is a keyboard change to provide IBM DA keycaps.

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-79

0  
0 RELEASE 28.01  
0 93 12 03

0 TOPS MP - IBM DA enables an operator to service DA calls using  
0 the IBM Directory Assistance Service (DAS) but retains the capa-  
0 bility of operating in other modes (i.e. Toll and Assist). Once a  
0 DA listing is located, the operator has the ability to complete  
0 the call.

0 Operator Reference Database Feature

0 Operator Reference Database (ORDB) is an optional feature for  
0 the TOPS MP system that allows the Operator to access a vendor-  
0 supplied database for various types of information, including rate  
0 quotes, emergency numbers, service codes, ticket information, etc.  
0 Additional services can be added as vendors develop additional  
0 information databases.

0 TOPS Message Switch (TMS)

0 The Tops Message Switch is an optional configuration for TOPS MP  
0 that provides facilities savings by replacing the direct links  
0 from each TPC to databases with consolidated links from the TMS  
0 controller. Previous TOPS MP configurations interface with the  
0 DMS via trunk modules on a DTE or TME frame. The TMS is an  
0 LTC-based peripheral that terminates links from Channel Banks  
0 (DS-1 signals) and interfaces them with the DMS host and various  
0 service-providing databases. The TMS is required for all applica-  
0 tions using TOPS MPX equipment (refer to API173). The digital  
0 modems required at the host for TOPS MP applications are no  
0 longer required with the TMS. Refer to ECM468 for additional TMS  
0 information.

RELEASE 28.01  
93 12 03

Links established  
for TOPS MP Phase I.  
Required for DA also.

#### Notes:

- MPC-based links consist of a minimum of two IOC-mounted Multi-Protocol Converters (NT1X89AA) with 9600 baud modems to provide call set-up/take-down data, billing information, etc.
- ARU trunk is a DS-1 channel for each equipped Directory Assistance position. Forty-eight positions can be handled by a single NT6X50AA CP. This CP is mounted on a DTC.
- The link from the ARU to the Gateway is vendor-supplied.
- The HSDA CP (NTNX66AA) mounts on the TPC shelf and provides two V.35 ports. Each V.35 port requires one D56 modem which mounts on a Data Set Unit on the AAE cabinet.

Figure 1a : TOPS MP Directory Assistance

0 RELEASE 28.01  
0 93 12 03

# 0 TOPS MP Directory Assistance with Operator Centralization

0 When the Operator Centralization (OC) feature is included, an additional DMS-DAS/C data link and DMS-ARS voice link are required to the remote DMS office. Additional remote offices require similar additional links. On an OC Directory Assistance call, DMS to Gateway (DAS/C) communication occurs between the remote office and the Gateway. Closedown is supported when all switches in the network are connected to a single Gateway. Provisioning for these links is based on the same guidelines as the Host links performing the same functions. See Figure 1b for OC System configuration for TOPS MP Directory Assistance.

0 Figure 1b : TOPS MP Directory Assistance with OC Feature

0 RELEASE 28.01  
0 93 12 03

0 | TOPS QMS

0 | TOPS QMS (Queuing Management System) is an enhanced queuing sys-  
0 | tem for TOPS that replaces the current ACD (Automatic Call Dis-  
0 | tribution) queuing system used with TOPS. The queuing  
0 | enhancements for TOPS provided by QMS include:

0 | TOPS QMS increases the maximum number of assignable call queues  
0 | available in TOPS from 4 to 255.

0 | TOPS QMS integrates absolute priority queuing of calls with as-  
0 | signable grade of service (AGS), on an operator profile basis.  
0 | This allows Telephone Operating Companies to introduce the con-  
0 | cept of primary and secondary responsibilities for its operators.  
0 | For example, a group of operators support Directory Assistance  
0 | service as a primary responsibility, but "help out" with Toll and  
0 | Assistance service as a secondary responsibility when required.

0 | TOPS QMS supports an enhanced set of force management statistics,  
0 | and supports reporting of these statistics continuously and imme-  
0 | diately, rather than only in periodic reports. TOPS QMS continues  
0 | to provide support for backup periodic FM reports, which can be  
0 | optionally activated and deactivated.

0 | TOPS QMS allows the Telephone Operating Companies to segregate  
0 | traffic across the 255 queues by a wide range of criteria, in-  
0 | cluding: time of day, called digits, incoming trunk group, call-  
0 | ing digits, inter-LATA carrier, class of service, restricted  
0 | billing index, prefix dialing and others. Furthermore, QMS is de-  
0 | signed to allow for extending this set of criteria as new queue-  
0 | ing capabilities are required.

0 | The new force management capability for sending continuous sta-  
0 | tistics is implemented with an external Management Information  
0 | System. The Management Information System is a Customer provided  
0 | computer system capable of storing and reports TOPS statistics.  
0 | Some new enhancements to the existing force management capabili-  
0 | ties are implemented with the current hardware including the  
0 | FMCRT. Both the new MIS system and the existing FMCRT may co-  
0 | exist in a TOPS host office.

0 | The TOPS QMS set of features also allows the Telephone Operating  
0 | Company to establish a new class of operators called Senior Oper-  
0 | ators. The Senior Operators have the capability to assist an-  
0 | other operator with a call and to even complete that call. This  
0 | assistance to other operators may serve as their primary task  
0 | while answering subscriber initiated traffic serves as a second-

0  
0 RELEASE 28.01  
0 93 12 03

0 | ary task. Access by a regular operator to a Senior Operator is  
0 | accomplished via the OGT (outgoing trunk key function) causing an  
0 | incoming call to be queued for a Senior Operator. Completion of  
0 | a call of this type within the TOPS office requires a loop-around  
0 | trunk.

RELEASE 28.01  
93 12 03

The following chart is a comparison of the Senior Operator class of operators to the Service Assistant class of operators:

| Capability                           | Senior Operator | Service Assistant |
|--------------------------------------|-----------------|-------------------|
| Use QMS queuing                      | Yes             | No                |
| Call completion for assistance calls | Yes             | No                |
| Serve non-assistant traffic          | Yes             | No                |
| Receive directed calls               | Yes             | Yes               |
| Paging capability                    | No              | Yes               |
| Monitor capability                   | No              | Yes               |

### 3.1 HARDWARE PROVISIONING

#### 3.1.1 HARDWARE USAGE RESTRICTIONS

The standard TOPS MP line-up will be as follows:

Standard TOPS MP Line-up

\* A 30 inch Empty Space between the AAE and PCE Cabinets is required for EMI and Earthquake requirements.

0 RELEASE 28.01  
0 93 12 03

0 The TOPS Message Switch is required for all applications using  
0 TOPS MPX equipment.

0 TOPS MP - IBM DA requires TOPS MP equipped with the TOPS Mes-  
0 sage Switch (TMS).

0 TOPS MP - IBM DA keyboards are currently available for English  
0 applications only.

0 The maximum allowable number of operators depends on the of-  
0 fice configuration. Refer to the Real Time section of this ECM  
0 for additional information.

0 While the IBM protocol does not provide for monitoring a DA  
0 call, the DMS allows for monitoring an operator. When monitoring  
0 a DA call, the supervisor receives a duplicate display of the  
0 billing screen of the operator position being monitored.

0 The IBM protocol does provide a list status field but it does  
0 not provide the listing detail required by the Extended Bellcore  
0 AMA Format (EBAF). Currently, DA or Intercept calls handled by  
0 the IBM vendor cannot fully populate the Listing Status fields  
0 for EBAF conforming AMA.

0 The ARUs used for TOPS MP - IBM DA are associated with the IBM  
0 DAS. The organization providing the ARUs must be notified of the  
0 number of DA operators to be served at 95% utilization and the  
0 ratio of traffic requiring call completion to traffic not requir-  
0 ing call completion. Call completion requires special ARUs capa-  
0 ble of performing the call completion function.

#### 0 | TOPS QMS

0 | The TOPS QMS software feature (NTXR50AA) that provides for an ex-  
0 | ternal MIS system must have the external MIS equipment provided  
0 | by the Customer.

0 RELEASE 28.01  
0 93 12 03

0 3.1.2 HARDWARE DEPENDENCIES

0  
0 The three (3) Major Components of the TOPS MP System are:

- 0 1. Position Controller Equipment (PCE) Cabinet
- 0 (Including Associated Equipment)
- 0 2. Auxiliary Access Equipment (AAE) Cabinet
- 0 3. TOPS Multipurpose Position (Modular or Integrated)

## 0 Position Controller Equipment Cabinet (PCE)

0 The PCE Cabinet (NTNX60AA) consists of the following Always Pro-  
0 vided equipment:

- 0 1 SL-100 Cabinet (NTNX25BA)
- 0 1 PCE EMI Bulkhead Assembly (NTNX6022)
- 0 1 Frame Supervisory Panel (FSP) (NTNX26CA)
- 0 4 TOPS Position Controller (TPC) Shelf
- 0 Assemblies (NTNX6101)
- 0 1 Cooling Unit (CU) (NTNX27BA)

0 Associated PCE equipment includes the following:

0 PCE - allows an administrator to print  
0 Printer logs, help screens or program panels  
0 for TPC shelves.

0 TAMI - TPC Administration and Maintenance In-  
0 terface. This interface is a VT100  
0 compatible terminal connected to a TPC (via modems)  
0 which allows an administrator to perform  
0 maintenance or administrative functions  
0 as required. The TAMI (VDU) may be located  
0 remotely or locally (In either case a autoanswer,  
0 autodial modem will be required for the VDU).

0 Wicat - each CBT unit provides training for up to 16  
0 Computer operator positions and the dimensions for the unit  
0 Based are 44"(H) x 22.1" (W) x 31.8" (D). A Cartridge  
0 Training tape will be used to load the TOPS MP training S/W  
0 (CBT) onto the CBT unit's hard-drive disk. A Wicat VDU  
0 Unit will be used for administration on the CBT units.

0 RELEASE 28.01  
0 93 12 03  
0

0 Auxiliary Access Equipment Cabinet (AAE)

0 The NTNX57AA AAE Cabinet has a status of Manufacture Discontin-  
0 ued. The NTNX57AC version of the AAE should be supplied for all  
0 applications.

0 The AAE Cabinet (NTNX57AC) consists of the following Always Pro-  
0 vided equipment:

0 1 SL-100 Cabinet (NTNX25BA)  
0 1 AAE Bulkhead Assy (NTNX5708)  
0 1 End Panel Assy, Right (NTNX2531)  
0 1 End Panel Assy, Left (NTNX2532)  
0 1 Modem Shelf (A0344310)  
0 1 Power Distribution Panel (NTNX24CB)  
0 1 4" Filler Panel (P0688213)  
0 1 Hazard Plate Assy (NTNX5707)

0 Auxiliary Access Equipment:

0 Modem - One (1) Modem Shelf will be Always Provided on the  
0 Shelf AAE Cabinet. Three (3) additional shelves may be  
0 provisioned to mount modems required for database  
0 access for Directory Assistance, Operator Reference  
0 Database (ORDB) or future features. Each modem  
0 shelf is supplied with two power supplies. Up to  
0 16 UDS modem cards may be mounted on a UDS modem  
0 shelf.

0 Power - One (1) Power Distribution Panel (PDP) will be  
0 Distribution Always Provided on the AAE Cabinet. The PDP will  
0 Panel (PDP) power PCEs, the UDS Modem Shelf & the Alarm  
0 Battery Supply (ABS). The PDP can accommodate  
0 up to 15 fuses for the A power feed and up to  
0 15 fuses for the B power feed. The PDP fuse are  
0 physically designated 00-29 with fuse 00 being the  
0 first A power fuse and fuse 15 being the first B  
0 power fuse. The UDS Modem shelf will come prewired  
0 for power. Each will be fused by 2 5A fuses(fuses  
0 are always provided as part of the PDP and are  
0 F11-F13 and F26-F28). The ABS will be supplied  
0 via one (1) 10A fuse on the PDP labeled FABS. (The  
0 10A fuse will be supplied as part of the PDP  
0 stocklist.) The FABS fuse is prewired to the  
0 bulkhead such that only the bulkhead connections  
0 are required from AAE to PCEs.

0 TOPS Multipurpose Position (Modular or Integrated)

0 Since all TOPS Multipurpose Positions (operator or administration  
0 (in- charge, assistance, or force manager)) have the same hard-  
0 ware requirements, all TOPS Multipurpose Positions are available  
0 as a Modular or Integrated Position. The components of each type  
0 of Operator Position are as follows:

0 Modular TOPS MP Operator Position

0 Qty./Position

0 1 TOPS MP Terminal Base Unit (NT0M90SA)  
0 1 Monitor (NT0M92FA)  
0 1 Gnd. Bar (NTNX5305)(1 per 128 positions)

0 EITHER 1 Keyboard (NT0M36AE) - English Universal Keyboard  
0 OR 1 Keyboard (NT0M36AA) - French Universal Keyboard  
0 OR 1 Keyboard (NT0M36AH) - IBM DA English Keyboard  
0 OR 1 Keyboard (NT4X81EA) - TELMEX DA Keyboard  
0 (TELMEX is an international application)

0 \*\*\* Keyboard NT4X81DA is now Manufacture Discontinued. \*\*\*

0 EITHER 2 Modular Headset Jack Assembly - 7.25 feet (NTNX5303)  
0 OR 2 Modular Headset Jack Assembly - 6.5 feet (NTNX5306)  
0 OR 2 Modular Headset Jack Assembly - 10.0 feet (NTNX5308)

0 Integrated TOPS MP Operator Position

0 Qty./Position

0 1 TOPS MP Terminal Base Unit (NT0M90SA)  
0 1 Monitor (NT0M92FA)  
0 1 Gnd. Bar (NTNX5305)(1 per 128 positions)

0 EITHER 1 Keyboard (NT0M36AE) - English Universal Keyboard  
0 OR 1 Keyboard (NT0M36AA) - French Universal Keyboard  
0 OR 1 Keyboard (NT0M36AH) - IBM DA English Keyboard  
0 OR 1 Keyboard (NT4X81EA) - TELMEX DA keyboard  
0 (TELMEX is an international application)

0 \*\*\* Keyboard NT4X81DA is now Manufacture Discontinued. \*\*\*

0 RELEASE 28.01  
0 93 12 03

0 TOPS MP Position Description

0 Controller (NT0M90SA) -

0 The NT0M90SA Controller includes the digital  
0 telephony circuit board which is compatible  
0 with all previous TOPS MP equipment. This  
0 controller provides improved noise performance  
0 when used with the NTNX62AB HSLI pack. When used  
0 with the NTNX62AA, performance equals that of  
0 previous controllers.

0 Change Kit (NT0M96QE)

0 This change kit upgrades an existing NT0M90NA  
0 controller to NT0M90SA.

0 Monitor (NT0M92FA)

0 The video monitor provides a high resolution  
0 display of eight different shades of grey.  
0 The screen consists of 29 lines of text with  
0 90 characters per line and a 12" diagonal  
0 screen.

0 Ground Bar Assembly (NTNX5305)

0 The Ground Bar Assembly provides a  
0 junction point for furniture grounds and one (1)  
0 system single point ground. Provide one Ground Bar  
0 Assembly for up to 128 positions.

0 Keyboard (NT0M36AE)

0 The keyboard consists of 126 keys which are  
0 configured to provide an efficient operator  
0 interface. The keys are designed using Hall-  
0 effect solid state switches. Keys on the  
0 keyboard are as follows:

0 57 typewriter keys  
0 34 call processing keys  
0 8 softkeys  
0 27 keys available for future applications

0 RELEASE 28.01  
0 93 12 03

0 (Note: All key caps are provided as part of the  
0 keyboard stocklist as no specially engraved  
0 key caps are possible.)

0 Keyboard (NT0M36AA)

0 French version of the NT0M36AE keyboard described  
0 above.

0 Keyboard (NT0M36AH)

0 IBM DA (English) version of the TOPS MP keyboard.

0 Keyboard (NT4X81DA) is Manufacture Discontinued.

0 Keyboard Change Kit (NT0M36AF)

0 Upgrades NT4X81DA keyboard to NT0M36AE  
0 equivalence for Directory Assistance/ORDB use.  
0 Application of NT0M36AF to an NT4X81DA keyboard  
0 produces an NT4X81DB (B0229511) keyboard, which is  
0 functionally the same as NT0M36AE but uses  
0 different artwork.

0 Keyboard Change Kit (NT0M36AK)

0 Upgrades NT0M36AE Keyboard to NT0M36AH  
0 equivalence for IBM DA use.

0 | Keyboard Change Kit (NT4X81EB)

0 | Upgrades NT0M36AE Keyboard to NT4X81EA for TELMEX  
0 | applications only.  
0 | (TELMEX is an international application)

0 The customer is to provide headsets that meet the generic re-  
0 quirements in the Proposed Generic Requirements for Telephone  
0 Headsets used at Bell Operating Companies (BOC) Operator Con-  
0 soles, Issue 1, August 1986, TA-EOP-000314, published by Bell  
0 Communications Research (Bell Core).

0 A TOPS MP Position will require approximately 25 square feet of  
0 office space (with NTI furniture, without privacy panels).

0 A TOPS MP Position will require approximately 28 square feet of  
0 office space (with NTI furniture and customer provided privacy  
0 panels).

0 Remote Office - Traffic Operator Position Equip.

0  
0 RELEASE 28.01  
0 93 12 03

0 (Attenuation pads are not required for TOPS MP. Also, no op-  
0 tional key caps are orderable with TOPS MP.)

0 A Computer Based Training (CBT) Unit is to be provided per the  
0 customer's request and NTI's Building Studies Engineer shall de-  
0 termine the location of this unit. The CBT Unit must be located  
0 within 100' of all associated PCEs.

0 93 12 03

0 Hardware Required for Directory Assistance Application

0 The equipment described in this section is required in addition  
0 to the basic office configuration described elsewhere in ECM 345.  
0 The main components of the DA system are the TOPS MP facility, the  
0 DMS-200 host office, the Announcement Recording Unit (ARU) facil-  
0 ity and the Directory Assistance System / Computerized (DAS/C or  
0 Gateway), a vendor-supplied database. These facilities must be  
0 connected by voice or data links to provide DA service. Refer to  
0 Figure 1a or Figure 1b for TOPS MP DA without TMS or Figure 6 for  
0 TOPS MP DA with TMS for the layout of the components of the TOPS  
0 MP DA system.

0 The NTN62AB HSLI CP is required for the Directory Assistance ap-  
0 plication. While the NTN62AB is the standard HSLI and is cur-  
0 rently supplied for all applications, offices previously using  
0 the NTN62AA for Toll and Assistance service must convert to  
0 NTN62AB when adding Directory Assistance service.

0 Hardware Required for Operator Reference Database

0 In addition to the equipment that is required for a basic TOPS MP  
0 Toll and Assist office, database access for ORDB requires a High  
0 Speed Data Access circuit pack and its associated modem. This  
0 NTN66AA HSDA pack mounts in slot 8 of the TPC shelf being con-  
0 figured for ORDB and the UDS D56 modem required for the HSDA pack  
0 mounts on shelf 42 of the AAE cabinet. Refer to the Engineering  
0 Manual section for details of configuring the necessary HSDA and  
0 D56 modem. This HSDA pack and modem provide ORDB access for all  
0 four operator positions supported by the TPC. The HSDA pack pro-  
0 vides two V.35 ports but only one (Port 1) is used for the ORDB  
0 application and therefore only one (1) UDS D56 modem (per HSDA in  
0 slot 8) is required.

0 The NTN62AB HSLI CP is required for the Operator Reference Data-  
0 base application. While the NTN62AB is the standard HSLI and is  
0 currently supplied for all applications, offices previously using  
0 the NTN62AA for Toll and Assistance service must convert to  
0 NTN62AB when adding Operator Reference Database service.

0 Auxiliary Access Equipment Frame

0 The NTN57AC Auxiliary Access Equipment (AAE) frame is supplied  
0 with the modem shelf for TOPS Administration and Maintenance  
0 Interface as Always Provided equipment but the additional modem

0 shelves required for Directory Assistance must be provisioned.  
0 The Data Set Units (DSU) for use on the AAE have a Corporate  
0 Product Code (CPC) of A0344310 and should be provided and config-  
0 ured per the rules in the Engineering Manual section of this ECM.

0 RELEASE 28.01  
0 93 12 03  
0

0 The individual TOPS MP positions require access to the DAS/C for  
0 Directory information. This access is provided by the NTNX66AA  
0 High Speed Data Access CP which mounts on the TPC shelf in slot  
0 13. This CP supplies the required access for all four positions  
0 on that TPC shelf. The NTNX66AA HSDA CP provides two (2) V.35  
0 ports for database access and each port requires one (1) UDS D56  
0 modem card on a modem shelf in the Auxiliary Access Equipment  
0 frame. Therefore, one (1) NTNX66AA HSDA CP must be provisioned  
0 for every four DA positions and two (2) D56 modems ( A0336873 -  
0 UDS # 64565007) must be provisioned for each HSDA CP.

0 The DA application requires additional memory and this is pro-  
0 vided by an additional NTNX63AA CP mounted on each TPC shelf.  
0 Provide one (1) NTNX63AA for each TPC shelf and mount in slot 5  
0 per the Engineering Manual section.

#### 0 | ARU TRUNK PROVISIONING

0 | The voice announcement of the directory number is actually sup-  
0 | plied by the Announcement Recording Unit (ARU) which must be con-  
0 | nected to the DMS by DS-1 trunks.

#### 0 | Directory Assistance/Intercept/ARU Trunk Provisioning

0 | 1. Calculate the quantity of DA/Intercept trunks required based  
0 | on traffic requirements. Use standard CCS method.

0 |  $BHC \times HT/100 = CCS$  (Refer to the Poisson trunk capacity  
0 | tables in NTP 297-1001-450)

0 | Locate the CCS value in the table under the appropriate GOS  
0 | to determine the number of trunks required.

0 | 2. Calculate the quantity of ARU trunks required based on  
0 | DA/Intercept traffic requirements. Use standard CCS method.

0 |  $BHC \times HT/100 = CCS$  (Refer to the Poisson trunk capacity  
0 | tables in NTP 297-1001-450)

0 | Locate the CCS value in the table under the appropriate GOS  
0 | to determine the number of trunks required.

0 | Average ARU Holding Times are as follows:

0 | - Calls not eligible for auto call completion = 12 sec.

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-109

0 RELEASE 28.01  
0 93 12 03

0 | - Calls eligible for auto call completion,  
0 | call completion declined = 25 sec.

0 | - Calls eligible for auto call completion,  
0 | call completion accepted = 45 sec.

0 | - Intercept calls = 12 sec.

0 | 3. Calculate the number of DA/Intercept DS1s required.

0 | DA/Intercept trunks required (Step 1) / 24 = DS1s required

0 | 4. Calculate the number of ARU DS1s required.

0 | ARU trunks required (Step 2) / 24 = DS1s required

0 | 5. Calculate the number of DTC required based on DTC real  
0 | time capacity

0 | DA/Intercept BHC x 90 ms / 612,000 ms = Number of DTC  
0 | required.

0 | 6. Spread the DA/Intercept DS1s evenly over the number of  
0 | required DTC. Spread the ARU DS1s evenly over the number of  
0 | required DTC. Calculate the the number of attempts per DTC  
0 | using the following formulas:

0 | DA/Intercept trunks:  $28 \text{ CCS} \times 100 / \text{Holding time} = \text{Attempts}$   
0 |  $\text{per trunk} \times 24 \text{ trunks per DS1} \times \text{number}$   
0 |  $\text{of DS1} = \text{attempts per DTC}.$

0 | ARU trunks :  $36 \text{ CCS} \times 100 / \text{Holding time} = \text{Attempts per}$   
0 |  $\text{trunk} \times 24 \text{ trunks per DS1} \times \text{number of DS1} =$   
0 |  $\text{attempts per DTC}.$

0 | (36 CCS is used for the ARU trunks rather than 28 CCS  
0 | because of the extremely low overhead associated with ARU  
0 | connections.)

0 | 7. If any of the DTCs has attempts equal to more than 13,600,  
0 | then add one or more DTC and recalculate attempts per DTC.  
0 | Enough DTC must be provided to achieve attempts less than or  
0 | or equal to 13,600.

0 | Example :

0 | (The numbers used are for this example only)

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-110

0 RELEASE 28.01  
0 93 12 03  
0

0  
0 DA/Intercept BHC = 86,000  
0 DA/Intercept HT = 42 sec  
0 ARU HT = 14 sec

0 1. Total DA/Intercept trunks required = 1290 (Based on 28 CCS  
0 per trunk).

0 2. Total ARU trunks required = 336 (Based on 28 CCS per trunk).

0 3. DA/Intercept DS1s =  $1290/24 = 54$  DS1s

0 4. ARU DS1s =  $336/24 = 14$  DS1s

0 (Note the total DS1s required divided by the DTC physical  
0 capacity of 20 DS1s = 4 DTC are required based on traffic).

0 5.  $86000 \times 90 \text{ ms} / 612000 \text{ ms} = 13$  DTC (Based on real time  
0 capacity).

0 6. DS1s spread evenly over the 13 DTC =

0 DTC 1- 1 ARU DS1  $((36 \times 100 / 14) \times 24) \times 1 = 6172$   
0 11 4 DA/Intc DS1  $((28 \times 100 / 42) \times 24) \times 4 = 6400$   
0 Total attempts 12572

0 DTC 12 1 ARU DS1  $((36 \times 100 / 14) \times 24) \times 1 = 6172$   
0 5 DA/Intc DS1  $((28 \times 100 / 42) \times 24) \times 5 = 8000$   
0 Total attempts 14172

0 DTC 13 2 ARU DS1  $((36 \times 100 / 14) \times 24) \times 2 = 12344$   
0 5 DA/Intc DS1  $((28 \times 100 / 42) \times 24) \times 5 = 8000$   
0 Total attempts 20344

0 DTC 1-11 are well within the 13,600 attempts per DTC limit.  
0 DTC 12 and DTC 13 exceed this limit. A DTC must be added and  
0 the DS1s re-spread over 14 DTC.

0 DTC 1-11 remain the same.

0 DTC 12 is configured the same as DTC 1-11.

0 DTC 13 and 14 are configured with:

0 1 ARU DS1  $((36 \times 100 / 14) \times 24) \times 2 = 6172$   
0 3 DA/Intc DS1  $((28 \times 100 / 42) \times 24) \times 2 = 3200$   
0 Total attempts 9372

0 Remote Office - Traffic Operator Position Equip.

## 0 MPC PROVISIONING

0 Each NT1X89AA MPC or NT1X89BA EMPC used for DMS to DAS/C access  
0 will require one (1) 9600 baud modem. Refer to ECM 349 for ap-  
0 propriate modem ordering information (See Case R96).

0 The call control links from the DMS to the DAS are provided via  
0 either NT1X89AA MultiProtocol Converters (MPCs) or NT1X89BA En-  
0 hanced MultiProtocol Converters (EMPCs). The MPCs or EMPCs are  
0 mounted on IOC shelves and are provisioned based on traffic. Each  
0 MPC is capable of handling 9000 Busy Hour Calls and each EMPC can  
0 handle 18000 BHC. A maximum of sixteen MPCs or EMPCs is allowed  
0 per application. The total DA traffic should be divided by 9000  
0 to determine how many MPCs are required, or by 18000 when using  
0 EMPCs. The number of MPCs/EMPCs should be doubled to provide re-  
0 dundancy and spread over as many IOCs as possible to minimize the  
0 impact of an IOC failure. Refer to ECM 482 for additional infor-  
0 mation about EMPC link provisioning and ECM 468 for a diagram  
0 showing system configuration. Refer to availability reports be-  
0 fore ordering EMPCs.

0 The MultiProtocol Converters (MPC/EMPC) used for the datalink  
0 from the DMS to the DA database must be provisioned based on  
0 traffic. Each MPC/EMPC CP will use only one port.

0 LET BHC = total Busy Hour Calls requiring DA access  
0 N = preliminary Number of MPCs/EMPCs required  
0 TC = Total MPC CPs required

0 
$$N = \text{BHC} / 9,000 \quad (\text{Round Up}) \text{ MPC}$$

0 - or -

0 
$$N = \text{BHC} / 18,000 \quad (\text{Round Up}) \text{ EMPC}$$

0 
$$\text{TC} = N * 2$$

0 The preliminary number of MPCs/EMPCs is doubled to provide the  
0 necessary redundancy. In applications requiring more than eight  
0 MPCs/EMPCs for traffic, it is not possible to provide "N \* 2" re-  
0 dundancy, due to the limit of sixteen (maximum) MPCs/EMPCs per  
0 application. In such a configuration sparing should be based on  
0 the concept that no single point failure should degrade capacity.  
0 The MPCs/EMPCs should be spread over as many IOCs as possible and  
0 spares provisioned based on the number of MPCs/EMPCs that would  
0 be lost if the most heavily loaded IOC were to be lost. For exam-  
0 ple, if an office needed twelve MPCs and had four IOCs, three

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-113

0 RELEASE 28.01  
0 93 12 03  
0

0 MPCs/EMPCs per IOC (12 total) would carry the traffic. By provi-  
0 sioning four MPCs/EMPCs per IOC the loss of any individual IOC  
0 would still leave twelve working MPCs/EMPCs. When possible, "N \*  
0 2" sparing is recommended.

0 Operator positions for IBM DA are provisioned the same as for Di-  
0 rectory Assistance via CCI except for the keyboard. Provide the  
0 NT0M36AH (English) keyboard for new IBM DA offices. Existing  
0 NT0M36AE keyboards may be upgraded for IBM DA applications with  
0 the NT0M36AK change kit.

#### 0 | TOPS QMS

0 | The TOPS QMS External MIS feature (NTXR50AA), if provided, re-  
0 | quires one or more MPC or EMPC circuit packs on the IOC shelf.

0 | The TOPS QMS Senior Operator feature (part of NTP41AA or  
0 | NTP42AA) requires a TOPS loop-around trunk for each Senior Oper-  
0 | ator established. This may require additional trunks or T1 con-  
0 | nections in the TOPS office.

#### 0 3.1.3 PROVISIONING CONSIDERATIONS

0  
0 The following equipment is to be configured to meet office re-  
0 quirements. Provisioning Guidelines for determining the number of  
0 TOPS MP positions (Phase I) and supporting DMS-100F equipment is  
0 identical to the TOPS 04 Provisioning Guidelines (with the excep-  
0 tion of power) (Reference NTP 297-2271-450 and Engineering Man-  
0 ual). Hardware required for the TOPS MP System is as follows:

| 0 | <u>PEC</u> | <u>DESCRIPTION/REQUIREMENTS</u> |
|---|------------|---------------------------------|
|---|------------|---------------------------------|

|   |          |                                               |
|---|----------|-----------------------------------------------|
| 0 | NTNX60AA | Position Controller Equipment (PCE) Cabinet - |
| 0 |          | provide per customer requirements. One (1)    |
| 0 |          | fully equipped PCE Cabinet will service 16    |
| 0 |          | operator positions. See attached Engineering  |
| 0 |          | Manual Section (EMA8-TOPSMP-1).               |

0 NTNX61AF TOPS Position Controller (TPC) Pack Fill -  
0 provide per customer requirements. One (1)  
0 TPC Pack Fill is required for every four (4)  
0 operator positions. See attached preliminary  
0 Engineering Manual Section (EMA-TOPSMP- ).  
0 All new TOPS MP jobs shall be provisioned  
0 with NTNX61AF. Check RTS date. This new pack  
0 fill provides the same functionality as the  
0 NTNX61AE pack fill but has an improved type  
0 interface for storage devices (SCSI).

0 NTNX62AB High Speed Line Interface (HSLI) CP - provide  
0 per customer requirements. One (1) HSLI CP is  
0 required for each operator position. Up to  
0 four (4) HSLI CPs can mount on a TPC shelf,  
0 card slots 9-12. See attached Engineering  
0 Manual Section (EMA8-TOPSMP-2).

0 NT0X50AA Filler Face Plates - mount on an equipped TPC  
0 shelf, in unoccupied card slots 5 and 8-13.

0 NTNX57AC Auxiliary Access Equipment (AAE) Cabinet -  
0 provide one (1) AAE per one (1) to four (4) PCEs.  
0

0 NTNX2531 PCE Row End Panel (Right) - provide one (1)  
0 per PCE line-up.

0 NTNX2532 PCE Row End Panel (Left) - provide one (1)  
0 per PCE line-up

0 NTNX56CA Furniture Floor Attachment Kit (Raised Floor)  
0 provide four (4) per TOPS MP Position.

0 Quantity CPC/ENG CODE - Description  
0 (Per 8 operator positions)

0 1 A0355018 - Modular Connector

0 TAMI Provide at least one TPC Administration and Maintenance  
0 Interface (TAMI) (recommend HP 700/22 or DEC VT-320)  
0 per Operating Serving Center (OSC). The TAMI VDU  
0 can access up to four (4) postions at one time (one (1)  
0 TPC shelf). If more than one (1) shelf is required to  
0 be monitored at one (1) time, the quantity of TAMI VDUs  
0 must equal the number of shelves to be monitored. The  
0 TAMI VDU can be located Remotely or Locally. For either  
0 case the TAMI requires a VT100 compatible VDU, a UDS 212  
0 A/D modem for the VDU and a UDS 212 A modem for each  
0 TPC shelf and a line circuit for each of these modems.

0 PCE At this time, an Isolated System Grounding (ISG)  
0 Printer compliant printer is not available. If the printing of  
0 logs, help screens, or program panels is required, a  
0 screen printer from the TAMI VDU is recommended.

0 Modems For TOPS MP, NTI will provide UDS modems for use on  
0 the modem shelves in the AAE frame. Provide per customer  
0 requirements (Reference ECM 313). Provide one (1) UDS 212  
0 A/D standalone type modem for the TAMI VDU and provide one  
0 (1) UDS 212 A card type modem for each equipped TPC shelf.

0 One digital modem circuit (NT3X02/NT3X03 pair provides  
0 four) is required for each TOPS position to make the  
0 necessary D/A or A/D conversion for processing data  
0 signals. The digital modems mount on an MTM shelf.  
0 This is not required when using a TMS configuration.

0 6-Port When a call is routed to an operator position, the voice  
0 Conference channel of that position is connected to a 6-port  
0 Circuits conference circuit. All TOPS applications use 6-port  
0 conference circuits as two 3-port conference circuits.  
0 The 6-port is recommended over the 3-port because of  
0 better noise characteristics. One 6-port conference  
0 circuit is to be provisioned for every two positions  
0 with a spare allotment of 5%.

0 No special maintenance kit exists for TOPS MP.

0 TOPS MP Position Labels

0 Provide two (2) sets of labels for the positions required per  
0 the following information.

0 P0709162 : TOPS Position Label for Positions #0000-0071  
0 P0709163 : TOPS Position Label for Positions #0072-0143  
0 P0709164 : TOPS Position Label for Positions #0144-0215  
0 P0709165 : TOPS Position Label for Positions #0216-0287  
0 P0709166 : TOPS Position Label for Positions #0288-0359  
0 P0709167 : TOPS Position Label for Positions #0360-0431  
0 P0709168 : TOPS Position Label for Positions #0432-0503  
0 P0709169 : TOPS Position Label for Positions #0504-0575  
0 P0709170 : TOPS Position Label for Positions #0576-0647  
0 P0709171 : TOPS Position Label for Positions #0648-0719  
0 P0709172 : TOPS Position Label for Positions #0720-0791  
0 P0709173 : TOPS Position Label for Positions #0792-0863  
0 P0709174 : TOPS Position Label for Positions #0864-0935  
0 P0709175 : TOPS Position Label for Positions #0936-1007  
0 P0709176 : TOPS Position Label for Positions #1008-1023

## 0 | TOPS QMS

0 Force management Basic Statistics are provided to devices QTADS,  
0 QFADS and QMFADS. These devices replace the TADS, FADS and MFADS  
0 of the TOPS ACD. The QTADS, QFADS and QMFADS hardware require-  
0 ments are the same the TADS, FADS and MFADS. This hardware in-  
0 cludes a DMODEM circuit (NT3X02AA, NT3X03AA), a BELL108 or  
0 BELL202 compatible modem and a TTY. The QTADS, QFADS and QMFADS  
0 can co-exist in an office during the transition period from TOPS  
0 ACD to TOPS QMS. TOPS QMS queue information can only be reported  
0 to the QTADS, QFADS or QMFADS devices.

0 The FMCRT (Force Manager) provisioning rules remain the same.  
0 The Force Manager position must be a TOPS MP position or a Cus-  
0 tomer provided TOPS 4 position. A TOPS MPX position cannot serve  
0 as a Force Manager position. Only one Force Manager can be provi-  
0 sioned per TOPS office.

0 The new external MIS system can replace the FMCRT, QTADS, QFADS  
0 and QMFADS, can be used in parallel with those devices or not im-  
0 plemented at all. The link for sending the statistics to the ex-  
0 ternal MIS system is an X.25 link. This link is implemented via a  
0 Multi-Protocol Controller circuit pack (MPC) (NT1X89AA) or an En-  
0 hanced Multi-Protocol Controller (EMPC) (NT1X89BA) mounted on an  
0 Input/Output Controller shelf in the TOPS host office. One MPC  
0 port or one EMPC port is required per link. A MPC can provide up  
0 to two 19.2 Kbps ports and an EMPC can provide up to two 56 Kbps  
0 ports. An appropriate modem must be provided per link based on  
0 the speed of the link and the interface requirements of the ex-  
0 ternal MIS system. The limit of one application per MPC or EMPC  
0 applies to these links allowing only one port of any MPC or EMPC  
0 to be used for this feature. The TOPS QMS MIS is limited to 16  
0 links. The external MIS system shall be provided by the customer.

0 The following information provides a calculation for determining  
0 the quantity of MPC or EMPC links required for an external MIS  
0 system.

0 The following calculation determines the average rate at which  
0 message data buffers are transmitted per minute by the toll  
0 switch to the MIS device.

0 Average msg bytes/call \* HDBH call attempts  
0 ----- = Buffers/min.  
0 8192 bytes \* 60

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-123

0 RELEASE 28.01  
0 93 12 03  
0

0 |       Average message bytes/call = average position event msgs/call  
0 |                                   \* 45 bytes + average queue  
0 |                                   event/call \* 26

0 |       As there are typically two queue event messages and three posi-  
0 |       tion event messages per call, assume 187 average msg bytes/call  
0 |       if specific message counts are not available.

0 |       Once HDBH data buffers/minute have been calculated, compare the  
0 |       data rate with the transmission rate of the selected MPC or EMPC  
0 |       port. An MPC card transmitting at 19.2 Kbs can send 18  
0 |       buffers/minute. An EMPC card transmitting at 56 Kbs can send 52.5  
0 |       buffers/minute. A .8 Erlang adjustment for link overhead changes  
0 |       the rated capacity of the MPC card and EMPC card to 14.4 and 42  
0 |       buffers/minute, respectively.

0 |       Percentage of link utilization can be computed using the follow-  
0 |       ing formula:

0 |       Buffers/minute  
0 |       ----- \* 100 = % link utilization on MPC port  
0 |       14.4 minutes

0 |       Buffers/minute  
0 |       ----- \* 100 = % link utilization on EMPC port  
0 |       42 minutes

0 |       If MPC is selected and % utilization is greater than 100% for one  
0 |       link, links shall be added to reduce the link utilization below  
0 |       100% per link. Another option would be to use EMPC.

0 |       If EMPC is selected and % utilization is greater than 100% for  
0 |       one link, links shall be added to reduce the link utilization be-  
0 |       low 100% per link.

0 |       An additional link shall be provisioned to protect against loss  
0 |       of data during a single link failure. All links share the data  
0 |       traffic load under normal operating conditions.

0 |       The above computations do not take into account encoding of Force  
0 |       Management messages and messages generated by non-call events.

0 |       Each Senior Operator established under the TOPS QMS software fea-  
0 |       ture requires a TOPS loop-around trunk.

0 3.1.4 OFFICE LAYOUT INFORMATION

0  
0 The standard TOPS MP line-up will be as follows:

0 Standard TOPS MP Line-up

0 \* A 30 inch Empty Space between the AAE and PCE Cabinets  
0 is required for EMI and Earthquake requirements.

0 3.1.5 TRAFFIC TABLES

0  
0 Complete Half-Hourly Force Capacity Tables are included in NTP  
0 297-2281-750. Information on how to use the tables is included in  
0 Part 6 (page 54) of that NTP and the Tables begin on page 95.  
0 Generally, the number of positions required will be based upon  
0 telco estimates but the Tables are available for reference.

## 0 FUSING REQUIREMENTS

0 The power requirements of TOPS MP equipment follows:

| 0 |                               | <u>Maximum</u> | <u>Current</u> | <u>Drain</u> | <u>Fusing</u> |
|---|-------------------------------|----------------|----------------|--------------|---------------|
| 0 | PCE Cabinet (-48V DC)         | 11 A           | (A Feed)       |              | 20 A          |
| 0 |                               | 11 A           | (B Feed)       |              | 20 A          |
| 0 | TOPS MP Position (115 AC)     | 0.85 A         |                |              |               |
| 0 | CBT Unit (115 AC)             | 12.0 A         |                |              |               |
| 0 | CBT VDU (115 AC)              | 1.0 A          |                |              |               |
| 0 | AAE Frame                     | 3 A            | (A Feed)       |              | 5 A           |
| 0 |                               | 3 A            | (B Feed)       |              | 5 A           |
| 0 | Alarm Battery (ABS) (-48V DC) | 6 A            |                |              | 10 A          |

0 The PCE Cabinet is powered by 2 power feeds (one A & one B), with  
0 each feed fused at 20 A. (Fuses are always provided as part of  
0 the PDP stocklist.) The power source for the PCE Cabinet will be  
0 a Power Distribution Panel (PDP) in the AAE Cabinet. The AAE  
0 cabinet must be provided for both Local and Remote configured  
0 TOPS MP offices. The AAE will also supply ABS to the PCE cabi-  
0 nets.

0 The customer is required to provide the AC power for the TOPS MP  
0 System.

0 NT recommends that a dedicated and protected AC power source be  
0 used for the TOPS Multipurpose Positions, the CBT unit, the  
0 Printer used with the PCE Cabinet or a Local TAMI. The TOPS MP  
0 Monitor will have a twist lock plug which will require a twist  
0 lock power receptacle. Any equipment not powered by the dedi-  
0 cated AC power source must be located at least 7 feet from the  
0 TOPS MP Equipment and if this 7 feet requirement cannot be met,  
0 barriers to separate this equipment from the TOPS MP equipment  
0 must be installed. This is necessary to eliminate the possi-  
0 bility of electrical shock due to grounding potential differ-  
0 ences. Reference the TOPS MP Power and Grounding Requirements  
0 NTP 297-2281-156.

0 3.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 A 30" empty space between the AAE and PCE frames is required for  
0 EMI and Earthquake requirements.

0 3.2.3 SPARING INFORMATION

0  
0 Recommended sparing guidelines call for one spare for each  
0 provisionable circuit pack.

0 | Provide one or more UDS Modem Shelf Spare Power Supply (65001860)  
0 | per Customer request as a spare power supply for the UDS modem  
0 | shelves mounted in the AAE cabinet (NTNX57AC).

0 3.3 SOFTWARE PROVISIONING

0

0 3.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 The following software for TOPS MP applications may be ordered,  
0 based on office configuration requirements.

0 | Packaging information is accurate at time of publication but, due  
0 | to changes often made in packaging, should be checked in the ap-  
0 | propriate software database system.

0| TOPS QMS FEATURE PACKAGES

0  
0| NTXP41AA TOPS Host Queue Management System

0| NTXP42AA TOPS Remote Queue Management System

0| NTXR48AA QMS: Call And Agent Manager

0| NTXR50AA TOPS QMS External MIS Interface

0| Either of NTXP41AA and NTXR48AA or NTXP42AA and NTXR48AA is re-  
0| quired to implement the TOPS QMS feature in a TOPS office.  
0| NTXR50AA is optional based on the Customer requirement for and  
0| provision of an external MIS.

0| The packages listed above are provisioned in addition to the re-  
0| quired appropriate TOPS master software package.

0| Refer to the SMS database for software package inter-  
0| dependencies.

0 3.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 TPC Software

0 The TPC is a 68000 based system that controls up to four TOPS MP  
0 positions. It handles the distribution of voice and data from  
0 the CC and manages the screen display of each of its positions.

0 A twenty megabyte hard disk and a five and a quarter inch floppy  
0 disk are available on each TPC. The hard disk contains all the  
0 required software and data files to control the operator posi-  
0 tions and the interface to the DMS200 CC. Some floppy disks con-  
0 taining a copy of the load on the hard disk are also shipped with  
0 each TPC. These installation disks can be used to reconfigure

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-139

0 RELEASE 28.01  
0 93 12 03

0 the hard disk in case the TPC fails to start up during installa-  
0 tion.

0 Software upgrades are also shipped on floppy disks. To incorpo-  
0 rate the software upgrades, one must first disable all the MPs on  
0 the TPC from call processing using the BSY command at the MAP and  
0 TAMI. Secondly, one must insert the appropriate floppy disk in  
0 the drive and power on the TPC. The TPC will automatically boot  
0 from the floppy disk and copy the required files on to the hard  
0 disk.

0 It is mandatory to connect the TAMI terminal to the TPC before  
0 TPC installation and TPC software upgrades are begun. The TPC can  
0 then out- put messages on the TAMI indicating progress and re-  
0 quest the user to insert the next floppy disk.

#### 0 Datalinks

0 In the TOPS IV system data communication between the CC and posi-  
0 tions is via asynchronous links. The CC transmits data to the  
0 position at 300 baud and receives data from the position at the  
0 same rate.

0 In the TOPS MP system data communication between the CC and the  
0 TPC is also over asynchronous links, but the CC transmits data to  
0 the TPC at 1200 baud and receives data from TPC at 300 baud.

0 The data channels of the TOPS system are connected through the  
0 switching network to digital modems (NT3X02/NT3X03). These modem  
0 circuits provide the necessary D/A or A/D conversion for process-  
0 ing the data signals. One digital modem circuit is required for  
0 each TOPS operator position unless a TMS configuration is used.  
0 Digital modems are not required with the TMS.

#### 0 Restrictions

- 0 1. a. TOPS offices should have a maximum of four pairs (NT3X02AA,  
0 NT3X03AA) of digital modem cards per MTM, providing a maximum  
0 of 16 modem circuits per MTM.
- 0 b. Combined IBN/TOPS offices should have a maximum of two pairs  
0 (NT3X02AA,NT3X03AA) of digital modem cards per MTM, providing  
0 a maximum of eight circuits per MTM.
- 0 c. In each case it is preferred to spread modem card pairs evenly  
0 across all MTMs to ensure reliability.

0  
0 Remote Office - Traffic Operator Position Equip.  
0

0 RELEASE 28.01  
0 93 12 03  
0

- 0 2. Hosts and remotes with different versions of TOPS software  
0 can be incompatible. The existing procedure for updating  
0 Operator Centralization (OC) software is that the host must  
0 be updated before the remote. This procedure will apply in  
0 TOPS MP as well as TOPS IV. Also, the host cannot have any  
0 inservice TOPS MP positions until the remote is upgraded to  
0 TOPS MP software.
- 0 A TOPS MP remote cannot communicate with a TOPS IV host  
0 because the host is not able to tell the remote what kind  
0 of position it has. The remote will not know whether to send  
0 TOPS IV or TOPS MP commands.
- 0 A TOPS IV remote cannot communicate with a TOPS MP host  
0 because if a TOPS MP position is associated with an OC call,  
0 the remote will not be able to send TOPS MP commands to the  
0 position. If there are no TOPS MP positions on the host this  
0 configuration does work.
- 0 Therefore, the procedure for upgrading OC offices to TOPS MP  
0 is to first update the software in the host without adding any  
0 inservice TOPS MP positions, second, update the software in all  
0 the remotes, and third, put the TOPS MP positions on the host  
0 into service.
- 0 3. TOPS CC software changes that add or change fields on the  
0 TOPS position screen will require parallel changes in the  
0 TPC software.
- 0 4. Operator calls handled at TOPS MP positions can only be  
0 monitored by TOPS MP Assistance positions. Operator calls  
0 handled at TOPS IV positions can only be monitored by  
0 TOPS IV Assistance positions.
- 0 5. To enable an MP for call processing, it must be first  
0 returned to service at the TPC using the TAMI terminal  
0 and then at the CC using the MAP.
- 0 6. All MPs connected to the TPC must be disabled from call  
0 processing before attempting software upgrades. To disable  
0 an MP from call processing, it must be first busied at the  
0 CC using the MAP and then at the TPC using the TAMI terminal.
- 0 7. TAMI baud rate must be reset to 1200 BAUD after a power  
0 hit unless it is already at 1200 baud. The TPC always boots  
0 up in REMOTE mode (1200 BAUD).

0 RELEASE 28.01  
0 93 12 03

- 0 8. Once the TPC is configured completely with all the required  
0 datafill, accessing TAMI to perform TPC maintenance is  
0 necessary only when there are problems in the TPC. It is  
0 recommended not to access the TAMI while CALL PROCESSING is  
0 enabled, as some performance degradation may result.

0 DRAM Assignment Restriction

0 Mechanized Calling Card Service (MCCS), provided in feature  
0 NTX171CA, requires at least one dedicated DRAM. The same DRAM is  
0 used for the Exchange Alternate Billing Service (EABS) feature  
0 (NTX825AA).

0 This DRAM is designated as MCCS type in Table ANNS and its con-  
0 troller card is dedicated to the CLLI for the MCCS type DRAM in  
0 Table DRAMS. Since the controller is dedicated in software to  
0 MCCS type announcements, the other cards on that DRAM cannot be  
0 used for any other type of announcement.

0 C. Affected Software Tables

0 CC

0 Two new subfields are added to the DEVTYPE field of table TOPSDEV  
0 when DEVTYPE equals FMCRT. One subfield, CNTRLR describes the  
0 type of position controller as either NT4X71, the TOPS IV con-  
0 troller, or the TPC, the TOPS MP controller. The other subfield,  
0 PROTOCOL, describes the communication protocol (with associated  
0 transmission rates) to be used for transmitting and receiving  
0 data to and from the FMCRT position.

0 Two new fields are also added to Table TOPSPOS: CNTRLR defines  
0 the TOPS Controller type and allows software to decide whether to  
0 send TOPS IV or TOPS MP commands to each position, and PROTOCOL  
0 describes the communication protocol (with associated trans-  
0 mission rates) to be used for transmitting and receiving data to  
0 and from the TOPS position.

0 Table OGTKEY is replaced by Tables OGTSPKEY and OGTMPKEY. Table  
0 OGTSPKEY is used for a single purpose (SP - TOPS IV) position and  
0 contains data for the 7 OGT keys on the TOPS SP position. Table  
0 OGTMPKEY allows a DMS-100 TOPS MP operator to transfer a call to  
0 high volume operating company destinations by activating the XFER  
0 key and entering a number from 1 to 7 on the TOPS MP position  
0 keyboard (this capability will be increased to entering a number  
0 from 1 to 99 in TOPS MP Phase II). It is recommended for an of-

0 RELEASE 28.01  
0 93 12 03

0 fice with both TOPS SP and TOPS MP positions that the first seven  
0 keys be datafilled the same to avoid confusion between operator  
0 teams. Table OGTMPKEY must match the TPC datafilled OUTTRUNKS  
0 SERVICES LIST as described below.

0 TPC

0 Hard keys, Outtrunks, and Position Types can be defined using the  
0 TAMI program.

0 Six customer definable hard keys can be defined as frequently  
0 used functions.

0 Outtrunks numbers allow frequently used numbers to be accessed  
0 quickly by pressing the outtrunks key and a specific digit 1 to  
0 7.

0 Positions can be defined as Toll and Assist, Assistant, In  
0 charge, or Force Management.

0 A mechanism based on floppies is provided to copy the datafill  
0 from one TPC to others.

0 The 7 outgoing trunks defined for the OUTTRUNKS key on the MP  
0 keyboard are datafilled at the TPC in the OUTTRUNKS SERVICES LIST  
0 and must match the datafill in Table OGTMPKEY at the CC.

0 Affected Office Parameters

0 The Office Engineered Parameter DM\_PCM\_ENCODING is required for  
0 switching units with NT3X02CA (not yet available) Digital Modems  
0 (DM) and selects the type of PCM encoding scheme required. For a  
0 switching unit located in Europe and one or more NT3X02CA DMs is  
0 provided, set the value of the parameter to DM\_A\_LAW. If the  
0 switching unit is located in North America, or until the NT3X02CA  
0 becomes available, leave at the default value, DM\_MU\_LAW.

0 The Office Engineered Parameter TOPS\_NUM\_TRANSFER\_TYPES is re-  
0 placed by Parameter TOPS\_TRANSFER\_TYPES which specifies the  
0 transfer types allowed by the transfer keys on each TOPS posi-  
0 tion.

0 Position types Operator, Assistance and In Charge are defined in  
0 Table TOPSPOS. Positions defined as Operator are assigned a Call  
0 Services Set (Toll and Assist and/or Directory Assistance) and a  
0 Transfer Set (General, Transfer 1, Transfer 2 and/or Directory  
0 Assistance Queues) set. For example: To give a TOPS position TA

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-143

0  
0 RELEASE 28.01  
0 93 12 03

0 and DA capabilities, set field SVCSET = ALL in Table TOPSPOS.  
0 Then assign queues in field XFERSET that are translated to handle  
0 both TA and DA traffic.

0 The Office Engineered Parameter TOPS\_TRANSFER\_TYPES specifies the  
0 transfer queues which are accessible to the TOPS operators via  
0 their outgoing trunk keys. The possible values for the parameter  
0 are NONE, XFR1, XFR2, DA, and ALL. A transfer queue must be speci-  
0 fied as a value of TOPS\_TRANSFER\_TYPES to be eligible for assign-  
0 ment in Table OGTSPKEY (TOPS 4) or Table OGTMPKEY (TOPS MP),  
0 where the outgoing trunk keys are assigned to particular transfer  
0 queues.

0 If TOPS\_TRANSFER\_TYPES is set to NONE, all calls go into a gen-  
0 eral queue and TOPS operators cannot transfer calls to other  
0 queues for special handling.

0 Note that DA functionality will not be discussed in this docu-  
0 ment.

### 0 3.3.3 MEMORY PROVISIONING

0  
0 Refer to the MEMCALC program for TOPS MP memory requirements.

0 neering Manual Section for provisioning and configuration de-  
0 tails.

0 Refer to MEMCALC for impact of IBM DA on memory provisioning

0 3.4 REAL TIME IMPACT

0 Phase I of TOPS MP provides no Central Control (CC) Real Time in-  
0 crease over TOPS 04 (Reference SEA 87-03-001).

0 TOPS MP Directory Assistance timings are estimated below. For  
0 customer dialed 0-,411 or 555-1212 from a non-coin station, a TOPS  
0 operator is attached and connection established to an external  
0 ARU. This example includes AMA billing.

| 0 Standalone | Host OC     | Remote OC   |
|--------------|-------------|-------------|
| 0 -----      | 0 -----     | 0 -----     |
| 0 75ms/Call  | 0 50ms/Call | 0 85ms/Call |

0 An additional 15ms/Call is required if either the standalone or  
0 remote office is equipped with an internal ARU.

0 When a customer dials a changed number, the call is routed to an  
0 intercept trunk within the DMS-200 TOPS equipped office and con-  
0 nected to an external ARU.

| 0 Standalone | Host OC    | Remote OC   |
|--------------|------------|-------------|
| 0 -----      | 0 -----    | 0 -----     |
| 0 45ms/Call  | 0 See Note | 0 45ms/Call |

0 Note: Host OC has no timing in this example. A call from the  
0 Remote OC office would route directly to the ARU that  
0 is connected to the Remote OC office. No inter-office  
0 facilities would be utilized between the Host and Remote  
0 offices. (Reference SEA 87-09-004)

0 The maximum number of TOPS Message Switches that can be served by  
0 a DMS 100/200 is physically limited by the number of network  
0 ports available in the DMS. The practical limit however is im-  
0 posed by DMS real time capacity. Refer to TABLE 1 for the maximum  
0 number of operators allowed using various office configurations.

Remote Office - Traffic Operator Position Equip.

RELEASE 28.01  
93 12 03

# Assumptions for TABLE 1:

- Operator utilization 95%
- CC CP Occupancy 70%
- Average Work Time/DA Call 18 sec.
- Average Processing Time/DA Call, NT40:
  - o Stand Alone (SA) system 70 msec.
  - o Host Operator Centralization (HOC) 25 msec.
  - o Remote Operator Centralization (ROC) 75 msec.
- Average Processing Time/DA Call, Supernode(68020 at 20Mhz):
  - o Stand Alone system 35 msec.
  - o Host Operator Centralization 12.5 msec.
  - o Remote Operator Centralization 37.5 msec.
- Average Processing Time/DA Call, Supernode(68030 at 33Mhz):
  - o Stand Alone system 23.3 msec.
  - o Host Operator Centralization 8.3 msec.
  - o Remote Operator Centralization 25 msec.
- Average Work Time 18 sec.
- Operator Call Rate 190 calls/hr.
- 100% Directory Assistance calls

| SYSTEM                  | CONFIG | CC CP OCC<br>(Calls/hr.) | APT<br>(ms) | MAX NO.<br>OPERATORS |
|-------------------------|--------|--------------------------|-------------|----------------------|
| NT40                    | SA     | 36000                    | 70          | 189                  |
|                         | HOC    | 100800                   | 25          | 530                  |
|                         | ROC    | 33600                    | 75          | 117                  |
| SUPERNODE<br>(68020/20) | SA     | 72000                    | 35          | 379                  |
|                         | HOC    | 194180 *                 | 12.5        | 1022 *               |
|                         | ROC    | 67200                    | 37.5        | 354                  |
| SUPERNODE<br>(68030/30) | SA     | 108000                   | 23.3        | 568                  |
|                         | HOC    | 194180 *                 | 8.3         | 1022 *               |
|                         | ROC    | 100800                   | 25          | 531                  |

\* The DMS host handles 1022 calls simultaneously, limited by software design. The maximum number of operators by calculation exceeds this limit and is therefore invalid.

## 0 4.0 TOPS MPX IWS Applications (OA, OIA, IBM DA OPP)

0 The existing TOPS MPX platform is a single function terminal which  
0 supports Directory Assistance. TOPS MPX IWS supports multiple ser-  
0 vices, and uses industry standard software. The TOPS MPX IWS platform  
0 refers to hardware and software, including the IBM PS/2 with plug-in  
0 cards, industry standard operating system and communications software,  
0 and several application and utility programs developed by BNR. Opera-  
0 tor Assistance (OA), Open Information Access (OIA), and IBM DA OPP are  
0 applications which run on the TOPS MPX IWS platform. TOPS MPX IWS  
0 supports Open Position Protocol (OPP).

0 Prior to the introduction of OA, OIA, and IBM DA OPP, TOPS MPX sup-  
0 ported only the IBM DA AOSS and NT DA AOSS applications. Toll & As-  
0 sist and ORDB were only available on TOPS MP positions. The OIA  
0 application allows MPX positions to access another service (e.g.  
0 ORDB).

0 The body of this ECM does not cover the aspects which are unchanged  
0 from the current TOPS MPX IBM DA AOSS system. The referenced Engi-  
0 neering Manual Sections (EMSs) cover all hardware elements of the TOPS  
0 MPX IWS platform, including those which are unchanged from the current  
0 TOPS MPX IBM DA AOSS system.

0 In order to support the new IWS-based applications (OA, OIA, and IBM  
0 DA OPP), NTN51CB/CC/CD/DB/DC/DD positions require a hardware upgrade.  
0 These positions can be upgraded to the minimum requirements or to the  
0 high performance configuration. The minimum requirements are:

0 386 processor  
0 8 MB RAM  
0 40 MB disk

0 NTN51FB and NTN51GB positions have the high performance configura-  
0 tion. The high performance configuration has the following features:

0 486 processor  
0 8 MB RAM  
0 106 MB disk

0 All new installations will use the high performance configuration. The  
0 high performance configuration may be used for any position, and is  
0 STRONGLY RECOMMENDED for some positions/ applications. Refer to sec-  
0 tion 2.2 to determine when the high performance configuration is re-

0  
0  
0

0  
0 RELEASE 28.01  
0 93 12 03

0 commended. Refer to the Engineering Manual Sections for the PECs  
0 required to upgrade existing positions.

0 4.1 HARDWARE PROVISIONING

0

0 4.1.1 HARDWARE USAGE RESTRICTIONS

0

- 0 - Mixing MPX AOSS and MPX IWS positions on a token ring is  
0 NOT permitted.
- 0 - Mixing MP, MPX AOSS and MPX IWS posit. in an OSC IS permitted.
- 0 - Mixing MP, MPX AOSS and MPX IWS positions on a TMS IS permitted  
0 (including mixing positions on DS-1 and DCH CPs); however,  
0 all posit. supported by a TMS must have the same cluster size.  
0 Since MP and MPX AOSS always have cluster size of four, TMSs  
0 supporting any MP or MPX AOSS posit. can only support cluster  
0 size of four.
- 0 - Mixing cluster sizes on a DMS IS permitted.
- 0 - Mixing NT DA and IBM DA (AOSS or OPP) on a DMS is NOT permitted.
- 0 - Cluster size may be four or sixteen. Cluster size of twenty is  
0 not supported at this time.
- 0 - Redundant datalinks (two DMS gateway positions per cluster)  
0 are STRONGLY RECOMMENDED for reliability.
- 0 - With cluster size of sixteen, the maximum number of positions  
0 on the token ring is sixteen. A cluster can NOT be split over  
0 more than one token ring.
- 0 - If any position in a cluster supports OIA, for optimum performance  
0 it's STRONGLY RECOMMENDED the DMS gateway position(s) in that  
0 cluster have the high performance configuration.
- 0 - For optimum performance with cluster size of sixteen, it is  
0 STRONGLY RECOMMENDED all positions on the token ring have the  
0 high performance configuration.
- 0 - Mixing 386 and 486 positions in a cluster IS permitted.
- 0 - Mixing clust. sizes on a token ring (eg. one cluster of sixteen  
0 positions and a second cluster of four positions) is NOT  
0 permitted.

0 4.1.2 HARDWARE DEPENDENCIES

0  
0 In order to use cluster size of sixteen, the Increased TOPS Data  
0 Multiplexing software package (NTXR52AA) is required. For cluster  
0 size of sixteen, the high performance configuration is STRONGLY  
0 RECOMMENDED for all positions.

## 0 P AND C SIDE PORT REQUIREMENTS

0  
0 Cluster size affects P and C side port requirements on the TMS.  
0 Refer to ECM 468.

## 0 DMS BUS PORT REQUIREMENTS

0  
0 Not applicable.

## 0 CIRCUITS PER CARD

0  
0 Not applicable.

0 RELEASE 28.01  
0 93 12 03

0

0

0 4.1.3 PROVISIONING CONSIDERATIONS

0

0 The recommended number of positions per token ring is sixteen; up  
0 to twenty positions per token ring are permitted. See section  
0 2.2 "Hardware Usage Restrictions".

0 Exactly two database gateway (formerly called "type 1") positions  
0 are required for EACH TOKEN RING which supports DA. If there is  
0 more than one cluster on the token ring, these database gateway  
0 positions must be in different clusters.

0 For redundant configurations, two DMS gateway (formerly called  
0 "type 2") positions are required PER CLUSTER. (NOTE: a cluster  
0 with a single DMS gateway position is permitted if the DMS gate-  
0 way position is the only position in the cluster.)

0 For non-redundant configurations, one DMS gateway (formerly  
0 called "type 2") position is required PER CLUSTER. Non- redundant  
0 configurations are NOT RECOMMENDED.

0 One operator position on each token ring may be equipped with a  
0 maintenance modem and cable. This position is referred to as an  
0 "operator/maintenance" position, and is used for dial-in mainte-  
0 nance (in addition to normal operator functions). This position  
0 can be in any cluster.

0 Each token ring can have from one to five "clusters" (subject to  
0 the limit of sixteen or twenty positions per token ring). A  
0 "cluster" is a group of positions which share common links to the  
0 DMS. Cluster size can be four or sixteen. A cluster does not  
0 have to be filled. It is recommended that new installations  
0 (with high performance positions) be configured with cluster size  
0 of sixteen.

0 Database gateway positions are only required on token rings which  
0 support Directory Assistance.

0 Performance is influenced by:

0 4.3 SOFTWARE PROVISIONING

0 The software ordering process is being modified. Position soft-  
0 ware for the V0 should be ordered using BOTH the NTG codes AND  
0 the CPC codes. For the V0, BCS 35 is required.

0 NTG codes are ordered as hardware items on Spec. 6324.

0

0 4.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

0 DMS 100/200

0  
0 Provide the following master package for each standalone or host  
0 DMS supporting OA and/or OIA (without IBM DA OPP):

0 NTXC14AA TOPS Open Interface Toll (Host)

0 Provide the following master package for each remote DMS  
0 supporting OA and/or OIA (without IBM DA OPP):

0 NTXC15AA TOPS Open Interface Toll (Remote)

0 Provide the following master package for each standalone or  
0 host DMS supporting IBM DA OPP (this package will also support OA  
0 and/or OIA):

0 NTXC18AA TOPS Open Interface Toll/IBM DA (Host)

0 Provide the following master package for each remote DMS supporting  
0 IBM DA OPP (this package will also support OA and/or OIA):

0 NTXC19AA TOPS Open Interface Toll/IBM DA (Remote)

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-154

0  
0 RELEASE 28.01  
0 93 12 03

0 The following pkg. is optional for standalone or host DMSs sup-  
0 porting OIA, and is additional to one of the above master pack-  
0 ages.

0 NTXN84AA Automatic OIA Session Start

0 In addition to the above packages, provision the following pack-  
0 age to support cluster sizes greater than four. If cluster size  
0 of four is the only cluster size to be supported, this package is  
0 not needed:

0 NTXR52AA Increased TOPS Data Multiplexing

0 In addition to the above packages, order the following  
0 packages for HOST DMSs:

0 NTX039AA Host OC Data Link Handling  
0 NTX873AA Host TOPS MP OC Data Link Handling

0 At the time of writing this ECM, the above packages provided the  
0 basic requirements for DMS software with IWS (OPP) applications.  
0 Check SOLID for updates and interdependencies.

## 0 Position Software

0  
0 Note: OA (NTG362AA) is a prerequisite for DA (NTG364AA) and OIA  
0 (NTG361AA).

## 0 Operator Positions

0 Provide the following packages for EACH operator position:

| 0 | PKG ID   | CPC      | DESCRIPTION                     |
|---|----------|----------|---------------------------------|
| 0 | -----    | -----    | -----                           |
| 0 | NTG384AA | A0601713 | Operating System Module         |
| 0 | NTG383AA | A0385823 | Task Manager Module             |
| 0 | NTG325AA | A0600691 | LAN Manager Module              |
| 0 | NTG385AA | A0407497 | LAN Network Module              |
| 0 | NTG360AA | B0238335 | IWS Base                        |
| 0 | NTG362AA | B0238337 | Operator Assistance Application |

0 Order one or both of the following packages for EACH position ac-  
0 cording to the application(s) supported on the position. Posi-  
0 tions on any given token ring may support different applications.

|   |          |          |                               |
|---|----------|----------|-------------------------------|
| 0 | NTG361AA | B0238336 | OIA Application and Interface |
| 0 | NTG364AA | B0238339 | IBM DA OPP Application        |

0  
0 Combined Operator/Maintenance Positions

0 Provide the following packages for EACH combined operator/ main-  
0 tenance position:

| 0 | PKG ID   | CPC      | DESCRIPTION                     |
|---|----------|----------|---------------------------------|
| 0 | -----    | -----    | -----                           |
| 0 | NTG384AA | A0601713 | Operating System Module         |
| 0 | NTG383AA | A0385823 | Task Manager Module             |
| 0 | NTG325AA | A0600691 | LAN Manager Module              |
| 0 | NTG385AA | A0407497 | LAN Network Module              |
| 0 | NTG360AA | B0238335 | IWS Base                        |
| 0 | NTG328AA | A0600690 | LAN Access Module               |
| 0 | NTG362AA | B0238337 | Operator Assistance Application |

0  
0 RELEASE 28.01  
0 93 12 03

0 Order one or both of the following packages for EACH position  
0 according to the application(s) supported on the position. Positions  
0 on any given token ring may support different applications.

0 NTG361AA B0238336 OIA Application and Interface  
0 NTG364AA B0238339 IBM DA OPP Application

0 DMS Gateway Positions

0 Provide the following packages for EACH DMS gateway position:

| 0 | PKG ID   | CPC      | DESCRIPTION                     |
|---|----------|----------|---------------------------------|
| 0 | -----    | -----    | -----                           |
| 0 | NTG384AA | A0601713 | Operating System Module         |
| 0 | NTG383AA | A0385823 | Task Manager Module             |
| 0 | NTG325AA | A0600691 | LAN Manager Module              |
| 0 | NTG385AA | A0407497 | LAN Network Module              |
| 0 | NTG360AA | B0238335 | IWS Base                        |
| 0 | NTG327AA | A0600692 | Gateway Communication Module    |
| 0 | NTG362AA | B0238337 | Operator Assistance Application |

0 Order one or both of the following packages for EACH position ac-  
0 cording to the application(s) supported on the position. Posi-  
0 tions on any given token ring may support different applications.

0 NTG361AA B0238336 OIA Application and Interface  
0 NTG364AA B0238339 IBM DA OPP Application

0 Dabatase Gateway Positions (only required for IBM DA OPP)

0 Provide the following packages for EACH database gateway posi-  
0 tion:

| 0 | PKG ID   | CPC      | DESCRIPTION                     |
|---|----------|----------|---------------------------------|
| 0 | -----    | -----    | -----                           |
| 0 | NTG384AA | A0601713 | Operating System Module         |
| 0 | NTG383AA | A0385823 | Task Manager Module             |
| 0 | NTG325AA | A0600691 | LAN Manager Module              |
| 0 | NTG385AA | A0407497 | LAN Network Module              |
| 0 | NTG360AA | B0238335 | IWS Base                        |

## 0 5.0 TOPS MPX NT DA AOSS

0 With the introduction of NT DA, TOPS MPX positions can access the Net-  
0 work Application Systems (NAS) Directory Assistance (DA) database.  
0 Previously, the NAS DA database was accessible from TOPS MP positions  
0 (and other non-NT positions).

0 The development of NT DA required new software for the MPX positions,  
0 a new keyboard, an upgraded position base, and a modem and modem cable  
0 for dial-in maintenance capability. NT DA uses existing hardware and  
0 software for all other elements of the MPX system (token ring hard-  
0 ware, MIS frame equipment, TMS, CM, and IOE).

0 5.1 HARDWARE PROVISIONING

0

0 5.1.1 HARDWARE USAGE RESTRICTIONS

0  
0 Positions are based on the IBM PS/2. NT DA AOSS requires PS/2  
0 positions with 486 processor, 8 MB RAM, and 106 MB disk.

0 5.1.2 HARDWARE DEPENDENCIES

0  
0 All hardware requirements are given in the Engineering Manual  
0 Sections.

## 0 DISCRIMINATION NUMBERING

0  
0 Not applicable.

0 5.1.3 PROVISIONING CONSIDERATIONS

0  
0 For redundant configurations, each cluster must have two DMS  
0 gateway (formerly called "type 2") positions (a single DMS gate-  
0 way position is permitted if it is the only position in the clus-  
0 ter). For non-redundant configurations, each cluster must have  
0 one DMS gateway position. Non-redundant configurations are NOT  
0 recommended. Cluster size of four is the only cluster size sup-  
0 ported at this time (for NT DA AOSS).

0 The other two or three positions in each cluster (depending on  
0 whether it is a redundant configuration) are operator (formerly  
0 called "type 3") positions. Optionally, one operator position on  
0 each token ring may be equipped with a dial-up modem and addi-  
0 tional software, enabling it to function as a combined  
0 operator/maintenance position.

0  
0 Remote Office - Traffic Operator Position Equip.  
0 Chapter 26 Page 26-161

0  
0 RELEASE 28.01  
0 93 12 03

0 Database gateway positions, also called "routers", are dedicated  
0 to the task of routing messages between the NAS database and the  
0 other positions on the token ring. These database gateway posi-  
0 tions are NOT part of any cluster. Unlike the "type 1" positions  
0 in IBM DA systems, these positions do not provide operator  
0 functionality. Two database gateway positions are required on  
0 each token ring.

0 Each token ring has a maximum of five clusters of up to four po-  
0 sitions each. (In addition, each token ring has two router (da-  
0 tabase gateway) positions, which are not part of any cluster.)  
0 Unlike TOPS MPX IBM DA AOSS, there is no recommendation to limit  
0 the number of positions on the token ring to something less than  
0 the maximum. (TOPS MPX IBM DA AOSS recommends sixteen positions  
0 per token ring, while the maximum allowed is twenty positions per  
0 token ring.)

0 5.3 SOFTWARE PROVISIONING

0 At the time of writing this ECM, the packages listed provide the  
0 basic requirements for DMS and position software. Check SOLID  
0 for updates and interdependencies.

0 5.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

## 0 DMS 100/200

0  
0 NT DA AOSS did not require the development of any DMS software.  
0 However, new master packages were created to provide the set of  
0 features required. For the VO and RAMP, BCS 34 is required.

0 Provide the following package for each standalone DMS supporting  
0 NT DA AOSS:

0 NTXC38AA TOPS MPX STD DA Terminal (Standalone/Host)

0 Provide the following packages for each host DMS supporting  
0 NT DA AOSS:

0 NTXC38AA TOPS MPX STD DA Terminal (Standalone/Host)  
0 NTX039AA Host OC Data Link Handling  
0 NTX873AA Host TOPS MP OC Data Link Handling

0 Provide the following package for each remote DMS supporting  
0 NT DA AOSS:

0 Remote Office - Traffic Operator Position Equip.

## 0 Operator Positions

0  
0 Provide the following packages for EACH operator position:

| 0 | PKG ID   | CPC      | DESCRIPTION                  |
|---|----------|----------|------------------------------|
| 0 | -----    | -----    | -----                        |
| 0 | NTG384AA | A0601713 | Operating System Module      |
| 0 | NTG383AA | A0385823 | Task Manager Module          |
| 0 | NTG325AA | A0600691 | LAN Manager Module           |
| 0 | NTG329AA | A0600689 | Network Communication Module |
| 0 | NTG326AA | B0238317 | NAS DA Application and Base  |

## 0 Combined Operator/Maintenance Positions

0  
0 Provide the following packages for EACH combined operator/ main-  
0 tenance position:

| 0 | PKG ID   | CPC      | DESCRIPTION                        |
|---|----------|----------|------------------------------------|
| 0 | -----    | -----    | -----                              |
| 0 | NTG384AA | A0601713 | Operating System Module            |
| 0 | NTG383AA | A0385823 | Task Manager Module                |
| 0 | NTG325AA | A0600691 | LAN Manager Module                 |
| 0 | NTG329AA | A0600689 | Network Communication Module       |
| 0 | NTG326AA | B0238317 | NAS DA Application and Base        |
| 0 | NTG328AA | A0600690 | LAN Access Module (maint pos only) |

## 0 Gateway Positions (DMS &amp; Database)

0  
0 Provide the following packages for EACH gateway position:

| 0 | PKG ID   | CPC      | DESCRIPTION             |
|---|----------|----------|-------------------------|
| 0 | -----    | -----    | -----                   |

0 5.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 Mixing NT DA (AOSS) and IBM DA (AOSS or OPP) on a DMS is NOT per-  
0 mitted.

0 5.3.3 MEMORY PROVISIONING

0  
0 NT DA AOSS has the same DMS memory requirements as IBM DA AOSS.  
0 Refer to MEMCALC.

0 5.4 REAL TIME IMPACT

0 DMS real-time requirements are the same for NT DA AOSS as for IBM  
0 DA AOSS. There are new DCH engineering rules in the TMS for NT  
0 DA AOSS. Refer to the Systems Engineering Bulletins.

## 0 6.0 Building Block Engineering

0 6.1 Hardware Provisioning

0

0 6.1.1 Hardware Usage Restrictions

0  
0 For ADAS, the LIS(s) which mount the ADAS VPUs and APUs shall be  
0 used for ADAS exclusively.

0 In BCS 35 the number of NIUs that may be provisioned per switch is  
0 restricted to six (6). This restriction applies to the total of  
0 NIUs for all applications using NIUs.

0 ADAS LISS may share an LPP with the LISSs containing equipment re-  
0 quired for other features with the exception of the LISSs used to  
0 house the equipment required for the Packet Handler feature.

0 6.1.2 Hardware Dependencies

0  
0 The product platform on which ADAS is based uses the LPP (Link  
0 Peripheral Processor) which is provisionable only on DMS  
0 SuperNode switches.

0 Not applicable.

0 93 12 03

0

0 :figcap ADAS - Hardware Configuration :efig

## 0 Network Considerations

0

0 ADAS may be configured to operate with a DMS 100/200 SuperNode or  
0 DMS 200.SuperNode. With respect to the telephone network, ADAS  
0 may be equipped in switches configured as follows: :ul :li HOC  
0 (Host Operator Center) :li ROC (Remote Operator Center) with ADAS  
0 equipped HOC :li ROC with non-ADAS HOC :eul

0 To operate as an ADAS ROC, the ROC switch must be equipped with  
0 ADAS hardware and software.

## 0 LPP Provisioning-General

0

0 The quantities of equipment required for provisioning ADAS is  
0 based on the number of voice resource servers i.e. Voice Process-  
0 ing Units (VPUs), needed for the expected DA traffic.

0 VPUs are required ADAS. The VPU voice resource servers are each  
0 capable of serving 20 callers simultaneously.

0 The number of LPP's required to house ADAS equipment depends upon  
0 the required capacity of the system.

0 The Voice Processing Platform (VPP) on which the ADAS is based  
0 requires processing resources of two APUs. These units are re-  
0 ferred to as the VPP-APUs. They are needed for the following  
0 functions:

- 0 - Ethernet Interface
- 0 - OA&M management and ADAS APU process management.

0 Single LPP System

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-172

0 RELEASE 28.01  
0 93 12 03

0 If the equipment required for an ADAS application can be housed  
0 in a single LPP, accommodation must be made for the VPP-APUs, re-  
0 fer to section 2.4.3 above.

0 The maximum number of ADAS servers that an LPP in a single LPP  
0 system can contain is 320, i.e.  $320/20 = 16$  VPU's.

0 Multi-LPP System (1+N LPPs)

0 The first LPP in a multi-LPP system houses the two (2) base sys-  
0 tem VPP-APUs. The maximum number of ADAS servers that this first  
0 LPP can accommodate is 320, i.e.,  $320/20 = 16$  VPUs.

0 The remaining LPPs can accommodate up to 360 ADAS servers each,  
0 i.e.,  $360/20 = 18$  VPUs each. Two (2) APUs must always be pro-  
0 vided in each of the remaining LPPs. These APUs perform OA&M  
0 management functions for the containing LPP. They are referred  
0 to as LPP-APUs. The LPP-APUs are also capable performing ADAS ap-  
0 plication call processing functions. Each LPP-APU can handle 20  
0 simultaneous calls and should be included in the count of appli-  
0 cation APUs required for the considered ADAS system.

0 LPP Provisioning Limits

0 The maximum number of ADAS LPP's is limited, in BCS 35, by the  
0 maximum number of NIU permitted per DMS switch. The maximum num-  
0 ber of NIUs permitted is six (6). This maximum may increase in  
0 later BCS. The limit of six NIUs means that the maximum number of  
0 LPPs that may be provisioned to contain ADAS is six, i.e. one  
0 ADAS LIS per LPP. The maximum number of ADAS servers that may be  
0 provisioned is therefore 80 (Max servers in first LIS) + 5 x 120  
0 (max servers in 1+N LIS) = 680.

0 LIS Provisioning-General

0  
0 When configured for ADAS operation, the LIS has the following  
0 provisioning limits: :ul :li Minimum Provision = 1 LIS :li  
0 Maximum/LPP = 3 :li Maximum/System = 6 (BCS 35) :eul :tabs

0 Each LIS houses between 20 and 120 ADAS call servers in incre-  
0 ments of 20, i.e. up to 6 VPU's, except for those LIS which are  
0 used to accommodate the VPP-ASUs.

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-173

0 RELEASE 28.01  
0 93 12 03

0 In a single LIS system, the LIS has a maximum capacity of 60 ADAS  
0 servers, i.e., 3 VPUs.

0 The base VPP requires at least one Ethernet Interface Unit (EIU).  
0 This unit is contained in an LIS in the first ADAS LPP.

0 In a system having a single LPP and two (2) LIS, each LIS has a  
0 maximum capacity of 80 ADAS call servers, i.e., 4 VPUs. The sin-  
0 gle LIS also contains the two (2) required VPP APUs and the re-  
0 quired VPP-EIU.

#### 0 VPU Provisioning-General

0  
0 A VPU is capable of handling 20 ADAS calls simultaneously.

0 Application APU's operate in conjunction with VPU's, and APU's  
0 are capable of handling at least 30 ADAS calls simultaneously,  
0 the ratio of Application APU's to VPU's required for a properly  
0 balanced system is 2 Application APU's to 3 VPUs.

0 Voice processing resources of VPU's are allocated to an APU ser-  
0 vice on a per call basis. The coupling between APU and VPU re-  
0 sources is not fixed but is dynamically allocated within the same  
0 LPP.

#### 0 NIU Provisioning-General

0  
0 For ADAS applications each LIS requires a Network Interface Unit  
0 NIU. An NIU is made up of two ASUs which are located in the cen-  
0 ter four front slot positions in the LIS.

0 In BCS 35 the maximum number of NIUs that may be provisioned per  
0 switch is six (6). This restriction is imposed by the integrated  
0 maintenance software.

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-174

0  
0 RELEASE 28.01  
0 93 12 03

## 0 | ADAS Initial Greeting

0  
0 The initial greeting a subscriber receives when making a DA call  
0 to a system served by ADAS may be provided either by the ADAS  
0 VPU, which is the general ADAS greeting or by an announcement gen-  
0 erated by the optional DA/Toll Branding feature which is gener-  
0 ally used to identify the DA service provider selected by the  
0 subscriber. The Digitally Recorded Announcement system is used by  
0 the DA/Toll Branding feature to provide the initial announcement  
0 if the DA/Toll Branding feature is used.

0

0

## 0 | DRAM Provisioning - General

0  
0 Digitally Recorded Announcements are required if the optional Di-  
0 rectory Assistance/Toll Branding feature is used. DRAs are pro-  
0 vided either by DRAMs (Digitally Recorded Announcement Modules)  
0 or EDRAMS (Enhanced Digitally Recorded Announcement Modules).  
0 Both DRAM and EDRAMS are mounted in MTM (Maintenance Trunk Mod-  
0 ule) shelves which are contained within Trunk Module Equipment  
0 (TME) frames or cabinets. The number of DRAs required depends  
0 upon the expected ABSBH DA/ADAS call traffic. The MTM and TME may  
0 be shared with compatible CPCs used by other features. Refer to  
0 ECM 611 for DRAM provisioning and to ECM 531 for EDRAM provision-  
0 ing.

0  
0 Announcements used for DA/Toll Branding feature are custom re-  
0 corded. Sufficient DRA memory must be provisioned to accommodate  
0 the announcements required. The DA/Toll announcements may either  
0 be broadcast in the switch network or may be assigned to multiple  
0 trunk circuits to provide the number of announcement 'servers'  
0 required to service the expected call traffic.

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-175

0  
0 RELEASE 28.01  
0 93 12 03

## 0 | OA&M Workstation Provisioning

0  
0 In BCS 35 ADAS supports a single EIU configuration with a single  
0 Simplex OA&M Workstation. The simplex workstation fulfills the  
0 minimum workstation requirements for ADAS. It uses a single Work-  
0 station having a single LAN connection interfacing to the switch  
0 through a single EIU.

0 | Refer to ECM 681 for general OA&M Workstation engineering re-  
0 quirements.

## 0 Power Failure Protection

0  
0 For failure protection purposes, the best compromise arrangement  
0 for limiting the effect of a power supply failure is to intermix  
0 APU's and VPU's within LIS's in the ratio of 2 APU's to 3 VPU's  
0 per LIS. For VPP-APUs failure protection the VPP-APUs should be  
0 configured on opposite LIS half shelves in a single LIS system  
0 and on different LIS shelves in a multi-LIS system.

## 0 Standard CP Configurations

0  
0 The slot configuration of the CPCs within LIS for the ADAS appli-  
0 cation are standardized according to the rules given in the ref-  
0 erenced Engineering Manual Sections covering 36 Link LPPs. In  
0 these rules, the APUs listed have three functional categories:  
0 VPP-APU, LPP-APU and APP-APU.

0 The APP-APU (ADAS Application APU) handles OA&M overheads and at  
0 least 30 ADAS calls simultaneously.

0 The VPP-APU (VPP OA&M APU) Contains the Central Data Collector  
0 for the LPP frame as well as the APU process Management function  
0 for the ADAS system. Each ADAS system requires 2 VPP APUs config-

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-176

0 RELEASE 28.01  
0 93 12 03  
0

0 ured in one of the LPP frames. For convenience, the first frame  
0 containing ADAS application APUs contains the 2 VPP ASUs.

0 The LPP-ASU (LPP OA&M APU) LPP-APU contains the ADAS application  
0 as well as the Central Data Collector for the containing LPP  
0 frame. The LPP-APU is capable of handling 30 ADAS calls simul-  
0 taneously. The LPP OA&M APU is included in the count of ADAS Ap-  
0 plication APUs when determining the number of APUs required using  
0 the APU to VPU ratio of 2:3. Each LPP frame containing APP-APUs  
0 requires 2 LPP-ASUs except for the LPP frame containing the 2  
0 VPP-APUs.

0 The above categorizations are used to indicate the corresponding  
0 APU function. The function is determined by table datafill. The  
0 software load is the same in each type of APU; the required func-  
0 tion is selected by datafill. The slot positions for each type of  
0 APU function are selected for optimum failure protection charac-  
0 teristics of the ADAS as a whole. The APU slot positions are as-  
0 signed according to the standard configuration rules given in the  
0 LPP Engineering Manual Sections referenced in Section 6, to en-  
0 sure optimum failure protection and traffic handling.

#### 0 | ADAS RTS - APU Application Software Loading

0  
0 The application software in the ADAS APU is run under the  
0 SuperNode UNIX (SNIX) operating system. This makes APU software  
0 loading different from other DMS peripherals. ADAS uses a 2 stage  
0 loading process. The first stage loads the base SNIX using PMLOAD  
0 like other peripherals. The operating system software remains  
0 loaded until the APU is powered down or is physically removed. In  
0 the second stage, i.e. the transition from the ISTb state to the  
0 INSV state, the ADAS application is loaded. This loading is per-  
0 formed each time an APU is returned to service from the MAP.

0 In the RTS process, ADAS application software is loaded into the  
0 APUs from the Software Load Module (SLM) or Disk Drive Units  
0 (DDU) via the HSDF file server during the RTS.

0 HSDF file servers are software entities which are defined in ta-  
0 ble SNIXVOLS. The data in SNIXVOLS also defines the Volumes and  
0 Filenames accessible to each HSDF server. Another table,  
0 SNIXAPPL, defines, for each ASU, the HSDF server assigned for ap-

0  
0 RELEASE 28.01  
0 93 12 03

0 | plication software file downloading . The HSDF server to APU as-  
0 | signment is specified using the identities of the files to be  
0 | downloaded, i.e., the file system names defined in the SNIXVOLS  
0 | table.

0 | On occasions when the multiple APUs need to be loaded, as it is  
0 | in when RTS ALL or a CM Reload restart is performed, the duration  
0 | of the secondary load process may be relatively long. The time  
0 | taken to load the ADAS application depends on the number of APUs  
0 | in the ADAS system, the size of the ADAS/APU application software  
0 | file, the throughput of the loading device or devices, SLM or IOC  
0 | Disk Drives, and other factors external to ADAS, such as  
0 | processor occupancy in the CM.

0 | Using datafill in the SNIXAPPL table configure SLM/IOC Disk Drive  
0 | to load APUs according to the following guidelines:

0 | :ol :li Generally, for systems having 4 (four) or less APUs, load  
0 | the APUs from SLMS only. Allocate APUs evenly across SLMS. :li  
0 | For systems with more than 4 APUs, allocate APUs across all  
0 | available SW loading devices, SLMS and DDUs with loads distrib-  
0 | uted commensurate with loading device throughput capability. :li  
0 | Because the throughput of SLMS is greater than that of DDUs, fa-  
0 | vor the allocation of APUs to SLMS rather than to DDUs. :eol

0 | Examples:

0 | For operation in the simplex mode, i.e. one HSDF server per SLM or  
0 | DDU.

| 0 | APUs | SLM0 | SLM1 | DDU0 | DDU1 |
|---|------|------|------|------|------|
| 0 | ---- | ---- | ---- | ---- | ---- |
| 0 | 4    | 2    | 2    | 0    | 0    |
| 0 | 5    | 2    | 2    | 1    | 0    |
| 0 | 6    | 2    | 2    | 1    | 1    |
| 0 | 7    | 3    | 2    | 1    | 1    |
| 0 | 8    | 3    | 3    | 1    | 1    |
| 0 | 9    | 3    | 3    | 2    | 1    |
| 0 | 10   | 4    | 3    | 2    | 1    |
| 0 | 11   | 4    | 4    | 2    | 1    |
| 0 | 12   | 4    | 4    | 2    | 2    |
| 0 | 13   | 5    | 4    | 2    | 2    |
| 0 | 14   | 5    | 5    | 2    | 2    |
| 0 | 15   | 5    | 5    | 3    | 2    |
| 0 | 16   | 6    | 5    | 3    | 2    |
| 0 | 17   | 6    | 6    | 3    | 2    |
| 0 | 18   | 6    | 6    | 3    | 3    |
| 0 | 19   | 7    | 6    | 3    | 3    |
| 0 | 20   | 7    | 7    | 3    | 3    |
| 0 | 21   | 7    | 7    | 4    | 3    |
| 0 | 22   | 8    | 7    | 4    | 3    |
| 0 | 23   | 8    | 8    | 4    | 3    |
| 0 | 24   | 8    | 8    | 4    | 4    |

0 | Note: The above configurations are controlled by datafill in the  
0 | SNIXAPPL table. The performance of software loading devices is  
0 | affected by factors external to the ADAS system and may affect  
0 | the optimum configuration for ADAS. The above should be used as a  
0 | guide only.

0 | In the above table, for convenience, SLM1 and DDU1 appear to be  
0 unused. In practice they are used as alternatives to their  
0 mates, SLM0 and DDU0 respectively.

0 6.1.4 Office Layout Information

0

0 6.1.5 Traffic Tables

0

0

0 Remote Office - Traffic Operator Position Equip.

0 Chapter 26

Page 26-180

0 RELEASE 28.01  
0 93 12 03

0 Refer to NTP279-1001-450 DMS-100 Family Provisioning for traffic  
0 tables required for calculating the number of voice resource  
0 servers needed for expected DA call traffic.

0 6.1.6 Network Impact

0  
0 When compared with non-ADAS DA call, the use of ADAS increases  
0 subscriber hold time. This causes an increase in traffic over End  
0 Office to ADAS TOPS Office trunks. Refer to the ADAS/DMS 200/TOPS  
0 Office Configurations illustration in :figref refid=ntwk.. Where  
0 ADAS is added to an existing office, End Office to ADAS TOPS Of-  
0 fice trunk provisioning should be reviewed and additional trunks  
0 provisioned to accommodate the expected increase in DA call traf-  
0 fic.

0 The use of ADAS decreases holding time on TOPS Remote Operator  
0 Center (ROC) with ADAS to TOPS Host Operator Centralization (HOC)  
0 trunks, for DA calls, where the HOC Operators handle the ROC DA  
0 calls. In this situation ADAS in the ROC automates the handling  
0 of DA calls thereby reducing the traffic on the ROC to HOC  
0 trunks.

0 The increase in EO to ROC or ADAS/TOPS Stand Alone trunk hold  
0 time for a DA call caused by ADAS is made up as follows: :ul :li  
0 Difference in hold time between existing TOPS/Toll Branding an-  
0 nouncement if any and the optional ADAS associated TOPS/Toll  
0 Branding Announcement, or ADAS greeting announcement, typically 4  
0 sec. per call :li The ADAS 'Hold for operator' announcement, typ-  
0 ically 3 sec per call :li THE ADAS Caller response playback to  
0 operator, typically 3 sec. per call :eul

0 From the above, the increase in hold time owing to ADAS is typi-  
0 cally 10 sec. per call

0 The decrease in ROC to HOC trunk holding time owing to ADAS auto-  
0 mation in the ROC with the operator force in the ROC not  
0 staffed.is made up as follows: :ul :li Operator Work Time (AWT)  
0 reduction owing to ADAS, typically 3 sec. per call. :eul

0 Refer to NTP 297-1001-450 DMS-100 Family Provisioning for trunk  
0 provisioning information.

0 1.0 DMS-300 Gateway

0 1.1 Introduction

0 The DMS-300 Gateway Switch functions as an international exchange  
0 for calls between different world zones and for domestic overseas  
0 traffic originating or terminating within a world zone (as exists  
0 between North America and some Caribbean countries).

0 Under the switching plan for distance dialing overseas each ex-  
0 change involved in the completion of long distance calls is clas-  
0 sified and designated according to the highest rank switching  
0 function performed, its interrelationship with other switching  
0 centers and its transmission requirements. The hierarchial rank-  
0 ing (and an associated office class) given to each switching cen-  
0 ter in the network determines the routing pattern.

0 With respect to the DMS-300 (GATEWAY) switching center, this of-  
0 fice class is of the form "CTX", where X is equal to 1, 2 or 3  
0 etc.

0 The CCITT R1, R2 and No. 5 trunk circuits are provisioned in the  
0 normal way as for other trunk types. Both types of trunk cards  
0 mount only on a TM8 module or on a T8A module (which is a TM8  
0 module equipped for Test Access).

0 In DMS-300 the signalling circuits for CCITT No. 6 signalling are  
0 provisioned. A No. 6 "Signalling Circuit" is comprised of a No.  
0 6 Signalling Terminal (ST) (consisting of a signalling terminal,  
0 a modem and a dedicated No. 6 voice circuit) in conjunction with  
0 a No. 6 Link Circuit (LINK). Each "ST-LINK" set up is capable of  
0 processing the signalling information required to complete 2048  
0 simultaneous calls.

0 The types of No. 6 link reserve arrangements currently supported  
0 by the DMS-300 are Synchronous Reserve, Non-Synchronous Reserve,  
0 Load-Sharing and Nominated Speech.

0 Synchronous Reserve

0 With this mode, two signalling circuits are used. One is la-  
0 belled as the "Primary" circuit and carries all of the signalling  
0 information. The second circuit is labelled as the "Synchronous  
0 Reserve" and carries no signalling information but is synchro-  
0 nized with the Primary circuit, as a back-up, in case of a car-  
0 rier failure.

0 RELEASE 28.01  
0 93 12 03

0 Non-Synchronous Reserve

0 With this mode, a "Primary" signalling circuit carries all of the  
0 signalling information, which the back-up consists of a No. 6  
0 link circuit without Signalling Terminal. When this link is re-  
0 quired for signalling it must be first switched to a free ST from  
0 a "pool" of STs and then synchronized.

0 Load Sharing

0 With this mode, there are two signalling circuits which are used  
0 on the basis of duplicate working with load sharing. Each circuit  
0 is then the back-up for the signalling load on the other circuit.

0 Nominated Speech

0 With this mode, a "Primary" signalling circuit carries all of the  
0 signalling information. The back up is a No. 6 voice circuit  
0 which when required for signalling must first be seized, switched  
0 to a free ST out of a pool of STs and then synchronized.

0 Within the DMS-300 the facility exists to relate one particular  
0 Signalling Circuit to another for the purposes of tandeming sig-  
0 nalling information. A gateway office with the ability is re-  
0 ferred to as a Signal Transfer Point (STP) for CCITT No. 6  
0 Signalling.

0 "Private Lines", in the DMS-300 are trunk circuits that are capa-  
0 ble of connecting to a subscriber set, receiving digitone signal-  
0 ling and giving the subscriber access to the international  
0 network.

0 The service circuit cards are equipped on a Maintenance Trunk  
0 Module (MTM). Provision service circuit cards as required.

0 RELEASE 28.01  
0 93 12 03

0 1.2 Features

0 1.2.1 The DMS-300 is capable of interfacing with the Dynamic Load  
0 Control Unit of a subtending office that uses a "Time Assign-  
0 ment Speech Interpolation (TASI-B)" type of facility to multi-  
0 plex voice and signalling traffic from a number of incoming  
0 circuit on to a reduced number of outgoing circuits.

0 The DMS-300 is not capable of performing the function of TASI-B  
0 multiplexing itself.

0 1.2.2 The "Call Detail Recording" feature within the DMS-300 allows  
0 the recording of originating and terminating information on a  
0 "per call" basis for every maintenance and customer originated  
0 call passing through the DMS-300. Although normally used for  
0 billing purposes by the Telco, this feature is optional and  
0 will only be provided if requested.

0 1.2.3 "Echo Suppressor Control" is a function of the DMS-300 software  
0 and is capable of enabling and/or disabling both the DMS ver-  
0 sion "Digital Echo Suppressor (DES)" and select types of analog  
0 Echo Suppressors currently on the market.

0 1.3 Equipment Provisioning

0 1.3.1 Common Channel Signalling

0 (a) General Description

0 CCITT No. 6 Signalling is required for DMS-300. For more infor-  
0 mation on the CCITT No. 6, refer to Section 3.15.

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules - Host  
0 Chapter 3, Section 3.15 Common Channel Signalling Systems

0 (c) Provisioning Considerations

0 ( i) By first selecting a foreign administration that will be  
0 connected to the DMS-300 via CCITT No. 6 Signalling, fill  
0 in the pertinent information, i.e., the connecting office  
0 name, the quantity of voice circuits required, the types  
0 of No. 6 link reserve arrangements required and the quan-  
0 tities of signalling terminals and link circuits needed  
0 to implement this arrangement.

0 The total number of entries is referred to as the number  
0 of routes for which No. 6 Signalling is required.

0 ( ii) The No. 6 Signaling Equipment (N6E) frame is capable of  
0 mounting sixteen signalling terminals and sixteen modems.  
0 Two of each come equipped when the frame is ordered, thus  
0 leaving fourteen provisional signalling terminals/modems.

0 ( iii) The total number of T8A mountable No. 6 trunk circuits  
0 can be found by totalling the number of voice circuits  
0 required, the number of signalling links required and the  
0 number of STs required.

0 ( iv) The CCITT definition of "Automatic Transmission Measuring  
0 and Signalling Testing Equipment (ATME-No. 2)" requires  
0 the presence of a "director" and a type (a), (b) and (c)  
0 "responder". In DMS-300 the "director" and a type (a)  
0 "responder" consist of a paired set of circuit packs  
0 (NT2X47AB/NT2X56AA), while the type (b) and (c) responder

are provided for in the software. The card pair can be used as either "director" or "responder" but not at the same time. Therefore, the Telco should specify the number of cards required depending on its maintenance requirements.

0  
0 RELEASE 28.01  
0 93 12 03

0 1.3.2 Test Access Network (TAN)

0 (a) General Description

0 The Test Access Network (TAN) provides a four wire metallic access from a jack on each Trunk Test Position (TTP) to all R1, R2 and No. 5 and No. 6 trunk circuits in the office.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) Provide one (1) NT5X00AB TAN module for every 32 TME frames requiring access.

0 ( ii) The NT5X00AB TAN module also provides test access from three test trunks (NT5X04AA) in conjunction with three test positions. For each additional three test positions requiring Test Access, provide one (1) NT5X00AA TAN module for every NT5X00AB being provided.

0 ( iii) When the TAN module is cabled directly to the test positions, provide one NT5X02AA Test Position Controller Card.

0 ( iv) Provide one test trunk (NT5X04AB, mounted on a T8A or IT8A module) per test position, from which test access will be required.

0 The NT5X04AB CCITT#5 Trunk Circuit Pack provides compatibility with the operation of V.22 type modems. The V.22 type modem is used extensively with personal computers to send voice band data. The Hayes modem is a V.22 device.

0 The V.22 modems generate 2400 Hz and 2600 Hz frequencies which are also employed as CCITT#5 line signals. This results in a conflict whenever a call employing the modem is routed over a CCITT#5 circuit. The NT5X04AB will include a guard tone capability which prevents interpretation of the 2400 Hz and 2600 Hz frequencies as line signals while a signal power in the voice frequency band exceeds a threshold.

0  
0 RELEASE 28.01  
0 93 12 03

0 ( v) Within each TAN module (NT5X00AB and NT5X00AA) utilize  
0 one group of three relay card slots per eight MTE frames  
0 requiring test access.

0 Within each relay group provide one Relay Card (NT5X01AA)  
0 per test position from which access is required (maximum  
0 3 per relay group).

0 | ( vi) Both types of TAN modules mount on the Test Access Equip-  
0 ment frame (TAE, NT5X12AA or NT5X12AB) with the following  
0 restrictions:

0 1) The NT5X00AB will mount only in positions  
0 65 and 51 on the TAE frame.

0 2) The NT5X00AA will mount in any position on  
0 the TAE frame (65, 51, 32, 18, 04) but  
0 yields positional preference to the  
0 NT5X00AB.

0 1.3.3 Echo Suppressor Control

0 (a) General Description

0 In the DMS-300, Digital Echo Suppressors are provisioned on a  
0 "pooled service circuit" basis (i.e. non-dedicated). This enables  
0 the Telco to provision the quantity of DESs based on traffic con-  
0 ditions and exceptional levels of blocking rather than strictly  
0 on a per circuit basis.

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations

0 ( i) Of the six provisionable DES cards per DES module the  
0 first, third and fifth card provide eight circuits each  
0 while the second, fourth and sixth card provide seven  
0 circuit each for a total of 45 DES circuits per module.

0 ( ii) The DES module mounts on a DCE frame in positions 65, 51,  
0 32 and 18 only.

0 ( iii) If existing echo suppressors are to be re-used for  
0 DMS-300 applications, please contact the NTL Customer En-  
0 gineer to determine whether or not an interface study is  
0 required.

0 ( iv) For more information on the Digital Echo Suppressors re-  
0 fer to Section 3.5.

#### 0 1.3.4 Universal Tone Receiver

##### 0 (a) General Description

0 The Universal Tone Receiver (UTR) circuit pack is provisioned for  
0 R2 call setup. Each UTR pair has thirty circuits. For more in-  
0 formation on the UTR, refer to Section 3.5.

##### 0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules - Host

##### 0 (c) Provisioning Considerations

0 ( i) The number of UTR circuits is obtained by calculating the  
0 UTR holding time and multiplying by the average number of  
0 calls per hour. In general it is always safe to provide  
0 two (2) pairs of UTR cards if unsure of the traffic de-  
0 mands.

0 For incoming R2 calls the UTR holding time is as follows:

- 0 1. From seizure to final digit collection  
0 plus
- 0 2. From final digit collection to - trunk  
0 selection if R1 or N5 outgoing, - seize  
0 acknowledgement if R2 outgoing.

0 For outgoing R2 calls the UTR holding time is as follows:

- 0 1. The UTR is held until told to release by  
0 the far office or timeout if we are the  
0 controlling signal office (i.e. R1 to R2  
0 calls).

0 The number of UTRs used on average is given by the fol-  
0 lowing formula:

$$\begin{array}{lcl}
 \text{\# of UTR} & & \text{SI} \qquad \qquad \text{S0} \\
 \text{Circuits} = \text{NI} \times \text{-----} \times \text{EI} + \text{NO} \times \text{-----} \times \text{EO} \\
 \text{required} & & \text{HI+SI} \qquad \qquad \text{HO+S0}
 \end{array}$$

0  
0 RELEASE 28.01  
0 93 12 03

0 where,

0 NI = Number of incoming R2 trunks (or 2-way  
0 used as incoming)

0 SI = Signalling time in seconds of incoming  
0 trunks

0 HI = Holding time (talking) of incoming trunks  
0 in seconds

0 EI = Erlang occupancy figure of incoming  
0 trunks

0 NO = Number of outgoing R2 trunks (or 2-way  
0 used as outgoing)

0 SO = Signalling time in seconds of outgoing  
0 trunks

0 HO = Holding time (talking) of outgoing trunks  
0 in seconds

0 EO = Erlang occupancy figure of outgoing trunks

0 ( ii) This circuit pack is only required for CCITT No. 6 Sig-  
0 nalling.

0 1.0 DMS-100 Mail - Service Peripheral Module

0 The Service Peripheral Module is a voice processing server developed  
0 for the DMS-100 central office environment. It will be used standalone  
0 initially and later in conjunction with an Intelligent Services Node  
0 (ISN) to provide (a) large capacity platform (1920 ports) with inte-  
0 grated OA&M capabilities, and (b) enhanced services to residential and  
0 centrex subscribers using display-based sets.

0 The Service Peripheral Module provides up to 192 ports in central of-  
0 fice packaging with redundancy and reliability features. It evolved  
0 from the Meridian Mail which originated as SL-1 peripheral equipment  
0 providing business-oriented voice messaging and voice response ser-  
0 vices to PBX customers.

0 The Service Peripheral Module provides the following services:

- 0 \* Voice Messaging
- 0 \* Call Answering
- 0 \* Auto-attendant
- 0 \* Voice Menus
- 0 \* Interactive Voice Response (Customs applications developed in  
0 an external UNIX environment)
- 0 \* Multi-Customer
- 0 \* Multiple Administration Position
- 0 \* Residential Call Answering with Dial Pulse Set Support

## 0 SERVICE MIX

0  
0 Provisioning will depend on the relative proportions of the fol-  
0 lowing service mix:

- 0 \* Centrex Voice Messaging/Voice Services
- 0 \* Small Business Call Answering
- 0 \* Residential Call Answering
- 0 \* Residential Networking

0 Business oriented services have a peak busy hour of mid-morning  
0 and mid-afternoon, while residential use peaks in late afternoon  
0 and early evening. Since the busy hours do not clash, they can  
0 share some of the same system resources with the exception of  
0 disk space.

0 Systems are engineered based on Call Answering and Message Re-  
0 trieval activities since these account for the majority of user  
0 activities:

- 0 \* The total number of ports required is determined by the com-  
0 bined busy hour load.
- 0 \* Disk space requirements are additive and not shared. Disk  
0 space must be the sum of disk space required for each appli-  
0 cation.
- 0 \* Number of ports required for networking is approximately 6%  
0 of the number of ports required in general for Centrex ap-  
0 plications only.

0 93 12 03

0 1.1.5 TRAFFIC TABLES

0  
0 The table shown indicates the heaviest traffic (in CCS) for which  
0 the system should be engineered. For a better grade of service  
0 additional channels should be allocated. With UCD (Uniform Call  
0 Distribution) queue used, the system does not block but rather  
0 delays caller in queue, listening to ringback, until a channel is  
0 available. The recommended grade of service is 'P.05' - 5% proba-  
0 bility of delay in queue exceeding 6 seconds, i.e. one ring cy-  
0 cle. When no UCD is deployed and MLHG (Multi Line Hunt Group) is  
0 used instead, the system will block when all channels are busy,  
0 and must be engineered to a lower throughput; P.02 is recom-  
0 mended. The traffic tables for various blocking and non-blocking  
0 grades of service indicates:

- 0 \* the traffic that can be handled by a given number of nodes  
0 (CCS, and calls per hour assuming 0.4CCS per call)
- 0 \* the number of users this represents (heavy use: 0.7 busy-  
0 hour CCS/user and light use: 0.2/0.3 busy-hour CCS/user)
- 0 \* an estimate of the number of ports required for networking  
0 based on typical centrex use.

0 Note that the use of broadcast messages or large distribution  
0 lists can result in a surge of login traffic. Sending a broadcast  
0 message results in all message waiting lights coming on in a  
0 short period of time. Users will notice the visual MWI and many  
0 will attempt to log in to retrieve the message immediately. All  
0 ports may become busy, and callers will be blocked (no UCD) or  
0 delayed (UCD) while waiting for a free port. Note that external  
0 callers may be affected as well, since Call Answering competes  
0 with Login for voice ports. It is advisable that broadcast mes-  
0 sages not be sent at peak hours.

0 Networking traffic is generated by AMIS Open Networking, which  
0 supports ad-hoc messaging to an open user community, and Private  
0 Networking, which supports messaging among a closed user commu-  
0 nity distributed over a closed set of sites (Centrex or PBX  
0 based). In both applications, all message transport is performed  
0 via voice call, with control information signalled via DTMF and  
0 message transfer via analog play/record on any voice channel.  
0 Networking traffic from AMIS message transfers resulting from com-

0 pose operations can be expected to increase traffic by about 6%  
0 under typical use.

0 1.1.7 VOICE PORT and STORAGE CALCULATIONS

0  
0 Voice Port Calculations

0 Business Mailboxes (BM) =  $BL \times PBL$

0 Residential Mailboxes (RM) =  $RL \times PRL$

0 Total Business BH ccs (TBBH) =  $(BM \times BBH) / PBBH$

0 Total Residential BH ccs (TRBH) =  $(RM \times RBH) / PRBH$

0 Select the larger of TBBH or TRBH and use the appropriate traffic  
0 table shown in Section 2.7 Traffic Tables to determine the port  
0 size required for the system. In the Central Office environment,  
0 the minimum port size is 48 ports.

0 Storage Calculations

0 Total Disk Storage =  $((BM \times BS) + (RM \times RS)) / PSO$

0 In the Central Office Environment only the shadowed disk storage  
0 options are available.

0 1.1.8 Port Connectivtiy

0  
0 Ports on the transition modules of the SPM allow connections of  
0 the following to be made:

0 1. NTGX07AA Modem Transition Module

0 \* 4 duplex SMDI links

0 2. NTGX09AA T1 Transition Module

0 \* 4 T1 spans

0 RELEASE 28.01  
0 93 12 03

## 0 3. NTGX06AA 68K Transition Module

0 \* 3 currents loops for terminals and printers

0 \* 1 V22 bis modem port with internal modem for simplex SMDI,  
0 networking modem or remote maintenance access.

0 1.1.9 Recommended Terminals

0 The following list shows the recommended terminals, printers and  
0 modems to be used with SPM. It also shows the current loop  
0 adapter, if required, and the current loop cable connecting the  
0 equipment.

| <u>Terminal</u>      | <u>CPC</u> | <u>Adapter</u> | <u>CPC</u> | <u>Cable</u> |
|----------------------|------------|----------------|------------|--------------|
| DEC VT420-AA (white) | A0383146   | H8673-AA       | A0384282   | NT0X96FR     |
| DEC VT420-BA (green) | A0383147   | H8673-AA       | A0384282   | NT0X96FR     |
| DEC VT420-CA (amber) | A0383150   | H8673-AA       | A0384282   | NT0X96FR     |
| HP 700/44            | A0378381   | not needed     |            | NT0X96FR     |

| <u>Printer</u>       | <u>CPC</u> | <u>Adapter</u> | <u>CPC</u> | <u>Cable</u> |
|----------------------|------------|----------------|------------|--------------|
| DEC LA75 kit         | A0383528   | H8673-AA       | A0384282   | NT0X96FR     |
| DEC LA424 (NTZZ14EC) | B0236797   | H8673-AA       | A0384282   | NT0X96FR     |

| <u>Modem</u>          | <u>CPC</u>             | <u>Cable</u>      |
|-----------------------|------------------------|-------------------|
| Ventel 2400 Plus 2    | A0384913               | NT0X96EH/NTNX36QA |
| GDC Datacom 224C      | A0605611               | NT0X96EH/NTNX36QA |
| Case Datatel DCM42220 | A0351638               | NT0X96EH/NTNX36QA |
| UDS 52245226          | A0385557 (rack-mount)  | NT0X96EH/NTNX36QA |
| UDS 62245079          | A0360824 (stand-alone) | NT0X96EH/NTNX36QA |

0 The NT0X96FR/NTNX36QA cable connects the current loop  
0 terminal/printer to the DF (Distribution Frame). The NT0X96EH  
0 connects the modem to the NT1X89AA/BA, the NTNX36QA connects the  
0 modem to the NT1X67FA, in the IOC of the DMS for the SMDI Link.

0  
0 RELEASE 28.01  
0 93 12 03

0 See CA0X15 items 4AF, 5AD and 5AX for the NT0X96FR, NT0X96EH and  
0 NTNX36QA cables.

0 1.1.10 Dataport Assignments

0  
0 Terminals, printers and modems are connected to the ports on the  
0 transition modules of the SPM Nodes (MSP, SPN, TIFN). The table  
0 below shows the suggested connections for the various SPN fea-  
0 tures:

| Node  | Port1           | Port2         | Port3           | Port4        |
|-------|-----------------|---------------|-----------------|--------------|
| MSP1  | Console(Note 1) | Modem(Note 2) | Printer(Note 3) | UAT (Note 4) |
| MSP2  | Console(Note 1) | Modem(Note 2) | Console         | UAT (Note 4) |
| SPN1  | Console         | SMDI(4,8,10)  | Console         | UAT (4,6)    |
| SPN2  | Console         | SMDI4,6,8,10) | Console         | ACCESS (5,6) |
| SPN3  | Console         | SMDI(4,8,10)  | Console         | Console      |
| SPN4  | Console         | SMDI(8,10)    | Console         | ACCESS (5,6) |
| SPN5  | Console         | SMDI(8,10)    | Console         | Console      |
| SPN6  | Console         | SMDI(8,10)    | Console         | ACCESS (5,6) |
| SPN7  | Console         | SMDI(8,10)    | Console         | Console      |
| SPN8  | Console         | SMDI(8,10)    | Console         | ACCESS (5,6) |
| TIFN1 | SMDI (Note 7,8) | SMDI(Note 8)  | SMDI (Note 8)   | SMDI(Note 8) |
| TIFN2 | SMDI (Note 7,9) | SMDI(Note 9)  | SMDI (Note 9)   | SMDI(Note 9) |
| TIFN3 | SMDI (Note 8)   | SMDI(Note 8)  | SMDI (Note 8)   | SMDI(Note 8) |
| TIFN4 | SMDI (Note 9)   | SMDI(Note 9)  | SMDI (Note 9)   | SMDI(Note 9) |

## 0 Note:

- 0 1. MSPs port 1 are reserved for either the Console or AdminPlus  
0 (if enabled) and cannot be reassigned. Consoles or terminals

0 RELEASE 28.01  
0 93 12 03  
0

0 are required for system and user administration. See Section  
0 2.11 for recommended terminals.

0 2. MSPs port 2 should be reserved for remote diagnostics use.

0 3. MSP1 port 3 should be assigned to the printer.

0 4. If the Multi-Admin feature is enable, up to 3 UAT (User Admin  
0 Terminal) may be assigned. For local terminals, MSP1 and MSP2  
0 port 4 should be assigned the 1st and 2nd UAT, SPN1 port 4  
0 should be assigned the 3rd UAT. For remote access, UATs may  
0 be assigned on a modem port on an SPN node.

0 5. If the ACCESS feature is enabled, an ACCESS port must be as-  
0 signed for every 48 ports that the SPM has been provisioned  
0 with. An ACCESS may only be assigned to an SPN node.

0 6. A UAT and ACCESS port must not be assigned to the same SPN  
0 node.

0 7. TIFN1 port 1 is assigned the 1st SMDI link and should not be  
0 reassigned. It may have an associated standby redundant link  
0 (even if the Multi-SMDI feature is not enabled) that will be  
0 assigned to TIFN2 port 1.

0 8. If the Multi-SMDI feature is enabled, additional SMDI ports  
0 may be assigned. The maximum of SMDI links supported will be  
0 determined by the number of SPM ports provisioned and the  
0 number of SPN modem ports not being used by other features. A  
0 48 port SPM with 2 SPNs could support 6 non-redundant SMDI  
0 links (4 links from TIFN1 and 2 links from SPN1 and SPN2) if  
0 no other feature uses the SPN modem port. SPM with 168-192  
0 ports will support 16 non-redundant SMDI links.

0 9. If Multi-SMDI feature is enabled, redundant SMDI links may be  
0 assigned. SPM with 48-96 ports will support up to 4 redundant  
0 SMDI Links. The primary (master) links should be assigned  
0 sequentially from TIFN1 port 1-4, and the associated standby  
0 (slave) links assigned from TIFN2 port 1-4. SPM with 120-192  
0 ports will support up to 8 redundant SMDI links. The primary  
0 links are assigned to TIFN1 port 1-4 and TIFN3 port 1-4. The  
0 associated standby links are assigned to the matching TIFN  
0 nodes.

0 10. If the Proprietary Networking feature is enabled, any SPN  
0 modem port may be used for networking. The maximum number of  
0 network connections that may be supported will be determined

RELEASE 28.01  
93 12 03

0 1.2 PRODUCT/SYSTEM SPECIFICATION

0

0 1.2.1 PHYSICAL CHARACTERISTICS

0

0 The Service Peripheral Module has the following mechanical dimen-  
0 sions:

0 \* Height 72in.

0 \* Width 42in.

0 \* Depth 28in.

0 The Service Peripheral Module has the following power/thermal  
0 characteristics:

0 \* Current drain 50 amps

0 \* Power consumption 1200 watts for 96-port system

0 2400 watts for 192-port system

0 \* Thermal profile not more than 20°C above ambient

0 1.2.2 EMI/EARTHQUAKE INFORMATION

0

0 The SPM uses the S/DMS Cost Reduced Supernode frame. The EMI and  
0 Earthquake compliancy will depend on the outcome of the S/DMS  
0 program which is not available at this moment in time.

| NT0X96EH | SMDI Link cable             | 1      |

0 Note: Spares for the above Circuit Packs should be one (1) or two  
0 (2) for the common packs at the customer's discretion espe-  
0 cially in market-places that have the 48-hour replacement  
0 service.

0

0 Spares for SPM in non-traditional CO environment

0 The following shows the critical minimal sparing list for SPM  
0 used in a non-traditional CO environment like PCS (Personal Com-  
0 puter Systems) to provide cost competitiveness. This list takes  
0 advantage of spares pooling and shows 3 (three) levels of sparing  
0 for systems with 1, 2 and 3 to 10 SPMs.

| PEC      | Description                | Spares for<br>no. of SPMs |   |           |

0 1.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 SPM has the following fusing requirements for both A and B feeds:

| <u>Shelf</u>     | <u>Fuse (amp)</u> |
|------------------|-------------------|
| Shelf Pos 00 - A | 20                |
| Shelf Pos 00 - B | 20                |
| Shelf Pos 13 - A | 20                |
| Shelf Pos 13 - B | 20                |
| Shelf Pos 26 - A | 30                |
| Shelf Pos 26 - B | 30                |
| Shelf Pos 39 - A | 30                |
| Shelf Pos 39 - B | 30                |
| Blower - A       | 10                |
| Blower - B       | 10                |

| 0 | 6            |            | 48           |              | 300          |            | 10582            |
| 0 | 8            |            | 96           |              | 300          |            | 10582            |
| 0 | 8            |            | 96           |              | 600          |            | 21164            |
| 0 | 12           |            | 144          |              | 450          |            | 15873            |
| 0 | 12           |            | 144          |              | 900          |            | 31746            |
| 0 | 14           |            | 192          |              | 600          |            | 21164            |
| 0 | 14           |            | 192          |              | 1200         |            | 42328            |

0 Note:

- 0 1. This limit corresponds to 8 SPN 24-channel nodes. These sys-
- 0 tems are configurable in increments of 24 channels.
- 0 2. This limit corresponds to a maximum 8 1400MB SPN disks, (suf-
- 0 ficient for 150 hours/disk). It includes voice messages and
- 0 personal greetings but not personal verifications, system
- 0 greetings, voice service definitions (unless on VS203, see
- 0 note 5 below) or prompts.
- 0 3. This is a feature implementation limit.
- 0 4. This limit is a user interface implementation.

0  
0 RELEASE 28.01  
0 93 12 03

- 0 5. Voice menus and other voice service definitions (announcements, voice form definitions) are stored on the System Volume (VS1) where they share space with personal verifications and network queues. If VS203 is defined as the voice service volume, there may be upto 150 hours of voice menus and other voice service definitions in addition to 100 hours of personal verifications.
- 0 6. This is an MMI feature limitation.
- 0 7. This is an implementation limitation based on maximum DMS-100 customers.
- 0 8. Only one maintenance printer is active at a time. The recommended configuration is to connect one printer to port 3 on MSP 1 and to connect the other printer to the printer port on the system console. The second printer is used when MSP 1 fails.
- 0 9. The proprietary network transport protocol is not supported on the SPM (CO market), nor is it supported at Gate 3 on the MSM (CPE market). Support for the proprietary network transport protocol on the MSM may be provided in a MM8 up-issue, together with new hardware to increase the number of RS-232 ports available for networking. A software change is needed in the Operating System to correctly control the DTR lines on ports connected to on-board modems to be used for networking. Furthermore, special cabling is needed to allow the modem ports on a TIFN node pair to be used independently (non-redundantly). This limit corresponds to 1 modem port per SPN (upto 8 SPN) plus 4 modem ports per TIFN, less 2 ports for a single redundant SMDI connection.

0 1.3 SOFTWARE PROVISIONING

0

0 1.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 The Service Peripheral Module requires non-BCS software release  
0 MM8 or higher.

0 RELEASE 28.01  
0 93 12 03

0 The following codes are used in Phase 1 for the SPM software:

| 0 | <u>Package Title</u>    | <u>Code</u> |
|---|-------------------------|-------------|
| 0 | SPM Base Software       | SPM000AA    |
| 0 | SMDI Interface Software | SPM010AA    |
| 0 | AMIS Analog Networking  | SPM011AA    |
| 0 | Voice Forms             | SPM020AA    |
| 0 | Voice Menus             | SPM021AA    |
| 0 | VMUIF Call Answering    | SPM100AA    |
| 0 | MM Voice Messaging      | SPM120AA    |

0 The Service Peripheral Module SPM 02 Software Packaging is as  
0 follows :

| 0 | <u>Package Title</u>   | <u>Code</u> |
|---|------------------------|-------------|
| 0 | SPM Base Software      | SPM000AA    |
| 0 | Multi-SMDI             | SPM010AA    |
| 0 | AMIS Analog Networking | SPM011AA    |
| 0 | Voice Forms            | SPM020AA    |
| 0 | Voice Menus            | SPM021AA    |
| 0 | Family Mailboxes       | SPM030AA    |
| 0 | Call Answering         | SPM100AA    |
| 0 | Voice Messaging        | SPM110AA    |
| 0 | Full Voice Messaging   | SPM120AA    |
| 0 | DMS-Mail Mailboxes     | SPM130AA    |

0 Note: The DMS-Mail Mailboxes Master Package include SPM100,  
0 SPM110, SPM120 and SPM030AA with no mailbox limits, priced by  
0 ports.

## 0 1.0 SNSE Integration for Meridian Cabinets

0 The integration of the SuperNode SE (SNSE) will provide the Meridian  
0 Cabinet System product line the ability to evolve from NT40 to a  
0 SuperNode based Core without having to expand to a full capacity  
0 SuperNode. The SNSE will also provide, within a single bay an alterna-  
0 tive packaging solution to the traditional Enhanced network (ENET)  
0 bays and the Link Peripheral Processor bay for the small to medium  
0 sized offices.

0 The SNSE platform contains in a single bay CM/SLM, DMS-BUS, LIS and  
0 Network functionalities. It's growth capacity, depending on engineered  
0 traffic and amount of features, is supported on the Meridian Cabinets  
0 up to 12,000 ports. If the potential for further growth is evident,  
0 beyond 14k- 16k range, then OPTION 211 (full SuperNode) should be se-  
0 riously considered.

0 This ECM will concentrate on the interface to the Meridian Cabinets  
0 that require cabling to either the MS, ENI, or LIS portions of the  
0 SNSE. The affected MCS equipment is the MCTMI, MCSM, MCEX (IOC), and  
0 the MCGM(IOC, STM).

0 For more in-depth provisioning rules of the SNSE itself, see ECM632.

### 0 1.1 HARDWARE PROVISIONING

0

#### 0 1.1.1 HARDWARE USAGE RESTRICTIONS

0

0 There are several restrictions concerning Meridian cabinets from  
0 network port usage to types of bulkheads and circuit packs. Spe-  
0 cial cabling schemes have been designed for DS30A and/or fiber  
0 options for peripheral ports on MCTMI, MCSM, or MCGM.

0 When provisioning an ENI shelf the following restrictions apply:

0 The Meridian bulkhead NT9X0813 must be provisioned one per plane.  
0 also provision internal DS30A cables NT9X0815 (ONE PER NT9X41)  
0 and NT9X0817 (ONE PER NT9X45). Due to bulkhead connector limita-  
0 tions a maximum of four (4) NT9X41 or NT9X45 PB's and cross point

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 cards (NT9X35) per plane can be provisioned for any DS30 copper  
0 connections.

0 When provisioning NT9X41's or NT9X45's provision in the following  
0 order and slots:(Provision in pairs)

| slots (SHF13) |      | NT9X0813 BULKHEAD CONNS. |                | CABLE PEC         |
|---------------|------|--------------------------|----------------|-------------------|
| PL0           | PL1  | CONN. NUMBERS            | CABLE TYPE     |                   |
| 13            | & 23 | C000,C001,C002,C003      | COPPER / FIBER | NTNX36AQ(COPPER)* |
| 14            | & 24 | C004,C005,C006,C007      | COPPER / FIBER |                   |
| 15            | & 25 | C008,C009,C010,C011      | COPPER / FIBER |                   |
| 16            | & 26 | C012,C013,C014,C015      | COPPER / FIBER |                   |
| 17            | & 27 | FIBER PORTS HOLES        | - FIBER        | NT0X97AK(FIBER)*  |
| 18            | & 28 | FIBER PORTS HOLES        | - FIBER        |                   |
| 19            | & 29 | FIBER PORTS HOLES        | - FIBER        |                   |

- 0 NOTE: 1) \* SEE CAZX15AA FOR SNSE CONNECTIVITY
- 0 2) SLOTS 13-16 PL0 AND 23-26 PL1 ARE THE DESIGNATED  
0 COPPER POSITIIONS BUT DEPENDING ON THE OFFICE  
0 REQUIREMENTS CAN BE USED AS FIBER (NT9X40) OR COPPER  
0 FIBER MIX (NT9X45).
- 0 3) IN PROVISIONING FOR FIBER(DS512) OR COPPER(DS30) PROVISION  
0 DS30 LINKS USING NT9X45'S FIRST BECAUSE OF BULKHEAD  
0 RESTRICTIONS. THEN UTILIZE THE FIBER PORTS ON THE 9X45'S  
0 (TOTAL 3) AND THEN MOVE TO NT9X40'S IF REQUIRED FOR MORE  
0 DS512 FIBER.

## 0 HARDWARE USAGE RESTRICTIONS FOT COMMERCIAL AND FEDERAL MARKETS

0  
0 The restriction for the Commercial MSL100 market are that:

- 0 1)All SNSE's will be supported on initial  
0 offices only. No extensions.  
0 2)JNET will NOT be supported. If SNSE is  
0 provisioned, it must start initially with  
0 ENET or ENI shelf in SNSE.

0 The restriction for the Federal MSL100 market are that:

- 0 1)SNSE's can be added as upgrades to existing  
0 offices. Extensions are supported.  
0 2)JNET will NOT be supported. If SNSE is  
0 provisioned, it must start initially with  
0 ENET or ENI shelf in SNSE.

0

0 1.1.2 HARDWARE DEPENDENCIES

0  
0 In provisioning for MSL cabinet interface to the SNSE/ENI, a  
0 Meridian bulkhead must be provisioned on each plane of the ENI  
0 shelf. The PEC Code for th e two bulkheads is NT9X0813. Provide  
0 two (2) per ENI shelf.

## 0 P AND C SIDE PORT REQUIREMENTS

0  
0 See section 2.2

0  
0 RELEASE 28.01  
0 93 12 03

## 0 DMS BUS PORT REQUIREMENTS

0  
0 See section 2.3.3 and ECM632 for SNSE provisioning.

## 0 CIRCUITS PER CARD

0  
0 See ECM632 for SNSE provisioning.

## 0 DISCRIMINATION NUMBERING

0  
0 N/A

## 0 MESSAGE SWITCH PROVISIONING AND IOC INTERFACE

0  
0 The MS shelf on the SNSE does not have a special bulkhead but  
0 uses the standard NT9X6550 and NT9X6551. SPECIAL NOTE: Earlier  
0 documentation did call out Meridian bulkhead to be provisioned:  
0 NT9X6560 & 61 these have been cancelled do not order them. Uti-  
0 lizing the "standard" bulkheads (nt9x6550 & 51) will allow the en-  
0 gineer to provision the 32 port MS I/F CP NT9X17BB and the 16  
0 link DS30 Paddle Board NT9X69BA in slots 10 and 11. This informa-  
0 tion is new and will be reflected in the next release of ECM632.

0 1.1.3 PROVISIONING CONSIDERATIONS

0  
0 The introduction of the SNSE to the MSL line-up requires a num-  
0 ber of changes to the existing equipment:

- 0 1) MCTMI TO BE FIBERIZED TO INTERFACE ENI  
0 A. DS30 OPTION CABLE KITS  
0 B. DS-512 OPTION CABLE KITS  
0 C. DS1 OPTION CABLE KITS  
0 2) MCSM DS30 CABLE BULKHEAD KIT FOR ENI

## 0 PROVISIONING OF LOCAL CABLE KITS FOR MCSM, MCTMI

0  
0 Due to the SNSE integration the "always provided" DS30 cables  
0 internal to the MCTMI cabinet are now provisionable through cabl-  
0 ing kits. The provisioning options for the kits will be DS30,  
0 DS30A, DS-512, and DS1.

0 The kit for the DS-512 interface, NTNX33SD provides no cabling,  
0 but provides the NT6X02BU Fiber Conversion Kit and 2 P0738373  
0 cover plates which provide coax port holes through the bulkhead.  
0 For a complete list of the cables provided in each of the kits  
0 look at the stocklists for the Pec Codes.

0 In provisioning an MCSM DS30 copper interface to SNSE ENI shelf  
0 the MCSM local cabling must be converted to external interface  
0 through the bulkhead. Apply the NTNX29BB Hardware Kit to provide  
0 connectivity for external DS30 ports. Provide one (1) NTNX29BB  
0 per MCSM Cabinet.

0 The NTNX29BB includes a bulkhead (P0686033) and two cables  
0 (NTNX2905 and NTNX2906. Two internal cables will need to be re-  
0 moved, they are (NTNX2903 and NTNX2904).

0 The cabling kits that have been created are designed to provision  
0 a complete cabinet, i.e. both modules, or four shelves. These  
0 kits provide internal cables only- from backplane to bulkhead.  
0 External cables also need to be job engineered.

## 0 1. NTNX33SD DS-512 FIBER INTERFACE KIT(MCTMI)

0 RULE: Provision one (1) NTNX33SD per MCTMI for DS-512  
0 interface to ENI/SNSE .

## 0 1 KIT PROVIDES:

0 (2) P0738373 COVER PLATE (has fiber port holes)

0 (2) NT6X02BU FIBER HARDWARE

## 0 2. NTNX33DS DS-30(XPM) PORT CABLES HARDWARE KIT (MCTMI)

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 RULE: Provision one (1) NTNX33DS per MCTMI for DS30 (XPM)  
0 interface to ENI/SNSE .

0 1 KIT PROVIDES:

- 0 (1) NTMX3310 FOR SHELF 05  
0 (1) NTMX3312 FOR SHELF 19  
0 (1) NTMX3311 FOR SHELF 33  
0 (1) NTMX3313 FOR SHELF 47  
0 (4) P0638261 CONNECTOR KEY BRACKET

0 3. NTNX33DT DS-30A PORT CABLES HARDWARE KIT (MCTMI)

0 RULE: Provision one (1) NTNX33DT per MCTMI when  
0 providing NT6X48AA DS30A cards.

- 0 (1) NTNX3305 FOR SHELF 05  
0 (1) NTNX3306 FOR SHELF 05

## Meridian Equipment Chapter 29

Page 29-10

0  
0 RELEASE 28.01  
0 93 12 03

0 1.1.4 OFFICE LAYOUT INFORMATION

0  
0 The SNSE integration program for Meridian Cabinet Systems will  
0 support two configurations. One configuration will be a separate  
0 C42 line-up powered by an MPDC and the other configuration will  
0 be a fully integrated SNSE into the MCS lineup and powered from  
0 the MCAM. The position of the SNSE in the line-up will be on the  
0 end of the line-up next to the MCAM for extensions, and the sec-  
0 ond bay in the first line-up (next to the MCAM) for initial of-  
0 fices.

0 1.1.5 TRAFFIC TABLES

0  
0 For detailed ASU capacity provisioning, refer to: SEB 92-02-001  
0 LPP

0 1.2 PRODUCT/SYSTEM SPECIFICATION

0

0 1.2.1 PHYSICAL CHARACTERISTICS

0  
0 The SNSE is packaged in a C42 (Streamline) cabinet.

0 1.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 The SNSE C42 cabinet is EMI compliant.

0 93 12 03

## 0 POWER CONSIDERATIONS FOR SNSE POWERED FROM AN MPDC

0  
0 When integrating the SNSE with the MSL lineup power cables must  
0 be job engineered. The fuse assignments are to be job engineered  
0 and are not preassigned as with the PDP in the MCAM.

|                           | MPDC FUSE<br>POSITION | FUSE<br>SIZE | DESCRIPTION  |
|---------------------------|-----------------------|--------------|--------------|
| A<br><br>F<br>E<br>E<br>D | FXX                   | 20A          | -48V(1)SH 00 |

## 0 2.0 Meridian Cabinet Remote Module-SONET (MCRMS)

0 The MCRMS is the Meridian Cabinet version of the Remote SONET switch (CRSC). Although the MCRMS uses the common existing CRSC and SL-100 hardware the MCRMS represents a different packaging solution. Whereas the CRSC utilizes a second cabinet for the D-Channel Handler extension shelf, the MCRMS has been designed to carry the extension shelf, eliminating the LCME shelf and adding a Power Distribution (PDP) shelf.

0 The functions within the MCRMS are:

0 The RMM at position 49 is a standard remote Maintenance module, based on the central-office DMS-100 family Maintenance Trunk module, that performs line testing, diagnostics, and alarm monitoring at the remote site.

0 The RCC2 shelf contains central control functions. the single shelf, 68020-based module will support an option for direct SONET interface, and significantly increases capacity. The central features of the RCC2 are:

0 54 P-side ports, an increase of 34 from the RCC. The 54 P-side ports can be a mix of DS1, DS30A, and DCH (D-Channel handlers. A maximum of 46 DS1's, 30 DS30A's, and 10 DCH's can be provisioned in various combinations. See Provisioning Considerations section 2.4 for port spread information and table.

0 The EXT shelf works in conjunction with the RCC2 to support 24 additional DS1 links or 10 D-Channel Handlers to accommodate ISDN line requirements.

0 The Cooling Unit(CU) is the fan unit providing air flow from the bottom of the cabinet to the top.

0 The Power Distribution Panel (PDP) provides power to the MCRMS and other cabinets in the lineup, plus up to 3 IPEC columns externally through bulkhead power filters. Special cable harnesses are provisionable for powering IPEC's from the PDP.

0 The MCRMS will introduce SONET interface in later BCS releases. The SONET interface will increase the network reliability, reduce hardware, Operation Administration, and Maintenance(OA&M), and provisioning costs. It will also expand the bandwidth to allow for future advanced services.

0 The MCRMS is based on the new Remote Cluster Controller 2 or RCC2. The RCC2 is a BCS34 introduction and will replace the RCC and RCCI. The

0  
0 RELEASE 28.01  
0 93 12 03

0 RCC2 expands the P-side ports from 20 (RCC) to 54 which can be a mix  
0 of DS1, DS30A and DCH port interfaces. The RCC2 in combination with  
0 EXT (Extension) shelf make up the Common Peripheral Module or CPM. The  
0 CPM is a family of peripheral modules used in the DMS-100 family and  
0 uniquely combined in the MCRMS.

0 The RCC2 shelf houses five (5) Quad frame Carrier circuit packs  
0 (NTMX87). Four DS1 packlets can mount on the Quad frame Carrier CP.  
0 For further expansion the extension shelf can house up to three more  
0 Quad Frame carrier circuit packs. The RCC2 can also house three (3)  
0 NTB02AA D Channel handlers for a total of approximately 324 ports.  
0 The D-Channel handler card receives data from ISDN terminals and  
0 routes the data to either the ISDN signaling pre-processor (ISP) card  
0 or the packet handler.

0 The PDP equipped in the bottom of the MCRMS will provide power to other  
0 cabinets in the line-up and also powers the IPE columns via EMI  
0 bulkhead filters. This eliminates the need for a separate power cabi-  
0 net at the remote sites.

## 0 2.1 HARDWARE PROVISIONING

0

### 0 2.1.1 HARDWARE USAGE RESTRICTIONS

0  
0 The maximum distance from the host to the farthest remote off the  
0 RCC2 and 150 miles for Private Line Applications.

0 The MCRMS is linked to the host by either DS1 or Fiber-Optic  
0 interface. Direct Fiber Interface (DFI) and PCM30 interface are  
0 not yet available (BCS37).

## 0 D-CHANNEL RESTRICTIONS

0  
0 The theoretical maximum of D-channels on a DCH circuit pack  
0 (NTB02) is 124. Due to restrictions the total amount of D-

0 RELEASE 28.01  
0 93 12 03

0 channels on the RCC2 ,utilizing all three DCH slot positions,  
0 will net approximately 324 total channels, or 108 per card. The  
0 total slots (ports) available for DCH with the RCC2 AND EXT shelf  
0 combined is 10.

0 2.1.2 HARDWARE DEPENDENCIES

0  
0 The MCRMS is developed from the existing RSCS platform, reconfig-  
0 ured and packaged in a Meridian Cabinet.

0 2.1.3 PROVISIONING CONSIDERATIONS

0

## 0 PROVISIONING OF P-SIDE PORTS

0  
0 The RCC2 in the MCRMS provides a maximum of 54 Peripheral Side  
0 (P-Side) ports of which can be engineered a combination of DS-1,  
0 DCH (D-Channel handler), and DS30A links. The hardware require-  
0 ment to support the 54 ports is greater than the physical capac-  
0 ity of the RCC2 (22 ports). When provisioning beyond 22 ports the  
0 EXT shelf is required to allow port expansion upwards to the max-  
0 imum of 54 ports.

0 The 54 ports are shared ports by the different types of links re-  
0 quired by the customer. When mixing links on the ports care must  
0 be taken not to overlap available ports. DS-1 links may be as-  
0 signed from ports 0-47 (excluding 22, 23) and DS30A links may be  
0 assigned from 53-24. DCH links may assigned at locations through-  
0 out the 54 ports taking away from possible DS-1 links.

0 The 54 shared ports should be assigned in the following sequence:

|   |                   |                                          |
|---|-------------------|------------------------------------------|
| 0 | -----             |                                          |
| 0 | 1) RMM LINK       | PORT 22(23 NOT USED)                     |
| 0 | -----             |                                          |
| 0 | 2) DS-1 INTERLINK | PORTS 0,8                                |
| 0 |                   |                                          |
| 0 | RULE:             | The first two interlinks in a dual       |
| 0 |                   | configuration must be port 0 (slot 12:0) |
| 0 |                   | and port 8 (slot 16:0). subsequent       |
| 0 |                   | interlinks may use any DS-1 ports.       |
| 0 | -----             |                                          |

0  
0 The number of DS30A links from the RCC2 to the peripheral is de-  
0 termined and dependent on the engineered CCS per line required to  
0 support the customers traffic requirements.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Each external cable (NTNX36AS) handles a maximum of 6 DS30A  
0 ports. The external cable interfaces into the MCRMS bulkhead and  
0 interfaces a level 5 connector on the internal cable that breaks  
0 out to 6 8 pin connectors at the backplane. Each 8 pin connector  
0 is one DS30A port, giving maximum flexibility of DS30A port us-  
0 age.

0 DS30A links are provisioned off the NTMX74AA DS30A Interface  
0 card. There are a total of 54 P-side ports (0-53). 32 ports are  
0 available for DS30A interface. The ports available are assigned  
0 in decsending order from 53 through 24.

0 The physical port 0 of the DS-30A I/F board(NTMX74AA) in slot 15  
0 is used for the internal communication between RCC2 and the RMM  
0 shelf. This port is represented as port 22 in the P-side  
0 (DCH,DS-1, and DS-30A) port mapping. Port 1 is also reserved for  
0 for a DS30A link, but will not be used in the MCRMS design. The  
0 RCC2 shelf provides 32 redundant ports on the NTMX74 circuit  
0 packs. The two packs in slots 13,15 are wired in parallel on the  
0 backplane. Due to connector restrictions the 32 ports are divided  
0 between the two cards. If one card fails the other will take over  
0 all 32 ports.(see table below)

0 The traffic capacity for the MCRMS can be as follows:

- 0 \* All ISDN lines : 2400 at 11.4 CCS
- 0 \* All MCLME POTS : 3360 at 7.9 CCS + 421 at 6.0 CCS
- 0 \* All MCLM Lines : 3585 at 7.4 CCS + 421 at 6.0 CCS
- 0 \* All IPE Lines : 1792 at 9.8 CCS + 1280 at 6.2 CCS
- 0 \* All MCDM Lines : 1120 at 15.8 CCS + 800 at 10.0 CCS

0 RELEASE 28.01  
0 93 12 03

0 2.2 PRODUCT/SYSTEM SPECIFICATION

0

0 2.2.1 PHYSICAL CHARACTERISTICS

0

0 The MCRMS is packaged in a Meridian Cabinet and is fully inte-  
0 grated into a Meridian Cabinet Remote switch lineup. The MCRMS  
0 can be ordered in either grey or brown.

0

0 2.2.2 EMI/EARTHQUAKE INFORMATION

0

0 The MCRMS complies with FCC EMI regulations: Part 15, Class A,  
0 and Part 68.

0

0 The MCRMS, being packaged in a Meridian Cabinet uses the same  
0 earthquake anchoring procedures and hardware as the Meridian  
0 Cabinet product line.

0 2.2.3 SPARING INFORMATION

0

0 The standard algorithm applies when provisioning spares.

0 2.2.4 POWER FEED AND FUSING REQUIREMENTS

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 The MCRMS receives sendary power from the Power Distribution  
0 Panel in the bottom of the Cabinet. The Cabinet requires -48VDC  
0 main feeds.

#### 0 2.2.5 CURRENT DRAIN INFORMATION

0  
0 The shelves within the MCRMS have the following power require-  
0 ments:

| 0 | SHELF | POWER REQUIREMENTS       |
|---|-------|--------------------------|
| 0 | RMM   | 5A @ -48V : 240W TOTAL   |
| 0 | RCC2  | 8.1A @ -42V : 340W TOTAL |
| 0 | EXT   | 7.3A @ -42V : 307W TOTAL |

#### 0 2.3 SOFTWARE PROVISIONING

0

##### 0 2.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 Existing RSCS software will be used. Minor changes to diagnostics  
0 for shelf position datafills will be required.

0 The MCRMS software will consist of Central Control and Peripheral  
0 Module Features packages.

0 The base MCRMS base software packages are:

|   |            |                                             |
|---|------------|---------------------------------------------|
| 0 | * NTX145AA | SOFTWARE SWITHING FEATURE                   |
| 0 | * NTX150AA | RSC-INTRA RSC CALLING                       |
| 0 | * NTP92AA  | REMOTE SWITCHING CENTER SONET BASIC         |
| 0 | * NTP92AB  | REMOTE SWITCHING CENTER SONET BASIC (BCS35) |

0 The follow is the list of optional software packages available to  
0 support additional capabilities for the MCRMS.

0

0 \* NTXR42AA FIRMWARE DOWNLOADING

0

0 2.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 This information is unavailable at this time.

0 2.3.3 MEMORY PROVISIONING

0  
0 The Processor card in the RCC2 shelf has an initial 8M of memory  
0 and can be expanded to 16MW.

0

0

0

0

0 2.4 REAL TIME IMPACT

0 The Real Time capacity of the MCRMS will be similar to the capac-  
0 ity as specified for the RSCS. Real Time capacity will not be  
0 specified until further testing is complete.

0 3.0 Meridian Cabinet Remote Switching Center

0 The cabinetized MSL100 RSC-C utilizes the DMS-100 as the basis for  
0 system and module design. The design is such that the existing and  
0 future DMS-100 RSC software is used without modification.

0 An RSC-C can support MCRU terminated on it. The MCRU is the Meridian  
0 Cabinet Remote Unit which is the cabinetized version of the RLCM (Re-  
0 mote Line Concentrating Module).

0 All standard features are available including Intra Switching and ESA.

0 3.1 HARDWARE PROVISIONING

0

0 3.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The RSC-C will support any combination of analog and digital ter-  
0 minals up the real time capacity and/or traffic limit of the RCC.  
0 This is typically around 3,000 lines.

0 Direct trunking to the local public telephone network can be pro-  
0 vided on a limited basis. Digital trunks can be provisioned at  
0 the expense of line peripheral ports.

0 If additional Universal Tone Receiver Packs (NT6X92BB) are re-  
0 quired for traffic considerations above the two (2) provided with  
0 the NTNX17BA Common Packfill, RCC is restricted to to a maximum  
0 of 10 NT6X50 total circuit packs. This will allow sufficient cur-  
0 rent for the operation of the second UTR pair.

0 Note that End Panels must be associated with the first MCRM (of a  
0 lineup) in the Configuration Section of the specification. It  
0 must not appear in the "Loose Items" section of the specification  
0 and must never "ship Loose".

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 3.1.2 HARDWARE DEPENDENCIES

0  
0 When provisioning NT6X50AB DS-1 Interface cards the host control-  
0 ler must also be equipped with the NT6X50AB CP. Also if a module  
0 is being upgraded to NT6X50AB the switch must be at least at  
0 BCS31 and an NT6x45BA or higher must be in place. For new offices  
0 use an NT6X45BD signal processor for NON XPM+ functionality.

## 0 P AND C SIDE PORT REQUIREMENTS

0  
0 Not applicable

## 0 DMS BUS PORT REQUIREMENTS

0  
0 Not applicable

## 0 CIRCUITS PER CARD

0  
0 Not applicable

## 0 DISCRIMINATION NUMBERING

0  
0 Not applicable

0  
0 RELEASE 28.01  
0 93 12 03

0 3.1.3 PROVISIONING CONSIDERATIONS

0  
0 The NT6X12ZF product change kit is ordered to provide the Uni-  
0 versal Processor, the buss terminator and backplane wiring. Use  
0 the NT6X12ZF change kit as a guide for provisioning and assigning  
0 the circuitpacks and wire and for removing circuit packs no  
0 longer for XPM+ upgrades.

0 MCRM CABINET

0  
0 The MCRM provides power to the first lineup of the RSC-C. The  
0 system alarm, service and diagnostic circuits are located in the  
0 RMM (Remote Maintenance Module) shelf. External connectors from  
0 these circuits to the MDF are provided via filtered connectors in  
0 the rear bulkhead.

0 The Power Distribution Panel (PDP) is located in the bottom shelf  
0 position of the MCRM cabinet.

0 Immediately above the PDP is the Cooling Unit. This cabinet is  
0 forced air cooled with a dual speed fan unit.

0 Above the cooling unit is the Remote Cluster Control (RCC) module  
0 which provides interface to the Host via DS1 Ports/T1 spans. The  
0 RCC can support MCRU and digital trunks as well as its local ELMS  
0 and DLMS.

0 All twenty P-side ports for the RCC are always fully wired to  
0 filtered connectors in the rear bulkhead for use as digital  
0 trunks and/or to interface other remote line equipment.

0 The Remote Maintenance Module (RMM) is located above the RCC.

0 Located in the top of the MCRM is the frame supervisory panel  
0 (FSP) which distributes and controls power and alarms for the  
0 cabinet.

0

0  
0 RELEASE 28.01  
0 93 12 03

## 0 MCLM Cabinet

0  
0 The MCLM contains up to two (2) fully duplicated Enhanced Line  
0 Modules (ELM). Each ELM has eight (8) Line Drawers providing a  
0 512 card slot capacity. A MCLM has the capacity of 1024 single,  
0 physical line card slots.

0 An ELM is a repackaged standard DMS LCM. All four Line Drawers  
0 on each shelf are located on the left, leaving the control equip-  
0 ment on the right. Each ELM module contains a Ringing Generator  
0 on the lower array shelf and a fuse panel on the upper array  
0 shelf.

0 All six DS30A links for each ELM are hardwired to a single con-  
0 nector on the rear bulkhead. The MTA cable is also hardwired to  
0 the backpanel and has sufficient length to connect to the MCRM  
0 cabinet. Each ELM can have 2, 3, 4, 5 or 6 DS30A speech links to  
0 the RCC.

0 All Tip/Ring cables from the Line Drawers are hardwired to EMI-  
0 filtered, fifty-pin telephony connectors on the rear bulkhead.

0 An FSP is located in the top of the cabinet to distribute power  
0 control and alarms in the cabinet.

0 This cabinet is forced air cooled with dual speed fan units inte-  
0 grated in both the top and the bottom of the cabinet.

## 0 MCDM Cabinet (Ref: ECM 283)

0  
0 This cabinet contains a maximum of four (4) Digital Line Modules  
0 (DLM), providing service for up to 640 Meridian digital sets. In  
0 the MSL100, the MCDM will support all the feature sets and data  
0 terminals, in contrast to the MCLM which are intended to support  
0 analog sets only.

0 Each of the four DLMS is a single shelf, stand-alone unit provid-  
0 ing 160 digital ports. Each port will support a single digital  
0 set and can also support a data option. The MCDM can therefore

0 RELEASE 28.01  
0 93 12 03

0 support 640 feature sets, plus 640 data terminals for a total of  
0 1280 terminals per cabinet. These are maximum numbers. The ac-  
0 tual number of sets and terminals supported will vary depending  
0 on other factors such as traffic considerations and messaging.

0 The DS30A links for each DLM are hardwired to a single connector  
0 per DLM on the rear bulkhead. All 640 ports are also hardwired  
0 to EMI-filtered, 50-pin connectors on the rear bulkhead for sim-  
0 plified connection to the MDF. All test access circuits (includ-  
0 ing "LTU" function) are built into each DLM itself, so that no  
0 external connectors are required for service circuits.

0 Each DLM on the MCDM cabinet (four DLM/cabinet max) can have 2, 4  
0 or 6 speech links to the RCC.

0 An FSP is located in the top of the cabinet to distribute power  
0 control and alarms to the cabinet.

0 This cabinet is forced air cooled with a dual speed fan unit in-  
0 tegrated into the base of the cabinet.

#### 0 Miscellaneous

0  
0 Always Required: (see Engineering Manual Insert for MCRM)

0 Provide a remote equipment label package (NTNX1102).

0 Provide two sets of doors and labels per cabinet  
0 (one set for front and one for rear).  
0 Provide a set of cabinet type labels.  
0 Provide a set of end panels per lineup.

0 Optional:

0 Provide one Patlon antistatic mat per RCC.  
0 Provide a remote equipment tool set (NT0X58AD) per site.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 3.1.4 OFFICE LAYOUT INFORMATION

0  
0 The PDP is located in the bottom shelf of the MCRM. It can supply up to eight (8) additional cabinets in a lineup. An equipment lineup may consist of more than one MCRM. Maximum number of cabinets in a lineup would then be limited also by the room size, traffic considerations (ie; #ELMs/DLMs served by the RCC), etc.

0 One set of End Panels must be provided per lineup and associated (in the configuration section of the specification) with the first MCRM in a lineup. They must be installed in the factory (never shipped loose).

0 3.1.5 TRAFFIC TABLES

0  
0 Refer to NTP 297-1001-450 DMS100 Family Provisioning, Section 2, Traffic Criteria and Capacities and/or ECM 350, DMS100 Traffic Provisioning "The Credit System".

0 3.2 PRODUCT/SYSTEM SPECIFICATION

0 3.2.2 EMI/EARTHQUAKE INFORMATION

0  
0 Refer to NTP 555-4001-103 Meridian SL100 Cabinetized Section 2-1  
0 Earthquake Resistance

0 3.2.3 SPARING INFORMATION

0  
0 As a rule of thumb, provision as spare, a minimum of one of each  
0 circuit pack up to a maximum of 10% of the total count of that  
0 item.

0 3.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 The following fuses and feeds are required: All cabinets within  
0 a RSC-C lineup are powered from the PDP on on the MCRM. The PDP  
0 is always provided with the following:

0 Qty 42 20.0A Fuses

0 Qty 1 10.0A Fuse

0 RSC-C is DC powered.

0 Cabinets in a lineup are powered from the Power Distribution  
0 Panel (PDP) located in the MCRM cabinet.

0 All power cables to the PDP from the cabinets in the lineup are  
0 factory equipped and shipped with the cabinets.

0 The MCRM will operate over the range of -44V to -56V.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 3.2.5 CURRENT DRAIN INFORMATION

0  
0 The current drain per MCRM NTNX17AA cabinet is 14.0 AMPS.  
0 The current drain per MCLM NTNX38\_\_ cabinet is 20.0 AMPS.  
0 The current drain per MCDM NTNX50AA cabinet is 18.0 AMPS.

0 3.3 SOFTWARE PROVISIONING

0

0 3.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 The MCRM is designed such that the existing and future DMS-100  
0 RSC software is used without modification.  
0 All standard features are available. Refer to NTP-1001-450 Sec-  
0 tion 32; Software Features, at the appropriate BCS level.

0 3.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 Not applicable.

0 3.3.3 MEMORY PROVISIONING

0  
0 CPU memory requirements are calculated with the host. Totals cal-  
0 culated include all remote lines and equipment.

THIS PAGE IS INTENTIONALLY LEFT BLANK

0 RELEASE 28.01  
0 93 12 03

0 1.0 BCS Insertion Gating Hardware

0 This NTP identifies the hardware modification needed to load BCS soft-  
0 ware into the DMS-100. The hardware modifications identified are cate-  
0 gorized as 'insertion gating', i.e. they are essential for the  
0 achievement of successful BCS software insertion into DMS 100 target  
0 configurations.

0 Two types of gating hardware are covered in this NTP:

0 \* BCS Gating Hardware

0 \* Feature Insertion Gating Hardware

0 Definitions of these and associated terms are given in the sec-  
0 tion headed "Definition of Terms".

0 BCS Gating Hardware and Feature Insertion Gating hardware are  
0 identified because they require to be shipped and installed be-  
0 fore loading of BCS software is attempted in the target DMS. If  
0 loading of BCS software is attempted before the BCS Software or  
0 Feature Insertion Hardware has been installed, a load abort will  
0 occur.

0 For commercial reasons, BCS Gating Hardware is differentiated  
0 from Feature Insertion Gating Hardware. Note that BCS gating  
0 hardware is required in all systems receiving the corresponding  
0 BCS software. Feature Insertion Gating Hardware, on the other  
0 hand, is required in addition to the BCS Gating Hardware for the  
0 following:

0 \* Systems in which the corresponding feature is required and  
0 the corresponding feature software is contained in the BCS  
0 load.

0 \* Systems receiving USL (Universal Software Load)

0 \* Systems receiving BCS Software obtained through a buy-out.

0 BCS Gating Hardware and Feature Insertion Gating Hardware are  
0 identified in tables covering BCS-26 through BCS-35.

0 ANY OFFICE THAT IS UPGRADING A BCS MUST MEET THE MINIMUM HARDWARE  
0 REQUIREMENTS FOR THAT OFFICE. HARDWARE MINIMUMS ARE BASED ON AD-  
0 DITIONS TO THE PREVIOUS BCS HARDWARE REQUIREMENTS.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 All other upgrade hardware is feature hardware. The feature re-  
0 lated hardware information and details on BCS Feature Gating  
0 Hardware should be obtained from Advanced Provisioning Informa-  
0 tion (API) or Engineering Change Memorandum (ECM) documents pro-  
0 viding provisioning information on the feature. This feature  
0 related hardware should be ordered in the appropriate specs.

0 Specific software packages in the BCS or USL software load are  
0 dependent on having specific insertion gating hardware for suc-  
0 cessful loading. This dependant software and corresponding hard-  
0 ware is identified in this NTP.

## 0 Circuits Per Card

0

## 0 Discrimination Numbering

0

0 1.1.3 Provisioning Considerations

0

0 BCS Gating and Feature Insertion Gating Procedures

0 - BCS Gating and Feature Insertion Gating Hardware is proc-  
0 essed by BCS scheduling.

0 \* Manufacturing ships the BCS Gating and Feature Insertion  
0 Gating material separately to site.

0 \* Hardware is installed prior to corresponding load applica-  
0 tion in the comprising hardware unit, e.g. CC (Central  
0 Control), XPM (Peripheral Module), MS (Message Switch).

0 General - USL Gating Hardware

0 USLs have a comprehensive feature content. A USL may contain fea-  
0 tures which are redundant for some target offices. The feature  
0 software is redundant in these cases if the target office does  
0 not operate the considered feature and, therefore, if there are  
0 special hardware requirements for the feature, the feature hard-  
0 ware will not be present. For some features the special hardware  
0 required is Feature Insertion Gating Hardware, e.g. additional

0  
0 RELEASE 28.01  
0 93 12 03

0 memory. If an attempt is made to load a USL in a target office  
0 not equipped with this Feature Insertion Gating Hardware, a load  
0 abort will occur. To avoid this, Feature Insertion Gating Hard-  
0 ware must be installed in offices receiving USL. Feature In-  
0 sertion Gating Hardware must be installed prior to USL  
0 insertion.

0 To facilitate the determination of whether or not an office has  
0 all of the hardware necessary for USL insertion, the features re-  
0 quiring Feature Insertion Gating Hardware are identified by soft-  
0 ware package identity codes in the tables presented later in this  
0 NTP.

0 General - SLM II

0 SLM II hardware is categorized as Feature Insertion Gating. Refer  
0 to the Definition of Terms section. Because it is Feature In-  
0 sertion Gating, BCS Gating material, shipping and installation  
0 procedures must be followed.

0 SLM II may be required for the following reasons:

- 0 1. For USL (Universal Software Load) applications. Refer to 'BCS  
0 33 Gating Hardware.'
- 0 2. Size of office image is greater than the capacity of SLM I.  
0 i.e., 62Mb. (calculated by MEMCALC) (Feature Insertion Gat-  
0 ing, refer to the Definitions of Terms).
- 0 3. Customer orders SLM II for other reasons, e.g. BRISC hardware  
0 requirement, planned capacity upgrade, etc. (Feature In-  
0 sertion Gating).

0 For SLM II installation details refer to Installation Manual IM  
0 925.

0 General - BRISC

0 BRISC hardware (NT9X10AA and NT9X26DA) is categorized as Feature  
0 Insertion Gating and, regardless of BCS level, must be installed  
0 prior to CC load application, according to the procedures de-  
0 scribed for BCS Gating and Feature Insertion Gating Hardware,  
0 above.

0 For BRISC installation details refer to Installation Manual IM  
0 925.

0 RELEASE 28.01  
0 93 12 03

0 BCS26 & 27 Gating Hardware

0 Only Feature Insertion Gating Hardware is identified for BCS 26  
0 and 27.

0 In the table, terms used are defined as:

| 0 Terms in Table | Associated PEC                    |
|------------------|-----------------------------------|
| 0 Ext. SP Mem    | NT6X46AC or NT6X46BB - SEE NOTE   |
| 0 Ext. MP Mem    | 2nd NT6X47AB per shelf - SEE NOTE |

0 NOTE: The NT6X46AC circuit pack (cp) will be used to update ex-  
0 isting modules. This cp (NT6X46AC) will be ordered via a Product  
0 Change (PC) kit. The PC kit will change the PEC of the base mod-  
0 ules and make several other circuit pack slots provisionable.  
0 (The slots are being made provisionable to eliminate the need for  
0 additional PC kits and base module PECs when the circuit packs  
0 change PECs due to upcoming features.) The NT6X46BB will be used  
0 on new modules. These new modules will contain provisionable  
0 slots for changing cp's.

0 For U.S. applications only, the second NT6X47AB (MP Memory CP)  
0 pair can be provisioned on updated modules. The second NT6X47AB  
0 CP pair will be ordered as a line item on modules where the ex-  
0 isting module already contained one (1) NT6X47AB CP pair. The one  
0 (1) NT6X47AC is provisionable on new modules and has the memory  
0 capacity equivalent of two (2) NT6X47AB. Existing modules should  
0 be updated via a change kit which replaces the NT6X47ABs with the  
0 NT6X47ACs.

0 BCS28 & 29 Gating Hardware

0 Only Feature Insertion Gating Hardware is identified for BCS 28  
0 and 29.

0 In the table, terms used are defined as:

| 0 Terms in Table | Associated PEC                         |
|------------------|----------------------------------------|
| 0 Ext. SP Mem    | NT6X46AC or NT6X46BB - SEE NOTE        |
| 0 Ext. MP Mem    | 2nd NT6X47AB per shelf or - SEE NOTE   |
| 0                | NT6X47AC                               |
| 0 New Msg        | NT6X69AA & 79AA or NT6X69AB - SEE NOTE |
| 0                | or NT6X69AC                            |

0 RELEASE 28.01  
0 93 12 03  
0

0 XPM Processor CP NT6X45BA - SEE NOTE  
0 Ext. LCM Processor CP NT6X51AB - SEE NOTE

0 NOTE: The NT6X46AC circuit pack (cp) will be used to update ex-  
0 isting modules. This cp (NT6X46AC) will be ordered via a Product  
0 Change (PC) kit. The PC kit will change the PEC of the base mod-  
0 ules and make several other circuit pack slots provisionable.  
0 (The slots are being made provisionable to eliminate the need for  
0 additional PC kits and base module PECs when the circuit packs  
0 change PECs due to upcoming features.) The NT6X46BB will be used  
0 on new modules. These new modules will contain provisionable  
0 slots for changing cp's.

0 For U.S. applications only, the second NT6X47AB (MP Memory CP)  
0 pair can be provisioned on updated modules. The second NT6X47AB  
0 CP pair will be ordered as a line item on modules where the ex-  
0 isting module already contained one (1) NT6X47AB CP pair. The one  
0 (1) NT6X47AC is provisionable on new modules and has the memory  
0 capacity equivalent of two (2) NT6X47AB. Existing modules should  
0 be updated via a change kit which replaces the NT6X47ABs with the  
0 NT6X47ACs.

0 The NT6X69AA and NT6X79AA or NT6X69AB cp can be used to update  
0 existing modules. These cp will be ordered via PC Kit. The PC  
0 kit will change the PEC of the base modules and make the card  
0 slots provisionable. The NT6X69AC is to be used for all New Mes-  
0 saging updates and replaces all the previous New Msg circuit  
0 packs.

0 For Canadian applications, the provisionable NT6X45BA circuit  
0 pack will be required for BCS-28 for XPM Super Charging.

0 For Canadian applications, the NT6X51AB circuit pack will be re-  
0 quired for BCS-28 for XPM Super Charging. NT6X51AB is an "Always  
0 Provided" circuit pack on the LCM Common CP fill. It is part of  
0 NT6X04AB LCM Common CP (i.e. pertaining to LCM, RSC, RLCM) and  
0 NT8X04AB LCM Common CP (i.e. pertaining to OPM). In Canada,  
0 Change Application Dept. 1955 BRW will field upgrade existing LCM  
0 modules as required (i.e. Systems Application Engineering will  
0 NOT retrofit NT6X51AA to NT6X51AB via product change kit). How-  
0 ever, after Change Application field upgrades an office, System  
0 Application Engineering will update the office records accord-  
0 ingly.

0 BCS30 & 31 Gating Hardware

0

0 RELEASE 28.01  
0 93 12 03

0 Only Feature Insertion Gating Hardware is identified for BCS 30  
0 and 31.

0 In the BCS 30 - 31 table, terms used are defined as:

| 0 Terms in Table | Associated PEC          |            |
|------------------|-------------------------|------------|
| 0 Ext. SP Mem    | NT6X46AC or NT6X46BB    | - SEE NOTE |
| 0 Ext. MP Mem    | 2nd NT6X47AB or one (1) | - SEE NOTE |
| 0                | NT6X47AC per shelf      |            |
| 0 4M MS Proc     | NT9X13DC                |            |
| 0 6M Memory      | NT9X14BB                |            |

0 NOTE: The NT6X46AC circuit pack (cp) will be used to update ex-  
0 isting modules. This cp (NT6X46AC) will be ordered via a Product  
0 Change (PC) kit. The PC kit will change the PEC of the base mod-  
0 ules and make several other circuit pack slots provisionable.  
0 (The slots are being made provisionable to eliminate the need for  
0 additional PC kits and base module PECs when the circuit packs  
0 change PECs due to upcoming features.) The NT6X46BA will be used  
0 on new modules. These new modules will contain provisionable  
0 slots for changing cp's.

0 For U.S. applications only, the second NT6X47AB (MP Memory CP)  
0 pair can be provisioned on updated modules. The second NT6X47AB  
0 CP pair will be ordered as a line item on modules where the ex-  
0 isting module already contained one (1) NT6X47AB CP pair. The one  
0 (1) NT6X47AC is provisionable on new modules and has the memory  
0 capacity equivalent of two (2) NT6X47AB. Existing modules should  
0 be updated via a change kit which replaces the NT6X47ABs with the  
0 NT6X47ACs.

0 For Canadian applications only, one (1) NT6X47AC pair will be  
0 provisioned on new modules and will replace NT6X47AB on existing  
0 modules. The second NT6X47AB is not to be provisioned for  
0 Canadian jobs. NT9X13DC, MS CPU Processor CP (4Meg), and  
0 NT9X14BB, 6MB Memory, must be provisioned on the Message Switch  
0 (MS) when ENET hardware and/or software (NTXE01AA) is ordered.  
0 Refer to ECM493 and ECM626.

#### 0 BCS32 Gating Hardware

0 Only Feature Insertion Gating Hardware is identified for BCS 32.

0 Effective BCS-32, all IACs in an office must be replaced with  
0 LGCI/LTCI or LGC/LTC modules with ISDN capabilities prior to ac-  
0 cepting a BCS-32 or above load.

0 RELEASE 28.01  
0 93 12 03

0 BCS33 Gating Hardware

0 Only Feature Insertion Gating Hardware is identified for BCS 33.

0 Effective with BCS33, the old messaging/small memory configura-  
0 tion will no longer be supported on new BCS loads for any XPM ex-  
0 cept DTC6, MSB6, and MSB7.

0 Switches using Universal Software Load require SLM II hardware,  
0 i.e. NT9X44AB. Refer to ECM 626, DMS Core, for provisionng de-  
0 tails.

0 The following terms used in the table below are defined as fol-  
0 lows:

| 0 Terms in Table | Associated PEC                                                     |
|------------------|--------------------------------------------------------------------|
| 0 -----          | 0 -----                                                            |
| 0 Ext. MP Mem    | 2nd NT6X47AB or one<br>0 NT6X47AC per shelf                        |
| 0 New Msg        | NT6X69AB, NT6X69AC, or<br>0 NT6X69AA & NT6X79AA & minimum NT6X45AC |
| 0 Ext. SP Mem    | NT6X46AC, NT6X46BA, or NT6X46BB                                    |
| 0 4M MS Proc     | NT9X13DC                                                           |
| 0 6M Memory      | NT9X14BB                                                           |
| 0 SLM II         | NT9X44AB                                                           |

0 The second NT6X47AB (MP Memory CP) can be provided when upgrading  
0 existing DTC modules. A NT6X02EQ change kit will be used on ex-  
0 isting DTCs to replace the NT6X47AB CPs with NT6X47AC CPs.

0 The NT6X47AC CP will be provisioned on new DTC modules and  
0 RLCM/OPM modules with ESA.

0 The NT6X69AC (Msg Protocol & Tone CP) will be provisioned on new  
0 DTC and SMR modules. DTC and SMR modules with old messaging,  
0 NT6X43AA, will be upgraded with the NT6X69AC, via a Product  
0 Change (PC) Kit, to meet new messaging requirements. DTC modules  
0 being upgraded to new messaging must upgrade the Signal Processor  
0 Memory CP with the NT6X46AC or NT6X46BB via PC Kits. New modules  
0 will be provisioned with the NT6X46BB CP. Existing DTC modules  
0 may have been provisioned with the NT6X46BA.

0 RELEASE 28.01  
0 93 12 03  
0

0 NT6X69AA & NT6X79AA or NT6X69AB, Msg Protocol & Tone CP, and  
0 NT6X45AC Processor CP satisfies the new messaging requirement on  
0 existing DTC modules.

0 NT9X13DC, MS CPU Processor CP (4Meg), and NT9X14BB, 6MB Memory,  
0 must be provisioned on the Message Switch (MS) when ENET hardware  
0 and/or software (NTXE01AA) is being ordered. Refer to ECM493 and  
0 ECM626. The NT9X13DC and NT9X14BB must also be provisioned when  
0 FLIS hardware and/or software (NTXQ51AA) is ordered in BCS33 and  
0 beyond. Refer to ECM612.

0 Refer to the appropriate API/ECM document for further provision-  
0 ing rules.

0 Refer to ECM441, XPM Power Provisioning, to ensure that the cor-  
0 rect NT2X70, Power Converter CP, is provisioned in upgraded XPMs.

0 BCS34 Gating Hardware

0 Only Feature Insertion Gating Hardware is identified for BCS 34.

0 The following terms used in the table below are defined as fol-  
0 lows:

| 0 Terms in Table | 0 Associated PEC |
|------------------|------------------|
| 0 -----          | 0 -----          |
| 0 Unified Proc   | 0 NTMX77AA       |
| 0 XPM+ Term PB   | 0 NTMX71AA       |
| 0 EISP           | 0 NTBX01AB       |
| 0 4M MS Proc     | 0 NT9X13DC       |
| 0 6M Memory      | 0 NT9X14BB       |

0 The NTMX77AA (Unified Processor), NTMX71AA (XPM Plus Terminator  
0 Paddleboard), and NTBX01AB (Enhanced ISP) must be provisioned on  
0 all RCCI modules going to BCS34.

0 NT9X13DC, MS CPU Processor CP (4Meg), and NT9X14BB, 6MB Memory,  
0 must be provisioned on the Message Switch (MS) for applications  
0 using the NIU hardware and or software (NTXP47AA) in BCS34, i.e.  
0 the Packet Handler.

0  
0 RELEASE 28.01  
0 93 12 030 BCS35 Gating Hardware0 The following BCS Insertion Gating Hardware is identified for BCS  
0 35:

- 0 \* Minimum 16M memory is required in the Message Switch prior to  
0 BCS 35 load insertion if USL load MIC is used and/or if SCP  
0 II and Billing Server is being added.
- 0 \* In STP switches Combined Clock CPs, NT9X53AC, and External  
0 Clock I/F CPs, NT9X54AC, are required in in the MS of STP  
0 switches prior to BCS SW load insertion.
- 0 \* When using "Universal" loads (USL) on the SuperNode SE, the  
0 Compute Module must be provisioned with NT9X14EA 96MByte mem-  
0 ory cards prior to USL insertion. The NT9X14EA is in these  
0 instances regarded as BCS Insertion Gating. Provisioning of  
0 the NT9X14EA is conditional on having NT9X13MB processors in  
0 the SNSE Compute Module. Refer to ECM 623 for SNSE provision-  
0 ing rules.

0 The following table provides a summary of MS USL loads, their  
0 size and their contents.

| MS LOAD | MEMORY | PRODUCT  | PACKAGE   |
|---------|--------|----------|-----------|
| -----   | -----  | -----    | -----     |
| MSC35   | 7M     | J-NET    | NTXP10    |
| MEC35   | 10M    | E-NET    | NTXE01 or |
|         |        | DMS-PH * | NTXP47 or |
|         |        | FLIS     | NTXQ51 or |
|         |        | ASN VM   | NTXR87 or |
|         |        | ADAS     | NTXQ23    |
| MIC35   | 16M    | DMS-SCP  | NTXN21    |
| MNC35   | 16M    | SNSE     | NTXP44    |

0 \* Requires minimum 7M in Canada

0 The following MS memory sizes may be configured. MS memory sizes  
0 are referenced as requirements in the tables which follow.

| 0 | TOTAL MEMORY | PROCESSOR        | MEMORY          |
|---|--------------|------------------|-----------------|
| 0 | -----        | -----            | -----           |
| 0 | 7 Meg        | 9X13DA (1 meg) + | 9X14BB (6 meg)  |
| 0 | 7 Meg        | 9X13DB (1 meg) + | 9X14BB (6 meg)  |
| 0 | 10 Meg       | 9X13DC (4 meg) + | 9X14BB (6 meg)  |
| 0 | 25 Meg *     | 9X13DB (1 meg) + | 9X14DB (24 meg) |
| 0 | 28 Meg       | 9X13DC (4 meg) + | 9X14DB (24 meg) |
| 0 | 16 Meg **    | 9X13DD (16 meg)  |                 |

0 \* (only used in DMS 250)  
0 \*\* VO in BCS 35)

## 0 TABLE 5: BCS Requirements for SuperNode

0 \*\* Existing NT9X14BB 6 MByte CPs do not have to be retrofit  
0 to NT9X14DB 24 Mbyte. Requirements for the NT9X14DB CP  
0 for BCS26 & 27 refers to new installations and replacements  
0 of existing NT9X14DA. Memory growth is provisioned in  
0 increments of 24 MBytes (i.e. NT9X14DB). The NT9X12AC replaces  
0 the NT9X12AB.

0 && Required when adding ENET H/W and/or S/W.(Package NTXE01AA  
0 in MS load MEC)

0 \$\$ Required when adding FLIS H/W and/or S/W (Package NTXQ51AA  
0 in MS load MEC)

0 ## Required when adding the NIU H/W and/or S/W,(Package NTPX47AA  
0 in MS load MEC), for the Packet Handler.

0 For the Canadian Market, the requirement for a  
0 minimum of 10M Byte of MS for Packet Handler in BCS 34 is  
0 reduced to a minimum of 7M Byte in BCS 35. The S/W package  
0 NTPX47AA is contained in the MS load MEC.

0 For the US Market the requirement for a minimum of 10M Byte of  
0 MS memory is also required in BCS 35.

0 @@ A minimum of 16M of MS memory is required when adding SCP II  
0 and Billing Server and/or S/W (Package NTXF06AA in MS load MIC),

0 %% Combined Clock CPs, NT9X53AC, and External Clock I/F CPs,  
0 NT9X54AC, are required in in the SuperNode MS  
0 of STP switches prior to BCS SW load insertion. The minimum MS  
0 packfill required to support NT9X53AC and NT9X54AC is NT9X04AG.

0 ++ A minimum of 10 Mbyte of MS memory is required when adding  
0 NIU HW and/or S/W (Package NTXQ23AA in MS load MEC) for ADAS.

TABLE 6: BCS Requirements for SuperNode SE

\*\* When using "Universal" loads (USL) on the SuperNode SE, the Compute Module must be provisioned with NT9X14EA 96MByte memory cards prior to USL insertion. The NT9X14EA is in these instances regarded as BCS Insertion Gating. Provisioning of the NT9X14EA is conditional on having NT9X13MB processors in the SNSE Compute Module. Refer to ECM 632 for SNSE provisioning rules.

The above requirements apply for the following SNSE USLs:

For the U.S., either of:

NTXC57AA DMS100 BCS35 S/W LOAD FOR SNSE ENET SERIES 20  
NTXC58AA DMS100/200 BCS35 S/W LOAD FOR SNSE SERIES 20  
NTXC59AA DMS200 BCS35 S/W LOAD FOR SNSE SERIES 20

For Canada, either of:

0  
0 RELEASE 28.01  
0 93 12 03

0 NTXC63AA SMART MANAGEMENT SNSE SERIES 20  
0 NTXC64AA UNIVERSAL S/W SNSE SERIES 20 FOR TOLL

0 @@ A minimum of 16M of MS memory is required when adding SCP II  
0 and Billing Server and/or S/W (Package NTXF06AA in MS load MIC),  
0 Also when adding SNSE S/W (Package NTP44AA  
0 in MS load MNC)

0 ## The PEC NT9X44AC represents Software Load Module SLM1A which is  
0 used with SNSE.

0 TABLE 9: BCS-35 Requirements for LPPs (CHART 3 OF 3)

0 Note - new = Product Engineering Codes (PEC) for an initial  
0 office receiving a BCS load  
0 upg = PEC for an existing office which is upgrading a  
0 BCS load  
0 Refer to ECM 620 for minimum hardware required for  
0 LPP applications in BCS 34.

0 CAUTION Before attempting BCS loading of STP LPPs in which the LIUs  
0 use NTEX22AA (4M) processors, ensure that DATAFILL memory  
0 requirements do not cause memory capacity to be exceeded.  
0 LIU memory requirement calculations are detailed in  
0 SEB 92-01-001. Refer to ECM 620 for LIU provisioning rules.

0 Where LIU memory requirements exceed 4M, replace NTEX22AAs  
0 with NTEX22BBs. In these instances, the NTEX22BBs should be  
0 treated as Feature Insertion Gating material. Refer to the  
0 Section "Feature Insertion Gating Hardware."

0 All other hardware is feature hardware. The BCS feature related  
0 hardware information and details on the BCS Gating hardware  
0 should be obtained from Advanced Provisioning Information (API)  
0 documents or Engineering Change Memorandums (ECM) on the feature.  
0 This feature related hardware should be ordered in the appropriate  
0 specs.

0 1.0 Service Standards

0 1.1 Introduction

0 The Service Standard Specifies the Delay and Matching Loss Crite-  
0 ria Service Objectives for Local (Class 5) and Toll switching  
0 systems recommended by Northern Telecom. Explicit objectives are  
0 given for the Average Busy Season Busy Hour (ABSBH), and High Day  
0 Busy Hour (HDBH)

0 The standard has been developed taking into account both the per-  
0 formance aspects of switching systems and the service expecta-  
0 tions of customers. The following three areas of traffic  
0 engineering related activities are impacted by design standards:

0 \* Switch Administration Switch administration will ensure that  
0 service provided meets these traffic  
0 standards using servicing techniques.

0 \* Switch Provisioning Initial switch implementation as well  
0 as switch extensions are engineered to  
0 meet given traffic service objectives.  
0 These service standards performance  
0 levels will be used in determination of  
0 switch capacities.

0 \* Switch Performance The Delay and Matching Loss design  
0 standard performance levels will be  
0 used as a point of reference in the de-  
0 velopment of performance requirement  
0 standards which specifies Northern  
0 Telecom's performance requirements re-  
0 commendations for the design and devel-  
0 opment of new switching systems.

0 1.2 Busy Hour Criteria

0 Provisioning of traffic sensitive components is based on service  
0 criteria and traffic intensity (Load) or on call attempts as a  
0 function of service relations. In engineering the facilities,  
0 the derived load versus service restrictions should be as accu-

0 RELEASE 28.01  
0 93 12 03

0 rate as possible. These functions should be verified by simu-  
0 lation and appropriate measurements on systems in service.

0 The traffic capacity tables that form the basis for equipment  
0 provisioning give the load or call volumes that can be handled by  
0 different equipment quantities, while attaining a fixed service  
0 criterion during an indicated period of time (Busy Hour). Se-  
0 lection of the Busy Hour is critical, because this is the period  
0 during a year for which the traffic load or call attempts should  
0 be forecast. In some cases, provisioning is based on the most  
0 limiting of two or three expected loads in different periods of  
0 time (i.e. ABSBH 10HDBH and HDBH) with a different service crite-  
0 rion. The purpose of this is to ensure adequate performance un-  
0 der both normal and peak load conditions.

### 0 1.3 Types of Service Criteria

#### 0 Blocking Loss (Matching Loss Criteria)

0 Blocking Loss occurs when a call arrives for service and all  
0 servers (service circuits, network paths, etc.) are busy. Block-  
0 ing is measured as the fraction of all calls attempted that are  
0 lost.

#### 0 Delay Criteria

0 Delay occurs when a call finds all servers (service circuits,  
0 software resources, etc.) busy and the call is queued until it  
0 defects or a server becomes idle. Delay is usually measured as  
0 the fraction of call attempts that are delayed greater than a  
0 specified criteria (i.e. Delay > 3 seconds or Delay > 1 Holding  
0 Time).

#### 0 Terminating Matching Loss (TML)

0 The DMS-100F is provisioned in modular sections, with each module  
0 having its own component of Matching Loss. Incoming Matching  
0 Loss (IML) is the linear addition of the Matching Loss allotted  
0 to component parts. Terminating Matching Loss (TML) is the IML  
0 portion allocated to Peripheral Modules (PM) (i.e. LCM/LGC,  
0 RLCM/LGC, OPM/LGC, LCM/RCC etc.) (see figure below).

0 RELEASE 28.01  
0 93 12 03  
0

0 1.4 Definitions

0 Busy Hour (BH)

0 In a business day, the peak 60 minute period (not necessarily a  
0 clock hour) when the largest volume of traffic is handled.

0 Time Consistent Busy Hour (TCBH)

0 The busy hour may vary from one day to another. In order to en-  
0 gineer the switching equipment, the hour of day which consist-  
0 ently has the highest average load over the study period is  
0 determined. This hour is called the Time Consistent Busy Hour.

0 Busy Season (BS)

0 Three selected months (not necessarily consecutive) each contain-  
0 ing 20 consecutive business days that have the highest average  
0 business day traffic in the TCBH is termed the Busy Season. It  
0 should be noted that the same hour is used for each month.

0 RELEASE 28.01  
0 93 12 03  
0

0 Average Busy Season Busy Hour (ABSBH)

0 The measured busy hour traffic, averaged across the business days  
0 of the busy season is termed the Average Busy Season Busy Hour  
0 (ABSBH) load.

0 Ten High Day Busy Hour (10HDBH)

0 Traffic Data are processed all year. From this data the average  
0 of the ten highest days busy hour load (excluding holiday traffic  
0 e.g. Mother's Day and abnormal traffic e.g. Snow Storms) is cal-  
0 culated. This is termed the Ten High Day Busy Hour Load. The  
0 10HDBH may not be the same busy hour as that calculated for the  
0 ABSBH.

0 Note that a 10HDBH performance standard is not based directly on  
0 the 10HDBH load. Such a standard is the (unweighted) average  
0 service expected for the relevant 10 busy hours. Since virtually  
0 all load/service relations are convex functions, this means that  
0 traffic engineering for the 10HDBH must include a "day-to-day  
0 variation" allowance, (i.e. a reduction in the capacity that  
0 would be cited to meet a single-hour service objective. This same  
0 remark applies to ABSBH service standard and capacities.

0 High Day Busy Hour (HDBH)

0 The one day among the 10HDBH Loads that has the highest traffic  
0 during the busy hour is designated the High Day Busy Hour.

0 Call Types

0 Calls processed by Local (Class 5) and Toll switching systems  
0 other than test calls are categorized as follows:

0 \* Originating Terminating These are calls which originate from  
0 and are terminated to customer lines  
0 within the same switch. These are also  
0 called intra-office calls.

0 \* Originating Outgoing These are calls which originate from  
0 the customer lines served by the switch  
0 but have a terminating destination ex-

0  
0 RELEASE 28.01  
0 93 12 03

0 ternal to that switch. These are also  
0 called interoffice calls.

0 \* Incoming Terminating These calls originate from sources ex-  
0 ternal to the switch and are destined  
0 for termination on customer lines  
0 within this switch

0 \* Incoming Outgoing These calls have originating sources  
0 and terminating destinations which are  
0 external to the switch. These con-  
0 nections are also called tandem calls  
0 and involve a minimum of three switch-  
0 ing systems.

### 0 1.5 Criteria at Normal Operating Conditions

0 Service standards specified in Chapter 2 will apply when there  
0 are no overload controls in effect and all load-related equipment  
0 is in service. Traffic engineering information will be provided  
0 to permit telcos to order DMS-100 systems that will handle  
0 smaller traffic loads while meeting service standard objectives.

### 0 1.6 Criteria Under Overload Conditions

0 Overload is defined as a condition in which the DMS-100 family of  
0 switching systems exceeds High Day Busy Hour performance require-  
0 ments because its call processing resources are exhausted. This  
0 condition can be caused by the exhaust of:

- 0 \* Real Time of the Processor
- 0 \* Switching Network Overloads
- 0 \* Peripheral Units Overload
- 0 \* Inadequate Provision of Service Circuits

0 A DMS-100 Family office is designed and configured to handle a  
0 defined amount of traffic with defined characteristics. If the  
0 designed load is exceeded, some of the traffic must be delayed or  
0 blocked. The exact effect depends on the nature of the overload.  
0 The design intent is that any part of the equipment that is of-

0  
0 RELEASE 28.01  
0 93 12 03

## 0 2.0 Grade of Service Specifications

0 The Office Grade of Service is defined as being a component of  
0 the office service quality, qualifying the normal office reaction  
0 to traffic variations in the ideal situation in which the Office  
0 is completely fault and trouble free. Therefore, to establish a  
0 standard basis of equipment provisioning, it is necessary to de-  
0 vise a measure of service to quantify the inconvenience suffered  
0 by the subscribers as a result of blocking. The definition of  
0 inconvenience depends on how the system deals with calls which  
0 encounter blocking. In a loss system, busy tone is immediately  
0 returned to the calling subscriber who must replace his receiver  
0 before trying again, whereas in a delay system, the calling sub-  
0 scriber can wait, possibly for a limited time, during which, he  
0 is immediately connected when the facility (i.e. service cir-  
0 cuits) becomes available. The subscriber is only considered to be  
0 inconvenienced if the delay exceeds some maximum tolerable value.  
0 DMS-100 family design apply a mixture of loss (matching loss) and  
0 delay criteria.

0 Standard grades of service have usually been arrived at on the  
0 basis of judgement and experience, the idea being to achieve the  
0 best service obtainable with the technology available at reason-  
0 able cost. These standards should not be too inflexible, and may  
0 need to be reviewed from time to time in light of technical de-  
0 velopments.

0 2.1 Dial Tone Delay (DTD) GOS Objectives

| DMS-100 Local |       |       |  |
|---------------|-------|-------|--|
| Criteria      | ABSBH | HDBH  |  |
| -----         | ----- | ----- |  |
| DTD > 3 sec   | 1.5%  | 20%   |  |

0 Note: \* Switches are to be provisioned to the more  
0 constraining of either ABSBH or HDBH load  
0 levels.

0 RELEASE 28.01  
0 93 12 03

0 DTD is a measure of the time it takes a switch to return dial  
0 tone to an originating subscriber after the subscriber goes off-  
0 hook. The receipt of dial tone indicates the system is ready to  
0 receive the subscribers keyed digits.

0 In DMS-100 Local the following times are major contributions to  
0 Dial Tone Delays:

0 \* Peripheral module response time to subscriber off-hook.

0 \* Time to process the request for service by the periph-  
0 eral processor.

0 \* Time required to connect the receiver and tone source

0 These times are cumulative and the system design provides for a  
0 total dial tone connect time that is within the dial tone delay  
0 standards as specified above.

0 Note that blocked dial tone occurs when the customer line circuit  
0 cannot access any digit receiver because of network congestion,  
0 particularly in the peripheral module front end concentrator.

## 0 2.2 Incoming Start to Dial Delay (ISDD) GOS Specification

| 0 | 0            | DMS-100 Local |      | DSM-200 Toll |      |
|---|--------------|---------------|------|--------------|------|
|   |              | -----         |      | -----        |      |
| 0 | Criteria     | ABSBH         | HDBH | 10HDBH       | HDBH |
| 0 | ISDD > 3 sec | 1.5%          | 20%  | 8%           | 20%  |

0 Note: \* Switches are to be provisioned to the more  
0 constraining of either ABSBH or HDBH for Local  
0 and 10HDBH or HDBH for Toll load levels.

0 When attempts are allowed to queue, interoffice receivers (MF)  
0 are subject to interoffice receiver (IR) delay criterion, ex-  
0 pressed as the probability that all MF receivers are busy when a

0 RELEASE 28.01  
0 93 12 03

0 call arrives. Generally, the dial tone delay standards apply to  
0 incoming start to dial delay as well.

0 Receiver circuit provisioning is given in item 2.5. These are  
0 engineered so that Call Processing Delay constitutes the major  
0 component of DTD and ISDD in a central control (Realtime) limited  
0 system.

0 2.3 Matching Loss G.O.S.

| DMS-100 LOCAL<br>-----               |                |               |             |  |

| Criteria<br>-----                    | ABSBH<br>----- | HDBH<br>----- |             |  |
|                                      |                | Current       | Recommended |  |
| Incoming Matching Loss (IML)         | 2%             | 20%           | 5%          |  |
| Outgoing Matching Loss (OML)         | 1%             | 20%           | 5%          |  |
| Intra Office Matching (IAML)<br>Loss | 2%             | 20%           | 5%          |  |

| DMS-200 Toll/Tandem<br>----- |        |      |  |
|------------------------------|--------|------|--|
| Criteria                     | 10HDBH | HDBH |  |
| Tandem Matching Loss (TAML)  | 0.5%   | 2%   |  |

0 Note: \* For Local applications the IML is the limiting  
0 factor

0 \* For Toll applications the TAML is the limiting  
0 factor

0 \* For Local/Toll applications the more stringent  
0 of the IML and/or TML is the limiting factor.

0 RELEASE 28.01  
0 93 12 03  
0

- 0  
0 \* The TELCO may wish to specify different GOS for  
0 their unique operating environment.

0 Matching loss is defined as the situation where no network path  
0 exists between an incoming or originating call and a free cus-  
0 tomer line or suitable outgoing trunk. Matching loss can be  
0 classified by the type of call being processed by the switching  
0 technology employed. In general it is classified as follows:

0 \* INCOMING MATCHING LOSS (IML) This term is used in con-  
0 junction with incoming ter-  
0 minating calls only.

0 \* OUTGOING MATCHING LOSS (OML) This term is used in con-  
0 junction with originating-  
0 outgoing calls only.

0 \* INTRA OFFICE MATCHING LOSS (IAML) This term is used in con-  
0 junction with originating-  
0 terminating calls only.

0 \* TANDEM MATCHING LOSS (TAML) This term is used in con-  
0 junction with incoming-  
0 outgoing calls only.

0 In general, all matching loss calls take up to two trials to find  
0 a suitable path through the network, i.e., All paths are in ef-  
0 fect "point to group" between the originating channel and the  
0 terminating channel.

#### 0 2.4 Service Circuits GOS Objectives

0 With the exception of receivers (i.e. Digitone, MF and UTR), oc-  
0 cupancy on individual groups of service circuits (i.e. tone cir-  
0 cuits, conference circuits, announcement circuits, etc) is  
0 limited to 80 percent on an ABSBH load level basis, and 90 per-  
0 cent on a HDBH load level basis. For large groups of service  
0 circuits, the occupancy limit is expected to be the limiting fac-  
0 tor. For smaller groups of service circuits, the criteria listed  
0 below provide the basis for service circuit delay and blocking

0 RELEASE 28.01  
0 93 12 03

0 requirements. In general, the quantities of these system compo-  
0 nents are engineered to cause minimal blocking. This helps to  
0 ensure that processing requirements per call do not increase sig-  
0 nificantly under peak load conditions.

0 The service circuits GOS based on blocking criteria are as fol-  
0 lows:

| 0 | Service Circuit       | Criteria | ABSBH | HDBH  |
|---|-----------------------|----------|-------|-------|
| 0 | -----                 | -----    | ----- | ----- |
| 0 | Announcement Circuits | BLOCKING | 1%    | 5%    |
| 0 | Tone Circuits         | BLOCKING | 1%    | 5%    |
| 0 | Conference Circuits   | BLOCKING | 0.1%  | 5%    |

## 0 2.5 Receiver GOS Objectives

0 In all cases, occupancy on individual groups of receiver circuits  
0 (i.e. digitone, MF, and UTR) is limited to 75 percent on a HDBH  
0 load level basis. The requirements are expected to be control-  
0 ling requirements for groups of receiver circuits over approxi-  
0 mately 35 receivers (i.e. pool of digitone and/or MF). For groups  
0 of receiver circuits smaller than 35 receivers the following cri-  
0 teria provide the basis for receiver circuit delay and blocking  
0 requirements.

0 The receiver circuits GOS based on blocking and delay criteria  
0 are as follows:

| 0 | Service Circuit | Criteria    | ABSBH | HDBH  |
|---|-----------------|-------------|-------|-------|
| 0 | -----           | -----       | ----- | ----- |
| 0 | DTMF Receiver   | DTD > 0 sec | 1%    | 5%    |
| 0 |                 | DTD > 3 sec | 0.1%  | 1.0%  |
| 0 | MF Receiver     | DTD > 0 sec | 1%    | 5%    |
| 0 |                 | DTD > 3 sec | 0.1%  | 1.0%  |

### 0| 3.0 Traffic Provisioning Considerations

0 The methodology is based on achieving the required Grade of Service Blocking criteria as allocated between the individual components of the DMS-100 System. Where the Grade of Service Blocking is unspecified or is not the most constraining provisioning criteria, NT recommends component blocking standards commensurate with optimal utilisation of the DMS-100 System.

0 For a given Office, NT recommends that engineering the provisioning requirements for series II Peripherals (i.e. LCM, RLCM, OPM, RCC, DTC, LGC, and LTC) be met at the projected High Day Busy Hour (HDBH) Office Load. Verify realtime Capacity, as detailed in appropriate NT Documentation, for both Peripheral and Central Control Complex to ensure satisfactory operation at the specified load.

0 Check the capacities of the link configurations selected to meet the HDBH Load against the relevant non-HDBH criteria, e.g., the projected Average Busy Season Busy Hour (ABSBH) Load. If ABSBH criteria are dominant, increase link quantities or de-load components where these are already at maximum. Re-size the Office physical equipment configurations. It should be noted that DMS-100 designs must satisfy essentially five precepts: Physical requirements, Teletraffic Capacity and Grade of Service criteria, Processor Realtime limits, Software Resources capacity, including total memory requirements, and relevant Administrative criteria (e.g., peripheral image loading).

0| The steps to simplified provisioning are as follows:

- 0 1) Define an overall Initial Matching Loss (IML) for an Office Define blocking by selecting the following:  
0 ABSBH: 0.003, 0.005, 0.007, 0.10 or 0.20  
0 HDBH : 0.03, 0.005, 0.07, 0.1, or 0.2
- 0 2) Use the value of the Initial Matching Loss to provision peripherals by referring to the appropriate traffic table.

0 | 4.3 Definition of a Node

0 | A node is defined as follows:

0 | Host LCMS, remote LCMS, RMMs, RCC, RLCM, OPM,  
0 | ESA processor (for the RLCM or OPM) and dummy  
0 | software nodes.

0 | Following is an example of how to count nodes:

0 | A host LGC configured with two (2) host LCMS, one (1) RLCM, one  
0 | (1) OPM and one (1) RSC (remotes configured below) would constitute  
0 | a total of 15 software nodes.

0 | o The host LCMS would constitute two (2) software nodes.

0 | o A RLCM configured with one (1) RMM and ESA processor would  
0 | constitute three (3) software nodes.

0 | o An OPM configured with one (1) RMM would constitute two (2)  
0 | software nodes.

0 | o An RSC configured with one (1) RCC, two (2) RMMs and five (5)  
0 | LCMS would constitute eight (8) software nodes.

## 0 5.0 Simplified Provisioning (Non-ISDN)

0 The following section provides simplified Teletraffic Engineering  
0 rules for provisioning Series 2 non-ISDN peripheral module equipment.  
0 It includes information about the assumptions that have been used and  
0 the restrictions which apply to this process. (Simplified provisioning  
0 rules for ISDN are discussed in a separate section, later in this doc-  
0 ument.)

0 The simplified traffic engineering methodology uses both High Day Busy  
0 Hour (HDBH) and Average Busy Season Busy Hour (ABSBH) engineering in  
0 calculations for the peripherals, and determines which of these crite-  
0 ria will provide the most stringent requirement. Traffic tables are  
0 provided to support these calculations.

### 0 5.1 LGC/LTC P-Side Configuration

0 The peripheral side (p-side) ports of an LGC/LTC can be configured for  
0 a maximum of two (2) RSCs if the following conditions are met:

- 0 1) 2 RSCs from a single configuration
- 0 2) 1 RSC from a dual configuration and 1 RSC from a single  
0 configuration.
- 0 3) Traffic, Real Time and software Nodal requirements do not  
0 exceed the recommended engineering limits.

0 In addition, the remaining p-side ports can be configured for RLCMs,  
0 OPMs and/or LCMs if the Traffic, Real Time and software Nodal require-  
0 ments do not exceed the recommended engineering limits.

0 An LGC/LTC can support a maximum of two RSC-SONET controllers, pro-  
0 vided RealTime and nodal limits are not exceeded. The LGC/LTC has 43  
0 messaging channels available for subtending processors (LCMs, ESA,  
0 RMM, etc), which limits modules off the RCC2. See the following sec-  
0 tion for more information regarding counting nodes.

0

0 RELEASE 28.01  
0 93 12 03

0 5.2 RSC P-Side Configuration

0 The peripheral (p-side) ports of an RSC can be configured for the fol-  
0 lowing maximums if the Traffic, Real Time and software Nodal require-  
0 ments do not exceed the recommended engineering limits:

- 0 1) Maximum of 9 LCMs (using 2 links per LCM)
- 0 2) Maximum of 4 DS1s for PBX Trunking and/or 4 DS1s for CDO  
0 Trunking.
- 0 3) Maximum of 9 non-ESA RLCM/OPMs using two links per module.
- 0 4) Any combination of the above not to exceed the stated  
0 individual maximums

0 A host LGC/LTC can support a maximum software datafilling of 18 Pe-  
0 ripheral side (P-side) software nodes. (Pre BCS23)

0 A host LGC/LTC can support a maximum software datafilling of 62  
0 software nodes. (BCS23 and onwards)

0 ( i) Traffic from Community Dial Office (CDO) trunks (Dy-  
0 namic Trunks) is assumed to stay at the remote site and  
0 does not utilize host links. The CCS value used for all  
0 lines that terminate on the same controller as the CDO  
0 trunks must include both host to line and CDO to line  
0 traffic.

0 CDO Dynamic trunks off a RSC - A maximum of four (4)  
0 DS-1 CDO Dynamic trunks will be supported.

0 ( ii) Traffic from Private Branch Exchange (PBX) trunks (Dy-  
0 namic trunks) is divided between the host and remote  
0 based on customer input.

0 PBX Dynamic trunks off a RSC - A maximum of four (4)  
0 DS-1 PBX Dynamic trunks will be supported.

0 (iii) The total number of P-side RCC ports to support  
0 RLCM/OPM lines and CDO,PBX Dynamic trunks in any combi-

0  
0 RELEASE 28.01  
0 93 12 03

0 nation, while maintaining individual maximums, must not  
0 exceed eighteen (18) ports.

0 ( iv) Dual RCC configurations must have traffic balanced as  
0 evenly as possible across both RCC's. Dual RCC's  
0 interfacing an odd number of LCM's must have a balanced  
0 traffic capacity across both RCC's by either adding a  
0 LCM to share traffic loads or distributing the Line  
0 Cards evenly to promote a balanced traffic capacity.  
0 This includes any RLCM/OPM that is "remoted" or CDO/PBX  
0 Digital Dynamic Trunks off the RCC's.

0 ( v) Minimum traffic on Host links is the total traffic  
0 less the intra traffic derated by a factor of 0.96.  
0 All call types (whether intra or non-intra) will  
0 require call set up using the Host links.

0 ( vi) All "INPUT" information must be provided on a per site  
0 basis for each type configuration. All "INPUT" informa-  
0 tion must be Telco specified.

0 ( vii) All line card types are spread evenly across all  
0 equipped line drawers as possible. This will avoid  
0 any "lumping" of a particular line card type in any  
0 one line drawer or LCM.

0 (viii) POTS wired lines are defined as line cards used for  
0 the following functions:

|   |              |   |          |                     |
|---|--------------|---|----------|---------------------|
| 0 | Single Party | - | NT6X17-- | (A type Line Cards) |
| 0 | Two Party    | - | NT6X18-- | (B type Line Cards) |
| 0 | Four Party   | " | "        | "                   |
| 0 | Eight Party  | " | "        | "                   |
| 0 | Coin Lines   | " | "        | "                   |
| 0 | PBX Lines    | " | "        | "                   |

0 ( ix) Meridian Digital Centrex (MDC) wired lines are defined  
0 as line cards used for the following functions;

|   |                    |   |          |                     |
|---|--------------------|---|----------|---------------------|
| 0 | MDC Business Lines | - | NT6X17-- | (A type Line Cards) |
| 0 | MDC Business Lines |   | NT6X18-- | (B type Line Cards) |

0  
0 RELEASE 28.01  
0 93 12 03

0 Business Sets - NT6X21-- (C type Line Cards)  
0 Message Waiting - NT6X19-- (E type Line Cards)

0 ( x) DATAPATH wired lines are defined as line card used  
0 for the following function;

0 Data Unit - NT6X71-- (D type Line Cards)

0 ( xi) IBERT wired lines are defined as line card used for the  
0 following function;

0 IBERT - NT6X99-- (INTEGRATED BIT ERROR RATE TEST CARD)

0 (xii) DIALAN lines are defined as line cards used for the  
0 following function;

0 DIALAN - NT6X76-- (L TYPE LINE CARD) FOR DATA PORTION  
0 - NT6X17-- (A TYPE LINE CARD) FOR VOICE PORTION

0 Voice portion of full DIALAN service is included in the  
0 MDC category since DIALAN service can be provided with  
0 or without the voice/MDC portion.

0 5.3 LCM Physical Configuration Calculation:

0 POTS + MDC + DATAPATH + IBERT + DIALAN + 48V PwrCnvt +  
0 MessWait + AttCon = T

0 # LCM = T/Number of slots to be used per LCM

0 Where:

0 POTS = (qty of A + B type Line cards) defined for POTS use

0 MDC = (qty of A + B + C + E Line Cards) defined for MDC use  
0 (includes voice portion of DIALAN)

0 DATAPATH = 2\*(qty of D type Line Cards) defined for DATAPATH use

0 IBERT = 2\*(qty of Ibert Line Cards)

0 DIALAN = Z\*(qty of L type Line Cards) defined for DIALAN use

0 Where: Z=2 if using NT6X76AC or data is = or < 10% of lines  
0 Z=3 if using NT6X76AA and data penetration is > 10%.

0 +48V Pwr Cnvt = 2\*(qty of NT6X23AA (+48V Power Converters))

0 Mess Wait = 2\*(qty of NT6X20AA (Message Waiting Converters))

0 Att Con = 3\*(quantity of Attendant Consoles)

0 ( i) This document addresses the traffic component of provi-  
0 sioning and assumes hardware will be provisioned based  
0 on the applicable Engineering Manual section.

0 ( ii) The Simplified Traffic method supports 2% ABSBH and and  
0 5% HDBH overall office Matching Loss only. For appli-  
0 cations where the overall office Matching Loss is other  
0 than 2% ABSBH and 5% HDBH contact System Engineering.

0 (iii) When completing the calculations, results may be ob-  
0 tained that exceed the allowable limits for the module  
0 being considered. This will be noted by an appropriate

0 comment (for example, "if > x, Dual RSC is required" or  
0 "if > y, reconfigure"). The engineer must reallocate  
0 lines or peripherals to provide a less-demanding load  
0 on the controller and recalculate until a configuration  
0 which falls within the limits is found.

0 5.5 Application of Tables used in Simplified Provisioning (Non-ISDN)

0 |

0 | Table D: LCM HDBH Carried Traffic Capacity (CCS)

0 The number of LCM required to support the specified number of  
0 line cards with their associated physical requirements and line  
0 card spreading rules, fill factors etc is determined. A distrib-  
0 ution of the total number of lines across the required number of  
0 LCMs is made. The LCM traffic load is calculated comprising the  
0 sum of the product of the number of lines times the mean traffic  
0 per line for each class of service. Per line traffic is normally  
0 quoted as ABSBH. This should be adjusted to HDBH by the applica-  
0 tion of a factor supplied by the Telco (HDBH/ABSBH ratio). The  
0 result is the LCM HDBH Traffic load requirement.

0 | The Telco also supplies an overall HDBH Blocking requirement for  
0 the Office. This is usually the Incoming Matching Loss (IML).

0 | 1. Select the preferred value (Concentrating vs Non-  
0 Concentrating).

0 | 2. Start with Table D-a (for concentrating LGC/LTCs) if you  
0 have chosen the concentrating option.

0 | 3. Given the IML Blocking, HDBH/ABSBH Ratio, and CCS per LC  
0 (ABSBH), read the number of links per LCM. See sample val-  
0 ues below:

0 | SAMPLE VALUES

0 | Use these sample values to walk through the example below:

0 | IML = .006  
0 | HDBH/ABSBH Ratio = 1.1  
0 | CCS/LCM = 3000

0 | a) For IML = .006, pick the next LOWEST range of values  
0 (representing a higher grade of service). These are ar-

0  
0  
0

0  
0 RELEASE 28.01  
0 93 12 03

0 | rayed in blocks of five rows, representing the number  
0 | of links (2-6) per LCM.

0 | b) Choose the appropriate column of values based on the  
0 | HDBH/ABSBH Ratio, e.g., one of 1.1, 1.15, 1.2, 1.3. (In  
0 | the sample values above, the ratio used is 1.1).

0 | c) Select the number of links per LCM by choosing the ap-  
0 | propriate row in the block that is GREATER THAN OR  
0 | EQUAL TO the value of CCS per LCM. Based on the sample  
0 | values above, Links per LCM in this example would be 5.  
0 | (Find block where IML = .005, as next higher grade of  
0 | service. Pick column for ratio = 1.1, then find row  
0 | showing CCS/LCM value of 3545 which is next highest  
0 | value to 3000.)

0 | 4. Use the same steps using Table D-b, for non-concentrating  
0 | LGC/LTCs, to produce a second value for Links per LCM.

0 | Table E: RLCM/OPM HDBD Carried Traffic Capacity (CCS)

0 | 1. In Table E1, locate the required HDBH/ABSBH ratio in the  
0 | ABSBH version of the table.

0 | 2. Locate the sub-table of Table E1 containing the HDBH/ABSB  
0 | ratio you require:

0 | E1-a = HDBH/ABSBH Ratio 1.1  
0 | E1-b = HDBH/ABSBH Ratio 1.15  
0 | E1-c = HDBH/ABSBH Ratio 1.2  
0 | E1-d = HDBH/ABSBH Ratio 1.3

0 | 3. Find the IML block which is lesser than or equal to the IML  
0 | value you calculated.

0 | 4. Select the appropriate column for the expected percentage  
0 | (%) Intra Office Traffic, e.g, 60%. If the expected per-  
0 | centage (%) is not in the table, use the column for the next  
0 | lowest percentage.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 5. Select the number of links per LCM by choosing the appropri-  
0 ate row in the block that is greater than or equal to the  
0 value of CCS per LCM.

0 6. Read the number of links per LCM from the left side of the  
0 table.

0 7. The above method applies to both RLCM and OPM peripherals.

0 Use the sample values below to follow the example:

0 SAMPLE VALUES

0 Use these sample values to walk through the example below:

0 IML = .006  
0 HDBH/ABSBH Ratio = 1.1  
0 CCS/LCM = 3000

0 8. If the CCS/LCM exceeds the values in the table block, i.e.,  
0 if number of links is greater than 6, change your configura-  
0 tion to reduce the the CCS/LCM (deload), and then recalcu-  
0 late based on the revised configuration.

0 9. Repeat this process using HDBH Data in Table E2, and select  
0 the higher of the two values (representing maximum links).

0 Table F (Mono RSC Host Link HDBH CCS)

0 1. Use Table F-a: RCC Traffic Capacity (CCS) Supporting Lines  
0 Only, if the the RCC has no trunk connections.

0 (a) Starting with the Host CCS, read down the columns for  
0 Host CCS until you reach the CCS number which is  
0 greater than or equal to the CCS figure you started  
0 with. Look left to identify the host links required.

0 For Example:

0

0  
0 RELEASE 28.01  
0 93 12 03

0 For Host CCS = 10006, scan down the column until you reach  
0 the next highest figure (10838). Looking left to the host links  
0 column, host links required would be 14.

0 (b) Repeat this process for Total CCS. Identify the host  
0 links required.

0 (c) If the number of host links required is greater than 16  
0 (max) for EITHER the Host CCS or Total CCS columns, a  
0 Dual RCC is required.

0 2. Use Table F-b: RCC Traffic Capacity (CCS) - Supporting Lines  
0 and Trunks, if there are CDO or PBX DS-1s attached to the  
0 RCC.

0 (a) Identify the number of supporting lines and trunks at-  
0 tached to the RCC (ranges from 1-8), and choose the  
0 column for Intra CCS corresponding to that number of  
0 lines/trunks.

0 (b) Read down the column for Intra CCS, to the CCS figure  
0 representing the amount of Intra CCS you calculated  
0 earlier.

0 (c) Read down the column to the next highest CCS figure,  
0 and read across to the amount of Host CCS available af-  
0 ter the Intra CCS has been accounted for. If there is  
0 enough Host CCS available, read across to the number of  
0 host links required. If there is NOT enough Host CCS  
0 left after the intra CCS, you must de-load and recalcu-  
0 late before going on to identify the host links re-  
0 quired for the new configuration.

0 Note: The number of possible host links decreases as  
0 the number of supporting lines and trunks increases.  
0 The maximum number of host links is 8 when supporting  
0 lines/trunks equals 8 (max).

0 (d) If the number of host links required exceeds the maxi-  
0 mum available, a Dual RCC is required.

- 0 | (e) Select the highest number of links required to satisfy  
0 | both Host and Intra CCS requirements.

0 | Table G: RSC-S Traffic Capacity

- 0 | 1. Given the figure for Switched CCS, read down the table to  
0 | find the next highest level, then read across to identify  
0 | channels required.

- 0 | 2. If CCS figures exceed the maximum, a dual RSC-S is required.

0 | Table H: Interlink Provisioning (Dual RSC)

- 0 | 1. Choose the highest CCS figure for RCC 1 or RCC 2, and use  
0 | this CCS figure for both RCCs.

- 0 | 2. Read down the CCS column to the next highest figure, the  
0 | read across to number of links (interlinks) required. The  
0 | minimum is two, and the maximum is 14.

- 0 | 3. If CCS figures exceed the maximum, a co-located RSC is re-  
0 | quired.

0 | Table K: DMS-100 Local Network Capacities

- 0 | 1. Given a figure for Total Two-way CCS per Network Module,  
0 | start with column for ABSBH blocking factor (IML) of .001.

- 0 | 2. Read down this column to find the total two-way CCS figure  
0 | which is greater than or equal to the required value.

- 0 | 3. Read left to find the number of network modules required

- 0 | 4. Repeat this process using the column for HDBH, IML = .01

- 0 | 5. The number of network modules required will be the higher of  
0 | these two figures, or the maximum number of modules accord-  
0 | ing to physical network requirements.

0 | Table L: DMS-200 Offices and DMS-100/200 Toll Offices

0

- 0 | 1. Use this table in the same way as Table K, for DMS-200 of-  
0 | fices and for DMS-100/200 Toll offices or offices combining  
0 | local/toll networks.

0 | Table X: IRLCM Capacity (CCS)

0 Table X is used in a similar manner to Table E, where the Remote  
0 site is served by IRLCM utilising PCM-30 digital spans.

0 | 6.0 Simplified Provisioning (ISDN)

0 | The provisioning of DMS-100 peripherals and DPN packet handler  
0 | equipment for the Integrated Services Digital Network (ISDN) of-  
0 | fice is based on meeting required traffic levels and Grade of  
0 | Service (GOS) requirements. The desired Incoming Matching Loss  
0 | and traffic load together determine the required quantity of:

- 0 |       - LCMI modules  
0 |       - ISDN Peripheral Controller (CPCI) modules  
0 |       - Links from LCMI to CPCI  
0 |       - Links from CPCI to Network  
0 |       - D-Channel Handler circuit packs on CPCI  
0 |       - Digital Interworking Unit T1 and Serial Interface Modules  
0 |       - Access Module LAPB and LAPD Processing Elements

0 | DMS-100 components, including ISDN peripherals, are engineered to  
0 | meet the projected High Day Busy Hour (HDBH) Load at the speci-  
0 | fied Grade Of Service parameters. Link configurations, traffic  
0 | loading of individual elements, and equipment quantities are then  
0 | adjusted if other criteria, (e.g., Real Time or capacity) are  
0 | dominant.

0 |

0 | NOTE: The overall Peripheral GOS (IML) for the non-ISDN peripher-  
0 | als must be the same as that used for the ISDN peripherals.

0 RELEASE 28.01  
0 93 12 03

0 | 6.1 Simplified ISDN Traffic Provisioning Method

0 | 1. The ISDN Peripheral engineering methodology results in the  
0 | provisioning of "n" CPCI modules across which the traffic  
0 | load is spread as evenly as possible. The first "n-1" mod-  
0 | ules are identical, and will be configured to contain the  
0 | near-optimum number of links, DCH circuit packs and LCMIs  
0 | appropriate to the quantity of loops with the desired char-  
0 | acteristics which can be supported. The "nth" or "Residual"  
0 | CPCI module is provisioned to accommodate the remaining pe-  
0 | ripherals.

0 | 2. If non-ISDN lines are included as part of the ISDN Order,  
0 | appropriate steps should be taken to provision the necessary  
0 | components to support that part of the order, following the  
0 | simplified method of engineering. Note that the overall Pe-  
0 | ripheral Grade of Service (IML) for the non-ISDN peripherals  
0 | must be the same as that used for the ISDN peripherals.

0 | Resulting from the engineering of the non-ISDN portion of  
0 | the Order will normally be several LGC modules. Select ONE  
0 | of the group of LGC(s) which supports the fewest LCMs; the  
0 | selected LGC must support LCMs ONLY (no RSC, trunks, etc).  
0 | Calculate the traffic carried by all the LCMs interfacing to  
0 | this LGC. If the sum is less than 6000 CCS, these LCMs will  
0 | be termed "Residual LCMs" and the "n"th LGCI should be  
0 | tested to check if it can support the Residual LCMs. If this  
0 | is feasible, the Residual LCMs should be re-assigned to the  
0 | LGCI and the LGC requirement correspondingly reduced.

0 | 3. Check whether the lines on the residual LCMs can be accommo-  
0 | dated on the LCMI. If this is feasible, the non-ISDN lines  
0 | from the Residual LCMs will be mixed with ISDN loops by as-  
0 | signing them to the LCMIs that interface to the residual  
0 | CPCI.

0 | If these checkpoints fail, the non-ISDN and ISDN services  
0 | will remain segregated on non-ISDN and ISDN peripherals as  
0 | per the original engineering.

0 | After the DMS-100 ISDN Peripheral equipment design is com-  
0 | plete, perform the Packet Handler traffic engineering; pro-

0 | vision the packet handler to meet the configurations  
0 | dictated by the CPCI engineering.

0 | 6.2 ISDN 2B1Q Simplified (Traffic) Engineering Rules

0 | ISDN 2B1Q Simplified engineering rules are used only for the pro-  
0 | visioning and engineering of host (LCGI/LTCI) or remote (RSCI)  
0 | peripherals which subtend the 2B1Q Enhanced Line Concentrating  
0 | Module (LCME). The 2B1Q Simplified method takes into account  
0 | current Telco projections for ISDN loop requirements and uses a  
0 | set of rules that meets the desired Grade of Service, capacity,  
0 | and high speed packet requirements. The 2B1Q Simplified rules  
0 | have been optimized to provide one (1) LCME per LCGI/LTCI/RSCI.

0 | 1. If non-ISDN lines are included as part of the ISDN order,  
0 | appropriate steps should be taken to provision that part of  
0 | the order using the simplified method for non-ISDN provi-  
0 | sioning. Note that the overall peripheral Grade of Service  
0 | (IML) for non-ISDN peripherals must be the same as the de-  
0 | fault parameters used within the 2B1Q Simplified rules.

0 | 2. Any resulting residual non-ISDN lines may be accommodated by  
0 | mixing of non-ISDN services with ISDN services on an LCME.  
0 | However, the LCME is not intended solely as a non-ISDN vehi-  
0 | cle. Thus a large residual non-ISDN requirement which can  
0 | not be engineered appropriately over the 2B1Q equipment com-  
0 | plement should be either re-engineered via step 1. above or  
0 | re-negotiated with the Telco.

0 | 3. The 2B1Q Simplified engineering method makes a number of as-  
0 | sumptions to simplify both the calculations and the number  
0 | of tables required based on current Telco ISDN loop require-  
0 | ments.

0 | The Grade of Service assumptions are as follows:

|                                     |         |              |
|-------------------------------------|---------|--------------|
| 0   DTD > 3 sec.                    | (ABSBH) | 0.015        |
| 0   DTD > 3 sec.                    | (HDBH)  | 0.2          |
| 0   ISDD > 3 sec.                   | (ABSBH) | 0.015        |
| 0   ISDD > 3 sec.                   | (HDBH)  | 0.2          |
| 0   HDBH/ABSBH ratio (lines/trunks) |         | 1.1/1.15/1.2 |

0 | The number of high speed packet data (Bb) is limited to 10%  
0 | of the total BRA (2B+D) lines to prevent excessive capacity  
0 | restrictions.

0  
0 RELEASE 28.01  
0 93 12 03

- 0 | 4. Once the general inputs section has been captured from the  
0 | Telco, calculations proceed as follows:
- 0 | - General calculations are performed to determine the  
0 | number of lines, slots, trunks, and the weighted CCS  
0 | per line.
  - 0 | - LCME calculations are performed to determine the  
0 | provisionable number of lines, Bd and Dd channels,  
0 | total CCS, and the number of host links on a per LCME  
0 | basis.
  - 0 | - DCH/Packet Handler calculations determine the number of  
0 | lines, Bb and Dd links per DCH, as well as the number  
0 | of packet handler (PH) links on a per LCME basis.
  - 0 | - For remote applications, Mono RSCI calculations deter-  
0 | mine the number of LCME ports, DCHs, C-side links to  
0 | the host and packet handler.
  - 0 | - If necessary, Dual RSCI calculations determine the num-  
0 | ber of LCME ports, DCHs, C-side links to the host and  
0 | packet handler, total CCS, as well as RSCI interlinks.
  - 0 | - LGCI/LTCI calculations determine the number of P-side  
0 | links, DCHs, host facilities, and number of C-side  
0 | loopback ports on a per LGCI/LTCI basis, as well as the  
0 | total number of LGCIs.
- 0 | 5. After the DMS-100 ISDN 2B1Q engineering has been  
0 | completed, do the packet handler (PH) engineering. Provision  
0 | the packet handler (PH) to meet the configurations dictated  
0 | by the DMS-100 ISDN engineering.

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 | 6.3 ISDN Configuration Restrictions

0 | The Packet Handler may be at a centralized location or at the  
0 | RCCI location.

0 | In host applications, the Packet Handler equipment may reside at  
0 | the LGCI/LTCI location or at a centralized location. The Packet  
0 | Handler may be accessed via the P-Side or the C-Side of the  
0 | LGCI/LTCI but, due to the capacity loss inherent in C-side  
0 | loopbacks, P-side access is not used. Rules for C-side config-  
0 | urations are included herein.)

0 | P-side access to the Packet Handler should only be used when the  
0 | Packet Handler is to be located with the RCCI to provide packet  
0 | data capability during Emergency Stand Alone (ESA) conditions.

0 | Since coin lines cannot mount in an LCME, an LCM dedicated to  
0 | coin lines will be provided when this capability is required. If  
0 | a dual RCCI configuration is required, one LCM for coin lines  
0 | will be provided on each RCCI (if coin capability is required).  
0 | This dedicated LCM will have no other line types equipped except  
0 | coin lines and the associated power converters.

0 | It is assumed that RLCM/OPMs will not home to LGCI/RCCI. These  
0 | additions will be added at a later date.

0 | It is assumed all host trunks will terminate to a DTC. Thus LTCs  
0 | will be used only to interface RCCI/RSCs with the trunking fea-  
0 | ture.

0 | It is assumed that the RCCI will home to an LGC or LTC, rather  
0 | than an LGCI/LTCI due to the increased capacity available to the  
0 | LGC/LTC.

0 | The LGC/LTC which is acting as host to an RCCI must have 64KB  
0 | clear channel capability. Likewise, any DTC that provides links  
0 | to the Packet Handler must be equipped for 64KB clear channel ca-  
0 | pability. This is accomplished by equipping NT6X50AB DS-1 circuit  
0 | packs.

0 | The maximum number of LTID per DCH circuit pack is restricted to  
0 | 511.

0  
0 RELEASE 28.01  
0 93 12 03

0 The average DPPS/D terminal is restricted to a maximum of 0.4  
0 packets for each single loop (maximum of 8 terminals per loop).  
0 Increasing the number of packets above 0.4 DPPS/D terminal will  
0 require additional D Channel Handlers (due to the current limit  
0 of 50 DPPS per DCH).

0 The Stat Mux ratio is assumed to be fixed at 64:1.

0 6.4 Application of Tables Used In ISDN Peripheral Engineering

0 Table D: LCM HDBH Carried Traffic Capacity (CCS)

0 The number of LCM required to support the specified number of  
0 line cards with their associated physical requirements and line  
0 card spreading rules, fill factors etc is determined. A distrib-  
0 ution of the total number of lines across the required number of  
0 LCMs is made. The LCM traffic load is calculated comprising the  
0 sum of the product of the number of lines times the mean traffic  
0 per line for each class of service. Per line traffic is normally  
0 quoted as ABSBH. This should be adjusted to HDBH by the applica-  
0 tion of a factor supplied by the Telco (HDBH/ABSBH ratio). The  
0 result is the LCM HDBH Traffic load requirement.

0 The Telco also supplies an overall HDBH Blocking requirement for  
0 the Office. This is usually the Incoming Matching Loss (IML).

0 1. Start with Table D-a (for concentrating LGC/LTCs) if you  
0 have chosen the concentrating option, or choose Table D-b if  
0 you have selecting the non-concentrating option.

0 2. Given the IML Blocking, HDBH/ABSBH Ratio, and CCS per LC  
0 (ABSBH), read the number of links per LCM. See sample val-  
0 ues below:

0 SAMPLE VALUES

0 Use these sample values to walk through the example below:

0 IML = .006  
0 HDBH/ABSBH Ratio = 1.1  
0 CCS/LCM = 3000

0 a) For IML = .006, pick the next LOWEST range of values  
0 (representing a higher grade of service). These are ar-  
0 rayed in blocks of five rows, representing the number  
0 of links (2-6) per LCM.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 | b) Choose the appropriate column of values based on the  
0 | HDBH/ABSBH Ratio, e.g., one of 1.1, 1.15, 1.2, 1.3. (In  
0 | the sample values above, the ratio used is 1.1).

0 | c) Select the number of links per LCM by choosing the ap-  
0 | propriate row in the block that is GREATER THAN OR  
0 | EQUAL TO the value of CCS per LCM. Based on the sample  
0 | values above, Links per LCM in this example would be 5.  
0 | (Find block where IML = .007, as next highest. Pick  
0 | column for ratio = 1.1, then find row showing CCS/LCM  
0 | value of 3545 which is next highest value to 3000.)

0 | 3. Use the same steps for Table D-b ( non-concentrating  
0 | LGC/LTCs) to produce the required value for Links per LCM.

0 | Table E: RLCM/OPM HDBD Carried Traffic Capacity (CCS)

0 | 1. In Table E1, locate the required HDBH/ABSBH ratio in the  
0 | ABSBH version of the table.

0 | 2. Locate the sub-table of Table E1 containing the HDBH/ABSB  
0 | ratio you require:

0 | E1-a = HDBH/ABSBH Ratio 1.1  
0 | E1-b = HDBH/ABSBH Ratio 1.15  
0 | E1-c = HDBH/ABSBH Ratio 1.2  
0 | E1-d = HDBH/ABSBH Ratio 1.3

0 | 3. Find the IML block which is lesser than or equal to the IML  
0 | value you calculated.

0 | 4. Select the appropriate column for the expected percentage  
0 | (%) Intra Office Traffic, .e.g, 60%. If the expected per-  
0 | centage (%) is not in the table, use the column for the next  
0 | lowest percentage.

0 | 5. Select the number of links per LCM by choosing the appropri-  
0 | ate row in the block that is greater than or equal to the  
0 | value of CCS per LCM.

0  
0 RELEASE 28.01  
0 93 12 03

0 | 6. Read the number of links per LCM from the left side of the  
0 | table.

0 | 7. The above method applies to both RLCM and OPM peripherals.

0 | Use the sample values below to follow the example:

0 | SAMPLE VALUES

0 | Use these sample values to walk through the example below:

0 | IML = .006  
0 | HDBH/ABSBH Ratio = 1.1  
0 | CCS/LCM = 3000

0 | 8. If the CCS/LCM exceeds the values in the table block, i.e.,  
0 | if number of links is greater than 6, change your configura-  
0 | tion to reduce the the CCS/LCM (deload), and then recalcu-  
0 | late based on the revised configuration.

0 | 9. Repeat this process using HDBH Data in Table E2, and select  
0 | the higher of the two values (representing maximum links).

0 | Table F (Mono RSC Host Link HDBH CCS)

0 | 1. Use Table F-a: RCC Traffic Capacity (CCS) Supporting Lines  
0 | Only, if the the RCC has no trunk connections.

0 | (a) Starting with the Host CCS, read down the columns for  
0 | Host CCS until you reach the CCS number which is  
0 | greater than or equal to the CCS figure you started  
0 | with. Look left to identify the host links required.

0 | For Example:

0 | For Host CCS = 10006, scan down the column until you reach  
0 | the next highest figure (10838). Looking left to the host links  
0 | column, host links required would be 14.

0 | (b) Repeat this process for Total CCS. Identify the host  
0 | links required.

0 (c) If the number of host links required is greater than 16  
0 (max) for EITHER the Host CCS or Total CCS columns, a  
0 Dual RCC is required.

0 2. Use Table F-b: RCC Traffic Capacity (CCS) - Supporting Lines  
0 and Trunks, if there are CDO or PBX DS-1s attached to the  
0 RCC.

0 (a) Identify the number of supporting lines and trunks at-  
0 tached to the RCC (ranges from 1-8), and choose the  
0 column for Intra CCS corresponding to that number of  
0 lines/trunks.

0 (b) Start with the Host CCS and read down to the number of  
0 host links required.

0 (c) Read down the column to the next highest CCS figure,  
0 and read across to the number of host links required.

0 Note: The number of possible host links decreases as  
0 the number of supporting lines and trunks increases.  
0 The maximum number of host links is 8 when supporting  
0 lines/trunks equals 8 (max).

0 (d) If the number of host links required exceeds the maxi-  
0 mum available, a Dual RCC is required.

0 (e) Select the highest number of links required by either  
0 of Host or Intra CCS.

0 Table G: RSC-S Traffic Capacity

0 1. Given the figure for Switched CCS, read down the table to  
0 find the next highest level, then read across to identify  
0 channels required.

0 2. If CCS figures exceed the maximum, a dual RSC-S is required.

0 Table H: Interlink Provisioning (Dual RSC)

0 1. Choose the highest CCS figure for RCC 1 or RCC 2, and use  
0 this CCS figure for both RCCs.

0  
0 RELEASE 28.01  
0 93 12 03

0 | 2. Read down the CCS column to the next highest figure, then  
0 | read across to number of links (interlinks) required. The  
0 | minimum is two, and the maximum is 14.

0 | 3. If CCS figures exceed the maximum, a co-located RSC is re-  
0 | quired.

0 | Table K: DMS-100 Local Network Capacities

0 | 1. Given a figure for Total Two-way CCS per Network Module,  
0 | start with column for ABSBH blocking factor (IML) of .001.

0 | 2. Read down this column to find the total two-way CCS figure  
0 | which is greater than or equal to the required value.

0 | 3. Read left to find the number of network modules required

0 | 4. Repeat this process using the column for HDBH, IML = .01

0 | 5. The number of network modules required will be the highest  
0 | of these two figures, or the maximum number of modules ac-  
0 | cording to physical network requirements.

0 | Table L: DMS-200 Offices and DMS-100/200 Toll Offices

0 | 1. Use this table in the same way as Table K, for DMS-200 of-  
0 | fices and for DMS-100/200 Toll offices or offices combining  
0 | local/toll networks.

0 | TABLE 8 - LCME Capacity (CCS per Channel)

0 | Use Table 8 to determine the number of switched channels per LCME  
0 | based on the total CCS requirements of the LCME. This is in turn  
0 | used to determine the number of links to the LGCI/LTCI/RSCI per  
0 | LCME. Select the desired HDBH/ABSBH ratio as per the Telco input  
0 | and the required IML, and match the column with the total calcu-  
0 | lated CCS for BOTH the ABSBH and HDBH default inputs. Select the  
0 | maximum value of these two readings as the basis for calculating  
0 | the number of links per LCME.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 6.5 Application Of Tables Used In ISDN 2B1Q Simplified Engineering

0 | TABLE 8 - LCME Capacity (CCS per Channel)

0 | Use Table 8 to determine the number of switched channels per LCME  
0 | based on the total CCS requirements of the LCME. This is in turn  
0 | used to determine the number of links to the LGCI/LTCI/RSCI per  
0 | LCME. Select the desired HDBH/ABSBH ratio as per the Telco input  
0 | and match the column with the total calculated CCS for BOTH the  
0 | ABSBH and HDBH default inputs. Select the maximum value of these  
0 | two readings as the basis for calculating the number of links per  
0 | LCME.

0 | TABLE 9- RCCI Capacity (CCS) Carried Load

0 | Use Table 9 for both mono and dual RCCI configurations. Calculate  
0 | the required number of host links by reading across the table  
0 | based on the HDBH total CCS requirement. Also, determine the  
0 | RCCI intra-channel occupancy by reading across the table based on  
0 | the calculated intra-switch link requirement. Both calculations  
0 | are used in mono and dual RCCI computations to determine the re-  
0 | quirement for either dual or dual co-located RCCI configurations.

0 | TABLE 10 - LGCI Capacity (CCS) Carried Load

0 | Use Table 10 to determine the number of C-side LGCI/LTCI links to  
0 | the network based on the total HDBH CCS per LCME. Read across  
0 | the table to find the calculated HDBH CCS for the LGCI/LTCI and  
0 | then read off the corresponding number of C-side links required.

## 0 NOTES:

- 0 1. Number of consoles = (Traffic offered in CCS/36)  
0  $\div$  (Value for AWT)
- 0 2. Figures to the left of this line represent occupancies  
0 greater than 92J.
- 0 3. With an upper limit for attendant occupancies of no  
0 greater than 92J (or 33.12 CCS/Attendant), the number of attendant  
0 consoles required (for values of attendant console activated CCS/36  
0 to the left of this line) is determined by the following formula:

0 No. Attendant Consoles =  
0 Traffic offered in CCS  
0 33.12

## 0 NOTES:

- 0 1. For capacity beyond 200 circuits, divide the traffic by 32.4 to  
0 determine the number of circuits required.

## 0 NOTES:

- 0 1. Table X defines the HDBH capacity for International RLCM (IRLCM)  
0 version of the Remote Line Concentrating Module. The principal  
0 difference between this model and the domestic RLCM is that Host-  
0 bound links employ the PCM-30 format. This means that all chan-  
0 nels from an LCA port equipped with PCM-30 will go to the Host  
0 and none will be available for use as intra- channels. Only une-  
0 quipped ports provide inter / intra-channels. It should be noted  
0 that five (5) and six (6) link IRLCM configurations cannot sup-  
0 port intraswitching due to the lack of intra-channels.
- 0 2. 5 and 6 link IRLCMs do not support Intra-office switching.

RELEASE 28.01  
93 12 03

## 0 8.0 ISDN 2B1Q Simplified Traffic

0 This document provides the worksheets and traffic tables for provi-  
0 sioning 2B1Q ISDN equipment.

0 The ISDN 2B1Q offering supports the American National Standards Insti-  
0 tute (ANSI) standard ISDN 2B1Q (Two Binary One Quarternary) U-line and  
0 S/T line interface for ISDN Basic Rate Access (BRA) terminations. The  
0 2B1Q Access Subsystem will be subtended from a DMS-100 ISDN LTC/LGC or  
0 ISDN RSC peripheral. It will provide access for most existing LCM  
0 line types plus ISDN 2B1Q-U and S/T line interface types for both the  
0 domestic and Offshore markets. Note that for notational purposes,  
0 where this ECM refers to ISDN LGC/LTC equipment, then the comments  
0 also refer to ISDN LGCO and ISDN RSCO equipment (also known as ISDN  
0 PLGC/PLTC and ISDN PRSC (PCM30) equipment) unless explicit equipment  
0 types are stated. See section 2.2 HARDWARE DEPENDENCIES below for  
0 market specific hardware information.

0 The ISDN 2B1Q Access Subsystem will offer the North American Standard-  
0 ized 2B1Q U and S/T line ISDN BRA from an enhanced capacity ISDN LCM  
0 (LCME). The LCME is basically an LCMI that has been utilized for the  
0 2B1Q interface. BCS 32 will expand the LCME services to offer EBS  
0 (P-Phone), Datapath, S/T ISDN and POTS services. The 2B1Q Access Sub-  
0 system will not support the AMI line card.

0 The ISDN 2B1Q Access Subsystem adds the following components to the  
0 LCME:

- 0 - A single slot 2B1Q U-Line ISDN line card (U-ISLC)
- 0 - A new high capacity line drawer
- 0 - A new Enhanced Bus Interface Card
- 0 - New ISDN LCM power packs

0 The 2B1Q line card will be used in both host and remote lo-  
0 cations. ISDN terminals on 2B+D BRA loops will have the option  
0 of being configured with either ISDN Functional signalling, or  
0 Meridian Feature Transparency (MFT) stimulus signalling. Func-  
0 tional and MFT sets can co-exist on the same BRA interface.

0 The 2B1Q line drawer will accomodate 60 single slot line cards,  
0 with eight (8) line drawers per LCME. Thus the LCME will support

0

0  
0 RELEASE 28.01  
0 93 12 03

0 480 single slot ("U") 2B1Q linecards, or 240 "S/T" interface  
0 linecards.

0 Note that there are several "flavours" or variations of ISDN sup-  
0 ported by DMS systems for various markets, each of which is (in  
0 general) based on the CCITT Blue Book (1988) ISDN Recommenda-  
0 tions:

- 0 - North American (Bellcore) ISDN
- 0 - Australian (Austel) ISDN
- 0 - European (ETSI MoU) ISDN

0 This ECM supports the engineering of both North American ISDN  
0 (specifically for the Canadian marketplace) as well as the engi-  
0 neering of Australian ISDN.

0 North American ISDN is based on Bellcore Technical Requirements  
0 which describe in detail the desired ISDN implementation for the  
0 U.S. marketplace. Currently various vendors and telecommuni-  
0 cations administrations are participating in the Bellcore driven  
0 National ISDN-1 (NI-1) program, which defines a set of Technical  
0 Recommendations to be followed by all service providers and man-  
0 ufacturers of ISDNs. NI-2 and NI-3 programs are also in the  
0 planning stages.

0 Australian ISDN is similar to Bellcore ISDN in that it is based  
0 (in general) on the CCITT Blue Book. However, Standards  
0 Australia has developed specific standards for BRA and PRA for  
0 the Australian marketplace (Austel Technical Standards TS13 and  
0 TS14). Australian ISDN is supported by the Offshore/PCM30 XPMs  
0 (XPMOs or PXPMS).

0 The European BRA and PRA is based on, and in compliance with, the  
0 relevant European telecommunications standards produced by the  
0 European Telecommunications Standards Institute (ETSI) in satis-  
0 faction of the work program resulting from the European Confer-  
0 ence of Postal and Telecommunications Administrations (CEPT)  
0 Memorandum of Understanding (MoU). ETSI ISDN engineering rules  
0 and Grade of Service criteria will be included in a future issue  
0 of this ECM.

## 0 8.1 HARDWARE PROVISIONING

0

### 0 8.1.1 HARDWARE USAGE RESTRICTIONS

0

0 | There are several ECMs which address ISDN 2B1Q engineering. For  
0 | U.S. markets see ECM 497 (Simplified Traffic Provisioning) as  
0 | well as ECM 616 (building blocks simplified ISDN 2B1Q). This  
0 | document addresses ISDN 2B1Q simplified teletraffic engineering  
0 | rules for the Canadian and Australian markets, and includes the  
0 | relevant Grade of Service provisioning tables.

0 | For hardware and software ordering information for the domestic  
0 | (Canadian) market, see ECM-418. For international/offshore hard-  
0 | ware and software ordering information, see ECM 529.

0 | The rules in this ECM apply to two processor ISDN XPMS and XPMOs,  
0 | (the ISDN LGC and ISDN LTC for the Canadian market, as well as  
0 | the ISDN LGCO and ISDN RSCO for the Australian market). ISDN RSCs  
0 | are NOT being deployed in the Canadian marketplace for ISDN ser-  
0 | vices.

0 | The two processor (MP/SP) RSCO will NOT support the following :

- 0 | - Emergency Stand-Alone (ESA)
- 0 | - P-side trunking or P-side remote links
- 0 | - Dual remote concentrators (dual RCCOs)

0 | Intra-switching WILL be supported on the RSCO in BCS34. The rules  
0 | for RSCO intra-switching are included in this ECM. All of the  
0 | above capabilities will be supported by the RSC-Sonet (RSC-S) in  
0 | the future.

0 | Engineering rules for coin lines (LCMs) have been removed from  
0 | this ECM, since coin lines are not provisionable on LCMEs. For

0  
0  
0

0  
0 RELEASE 28.01  
0 93 12 03

0 | engineering teletraffic rules for coin lines, refer to ECM-497  
0 | (North America only).

0 | For RSCOs, the Packet Handler (PH) resides at the host.

0 | In host applications, the PH equipment may reside at the ISDN  
0 | LTC/LGC/LGCO location or at a centralized location. The PH may  
0 | be accessed via the P-Side or the C-side of the ISDN  
0 | LTC/LGC/LGCO. Due to the capacity loss inherent in C-side ISDN  
0 | (Dd and Bd) loopbacks, C-side PH links are the preferred sol-  
0 | ution.

0 | In a 2B1Q ISDN office, the ISDN controller interfaces LCMEs,  
0 | DCHs, and PH links. Although primarily designed to handle 2B1Q  
0 | traffic exclusively, LCMEs can accommodate (at BCS 32 and above)  
0 | mixed services in the same line drawer (i.e. 2B1Q ISDN, POTS,  
0 | DATAPATH etc.).

0 | The LGCO which is acting as host to an RSCO must have 64KB clear  
0 | channel capability. Likewise, any DTC that provides links to the  
0 | Packet Handler must be equipped for 64KB clear channel capabil-  
0 | ity. This is accomplished by equipping XPMS with the appropriate  
0 | DS-1/PCM30 circuit packs. Consult ECM-418 and ECM-529 for hard-  
0 | ware and software ordering information and details.

#### 0 8.1.2 HARDWARE DEPENDENCIES

0  
0 | All hardware dependencies are documented in ECM-418 (domestic)  
0 | and ECM-529 (international/offshore).

RELEASE 28.01  
93 12 03

### 0 8.1.3 PROVISIONING CONSIDERATIONS

0  
0 See section 2.6 for a description of the traffic tables used in  
0 this ECM as well as a discussion of the Grade of Service (GOS)  
0 employed in the various markets.

0 It is assumed all traffic terminating on LCMs, DTCs, LTCs, LGCs,  
0 and RSCs will be traffic engineered per the existing methods  
0 found in ECM 350, and that only the residual non-ISDN lines, if  
0 any, and all non-ISDN lines that will home on the LCMEs will be  
0 considered as Inputs along with the 2B1Q equipment.

0 An ISDN Logical Terminal Identifier (LTID) is a data structure  
0 associated with ISDN BRA terminals (both B-channel and D-channel  
0 terminals). Note the following LTID restrictions :

- 0 - 511 LTIDs per DCH (maximum)
- 0 - 2 B-channel LTIDs per 2B+D BRA loop (maximum)
- 0 - no more than 8 B-channel or D-channels LTIDs/loop

0 The average DPPS (Data Packets Per Second) per D-channel terminal  
0 is restricted to a maximum of 0.4 DPPS for each terminal con-  
0 nected to a 2B+D loop. Increasing the number of packets above  
0 0.4 DPPS/D-terminal will require additional D-Channel Handlers  
0 (DCHs) due to the current limit of 50 DPPS per DCH. (Note : the  
0 50 DPPS limit has been set based on a data packet size of 128  
0 bytes).

0 The Statistical Multiplex Ratio (SMR), which is used to determine  
0 the amount of concentration of ISDN D-channel data into Packet  
0 Handler links (Bd links) can be specified by the operating com-  
0 pany from a value of 0 to 64:1.

0 The LCME provides flexible provisioning of Time Division Multi-  
0 plex (TDM) Dd groups. Any four ISDN lines from the same LCME  
0 physical drawer can belong to the same Dd group. Lines from the  
0 same Dd group must belong to the same physical drawer. Consult  
0 ECM 418 for further details on 2B1Q line drawer line card dis-  
0 tribution. See also section 2.4.3 below.

0  
0 RELEASE 28.01  
0 93 12 03

0 The trunk allocation algorithm is employed for PCM30 links from  
0 and RSC0, as well as PCM30 links to an LGC0 packet handler. This  
0 is reflected in the calculations sections for single controller  
0 configurations. Note that the trunk allocation algorithm will no  
0 longer be employed for RSC0 PCM30 trunks at a host LGC0 as of  
0 BCS34. This will be reflected in a future issue of this ECM.

0 Six sections make up the teletraffic method. Iteration is re-  
0 quired when the calculations indicate overloading of equipment.  
0 The paragraphs below give tips on parameters that can be adjusted  
0 to help deload equipment.

0 Where there is an alphabetical suffix associated with a formula  
0 (eg : R44a, R44b), choose the appropriate formula which repres-  
0 ents the market under consideration (eg : R44a - Canada; R44b -  
0 Australia).

0 Equipment summary sheets follow the traffic tables.

#### 0 | TRAFFIC MODEL INPUT PARAMETERS

0  
0 The first section (Traffic Model Input Parameters) covers the  
0 line traffic characteristics (number of lines, CCS/line, etc.).

0 Q1 asks for LCME line fill, while Q2 asks for the HDBH/ABSBH ra-  
0 tio. Either of these can be adjusted as required. For example,  
0 if the real-time analysis shows that the configuration should be  
0 deloaded, or if processing capacity is affected by an RSC0 sub-  
0 tended 50 miles or more beyond the host peripheral, Q1 or Q2 can  
0 be adjusted appropriately.

0 Q16 and Q17 ask for terminal configuration data. These figures  
0 are used in the parameter verification section to check that DMS  
0 ISDN datafill limits are not exceeded. In particular, C3 and C4  
0 check to see that LTID limits are not exceeded. LTIDs are also  
0 checked during DCH calculations (see below). See section 2.4  
0 above for a further discussion of ISDN LTIDs.

0 ate  
0  
0

RELEASE 28.01  
93 12 03

0 Q40 is a parameter associated with (residual) engineering of  
0 LGC0s which subtend RSC0 PCM30 links to the network. This is  
0 only valid for single LGC0 applications. Use of Q40 implies that  
0 the number of links from RSC0s is known (i.e. that the number of  
0 PCM30s from the RSC0s was engineered on a previous pass through  
0 this ECM). Q41 describes the number of PH bound DS0s (for Bb or  
0 Bd links) which are embedded WITHIN the quantity of RSC0 PCM30s  
0 (as described by Q40).

## 0 | GENERAL CALCULATIONS

0  
0 The General Calculation section assembles overall LCME parameters  
0 (e.g. physical number of 2B1Q and residual non-ISDN lines, card  
0 slots, and host/network circuits required).

## 0 | LCME CALCULATIONS

0  
0 The LCME Calculations section determines the physical number of  
0 LCMEs required and the number of DS30A links required (minimum of  
0 2, maximum of 18) to the ISDN LGC/LTC/RCC controller based on av-  
0 erage traffic per line (per LCME).

0 Note that these rules will support multiple LCMEs per controller  
0 for configurations which run a high percentage of POTS or other  
0 low capacity non-ISDN applications. However, a 100% ISDN config-  
0 uration is limited to one LCME per controller (LGC/LTC/RCC) be-  
0 cause of the inherent loss of C-side controller channels due to  
0 ISDN BRA Dd loopbacks.

0 In certain circumstances (for example, configurations which have  
0 only sparsely provisioned ISDN 2B1Q lines) it may be more appro-  
0 priate to calculate the number of required TDM Dd groups based on

0  
0 RELEASE 28.01  
0 93 12 03

0 the number of line drawers per LCME (instead of simply number of  
0 ISDN lines per LCME, as is the case with R12/R13). This is due  
0 to the fact that in sparse ISDN concentrations non-full Dd groups  
0 may be a practical reality. In this case, the following method  
0 may be employed to obtain a more accurate figure :

- 0 i) Obtain total number of ISDN lines per LCME (R12)  
0 ii) divide by 8 (line drawers per LCME) and ROUND UP  
0 (this gives # ISDN lines/drawer)  
0 iii) multiply by 8 (gives corrected # ISDN lines (R12'))

0 Note that this section also has Q1 and Q2 as product factors  
0 (R14). LCME calculation once again has Q1 and Q2 as product fac-  
0 tors. This allows for ABSBH traffic input parameters (Q2 > 1) or  
0 HDBH traffic input parameters (Q2 = 1) as well as LCME line fill  
0 adjustments.

0 The switched channels/LCME calculation (R16) allows for the se-  
0 lection of various GOS values for the various markets. Use the  
0 Traffic/LCME figure as the index into the Delay/Loss tables and  
0 read the value from the channels column which corresponds to the  
0 desired GOS. If the number of DS30A links per LCME is greater  
0 than 18, deloading is required. To deload, either alter the  
0 traffic model or adjust Q1 (PM line fill) or Q2 as appropriate.

#### 0 DCH (PER LCME) CALCULATIONS

0  
0 The DCH per LCME Calculation section determines the number of DCH  
0 circuit packs required for call control signalling and packet  
0 data. The requirements are calculated for each generic LCME;  
0 that is, on a per LCME basis.

0 The checks at the end of the section verify that the total  
0 SAPI-16 data rate of 50 DPPS is not exceeded and that the LTID  
0 load per DCH is not exceeded.

0

0 ate  
0  
0

RELEASE 28.01  
93 12 03

0 | If the data rate per DCH requires deloading (C20) then one of the  
0 | following parameters requires derating : Number of D-terminals  
0 | per loop (Q17), DPPS per D-terminal (Q25), or the SMR (Q26).

0 | If the LTID per DCH load is exceeded (C21), then either the num-  
0 | ber of D-terminals per loop (Q17) or the SMR (Q26) need to be de-  
0 | rated.

#### 0 | LGC/LTC/LGCO CALCULATIONS

0  
0 | The ISDN LGC/LTC/LGCO Calculations comprise several sections  
0 | which allow for single/multiple controller configurations, as  
0 | well as P-side or C-side PH link engineering. Note that P-side  
0 | PH links are valid only for single LGC/LTC/LGCO configurations,  
0 | since provisioning groups of controllers each of which has par-  
0 | tially filled PCM30/DS-1 PH links is poor engineering practice.

0 | The calculations determine the number of ports required for  
0 | DS30A, LCME, DCH, and PCM30 interfaces measured against the P-  
0 | side capacity of 20 ports, as well as the number of C-side ports  
0 | required for ISDN loopbacks, PH interfaces, and circuit switched  
0 | traffic. C-side requirements are analytically determined and  
0 | measured against the physical capacity of 480 channels.

0 | The first section (GENERAL) determines the number of controllers  
0 | required based on the number of DS30A and DCH ports required per  
0 | LCME.

#### 0 | SINGLE CONTROLLER (C-SIDE PH)

0 | The Single Controller (C-side PH links) section begins at step  
0 | R40. Circuit switched channels to the network use a non-blocking  
0 | criteria for Canadian networks and a GOS of 0.01 for Australian  
0 | configurations (R43). This configuration allows for RSCOs sub-  
0 | tended from the LGCO controller, and includes the effect of the

0  
0  
0

0  
0 RELEASE 28.01  
0 93 12 03

0 | spreading the RSC0 PCM30 links at the C-side of the LGCO as per  
0 | the trunk allocation algorithm.

0 | R44 calculates the number of channels that will be reserved by  
0 | the Trunk Allocation algorithm. This applies if there are PCM30  
0 | links from a subtended RSC0 (Australian configurations only). To  
0 | determine the number of reserved channels, divide the number of  
0 | PCM30 links (Q40) by four and then Round Up. This is then multi-  
0 | plied by four (trunk allocation algorithm reserves groups of four  
0 | C-side DS30 ports) and once again by 30 to obtain the reserved  
0 | number of channels. R45 calculates the number of channels re-  
0 | quired based on teletraffic considerations only, disregarding the  
0 | effect of the trunk allocation algorithm. R44 and R45 are used  
0 | by succeeding calculations to determine the actual number of  
0 | links/channels used up on the C-side of the controller. The two  
0 | values are compared and the larger of the two is selected.

0 | R46 and R47 ensure that there is enough bandwidth for the re-  
0 | quired number of C-side links and channels, respectively. Note  
0 | that this includes checking DS0 64K channels to the C-side PH  
0 | (nailed up via SPECCON), as well as checking Dd loopback chan-  
0 | nels, switched channels for voice traffic, and nailed up PCM30  
0 | links from subtended RSC0s (taking into consideration the trunk  
0 | allocation requirements by comparing R44 and R45). Deloading may  
0 | be required if any of the limits are exceeded. Note that  
0 | MAX(R44,R45) indicates that the largest value should be used af-  
0 | ter comparing R44 and R45.

#### 0 | SINGLE CONTROLLER (P-SIDE PH)

0 | The Single Controller (P-side PH) links section uses similar cri-  
0 | teria as per the C-side PH section, but additional calculations  
0 | are required. Both P-side RSC0 links as well as P-side PH links  
0 | are allowed in this configuration. The effect of the trunk allo-  
0 | cation algorithm is also included in the calculations.

0 | Note that the calculations in this section support the configura-  
0 | tion in which ALL PH DS0s enter and exit the XPM via the P-side  
0 | only (ie : to and from LCMEs, RSC0s, and PH ports on the P-side).  
0 | For C-side PH connections, see 2.4.5.1 above. Mixing of P-side  
0 | and C-side PH DS0s on the same XPM is NOT supported in this ECM.

0 ate  
0  
0

RELEASE 28.01  
93 12 03

0 R50 calculates the number of P-side PH ports required. Note that  
0 Australian configurations must consider not only local LCME PH  
0 links (R41), but also RSC0 LCME PH links (Q41).

0 R52 checks to ensure that there are enough P-side hardware slots  
0 for DCH and PH PCM30/DS-1 cards.

0 R53 and R54 are similar to R44 and R45 above. The number of  
0 channels reserved by the trunk allocation algorithm and the num-  
0 ber of traffic channels (disregarding the trunk allocation algo-  
0 rithm) are calculated for comparison purposes. In this case,  
0 note that channel totals (for Australian configurations) include  
0 both RSC0 as well as PH channel requirements.

0 R55 and R56 check C-side bandwidth (similar to R46 and R47  
0 above).

#### 0 | MULTIPLE CONTROLLER CONFIGURATIONS

0 The multiple ISDN LGC/LTC/LGC0 section begins at step R60. When  
0 configuring multiple ISDN LGCs/LTCs/LGC0s, the number of LCME  
0 modules may not be distributed evenly across all controllers.  
0 This will result in a group of identical controllers (calcu-  
0 lations for common controllers begins at R60) as well as one con-  
0 troller which is engineered with the residual LCMEs (calculations  
0 for the residual controller begin at R70).

0 Note that multiple controller configurations do not allow P-side  
0 PH connectivity or subtended PCM30 links from RSC0s. The trunk  
0 allocation algorithm is therefore not relevant for multiple con-  
0 troller configurations.

0 R60 is always  $\geq 1$  (since R30 is always  $\leq 1$ ) and therefore R60  
0 will give the number of LCMEs associated with each of the identi-  
0 cal controllers. The other calculations (R60-R70) are similar to  
0 calculations for single controllers with C-side PH connections.  
0 See the above paragraphs for details on the effect of different  
0 parameters (R40-R50).

0 R70 calculates the number of residual LCMEs for the residual con-  
0 troller. Note that while there may be several LCMEs associated

0  
0 RELEASE 28.01  
0 93 12 03

0 with the residual controller, at most there can only be ONE resi-  
0 dual controller per office. If R70 = 0, this indicates that  
0 there are no residual controllers and that the engineering exer-  
0 cise is complete.

## 0 RSC0 CALCULATIONS (AUSTRALIA)

0  
0 This section is valid for single RSC0 configurations (Australia  
0 only) and includes C-side PH host link calculations.

0 R80 checks the number of RCC0 P-side ports required for LCME and  
0 DCH interfaces (determined in earlier sections) measured against  
0 the physical capacity of 19 ports (i.e. 20 ports minus the spare  
0 DCH port).

0 R81 checks the total P-side port requirement (DS30As, DCHs, and  
0 RMMs). If a total of more than 20 ports are required, then de-  
0 loading of either the LCME traffic (see Q1, Q2, Q20-Q24), or of  
0 RMMs (Q32) or the number of DCHs (increasing Q26) is required.

0 If the maximum number of host links are exceeded (R90) then the  
0 LCME traffic parameters must be deloaded (see above paragraph  
0 concerning Q1, Q2, Q20-Q24).

0 The rules in this ECM include intra-switching for both MP/SP and  
0 UP RSCOs (which will be available in BCS34). For configurations  
0 which will not include intra-switching, simply set Q31 = 100 (%  
0 of featured calls for originating intra traffic).

0 If there are insufficient channels for intra-switching and Dd  
0 loopbacks (R93), then one method for deloading the intra traffic  
0 would be to choose a lower GOS (such as 0.09) in step (R91), thus  
0 reducing the number of intra-channels required. Otherwise, reduce  
0 the LCME traffic (Q1, Q2, Q20-Q24). If one of these methods is  
0 not used then the blocking on intra-switched traffic will be  
0 greater than the desired GOS.

0 ate  
0  
0

RELEASE 28.01  
93 12 03

0 8.1.4 OFFICE LAYOUT INFORMATION

0  
0 N/A

0 8.1.5 TRAFFIC TABLES

0  
0 Traffic tables based on Canadian and international HDBH load lev-  
0 els for switched ISDN 2B1Q and non-ISDN lines follow the work-  
0 sheets.

0 Terminating Matching Loss (TML) refers to the blocking probab-  
0 ility of the terminating portion of a call. At low blocking proba-  
0 bilities, this may be expressed (conservatively) as the sum of  
0 the blocking at each stage of the terminating path. In DMS sys-  
0 tems, TML is expressed as the sum of the blocking probabilities  
0 in the concentrator (LCME) and the controller (LGC/LTC/RCC). In-  
0 coming Matching Loss (IML) further defines terminating path  
0 blocking as the sum of TML + the probability of blocking through  
0 the network element.

0 DMS network elements are provisioned with a High Day Busy Hour  
0 (HDBH) blocking probability of 1% (0.01), or with an Average Busy  
0 Season Busy Hour (ABSBH) probability of 0.1% (0.001). See NTP  
0 297-1001-450 for further traffic criteria information.

0 TML for the Canadian ISDN market is composed of 9% (0.09) within  
0 the LCME and 0% blocking (1:1) in the ISDN LGC/LTC controller.  
0 IML for the Canadian market will therefore be 10% (0.1) at HDBH.

0 TML for the Australian ISDN market is composed of 1% (0.01) in  
0 both the LCME and LGGO/LTCO/RCCO controller. IML for the  
0 Australian market will therefore be 3% (0.03) at HDBH.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 The traffic tables used in this ECM are based on the Northern  
0 Telecom delay/loss model. A delay-loss system consists of two  
0 traffic streams combining loss (or blocking) with various delay  
0 models. The originations are queued, while the terminations are  
0 given loss treatment when all channels or service circuits are  
0 busy. In practice, this may not always be the case, particularly  
0 since originating subscribers who encounter blocking usually try  
0 again immediately; however, for low blocking/delay probabilities,  
0 this model closely approximates actual traffic characteristics.  
0 DMS systems actually queue originating subscribers until an idle  
0 channel is available; terminating calls are given two attempts at  
0 securing an idle channel before being routed to loss treatment.

0 The delay/loss tables in this ECM use a simple two stream delay  
0 loss ratio of 55/45. Originations comprise 55% of the traffic  
0 model and are based on the Erlang C model (lost calls queued).  
0 Terminations comprise 45% of the traffic model and are based on  
0 Erlang B assumptions (lost calls cleared). A comparison of these  
0 tables with standard traffic tables shows that the 55/45 delay  
0 loss model lies inbetween typical Poisson and Erlang B curves.  
0 Varying the origination/termination ratio produces slight differ-  
0 ences as may be expected; favouring originations produces more  
0 conservative traffic capacity values.

0 Note that in DMS systems delay due to channel congestion is much  
0 lower than delay due to real-time processing in peripheral equip-  
0 ment. For this reason Dial Tone Delay (DTD) and Incoming Start  
0 Dial Delay (ISDD) are not used as parameters or input for the  
0 traffic model.

0 RELEASE 28.01  
0 93 12 03

0 1.0 Software Features

0 1.1 General

0 This section captures the feature requirements of the office. Indi-  
0 vidual features are grouped into a number of entities called Feature  
0 Packages. Feature packages are identified by DMS Product Engineering  
0 Codes (PEC), e.g. Common Basic Package: NTX001AA04.

0 Feature packages relate to software only. Hardware required to imple-  
0 ment individual features must be identified and ordered separately un-  
0 der the appropriate hardware sections.

0 The feature packages are further grouped into Master Packages. Cus-  
0 tomers can order either by Master Packages (e.g. NTX071BB01 Bell  
0 Canada - Local) or by individual feature packages, or a combination of  
0 both.

0 To find out the available features within one available package, the  
0 customer has to refer to subsection 1.5.1 of this chapter which is up-  
0 dated automatically to include the RTM features.

0| This release includes the feature packages contained in BCS-36.

0 The following describes the grouping of Feature Packages into Master  
0 Packages and also new feature packages introduced via various BCS's:

0

0

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 As a result of the grouping of Feature Packages into Master Packages,  
0 a certain rationalization was undertaken which necessitated the cre-  
0 ation of five (5) "phantom" Feature Packages, namely:

|            |                    |
|------------|--------------------|
| 0 NTX901AA | Local Features I   |
| 0 NTX902AA | Local Features II  |
| 0 NTX801AA | Toll Features I    |
| 0 NTX802AA | Toll Features II   |
| 0 NTX701AA | Autovon Features I |

0 These packages are not orderable and therefore, are not found in this  
0 section.

0 With this new scheme, a two-level packaging concept has evolved. By  
0 definition, a Feature Package consists of features only and a Master  
0 Package consists of Feature Packages only.

0 TARGET

0 Unless specified, the packages are applicable to either NT40 or  
0 SuperNode. If TARGET is shown, the package can only be ordered for a  
0 switch containing that core. TARGETs are only shown against feature  
0 packages in the Feature Package Content and against master packages in  
0 the Master Package Content sections.

0 1.2 Feature Package Selection

0 To facilitate the Telco to select the right master and feature pack-  
0 ages, two listings are provided:

0 Subsection 1.5.1 Feature Package Content

0 Subsection 1.5.2 Alphabetical List of Features

0 These two listings detail all the DMS-100 family features which are  
0 currently available.

0 RELEASE 28.01  
0 93 12 03

0 1.3 Master Packages

0 As indicated in subsection 1.1 under General, Customer can order by:

0 a) Feature Packages

0 b) Master Packages

0 c) Combination of a) and b).

0 Care must be taken not to duplicate Feature Packages. For example, it  
0 is superfluous to order NTX002AB (a Master Package) and NTX053AA as  
0 NTX053AA is already included in NTX002AB.

0 Having checked off the required packages the Telco refers to sub-  
0 section 1.5.3 Master Packages to verify that the selected feature  
0 packages are not duplicated in the master packages selected.

0 The following rule applies:

0 (i) If any of the selected feature packages are included in the  
0 master packages selected, these feature packages are then  
0 eliminated.

0 RELEASE 28.01  
0 93 12 03

0 1.4 Feature Package Interdependencies

0 Certain packages are dependent upon other packages in order to func-  
0 tion. These prerequisite packages must be ordered when dependent  
0 packages are.

0 Having checked off the required packages the Telco refers to sub-  
0 section 1.5.4 Feature Package Interdependencies to verify whether all  
0 prerequisite packages have been ordered.

0 The following rule applies:

0 (i) If prerequisites exist for any of the packages selected, the  
0 prerequisites are then added to the selection.

0  
0 For any Canadian office which has ordered software package  
0 NTX250AA Datapath - Basic, software package NTX255AA Datapath  
0 Provisioning (Canada) must also be ordered. NTX255AA is not  
0 available to U.S. offices.
