Preface

0
0 RELEASE 28.01
0 93 12 03

0 General

0 This practice describes the rules and guidelines for provisioning the
0 DMS-100 Family switching machine, its components and its features.

0 The DMS-100 Family of digital multiplex switching systems consists of
0 a series of modular, software-controlled, digital central office
0 switches, providing local and/or toll service with a variety of op-
0 tional features. The particular package of services and features,
0 specified by the customer, is assembled by selecting types and quanti-
0 ties of hardware and software modules from the DMS-100 Family range of
0 products. The following basic types and capacities of switches are
0 available:

0 (a) DMS-100 A local central office, having a capacity of 1500 to
0 more than 100,000 subscriber lines.

0 (b) DMS-200 A toll central office, capable of handling from 400
0 to 60,000 trunks of various types.

0 (c) DMS-100/200 A local and toll central office, handling combina-
0 tions of subscriber lines and trunks, within the
0 ranges of (a) and (b) and as specified by the cus-
0 tomer.

0 (d) DMS-300 An International (Gateway) switching center capable
0 of handling up to 25,000 international trunks.

0 Practice Application

0 The information contained in this practice is applicable to offices
0 having Batch Change Supplement Release 36 (BCS-36) software.

0 It is also applicable to offices having a BCS release greater than
0 BCS-36 unless reissued. The application of all Northern Telecom Prac-
0 tices (NTP) editions with respect to a given BCS release is given in
0 297-1001-001.

0 The information contained in this NTP is subject to change since
0 Northern Telecom reserves the right, without notice, to make changes
0 in equipment design or components as progress in engineering or manu-
0 facturing methods may warrant. Such changes will be reflected in sub-
0 sequent issues of this NTP.

0 Reason For Reissue

0 This practice has been reissued to reflect the following changes in
0 format and organization:

0 Change	Description
0 -----	-----

0 1	- The existing sections on hardware provisioning have been 0 re-sequenced to conform more closely to the provisioning 0 (direct order) sequence. As a result, the document is 0 now divided into 29 chapters, and some material is 0 repeated in chapters where the provisioning process 0 overlaps.

0	The intent of these changes is to make individual chapters 0 more useful and complete, reducing the need for extensive 0 reading in multiple chapters during any one phase of the 0 provisioning process.

0 2	- Material on BCS Gating Requirements has been added in Appendix 0 A of this book.

0 3	- The Traffic Provisioning material has been moved to Appendix 0 B of this book.

0 4	- The Software Reference section has been moved to Appendix S.

0
0 (1 MAP is a trademark of Northern Telecom.)
0
0 Preface

0 RELEASE 28.01
0 93 12 03
0

0 5 - The content of the NTP450 was previously created using a manual
0 extract from the provisioning-related content of the Engineering
0 Change Memoranda (ECMs). Effective this issue, this
0 content is being extracted AUTOMATICALLY from the latest closed
0 issues of ECMs. This automatic extract will guarantee that
0 the information in the NTP450 reflects the most up to date
0 provisioning information available at the NTP release date.
0 However, ECMs in older formats cannot be automatically
0 extracted, and must be updated before they can be included
0 automatically. A transition process will therefore be required.

0 To avoid any possible loss of content during this transition
0 process, we have preserved the previous contents of some of
0 the NTP450 chapters, and have added new material to them.
0 You will probably notice some duplications of material
0 until we have finished streamlining these chapters over
0 the next few issues.

0 6 - Building Blocks provisioning information is now
0 included automatically in the NTP content.

0 PLEASE NOTE: THIS PRACTICE WILL BE UNDERGOING EXTENSIVE
0 REORGANIZATION AND REVISION OVER THE NEXT 4 BCS
0 CYCLES.

0 No changes in hardware provisioning have been added since the previous
0 release of this document. Change bars ('|') mark the changes found in
0 this document.

0 Software Identification

0 Software applicable to a specific DMS-100 Family office is identified
0 by a BCS release number and by Northern Telecom (NT) Product Engineer-
0 ing Codes (PEC).

0 A display of the BCS number and PEC for the NT feature packages avail-
0 able in a specific office can be obtained by entering the command
0 string:

0 PATCHER;INFORM LIST;LEAVE

0 at a Maintenance and Administration Position (MAP¹).

0 (1 MAP is a trademark of Northern Telecom.)

0 References

0 References listed as prerequisites are essential for an understanding
0 of this practice. Those listed as informative contain detailed infor-
0 mation concerning other items mentioned in this practice, but are not
0 essential. References are inserted at the appropriate places in the
0 text.

0 NOTE: The documents listed may exist in more than one version.
0 See 297-1001-001 and GFXINDEX to determine the release
0 code of the version compatible with a specific release
0 of software.

0 1.0 Line Concentrating Module

0 1.1 Introduction

0 (i) Line Equipment General Description

0 The new DMS-100 line peripherals consist of two (2) modules - the
0 Line Concentrating Module (LCM) which interfaces with the sub-
0 scriber lines via line cards, and the control module, the Line
0 Group Controller (LGC) or the Line Trunk Controller (LTC), de-
0 scribed in Section 35.

0 DMS Line Concentrating Modules are packaged in Line Concentrating
0 Equipment (LCE) Frames. Each LCE frame accommodates two Ringing
0 Generators and two LCM modules each of which houses two (2) Line
0 Concentrating Array (LCA) shelves. Each LCA shelf accommodates
0 up to five (5) Line Drawers (LD) and each drawer has sixty-four
0 (64) line card slots.

0 The sixty-four (64) line card slots are arranged in four rows of
0 sixteen (16) slots each.

0 The line drawer is functionally divided into two (2) Line Sub
0 Groups (LSG), each with thirty-two (32) line card slots. One LSG
0 is composed of the two lower rows of line card slots and the
0 other is composed of the two upper rows of line card slots.

0 Hence, each LCA shelf within the LCM has, five (5) Line Drawers
0 or ten (10) LSG's. Each LCM, has ten (10) LD's or twenty (20)
0 LSG's. Line Drawers are not numbered. LSG's are numbered from
0 00 to 19 within each LCM. Each LD has an even numbered LSG on
0 the bottom and an odd numbered LSG on the top. The left most LD
0 on the lower shelf has LSG 00 and 01. The right most LD on the
0 lower shelf has LSG 08 and 09. The left most LD on the upper
0 shelf has LSG 10 and 11. The right most LD on the upper shelf
0 has LSG 18 and 19. Each LSG has one cable to the MDF.

0 Each LCM has a physical termination capacity of 640 line card
0 slots. Of these, 639 are available for directory number (DN) as-
0 signment. The remaining card is reserved for LCM testing.

0 Depending on the traffic requirements, each LCM will interface
0 with the LGC or LTC module via two, three, four, five or six
0 speech links. An LCM so configured is referred to as a 2-port
0 LCM, 3-port LCM, 4-port LCM, 5-port LCM, or 6-port LCM respec-
0 tively.

0 RELEASE 28.01
0 93 12 03

0 (ii) Multi-Frequency Ringing Generator Types

0 DMS supports standard multi-frequency ringing types as listed in
0 Table 35.3 by means of a switch on the Ringing Generator. Both
0 LCM modules of a given LCE must have the same type of MF ringing.

0 In an office serving more than one MF ringing type, subscriber
0 lines must be segregated by MF type and terminate only on corre-
0 spondingly equipped LCE frames. LCM provisioning must take this
0 into account.

MF TYPE		FREQUENCIES (Hz)
Harmonic		16-2/3, 25, 33-1/3, 50, 66-2/3
Decimonic		20, 30, 40, 50, 60
Synchromonic (16 Hz)		16, 30, 42, 54, 66
Synchromonic		20, 30, 42, 54, 66
NOTE: DMS supports only 4 frequencies in each group. Any four may be selected.		

0 MULTI-FREQUENCY RINGING TYPES

0 Table 35.3

0 (iii) Line Concentrating Device Provisioning

0 Prior to BCS28, the maximum number of LCD line peripherals that
0 can be datafilled on a DMS is equal to 200. There is a minimum
0 of 54 and a maximum of 185 LCDs reserved for Virtual IDs. The
0 combined total LCDs for Virtual IDs and line peripherals is 255.

0 In BCS 28 and 29, the number of LCD peripherals which can be
0 datafilled on a DMS is equal to 255. There are no minimum LCDs
0 reserved for Virtual IDs. The maximum number of LCDs for Virtual
0 IDs is 185. The combined total LCDs for Virtual IDs and line pe-
0 ripherals is 255.

0
0 RELEASE 28.01
0 93 12 03

0 In BCS 30, the following changes are made for the Supernode only:
0 The total combined LCD limit for Virtual IDs and line peripherals
0 is increased to 1000. The maximum number of LCDs for Virtual IDs
0 is 441. The maximum number of allowed RCS devices is increased
0 to 511, while that allowed for the other devices remains at the
0 255 maximum.

0 In summary:

0		Maximum	Minimum	Maximum	*Number of
0		number of	number of	number of	*Number of
0		line per.	Virtual IDs	Virtual IDs	total LCDs
0	BCS27	200	54	185	255
0	and				
0	below				
0	BCS28	255	-	185	255
0	and				
0	BCS29				
0	BCS30	511	-	441	1000
0	(Supernode)				
0	BCS30	255	-	185	255
0	(NT40)				

0 *It is recommended that an office be provisioned only to within 5
0 of the total LCD limit.

0 RELEASE 28.01
0 93 12 03

0 Number of LCDs = Number of line peripherals +
0 (# of Virtual IDs on all business and ISDN sets/1024)

0 Where:

0 line peripherals include:

0 LCMs, RLCMs, OPMS (number of entries in LCMINV)
0 LMs (number of entries in LMINV)
0 RCSs (number of entries in RCSINV for BCS 28 and
0 29)
0 (number of entries in RSCINV/8 for BCS 30
0 and above)
0 RCUs (number of entries in RCUINV)
0 RCTs (number of entries in RCTINV)
0 ISLMs (number of entries in ISLMINV)
0 DLMS (number of entries in DLMINV)
0 LDTs (number of entries in LDTINV)
0 VSRs (number of entries in VSRINV-international
0 only)
0 LRUs (number of entries in LRUINV)
0 RDTs (number of entries in RDTINV)
0 IDTs (number of entries in RDTINV)

0 Virtual IDs are assigned to Electronic Business sets
0 (EBS) and ISDN sets as follows:

0 1) One for each directory number

0 2) One for EACH of the following features:

0 CWT - Call Waiting
0 RAG - Ring Again
0 ICM - Intercom
0 GIC - Group Intercom
0 AUL - Automatic Line
0 CAG - Call Agent (ACD)
0 CLSUP - Calling Line Supervisor (ACD)

0

0

0

0 Host - Line Equipment
0 Chapter 1

0
0 RELEASE 28.01
0 93 12 03

0 3) One if the Business Set has ANY of the following
0 keys:

0 CFW - Call Forwarding
0 MSB - Make Set Busy
0 MWT - Message Waiting
0 QTD - Query Time and Date
0 SPS - Speed Call Short
0 SPL - Speed Call Long
0 EMK - Emergency Key
0 AAB - Auto Call Back
0 MMI - Man Machine Interface
0 TME - Terminal Management Key
0 AUD - Auto Dial
0 INSPECT - Inspect Key
0 ACDNR - ACD Not Ready
0 UC DLG - UCD Login

0 1024 represents the maximum number of virtual IDs that
0 can be stored on one LCD.

0 RELEASE 28.01
0 93 12 03

0 1.1.1 Host Office With Unique LCE/LCM Numbering Option

0 With this option, the LCE/LCM numbering can be unique per site or
0 per office (i.e. host and all remote sites).

0 If the RLCM/LCM or LCE/LCM numbering is unique per remote site,
0 then the numbering will start with RLCM 00 LCM 00 0 or LCE 00 LCM
0 00 0 respectively for each remote site.

0 If the RLCM/LCM or LCE/LCM numbering is unique per office, then
0 the numbering will be contiguous to the LCE/LCM's in the host of-
0 fice.

0 If the remote site already has RLM's, then the RLCM/LCM or
0 LCE/LCM numbering will be contiguous to the RLM frame/RLM bay
0 number of this site.

0 If the remote site already has RLCM's or RSC's, then the RLCM/LCM
0 or LCE/LCM numbering will be contiguous to the existing RLCM/LCM
0 or LCE/LCM numbering of this site.

0 If the host office already has LME's, then the LCE/LCM numbering
0 will be contiguous to the existing LME frame/LM bay number of
0 this host office.

0 Once the numbering option has been chosen, it cannot be changed
0 at a subsequent extension.

0 If the Line Equipment Numbers (LEN) (i.e. for LM, RLM, LCM) will
0 be unique per office, in order to have sequential (contiguous)
0 LEN numbers for the host office and each remote site, the cus-
0 tomer may reserve groups of numbers for future growth in the host
0 and each remote site (i.e. gaps are allowed in the numbering).

0 1.1.2 Line Cards

0 (a) General Description

0 The line card provides circuitry for one (1) subscriber line.

0 (b) Reference

0 Chapter 3, Section 3.7 Office Maintenance
0 Section 3.8 Office Miscellaneous

0 (c) Provisioning Considerations:

0 (i) Line circuit quantities are determined for the busy sea-
0 son prior to exhaust based on forecasts.

0 (ii) Line cards contain one line circuit each and are avail-
0 able in the following configurations:

0 1. Line Card Type A

- 0 - Plain Ordinary Telephone Service (POTS).
- 0 - supports a single, two-party, and PBX analog tele-
0 phone sets (type 500 or 2500) and provides signalling
0 interface.
- 0 - occupies one (1) line card slot

0 Domestic

- 0 - NT6X17AA--POTS line card.
- 0 - NT6X17AB--POTS line card. For U.S. offices, this
0 line card is to be provided instead of the
0 NT6X17AA.
- 0 - NT6X17AC--Optimized line card.

0

0

0

0

0 RELEASE 28.01
0 93 12 03
0

0 International

- 0 - NT6X93AA--600 ohm POTS Line Card.
- 0 - NT6X93BA--600 ohm POTS Line Card. Used for Caribbean
- 0 Expansion Project (CEP).
- 0 - NT6X93CA--POTS Line Card for China.
- 0 - NT6X93FA--POTS Line Card for China (Extended Range)
- 0 - NT6X17AA--Used in international applications for
- 0 North American 500 telephone sets and to
- 0 interface attendant consoles.

0 2. Line Card Type B

- 0 - provides all features of the Type A line card plus
- 0 multiparty lines.
- 0 - supports coded ringing, PBX ground start,
- 0 Hotel/Motel, and analog pay telephone sets requiring
- 0 coin control.
- 0 - occupies one (1) line card slot.

0 Domestic

- 0 - NT6X18AA--standard Type B line card.
- 0 - NT6X18AB--provided in offices where +48V method of
- 0 coin fraud prevention is required. It is
- 0 recommended that every Type B line in this
- 0 office that does not require coin fraud
- 0 prevention be equipped with the NT6X18AB.

0 International

- 0 - NT6X94AB--600 ohm line card used for meter pulsing
- 0 coin control or for reversals for coin or
- 0 PBX lines.
- 0 - NT6X94BA--same as NT6X94AB. Used for Caribbean Ex-
- 0 pansion Project (CEP).
- 0 - NT6X94BB--replaces NT6X94BA for BCS-24.
- 0 - NT6X94CA--Same as NT6X94AB. Used for China.

0 The World Line Card (WLC) is a universal type B line
0 card introduced to replace domestic and international
0 type B line cards. The cards it replaces are:

- 0 NT6X33AA - Japan Type A
- 0 NT6X94AB - Turkey, Belize and Guyana
- 0 NT6X94BB - Caribbean
- 0 NT6X94CA - China

0
0 RELEASE 28.01
0 93 12 03

0 NT6X93DA - Morocco
0 NT6X18AA - North America

0 The WLC has software selectable loop current limit
0 characteristics and software selectable automatic
0 loss equalization. The card is capable of adjusting
0 to a wide variety of input and balance impedances.
0 This capability gives the WLC potential for being
0 used in a wide range of market areas, including those
0 not already penetrated by NT.

0 The WLC is designed to work in the LCM, LCME, LCMI,
0 ILCM, RLCM, OPM, SRU, RSC, RSCI, SRSC, XLCM and LCM
0 peripherals.

0 The WLC works with both DTMF and DP units. It is com-
0 patible with CLASS/CMS signalling and MTU equipment.
0 It also has electronic overvoltage protection to im-
0 prove its robustness in hostile environments.

0 Compared with the the line cards it replaces, the WLC
0 has increased reliability due to reduced component
0 count and lower operating temperature which is a re-
0 sult of lower power consumption.

0 The World Line Card Type B may be accommodated by any
0 of the following line drawers:y

- 0 * Line Drawer (Domestic)
0 * ISDN Line Drawer
0 * ISDN Enhanced Line Drawer
0 * Line Drawer (International)

0 Software selectable parameters enable the WLC to re-
0 place existing domestic and international line cards.
0 These parametric variants are held in templates which
0 can be applied from the MAP.

0 Software features required for the WLC are:

- 0 * AE0905 - World Line Card Software Support (BCS33)
0 * AE0896 - World Line Card in the LCM (BCS33)

0
0 RELEASE 28.01
0 93 12 03

- 0 | * AE0945 - WLC in the SRU and LCME (BCS34)
- 0 | * AE0946 - WLC Enhancements - Type A and B (BCS34)
- 0 | * AE0956 - Cutover by DN (BCS 34)
- 0 | * AE1013 - WLC Overvoltage Reporting
- 0 | * TBD - Register Recall Earth and Earth Left
0 | (British Telecom) (BCS TBD).

0 3. Line Card Type C

- 0 - interface for the IBN Electronic Business Set (P-
0 Phone).
- 0 - requires one (1) slot
- 0 - will only support the Business Set
- 0 - NT6X21AB--standard line card. Replaced by NT6X21AC.
- 0 - NT6X21AC--standard line card.
- 0 - NT6X21BC--standard line card modified for A-Law oper-
0 ation. Introduced for U.K. application.

0 4. Line Card Type D

- 0 - provides data transmission interfaces for operation
0 with computer terminals (Data Units).
- 0 - requires two (2) slots
- 0 - will only support the Data Unit
- 0 - NT6X71AA--standard line card. Replaced by NT6X21AC.
- 0 - NT6X71AB--standard line card. Provide for each modem
0 pool member.

0 5. Line Card Type E (NT6X19AA)

- 0 - provides all the features of the Type A line circuit
0 plus a message-waiting lamp driver circuit.
- 0 - message waiting line card requires one (1) slot

0 6. Asynchronous Interface Line Card (NT6X76AA/AC)

- 0 - used in conjunction with an Asynchronous Interface
0 Module (AIM) to interface a user's DTE to the SL-100
0 switch.
- 0 - can be used with equipment (terminals, packet
0 assembler/disassemblers or protocol converters) that
0 uses a compatible RS-422 interface.

0

0 RELEASE 28.01
0 93 12 03
0

0 The NT6X76AA/AC AILC is a two slot line card similar
0 to regular data unit line cards except that it draws
0 more of the 15V current supply per slot than normally
0 allowed. The total 15V power capability of a line
0 drawer would be consumed by twenty-one (21)
0 NT6X76AA/ACs.

0 If data penetration in an office is equal to or less
0 than 10% (total NT6X71 and NT6X76 cards = or < 10% of
0 total lines), then the NT6X76AA/AC can be treated as
0 a regular 2 slot circuit pack and all remaining line
0 card slots can be provisioned as required. If data
0 penetration exceeds 10%, the NT6X76AA/AC must be
0 treated as a three (3) slot circuit pack to prevent
0 overextending the power supply in a partial failure
0 mode.

0 This line card mix rule is based on 15V power con-
0 sumption only and further consideration must be given
0 to traffic factors.

0 7. Integrated Bit Error Rate Testing (IBERT) (NT6X99AA)

- 0 - provides testing data loops in DMS offices with
0 Datapath features. The IBERT card is NOT a line card
0 in the normal sense as there is no subscriber loop or
0 set associated with it. The only interaction with
0 this card is achieved from a MAP through the
0 DMS/IBERT messaging interface. Refer to Section 3.7
0 for more provisioning information.
0 - requires two (2) slots

0 (iii) For economic reasons the basic line card type should be
0 selected wherever possible.

0 (iv) One Type A line card in slot 00 on line sub group 00 must
0 be provided per LCM to be dedicated for
0 diagnostic/testing purposes when analog ringing is re-
0 quired. This card is not assignable to a subscriber. If
0 analog ringing is not required, this slot is available
0 for subscriber use.

0 (v) At least one line card per equipped LSG is required to
0 enable the Telco to commission and diagnose the Bus
0 Interface Card of each LSG during in service. For LSG 00
0 this means that there will be a minimum of two (2) line
0 cards required (i.e. this requirement is in addition to

0
0 RELEASE 28.01
0 93 12 03

0 LSG 00 line card 00). This card can be assigned to a
0 subscriber.

0 (vi) In addition to the requirement of paragraph (v) above,
0 for each initial and extension office, host or remote
0 site, at least thirty-two (32) line cards must be avail-
0 able in the office in order to enable commissioning of
0 the LSG-MDF cables.

0 (vii) For each modem pool member, provide one (1) NT6X17AB Type
0 A Line Card and one (1) NT6X71AB Type D Line Card. The
0 Type D Line Card can be mounted only in LCM. However, the
0 Type A Line Card can be mounted in either the LCM or the
0 LM/RLM (NT2X17AB is used as the Type A line card on the
0 LM/RLM). For more provisioning information, refer to
0 Section 3.8.

0 NOTES FOR TABLE 35.5

- 0 1. When no ground isolation is provided in the coin station, a 900
0 ohm limit applies.
- 0 2. This feature disables the Touch-Tone pad in the coin stations by
0 providing a Tip/Ring reversal on operator connections. This uses
0 the -48V office battery. This feature will be used in the major-
0 ity of offices.
- 0 3. This method provides +48V on the Ring and ground on the Tip dur-
0 ing a reversal condition to disable the Touch-Tone pad in the
0 coin station. A +48V power converter must be supplied.
- 0 4. Indication provided by reverse battery.
- 0 5. Indication provided by reverse battery to PBX message registers.

0 1.1.3 Line Concentrating Module

0 (a) General Description

0 The Line Concentrating Module (LCM) provides voice and signalling
0 interfaces between 2, 3, 4, 5 or 6 32-channel 2.56 Mb/sec with
0 640 analog subscriber lines. This procedure will determine the
0 number of LCM's needed based on physical and traffic calcu-
0 lations.

0 (b) Reference

0 Chapter 2 Traffic Criteria and Capacities.

0 (c) Provisioning Considerations:

0 (i) LCM provisioning is based on traffic criteria and phys-
0 ical terminations criteria requirements. Traffic criteria
0 requirements are based on ABSBH and HDBH traffic.

0 (ii) Each LCM has 640 line card slots to accommodate the dif-
0 ferent line card types. These line cards are to be
0 spread evenly over all LCM's in the office. Within each
0 LCM, the line cards are to be spread evenly over the
0 LSG's.

0 (iii) One Type A line card must be provided per LCM to be dedi-
0 cated as a test card. This card is not assignable to a
0 subscriber.

0 (iv) The maximum number of IBN Business Set Multiple Appear-
0 ance Directory Number (MADN) members of the same MADN
0 group is eight (8) per LCM.

0 (v) Some special LCM applications characterized by very short
0 subscriber loops and high traffic (such as for example
0 PBX or RLCM on a subscriber's premises) will require ad-
0 ditional engineering attention. NTL should be consulted
0 when provisioning LCM's in such offices.

0 (vi) There is a fifty (50) foot cabling length restriction be-
0 tween the LCM and the LGC/LTC.

0 (vii) Provide LCM Common CP fill as follows:

0 NT6X04AB - Domestic applications.

0 NT6X04BA - International applications.

0 The LCM NT6X04AB can handle up to 256KB of processor mem-
0 ory.

0 The ILCM NT6X04BA can handle up to 64KB of processor mem-
0 ory.

0 RELEASE 28.01
0 93 12 03

0 1.1.4 Line Drawer

0 (a) General Description

0 The Line Drawer contains 64 card slots for line cards. This sec-
0 tion may affect the number of LCM's provisioned.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) Each Line Drawer (LD) has sixty-four (64) line card
0 slots.

0 (ii) There are two (2) Line Sub Groups (LSG) per LD. Each LSG
0 has thirty-two (32) line card slots.

0 (iii) Each LSG has one cable to the MDF.

0 (iv) Where DF zoning is employed, the number of LSG's must be
0 an integer multiple of zones. For non-zero DF's let num-
0 ber of zones equal 1.

0 (v) There shall be an equal mix of line cards on all LSG's.
0 Cards are evenly distributed over all LCM's filling up
0 all LSG's evenly.

0 (vi) As a minimum requirement, provide one (1) Power Converter
0 +48V (NT6X23AA) for each Line Drawer which is to be
0 equipped with at least one NT6X18AB card which requires
0 +48V to support its assigned features. For optimum flex-
0 ibility in an office requiring NT6X23AA cards, the stand-
0 ard procedure is to provide one (1) NT6X23AA for each LD
0 equipped with NT6X18AB cards (whether they require the
0 +48V feature or not). This card requires two (2) slots
0 on a line drawer.

0

0

0

0 RELEASE 28.01
0 93 12 03
0

0 (vii) One Message Waiting Converter Card is required in each
0 Line Drawer which could accommodate message waiting line
0 cards; i.e. Type E Line Cards. The Message Waiting Con-
0 verter Card requires two (2) line card slots.

0 (viii) Only one converter card is assignable per Line Drawer.
0 Therefore, Line Card Type E requiring message waiting and
0 Line Card Type B requiring fraud prevention feature can-
0 not co-exist in the same Line Drawer.

0 (ix) One (1) Metering Tone Converter 12 and 16 kHz (NT6X95AB)
0 is provided per line drawer equipped with Type B line
0 cards for meter pulsing control (not required for line
0 drawers with Type B line cards for reversals only). It
0 requires one (1) slot on a line drawer.

0 (x) Since the Asynchronous Interface Line Card (AILC) re-
0 quires 55 mA of +15V power in standby mode and 70 mA when
0 active, it is important to consider an LCM that is heav-
0 ily populated with AILCs. The +15V supply is limited to
0 15A when operating off a single power supply; therefore,
0 this could limit the number of line cards to 23 per line
0 drawer.

0 (xi) The following line cards are mountable on the NT6X05AA
0 Line Drawer:

0 NT6X17AA, NT6X17AB, NT6X17AC
0 NT6X18AA, NT6X18AB
0 NT6X19AA
0 NT6X20AA
0 NT6X21AB, NT6X21AC
0 NT6X23AA
0 NT6X71AA, NT6X71AB
0 NT6X76AA, NT6X76AC
0 NT6X93AA
0 NT6X99AA

0 The following line cards are mountable on the NT6X05BA
0 International Line Drawer:

0 NT6X93AA, NT6X93BA, NT6X93CA, NT6X93FA
0 NT6X94AB, NT6X94BA, NT6X94CA
0 NT6X95AB
0 NT6X98AA

0

0
0 RELEASE 28.01
0 93 12 03

0 (xii) A maximum of 10 Line Drawer can mount on a LCM. Ensure
0 that an adequate number of LCMs are provided to support
0 the Line Drawers.

0 RELEASE 28.01
0 93 12 03

0 1.1.5 PCM-30 Line Drawer (PLD)

0 (a) General Description

0 In the United Kingdom (UK), Mercury Communications Limited (MCL)
0 has defined a standard for POTS line interface multiplexors which
0 is supported on the trunk side of the DMS-250 switch. This con-
0 figuration is limited to small applications because each customer
0 must be assigned a dedicated trunk group for billing purposes,
0 and there is a maximum of 2048 trunk groups per DMS.

0 An alternative configuration is provided by the PCM-30 Line
0 Drawer, which offers two PCM-30 2.048 Mbit/sec interfaces for
0 connecting Type 1 Mercury Exchange Line Multiplexor (MEL MUX)
0 equipment. This equipment is used by Mercury Communications Lim-
0 ited in the UK to interface POTS subscribers. A total of 60 dig-
0 ital lines per drawer can be connected via the two PCM-30 links.
0 MEL Loop Calling and MEL Earth Calling signaling protocols are
0 supported. Since the subscribers are treated as normal line ap-
0 pearances, the trunk group limitation does not apply.

0 The configuration consists of an NT6X05CA PCM-30 Line Drawer
0 (PLD) with one always provided NT6X54AC PLD Bus Interface Card
0 (BIC) and one (1) always provided NT6X27CA PCM-30 Interface Card
0 (PIC). The PIC provides two ports for direct termination of the
0 PCM-30 links.

0 PCM-30 Line Drawers may be assigned to the PRLCM or host LCM/ILCM
0 in any combination with standard line drawers.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) The PLD employs the LCM/ILCM to effect economic concen-
0 tration of line traffic. If the level of traffic per
0 line is sufficiently high, it is more economical to con-
0 nect the PCM-30 links directly to an IDTC, which does not
0 employ any concentration. The total number of lines al-
0 lowed in this configuration is limited by the fact that
0 one trunk group is required per line for billing pur-
0 poses, and a maximum of 2048 trunk groups are allowed in
0 the DMS switch. The initial estimate based on economic
0 considerations is as follows: If total traffic from the

0 RELEASE 28.01
0 93 12 03
0

0 MEL MUX exceeds 270 CCS per PCM-30 link, assign the
0 PCM-30 links to IDTC, subject to the total line quantity
0 restriction (2048). Otherwise, assign the links to
0 PCM-30 Line Drawers.

0 Further, it is assumed that individual MEL MUX sites will
0 be relatively small and therefore it will not be feasible
0 to forecast line growth and traffic levels with accuracy.
0 On the basis of this assumption, each PCM-30 link shall
0 be treated as 30 traffic sources each offering busy hour
0 traffic at the maximum economic level mentioned above;
0 that is, 9 CCS per line.

0 (ii) Provision one (1) PCM-30 link per thirty (30) subscribers
0 homing on a MEL MUX. Provision one (1) NT6X05CA PCM-30
0 Line Drawer for every two (2) PCM-30 links; the NT6X27CA
0 PCM-30 Interface Card and NT6X54CA PLD Bus Interface Card
0 are always provided with the line drawer. Assign the
0 line drawer to the PRLCM or host LCM/ILCM as required.

0 (iii) Telcos often fully equip the LCM/ILCMs with line drawers.
0 Where there are two types of line drawer (regular and
0 PCM-30) to choose from, it is recommended to maintain the
0 same ratio of drawer types across all LCM/ILCMs, while
0 maximizing the traffic on each LCM/ILCM. To determine
0 the optimum configuration and calculate the LCM/ILCM
0 links, use the following method:

0 A = Total number of non-PCM-30 line drawers

0 To calculate this value use standard methods based on
0 line card slot width and 64 slots per drawer.

0 B = Total number of line drawers

0 = A + Number of PLD

0 C = Total number of LCM or ILCM

0 = B / 10 (round up)

0 D = Number of non-PCM-30 line drawers per LCM or ILCM

0 = A / C (do NOT round up or down yet)

0 E = Average line traffic (not including MEL MUXs)

0 RELEASE 28.01
0 93 12 03
0

0 Using standard methods, calculate this value by sum-
0 ming the components of local line traffic (POTS, MDC,
0 Datapath, DIALAN, etc.) and dividing by the number
0 of lines.

0 F = Average line drawer traffic (non-PCM-30)

0 = E * 64

0 G = Actual number of non-PCM-30 line drawers per LCM or
0 ILCM

0 If F is greater than or equal to 540, round up the
0 value calculated in step D (maximum 9); otherwise,
0 round it down (minimum 1). Call the rounded value
0 "G".

0 Note that the number 540 represents the economic
0 level of traffic assumed for MEL MUX lines; that is,
0 9 CCS per line * 30 lines per PCM-30 link * 2 links
0 per drawer. This step maximizes the traffic carried
0 per LCM/ILCM.

0 H = Number of PCM-30 line drawers per LCM or ILCM

0 = 10 - G

0 J = Traffic carried per LCM or ILCM

0 = (F * G) + (540 * H)

0 K = Number of links per LCM or ILCM

0 This is computed using standard LCM Carried Traffic
0 Capacity tables, using the value in step J and the
0 required Grade of Service. The value in step E is to
0 be used when selecting from multiple tables parti-
0 tioned based on CCS/line.

0 (iv) Provide the following software package when the PCM-30
0 Line Drawer is equipped:

0 NTXK00AA PCM-30 Line Drawer

0 93 12 03

0 1.1.6 Line Concentrating Equipment (LCE) Frame Provisioning

0 (a) General Description

0 The primary function of this frame is to house Line Concentrating
0 Modules.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) This frame can accommodate four shelves of equipment
0 (i.e. two modules). Modules are filled and numbered on
0 the frame from the bottom up.

0 (ii) Ringing Generators are required to provide analog ring-
0 ing. There are three versions of the Ringing Generators:

0 NT6X30AA for Domestic applications
0 NT6X30AB for U.K. applications
0 NT6X30DA for China

0 (iii) The Business Set and the Data Unit do not require analog
0 ringing.

0 (iv) If required, two Ringing Generators are mounted on the
0 LCE frame.

0 (v) Ringing type and level are set by means of a switch on
0 the Ringing Generator.

0 (vi) Both LCM modules of a given LCE frame must have the same
0 type of MF ringing.

0 (vii) If analog ringing is required for an LCE frame which con-
0 tains only one LCM module, both Ringing Generators are
0 still required.

0 (viii) Normally one Ringing Generator serves one LCM. However,
0 under a failure condition, the remaining good Ringing
0 Generator can serve both LCM's on the frame.

0 (ix) When ISG is being applied to an office, LCE frames and
0 their associated Common Peripheral Controller frame (i.e.

0
0 RELEASE 28.01
0 93 12 03

0 LGE/LTE/RCE/RCME/SME) must be served by the same PDC
0 frame.

0 (x) The minimum packfill for BCS-32/33 is NT6X03RA/RB and
0 NT6X04AA for LCMS.

0 2.0 Integrated Services Digital Network (ISDN)

0 2.1 Introduction

0 The concept of ISDN is to integrate many different services
0 (voice and data, circuit switched, packet data etc.) onto a sin-
0 gle network to which a user has access through a limited set of
0 multi-purpose user-network interfaces.

0 The services that are offered by the ISDN are defined as bearer
0 services and tele services.

0 Bearer services represent the digital connections used for commu-
0 nication and may be circuit switched or packet connections. Sup-
0plementary bearer services represent different ways of
0 manipulating these connections to provide features i.e. call for-
0 warding etc.

0 Teleservices are higher level services, such as voice or text
0 messaging, which use the bearer services for connections and run
0 messaging protocols over these connections to control the service
0 operation.

0 Users have access to these services through two multi-purpose
0 user-network interfaces: Basic Rate Interface (BRI) and Primary
0 Rate Interface (PRI).

0 Basic Rate Interface

0 ISDN Basic Rate Interface (BRI) is provided to the subscriber via
0 the ISDN LCM, U-ISLC and NT1. This is designated as 2B+D, with
0 the B1 and B2 channels each consisting of 64 kbps data, and the D
0 channel consisting of 16 kb data and signalling. A further 16
0 kbps bandwidth is used between the U-ISLC and the NT1 for mainte-
0 nance and framing purposes. Either of the two 64 kbps B channels
0 may be used for circuit-switched voice, circuit-switched data or
0 packet-switched data, with associated signalling being performed
0 on the common 16 kbps D-channel. Low-speed packet data, together
0 with its associated signalling, may also be sent on the D chan-
0 nel.

Key:

- DCC - ISDN LCM Digroup Controller
- PROC - LCME Processor
- BIC - Bus Interface Card
- PUPS - Point of Use Power Supply
- U-ISLC - U-loop ISDN 2B1Q Line Card

Figure 316.1:

ISDN Basic Rate Interface via the LCME, U-ISLC, and NT1

The ISDN 2B1Q Access Subsystem represents Northern Telecom's first product offering that supports the American National Standards Institute (ANSI) standard ISDN 2B1Q (Two Binary One Quarternary) U-loop interface. It is deployed as an enhancement of the current Phase 1C ISDN offering, which supports the AMI (Alternate Mark Inversion) U-loop interface. The 2B1Q Access Subsystem will be subtended from a DMS-100/MSL-100 LTCI/LGCI or RSCI peripheral. It will provide access for most existing LCM line types plus ISDN 2B1Q-U and ISDN S/T.

The ISDN 2B1Q Access Subsystem will offer the North American Standardized 2B1Q U Loop ISDN Basic Rate Interface (BRI) from an enhanced capacity ISDN LCM (LCME). The LCME is basically a LCMI that has been utilized for 2B1Q interface. It will offer S/T

0 RELEASE 28.01
0 93 12 03
0

0 ISDN services in BCS-31 and continue to offer EBS (P-Phone),
0 Datapath, S/T ISDN and POTS services in BCS-32. The 2B1Q (2 Bi-
0 nary, 1 Quarternary) Access Subsystem will not support the AMI
0 line card.

0 The ISDN 2B1Q Access Subsystem adds the following components to
0 the LCME:

- 0 - A single slot 2B1Q U-Loop ISDN line card (U-ISLC).
- 0 - A new high capacity line drawer.
- 0 - A new Enhanced Bus Interface Card.
- 0 - New ISDN LCM power packs.

0 The 2B1Q line card will be used in both host and remote lo-
0 cations.

0 The 2B1Q line drawer will accomodate 60 single slot line cards,
0 with eight (8) line drawers per LCME. Thus the LCME will support
0 480 single slot 2B1Q lines.

0 Primary Rate Interface

0 For the CPEI configured as a DTCTI, the PRI interface offers 479B
0 + D channels.

0 Primary Rate Interface may also be structured as eB + fD where e
0 = 0 to g, f = 0 to (24-g), g = 0 to 23.

0 For PRI, both B-channel and D-channel bandwidths are 64 Kbps.

0 The PRI links will be used for applications such as connecting
0 PBXs to the DMS-100 switch.

0 The current definition of the INWATS service in Canada does not
0 allow it to be supported on PRI. By definition (i.e. Service
0 Regulations), INWATS service currently must terminate on dedi-
0 cated incoming only lines.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 System Overview

0 For the implementation of Basic Rate Interface (reference Figure
0 316.2), access termination for the 2B+D lines is furnished by the
0 ISDN LCM and ISDN line cards.

0 The Peripheral Controller for the ISDN LCM has the capability of
0 handling the D channel. The configuration that has been phased
0 out used the Integrated Access Controller (IAC) which has an LTC
0 combined with a Message Switch Buffer (MSB) and Signalling Termi-
0 nal (ST) cards to handle the D channels. The D channel handler
0 capability is now integrated into the standard Peripheral Con-
0 troller, which for ISDN is called the ISDN Common Peripheral Con-
0 troller, or CPEI. The CPEI frame is named LGEI, LTEI, or DTEI
0 depending on the access modes supported (BRI, PRI, etc.). The
0 CPEI frame is named DTE when the non-ISDN DTC module is used on
0 the frame.

0 Effective BCS-32, all IACs in an office must be replaced with
0 LGCI/LTCI or LGC/LTC modules with ISDN capabilities prior to ac-
0 cepting a BCS-32 or above load.

0 Access to the packet network to accomodate user packet data is
0 furnished via DS-1 (B8ZS) clear 64 Kbps connection from the CPEI
0 to the Packet Handler (PH) equipment. The packet handler equip-
0 ment is based on Digital Packet Network (DPN) technology.

0 Customer Premise Equipment (CPE) is required to interface the
0 customer's terminals to the ISDN line. The NT1 is available to
0 interface the standard ISDN 'S/T' interface to the 2 wire 'U'
0 interface line card. A Digital Phone based on NT's Meridian
0 product enables PCM voice services using a B channel. The phone
0 will be marketed in Canada as the T2317C and in the US as M5317T.
0 Terminal Adapters (TA) are available to allow the connection of
0 IBM PCs to the 'S/T' interface. Under development are interfaces
0 to be used with dumb ASCII terminals. An M5317T/T2317C with a
0 personal computer provides an integrated voice and data work sta-
0 tion.

0 The S/T interface is a 4-wire digital bus supporting multiple
0 terminals per loop (8 terminals maximum - 2B + 6D) requiring bus
0 termination built into the NT1 (switchable) or external. Termi-
0 nals are identified by a logical terminal number (LTID) for each
0 terminal on the switch. The LTID must be unique for each termi-
0 nal. Within each loop a Terminal End-point Identifier (TEI) is
0 used to differentiate messaging. These must be unique within the
0 loop. There can be up to 16 logical TEI per BRI interface.

0 93 12 03

0 Line Concentrating Device Provisioning

0 Prior to BCS28, the maximum number of LCDs allowed in an office
0 was 254 with the maximum number of real LCDs limited to 200.
0 Changes in BCS 28 allow up to 254 real LCDs. The use of virtual
0 LCDs will lower the number of real LCDs allowed. For BCS30 and
0 above, the calculation of LCDs per SLC will be changed to 8 SLCs
0 per real LCD.

0 The ISLM is considered a real line module in the LCD provision-
0 ing. Refer to the Line Concentrating Module, Section 450/35, for
0 more information.

0 2.3 Equipment Provisioning

0 2.3.1 ISDN Line Controller Equipment

0 (a) General Description

0 For the implementation of Basic Rate Interface, access termination for the 2B+D lines is furnished by the ISDN LCM. Each module houses eight line drawers each of which can support forty-eight line cards. The primary function of the LCEI is to support ISDN line cards. The ISDN Line Concentrating Equipment Frame is a standard DMS frame which houses two dual shelf LCMI modules. The LCEI is an evolution of the standard LCE frame.

0 The ISDN LCM will be allowed from 2-18 DS-30A links to the serving CPEI. The ISDN-LCM may have up to:

- 0 - 160 ISDN 'U' line cards, or
- 0 - 192 ISDN 'S/T' line cards, or
- 0 - 384 Business Set Line Cards, or
- 0 - 192 Data Line Cards, or
- 0 - 384 POTS Line Cards, or some combination of the above line cards. It is structured similar to the standard LCE frame.

0 The 'U' line card interfaces to standard 2-wire outside plant for connection to the NT1 at customer premises. NTB27AA is the new ISDN 2B1Q U Line Card which replaces the AMI U Line Card NTB25AB. The 2B1Q U-interface will be supported through the use of the NTB27AA. The 2B1Q line card NTB27AA is used in the high capacity 2B1Q line drawer for host and remote locations.

0 In BCS-28, an 'S/T' line card will be introduced which does not require an NT1. It will interface directly to the 4-wire S/T interface, with a restricted loop range. The S/T line card is only intended for applications where a remote system or Private Branch Exchange (PBX) is located in the customer premise. If the S/T line card is to be engineered in a C.O. environment where it will interface to outside plant wiring, overvoltage protection that meets the requirements of LSSGR Bell Communications Research (Bellcore) Spec TR-TSY-000057 First Level Surge Tests must be used.

0 'U' and 'S/T' line card types can be mixed within a line subgroup.

0

0 (b) References

0 Chapter 2 Traffic Criteria and Capacities
0 Chapter 3, Section 3.5 Peripheral Modules - Host
0 System Engineering Bulletin (SEB) 88-10-001

0 (c) Provisioning Considerations

0 (i) ISDN Enhanced Line Concentrating Module (LCME)

0 The LCME is a new peripheral module and is numbered the
0 same as already existing LCM/LCMIs. The number assigned
0 to each LCM/LCMI/LCME must be unique. The individual
0 modules in a frame will be numbered from the bottom up.

0 The discrimination numbering of frames must also be
0 unique. LCE and LCEI frames should be numbered sequen-
0 tially. If LCE 00 - 11 exist in an office and an LCEI is
0 added, it should be numbered LCEI 12 and the next frame
0 would continue the numbering consecutively.

0 There are eight (8) drawers per LCME with a maximum of 18
0 DS30A links per LCME. Refer to Figure 316.3 for a layout
0 of the LCME and the numbering of line drawers existing in
0 it.

0 One (1) LCME and one (1) LCMI can coexist on the same
0 LCEI frame (for field retrofit only).

Figure 316.3: LCME Module

ISDN AMI Line Concentrating Module (LCMI)

Provide one LCMI module to accommodate up to 160 ISDN U Line Cards, or 192 ISDN S/T Line Cards, or a mixture of U Line Cards, S/T Line Cards, Business Set, Data and POTS Line Cards as detailed below.

- (ii) The ISDN 2B1Q Line Drawer NTB32BA will not support AMI line cards. The ISDN AMI Line Drawer NTB32AA will not support 2B1Q line cards.

There is no mixing of NTB32BA and NTB32AA line drawers allowed within an ISDN LCM module.

- (iii) Service Mix

The 2B1Q Access Subsystem will support many line card types. The list below summarize which are and are not supported.

The 2B1Q Access Subsystem will support the following line card types:

0
0 RELEASE 28.01
0 93 12 03

- 0 1. POTS Type A line cards (NT6X17AA/AB/AC).
0 2. Datapath Data line cards (NT6X71AA/AB).
0 3. Datapath Asynchronous Interface line card
0 (NT6X76AA/AC).
0 4. Datapath IBERT line card (NT6X99AA).
0 5. EBS P-Phone line card (NT6X21AC).
0 6. Message Waiting POTS type line card (NT6X19AA).
0 This card requires a power converter line
0 card (NT6X20AA) to function.
0 7. ISDN S/T-Interface line card (NTBX26AA). This
0 card offers a digital 4-wire ISDN S/T
0 Interface for ISDN services.
0 8. ISDN U-Interface (2B1Q) line card (NTBX27AA).
0 This card offers a digital 2-wire ISDN U
0 Interface for ISDN services.

0 The 2B1Q Access Subsystem will not support the following
0 line card types:

- 0 1. POTS Type B line cards (NT6X18AA/AB).
0 2. ISDN AMI U-Interface line cards (NTBX25AA/AB).

RELEASE 28.01

Datapath IBERT Line Card	1	1

Table 316.1: Line Capacities for the 2B1Q ISDN LCME

Powering for a full frame of 2B1Q U ISDN Line Cards, EBS Line Cards, POTS Line Cards, Data Line Cards, or S/T ISDN Line Cards is provided.

Power limits the NT6X76AA Asynchronous Interface Line Card to 26 per drawer. The NT6X76AC AILC has no greater current limit than a regular 2-slot line card; therefore, there is no limit to the provisioning of the NT6X76AC (maximum 30 per drawer).

(iv) LCME Line Card Distribution

In BCS-31, the LCME will support only ISDN lines.

In BCS-32 (and beyond), any of the line cards supported can be mixed with any other line card at the drawer of logical subgroup level. However, if there is more than eight (8) S/T-Interface line cards in the same row as POTS line cards, then the POTS line cards will NOT stay in-service on PUPS failure. The Data Line Cards cannot be mounted in the five line card position (slots 18 to 26) in the top LSG next to the PUPS line card. It is permitted to mount the Data Line Card in the lower LSG directly under the PUPS. Refer to Chapter 3, Section 3.5 for more information on the non-ISDN line cards and their provisioning rules.

0 RELEASE 28.01
0 93 12 03
0

0 The LCME provides flexible Time Division Multiplexing
0 (TDM) groups. This enables an ISDN line to be placed
0 anywhere in a drawer. Any four ISDN lines from the same
0 physical drawer can belong to the same TDM group subject
0 to rule that lines in a particular TDM group must come
0 from the same physical drawer.

0 D-channels from line cards within one physical drawer
0 will be multiplexed together in any manner. D-channels
0 from line cards in different physical drawers will not be
0 multiplexed together.

0 (v) LCMI Line Card Distribution BCS-28 (and up)

0 In BCS-28, S/T line cards can be assigned to the ISDN
0 line drawer. Any combination of U and S/T line cards is
0 permitted within a drawer as long as the respective lim-
0 its of 20 U loops and/or 24 S/T loops is not exceeded.

0 Up to 384 POTS lines can be equipped in BCS-28 subject to
0 the assignment rules for mixing ISDN loops and non-ISDN
0 lines described in the above point.

0 (vi) LCMI Line Card Distribution BCS-27

0 Mixed ISDN, Business Set and Data line types are sup-
0 ported within the physical line drawer starting from
0 BCS-27 with the only restriction that ISDN lines may not
0 be mixed in the same line subgroup. Business Set and
0 Data line types can be mixed within the same line sub-
0 group as required.

0 Assign the Business Set and Data line cards as follows:

0 1) When all of the ISDN line cards have been spread, the
0 unused line sub groups (if there are any) may be used
0 for Business Set line cards and Data line cards.
0 Business Set line cards are limited by power dissipa-
0 tion when mixed within a physical drawer with ISDN
0 line cards.

0 If Business Set and Data line cards are to be mixed
0 in a Line Drawer with ISDN line cards then the maxi-
0 mum number of slots that may be equipped is given un-
0 der "maximum # of slots in mixed drawer". This limit
0 is based on the most efficient multiplexing of D
0 channels.

0	ISDN 'U'	Max. Business Set	Maximum Data	Maximum # of
0	Loops in	Line Cards	Line Cards	Slots in
0	Drawer	in Drawer	in Drawer	Mixed Drawer
0	20	0	0	0
0	16	8	8	8
0	8	30	16	30
0	0	48	24	48

0 An additional limit is imposed by power consider-
0 ations in mixing line types. The following table
0 summarizes the configurations which satisfy both
0 physical and power constraints at the module level:

0 2) If IBERT line card is to be equipped, assign it to
0 slot 0 of first line sub group which is to be used
0 for Business Set and/or Data Line Cards. If the LCMI
0 is full with other line card types, the IBERT line
0 card may be located in another line module in the
0 same office.

0 3) Equip the single slot Business Set line cards start-
0 ing at slot 0, 8, 1, 9, 2, 10, 3, 11, 4, 12 etc.

0 4) Equip the 2-slot Data line cards after all of the
0 Business Set line cards have been spread starting at
0 slot 7, 6, 5, 4, etc.

0 5) Continue until all of the remaining D line cards have
0 been assigned.

0 (vii) LCMI Line Card Distribution BCS-26

0 The ISDN line cards each interface one 16 Kbps 'D' chan-
0 nel. Four of these 'D' channels are multiplexed into one
0 DS-0 channel in the LCMI. Four 'D' channels will then
0 occupy one DS-0 channel to the host.

0 The four channels that are multiplexed together are se-
0 lected by a fixed mapping scheme from a Block of Logical
0 Drawers (BLD). The D channel time division multiplexing
0 is done by combining the D channel from the same slot in
0 four line sub groups (logical drawers). For example, the
0 D channels from slot 0 LSG0, slot 0 LSG 1, slot 0 LSG6
0 and slot 0 LSG 7 are combined. The BLDs are as shown be-
0 low.

RELEASE 28.01

6	16, 17, 22, 23	32	32

Starting with BCS-26, the restriction of six c-side ports is removed and a maximum of eighteen c-side ports are now available. The full potential of 160 ISDN 'U' lines or 192 ISDN 'S/T' lines per LCMI will only be realizable with the LCMI/CPEI combination. Also in BCS-26, the IBERT line card may be equipped for Datapath and ISDN loop testing.

The provisioning information outlined below for filling the line drawer is based on the following:

- Taking advantage of the fixed mapping of the four D channel multiplexing. Although the time division multiplexing feature of the four D channels is available starting from BCS-27 only when the CPEI/LCMI combination is introduced, this method will be used for BCS-26, bearing in mind the CPEI retrofit.
- Balancing the real time load between the two units of the LCMI.

It is recommended that starting from BCS-26, the following provisioning rules be observed:

- a) ISDN line cards (or loops) should be equipped in groups of four, occupying parallel slots in a BLD. Thus when one ISDN line card is allocated, the D

0 channel multiplexing servicing for the other three in
0 the BLD are automatically allocated.

- 0 b) BLD should be allocated as a "group" to either ISDN
0 or Business Set or Datapath. In other words, it is
0 recommended that infringement of ISDN with non-ISDN
0 BLD not take place unless necessary. If possible, it
0 is better to partially fill ISDN BLD than mix differ-
0 ent line types. This will ease future expansion when
0 mixed line types are permitted (BCS-27) and allow ef-
0 ficient use of the LCMI/DCH bandwidth and DCH D chan-
0 nel processing capacity.

0 Thus the order of filling the two LCMI units will be
0 BLD1, BLD4, BLD3, BLD6, BLD2 and BLD5. When using ISDN
0 'U' line cards, BLD2 and BLD5 are only half filled (slots
0 0-3 only so as to limit the number of ISDN 'U' line cards
0 per physical drawer to a maximum of 20).

0 The IBERT line card may be equipped for Datapath and ISDN
0 loop testing.

0 (viii) LCMI Line Card Distribution BCS-25

0 Due to power limitations of the LCMI, a maximum of 20
0 ISDN 'U' line cards can be supported per physical drawer.
0 For BCS-25, a maximum of only six c-side ports can be
0 datafilled for the LCMI, the minimum number of c-side
0 ports being two. This restricts the number of ISDN lines
0 for BCS-25 to 58 only. Since call processing is done
0 with static connections only, for BCS-25 the ISDN line
0 cards will be supported in pre-defined slot positions
0 only.

0 The total of 58 ISDN line cards are spread equally over
0 both the units of the LCMI. It should be noted that all
0 six c-side ports are utilized in this case, three for
0 each unit of the LCMI.

- 0 (ix) Any drawer containing NT6X19AA Type E Line Cards requires
0 a NT6X20AA Message Waiting Power Converter. In BCS-28,
0 Message Waiting Power Converters are restricted to LSG1
0 in each physical drawer (ie. logical drawers
0 1,4,7,10,13,16,19, and 22). In BCS-29, this restriction
0 is removed; the Converter is permitted in any logical
0 drawer. Type E Line Cards and Message Waiting Power Con-

0 RELEASE 28.01
0 93 12 03

0 verter are not permitted in a Line Sub Group containing
0 ISDN line cards.

0 (x) Each LCME/LCMI may have from two to eighteen DS-30A links
0 to the supporting CPEI. Refer to the Traffic Criteria
0 and Capacity (Chapter 2) for the traffic tables required
0 for link provisioning.

0 (xi) The LCMI modules in the frame will be numbered from the
0 bottom up. In an office equipped with both LCE and LCEI
0 frames, the LCMI modules must be uniquely numbered. They
0 may not be numbered the same as already existing LCM mod-
0 ules (ie. LCM 01 and LCMI 01 cannot co-exist in an of-
0 fice).

0 (xii) ISDN 2B1Q Line Drawer

0 NTBX32BA ISDN Enhanced Line Drawer has been introduced
0 for 2B1Q Access Subsystem. The NTBX32BA is a new high
0 capacity line drawer replacing NTBX32AA. It will in-
0 crease the ISDN LCM capacity from 48 slots to 60 slots.
0 This will provide a physical capacity of 480 single slot
0 lines per LCME. Each drawer can support up to 60 single
0 slot line cards. The D channel of each line is statis-
0 tically multiplexed at a 4 to 1 ratio at the LCME and
0 sent to the D Channel Handler for processing.

0 The ISDN 2B1Q line drawer consists of the following:

- 0 - One Bus Interface Card (BIC)
- 0 - Sixty line card slots
- 0 - One Point of Use Power Supply (PUPS). The PUPS con-
0 verts the common equipment -48V BATTERY to +5V. This
0 +5V is routed to the line card slots.

0 Each drawer is divided into two (2) logical drawers or
0 subgroups. This differs from the LCMI which has three
0 (3) logical subgroups per each physical drawer.

0 The individual logical subgroups in a line drawer will be
0 numbered from the bottom up; starting as subgroup 0 at
0 the first line drawer (Line Drawer 0) and continuing, in
0 sequential order, up to subgroup 15 (at the top of Line
0 Drawer 7).

0 ISDN AMI Line Drawer

0 RELEASE 28.01

0 93 12 03

0 Each physical line drawer is comprised of three logical
0 drawers and associated sub group from a software aspect.
0 The logical drawer is individually maintained, provi-
0 sioned and with respect to call processing, failure of
0 one logical drawer does not affect other logical drawers.

0 Each logical drawers (or line sub group) has the physical
0 capacity to hold up to 16 line cards. Each LCMI has the
0 physical capacity to hold up to eight (8) physical line
0 drawers.

- 0 (xiii) An LTID number is required for each terminal on the
0 switch. The current limit for LTIDs is 32,000 per
0 switch. The limit for packet data devices will remain at
0 16,000 for the packet handler equipment. Therefore, the
0 switch will only be able to accommodate 1022 packet

0 Up to eight terminals may be assigned to each loop. A
0 maximum of 2 B channel devices (voice, circuit switched
0 data or 64K packet data) + 6 D channel devices (16K
0 packet data), 1B + 7D or 8D may be assigned to each loop.

- 0 (xiv) MTU for 2B1Q Lines on a LCME.

0 For every MTA that has a LCME on the vertical there must
0 be at least one MTU on a horizontal of that MTA. Each MTU
0 (NT2X10BA and NT2X11BA card set) has two test access
0 ports; that is two (2) sets of tip and ring. Thus it can
0 test two 2B1Q lines at the same time. A LTU that has ac-
0 cess to an MTA that has a LCME on the vertical will NOT
0 be used to perform any metallic testing on the 2B1Q
0 lines. Any rover test units (ones shared across MTAs)
0 that has access to the MTA that has a LCME on it must be
0 a MTU for it to be used on the LCME.

0 The physical installation of MTUs in MTMs is no different
0 for 2B1Q than for POTS. For more information on MTUs,
0 refer to Section 3.5.

- 0 (xv) The following chart illustrates the call types which im-
0 pact Real Time Engineering of the LCMI.

CALL TYPE	BCS			
	25	26	27	28
-----	--	--	--	--
ISDN Circuit Switched	Y	Y	Y	Y
B Channel Packet Switched	N	N	N	N

0 RELEASE 28.01
0 93 12 03
0

0	D Channel Packet Switched	N	N	N	N
0	Electronic Business Set	N	N	Y	Y
0	Datapath	N	N	Y	Y
0	Other (POTS and MDC)	N	N	N	Y

0 Refer to System Engineering Bulletin (SEB) 88-10-001 for
0 BCS 25-27 Abbreviated Real Time Engineering Guidelines
0 for the LCMI.

0 PRI CC REALTIME - PRI calls cost approximately 5- 20%
0 more in realtime than equivalent POTS-type calls from a
0 PBX. Use 10% as a good average to convert existing PBX
0 calls to equivalent PRI; that is, multiply existing call-
0 type by 1.1.

0 (xvi) The NTB31AD LCMI Processor Memory Upgrade Kit is pro-
0 vided to field upgrade NTB31AA LCMI Common CP (contain-
0 ing NTB34AA LCMI Processor CP) to NTB31AC LCMI Common
0 CP (containing NTB34AB LCMI Processor CP). This upgrade
0 is required for BCS-28 application.

0 (xvii) EMI protection hardware is available for LCEI frames in a
0 Remote Switching Center office being equipped with ISDN
0 2B1Q service.

0 RELEASE 28.01
0 93 12 03

0 3.0 NT6X17BA - World Line Card (WLC) Type A

0 NT6X17BA World Line Card (WLC) is a universal type A line card
0 introduced to replace domestic and international type A line
0 cards.

0 The cards it replaces are:

0 NT6X17AC - North America
0 NT6X93AA - Turkey, Belize
0 NT6X93BA - Carribean
0 NT6X93CA - China
0 NT6X93DA - Morocco
0 NT6X93EA - Australia
0 NT6X98AA - UK Scopedia
0 NTMX29AA - British Telecom

0 |

0 The WLC has software selectable loop current limit character-
0 istics and software selectable automatic loss equalization. The
0 card has the flexibility to generate a wide variety of input and
0 balance impedances that may allow it to be used in potential new
0 markets.

0 The WLC is designed to work in the LCM, LCME, LCMI, ILCM, RLCM,
0 OPM, SRU, RSC, RSCI, SRSC, XLCM, XRLCM and SMBR/NSM peripherals.

0 The WLC functions with both DTMF and DP units. It is compatible
0 with CLASS/CMS signalling and MTU equipment. It also has elec-
0 tronic overvoltage protection to improve its robustness in hos-
0 tile environments.

0

0 RELEASE 28.01
0 93 12 03

0 Note:

0 For North American markets, the NT2X10/NT2X11 MTU combination is
0 to be provisioned. The NT4X97/NT4X98 MTU combination is the
0 equipment to be provisioned for International markets.

0 The WLC has increased reliability due to reduced component count
0 and lower operating temperatures because of lower power consump-
0 tion.

0 3.1 HARDWARE PROVISIONING

0 3.1.1 HARDWARE USAGE RESTRICTIONS

0 For jobs being provisioned by RNS in Richardson, the NT6X17AC is
0 still the type 'A' line card of choice. Until the NT6X17BA be-
0 comes fully compliant with RNS market requirements, the NT6X17AC
0 is to be provisioned for all RNS jobs.

0 BCS33 software and XLCM hardware are required for all interna-
0 tional applications for the type 'A' WLC.

0 In North American markets, the WLC defaults to NT6X17AC config-
0 uration and therefore can be used with BCS30 and newer software
0 with the application of the appropriate software patches.

0 3.1.2 HARDWARE DEPENDENCIES

0 XLCM hardware running BCS33 software is required for interna-
0 tional DMS offices in order to use the type 'A' WLC.

0
0 RELEASE 28.01
0 93 12 03

0 3.1.3 PROVISIONING CONSIDERATIONS

0
0 Currently, 2FR and 4FR multiparty applications are not supported
0 by the NT6X17BA. For 2FR and 4FR multi-party applications, pro-
0 vide the the type 'B' World Line Card, NT6X18BA.

0 3.3 SOFTWARE PROVISIONING

0

0 3.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

0 Software selectable parameters enable the NT6X17BA to replace ex-
0 isting domestic and international line cards. These parametric
0 variants are held in templates which can be applied from the MAP.
0 An NT6X17BA with no template allocated will behave as an
0 NT6X17AC.

0 Software packages required for the WLC are:

- 0 * NTXW00AA World Line Card Base (BCS33)
- 0 * NTXW02AA World Line Card Cutover by DN (BCS34)
- 0 * NTXW03AA World Line Card Over Voltage Report (BCS34)
- 0 * NTXW20AA World Line Card 900 +2 (BCS33)
- 0 * NTXW22AA World Line Card, UK (BCS33)

0 For Type 'B' only:

- 0 * NTXW01AA World Line Card Type 'B' (BCS34)
- 0 * NTXW21AA (BCS34)

0 3.3.2 SOFTWARE USAGE RESTRICTIONS

0

0 Offices equipped with the WLC must have a minimum of BCS33 re-
0 lease software for international applications.

0 North American offices can utilize the World Line Card with BCS30
0 software plus applicable software patches. The North American op-
0 eration at BCS30 is possible due to the fact that the World Line
0 Card Type 'A' defaults to NT6X17AC operation when no template
0 overlays are in use in the software.

0 4.0 World Line Card Type B

0 The World Line Card (WLC) is a universal type B line card introduced
0 to replace domestic and international type B line cards. The cards it
0 replaces are:

- 0 * NT6X33AA - Japan Type A
- 0 * NT6X94AB - Turkey, Belize and Guyana
- 0 * NT6X94BB - Carribean
- 0 * NT6X94CA - China
- 0 * NT6X93DA - Morocco
- 0 * NT6X18AA - North America

0 The World Line Card (WLC) Type B simplifies engineering by re-
0 places many line card types. This is accomplished by combining
0 the characteristics of many line cards in one card type.

0 The WLC has software selectable loop current limit character-
0 istics and software selectable automatic loss equalization. The
0 card is capable of adjusting to a wide variety of input and bal-
0 ance impedances. This capability gives the WLC type B the capa-
0 bility of being used in many market areas having diverse line
0 characteristics throughout the world.

0 The WLC is designed to work in the LCM, LCME, LCMI, ILCM, RLCM,
0 OPM, SRU, RSC, RSCI, SRSC, XLCM and LCM peripherals.

0 The WLC works with both DTMF and DP units. It is compatible with
0 CLASS/CMS signalling and MTU equipment. It also has electronic
0 overvoltage protection to improve its robustness in hostile envi-
0 ronments.

0 Compared with the the line cards it replaces, the WLC has in-
0 creased reliability due to reduced component count and lower op-
0 erating temperature and lower power consumption.

0 RELEASE 28.01
0 93 12 03

0 1.0 Common Peripheral Controller

0 1.1 Introduction

0 The Common Peripheral Controller modules are microprocessor- con-
0 troller Peripheral Modules which are responsible for:
0 - scanning the lines in the modules for changes of circuit
0 state,
0 - performing timing functions for call processing,
0 - collecting and storing digits,
0 - generating digital tones,
0 - detecting tones (MF, DTMF) through the Universal Tone Re-
0 ceiver (UTR),
0 - sending and receiving signaling and control information
0 to and from the CCC,
0 - providing integrity checking of the network.
0 The message system provides the control interface between the Pe-
0 ripheral Modules and the rest of the system.

0 Tones for subscriber lines (DTMF) and for trunks (MF) are de-
0 tected by the Universal Tone Receiver (UTR) located in associated
0 PMs (LGC, DTC, LTC, SCM and RSC). Use of the UTR removes the re-
0 quirement for a network connection to a pool of receivers at the
0 Trunk Module (TM) and Maintenance Trunk Module (MTM). This
0 functionality offers improvements in CC, LGC, and RSC real time.

0 (i) Line Group Controller Equipment General Description

0 The LGC performs the medium-level processing tasks associ-
0 ated with subscriber line interfaces both for host office
0 and remote units. The LGC has duplicated control on two
0 shelves.

0 It can interface with up to 16 32-channel (30 voice and two
0 signal) speech links to the network, and up to 20
0 32-channel speech links (DS30A protocol) to its associated
0 Line Concentrating Modules (for host lines), or up to 20
0 24-channel DS1-rate lines serving remote equipment (RLCM,
0 OPM, or RSC). The same holds true for the International
0 Line Group Controller Modules, except for the interface to
0 the international remote equipment (IRLCM). Up to 20
0 30-channel PCM 30 lines can interface the remote equipment.

0 (ii) Digital Trunk Controller Equipment General Description

0

0 RELEASE 28.01
0 93 12 03
0

0 The DTC is indential to the LGC except that it contains
0 hardware to extract or insert A/B bit signaling and is pro-
0 grammed to perform trunk-oriented tasks.

0 The DTC is a two-shelf module and contains up to 10
0 DS1-rate interface cards, each having the capability of
0 interfacing with up to two DS1-rate lines. The 20
0 24-channel DS1-rate lines interface with 16 32-channel (30
0 voice + 2 signal) speech links to the network.

0 For international applications, the International Digital
0 Trunk Controller (IDTC) is the same as the DTC except it
0 interfaces with PCM 30 lines. Up to 20 30-channel PCM 30
0 lines can be interfaced with the IDTC.

0 (iii) Line Trunk Controller Equipment General Description

0 The LTC is a hybrid of the LGC and the DTC and is capable
0 of supporting the LCMS, remotes, and digital trunk inter-
0 faces. The LTC is a two-shelf module and has 20 ports
0 available to be assigned to host lines (DS30A protocol),
0 remote lines (DS1 protocol) and digital trunks (DS1 proto-
0 col). It can interface with up to 16 32-channel (30 voice
0 + 2 signal) speech links to the network. Like the DTC, the
0 LTC provides A/B bit scanning capability.

0 (iv) Subscriber Module Equipment General Description

0 The Subscriber Carrier Module SCM-100 Family of peripheral
0 modules provide interfaces between DMS-100 Family Systems
0 and non DMS-100 remote equipment. There are three versions
0 of the SCMs, Subscriber Module Remote (SMR), Subscriber
0 Carrier Module for SLC-96 (SMS) and Subscriber Carrier Mod-
0 ule - Urban (SMU).

0 a) The Subscriber Module Remote (SMR), also referred to as
0 Subscriber Carrier Module Rural (SCMR), is the first
0 peripheral in the SCM-100 family. It replaces the Con-
0 trol Concentrator Terminal (CCT) of the DMS-1R sub-
0 scriber carrier system and provides direct digital
0 interface between the DMS-1R Remote Concentrator Termi-
0 nal (RCT) and the DMS-100F.

0 The SMR provides all basic tones to a RCT, including
0 dial tone, busy tone, reorder tone, audible ringing
0 (ringback) tone, high tone, receiver offhook tone and

0 RELEASE 28.01
0 93 12 03

0 call waiting tone. Additionally, the SMR supports all
0 the currently available ringing schemes: coded, fre-
0 quency selective and superimposed.

0 b) The Subscriber Carrier Module (SMS) will interface on a
0 direct digital basis with the SLC-96 Remote Terminal
0 (RT) via DS-1 transmission facilities.

0 The SMS will replace the Central Office Terminal (COT)
0 currently associated with the RT thus eliminating indi-
0 vidual analog line circuits currently necessary to com-
0 municate on a line by line basis with the SLC-96.

0 The SLC-96 can operate in one of three modes:

0 MODE I - (non-concentrated line mode)

0 Used primarily for single and multiparty lines. Mode I
0 supports up to 96 subscriber lines and connects to the
0 SMS through up to five (5) DS-1 lines. One of these
0 lines is a protection line, active only when any of the
0 remaining four is out of service.

0 MODE II - (concentrated line mode)

0 Used for subscriber lines, special service and coin
0 lines. Mode II supports up to 96 subscriber lines and
0 connects to the SMS through up to three (3) DS-1 lines.
0 One of these lines is used for a protection line. Each
0 shelf group of 48 subscribers (two shelf groups total)
0 at the SLC-96 must compete for 24 channels on the DS-1
0 line.

0 MODE III - (non-concentrated single shelf group)

0 Used for special service and coin circuits. Mode III
0 supports up to 48 lines and connects to the SMS through
0 up to three (3) DS-1 lines. One of these lines is used
0 for a protection line.

0 c) The Urban Subscriber Carrier Module (SMU) (NT6X02EA)
0 will interface on a direct digital basis with a DMS-1
0 Urban Remote Terminal (RCU) via DS-1 transmission fa-
0 cilities.

0 The SMU is designed to replace the Central Control Ter-
0 minal (CCT) now required when the RCU is connected to a

0 RELEASE 28.01
0 93 12 03

0 DMS-100 Family switch. This will eliminate the need
0 for duplicated line circuits and will reduce floor
0 space required at the DMS-100 host office.

0 (v) Common Peripheral Controller Equipment Frame

0 The Common Peripheral Controller modules are housed in a
0 standard DMS frame named the Common Peripheral Equipment
0 Frame. Up to two modules can be mounted in this frame.
0 Since it is possible to house two different types of PM
0 within the same frame, the frame name assumes the identity
0 of the PM in the bottom of the frame. Possible frames
0 names are:

- 0 - Line Group Equipment (LGE) frame (for LGCs)
- 0 - Digital Trunk Equipment (DTE) frame (for DTCs)
- 0 - Line Trunk Equipment (LTE) frame (for LTCs)
- 0 - Subscriber Module Equipment (SME) frame (for SMR, SMS
0 or SMU)

0 (vi) Line Concentrating Device Provisioning

0 Prior to BCS28, the maximum number of LCDs allowed in an
0 office was 254 with the maximum number of real LCDs limited
0 to 200. Changes in BCS 28 allow up to 254 real LCDs. The
0 use of virtual LCDs will lower the number of real LCDs al-
0 lowed. For BCS30 and above, the calculation of LCDs per
0 SLC will be changed to 8 SLCs per real LCD.

0 SMS, SMR, SMU are classed as real time modules when consid-
0 ering LCD provisioning. Refer to the Line Concentrating
0 Module section for more information.

0 1.3 Equipment Provisioning

0 1.3.1 DS30A Interface Cards

0 (a) General Description

0 To enable the Telco to specify the quantity of interface circuit
0 packs required to interface the DS30A ports from the Line Concen-
0 trating Module (LCM).

0 (b) Reference

0 None

0 (c) Provisioning Considerations

0 (i) NT6X48AA is required to interface with the DS30A ports of
0 the LCM module (domestic and international).

0 (ii) There can be a maximum of two (2) pairs of NT6X48AA cards
0 (four cards in total) per LGC module.

0 (iii) One pair of NT6X48AA cards provides an interface for up
0 to 10 DS30A ports from LCM's.

0 (iv) For each new LGC module that links to LCMs, always pro-
0 vide two (2) pairs of DS30A Interface Cards.

0 (v) When an existing LGC has only one (1) pair of the DS30A
0 Interface Cards, order one more pair if there will be
0 more than 10 DS30A links from the LCMs.

0

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 1.3.2 DS1 Interface Cards

0 (a) General Description

0 To enable the Telco to specify the quantity of interface circuit
0 packs required to interface the DS1 digital carrier system and
0 the DS1 links from the Remote Line Concentrating Module (RLCM),
0 the Remote Switching Centre (RSC) and the Outside Plant Module
0 (OPM).

0 (b) Reference

0 NTP 297-1001-451 DMS-100 Family Common Customer
0 Data Schema

0 (c) Provisioning Considerations

0 (i) The DS1 Interface Cards are required to interface with
0 the DS1 digital carrier systems and the DS1 links from
0 the Remote Sites (i.e. Remote Line Concentrating Module
0 (RLCM), Remote Switching Center (RSC), Outside Plant Mod-
0 ule (OPM)).

0 (ii) There can be a maximum of ten (10) DS1 I/F cards per
0 LGC/DTC/LTC module.

0 (iii) One NT6X50AA/AB card provides an interface for up to two
0 (2) DS1 links. The NT6X50AB card will replace the
0 NT6X50AA card as the DS1 I/F card in many but not all ap-
0 plications (- the NT6X50AB will not be used in SMR, RSC,
0 and RLCM).

0 In order to support the enhanced features of the NT6X50AB
0 (i.e. ESF and 64 Kb/s clear channel capability based on
0 B8ZS), the DTC/LGC/LTC modules must be equipped with new
0 messaging (i.e. NT6X69AA/79AA or NT6X69AB) and new memory
0 (i.e. NT6X46AB/BA and NT6X47AB or NT6X47AC) cards. Pick
0 the appropriate DTC/LGC/LTC circuit pack fills.

0 The full support of the NT6X50AB card will not be avail-
0 able in DTC/LGC/LTC modules which have small memories
0 (i.e. NT6X46AA, NT6X47AA) and old messaging (i.e.
0 NT6X43AA). In these modules, the NT6X50AB can be used as
0 replacements for normal NT6X50AA carriers but the en-
0 hanced DS-1 feature set will not be available.

0
0 RELEASE 28.01
0 93 12 03

0 The above is only applicable to DMS host offices and not
0 to remotes such as RSC and RLCM.

0 The Customer cannot use NT6X50AB to substitute for
0 NT6X50AA unless NTX270AA software is loaded and
0 datafilled for the respective XPM's. It is recommended
0 that NT6X50AA cards and NT6X50AB cards not be mixed on a
0 shelf to minimize cases where the Customer forgets that
0 NT6X50AB needs to be explicitly software datafilled. The
0 datafill is via software table CARRMTC.

0 (iv) The DS-1 Interface Circuit Pack provisionable to the SMS
0 is the NT6X85AA or NT6X85AB. If software package
0 NTX299AB is present, the NT6X85AB is required for all
0 modules that require special services features. Other SMS
0 modules may use NT6X85AA packs but will be unable to use
0 the special services features of the software package
0 NTX299AB. (Check availability reports for the proper or-
0 dering PEC.)

0 The SMU DS-1 CP Product Engineering Code (PEC) is
0 NT6X85AB. Each NT6X85AB CP contains two (2) DS-1 cir-
0 cuits. A maximum of ten (10) NT6X85AB CP may be provi-
0 sioned on each SMU.

0 1.3.3 PCM 30 Interface Cards

0 (a) General Description

0 To enable the Telco to specify the quantity of interface circuit
0 packs required to interface the PCM 30 links from the Interna-
0 tional Remote Line Concentrating Module (IRLCM) and the PCM 30
0 Digital Carrier Systems.

0 (b) Reference

0 Chapter 3, Section 3.3 Operator Services
0 NTP 297-1001-451 DMS-100 Family Common Customer
0 Data Schema

0 (c) Provisioning Considerations

0 (i) The PCM 30 Interface Cards are required to interface with
0 the PCM 30 digital carrier systems and the PCM 30 links
0 from the Remote Sites (i.e. International Remote Line
0 Concentrating Module (IRLCM)).

0 (ii) One NT6X27AA/AB card provides an interface for up to two
0 (2) PCM 30 links.

0 (iii) There can be a maximum of eight (8) PCM 30 I/F cards per
0 International DTC (IDTC) module.

0 (iv) A DMS-100 host interfaces with an IRLCM over 2-6 PCM 30
0 links. The PCM 30 I/F cards mount on the ILGC.

0 (v) There can be a maximum of two (2) NT6X27AB PCM 30 I/F
0 cards per ILGC/IDTC module when the interoffice synchro-
0 nization feature is required.

0 (vi) When ITOPS is equipped on a DMS-100/200 configuration,
0 loop around trunks (NT6X27AA) must be provisioned to
0 route traffic between the DMS-100 and the DMS-200 portion
0 of the switch. Refer to Section 3.3 - Operator Services,
0 for more ITOPS provisioning information.

0 (vii) Provide one pair of NT6X28AA PCM 30 Signalling CP per
0 IDTC if TS16 signalling is used on the PCM link.

0 (viii) Provide one pair of NT6X28AA PCM 30 Signalling CP per
0 ILGC which supports LCM equipped with Metering Tone Con-

0 verter line cards (see the subsection on the Line Draw-
0 ers, found in this chapter, for more information on the
0 Metering Tone Converter line card).

0 1.3.4 Line Trunk Controller (LTC) Module0 (a) General Description

0 The LTC provides the interface between the LCM and the DMS net-
0 work. It is also an interface between the Remote Sites and the
0 DMS network and an interface between the DS1 digital carrier sys-
0 tem and the DMS network.

0 (b) Reference

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

- 0 (i) The LTC module is a two shelf module.
- 0 (ii) Each LTC module can accommodate up to four (4) DS30A LCM
0 Interface Cards and up to ten (10) DS1 Interface Circuit
0 Packs. Each module can interconnect with the network via
0 up to sixteen (16) speech links.
- 0 (iii) Each LTC can terminate up to a maximum of twenty (20)
0 ports on the peripheral side, in any combination of DS30A
0 or DS1 ports (i.e. up to a maximum of twenty (20) DS30A
0 ports or up to a maximum of twenty (20) DS1 ports or any
0 combination of DS30A and DS1 ports up to a maximum of
0 twenty (20) ports).
- 0 (iv) Each LTC can terminate up to 16 DS30 ports x 30 = 480
0 speech channels on the CPU (network) side.
- 0 (v) The peripheral ports (DS30A and DS1) in the LTC can be
0 assigned in either a concentrating or a non-concentrating
0 configuration. In the concentrating configuration, up to
0 600 P-side speech channels can be assigned; while in the
0 non-concentrating configuration, a maximum of 480 P-side
0 speech channels can be assigned. Each DS30A link sup-
0 ports 30 speech channels. Each DS1 link supports 24
0 speech channels.
- 0 (vi) In offices with BCS-22 or earlier, the host LGC/LTC can
0 support up to a maximum of 18 p-side datafilled software
0 nodes, where a node is defined as host LCMs, RSC LCMs,
0 RCC, RLCM, OPM, RMMs, ESA processor (for RLCM/OPMs) and
0 dummy software nodes.

0
0 RELEASE 28.01
0 93 12 03

0 In BCS-23, this node limit is raised to a maximum of 62
0 p-side nodes.

0 (vii) A host LTC is required, rather than a LGC, when the RSC
0 trunking option (NTX152AB) is planned/provisioned.

0 (viii) It is recommended that the host LTC interface to only one
0 RSC. However, a maximum of two RSCs per LTC is allowed
0 (except for the Dual RCC configuration).

0 (ix) Dual RCC configurations require one LTC per RCC. The host
0 LTC will not interface to a second RCC.

0 (x) Provision RSCs off of the host LTC first. The remaining
0 LTC ports can be used to provision host LCMs, RLCMs,
0 OPMs, or DS1 digital carriers as host LTC capacity per-
0 mits. However, consideration should be given to RSC
0 growth.

0 (xi) The maximum number of Remotes (RSC, RLCM, OPM) that a
0 Host LGC can support is defined as follows:

- 0 - Two (2) RSCs from a single configuration.
- 0 - One (1) RSC from a dual configuration and one (1) RSC
- 0 from a single configuration.
- 0 - Traffic, Real Time and software Nodal requirements do
- 0 not exceed the recommended engineering limits.

0 In addition, the remaining p-side ports can be configured
0 for two (2) RLCMs and OPMs if the Traffic, Real Time and
0 software Nodal requirements do not exceed the recommended
0 engineering limits.

0 (xii) All ports from an LCM module must terminate onto the same
0 LTC module.

0 (xiii) All ports from an RLCM must terminate onto the same LTC
0 module.

0 (xiv) All ports from an OPM must terminate onto the same LTC
0 module.

0 (xv) There is a fifty (50) foot cabling length restriction be-
0 tween the LTC and the LCM.

0 (xvi) The newly provisioned modules can be linked to existing
0 LGC/LTCs. Take this into account when provisioning new
0 LTCs.

0 RELEASE 28.01
0 93 12 03

0 (xvii) When a LTC module is handling CCIS voice trunking, two
0 (2) Continuity Tone Detector cards are required.

0 (xviii) The following LTC Common Peripheral Controller CPs sup-
0 port the following applications:
0 NT6X02MC supports RSC, UTRs
0 replaces NT6X02AK/AG (BCS-27)

0 (xix) For each NT6X02MC ordered (BCS-27), provide:

- 0 - four (4) XPM Processor CP NT6X45AF/BA
- 0 - two (2) DS30 Network Interface CP NT6X40AC
- 0 - two (2) SP Memory Plus CP NT6X46BB
- 0 - two (2) MP Memory Plus CP NT6X47AC
- 0 - two (2) MSG Protocol & Tone CP NT6X69AC
- 0 - two (2) Power Converter CP NT2X70AE

0 NT6X02MC is to be ordered instead of NT6X02MA.

0 (xx) NT6X02MC is the minimum packfill level for new offices
0 (for BCS-32 or later). NT6XMA/AU is the minimum packfill
0 level required to support BCS-32 or later in existing of-
0 fices.

0 Upon general availability, the NT6X45BA CP will become
0 the standard XPM Processor offering instead of the
0 NT6X45AF CP.

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four (4) NT6X45BA XPM Processor CP for upgrading
0 existing offices.

0 (xxi) If interface to the Enhanced Network (ENET) is required,
0 then the relevant DTC/LGC/LTC modules must have the
0 NT6X69AC Msg Protocol & Tone CP. NT6X69AC replaces
0 NT6X69AB.

0 Provide 1 NT6X02BQ change kit for each DTC/LGC/LTC module
0 you are upgrading to ENET. This change kit applies only
0 to modules provisioned at NT6X02 AS/IA, AT/LA or AU/MA
0 levels. Modules provisioned at earlier levels must be
0 upgraded to these levels before the NT6X02BQ change kit
0 can be applied.

0 RELEASE 28.01
0 93 12 03
0

0 (xxii) If ENET interface is not required, use the product change
0 kit NT6X02EQ to upgrade LTC modules from NT6X02IA/LA/MC
0 to NT6X02IC/LC/MC levels.

0 (xxiii) In new offices, at BCS32 or later, the minimum packfill
0 level for DTC modules (to be used for CCS6/CCS7) is
0 NT6X02IC.

0 (xxiii) There are two methods available to satisfy 4 MB MP memory
0 requirements in existing DTC/LGC/LTC modules. The first
0 method is to apply one NT6X02EQ product change kit to
0 each DTC/LGC/LTC module to be upgraded as in item (1) be-
0 low. Per customer request, a second pair of office sup-
0 plied NT6X47AB packs may be added to each DTC/LGC/LTC
0 module to be upgraded as in item (2) below. Do not order
0 new NT6X47AB packs for the upgrade of NT6X02IA, LA, MA mod-
0 ules. The NT6X47AB packs that have been removed from up-
0 graded DTC/LGC/LTC modules may then be applied to other
0 relevant DTC/LGC/LTC modules.

0 1) Provision NT6X02EQ Product Change Kit to replace the
0 NT6X47AB MP Memory Plus circuit packs in slot 10 with
0 NT6X47AC packs. The NT6X02EQ kit may only be applied
0 to the following modules:

0	DTC	(CCS7)	:	BCS-27	and later	(NT6X02AS/IA)
0	DTC	(other)	:	BCS-33	and later	(NT6X02AS/IA)
0	LGC	(all)	:	BCS-31	and later	(NT6X02AT/LA)
0	LTC	(all)	:	BCS-30	and later	(NT6X02AU/MA)

0 2) Existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT0X50AA, Filler Face Plate, in Slot 09.
0 Provide two (2) NT6X47AB, MP Memory Plus CP for the
0 above listed modules.

0 One NT6X47AC in slot 10 (item 1) has the same mem-
0 ory capacity as two (2) NT6X47AB in slots 9 and 10
0 (item 2).

0 Existing DTC/LGC/LTC module is presently equipped
0 with two NT6X69AB in slot 18. If existing module is
0 not required to interface ENET, new cards are not re-
0 quired for these slots.

0
0 RELEASE 28.01
0 93 12 03

0
0 Provide one (1) NT6X02BQ Product Change kit for each
0 existing DTC/LGC/LTC module to be upgraded to inter-
0 face ENET. The NT6X02BQ contains (2) NT6X69AC circuit
0 packs. The NT6X02BQ will convert the NT6X02IA/AS to
0 NT6X02IC, the NT6X02LA/AT to NT6X02LC, and the
0 NT6X02MA/AU to NT6X02MC.

0 If an existing DTC/LGC/LTC module has ALREADY been
0 upgraded to the NT6X02IC/LC/MC packfill level via the
0 NT6X02EQ KIT, provide two NT6X69AC circuit packs in
0 slot 18 to upgrade the module for ENET interface.

0 (xxiv) Provide two (2) NT6X78AA, Class Modem Resource CP, for
0 each LTC module that is handling Custom Local Area Sig-
0 naling Services (CLASS -U.S.) or Call Management Services
0 (CMS -Canada) -Calling Number Display. This rule only
0 applies to the following LTC modules:

0 NT6X02MC/MA, NT6X02AU

0 Upon general availability, the NT6X78AB will replace the
0 NT6X78AA as the standard CLASS Modem Resource CP. When
0 this happens, provide two (2) NT6X78AB CLASS Modem Re-
0 source CP in slot 13 of each LGC/LTC module that is han-
0 dling CLASS-Calling Number Display.

0 (2) NT0X50AA Filler Face Plate
0 (2) NT6X47AC Master Proc Memory Plus CP
0 (2) NT6X46BB Signal Processor Memory Plus CP
0 (2) NT6X69AC CPP Msg Protocol & Tone CP
0 (2) P0711663 Desig. Label for NT6X47AC
0 (2) P0711664 Desig. Label for NT6X46BB
0 (2) P0710476 Desig. Label for NT6X69AC

0 (NOTE: The NTZZ04GA includes all circuit packs required
0 to upgrade a NT6X02AC module except the NT6X45 cards.

0 The NTZZ04GA building block kit may be used to upgrade
0 the NT6X02AC module as follows:

0
0
0
0
0
0
0
0
0

Building Block	From	To
NTZZ04GA	NT6X02AC (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

0 | (xxvi) Existing DTC/LGC/LTC module is presently equipped with
0 four (4) NT6X45AA, XPM Processor CP, in Slots 08 & 12.
0 Application of the NTZZ04EA/NTZZ04GA makes these slots
0 provisionable and replacement cards must be ordered as
0 follows:

0 For A-stock upgrades provide four (4) NT6X45BA cards in
0 slots 8 and 12 of the upper and lower shelves of the pe-
0 ripheral modules. If B-stock material is required, then
0 four NT6X45BB packs must be merchandise ordered via an
0 88K.

0 | The existing NT6X45AA packs must be replaced because they
0 will not work with New Messaging. The only reason NT6X45
0 cards are not included in the NTZZ04EA/GA upgrade kit is
0 because there is an option between NT6X45BA and NT6X45BB
0 packs. Either the NT6X45BA packs or the NT6X45BB packs

0 RELEASE 28.01
0 93 12 03
0

0 must be ordered or the upgrade will not have been done
0 correctly.

0 (xxvii) The existing DTC/LGC/LTC module is presently equipped
0 with the following DS30 Network Interface CP in Slots 22
0 & 23: four (4) NT6X40AA.

0 If copper interface to the Network is required, then DO
0 NOT order new circuit packs for these slots.

0 If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP in Slot 22, and two (2) NT6X40DA, DS512 Pad-
0 dle Board, in Slot 22R of each relevant DTC/LGC/LTC mod-
0 ule. Also, provide one (1) NT6X02BU, Fiber I/F Hardware
0 Assembly, for each DTC/LGC/LTC module interfacing to the
0 Enhanced Network (ENET). The NT6X02BU Fiber Assembly
0 mounts on the backplane of the lower array in a module
0 and provides the fiber interface for both arrays.

0 Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0 (xxviii) The existing DTC/LGC/LTC module is presently equipped
0 with four (4) NT6X47AA, MP Memory CP, in Slots 09 & 10.
0 Application of the NTZZ04EA/NTZZ04GA replaces these cir-
0 cuit packs with two NT6X47AC Master Processor Memory cir-
0 cuit packs.

0 (xxix) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X46AA Signal Processor Memory Plus CP in
0 slot 11. Application of the NTZZ04EA/NTZZ04GA replaces
0 these circuit packs with two NT6X46BB circuit packs.

0 (xxx) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X43AA, Msg Interface CP, in Slot 18. Ap-
0 plication of the NTZZ04EA/NTZZ04GA replaces these circuit
0 packs with two NT6X69AC Msg Protocol & Tone circuit
0 packs.

0

0
0 RELEASE 28.01
0 93 12 03

0 (xxxi) If the existing module was a NT6X02AA, then the NTZZ04EA
0 provides two (2) NT2X70AE, Power Converter CP, in Slot 25
0 of each DTC/LGC/LTC module.

0 If the existing module was a NT6X02AC, then two (2)
0 NT2X70AD, Power Converter CP, already exist in Slot 25 of
0 each DTC/LGC/LTC module. DO NOT order new circuit packs
0 for these slots unless requested by the customer. Per
0 Telco request, the existing NT2X70AD CP's in each
0 DTC/LGC/LTC can be replaced by the NT2X70AE, Power Con-
0 verter ESD CP.

0 RELEASE 28.01
0 93 12 03

0 2.3 Equipment Provisioning

0 2.3.1 CLASS/CMS Feature

0 (a) General Description

0 Custom Local Area Signalling Services or CLASS Features are a set
0 of line-oriented features which the telephone company can deploy
0 in their residential or Centrex customer environment to generate
0 additional revenue. These features operate within a single
0 switch or transparently between users on different end-office
0 switches by means of CCS7-based signalling in a multi-node switch
0 configuration. In the U.S., this feature is called CLASS and in
0 Canada, the feature is called CMS. In this document, the feature
0 will be referred to as CLASS.

0 CLASS Features are separated into Phase I and Phase II features.
0 Phase I features include

- 0 - Automatic Callback (ACB) - allows a calling party to automat-
0 ically call again the number most recently dialed, whether
0 that call was answered, unanswered, or busy. If the station
0 is busy, the user may queue against that station and be re-
0 called when it becomes idle. The Automatic Callback feature
0 is very similar to the Ring Again (RAG) feature, but will be
0 deployed in the Public Network.
- 0 - Automatic Recall (AR) - enables the end user to return his
0 latest incoming call automatically, regardless of whether the
0 incoming call was answered, and regardless of whether the end
0 user knows the identity of the calling party. If the station
0 is busy, the user may queue against that station and be re-
0 called when it becomes idle. With two (2) level activation,
0 the directory number of the last call is voiced back prior to
0 completing the call.
- 0 - Calling Number Delivery or Calling Number Display (CND) - en-
0 ables receipt and display of the calling party's directory
0 number and Date/Time during the ringing cycle. This allows
0 the end user with a display set to make an informed decision
0 about answering the call.
- 0 - Calling Number Delivery Blocking (CNDB) - permits the origi-
0 nating customer, by designating his calling identity as "pri-

0 RELEASE 28.01
0 93 12 03
0

0 vate", to prevent his directory number from being transmitted
0 for Calling Number Delivery. The calling party may change
0 his DN Suppression default - Suppress DN or not Suppress DN -
0 to the opposite status.

0 - Customer Originated Trace (COT) - enables the called party to
0 request an automatic trace of the last call received. The
0 trace record identifies the calling party and other call-
0 related information. The results of the trace are not pro-
0 vided directly to the end user, but are made available only
0 to an authorized agency, such as the telephone company or law
0 enforcement agency.

0 Note that CLASS features are available only to lines with a line
0 class code of RES (Residential Enhanced Services). Note that
0 this does not include ISDN RES lines.

0 Automatic Recall Date and Time Feature (ARDT)

0 This feature provides the date and time voiceback capability for
0 the Automatic Recall (AR) two-level activation sequence.

0 CLASS Configuration

0 Figure 35.2 illustrates a typical configuration with a CLASS ter-
0 minal on the DMS. This terminal is equipped with an enhanced
0 Man-Machine Interface (MMI), such as a Liquid-Crystal Display
0 (LCD) panel. The terminal could also consist of a standard tele-
0 phone with a CLASS add-on unit. An integrated telephone set,
0 such as NTL's MAESTRO, can also be used. The telephone section
0 of the Customer Premises Equipment (CPE) is loop powered, whereas
0 the CPE section providing CLASS features is powered by local AC.

0

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 Figure 35.2 Typical Configuration with a CLASS CPE

0 The transmission of the calling party number to the Customer Premises
0 Equipment (CPE) is accomplished via asynchronous FSK simplex-mode
0 transmission at 1200 bits/sec over the 2-wire loop, in accordance with
0 the Bell 202A standard. A burst of data is transmitted to the CPE
0 during the silent interval between the first and second ring of the
0 telephone set, before the incoming call is answered. The data link
0 terminates at a 202A modem in the CPE, which outputs the calling party
0 number to the LCD panel.

0 (b) Reference

0 Chapter 3, Section 3.4 Meridian Business Services

0 Section 3.15 Common Channel Signaling Systems

0 RELEASE 28.01
0 93 12 03

0 (c) Provisioning Considerations

0 (i) CCS7 Signalling is required when CLASS features are ac-
0 cessed between nodes. Within the same node, CCS7 Signal-
0 ling is NOT required. Refer to Section 3.15 for more
0 information on CCS7 Signalling.

0 (ii) An optional feature exists called Automatic Recall Date
0 and Time (ARDT). This feature requires announcements
0 provided on a pair of CPs; NT1X76JA and NT1X76JB. The
0 NT1X76AJ and the NT1X76AK cards are required when the
0 NT1X76JA and NT1X76JB cards are ordered. The NT1X76AJ,
0 NT1X76AK, NT1X76JA, and NT1X76JB should be assigned to
0 the same DRA module. In a Class Phase 1 English office,
0 the NT1X76JA/JB can be assigned to a DRA where the
0 NT1X76AJ/AK cards are existing and there is room. Other-
0 wise, in other offices or where the DRAs with NT1X76AJ/AK
0 cards are filled, an additional set of NT1X76AJ/AK cards
0 must be ordered.

0 (iii) LCM Processor Cards, NT6X51AB, are required to support
0 CND in LCMS. LCM Common CP, NT6X04AB, contains NT6X51AB
0 and hence can support CND. Only LCMS which contain lines
0 utilizing the CND feature must be upgraded to use the
0 NT6X51AB.

0 (iv) In addition to the LCM Processor Card NT6X51AB, the CLASS
0 Modem Resource (CMR) card NT6X78AA has been developed to
0 support the introduction of CND.

0 The CMR card will support software to provide SP
0 processor - CMR messaging and thus provide CMR sanity
0 supervision, software downloading,
0 maintenance/diagnostics, operational measurements and
0 swact activity.

0 When the CND feature is required, provide two (2) CMR
0 cards per LGC/LTC/RCC/SMS/SMU module (i.e. one (1) card
0 per shelf). It is not necessary to equip all the
0 LGC/LTC/RCC/SMS/SMU in the office with the CMR card. Only
0 LGC/LTC/RCC/SMS/SMUs that will provide CND to the sub-
0 scribers that home on these peripherals will require the
0 CMR card. Any number of LGC/LTC/RCC/SMS/SMUs of a given
0 DMS may be equipped with CMR cards.

0

0 RELEASE 28.01
0 93 12 03
0

- 0 (v) For Canadian Applications when the NT6X78AA cards are
0 provisioned into an LGC, LTC, or SMS module,

0 EITHER:

- 0 1. Retrofit the NT6X69AA/NT6X79AA card combination (if
0 existing) to an NT6X69AB card via the application of
0 the NT6X12ZY PC Kit.

0 This upgrade kit allows card slot 18 to be provi-
0 sioned with the CLASS Modem Resource (CMR) card
0 NT6X78AA which is used for the CND feature. The
0 power-reduced NT6X78AB replaces NT6X78AA and does not
0 require this upgrade.

0 OR

- 0 2. Limit the number of NT6X50AA DS-1 cards to four per
0 shelf (i.e. eight per module).

0 This is required to limit the shelf's overall +5 volt
0 power requirements to below 55 amps.

- 0 (vi) There are optional announcements available for CLASS fea-
0 tures to indicate successful or denied operation.

0 For BCS-27, the NT1X75BA DRAM Controller must be provi-
0 sioned for all CLASS applications.

0 There are two groups of announcements, Phase 1 CLASS DRA
0 Announcements and Phase 2 CLASS DRA Announcements. If the
0 CLASS/CMS feature is required, at least one group of an-
0 nouncements (i.e. Phase 1 or Phase 2) must be provided.
0 The Customer can either have Phase 1 announcements or
0 Phase 2 announcements or both.

- 0 (vii) Phase 1 CLASS DRA Announcements

0 For the optional Phase 1 CLASS DRA Announcements, the
0 Customer can either make up his own announcements or he
0 can order the pre-recorded ones from NT.

0 For provisioning the Digital Recorded Announcement Re-
0 cordable Memory cards (NT1X77AA/79AA), divide the total
0 length of the announcements (in seconds) by 31. This de-
0 termines the number of circuits required for these an-
0 nouncements. These are the announcements that the
0 Customer can make up himself.

0 RELEASE 28.01
0 93 12 03
0

0 If the Customer chooses to create his own announcements,
0 and if he wants the Automatic Recall (AR) feature with
0 the Voice Back Option within NTXA00AA activated, then the
0 CLASS Phase 1 English Announcements (2) of (2) CP card,
0 NT1X76AK, and/or the CLASS Phase 1 French Announcements
0 (2) of (2) CP card, NT1X76BK, must be provided. Other-
0 wise, if the Voice Back Option is not to be activated,
0 then NT1X76AK and/or NT1X76BK are optional.

0 If the Customer wants our pre-recorded announcements, the
0 following DRA cards are available:

0	PEC	DESCRIPTION
0	NT1X76AJ	CLASS Phase 1 English Announcements
0		(1) of (2) CP
0	NT1X76AK	CLASS Phase 1 English Announcements
0		(2) of (2) CP
0	NT1X76BJ	CLASS Phase 1 French Announcements
0		(1) of (2) CP
0	NT1X76BK	CLASS Phase 1 French Announcements
0		(2) of (2) CP

0 The above cards are the approved Telecom Canada Phase 1
0 CLASS DRA Announcements.

0 If bilingual announcements are required (e.g. French fol-
0 lowed by English on the same announcement), then the
0 Phase 1 CLASS DRA Announcement cards must be provisioned
0 on the same DRA shelf (i.e. NT1X76AJ/AK/BJ/BK).

0 The Phase 1 CLASS DRA Announcement cards are only avail-
0 able in sets (e.g. NT1X76AJ/AK or NT1X76BJ/BK) and cannot
0 be provisioned separately. However, the NT1X76AK and
0 NT1X76BK cards can be ordered separately for the Auto-
0 matic Recall feature (noted above). The NT1X76AK card
0 can be ordered separately for the Call Forward Remote Ac-
0 tivation (CFRA) feature. (See Meridian Business Ser-
0 vices, Section 3.4, for more information on Residential
0 Enhanced Services.)

0 If the optional announcements are not selected, confirma-
0 tion tone can be used for successful feature operation
0 and fast busy (120 ipm) can be used for denial of feature
0 operation. This is only applicable to Calling Number De-
0 livery Blocking (CNDB) and Customer Originated Trace
0 (COT).

0 RELEASE 28.01
0 93 12 03

0 (viii) Phase 2 CLASS DRA Announcements

0 For Phase 2 CLASS DRA Announcements, the Digital Recorded
0 Announcement Recordable Memory cards (NT1X77AA/79AA) can-
0 not be used.

0 For provisioning, two groups of Phase 2 CLASS DRA An-
0 nouncements are available:

0 1) Phase 2 CLASS DRA Announcements (List 1-12)

0 2) Phase 2 CLASS DRA Announcements (List 13-31)

0 The following are the Phase 2 CLASS DRA Announcement
0 (List 1-12) cards:

0	PEC	DESCRIPTION
0	NT1X76AP	CLASS Phase 2 English Announcements
0		(1) of (8) CP
0	NT1X76AQ	CLASS Phase 2 English Announcements
0		(2) of (8) CP
0	NT1X76AR	CLASS Phase 2 English Announcements
0		(3) of (8) CP
0	NT1X76AS	CLASS Phase 2 English Announcements
0		(4) of (8) CP
0	NT1X76AT	CLASS Phase 2 English Announcements
0		(5) of (8) CP
0	NT1X76AU	CLASS Phase 2 English Announcements
0		(6) of (8) CP
0	NT1X76AV	CLASS Phase 2 English Announcements
0		(7) of (8) CP
0	NT1X76__*	English "Personality" card
0	NT1X76BP	CLASS Phase 2 French Announcements
0		(1) of (8) CP
0	NT1X76BQ	CLASS Phase 2 French Announcements
0		(2) of (8) CP
0	NT1X76BR	CLASS Phase 2 French Announcements
0		(3) of (8) CP
0	NT1X76BS	CLASS Phase 2 French Announcements
0		(4) of (8) CP

0		(7) of (8) CP

0
0 RELEASE 28.01
0 93 12 03

0 NT1X76__* French "Personality" card

0 The following are the Phase 2 CLASS DRA Announcement
0 (List 13-31) cards:

0	PEC	DESCRIPTION
0	NT1X76GA	CLASS Phase 2 English Announcements
0		(1) of (4) CP
0	NT1X76GB	CLASS Phase 2 English Announcements
0		(2) of (4) CP
0	NT1X76GC	CLASS Phase 2 English Announcements
0		(3) of (4) CP
0	NT1X76__	English "Personality" card

0 If Customers want Phase 2 CLASS DRA Announcements, the
0 group of List 13-31 cards are optional.

0 If either group or both groups of Phase 2 CLASS DRA An-
0 nouncements are required, provide a "Personality" card
0 for each group. Note that if both groups are required,
0 two "Personality" cards of the same type (i.e. one for
0 each group) must be provided.

0 The following are the Phase 2 CLASS DRA "Personality"
0 cards:

0

0

0

0

0

0

0

0	PEC	CPC
0	NT1X76AW	CLASS Phase 2 English Announcements (8) of (8) CP
0	NT1X76BW	CLASS Phase 2 French Announcements (8) of (8) CP
0	NT1X76GE	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type I CP For Bell South
0	NT1X76GF	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type II CP For Bell Atlantic
0	NT1X76GG	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type III CP For United Tel
0	NT1X76GH	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type IV CP For GTE
0	NT1X76GJ	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type V CP For Pacific Bell
0	NT1X76GK	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type VI CP For Ameritech
0	NT1X76GL	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type VII CP For Southwest Bell

0 * The "Personality" card, NT1X76AW, contains only Bell
0 Canada names and Bell South BCS-29 VO information. The
0 "Personality" card, NT1X76BW, contains only Bell Canada
0 names. It must be determined up front which "Personal-
0 ity" cards are required by which Customer. When engi-
0 neering a DMS job (initial or extension) which will
0 require Phase 2 CLASS DRA Announcements, the onus will be
0 on the Customer to determine which "Personality" card is
0 required.

0 The Phase 2 CLASS DRA Announcement cards are only avail-
0 able in sets (e.g. NT1X76AP/AQ/AR/AS/AT/AU/AV/AW or
0 NT1X76BP/BQ/BR/BS/BT/BU/BV/BW or NT1X76GA/GB/GC) and can-
0 not be provisioned separately. Note that the only excep-
0 tion to this is the "Personality" card (e.g. NT1X76AW)
0 which will be provisionable with other Customer specific
0 packs (as highlighted above).

0 RELEASE 28.01
0 93 12 03

- 0 (ix) Automatic Recall Date and Time (ARDT) CLASS DRA Announce-
0 ments

0 The customized announcements require a DRAM with a
0 NT1X75BA controller card. A set of AR Date and Time
0 Phrase List PROM Cards NT1X76JA and NT1X76JB are required
0 for ARDT (English) announcements. Each CP contain two
0 (2) virtual card credits because they are double density
0 cards.

0 The following are the AR Date and Time Phrase List PROM
0 cards:

0	PEC	CPC	
0	NT1X76JA	B0231819	Automatic Recall Date/Time
0			Announcements (1) of (2) CP
0	NT1X76JB	B0231820	Automatic Recall Date/Time
0			Announcements (2) of (2) CP

0 The NT1X76AJ and the NT1X76AK cards are required and
0 should be assigned to the same DRA module as the NT1X76JA
0 and NT1X76JB cards. In a Class Phase 1 English office,
0 the NT1X76JA/JB can be assigned to a DRA where the
0 NT1X76AJ/AK cards are existing and there is room. Other-
0 wise, in other offices or where the DRAs with NT1X76AJ/AK
0 cards are filled, an additional set of NT1X76AJ/AK cards
0 must be ordered.

- 0 (x) The DRA cards (either recordable or pre-recorded) can
0 mount on DRA modules (i.e. NT2X58AM, NT2X58CB, NT2X58AK,
0 NT2X58AG).

0 The DRA module can accommodate one (1) NT1X75BA DRAM Con-
0 troller card and up to a maximum of eight (8) virtual
0 card credits (i.e. the addressing range of the NT1X75BA).

0 The DRA Recordable Memory cards (NT1X77AA and NT1X79AA)
0 each contain one (1) virtual card credit because they are
0 single density cards.

0 The existing DRA pre-recorded announcement card NT1X76AA
0 contains one (1) virtual card credit. Currently, this is
0 the only NT1X76__ card which contains one (1) virtual
0 card credit. All other NT1X76__ cards contain two (2)
0 virtual card credits because they are double density
0 cards.

0 RELEASE 28.01
0 93 12 03
0

0 All Phase 1 and Phase 2 CLASS DRA pre-recorded announce-
0 ment cards (i.e. NT1X76AJ/AK/BJ/BK, NT1X76AP-AW,
0 NT1X76BP-BW, NT1X76GA-GC, NT1X76GE-GL) each contain two
0 (2) virtual card credits because they are double density
0 cards. Hence, a DRA module can accommodate a maximum of
0 eight (8) single density cards or a maximum of four (4)
0 double density cards.

0 The two (2) Phase 1 CLASS DRA Announcement cards (Eng-
0 lish) can be mounted on half of a DRA module. The two
0 (2) Phase 1 CLASS DRA Announcement cards (French) can be
0 mounted on half of a DRA module. If both English and
0 French are required, then the four (4) Phase 1 CLASS DRA
0 Announcement cards (English and French) can be mounted on
0 one (1) DRA module.

0 The eight (8) Phase 2 CLASS DRA Announcement (List 1-12)
0 cards (English) can be mounted on two (2) DRA modules.
0 The eight (8) Phase 2 CLASS DRA Announcement (List 1-12)
0 cards (French) can be mounted on two (2) DRA modules.

0 A quantity of five (5) DRA modules may be provisioned on
0 a TME frame, NT0X46AB, if and only if double density DRA
0 cards are provisioned on these modules. Any double den-
0 sity DRA cards (i.e. all NT1X76__ cards with the excep-
0 tion of NT1X76AA which is a single density card), up to a
0 maximum of four (4) per module, may be provisioned. Oth-
0 erwise, only four (4) DRA modules may be provisioned on a
0 TME frame.

0 Hence, a DMS office requiring both Phase 1 and Phase 2
0 (List 1-12) pre-recorded CLASS DRA Announcements in Eng-
0 lish and French can have all twenty (20) double density
0 DRA cards mounted on five (5) DRA modules and these five
0 (5) modules could be mounted onto one (1) TME frame.

0 Redundancy of announcements is available as an option in
0 the U.S. only. If redundancy is provided, ensure that
0 the announcement MTMs are on different power feeds.

0 The assignment rules for mounting Phase 1 and Phase 2
0 CLASS DRA Announcement cards onto DRA modules are the
0 same as the rules pertaining to the existing NT1X76__ DRA
0 Announcement cards. Cards NT1X76AP/AQ/AR/AS must be
0 mounted together onto the same DRA module. Cards
0 NT1X76AT/AU/AV/AW must be mounted together onto the same
0 DRA module. Similarly, cards NT1X76BP/BQ/BR/BS must be

0
0 RELEASE 28.01
0 93 12 03

0 mounted together onto the same DRA module and cards
0 NT1X76BT/BU/BV/BW must be mounted together onto the same
0 DRA module. Cards NT1X76GA/GB/GC/+"Personality" Card
0 must be mounted together onto the same DRA module. The
0 previous cards within each DRA module can be in any or-
0 der. (See DRA System Provisioning in this section for
0 further information on the DRA.)

0 (xi) Log messages are produced when a subscriber activates the
0 Customer Originated Trace (COT) feature. If the
0 customer/telco wants these log messages to be routed to a
0 dedicated TTY, then a separate I/O port (i.e. one port
0 off of a NT1X67BC card) is required. Otherwise, these
0 log messages will be routed along with other log messages
0 to the customer specified TTY.

0 (xii) Canadian customers will be able to obtain CLASS Terminals
0 from NTCL or from outside suppliers. To obtain CLASS
0 terminals (i.e. an integrated telephone set, such as
0 MAESTRO) from NTCL, Canadian customers will contact
0 London Terminal Division.

0 U.S. customers will obtain CLASS terminals from outside
0 suppliers.

0 RELEASE 28.01
0 93 12 03

0 2.3.2 Common Peripheral Controller Equipment

0 (a) General Description

0 The Signalling Data Link (SDL) is channel on a T1 Carrier which
0 terminates on a DTC, DCM or LTC. ISDN trunks must terminate on a
0 DTC since they are only supported on DTCs.

0 (b) Reference

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations:

0 (i) The DTC may be used for SDL and ISDN trunks, however, for
0 reliability against failures, it is recommended to dis-
0 tribute the ISDN trunks and SDL across several peripher-
0 als.

0 (ii) CCS7 trunks must terminate on DTCs ONLY. Signalling Links
0 can terminate on DTCs, DCMs or LTCs. Signalling Links
0 and CCS7 trunks can be assigned to the same DTC.

0 (iii) CCS7 trunks can be mixed with PTS trunks on the same DTC,
0 however, both cannot be in the same trunk group.

0 (iv) Provision one (1) NT6X55AB DS0A Signaling Interface CP on
0 the DTC for each DS0A CCS7 signaling link. (Refer to
0 section 3.5 for more information.)

0 (v) DTC modules supporting CCS7 trunks must be equipped with
0 Extended Memory (NT6X46) and Enhanced Messaging (NT6X69).

0 (vi) The maximum number of DTCs utilizing CCS7 is 60 per of-
0 fice based on each DTC requiring 2 IPMLs per MSB7.

0 (vii) Each DTC utilizing CCS7, requires two continuity cards
0 NT6X70AA for continuity checking on ISUP trunks for BCS23
0 and earlier. In BCS24 and later, the software require-
0 ment for Continuity Cards was removed so that customers
0 requesting the cost reduction when testing is not re-
0 quired are not required to order the cards.

0 For U.S. applications only, since the NT6X70-- is re-
0 quired for the COT test, it is recommended that continu-

0
0 RELEASE 28.01
0 93 12 03

0 ity cards continue to be provisioned in most cases.
0 Provisioning Continuity Cards on CCS7 DTCs should be con-
0 sidered standard. Only per customer request can they be
0 omitted.

0 For Canadian applications only, many customers have a
0 high penetration of digital trunk facilities and do not
0 require the Continuity card. Provision these cards only
0 on DTCs whose trunks support analog facilities at some
0 point in the end-to-end connection of the trunk.

0 (viii) Refer to Section 3.5 for more information on the DTC, DCM
0 and LTC.

0 2.3.3 Network Termination 1 (NT1)

0 (a) General Description

0 The Network Termination One (NT1) will provide the interface be-
0 tween 2B+D 2-wire U-interface and the customers 4-wire S/T inter-
0 face.

0 The NT1 is a standalone device located at the customers premisis.
0 It is AC powered.

0 (b) References

0 None.

0 (c) Provisioning Considerations

0 (i) Provide one (1) NT1 NTB11AB for each ISDN 'U' Line Card.
0 All standalone NT1 units are to be Merchandise Ordered by
0 the customer.

0 (ii) The T-Side termination hardware will be supplied by the
0 customer to connect from one to eight terminals.

0 (iii) The physical dimensions of the NT1 are 1.5"H x 7.8"W x
0 6.7" L. It has a separate power supply always provided
0 with dimensions 3.9"H x 2.4"W x 2.3"L

0 The supply is connected directly to an AC outlet. It will
0 supply voltages of +5v, +15v and -15v via a cable to the
0 NT1.

0 (iv) The NT1 is not required for loops using the ISDN 'S/T'
0 Line Card.

0

0

0 RELEASE 28.01
0 93 12 03

0 2.3.4 Primary Rate Interface System Level Provisioning

0 (a) General Description

0 Primary Rate Interface (PRI) will be implemented on the CPEI
0 frame.

0 Primary Rate Interface is configured as per Figure 316.4.

0 (b) References

0 None.

0 (c) Provisioning Considerations

0 (i) Primary Rate Interface Link Provisioning

0 The sixteen network ports (C-side) on the peripheral con-
0 trollers are pre-allocated for each p-side trunk member.
0 For example, the first five DS-1 links are mapped onto
0 the first four C-side ports (reference Figure 316.5):

0

0

0

RELEASE 28.01
93 12 03

24 channels X 5 ports = 120 channels total 30 channels X 4 ports = 120 channels total

Figure 316.5

Pre-Allocated Network Ports

Therefore, for most efficient usage of ports, the DS-1 ports should be allocated in contiguous groups of five (5) and the DS-30 ports in contiguous groups of four (4).

A single PRI D channel may provide signalling for up to 16 DS-1 links (383 B channels). All of these DS-1 facilities must be present on the same ISDN peripheral.

The CPEI has twenty (20) peripheral ports. These are divided between the incoming PRI DS-1 links and provisioned DS-1 links to the Packet Handler. On the LGEI/LTEI only, p-side ports are reserved for DS-30A links from LCE and LCEI frames (BRI or combined BRI/PRI access).

0
0 RELEASE 28.01
0 93 12 03

0 2.3.5 Primary Rate Interface Equipment Provisioning

0 (a) General Description

0 This section deals with the frame level provisioning for Primary
0 Rate Interface (PRI).

0 (b) References

0 None.

0 (c) Provisioning Considerations

0 (i) For the CPCI peripheral controller:

- 0 1. Provide one (1) NT6X01AB ISDN Common Peripheral Con-
0 troller Equipment frame.
- 0 2. Provide one (1) NT6X02NA ISDN Common CP Fill for each
0 module to be equipped.
- 0 3. Provide one (1) NT6X50AB to accommodate two DS-1
0 links up to a maximum of ten circuit packs (20 DS-1
0 links) per DTCI module.

0 If the module is only equipped for PRI it will be called
0 DTCI, and if equipped for BRI/PRI it will be called LTCI.
0 D-channel Handler (DCH) CP are not required on the DTCI,
0 nor where the CPCI supports only non-ISDN LCMs.

0 3.0 DTC/LGC/LTC Modules - DETAIL/BUILDING BLOCK ENGINEERING

0 The current packfills for the DTC/LGC/LTC peripheral controller
0 modules replace the existing NT6X02IA,LA,MA packfills. The cur-
0 rent packfills for the DTC/LGC/LTC modules are the
0 NT6X02IC,LC,MC. These packfills consist of newly-designed cir-
0 cuit packs having a lower power consumption than existing equiv-
0 alent packs. The current packfills also have increased master
0 processor memory from 2Meg to 4Meg.

0 Following are the peripheral packfills to be ordered for new pe-
0 ripheral modules:

DESCRIPTION	NEW-ORDER PACKFILL PEC	REPLACES PEC
DTC Common CP	NT6X02IC	NT6X02IA
LGC Common CP	NT6X02LC	NT6X02LA
LTC Common CP	NT6X02MC	NT6X02MA
NOTE: The NT6X02IC,LC,MC are the standard DTC/LGC/LTC offerings. All initials and extensions ordering new XPM modules will receive the NT6X02IC,LC,MC packfills.

0 3.1 HARDWARE PROVISIONING

0

0 3.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The DTC/LGC/LTC modules have a power consumption limitation which
0 affects the provisioning of circuit packs on these modules. This
0 limitation MUST be taken into consideration before any
0 DTC/LGC/LTC module is engineered, new or existing.

0 IN U.S. - Refer to ECM-441, XPM Power Provisioning, for further
0 information on this subject.

0 IN CANADA - Currently the only power consumption limitation oc-
0 curs when the CLASS Modem Resource (CMR) card, NT6X78AA, is pro-
0 visioned into a LGC, LTC, or SMS module. For further
0 information, refer to ECM-332, CLASS - U.S. / CMS - Canada.

0 Ordering New Peripheral Modules

0
0 Information in sections 2.4.1 - 2.4.9 is contained in the Engi-
0 neering manual sections for the NT6X01AA/AD frames and has been
0 removed from this ECM body.

0 o Application of XPM PLUS to LGC, and LTC modules
0 is mandatory (BCS Gating) for BCS-38. Application of
0 XPM PLUS to DTC modules is mandatory for BCS-41.

0 o As of BCS 35 the MP/SP processor will no longer be
0 shipped for new orders of the LGC/LTC/DTC. The Unified
0 process (XPM Plus) will be shipped for all new LGC/DTC/LTC/
0 modules ordered.

0 Refer to ECM 678 for additional information on XPM Plus.

0 3.1.4 OFFICE LAYOUT INFORMATION

0

0
0 3.1.5 TRAFFIC TABLES

0
0 Refer to ECM-350, The Credit System.

0 The following information supplements the Credit System Assump-
0 tions in ECM350 DMS-100 Traffic Provisioning "The Credit System":

0

0 Host - Line Trunk Controller Equipment
0 Chapter 2

0
0 RELEASE 28.01
0 93 12 03

0 In ECM350, it is stated that a maximum of 62 software nodes can
0 be datafilled on an LGC/LTC P-side in BCS23 and onwards. The term
0 "software nodes" is defined fully in the ECM.

0 However, there is an additional restriction due to the limited
0 number of direct messaging channels to the LGC/LTC P-side. A
0 maximum of thirty (30) channels is available for this purpose.
0 Each of the following nodes consumes two (2) direct messaging
0 channels:

- 0 - LCM
- 0 - RCC
- 0 - RLCM/OPM
- 0 - Each RMM shelf on the RLCM/OPMs
- 0 - Each ESA Processor (NT6X75AA CP) on the RLCM/OPMs

0 The total number of nodes provisioned on the LGC/LTC P-side can-
0 not exceed the maximum (30) available.

0 Nodes that do NOT require a direct messaging channel comprise
0 those interfaced to the LGC/LTC via a Remote Switching Center
0 (RSC), ie. any LCMs, RLCM/OPMs, RMM shelves, and ESA Processors
0 off the P-side of the RCC. The TOTAL of these nodes plus those
0 above which require direct messaging channels cannot exceed 62.
0 Refer to Figure A on the following page.

0

0 LGE/LTE/DTE CUSTOMER QUESTIONS

0

0 Assumptions

- 0 1. Capacity figures in this document are based on REAL:QUICK.
0 2. 50/50 Orig/Term split provides a worst case scenario.
0 3. 4 secondary members per MADN group.
0 4. 40 percent Custom Calling Feature assignment to POTS lines.
0 5. 100 percent Custom Calling Feature assignment to MDC lines.
0 6. 100 percent UTR provisioning.
0 7. 100 percent secondary member ringing for MADN groups.
0 8. 50 percent secondary member answer.
0 9. Trunks are data filled requiring A and B Scanning,
0 CSM and DS-1 maintenance overheads.

0 Considerations

- 0 1. Utilization higher than 80 percent requires a detailed
0 capacity study using PRTCALC.
0 2. When MADN penetration is higher than 40 percent, then
0 a detailed study is required using PRTCALC.
0 3. Deviation from recommended NTI assignment rules will
0 dictate a detailed capacity study.
0 4. Special applications of the LGC will require detailed
0 capacity study using PRTCALC.
0 5. Call timings used reflect average work times for the
0 lines types.

0 RELEASE 28.01
0 93 12 03

0 4.0 NT6X50EC - DS1 Interface with Echo Cancellation

0 The NT6X50EC is to provide echo cancellation inside the DMS envi-
0 ronment. This function is now being done outside of the switch
0 using equipment not provided by NORTHERN TELECOM. Integration of
0 echo cancellation is required due to the high cost of operation
0 and maintenance of these external devices.

0 The NT6X50EC cancels the echo created by the impedance mismatch
0 in the near end hybrid. The cancellation prevents the far end
0 talker from hearing the echo of their own voice. Echo cancellers
0 are useful only where the delay is long enough for the echo to be
0 noticed.

0 4.1 HARDWARE PROVISIONING

0

0 4.1.1 HARDWARE USAGE RESTRICTIONS

0
0 The NT6X50EC does not perform the permanent loop back for an in-
0 active port, therefore it cannot be used in the remote line con-
0 centrating module (RLCM)

0 This circuit pack cannot be installed on a trunk that is provi-
0 sioned with an echo suppressor.

0 4.1.2 HARDWARE DEPENDENCIES

0
0 If the NT6X50EC is to be installed in a DTE frame, an Auxiliary
0 Fuse Panel (AFP, NT6X0131) must be used. The AFP will allow -48V
0 power to be run up to the card slot of the NT6X01AA frame. The
0 NT6X0130 will include all cabling needed to power the card slots.

0

0
0 RELEASE 28.01
0 93 12 03

0 4.1.3 POWER/HEAT DISSIPATION

0
0 This circuit pack connects to 5V, +/- 12V and -48V power sup-
0 plies. The majority of the power is derived from the -48V supply,
0 thereby reducing the demand on the existing 5V supply.

0 There will be a kit developed to run -48V up to the CP slots.
0 There is no pec code for this kit as of this release.

0 4.1.4 PROVISIONING CONSIDERATIONS.

0
0 The DTC and DTCI can be provisioned with up to 10 NT6X50EC cp's.

0 The NT6X50EC and NT6X50AB can be mixed on the same shelf. This
0 will allow the customer to chose wich trunks will have the echo
0 cancellation feature.

0 4.1.5 OFFICE LAYOUT INFORMATION

0
0 Not Applicable

0 4.1.6 TRAFFIC TABLES

0
0 The NT6X50EC traffic studies are the same as the NT6X50AB. The
0 only difference is that the NT6X50EC has echo cancellation.

0

0 4.2 PRODUCT/SYSTEM SPECIFICATION

0

0 4.2.1 PHYSICAL CHARACTERISTICS

0

0 Not Applicable

0 4.2.2 EMI/EARTHQUAKE INFORMATION

0

0 Not Applicable

0 4.2.3 SPARING INFORMATION

0

0 Standard algorithms for sparing apply.

0 4.3 SOFTWARE PROVISIONING

0

0 4.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCY

0

0 The software for the NT6X50EC will be incorporated into the BCS
0 30 software load.

0

0
0 RELEASE 28.01
0 93 12 03

0 4.3.2 SOFTWARE USAGE RESTRICTIONS

0
0 Integrated echo cancellation is supported by BCS30 and later re-
0 leases. The new CC and XPM software required for use and control
0 of the NT6X50EC trunk interface will be integrated into the ex-
0 isting software structure with minimal impact. The software will
0 be backwards compatible, such that it will operate with either
0 the NT6X50AB/EC trunk interface cards. The table control modifi-
0 cations and new tables will be consistent with existing DMS-250
0 table control interface. New MAP displays will be built upon the
0 existing MAP hierarchy. The LOGS, alarm, and OM'S will all con-
0 form to the existing standards.

0 4.3.3 MEMORY PROVISIONING

0
0 Not Applicable

0 4.4 REAL TIME IMPACT

0 To perform echo cancellation, in each frame (125 usec) a single
0 DSP must perform 64 multiplies of 100ns each 8 channels.
0 $64 \times 100 \times 8 = 51.2 \text{ usec}$
0 51.2 usec is required for multiply/accumulate operations for echo
0 cancellation alone. Coefficient adaption requires another 51.2
0 usec for multiply accumulate operations. This leaves 22.6 usec
0 (18%) of each frame for overhead and other tasks. In order to
0 achieve this level of performance, the echo canceller is limited
0 to processing a maximum of two hybrids on a DS0 line at the same
0 time. Thus, the echo canceller can cancel echos for three-way
0 calling, but not for larger conference groups.

0 5.0 International Cabinet LGE/DTE/LTE ISDN

0 The Australian DMS-300 International Gateway Switch is based on the
0 DMS-300 supplied to Turkey with the following enhancements:

- 0 - Signalling systems necessary to introduce the product
0 into the Australian National Network.
- 0 - Enhancements to the Call Detail Recording, Operational
0 Measurements and Call Progression tone systems.

0 Similarly, the DMS-300 Gateway Switch for Madley-B Digital Interna-
0 tional Switching Centre (DISC) in the United Kingdom is based on ex-
0 isting technology, adapted for that market.

0 The NTFX33CA International Cabinet LGE/DTE/LTE ISDN houses one or two
0 International PCM-30 LGC/DTC/LTC ISDN or not dual shelf modules in a
0 cabinet configuration for applications not requiring fiber network
0 interfaces.

0 5.1 HARDWARE PROVISIONING

0
0 Not applicable

0 CIRCUITS PER CARD

0
0 Not applicable

0 DISCRIMINATION NUMBERING

0
0 Not applicable0 5.1.3 PROVISIONING CONSIDERATIONS0
0 The NTFX33CA International Cabinet LGE/DTE/LTE ISDN is provi-
0 sioned as follows:0 The shelves within the LTEM cabinet are provisioned in the same
0 way as the domestic ISDN frame NT6X01AB, except that PCM-30

0 RELEASE 28.01
0 93 12 03

0 interfaces are used instead of DS-1 and some circuit pack vin-
0 tages are different for the Offshore market.

0 Refer to the Engineering Manual sections for details on circuit
0 pack vintages and cabinet hardware provisioning.

0 Common Circuit Pack:

0 Provision up to two (2) NT6X02UB PCM-30 LGC/DTC Common Circuit
0 Pack (Offshore) per LTEM.

0 PCM-30 Interface:

0 Provision up to eight (8) NT6X27AC/BB PCM-30 Interface CP per
0 PCM-30 LGC/DTC module, to interface up to sixteen PCM-30 links (2
0 links per CP).

0 The NT6X27BB Enhanced PCM-30 Interface circuit pack is backward
0 compatible with the NT6X27AC/BA circuit packs. It is also a re-
0 placement for the NT6X27AA/AB circuit packs, although it cannot
0 be mixed with the NT6X27AA/AB in the same frame or cabinet.

0 The NT6X27BB includes enhancements over the NT6X27AA/AB such as:

- 0 - Full compliance to CCITT,
0 - Improved alarm handling, and
0 - Support for DCME.

0 The initial application for the NT6X27BB is all the frames and
0 cabinets where the NT6X27AC/BA are provisioned. The manufacture
0 of the NT6X27AC/BA is being discontinued.

0 PCM-30 Signaling Interface:

0 For each equipped LGC/DTC which supports PCM30 links or for each
0 equipped LGC module which supports links to an LCM which is
0 equipped with a PCM30 line drawer such as the NT6X05CA, provide:

0 two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 CND Feature:

0 When the Calling Number Delivery/Calling Number Display (CND)
0 feature is required, provision two (2) NT6X78AB CLASS Modem Re-
0 source CPs for each PCM-30 LGC/DTC module.

0 Network Interface:

0
0 RELEASE 28.01
0 93 12 03

0 In an office with the Enhanced Network (ENET) provide a fiber
0 interface per module as follows:

0 two (2) NT6X40FA DS-512 Link Control CPs,
0 two (2) NT6X40GA DS-512 Link Control Paddleboards,
0 two (2) NT6X69LB DS-512 CPP Protocol & Downld CPs, and
0 one (1) P0736273 Fiber Cable Warning Label.

0 And for each cabinet

0 one (1) NTN33SD DS-512 Fiber Interface to Network Kit.

0 Depending on availability, NT6X40CA and NT6X40DA functional pair
0 may be used in place of the preferred NT6X40FA and NT6X40GA func-
0 tional pair. The paddleboards and circuit packs cannot be mixed
0 because they do not function in mismatched pairs.

0 In a non-ENET office, provide a copper interface as follows:

0 two (2) NT6X40AC DS30 Network Interface CPs
0 two (2) NT6X69LA/LB CPP Protocol & Downld CPs.

0 The NT6X69LA may be used for non-fiberised peripherals when the
0 preferred NT6X69LB is not available.

0 5.1.4 OFFICE LAYOUT INFORMATION

0 - Signalling systems necessary to introduce the product
0 into the Australian National Network.

0 - Enhancements to the Call Detail Recording, Operational
0 Measurements and Call Progression tone systems.

0 Similarly, the DMS-300 Gateway Switch for Madley-B Digital Interna-
0 tional Switching Centre (DISC) in the United Kingdom is based on ex-
0 isting technology, adapted for that market.

0 The FCTM-ISDN houses one or two International ISDN LGC/DTC dual shelf
0 modules in a cabinet configuration supporting both copper and fiber
0 network interfaces.

0 6.1.3 PROVISIONING CONSIDERATIONS

0
0 The NTNX33GA International Cabinet LGE/DTE Fiber ISDN (FCTM-ISDN)
0 is provisioned as follows:

0 The shelves within the FCTM-ISDN cabinet are provisioned the same
0 as the domestic ISDN frame (NT6X01AB), except that PCM-30 inter-
0 faces are used instead of DS-1, and some circuit pack vintages
0 are different for the International market. Maximum eight (8)
0 PCM-30 Interface CP (supporting 16 PCM-30 links) may be equipped.
0 Refer to the Engineering Manual sections for details on circuit
0 pack vintages and cabinet hardware provisioning.

0 Provision up to two (2) NTNX33GB LGCI/DTCI Fiber Common CP
0 (International) per FCTM-ISDN.

0 Provision up to eight (8) NT6X27AC/BB PCM-30 Interface CP per
0 PCM-30 LGC/DTC module, to interface up to sixteen PCM-30 links (2
0 links per CP).

0 The NT6X27BB Enhanced PCM-30 Interface circuit pack is backward
0 compatible with the NT6X27AC/BA circuit packs. It is also a re-
0 placement for the NT6X27AA/AB circuit packs, although it cannot
0 be mixed with the NT6X27AA/AB in the same frame or cabinet.

0 The NT6X27BB includes enhancements over the NT6X27AA/AB such as:

- 0 - Full compliance to CCITT,
- 0 - Improved alarm handling, and
- 0 - Support for DCME.

0 The initial application for the NT6X27BB is all the frames and
0 cabinets where the NT6X27AC/BA are provisioned. The manufacture
0 of the NT6X27AC/BA is being discontinued.

0 When the Calling Number Delivery/Calling Number Display (CND)
0 feature is required, provision two (2) NT6X78AB CLASS Modem Re-
0 source CPs for each PCM-30 LGC/DTC module.

0 For each equipped LGC/DTC which supports PCM30 links or for each
0 equipped LGC module which supports links to an LCM which is

0

0| equipped with a PCM30 line drawer such as the NT6X05CA, provide:
0 two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 6.1.4 OFFICE LAYOUT INFORMATION

0

0 7.0 XPM PLUS for Base Non-ISDN XPM

0 The XPM PLUS (Product Life Upgrade Strategy) Phase II program addresses the need for memory and processing enhancements by replacing the separate MP and SP circuit packs in DTC/LGC/LTC/RCC modules with the Unified Processor (UP). The UP increases available memory to 8Mb and increases RealTime processing power, compared to the current XPM. All existing functions, interfaces and tools continue to be supported.

0 The XPM PLUS schedule has been pulled in so that all new shipments of LTCI/LGCI from BCS-34 forward will utilize the Unified Processor (XPM PLUS). Support for Subscriber Carrier equipment is planned to V0 in BCS-36 and to be Generally Available in BCS-37.

0 This ECM describes both upgrades of existing equipment and new shipments of XPM+ peripherals on the combined ISDN/non-ISDN frame. XPM PLUS capability may also be supplied for both new shipments and upgrades to existing RCE frames.

0 7.1 HARDWARE PROVISIONING

0

0 7.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The following usage restrictions apply to the XPM+ Phase II product:
0

- 0 o RLCM and MSB7 are not to be upgraded to XPM PLUS with the Unified Processor.
- 0 o In order to use the new software that is available in BCS-35 and above, XPMs currently equipped with enhanced messaging will require upgrade from MP/SP processors to the XPM PLUS processor. Since XPMs must meet minimum BCS packfill requirements before these kits can be applied, the modules will be equipped with one of the following:

0 Base XPMs:
0 -----

0 RELEASE 28.01
0 93 12 03
0

0 DTC Modules - NT6X02AS, NT6X02IA or NT6X02IC
0 LGC Modules - NT6X02AT, NT6X02LA or NT6X02LC
0 LTC Modules - NT6X02AU, NT6X02MA or NT6X02MC

0 The slots that mount the processors and memory are provisionable
0 in packfills NT6X02IC, NT6X02LC and NT6X02MC. Application of the
0 NT6X02XC kit to modules containing one of the other packfills
0 will bring the module to the NT6X02IC/LC/MC level, making these
0 slots provisionable.

0 Remote:

0 -----

0 RCC Modules - NT6X12AD, NT6X12AG and NT6X12CA

0 The processors and memory are Always Provided in these packfills.
0 Application of the NT6X12ZF to a module equipped with NT6X12AG
0 will change the RCC module to the NT6X12AK level. When applying
0 the NTZZ12ZF kit to a module equipped with NT6X12CA or any
0 packfill NT6X12AF or earlier, the NT6X72AA packs must be replaced
0 with NT6X72ABs. Application of the NT6X12ZF and the NT6X72AA re-
0 placement with NT6X72AB, upgrades these modules to the NT6X12AK
0 level. The slots requiring upgrade for XPM PLUS become
0 provisionable upon application of the NT6X12ZF kit. The NT6X12AK
0 is now available for new orders.

0 o Application of XPM PLUS to LGC, LTC and RCC modules
0 is mandatory (BCS Gating) for BCS-38. Application of
0 XPM PLUS to DTC modules is mandatory for BCS-41.

0 o As of BCS 35 the MP/SP processor will no longer be
0 shipped for new orders of the LGC/LTC/DTC/RCC. The Unified
0 Processor (XPM Plus) will be shipped for all new LGC/DTC/
0 LTC/RCC modules ordered.

0 7.1.2 HARDWARE DEPENDENCIES

0 The hardware required to implement XPM PLUS capability is the
0 Unified Processor, the terminator card (which mounts in a rear
0 side slot) and backplane strapping. These changes are applied to
0 the existing non-ISDN XPM equipment as described in the Product
0 Change Kit documents and will result in XPM packfills NT6X02IC,
0 NT6X02LC or NT6X02MC or RCC packfill NT6X12AK.

0
0 RELEASE 28.01
0 93 12 03

0 P AND C SIDE PORT REQUIREMENTS

0
0 There are no P or C side ports associated with the Unified
0 Processor (XPM PLUS).

0 DMS BUS PORT REQUIREMENTS

0
0 There are no DMS BUS ports associated with the Unified Processor
0 (XPM PLUS).

0 CIRCUITS PER CARD

0
0 There is one Unified Processor per circuit pack.

0 DISCRIMINATION NUMBERING

0
0 There is no discrimination numbering associated with XPM PLUS.

0 7.1.3 PROVISIONING CONSIDERATIONS

0
0 The following kits are available for application as described be-
0 low:

0

0 Host - Line Trunk Controller Equipment
0 Chapter 2

0 RELEASE 28.01
0 93 12 03
0

- 0 o Upgrade of host DTC/LGC/LTC to XPM PLUS:
0 Provide one XPM to XPM+ kit to upgrade one existing
0 host XPM module to XPM PLUS capability. All
0 provisionable circuit pack rules are unchanged
0 except for processors/memory, which are replaced
0 as part of kit application. The NT6X02XC kit
0 includes backplane stapping materials and
0 instructions for application on existing NT6X01AA
0 frames. The NTZZ99AN kit provides only the circuit
0 packs required and is used for applications where
0 the necessary wiring is already in place (i.e. the
0 upgrade of an existing module on a NT6X01AD frame).
- 0 o Upgrade of non-ISDN RSC to XPM PLUS:
0 Provide one RCC to XPM+ kit to upgrade one existing
0 RCC module to XPM PLUS capability. All
0 provisionable circuit pack rules are unchanged
0 except for processors/memory, which are replaced
0 as part of kit application.
- 0 o New shipments of XPMs with XPM PLUS:
0 Packfills are now available for application on the
0 combined ISDN/non-ISDN frame (NT6X01AD). New XPM+
0 shipments on the Model A CCPE (NTRX36AB) are NOT
0 supported. The packfills for NT6X01AD are:

0 NTZZ02PA for LTC with XPM+
0 NTZZ02QA for LGC with XPM+
0 NTZZ04HB for DTC with XPM+
- 0 o New shipments of RCCs with XPM PLUS:
0 Packfills are now available for application on the
0 RCE frame in either detail or Building Block format.
0 They are:

0 NTZZ46EA for RCC with XPM+ (in Building Block)
0 NT6X12AK for RCC with XPM+ (in detail)

0
0 Not applicable.

0 7.2.3 SPARING INFORMATION

0
0 Standard sparing algorithms apply to this product. Both the Uni-
0 fied Processor and Termination Card will need to be spared.

0 7.2.4 POWER FEED AND FUSING REQUIREMENTS

0

0

0
0 RELEASE 28.01
0 93 12 03

0 There is no fusing or power feed associated with the Unified
0 Processor.

0 7.2.5 CURRENT DRAIN INFORMATION

0
0 The NTMX77AA Unified Processor requires a maximum of 3.80 Amps
0 and the NTMX71AA Terminator CP requires a maximum of 0.68 Amps.

0 7.3 SOFTWARE PROVISIONING

0

0 7.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0
0 Software package NTXR34-- is required to support the Unified
0 Processor and will be needed for all XPM PLUS upgrades.

0 Software package NTXR42-- is required to utilize the downloadable
0 firmware feature and is required with NTXR34--. In BCS-35,
0 NTXR34AB replaces NTXR34AA and NTXR34AA is declared Manufacture
0 Discontinued.

0 Refer to SMS/SOLID for software requirements and interdependen-
0 cies.

0 7.3.2 SOFTWARE USAGE RESTRICTIONS

0
0 Not applicable.

0

0 7.3.3 MEMORY PROVISIONING

0
0 Not applicable.

0 7.4 REAL TIME IMPACT

0 The Unified Processor provides an improvement in RealTime capac-
0 ity by a factor of approximately 1.6X compared to the existing
0 MP/SP.

0 RELEASE 28.01
0 93 12 03

0 8.0 Detailed/Bldg Block Engineering - ISDN LCE

0 The ISDN 2B1Q Access Subsystem represents Northern Telecom's first
0 product offering that supports the American National Standards Insti-
0 tute (ANSI) standard ISDN 2B1Q (Two Binary One Quarternary) U-loop
0 interface. The 2B1Q Access Subsystem will be subtended from a
0 DMS-100/MSL-100 LTCI/LGCI, RCCI, or RCC2 peripheral module. It will
0 provide access for most existing LCM line types plus ISDN 2B1Q-U and
0 ISDN S/T.

0 The ISDN 2B1Q Access Subsystem will offer the North American Standard-
0 ized 2B1Q U Loop ISDN Basic Rate Interface (BRI) from an enhanced ca-
0 pacity ISDN LCM (LCME). The LCME is basically a LCMI that has been
0 utilized for 2B1Q interface. It will offer S/T ISDN services in
0 BCS-31 and EBS (P-Phone), Datapath, S/T ISDN and POTS services in
0 BCS-32. The 2B1Q (2 Binary, 1 Quarternary) Access Subsystem will not
0 support the AMI line card.

0 The ISDN 2B1Q Access Subsystem adds the following components to the
0 LCME:

- 0 * A single slot 2B1Q U-Loop ISDN line card (U-ISLC).
- 0 * A new high capacity line drawer.
- 0 * A new Enhanced Bus Interface Card.
- 0 * New ISDN LCM power packs.

0 The 2B1Q line card will be used in both host and remote lo-
0 cations.

0 The 2B1Q line drawer will accomodate 60 single slot line cards,
0 with eight (8) line drawers per LCME. Thus the LCME will support
0 480 single slot 2B1Q lines.

0 Figure 5J Preferred ISDN System Configuration w/DMS-PH

0 8.1 HARDWARE PROVISIONING

0 8.1.1 HARDWARE USAGE RESTRICTIONS

0
0 The ISDN 2B1Q Line Drawer NTB32BA will not support AMI line
0 cards. The ISDN AMI Line Drawer NTB32AA will not support 2B1Q
0 line cards.

0 There is no mixing of NTB32BA and NTB32AA line drawers allowed
0 within an ISDN LCM module.

0 An AMI LCMI and a 2B1Q LCME can coexist on the same LCEI frame
0 for field retrofit only. No mixed frames will be built from
0 scratch. The LCMI to LCME Upgrade Kit (NTB30BA) is used to
0 change an existing LCMI (AMI) to a LCME (2B1Q) on an existing
0 LCEI frame or to add a new LCME module to an existing LCEI frame
0 with only one LCMI module already equipped on it.

0 8.1.2 HARDWARE DEPENDENCIES

0
0 The software development for 2B1Q will be done in two phases. In
0 Phase I (BCS31): The LCME will support only ISDN lines. In Phase
0 II (BCS32): The LCME will support ISDN lines POTS, EBS, and
0 DATAPATH lines.

0

0
0 RELEASE 28.01
0 93 12 03

0 P AND C SIDE PORT REQUIREMENTS

0
0 The Line Concentrating Equipment frame for ISDN is an evolution
0 of the standard LCE frame. The ISDN LCM will allow from 2-18
0 DS-30A links to the serving CPEI.

0 Each LCME may have from two to eighteen DS-30A links to the sup-
0 porting CPEI (i.e. either an LTCI, LGCI, RCCI, or RCC2). Refer
0 to the Traffic Engineering section for detailed link provisioning
0 worksheets based on traffic loading calculations in ECM-497.

0 DMS BUS PORT REQUIREMENTS

0
0 Not applicable

0 CIRCUITS PER CARD

0
0 Not applicable

0 DISCRIMINATION NUMBERING

0
0 ISDN LCE Frames and/or Cabinets must be numbered consecutively,
0 starting from LCEI 000 to completion or starting from the next
0 available Line Module number. For example:

0 * If no Line Modules exist and five (5) LCEIs are provisioned.
0 The LCEIs or CLMIs shall be numbered as 000 to 004, or

0

0 RELEASE 28.01
0 93 12 03

0 * If LMEs exist from 00 0 to 03 1, and five (5) ISDN LCEs are
0 added start number LCEs as 004 to 009.

0 8.1.3 PROVISIONING CONSIDERATIONS

0
0 When provisioning ISDN Line Concentrating Equipment (LCEI) the
0 following must be considered:

0 * Module Housing (Frame or Cabinet)

0 When provisioning a cabinet based system refer to ECM-600 for
0 additional equipment which may be required in support of the
0 cabinet itself as opposed to the ISDN Line Function housed
0 therein.

- 0 - LCME Module 2 per frame or cabinet
- 0 - Line Drawers 8 Per Module
- 0 - Line Card provisioning 60/LD, 480/LCME

0 * Line Cards

- 0 - Type of cards provisionable
- 0 - Ringing Generators
- 0 - Line Card Spread

0 * Other Supporting Equipment

- 0 - MTU Requirement
- 0 - Peripheral Controller

0 LCEI Frames/Cabinets

0
0 The ISDN Line Concentrating Equipment (LCEI) is a single-bay
0 equipment frame or cabinet containing two ISDN Line Concentrating
0 Modules Enhanced (LCME). Provisioning this equipment in either
0 the frame or cabinet configuration is based on customer prefer-
0 ence.

0 RELEASE 28.01
0 93 12 03

0 However, the LCEI cabinet based system offers EMI/RFI shielding
0 inherent in its design as opposed to the frame based system which
0 requires add-on devices to facilitate EMI/RFI shielding.

0 When provisioning a frame based system refer to ECM-125 for addi-
0 tional equipment which may be required in support of the frame
0 itself as opposed to the ISDN line function housed therein.

0 LCEI Modules (LCME)

0
0 The ISDN Line Concentrating Module (LCME) is a dual unit periph-
0 eral module which terminates ISDN lines. Each shelf in the mod-
0 ule is referred to as a ISDN Line Concentrating Array (LCAI). The
0 LCME consists of two Line Concentrating Arrays, which operate in
0 a load sharing mode with mutual takeover capability.

0 Each shelf (LCAI) in the ISDN Line Concentrating Module contains
0 four physical Line Drawers.

0 ISDN 2B1Q Line Drawers

0 There are eight (8) drawers per LCME with a maximum of 18 DS30A
0 links per LCME. Refer to Figure 03 for a layout of the LCME and
0 the numbering of line drawers existing in it.

0 NTB32BA ISDN Enhanced Line Drawer has been introduced for 2B1Q
0 Access Subsystem. The NTB32BA is a high capacity line drawer
0 replacing NTB32AA. It increases the ISDN LCM capacity from 48
0 slots to 60 slots. This provides a physical capacity of 480 sin-
0 gle slot lines per LCME.

0 Each drawer can support up to 60 single slot line cards. The "D"
0 channel of each line is statistically multiplexed at a 4 to 1 ra-
0 tio at the LCME and sent to the D Channel Handler for processing.
0 Refer to ECM-497 for calculations to determine provisioning based
0 on traffic levels.

0 The ISDN 2B1Q line drawer consists of the following:

- 0 * One Bus Interface Card (BIC)

0
0 RELEASE 28.01
0 93 12 03

0 * Sixty line card slots

0 * One Point of Use Power Supply (PUPS).

0 The PUPS converts the common equipment -48V BATTERY to +5V.
0 This +5V is routed to the line card slots.

0

0

Figure 9: 2B1Q Enhanced Line Drawer Layout

Each drawer is divided into two (2) logical drawers or subgroups. This differs from the LCMI which has three (3) logical subgroups per each physical drawer.

0 RELEASE 28.01
0 93 12 03

0 LCME Provisionable Line Cards

0
0 The 'U' line card interfaces to standard 2-wire outside plant for
0 connection to the NT1 at customer premises. NTB27AA is the ISDN
0 2B1Q U Line Card which replaces the AMI U Line Card NTB25AB. The
0 2B1Q U-interface will be supported through the use of the
0 NTB27AA. The 2B1Q line card NTB27AA is used in the high capac-
0 ity 2B1Q line drawer for host and remote locations.

0 In BCS-28, an 'S/T' line card will be introduced which does not
0 require an NT1. It will interface directly to the 4-wire S/T
0 interface, with a restricted loop range. The S/T line card is
0 only intended for applications where a remote system or Private
0 Branch Exchange (PBX) is located in the customer premise. If the
0 S/T line card is to be engineered in a C.O. environment where it
0 will interface to outside plant wiring, overvoltage protection
0 that meets the requirements of LSSGR Bell Communications Research
0 (Bellcore) Spec TR-TSY-000057 First Level Surge Tests must be
0 used.

0 'U' and 'S/T' line card types can be mixed within a line sub-
0 group.

0 LCME Line Card Service Mix

0 The 2B1Q Access Subsystem will support many line card types.
0 The list below summarizes which are not supported.

0 The 2B1Q Access Subsystem will support the following line card
0 types:

- 0 1. POTS - Type-A Line Cards (NT6X17AA/AB/AC/BA).
- 0 2. POTS - Type-B Line Cards (NT6X18AA/AB/BA) (Non-coin/ANI only)
- 0 3. Datapath-Data line cards (NT6X71AA/AB/BA).
- 0 4. Datapath-Asynchronous Interface line card (NT6X76AA/AC/AD).
- 0 5. Datapath-IBERT line card (NT6X99AA).
- 0 6. EBS-P-Phone line card (NT6X21AC).
- 0 7. Message Waiting POTS type line card (NT6X19AA). This card
0 requires a power converter line card (NT6X20AA) to function.
- 0 8. ISDN-S/T-Interface line card (NTB26AA). This card offers a
0 digital 4-wire ISDN S/T Interface for ISDN services.

0 9. ISDN-U-Interface (2B1Q) line card (NTBX27AA). This card of-
0 fers a digital 2-wire ISDN U Interface for ISDN services.

0 The 2B1Q Access Subsystem will not support the following line
0 card types:

0 1. POTS Type B line cards (NT6X18AA/AB)(Coin/ANI function)

0 Ringing Generator CPs are required in the ISDN Line Module
0 Frame and or cabinet when POTS Line Cards are provisioned.

0 2. ISDN AMI U-Interface line cards (NTBX25AA/AB).

Datapath IBERT Line Card	1	1

0 Table 1: Line Capacities for the 2B1Q ISDN LCME

0 Powering for a full frame of 2B1Q U ISDN Line Cards, EBS Line
0 Cards, POTS Line Cards, Data Line Cards, or S/T ISDN Line Cards
0 is provided.

0 Power limits the NT6X76AA Asynchronous Interface Line Card to 26
0 per drawer. The NT6X76AC AILC has no greater current limit than
0 a regular 2-slot line card; therefore, there is no limit to the
0 provisioning of the NT6X76AC (maximum 30 per drawer).

0 LCME Line Card Distribution

0 In BCS-31, the LCME will support only ISDN lines.

0 In BCS-32 (and beyond), any of the line cards supported can be
0 mixed with any other line card at the drawer of logical subgroup
0 level. However, if there are more than eight (8) S/T-Interface
0 line cards in the same row as POTS line cards, then the POTS line
0 cards will NOT stay in-service on PUPS failure. The Data Line
0 Cards cannot be mounted in the five line card position (slots 18
0 to 26) in the top LSG next to the PUPS line card. It is permit-
0 ted to mount the Data Line Card in the lower LSG directly under
0 the PUPS. Refer to the Engineering Manual, section EMA14-03-000,

0 RELEASE 28.01
0 93 12 03

0 for more information on the non-ISDN line cards and their provi-
0 sioning rules.

0 The LCME provides flexible Time Division Multiplexing (TDM)
0 groups. This enables an ISDN line to be placed anywhere in a
0 drawer. Any four ISDN lines from the same physical drawer can
0 belong to the same TDM group subject to rule that lines in a par-
0 ticular TDM group must come from the same physical drawer.

0 D-channels from line cards within one physical drawer will be
0 multiplexed together in any manner. D-channels from line cards
0 in different physical drawers will not be multiplexed together.

0 Refer to ECM-497 for more information on how to engineer LCMEs
0 that support ISDN lines only or mixed lines.

0 Terminal Provisioning

0
0 An LTID number is required for each terminal on the switch. The
0 current limit for LTIDs is 32,000 per switch. The limit for
0 packet data devices will remain at 16000 for the packet handler
0 equipment.

0 Up to eight terminals may be assigned to each loop. A maximum of
0 2 B channel devices (voice, circuit switched data or 64K packet
0 data) + 6 D channel devices (16K packet data), 1B + 7D or 8D may
0 be assigned to each loop.

0 MTU for 2B1Q Lines on a LCME.

0
0 For every MTA that has a LCME on the vertical there must be at
0 least one MTU on a horizontal of that MTA. Each MTU (NT2X10BA
0 and NT2X11BA card set) has two test access ports; that is two (2)
0 sets of tip and ring. Thus it can test two 2B1Q lines at the
0 same time. A LTU that has access to an MTA that has a LCME on
0 the vertical will NOT be used to perform any metallic testing on
0 the 2B1Q lines. Any rover test units (ones shared across MTAs)

0
0 RELEASE 28.01
0 93 12 03

0 that has access to the MTA that has a LCME on it must be a MTU
0 for it to be used on the LCME.

0 The physical installation of MTUs in MTMs is no different for
0 2B1Q than for POTS. For more information on MTUs, refer to
0 ECM-389.

0 8.1.4 OFFICE LAYOUT INFORMATION

0
0 The maximum cable length for the DS-30A connections between CLMI
0 Model A cabinet and it associated CPEI/IAC Controller shall not
0 exceed 50 feet.

0

0 8.1.5 TRAFFIC TABLES

0
0 The Traffic Engineering Rules for the ISDN LCME will be based on
0 the provisioning of the DS-30A Links to the LGCI and or the LTCI,
0 refer to ECM-497 (Simplified Traffic Provisioning).

0 Refer to ECM-413 (ISDN Traffic Provisioning. This ECM contains
0 worksheets and tables for engineering the required quantity of
0 DMS100 ISDN peripherals and DPN-PH equipment based on Carried
0 Traffic and Grade Of Service (GOS) considerations.

0 NTRX30BA - Power Feed And Fusing Chart

0 The following fuses and feeds are required:

0 Fusing:

0 The NTRX30BA is fused at the PDC with 4 x 30 Amp feeds for the
0 each LCEI (2A and 2B). All existing LCEI jobs, equipped with 20
0 Amp fusing, will be upgraded to 30 Amp fusing.

0 In existing offices, it is possible that the cables between LCEI
0 and PDC will not support a 30 Amp rating based on their length
0 and gauge. In this case, it will be necessary to provide a
0 larger gauge cable, or re-route the cable to reduce the length,
0 or move the LCEI closer to the PDC.

0 8.4 REAL TIME IMPACT

0 LCME Real-Time Engineering for BRI is as follows:

0 The following chart illustrates the call types which impact Real
0 Time Engineering of the LCME.

CALL TYPE	31	32+
-----	--	---
ISDN Circuit Switched	Y	Y
ISDN Packet Switched	N	N
Non-ISDN Circuit Switched (POTS, MDC,...)	N/A	Y

0 Refer to System Engineering Bulletin (SEB) 90-05-002 for Real
0 Time Engineering Guidelines for the LCME.

0 LCMI Real-Time Engineering

0
0 The following chart illustrates the call types which impact Real
0 Time Engineering of the LCMI.

CALL TYPE	BCS			
	25	26	27	28
-----	--	--	--	--
ISDN Circuit Switched	Y	Y	Y	Y
B Channel Packet Switched	N	N	N	N
D Channel Packet Switched	N	N	N	N
Electronic Business Set	N	N	Y	Y
Datapath	N	N	Y	Y
Other (POTS and MDC)	N	N	N	Y

0 Refer to System Engineering Bulletin (SEB) 88-10-001 for BCS
0 25-27 Abbreviated Real Time Engineering Guidelines for the LCMI.

0 RELEASE 28.01
0 93 12 03

0 1.0 Common Peripheral Controller

0 1.1 Introduction

0 The Common Peripheral Controller modules are microprocessor- con-
0 troller Peripheral Modules which are responsible for:
0 - scanning the lines in the modules for changes of circuit
0 state,
0 - performing timing functions for call processing,
0 - collecting and storing digits,
0 - generating digital tones,
0 - detecting tones (MF, DTMF) through the Universal Tone Re-
0 ceiver (UTR),
0 - sending and receiving signaling and control information
0 to and from the CCC,
0 - providing integrity checking of the network.
0 The message system provides the control interface between the Pe-
0 ripheral Modules and the rest of the system.

0 Tones for subscriber lines (DTMF) and for trunks (MF) are de-
0 tected by the Universal Tone Receiver (UTR) located in associated
0 PMs (LGC, DTC, LTC, SCM and RSC). Use of the UTR removes the re-
0 quirement for a network connection to a pool of receivers at the
0 Trunk Module (TM) and Maintenance Trunk Module (MTM). This
0 functionality offers improvements in CC, LGC, and RSC real time.

0 (i) Line Group Controller Equipment General Description

0 The LGC performs the medium-level processing tasks associ-
0 ated with subscriber line interfaces both for host office
0 and remote units. The LGC has duplicated control on two
0 shelves.

0 It can interface with up to 16 32-channel (30 voice and two
0 signal) speech links to the network, and up to 20
0 32-channel speech links (DS30A protocol) to its associated
0 Line Concentrating Modules (for host lines), or up to 20
0 24-channel DS1-rate lines serving remote equipment (RLCM,
0 OPM, or RSC). The same holds true for the International
0 Line Group Controller Modules, except for the interface to
0 the international remote equipment (IRLCM). Up to 20
0 30-channel PCM 30 lines can interface the remote equipment.

0 (ii) Digital Trunk Controller Equipment General Description

0

0 RELEASE 28.01
0 93 12 03
0

0 The DTC is indential to the LGC except that it contains
0 hardware to extract or insert A/B bit signaling and is pro-
0 grammed to perform trunk-oriented tasks.

0 The DTC is a two-shelf module and contains up to 10
0 DS1-rate interface cards, each having the capability of
0 interfacing with up to two DS1-rate lines. The 20
0 24-channel DS1-rate lines interface with 16 32-channel (30
0 voice + 2 signal) speech links to the network.

0 For international applications, the International Digital
0 Trunk Controller (IDTC) is the same as the DTC except it
0 interfaces with PCM 30 lines. Up to 20 30-channel PCM 30
0 lines can be interfaced with the IDTC.

0 (iii) Line Trunk Controller Equipment General Description

0 The LTC is a hybrid of the LGC and the DTC and is capable
0 of supporting the LCMS, remotes, and digital trunk inter-
0 faces. The LTC is a two-shelf module and has 20 ports
0 available to be assigned to host lines (DS30A protocol),
0 remote lines (DS1 protocol) and digital trunks (DS1 proto-
0 col). It can interface with up to 16 32-channel (30 voice
0 + 2 signal) speech links to the network. Like the DTC, the
0 LTC provides A/B bit scanning capability.

0 (iv) Subscriber Module Equipment General Description

0 The Subscriber Carrier Module SCM-100 Family of peripheral
0 modules provide interfaces between DMS-100 Family Systems
0 and non DMS-100 remote equipment. There are three versions
0 of the SCMs, Subscriber Module Remote (SMR), Subscriber
0 Carrier Module for SLC-96 (SMS) and Subscriber Carrier Mod-
0 ule - Urban (SMU).

0 a) The Subscriber Module Remote (SMR), also referred to as
0 Subscriber Carrier Module Rural (SCMR), is the first
0 peripheral in the SCM-100 family. It replaces the Con-
0 trol Concentrator Terminal (CCT) of the DMS-1R sub-
0 scriber carrier system and provides direct digital
0 interface between the DMS-1R Remote Concentrator Termi-
0 nal (RCT) and the DMS-100F.

0 The SMR provides all basic tones to a RCT, including
0 dial tone, busy tone, reorder tone, audible ringing
0 (ringback) tone, high tone, receiver offhook tone and

0 RELEASE 28.01
0 93 12 03

0 call waiting tone. Additionally, the SMR supports all
0 the currently available ringing schemes: coded, fre-
0 quency selective and superimposed.

0 b) The Subscriber Carrier Module (SMS) will interface on a
0 direct digital basis with the SLC-96 Remote Terminal
0 (RT) via DS-1 transmission facilities.

0 The SMS will replace the Central Office Terminal (COT)
0 currently associated with the RT thus eliminating indi-
0 vidual analog line circuits currently necessary to com-
0 municate on a line by line basis with the SLC-96.

0 The SLC-96 can operate in one of three modes:

0 MODE I - (non-concentrated line mode)

0 Used primarily for single and multiparty lines. Mode I
0 supports up to 96 subscriber lines and connects to the
0 SMS through up to five (5) DS-1 lines. One of these
0 lines is a protection line, active only when any of the
0 remaining four is out of service.

0 MODE II - (concentrated line mode)

0 Used for subscriber lines, special service and coin
0 lines. Mode II supports up to 96 subscriber lines and
0 connects to the SMS through up to three (3) DS-1 lines.
0 One of these lines is used for a protection line. Each
0 shelf group of 48 subscribers (two shelf groups total)
0 at the SLC-96 must compete for 24 channels on the DS-1
0 line.

0 MODE III - (non-concentrated single shelf group)

0 Used for special service and coin circuits. Mode III
0 supports up to 48 lines and connects to the SMS through
0 up to three (3) DS-1 lines. One of these lines is used
0 for a protection line.

0 c) The Urban Subscriber Carrier Module (SMU) (NT6X02EA)
0 will interface on a direct digital basis with a DMS-1
0 Urban Remote Terminal (RCU) via DS-1 transmission fa-
0 cilities.

0 The SMU is designed to replace the Central Control Ter-
0 minal (CCT) now required when the RCU is connected to a

0 RELEASE 28.01
0 93 12 03
0

0 DMS-100 Family switch. This will eliminate the need
0 for duplicated line circuits and will reduce floor
0 space required at the DMS-100 host office.

0 (v) Common Peripheral Controller Equipment Frame

0 The Common Peripheral Controller modules are housed in a
0 standard DMS frame named the Common Peripheral Equipment
0 Frame. Up to two modules can be mounted in this frame.
0 Since it is possible to house two different types of PM
0 within the same frame, the frame name assumes the identity
0 of the PM in the bottom of the frame. Possible frames
0 names are:

- 0 - Line Group Equipment (LGE) frame (for LGCs)
- 0 - Digital Trunk Equipment (DTE) frame (for DTCs)
- 0 - Line Trunk Equipment (LTE) frame (for LTCs)
- 0 - Subscriber Module Equipment (SME) frame (for SMR, SMS
0 or SMU)

0 (vi) Line Concentrating Device Provisioning

0 Prior to BCS28, the maximum number of LCDs allowed in an
0 office was 254 with the maximum number of real LCDs limited
0 to 200. Changes in BCS 28 allow up to 254 real LCDs. The
0 use of virtual LCDs will lower the number of real LCDs al-
0 lowed. For BCS30 and above, the calculation of LCDs per
0 SLC will be changed to 8 SLCs per real LCD.

0 SMS, SMR, SMU are classed as real time modules when consid-
0 ering LCD provisioning. Refer to the Line Concentrating
0 Module section for more information.

0 1.3 Equipment Provisioning

0 1.3.1 DS30A Interface Cards

0 (a) General Description

0 To enable the Telco to specify the quantity of interface circuit
0 packs required to interface the DS30A ports from the Line Concen-
0 trating Module (LCM).

0 (b) Reference

0 None

0 (c) Provisioning Considerations

0 (i) NT6X48AA is required to interface with the DS30A ports of
0 the LCM module (domestic and international).

0 (ii) There can be a maximum of two (2) pairs of NT6X48AA cards
0 (four cards in total) per LGC module.

0 (iii) One pair of NT6X48AA cards provides an interface for up
0 to 10 DS30A ports from LCM's.

0 (iv) For each new LGC module that links to LCMs, always pro-
0 vide two (2) pairs of DS30A Interface Cards.

0 (v) When an existing LGC has only one (1) pair of the DS30A
0 Interface Cards, order one more pair if there will be
0 more than 10 DS30A links from the LCMs.

0

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 1.3.2 DS1 Interface Cards

0 (a) General Description

0 To enable the Telco to specify the quantity of interface circuit
0 packs required to interface the DS1 digital carrier system and
0 the DS1 links from the Remote Line Concentrating Module (RLCM),
0 the Remote Switching Centre (RSC) and the Outside Plant Module
0 (OPM).

0 (b) Reference

0 NTP 297-1001-451 DMS-100 Family Common Customer
0 Data Schema

0 (c) Provisioning Considerations

0 (i) The DS1 Interface Cards are required to interface with
0 the DS1 digital carrier systems and the DS1 links from
0 the Remote Sites (i.e. Remote Line Concentrating Module
0 (RLCM), Remote Switching Center (RSC), Outside Plant Mod-
0 ule (OPM)).

0 (ii) There can be a maximum of ten (10) DS1 I/F cards per
0 LGC/DTC/LTC module.

0 (iii) One NT6X50AA/AB card provides an interface for up to two
0 (2) DS1 links. The NT6X50AB card will replace the
0 NT6X50AA card as the DS1 I/F card in many but not all ap-
0 plications (- the NT6X50AB will not be used in SMR, RSC,
0 and RLCM).

0 In order to support the enhanced features of the NT6X50AB
0 (i.e. ESF and 64 Kb/s clear channel capability based on
0 B8ZS), the DTC/LGC/LTC modules must be equipped with new
0 messaging (i.e. NT6X69AA/79AA or NT6X69AB) and new memory
0 (i.e. NT6X46AB/BA and NT6X47AB or NT6X47AC) cards. Pick
0 the appropriate DTC/LGC/LTC circuit pack fills.

0 The full support of the NT6X50AB card will not be avail-
0 able in DTC/LGC/LTC modules which have small memories
0 (i.e. NT6X46AA, NT6X47AA) and old messaging (i.e.
0 NT6X43AA). In these modules, the NT6X50AB can be used as
0 replacements for normal NT6X50AA carriers but the en-
0 hanced DS-1 feature set will not be available.

0
0 RELEASE 28.01
0 93 12 03

0 The above is only applicable to DMS host offices and not
0 to remotes such as RSC and RLCM.

0 The Customer cannot use NT6X50AB to substitute for
0 NT6X50AA unless NTX270AA software is loaded and
0 datafilled for the respective XPM's. It is recommended
0 that NT6X50AA cards and NT6X50AB cards not be mixed on a
0 shelf to minimize cases where the Customer forgets that
0 NT6X50AB needs to be explicitly software datafilled. The
0 datafill is via software table CARRMTC.

0 (iv) The DS-1 Interface Circuit Pack provisionable to the SMS
0 is the NT6X85AA or NT6X85AB. If software package
0 NTX299AB is present, the NT6X85AB is required for all
0 modules that require special services features. Other SMS
0 modules may use NT6X85AA packs but will be unable to use
0 the special services features of the software package
0 NTX299AB. (Check availability reports for the proper or-
0 dering PEC.)

0 The SMU DS-1 CP Product Engineering Code (PEC) is
0 NT6X85AB. Each NT6X85AB CP contains two (2) DS-1 cir-
0 cuits. A maximum of ten (10) NT6X85AB CP may be provi-
0 sioned on each SMU.

0

0

0

0

0

0

0

0
0 RELEASE 28.01
0 93 12 03

0 1.3.3 DS0A Interface Cards

0 (a) General Description

0 The NT6X55AB DS-0A Signaling Interface circuit pack provides a
0 DS-0A channel for the Digital Trunk Controller (DTC). Prior to
0 the introduction of this CP, channel banks were used to convert
0 the DS-1 link to 24 DS-0A channels.

0 The NT6X55AB CP provides one DS-0A channel for the CCS7 signaling
0 link. The CP supports 56 Kb/s and 64 Kb/s links.

0 (b) Reference

0 None

0 (c) Provisioning Considerations

0 (i) The DS-0A Signaling Interface Cards are provided in the
0 DTC for CCS7 signaling links. Provision one (1) DS-0A
0 card for each DS-0A link required.

0 (ii) There can be a maximum of ten (10) DS-0A I/F cards per
0 DTC module. The DS-0A I/F card is not applicable in an
0 LTC. A NT6X55AB can be provisioned in any slot that a
0 NT6X50 is allowed in a DTC. One NT6X55AB consumes two
0 DS-1 links on a DTC. One channel of the first DS-1 link
0 is used for the DS-0A channel. The remaining 47 channels
0 are not used. Therefore, the NT6X55ABs should be dis-
0 tributed evenly across all DTCs to minimize the port im-
0 pact.

0 (iii) The DTC supporting the NT6X55AB must be equipped with Ex-
0 tended Memory (NT6X46) and Enhanced Messaging (NT6X69).

0 (iv) The DS-0A link must not exceed 1500 feet.

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 1.3.4 DS512 Interface Cards

0 (a) General Description

0 The NT6X40CA DS512 Network Interface circuit pack provides a fi-
0 ber interface to the Enhanced Network (ENET).

0 (b) Reference

0 None

0 (c) Provisioning Considerations

0 (i) If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP and two (2) NT6X40DA, DS512 Paddle Board,
0 for each relevant DTC/LGC/LTC module.

0 (ii) Provide one (1) NT6X02BU, Fiber I/F Hardware Assembly,
0 for each DTC/LGC/LTC module interfacing to the Enhanced
0 Network (ENET). The NT6X02BU Fiber Assembly mounts on
0 the backplane of the lower array in a module and provides
0 the fiber interface for both arrays.

0 (iii) If copper interface to the Network is required, then pro-
0 vide two (2) NT6X40AC, DS30 Network Interface CP, for
0 each relevant DTC/LGC/LTC module.

0 Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0

0 RELEASE 28.01
0 93 12 03

0 1.3.5 PCM 30 Interface Cards

0 (a) General Description

0 To enable the Telco to specify the quantity of interface circuit
0 packs required to interface the PCM 30 links from the Interna-
0 tional Remote Line Concentrating Module (IRLCM) and the PCM 30
0 Digital Carrier Systems.

0 (b) Reference

0 Chapter 3, Section 3.3 Operator Services
0 NTP 297-1001-451 DMS-100 Family Common Customer
0 Data Schema

0 (c) Provisioning Considerations

- 0 (i) The PCM 30 Interface Cards are required to interface with
0 the PCM 30 digital carrier systems and the PCM 30 links
0 from the Remote Sites (i.e. International Remote Line
0 Concentrating Module (IRLCM)).
- 0 (ii) One NT6X27AA/AB card provides an interface for up to two
0 (2) PCM 30 links.
- 0 (iii) There can be a maximum of eight (8) PCM 30 I/F cards per
0 International DTC (IDTC) module.
- 0 (iv) A DMS-100 host interfaces with an IRLCM over 2-6 PCM 30
0 links. The PCM 30 I/F cards mount on the ILGC.
- 0 (v) There can be a maximum of two (2) NT6X27AB PCM 30 I/F
0 cards per ILGC/IDTC module when the interoffice synchro-
0 nization feature is required.
- 0 (vi) When ITOPS is equipped on a DMS-100/200 configuration,
0 loop around trunks (NT6X27AA) must be provisioned to
0 route traffic between the DMS-100 and the DMS-200 portion
0 of the switch. Refer to Section 3.3 - Operator Services,
0 for more ITOPS provisioning information.
- 0 (vii) Provide one pair of NT6X28AA PCM 30 Signalling CP per
0 IDTC if TS16 signalling is used on the PCM link.
- 0 (viii) Provide one pair of NT6X28AA PCM 30 Signalling CP per
0 ILGC which supports LCM equipped with Metering Tone Con-

0 verter line cards (see the subsection on the Line Draw-
0 ers, found in this chapter, for more information on the
0 Metering Tone Converter line card).

0 1.3.6 Universal Tone Receivers

0 (a) General Description

0 The Universal Tone Receiver (UTR) is a combined service circuit
0 that can perform the function of a Digitone Receiver for lines
0 and a MF Receiver for trunks.

0 The Universal Tone Receiver (UTR) circuit pack is provisioned for
0 R2 call setup. Each UTR pair has thirty circuits. For more in-
0 formation on the UTR, refer to Section 3.5.

0 (b) Reference

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 (i) The UTR is provisionable in pairs (maximum two (2) pairs)
0 on the DTC, LGC, (IDTC, ILGC) and LTC modules. All lines
0 and trunks connected to the module will be serviced by
0 the UTR within the module. This includes all lines in
0 LCMS, RLCMS, and OPMS.

0 (ii) UTRs will slightly reduce the DTC/LGC/LTC and RSC periph-
0 eral real time capacity. A real time work up should be
0 performed to ensure sufficient capacity. Refer to Sys-
0 tems Engineering Letter, Issue #01, Subject "Guidelines
0 for XPM Real Time Capacity Study - BCS-22" (Date: May 22,
0 1987).

0 (iii) Lines and trunks on a RSC are serviced by UTR cards lo-
0 cated in the RCC module of the RSC. There is no traffic
0 overflow to the host office.

0 (iv) Although the UTR can perform the function of a Digitone
0 Receiver (NT2X48AA) and the function of a MF Receiver
0 (NT2X48AB), there is no traffic overflow from UTRs onto
0 existing Digitone Receivers nor existing MF Receivers.
0 The Digitone Receivers and MF Receivers mounted on MTMs
0 and TMs are still required to service the following:

- 0 - analog trunk groups existing on TM/MTM shelves
- 0 - lines equipped on LM modules
- 0 - trunk groups equipped on DCM modules
- 0 - Mechanized Calling Card Service (MCCS)

0 RELEASE 28.01

0| Any incoming or incoming portion of a 2 way trunk group
0| requiring a receiver not listed above will require
0| Digitone or MF receivers.

0| (vi) The number of UTR circuits is obtained by calculating the
0| UTR holding time and multiplying by the average number of
0| calls per hour. In general it is always safe to provide
0| two (2) pairs of UTR cards if unsure of the traffic de-
0| mands.

0| For incoming R2 calls the UTR holding time is as follows:

0| 1. From seizure to final digit collection
0| plus

0 RELEASE 28.01
0 93 12 03

- 0 2. From final digit collection to - trunk
0 selection if R1 or N5 outgoing, - seize
0 acknowledgement if R2 outgoing.

0 For outgoing R2 calls the UTR holding time is as follows:

- 0 1. The UTR is held until told to release by
0 the far office or timeout if we are the
0 controlling signal office (i.e. R1 to R2
0 calls).

0 The number of UTRs used on average is given by the fol-
0 lowing formula:

$$\begin{array}{lcl} \# \text{ of UTR} & \text{SI} & \text{S0} \\ \text{Circuits} = \text{NI} \times \frac{\text{-----}}{\text{HI+SI}} \times \text{EI} + \text{NO} \times \frac{\text{-----}}{\text{HO+S0}} \times \text{EO} \\ \text{required} & & \end{array}$$

0 where,

0 NI = Number of incoming R2 trunks (or 2-way
0 used as incoming)

0 SI = Signalling time in seconds of incoming
0 trunks

0 HI = Holding time (talking) of incoming trunks
0 in seconds

0 EI = Erlang occupancy figure of incoming
0 trunks

0 NO = Number of outgoing R2 trunks (or 2-way
0 used as outgoing)

0 S0 = Signalling time in seconds of outgoing
0 trunks

0 HO = Holding time (talking) of outgoing trunks
0 in seconds

0 EO = Erlang occupancy figure of outgoing trunks

- 0 (vii) This circuit pack is only required for CCITT No. 6 Sig-
0 nalling.

0 RELEASE 28.01
0 93 12 03

0 1.3.7 Special Tone Receiver/Blue Box Fraud

0 (a) General Description

0 The STR (Special Tone Receiver) is a digital signal tone process-
0 ing tone receiver for applications that are characterized by per
0 call, long holding time (30 + seconds) receiver requirements.
0 Examples of this type of receiver are Reorigination and Blue Box
0 Fraud detection.

0 The NT6X62AB STR/BBF ckt pack is designed for use in the Extended
0 Peripheral Module (XPM) environment. It is capable of monitor-
0 ing all 480 active speech channels in the XPM architecture.

0 The NT6X62AB STR/BBF ckt pack is a single-slot (dual board)
0 provisionable XPM circuit pack which supports Reorigination and
0 Blue Box fraud detection features.

0 (b) Reference

0 None.

0 (c) Provisioning Considerations

0 (i) The technology of the NT6X62AB STR receiver is applicable
0 to the Extended Peripheral Module (XPM) (which mounts on
0 the NT6X01AA/AB frames). The product features of Special
0 Tone Receiver (Reorigination and Blue Box Fraud) are ap-
0 plicable to the DMS-250 only.

0 (ii) One (1) STR/BBF ckt pack pair (1/shelf unit) will provide
0 special tone receiver features of Reorigination and Blue
0 Box Fraud Detection for all 480 channels of the DTC (XPM)
0 in which they are installed. The STR/BBF may only be
0 data filled for slot 16.

0 There may be only one UTR per XPM shelf when the STR/BBF
0 is present.

0 (iii) Only those trunk subgroups which go through an XPM on the
0 incoming side of the switch with STR may be monitored for
0 BBF.

0 Incoming ISUP trunks are not supported.

0

0 RELEASE 28.01
0 93 12 03
0

0 (iv) As a minimum, the following XPM configurations are re-
0 quired to support Reorigination and Blue Box Fraud fea-
0 tures:

- 0 A. Expanded Memory CPs NT6X47AB or NT6X47AC, NT6X46AB
- 0 B. New Messaging CPs, NT6X69AB
- 0 C. MP/SP CPU, NT6X45AC/AE
- 0 D. Power Converter, NT2X70AE
- 0 E. STR/BBF CP, NT6X62AB

0 (v) TRAFFIC CAPACITY OF REORIGINATION RECEIVERS

- 0 - 480 Erlangs at Busy Hour (monitoring only)
- 0 - Originating CPS are limited by XPM, not the STR

0 The STR is capable of monitoring all 480 active speech
0 channels for star and pound symbols. This does not mean
0 that the XPM is capable of accepting 480 simultaneous
0 requests for reorigination. However, the STR and it's
0 associated XPM code will not cause significant degrada-
0 tion (greater than 1.0%) in call processing capability of
0 the XPM. The actual XPM traffic capacity is determined by
0 the call and trunk mix.

0 TRAFFIC CAPACITY BLUE BOX FRAUD DETECTION

- 0 - 480 Erlangs at Busy Hour (monitoring only)
- 0 - Originating CPS are limited by XPM, not the STR

0 The BBF is capable of monitoring all 480 active speech
0 channels for Blue Box Fraud signals. This does not mean
0 that the XPM is capable of accepting 480 simultaneous
0 requests for call termination. Nor is the STR/BBF capa-
0 ble of generating that many successful BBF detection.
0 However, the STR and it's associated XPM code will not
0 cause significant degradation (greater than 1.0%) in call
0 processing capability of the XPM. The actual XPM traffic
0 capacity is determined by the call and trunk mix.

0 (vi) All required software to support features provided by the
0 NT6X62AB STR/BBF CP are included in the base software for
0 the switch. No special software feature package is re-
0 quired.

0 RELEASE 28.01
0 93 12 03

0 1.3.8 Line Group Controller (LGC) Module

0 (a) General Description

0 The LGC provides the interface between the LCM and the DMS net-
0 work. It is also an interface between the Remote Sites and the
0 DMS network.

0 (c) Reference

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations:

0 (i) The LGC module is a two shelf module.

0 (ii) Each LGC module can accommodate up to four (4) DS30A LCM
0 Interface Cards and up to ten (10) DS1 Interface Circuit
0 Packs. Each module can interconnect with the network via
0 up to sixteen (16) speech links.

0 (iii) Each LGC can terminate up to a maximum of twenty (20)
0 ports on the peripheral side, in any combination of DS30A
0 or DS1 ports (i.e. up to a maximum of twenty (20) DS30A
0 ports or up to a maximum of twenty (20) DS1 ports or any
0 combination of DS30A and DS1 ports up to a maximum of
0 twenty (20) ports).

0 (iv) Each LGC can terminate up to sixteen (16) DS30 ports x 30
0 = 480 speech channels on the CPU (network) side.

0 (v) The peripheral ports (DS30A and DS1) in the LGC can be
0 assigned in either a concentrating or a non-concentrating
0 configuration. In the concentrating configuration, up to
0 600 P-side speech channels can be assigned; while in the
0 non-concentrating configuration, a maximum of 480 P-side
0 speech channels can be assigned. Each DS30A link sup-
0 ports 30 speech channels. Each DS1 link supports 24
0 speech channels.

0 (vi) In offices with BCS-22 or earlier, the host LGC/LTC can
0 support up to a maximum of 18 p-side datafilled software
0 nodes, where a node is defined as host LCMs, RSC LCMs,
0 RCC, RLCM, OPM, RMMs, ESA processor (for RLCM/OPMs) and
0 dummy software nodes.

0 RELEASE 28.01
0 93 12 03

0 In BCS-23, this node limit is raised to a maximum of 62
0 p-side nodes.

0 (vii) When the RSC trunking option (NTX152AB) is
0 planned/provisioned, a host LTC is required.

0 (viii) It is recommended that the host LGC interface to only one
0 RSC. However, a maximum of two RSCs per LGC is allowed
0 (except for the Dual RCC configuration).

0 (ix) Dual RCC configurations require one LGC per RCC. The host
0 LGC will not interface to a second RCC.

0 (x) Provision RSCs off of the host LGC first. The remaining
0 LGC ports can be used to provision host LCMs, RLCMs or
0 OPMs as host LGC capacity permits. However, consideration
0 should be given to RSC growth.

0 (xi) The maximum number of Remotes (RSC, RLCM, OPM) that a
0 Host LGC can support is defined as follows:

- 0 - Two (2) RSCs from a single configuration.
- 0 - One (1) RSC from a dual configuration and one (1) RSC
0 from a single configuration.
- 0 - Traffic, Real Time and software Nodal requirements do
0 not exceed the recommended engineering limits.

0 In addition, the remaining p-side ports can be configured
0 for two (2) RLCMs and OPMs if the Traffic, Real Time and
0 software Nodal requirements do not exceed the recommended
0 engineering limits.

0 (xii) All ports from an LCM module must terminate onto the same
0 LGC module.

0 (xiii) All ports from an RLCM must terminate onto the same LGC
0 module.

0 (xiv) All ports from an OPM must terminate onto the same LGC
0 module.

0 (xv) There is a fifty (50) foot cabling length restriction be-
0 tween the LGC and the LCM.

0 (xvi) The newly provisioned modules can be linked to existing
0 LGCs. Take this into account when provisioning new LGCs.

0

0 RELEASE 28.01
0 93 12 03

0 (xvii) The following LGC Common Peripheral Controller CPs sup-
0 port the following applications:

0 LGCs
0 NT6X02LC supports RSC, UTRs
0 replaces NT6X02AL/AH (BCS-27)

0 ILGCs
0 NT6X02BD supports SL-100 U.K.
0 NT6X02BK supports Turkey applications
0 NT6X02BW replaces NT6X02BP (BCS-28)
0 NT6X02BP supports International
0 NT6X02HB supports Caribbean (CEP)
0 NT6X02KF supports China

0 (xviii) For each NT6X02LC ordered (BCS-27), provide:

0 - four (4) XPM Processor CP NT6X45AF/BA
0 - two (2) DS30 Network Interface CP NT6X40AC
0 - two (2) SP Memory Plus CP NT6X46BB
0 - two (2) MP Memory Plus CP NT6X47AC

0 - two (2) MSG Protocol & Tone CP NT6X69AC
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02LC is to be ordered instead of NT6X02LA.

0 For each NT6X02BW ordered, provide:

0 - six (6) XPM Processor CP NT6X45BA
0 - two (2) Time Switch CP NT6X44AB/EA
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02BW is to be ordered instead of NT6X02BP.

0 Upon general availability, the NT6X45BA CP will become
0 the standard XPM Processor offering instead of the
0 NT6X45AF/AD CP.

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four NT6X45BA XPM Processor CP for upgrading ex-
0 isting offices.

0 NT6X44EA adds Even-Bit-Inversion (EBI) to the Time Switch
0 CP (NT6X44AB).

0 RELEASE 28.01
0 93 12 03
0

- 0 (xix) If interface to the Enhanced Network (ENET) is required,
0 then the relevant DTC/LGC/LTC modules must have the
0 NT6X69AC Msg Protocol & Tone CP. NT6X69AC replaces
0 NT6X69AB.

0 Provide 1 NT6X02BQ change kit for each DTC/LGC/LTC module
0 you are upgrading to ENET. This change kit applies only
0 to modules provisioned at NT6X02 AS/IA, AT/LA or AU/MA
0 levels. Modules provisioned at earlier levels must be
0 upgraded to these levels before the NT6X02BQ change kit
0 can be applied.

- 0 (xx) Existing DTC/LGC/LTC modules are equipped with two
0 NT6X46BA in slot 11. Do not order new circuit packs for
0 these slots.

- 0 (xxi) There are two methods available to satisfy 4 MB MP memory
0 requirements in existing DTC/LGC/LTC modules. The first
0 method is to apply one NT6X02EQ product change kit to
0 each DTC/LGC/LTC module to be upgraded as in item (1) be-
0 low. Per customer request, a second pair of office sup-
0 plied NT6X47AB packs may be added to each DTC/LGC/LTC
0 module to be upgraded as in item (2) below. Do not order
0 new NT6X47AB packs for the upgrade of NT6X02IA, LA, MA mod-
0 ules. The NT6X47AB packs that have been removed from up-
0 graded DTC/LGC/LTC modules may then be applied to other
0 relevant DTC/LGC/LTC modules.

- 0 1) Provision NT6X02EQ Product Change Kit to replace the
0 NT6X47AB MP Memory Plus circuit packs in slot 10 with
0 NT6X47AC packs. The NT6X02EQ kit may only be applied
0 to the following modules:

0	DTC (CCS7) :	BCS-27	and later	(NT6X02AS/IA)
0	DTC (other):	BCS-33	and later	(NT6X02AS/IA)
0	LGC (all) :	BCS-31	and later	(NT6X02AT/LA)
0	LTC (all) :	BCS-30	and later	(NT6X02AU/MA)

- 0 2) Existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT0X50AA, Filler Face Plate, in Slot 09.
0 Provide two (2) NT6X47AB, MP Memory Plus CP for the
0 above listed modules.

0 RELEASE 28.01
0 93 12 03
0

0 One NT6X47AC in slot 10 (item 1) has the same memory
0 capacity as two (2) NT6X47AB in slots 9 and 10 (item
0 2).

0 Existing DTC/LGC/LTC module is presently equipped
0 with two NT6X69AB in slot 18. If existing module is
0 not required to interface ENET, new cards are not re-
0 quired for these slots.

0 Provide one (1) NT6X02BQ Product Change kit for each
0 existing DTC/LGC/LTC module to be upgraded to inter-
0 face ENET. The NT6X02BQ contains (2) NT6X69AC circuit
0 packs. The NT6X02BQ will convert the NT6X02IA/AS to
0 NT6X02IC, the NT6X02LA/AT to NT6X02LC, and the
0 NT6X02MA/AU to NT6X02MC.

0 If an existing DTC/LGC/LTC module has ALREADY been
0 upgraded to the NT6X02IC/LC/MC packfill level via the
0 NT6X02EQ KIT, provide two NT6X69AC circuit packs in
0 slot 18 to upgrade the module for ENET interface.

0 (xxii) Provide two (2) NT6X78AA, Class Modem Resource CP, for
0 each LGC module that is handling Custom Local Area Sig-
0 naling Services (CLASS -U.S.) or Call Management Services
0 (CMS -Canada) -Calling Number Display. This rule only
0 applies to the following LGC modules:

0 NT6X02LC/LA, NT6X02AT

0 Upon general availability, the NT6X78AB will replace the
0 NT6X78AA as the standard CLASS Modem Resource CP. When
0 this happens, provide two (2) NT6X78AB CLASS Modem Re-
0 source CP in slot 13 of each LGC/LTC module that is han-
0 dling CLASS-Calling Number Display.

0 (xxiii) Module NT6X02LC is the minimum packfill level for new of-
0 fices at BCS-32 or later.

0 (xxiv) Modules NT6X02LA/AT represent the minimum packfill level
0 for BCS-32 in existing offices.

0 Building Blocks

0 (xxv) Provide one NTZZ04EA Building Block product change kit
0 for each existing NT6X02AA DTC/LGC/LTC module to be up-
0 graded. Do not order the NT6X02ZE PC Kit.

0 RELEASE 28.01
0 93 12 03
0

0 The NTZZ04EA building block contains the following:

0 (1) NT6X02ER XPM PC Kit
0 (1) NT6X02ZL Wiring Kit
0 (2) NT0X50AA Filler Face Plate
0 (2) NT6X47AC Master Proc Memory Plus CP
0 (2) NT6X46BB Signal Processor Memory Plus CP
0 (2) NT6X69AC CPP Msg Protocol & Tone CP
0 (2) NT2X70AE Power Conv +/-5V & 12V CP
0 (2) P0711663 Desig. Label for NT6X47AC
0 (2) P0711664 Desig. Label for NT6X46BB
0 (2) P0710476 Desig. Label for NT6X69AC
0 (2) P0698943 Desig. Label for NT2X70AE

0 (NOTE: The NTZZ04EA includes all circuit packs required
0 to upgrade an NT6X02AA module except the NT6X45 cards.

0 The NTZZ04EA building block kit may be used to upgrade
0 the NT6X02AA module as follows:

0
0
0
0
0
0
0
0
0

Building Block	From	To
NTZZ04EA	NT6X02AA (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

0 Provide one NTZZ04GA Building Block product change kit
0 for each existing NT6X02AC DTC/LGC/LTC module to be up-
0 graded. Do not order the NT6X02ZE PC Kit.

0 The NTZZ04GA building block contains the following:

0 (1) NT6X02ER XPM PC Kit
0 (1) NT6X02ZL Wiring Kit
0 (2) NT0X50AA Filler Face Plate
0 (2) NT6X47AC Master Proc Memory Plus CP
0 (2) NT6X46BB Signal Processor Memory Plus CP
0 (2) NT6X69AC CPP Msg Protocol & Tone CP
0 (2) P0711663 Desig. Label for NT6X47AC
0 (2) P0711664 Desig. Label for NT6X46BB

0 RELEASE 28.01
0 93 12 03

0 (2) P0710476 Desig. Label for NT6X69AC

0 (NOTE: The NTZZ04GA includes all circuit packs required
0 to upgrade a NT6X02AC module except the NT6X45 cards.)0 The NTZZ04GA building block kit may be used to upgrade
0 the NT6X02AC module as follows:0
0
0
0
0
0
0
0
0
0

Building Block	From	To
NTZZ04GA	NT6X02AC (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

0 | (xxvi) Existing DTC/LGC/LTC module is presently equipped with
0 four (4) NT6X45AA, XPM Processor CP, in Slots 08 & 12.
0 Application of the NTZZ04EA/NTZZ04GA makes these slots
0 provisionable and replacement cards must be ordered as
0 follows:0 For A-stock upgrades provide four (4) NT6X45BA cards in
0 slots 8 and 12 of the upper and lower shelves of the pe-
0 ripheral modules. If B-stock material is required, then
0 four NT6X45BB packs must be merchandise ordered via an
0 88K.0 | The existing NT6X45AA packs must be replaced because they
0 will not work with New Messaging. The only reason NT6X45
0 cards are not included in the NTZZ04EA/GA upgrade kit is
0 because there is an option between NT6X45BA and NT6X45BB
0 packs. Either the NT6X45BA packs or the NT6X45BB packs
0 must be ordered or the upgrade will not have been done
0 correctly.0 (xxvii) The existing DTC/LGC/LTC module is presently equipped
0 with the following DS30 Network Interface CP in Slots 22
0 & 23: four (4) NT6X40AA.0 If copper interface to the Network is required, then DO
0 NOT order new circuit packs for these slots.

0 RELEASE 28.01

0 93 12 03

0 If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP in Slot 22, and two (2) NT6X40DA, DS512 Pad-
0 dle Board, in Slot 22R of each relevant DTC/LGC/LTC mod-
0 ule. Also, provide one (1) NT6X02BU, Fiber I/F Hardware
0 Assembly, for each DTC/LGC/LTC module interfacing to the
0 Enhanced Network (ENET). The NT6X02BU Fiber Assembly
0 mounts on the backplane of the lower array in a module
0 and provides the fiber interface for both arrays.

0 Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0 (xxviii) The existing DTC/LGC/LTC module is presently equipped
0 with four (4) NT6X47AA, MP Memory CP, in Slots 09 & 10.
0 Application of the NTZZ04EA/NTZZ04GA replaces these cir-
0 cuit packs with two NT6X47AC Master Processor Memory cir-
0 cuit packs.

0 (xxix) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X46AA Signal Processor Memory Plus CP in
0 slot 11. Application of the NTZZ04EA/NTZZ04GA replaces
0 these circuit packs with two NT6X46BB circuit packs.

0 (xxx) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X43AA, Msg Interface CP, in Slot 18. Ap-
0 plication of the NTZZ04EA/NTZZ04GA replaces these circuit
0 packs with two NT6X69AC Msg Protocol & Tone circuit
0 packs.

0 (xxxi) If the existing module was a NT6X02AA, then the NTZZ04EA
0 provides two (2) NT2X70AE, Power Converter CP, in Slot 25
0 of each DTC/LGC/LTC module.

0 If the existing module was a NT6X02AC, then two (2)
0 NT2X70AD, Power Converter CP, already exist in Slot 25 of
0 each DTC/LGC/LTC module. DO NOT order new circuit packs
0 for these slots unless requested by the customer. Per
0 Telco request, the existing NT2X70AD CP's in each
0 DTC/LGC/LTC can be replaced by the NT2X70AE, Power Con-
0 verter ESD CP.

0 RELEASE 28.01
0 93 12 03

0 1.3.9 Digital Trunk Controller (DTC) Module

0 (a) General Description

0 The Digital Trunk Controller (DTC) Module provides the interface
0 between DS-1 digital systems and the DMS network. (The DTC does
0 not provide the digital interface between a host DMS and a re-
0 mote.)

0 (b) Reference

0 Chapter 3, Section 3.15 Common Channel Signalling

0 (c) Provisioning Considerations

0 (i) The DTC module is a two shelf module (versus the present
0 single shelf or single bay peripheral module).

0 (i) Each DTC module can terminate up to twenty (20) digital
0 carrier systems (i.e. up to ten (10) DS1 Interface cards)
0 and interconnect with the network via up to sixteen (16)
0 DS30 speech links.

0 (iii) Each DTC can terminate up to a maximum of twenty (20) DS1
0 ports on the peripheral side and a maximum of sixteen
0 (16) DS30 ports on the CPU (network) side.

0 (iv) Since each DTC terminates up to $20 \times 24 = 480$ voice chan-
0 nels and the internal speech links can accommodate up to
0 $16 \times 30 = 480$ VF paths, there is no concentration.

0 (v) DTC modules are provisioned for total terminations based
0 on the forecast of digital trunk requirements for the
0 busy season prior to exhaust.

0 (vi) For service protection, it is recommended that trunk cir-
0 cuits of each trunk group be spread over more than one
0 DS1 Interface card. Both of these cards can be mounted
0 on the same DTC module because of the duplicated
0 processor residing in the module.

0 (vii) Existing DTC modules which have spare capacity shall be
0 used to terminate new digital systems.

0 (viii) When a DTC module is handling CCIS/CCS7 voice trunk-
0 ing, two (2) Continuity Tone Detector cards NT6X70AA are

0 RELEASE 28.01
0 93 12 03
0

0 required when analog trunk facilities are employed. The
0 NT6X70AA card is not required if the transmission path is
0 all-digital.

0 (ix) The following DTC Common Peripheral Controller CPs sup-
0 port the following applications:

0 DTCs
0 NT6X02IC supports UTRs
0 replaces NT6X02AQ/AR (BCS-27)

0 IDTCs
0 NT6X02BD supports SL-100 U.K.
0 NT6X02BN supports Mercury UK applications with
0 New Message requirements (eg. DPNSS) *
0 NT6X02GB supports Caribbean (CEP)
0 NT6X02JA supports DMS-300 Turkey
0 NT6X02KE supports China
0 NT6X02QA supports Turkey applications
0 NT6X02BW replaces NT6X02BP (BCS-28)
0 NT6X02BP supports all International

0 * See Section 3.15 Common Channel Signalling for more
0 information on DPNSS.

0 (x) For each NT6X02IC ordered (BCS-27), provide:

0 - four (4) XPM Processor CP NT6X45AF/BA
0 - two (2) DS30 Network Interface CP NT6X40AC
0 - two (2) SP Memory Plus CP NT6X46BB
0 - two (2) MP Memory Plus CP NT6X47AC

0 - two (2) MSG Protocol & Tone CP NT6X69AC
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02IC is to be ordered instead of NT6X02IA.

0 For each NT6X02BW ordered, provide:

0 - six (6) XPM Processor CP NT6X45BA
0 - two (2) Time Switch CP NT6X44AB/EA
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02BW is to be ordered instead of NT6X02BP.

0

0 RELEASE 28.01
0 93 12 03
0

0 Upon general availability, the NT6X45BA CP will become
0 the standard XPM Processor offering instead of the
0 NT6X45AF/AD CP.

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four NT6X45BA XPM Processor CP for upgrading ex-
0 isting offices.

0 NT6X44EA adds Even-Bit-Inversion (EBI) to the Time Switch
0 CP (NT6X44AB).

- 0 (xi) If interface to the Enhanced Network (ENET) is required,
0 then the relevant DTC/LGC/LTC modules must have the
0 NT6X69AC Msg Protocol & Tone CP. NT6X69AC replaces
0 NT6X69AB.

0 Provide 1 NT6X02BQ change kit for each DTC/LGC/LTC module
0 you are upgrading to ENET. This change kit applies only
0 to modules provisioned at NT6X02 AS/IA, AT/LA or AU/MA
0 levels. Modules provisioned at earlier levels must be
0 upgraded to these levels before the NT6X02BQ change kit
0 can be applied.

- 0 (xii) If ENET interface is not required, use the product change
0 kit NT6X02EQ to upgrade DTC modules from NT6X02IA/LA/MC
0 to NT6X02IC/LC/MC levels.

- 0 (xiii) There are two methods available to satisfy 4 MB MP memory
0 requirements in existing DTC/LGC/LTC modules. The first
0 method is to apply one NT6X02EQ product change kit to
0 each DTC/LGC/LTC module to be upgraded as in item (1) be-
0 low. Per customer request, a second pair of office sup-
0 plied NT6X47AB packs may be added to each DTC/LGC/LTC
0 module to be upgraded as in item (2) below. Do not order
0 new NT6X47AB packs for the upgrade of NT6X02IA, LA, MA mod-
0 ules. The NT6X47AB packs that have been removed from up-
0 graded DTC/LGC/LTC modules may then be applied to other
0 relevant DTC/LGC/LTC modules.

- 0 1) Provision NT6X02EQ Product Change Kit to replace the
0 NT6X47AB MP Memory Plus circuit packs in slot 10 with
0 NT6X47AC packs. The NT6X02EQ kit may only be applied
0 to the following modules:

0 RELEASE 28.01
0 93 12 03
0

0 DTC (CCS7) : BCS-27 and later (NT6X02AS/IA)
0 DTC (other): BCS-33 and later (NT6X02AS/IA)
0 LGC (all) : BCS-31 and later (NT6X02AT/LA)
0 LTC (all) : BCS-30 and later (NT6X02AU/MA)

0 2) Existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT0X50AA, Filler Face Plate, in Slot 09.
0 Provide two (2) NT6X47AB, MP Memory Plus CP for the
0 above listed modules.

0 One NT6X47AC in slot 10 (item 1) has the same memory
0 capacity as two (2) NT6X47AB in slots 9 and 10 (item 2).

0 | Where an existing DTC/LGC/LTC module is presently
0 equipped with two NT6X69AB in slot 18, if the existing
0 module is not required to interface ENET, new cards are
0 not required for these slots.

0 Provide one (1) NT6X02BQ Product Change kit for each ex-
0 isting DTC/LGC/LTC module to be upgraded to interface
0 ENET. The NT6X02BQ contains (2) NT6X69AC circuit packs.
0 The NT6X02BQ will convert the NT6X02IA/AS to NT6X02IC,
0 the NT6X02LA/AT to NT6X02LC, and the NT6X02MA/AU to
0 NT6X02MC.

0 If an existing DTC/LGC/LTC module has ALREADY been up-
0 graded to the NT6X02IC/LC/MC packfill level via the
0 NT6X02EQ KIT, provide two NT6X69AC circuit packs in slot
0 18 to upgrade the module for ENET interface.

0 | For Canadian applications only, provide the NT6X02ER
0 Product Change Kit for each existing DTC peripheral mod-
0 ule (NT6X02AR/AM) to be upgraded. This change kit makes
0 the appropriate circuit pack positions provisionable, but
0 contains no circuit packs. Refer to the engineering man-
0 ual rules to identify the circuit packs required for up-
0 grade of the NT6X02AR or NT6X02AM.

0 (xiv) The following are the minimum packfill levels required
0 for BCS-32 or later: NT6X02IA/IS, or NT6X02IC (for new
0 offices).

0 **Building Blocks**

0 (xv) Provide one NTZZ04EA Building Block product change kit
0 for each existing NT6X02AA DTC/LGC/LTC module to be up-
0 graded. Do not order the NT6X02ZE PC Kit.

0
0 RELEASE 28.01
0 93 12 03

0

0 The NTZZ04EA building block contains the following:

0 (1) NT6X02ER XPM PC Kit
0 (1) NT6X02ZL Wiring Kit
0 (2) NT0X50AA Filler Face Plate
0 (2) NT6X47AC Master Proc Memory Plus CP
0 (2) NT6X46BB Signal Processor Memory Plus CP
0 (2) NT6X69AC CPP Msg Protocol & Tone CP
0 (2) NT2X70AE Power Conv +/-5V & 12V CP
0 (2) P0711663 Desig. Label for NT6X47AC
0 (2) P0711664 Desig. Label for NT6X46BB
0 (2) P0710476 Desig. Label for NT6X69AC
0 (2) P0698943 Desig. Label for NT2X70AE

0 (Note: The NTZZ04EA includes all circuit packs required
0 to upgrade an NT6X02AA module except the NT6X45 cards.

0 The NTZZ04EA building block kit may be used to upgrade
0 the NT6X02AA module as follows:

0

RELEASE 28.01
93 12 03

Building Block	From	To
NTZZ04EA	NT6X02AA (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

Provide one NTZZ04GA Building Block product change kit for each existing NT6X02AC DTC/LGC/LTC module to be upgraded. Do not order the NT6X02ZE PC Kit.

The NTZZ04GA building block contains the following:

(1)	NT6X02ER	XPM PC Kit
(1)	NT6X02ZL	Wiring Kit
(2)	NT0X50AA	Filler Face Plate
(2)	NT6X47AC	Master Proc Memory Plus CP
(2)	NT6X46BB	Signal Processor Memory Plus CP
(2)	NT6X69AC	CPP Msg Protocol & Tone CP
(2)	P0711663	Desig. Label for NT6X47AC
(2)	P0711664	Desig. Label for NT6X46BB
(2)	P0710476	Desig. Label for NT6X69AC

(Note: The NTZZ04GA includes all circuit packs required to upgrade a NT6X02AC module except the NT6X45 cards.

The NTZZ04GA building block kit may be used to upgrade the NT6X02AC module as follows:

Building Block	From	To
NTZZ04GA	NT6X02AC (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

0
0 RELEASE 28.01
0 93 12 03

0 | (xvi) Existing DTC/LGC/LTC module is presently equipped with
0 four (4) NT6X45AA, XPM Processor CP, in Slots 08 & 12.
0 Application of the NTZZ04EA/NTZZ04GA makes these slots
0 provisionable and replacement cards must be ordered as
0 follows:

0 For A-stock upgrades provide four (4) NT6X45BA cards in
0 slots 8 and 12 of the upper and lower shelves of the pe-
0 ripheral modules. If B-stock material is required, then
0 four NT6X45BB packs must be merchandise ordered via an
0 88K.

0 | The existing NT6X45AA packs must be replaced because they
0 will not work with New Messaging. The only reason NT6X45
0 cards are not included in the NTZZ04EA/GA upgrade kit is
0 because there is an option between NT6X45BA and NT6X45BB
0 packs. Either the NT6X45BA packs or the NT6X45BB packs
0 must be ordered or the upgrade will not have been done
0 correctly.

0 (xvii) The existing DTC/LGC/LTC module is presently equipped
0 with the following DS30 Network Interface CP in Slots 22
0 & 23: four (4) NT6X40AA.

0 If copper interface to the Network is required, then DO
0 NOT order new circuit packs for these slots.

0 If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP in Slot 22, and two (2) NT6X40DA, DS512 Pad-
0 dle Board, in Slot 22R of each relevant DTC/LGC/LTC mod-
0 ule. Also, provide one (1) NT6X02BU, Fiber I/F Hardware
0 Assembly, for each DTC/LGC/LTC module interfacing to the
0 Enhanced Network (ENET). The NT6X02BU Fiber Assembly
0 mounts on the backplane of the lower array in a module
0 and provides the fiber interface for both arrays.

0 | Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0

0
0 RELEASE 28.01
0 93 12 03

0 (xviii) The existing DTC/LGC/LTC module is presently equipped
0 with four (4) NT6X47AA, MP Memory CP, in Slots 09 & 10.
0 Application of the NTZZ04EA/NTZZ04GA replaces these cir-
0 cuit packs with two NT6X47AC Master Processor Memory cir-
0 cuit packs.

0 (xix) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X46AA Signal Processor Memory Plus CP in
0 slot 11. Application of the NTZZ04EA/NTZZ04GA replaces
0 these circuit packs with two NT6X46BB circuit packs.

0 (xx) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X43AA, Msg Interface CP, in Slot 18. Ap-
0 plication of the NTZZ04EA/NTZZ04GA replaces these circuit
0 packs with two NT6X69AC Msg Protocol & Tone circuit
0 packs.

0 (xxi) If the existing module was a NT6X02AA, then the NTZZ04EA
0 provides two (2) NT2X70AE, Power Converter CP, in Slot 25
0 of each DTC/LGC/LTC module.

0 If the existing module was a NT6X02AC, then two (2)
0 NT2X70AD, Power Converter CP, already exist in Slot 25 of
0 each DTC/LGC/LTC module. DO NOT order new circuit packs
0 for these slots unless requested by the customer. Per
0 Telco request, the existing NT2X70AD CP's in each
0 DTC/LGC/LTC can be replaced by the NT2X70AE, Power Con-
0 verter ESD CP.

0 RELEASE 28.01
0 93 12 03

0 1.3.10 Line Trunk Controller (LTC) Module

0 (a) General Description

0 The LTC provides the interface between the LCM and the DMS net-
0 work. It is also an interface between the Remote Sites and the
0 DMS network and an interface between the DS1 digital carrier sys-
0 tem and the DMS network.

0 (b) Reference

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

- 0 (i) The LTC module is a two shelf module.
- 0 (ii) Each LTC module can accommodate up to four (4) DS30A LCM
0 Interface Cards and up to ten (10) DS1 Interface Circuit
0 Packs. Each module can interconnect with the network via
0 up to sixteen (16) speech links.
- 0 (iii) Each LTC can terminate up to a maximum of twenty (20)
0 ports on the peripheral side, in any combination of DS30A
0 or DS1 ports (i.e. up to a maximum of twenty (20) DS30A
0 ports or up to a maximum of twenty (20) DS1 ports or any
0 combination of DS30A and DS1 ports up to a maximum of
0 twenty (20) ports).
- 0 (iv) Each LTC can terminate up to 16 DS30 ports x 30 = 480
0 speech channels on the CPU (network) side.
- 0 (v) The peripheral ports (DS30A and DS1) in the LTC can be
0 assigned in either a concentrating or a non-concentrating
0 configuration. In the concentrating configuration, up to
0 600 P-side speech channels can be assigned; while in the
0 non-concentrating configuration, a maximum of 480 P-side
0 speech channels can be assigned. Each DS30A link sup-
0 ports 30 speech channels. Each DS1 link supports 24
0 speech channels.
- 0 (vi) In offices with BCS-22 or earlier, the host LGC/LTC can
0 support up to a maximum of 18 p-side datafilled software
0 nodes, where a node is defined as host LCMs, RSC LCMs,
0 RCC, RLCM, OPM, RMMs, ESA processor (for RLCM/OPMs) and
0 dummy software nodes.

0
0 RELEASE 28.01
0 93 12 03

0 In BCS-23, this node limit is raised to a maximum of 62
0 p-side nodes.

0 (vii) A host LTC is required, rather than a LGC, when the RSC
0 trunking option (NTX152AB) is planned/provisioned.

0 (viii) It is recommended that the host LTC interface to only one
0 RSC. However, a maximum of two RSCs per LTC is allowed
0 (except for the Dual RCC configuration).

0 (ix) Dual RCC configurations require one LTC per RCC. The host
0 LTC will not interface to a second RCC.

0 (x) Provision RSCs off of the host LTC first. The remaining
0 LTC ports can be used to provision host LCMs, RLCMs,
0 OPMs, or DS1 digital carriers as host LTC capacity per-
0 mits. However, consideration should be given to RSC
0 growth.

0 (xi) The maximum number of Remotes (RSC, RLCM, OPM) that a
0 Host LGC can support is defined as follows:

- 0 - Two (2) RSCs from a single configuration.
- 0 - One (1) RSC from a dual configuration and one (1) RSC
- 0 from a single configuration.
- 0 - Traffic, Real Time and software Nodal requirements do
- 0 not exceed the recommended engineering limits.

0 In addition, the remaining p-side ports can be configured
0 for two (2) RLCMs and OPMs if the Traffic, Real Time and
0 software Nodal requirements do not exceed the recommended
0 engineering limits.

0 (xii) All ports from an LCM module must terminate onto the same
0 LTC module.

0 (xiii) All ports from an RLCM must terminate onto the same LTC
0 module.

0 (xiv) All ports from an OPM must terminate onto the same LTC
0 module.

0 (xv) There is a fifty (50) foot cabling length restriction be-
0 tween the LTC and the LCM.

0 (xvi) The newly provisioned modules can be linked to existing
0 LGC/LTCs. Take this into account when provisioning new
0 LTCs.

0 RELEASE 28.01
0 93 12 03
0

0 (xvii) When a LTC module is handling CCIS voice trunking, two
0 (2) Continuity Tone Detector cards are required.

0 (xviii) The following LTC Common Peripheral Controller CPs sup-
0 port the following applications:
0 NT6X02MC supports RSC, UTRs
0 replaces NT6X02AK/AG (BCS-27)

0 (xix) For each NT6X02MC ordered (BCS-27), provide:

- 0 - four (4) XPM Processor CP NT6X45AF/BA
- 0 - two (2) DS30 Network Interface CP NT6X40AC
- 0 - two (2) SP Memory Plus CP NT6X46BB
- 0 - two (2) MP Memory Plus CP NT6X47AC
- 0 - two (2) MSG Protocol & Tone CP NT6X69AC
- 0 - two (2) Power Converter CP NT2X70AE

0 NT6X02MC is to be ordered instead of NT6X02MA.

0 (xx) NT6X02MC is the minimum packfill level for new offices
0 (for BCS-32 or later). NT6XMA/AU is the minimum packfill
0 level required to support BCS-32 or later in existing of-
0 fices.

0 Upon general availability, the NT6X45BA CP will become
0 the standard XPM Processor offering instead of the
0 NT6X45AF CP.

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four (4) NT6X45BA XPM Processor CP for upgrading
0 existing offices.

0 (xxi) If interface to the Enhanced Network (ENET) is required,
0 then the relevant DTC/LGC/LTC modules must have the
0 NT6X69AC Msg Protocol & Tone CP. NT6X69AC replaces
0 NT6X69AB.

0 Provide 1 NT6X02BQ change kit for each DTC/LGC/LTC module
0 you are upgrading to ENET. This change kit applies only
0 to modules provisioned at NT6X02 AS/IA, AT/LA or AU/MA
0 levels. Modules provisioned at earlier levels must be
0 upgraded to these levels before the NT6X02BQ change kit
0 can be applied.

0 RELEASE 28.01
0 93 12 03
0

0 (xxii) If ENET interface is not required, use the product change
0 kit NT6X02EQ to upgrade LTC modules from NT6X02IA/LA/MC
0 to NT6X02IC/LC/MC levels.

0 (xxiii) In new offices, at BCS32 or later, the minimum packfill
0 level for DTC modules (to be used for CCS6/CCS7) is
0 NT6X02IC.

0 (xxiii) There are two methods available to satisfy 4 MB MP memory
0 requirements in existing DTC/LGC/LTC modules. The first
0 method is to apply one NT6X02EQ product change kit to
0 each DTC/LGC/LTC module to be upgraded as in item (1) be-
0 low. Per customer request, a second pair of office sup-
0 plied NT6X47AB packs may be added to each DTC/LGC/LTC
0 module to be upgraded as in item (2) below. Do not order
0 new NT6X47AB packs for the upgrade of NT6X02IA, LA, MA mod-
0 ules. The NT6X47AB packs that have been removed from up-
0 graded DTC/LGC/LTC modules may then be applied to other
0 relevant DTC/LGC/LTC modules.

0 1) Provision NT6X02EQ Product Change Kit to replace the
0 NT6X47AB MP Memory Plus circuit packs in slot 10 with
0 NT6X47AC packs. The NT6X02EQ kit may only be applied
0 to the following modules:

0	DTC	(CCS7)	:	BCS-27	and later	(NT6X02AS/IA)
0	DTC	(other)	:	BCS-33	and later	(NT6X02AS/IA)
0	LGC	(all)	:	BCS-31	and later	(NT6X02AT/LA)
0	LTC	(all)	:	BCS-30	and later	(NT6X02AU/MA)

0 2) Existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT0X50AA, Filler Face Plate, in Slot 09.
0 Provide two (2) NT6X47AB, MP Memory Plus CP for the
0 above listed modules.

0 One NT6X47AC in slot 10 (item 1) has the same mem-
0 ory capacity as two (2) NT6X47AB in slots 9 and 10
0 (item 2).

0 Existing DTC/LGC/LTC module is presently equipped
0 with two NT6X69AB in slot 18. If existing module is
0 not required to interface ENET, new cards are not re-
0 quired for these slots.

0
0 RELEASE 28.01
0 93 12 03

0
0 Provide one (1) NT6X02BQ Product Change kit for each
0 existing DTC/LGC/LTC module to be upgraded to inter-
0 face ENET. The NT6X02BQ contains (2) NT6X69AC circuit
0 packs. The NT6X02BQ will convert the NT6X02IA/AS to
0 NT6X02IC, the NT6X02LA/AT to NT6X02LC, and the
0 NT6X02MA/AU to NT6X02MC.

0 If an existing DTC/LGC/LTC module has ALREADY been
0 upgraded to the NT6X02IC/LC/MC packfill level via the
0 NT6X02EQ KIT, provide two NT6X69AC circuit packs in
0 slot 18 to upgrade the module for ENET interface.

0 (xxiv) Provide two (2) NT6X78AA, Class Modem Resource CP, for
0 each LTC module that is handling Custom Local Area Sig-
0 naling Services (CLASS -U.S.) or Call Management Services
0 (CMS -Canada) -Calling Number Display. This rule only
0 applies to the following LTC modules:

0 NT6X02MC/MA, NT6X02AU

0 Upon general availability, the NT6X78AB will replace the
0 NT6X78AA as the standard CLASS Modem Resource CP. When
0 this happens, provide two (2) NT6X78AB CLASS Modem Re-
0 source CP in slot 13 of each LGC/LTC module that is han-
0 dling CLASS-Calling Number Display.

0 RELEASE 28.01
0 93 12 03
0

0 **Building Blocks**

0 (xxv) Provide one NTZZ04EA Building Block product change kit
0 for each existing NT6X02AA DTC/LGC/LTC module to be up-
0 graded. Do not order the NT6X02ZE PC Kit.

0 The NTZZ04EA building block contains the following:

0	(1)	NT6X02ER	XPM PC Kit
0	(1)	NT6X02ZL	Wiring Kit
0	(2)	NT0X50AA	Filler Face Plate
0	(2)	NT6X47AC	Master Proc Memory Plus CP
0	(2)	NT6X46BB	Signal Processor Memory Plus CP
0	(2)	NT6X69AC	CPP Msg Protocol & Tone CP
0	(2)	NT2X70AE	Power Conv +/-5V & 12V CP
0	(2)	P0711663	Desig. Label for NT6X47AC
0	(2)	P0711664	Desig. Label for NT6X46BB
0	(2)	P0710476	Desig. Label for NT6X69AC
0	(2)	P0698943	Desig. Label for NT2X70AE

0 (NOTE: The NTZZ04EA includes all circuit packs required
0 to upgrade an NT6X02AA module except the NT6X45 cards.

0 The NTZZ04EA building block kit may be used to upgrade
0 the NT6X02AA module as follows:

Building Block	From	To
NTZZ04EA	NT6X02AA (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

0 Provide one NTZZ04GA Building Block product change kit
0 for each existing NT6X02AC DTC/LGC/LTC module to be up-
0 graded. Do not order the NT6X02ZE PC Kit.

0 The NTZZ04GA building block contains the following:

0 RELEASE 28.01
0 93 12 03
0

0 (1) NT6X02ER XPM PC Kit
0 (1) NT6X02ZL Wiring Kit
0 (2) NT0X50AA Filler Face Plate
0 (2) NT6X47AC Master Proc Memory Plus CP
0 (2) NT6X46BB Signal Processor Memory Plus CP
0 (2) NT6X69AC CPP Msg Protocol & Tone CP
0 (2) P0711663 Desig. Label for NT6X47AC
0 (2) P0711664 Desig. Label for NT6X46BB
0 (2) P0710476 Desig. Label for NT6X69AC

0 (NOTE: The NTZZ04GA includes all circuit packs required
0 to upgrade a NT6X02AC module except the NT6X45 cards.

0 The NTZZ04GA building block kit may be used to upgrade
0 the NT6X02AC module as follows:

0

0

Building Block	From	To
NTZZ04GA	NT6X02AC (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

0

0 (xxvi) Existing DTC/LGC/LTC module is presently equipped with
0 four (4) NT6X45AA, XPM Processor CP, in Slots 08 & 12.
0 Application of the NTZZ04EA/NTZZ04GA makes these slots
0 provisionable and replacement cards must be ordered as
0 follows:

0 For A-stock upgrades provide four (4) NT6X45BA cards in
0 slots 8 and 12 of the upper and lower shelves of the pe-
0 ripheral modules. If B-stock material is required, then
0 four NT6X45BB packs must be merchandise ordered via an
0 88K.

0 The existing NT6X45AA packs must be replaced because they
0 will not work with New Messaging. The only reason NT6X45
0 cards are not included in the NTZZ04EA/GA upgrade kit is
0 because there is an option between NT6X45BA and NT6X45BB
0 packs. Either the NT6X45BA packs or the NT6X45BB packs

0 RELEASE 28.01
0 93 12 03
0

0 must be ordered or the upgrade will not have been done
0 correctly.

0 (xxvii) The existing DTC/LGC/LTC module is presently equipped
0 with the following DS30 Network Interface CP in Slots 22
0 & 23: four (4) NT6X40AA.

0 If copper interface to the Network is required, then DO
0 NOT order new circuit packs for these slots.

0 If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP in Slot 22, and two (2) NT6X40DA, DS512 Pad-
0 dle Board, in Slot 22R of each relevant DTC/LGC/LTC mod-
0 ule. Also, provide one (1) NT6X02BU, Fiber I/F Hardware
0 Assembly, for each DTC/LGC/LTC module interfacing to the
0 Enhanced Network (ENET). The NT6X02BU Fiber Assembly
0 mounts on the backplane of the lower array in a module
0 and provides the fiber interface for both arrays.

0 Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0 (xxviii) The existing DTC/LGC/LTC module is presently equipped
0 with four (4) NT6X47AA, MP Memory CP, in Slots 09 & 10.
0 Application of the NTZZ04EA/NTZZ04GA replaces these cir-
0 cuit packs with two NT6X47AC Master Processor Memory cir-
0 cuit packs.

0 (xxix) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X46AA Signal Processor Memory Plus CP in
0 slot 11. Application of the NTZZ04EA/NTZZ04GA replaces
0 these circuit packs with two NT6X46BB circuit packs.

0 (xxx) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X43AA, Msg Interface CP, in Slot 18. Ap-
0 plication of the NTZZ04EA/NTZZ04GA replaces these circuit
0 packs with two NT6X69AC Msg Protocol & Tone circuit
0 packs.

0

0
0 RELEASE 28.01
0 93 12 03

0 (xxxi) If the existing module was a NT6X02AA, then the NTZZ04EA
0 provides two (2) NT2X70AE, Power Converter CP, in Slot 25
0 of each DTC/LGC/LTC module.

0 If the existing module was a NT6X02AC, then two (2)
0 NT2X70AD, Power Converter CP, already exist in Slot 25 of
0 each DTC/LGC/LTC module. DO NOT order new circuit packs
0 for these slots unless requested by the customer. Per
0 Telco request, the existing NT2X70AD CP's in each
0 DTC/LGC/LTC can be replaced by the NT2X70AE, Power Con-
0 verter ESD CP.

0 RELEASE 28.01
0 93 12 03

0 1.3.11 Subscriber Module Remote (SMR)

0 (a) General Description

0 Subscriber Module-100 Rural (SCM-100R) also referred to as Sub-
0 scriber Module Rural (SMR), is the first peripheral in the
0 SCM-100 family. It replaces the Control Concentrator Terminal
0 (CCT) of the DMS-1R and provides direct digital interface between
0 the DMS-1R Remote Concentrator Terminal (RCT) and the DMS-100F.

0 The SMR provides all basic tones to a RCT, including dial tone,
0 busy tone, reorder tone, audible ringing (ringback) tone, high
0 tone, receiver offhook tone, and call waiting tone. Additionally,
0 the SMR supports all the currently available ringing schemes:
0 coded, frequency selective, and superimposed.

0 (b) Reference

0 Chapter 3, Section 3.7 Office Maintenance
0 NTP 297-1001-103 DMS-100 Family Peripheral Modules

0 (c) Provisioning Considerations:

0 (i) The following list summarizes features supported for the
0 SMR-RCT subsystem.

- 0 - 256 RCT serviced subscriber lines
- 0 - coin functions: semi post pay and post pay
- 0 - custom calling services: speed calling,
0 call waiting, 3-way calling and call forward
- 0 - Dial pulse, Digitone
- 0 - Dial Tone Speed Recording (DTSR)
- 0 - DMS-1R RCT integrated alarms
- 0 - Operational Measurements
- 0 - Operator Verification
- 0 - POTS
- 0 - Protection Switching (External hardware device)
- 0 - Station Ringer Test

0 (ii) Most features supported by the LCM are supported by the
0 SMR except for the following main exceptions:

- 0 - Business Set
- 0 - Circuit Switched Digital Data Service
0 (CSDDS)
- 0 - Four-Party ANI

0 RELEASE 28.01
0 93 12 03
0

- 0 - Integrated Business Network (IBN)
- 0 - PBX Line Features
- 0 - Random Make Busy
- 0 - Remote Register, SD Point
- 0 - Remote Meter (register) Pulsing
- 0 - Remote Message Register
- 0 - Sleeve Lead Control
- 0 - Sleeve Lead Control for Public Fire
- 0 Reporting System
- 0 - Stop Hunt

0 (iii) The SMR supports six (6) DMS-1R RCT with each RCT servicing
0 up to 256 subscriber lines. The RCT is connected to
0 the SMR via one (1), maximum two (2) DS-1 lines with an
0 optional DS-1 line called a protection line.

0 A protection line is a DS-1 line which can connect to up
0 to six (6) RCTs in a daisy chain. A protection line
0 serves as a spare DS-1 which can be rapidly switched in
0 to replace a failed DS-1. The physical connection between
0 the protection line and an RCT is by means of relays which
0 physically substitute the protection line's wires for the
0 wires of a normally working line. When provisioning protection
0 lines, a minimum of one (1) DS-1 line per SMR is required.
0 The maximum is six (6) per SMR, or one (1) per RCT.

0 (iv) Three (3) to sixteen (16) DS-30 speech links connect the
0 SMR to the network ports of the Network Modules. The SMR
0 is compatible with all existing and new Network Modules.
0 The quantity of DS-30 ports to the Network should be engineered
0 on a non-concentration basis due to the concentration already
0 existing at the RCT, therefore, configure DS-30 ports per a
0 channel-in/channel-out ratio of one to one.

0 (v) The NT6X02CS common packfill replaces the NT6X02CC common
0 packfill for use on all new SMR applications at or above
0 BCS-31. This packfill is the minimum packfill required
0 for BCS-31 applications on initial offices. Existing offices
0 require the NT6X02CC or NT6X02CQ packfill for BCS-31.

0 (vi) Provision the NT6X02CS packfill per SMR requirements
0 (Check availability reports for valid ordering dates).
0 The Subscriber Module Equipment frame (SME) can contain
0 up to two (2) dual shelf modules. Upon general avail-

0 RELEASE 28.01
0 93 12 03

0 ability, the NT6X02CP will become the standard SMR offer-
0 ing.

0 Provide a maximum of ten (10) NT6X50AA, DS-1 Interface
0 CP, in slots 5-1 of each SMR module. One (1) NT6X50AA
0 provides interface for up to two (2) T-1 span lines.

- 0 (vii) Existing NT6X02CA packfills can be upgraded to the
0 NT6X02CQ level with the application of the NT6X02ZJ prod-
0 uct change kit. The NT6X02ZJ kit replaces the two (2)
0 NT6X46AB CPs in slot 11 of each module with two (2)
0 NT6X46AC CPs. It also allows the provisioning of a sec-
0 ond NT6X47AB CP.

- 0 (viii) For US applications, provide two (2) NT6X47AB, Master
0 Processor Memory CP, in slot 09 of each NT6X02CC and
0 NT6X02CQ module when upgrading to BCS-31. For Canadian ap-
0 plications, replace the NT6X47AB pair with an NT6X47AC
0 pair when upgrading to BCS-31.

- 0 (ix) ENET Interface

0 SMR modules can interface with the Enhanced Network
0 (ENET) using DS-30 copper speech links without modifica-
0 tion.

0 SMR modules can interface with ENET using DS-512 Fiber
0 speech links with the application of the following equip-
0 ment:

0 NT6X40CA - DS-512 XPM Interface CP
0 NT6X40DA - DS-512 Link Paddle Board
0 NT6X02BU - Fiber Interface H/W Assembly

0 Provide two (2) NT6X40CA CPs in slot 22 and two (2)
0 NT6X40DA Paddle Boards in slot 22R of each SMR module.
0 Also, provide one (1) NT6X02BU H/W Assembly per SMR up-
0 graded for fiber interface to ENET.

0 The minimum packfill level required for Fiber Interface
0 to the ENET is NT6X02CC.

- 0 (x) The Universal Tone Receiver (NT6X92BB) is not currently
0 supported in the SMR. Digitone Receivers (NT2X48AB) must
0 be provisioned for lines at the RCT.

- (xii) In Central Offices(CO) where protection switching is a requirement, provision the Alcatel Lynch Automatic Protection Switch (B302MA09).

- (xiii) Effective with BCS33, the old messaging/small memory configuration will no longer be supported on new BCS loads for any XPM.

The NT6X69AC (Msg Protocol & Tone CP) will be provisioned on new and existing DTC and SMR modules to meet new messaging requirements. Existing NT6X69AA & NT6X79AA or NT6X69AB (Msg Protocol & Tone CP) satisfy the new messaging requirements on existing DTC and SMR modules.

0 RELEASE 28.01
0 93 12 03

0 1.3.12 Subscriber Carrier Module for SLC-96 (SMS)

0 (a) General Description

0 The SMS will interface on a direct digital basis with the SLC-96
0 Remote Terminal (RT) via DS-1 transmission facilities.

0 SMS will appear to the DMS-100F as a peripheral module. Each
0 module consists of two shelves of equipment with duplicated con-
0 trollers and power converters. The SMS shelf pairs are housed in
0 a standard DMS-100 single bay frame.

0 (b) Reference

0 Chapter 3, Section 3.7 Office Maintenance
0 NTP 297-1001-103 DMS-100 Family Peripheral Modules

0 (c) Provisioning Considerations:

0 (i)jThe SMS will support the following features:

0 - POTS

0 - single party
0 - multi party
0 - two party ANI & ONI
0 - four & eight party ONI

0 - COIN

0 - coin first
0 - dial tone first

0 - PBX

0 - loop start

0 - CUSTOM CALLING

0 - speed calling
0 - call waiting
0 - call forwarding
0 - all current IBN features with the
0 exception of datapath and P-phones

0 - RINGING

0 RELEASE 28.01
0 93 12 03
0

- 0 - bridged ringing
- 0 - single party
- 0 - superimposed ringing
- 0 - multiparty
 - 0 - four party fully selective
 - 0 - eight party semi selective
- 0 - coded ringing
 - 0 - multiparty
 - 0 - four party semi selective
 - 0 - eight party divided code

0 - DIALLING

- 0 - dial pulse
- 0 - dual tone multi frequency (DTMF)

0 - TONES

- 0 - dial tone
- 0 - audible ringback
- 0 - reorder
- 0 - busy

0 (ii) The Universal Tone Receiver (NT6X92BB) is not currently
0 supported in the SMS. Digitone Receivers (NT2X48AB) must
0 be provisioned for lines at the SLC-96.

0 (iii) The SMS will be capable of supporting four (4) Mode I
0 (five (5) DS-1 links) or six (6) Mode II/III (three (3)
0 DS-1 links) SLC-96 units. Mix of Mode I, II or III oper-
0 ations will be supported in a SMS. All DS-1 links from a
0 SLC-96 must terminate on the same SMS (via a DSX or ORB).

0 Effective with Batch Change Supplement (BCS) 22 the mini-
0 mum number DS-30 ports to the Network Module from a SMS
0 will be three (3) and a maximum will be four (4).

0 (iv) The SMS will be connected to the Network Module of the
0 DMS-100F via DS-30 ports which are duplicated to provide
0 connections to each plane of the network.

0 The quantity of DS-30 ports should be engineered based on
0 Mode type of SLC-96 and grade of service requested by the
0 telco.

0 MODE I & III - No concentration at the SLC-96

Page 3-50

0 RELEASE 28.01
0 93 12 03
0

0 When testing subscriber loops attached to a SLC-96 Remote
0 Terminal (RT) there are prerequisites/limitations which
0 must be met to complete the ABBT. Refer to Section 3.7,
0 Office Maintenance for more information on the ABBT.

0 (vii) Mechanized line testing is provided for testing sub-
0 scriber loops and line cards of an SLC-96. Refer to Sec-
0 tion 3.7, Office Maintenance for more information.

0 (viii) When Custom Local Area Signaling Services (CLASS-U.S.)
0 or Call Management Services (CMS-Canada) are required,
0 the NT6X78AA circuit pack must be provisioned in the SMS.
0 If NT6X85AA CPs exist in the module, replace the two (2)
0 NT6X40AA/AB/AC circuit packs in slot 22 and 23 with one
0 (1) NT6X40BA circuit pack in slot 22. If NT6X85AB CPs
0 exist, the NT6X40 packs do not have to be replaced. Refer
0 to CLASS/CMS in this section for further information.

0 (ix) SMS modules can interface ENET using either copper or fi-
0 ber speech links . Either case requires the applica-
0 tion of the NT6X69AC, Message Protocol & Tone CP. Mount
0 circuit packs in slot 18 of the upper and lower shelves
0 of the peripheral modules.

0 For the SMS to interface ENET using Fiber speech links,
0 the following equipment is required:

0 NT6X40CA - DS-512 XPM Interface CP
0 NT6X40DA - DS-512 Link Paddle Board
0 NT6X02BU - Fiber Interface H/W Assembly

0 Provide Two (2) NT6X40CA in slot 22 and two (2) NT6X40DA
0 in slot 22R of each SMU module. Also, provide one (1)
0 NT6X02BU per SMU.

0 Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board.

0 (x) Provide two (2) NT6X69AC, CPP Msg Protocol CP, for each
0 new SMS module ordered. The NT6X69AC replaces the
0 NT6X69AB for all applications. Mount circuit packs in
0 slot 18 of the upper and lower shelves of the peripheral

0
0 RELEASE 28.01
0 93 12 03

0 modules. For pre-BCS28 offices, the NT6X43AA Msg Inter-
0 face CP must be provisioned in slot 18.

0 (xi) The distinctive ringing feature requires that the RCS be
0 configured with coded ringing.

0 (xii) For BCS-31, replace the NT6X47AB pair with one NT6X47AC
0 pair. One (1) NT6X47AC circuit pack has the same memory
0 capacity as two (2) NT6X47AB circuit packs.

0 (xiii) The NT6X47AC circuit pack is a provisionable card on new
0 DTC/LGC/LTC modules. It is always provided in new
0 SMS/SMU/SMR packfills.

0 (xiv) The minimum packfill level required for BCS-31 is
0 NT6X02DH for new offices, and NT6X02DJ for upgrades.

0 (xv) The minimum packfill level required for BCS-33 is
0 NT6X02DD for new offices, and NT6X02DC for upgrades.

0 RELEASE 28.01
0 93 12 03

0 1.3.13 Subscriber Carrier Module - Urban (SMU)

0 (a) General Description

0 | The SMU will interface on a direct digital basis with a DMS-1 Ur-
0 ban Remote Terminal (RCU) via DS-1 transmission facilities.

0 The SMU will only interface RCUs. The SMU does not offer inter-
0 face support to any other remote system (eg. DMS-1R, SLC-96, RSC,
0 | RLCM, OPM etc.) nor host equipment (eg. LCM).

0 The RCU may be located outside the central office up to a maximum
0 distance of 100 miles.

0 SMU will appear to the DMS-100F as a peripheral module. Each
0 module consists of two shelves of equipment with duplicated con-
0 trollers and power converters. The SMU shelf pairs are housed in
0 a standard DMS-100 single bay frame.

0 (b) Reference

0 Chapter 3, Section 3.7 Office Maintenance
0 NTP 297-1001-103 DMS-100 Family Peripheral Modules

0 (c) Provisioning Considerations:

0 (i) The SMU will support the following features:

0 - POTS

- 0 - single party
- 0 - multi party
 - 0 - two or four party Frequency Selective
 - 0 Ringing (FSR) with
 - 0 - two party Automatic Number
 - 0 Identification (ANI)
 - 0 - four party Operator Number
 - 0 Identification (ONI)
 - 0 - two, four or eight party Coded Ringing
 - 0 with
 - 0 - two party ANI
 - 0 - two, four or eight party ONI
 - 0 - two party Divided Ringing with ANI

0 - COIN

0
0 RELEASE 28.01
0 93 12 03

- 0 - coin first
- 0 - dial tone first
- 0 - semi post pay
- 0 - ground start
- 0 - loop start

0 - CUSTOM CALLING

- 0 - speed calling
- 0 - three way calling
- 0 - call waiting
- 0 - call forwarding
- 0 - all current IBN features with the
- 0 exception of distinctive ringing, datapath
- 0 and Electronic Business Set (EBS)

0 - DIALING

- 0 - dial pulse
- 0 - digitone

0 - TONES

- 0 - dial tone
- 0 - audible ringback
- 0 - reorder
- 0 - busy

0 - MAINTENANCE

- 0 - Automatic Board to Board Test (ABBT)
- 0 - Test Desk (eg. MLT, LRS or #14 LTD)
- 0 - Automatic Line Testing (ALT)
- 0 - Line Card Testing
- 0 - Subscriber Loop Testing

0 (ii) The SMU shelf pairs are housed in a standard DMS-100 sin-
0 gle bay frame. The Subscriber Module Equipment Frame
0 (SME) (PEC NT6X01AA) can contain up to two modules. Each
0 module has a PEC of NT6X02EG.

0 | The NT6X02EG replaces the NT6X02EB Common Circuit
0 Packfill for use on all new SMU applications. Order the
0 NT6X02EG for all new SMU applications.

0 |

0 RELEASE 28.01
0 93 12 03
0

0 The minimum packfill for BCS-31 and following is
0 NT6X02EB/AW.

0 Provide one (1) NT6X02EH Product Change Kit and two (2)
0 NT6X47AC MP Memory Plus circuit packs for each NT6X02EB
0 and NT6X02AW module when upgrading to BCS-31. The
0 NT6X02EH PC Kit upgrades the NT6X02EB/AW module to the
0 NT6X02EF module and makes slots 10, 11, 11R and 18
0 provisionable. Mount the NT6X47AC circuit packs in slot
0 10 of the upper and lower shelves of the module.

0 Per customer request, the NT6X47AB packs removed from
0 modules upgraded via a PC Kit may be used to upgrade
0 other relevant modules. Provide two (2) office supplied
0 NT6X47AB CP for each NT6X02EB/AW module to be upgraded to
0 BCS-31. Do not order new NT6X47AB packs for the upgrade
0 of SMU modules.

0 Slots 22-23,25 of the NT6X02EB Common CP Fill are now
0 provisionable. Provide two (2) NT6X40AC, DS30 Network
0 Interface CP, in slot 22. Also, provide two(2) NT0X50AA,
0 Filler Face Plates, in slot 23 of each NT6X02EB Common CP
0 Fill. Provision two(2) NT2X70AE Power Converter CP in
0 slot 25 of each module.

0 The slots mentioned above are being made provisionable in
0 order to ease future design development. The remaining
0 circuit packs in the NT6X02EB Common CP Fill are un-
0 changed.

0 Upgrading Existing NT6X02EA Modules

0 In order to enhance an existing NT6X02EA module with the
0 Expanded Signaling Processor Memory CP required for
0 BCS-27, a product change kit NT6X02ZJ was created for
0 each existing SMU peripheral module. The NT6X02ZJ PC Kit
0 contains two (2) NT6X46AC, Enhanced Signaling Processor
0 CP, and new designation strips for the upgraded modules.

0 The NT6X02ZJ Product Change Kit will upgrade the follow-
0 ing peripheral module:

DESCRIPTION	FROM	TO

0		SMU Common CP	NT6X02EA	NT6X02AW
0				
0				

0 Slots 08,09,12,22-23,25 of the Upgraded SMU module are
0 now provisionable slots. These slots are being made
0 provisionable to ease future design development.

0 Provide four(4) NT6X45BB, XPM Processor CP, for slots
0 08&12 of each upgraded SMU module. New circuit packs DO
0 NOT need to be ordered for slots 09,22-23,25 of the Up-
0 graded SMU module.

0 Refer to availability reports to identify valid ordering
0 dates.

0 The NT6X02AW Common CP Fill are PEC codes used for the
0 field upgrade of existing peripheral modules ONLY. The
0 NT6X02AW Common CP Fills CANNOT be ordered.

0 Upgrading Existing NT6X02EB/AW Modules

0 The NT6X02EH Product Change Kit was created to convert
0 the NT6X02EB/AW module to the NT6X02EF module. This PC
0 Kit makes certain slots provisionable, but does not con-
0 tain any circuit packs.

0 The NT6X02EH Product Change Kit will upgrade the follow-
0 ing peripheral modules:

0	DESCRIPTION	FROM	TO
0	SMU Common CP	NT6X02EB	NT6X02EF
0	SMU Common CP	NT6X02AW	NT6X02EF

0 Slots 10,11,11R and 18 of the Upgraded SMU module are now
0 provisionable slots. These slots are being made provisionable to ease
0 future design development.

0 RELEASE 28.01
0 93 12 03

0 Since this PC Kit does not contain any circuit packs, any required up-
0 grade packs (provisionable in slots 10,11,11R or 18) must be ordered
0 in conjunction with the PC Kit. For instance, if a NT6X02EB/AW SMU
0 module is required to meet the BCS-31 extended MP memory requirement,
0 then one NT6X02EH Product Change Kit and two NT6X47AC packs must be
0 ordered to upgrade the module. If a NT6X02EB/AW SMU module is re-
0 quired to interface with ENET, then one NT6X02EH kit and two NT6X69AC
0 packs must be ordered to upgrade the module.

0 The NT6X02EF Common CP Fill is the PEC used for the field upgrade of
0 existing peripheral modules ONLY. The NT6X02EF Common CP Fill CANNOT
0 be ordered.

0 (iii) The SMU will be connected to the Network Module of the
0 DMS-100F via three (3) to sixteen (16) provisionable
0 DS-30 ports which are duplicated to provide connections
0 to each plane of the network. Configure the SMU as non-
0 blocking, that is, configure one DS-30port per each DS-1
0 channel provisioned to the RCUs.

0 The SMU peripheral side (p-side) interfaces to multiple
0 RCUs, and can accommodate up to twenty (20) DS-1 ports.

0 Each RCU will have one (1) to eight (8) DS-1 links to the
0 SMU. All DS-1 links must terminate on the same SMU. The
0 number of RCU that may terminate on a SMU is dependent on
0 the total traffic presented to the SMU and the physical
0 limitation of the twenty ports.

0 The mininum number of DS-1 required to interface a RCU is
0 one (1), however, two (2) DS-1 links are recommended to
0 prevent an outage during a single link failure.

0 A fully equipped RCU supports over 500 subscriber and/or
0 special service lines.

0 The SMU does not support DS-1 protection switching as it
0 will not be offered in the RCU product.

0 The SMU should be configured as non-blocking. The number
0 of DS-30 channels to the Network should be equal to the
0 number of DS-1 channels to the RCUs.

0 The following table represents the CCC capacity of the
0 SMU per DS-30 port to the Network.

0 Capacity of SMU (CCS)

0 RELEASE 28.01
0 93 12 03

0 at 4% TML

0 Network Ports 3 4 5 6
0 2780 3806 4841 5883 (CCS)

0 Network Ports 7 8 9 10
0 6929 7979 9032 10087 (CCS)

0 Network Ports 11 12 13 14
0 11144 12203 13264 14325 (CCS)

0 Network Ports 15 16
0 15388 16451 (CCS)

0 (iv) The Universal Tone Receiver (NT6X92BB) is not currently
0 supported in the SMU. Digitone Receivers (NT2X48AB) must
0 be provisioned for lines at the RCU.

0 (v) Provide two (2) NT6X69AC, CPP Msg Protocol CP, for each
0 new SMU module ordered. Mount circuit packs in slot 18
0 of the upper and lower shelves of the module. The NT6x69AC
0 replaces the NT6X69AB circuit pack for use on all SMU ap-
0 plications.

0 (vi) Provide two (2) NT6X78AA, Class Modem Resource CP, for
0 each SMU module that is handling Custom Local Area Sig-
0 naling Services (CLASS -U.S.) or Call Management Services
0 (CMS -Canada) -Calling Number Display.

0 On general availability, the NT6X78AB will replace the
0 NT6X78AA as the standard CLASS Modem Resource CP.

0 (vii) Mechanized line testing is provided for testing sub-
0 scriber loops and line cards of a DMS-1 Urban Remote ter-
0 minal. Refer to Section 3.7, Office Maintenance for more
0 information.

0 SMU modules can interface ENET using either copper or fi-
0 ber speech links. Either case requires the application
0 of the NT6X69AC, CCP Msg Protocol & Tone CP. Existing
0 NT6X02EB and NT6X02AW modules can be field upgraded to a
0 NT6X02EF module with the application of the NT6X02EH
0 Product Change Kit. This change kit allows provisioning
0 of the NT6X69AC CP in slot 18.

0 For the SMU to interface ENET using Fiber speech links,
0 the following equipment is required:

0
0 RELEASE 28.01
0 93 12 03

0
0 NT6X40CA - DS-512 XPM Interface CP
0 NT6X40DA - DS-512 Link Paddle Board
0 NT6X02BU - Fiber Interface H/W Assembly

0 Provide two (2) NT6X40CA in slot 22 and two (2) NT6X02DA
0 in slot 22R of each SMU module. Also, provide one (1)
0 NT6X02BU per SMU.

0| On general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface, and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board.

0 1.3.14 Common Peripheral Controller Equipment Frame

0 (a) General Description

0 The primary function of this frame is to house Line Group Con-
0 troller (LGC) Modules, Digital Trunk Controller (DTC) Modules or
0 Line Trunk Controller (LTC) Modules. Subject to certain re-
0 strictions, two different kinds of modules can be mounted on the
0 same frame. NTL Customer Engineering is to be consulted regard-
0 ing these configurations.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) This frame can accommodate four (4) shelves of equipment
0 (i.e. two modules). Modules are filled and numbered on
0 the frame from the bottom up.

0 (ii) Normally both modules are the same type. Two (2) modules
0 of different types can also be mounted on the same frame.
0 This situation would only occur in a very small office or
0 for the last frame in an office in order to save one
0 frame.

0 (iii) A LGC/LTC/DTC module cannot mount on the same frame as an
0 ILGC/IDTC module.

0 (iv) When ISG is being applied to an office, the LCE frames
0 and their associated Common Peripheral Controller Equip-
0 ment Frame must be served by the same PDC frame.

0 1.3.15 Conversion From SMR To DTC Or LGC Module0 (a) General Description

0 These provisioning considerations deal with field conversion of a
0 Subscriber Module Rural (SMR) to a Digital Trunk Controller (DTC)
0 or Line Group Controller (LGC).

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) The NT6X02ZG Product Change Kit will upgrade the follow-
0 ing peripheral module:

DESCRIPTION	FROM	TO
Peripheral Module	NT6X02CA(SMR)	NT6X02AQ(DTC)
Peripheral Module	NT6X02CA(SMR)	NT6X02AH(LGC)

0 Provide one (1) NT6X02ZG PC Kit, for each existing SMR
0 peripheral module to be converted. The NT6X02ZG PC Kit
0 contains circuit packs to convert a SMR module to a DTC
0 or LGC module.

0 (ii) Due to the conversion of an SMR module to a DTC or LTC
0 module, the messaging has changed; therefore, provide one
0 (1) NT6X02ZL PC Kit for Enhanced Messaging per NT6X01AA
0 frame (for U.S. offices only).

0 (iii) For the DTC module (NT6X02AQ) provision a maximum of ten
0 (10) NT6X50AB DS1 Interface Circuit Packs for each SMR
0 module converted per customer requirements. The NT0X50AA
0 Filler Face Plates provided in the NT6X02ZG PC Kit shall
0 be discarded if the NT6X70AA Continuity Tone Detector
0 Cards are provisioned for card slot 13 of both shelves.
0 Provision in pairs up to a maximum of four (4) NT6X92BB
0 Universal Tone Receiver CPs per customer requirements for
0 each SMR module converted.

0

0 RELEASE 28.01
0 93 12 03

0 1.3.16 Conversion From SMS To SMU Module

0 (a) General Description

0 These provisioning considerations deal with field conversion of a
0 Subscriber Module for SLC-96 (SMS) to a Subscriber Module for
0 DMS-1 Urban (SMU).

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) The Product Change Kits will upgrade the peripheral mod-
0 ules as follows:

PRODUCT CHANGE KIT	FROM	TO
NT6X02ZH	NT6X02DA(SMS)	NT6X02EA(SMU)
NT6X02ZD	NT6X02DB(SMS)	NT6X02EA(SMU)
NT6X02ZK	NT6X02DA/DB(SMS)	NT6X02EB(SMU)
NT6X02ZL	NT6X02DC(SMS)	NT6X02EB(SMU)
NT6X02ZM	NT6X02DD(SMS)	NT6X02EB(SMU)

0 Provide one (1) of the above PC Kits for each existing
0 SMS peripheral module to be converted. The PC Kits con-
0 tains circuit packs to convert a SMS module to a SMU mod-
0 ule.

0 (ii) Due to the conversion of an SMS module to a SMU module,
0 the messaging has changed; therefore, provide one (1)
0 NT6X02ZL PC Kit for Enhanced Messaging per NT6X01AA frame
0 (for U.S. offices only).

0 (iii) Provision a maximum of ten (10) NT6X85AB SCM DS1 Inter-
0 face Circuit Packs for each SMS module converted per cus-
0 tomer requirements.

0

0

0
0 RELEASE 28.01
0 93 12 03

0 | 1.3.17 Common Peripheral Controller Equipment

0 (a) General Description

0 The Signalling Data Link (SDL) is channel on a T1 Carrier which
0 terminates on a DTC, DCM or LTC. ISDN trunks must terminate on a
0 DTC since they are only supported on DTCs.

0 (b) Reference

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations:

0 (i) The DTC may be used for SDL and ISDN trunks, however, for
0 reliability against failures, it is recommended to dis-
0 tribute the ISDN trunks and SDL across several peripher-
0 als.

0 (ii) CCS7 trunks must terminate on DTCs ONLY. Signalling Links
0 can terminate on DTCs, DCMs or LTCs. Signalling Links
0 and CCS7 trunks can be assigned to the same DTC.

0 (iii) CCS7 trunks can be mixed with PTS trunks on the same DTC,
0 however, both cannot be in the same trunk group.

0 (iv) Provision one (1) NT6X55AB DS0A Signaling Interface CP on
0 the DTC for each DS0A CCS7 signaling link. (Refer to
0 section 3.5 for more information.)

0 (v) DTC modules supporting CCS7 trunks must be equipped with
0 Extended Memory (NT6X46) and Enhanced Messaging (NT6X69).

0 (vi) The maximum number of DTCs utilizing CCS7 is 60 per of-
0 fice based on each DTC requiring 2 IPMLs per MSB7.

0 (vii) Each DTC utilizing CCS7, requires two continuity cards
0 NT6X70AA for continuity checking on ISUP trunks for BCS23
0 and earlier. In BCS24 and later, the software require-
0 ment for Continuity Cards was removed so that customers
0 requesting the cost reduction when testing is not re-
0 quired are not required to order the cards.

0 For U.S. applications only, since the NT6X70-- is re-
0 quired for the COT test, it is recommended that continu-

0
0 RELEASE 28.01
0 93 12 03

0 ity cards continue to be provisioned in most cases.
0 Provisioning Continuity Cards on CCS7 DTCs should be con-
0 sidered standard. Only per customer request can they be
0 omitted.

0 For Canadian applications only, many customers have a
0 high penetration of digital trunk facilities and do not
0 require the Continuity card. Provision these cards only
0 on DTCs whose trunks support analog facilities at some
0 point in the end-to-end connection of the trunk.

0 (viii) Refer to Section 3.5 for more information on the DTC, DCM
0 and LTC.

0 RELEASE 28.01
0 93 12 03

0 1.3.18 D-Channel Handler

0 (a) General Description

0 The D-Channel Handler separates call control signalling for the B
0 channels (used for encoded voice, circuit switched, or packet
0 data information) from user packet data. Signalling information
0 is passed to the Central Control, while packet data from several
0 D-Channels is multiplexed and routed to the packet handler.

0 (b) References

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 (i) The D channel handling function is performed by two cir-
0 cuit packs on the CPEI:

0 NTBX01AA - ISDN Signalling Pre-processor (ISP) CP

0 NTBX02AA - D Channel Handler CP

0 The ISDN Signalling Pre-processor CP is provisionable;
0 two (2) are required in the CPCI for all applications.

0 (ii) The D channel handler CP will be assigned to slots cur-
0 rently used by DS-1 interface circuit packs. Assignment
0 of a DCH card makes physically unavailable 2 DS-1 ports.

0 (iii) Each DCH circuit pack takes one peripheral port of the
0 twenty P-side ports available. The total of twenty P-
0 side ports are shared between the DS-1, DS-30A and DCH
0 links.

0 (iv) From BCS-28 onwards, one (1) of the DCH circuit packs
0 will be used as a spare to support N+1 redundancy. There
0 is no DCH sparing in BCS-27.

0 At least two DCH cards must be provided after BCS-28 (ie.
0 one plus one spare).

0 (v) Up to ten (10) DCH Circuit Packs may be provided per
0 CPCI. (Nine plus one spare). Refer to the Traffic Crite-

0 ria and Capacities (Chapter 2) to calculate the number of
0 DCH required to support the anticipated packet traffic.

0 (vi) Each DCH circuit pack has 32 "ports" available. One port
0 is dedicated to the ISP, and the remaining 31 ports are
0 capable of handling 4 multiplexed BRI D channels each, or
0 $31 \times 4 = 124$ BRI D channels maximum.

0 The ISP will occupy a free slot on the speech bus.

0 93 12 03

0 1.3.19 ISDN Common Peripheral Controller (CPEI)

0 (a) General Description

0 The ISDN Common Peripheral Controller (CPEI) is the Peripheral
0 Controller for the ISDN. The CPEI frame is named LGEI, LTEI or
0 DTEI depending on the access modes supported (BRI, PRI, etc.)

0 The CPEI has 20 p-side ports that are provisioned as required to
0 support DS-30A links from LCMs, LCMEs, and LCMIs; DS-1 links to
0 the Packet Handler; DS-1 links for PRI or non-ISDN trunks; and
0 D-channel handlers.

0 An offshore version of the CPEI has also been created whose pri-
0 mary difference is the use of PCM-30 interfaces instead of DS-1
0 interfaces.

0 (b) References

0 System Engineering Bulletin (SEB) 88-10-001

0 (c) Provisioning Considerations

0 (i) The CPEI is used to interface the DS-30A links from line
0 modules, the DS-1 links to the Packet Handler, and the
0 non-ISDN and ISDN-PRI DS-1 links.

0 The frame and its modules and shelves are assigned func-
0 tional names depending on the ISDN access modes sup-
0 ported. For BRI access the following names apply:

Access Modes	Equip	Name	Abbr
-----	-----	-----	----
DS-30A links to LCM/LCME/LCMIs, DS-1 links to Packet Handler	Frame	ISDN Line Group Equipment	LGEI
	Module	ISDN Line Group Controller	LGCI
	Shelf	ISDN Line Group Array	LGAI

0

0
0 RELEASE 28.01
0 93 12 03

Access Modes	Equip	Name	Abbr
-----	-----	-----	-----
DS-30A links to LCM/LCME/LCMIs, DS-1 links to Packet Handler, non-ISDN DS-1 trunks	Frame	ISDN Line Trunk Equipment	LTEI
	Module	ISDN Line Trunk Controller	LTCI
	Shelf	ISDN Line Trunk Array	LTAI

0 Planned availability of these functions is as follows:
0 LGEI in BCS-27, LTEI in BCS-28. In addition, PRI DS-1
0 links are to be supported on LTEI in BCS-30.

0 (ii) Upgrade kits will be available to apply ISDN capability
0 to existing LGE/LTE/DTE/SME frames. The required kits
0 are:

0 NT6X02ZA CPCI ISDN Upgrade Circuit Pack Change Kit
0 NT6X01ZZ CPCE ISDN Upgrade Wiring Change Kit

0 These kits are not to be ordered for U.S. applications
0 until further notice.

0 The above kits will take any NT6X01AA CPCE frame and any
0 common circuit pack fill associated with this frame and
0 convert it to NT6X01AB CPEI frame and NT6X02NA ISDN com-
0 mon CP fill.

0 The NT6X02ZA CPCI ISDN Upgrade Circuit Pack Change Kit
0 can also be used on the NT6X01AB CPCE frame to upgrade a
0 non-ISDN DTC module to handle ISDN applications.

0

0

0

0

0

0 Host - Line Group Controller Equipment
0 Chapter 3

0 RELEASE 28.01
0 93 12 03
0

0 (iii) The Maximum number of each type of link, and the minimum
0 software release that supports it are:

0 LCM/LCME/LCMI - CPEI DS-30A links:
0 - up to 18 (BCS-27 or higher)

0 CPEI - Packet Handler DS-1 links:
0 - up to 16 (BCS-27 or higher)

0 Non-ISDN trunks:
0 - up to 16 (BCS-28 or higher)

0 PRI trunks:
0 - up to 16 (BCS-29 or higher)

0 There are no restrictions on the assignment of Bb or Bd
0 channels to packet handler DS-1 link channels. Note that
0 the CPEI statmux maximum is 64:1 for Bd channels.

0 | (iv) Prior to BCS-31, in an office equipped with both ISDN and
0 non-ISDN peripheral controllers, the CPCI modules could
0 be assigned the same discrimination numbers as existing
0 non-ISDN modules. For example, LGC 01 and LGCI 01 could
0 co-exist in an office. The same is not true for LCME/LCMI
0 versus LCM bays.

0 | For BCS-31 and above, discrimination numbering of ISDN
0 peripherals has been changed, requiring them to be con-
0 secutive with non-ISDN modules. Frame level naming and
0 numbering is unchanged and the frame type is still deter-
0 mined by the bottom module in the frame. At the MAP, ISDN
0 modules are no longer called LGCI/LTCI. Instead, only
0 LGC/LTC are allowed. (Note that DTCI has not been changed
0 to DTC at the MAP). As a result of this change, at
0 BCS-31, existing ISDN peripheral controllers (LGCI/LTCI)
0 will need to be renumbered to be consecutive with
0 non-ISDN controllers. For example, an office with exist-
0 ing LGC 00-05 and LGCI 00-01 will require renumbering the
0 ISDN modules to LGCI 06-07 at BCS-31. New labels for the
0 ISDN controllers will be required.

0 | DTC and DTCI numbering will not be changed due to the
0 complexity of changing in-service trunks and the lack of
0 a software tool for this activity. Numbering for DTC/DTCI
0 modules will be unchanged from pre-BCS31 practices.

0

0 RELEASE 28.01
0 93 12 03

0 | At the MAP, modules can still be identified as ISDN or
0 non-ISDN by referring to the ISP16 table.

0 (v) In an office equipped with both ISDN and non-ISDN periph-
0 eral controllers, the CPCI modules can be assigned the
0 same discrimination numbers as existing non-ISDN modules.
0 For example, LGC 01 and LGCI 01 can co-exist in an of-
0 fice. The same is not true for LCMI versus LCM bays.

0 (vi) The following chart illustrates the call types which im-
0 pact Real Time Engineering of the Master Processor in the
0 LGCI provisioned with Basic Rate Interface (BRI). Cur-
0 rently, the Master Processor is the only processor which
0 requires Real Time Engineering.

CALL TYPE	BCS	
	27	28
ISDN Circuit Switched	Y	Y
B Channel Packet Switched	N	N
D Channel Packet Switched	N	N
Electronic Business Set	Y	Y
Datapath	Y	Y
Other (POTS and MDC)	N	Y

0 Refer to System Engineering Bulletin (SEB) 88-10-001 for
0 BCS 25-27 Abbreviated Real Time Engineering Guidelines
0 for the LGCI.

0 BCS 28 Abbreviated Real Time Engineering Guidelines for
0 the LGCI provisioned with Basic Rate Interface is to be
0 provided in a future issue of this document.

0 (vi) The DTC NT6X02AI can be provided on the CPEI frame for
0 DMS-250 applications. This module will handle non-ISDN
0 trunking (employing A/B bit signaling) required for
0 DMS-250 applications but will not handle ISDN PRI. The
0 DTC can be converted at a later date to a DTCT in order
0 to handle ISDN PRI.

0 The NT6X01WC DTC Wiring Option (NT6X01AB) is provided per
0 each non-ISDN module equipped on the CPEI frame.

0 RELEASE 28.01
0 93 12 03
0

0 Standard DMS-250 DTC circuit packs are provisioned on the
0 DTC module as required.

0 (vii) Optional Software Features

0 Enhanced Office Recovery, NTXA66AA, is an optional soft-
0 ware feature that improves the present office recovery
0 time of extended peripheral modules (XPM). Extended XPM
0 Diagnostics, NTXA67AA, is an optional software feature
0 that enhances the present diagnostics of extended periph-
0 eral modules (XPM). The LTCI is classified as an XPM.

0 These Software features are applicable to any peripheral
0 module (XPM) which contains both enhanced messaging (i.e.
0 the 6X69/79 pair or the 6X69AB CP) and enhanced memory
0 (i.e. the 6X46AC CP or the 6X46BA CP).

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four (4) NT6X45BB (U.S. applications) or
0 NT6X45BA (Canadian applications) XPM Processor CP for up-
0 grading existing offices.

0 | (viii) Offshore CPEI

0 | NT6X01AC Offshore Peripheral Controller Equipment Frame

0 | The NT6X01AC Offshore Common Peripheral Controller Equip-
0 | ment Frame is based on the domestic NT6X01AB ISDN periph-
0 | eral controller, adapted for applications outside North
0 | America ("Offshore"). It supports PCM30 links, ISDN ser-
0 | vices, and Common Channel Signaling 7 (CCS7) features on
0 | two independent peripheral modules.

0 | The NT6X01AC Offshore Peripheral Controller Equipment
0 | frame supports two peripheral module types: PLGC and
0 | PDTC.

0 | PLGC - Supports ISDN, Centrex, EBS, IBN and POTS services on
0 | standard Line Concentrating Module types

0 | - Has PCM-30 P-side links for PRLCM and Offshore Remote
0 | Switching Center interface

0 | - Operation as a non-ISDN peripheral is not yet imple-
0 | mented in software, meaning that the NTB01AA ISDN

0
0 RELEASE 28.01
0 93 12 03

0 | Pre-Preprocessor CP is required even if no ISDN fea-
0 | tures are used

0 | - Supports AMI interface to the NT1. 2B1Q is not sup-
0 | ported for this interface

0 | PDTC - Supports CCS7 and R1 signaling in Offshore applica-
0 | tions, using PCM-30 links

0 | - ISDN services like Primary Rate Interface are not
0 | supported

0 | Modules of different types may be mixed on the frame if
0 | required.

0 | NTBX02AA D-Channel Handler CP are not required for PDTC
0 | applications, nor where the PLGC supports only non-ISDN
0 | LCMS.

0 | NTBX01AA ISDN Pre-Processor CP are always required on
0 | PLGC (until such time as software supports purely
0 | non-ISDN operation). This CP is not required on PDTC.

0 | (ix) All PCM30 links from a PRCC must terminate on the same
0 | host PLGC. Only the PLGC peripheral type can terminate
0 | PRCC host links.

0 | (x) The Offshore Offshore versions of the Common Peripheral
0 | Controller Equipment Frame and Remote Controller Equip-
0 | ment Frame are provisioned the same as their domestic
0 | counterparts (subject to the usage restrictions). The
0 | primary difference is the use of PCM-30 interfaces in-
0 | stead of DS-1 interfaces. A maximum of sixteen (16)
0 | PCM-30 interfaces may be equipped on the PLGC/PDTC versus
0 | twenty (20) DS-1 interfaces on the North American prod-
0 | uct. Provision one (1) NT6X27AC PCM-30 Interface CP for
0 | every two PCM-30 interfaces required. Certain other cir-
0 | cuit pack vintages are different between domestic and
0 | Offshore products; refer to the Engineering Manual
0 | sections for details.

0

0 RELEASE 28.01
0 93 12 03

0 1.3.20 Digital Packet Network (DPN) Equipment Provisioning

0 (a) General Description

0 Nailed-up B channel and statistically multiplexed D channel
0 packet data are routed to the DMS-100 Integrated Packet Handler
0 (IPH) equipment via DS-1 links from the CPEI frame. The IPH is
0 one of the peripherals needed to add ISDN to a DMS-100. The IPH
0 comes in a cabinet that is configured to support a set number of
0 B-channels and D-channels. Contained in a single cabinet is a
0 Digital Interworking Unit (DIU) and two Resource Modules (RM).

0 The DS-1 links are interfaced to the IPH by means of the DIU. The
0 RM portion of the IPH is a fully redundant module, including two
0 office Processing Elements (PE), two Call Server PEs, two DIU
0 servers, and two Disk Drives. In addition, the RM contains the
0 necessary hardware to support the OAM and subscriber service con-
0 nections. This IPH can be supported with G24 and later software
0 release. G26 is compatible with BCS29, 30, 31, and 32 if I-OAM
0 is not fully utilized. If full I-OAM capabilities are desired,
0 G26 is compatible with BCS31.

0 Prior to G26, the configuration of the PH equipment depended on
0 the software release. Prior to G23 release, the DIU worked in
0 conjunction with a DPN Access Module (AM) and the Network Module
0 (NM). The AM provides interfaces for the DIU, while the NM
0 interfaces the AM to the packet-switched network. A configuration
0 requiring only one AM shelf is called a DPN-10. A two-AM shelf
0 configuration is called DPN-15.

0 As of G23 release, the DPN-100 with the Resource Module (RM) was
0 introduced to provide significantly increased throughput. The NM
0 was still required for applications involving X.75 gateways (un-
0 til G24), and Network Control System (NCS) and data spooling
0 functions (until G26).

0 In G24, the AM and RM can interface to X.75 gateways. Generic G24
0 is the baseline for interfacing with the BCS-27 LGCI.

0 In G26, the IPH does not require an NM. The data spooling and
0 Network Control System functions can be performed by the IPH. The
0 AM is replaced by the RM. Reference Figure 316.6, Packet Handler
0 System Configuration.

0 This section describes the engineering of the ISDN-specific com-
0 ponents of the PH; that is, the DIU and the related RM equipment.

Figure 316.6: Packet Handler System Configuration

0
0 RELEASE 28.01
0 93 12 03

0 (b) References

0 NTP 241-1001-XXX DPN.....

0 (c) Provisioning Considerations

0 (i) The quantity of DS-1 links from the DMS is used to deter-
0 mine the quantity of DIU systems (shelves) and sub-
0 systems required. Each sub-system supports a single DS-1
0 link, and the number of interface cards in the sub-system
0 is determined by the number of Bb and Bd channels provi-
0 sioned on the DS-1 link.

0 On the CPCI, DS-1 links and individual channels within
0 the links may be allocated to Bb or Bd as required. Bb
0 and Bd should be distributed as equally as possible over
0 all the links from the same CPCI.

0 (ii) For more information on the DPN, refer to the NTP
0 241-1001- series of documents.

0 2.0 Subscriber Module Rural (SMR)

0 Subscriber Module-100 Rural (SCM-100R) also referred to as Sub-
0 scriber Module Rural (SMR), is the first peripheral in the
0 SCM-100 family. It replaces the Control Concentrator Terminal
0 (CCT) of the DMS-1R subscriber carrier system and provides direct
0 digital interface between the DMS-1R Remote Concentrator Terminal
0 (RCT) and the DMS-100F.

0 The SMR provides all basic tones to a RCT, including dial tone,
0 busy tone, reorder tone, audible ringing (ringback) tone, high
0 tone, receiver offhook tone, and call waiting tone. Additionally,
0 the SMR supports all the currently available ringing schemes:
0 coded, frequency selective, and superimposed.

0 The Universal Tone Receiver (NT6X92BB) is not currently supported
0 in the SMR. Digitone Receivers (NT2X48AB) must be provisioned
0 for lines at the RCT.

0 The following list summarizes features supported for the SMR-RCT
0 subsystem.

- 0 - 256 RCT-serviced subscriber lines
- 0 - Coin functions: semi-post pay and post pay.
- 0 - Custom calling services: speed calling, call waiting, 3-way
0 calling, and call forwarding.
- 0 - Dial pulse, Digitone
- 0 - Dial Tone Speed Recording (DTSR)
- 0 - DMS-1R RCT integrated alarms
- 0 - Operational Measurements
- 0 - Operator Verification
- 0 - POTS
- 0 - Protection Switching- Software Feature Deleted-Replaced by a
0 Telco provided Hardware Device.
- 0 - Station Ringer Test

0

0
0 RELEASE 28.01
0 93 12 03

0 Most features supported by the LCM are supported by the SMR except
0 for the following main exceptions:

- 0 - Business Set
- 0 - Circuit Switched Digital Data Service (CSDDS)
- 0 - Four-Party ANI
- 0 - Integrated Business Network (IBN) Features
- 0 - PBX Line Features
- 0 - Random Make Busy
- 0 - Remote Register, SD Point
- 0 - Remote Meter (register) Pulsing
- 0 - Remote Message Register
- 0 - Sleeve Lead Control
- 0 - Sleeve Lead Control for Public Fire Reporting System
- 0 - Stop Hunt

0 2.1.3 PROVISIONING CONSIDERATIONS

0
0 The rating on the SMR module will be changed to A&M. Do not or-
0 der any new SMR modules. The replacement for the SMR/DMS-1R sys-
0 tem is the SMU (Subscriber Module for DMS-1 Urban)/DMS-1U system.
0 Refer to ECM 314 and associated Engineering Manual sections for
0 provisioning information on the SMU.

0 Provide a maximum of ten (10) NT6X50AA, DS-1 Interface CP, in
0 slots 5-1 of each SMR module. One (1) NT6X50AA provides inter-
0 face for up to two (2) T-1 span lines.

0 The minimum packfill required for existing offices at BCS 31 is
0 the NT6X02CC or NT6X02CQ.

0 Existing NT6X02CA packfills can be upgraded to the NT6X02CQ level
0 with the application of the NT6X02ZJ product change kit. The
0 NT6X02ZJ kit replaces the two (2) NT6X46AB CPs in slot 11 of each
0 module with two (2) NT6X46AC CPs. It also allows the provision-
0 ing of a second NT6X47AB CP.

0 Provide two (2) NT6X47AB, Master Processor Memory CP, in slot 09
0 of each NT6X02CC and NT6X02CQ module when upgrading to BCS-31.

0 SLC-96 Interface

0 The SMR supports up to six (6) DMS-1R RCT with each RCT servicing
0 up to 256 subscriber lines. The RCT is connected to the SMR via
0 one (1), maximum two (2) DS-1 lines.

0

0 RELEASE 28.01
0 93 12 03

0 LINE TEST

0 Line testing is provided for RCT subscriber loops. Tests may be
0 performed through the MAP or from remote test desks (e.g. MLT 1
0 or 2, LTC, LTD, (CALRS for Canadian offices), etc.).

0 Loop testing for SMR/RCT lines will interface via the host Metal-
0 lic Test Access (MTA). Up to ten RCT modules can share the same
0 metallic test pair provided they have the same software site and
0 frame designations.

0 Mechanized line testing refers to testing subscriber loops and
0 line cards using non-DMS equipment located at a remote site (e.g.
0 #14 Local Test Desk (LTD), #3 Local Test Cabinet (LTC), Mech-
0 anized Loop Testing (MLT), etc.). The remote test site works
0 with the DMS system to gain metallic access to the subscriber
0 loops. The remote site executes tests on the loop such as meas-
0 uring foreign AC and DC voltage, resistance, etc.

0 All remote loop testing devices will be interfaced to the DMS by
0 a MTM test trunk. A NT2X90AD test trunk will provide all func-
0 tions currently supported by previous vintages of the NT2X90 CP
0 and will support the Subscriber Carrier module loop testing re-
0 quirements.

0 An applique circuit must be provisioned to support line testing
0 results to the Mechanized Loop Testing system (MLT). The applique
0 will provide DC signals required to report channel test results
0 to the MLT system.

0 No other remote site loop test facility (e.g. #14 Local Test Desk
0 (LTD), #3 Local Test Cabinet (LTC), etc.) will require the
0 NT3J00BB applique.

0 The applique circuit pack (NT3J00BB) and card cage (NT3J00BA) in-
0 troduced with the Subscriber Carrier Module for the SLC-96 (SMS)
0 will be utilized for loop testing on the SMR. Offices containing
0 SMS and SMU peripherals may share NT3J00BB and NT3J00BA facili-
0 ties. A summary of the provisioning rules for the NT3J00BA & BB
0 equipment follows.

0 An applique circuit pack (NT3J00BB) contains two (2) circuits.
0 Each circuit will interface one NT2X90AD CP provisioned for line
0 testing to the RCT for loop testing. An applique CP is required
0 for any interface test multiple (NT2X90AD) which utilizes a Mech-
0 anized Loop Test facility (MLT).

0 RELEASE 28.01
0 93 12 03

0 The NT3J00BA card cage will house ten (10) NT3J00BB applique cp.

0 A Signal Distribution circuit, seven points, (NT2X57AA) is re-
0 quired for each NT3J00BB circuit provisioned to operate relays on
0 the applique cp.

0 MOUNTING The NT3J00BA applique shelf will be mounted in a stand-
0 ard MIS frame and is seven (7) inches high by twenty six (26)
0 inches wide. The NT3J00BB applique circuit is packaged on a dou-
0 ble wide circuit pack with two (2) circuits per pack. Cards
0 should be located in odd slots 03 through 21. An NT3J00BC power
0 supply is always provided in slot 01 of the shelf.

0 The NT3J00BA applique shelf should be fused at 1 1/3 amps with
0 power terminations at TB1-1 (-48V) and TB1-2 (GRD) using 22 AWG
0 wire.

0 PROTECTION SWITCHING (U.S. Applications Only)

0 In Central Offices(CO) where protection switching is a require-
0 ment, the Telco must provide an external protection switch. Re-
0 commended is the Alcatel (Lynch) Automatic Protection Switch
0 (B302MA09).

0 These Lynch units must be installed and used in accordance with
0 the Lynch instruction manual in order to comply with subpart J of
0 part 15 of FCC Rules for Class A computing devices. Refer to
0 Alcatel for further information on the Lynch Automatic Protection
0 Switch.

0 REPLACED PRODUCT/PACKAGE

0
0 The NT6X81BA circuit pack replaces the NT6X81AA circuit pack for
0 use on all existing SMR applications.

0 The rating on the SMR module will be changed to A&M. No new SMR
0 modules should be ordered. The recommended replacement for the
0 SMR/DMS-1R system is the SMU (Subscriber Module for DMS-1

0
0 RELEASE 28.01
0 93 12 03

0 Urban)/DMS-1U system. Refer to ECM 314 and associated Engineer-
0 ing Manual sections for provisioning information on the SMU.

0 When an office reaches BCS 33 or above the SMR needs to be up-
0 graded to have the new Message Protocol Tone Generator CP. Since
0 the SMR is going to A&Med this is a field upgrade only.

0 3.0 Universal Tone Receiver CP NT6X92BB (Domestic Version)

0 The domestic version of the UTR is the NT6X92BB. The international
0 version is the NT6X92AA. For North American (domestic) applications
0 in DMS host offices (equipped with DTC/LGC/LTC modules) the digitone
0 and MF functions of the UTR will be V.O.'ed in BCS-19. General avail-
0 ability will be in BCS-20.

0 In the U.S. and Canada the Change Management/Customer Service Dept.
0 will issue 88,000 orders for the retrofit of NT6X92BA to NT6X92BB in
0 existing offices containing the UTR. The System and Customer Engi-
0 neering Depts. will update office release records upon receipt of the
0 88,000 order.

0 Note that any U.S. office which contains NT6X92AA UTR circuit packs
0 will not be retrofit to the NT6X92BB.

0 3.1.3 PROVISIONING CONSIDERATIONS

0

0

0
0 RELEASE 28.01
0 93 12 03

- 0 1. For Canadian offices, UTR's may be provisioned in initials and
0 extensions with D dates of week 30/86 (i.e. RTS = wk 30/86) and
0 later. For U.S. offices refer to the URT0/URTS report for appli-
0 cation dates. Otherwise MF Receivers and/or Digitone Receivers
0 may be provisioned.
- 0 2. The UTR is provisionable in all (initial & extension) DMS-100F
0 offices. MF Receivers (NT2X48AA) and Digitone Receivers
0 (NT2X48AB) mounted on MTM's and TM's are still required to ser-
0 vice the following:
- 0 - "Old Peripherals"
 - 0 analog trunk groups equipped on TM/MTM shelves
 - 0 lines equipped on LME modules
 - 0 trunk groups equipped on DCM modules
 - 0 - MCCS
 - 0 - Subscriber Carrier Modules
 - 0 SMS
 - 0 SMR SMU
 - 0 - incoming and the incoming portion of 2 way service and test
 - 0 circuits (i.e. Remote Office Test Line and Blue Box Fraud Pre-
 - 0 ventions). MF and Digitone circuit pack requirements for these
 - 0 service and test circuits are to be based on Telco traffic re-
 - 0 quirements.
- 0 Provide NT2X48AA MF Receivers for the following;
- 0 - Incoming RONI trunk groups
 - 0 - Super Cama - 2 way Incoming DP outgoing DP trunk groups
- 0 Provide NT2X48AB Digitone Receivers for the following;
- 0 - any FX type trunks (e.g. DS1FX0,FX0GS,FX0LS,FXSGS,FXSLS)
- 0 Provisioning for the above functions can be based on existing
0 DTMF and MF Receiver tables.

0

0

0

0

0 RELEASE 28.01
0 93 12 03
0

- 0 3. In DMS host offices, the UTR is provisionable on the DTA/LGA/LTA
0 shelves. The first UTR card is to be assigned to slot 15 and the
0 second UTR is to be assigned to slot 16 of the DTA/LGA/LTA shelf.
0 Otherwise, provide filler face plate, NT0X50AA. A filler face
0 plate, NT0X50AA, must always be provided in slot 17.
- 0 4. Provide one Designation Label, P0676183, in each card slot posi-
0 tion equipped with a UTR card, NT6X92BA.
- 0 Provide one Designation Label P0686332 in each card slot position
0 equipped with a UTR card, NT6X92BB.
- 0 5. In the DTC/LGC/LTC modules, UTR cards are provisionable in pairs
0 (i.e. 0, 2 or 4).
- 0 6. In the RCC module of an RSC remote site, one pair of UTR cards is
0 always provided in the Remote Cluster Controller Common CP. A
0 second pair is provisionable, however, a power constraint must be
0 considered. Reference RSC provisioning information for RCC pro-
0 visioning considerations.
- 0 7. In the domestic market, the UTR card will be Plug In
0 Provisionable (PIP).
- 0 8. There is no traffic overflow from UTR's onto MF Receivers
0 (NT2X48AA) and Digitone Receivers (NT2X48AB).
- 0 9. On any extension where an improvement to the CPU real time capac-
0 ity is required, and UTR cards are being added to existing
0 DTC/LGC/LTC modules, surplus MF Receivers and Digitone Receivers
0 in MTM's and TM's may be removed and replaced with other types of
0 service circuits.
- 0 10. UTR cards located in a particular DTC/LGC/LTC module will service
0 all lines and trunks connected to that module. This includes all
0 lines in LCM's, RLCM's, and OPM's.
- 0 11. Lines and trunks on an RSC are serviced by UTR cards located in
0 the RCC module of the RSC. There is no traffic overflow to the
0 host office.

0 3.4 REAL TIME IMPACT

0 UTR's will slightly reduce the DTC/LGC/LTC and RSC peripheral
0 real time capacity. A real time work up should be performed to
0 ensure sufficient capacity.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 4.0 Subscriber Module for DMS-1 Urban (SMU)

0 The SMU is designed to replace the Central Control Terminal (CCT)
0 now required when the RCU is connected to a DMS-100 Family
0 switch. This will eliminate the need for duplicated line cir-
0 cuits and will reduce floor space required at the DMS-100 host
0 office.

0 The SMU is a partially redundant peripheral module that inter-
0 faces via 3 to 16 DS-30 links to the DMS-100 Network on the Con-
0 trol side (C-side). (Note - partially redundant means that all
0 circuit packs are duplicated with the exception of the DS-1 cir-
0 cuit packs).

0 The SMU interfaces to multiple RCU on the Peripheral side (P-
0 Side) which can accommodate up to 20 DS-1 ports.

0 Each RCU will have one (1) to eight (8) DS-1 links to the SMU.
0 All DS-1 links must terminate on the same SMU. The number of RCU
0 that may terminate on a SMU is dependant on the total traffic
0 presented to the SMU and the physical limitation of the 20 ports.

0 The minimum number of DS-1 required to interface a RCU is one
0 (1), however, two (2) DS-1 links are recommended to prevent an
0 outage during a single link failure. A fully equipped RCU sup-
0 ports over 500 Subscriber and/or Special Service lines.

0 FEATURES

0 The SMU will support the following features;

- 0 -POTS
- 0 -single party
- 0 -multi party
- 0 -two or four party Frequency Selective Ringing (FSR) with
- 0 -two party Automatic Number Identification (ANI)
- 0 -four party Operator Number Identification (ONI)
- 0 -two, four or eight party Coded Ringing with
- 0 -two party ANI
- 0 -two, four or eight party ONI
- 0 -two party Divided Ringing with ANI

0 4.1 HARDWARE PROVISIONING

0

0 4.1.1 HARDWARE USAGE RESTRICTIONS

0
0 The RCU may be located outside the central office up to a maximum
0 distance of 100 miles.

0
0 RELEASE 28.01
0 93 12 03

0 The SMU will only interface RCU's. The SMU does not offer inter-
0 face support to any other remote system (e.g. DMS-1R, SLC-96,
0 RSC, RLCM,OPM, etc.) nor host equipment (e.g. LCM).

0 The SMU does not support DS-1 protection switching as it will not
0 be offered in the RCU product.

0 The SMU requires office repeaters located in a separate Span
0 Rack.

0 The Universal Tone Receiver (NT6X92BB) is not currently supported
0 in the SMU. Digitone Receivers (NT2X48AB) must be provisioned
0 for lines at the RCU.

0
0 4.1.2 HARDWARE DEPENDENCIES

0
0 Not Applicable

0
0 4.1.3 PROVISIONING CONSIDERATIONS

0
0 SMU will appear to the DMS-100F as a peripheral module. Each mod-
0 ule consists of two shelves of equipment with duplicated control-
0 lers and power converters.

0 The SMU shelf pairs are housed in a standard DMS-100 single bay
0 frame. The Subscriber Module Equipment Frame (SME) (PEC NT6X01AA)
0 can contain up to two (2) modules. Each module has a PEC of
0 NT6X02EG.

0 The NT6X02EG Common Circuit Packfill should be ordered for all
0 new SMU applications.

0 Slots 08,09,12 of the NT6X02EB Common CP Fill are now
0 provisionable. Provide four (4) NT6X45BA, XPM Processor CP, in
0 slots 08 & 12 of each NT6X02EB Common CP Fill.

0 RELEASE 28.01
0 93 12 03
0

0

0 Provide one (1) NT6X02EH Product Change Kit and two (2) NT6X47AC
0 MP Memory Plus circuit packs for each NT6X02EB and NT6X02AW mod-
0 ule when upgrading to BCS-31. The NT6X02EH PC Kit upgrades the
0 NT6X02EB/AW module to the NT6X02EF module and makes slots 10, 11,
0 11R and 18 provisionable. Mount the NT6X47AC circuit packs in
0 slot 10 of the upper and lower shelves of the module.

0 Per customer request, the NT6X47AB packs removed from modules up-
0 graded via a PC Kit may be used to upgrade other relevant mod-
0 ules. Provide two (2) office supplied NT6X47AB CP for each
0 NT6X02EB/AW module to be upgraded to BCS-31. Do not order new
0 NT6X47AB packs for the upgrade of SMU modules.

0 Slots 22-23,25 of the NT6X02EB Common CP Fill are now
0 provisionable. Provide two (2) NT6X40AC, DS30 Network Interface
0 CP, in slot 22. Also, provide two(2) NT0X50AA, Filler Face
0 Plates, in slot 23 of each NT6X02EB Common CP Fill. Provision
0 two(2) NT2X70AE Power Converter CP in slot 25 of each module.

0 The slots mentioned above are being made provisionable in order
0 to ease future design development. The remaining circuit packs
0 in the NT6X02EB Common CP Fill are unchanged.

0 Provide two (2) NT6X69AC, CPP Msg Protocal CP, for each new SMU
0 module ordered. Mount circuit packs in slot 18 of the upper and
0 lower shelves of the module.

0 A cooling/inverter (NT3X90AC), which will reside at the bottom of
0 the frame, is a provisionable unit to provide forced air cooling.

0 The SMU DS-1 CP Product Engineering Code (PEC) is NT6X85AB. Each
0 NT6X85AB CP contains two (2) DS-1 circuits. A maximum of 10
0 NT6X85AB CP may be provisioned on each SMU.

0 When Custon Local Area Signaling Services(CLASS -U.S.) or Call
0 Management Services(CMS -Canada) are required, the NT6X78AA cir-
0 cuit pack must be provisioned in card slot 16 of the SMU. Refer
0 to ECM-332 for further information on CLASS.

0 Upon general availability, the NT6X78AB will replace the NT6X78AA
0 as the standard CLASS Modem Resource CP.

0 RELEASE 28.01
0 93 12 03

0 Upgrading Existing Peripheral Modules

0 Upgrading Existing NT6X02EA Modules

0 In order to enhance an existing NT6X02EA module with the Expanded
0 Signaling Processor Memory CP required for BCS-27, a product
0 change kit NT6X02ZJ was created for each existing SMU peripheral
0 module. The NT6X02ZJ PC Kit contains two (2) NT6X46AC, Enhanced
0 Signaling Processor CP, and new designation strips for the up-
0 graded modules.

0 The NT6X02ZJ Product Change Kit will upgrade the following pe-
0 ripheral module:

0
0
0
0
0
0
0

DESCRIPTION	FROM	TO
SMU Common CP	NT6X02EA	NT6X02AW

0 Slots 08,09,12,22-23,25 of the Upgraded SMU module are now
0 provisionable slots. These slots are being made provisionable to
0 ease future design development. Provide four(4) NT6X45BB, XPM
0 Processor CP, for slots 08&12 of each upgraded SMU module. New
0 circuit packs DO NOT need to be ordered for slots 09,22-23,25 of
0 the Upgraded SMU module.

0 Refer to availability reports to identify valid ordering dates.

0 The NT6X02AW Common CP Fill are PEC codes used for the field up-
0 grade of existing peripheral modules ONLY. The NT6X02AW Common
0 CP Fills CANNOT be ordered.

RELEASE 28.01
93 12 03

Upgrading Existing NT6X02EB/AW Modules

The NT6X02EH Product Change Kit was created to convert the NT6X02EB/AW module to the NT6X02EF module. This PC Kit makes certain slots provisionable, but does not contain any circuit packs.

The NT6X02EH Product Change Kit will upgrade the following peripheral modules:

DESCRIPTION	FROM	TO
SMU Common CP	NT6X02EB	NT6X02EF
SMU Common CP	NT6X02AW	NT6X02EF

Slots 10,11,11R and 18 of the Upgraded SMU module are now provisionable slots. These slots are being made provisionable to ease future design development.

Since this PC Kit does not contain any circuit packs, any required upgrade packs (provisionable in slots 10,11,11R or 18) must be ordered in conjunction with the PC Kit. For instance, if a NT6X02EB/AW SMU module is required to meet the BCS-31 extended MP memory requirement, then one NT6X02EH Product Change Kit and two NT6X47AC packs must be ordered to upgrade the module. If a NT6X02EB/AW SMU module is required to interface with ENET, then one NT6X02EH kit and two NT6X69AC packs must be ordered to upgrade the module.

The NT6X02EF Common CP Fill is the PEC used for the field upgrade of existing peripheral modules ONLY. The NT6X02EF Common CP Fill CANNOT be ordered.

0 RELEASE 28.01
0 93 12 03

0 ENET INTERFACE

0 SMU modules can interface ENET using either copper or fiber
0 speech links. Either case requires the application of the
0 NT6X69AC, CCP Msg Protocol & Tone CP. Existing NT6X02EB and
0 NT6X02AW modules can be field upgraded to a NT6X02EF module with
0 the application of the NT6X02EH Product Change Kit. This change
0 kit allows provisioning of the NT6X69AC CP in slot 18.

0 For the SMU to interface ENET using Fiber speech links, the fol-
0 lowing equipment is required:

0 NT6X40CA - DS-512 XPM Interface CP
0 NT6X40DA - DS-512 Link Paddle Board
0 NT6X02BU - Fiber Interface H/W Assembly

0 Provide two (2) NT6X40CA in slot 22 and two (2) NT6X40DA in slot
0 22R of each SMU module. Also, provide one (1) NT6X02BU per SMU.

0 Upon general availability, the NT6X40FA will replace the NT6X40CA
0 as the standard DS512 XPM Interface and the NT6X40GA will replace
0 the NT6X40DA as the standard DS512 Link Paddle Board.

0 MAINTENANCE

0 Loop testing is provided for RCU subscriber lines. Tests may be
0 performed through the MAP or from remote test desks (e.g. MLT 1
0 or 2, LTC, LTD, (CALRS for Canadian offices), etc.).

0 When a SMU is provisioned in a DMS-100F office, the following
0 maintenance trunk circuit pack derivations have been updated to
0 include the Subscriber Carrier Modules. Refer to ECM276 for Me-
0 tallic Test Access (MTA) provisioning criteria.

0 NT2X10AB - Line Test Unit (ODD) (LTU)
0 NT2X11AA - Line Test Unit (EVEN)

0 NT2X46AB - METALLIC TEST ACCESS (MTA)
0 NT3X09BA - 8 X 8 METALLIC TEST ACCESS

0 LINE TEST

0 Mechanized line testing refers to testing subscriber loops and
0 line cards using non-DMS equipment located at a remote site (e.g.
0 #14 Local Test Desk (LTD), #3 Local Test Cabinet (LTC), Mech-
0 anized Loop Testing (MLT), etc.). The remote test site works
0 with the DMS system to gain metallic access to the subscriber
0 loops. The remote site executes tests on the loop such as meas-
0 uring foreign AC and DC voltage, resistance, etc.

0 All remote loop testing devices will be interfaced to the DMS by
0 a modified test trunk. A NT2X90AD test multiple will provide all
0 functions currently supported by previous vintages of the NT2X90
0 CP and will support the Subscriber Carrier module loop testing
0 requirements.

0 An applique circuit must be provisioned to support line testing
0 results to the Mechanized Loop Testing system (MLT). The applique
0 will provide DC signals required to report channel test results
0 to the MLT system.

0 No other remote site loop test facility (e.g. #14 Local Test Desk
0 (LTD), #3 Local Test Cabinet (LTC), etc.) will require the
0 NT3J00BB applique.

0 The applique circuit pack (NT3J00BB) and card cage (NT3J00BA) in-
0 troduced with the Subscriber Carrier Module for the SLC-96 will
0 be utilized for loop testing on the SMU. Offices containing SMS
0 and SMU peripherals may share NT3J00BB and NT3J00BA facilities.
0 A summary of the provisioning rules for the NT3J00BA & BB equip-
0 ment follows.

0 An applique circuit pack (NT3J00BB) contains two (2) circuits.
0 Each circuit will interface one NT2X90AD cp provisioned for line
0 testing to the RCU for loop testing. An applique CP is required
0 for any interface test multiple (NT2X90AD) which utilizes a Mech-
0 anized Loop Test facility (MLT).

0 The NT3J00BA card cage will house ten (10) NT3J00BB applique cp.

0 A Signal Distribution circuit, seven points, (NT2X57AA) is re-
0 quired for each NT3J00BB circuit provisioned to operate relays on
0 the applique cp.

0 RELEASE 28.01
0 93 12 03

0 MOUNTING

0 The NT3J00BA applique shelf will be mounted in a standard MIS
0 frame and is seven (7) inches high by twenty six (26) inches
0 wide. The NT3J00BB applique circuit is packaged on a double wide
0 circuit pack with two (2) circuits per pack. Cards should be lo-
0 cated in odd slots 03 through 21. An NT3J00BC power supply is
0 always provided in slot 01 of the shelf.

0 The NT3J00BA applique shelf should be fused at 1 1/3 amps with
0 power terminations at TB1-1 (-48V) and TB1-2 (GRD) using 22 AWG
0 wire.

0
0 REPLACED PRODUCT/PACKAGE

0
0 The NT6X02EG replaces the NT6X02EB Common Circuit Packfill for
0 use on all new SMU applications.

0 The NT6X69AC replaces the NT6X69AB Circuit Pack for use on all
0 SMU applications.

0 Upon general availability, the NT6X40FA will replace the NT6X40CA
0 as the standard DS512 XPM Interface and the NT6X40GA will replace
0 the NT6X40DA as the standard DS512 Link Paddle Board.

0 Upon general availability, the NT6X78AB will replace the NT6X78AA
0 as the standard CLASS Modem Resource CP.

0 4.1.5 TRAFFIC TABLES

0
0 The SMU is presently capable of supporting 20 RCU DS-1 ports
0 (each RCU may have up to eight (8) DS-1 links). The total number
0 of DS-1 ports from the RCUs must be less than or equal to 20. All
0 DS-1 links from a RCU must terminate on the same SMU.

0 The SMU will be connected to the Network Module of the DMS-100F
0 via three (3) to 16 provisionable DS-30 ports which are dupli-
0 cated to provide connections to each plane of the network. The
0 SMU should be configured as non-blocking, that is configure DS-30
0 ports per a channel in/channel out ratio to the DS-1 channels
0 provisioned to the RCUs.

0 SMU CAPACITY

0 The SMU should be configured as non-blocking. That is, the num-
0 ber of DS30 channels to the Network should be equal to the number
0 of DS-1 channels to the RCUs.

0 The following table represents the CCS capacity of the SMU per
0 DS30 port to the Network.

		Capacity of SMU (CCS) at 4% TML						
Network ports	3	4	5	6	7	8	9

0 4.4 REAL TIME IMPACT

0 The Master Processor (MP) will support 2.38 Call Attempts (CA)
0 per second and the Signal Processor (SP) will support 2.20 CA per
0 second. When you achieve 2.8 CA per second the processors are
0 operating above the engineerable capacity level and using buffer
0 space. This buffer space is non-engineerable and provides
0 room for peakedness.

0 CALCULATION
0 -----

0 $(CPOCC/100) \times 1000 = \text{ms per second of call processing available}$

0 $\text{CA per second} = (\text{ms per sec of call processing}) / \text{ms per CA.}$

0 CPOCC for both the MP and the SP are known factors as is the ms
0 per CA. Reference SEB 88-01-001 "BCS 24 New Peripheral Processor
0 Occupancy and per Call Timing Tables", January 5, 1988.

0 RESULTS
0 -----

0 MASTER PROCESSOR (MP)

SIGNAL PROCESSOR (SP)

0 CPOCC = 67%

CPOCC = 41%

0 ms PER CALL ATTEMPT

ms PER CALL ATTEMPT

0 ORIG. TERM.

ORIG. TERM.

0 -----

0 189 92

107 79

0 TOTAL ms/CA = 281

TOTAL ms/CA = 186

0 $(67/100) \times 1000 = 670$

$(41/100) \times 1000 = 410$

0 $670/281 = 2.38 \text{ CA per sec}$

$410/186 = 2.20 \text{ CA per sec}$

0 5.0 DTC/LGC/LTC Modules - DETAIL/BUILDING BLOCK ENGINEERING

0 The current packfills for the DTC/LGC/LTC peripheral controller
0 modules replace the existing NT6X02IA,LA,MA packfills. The cur-
0 rent packfills for the DTC/LGC/LTC modules are the
0 NT6X02IC,LC,MC. These packfills consist of newly-designed cir-
0 cuit packs having a lower power consumption than existing equiv-
0 alent packs. The current packfills also have increased master
0 processor memory from 2Meg to 4Meg.

0 Following are the peripheral packfills to be ordered for new pe-
0 ripheral modules:

DESCRIPTION	NEW-ORDER PACKFILL PEC	REPLACES PEC
DTC Common CP	NT6X02IC	NT6X02IA
LGC Common CP	NT6X02LC	NT6X02LA
LTC Common CP	NT6X02MC	NT6X02MA
NOTE: The NT6X02IC,LC,MC are the standard DTC/LGC/LTC offerings. All initials and extensions ordering new XPM modules will receive the NT6X02IC,LC,MC packfills.

0 Host - Line Group Controller Equipment
0 Chapter 3

Page 3-117

0 RELEASE 28.01
0 93 12 03

0 In ECM350, it is stated that a maximum of 62 software nodes can
0 be datafilled on an LGC/LTC P-side in BCS23 and onwards. The term
0 "software nodes" is defined fully in the ECM.

0 However, there is an additional restriction due to the limited
0 number of direct messaging channels to the LGC/LTC P-side. A
0 maximum of thirty (30) channels is available for this purpose.
0 Each of the following nodes consumes two (2) direct messaging
0 channels:

- 0 - LCM
- 0 - RCC
- 0 - RLCM/OPM
- 0 - Each RMM shelf on the RLCM/OPMs
- 0 - Each ESA Processor (NT6X75AA CP) on the RLCM/OPMs

0 The total number of nodes provisioned on the LGC/LTC P-side can-
0 not exceed the maximum (30) available.

0 Nodes that do NOT require a direct messaging channel comprise
0 those interfaced to the LGC/LTC via a Remote Switching Center
0 (RSC), ie. any LCMs, RLCM/OPMs, RMM shelves, and ESA Processors
0 off the P-side of the RCC. The TOTAL of these nodes plus those
0 above which require direct messaging channels cannot exceed 62.
0 Refer to Figure A on the following page.

0 5.1.6 PROVISIONING CONSIDERATIONS (BUILDING BLOCK ENGINEERING)

0

0 LGE/LTE/DTE CUSTOMER QUESTIONS

0

0 Assumptions

- 0 1. Capacity figures in this document are based on REAL:QUICK.
- 0 2. 50/50 Orig/Term split provides a worst case scenario.
- 0 3. 4 secondary members per MADN group.
- 0 4. 40 percent Custom Calling Feature assignment to POTS lines.
- 0 5. 100 percent Custom Calling Feature assignment to MDC lines.
- 0 6. 100 percent UTR provisioning.
- 0 7. 100 percent secondary member ringing for MADN groups.
- 0 8. 50 percent secondary member answer.
- 0 9. Trunks are data filled requiring A and B Scanning,
0 CSM and DS-1 maintenance overheads.

0 Considerations

- 0 1. Utilization higher than 80 percent requires a detailed
0 capacity study using PRTCALC.
- 0 2. When MADN penetration is higher than 40 percent, then
0 a detailed study is required using PRTCALC.
- 0 3. Deviation from recommended NTI assignment rules will
0 dictate a detailed capacity study.
- 0 4. Special applications of the LGC will require detailed
0 capacity study using PRTCALC.
- 0 5. Call timings used reflect average work times for the
0 lines types.

0 6.0 International Frame LGE/DTE/LTE

0 The first application for the NT6X01AC International Frame LGE/DTE/LTE
0 Fiber ISDN is the Australia DMS-100 Intelligent Network.

0 The NT6X01AC International Common Peripheral Controller Equipment
0 Frame was developed for the DMS-100 Intelligent Network product for
0 the international market. The NT6X01AC design is based on the domes-
0 tic NT6X01AB ISDN peripheral controller, adapted for applications out-
0 side North America ("International"). It supports PCM30 links, ISDN
0 services, and Common Channel Signaling 7 (CCS7) features on two inde-
0 pendent peripheral modules.

0 6.1 HARDWARE PROVISIONING

0

0 6.1.1 HARDWARE USAGE RESTRICTIONS

0

0 NT6X01AC International Peripheral Controller Equipment Frame

0 The NT6X01AC International Peripheral Controller Equipment frame
0 supports two peripheral module types: PCM-30 LGC and DTC.

0 PCM-30 LGC - Supports ISDN, Centrex, EBS, IBN and POTS services
0 on standard Line Concentrating Module types

0 - Has PCM-30 P-side links for PRLCM and International
0 Remote Switching Center interface

0 - Operation as a non-ISDN peripheral is not yet imple-
0 mented in software, meaning that the NTB01AA ISDN
0 Pre-Preprocessor CP is required even if no ISDN fea-
0 tures are used

0 - Supports AMI interface to the NT1. 2B1Q is not sup-
0 ported for this interface

0 PCM-30 DTC - Supports CCS7 and R1 signaling in International ap-
0 plications, using PCM-30 links.

0 - ISDN services like Primary Rate Interface are not
0 supported

0 Modules of different types may be mixed on the frame if required.

0 NTB02AA D-Channel Handler CP are not required for PCM-30 DTC ap-
0 plications, nor where the PCM-30 LGC supports only non-ISDN LCMs.

0 NTB01AA ISDN Pre-Processor CP are always required on PCM-30 LGC
0 (until such time as software supports purely non-ISDN operation).
0 This CP is not required on PCM-30 DTC.

0 6.1.3 PROVISIONING CONSIDERATIONS

0
0 NT6X01AC International Frame LGE/DTE/LTE ISDN

0 Common Circuit Packfill:

0 NT6X01AC is a general purpose Common Peripheral Controller Equip-
0 ment Frame for applications outside North America ("Internat-
0 tional"). It houses two dual shelf peripheral modules which
0 support PCM30 links, ISDN services, and Common Channel Signaling
0 7 (CCS7) features. Each peripheral module is housed on two adja-
0 cent shelves (ie. a pair of shelves on positions 65 and 51 and a
0 pair of shelves on positions 32 and 18).

0 Each of the two modules in the frame may be configured as:

- 0 - LGCO Line Group Controller Offshore Non-ISDN,
- 0 - LGC0I Line Group Controller Offshore ISDN,
- 0 - DTCO Digital Trunk Controller Offshore Non-ISDN,
- 0 - DTC0I Digital Trunk Controller Offshore ISDN, or
- 0 - TMS (TOPS Message Switch) for
 - 0 - TPC (TOPS Position Controller) interface,
 - 0 - Data base access, and
 - 0 - Inter DCH (D-Channel Handler) for
- 0 ORDB (Operator Reference Database).

0 Cooling Inverter Unit:

0 Provide for each frame,

- 0 - one (1) NT3X90AC Cooling Inverter Unit.

0 Isolated System Grounding:

0 When extending existing offices not equipped with Isolated System
0 Grounding (ISG), provide:

- 0 - one (1) NT0X0009 Logic Return Cable Assembly.

0

0

0 RELEASE 28.01
0 93 12 03

0 Common Circuit Packfill:

0 Provide per customer requirements:

0 - maximum two (2) NT6X02UB LGC/DTC Common CPs (International).

0 NT6X02UB replaces NT6X02UA.

0 Filler Faceplates for Unequipped Modules:

0 When shelves 18-32 or 51-65 are not equipped with any circuit
0 packs, provide for each module:

0 - one (1) NT6X02AB CPC Filler Faceplates.

0 Filler Faceplates for Unequipped CP Slots:

0 For each unequipped circuit pack position on the module, provide:

0 - one (1) NT0X50AA filler faceplate.

0 ISDN Applications:

0 When ISDN BRA functions are required (ISDN functions on sub-
0 scriber lines) for each equipped LGC module, provide:

0 - up to nine (9) NTB02AA D Channel Handler CPs.

0 In BCS-28 or later, provide for use as a hot spare:

0 - one (1) additional NTB02AA D Channel Handler CP.

0 Note that NTB01AA/AB and NTB02AA ISDN CPs may not be provi-
0 sioned on a DTC which is provisioned with NT6X70AAs to handle
0 CCIS/CCS7 voice trunking.

0 DCH CP are not required on a PCM-30 DTC module nor where a PCM-30
0 LGC module supports only non-ISDN LCMs.

0 For TMS (TOPS Message Switch) applications, provide:

0 - four (4) NTB02AA D Channel Handler CPs.

0 Each NTB02AA supports up to 124 BRI D-Channels. The spare DCH
0 CP should not be counted when determining the number of NTB02AA
0 required to support D-channel traffic.

0 RELEASE 28.01
0 93 12 03

0 PCM-30 Interface CPs:

0 Provide for each equipped LGC or DTC module, as per customer re-
0 quirements:

- 0 - maximum eight (8) NT6X27AC/BB PCM-30 Interface CPs.

0 For each TMS module,

- 0 - For TPC (TOPS Position Controller) interface,
0 - for up to 64 operators, provide:
0 - two (2) NT6X27AC/BB PCM-30 Interface CPs
0 in CP slots 5 of both shelves, and
0 - for more than 64 operators and up to 96 operators,
0 provide an additional:
0 - one (1) NT6X27AC/BB PCM-30 Interface CP
0 in CP slot 4 of shelf 0,

0 - For data base access, provide:
0 - two (2) NT6X27AC/BB PCM-30 Interface CPs
0 in CP slot 4 of shelf 1 and
0 in CP slot 3 of shelf 0, and

0 - For inter DCH ORDB, provide:
0 - one (1) NT6X27AC/BB PCM-30 Interface CP
0 in CP slot 3 of shelf 1.

0 Otherwise provide for each unequipped CP slot:

- 0 - one (1) NT0X50AA Filler Faceplate.
- 0
- 0
- 0
- 0
- 0
- 0
- 0

RELEASE 28.01
93 12 03

Provide one (1) NT6X27AC/BB for every two PCM 30 ports required.

Peripheral port/pack location relationship is as follows:

CP POS	5	4	3	2
SHELF POS X+14	PORTS 2, 3	PORTS 6, 7	PORTS 10, 11	PORTS 14, 15
SHELF POS X	PORTS 0, 1	PORTS 4, 5	PORTS 8, 9	PORTS 12, 13

Where:

For the lower module in the frame
shelf position X=18, X+14=32

For the upper module in the frame
shelf position X=51, X+14=65

Assign NT6X27AC/BB to module starting at port 0 and continue in sequential order to port 15.

Each NTB02AA already assigned to CP pos 2 to 5 physically makes the two PCM 30 ports shown above unavailable for assignment to PCM 30.

LCM Interface CPs:

For PCM-30 LGC applications, to interface links from LCMI and/or LCM, provide:

- four (4) NT6X48AA DS30A LCM Interface CPs.

The NT6X48AA CP are assigned in pairs for reliability. One member of the pair interfaces the same DS30A ports as the other member. Each member of the pair occupies the same CP position, with one CP assigned to LGAI/LTAI 0 (lower shelf of the module) and the other assigned to LGAI/LTAI 1 (upper shelf of the module).

0
0
0

RELEASE 28.01
93 12 03

0 The two pairs of NT6X48AA provide interfaces for up to twenty
0 (20) DS30A ports (links) from LCMEs, LCMIs, and/or LCMs.

0 The following is a listing of DS30A ports per DS30A LCM Interface
0 CP, NT6X48AA location:

0
0

PORT	7	5
PORT	10	8
PORT	11	9
PORT	14	12
PORT	15	13
PORT	18	16
PORT	19	17

0 The ports for DS30A must be selected from the those ports that
0 remain after assignment of port circuits.

0 Assign ports to DS30A in the following sequence: 19, 17, 18, 16,
0 15, 13, 14, 12, 11, 9, 10, 8, 7, 5, 6, 4, 3, 1, 2 and 0 (if un-
0 used by DCH or DS-1). In an extension job, when adding new DCH
0 ports, the DS30A ports may have to be reconfigured in accordance
0 with this rule.

0 RELEASE 28.01
0 93 12 03

0 Two Processor XPM (MP/SP) or XPM Plus (UP):

0 For offices with the XPM (MP/SP) feature, provide for each
0 equipped LGC or DTC module:

- 0 - four (4) NT6X45BA LGC/DTC Processor CPs,
- 0 - two (2) NT6X47AC 4MB MP Memory CPs,
- 0 - two (2) NT0X50AA Filler Face Plates in slot 10, and
- 0 - two (2) NT6X46BA/BB Signal Processor Memory Plus CPs.

0 Also provide NTB01AAs per 2) below.

0 Alternatively, for offices with the XPM Plus (UP) feature, pro-
0 vide for each equipped LGC or DTC module:

- 0 - two (2) NTMX77AA XPM Plus Processor CPs,
- 0 - two (2) NTMX71AA XPM Plus Paddleboards,
- 0 - one (1) NT6X01WE Wiring List XPM Plus, and
- 0 - eight (8) NT0X50AA Filler Face Plates
- 0 in slots 8, 9, 10, and 11.

0 Also provide NTB01ABs per 2) below.

0 In offices with the XPM (MP/SP) feature, provide:

- 0 - for each equipped LGC module:
 - 0 - two (2) NTB01AA ISDN Sig. Preproc. CPs.
 - 0 (Note that NTB01AAs must be provisioned for LGC
 - 0 even when ISDN services are not required).
- 0 - for each equipped DTC module:
 - 0 - when ISDN services are required,
 - 0 - two (2) NTB01AA ISDN Sig. Preproc. CPs, or
 - 0 - when ISDN services are not required,
 - 0 - two (2) NT0X50AA Filler Face Plates.

0 Note that NTB01AA ISDN CPs may not be provisioned on a DTC which
0 is provisioned with NT6X70AAs to handle CCIS/CCS7 voice trunking.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 In offices with the XPM Plus (UP) feature, provide:

- 0 - for each equipped LGC module:
 - 0 - two (2) NTB01AB ISDN Sig. Preproc. CPs.
 - 0 (Note that NTB01ABs must be provisioned for LGC
 - 0 even when ISDN services are not required).
- 0 - for each equipped DTC module:
 - 0 - when ISDN services are required,
 - 0 - two (2) NTB01AB ISDN Sig. Preproc. CPs, or
 - 0 - when ISDN services are not required,
 - 0 - two (2) NT0X50AA Filler Face Plates.

0 Note that NTB01AB ISDN CPs may not be provisioned on a DTC which
0 is provisioned with NT6X70AAs to handle CCIS/CCS7 voice trunking.

0 For existing modules being converted from XPM to XPM Plus pro-
0 vide:

- 0 - for each equipped LGC module:
 - 0 - one (1) NT6X02XB XPM Plus Change Kit and
 - 0 NT0X50AA Filler faceplates per EMS
 - 0 EMA2-99-XPM-9 for NT6X02XB.
- 0 - for each equipped DTC module:
 - 0 - In a Non-ISDN environment,
 - 0 - one (1) NT6X02XA XPM Plus Change Kit and
 - 0 NT0X50AA Filler faceplates per EMS
 - 0 EMA2-99-XPM-6 for NT6X02XA, or
 - 0 - In an ISDN environment,
 - 0 - one (1) NT6X02XB XPM Plus Change Kit and
 - 0 NT0X50AA Filler faceplates per EMS
 - 0 EMA2-99-XPM-9 for NT6X02XB.

0 (NT6X02XB has the same parts as NT6X02XA plus two (2) NTB01ABs)

0 Wiring Option for Non-ISDN:

0 Provide one (1) NT6X01WD Wiring Option when ISDN features are not
0 required on the frame. The option adds a wire strap to the back-
0 panel NT6X0103 Slot XX-12 between pins 7A and 8A to allow for
0 non-ISDN operation.

0 RELEASE 28.01
0 93 12 03
0

0 Continuity Tone Detector CPs:

0 When this module is handling CCIS/CCS7 voice trunking, provision
0 for each PCM-30 DTC module:

0 - two (2) NT6X70AA Continuity Tone Detector CPs.

0 Note that NT6X70AAs for CCIS/CCS7 voice trunking, may not be pro-
0 visioned on a DTC which is provisioned with NTB01AA/AB ISDN CPs.

0 This CP supports a Continuity Test (COT), and is recommended
0 whenever analog facilities are employed in part or all of the
0 transmission path.

0 When the facility is end-to-end digital, this CP is not required
0 since digital facilities employ other means of fault detection.

0 An LGC may not be provisioned with NT6X70AA CPs.

0 Calling Number Display Feature CPs:

0 When the module is handling CMS Calling Number Display feature,
0 provide for each PCM-30 LGC module:

0 - two (2) NT6X78AA/AB CLASS Modem Resource CPs.

0 Universal Time Switch CPs:

0 Provide for each PCM-30 LGC/DTC module:

0 - two (2) NT6X44EA Universal Time Switch (UK) CPs.

0 Universal Tone Receiver CPs:

0 When analog (POTS) lines are to be supported, or when non-ISDN
0 trunks (A/B bit signalling) are interfaced to a PCM-30 DTC mod-
0 ule, provide the following Universal Tone Receiver (UTR) CP for
0 each PCM-30 LGC module:

0 - maximum two (2) NT6X92CA UTR CPs.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 Message Protocol and Downloadable Tone CPs:

0 Provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT6X69LB Msg Protcl & Downldbl Tone CPs.

0 The NT6X69LB is recommended for use in all applications in place
0 of the NT6X69LA. However, depending on availability, the
0 NT6X69LA may be used when fiber network interface is not re-
0 quired.

0 Network Interface CPs:

0 When DS30 copper network interface is required in a non-ENET of-
0 fice, provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT6X40AC packs DS30 Network Interface CPs.

0 Otherwise, when fiber network interface is required in an ENET
0 office, provide for each PCM-30 LGC/DTC module:

- 0 - one (1) NT6X02BU Fiber I/F H/W Assembly,
0 - two (2) NT6X40FA DS512 Network Interface CPs,
0 - two (2) NT6X40GA DS512 Paddle Boards, and
0 - two (2) P0736273 Optical Fiber Danger Labels.

0 Depending on availability, NT6X40CA and NT6X40DA functional pair
0 may be used in place of the preferred NT6X40FA and NT6X40GA func-
0 tional pair. The paddleboards and circuit packs cannot be mixed
0 because they do not function in mismatched pairs.

0 Also both pairs in a module must be NT6X40FA and NT6X40GA or both
0 NT6X40CA and NT6X40DA. In other words if one of the pairs in the
0 module is NT6X40FA and NT6X40GA, the other pair in the module may
0 not be NT6X40CA and NT6X40DA.

0 Power Conversion CPs:

0 Provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT2X70AE Power Conv +/-5V & 12V CPs.

0 Designation Labels for CPs:

0 Provide the appropriate designation label for each CP provided.

0
0 RELEASE 28.01
0 93 12 03

0 PCM-30 Signaling CPs:

0 For each equipped LGC/DTC which supports PCM30 links (NT6X27
0 PCM-30 Interface CPs), or for each equipped LGC module which sup-
0 ports links to an LCM (NT6X48 DS30A LCM Interface CPs provided),
0 and the LCM is equipped with a PCM30 line drawer such as the
0 NT6X05CA, provide:

0 - two (2) NT6X28AA PCM-30 Signaling CPs.

0 CPC Coax Panel:

0 When PCM30 feature is required, provide for each PCM-30 LGC/DTC
0 module:

0 - one (1) NT6X01ZA CPC Coax Panel.

0 When this feature is to be field installed, then the NT6X01ZA CPC
0 Coax Panel will require the following supporting documents:
0 PC6X01ZB and SRJ6X01AC.

0 7.0 International Frame LGE/DTE Non-ISDN

0 NT6X01BA is a general purpose Common Peripheral Controller Equip-
0 ment Frame for international applications which houses two inde-
0 pendent dual shelf modules.

0 Each module may be provisioned as a

- 0 - PCM30 Line Group Controllers (PLGC), or
- 0 - PCM30 Digital Trunk Controllers (PDTC),

0 Or, with DMS100I software in the office, each module may be pro-
0 visioned as a

- 0 - International Line Group Controllers (ILGC), or
- 0 - International Digital Trunk Controllers (IDTC).

0 An ILGC/PLGC may be provisioned to support

- 0 - copper interface (DS-30) or
- 0 fiber interface (DS-512) to the network,
- 0 - PCM-30 links to RLCM, RSC or OPM,
- 0 - DS-30A interface to LCM.

0 A IDTC/PDTC may be provisioned to support

- 0 - copper interface (DS-30) or
- 0 fiber interface (DS-512) to the network,
- 0 - PCM-30 links to other offices,
- 0 - Common Channel Signaling 7 (CCS7).

0 7.1.3 PROVISIONING CONSIDERATIONS

0
0 NT6X01BA International Frame LGE/DTE Non-ISDN:

0 Common Circuit Packfill:

0 A maximum of two (2) PLGC or PDTC, or, in offices with DMS100I
0 software, ILGC or IDTC modules may be equipped per frame.

0 For new applications, provide for each equipped module:

- 0 - one (1) NT6X02GM International LGC/DTC Common CP,
0 which includes
- 0 - two (2) NT6X44EA Time Switch CPs
0 - two (2) NT2X70AE Power Converter +-5V +-12Vs CPs.

0 Otherwise provide for each unequipped CP slot:

- 0 - one (1) NT0X50AA Filler Faceplate.

0 PCM-30 COAXIAL INTERFACE:

0 When 75 ohm coaxial PCM 30 interface cabling is required, a Patch
0 Panel, grounded to the frame, must be provided as follows:

0 Coaxial Interface BNC Connectors, Grounded on Receive:

0 When coaxial interface cabling via 75 Ohm BNC connectors grounded
0 on receive (Brazil, Curacao) is required by the customer, provide
0 for each frame:

- 0 - two (2) NT6X01ZA/ZD Coaxial Panels.

0 NT6X01ZA may not be provisioned when NTCX50AA is provisioned.

0

0

0

0 RELEASE 28.01
0 93 12 03
0

0 Coaxial Interface BT43 Connectors, Grounded on Transmit:

0 When coaxial interface cabling via 75 Ohm BT43 connectors
0 grounded on transmit is required by the customer, and four (4) or
0 more NT6X27s per module are provisioned, provide for each frame:

- 0 - to connect the first four (4) NT6X27s provisioned
0 in CP slots 04 and 03:
 - 0 - two (2) NT6X01ZE Coaxial Panels,
- 0 - to connect the 5th and 6th NT6X27s, when provisioned,
0 in CP slots 02:
 - 0 - two (2) NT6X0126 Coax Cable Kits, and
 - 0 - two (2) NT6X01WH Wiring Lists,
- 0 - to connect the 7th and 8th NT6X27s, when provisioned,
0 in CP slots 01:
 - 0 - two (2) NT6X0127 Coax Cable Kits, and
 - 0 - two (2) NT6X01WJ Wiring Lists.

0 Coaxial Interface BNC Connectors, Grounded on Transmit:

0 When coaxial interface cabling via 75 Ohm BNC connectors grounded
0 on transmit (China, NETAS), is required by the customer provide
0 for each frame:

- 0 - two (2) NT6X01ZF Coaxial Panels.

0 For addition and maintenance in frames equipped with NT6X27AAs
0 or NT6X27ABs, provide for each equipped module:

- 0 - minimum four (4) and
0 maximum eight (8) NT6X27AB PCM 30 Interface CPs.

0 Otherwise provide for each unequipped CP slot:

- 0 - one (1) NT0X50AA Filler Faceplate.

0 Do not provision NT6X27BB in a frame equipped with NT6X27AAs or
0 NT6X27ABs.

0 When the enhancements of the NT6X27BB are required in a frame
0 equipped with NT6X27AAs or NT6X27ABs, each of the NT6X27AA or
0 NT6X27AB in the frame must be replaced with a NT6X27BB, and, when
0 PCM-30 coaxial interface is required, the frame must be equipped
0 with a grounded NT6X01 Coaxial Panel.

0 RELEASE 28.01
0 93 12 03
0

0 For additions and maintenance in frames equipped with NT6X27ACs
0 use NT6X27BBs, and, when PCM-30 coaxial interface is required,
0 the frame must be equipped with a grounded NT6X01 Coaxial Patch
0 Panel.

0 PCM-30 Signaling Interface:

0 For each equipped LGC/DTC which supports PCM-30 links (NT6X27
0 PCM-30 Interface CPs provided), or for each equipped LGC module
0 which supports links to an LCM (NT6X48 DS30A LCM Interface CPs
0 provided), and the LCM is equipped with a PCM-30 line drawer such
0 as the NT6X05CA, provide:

- 0 - two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 PCM-30 Coaxial Interface Panel:

0 For frames equipped with NT6X27AC/BB PCM-30 Interface CPs, a 75
0 ohm coaxial PCM-30 Interface Patch Panel, grounded to the frame,
0 must be provided as follows:

0 When coaxial interface cabling via 75 Ohm BNC connectors grounded
0 on receive (Brazil, Curacao) is required by the customer, provide
0 for each frame:

- 0 - two (2) NT6X01ZA/ZD Coaxial Panels.

0 Coaxial interface cabling with connectors grounded on transmit
0 will become available in the third quarter of 1993.

0 DS-30A Interface:

0 For each ILGC or PLGC module equipped with NT6X02GM Common CP,
0 provide as per customer requirements:

- 0 - maximum four (4) NT6X48AA DS-30A LCM Interface CPs.

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 Universal Tone Receiver:

0 For each ILGC, IDTC, PLGC, or PDTC module equipped with NT6X02GM
0 Common CP, provide as per customer requirements:

- 0 - zero (0),
0 two (2) or
0 four (4) NT6X92CA Universal Tone Receiver (UTR) CPs.

0 One pair of Universal Tone Receiver CP's contains the equivalent
0 of thirty receivers.

0 Continuity Tone Detector:

0 For Mercury 300 offices, provide for each equipped module, as per
0 customer requirements:

- 0 - two (2) NT6X70AA Continuity Tone Detector CPs, and
0 - one (1) NT6X01WA Continuity Tone Detector Wiring.

0 XPM (MP/SP/FP) or XPM Plus (UP):

0 For each ILGC, IDTC, PLGC, or PDTC module equipped with NT6X02GM
0 Common CP, provide:

- 0 - six (6) NT6X45BA ILGC/IDTC Processor CPs,
0 - two (2) NT6X47AC 4MB MP Memory CPs,
0 - four (4) NT6X46BB Signal Processor Memory Plus CPs.

0 Alternatively, for offices with the XPM Plus (UP) feature,
0 provide for each LGC or DTC module equipped with NT6X02GM
0 Common CP:

- 0 - two (2) NTMX77AA XPM Plus Processor CPs,
0 - two (2) NTMX71AA XPM Plus Paddleboards, and
0 - four (4) NT7X80AA Bus Shorter CPs.

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 2) To convert one PDTC module equipped for XPM to XPM+ provide:

- 0 - one (1) NT6X01XE XPM+ 3P Upgrade Kit.

0 The NT6X01XE kit includes:

- 0 - two (2) NTMX77AA XPM Plus Processor CPs,
0 - two (2) NTMX71AA XPM Plus Paddleboards,
0 - four (4) NT7X80AA Bus Shorter CPs, and
0 - backplane wiring modifications for XPM+.

0 The XPM CPs NT6X45BA, NT6X47AC, and NT6X46BB must be re-
0 moved before the NT6X01XE XPM+ 3P Upgrade Kit is applied.

0 Channel Supervision:

0 For each ILGC, IDTC, PLGC, or PDTC module equipped with NT6X02GM
0 Common CP, provide, except when CCITT N5 Signaling feature is re-
0 quired:

- 0 - two (2) NT6X42AA Channel Supervision Msg CPs.

0 CCITT N5 Signaling:

0 For each ILGC, IDTC, PLGC, or PDTC module equipped with NT6X02GM
0 Common CP, provide,

- 0 - two (2) NT6X62DA CCITT N5 Tone Receiver CPs, and
0 - two (2) NT6X42CA CSM and CCITT N5 Splitter CPs.

0 Always provide (in case NT6X62DA and NT6X42CA CPs are provided
0 later):

- 0 - one (1) NT6X01WG CCITT N5 Signaling Wiring List.

0 Speech Bus Formatter:

0 For each ILGC, IDTC, PLGC, or PDTC module equipped with NT6X02GM
0 Common CP, provide:

- 0 - two (2) NT6X41AB Speech Bus Formatter CPs.

0 RELEASE 28.01
0 93 12 03

0 DS-30 Interface:

0 When DS30 copper network interface is required in a non-ENET of-
0 fice, provide for each ILGC, IDTC, PLGC, or PDTC module equipped
0 with NT6X02GM Common CP:

- 0 - two (2) NT6X40AC packs DS30 Network Interface CPs, and
- 0 - two (2) NT6X69LB Msg Protcl & Downldbl Tone CPs.

0 The NT6X69LB is recommended for use in all applications in place
0 of the NT6X69LA. However, depending on availability, the
0 NT6X69LA may be used when fiber network interface is not re-
0 quired.

0 DS-512 Interface:

0 When fiber network interface is required in an ENET office, pro-
0 vide for each ILGC, IDTC, PLGC, or PDTC module equipped with
0 NT6X02GM Common CP:

- 0 - one (1) NT6X02BU Fiber I/F H/W Assembly,
- 0 - two (2) NT6X40FA DS512 Network Interface CPs,
- 0 - two (2) NT6X40GA DS512 Paddle Boards,
- 0 - two (2) NT6X69LB Msg Protcl & Downldbl Tone CPs, and
- 0 - two (2) P0736273 Optical Fiber Danger Labels.

0 For fiber network interface the NT6X69LB must be used (the
0 NT6X69LA may not be substituted for NT6X69LB when fiber network
0 interface is required).

0 Cooling Unit:

0 For the only ILGE, IDTE, PLGE, or PDTE frame equipped in an of-
0 fice, or for the first of each group of frames served by a dif-
0 ferent PDC, provide:

- 0 - one (1) NT3X90AB Cooling Inverter Unit, or
- 0 one (1) NT3X90AC DC Fan Cooling Unit.

0 Thereafter, for each subsequent frame, provide:

- 0 - one (1) NT3X90AA Cooling Inverter Unit, or
- 0 one (1) NT3X90AC one DC Fan Cooling Unit.

0 NT3X90AC replaces NT3X90AA and NT3X90AB for new jobs.

0

0
0 RELEASE 28.01
0 93 12 03

0 Enhanced Grounding:

0 When extending existing offices not equipped with enhanced
0 grounding per IS0X00, provide for each frame:

- 0 - one (1) NT0X0009 Logic Return Cable Assembly.

0 Echo Cancellor:

0 When the Echo canceller feature is required, provide:

- 0 - two (2) NTCX50AA Echo Cancellor Control Paddle Boards.

0 The Coax Panel provisioned must be other than NT6X01ZA.

0 As the Echo Cancellor Control interface cable uses the bulkhead
0 connector positions normally used for twisted pair PCM-30, the
0 ECC can only be provisioned when these connectors are not being
0 used.

0 Always provide (in case NTCX50AA CPs are provided later):

- 0 - one (1) NT6X01WF Echo Cancellor Wiring List.

0 XPM Software Planned Introduction:

0 XPM software XPM01 is planned to be introduced in BCS35 time
0 frame.

0 XPM software XPM02 is planned to be introduced in CSP01 (BCS36)
0 time frame.

0 XPM THREE PROCESSOR (MP/SP/FP) LOAD PHASE-OUT:

0 PDTC (PCM-30 Digital Trunk Controller):

0 Current Three Processor (MP/SP/FP) NPD load supporting PDTC
0 will be:

- 0 - Frozen in XPM02 software, and
- 0 - Become unavailable in XPM03 software.

0 PLGC (PCM-30 Line Group Controller):

0 Current Three Processor (MP/SP/FP) NPL load supporting PLGC
0 will be:

- 0 - Frozen in XPM02 software, and
- 0 - Become unavailable in XPM03 software.

0 RELEASE 28.01
0 93 12 03

0 XPM PLUS (UP) LOAD PHASE-IN:

0 PDTC (PCM-30 Digital Trunk Controller):

0 XPM Plus (UP) ODT load supporting PDTC (without NTCX50AA Echo
0 Cancellor) will be:

- 0 - Introduced in Verification Office XPM01 software
0 (Feature Packages NTXK79AB and NTRX34AB), and
- 0 - Become Generally Available in XPM03 software
0 (Feature Packages NTXK79AC and NTRX34AB).

0 PLGC (PCM-30 Line Group Controller):

0 XPM Plus (UP) OLG load supporting PLGC will be:

- 0 - In Verification Office XPM02 software
0 (Feature Packages NTXK79AC and NTRX34AB), and
- 0 - Become Generally Available in XPM03 software.

0 RELEASE 28.01
0 93 12 03

0 8.0 International Cabinet LGE/DTE Fiber

0 NTFX33AA is a general purpose Common Peripheral Controller Equip-
0 ment Frame for international applications which houses two inde-
0 pendent dual shelf modules.

0 Each module may be provisioned as a

- 0 - PCM30 Line Group Controllers (PLGC), or
- 0 - PCM30 Digital Trunk Controllers (PDTC),

0 Or, with DMS100I software in the office, each module may be pro-
0 visioned as a

- 0 - International Line Group Controllers (ILGC), or
- 0 - International Digital Trunk Controllers (IDTC).

0 An ILGC/PLGC may be provisioned to support

- 0 - copper interface (DS-30) or
- 0 fiber interface (DS-512) to the network,
- 0 - PCM-30 links to RLCM, RSC or OPM,
- 0 - DS-30A interface to LCM.

0 A IDTC/PDTC may be provisioned to support

- 0 - copper interface (DS-30) or
- 0 fiber interface (DS-512) to the network,
- 0 - PCM-30 links to other offices,
- 0 - Common Channel Signaling 7 (CCS7).

0 8.1.3 PROVISIONING CONSIDERATIONS

0
0 NTFX33AA International Cabinet LGE/DTE Fiber

0 Common Circuit Packfill:

0 For each equipped module, provide except for Digital N5 applica-
0 tions:

- 0 - one (1) NTFX33BC International LGC/DTC Common CP.

0 For Digital N5 application, provide for each equipped module:

- 0 - one (1) NTFX33BD International LGC/DTC Common CP.

0 If the second module is not equipped on the FCTM cabinet, pro-
0 vide:

- 0 - one (1) NT6X02AB Common Peripheral Controller Module Filler
0 Faceplate Kit.

0 CCITT N5 Signaling:

0 For Digital N5 application, provide for each module equipped with
0 NTFX33BD per customer requirements:

- 0 - two (2) NT6X42CA CSM and N5 Splitter CPs, and
0 - two (2) NT6X62DA CCITT N5 Version Special Tone Receiver
0 (STR) CPs.
0 - two (2) NTFX33WF wiring lists.

0 PCM-30 Interface:

0 For each equipped module, provide as per customer requirements:

- 0 - minimum four (4) and
0 maximum eight (8) NT6X27AC/BB PCM-30 Interface CPs.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 PCM-30 Signaling Interface:

0 For each equipped LGC/DTC which supports PCM-30 links (NT6X27
0 PCM-30 Interface CPs provisioned), or for each equipped LGC mod-
0 ule which supports links to an LCM (NT6X48 DS30A LCM Interface
0 CPs provisioned), and the LCM is equipped with a PCM-30 line
0 drawer such as the NT6X05CA, provide:

- 0 - two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 PCM-30 Coaxial Interface Panel:

0 For PCM-30 interface via coaxial cable, provide for each equipped
0 module:

- 0 - one (1) NTN3366 Coaxial Interface Assembly
0 (NTNX3366 connects shelves 05 and/or 33), and
0 - one (1) NTN3369 Coaxial Interface Cable Assembly
0 (NTNX3369 connects shelves 19 and/or 47).

0 PCM-30 Twisted Pair Interface:

0 For PCM-30 interface via twisted pair wiring, provide for each
0 equipped IDTC module:

- 0 - two (2) NTN3370 PCM-30 Twisted Pair Interface Assemblies, and
0 - two (2) NTN3371 PCM-30 Twisted Pair Interface Assemblies.

0 As the Echo Canceller Control interface cable uses the bulkhead
0 connector positions normally used for twisted pair PCM-30, the
0 ECC can only be provisioned when these connectors are not being
0 used.

0 When twisted pair PCM-30 interface is equipped, provide for each
0 cabinet:

- 0 - one (1) P0711579 Designation Labels Sheet.

0 One sheet contains sufficient cable connector designation labels
0 for both modules in the frame.

0 RELEASE 28.01
0 93 12 03

0 Universal Tone Receiver:

0 The NT6X92CA Universal Tone Receiver is a combined service circuit that can perform the function of Digitone Receiver for lines and MF Receiver for trunks. One pair of NT6X92CA provides up to thirty circuits.

0 For each equipped module, provide per customer requirements:

- 0 - zero (0),
- 0 two (2) or
- 0 four (4) NT6X92CA Universal Tone Receiver CPs.

0 The first provisionable UTR (NT6X92CA) pair shall be located in CP slot 8 unless CP slot 8 is equipped with an NT6X62DA. The second provisionable UTR pair shall be located in CP slot 9, unless CP slot 9 is equipped with an NT6X70AA. In this case, the second UTR pair will be located in CP slot 11. Each UTR on the shelf is paired with a UTR in the same circuit pack position on the other shelf in the module.

0 Continuity Tone Detector:

0 When the DTC is handling CCIS/CCS7 voice trunking, provide for each equipped module:

- 0 - two (2) NT6X70AA Continuity Tone Detector CPs, and
- 0 - two (2) NTN33WA Continuity Tone Detector Wiring Assembly.

0 The NT6X70AA supports a Continuity Test (COT), and is recommended whenever analog facilities are employed in part or all of the transmission path.

0 When the facility is end-to-end digital, the NT6X70AA is not required since digital facilities employ other means of fault detection.

0 An LGC may not be provisioned with NT6X70AA CPs.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 Echo Cancellor:

0 When the Echo canceller feature is required, provide for each
0 pair of NT6X28AAs provisioned:

- 0 - two (2) NTCX50AA Echo Cancellor Control Paddle Boards.
- 0 - one (1) NTNX3390 Echo Cancellor Control Interconnect
0 Cable Assembly and
- 0 - two (2) NTFX33WE Echo Cancellor Wiring Lists.

0 As the Echo Cancellor Control interface cable uses the bulkhead
0 connector positions normally used for twisted pair PCM-30, the
0 ECC can only be provisioned when these connectors are not being
0 used.

0 For the field application of the Echo Cancelling feature, provide
0 for each equipped module:

- 0 - one (1) NTFX33ZA Echo Cancellor Control Kit.

0 This kit consists of:

- 0 - two (2) NTCX50AA paddle boards and
- 0 - one (1) NTNX3390 interconnect cable assembly.

0 DS-512 Interface:

0 For each module equipped with network interface via fiber cabling
0 in an ENET office, provide:

- 0 - two (2) NT6X40FA DS-512 Interface CP,
- 0 - two (2) NT6X40GA DS-512 Link Paddleboard,
- 0 - one (1) NT6X02BU FXPM Bracket Assembly, and
- 0 - two (2) P0736273 Optical Fiber Danger Labels.

0 Depending on availability, NT6X40CA and NT6X40DA functional pair
0 may be used in place of the preferred NT6X40FA and NT6X40GA func-
0 tional pair. The paddleboards and circuit packs cannot be mixed
0 because they do not function in mismatched pairs.

0 When either module in the FCTM cabinet is equipped with network
0 interface via fiber cabling, provide for each cabinet:

- 0 - one (1) P0713105 Fiber Cover Plate,
- 0 - one (1) P0713256 Fiber Cover Plate, and
- 0 - two (2) P0682727 Bushings

0 RELEASE 28.01
0 93 12 03

0 DS-30 Interface:

0 For each upper module (Shelf positions 33 and 47) equipped with
0 network interface via copper cabling, provide:

- 0 - two (2) NT6X40AC DS-30 Interface CP,
- 0 - one (1) P0713257 Connector Cover Plate, and
- 0 - one (1) NTNX3389 DS-30 Interface Cable Assembly.

0 For each lower module (Shelf positions 05 and 19) equipped with
0 network interface via copper cabling, provide:

- 0 - two (2) NT6X40AC DS-30 Interface CP,
- 0 - one (1) P0713258 Connector Cover Plate, and
- 0 - one (1) NTNX3384 DS-30 Interface Cable Assembly.

0 DS-30A Interface:

0 For ILGC applications to interface links from ILCM, provide:

- 0 - four (4) NT6X48AA DS30A LCM Interface CPs.

0 The NT6X48AA CP are assigned in pairs for reliability. One member
0 of the pair interfaces the same DS30A ports as the other member.
0 Each member of the pair occupies the same CP position, with one
0 CP assigned to LGAI 0 (lower shelf of the module) and the other
0 assigned to LGAI 1 (upper shelf of the module).

0 For each DS-30A Interface Cable Assembly ordered, provide:

- 0 - two (2) P0638259 Bushings and
- 0 - two (2) P0423631 Washers.

0 8-port 64Kbit Interface:

0 When an 8-port 64Kbit interface is requested by the customer,
0 provide for each equipped module:

- 0 - one (1) NT6X55CA 8-port 64-Kbit I/F CP, and
- 0 - one (1) NTFX3303 Cable Assembly.

0 When both PCM-30 and 8-port 64-Kbit interface are provisioned in
0 the same cabinet simultaneously, the number of associated ports
0 per module will be fourteen (14) PCM-30 ports and eight (8)
0 64-Kbit ports.

0 RELEASE 28.01
0 93 12 03
0

0 For the field application of the 8-port 64Kbit feature, provide
0 for each equipped module:

0 - one (1) NTFX33ZB 8-port 64Kbit Interface Circuit Kits.

0 Each NTFX33ZB kit consists of:

0 - one (1) NT6X55CA 8-port 64-Kbit I/F CP, and
0 - one (1) NTFX3303 Cable assembly.

0 1-port 64Kbit Interface:

0 For each 1-port 64Kbit interface required, maximum 1 per shelf of
0 an equipped module, provide:

0 - one (1) NT6X55BA 64-Kbit Access CPs,

0 for each shelf in position 19 or 47 provisioned with a NT6X55BA,
0 provide:

0 - one (1) NTFX3305 Cable Assembly, and

0 for each shelf in position 05 or 33 provisioned with a NT6X55BA,
0 provide:

0 - one (1) NTFX3306 Cable Assembly.

0 The NT6X55BA should only be provisioned when DS30A p-side ports
0 (provisioned per RUL16) are not used.

0 Earthquake Anchor Kit:

0 When cabinet is installed in seismic (earthquake) zones

0 - ATC Zones 6 & 7,
0 - NEBS Zone 4, and
0 - UBC Zone 4

0 provision for each cabinet:

0 - for slab-type flooring,
0 - one (1) NTNX2540 Earthquake Anchor Kit, or
0 - for computer-type flooring,
0 - one (1) NTNX2578 Earthquake Anchor Kit.

0

0 RELEASE 28.01
0 93 12 03

0 Non-Earthquake Frame Mounting Kit:

0 When installing cabinet in a non-earthquake zone, provision for
0 each cabinet:

- 0 - for slab-type flooring,
 - 0 - one (1) NTN2579 Frame Mounting Kit, or
- 0 - for computer-type flooring,
 - 0 - one (1) NTN2580 Frame Mounting Kit.

0 Cabinet Color:

0 When specifying a brown cabinet, provision for each cabinet:

- 0 - two (2) NTN2550 Left Door Assemblies (Brown),
- 0 - two (2) P0699464 Left Door Labels (Brown),
- 0 - two (2) NTN2552 Right Door Assemblies (Brown), and
- 0 - two (2) P0695230 Right Door Labels (Brown),
 - 0 one each for front and rear respectively, as well as
- 0 - one (1) P0714720 Cabinet Type Label (Brown).

0 When specifying a grey cabinet, provision for each cabinet:

- 0 - two (2) NTN2515 Left Door Assemblies (Grey),
- 0 - two (2) P0677704 Left Door Labels (Grey),
- 0 - two (2) NTN2513 Right Door Assemblies (Grey), and
- 0 - two (2) P0699158 Right Door Labels (Grey),
 - 0 one each for front and rear respectively, as well as
- 0 - one (1) P0714721 Cabinet Type Label (Grey),

0 CP Designation Labels:

0 Provide the appropriate designation label for each CP provided.

0 Unequipped CP Slots:

0 For each unequipped CP slot 1-6, 8,9,11, and 19, provide:

- 0 - one (1) NT0X50AA Filler Face Plate.

0 8.1.4 OFFICE LAYOUT INFORMATION

0 9.0 International Cabinet LGE/DTE/LTE ISDN

0 The Australian DMS-300 International Gateway Switch is based on the
0 DMS-300 supplied to Turkey with the following enhancements:

- 0 - Signalling systems necessary to introduce the product
0 into the Australian National Network.
- 0 - Enhancements to the Call Detail Recording, Operational
0 Measurements and Call Progression tone systems.

0 Similarly, the DMS-300 Gateway Switch for Madley-B Digital Interna-
0 tional Switching Centre (DISC) in the United Kingdom is based on ex-
0 isting technology, adapted for that market.

0 The NTFX33CA International Cabinet LGE/DTE/LTE ISDN houses one or two
0 International PCM-30 LGC/DTC/LTC ISDN or not dual shelf modules in a
0 cabinet configuration for applications not requiring fiber network
0 interfaces.

0 9.1 HARDWARE PROVISIONING

0
0 Not applicable

0 CIRCUITS PER CARD

0
0 Not applicable

0 DISCRIMINATION NUMBERING

0
0 Not applicable0 9.1.3 PROVISIONING CONSIDERATIONS0
0 The NTFX33CA International Cabinet LGE/DTE/LTE ISDN is provi-
0 sioned as follows:0 The shelves within the LTEM cabinet are provisioned in the same
0 way as the domestic ISDN frame NT6X01AB, except that PCM-30

0 RELEASE 28.01
0 93 12 03

0 interfaces are used instead of DS-1 and some circuit pack vin-
0 tages are different for the Offshore market.

0 Refer to the Engineering Manual sections for details on circuit
0 pack vintages and cabinet hardware provisioning.

0 Common Circuit Pack:

0 Provision up to two (2) NT6X02UB PCM-30 LGC/DTC Common Circuit
0 Pack (Offshore) per LTEM.

0 PCM-30 Interface:

0 Provision up to eight (8) NT6X27AC/BB PCM-30 Interface CP per
0 PCM-30 LGC/DTC module, to interface up to sixteen PCM-30 links (2
0 links per CP).

0 The NT6X27BB Enhanced PCM-30 Interface circuit pack is backward
0 compatible with the NT6X27AC/BA circuit packs. It is also a re-
0 placement for the NT6X27AA/AB circuit packs, although it cannot
0 be mixed with the NT6X27AA/AB in the same frame or cabinet.

0 The NT6X27BB includes enhancements over the NT6X27AA/AB such as:

- 0 - Full compliance to CCITT,
0 - Improved alarm handling, and
0 - Support for DCME.

0 The initial application for the NT6X27BB is all the frames and
0 cabinets where the NT6X27AC/BA are provisioned. The manufacture
0 of the NT6X27AC/BA is being discontinued.

0 PCM-30 Signaling Interface:

0 For each equipped LGC/DTC which supports PCM30 links or for each
0 equipped LGC module which supports links to an LCM which is
0 equipped with a PCM30 line drawer such as the NT6X05CA, provide:

0 two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 CND Feature:

0 When the Calling Number Delivery/Calling Number Display (CND)
0 feature is required, provision two (2) NT6X78AB CLASS Modem Re-
0 source CPs for each PCM-30 LGC/DTC module.

0 Network Interface:

0
0 RELEASE 28.01
0 93 12 03

0 In an office with the Enhanced Network (ENET) provide a fiber
0 interface per module as follows:

0 two (2) NT6X40FA DS-512 Link Control CPs,
0 two (2) NT6X40GA DS-512 Link Control Paddleboards,
0 two (2) NT6X69LB DS-512 CPP Protocol & Downld CPs, and
0 one (1) P0736273 Fiber Cable Warning Label.

0 And for each cabinet

0 one (1) NTNX33SD DS-512 Fiber Interface to Network Kit.

0 Depending on availability, NT6X40CA and NT6X40DA functional pair
0 may be used in place of the preferred NT6X40FA and NT6X40GA func-
0 tional pair. The paddleboards and circuit packs cannot be mixed
0 because they do not function in mismatched pairs.

0 In a non-ENET office, provide a copper interface as follows:

0 two (2) NT6X40AC DS30 Network Interface CPs
0 two (2) NT6X69LA/LB CPP Protocol & Downld CPs.

0 The NT6X69LA may be used for non-fiberised peripherals when the
0 preferred NT6X69LB is not available.

0 9.1.4 OFFICE LAYOUT INFORMATION

0
0 The NTN33GA International Cabinet LGE/DTE Fiber ISDN (FCTM-ISDN)
0 is provisioned as follows:

0 The shelves within the FCTM-ISDN cabinet are provisioned the same
0 as the domestic ISDN frame (NT6X01AB), except that PCM-30 inter-
0 faces are used instead of DS-1, and some circuit pack vintages
0 are different for the International market. Maximum eight (8)
0 PCM-30 Interface CP (supporting 16 PCM-30 links) may be equipped.
0 Refer to the Engineering Manual sections for details on circuit
0 pack vintages and cabinet hardware provisioning.

0 Provision up to two (2) NTN33GB LGCI/DTCI Fiber Common CP
0 (International) per FCTM-ISDN.

0 Provision up to eight (8) NT6X27AC/BB PCM-30 Interface CP per
0 PCM-30 LGC/DTC module, to interface up to sixteen PCM-30 links (2
0 links per CP).

0 The NT6X27BB Enhanced PCM-30 Interface circuit pack is backward
0 compatible with the NT6X27AC/BA circuit packs. It is also a re-
0 placement for the NT6X27AA/AB circuit packs, although it cannot
0 be mixed with the NT6X27AA/AB in the same frame or cabinet.

0 The NT6X27BB includes enhancements over the NT6X27AA/AB such as:

- 0 - Full compliance to CCITT,
0 - Improved alarm handling, and
0 - Support for DCME.

0 The initial application for the NT6X27BB is all the frames and
0 cabinets where the NT6X27AC/BA are provisioned. The manufacture
0 of the NT6X27AC/BA is being discontinued.

0 When the Calling Number Delivery/Calling Number Display (CND)
0 feature is required, provision two (2) NT6X78AB CLASS Modem Re-
0 source CPs for each PCM-30 LGC/DTC module.

0 For each equipped LGC/DTC which supports PCM30 links or for each
0 equipped LGC module which supports links to an LCM which is

0

0| equipped with a PCM30 line drawer such as the NT6X05CA, provide:
0 two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 10.1.4 OFFICE LAYOUT INFORMATION

0 Please refer to Northern Telecom Practice 555-4001-103 Integrated
0 Services Network Meridian SL-100 Cabinetized General Description.

0 10.1.5 TRAFFIC TABLES

0 Not applicable.

0 10.2 PRODUCT/SYSTEM SPECIFICATION

0

0 10.2.1 PHYSICAL CHARACTERISTICS

0
0 Fusing and current drain information for the four cabinets intro-
0 duced specifically for Australia is not available at this time.

0 11.0 XPM PLUS for Base Non-ISDN XPM

0 The XPM PLUS (Product Life Upgrade Strategy) Phase II program ad-
0 dresses the need for memory and processing enhancements by re-
0 placing the separate MP and SP circuit packs in DTC/LGC/LTC/RCC
0 modules with the Unified Processor (UP). The UP increases avail-
0 able memory to 8Mb and increases RealTime processing power, com-
0 pared to the current XPM. All existing functions, interfaces and
0 tools continue to be supported.

0 The XPM PLUS schedule has been pulled in so that all new ship-
0 ments of LTCI/LGCI from BCS-34 forward will utilize the Unified
0 Processor (XPM PLUS). Support for Subscriber Carrier equipment is
0 planned to VO in BCS-36 and to be Generally Available in BCS-37.

0 This ECM describes both upgrades of existing equipment and new
0 shipments of XPM+ peripherals on the combined ISDN/non-ISDN
0 frame. XPM PLUS capability may also be supplied for both new
0 shipments and upgrades to existing RCE frames.

0 11.1 HARDWARE PROVISIONING

0

0 11.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The following usage restrictions apply to the XPM+ Phase II prod-
0 uct:

- 0 o RLCM and MSB7 are not to be upgraded to XPM PLUS
0 with the Unified Processor.
- 0 o In order to use the new software that is available
0 in BCS-35 and above, XPMs currently equipped with
0 enhanced messaging will require upgrade from MP/SP
0 processors to the XPM PLUS processor. Since XPMs
0 must meet minimum BCS packfill requirements before
0 these kits can be applied, the modules will be
0 equipped with one of the following:

0 Base XPMs:
0 -----

0 RELEASE 28.01
0 93 12 03
0

0 DTC Modules - NT6X02AS, NT6X02IA or NT6X02IC
0 LGC Modules - NT6X02AT, NT6X02LA or NT6X02LC
0 LTC Modules - NT6X02AU, NT6X02MA or NT6X02MC

0 The slots that mount the processors and memory are provisionable
0 in packfills NT6X02IC, NT6X02LC and NT6X02MC. Application of the
0 NT6X02XC kit to modules containing one of the other packfills
0 will bring the module to the NT6X02IC/LC/MC level, making these
0 slots provisionable.

0 Remote:
0 -----
0 RCC Modules - NT6X12AD, NT6X12AG and NT6X12CA

0 The processors and memory are Always Provided in these packfills.
0 Application of the NT6X12ZF to a module equipped with NT6X12AG
0 will change the RCC module to the NT6X12AK level. When applying
0 the NTZZ12ZF kit to a module equipped with NT6X12CA or any
0 packfill NT6X12AF or earlier, the NT6X72AA packs must be replaced
0 with NT6X72ABs. Application of the NT6X12ZF and the NT6X72AA re-
0 placement with NT6X72AB, upgrades these modules to the NT6X12AK
0 level. The slots requiring upgrade for XPM PLUS become
0 provisionable upon application of the NT6X12ZF kit. The NT6X12AK
0 is now available for new orders.

0 o Application of XPM PLUS to LGC, LTC and RCC modules
0 is mandatory (BCS Gating) for BCS-38. Application of
0 XPM PLUS to DTC modules is mandatory for BCS-41.

0 o As of BCS 35 the MP/SP processor will no longer be
0 shipped for new orders of the LGC/LTC/DTC/RCC. The Unified
0 Processor (XPM Plus) will be shipped for all new LGC/DTC/
0 LTC/RCC modules ordered.

0 11.1.2 HARDWARE DEPENDENCIES

0
0 The hardware required to implement XPM PLUS capability is the
0 Unified Processor, the terminator card (which mounts in a rear
0 side slot) and backplane strapping. These changes are applied to
0 the existing non-ISDN XPM equipment as described in the Product
0 Change Kit documents and will result in XPM packfills NT6X02IC,
0 NT6X02LC or NT6X02MC or RCC packfill NT6X12AK.

0
0 RELEASE 28.01
0 93 12 03

0 P AND C SIDE PORT REQUIREMENTS

0
0 There are no P or C side ports associated with the Unified
0 Processor (XPM PLUS).

0 DMS BUS PORT REQUIREMENTS

0
0 There are no DMS BUS ports associated with the Unified Processor
0 (XPM PLUS).

0 CIRCUITS PER CARD

0
0 There is one Unified Processor per circuit pack.

0 DISCRIMINATION NUMBERING

0
0 There is no discrimination numbering associated with XPM PLUS.

0 11.1.3 PROVISIONING CONSIDERATIONS

0
0 The following kits are available for application as described be-
0 low:

0

0 Host - Line Group Controller Equipment
0 Chapter 3

0 RELEASE 28.01
0 93 12 03
0

- 0 o Upgrade of host DTC/LGC/LTC to XPM PLUS:
0 Provide one XPM to XPM+ kit to upgrade one existing
0 host XPM module to XPM PLUS capability. All
0 provisionable circuit pack rules are unchanged
0 except for processors/memory, which are replaced
0 as part of kit application. The NT6X02XC kit
0 includes backplane stapping materials and
0 instructions for application on existing NT6X01AA
0 frames. The NTZZ99AN kit provides only the circuit
0 packs required and is used for applications where
0 the necessary wiring is already in place (i.e. the
0 upgrade of an existing module on a NT6X01AD frame).
- 0 o Upgrade of non-ISDN RSC to XPM PLUS:
0 Provide one RCC to XPM+ kit to upgrade one existing
0 RCC module to XPM PLUS capability. All
0 provisionable circuit pack rules are unchanged
0 except for processors/memory, which are replaced
0 as part of kit application.
- 0 o New shipments of XPMs with XPM PLUS:
0 Packfills are now available for application on the
0 combined ISDN/non-ISDN frame (NT6X01AD). New XPM+
0 shipments on the Model A CCPE (NTRX36AB) are NOT
0 supported. The packfills for NT6X01AD are:
- 0 NTZZ02PA for LTC with XPM+
0 NTZZ02QA for LGC with XPM+
0 NTZZ04HB for DTC with XPM+
- 0 o New shipments of RCCs with XPM PLUS:
0 Packfills are now available for application on the
0 RCE frame in either detail or Building Block format.
0 They are:
- 0 NTZZ46EA for RCC with XPM+ (in Building Block)
0 NT6X12AK for RCC with XPM+ (in detail)

0
0 Not applicable.

0 11.2.2 EMI/EARTHQUAKE INFORMATION

0
0 Not applicable.

0 11.2.3 SPARING INFORMATION

0
0 Standard sparing algorithms apply to this product. Both the Uni-
0 fied Processor and Termination Card will need to be spared.

0 11.2.4 POWER FEED AND FUSING REQUIREMENTS

0

0

0
0 RELEASE 28.01
0 93 12 03

0 There is no fusing or power feed associated with the Unified
0 Processor.

0 11.2.5 CURRENT DRAIN INFORMATION

0
0 The NTMX77AA Unified Processor requires a maximum of 3.80 Amps
0 and the NTMX71AA Terminator CP requires a maximum of 0.68 Amps.

0 11.3 SOFTWARE PROVISIONING

0

0 11.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0
0 Software package NTXR34-- is required to support the Unified
0 Processor and will be needed for all XPM PLUS upgrades.

0 Software package NTXR42-- is required to utilize the downloadable
0 firmware feature and is required with NTXR34--. In BCS-35,
0 NTXR34AB replaces NTXR34AA and NTXR34AA is declared Manufacture
0 Discontinued.

0 Refer to SMS/SOLID for software requirements and interdependen-
0 cies.

0 11.3.2 SOFTWARE USAGE RESTRICTIONS

0
0 Not applicable.

0

0 11.3.3 MEMORY PROVISIONING0
0 Not applicable.0 11.4 REAL TIME IMPACT0 The Unified Processor provides an improvement in RealTime capac-
0 ity by a factor of approximately 1.6X compared to the existing
0 MP/SP.

0 RELEASE 28.01
0 93 12 03

0 1.0 Digital Trunk Controller Equipment

0 1.1 Equipment Provisioning0 1.1.1 DS1 Interface Cards0 (a) General Description

0 To enable the Telco to specify the quantity of interface circuit
0 packs required to interface the DS1 digital carrier system and
0 the DS1 links from the Remote Line Concentrating Module (RLCM),
0 the Remote Switching Centre (RSC) and the Outside Plant Module
0 (OPM).

0 (b) Reference

0 NTP 297-1001-451 DMS-100 Family Common Customer
0 Data Schema

0 (c) Provisioning Considerations

0 (i) The DS1 Interface Cards are required to interface with
0 the DS1 digital carrier systems and the DS1 links from
0 the Remote Sites (i.e. Remote Line Concentrating Module
0 (RLCM), Remote Switching Center (RSC), Outside Plant Mod-
0 ule (OPM)).

0 (ii) There can be a maximum of ten (10) DS1 I/F cards per
0 LGC/DTC/LTC module.

0 (iii) One NT6X50AA/AB card provides an interface for up to two
0 (2) DS1 links. The NT6X50AB card will replace the
0 NT6X50AA card as the DS1 I/F card in many but not all ap-
0 plications (- the NT6X50AB will not be used in SMR, RSC,
0 and RLCM).

0 In order to support the enhanced features of the NT6X50AB
0 (i.e. ESF and 64 Kb/s clear channel capability based on
0 B8ZS), the DTC/LGC/LTC modules must be equipped with new
0 messaging (i.e. NT6X69AA/79AA or NT6X69AB) and new memory
0 (i.e. NT6X46AB/BA and NT6X47AB or NT6X47AC) cards. Pick
0 the appropriate DTC/LGC/LTC circuit pack fills.

0

0 RELEASE 28.01
0 93 12 03
0

0 The full support of the NT6X50AB card will not be avail-
0 able in DTC/LGC/LTC modules which have small memories
0 (i.e. NT6X46AA, NT6X47AA) and old messaging (i.e.
0 NT6X43AA). In these modules, the NT6X50AB can be used as
0 replacements for normal NT6X50AA carriers but the en-
0 hanced DS-1 feature set will not be available.

0 The above is only applicable to DMS host offices and not
0 to remotes such as RSC and RLCM.

0 The Customer cannot use NT6X50AB to substitute for
0 NT6X50AA unless NTX270AA software is loaded and
0 datafilled for the respective XPM's. It is recommended
0 that NT6X50AA cards and NT6X50AB cards not be mixed on a
0 shelf to minimize cases where the Customer forgets that
0 NT6X50AB needs to be explicitly software datafilled. The
0 datafill is via software table CARRMTC.

- 0 (iv) The DS-1 Interface Circuit Pack provisionable to the SMS
0 is the NT6X85AA or NT6X85AB. If software package
0 NTX299AB is present, the NT6X85AB is required for all
0 modules that require special services features. Other SMS
0 modules may use NT6X85AA packs but will be unable to use
0 the special services features of the software package
0 NTX299AB. (Check availability reports for the proper or-
0 dering PEC.)

0 The SMU DS-1 CP Product Engineering Code (PEC) is
0 NT6X85AB. Each NT6X85AB CP contains two (2) DS-1 cir-
0 cuits. A maximum of ten (10) NT6X85AB CP may be provi-
0 sioned on each SMU.

0 RELEASE 28.01
0 93 12 03

0 1.1.2 DS512 Interface Cards

0 (a) General Description

0 The NT6X40CA DS512 Network Interface circuit pack provides a fi-
0 ber interface to the Enhanced Network (ENET).

0 (b) Reference

0 None

0 (c) Provisioning Considerations

0 (i) If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP and two (2) NT6X40DA, DS512 Paddle Board,
0 for each relevant DTC/LGC/LTC module.

0 (ii) Provide one (1) NT6X02BU, Fiber I/F Hardware Assembly,
0 for each DTC/LGC/LTC module interfacing to the Enhanced
0 Network (ENET). The NT6X02BU Fiber Assembly mounts on
0 the backplane of the lower array in a module and provides
0 the fiber interface for both arrays.

0 (iii) If copper interface to the Network is required, then pro-
0 vide two (2) NT6X40AC, DS30 Network Interface CP, for
0 each relevant DTC/LGC/LTC module.

0 Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0

0 RELEASE 28.01
0 93 12 03

0 1.1.3 PCM 30 Interface Cards

0 (a) General Description

0 To enable the Telco to specify the quantity of interface circuit
0 packs required to interface the PCM 30 links from the Interna-
0 tional Remote Line Concentrating Module (IRLCM) and the PCM 30
0 Digital Carrier Systems.

0 (b) Reference

0 Chapter 3, Section 3.3 Operator Services
0 NTP 297-1001-451 DMS-100 Family Common Customer
0 Data Schema

0 (c) Provisioning Considerations

- 0 (i) The PCM 30 Interface Cards are required to interface with
0 the PCM 30 digital carrier systems and the PCM 30 links
0 from the Remote Sites (i.e. International Remote Line
0 Concentrating Module (IRLCM)).
- 0 (ii) One NT6X27AA/AB card provides an interface for up to two
0 (2) PCM 30 links.
- 0 (iii) There can be a maximum of eight (8) PCM 30 I/F cards per
0 International DTC (IDTC) module.
- 0 (iv) A DMS-100 host interfaces with an IRLCM over 2-6 PCM 30
0 links. The PCM 30 I/F cards mount on the ILGC.
- 0 (v) There can be a maximum of two (2) NT6X27AB PCM 30 I/F
0 cards per ILGC/IDTC module when the interoffice synchro-
0 nization feature is required.
- 0 (vi) When ITOPS is equipped on a DMS-100/200 configuration,
0 loop around trunks (NT6X27AA) must be provisioned to
0 route traffic between the DMS-100 and the DMS-200 portion
0 of the switch. Refer to Section 3.3 - Operator Services,
0 for more ITOPS provisioning information.
- 0 (vii) Provide one pair of NT6X28AA PCM 30 Signalling CP per
0 IDTC if TS16 signalling is used on the PCM link.
- 0 (viii) Provide one pair of NT6X28AA PCM 30 Signalling CP per
0 ILGC which supports LCM equipped with Metering Tone Con-

0 verter line cards (see the subsection on the Line Draw-
0 ers, found in this chapter, for more information on the
0 Metering Tone Converter line card).

0 RELEASE 28.01
0 93 12 03

0 1.1.4 Universal Tone Receivers

0 (a) General Description

0 The Universal Tone Receiver (UTR) is a combined service circuit
0 that can perform the function of a Digitone Receiver for lines
0 and a MF Receiver for trunks.

0 The Universal Tone Receiver (UTR) circuit pack is provisioned for
0 R2 call setup. Each UTR pair has thirty circuits. For more in-
0 formation on the UTR, refer to Section 3.5.

0 (b) Reference

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 (i) The UTR is provisionable in pairs (maximum two (2) pairs)
0 on the DTC, LGC, (IDTC, ILGC) and LTC modules. All lines
0 and trunks connected to the module will be serviced by
0 the UTR within the module. This includes all lines in
0 LCMS, RLCMS, and OPMS.

0 (ii) UTRs will slightly reduce the DTC/LGC/LTC and RSC periph-
0 eral real time capacity. A real time work up should be
0 performed to ensure sufficient capacity. Refer to Sys-
0 tems Engineering Letter, Issue #01, Subject "Guidelines
0 for XPM Real Time Capacity Study - BCS-22" (Date: May 22,
0 1987).

0 (iii) Lines and trunks on a RSC are serviced by UTR cards lo-
0 cated in the RCC module of the RSC. There is no traffic
0 overflow to the host office.

0 (iv) Although the UTR can perform the function of a Digitone
0 Receiver (NT2X48AA) and the function of a MF Receiver
0 (NT2X48AB), there is no traffic overflow from UTRs onto
0 existing Digitone Receivers nor existing MF Receivers.
0 The Digitone Receivers and MF Receivers mounted on MTMs
0 and TMs are still required to service the following:

- 0 - analog trunk groups existing on TM/MTM shelves
- 0 - lines equipped on LM modules
- 0 - trunk groups equipped on DCM modules
- 0 - Mechanized Calling Card Service (MCCS)

0
0 RELEASE 28.01

0| Any incoming or incoming portion of a 2 way trunk group
0| requiring a receiver not listed above will require
0| Digitone or MF receivers.

0| (vi) The number of UTR circuits is obtained by calculating the
0| UTR holding time and multiplying by the average number of
0| calls per hour. In general it is always safe to provide
0| two (2) pairs of UTR cards if unsure of the traffic de-
0| mands.

0| For incoming R2 calls the UTR holding time is as follows:

0| 1. From seizure to final digit collection
0| plus

0 RELEASE 28.01
0 93 12 03

- 0 2. From final digit collection to - trunk
0 selection if R1 or N5 outgoing, - seize
0 acknowledgement if R2 outgoing.

0 For outgoing R2 calls the UTR holding time is as follows:

- 0 1. The UTR is held until told to release by
0 the far office or timeout if we are the
0 controlling signal office (i.e. R1 to R2
0 calls).

0 The number of UTRs used on average is given by the fol-
0 lowing formula:

$$\begin{array}{lcl} \# \text{ of UTR} & & \text{SI} & & \text{S0} \\ \text{Circuits} = \text{NI} \times \frac{\text{-----}}{\text{HI+SI}} \times \text{EI} + \text{NO} \times \frac{\text{-----}}{\text{HO+S0}} \times \text{EO} \\ \text{required} & & & & \end{array}$$

0 where,

0 NI = Number of incoming R2 trunks (or 2-way
0 used as incoming)

0 SI = Signalling time in seconds of incoming
0 trunks

0 HI = Holding time (talking) of incoming trunks
0 in seconds

0 EI = Erlang occupancy figure of incoming
0 trunks

0 NO = Number of outgoing R2 trunks (or 2-way
0 used as outgoing)

0 S0 = Signalling time in seconds of outgoing
0 trunks

0 HO = Holding time (talking) of outgoing trunks
0 in seconds

0 EO = Erlang occupancy figure of outgoing trunks

- 0 (vii) This circuit pack is only required for CCITT No. 6 Sig-
0 nalling.

0 RELEASE 28.01
0 93 12 03

0 1.1.5 Digital Trunk Controller (DTC) Module

0 (a) General Description

0 The Digital Trunk Controller (DTC) Module provides the interface
0 between DS-1 digital systems and the DMS network. (The DTC does
0 not provide the digital interface between a host DMS and a re-
0 mote.)

0 (b) Reference

0 Chapter 3, Section 3.15 Common Channel Signalling

0 (c) Provisioning Considerations

0 (i) The DTC module is a two shelf module (versus the present
0 single shelf or single bay peripheral module).

0 (i) Each DTC module can terminate up to twenty (20) digital
0 carrier systems (i.e. up to ten (10) DS1 Interface cards)
0 and interconnect with the network via up to sixteen (16)
0 DS30 speech links.

0 (iii) Each DTC can terminate up to a maximum of twenty (20) DS1
0 ports on the peripheral side and a maximum of sixteen
0 (16) DS30 ports on the CPU (network) side.

0 (iv) Since each DTC terminates up to $20 \times 24 = 480$ voice chan-
0 nels and the internal speech links can accommodate up to
0 $16 \times 30 = 480$ VF paths, there is no concentration.

0 (v) DTC modules are provisioned for total terminations based
0 on the forecast of digital trunk requirements for the
0 busy season prior to exhaust.

0 (vi) For service protection, it is recommended that trunk cir-
0 cuits of each trunk group be spread over more than one
0 DS1 Interface card. Both of these cards can be mounted
0 on the same DTC module because of the duplicated
0 processor residing in the module.

0 (vii) Existing DTC modules which have spare capacity shall be
0 used to terminate new digital systems.

0 (viii) When a DTC module is handling CCIS/CCS7 voice trunk-
0 ing, two (2) Continuity Tone Detector cards NT6X70AA are

0 RELEASE 28.01
0 93 12 03
0

0 required when analog trunk facilities are employed. The
0 NT6X70AA card is not required if the transmission path is
0 all-digital.

0 (ix) The following DTC Common Peripheral Controller CPs sup-
0 port the following applications:

0 DTCs
0 NT6X02IC supports UTRs
0 replaces NT6X02AQ/AR (BCS-27)

0 IDTCs
0 NT6X02BD supports SL-100 U.K.
0 NT6X02BN supports Mercury UK applications with
0 New Message requirements (eg. DPNSS) *
0 NT6X02GB supports Caribbean (CEP)
0 NT6X02JA supports DMS-300 Turkey
0 NT6X02KE supports China
0 NT6X02QA supports Turkey applications
0 NT6X02BW replaces NT6X02BP (BCS-28)
0 NT6X02BP supports all International

0 * See Section 3.15 Common Channel Signalling for more
0 information on DPNSS.

0 (x) For each NT6X02IC ordered (BCS-27), provide:

0 - four (4) XPM Processor CP NT6X45AF/BA
0 - two (2) DS30 Network Interface CP NT6X40AC
0 - two (2) SP Memory Plus CP NT6X46BB
0 - two (2) MP Memory Plus CP NT6X47AC

0 - two (2) MSG Protocol & Tone CP NT6X69AC
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02IC is to be ordered instead of NT6X02IA.

0 For each NT6X02BW ordered, provide:

0 - six (6) XPM Processor CP NT6X45BA
0 - two (2) Time Switch CP NT6X44AB/EA
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02BW is to be ordered instead of NT6X02BP.

0

0 RELEASE 28.01
0 93 12 03
0

0 Upon general availability, the NT6X45BA CP will become
0 the standard XPM Processor offering instead of the
0 NT6X45AF/AD CP.

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four NT6X45BA XPM Processor CP for upgrading ex-
0 isting offices.

0 NT6X44EA adds Even-Bit-Inversion (EBI) to the Time Switch
0 CP (NT6X44AB).

0 (xi) If interface to the Enhanced Network (ENET) is required,
0 then the relevant DTC/LGC/LTC modules must have the
0 NT6X69AC Msg Protocol & Tone CP. NT6X69AC replaces
0 NT6X69AB.

0 Provide 1 NT6X02BQ change kit for each DTC/LGC/LTC module
0 you are upgrading to ENET. This change kit applies only
0 to modules provisioned at NT6X02 AS/IA, AT/LA or AU/MA
0 levels. Modules provisioned at earlier levels must be
0 upgraded to these levels before the NT6X02BQ change kit
0 can be applied.

0 (xii) If ENET interface is not required, use the product change
0 kit NT6X02EQ to upgrade DTC modules from NT6X02IA/LA/MC
0 to NT6X02IC/LC/MC levels.

0 (xiii) There are two methods available to satisfy 4 MB MP memory
0 requirements in existing DTC/LGC/LTC modules. The first
0 method is to apply one NT6X02EQ product change kit to
0 each DTC/LGC/LTC module to be upgraded as in item (1) be-
0 low. Per customer request, a second pair of office sup-
0 plied NT6X47AB packs may be added to each DTC/LGC/LTC
0 module to be upgraded as in item (2) below. Do not order
0 new NT6X47AB packs for the upgrade of NT6X02IA, LA, MA mod-
0 ules. The NT6X47AB packs that have been removed from up-
0 graded DTC/LGC/LTC modules may then be applied to other
0 relevant DTC/LGC/LTC modules.

0 1) Provision NT6X02EQ Product Change Kit to replace the
0 NT6X47AB MP Memory Plus circuit packs in slot 10 with
0 NT6X47AC packs. The NT6X02EQ kit may only be applied
0 to the following modules:

0 RELEASE 28.01
0 93 12 03
0

0 DTC (CCS7) : BCS-27 and later (NT6X02AS/IA)
0 DTC (other): BCS-33 and later (NT6X02AS/IA)
0 LGC (all) : BCS-31 and later (NT6X02AT/LA)
0 LTC (all) : BCS-30 and later (NT6X02AU/MA)

0 2) Existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT0X50AA, Filler Face Plate, in Slot 09.
0 Provide two (2) NT6X47AB, MP Memory Plus CP for the
0 above listed modules.

0 One NT6X47AC in slot 10 (item 1) has the same memory
0 capacity as two (2) NT6X47AB in slots 9 and 10 (item 2).

0 | Where an existing DTC/LGC/LTC module is presently
0 equipped with two NT6X69AB in slot 18, if the existing
0 module is not required to interface ENET, new cards are
0 not required for these slots.

0 Provide one (1) NT6X02BQ Product Change kit for each ex-
0 isting DTC/LGC/LTC module to be upgraded to interface
0 ENET. The NT6X02BQ contains (2) NT6X69AC circuit packs.
0 The NT6X02BQ will convert the NT6X02IA/AS to NT6X02IC,
0 the NT6X02LA/AT to NT6X02LC, and the NT6X02MA/AU to
0 NT6X02MC.

0 If an existing DTC/LGC/LTC module has ALREADY been up-
0 graded to the NT6X02IC/LC/MC packfill level via the
0 NT6X02EQ KIT, provide two NT6X69AC circuit packs in slot
0 18 to upgrade the module for ENET interface.

0 | For Canadian applications only, provide the NT6X02ER
0 Product Change Kit for each existing DTC peripheral mod-
0 ule (NT6X02AR/AM) to be upgraded. This change kit makes
0 the appropriate circuit pack positions provisionable, but
0 contains no circuit packs. Refer to the engineering man-
0 ual rules to identify the circuit packs required for up-
0 grade of the NT6X02AR or NT6X02AM.

0 (xiv) The following are the minimum packfill levels required
0 for BCS-32 or later: NT6X02IA/IS, or NT6X02IC (for new
0 offices).

0 Building Blocks

0 (xv) Provide one NTZZ04EA Building Block product change kit
0 for each existing NT6X02AA DTC/LGC/LTC module to be up-
0 graded. Do not order the NT6X02ZE PC Kit.

Building Block	From	To
NTZZ04EA	NT6X02AA (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

Provide one NTZZ04GA Building Block product change kit for each existing NT6X02AC DTC/LGC/LTC module to be upgraded. Do not order the NT6X02ZE PC Kit.

The NTZZ04GA building block contains the following:

(1)	NT6X02ER	XPM PC Kit
(1)	NT6X02ZL	Wiring Kit
(2)	NT0X50AA	Filler Face Plate
(2)	NT6X47AC	Master Proc Memory Plus CP
(2)	NT6X46BB	Signal Processor Memory Plus CP
(2)	NT6X69AC	CPP Msg Protocol & Tone CP
(2)	P0711663	Desig. Label for NT6X47AC
(2)	P0711664	Desig. Label for NT6X46BB
(2)	P0710476	Desig. Label for NT6X69AC

(Note: The NTZZ04GA includes all circuit packs required to upgrade a NT6X02AC module except the NT6X45 cards.

The NTZZ04GA building block kit may be used to upgrade the NT6X02AC module as follows:

Building Block	From	To
NTZZ04GA	NT6X02AC (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

0 RELEASE 28.01

0 93 12 03

0 (xvi) Existing DTC/LGC/LTC module is presently equipped with
0 four (4) NT6X45AA, XPM Processor CP, in Slots 08 & 12.
0 Application of the NTZZ04EA/NTZZ04GA makes these slots
0 provisionable and replacement cards must be ordered as
0 follows:

0 For A-stock upgrades provide four (4) NT6X45BA cards in
0 slots 8 and 12 of the upper and lower shelves of the pe-
0 ripheral modules. If B-stock material is required, then
0 four NT6X45BB packs must be merchandise ordered via an
0 88K.

0 The existing NT6X45AA packs must be replaced because they
0 will not work with New Messaging. The only reason NT6X45
0 cards are not included in the NTZZ04EA/GA upgrade kit is
0 because there is an option between NT6X45BA and NT6X45BB
0 packs. Either the NT6X45BA packs or the NT6X45BB packs
0 must be ordered or the upgrade will not have been done
0 correctly.

0 (xvii) The existing DTC/LGC/LTC module is presently equipped
0 with the following DS30 Network Interface CP in Slots 22
0 & 23: four (4) NT6X40AA.

0 If copper interface to the Network is required, then DO
0 NOT order new circuit packs for these slots.

0 If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP in Slot 22, and two (2) NT6X40DA, DS512 Pad-
0 dle Board, in Slot 22R of each relevant DTC/LGC/LTC mod-
0 ule. Also, provide one (1) NT6X02BU, Fiber I/F Hardware
0 Assembly, for each DTC/LGC/LTC module interfacing to the
0 Enhanced Network (ENET). The NT6X02BU Fiber Assembly
0 mounts on the backplane of the lower array in a module
0 and provides the fiber interface for both arrays.

0 Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0

0
0 RELEASE 28.01
0 93 12 03

0 (xviii) The existing DTC/LGC/LTC module is presently equipped
0 with four (4) NT6X47AA, MP Memory CP, in Slots 09 & 10.
0 Application of the NTZZ04EA/NTZZ04GA replaces these cir-
0 cuit packs with two NT6X47AC Master Processor Memory cir-
0 cuit packs.

0 (xix) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X46AA Signal Processor Memory Plus CP in
0 slot 11. Application of the NTZZ04EA/NTZZ04GA replaces
0 these circuit packs with two NT6X46BB circuit packs.

0 (xx) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X43AA, Msg Interface CP, in Slot 18. Ap-
0 plication of the NTZZ04EA/NTZZ04GA replaces these circuit
0 packs with two NT6X69AC Msg Protocol & Tone circuit
0 packs.

0 (xxi) If the existing module was a NT6X02AA, then the NTZZ04EA
0 provides two (2) NT2X70AE, Power Converter CP, in Slot 25
0 of each DTC/LGC/LTC module.

0 If the existing module was a NT6X02AC, then two (2)
0 NT2X70AD, Power Converter CP, already exist in Slot 25 of
0 each DTC/LGC/LTC module. DO NOT order new circuit packs
0 for these slots unless requested by the customer. Per
0 Telco request, the existing NT2X70AD CP's in each
0 DTC/LGC/LTC can be replaced by the NT2X70AE, Power Con-
0 verter ESD CP.

0 1.1.6 Common Peripheral Controller Equipment Frame

0 (a) General Description

0 The primary function of this frame is to house Line Group Con-
0 troller (LGC) Modules, Digital Trunk Controller (DTC) Modules or
0 Line Trunk Controller (LTC) Modules. Subject to certain re-
0 strictions, two different kinds of modules can be mounted on the
0 same frame. NTL Customer Engineering is to be consulted regard-
0 ing these configurations.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) This frame can accommodate four (4) shelves of equipment
0 (i.e. two modules). Modules are filled and numbered on
0 the frame from the bottom up.

0 (ii) Normally both modules are the same type. Two (2) modules
0 of different types can also be mounted on the same frame.
0 This situation would only occur in a very small office or
0 for the last frame in an office in order to save one
0 frame.

0 (iii) A LGC/LTC/DTC module cannot mount on the same frame as an
0 ILGC/IDTC module.

0 (iv) When ISG is being applied to an office, the LCE frames
0 and their associated Common Peripheral Controller Equip-
0 ment Frame must be served by the same PDC frame.

0 RELEASE 28.01
0 93 12 03

0 1.1.7 Common Peripheral Controller Equipment

0 (a) General Description

0 The Signalling Data Link (SDL) is channel on a T1 Carrier which
0 terminates on a DTC, DCM or LTC. ISDN trunks must terminate on a
0 DTC since they are only supported on DTCs.

0 (b) Reference

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations:

0 (i) The DTC may be used for SDL and ISDN trunks, however, for
0 reliability against failures, it is recommended to dis-
0 tribute the ISDN trunks and SDL across several peripher-
0 als.

0 (ii) CCS7 trunks must terminate on DTCs ONLY. Signalling Links
0 can terminate on DTCs, DCMs or LTCs. Signalling Links
0 and CCS7 trunks can be assigned to the same DTC.

0 (iii) CCS7 trunks can be mixed with PTS trunks on the same DTC,
0 however, both cannot be in the same trunk group.

0 (iv) Provision one (1) NT6X55AB DS0A Signaling Interface CP on
0 the DTC for each DS0A CCS7 signaling link. (Refer to
0 section 3.5 for more information.)

0 (v) DTC modules supporting CCS7 trunks must be equipped with
0 Extended Memory (NT6X46) and Enhanced Messaging (NT6X69).

0 (vi) The maximum number of DTCs utilizing CCS7 is 60 per of-
0 fice based on each DTC requiring 2 IPMLs per MSB7.

0 (vii) Each DTC utilizing CCS7, requires two continuity cards
0 NT6X70AA for continuity checking on ISUP trunks for BCS23
0 and earlier. In BCS24 and later, the software require-
0 ment for Continuity Cards was removed so that customers
0 requesting the cost reduction when testing is not re-
0 quired are not required to order the cards.

0 For U.S. applications only, since the NT6X70-- is re-
0 quired for the COT test, it is recommended that continu-

0
0 RELEASE 28.01
0 93 12 03

0 ity cards continue to be provisioned in most cases.
0 Provisioning Continuity Cards on CCS7 DTCs should be con-
0 sidered standard. Only per customer request can they be
0 omitted.

0 For Canadian applications only, many customers have a
0 high penetration of digital trunk facilities and do not
0 require the Continuity card. Provision these cards only
0 on DTCs whose trunks support analog facilities at some
0 point in the end-to-end connection of the trunk.

0 (viii) Refer to Section 3.5 for more information on the DTC, DCM
0 and LTC.

0 1.1.8 ISDN Common Peripheral Controller (CPEI)

0 (a) General Description

0 The ISDN Common Peripheral Controller (CPEI) is the Peripheral
0 Controller for the ISDN. The CPEI frame is named LGEI, LTEI or
0 DTEI depending on the access modes supported (BRI, PRI, etc.)

0 The CPEI has 20 p-side ports that are provisioned as required to
0 support DS-30A links from LCMs, LCMEs, and LCMIs; DS-1 links to
0 the Packet Handler; DS-1 links for PRI or non-ISDN trunks; and
0 D-channel handlers.

0 An offshore version of the CPEI has also been created whose pri-
0 mary difference is the use of PCM-30 interfaces instead of DS-1
0 interfaces.

0 (b) References

0 System Engineering Bulletin (SEB) 88-10-001

0 (c) Provisioning Considerations

0 (i) The CPEI is used to interface the DS-30A links from line
0 modules, the DS-1 links to the Packet Handler, and the
0 non-ISDN and ISDN-PRI DS-1 links.

0 The frame and its modules and shelves are assigned func-
0 tional names depending on the ISDN access modes sup-
0 ported. For BRI access the following names apply:

Access Modes	Equip	Name	Abbr
-----	-----	-----	----
DS-30A links to LCM/LCME/LCMIs, DS-1 links to Packet Handler	Frame	ISDN Line Group Equipment	LGEI
	Module	ISDN Line Group Controller	LGCI
	Shelf	ISDN Line Group Array	LGAI

0

0 RELEASE 28.01
0 93 12 03

Access Modes	Equip	Name	Abbr
-----	-----	-----	-----
DS-30A links to LCM/LCME/LCMIs,	Frame	ISDN Line Trunk Equipment	LTEI
DS-1 links to Packet Handler, non-ISDN DS-1 trunks	Module	ISDN Line Trunk Controller	LTCI
	Shelf	ISDN Line Trunk Array	LTAI

0 Planned availability of these functions is as follows:
0 LGEI in BCS-27, LTEI in BCS-28. In addition, PRI DS-1
0 links are to be supported on LTEI in BCS-30.

0 (ii) Upgrade kits will be available to apply ISDN capability
0 to existing LGE/LTE/DTE/SME frames. The required kits
0 are:

0 NT6X02ZA CPCI ISDN Upgrade Circuit Pack Change Kit
0 NT6X01ZZ CPCE ISDN Upgrade Wiring Change Kit

0 These kits are not to be ordered for U.S. applications
0 until further notice.

0 The above kits will take any NT6X01AA CPCE frame and any
0 common circuit pack fill associated with this frame and
0 convert it to NT6X01AB CPEI frame and NT6X02NA ISDN com-
0 mon CP fill.

0 The NT6X02ZA CPCI ISDN Upgrade Circuit Pack Change Kit
0 can also be used on the NT6X01AB CPCE frame to upgrade a
0 non-ISDN DTC module to handle ISDN applications.

0

0

0

0

0

0 Host - Digital Trunk Controller Equipment
0 Chapter 4

0 RELEASE 28.01
0 93 12 03
0

0 (iii) The Maximum number of each type of link, and the minimum
0 software release that supports it are:

0 LCM/LCME/LCMI - CPEI DS-30A links:
0 - up to 18 (BCS-27 or higher)

0 CPEI - Packet Handler DS-1 links:
0 - up to 16 (BCS-27 or higher)

0 Non-ISDN trunks:
0 - up to 16 (BCS-28 or higher)

0 PRI trunks:
0 - up to 16 (BCS-29 or higher)

0 There are no restrictions on the assignment of Bb or Bd
0 channels to packet handler DS-1 link channels. Note that
0 the CPEI statmux maximum is 64:1 for Bd channels.

0 | (iv) Prior to BCS-31, in an office equipped with both ISDN and
0 non-ISDN peripheral controllers, the CPCI modules could
0 be assigned the same discrimination numbers as existing
0 non-ISDN modules. For example, LGC 01 and LGCI 01 could
0 co-exist in an office. The same is not true for LCME/LCMI
0 versus LCM bays.

0 | For BCS-31 and above, discrimination numbering of ISDN
0 peripherals has been changed, requiring them to be con-
0 secutive with non-ISDN modules. Frame level naming and
0 numbering is unchanged and the frame type is still deter-
0 mined by the bottom module in the frame. At the MAP, ISDN
0 modules are no longer called LGCI/LTCI. Instead, only
0 LGC/LTC are allowed. (Note that DTCI has not been changed
0 to DTC at the MAP). As a result of this change, at
0 BCS-31, existing ISDN peripheral controllers (LGCI/LTCI)
0 will need to be renumbered to be consecutive with
0 non-ISDN controllers. For example, an office with exist-
0 ing LGC 00-05 and LGCI 00-01 will require renumbering the
0 ISDN modules to LGCI 06-07 at BCS-31. New labels for the
0 ISDN controllers will be required.

0 | DTC and DTCI numbering will not be changed due to the
0 complexity of changing in-service trunks and the lack of
0 a software tool for this activity. Numbering for DTC/DTCI
0 modules will be unchanged from pre-BCS31 practices.

0

0 RELEASE 28.01
0 93 12 03
0

0 | At the MAP, modules can still be identified as ISDN or
0 non-ISDN by referring to the ISP16 table.

0 (v) In an office equipped with both ISDN and non-ISDN periph-
0 eral controllers, the CPCI modules can be assigned the
0 same discrimination numbers as existing non-ISDN modules.
0 For example, LGC 01 and LGCI 01 can co-exist in an of-
0 fice. The same is not true for LCMI versus LCM bays.

0 (vi) The following chart illustrates the call types which im-
0 pact Real Time Engineering of the Master Processor in the
0 LGCI provisioned with Basic Rate Interface (BRI). Cur-
0 rently, the Master Processor is the only processor which
0 requires Real Time Engineering.

CALL TYPE	BCS	
	27	28
ISDN Circuit Switched	Y	Y
B Channel Packet Switched	N	N
D Channel Packet Switched	N	N
Electronic Business Set	Y	Y
Datapath	Y	Y
Other (POTS and MDC)	N	Y

0 Refer to System Engineering Bulletin (SEB) 88-10-001 for
0 BCS 25-27 Abbreviated Real Time Engineering Guidelines
0 for the LGCI.

0 BCS 28 Abbreviated Real Time Engineering Guidelines for
0 the LGCI provisioned with Basic Rate Interface is to be
0 provided in a future issue of this document.

0 (vi) The DTC NT6X02AI can be provided on the CPEI frame for
0 DMS-250 applications. This module will handle non-ISDN
0 trunking (employing A/B bit signaling) required for
0 DMS-250 applications but will not handle ISDN PRI. The
0 DTC can be converted at a later date to a DTCT in order
0 to handle ISDN PRI.

0 The NT6X01WC DTC Wiring Option (NT6X01AB) is provided per
0 each non-ISDN module equipped on the CPEI frame.

0 RELEASE 28.01
0 93 12 03
0

0 Standard DMS-250 DTC circuit packs are provisioned on the
0 DTC module as required.

0 (vii) Optional Software Features

0 Enhanced Office Recovery, NTXA66AA, is an optional soft-
0 ware feature that improves the present office recovery
0 time of extended peripheral modules (XPM). Extended XPM
0 Diagnostics, NTXA67AA, is an optional software feature
0 that enhances the present diagnostics of extended periph-
0 eral modules (XPM). The LTCI is classified as an XPM.

0 These Software features are applicable to any peripheral
0 module (XPM) which contains both enhanced messaging (i.e.
0 the 6X69/79 pair or the 6X69AB CP) and enhanced memory
0 (i.e. the 6X46AC CP or the 6X46BA CP).

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four (4) NT6X45BB (U.S. applications) or
0 NT6X45BA (Canadian applications) XPM Processor CP for up-
0 grading existing offices.

0 | (viii) Offshore CPEI

0 | NT6X01AC Offshore Peripheral Controller Equipment Frame

0 | The NT6X01AC Offshore Common Peripheral Controller Equip-
0 | ment Frame is based on the domestic NT6X01AB ISDN periph-
0 | eral controller, adapted for applications outside North
0 | America ("Offshore"). It supports PCM30 links, ISDN ser-
0 | vices, and Common Channel Signaling 7 (CCS7) features on
0 | two independent peripheral modules.

0 | The NT6X01AC Offshore Peripheral Controller Equipment
0 | frame supports two peripheral module types: PLGC and
0 | PDTC.

0 | PLGC - Supports ISDN, Centrex, EBS, IBN and POTS services on
0 | standard Line Concentrating Module types

0 | - Has PCM-30 P-side links for PRLCM and Offshore Remote
0 | Switching Center interface

0 | - Operation as a non-ISDN peripheral is not yet imple-
0 | mented in software, meaning that the NTB01AA ISDN

0
0 RELEASE 28.01
0 93 12 03

0 | Pre-Preprocessor CP is required even if no ISDN fea-
0 | tures are used

0 | - Supports AMI interface to the NT1. 2B1Q is not sup-
0 | ported for this interface

0 | PDTC - Supports CCS7 and R1 signaling in Offshore applica-
0 | tions, using PCM-30 links

0 | - ISDN services like Primary Rate Interface are not
0 | supported

0 | Modules of different types may be mixed on the frame if
0 | required.

0 | NTBX02AA D-Channel Handler CP are not required for PDTC
0 | applications, nor where the PLGC supports only non-ISDN
0 | LCMS.

0 | NTBX01AA ISDN Pre-Processor CP are always required on
0 | PLGC (until such time as software supports purely
0 | non-ISDN operation). This CP is not required on PDTC.

0 | (ix) All PCM30 links from a PRCC must terminate on the same
0 | host PLGC. Only the PLGC peripheral type can terminate
0 | PRCC host links.

0 | (x) The Offshore Offshore versions of the Common Peripheral
0 | Controller Equipment Frame and Remote Controller Equip-
0 | ment Frame are provisioned the same as their domestic
0 | counterparts (subject to the usage restrictions). The
0 | primary difference is the use of PCM-30 interfaces in-
0 | stead of DS-1 interfaces. A maximum of sixteen (16)
0 | PCM-30 interfaces may be equipped on the PLGC/PDTC versus
0 | twenty (20) DS-1 interfaces on the North American prod-
0 | uct. Provision one (1) NT6X27AC PCM-30 Interface CP for
0 | every two PCM-30 interfaces required. Certain other cir-
0 | cuit pack vintages are different between domestic and
0 | Offshore products; refer to the Engineering Manual
0 | sections for details.

0 RELEASE 28.01
0 93 12 03

0 1.1.9 Digital Packet Network (DPN) Equipment Provisioning

0 (a) General Description

0 Nailed-up B channel and statistically multiplexed D channel
0 packet data are routed to the DMS-100 Integrated Packet Handler
0 (IPH) equipment via DS-1 links from the CPEI frame. The IPH is
0 one of the peripherals needed to add ISDN to a DMS-100. The IPH
0 comes in a cabinet that is configured to support a set number of
0 B-channels and D-channels. Contained in a single cabinet is a
0 Digital Interworking Unit (DIU) and two Resource Modules (RM).

0 The DS-1 links are interfaced to the IPH by means of the DIU. The
0 RM portion of the IPH is a fully redundant module, including two
0 office Processing Elements (PE), two Call Server PEs, two DIU
0 servers, and two Disk Drives. In addition, the RM contains the
0 necessary hardware to support the OAM and subscriber service con-
0 nections. This IPH can be supported with G24 and later software
0 release. G26 is compatible with BCS29, 30, 31, and 32 if I-OAM
0 is not fully utilized. If full I-OAM capabilities are desired,
0 G26 is compatible with BCS31.

0 Prior to G26, the configuration of the PH equipment depended on
0 the software release. Prior to G23 release, the DIU worked in
0 conjunction with a DPN Access Module (AM) and the Network Module
0 (NM). The AM provides interfaces for the DIU, while the NM
0 interfaces the AM to the packet-switched network. A configuration
0 requiring only one AM shelf is called a DPN-10. A two-AM shelf
0 configuration is called DPN-15.

0 As of G23 release, the DPN-100 with the Resource Module (RM) was
0 introduced to provide significantly increased throughput. The NM
0 was still required for applications involving X.75 gateways (un-
0 til G24), and Network Control System (NCS) and data spooling
0 functions (until G26).

0 In G24, the AM and RM can interface to X.75 gateways. Generic G24
0 is the baseline for interfacing with the BCS-27 LGCI.

0 In G26, the IPH does not require an NM. The data spooling and
0 Network Control System functions can be performed by the IPH. The
0 AM is replaced by the RM. Reference Figure 316.6, Packet Handler
0 System Configuration.

0 This section describes the engineering of the ISDN-specific com-
0 ponents of the PH; that is, the DIU and the related RM equipment.

Figure 316.6: Packet Handler System Configuration

0 (b) References

0 NTP 241-1001-XXX DPN.....

0 (c) Provisioning Considerations

0 (i) The quantity of DS-1 links from the DMS is used to deter-
0 mine the quantity of DIU systems (shelves) and sub-
0 systems required. Each sub-system supports a single DS-1
0 link, and the number of interface cards in the sub-system
0 is determined by the number of Bb and Bd channels provi-
0 sioned on the DS-1 link.

0 On the CPCI, DS-1 links and individual channels within
0 the links may be allocated to Bb or Bd as required. Bb
0 and Bd should be distributed as equally as possible over
0 all the links from the same CPCI.

0 (ii) For more information on the DPN, refer to the NTP
0 241-1001- series of documents.

0 Ordering New Peripheral Modules

0
0 Information in sections 2.4.1 - 2.4.9 is contained in the Engi-
0 neering manual sections for the NT6X01AA/AD frames and has been
0 removed from this ECM body.

0 o Application of XPM PLUS to LGC, and LTC modules
0 is mandatory (BCS Gating) for BCS-38. Application of
0 XPM PLUS to DTC modules is mandatory for BCS-41.

0 o As of BCS 35 the MP/SP processor will no longer be
0 shipped for new orders of the LGC/LTC/DTC. The Unified
0 process (XPM Plus) will be shipped for all new LGC/DTC/LTC/
0 modules ordered.

0 Refer to ECM 678 for additional information on XPM Plus.

0 tions in ECM350 DMS-100 Traffic Provisioning "The Credit System":

0

0 Host - Digital Trunk Controller Equipment
0 Chapter 4

Page 4-33

0 RELEASE 28.01
0 93 12 03

0 In ECM350, it is stated that a maximum of 62 software nodes can
0 be datafilled on an LGC/LTC P-side in BCS23 and onwards. The term
0 "software nodes" is defined fully in the ECM.

0 However, there is an additional restriction due to the limited
0 number of direct messaging channels to the LGC/LTC P-side. A
0 maximum of thirty (30) channels is available for this purpose.
0 Each of the following nodes consumes two (2) direct messaging
0 channels:

- 0 - LCM
- 0 - RCC
- 0 - RLCM/OPM
- 0 - Each RMM shelf on the RLCM/OPMs
- 0 - Each ESA Processor (NT6X75AA CP) on the RLCM/OPMs

0 The total number of nodes provisioned on the LGC/LTC P-side can-
0 not exceed the maximum (30) available.

0 Nodes that do NOT require a direct messaging channel comprise
0 those interfaced to the LGC/LTC via a Remote Switching Center
0 (RSC), ie. any LCMs, RLCM/OPMs, RMM shelves, and ESA Processors
0 off the P-side of the RCC. The TOTAL of these nodes plus those
0 above which require direct messaging channels cannot exceed 62.
0 Refer to Figure A on the following page.

0 2.1.6 PROVISIONING CONSIDERATIONS (BUILDING BLOCK ENGINEERING)

0

0 LGE/LTE/DTE CUSTOMER QUESTIONS

0

0 Assumptions

- 0 1. Capacity figures in this document are based on REAL:QUICK.
0 2. 50/50 Orig/Term split provides a worst case scenario.
0 3. 4 secondary members per MADN group.
0 4. 40 percent Custom Calling Feature assignment to POTS lines.
0 5. 100 percent Custom Calling Feature assignment to MDC lines.
0 6. 100 percent UTR provisioning.
0 7. 100 percent secondary member ringing for MADN groups.
0 8. 50 percent secondary member answer.
0 9. Trunks are data filled requiring A and B Scanning,
0 CSM and DS-1 maintenance overheads.

0 Considerations

- 0 1. Utilization higher than 80 percent requires a detailed
0 capacity study using PRTCALC.
0 2. When MADN penetration is higher than 40 percent, then
0 a detailed study is required using PRTCALC.
0 3. Deviation from recommended NTI assignment rules will
0 dictate a detailed capacity study.
0 4. Special applications of the LGC will require detailed
0 capacity study using PRTCALC.
0 5. Call timings used reflect average work times for the
0 lines types.

0 3.0 International Frame LGE/DTE/LTE

0 The first application for the NT6X01AC International Frame LGE/DTE/LTE
0 Fiber ISDN is the Australia DMS-100 Intelligent Network.

0 The NT6X01AC International Common Peripheral Controller Equipment
0 Frame was developed for the DMS-100 Intelligent Network product for
0 the international market. The NT6X01AC design is based on the domes-
0 tic NT6X01AB ISDN peripheral controller, adapted for applications out-
0 side North America ("International"). It supports PCM30 links, ISDN
0 services, and Common Channel Signaling 7 (CCS7) features on two inde-
0 pendent peripheral modules.

0 3.1 HARDWARE PROVISIONING

0

0 3.1.1 HARDWARE USAGE RESTRICTIONS

0

0 NT6X01AC International Peripheral Controller Equipment Frame

0 The NT6X01AC International Peripheral Controller Equipment frame
0 supports two peripheral module types: PCM-30 LGC and DTC.

0 PCM-30 LGC - Supports ISDN, Centrex, EBS, IBN and POTS services
0 on standard Line Concentrating Module types

0 - Has PCM-30 P-side links for PRLCM and International
0 Remote Switching Center interface

0 - Operation as a non-ISDN peripheral is not yet imple-
0 mented in software, meaning that the NTB01AA ISDN
0 Pre-Preprocessor CP is required even if no ISDN fea-
0 tures are used

0 - Supports AMI interface to the NT1. 2B1Q is not sup-
0 ported for this interface

0 PCM-30 DTC - Supports CCS7 and R1 signaling in International ap-
0 plications, using PCM-30 links.

0 - ISDN services like Primary Rate Interface are not
0 supported

0 Modules of different types may be mixed on the frame if required.

0 NTB02AA D-Channel Handler CP are not required for PCM-30 DTC ap-
0 plications, nor where the PCM-30 LGC supports only non-ISDN LCMs.

0 NTB01AA ISDN Pre-Processor CP are always required on PCM-30 LGC
0 (until such time as software supports purely non-ISDN operation).
0 This CP is not required on PCM-30 DTC.

0

0 3.1.2 HARDWARE DEPENDENCIES

0
0 All PCM-30 links from a PRCC must terminate on the same host
0 PCM-30 LGC. Only the PCM-30 LGC peripheral type can terminate
0 PRCC host links.

0 3.1.3 PROVISIONING CONSIDERATIONS

0
0 NT6X01AC International Frame LGE/DTE/LTE ISDN

0 Common Circuit Packfill:

0 NT6X01AC is a general purpose Common Peripheral Controller Equip-
0 ment Frame for applications outside North America ("Internat-
0 ional"). It houses two dual shelf peripheral modules which
0 support PCM30 links, ISDN services, and Common Channel Signaling
0 7 (CCS7) features. Each peripheral module is housed on two adja-
0 cent shelves (ie. a pair of shelves on positions 65 and 51 and a
0 pair of shelves on positions 32 and 18).

0 Each of the two modules in the frame may be configured as:

- 0 - LGCO Line Group Controller Offshore Non-ISDN,
- 0 - LGC0I Line Group Controller Offshore ISDN,
- 0 - DTCO Digital Trunk Controller Offshore Non-ISDN,
- 0 - DTC0I Digital Trunk Controller Offshore ISDN, or
- 0 - TMS (TOPS Message Switch) for
 - 0 - TPC (TOPS Position Controller) interface,
 - 0 - Data base access, and
 - 0 - Inter DCH (D-Channel Handler) for
- 0 ORDB (Operator Reference Database).

0 Cooling Inverter Unit:

0 Provide for each frame,

- 0 - one (1) NT3X90AC Cooling Inverter Unit.

0 Isolated System Grounding:

0 When extending existing offices not equipped with Isolated System
0 Grounding (ISG), provide:

- 0 - one (1) NT0X0009 Logic Return Cable Assembly.

0

0

0 RELEASE 28.01
0 93 12 03

0 Common Circuit Packfill:

0 Provide per customer requirements:

0 - maximum two (2) NT6X02UB LGC/DTC Common CPs (International).

0 NT6X02UB replaces NT6X02UA.

0 Filler Faceplates for Unequipped Modules:

0 When shelves 18-32 or 51-65 are not equipped with any circuit
0 packs, provide for each module:

0 - one (1) NT6X02AB CPC Filler Faceplates.

0 Filler Faceplates for Unequipped CP Slots:

0 For each unequipped circuit pack position on the module, provide:

0 - one (1) NT0X50AA filler faceplate.

0 ISDN Applications:

0 When ISDN BRA functions are required (ISDN functions on sub-
0 scriber lines) for each equipped LGC module, provide:

0 - up to nine (9) NTB02AA D Channel Handler CPs.

0 In BCS-28 or later, provide for use as a hot spare:

0 - one (1) additional NTB02AA D Channel Handler CP.

0 Note that NTB01AA/AB and NTB02AA ISDN CPs may not be provi-
0 sioned on a DTC which is provisioned with NT6X70AAs to handle
0 CCIS/CCS7 voice trunking.

0 DCH CP are not required on a PCM-30 DTC module nor where a PCM-30
0 LGC module supports only non-ISDN LCMs.

0 For TMS (TOPS Message Switch) applications, provide:

0 - four (4) NTB02AA D Channel Handler CPs.

0 Each NTB02AA supports up to 124 BRI D-Channels. The spare DCH
0 CP should not be counted when determining the number of NTB02AA
0 required to support D-channel traffic.

O O O O O O O O O O O O O O O

00000

0

0 RELEASE 28.01
0 93 12 03

0 PCM-30 Interface CPs:

0 Provide for each equipped LGC or DTC module, as per customer re-
0 quirements:

- 0 - maximum eight (8) NT6X27AC/BB PCM-30 Interface CPs.

0 For each TMS module,

- 0 - For TPC (TOPS Position Controller) interface,
0 - for up to 64 operators, provide:
0 - two (2) NT6X27AC/BB PCM-30 Interface CPs
0 in CP slots 5 of both shelves, and
0 - for more than 64 operators and up to 96 operators,
0 provide an additional:
0 - one (1) NT6X27AC/BB PCM-30 Interface CP
0 in CP slot 4 of shelf 0,

0 - For data base access, provide:
0 - two (2) NT6X27AC/BB PCM-30 Interface CPs
0 in CP slot 4 of shelf 1 and
0 in CP slot 3 of shelf 0, and

0 - For inter DCH ORDB, provide:
0 - one (1) NT6X27AC/BB PCM-30 Interface CP
0 in CP slot 3 of shelf 1.

0 Otherwise provide for each unequipped CP slot:

- 0 - one (1) NT0X50AA Filler Faceplate.
- 0
- 0
- 0
- 0
- 0
- 0
- 0

RELEASE 28.01
93 12 03

Provide one (1) NT6X27AC/BB for every two PCM 30 ports required.

Peripheral port/pack location relationship is as follows:

CP POS	5	4	3	2
SHELF POS X+14	PORTS 2, 3	PORTS 6, 7	PORTS 10, 11	PORTS 14, 15
SHELF POS X	PORTS 0, 1	PORTS 4, 5	PORTS 8, 9	PORTS 12, 13

Where:

For the lower module in the frame
shelf position X=18, X+14=32

For the upper module in the frame
shelf position X=51, X+14=65

Assign NT6X27AC/BB to module starting at port 0 and continue in sequential order to port 15.

Each NTB02AA already assigned to CP pos 2 to 5 physically makes the two PCM 30 ports shown above unavailable for assignment to PCM 30.

LCM Interface CPs:

For PCM-30 LGC applications, to interface links from LCMI and/or LCM, provide:

- four (4) NT6X48AA DS30A LCM Interface CPs.

The NT6X48AA CP are assigned in pairs for reliability. One member of the pair interfaces the same DS30A ports as the other member. Each member of the pair occupies the same CP position, with one CP assigned to LGAI/LTAI 0 (lower shelf of the module) and the other assigned to LGAI/LTAI 1 (upper shelf of the module).

0
0 RELEASE 28.01
0 93 12 03

0 The two pairs of NT6X48AA provide interfaces for up to twenty
0 (20) DS30A ports (links) from LCMEs, LCMIs, and/or LCMs.

0 The following is a listing of DS30A ports per DS30A LCM Interface
0 CP, NT6X48AA location:

	CP POS 6	CP POS 7
PORT	2	0
PORT	3	1
PORT	6	4
PORT	7	5
PORT	10	8
PORT	11	9
PORT	14	12
PORT	15	13
PORT	18	16
PORT	19	17

0 The ports for DS30A must be selected from the those ports that
0 remain after assignment of port circuits.

0 Assign ports to DS30A in the following sequence: 19, 17, 18, 16,
0 15, 13, 14, 12, 11, 9, 10, 8, 7, 5, 6, 4, 3, 1, 2 and 0 (if un-
0 used by DCH or DS-1). In an extension job, when adding new DCH
0 ports, the DS30A ports may have to be reconfigured in accordance
0 with this rule.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 Two Processor XPM (MP/SP) or XPM Plus (UP):

0 For offices with the XPM (MP/SP) feature, provide for each
0 equipped LGC or DTC module:

- 0 - four (4) NT6X45BA LGC/DTC Processor CPs,
- 0 - two (2) NT6X47AC 4MB MP Memory CPs,
- 0 - two (2) NT0X50AA Filler Face Plates in slot 10, and
- 0 - two (2) NT6X46BA/BB Signal Processor Memory Plus CPs.

0 Also provide NTB01AAs per 2) below.

0 Alternatively, for offices with the XPM Plus (UP) feature, pro-
0 vide for each equipped LGC or DTC module:

- 0 - two (2) NTMX77AA XPM Plus Processor CPs,
- 0 - two (2) NTMX71AA XPM Plus Paddleboards,
- 0 - one (1) NT6X01WE Wiring List XPM Plus, and
- 0 - eight (8) NT0X50AA Filler Face Plates
- 0 in slots 8, 9, 10, and 11.

0 Also provide NTB01ABs per 2) below.

0 In offices with the XPM (MP/SP) feature, provide:

- 0 - for each equipped LGC module:
 - 0 - two (2) NTB01AA ISDN Sig. Preproc. CPs.
 - 0 (Note that NTB01AAs must be provisioned for LGC
 - 0 even when ISDN services are not required).
- 0 - for each equipped DTC module:
 - 0 - when ISDN services are required,
 - 0 - two (2) NTB01AA ISDN Sig. Preproc. CPs, or
 - 0 - when ISDN services are not required,
 - 0 - two (2) NT0X50AA Filler Face Plates.

0 Note that NTB01AA ISDN CPs may not be provisioned on a DTC which
0 is provisioned with NT6X70AAs to handle CCIS/CCS7 voice trunking.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 In offices with the XPM Plus (UP) feature, provide:

- 0 - for each equipped LGC module:
 - 0 - two (2) NTB01AB ISDN Sig. Preproc. CPs.
 - 0 (Note that NTB01ABs must be provisioned for LGC
 - 0 even when ISDN services are not required).
- 0 - for each equipped DTC module:
 - 0 - when ISDN services are required,
 - 0 - two (2) NTB01AB ISDN Sig. Preproc. CPs, or
 - 0 - when ISDN services are not required,
 - 0 - two (2) NT0X50AA Filler Face Plates.

0 Note that NTB01AB ISDN CPs may not be provisioned on a DTC which
0 is provisioned with NT6X70AAs to handle CCIS/CCS7 voice trunking.

0 For existing modules being converted from XPM to XPM Plus pro-
0 vide:

- 0 - for each equipped LGC module:
 - 0 - one (1) NT6X02XB XPM Plus Change Kit and
 - 0 NT0X50AA Filler faceplates per EMS
 - 0 EMA2-99-XPM-9 for NT6X02XB.
- 0 - for each equipped DTC module:
 - 0 - In a Non-ISDN environment,
 - 0 - one (1) NT6X02XA XPM Plus Change Kit and
 - 0 NT0X50AA Filler faceplates per EMS
 - 0 EMA2-99-XPM-6 for NT6X02XA, or
 - 0 - In an ISDN environment,
 - 0 - one (1) NT6X02XB XPM Plus Change Kit and
 - 0 NT0X50AA Filler faceplates per EMS
 - 0 EMA2-99-XPM-9 for NT6X02XB.

0 (NT6X02XB has the same parts as NT6X02XA plus two (2) NTB01ABs)

0 Wiring Option for Non-ISDN:

0 Provide one (1) NT6X01WD Wiring Option when ISDN features are not
0 required on the frame. The option adds a wire strap to the back-
0 panel NT6X0103 Slot XX-12 between pins 7A and 8A to allow for
0 non-ISDN operation.

0 RELEASE 28.01
0 93 12 03
0

0 Continuity Tone Detector CPs:

0 When this module is handling CCIS/CCS7 voice trunking, provision
0 for each PCM-30 DTC module:

- 0 - two (2) NT6X70AA Continuity Tone Detector CPs.

0 Note that NT6X70AAs for CCIS/CCS7 voice trunking, may not be pro-
0 visioned on a DTC which is provisioned with NTB01AA/AB ISDN CPs.

0 This CP supports a Continuity Test (COT), and is recommended
0 whenever analog facilities are employed in part or all of the
0 transmission path.

0 When the facility is end-to-end digital, this CP is not required
0 since digital facilities employ other means of fault detection.

0 An LGC may not be provisioned with NT6X70AA CPs.

0 Calling Number Display Feature CPs:

0 When the module is handling CMS Calling Number Display feature,
0 provide for each PCM-30 LGC module:

- 0 - two (2) NT6X78AA/AB CLASS Modem Resource CPs.

0 Universal Time Switch CPs:

0 Provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT6X44EA Universal Time Switch (UK) CPs.

0 Universal Tone Receiver CPs:

0 When analog (POTS) lines are to be supported, or when non-ISDN
0 trunks (A/B bit signalling) are interfaced to a PCM-30 DTC mod-
0 ule, provide the following Universal Tone Receiver (UTR) CP for
0 each PCM-30 LGC module:

- 0 - maximum two (2) NT6X92CA UTR CPs.

0 RELEASE 28.01
0 93 12 03

0 Message Protocol and Downloadable Tone CPs:

0 Provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT6X69LB Msg Protcl & Downldbl Tone CPs.

0 The NT6X69LB is recommended for use in all applications in place
0 of the NT6X69LA. However, depending on availability, the
0 NT6X69LA may be used when fiber network interface is not re-
0 quired.

0 Network Interface CPs:

0 When DS30 copper network interface is required in a non-ENET of-
0 fice, provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT6X40AC packs DS30 Network Interface CPs.

0 Otherwise, when fiber network interface is required in an ENET
0 office, provide for each PCM-30 LGC/DTC module:

- 0 - one (1) NT6X02BU Fiber I/F H/W Assembly,
0 - two (2) NT6X40FA DS512 Network Interface CPs,
0 - two (2) NT6X40GA DS512 Paddle Boards, and
0 - two (2) P0736273 Optical Fiber Danger Labels.

0 Depending on availability, NT6X40CA and NT6X40DA functional pair
0 may be used in place of the preferred NT6X40FA and NT6X40GA func-
0 tional pair. The paddleboards and circuit packs cannot be mixed
0 because they do not function in mismatched pairs.

0 Also both pairs in a module must be NT6X40FA and NT6X40GA or both
0 NT6X40CA and NT6X40DA. In other words if one of the pairs in the
0 module is NT6X40FA and NT6X40GA, the other pair in the module may
0 not be NT6X40CA and NT6X40DA.

0 Power Conversion CPs:

0 Provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT2X70AE Power Conv +/-5V & 12V CPs.

0 Designation Labels for CPs:

0 Provide the appropriate designation label for each CP provided.

0
0 RELEASE 28.01
0 93 12 03

0 PCM-30 Signaling CPs:

0 For each equipped LGC/DTC which supports PCM30 links (NT6X27
0 PCM-30 Interface CPs), or for each equipped LGC module which sup-
0 ports links to an LCM (NT6X48 DS30A LCM Interface CPs provided),
0 and the LCM is equipped with a PCM30 line drawer such as the
0 NT6X05CA, provide:

0 - two (2) NT6X28AA PCM-30 Signaling CPs.

0 CPC Coax Panel:

0 When PCM30 feature is required, provide for each PCM-30 LGC/DTC
0 module:

0 - one (1) NT6X01ZA CPC Coax Panel.

0 When this feature is to be field installed, then the NT6X01ZA CPC
0 Coax Panel will require the following supporting documents:
0 PC6X01ZB and SRJ6X01AC.

0 4.0 International Frame LGE/DTE Non-ISDN

0 NT6X01BA is a general purpose Common Peripheral Controller Equip-
0 ment Frame for international applications which houses two inde-
0 pendent dual shelf modules.

0 Each module may be provisioned as a

- 0 - PCM30 Line Group Controllers (PLGC), or
- 0 - PCM30 Digital Trunk Controllers (PDTC),

0 Or, with DMS100I software in the office, each module may be pro-
0 visioned as a

- 0 - International Line Group Controllers (ILGC), or
- 0 - International Digital Trunk Controllers (IDTC).

0 An ILGC/PLGC may be provisioned to support

- 0 - copper interface (DS-30) or
- 0 fiber interface (DS-512) to the network,
- 0 - PCM-30 links to RLCM, RSC or OPM,
- 0 - DS-30A interface to LCM.

0 A IDTC/PDTC may be provisioned to support

- 0 - copper interface (DS-30) or
- 0 fiber interface (DS-512) to the network,
- 0 - PCM-30 links to other offices,
- 0 - Common Channel Signaling 7 (CCS7).

0 4.1.3 PROVISIONING CONSIDERATIONS

0
0 NT6X01BA International Frame LGE/DTE Non-ISDN:

0 Common Circuit Packfill:

0 A maximum of two (2) PLGC or PDTC, or, in offices with DMS100I
0 software, ILGC or IDTC modules may be equipped per frame.

0 For new applications, provide for each equipped module:

- 0 - one (1) NT6X02GM International LGC/DTC Common CP,
0 which includes
- 0 - two (2) NT6X44EA Time Switch CPs
0 - two (2) NT2X70AE Power Converter +-5V +-12Vs CPs.

0 Otherwise provide for each unequipped CP slot:

- 0 - one (1) NT0X50AA Filler Faceplate.

0 PCM-30 COAXIAL INTERFACE:

0 When 75 ohm coaxial PCM 30 interface cabling is required, a Patch
0 Panel, grounded to the frame, must be provided as follows:

0 Coaxial Interface BNC Connectors, Grounded on Receive:

0 When coaxial interface cabling via 75 Ohm BNC connectors grounded
0 on receive (Brazil, Curacao) is required by the customer, provide
0 for each frame:

- 0 - two (2) NT6X01ZA/ZD Coaxial Panels.

0 NT6X01ZA may not be provisioned when NTCX50AA is provisioned.

0

0

0

0 RELEASE 28.01
0 93 12 03
0

0 Coaxial Interface BT43 Connectors, Grounded on Transmit:

0 When coaxial interface cabling via 75 Ohm BT43 connectors
0 grounded on transmit is required by the customer, and four (4) or
0 more NT6X27s per module are provisioned, provide for each frame:

- 0 - to connect the first four (4) NT6X27s provisioned
0 in CP slots 04 and 03:
 - 0 - two (2) NT6X01ZE Coaxial Panels,
- 0 - to connect the 5th and 6th NT6X27s, when provisioned,
0 in CP slots 02:
 - 0 - two (2) NT6X0126 Coax Cable Kits, and
 - 0 - two (2) NT6X01WH Wiring Lists,
- 0 - to connect the 7th and 8th NT6X27s, when provisioned,
0 in CP slots 01:
 - 0 - two (2) NT6X0127 Coax Cable Kits, and
 - 0 - two (2) NT6X01WJ Wiring Lists.

0 Coaxial Interface BNC Connectors, Grounded on Transmit:

0 When coaxial interface cabling via 75 Ohm BNC connectors grounded
0 on transmit (China, NETAS), is required by the customer provide
0 for each frame:

- 0 - two (2) NT6X01ZF Coaxial Panels.

0 For addition and maintenance in frames equipped with NT6X27AAs
0 or NT6X27ABs, provide for each equipped module:

- 0 - minimum four (4) and
0 maximum eight (8) NT6X27AB PCM 30 Interface CPs.

0 Otherwise provide for each unequipped CP slot:

- 0 - one (1) NT0X50AA Filler Faceplate.

0 Do not provision NT6X27BB in a frame equipped with NT6X27AAs or
0 NT6X27ABs.

0 When the enhancements of the NT6X27BB are required in a frame
0 equipped with NT6X27AAs or NT6X27ABs, each of the NT6X27AA or
0 NT6X27AB in the frame must be replaced with a NT6X27BB, and, when
0 PCM-30 coaxial interface is required, the frame must be equipped
0 with a grounded NT6X01 Coaxial Panel.

0 RELEASE 28.01
0 93 12 03
0

0 For additions and maintenance in frames equipped with NT6X27ACs
0 use NT6X27BBs, and, when PCM-30 coaxial interface is required,
0 the frame must be equipped with a grounded NT6X01 Coaxial Patch
0 Panel.

0 PCM-30 Signaling Interface:

0 For each equipped LGC/DTC which supports PCM-30 links (NT6X27
0 PCM-30 Interface CPs provided), or for each equipped LGC module
0 which supports links to an LCM (NT6X48 DS30A LCM Interface CPs
0 provided), and the LCM is equipped with a PCM-30 line drawer such
0 as the NT6X05CA, provide:

0 - two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 PCM-30 Coaxial Interface Panel:

0 For frames equipped with NT6X27AC/BB PCM-30 Interface CPs, a 75
0 ohm coaxial PCM-30 Interface Patch Panel, grounded to the frame,
0 must be provided as follows:

0 When coaxial interface cabling via 75 Ohm BNC connectors grounded
0 on receive (Brazil, Curacao) is required by the customer, provide
0 for each frame:

0 - two (2) NT6X01ZA/ZD Coaxial Panels.

0 Coaxial interface cabling with connectors grounded on transmit
0 will become available in the third quarter of 1993.

0 DS-30A Interface:

0 For each ILGC or PLGC module equipped with NT6X02GM Common CP,
0 provide as per customer requirements:

0 - maximum four (4) NT6X48AA DS-30A LCM Interface CPs.

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 2) To convert one PDTC module equipped for XPM to XPM+ provide:

- 0 - one (1) NT6X01XE XPM+ 3P Upgrade Kit.

0 The NT6X01XE kit includes:

- 0 - two (2) NTMX77AA XPM Plus Processor CPs,
0 - two (2) NTMX71AA XPM Plus Paddleboards,
0 - four (4) NT7X80AA Bus Shorter CPs, and
0 - backplane wiring modifications for XPM+.

0 The XPM CPs NT6X45BA, NT6X47AC, and NT6X46BB must be re-
0 moved before the NT6X01XE XPM+ 3P Upgrade Kit is applied.

0 Channel Supervision:

0 For each ILGC, IDTC, PLGC, or PDTC module equipped with NT6X02GM
0 Common CP, provide, except when CCITT N5 Signaling feature is re-
0 quired:

- 0 - two (2) NT6X42AA Channel Supervision Msg CPs.

0 CCITT N5 Signaling:

0 For each ILGC, IDTC, PLGC, or PDTC module equipped with NT6X02GM
0 Common CP, provide,

- 0 - two (2) NT6X62DA CCITT N5 Tone Receiver CPs, and
0 - two (2) NT6X42CA CSM and CCITT N5 Splitter CPs.

0 Always provide (in case NT6X62DA and NT6X42CA CPs are provided
0 later):

- 0 - one (1) NT6X01WG CCITT N5 Signaling Wiring List.

0 Speech Bus Formatter:

0 For each ILGC, IDTC, PLGC, or PDTC module equipped with NT6X02GM
0 Common CP, provide:

- 0 - two (2) NT6X41AB Speech Bus Formatter CPs.

0 RELEASE 28.01
0 93 12 03

0 DS-30 Interface:

0 When DS30 copper network interface is required in a non-ENET of-
0 fice, provide for each ILGC, IDTC, PLGC, or PDTC module equipped
0 with NT6X02GM Common CP:

- 0 - two (2) NT6X40AC packs DS30 Network Interface CPs, and
- 0 - two (2) NT6X69LB Msg Protcl & Downldbl Tone CPs.

0 The NT6X69LB is recommended for use in all applications in place
0 of the NT6X69LA. However, depending on availability, the
0 NT6X69LA may be used when fiber network interface is not re-
0 quired.

0 DS-512 Interface:

0 When fiber network interface is required in an ENET office, pro-
0 vide for each ILGC, IDTC, PLGC, or PDTC module equipped with
0 NT6X02GM Common CP:

- 0 - one (1) NT6X02BU Fiber I/F H/W Assembly,
- 0 - two (2) NT6X40FA DS512 Network Interface CPs,
- 0 - two (2) NT6X40GA DS512 Paddle Boards,
- 0 - two (2) NT6X69LB Msg Protcl & Downldbl Tone CPs, and
- 0 - two (2) P0736273 Optical Fiber Danger Labels.

0 For fiber network interface the NT6X69LB must be used (the
0 NT6X69LA may not be substituted for NT6X69LB when fiber network
0 interface is required).

0 Cooling Unit:

0 For the only ILGE, IDTE, PLGE, or PDTE frame equipped in an of-
0 fice, or for the first of each group of frames served by a dif-
0 ferent PDC, provide:

- 0 - one (1) NT3X90AB Cooling Inverter Unit, or
- 0 one (1) NT3X90AC DC Fan Cooling Unit.

0 Thereafter, for each subsequent frame, provide:

- 0 - one (1) NT3X90AA Cooling Inverter Unit, or
- 0 one (1) NT3X90AC one DC Fan Cooling Unit.

0 NT3X90AC replaces NT3X90AA and NT3X90AB for new jobs.

0

0
0 RELEASE 28.01
0 93 12 03

0 Enhanced Grounding:

0 When extending existing offices not equipped with enhanced
0 grounding per IS0X00, provide for each frame:

- 0 - one (1) NT0X0009 Logic Return Cable Assembly.

0 Echo Cancellor:

0 When the Echo canceller feature is required, provide:

- 0 - two (2) NTCX50AA Echo Cancellor Control Paddle Boards.

0 The Coax Panel provisioned must be other than NT6X01ZA.

0 As the Echo Cancellor Control interface cable uses the bulkhead
0 connector positions normally used for twisted pair PCM-30, the
0 ECC can only be provisioned when these connectors are not being
0 used.

0 Always provide (in case NTCX50AA CPs are provided later):

- 0 - one (1) NT6X01WF Echo Cancellor Wiring List.

0 Common Circuit Packfill:

0 For each equipped module, provide except for Digital N5 applica-
0 tions:

- 0 - one (1) NTFX33BC International LGC/DTC Common CP.

0 For Digital N5 application, provide for each equipped module:

- 0 - one (1) NTFX33BD International LGC/DTC Common CP.

0 If the second module is not equipped on the FCTM cabinet, pro-
0 vide:

- 0 - one (1) NT6X02AB Common Peripheral Controller Module Filler
0 Faceplate Kit.

0 CCITT N5 Signaling:

0 For Digital N5 application, provide for each module equipped with
0 NTFX33BD per customer requirements:

- 0 - two (2) NT6X42CA CSM and N5 Splitter CPs, and
0 - two (2) NT6X62DA CCITT N5 Version Special Tone Receiver
0 (STR) CPs.
0 - two (2) NTFX33WF wiring lists.

0 PCM-30 Interface:

0 For each equipped module, provide as per customer requirements:

- 0 - minimum four (4) and
0 maximum eight (8) NT6X27AC/BB PCM-30 Interface CPs.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 PCM-30 Signaling Interface:

0 For each equipped LGC/DTC which supports PCM-30 links (NT6X27
0 PCM-30 Interface CPs provisioned), or for each equipped LGC mod-
0 ule which supports links to an LCM (NT6X48 DS30A LCM Interface
0 CPs provisioned), and the LCM is equipped with a PCM-30 line
0 drawer such as the NT6X05CA, provide:

- 0 - two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 PCM-30 Coaxial Interface Panel:

0 For PCM-30 interface via coaxial cable, provide for each equipped
0 module:

- 0 - one (1) NTN3366 Coaxial Interface Assembly
0 (NTNX3366 connects shelves 05 and/or 33), and
0 - one (1) NTN3369 Coaxial Interface Cable Assembly
0 (NTNX3369 connects shelves 19 and/or 47).

0 PCM-30 Twisted Pair Interface:

0 For PCM-30 interface via twisted pair wiring, provide for each
0 equipped IDTC module:

- 0 - two (2) NTN3370 PCM-30 Twisted Pair Interface Assemblies, and
0 - two (2) NTN3371 PCM-30 Twisted Pair Interface Assemblies.

0 As the Echo Canceller Control interface cable uses the bulkhead
0 connector positions normally used for twisted pair PCM-30, the
0 ECC can only be provisioned when these connectors are not being
0 used.

0 When twisted pair PCM-30 interface is equipped, provide for each
0 cabinet:

- 0 - one (1) P0711579 Designation Labels Sheet.

0 One sheet contains sufficient cable connector designation labels
0 for both modules in the frame.

0 RELEASE 28.01
0 93 12 03

0 Universal Tone Receiver:

0 The NT6X92CA Universal Tone Receiver is a combined service circuit that can perform the function of Digitone Receiver for lines and MF Receiver for trunks. One pair of NT6X92CA provides up to thirty circuits.

0 For each equipped module, provide per customer requirements:

- 0 - zero (0),
- 0 two (2) or
- 0 four (4) NT6X92CA Universal Tone Receiver CPs.

0 The first provisionable UTR (NT6X92CA) pair shall be located in CP slot 8 unless CP slot 8 is equipped with an NT6X62DA. The second provisionable UTR pair shall be located in CP slot 9, unless CP slot 9 is equipped with an NT6X70AA. In this case, the second UTR pair will be located in CP slot 11. Each UTR on the shelf is paired with a UTR in the same circuit pack position on the other shelf in the module.

0 Continuity Tone Detector:

0 When the DTC is handling CCIS/CCS7 voice trunking, provide for each equipped module:

- 0 - two (2) NT6X70AA Continuity Tone Detector CPs, and
- 0 - two (2) NTN33WA Continuity Tone Detector Wiring Assembly.

0 The NT6X70AA supports a Continuity Test (COT), and is recommended whenever analog facilities are employed in part or all of the transmission path.

0 When the facility is end-to-end digital, the NT6X70AA is not required since digital facilities employ other means of fault detection.

0 An LGC may not be provisioned with NT6X70AA CPs.

0 RELEASE 28.01
0 93 12 03

0 Echo Cancellor:

0 When the Echo canceller feature is required, provide for each
0 pair of NT6X28AAs provisioned:

- 0 - two (2) NTCX50AA Echo Cancellor Control Paddle Boards.
- 0 - one (1) NTNX3390 Echo Cancellor Control Interconnect
0 Cable Assembly and
- 0 - two (2) NTFX33WE Echo Cancellor Wiring Lists.

0 As the Echo Cancellor Control interface cable uses the bulkhead
0 connector positions normally used for twisted pair PCM-30, the
0 ECC can only be provisioned when these connectors are not being
0 used.

0 For the field application of the Echo Cancelling feature, provide
0 for each equipped module:

- 0 - one (1) NTFX33ZA Echo Cancellor Control Kit.

0 This kit consists of:

- 0 - two (2) NTCX50AA paddle boards and
- 0 - one (1) NTNX3390 interconnect cable assembly.

0 DS-512 Interface:

0 For each module equipped with network interface via fiber cabling
0 in an ENET office, provide:

- 0 - two (2) NT6X40FA DS-512 Interface CP,
- 0 - two (2) NT6X40GA DS-512 Link Paddleboard,
- 0 - one (1) NT6X02BU FXPM Bracket Assembly, and
- 0 - two (2) P0736273 Optical Fiber Danger Labels.

0 Depending on availability, NT6X40CA and NT6X40DA functional pair
0 may be used in place of the preferred NT6X40FA and NT6X40GA func-
0 tional pair. The paddleboards and circuit packs cannot be mixed
0 because they do not function in mismatched pairs.

0 When either module in the FCTM cabinet is equipped with network
0 interface via fiber cabling, provide for each cabinet:

- 0 - one (1) P0713105 Fiber Cover Plate,
- 0 - one (1) P0713256 Fiber Cover Plate, and
- 0 - two (2) P0682727 Bushings

0 RELEASE 28.01
0 93 12 03

0 DS-30 Interface:

0 For each upper module (Shelf positions 33 and 47) equipped with
0 network interface via copper cabling, provide:

- 0 - two (2) NT6X40AC DS-30 Interface CP,
0 - one (1) P0713257 Connector Cover Plate, and
0 - one (1) NTNX3389 DS-30 Interface Cable Assembly.

0 For each lower module (Shelf positions 05 and 19) equipped with
0 network interface via copper cabling, provide:

- 0 - two (2) NT6X40AC DS-30 Interface CP,
0 - one (1) P0713258 Connector Cover Plate, and
0 - one (1) NTNX3384 DS-30 Interface Cable Assembly.

0 DS-30A Interface:

0 For ILGC applications to interface links from ILCM, provide:

- 0 - four (4) NT6X48AA DS30A LCM Interface CPs.

0 The NT6X48AA CP are assigned in pairs for reliability. One member
0 of the pair interfaces the same DS30A ports as the other member.
0 Each member of the pair occupies the same CP position, with one
0 CP assigned to LGAI 0 (lower shelf of the module) and the other
0 assigned to LGAI 1 (upper shelf of the module).

0 For each DS-30A Interface Cable Assembly ordered, provide:

- 0 - two (2) P0638259 Bushings and
0 - two (2) P0423631 Washers.

0 8-port 64Kbit Interface:

0 When an 8-port 64Kbit interface is requested by the customer,
0 provide for each equipped module:

- 0 - one (1) NT6X55CA 8-port 64-Kbit I/F CP, and
0 - one (1) NTFX3303 Cable Assembly.

0 When both PCM-30 and 8-port 64-Kbit interface are provisioned in
0 the same cabinet simultaneously, the number of associated ports
0 per module will be fourteen (14) PCM-30 ports and eight (8)
0 64-Kbit ports.

0 RELEASE 28.01
0 93 12 03
0

0 For the field application of the 8-port 64Kbit feature, provide
0 for each equipped module:

0 - one (1) NTFX33ZB 8-port 64Kbit Interface Circuit Kits.

0 Each NTFX33ZB kit consists of:

0 - one (1) NT6X55CA 8-port 64-Kbit I/F CP, and
0 - one (1) NTFX3303 Cable assembly.

0 1-port 64Kbit Interface:

0 For each 1-port 64Kbit interface required, maximum 1 per shelf of
0 an equipped module, provide:

0 - one (1) NT6X55BA 64-Kbit Access CPs,

0 for each shelf in position 19 or 47 provisioned with a NT6X55BA,
0 provide:

0 - one (1) NTFX3305 Cable Assembly, and

0 for each shelf in position 05 or 33 provisioned with a NT6X55BA,
0 provide:

0 - one (1) NTFX3306 Cable Assembly.

0 The NT6X55BA should only be provisioned when DS30A p-side ports
0 (provisioned per RUL16) are not used.

0 Earthquake Anchor Kit:

0 When cabinet is installed in seismic (earthquake) zones

0 - ATC Zones 6 & 7,
0 - NEBS Zone 4, and
0 - UBC Zone 4

0 provision for each cabinet:

0 - for slab-type flooring,
0 - one (1) NTNX2540 Earthquake Anchor Kit, or
0 - for computer-type flooring,
0 - one (1) NTNX2578 Earthquake Anchor Kit.

0

0 RELEASE 28.01
0 93 12 03

0 Non-Earthquake Frame Mounting Kit:

0 When installing cabinet in a non-earthquake zone, provision for
0 each cabinet:

- 0 - for slab-type flooring,
 - 0 - one (1) NTNX2579 Frame Mounting Kit, or
- 0 - for computer-type flooring,
 - 0 - one (1) NTNX2580 Frame Mounting Kit.

0 Cabinet Color:

0 When specifying a brown cabinet, provision for each cabinet:

- 0 - two (2) NTNX2550 Left Door Assemblies (Brown),
- 0 - two (2) P0699464 Left Door Labels (Brown),
- 0 - two (2) NTNX2552 Right Door Assemblies (Brown), and
- 0 - two (2) P0695230 Right Door Labels (Brown),
 - 0 one each for front and rear respectively, as well as
- 0 - one (1) P0714720 Cabinet Type Label (Brown).

0 When specifying a grey cabinet, provision for each cabinet:

- 0 - two (2) NTNX2515 Left Door Assemblies (Grey),
- 0 - two (2) P0677704 Left Door Labels (Grey),
- 0 - two (2) NTNX2513 Right Door Assemblies (Grey), and
- 0 - two (2) P0699158 Right Door Labels (Grey),
 - 0 one each for front and rear respectively, as well as
- 0 - one (1) P0714721 Cabinet Type Label (Grey),

0 CP Designation Labels:

0 Provide the appropriate designation label for each CP provided.

0 Unequipped CP Slots:

0 For each unequipped CP slot 1-6, 8,9,11, and 19, provide:

- 0 - one (1) NT0X50AA Filler Face Plate.

0 6.0 International Cabinet LGE/DTE/LTE ISDN

0 The Australian DMS-300 International Gateway Switch is based on the
0 DMS-300 supplied to Turkey with the following enhancements:

- 0 - Signalling systems necessary to introduce the product
0 into the Australian National Network.
- 0 - Enhancements to the Call Detail Recording, Operational
0 Measurements and Call Progression tone systems.

0 Similarly, the DMS-300 Gateway Switch for Madley-B Digital Interna-
0 tional Switching Centre (DISC) in the United Kingdom is based on ex-
0 isting technology, adapted for that market.

0 The NTFX33CA International Cabinet LGE/DTE/LTE ISDN houses one or two
0 International PCM-30 LGC/DTC/LTC ISDN or not dual shelf modules in a
0 cabinet configuration for applications not requiring fiber network
0 interfaces.

0 The NTFX33CA International Cabinet LGE/DTE/LTE ISDN is provi-
0 sioned as follows:0 The shelves within the LTEM cabinet are provisioned in the same
0 way as the domestic ISDN frame NT6X01AB, except that PCM-30

0 RELEASE 28.01
0 93 12 03
0

0 interfaces are used instead of DS-1 and some circuit pack vin-
0 tages are different for the Offshore market.

0 Refer to the Engineering Manual sections for details on circuit
0 pack vintages and cabinet hardware provisioning.

0 Common Circuit Pack:

0 Provision up to two (2) NT6X02UB PCM-30 LGC/DTC Common Circuit
0 Pack (Offshore) per LTEM.

0 PCM-30 Interface:

0 Provision up to eight (8) NT6X27AC/BB PCM-30 Interface CP per
0 PCM-30 LGC/DTC module, to interface up to sixteen PCM-30 links (2
0 links per CP).

0 The NT6X27BB Enhanced PCM-30 Interface circuit pack is backward
0 compatible with the NT6X27AC/BA circuit packs. It is also a re-
0 placement for the NT6X27AA/AB circuit packs, although it cannot
0 be mixed with the NT6X27AA/AB in the same frame or cabinet.

0 The NT6X27BB includes enhancements over the NT6X27AA/AB such as:

- 0 - Full compliance to CCITT,
0 - Improved alarm handling, and
0 - Support for DCME.

0 The initial application for the NT6X27BB is all the frames and
0 cabinets where the NT6X27AC/BA are provisioned. The manufacture
0 of the NT6X27AC/BA is being discontinued.

0 PCM-30 Signaling Interface:

0 For each equipped LGC/DTC which supports PCM30 links or for each
0 equipped LGC module which supports links to an LCM which is
0 equipped with a PCM30 line drawer such as the NT6X05CA, provide:

0 two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 CND Feature:

0 When the Calling Number Delivery/Calling Number Display (CND)
0 feature is required, provision two (2) NT6X78AB CLASS Modem Re-
0 source CPs for each PCM-30 LGC/DTC module.

0 Network Interface:

0
0 RELEASE 28.01
0 93 12 03

0 In an office with the Enhanced Network (ENET) provide a fiber
0 interface per module as follows:

0 two (2) NT6X40FA DS-512 Link Control CPs,
0 two (2) NT6X40GA DS-512 Link Control Paddleboards,
0 two (2) NT6X69LB DS-512 CPP Protocol & Downld CPs, and
0 one (1) P0736273 Fiber Cable Warning Label.

0 And for each cabinet

0 one (1) NTNX33SD DS-512 Fiber Interface to Network Kit.

0 Depending on availability, NT6X40CA and NT6X40DA functional pair
0 may be used in place of the preferred NT6X40FA and NT6X40GA func-
0 tional pair. The paddleboards and circuit packs cannot be mixed
0 because they do not function in mismatched pairs.

0 In a non-ENET office, provide a copper interface as follows:

0 two (2) NT6X40AC DS30 Network Interface CPs
0 two (2) NT6X69LA/LB CPP Protocol & Downld CPs.

0 The NT6X69LA may be used for non-fiberised peripherals when the
0 preferred NT6X69LB is not available.

0 7.1.3 PROVISIONING CONSIDERATIONS

0
0 The NTNX33GA International Cabinet LGE/DTE Fiber ISDN (FCTM-ISDN)
0 is provisioned as follows:

0 The shelves within the FCTM-ISDN cabinet are provisioned the same
0 as the domestic ISDN frame (NT6X01AB), except that PCM-30 inter-
0 faces are used instead of DS-1, and some circuit pack vintages
0 are different for the International market. Maximum eight (8)
0 PCM-30 Interface CP (supporting 16 PCM-30 links) may be equipped.
0 Refer to the Engineering Manual sections for details on circuit
0 pack vintages and cabinet hardware provisioning.

0 Provision up to two (2) NTNX33GB LGCI/DTCI Fiber Common CP
0 (International) per FCTM-ISDN.

0 Provision up to eight (8) NT6X27AC/BB PCM-30 Interface CP per
0 PCM-30 LGC/DTC module, to interface up to sixteen PCM-30 links (2
0 links per CP).

0 The NT6X27BB Enhanced PCM-30 Interface circuit pack is backward
0 compatible with the NT6X27AC/BA circuit packs. It is also a re-
0 placement for the NT6X27AA/AB circuit packs, although it cannot
0 be mixed with the NT6X27AA/AB in the same frame or cabinet.

0 The NT6X27BB includes enhancements over the NT6X27AA/AB such as:

- 0 - Full compliance to CCITT,
- 0 - Improved alarm handling, and
- 0 - Support for DCME.

0 The initial application for the NT6X27BB is all the frames and
0 cabinets where the NT6X27AC/BA are provisioned. The manufacture
0 of the NT6X27AC/BA is being discontinued.

0 When the Calling Number Delivery/Calling Number Display (CND)
0 feature is required, provision two (2) NT6X78AB CLASS Modem Re-
0 source CPs for each PCM-30 LGC/DTC module.

0 For each equipped LGC/DTC which supports PCM30 links or for each
0 equipped LGC module which supports links to an LCM which is

0

0| equipped with a PCM30 line drawer such as the NT6X05CA, provide:
0 two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 RELEASE 28.01
0 93 12 03

0 8.0 XPM PLUS for Base Non-ISDN XPM

0 The XPM PLUS (Product Life Upgrade Strategy) Phase II program ad-
0 dresses the need for memory and processing enhancements by re-
0 placing the separate MP and SP circuit packs in DTC/LGC/LTC/RCC
0 modules with the Unified Processor (UP). The UP increases avail-
0 able memory to 8Mb and increases RealTime processing power, com-
0 pared to the current XPM. All existing functions, interfaces and
0 tools continue to be supported.

0 The XPM PLUS schedule has been pulled in so that all new ship-
0 ments of LTCI/LGCI from BCS-34 forward will utilize the Unified
0 Processor (XPM PLUS). Support for Subscriber Carrier equipment is
0 planned to VO in BCS-36 and to be Generally Available in BCS-37.

0 This ECM describes both upgrades of existing equipment and new
0 shipments of XPM+ peripherals on the combined ISDN/non-ISDN
0 frame. XPM PLUS capability may also be supplied for both new
0 shipments and upgrades to existing RCE frames.

0 8.1 HARDWARE PROVISIONING

0

0 8.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The following usage restrictions apply to the XPM+ Phase II prod-
0 uct:

- 0 o RLCM and MSB7 are not to be upgraded to XPM PLUS
0 with the Unified Processor.
- 0 o In order to use the new software that is available
0 in BCS-35 and above, XPMs currently equipped with
0 enhanced messaging will require upgrade from MP/SP
0 processors to the XPM PLUS processor. Since XPMs
0 must meet minimum BCS packfill requirements before
0 these kits can be applied, the modules will be
0 equipped with one of the following:

0 Base XPMs:
0 -----

0 RELEASE 28.01
0 93 12 03
0

0 DTC Modules - NT6X02AS, NT6X02IA or NT6X02IC
0 LGC Modules - NT6X02AT, NT6X02LA or NT6X02LC
0 LTC Modules - NT6X02AU, NT6X02MA or NT6X02MC

0 The slots that mount the processors and memory are provisionable
0 in packfills NT6X02IC, NT6X02LC and NT6X02MC. Application of the
0 NT6X02XC kit to modules containing one of the other packfills
0 will bring the module to the NT6X02IC/LC/MC level, making these
0 slots provisionable.

0 Remote:

0 -----

0 RCC Modules - NT6X12AD, NT6X12AG and NT6X12CA

0 The processors and memory are Always Provided in these packfills.
0 Application of the NT6X12ZF to a module equipped with NT6X12AG
0 will change the RCC module to the NT6X12AK level. When applying
0 the NTZZ12ZF kit to a module equipped with NT6X12CA or any
0 packfill NT6X12AF or earlier, the NT6X72AA packs must be replaced
0 with NT6X72ABs. Application of the NT6X12ZF and the NT6X72AA re-
0 placement with NT6X72AB, upgrades these modules to the NT6X12AK
0 level. The slots requiring upgrade for XPM PLUS become
0 provisionable upon application of the NT6X12ZF kit. The NT6X12AK
0 is now available for new orders.

0 o Application of XPM PLUS to LGC, LTC and RCC modules
0 is mandatory (BCS Gating) for BCS-38. Application of
0 XPM PLUS to DTC modules is mandatory for BCS-41.

0 o As of BCS 35 the MP/SP processor will no longer be
0 shipped for new orders of the LGC/LTC/DTC/RCC. The Unified
0 Processor (XPM Plus) will be shipped for all new LGC/DTC/
0 LTC/RCC modules ordered.

0 8.1.2 HARDWARE DEPENDENCIES

0 The hardware required to implement XPM PLUS capability is the
0 Unified Processor, the terminator card (which mounts in a rear
0 side slot) and backplane strapping. These changes are applied to
0 the existing non-ISDN XPM equipment as described in the Product
0 Change Kit documents and will result in XPM packfills NT6X02IC,
0 NT6X02LC or NT6X02MC or RCC packfill NT6X12AK.

0
0 RELEASE 28.01
0 93 12 03

0 P AND C SIDE PORT REQUIREMENTS

0
0 There are no P or C side ports associated with the Unified
0 Processor (XPM PLUS).

0 DMS BUS PORT REQUIREMENTS

0
0 There are no DMS BUS ports associated with the Unified Processor
0 (XPM PLUS).

0 CIRCUITS PER CARD

0
0 There is one Unified Processor per circuit pack.

0 DISCRIMINATION NUMBERING

0
0 There is no discrimination numbering associated with XPM PLUS.

0 8.1.3 PROVISIONING CONSIDERATIONS

0
0 The following kits are available for application as described be-
0 low:

0

0 Host - Digital Trunk Controller Equipment
0 Chapter 4

Page 4-113

0 RELEASE 28.01
0 93 12 03
0

- 0 o Upgrade of host DTC/LGC/LTC to XPM PLUS:
0 Provide one XPM to XPM+ kit to upgrade one existing
0 host XPM module to XPM PLUS capability. All
0 provisionable circuit pack rules are unchanged
0 except for processors/memory, which are replaced
0 as part of kit application. The NT6X02XC kit
0 includes backplane stapping materials and
0 instructions for application on existing NT6X01AA
0 frames. The NTZZ99AN kit provides only the circuit
0 packs required and is used for applications where
0 the necessary wiring is already in place (i.e. the
0 upgrade of an existing module on a NT6X01AD frame).
- 0 o Upgrade of non-ISDN RSC to XPM PLUS:
0 Provide one RCC to XPM+ kit to upgrade one existing
0 RCC module to XPM PLUS capability. All
0 provisionable circuit pack rules are unchanged
0 except for processors/memory, which are replaced
0 as part of kit application.
- 0 o New shipments of XPMs with XPM PLUS:
0 Packfills are now available for application on the
0 combined ISDN/non-ISDN frame (NT6X01AD). New XPM+
0 shipments on the Model A CCPE (NTRX36AB) are NOT
0 supported. The packfills for NT6X01AD are:

0 NTZZ02PA for LTC with XPM+
0 NTZZ02QA for LGC with XPM+
0 NTZZ04HB for DTC with XPM+
- 0 o New shipments of RCCs with XPM PLUS:
0 Packfills are now available for application on the
0 RCE frame in either detail or Building Block format.
0 They are:

0 NTZZ46EA for RCC with XPM+ (in Building Block)
0 NT6X12AK for RCC with XPM+ (in detail)

0 8.1.4 OFFICE LAYOUT INFORMATION

0
0 Not applicable.

0

0 8.2.1 PHYSICAL CHARACTERISTICS

0
0 Not applicable.

0 8.2.2 EMI/EARTHQUAKE INFORMATION

0
0 Not applicable.

0 8.2.3 SPARING INFORMATION

0
0 Standard sparing algorithms apply to this product. Both the Uni-
0 fied Processor and Termination Card will need to be spared.

0 8.2.4 POWER FEED AND FUSING REQUIREMENTS

0

0

0
0 RELEASE 28.01
0 93 12 03

0 There is no fusing or power feed associated with the Unified
0 Processor.

0 8.2.5 CURRENT DRAIN INFORMATION

0
0 The NTMX77AA Unified Processor requires a maximum of 3.80 Amps
0 and the NTMX71AA Terminator CP requires a maximum of 0.68 Amps.

0 8.3 SOFTWARE PROVISIONING

0

0 8.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0
0 Software package NTXR34-- is required to support the Unified
0 Processor and will be needed for all XPM PLUS upgrades.

0 Software package NTXR42-- is required to utilize the downloadable
0 firmware feature and is required with NTXR34--. In BCS-35,
0 NTXR34AB replaces NTXR34AA and NTXR34AA is declared Manufacture
0 Discontinued.

0 Refer to SMS/SOLID for software requirements and interdependen-
0 cies.

0 8.3.2 SOFTWARE USAGE RESTRICTIONS

0
0 Not applicable.

0

0
0 RELEASE 28.01
0 93 12 03

0 8.3.3 MEMORY PROVISIONING

0
0 Not applicable.

0 8.4 REAL TIME IMPACT

0 The Unified Processor provides an improvement in RealTime capac-
0 ity by a factor of approximately 1.6X compared to the existing
0 MP/SP.

0 RELEASE 28.01
0 93 12 03

0 1.0 Host Subscriber Module Equipment

0 1.1 Equipment Provisioning0 1.1.1 DS1 Interface Cards0 (a) General Description

0 To enable the Telco to specify the quantity of interface circuit
0 packs required to interface the DS1 digital carrier system and
0 the DS1 links from the Remote Line Concentrating Module (RLCM),
0 the Remote Switching Centre (RSC) and the Outside Plant Module
0 (OPM).

0 (b) Reference

0 NTP 297-1001-451 DMS-100 Family Common Customer
0 Data Schema

0 (c) Provisioning Considerations

0 (i) The DS1 Interface Cards are required to interface with
0 the DS1 digital carrier systems and the DS1 links from
0 the Remote Sites (i.e. Remote Line Concentrating Module
0 (RLCM), Remote Switching Center (RSC), Outside Plant Mod-
0 ule (OPM)).

0 (ii) There can be a maximum of ten (10) DS1 I/F cards per
0 LGC/DTC/LTC module.

0 (iii) One NT6X50AA/AB card provides an interface for up to two
0 (2) DS1 links. The NT6X50AB card will replace the
0 NT6X50AA card as the DS1 I/F card in many but not all ap-
0 plications (- the NT6X50AB will not be used in SMR, RSC,
0 and RLCM).

0 In order to support the enhanced features of the NT6X50AB
0 (i.e. ESF and 64 Kb/s clear channel capability based on
0 B8ZS), the DTC/LGC/LTC modules must be equipped with new
0 messaging (i.e. NT6X69AA/79AA or NT6X69AB) and new memory
0 (i.e. NT6X46AB/BA and NT6X47AB or NT6X47AC) cards. Pick
0 the appropriate DTC/LGC/LTC circuit pack fills.

0

0 RELEASE 28.01
0 93 12 03
0

0 The full support of the NT6X50AB card will not be avail-
0 able in DTC/LGC/LTC modules which have small memories
0 (i.e. NT6X46AA, NT6X47AA) and old messaging (i.e.
0 NT6X43AA). In these modules, the NT6X50AB can be used as
0 replacements for normal NT6X50AA carriers but the en-
0 hanced DS-1 feature set will not be available.

0 The above is only applicable to DMS host offices and not
0 to remotes such as RSC and RLCM.

0 The Customer cannot use NT6X50AB to substitute for
0 NT6X50AA unless NTX270AA software is loaded and
0 datafilled for the respective XPM's. It is recommended
0 that NT6X50AA cards and NT6X50AB cards not be mixed on a
0 shelf to minimize cases where the Customer forgets that
0 NT6X50AB needs to be explicitly software datafilled. The
0 datafill is via software table CARRMTC.

- 0 (iv) The DS-1 Interface Circuit Pack provisionable to the SMS
0 is the NT6X85AA or NT6X85AB. If software package
0 NTX299AB is present, the NT6X85AB is required for all
0 modules that require special services features. Other SMS
0 modules may use NT6X85AA packs but will be unable to use
0 the special services features of the software package
0 NTX299AB. (Check availability reports for the proper or-
0 dering PEC.)

0 The SMU DS-1 CP Product Engineering Code (PEC) is
0 NT6X85AB. Each NT6X85AB CP contains two (2) DS-1 cir-
0 cuits. A maximum of ten (10) NT6X85AB CP may be provi-
0 sioned on each SMU.

0 RELEASE 28.01
0 93 12 03

0 1.1.2 DS512 Interface Cards

0 (a) General Description

0 The NT6X40CA DS512 Network Interface circuit pack provides a fi-
0 ber interface to the Enhanced Network (ENET).

0 (b) Reference

0 None

0 (c) Provisioning Considerations

0 (i) If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP and two (2) NT6X40DA, DS512 Paddle Board,
0 for each relevant DTC/LGC/LTC module.

0 (ii) Provide one (1) NT6X02BU, Fiber I/F Hardware Assembly,
0 for each DTC/LGC/LTC module interfacing to the Enhanced
0 Network (ENET). The NT6X02BU Fiber Assembly mounts on
0 the backplane of the lower array in a module and provides
0 the fiber interface for both arrays.

0 (iii) If copper interface to the Network is required, then pro-
0 vide two (2) NT6X40AC, DS30 Network Interface CP, for
0 each relevant DTC/LGC/LTC module.

0 Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 1.1.3 Universal Tone Receivers

0 (a) General Description

0 The Universal Tone Receiver (UTR) is a combined service circuit
0 that can perform the function of a Digitone Receiver for lines
0 and a MF Receiver for trunks.

0 The Universal Tone Receiver (UTR) circuit pack is provisioned for
0 R2 call setup. Each UTR pair has thirty circuits. For more in-
0 formation on the UTR, refer to Section 3.5.

0 (b) Reference

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 (i) The UTR is provisionable in pairs (maximum two (2) pairs)
0 on the DTC, LGC, (IDTC, ILGC) and LTC modules. All lines
0 and trunks connected to the module will be serviced by
0 the UTR within the module. This includes all lines in
0 LCMS, RLCMS, and OPMS.

0 (ii) UTRs will slightly reduce the DTC/LGC/LTC and RSC periph-
0 eral real time capacity. A real time work up should be
0 performed to ensure sufficient capacity. Refer to Sys-
0 tems Engineering Letter, Issue #01, Subject "Guidelines
0 for XPM Real Time Capacity Study - BCS-22" (Date: May 22,
0 1987).

0 (iii) Lines and trunks on a RSC are serviced by UTR cards lo-
0 cated in the RCC module of the RSC. There is no traffic
0 overflow to the host office.

0 (iv) Although the UTR can perform the function of a Digitone
0 Receiver (NT2X48AA) and the function of a MF Receiver
0 (NT2X48AB), there is no traffic overflow from UTRs onto
0 existing Digitone Receivers nor existing MF Receivers.
0 The Digitone Receivers and MF Receivers mounted on MTMs
0 and TMs are still required to service the following:

- 0 - analog trunk groups existing on TM/MTM shelves
0 - lines equipped on LM modules
0 - trunk groups equipped on DCM modules
0 - Mechanized Calling Card Service (MCCS)

0
0 RELEASE 28.01
0 93 12 03

- 0 | - Subscriber Carrier Modules (SMS, SMR, SMU)
0 | - incoming and the incoming portion of 2 way service
0 | and test circuits (i.e. Remote Office Test Line and
0 | Blue Box Fraud
0 | Prevention). Refer to Section 3.5 (1.3.14) for the
0 | Digitone
0 | Receiver and Section 3.5 (1.3.13) for the MF Re-
0 | ceiver.

- 0 | (v) The following is a list of trunk types which require a
0 | receiver that are supported by the UTR

0| AVTNDM 2 WAY Tandem MF Trunk

0| Any incoming or incoming portion of a 2 way trunk group
0| requiring a receiver not listed above will require
0| Digitone or MF receivers.

0| (vi) The number of UTR circuits is obtained by calculating the
0| UTR holding time and multiplying by the average number of
0| calls per hour. In general it is always safe to provide
0| two (2) pairs of UTR cards if unsure of the traffic de-
0| mands.

0| For incoming R2 calls the UTR holding time is as follows:

0| 1. From seizure to final digit collection
0| plus

0 RELEASE 28.01
0 93 12 03

- 0 2. From final digit collection to - trunk
0 selection if R1 or N5 outgoing, - seize
0 acknowledgement if R2 outgoing.

0 For outgoing R2 calls the UTR holding time is as follows:

- 0 1. The UTR is held until told to release by
0 the far office or timeout if we are the
0 controlling signal office (i.e. R1 to R2
0 calls).

0 The number of UTRs used on average is given by the fol-
0 lowing formula:

$$\begin{array}{lcl} \# \text{ of UTR} & & \text{SI} \qquad \qquad \text{S0} \\ \text{Circuits} = \text{NI} \times \frac{\text{-----}}{\text{HI+SI}} \times \text{EI} + \text{NO} \times \frac{\text{-----}}{\text{HO+S0}} \times \text{EO} \\ \text{required} & & \end{array}$$

0 where,

0 NI = Number of incoming R2 trunks (or 2-way
0 used as incoming)

0 SI = Signalling time in seconds of incoming
0 trunks

0 HI = Holding time (talking) of incoming trunks
0 in seconds

0 EI = Erlang occupancy figure of incoming
0 trunks

0 NO = Number of outgoing R2 trunks (or 2-way
0 used as outgoing)

0 S0 = Signalling time in seconds of outgoing
0 trunks

0 HO = Holding time (talking) of outgoing trunks
0 in seconds

0 EO = Erlang occupancy figure of outgoing trunks

- 0 (vii) This circuit pack is only required for CCITT No. 6 Sig-
0 nalling.

0

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 1.1.4 Digital Trunk Controller (DTC) Module

0 (a) General Description

0 The Digital Trunk Controller (DTC) Module provides the interface
0 between DS-1 digital systems and the DMS network. (The DTC does
0 not provide the digital interface between a host DMS and a re-
0 mote.)

0 (b) Reference

0 Chapter 3, Section 3.15 Common Channel Signalling

0 (c) Provisioning Considerations

0 (i) The DTC module is a two shelf module (versus the present
0 single shelf or single bay peripheral module).

0 (i) Each DTC module can terminate up to twenty (20) digital
0 carrier systems (i.e. up to ten (10) DS1 Interface cards)
0 and interconnect with the network via up to sixteen (16)
0 DS30 speech links.

0 (iii) Each DTC can terminate up to a maximum of twenty (20) DS1
0 ports on the peripheral side and a maximum of sixteen
0 (16) DS30 ports on the CPU (network) side.

0 (iv) Since each DTC terminates up to $20 \times 24 = 480$ voice chan-
0 nels and the internal speech links can accommodate up to
0 $16 \times 30 = 480$ VF paths, there is no concentration.

0 (v) DTC modules are provisioned for total terminations based
0 on the forecast of digital trunk requirements for the
0 busy season prior to exhaust.

0 (vi) For service protection, it is recommended that trunk cir-
0 cuits of each trunk group be spread over more than one
0 DS1 Interface card. Both of these cards can be mounted
0 on the same DTC module because of the duplicated
0 processor residing in the module.

0 (vii) Existing DTC modules which have spare capacity shall be
0 used to terminate new digital systems.

0 (viii) When a DTC module is handling CCIS/CCS7 voice trunk-
0 ing, two (2) Continuity Tone Detector cards NT6X70AA are

0 RELEASE 28.01
0 93 12 03
0

0 required when analog trunk facilities are employed. The
0 NT6X70AA card is not required if the transmission path is
0 all-digital.

0 (ix) The following DTC Common Peripheral Controller CPs sup-
0 port the following applications:

0 DTCs
0 NT6X02IC supports UTRs
0 replaces NT6X02AQ/AR (BCS-27)

0 IDTCs
0 NT6X02BD supports SL-100 U.K.
0 NT6X02BN supports Mercury UK applications with
0 New Message requirements (eg. DPNSS) *
0 NT6X02GB supports Caribbean (CEP)
0 NT6X02JA supports DMS-300 Turkey
0 NT6X02KE supports China
0 NT6X02QA supports Turkey applications
0 NT6X02BW replaces NT6X02BP (BCS-28)
0 NT6X02BP supports all International

0 * See Section 3.15 Common Channel Signalling for more
0 information on DPNSS.

0 (x) For each NT6X02IC ordered (BCS-27), provide:

- 0 - four (4) XPM Processor CP NT6X45AF/BA
0 - two (2) DS30 Network Interface CP NT6X40AC
0 - two (2) SP Memory Plus CP NT6X46BB
0 - two (2) MP Memory Plus CP NT6X47AC

0 - two (2) MSG Protocol & Tone CP NT6X69AC
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02IC is to be ordered instead of NT6X02IA.

0 For each NT6X02BW ordered, provide:

- 0 - six (6) XPM Processor CP NT6X45BA
0 - two (2) Time Switch CP NT6X44AB/EA
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02BW is to be ordered instead of NT6X02BP.

0

0 RELEASE 28.01
0 93 12 03
0

0 Upon general availability, the NT6X45BA CP will become
0 the standard XPM Processor offering instead of the
0 NT6X45AF/AD CP.

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four NT6X45BA XPM Processor CP for upgrading ex-
0 isting offices.

0 NT6X44EA adds Even-Bit-Inversion (EBI) to the Time Switch
0 CP (NT6X44AB).

0 (xi) If interface to the Enhanced Network (ENET) is required,
0 then the relevant DTC/LGC/LTC modules must have the
0 NT6X69AC Msg Protocol & Tone CP. NT6X69AC replaces
0 NT6X69AB.

0 Provide 1 NT6X02BQ change kit for each DTC/LGC/LTC module
0 you are upgrading to ENET. This change kit applies only
0 to modules provisioned at NT6X02 AS/IA, AT/LA or AU/MA
0 levels. Modules provisioned at earlier levels must be
0 upgraded to these levels before the NT6X02BQ change kit
0 can be applied.

0 (xii) If ENET interface is not required, use the product change
0 kit NT6X02EQ to upgrade DTC modules from NT6X02IA/LA/MC
0 to NT6X02IC/LC/MC levels.

0 (xiii) There are two methods available to satisfy 4 MB MP memory
0 requirements in existing DTC/LGC/LTC modules. The first
0 method is to apply one NT6X02EQ product change kit to
0 each DTC/LGC/LTC module to be upgraded as in item (1) be-
0 low. Per customer request, a second pair of office sup-
0 plied NT6X47AB packs may be added to each DTC/LGC/LTC
0 module to be upgraded as in item (2) below. Do not order
0 new NT6X47AB packs for the upgrade of NT6X02IA, LA, MA mod-
0 ules. The NT6X47AB packs that have been removed from up-
0 graded DTC/LGC/LTC modules may then be applied to other
0 relevant DTC/LGC/LTC modules.

0 1) Provision NT6X02EQ Product Change Kit to replace the
0 NT6X47AB MP Memory Plus circuit packs in slot 10 with
0 NT6X47AC packs. The NT6X02EQ kit may only be applied
0 to the following modules:

0
0 RELEASE 28.01
0 93 12 03

0 DTC (CCS7) : BCS-27 and later (NT6X02AS/IA)
0 DTC (other): BCS-33 and later (NT6X02AS/IA)
0 LGC (all) : BCS-31 and later (NT6X02AT/LA)
0 LTC (all) : BCS-30 and later (NT6X02AU/MA)

0 2) Existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT0X50AA, Filler Face Plate, in Slot 09.
0 Provide two (2) NT6X47AB, MP Memory Plus CP for the
0 above listed modules.

0 One NT6X47AC in slot 10 (item 1) has the same memory
0 capacity as two (2) NT6X47AB in slots 9 and 10 (item 2).

0 | Where an existing DTC/LGC/LTC module is presently
0 equipped with two NT6X69AB in slot 18, if the existing
0 module is not required to interface ENET, new cards are
0 not required for these slots.

0 Provide one (1) NT6X02BQ Product Change kit for each ex-
0 isting DTC/LGC/LTC module to be upgraded to interface
0 ENET. The NT6X02BQ contains (2) NT6X69AC circuit packs.
0 The NT6X02BQ will convert the NT6X02IA/AS to NT6X02IC,
0 the NT6X02LA/AT to NT6X02LC, and the NT6X02MA/AU to
0 NT6X02MC.

0 If an existing DTC/LGC/LTC module has ALREADY been up-
0 graded to the NT6X02IC/LC/MC packfill level via the
0 NT6X02EQ KIT, provide two NT6X69AC circuit packs in slot
0 18 to upgrade the module for ENET interface.

0 | For Canadian applications only, provide the NT6X02ER
0 Product Change Kit for each existing DTC peripheral mod-
0 ule (NT6X02AR/AM) to be upgraded. This change kit makes
0 the appropriate circuit pack positions provisionable, but
0 contains no circuit packs. Refer to the engineering man-
0 ual rules to identify the circuit packs required for up-
0 grade of the NT6X02AR or NT6X02AM.

0 (xiv) The following are the minimum packfill levels required
0 for BCS-32 or later: NT6X02IA/IS, or NT6X02IC (for new
0 offices).

0 Building Blocks

0 (xv) Provide one NTZZ04EA Building Block product change kit
0 for each existing NT6X02AA DTC/LGC/LTC module to be up-
0 graded. Do not order the NT6X02ZE PC Kit.

0
0 RELEASE 28.01
0 93 12 03

0

0 The NTZZ04EA building block contains the following:

0 (1) NT6X02ER XPM PC Kit
0 (1) NT6X02ZL Wiring Kit
0 (2) NT0X50AA Filler Face Plate
0 (2) NT6X47AC Master Proc Memory Plus CP
0 (2) NT6X46BB Signal Processor Memory Plus CP
0 (2) NT6X69AC CPP Msg Protocol & Tone CP
0 (2) NT2X70AE Power Conv +/-5V & 12V CP
0 (2) P0711663 Desig. Label for NT6X47AC
0 (2) P0711664 Desig. Label for NT6X46BB
0 (2) P0710476 Desig. Label for NT6X69AC
0 (2) P0698943 Desig. Label for NT2X70AE

0 (Note: The NTZZ04EA includes all circuit packs required
0 to upgrade an NT6X02AA module except the NT6X45 cards.

0 The NTZZ04EA building block kit may be used to upgrade
0 the NT6X02AA module as follows:

0

0

0

0

0

0

0

0

0

RELEASE 28.01
93 12 03

Building Block	From	To
NTZZ04EA	NT6X02AA (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

Provide one NTZZ04GA Building Block product change kit for each existing NT6X02AC DTC/LGC/LTC module to be upgraded. Do not order the NT6X02ZE PC Kit.

The NTZZ04GA building block contains the following:

(1)	NT6X02ER	XPM PC Kit
(1)	NT6X02ZL	Wiring Kit
(2)	NT0X50AA	Filler Face Plate
(2)	NT6X47AC	Master Proc Memory Plus CP
(2)	NT6X46BB	Signal Processor Memory Plus CP
(2)	NT6X69AC	CPP Msg Protocol & Tone CP
(2)	P0711663	Desig. Label for NT6X47AC
(2)	P0711664	Desig. Label for NT6X46BB
(2)	P0710476	Desig. Label for NT6X69AC

(Note: The NTZZ04GA includes all circuit packs required to upgrade a NT6X02AC module except the NT6X45 cards.

The NTZZ04GA building block kit may be used to upgrade the NT6X02AC module as follows:

Building Block	From	To
NTZZ04GA	NT6X02AC (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

0
0 RELEASE 28.01
0 93 12 03

0 | (xvi) Existing DTC/LGC/LTC module is presently equipped with
0 four (4) NT6X45AA, XPM Processor CP, in Slots 08 & 12.
0 Application of the NTZZ04EA/NTZZ04GA makes these slots
0 provisionable and replacement cards must be ordered as
0 follows:

0 For A-stock upgrades provide four (4) NT6X45BA cards in
0 slots 8 and 12 of the upper and lower shelves of the pe-
0 ripheral modules. If B-stock material is required, then
0 four NT6X45BB packs must be merchandise ordered via an
0 88K.

0 | The existing NT6X45AA packs must be replaced because they
0 will not work with New Messaging. The only reason NT6X45
0 cards are not included in the NTZZ04EA/GA upgrade kit is
0 because there is an option between NT6X45BA and NT6X45BB
0 packs. Either the NT6X45BA packs or the NT6X45BB packs
0 must be ordered or the upgrade will not have been done
0 correctly.

0 (xvii) The existing DTC/LGC/LTC module is presently equipped
0 with the following DS30 Network Interface CP in Slots 22
0 & 23: four (4) NT6X40AA.

0 If copper interface to the Network is required, then DO
0 NOT order new circuit packs for these slots.

0 If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP in Slot 22, and two (2) NT6X40DA, DS512 Pad-
0 dle Board, in Slot 22R of each relevant DTC/LGC/LTC mod-
0 ule. Also, provide one (1) NT6X02BU, Fiber I/F Hardware
0 Assembly, for each DTC/LGC/LTC module interfacing to the
0 Enhanced Network (ENET). The NT6X02BU Fiber Assembly
0 mounts on the backplane of the lower array in a module
0 and provides the fiber interface for both arrays.

0 | Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0

0
0 RELEASE 28.01
0 93 12 03

0 (xviii) The existing DTC/LGC/LTC module is presently equipped
0 with four (4) NT6X47AA, MP Memory CP, in Slots 09 & 10.
0 Application of the NTZZ04EA/NTZZ04GA replaces these cir-
0 cuit packs with two NT6X47AC Master Processor Memory cir-
0 cuit packs.

0 (xix) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X46AA Signal Processor Memory Plus CP in
0 slot 11. Application of the NTZZ04EA/NTZZ04GA replaces
0 these circuit packs with two NT6X46BB circuit packs.

0 (xx) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X43AA, Msg Interface CP, in Slot 18. Ap-
0 plication of the NTZZ04EA/NTZZ04GA replaces these circuit
0 packs with two NT6X69AC Msg Protocol & Tone circuit
0 packs.

0 (xxi) If the existing module was a NT6X02AA, then the NTZZ04EA
0 provides two (2) NT2X70AE, Power Converter CP, in Slot 25
0 of each DTC/LGC/LTC module.

0 If the existing module was a NT6X02AC, then two (2)
0 NT2X70AD, Power Converter CP, already exist in Slot 25 of
0 each DTC/LGC/LTC module. DO NOT order new circuit packs
0 for these slots unless requested by the customer. Per
0 Telco request, the existing NT2X70AD CP's in each
0 DTC/LGC/LTC can be replaced by the NT2X70AE, Power Con-
0 verter ESD CP.

0 RELEASE 28.01
0 93 12 03

0 1.1.5 Subscriber Carrier Module - Urban (SMU)

0 (a) General Description

0 | The SMU will interface on a direct digital basis with a DMS-1 Ur-
0 ban Remote Terminal (RCU) via DS-1 transmission facilities.

0 The SMU will only interface RCUs. The SMU does not offer inter-
0 face support to any other remote system (eg. DMS-1R, SLC-96, RSC,
0 | RLCM, OPM etc.) nor host equipment (eg. LCM).

0 The RCU may be located outside the central office up to a maximum
0 distance of 100 miles.

0 SMU will appear to the DMS-100F as a peripheral module. Each
0 module consists of two shelves of equipment with duplicated con-
0 trollers and power converters. The SMU shelf pairs are housed in
0 a standard DMS-100 single bay frame.

0 (b) Reference

0 Chapter 3, Section 3.7 Office Maintenance
0 NTP 297-1001-103 DMS-100 Family Peripheral Modules

0 (c) Provisioning Considerations:

0 (i) The SMU will support the following features:

0 - POTS

- 0 - single party
- 0 - multi party
 - 0 - two or four party Frequency Selective
 - 0 Ringing (FSR) with
 - 0 - two party Automatic Number
 - 0 Identification (ANI)
 - 0 - four party Operator Number
 - 0 Identification (ONI)
 - 0 - two, four or eight party Coded Ringing
 - 0 with
 - 0 - two party ANI
 - 0 - two, four or eight party ONI
 - 0 - two party Divided Ringing with ANI

0 - COIN

0
0 RELEASE 28.01
0 93 12 03

- 0 - coin first
- 0 - dial tone first
- 0 - semi post pay
- 0 - ground start
- 0 - loop start

0 - CUSTOM CALLING

- 0 - speed calling
- 0 - three way calling
- 0 - call waiting
- 0 - call forwarding
- 0 - all current IBN features with the
- 0 exception of distinctive ringing, datapath
- 0 and Electronic Business Set (EBS)

0 - DIALING

- 0 - dial pulse
- 0 - digitone

0 - TONES

- 0 - dial tone
- 0 - audible ringback
- 0 - reorder
- 0 - busy

0 - MAINTENANCE

- 0 - Automatic Board to Board Test (ABBT)
- 0 - Test Desk (eg. MLT, LRS or #14 LTD)
- 0 - Automatic Line Testing (ALT)
- 0 - Line Card Testing
- 0 - Subscriber Loop Testing

0 (ii) The SMU shelf pairs are housed in a standard DMS-100 sin-
0 gle bay frame. The Subscriber Module Equipment Frame
0 (SME) (PEC NT6X01AA) can contain up to two modules. Each
0 module has a PEC of NT6X02EG.

0 | The NT6X02EG replaces the NT6X02EB Common Circuit
0 Packfill for use on all new SMU applications. Order the
0 NT6X02EG for all new SMU applications.

0 |

0 RELEASE 28.01
0 93 12 03
0

0 The minimum packfill for BCS-31 and following is
0 NT6X02EB/AW.

0 Provide one (1) NT6X02EH Product Change Kit and two (2)
0 NT6X47AC MP Memory Plus circuit packs for each NT6X02EB
0 and NT6X02AW module when upgrading to BCS-31. The
0 NT6X02EH PC Kit upgrades the NT6X02EB/AW module to the
0 NT6X02EF module and makes slots 10, 11, 11R and 18
0 provisionable. Mount the NT6X47AC circuit packs in slot
0 10 of the upper and lower shelves of the module.

0 Per customer request, the NT6X47AB packs removed from
0 modules upgraded via a PC Kit may be used to upgrade
0 other relevant modules. Provide two (2) office supplied
0 NT6X47AB CP for each NT6X02EB/AW module to be upgraded to
0 BCS-31. Do not order new NT6X47AB packs for the upgrade
0 of SMU modules.

0 Slots 22-23,25 of the NT6X02EB Common CP Fill are now
0 provisionable. Provide two (2) NT6X40AC, DS30 Network
0 Interface CP, in slot 22. Also, provide two(2) NT0X50AA,
0 Filler Face Plates, in slot 23 of each NT6X02EB Common CP
0 Fill. Provision two(2) NT2X70AE Power Converter CP in
0 slot 25 of each module.

0 The slots mentioned above are being made provisionable in
0 order to ease future design development. The remaining
0 circuit packs in the NT6X02EB Common CP Fill are un-
0 changed.

0 Upgrading Existing NT6X02EA Modules

0 In order to enhance an existing NT6X02EA module with the
0 Expanded Signaling Processor Memory CP required for
0 BCS-27, a product change kit NT6X02ZJ was created for
0 each existing SMU peripheral module. The NT6X02ZJ PC Kit
0 contains two (2) NT6X46AC, Enhanced Signaling Processor
0 CP, and new designation strips for the upgraded modules.

0 The NT6X02ZJ Product Change Kit will upgrade the follow-
0 ing peripheral module:

DESCRIPTION	FROM	TO

0		SMU Common CP	NT6X02EA	NT6X02AW
0				
0				

0 Slots 08,09,12,22-23,25 of the Upgraded SMU module are
0 now provisionable slots. These slots are being made
0 provisionable to ease future design development.

0 Provide four(4) NT6X45BB, XPM Processor CP, for slots
0 08&12 of each upgraded SMU module. New circuit packs DO
0 NOT need to be ordered for slots 09,22-23,25 of the Up-
0 graded SMU module.

0 Refer to availability reports to identify valid ordering
0 dates.

0 The NT6X02AW Common CP Fill are PEC codes used for the
0 field upgrade of existing peripheral modules ONLY. The
0 NT6X02AW Common CP Fills CANNOT be ordered.

0 Upgrading Existing NT6X02EB/AW Modules

0 The NT6X02EH Product Change Kit was created to convert
0 the NT6X02EB/AW module to the NT6X02EF module. This PC
0 Kit makes certain slots provisionable, but does not con-
0 tain any circuit packs.

0 The NT6X02EH Product Change Kit will upgrade the follow-
0 ing peripheral modules:

0	DESCRIPTION	FROM	TO
0			
0	SMU Common CP	NT6X02EB	NT6X02EF
0			
0	SMU Common CP	NT6X02AW	NT6X02EF
0			
0			
0			

0 Slots 10,11,11R and 18 of the Upgraded SMU module are now
0 provisionable slots. These slots are being made provisionable to ease
0 future design development.

0
0 RELEASE 28.01
0 93 12 03

0 Since this PC Kit does not contain any circuit packs, any required up-
0 grade packs (provisionable in slots 10,11,11R or 18) must be ordered
0 in conjunction with the PC Kit. For instance, if a NT6X02EB/AW SMU
0 module is required to meet the BCS-31 extended MP memory requirement,
0 then one NT6X02EH Product Change Kit and two NT6X47AC packs must be
0 ordered to upgrade the module. If a NT6X02EB/AW SMU module is re-
0 quired to interface with ENET, then one NT6X02EH kit and two NT6X69AC
0 packs must be ordered to upgrade the module.

0 The NT6X02EF Common CP Fill is the PEC used for the field upgrade of
0 existing peripheral modules ONLY. The NT6X02EF Common CP Fill CANNOT
0 be ordered.

0 (iii) The SMU will be connected to the Network Module of the
0 DMS-100F via three (3) to sixteen (16) provisionable
0 DS-30 ports which are duplicated to provide connections
0 to each plane of the network. Configure the SMU as non-
0 blocking, that is, configure one DS-30port per each DS-1
0 channel provisioned to the RCUs.

0 The SMU peripheral side (p-side) interfaces to multiple
0 RCUs, and can accommodate up to twenty (20) DS-1 ports.

0 Each RCU will have one (1) to eight (8) DS-1 links to the
0 SMU. All DS-1 links must terminate on the same SMU. The
0 number of RCU that may terminate on a SMU is dependent on
0 the total traffic presented to the SMU and the physical
0 limitation of the twenty ports.

0 The mininum number of DS-1 required to interface a RCU is
0 one (1), however, two (2) DS-1 links are recommended to
0 prevent an outage during a single link failure.

0 A fully equipped RCU supports over 500 subscriber and/or
0 special service lines.

0 The SMU does not support DS-1 protection switching as it
0 will not be offered in the RCU product.

0 The SMU should be configured as non-blocking. The number
0 of DS-30 channels to the Network should be equal to the
0 number of DS-1 channels to the RCUs.

0 The following table represents the CCC capacity of the
0 SMU per DS-30 port to the Network.

0 Capacity of SMU (CCS)

0 RELEASE 28.01
0 93 12 03

0 at 4% TML

0 Network Ports 3 4 5 6
0 2780 3806 4841 5883 (CCS)

0 Network Ports 7 8 9 10
0 6929 7979 9032 10087 (CCS)

0 Network Ports 11 12 13 14
0 11144 12203 13264 14325 (CCS)

0 Network Ports 15 16
0 15388 16451 (CCS)

0 (iv) The Universal Tone Receiver (NT6X92BB) is not currently
0 supported in the SMU. Digitone Receivers (NT2X48AB) must
0 be provisioned for lines at the RCU.

0 (v) Provide two (2) NT6X69AC, CPP Msg Protocol CP, for each
0 new SMU module ordered. Mount circuit packs in slot 18
0 of the upper and lower shelves of the module. The NT6X69AC
0 replaces the NT6X69AB circuit pack for use on all SMU ap-
0 plications.

0 (vi) Provide two (2) NT6X78AA, Class Modem Resource CP, for
0 each SMU module that is handling Custom Local Area Sig-
0 naling Services (CLASS -U.S.) or Call Management Services
0 (CMS -Canada) -Calling Number Display.

0 On general availability, the NT6X78AB will replace the
0 NT6X78AA as the standard CLASS Modem Resource CP.

0 (vii) Mechanized line testing is provided for testing sub-
0 scriber loops and line cards of a DMS-1 Urban Remote ter-
0 minal. Refer to Section 3.7, Office Maintenance for more
0 information.

0 SMU modules can interface ENET using either copper or fi-
0 ber speech links. Either case requires the application
0 of the NT6X69AC, CCP Msg Protocol & Tone CP. Existing
0 NT6X02EB and NT6X02AW modules can be field upgraded to a
0 NT6X02EF module with the application of the NT6X02EH
0 Product Change Kit. This change kit allows provisioning
0 of the NT6X69AC CP in slot 18.

0 For the SMU to interface ENET using Fiber speech links,
0 the following equipment is required:

0
0 RELEASE 28.01
0 93 12 03

0
0 NT6X40CA - DS-512 XPM Interface CP
0 NT6X40DA - DS-512 Link Paddle Board
0 NT6X02BU - Fiber Interface H/W Assembly

0 Provide two (2) NT6X40CA in slot 22 and two (2) NT6X02DA
0 in slot 22R of each SMU module. Also, provide one (1)
0 NT6X02BU per SMU.

0| On general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface, and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board.

0 1.1.6 Common Peripheral Controller Equipment Frame

0 (a) General Description

0 The primary function of this frame is to house Line Group Con-
0 troller (LGC) Modules, Digital Trunk Controller (DTC) Modules or
0 Line Trunk Controller (LTC) Modules. Subject to certain re-
0 strictions, two different kinds of modules can be mounted on the
0 same frame. NTL Customer Engineering is to be consulted regard-
0 ing these configurations.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) This frame can accommodate four (4) shelves of equipment
0 (i.e. two modules). Modules are filled and numbered on
0 the frame from the bottom up.

0 (ii) Normally both modules are the same type. Two (2) modules
0 of different types can also be mounted on the same frame.
0 This situation would only occur in a very small office or
0 for the last frame in an office in order to save one
0 frame.

0 (iii) A LGC/LTC/DTC module cannot mount on the same frame as an
0 ILGC/IDTC module.

0 (iv) When ISG is being applied to an office, the LCE frames
0 and their associated Common Peripheral Controller Equip-
0 ment Frame must be served by the same PDC frame.

0 RELEASE 28.01
0 93 12 03

0 1.1.7 Conversion From SMS To SMU Module0 (a) General Description

0 These provisioning considerations deal with field conversion of a
0 Subscriber Module for SLC-96 (SMS) to a Subscriber Module for
0 DMS-1 Urban (SMU).

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) The Product Change Kits will upgrade the peripheral mod-
0 ules as follows:

PRODUCT CHANGE KIT	FROM	TO
NT6X02ZH	NT6X02DA(SMS)	NT6X02EA(SMU)
NT6X02ZD	NT6X02DB(SMS)	NT6X02EA(SMU)
NT6X02ZK	NT6X02DA/DB(SMS)	NT6X02EB(SMU)
NT6X02ZL	NT6X02DC(SMS)	NT6X02EB(SMU)
NT6X02ZM	NT6X02DD(SMS)	NT6X02EB(SMU)

0 Provide one (1) of the above PC Kits for each existing
0 SMS peripheral module to be converted. The PC Kits con-
0 tains circuit packs to convert a SMS module to a SMU mod-
0 ule.

0 (ii) Due to the conversion of an SMS module to a SMU module,
0 the messaging has changed; therefore, provide one (1)
0 NT6X02ZL PC Kit for Enhanced Messaging per NT6X01AA frame
0 (for U.S. offices only).

0 (iii) Provision a maximum of ten (10) NT6X85AB SCM DS1 Inter-
0 face Circuit Packs for each SMS module converted per cus-
0 tomer requirements.

0

0

0 | 2.0 Peripheral Modules Features

0 2.1 Introduction

0 This section describes the line-oriented software features that
0 require special hardware provisioning to make the feature work.

0 2.2 Features

0 The line-oriented software features included in the Peripheral
0 Modules Features that require special hardware provisioning con-
0 siderations are listed below:

0 Custom Local Area Signalling Services (CLASS) or Call Man-
0 agement Services (CMS)

0 Residential Enhancement Services

0 Enhanced Coin Services

0 2.3 Equipment Provisioning

0 2.3.1 CLASS/CMS Feature

0 (a) General Description

0 Custom Local Area Signalling Services or CLASS Features are a set
0 of line-oriented features which the telephone company can deploy
0 in their residential or Centrex customer environment to generate
0 additional revenue. These features operate within a single
0 switch or transparently between users on different end-office
0 switches by means of CCS7-based signalling in a multi-node switch
0 configuration. In the U.S., this feature is called CLASS and in
0 Canada, the feature is called CMS. In this document, the feature
0 will be referred to as CLASS.

0 CLASS Features are separated into Phase I and Phase II features.
0 Phase I features include

- 0 - Automatic Callback (ACB) - allows a calling party to automat-
0 ically call again the number most recently dialed, whether
0 that call was answered, unanswered, or busy. If the station
0 is busy, the user may queue against that station and be re-
0 called when it becomes idle. The Automatic Callback feature
0 is very similar to the Ring Again (RAG) feature, but will be
0 deployed in the Public Network.
- 0 - Automatic Recall (AR) - enables the end user to return his
0 latest incoming call automatically, regardless of whether the
0 incoming call was answered, and regardless of whether the end
0 user knows the identity of the calling party. If the station
0 is busy, the user may queue against that station and be re-
0 called when it becomes idle. With two (2) level activation,
0 the directory number of the last call is voiced back prior to
0 completing the call.
- 0 - Calling Number Delivery or Calling Number Display (CND) - en-
0 ables receipt and display of the calling party's directory
0 number and Date/Time during the ringing cycle. This allows
0 the end user with a display set to make an informed decision
0 about answering the call.
- 0 - Calling Number Delivery Blocking (CNDB) - permits the origi-
0 nating customer, by designating his calling identity as "pri-

0 RELEASE 28.01
0 93 12 03
0

0 vate", to prevent his directory number from being transmitted
0 for Calling Number Delivery. The calling party may change
0 his DN Suppression default - Suppress DN or not Suppress DN -
0 to the opposite status.

0 - Customer Originated Trace (COT) - enables the called party to
0 request an automatic trace of the last call received. The
0 trace record identifies the calling party and other call-
0 related information. The results of the trace are not pro-
0 vided directly to the end user, but are made available only
0 to an authorized agency, such as the telephone company or law
0 enforcement agency.

0 Note that CLASS features are available only to lines with a line
0 class code of RES (Residential Enhanced Services). Note that
0 this does not include ISDN RES lines.

0 Automatic Recall Date and Time Feature (ARDT)

0 This feature provides the date and time voiceback capability for
0 the Automatic Recall (AR) two-level activation sequence.

0 CLASS Configuration

0 Figure 35.2 illustrates a typical configuration with a CLASS ter-
0 minal on the DMS. This terminal is equipped with an enhanced
0 Man-Machine Interface (MMI), such as a Liquid-Crystal Display
0 (LCD) panel. The terminal could also consist of a standard tele-
0 phone with a CLASS add-on unit. An integrated telephone set,
0 such as NTL's MAESTRO, can also be used. The telephone section
0 of the Customer Premises Equipment (CPE) is loop powered, whereas
0 the CPE section providing CLASS features is powered by local AC.

0

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 Figure 35.2 Typical Configuration with a CLASS CPE

0 The transmission of the calling party number to the Customer Premises
0 Equipment (CPE) is accomplished via asynchronous FSK simplex-mode
0 transmission at 1200 bits/sec over the 2-wire loop, in accordance with
0 the Bell 202A standard. A burst of data is transmitted to the CPE
0 during the silent interval between the first and second ring of the
0 telephone set, before the incoming call is answered. The data link
0 terminates at a 202A modem in the CPE, which outputs the calling party
0 number to the LCD panel.

0 (b) Reference

0 Chapter 3, Section 3.4 Meridian Business Services

0 Section 3.15 Common Channel Signaling Systems

0 RELEASE 28.01
0 93 12 03

0 (c) Provisioning Considerations

0 (i) CCS7 Signalling is required when CLASS features are ac-
0 cessed between nodes. Within the same node, CCS7 Signal-
0 ling is NOT required. Refer to Section 3.15 for more
0 information on CCS7 Signalling.

0 (ii) An optional feature exists called Automatic Recall Date
0 and Time (ARDT). This feature requires announcements
0 provided on a pair of CPs; NT1X76JA and NT1X76JB. The
0 NT1X76AJ and the NT1X76AK cards are required when the
0 NT1X76JA and NT1X76JB cards are ordered. The NT1X76AJ,
0 NT1X76AK, NT1X76JA, and NT1X76JB should be assigned to
0 the same DRA module. In a Class Phase 1 English office,
0 the NT1X76JA/JB can be assigned to a DRA where the
0 NT1X76AJ/AK cards are existing and there is room. Other-
0 wise, in other offices or where the DRAs with NT1X76AJ/AK
0 cards are filled, an additional set of NT1X76AJ/AK cards
0 must be ordered.

0 (iii) LCM Processor Cards, NT6X51AB, are required to support
0 CND in LCMS. LCM Common CP, NT6X04AB, contains NT6X51AB
0 and hence can support CND. Only LCMS which contain lines
0 utilizing the CND feature must be upgraded to use the
0 NT6X51AB.

0 (iv) In addition to the LCM Processor Card NT6X51AB, the CLASS
0 Modem Resource (CMR) card NT6X78AA has been developed to
0 support the introduction of CND.

0 The CMR card will support software to provide SP
0 processor - CMR messaging and thus provide CMR sanity
0 supervision, software downloading,
0 maintenance/diagnostics, operational measurements and
0 swact activity.

0 When the CND feature is required, provide two (2) CMR
0 cards per LGC/LTC/RCC/SMS/SMU module (i.e. one (1) card
0 per shelf). It is not necessary to equip all the
0 LGC/LTC/RCC/SMS/SMU in the office with the CMR card. Only
0 LGC/LTC/RCC/SMS/SMUs that will provide CND to the sub-
0 scribers that home on these peripherals will require the
0 CMR card. Any number of LGC/LTC/RCC/SMS/SMUs of a given
0 DMS may be equipped with CMR cards.

0

0 RELEASE 28.01
0 93 12 03
0

0 (v) For Canadian Applications when the NT6X78AA cards are
0 provisioned into an LGC, LTC, or SMS module,

0 EITHER:

0 1. Retrofit the NT6X69AA/NT6X79AA card combination (if
0 existing) to an NT6X69AB card via the application of
0 the NT6X12ZY PC Kit.

0 This upgrade kit allows card slot 18 to be provi-
0 sioned with the CLASS Modem Resource (CMR) card
0 NT6X78AA which is used for the CND feature. The
0 power-reduced NT6X78AB replaces NT6X78AA and does not
0 require this upgrade.

0 OR

0 2. Limit the number of NT6X50AA DS-1 cards to four per
0 shelf (i.e. eight per module).

0 This is required to limit the shelf's overall +5 volt
0 power requirements to below 55 amps.

0 (vi) There are optional announcements available for CLASS fea-
0 tures to indicate successful or denied operation.

0 For BCS-27, the NT1X75BA DRAM Controller must be provi-
0 sioned for all CLASS applications.

0 There are two groups of announcements, Phase 1 CLASS DRA
0 Announcements and Phase 2 CLASS DRA Announcements. If the
0 CLASS/CMS feature is required, at least one group of an-
0 nouncements (i.e. Phase 1 or Phase 2) must be provided.
0 The Customer can either have Phase 1 announcements or
0 Phase 2 announcements or both.

0 (vii) Phase 1 CLASS DRA Announcements

0 For the optional Phase 1 CLASS DRA Announcements, the
0 Customer can either make up his own announcements or he
0 can order the pre-recorded ones from NT.

0 For provisioning the Digital Recorded Announcement Re-
0 cordable Memory cards (NT1X77AA/79AA), divide the total
0 length of the announcements (in seconds) by 31. This de-
0 termines the number of circuits required for these an-
0 nouncements. These are the announcements that the
0 Customer can make up himself.

0 RELEASE 28.01
0 93 12 03
0

0 If the Customer chooses to create his own announcements,
0 and if he wants the Automatic Recall (AR) feature with
0 the Voice Back Option within NTXA00AA activated, then the
0 CLASS Phase 1 English Announcements (2) of (2) CP card,
0 NT1X76AK, and/or the CLASS Phase 1 French Announcements
0 (2) of (2) CP card, NT1X76BK, must be provided. Other-
0 wise, if the Voice Back Option is not to be activated,
0 then NT1X76AK and/or NT1X76BK are optional.

0 If the Customer wants our pre-recorded announcements, the
0 following DRA cards are available:

0	PEC	DESCRIPTION
0	NT1X76AJ	CLASS Phase 1 English Announcements
0		(1) of (2) CP
0	NT1X76AK	CLASS Phase 1 English Announcements
0		(2) of (2) CP
0	NT1X76BJ	CLASS Phase 1 French Announcements
0		(1) of (2) CP
0	NT1X76BK	CLASS Phase 1 French Announcements
0		(2) of (2) CP

0 The above cards are the approved Telecom Canada Phase 1
0 CLASS DRA Announcements.

0 If bilingual announcements are required (e.g. French fol-
0 lowed by English on the same announcement), then the
0 Phase 1 CLASS DRA Announcement cards must be provisioned
0 on the same DRA shelf (i.e. NT1X76AJ/AK/BJ/BK).

0 The Phase 1 CLASS DRA Announcement cards are only avail-
0 able in sets (e.g. NT1X76AJ/AK or NT1X76BJ/BK) and cannot
0 be provisioned separately. However, the NT1X76AK and
0 NT1X76BK cards can be ordered separately for the Auto-
0 matic Recall feature (noted above). The NT1X76AK card
0 can be ordered separately for the Call Forward Remote Ac-
0 tivation (CFRA) feature. (See Meridian Business Ser-
0 vices, Section 3.4, for more information on Residential
0 Enhanced Services.)

0 If the optional announcements are not selected, confirma-
0 tion tone can be used for successful feature operation
0 and fast busy (120 ipm) can be used for denial of feature
0 operation. This is only applicable to Calling Number De-
0 livery Blocking (CNDB) and Customer Originated Trace
0 (COT).

0 RELEASE 28.01
0 93 12 03
0

0 (viii) Phase 2 CLASS DRA Announcements

0 For Phase 2 CLASS DRA Announcements, the Digital Recorded
0 Announcement Recordable Memory cards (NT1X77AA/79AA) can-
0 not be used.

0 For provisioning, two groups of Phase 2 CLASS DRA An-
0 nouncements are available:

0 1) Phase 2 CLASS DRA Announcements (List 1-12)

0 2) Phase 2 CLASS DRA Announcements (List 13-31)

0 The following are the Phase 2 CLASS DRA Announcement
0 (List 1-12) cards:

0	PEC	DESCRIPTION
0	NT1X76AP	CLASS Phase 2 English Announcements
0		(1) of (8) CP
0	NT1X76AQ	CLASS Phase 2 English Announcements
0		(2) of (8) CP

0		- Type VII CP For Southwest Bell

0 * The "Personality" card, NT1X76AW, contains only Bell
0 Canada names and Bell South BCS-29 V0 information. The
0 "Personality" card, NT1X76BW, contains only Bell Canada
0 names. It must be determined up front which "Personal-
0 ity" cards are required by which Customer. When engi-
0 neering a DMS job (initial or extension) which will
0 require Phase 2 CLASS DRA Announcements, the onus will be
0 on the Customer to determine which "Personality" card is
0 required.

0 The Phase 2 CLASS DRA Announcement cards are only avail-
0 able in sets (e.g. NT1X76AP/AQ/AR/AS/AT/AU/AV/AW or
0 NT1X76BP/BQ/BR/BS/BT/BU/BV/BW or NT1X76GA/GB/GC) and can-
0 not be provisioned separately. Note that the only excep-
0 tion to this is the "Personality" card (e.g. NT1X76AW)
0 which will be provisionable with other Customer specific
0 packs (as highlighted above).

0 RELEASE 28.01
0 93 12 03
0

- 0 (ix) Automatic Recall Date and Time (ARDT) CLASS DRA Announce-
0 ments

0 The customized announcements require a DRAM with a
0 NT1X75BA controller card. A set of AR Date and Time
0 Phrase List PROM Cards NT1X76JA and NT1X76JB are required
0 for ARDT (English) announcements. Each CP contain two
0 (2) virtual card credits because they are double density
0 cards.

0 The following are the AR Date and Time Phrase List PROM
0 cards:

0	PEC	CPC	
0	NT1X76JA	B0231819	Automatic Recall Date/Time
0			Announcements (1) of (2) CP
0	NT1X76JB	B0231820	Automatic Recall Date/Time
0			Announcements (2) of (2) CP

0 The NT1X76AJ and the NT1X76AK cards are required and
0 should be assigned to the same DRA module as the NT1X76JA
0 and NT1X76JB cards. In a Class Phase 1 English office,
0 the NT1X76JA/JB can be assigned to a DRA where the
0 NT1X76AJ/AK cards are existing and there is room. Other-
0 wise, in other offices or where the DRAs with NT1X76AJ/AK
0 cards are filled, an additional set of NT1X76AJ/AK cards
0 must be ordered.

- 0 (x) The DRA cards (either recordable or pre-recorded) can
0 mount on DRA modules (i.e. NT2X58AM, NT2X58CB, NT2X58AK,
0 NT2X58AG).

0 The DRA module can accommodate one (1) NT1X75BA DRAM Con-
0 troller card and up to a maximum of eight (8) virtual
0 card credits (i.e. the addressing range of the NT1X75BA).

0 The DRA Recordable Memory cards (NT1X77AA and NT1X79AA)
0 each contain one (1) virtual card credit because they are
0 single density cards.

0 The existing DRA pre-recorded announcement card NT1X76AA
0 contains one (1) virtual card credit. Currently, this is
0 the only NT1X76__ card which contains one (1) virtual
0 card credit. All other NT1X76__ cards contain two (2)
0 virtual card credits because they are double density
0 cards.

0 RELEASE 28.01
0 93 12 03
0

0 All Phase 1 and Phase 2 CLASS DRA pre-recorded announce-
0 ment cards (i.e. NT1X76AJ/AK/BJ/BK, NT1X76AP-AW,
0 NT1X76BP-BW, NT1X76GA-GC, NT1X76GE-GL) each contain two
0 (2) virtual card credits because they are double density
0 cards. Hence, a DRA module can accommodate a maximum of
0 eight (8) single density cards or a maximum of four (4)
0 double density cards.

0 The two (2) Phase 1 CLASS DRA Announcement cards (Eng-
0 lish) can be mounted on half of a DRA module. The two
0 (2) Phase 1 CLASS DRA Announcement cards (French) can be
0 mounted on half of a DRA module. If both English and
0 French are required, then the four (4) Phase 1 CLASS DRA
0 Announcement cards (English and French) can be mounted on
0 one (1) DRA module.

0 The eight (8) Phase 2 CLASS DRA Announcement (List 1-12)
0 cards (English) can be mounted on two (2) DRA modules.
0 The eight (8) Phase 2 CLASS DRA Announcement (List 1-12)
0 cards (French) can be mounted on two (2) DRA modules.

0 A quantity of five (5) DRA modules may be provisioned on
0 a TME frame, NT0X46AB, if and only if double density DRA
0 cards are provisioned on these modules. Any double den-
0 sity DRA cards (i.e. all NT1X76__ cards with the excep-
0 tion of NT1X76AA which is a single density card), up to a
0 maximum of four (4) per module, may be provisioned. Oth-
0 erwise, only four (4) DRA modules may be provisioned on a
0 TME frame.

0 Hence, a DMS office requiring both Phase 1 and Phase 2
0 (List 1-12) pre-recorded CLASS DRA Announcements in Eng-
0 lish and French can have all twenty (20) double density
0 DRA cards mounted on five (5) DRA modules and these five
0 (5) modules could be mounted onto one (1) TME frame.

0 Redundancy of announcements is available as an option in
0 the U.S. only. If redundancy is provided, ensure that
0 the announcement MTMs are on different power feeds.

0 The assignment rules for mounting Phase 1 and Phase 2
0 CLASS DRA Announcement cards onto DRA modules are the
0 same as the rules pertaining to the existing NT1X76__ DRA
0 Announcement cards. Cards NT1X76AP/AQ/AR/AS must be
0 mounted together onto the same DRA module. Cards
0 NT1X76AT/AU/AV/AW must be mounted together onto the same
0 DRA module. Similarly, cards NT1X76BP/BQ/BR/BS must be

0
0 RELEASE 28.01
0 93 12 03

0 mounted together onto the same DRA module and cards
0 NT1X76BT/BU/BV/BW must be mounted together onto the same
0 DRA module. Cards NT1X76GA/GB/GC/+"Personality" Card
0 must be mounted together onto the same DRA module. The
0 previous cards within each DRA module can be in any or-
0 der. (See DRA System Provisioning in this section for
0 further information on the DRA.)

0 (xi) Log messages are produced when a subscriber activates the
0 Customer Originated Trace (COT) feature. If the
0 customer/telco wants these log messages to be routed to a
0 dedicated TTY, then a separate I/O port (i.e. one port
0 off of a NT1X67BC card) is required. Otherwise, these
0 log messages will be routed along with other log messages
0 to the customer specified TTY.

0 (xii) Canadian customers will be able to obtain CLASS Terminals
0 from NTCL or from outside suppliers. To obtain CLASS
0 terminals (i.e. an integrated telephone set, such as
0 MAESTRO) from NTCL, Canadian customers will contact
0 London Terminal Division.

0 U.S. customers will obtain CLASS terminals from outside
0 suppliers.

0 2.3.2 D-Channel Handler

0 (a) General Description

0 The D-Channel Handler separates call control signalling for the B
0 channels (used for encoded voice, circuit switched, or packet
0 data information) from user packet data. Signalling information
0 is passed to the Central Control, while packet data from several
0 D-Channels is multiplexed and routed to the packet handler.

0 (b) References

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 (i) The D channel handling function is performed by two cir-
0 cuit packs on the CPEI:

0 NTBX01AA - ISDN Signalling Pre-processor (ISP) CP

0 NTBX02AA - D Channel Handler CP

0 The ISDN Signalling Pre-processor CP is provisionable;
0 two (2) are required in the CPCI for all applications.

0 (ii) The D channel handler CP will be assigned to slots cur-
0 rently used by DS-1 interface circuit packs. Assignment
0 of a DCH card makes physically unavailable 2 DS-1 ports.

0 (iii) Each DCH circuit pack takes one peripheral port of the
0 twenty P-side ports available. The total of twenty P-
0 side ports are shared between the DS-1, DS-30A and DCH
0 links.

0 (iv) From BCS-28 onwards, one (1) of the DCH circuit packs
0 will be used as a spare to support N+1 redundancy. There
0 is no DCH sparing in BCS-27.

0 At least two DCH cards must be provided after BCS-28 (ie.
0 one plus one spare).

0 (v) Up to ten (10) DCH Circuit Packs may be provided per
0 CPCI. (Nine plus one spare). Refer to the Traffic Crite-

0
0 RELEASE 28.01
0 93 12 03

0 ria and Capacities (Chapter 2) to calculate the number of
0 DCH required to support the anticipated packet traffic.

0 (vi) Each DCH circuit pack has 32 "ports" available. One port
0 is dedicated to the ISP, and the remaining 31 ports are
0 capable of handling 4 multiplexed BRI D channels each, or
0 $31 \times 4 = 124$ BRI D channels maximum.

0 The ISP will occupy a free slot on the speech bus.

0 2.3.3 ISDN Common Peripheral Controller (CPEI)

0 (a) General Description

0 The ISDN Common Peripheral Controller (CPEI) is the Peripheral
0 Controller for the ISDN. The CPEI frame is named LGEI, LTEI or
0 DTEI depending on the access modes supported (BRI, PRI, etc.)

0 The CPEI has 20 p-side ports that are provisioned as required to
0 support DS-30A links from LCMs, LCMEs, and LCMIs; DS-1 links to
0 the Packet Handler; DS-1 links for PRI or non-ISDN trunks; and
0 D-channel handlers.

0 An offshore version of the CPEI has also been created whose pri-
0 mary difference is the use of PCM-30 interfaces instead of DS-1
0 interfaces.

0 (b) References

0 System Engineering Bulletin (SEB) 88-10-001

0 (c) Provisioning Considerations

0 (i) The CPEI is used to interface the DS-30A links from line
0 modules, the DS-1 links to the Packet Handler, and the
0 non-ISDN and ISDN-PRI DS-1 links.

0 The frame and its modules and shelves are assigned func-
0 tional names depending on the ISDN access modes sup-
0 ported. For BRI access the following names apply:

Access Modes	Equip	Name	Abbr
-----	-----	-----	----
DS-30A links to LCM/LCME/LCMIs, DS-1 links to Packet Handler	Frame	ISDN Line Group Equipment	LGEI
	Module	ISDN Line Group Controller	LGCI
	Shelf	ISDN Line Group Array	LGAI

0

0 RELEASE 28.01
0 93 12 03

Access Modes	Equip	Name	Abbr
-----	-----	-----	-----
DS-30A links to LCM/LCME/LCMIs,	Frame	ISDN Line Trunk Equipment	LTEI
DS-1 links to Packet Handler, non-ISDN DS-1 trunks	Module	ISDN Line Trunk Controller	LTCI
	Shelf	ISDN Line Trunk Array	LTAI

0 Planned availability of these functions is as follows:
0 LGEI in BCS-27, LTEI in BCS-28. In addition, PRI DS-1
0 links are to be supported on LTEI in BCS-30.

0 (ii) Upgrade kits will be available to apply ISDN capability
0 to existing LGE/LTE/DTE/SME frames. The required kits
0 are:

0 NT6X02ZA CPCI ISDN Upgrade Circuit Pack Change Kit
0 NT6X01ZZ CPCE ISDN Upgrade Wiring Change Kit

0 These kits are not to be ordered for U.S. applications
0 until further notice.

0 The above kits will take any NT6X01AA CPCE frame and any
0 common circuit pack fill associated with this frame and
0 convert it to NT6X01AB CPEI frame and NT6X02NA ISDN com-
0 mon CP fill.

0 The NT6X02ZA CPCI ISDN Upgrade Circuit Pack Change Kit
0 can also be used on the NT6X01AB CPCE frame to upgrade a
0 non-ISDN DTC module to handle ISDN applications.

0

0

0

0

0 RELEASE 28.01
0 93 12 03
0

0 (iii) The Maximum number of each type of link, and the minimum
0 software release that supports it are:

0 LCM/LCME/LCMI - CPEI DS-30A links:
0 - up to 18 (BCS-27 or higher)

0 CPEI - Packet Handler DS-1 links:
0 - up to 16 (BCS-27 or higher)

0 Non-ISDN trunks:
0 - up to 16 (BCS-28 or higher)

0 PRI trunks:
0 - up to 16 (BCS-29 or higher)

0 There are no restrictions on the assignment of Bb or Bd
0 channels to packet handler DS-1 link channels. Note that
0 the CPEI statmux maximum is 64:1 for Bd channels.

0 | (iv) Prior to BCS-31, in an office equipped with both ISDN and
0 non-ISDN peripheral controllers, the CPCI modules could
0 be assigned the same discrimination numbers as existing
0 non-ISDN modules. For example, LGC 01 and LGCI 01 could
0 co-exist in an office. The same is not true for LCME/LCMI
0 versus LCM bays.

0 | For BCS-31 and above, discrimination numbering of ISDN
0 peripherals has been changed, requiring them to be con-
0 secutive with non-ISDN modules. Frame level naming and
0 numbering is unchanged and the frame type is still deter-
0 mined by the bottom module in the frame. At the MAP, ISDN
0 modules are no longer called LGCI/LTCI. Instead, only
0 LGC/LTC are allowed. (Note that DTCI has not been changed
0 to DTC at the MAP). As a result of this change, at
0 BCS-31, existing ISDN peripheral controllers (LGCI/LTCI)
0 will need to be renumbered to be consecutive with
0 non-ISDN controllers. For example, an office with exist-
0 ing LGC 00-05 and LGCI 00-01 will require renumbering the
0 ISDN modules to LGCI 06-07 at BCS-31. New labels for the
0 ISDN controllers will be required.

0 | DTC and DTCI numbering will not be changed due to the
0 complexity of changing in-service trunks and the lack of
0 a software tool for this activity. Numbering for DTC/DTCI
0 modules will be unchanged from pre-BCS31 practices.

0

0 RELEASE 28.01
0 93 12 03

0 | At the MAP, modules can still be identified as ISDN or
0 non-ISDN by referring to the ISP16 table.

0 (v) In an office equipped with both ISDN and non-ISDN periph-
0 eral controllers, the CPCI modules can be assigned the
0 same discrimination numbers as existing non-ISDN modules.
0 For example, LGC 01 and LGCI 01 can co-exist in an of-
0 fice. The same is not true for LCMI versus LCM bays.

0 (vi) The following chart illustrates the call types which im-
0 pact Real Time Engineering of the Master Processor in the
0 LGCI provisioned with Basic Rate Interface (BRI). Cur-
0 rently, the Master Processor is the only processor which
0 requires Real Time Engineering.

CALL TYPE	BCS	
	27	28
ISDN Circuit Switched	Y	Y
B Channel Packet Switched	N	N
D Channel Packet Switched	N	N
Electronic Business Set	Y	Y
Datapath	Y	Y
Other (POTS and MDC)	N	Y

0 Refer to System Engineering Bulletin (SEB) 88-10-001 for
0 BCS 25-27 Abbreviated Real Time Engineering Guidelines
0 for the LGCI.

0 BCS 28 Abbreviated Real Time Engineering Guidelines for
0 the LGCI provisioned with Basic Rate Interface is to be
0 provided in a future issue of this document.

0 (vi) The DTC NT6X02AI can be provided on the CPEI frame for
0 DMS-250 applications. This module will handle non-ISDN
0 trunking (employing A/B bit signaling) required for
0 DMS-250 applications but will not handle ISDN PRI. The
0 DTC can be converted at a later date to a DTCT in order
0 to handle ISDN PRI.

0 The NT6X01WC DTC Wiring Option (NT6X01AB) is provided per
0 each non-ISDN module equipped on the CPEI frame.

0 RELEASE 28.01
0 93 12 03
0

0 Standard DMS-250 DTC circuit packs are provisioned on the
0 DTC module as required.

0 (vii) Optional Software Features

0 Enhanced Office Recovery, NTXA66AA, is an optional soft-
0 ware feature that improves the present office recovery
0 time of extended peripheral modules (XPM). Extended XPM
0 Diagnostics, NTXA67AA, is an optional software feature
0 that enhances the present diagnostics of extended periph-
0 eral modules (XPM). The LTCI is classified as an XPM.

0 These Software features are applicable to any peripheral
0 module (XPM) which contains both enhanced messaging (i.e.
0 the 6X69/79 pair or the 6X69AB CP) and enhanced memory
0 (i.e. the 6X46AC CP or the 6X46BA CP).

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four (4) NT6X45BB (U.S. applications) or
0 NT6X45BA (Canadian applications) XPM Processor CP for up-
0 grading existing offices.

0 | (viii) Offshore CPEI

0 | NT6X01AC Offshore Peripheral Controller Equipment Frame

0 | The NT6X01AC Offshore Common Peripheral Controller Equip-
0 | ment Frame is based on the domestic NT6X01AB ISDN periph-
0 | eral controller, adapted for applications outside North
0 | America ("Offshore"). It supports PCM30 links, ISDN ser-
0 | vices, and Common Channel Signaling 7 (CCS7) features on
0 | two independent peripheral modules.

0 | The NT6X01AC Offshore Peripheral Controller Equipment
0 | frame supports two peripheral module types: PLGC and
0 | PDTC.

0 | PLGC - Supports ISDN, Centrex, EBS, IBN and POTS services on
0 | standard Line Concentrating Module types

0 | - Has PCM-30 P-side links for PRLCM and Offshore Remote
0 | Switching Center interface

0 | - Operation as a non-ISDN peripheral is not yet imple-
0 | mented in software, meaning that the NTB01AA ISDN

0
0 RELEASE 28.01
0 93 12 03

0 | Pre-Preprocessor CP is required even if no ISDN fea-
0 | tures are used

0 | - Supports AMI interface to the NT1. 2B1Q is not sup-
0 | ported for this interface

0 | PDTC - Supports CCS7 and R1 signaling in Offshore applica-
0 | tions, using PCM-30 links

0 | - ISDN services like Primary Rate Interface are not
0 | supported

0 | Modules of different types may be mixed on the frame if
0 | required.

0 | NTBX02AA D-Channel Handler CP are not required for PDTC
0 | applications, nor where the PLGC supports only non-ISDN
0 | LCMS.

0 | NTBX01AA ISDN Pre-Processor CP are always required on
0 | PLGC (until such time as software supports purely
0 | non-ISDN operation). This CP is not required on PDTC.

0 | (ix) All PCM30 links from a PRCC must terminate on the same
0 | host PLGC. Only the PLGC peripheral type can terminate
0 | PRCC host links.

0 | (x) The Offshore Offshore versions of the Common Peripheral
0 | Controller Equipment Frame and Remote Controller Equip-
0 | ment Frame are provisioned the same as their domestic
0 | counterparts (subject to the usage restrictions). The
0 | primary difference is the use of PCM-30 interfaces in-
0 | stead of DS-1 interfaces. A maximum of sixteen (16)
0 | PCM-30 interfaces may be equipped on the PLGC/PDTC versus
0 | twenty (20) DS-1 interfaces on the North American prod-
0 | uct. Provision one (1) NT6X27AC PCM-30 Interface CP for
0 | every two PCM-30 interfaces required. Certain other cir-
0 | cuit pack vintages are different between domestic and
0 | Offshore products; refer to the Engineering Manual
0 | sections for details.

0 RELEASE 28.01
0 93 12 03

0 2.3.4 Digital Packet Network (DPN) Equipment Provisioning

0 (a) General Description

0 Nailed-up B channel and statistically multiplexed D channel
0 packet data are routed to the DMS-100 Integrated Packet Handler
0 (IPH) equipment via DS-1 links from the CPEI frame. The IPH is
0 one of the peripherals needed to add ISDN to a DMS-100. The IPH
0 comes in a cabinet that is configured to support a set number of
0 B-channels and D-channels. Contained in a single cabinet is a
0 Digital Interworking Unit (DIU) and two Resource Modules (RM).

0 The DS-1 links are interfaced to the IPH by means of the DIU. The
0 RM portion of the IPH is a fully redundant module, including two
0 office Processing Elements (PE), two Call Server PEs, two DIU
0 servers, and two Disk Drives. In addition, the RM contains the
0 necessary hardware to support the OAM and subscriber service con-
0 nections. This IPH can be supported with G24 and later software
0 release. G26 is compatible with BCS29, 30, 31, and 32 if I-OAM
0 is not fully utilized. If full I-OAM capabilities are desired,
0 G26 is compatible with BCS31.

0 Prior to G26, the configuration of the PH equipment depended on
0 the software release. Prior to G23 release, the DIU worked in
0 conjunction with a DPN Access Module (AM) and the Network Module
0 (NM). The AM provides interfaces for the DIU, while the NM
0 interfaces the AM to the packet-switched network. A configuration
0 requiring only one AM shelf is called a DPN-10. A two-AM shelf
0 configuration is called DPN-15.

0 As of G23 release, the DPN-100 with the Resource Module (RM) was
0 introduced to provide significantly increased throughput. The NM
0 was still required for applications involving X.75 gateways (un-
0 til G24), and Network Control System (NCS) and data spooling
0 functions (until G26).

0 In G24, the AM and RM can interface to X.75 gateways. Generic G24
0 is the baseline for interfacing with the BCS-27 LGCI.

0 In G26, the IPH does not require an NM. The data spooling and
0 Network Control System functions can be performed by the IPH. The
0 AM is replaced by the RM. Reference Figure 316.6, Packet Handler
0 System Configuration.

0 This section describes the engineering of the ISDN-specific com-
0 ponents of the PH; that is, the DIU and the related RM equipment.

Figure 316.6: Packet Handler System Configuration

0
0 RELEASE 28.01
0 93 12 03

0 (b) References

0 NTP 241-1001-XXX DPN.....

0 (c) Provisioning Considerations

0 (i) The quantity of DS-1 links from the DMS is used to deter-
0 mine the quantity of DIU systems (shelves) and sub-
0 systems required. Each sub-system supports a single DS-1
0 link, and the number of interface cards in the sub-system
0 is determined by the number of Bb and Bd channels provi-
0 sioned on the DS-1 link.

0 On the CPCI, DS-1 links and individual channels within
0 the links may be allocated to Bb or Bd as required. Bb
0 and Bd should be distributed as equally as possible over
0 all the links from the same CPCI.

0 (ii) For more information on the DPN, refer to the NTP
0 241-1001- series of documents.

0 1.0 Host Office - Subscriber Access Equipment

0 1.1 Equipment Provisioning

0 1.1.1 Time Switch Broadcasting

0 Time Switch Broadcasing (TSB) is a process employed in DMS to
0 distribute certain tones and recorded messages via the network
0 simultaneously to many users from a single source. The speech
0 channel incoming to the network from each source can be connected
0 in a broadcast mode to all outgoing speech channels within the
0 same network incoming time switch. A number of service circuits
0 utilize this process.

0 Old Network

0 It is necessary to limit the number of simultaneous connections
0 in order to reduce the possibility of Network Subgroup (NSG)
0 blocking. This maximum is normally specified in translations and
0 should not exceed 16 per NSG in the network without deloading.
0 These additional 16 channels are the signalling channels which
0 are available for speech connections within the network module.

0 With NSG deloading, the maximum number of simultaneous con-
0 nections can be up to a maximum of 256.

0 New Network

0 Same criteria as above except that the maximum number of simul-
0 taneous connections should not exceed 32 per NSG in the network
0 without deloading.

0 With NSG deloading, the maximum number of simultaneous con-
0 nections can be up to a maximum of 512.

0 From a traffic standpoint each TSB source can be viewed as being
0 a trunk group in which the number of servers equals the above
0 specified maximum number of connections.

0 RELEASE 28.01
0 93 12 03

0 1.1.2 DS512 Interface Cards

0 (a) General Description

0 The NT6X40CA DS512 Network Interface circuit pack provides a fi-
0 ber interface to the Enhanced Network (ENET).

0 (b) Reference

0 None

0 (c) Provisioning Considerations

0 (i) If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP and two (2) NT6X40DA, DS512 Paddle Board,
0 for each relevant DTC/LGC/LTC module.

0 (ii) Provide one (1) NT6X02BU, Fiber I/F Hardware Assembly,
0 for each DTC/LGC/LTC module interfacing to the Enhanced
0 Network (ENET). The NT6X02BU Fiber Assembly mounts on
0 the backplane of the lower array in a module and provides
0 the fiber interface for both arrays.

0 (iii) If copper interface to the Network is required, then pro-
0 vide two (2) NT6X40AC, DS30 Network Interface CP, for
0 each relevant DTC/LGC/LTC module.

0 Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 1.1.3 Universal Tone Receivers

0 (a) General Description

0 The Universal Tone Receiver (UTR) is a combined service circuit
0 that can perform the function of a Digitone Receiver for lines
0 and a MF Receiver for trunks.

0 The Universal Tone Receiver (UTR) circuit pack is provisioned for
0 R2 call setup. Each UTR pair has thirty circuits. For more in-
0 formation on the UTR, refer to Section 3.5.

0 (b) Reference

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 (i) The UTR is provisionable in pairs (maximum two (2) pairs)
0 on the DTC, LGC, (IDTC, ILGC) and LTC modules. All lines
0 and trunks connected to the module will be serviced by
0 the UTR within the module. This includes all lines in
0 LCMS, RLCMS, and OPMS.

0 (ii) UTRs will slightly reduce the DTC/LGC/LTC and RSC periph-
0 eral real time capacity. A real time work up should be
0 performed to ensure sufficient capacity. Refer to Sys-
0 tems Engineering Letter, Issue #01, Subject "Guidelines
0 for XPM Real Time Capacity Study - BCS-22" (Date: May 22,
0 1987).

0 (iii) Lines and trunks on a RSC are serviced by UTR cards lo-
0 cated in the RCC module of the RSC. There is no traffic
0 overflow to the host office.

0 (iv) Although the UTR can perform the function of a Digitone
0 Receiver (NT2X48AA) and the function of a MF Receiver
0 (NT2X48AB), there is no traffic overflow from UTRs onto
0 existing Digitone Receivers nor existing MF Receivers.
0 The Digitone Receivers and MF Receivers mounted on MTMs
0 and TMs are still required to service the following:

- 0 - analog trunk groups existing on TM/MTM shelves
- 0 - lines equipped on LM modules
- 0 - trunk groups equipped on DCM modules
- 0 - Mechanized Calling Card Service (MCCS)

0 RELEASE 28.01
0 93 12 03
0

0 - Subscriber Carrier Modules (SMS, SMR, SMU)
0 - incoming and the incoming portion of 2 way service
0 and test circuits (i.e. Remote Office Test Line and
0 Blue Box Fraud
0 Prevention). Refer to Section 3.5 (1.3.14) for the
0 Digitone
0 Receiver and Section 3.5 (1.3.13) for the MF Re-
0 ceiver.

0 (v) The following is a list of trunk types which require a
0 receiver that are supported by the UTR

0| Any incoming or incoming portion of a 2 way trunk group
0| requiring a receiver not listed above will require
0| Digitone or MF receivers.

0| (vi) The number of UTR circuits is obtained by calculating the
0| UTR holding time and multiplying by the average number of
0| calls per hour. In general it is always safe to provide
0| two (2) pairs of UTR cards if unsure of the traffic de-
0| mands.

0| For incoming R2 calls the UTR holding time is as follows:

0| 1. From seizure to final digit collection
0| plus

0 | 2. From final digit collection to - trunk
0 | selection if R1 or N5 outgoing, - seize
0 | acknowledgement if R2 outgoing.

0 | For outgoing R2 calls the UTR holding time is as follows:

0 | 1. The UTR is held until told to release by
0 | the far office or timeout if we are the
0 | controlling signal office (i.e. R1 to R2
0 | calls).

0 | The number of UTRs used on average is given by the fol-
0 | lowing formula:

0 | # of UTR SI S0
0 | Circuits = NI x ----- x EI + NO x ----- x EO
0 | required HI+SI HO+S0

0 | where,

0 | NI = Number of incoming R2 trunks (or 2-way
0 | used as incoming)

0 | SI = Signalling time in seconds of incoming
0 | trunks

0 | HI = Holding time (talking) of incoming trunks
0 | in seconds

0 | EI = Erlang occupancy figure of incoming
0 | trunks

0 | NO = Number of outgoing R2 trunks (or 2-way
0 | used as outgoing)

0 | S0 = Signalling time in seconds of outgoing
0 | trunks

0 | HO = Holding time (talking) of outgoing trunks
0 | in seconds

0 | EO = Erlang occupancy figure of outgoing trunks

0 | (vii) This circuit pack is only required for CCITT No. 6 Sig-
0 | nalling.

0 RELEASE 28.01
0 93 12 03

0 1.1.4 Digital Trunk Controller (DTC) Module

0 (a) General Description

0 The Digital Trunk Controller (DTC) Module provides the interface
0 between DS-1 digital systems and the DMS network. (The DTC does
0 not provide the digital interface between a host DMS and a re-
0 mote.)

0 (b) Reference

0 Chapter 3, Section 3.15 Common Channel Signalling

0 (c) Provisioning Considerations

0 (i) The DTC module is a two shelf module (versus the present
0 single shelf or single bay peripheral module).

0 (i) Each DTC module can terminate up to twenty (20) digital
0 carrier systems (i.e. up to ten (10) DS1 Interface cards)
0 and interconnect with the network via up to sixteen (16)
0 DS30 speech links.

0 (iii) Each DTC can terminate up to a maximum of twenty (20) DS1
0 ports on the peripheral side and a maximum of sixteen
0 (16) DS30 ports on the CPU (network) side.

0 (iv) Since each DTC terminates up to $20 \times 24 = 480$ voice chan-
0 nels and the internal speech links can accommodate up to
0 $16 \times 30 = 480$ VF paths, there is no concentration.

0 (v) DTC modules are provisioned for total terminations based
0 on the forecast of digital trunk requirements for the
0 busy season prior to exhaust.

0 (vi) For service protection, it is recommended that trunk cir-
0 cuits of each trunk group be spread over more than one
0 DS1 Interface card. Both of these cards can be mounted
0 on the same DTC module because of the duplicated
0 processor residing in the module.

0 (vii) Existing DTC modules which have spare capacity shall be
0 used to terminate new digital systems.

0 (viii) When a DTC module is handling CCIS/CCS7 voice trunk-
0 ing, two (2) Continuity Tone Detector cards NT6X70AA are

0 RELEASE 28.01
0 93 12 03
0

0 required when analog trunk facilities are employed. The
0 NT6X70AA card is not required if the transmission path is
0 all-digital.

0 (ix) The following DTC Common Peripheral Controller CPs sup-
0 port the following applications:

0 DTCs
0 NT6X02IC supports UTRs
0 replaces NT6X02AQ/AR (BCS-27)

0 IDTCs
0 NT6X02BD supports SL-100 U.K.
0 NT6X02BN supports Mercury UK applications with
0 New Message requirements (eg. DPNSS) *
0 NT6X02GB supports Caribbean (CEP)
0 NT6X02JA supports DMS-300 Turkey
0 NT6X02KE supports China
0 NT6X02QA supports Turkey applications
0 NT6X02BW replaces NT6X02BP (BCS-28)
0 NT6X02BP supports all International

0 * See Section 3.15 Common Channel Signalling for more
0 information on DPNSS.

0 (x) For each NT6X02IC ordered (BCS-27), provide:

0 - four (4) XPM Processor CP NT6X45AF/BA
0 - two (2) DS30 Network Interface CP NT6X40AC
0 - two (2) SP Memory Plus CP NT6X46BB
0 - two (2) MP Memory Plus CP NT6X47AC

0 - two (2) MSG Protocol & Tone CP NT6X69AC
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02IC is to be ordered instead of NT6X02IA.

0 For each NT6X02BW ordered, provide:

0 - six (6) XPM Processor CP NT6X45BA
0 - two (2) Time Switch CP NT6X44AB/EA
0 - two (2) Power Converter CP NT2X70AE

0 NT6X02BW is to be ordered instead of NT6X02BP.

0

0 RELEASE 28.01
0 93 12 03
0

0 Upon general availability, the NT6X45BA CP will become
0 the standard XPM Processor offering instead of the
0 NT6X45AF/AD CP.

0 If optional software feature NTXA66AA (Enhanced Office
0 Recovery) or NTXA67AA (Extended XPM Diagnostics) are
0 present, then the XPM Processor CP must be the NT6X45BA.
0 Provide four NT6X45BA XPM Processor CP for upgrading ex-
0 isting offices.

0 NT6X44EA adds Even-Bit-Inversion (EBI) to the Time Switch
0 CP (NT6X44AB).

0 (xi) If interface to the Enhanced Network (ENET) is required,
0 then the relevant DTC/LGC/LTC modules must have the
0 NT6X69AC Msg Protocol & Tone CP. NT6X69AC replaces
0 NT6X69AB.

0 Provide 1 NT6X02BQ change kit for each DTC/LGC/LTC module
0 you are upgrading to ENET. This change kit applies only
0 to modules provisioned at NT6X02 AS/IA, AT/LA or AU/MA
0 levels. Modules provisioned at earlier levels must be
0 upgraded to these levels before the NT6X02BQ change kit
0 can be applied.

0 (xii) If ENET interface is not required, use the product change
0 kit NT6X02EQ to upgrade DTC modules from NT6X02IA/LA/MC
0 to NT6X02IC/LC/MC levels.

0 (xiii) There are two methods available to satisfy 4 MB MP memory
0 requirements in existing DTC/LGC/LTC modules. The first
0 method is to apply one NT6X02EQ product change kit to
0 each DTC/LGC/LTC module to be upgraded as in item (1) be-
0 low. Per customer request, a second pair of office sup-
0 plied NT6X47AB packs may be added to each DTC/LGC/LTC
0 module to be upgraded as in item (2) below. Do not order
0 new NT6X47AB packs for the upgrade of NT6X02IA, LA, MA mod-
0 ules. The NT6X47AB packs that have been removed from up-
0 graded DTC/LGC/LTC modules may then be applied to other
0 relevant DTC/LGC/LTC modules.

0 1) Provision NT6X02EQ Product Change Kit to replace the
0 NT6X47AB MP Memory Plus circuit packs in slot 10 with
0 NT6X47AC packs. The NT6X02EQ kit may only be applied
0 to the following modules:

0 RELEASE 28.01
0 93 12 03
0

0 DTC (CCS7) : BCS-27 and later (NT6X02AS/IA)
0 DTC (other): BCS-33 and later (NT6X02AS/IA)
0 LGC (all) : BCS-31 and later (NT6X02AT/LA)
0 LTC (all) : BCS-30 and later (NT6X02AU/MA)

0 2) Existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT0X50AA, Filler Face Plate, in Slot 09.
0 Provide two (2) NT6X47AB, MP Memory Plus CP for the
0 above listed modules.

0 One NT6X47AC in slot 10 (item 1) has the same memory
0 capacity as two (2) NT6X47AB in slots 9 and 10 (item 2).

0 | Where an existing DTC/LGC/LTC module is presently
0 equipped with two NT6X69AB in slot 18, if the existing
0 module is not required to interface ENET, new cards are
0 not required for these slots.

0 Provide one (1) NT6X02BQ Product Change kit for each ex-
0 isting DTC/LGC/LTC module to be upgraded to interface
0 ENET. The NT6X02BQ contains (2) NT6X69AC circuit packs.
0 The NT6X02BQ will convert the NT6X02IA/AS to NT6X02IC,
0 the NT6X02LA/AT to NT6X02LC, and the NT6X02MA/AU to
0 NT6X02MC.

0 If an existing DTC/LGC/LTC module has ALREADY been up-
0 graded to the NT6X02IC/LC/MC packfill level via the
0 NT6X02EQ KIT, provide two NT6X69AC circuit packs in slot
0 18 to upgrade the module for ENET interface.

0 | For Canadian applications only, provide the NT6X02ER
0 Product Change Kit for each existing DTC peripheral mod-
0 ule (NT6X02AR/AM) to be upgraded. This change kit makes
0 the appropriate circuit pack positions provisionable, but
0 contains no circuit packs. Refer to the engineering man-
0 ual rules to identify the circuit packs required for up-
0 grade of the NT6X02AR or NT6X02AM.

0 (xiv) The following are the minimum packfill levels required
0 for BCS-32 or later: NT6X02IA/IS, or NT6X02IC (for new
0 offices).

0 **Building Blocks**

0 (xv) Provide one NTZZ04EA Building Block product change kit
0 for each existing NT6X02AA DTC/LGC/LTC module to be up-
0 graded. Do not order the NT6X02ZE PC Kit.

0
0 RELEASE 28.01
0 93 12 03

0

0 The NTZZ04EA building block contains the following:

0 (1) NT6X02ER XPM PC Kit
0 (1) NT6X02ZL Wiring Kit
0 (2) NT0X50AA Filler Face Plate
0 (2) NT6X47AC Master Proc Memory Plus CP
0 (2) NT6X46BB Signal Processor Memory Plus CP
0 (2) NT6X69AC CPP Msg Protocol & Tone CP
0 (2) NT2X70AE Power Conv +/-5V & 12V CP
0 (2) P0711663 Desig. Label for NT6X47AC
0 (2) P0711664 Desig. Label for NT6X46BB
0 (2) P0710476 Desig. Label for NT6X69AC
0 (2) P0698943 Desig. Label for NT2X70AE

0 (Note: The NTZZ04EA includes all circuit packs required
0 to upgrade an NT6X02AA module except the NT6X45 cards.

0 The NTZZ04EA building block kit may be used to upgrade
0 the NT6X02AA module as follows:

0

0

0

0

0

0

0

0

RELEASE 28.01
93 12 03

Building Block	From	To
NTZZ04EA	NT6X02AA (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

Provide one NTZZ04GA Building Block product change kit for each existing NT6X02AC DTC/LGC/LTC module to be upgraded. Do not order the NT6X02ZE PC Kit.

The NTZZ04GA building block contains the following:

(1)	NT6X02ER	XPM PC Kit
(1)	NT6X02ZL	Wiring Kit
(2)	NT0X50AA	Filler Face Plate
(2)	NT6X47AC	Master Proc Memory Plus CP
(2)	NT6X46BB	Signal Processor Memory Plus CP
(2)	NT6X69AC	CPP Msg Protocol & Tone CP
(2)	P0711663	Desig. Label for NT6X47AC
(2)	P0711664	Desig. Label for NT6X46BB
(2)	P0710476	Desig. Label for NT6X69AC

(Note: The NTZZ04GA includes all circuit packs required to upgrade a NT6X02AC module except the NT6X45 cards.

The NTZZ04GA building block kit may be used to upgrade the NT6X02AC module as follows:

Building Block	From	To
NTZZ04GA	NT6X02AC (DTC) (LGC) (LTC)	NT6X02IC (DTC) NT6X02LC (LGC) NT6X02MC (LTC)

0
0 RELEASE 28.01
0 93 12 03

0 | (xvi) Existing DTC/LGC/LTC module is presently equipped with
0 four (4) NT6X45AA, XPM Processor CP, in Slots 08 & 12.
0 Application of the NTZZ04EA/NTZZ04GA makes these slots
0 provisionable and replacement cards must be ordered as
0 follows:

0 For A-stock upgrades provide four (4) NT6X45BA cards in
0 slots 8 and 12 of the upper and lower shelves of the pe-
0 ripheral modules. If B-stock material is required, then
0 four NT6X45BB packs must be merchandise ordered via an
0 88K.

0 | The existing NT6X45AA packs must be replaced because they
0 will not work with New Messaging. The only reason NT6X45
0 cards are not included in the NTZZ04EA/GA upgrade kit is
0 because there is an option between NT6X45BA and NT6X45BB
0 packs. Either the NT6X45BA packs or the NT6X45BB packs
0 must be ordered or the upgrade will not have been done
0 correctly.

0 (xvii) The existing DTC/LGC/LTC module is presently equipped
0 with the following DS30 Network Interface CP in Slots 22
0 & 23: four (4) NT6X40AA.

0 If copper interface to the Network is required, then DO
0 NOT order new circuit packs for these slots.

0 If fiber interface to the Enhanced Network (ENET) is re-
0 quired, then provide two (2) NT6X40CA, DS512 Network
0 Interface CP in Slot 22, and two (2) NT6X40DA, DS512 Pad-
0 dle Board, in Slot 22R of each relevant DTC/LGC/LTC mod-
0 ule. Also, provide one (1) NT6X02BU, Fiber I/F Hardware
0 Assembly, for each DTC/LGC/LTC module interfacing to the
0 Enhanced Network (ENET). The NT6X02BU Fiber Assembly
0 mounts on the backplane of the lower array in a module
0 and provides the fiber interface for both arrays.

0 | Upon general availability, the NT6X40FA will replace the
0 NT6X40CA as the standard DS512 XPM Interface and the
0 NT6X40GA will replace the NT6X40DA as the standard DS512
0 Link Paddle Board. Mount the NT6X40FA and NT6X40GA cir-
0 cuit packs in slot 22 and 22R, respectively, of the upper
0 and lower shelves of the peripheral modules requiring fi-
0 ber interface to ENET. Also, provide one (1) NT6X02BU,
0 H/W Assembly, per module for fiber interface to ENET.

0

0
0 RELEASE 28.01
0 93 12 03

0 (xviii) The existing DTC/LGC/LTC module is presently equipped
0 with four (4) NT6X47AA, MP Memory CP, in Slots 09 & 10.
0 Application of the NTZZ04EA/NTZZ04GA replaces these cir-
0 cuit packs with two NT6X47AC Master Processor Memory cir-
0 cuit packs.

0 (xix) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X46AA Signal Processor Memory Plus CP in
0 slot 11. Application of the NTZZ04EA/NTZZ04GA replaces
0 these circuit packs with two NT6X46BB circuit packs.

0 (xx) The existing DTC/LGC/LTC module is presently equipped
0 with two (2) NT6X43AA, Msg Interface CP, in Slot 18. Ap-
0 plication of the NTZZ04EA/NTZZ04GA replaces these circuit
0 packs with two NT6X69AC Msg Protocol & Tone circuit
0 packs.

0 (xxi) If the existing module was a NT6X02AA, then the NTZZ04EA
0 provides two (2) NT2X70AE, Power Converter CP, in Slot 25
0 of each DTC/LGC/LTC module.

0 If the existing module was a NT6X02AC, then two (2)
0 NT2X70AD, Power Converter CP, already exist in Slot 25 of
0 each DTC/LGC/LTC module. DO NOT order new circuit packs
0 for these slots unless requested by the customer. Per
0 Telco request, the existing NT2X70AD CP's in each
0 DTC/LGC/LTC can be replaced by the NT2X70AE, Power Con-
0 verter ESD CP.

0 2.0 Peripheral Modules Features

0 2.1 Introduction

0 This section describes the line-oriented software features that
0 require special hardware provisioning to make the feature work.

0 2.2 Features

0 The line-oriented software features included in the Peripheral
0 Modules Features that require special hardware provisioning con-
0 siderations are listed below:

0 Custom Local Area Signalling Services (CLASS) or Call Man-
0 agement Services (CMS)

0 Residential Enhancement Services

0 Enhanced Coin Services

0 RELEASE 28.01
0 93 12 03

0 2.3 Equipment Provisioning

0 2.3.1 CLASS/CMS Feature

0 (a) General Description

0 Custom Local Area Signalling Services or CLASS Features are a set
0 of line-oriented features which the telephone company can deploy
0 in their residential or Centrex customer environment to generate
0 additional revenue. These features operate within a single
0 switch or transparently between users on different end-office
0 switches by means of CCS7-based signalling in a multi-node switch
0 configuration. In the U.S., this feature is called CLASS and in
0 Canada, the feature is called CMS. In this document, the feature
0 will be referred to as CLASS.

0 CLASS Features are separated into Phase I and Phase II features.
0 Phase I features include

- 0 - Automatic Callback (ACB) - allows a calling party to automat-
0 ically call again the number most recently dialed, whether
0 that call was answered, unanswered, or busy. If the station
0 is busy, the user may queue against that station and be re-
0 called when it becomes idle. The Automatic Callback feature
0 is very similar to the Ring Again (RAG) feature, but will be
0 deployed in the Public Network.
- 0 - Automatic Recall (AR) - enables the end user to return his
0 latest incoming call automatically, regardless of whether the
0 incoming call was answered, and regardless of whether the end
0 user knows the identity of the calling party. If the station
0 is busy, the user may queue against that station and be re-
0 called when it becomes idle. With two (2) level activation,
0 the directory number of the last call is voiced back prior to
0 completing the call.
- 0 - Calling Number Delivery or Calling Number Display (CND) - en-
0 ables receipt and display of the calling party's directory
0 number and Date/Time during the ringing cycle. This allows
0 the end user with a display set to make an informed decision
0 about answering the call.
- 0 - Calling Number Delivery Blocking (CNDB) - permits the origi-
0 nating customer, by designating his calling identity as "pri-

0 RELEASE 28.01
0 93 12 03
0

0 vate", to prevent his directory number from being transmitted
0 for Calling Number Delivery. The calling party may change
0 his DN Suppression default - Suppress DN or not Suppress DN -
0 to the opposite status.

0 - Customer Originated Trace (COT) - enables the called party to
0 request an automatic trace of the last call received. The
0 trace record identifies the calling party and other call-
0 related information. The results of the trace are not pro-
0 vided directly to the end user, but are made available only
0 to an authorized agency, such as the telephone company or law
0 enforcement agency.

0 Note that CLASS features are available only to lines with a line
0 class code of RES (Residential Enhanced Services). Note that
0 this does not include ISDN RES lines.

0 Automatic Recall Date and Time Feature (ARDT)

0 This feature provides the date and time voiceback capability for
0 the Automatic Recall (AR) two-level activation sequence.

0 CLASS Configuration

0 Figure 35.2 illustrates a typical configuration with a CLASS ter-
0 minal on the DMS. This terminal is equipped with an enhanced
0 Man-Machine Interface (MMI), such as a Liquid-Crystal Display
0 (LCD) panel. The terminal could also consist of a standard tele-
0 phone with a CLASS add-on unit. An integrated telephone set,
0 such as NTL's MAESTRO, can also be used. The telephone section
0 of the Customer Premises Equipment (CPE) is loop powered, whereas
0 the CPE section providing CLASS features is powered by local AC.

0

0

0

0

0

0 RELEASE 28.01
0 93 12 03

0 Figure 35.2 Typical Configuration with a CLASS CPE

0 The transmission of the calling party number to the Customer Premises
0 Equipment (CPE) is accomplished via asynchronous FSK simplex-mode
0 transmission at 1200 bits/sec over the 2-wire loop, in accordance with
0 the Bell 202A standard. A burst of data is transmitted to the CPE
0 during the silent interval between the first and second ring of the
0 telephone set, before the incoming call is answered. The data link
0 terminates at a 202A modem in the CPE, which outputs the calling party
0 number to the LCD panel.

0 (b) Reference

0 Chapter 3, Section 3.4 Meridian Business Services

0 Section 3.15 Common Channel Signaling Systems

0 RELEASE 28.01
0 93 12 03

0 (c) Provisioning Considerations

0 (i) CCS7 Signalling is required when CLASS features are ac-
0 cessed between nodes. Within the same node, CCS7 Signal-
0 ling is NOT required. Refer to Section 3.15 for more
0 information on CCS7 Signalling.

0 (ii) An optional feature exists called Automatic Recall Date
0 and Time (ARDT). This feature requires announcements
0 provided on a pair of CPs; NT1X76JA and NT1X76JB. The
0 NT1X76AJ and the NT1X76AK cards are required when the
0 NT1X76JA and NT1X76JB cards are ordered. The NT1X76AJ,
0 NT1X76AK, NT1X76JA, and NT1X76JB should be assigned to
0 the same DRA module. In a Class Phase 1 English office,
0 the NT1X76JA/JB can be assigned to a DRA where the
0 NT1X76AJ/AK cards are existing and there is room. Other-
0 wise, in other offices or where the DRAs with NT1X76AJ/AK
0 cards are filled, an additional set of NT1X76AJ/AK cards
0 must be ordered.

0 (iii) LCM Processor Cards, NT6X51AB, are required to support
0 CND in LCMs. LCM Common CP, NT6X04AB, contains NT6X51AB
0 and hence can support CND. Only LCMs which contain lines
0 utilizing the CND feature must be upgraded to use the
0 NT6X51AB.

0 (iv) In addition to the LCM Processor Card NT6X51AB, the CLASS
0 Modem Resource (CMR) card NT6X78AA has been developed to
0 support the introduction of CND.

0 The CMR card will support software to provide SP
0 processor - CMR messaging and thus provide CMR sanity
0 supervision, software downloading,
0 maintenance/diagnostics, operational measurements and
0 swact activity.

0 When the CND feature is required, provide two (2) CMR
0 cards per LGC/LTC/RCC/SMS/SMU module (i.e. one (1) card
0 per shelf). It is not necessary to equip all the
0 LGC/LTC/RCC/SMS/SMU in the office with the CMR card. Only
0 LGC/LTC/RCC/SMS/SMUs that will provide CND to the sub-
0 scribers that home on these peripherals will require the
0 CMR card. Any number of LGC/LTC/RCC/SMS/SMUs of a given
0 DMS may be equipped with CMR cards.

0

0 RELEASE 28.01
0 93 12 03
0

0 (v) For Canadian Applications when the NT6X78AA cards are
0 provisioned into an LGC, LTC, or SMS module,

0 EITHER:

0 1. Retrofit the NT6X69AA/NT6X79AA card combination (if
0 existing) to an NT6X69AB card via the application of
0 the NT6X12ZY PC Kit.

0 This upgrade kit allows card slot 18 to be provi-
0 sioned with the CLASS Modem Resource (CMR) card
0 NT6X78AA which is used for the CND feature. The
0 power-reduced NT6X78AB replaces NT6X78AA and does not
0 require this upgrade.

0 OR

0 2. Limit the number of NT6X50AA DS-1 cards to four per
0 shelf (i.e. eight per module).

0 This is required to limit the shelf's overall +5 volt
0 power requirements to below 55 amps.

0 (vi) There are optional announcements available for CLASS fea-
0 tures to indicate successful or denied operation.

0 For BCS-27, the NT1X75BA DRAM Controller must be provi-
0 sioned for all CLASS applications.

0 There are two groups of announcements, Phase 1 CLASS DRA
0 Announcements and Phase 2 CLASS DRA Announcements. If the
0 CLASS/CMS feature is required, at least one group of an-
0 nouncements (i.e. Phase 1 or Phase 2) must be provided.
0 The Customer can either have Phase 1 announcements or
0 Phase 2 announcements or both.

0 (vii) Phase 1 CLASS DRA Announcements

0 For the optional Phase 1 CLASS DRA Announcements, the
0 Customer can either make up his own announcements or he
0 can order the pre-recorded ones from NT.

0 For provisioning the Digital Recorded Announcement Re-
0 cordable Memory cards (NT1X77AA/79AA), divide the total
0 length of the announcements (in seconds) by 31. This de-
0 termines the number of circuits required for these an-
0 nouncements. These are the announcements that the
0 Customer can make up himself.

RELEASE 28.01
93 12 03

If the Customer chooses to create his own announcements, and if he wants the Automatic Recall (AR) feature with the Voice Back Option within NTXA00AA activated, then the CLASS Phase 1 English Announcements (2) of (2) CP card, NT1X76AK, and/or the CLASS Phase 1 French Announcements (2) of (2) CP card, NT1X76BK, must be provided. Otherwise, if the Voice Back Option is not to be activated, then NT1X76AK and/or NT1X76BK are optional.

If the Customer wants our pre-recorded announcements, the following DRA cards are available:

PEC	DESCRIPTION
NT1X76AJ	CLASS Phase 1 English Announcements (1) of (2) CP
NT1X76AK	CLASS Phase 1 English Announcements (2) of (2) CP
NT1X76BJ	CLASS Phase 1 French Announcements (1) of (2) CP
NT1X76BK	CLASS Phase 1 French Announcements (2) of (2) CP

The above cards are the approved Telecom Canada Phase 1 CLASS DRA Announcements.

If bilingual announcements are required (e.g. French followed by English on the same announcement), then the Phase 1 CLASS DRA Announcement cards must be provisioned on the same DRA shelf (i.e. NT1X76AJ/AK/BJ/BK).

The Phase 1 CLASS DRA Announcement cards are only available in sets (e.g. NT1X76AJ/AK or NT1X76BJ/BK) and cannot be provisioned separately. However, the NT1X76AK and NT1X76BK cards can be ordered separately for the Automatic Recall feature (noted above). The NT1X76AK card can be ordered separately for the Call Forward Remote Activation (CFRA) feature. (See Meridian Business Services, Section 3.4, for more information on Residential Enhanced Services.)

If the optional announcements are not selected, confirmation tone can be used for successful feature operation and fast busy (120 ipm) can be used for denial of feature operation. This is only applicable to Calling Number Delivery Blocking (CNDB) and Customer Originated Trace (COT).

0 RELEASE 28.01
0 93 12 03
0

0 (viii) Phase 2 CLASS DRA Announcements

0 For Phase 2 CLASS DRA Announcements, the Digital Recorded
0 Announcement Recordable Memory cards (NT1X77AA/79AA) can-
0 not be used.

0 For provisioning, two groups of Phase 2 CLASS DRA An-
0 nouncements are available:

0 1) Phase 2 CLASS DRA Announcements (List 1-12)

0 2) Phase 2 CLASS DRA Announcements (List 13-31)

0 The following are the Phase 2 CLASS DRA Announcement
0 (List 1-12) cards:

0	NT1X76GJ	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type V CP For Pacific Bell
0	NT1X76GK	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type VI CP For Ameritech
0	NT1X76GL	CLASS Phase 2 U.S. Custom Feature Names Announcements - Type VII CP For Southwest Bell

0 * The "Personality" card, NT1X76AW, contains only Bell
0 Canada names and Bell South BCS-29 VO information. The
0 "Personality" card, NT1X76BW, contains only Bell Canada
0 names. It must be determined up front which "Personal-
0 ity" cards are required by which Customer. When engi-
0 neering a DMS job (initial or extension) which will
0 require Phase 2 CLASS DRA Announcements, the onus will be
0 on the Customer to determine which "Personality" card is
0 required.

0 The Phase 2 CLASS DRA Announcement cards are only avail-
0 able in sets (e.g. NT1X76AP/AQ/AR/AS/AT/AU/AV/AW or
0 NT1X76BP/BQ/BR/BS/BT/BU/BV/BW or NT1X76GA/GB/GC) and can-
0 not be provisioned separately. Note that the only excep-
0 tion to this is the "Personality" card (e.g. NT1X76AW)
0 which will be provisionable with other Customer specific
0 packs (as highlighted above).

0 RELEASE 28.01
0 93 12 03

- 0 (ix) Automatic Recall Date and Time (ARDT) CLASS DRA Announce-
0 ments

0 The customized announcements require a DRAM with a
0 NT1X75BA controller card. A set of AR Date and Time
0 Phrase List PROM Cards NT1X76JA and NT1X76JB are required
0 for ARDT (English) announcements. Each CP contain two
0 (2) virtual card credits because they are double density
0 cards.

0 The following are the AR Date and Time Phrase List PROM
0 cards:

0	PEC	CPC	
0	NT1X76JA	B0231819	Automatic Recall Date/Time
0			Announcements (1) of (2) CP
0	NT1X76JB	B0231820	Automatic Recall Date/Time
0			Announcements (2) of (2) CP

0 The NT1X76AJ and the NT1X76AK cards are required and
0 should be assigned to the same DRA module as the NT1X76JA
0 and NT1X76JB cards. In a Class Phase 1 English office,
0 the NT1X76JA/JB can be assigned to a DRA where the
0 NT1X76AJ/AK cards are existing and there is room. Other-
0 wise, in other offices or where the DRAs with NT1X76AJ/AK
0 cards are filled, an additional set of NT1X76AJ/AK cards
0 must be ordered.

- 0 (x) The DRA cards (either recordable or pre-recorded) can
0 mount on DRA modules (i.e. NT2X58AM, NT2X58CB, NT2X58AK,
0 NT2X58AG).

0 The DRA module can accommodate one (1) NT1X75BA DRAM Con-
0 troller card and up to a maximum of eight (8) virtual
0 card credits (i.e. the addressing range of the NT1X75BA).

0 The DRA Recordable Memory cards (NT1X77AA and NT1X79AA)
0 each contain one (1) virtual card credit because they are
0 single density cards.

0 The existing DRA pre-recorded announcement card NT1X76AA
0 contains one (1) virtual card credit. Currently, this is
0 the only NT1X76__ card which contains one (1) virtual
0 card credit. All other NT1X76__ cards contain two (2)
0 virtual card credits because they are double density
0 cards.

0 RELEASE 28.01
0 93 12 03
0

0 All Phase 1 and Phase 2 CLASS DRA pre-recorded announce-
0 ment cards (i.e. NT1X76AJ/AK/BJ/BK, NT1X76AP-AW,
0 NT1X76BP-BW, NT1X76GA-GC, NT1X76GE-GL) each contain two
0 (2) virtual card credits because they are double density
0 cards. Hence, a DRA module can accommodate a maximum of
0 eight (8) single density cards or a maximum of four (4)
0 double density cards.

0 The two (2) Phase 1 CLASS DRA Announcement cards (Eng-
0 lish) can be mounted on half of a DRA module. The two
0 (2) Phase 1 CLASS DRA Announcement cards (French) can be
0 mounted on half of a DRA module. If both English and
0 French are required, then the four (4) Phase 1 CLASS DRA
0 Announcement cards (English and French) can be mounted on
0 one (1) DRA module.

0 The eight (8) Phase 2 CLASS DRA Announcement (List 1-12)
0 cards (English) can be mounted on two (2) DRA modules.
0 The eight (8) Phase 2 CLASS DRA Announcement (List 1-12)
0 cards (French) can be mounted on two (2) DRA modules.

0 A quantity of five (5) DRA modules may be provisioned on
0 a TME frame, NT0X46AB, if and only if double density DRA
0 cards are provisioned on these modules. Any double den-
0 sity DRA cards (i.e. all NT1X76__ cards with the excep-
0 tion of NT1X76AA which is a single density card), up to a
0 maximum of four (4) per module, may be provisioned. Oth-
0 erwise, only four (4) DRA modules may be provisioned on a
0 TME frame.

0 Hence, a DMS office requiring both Phase 1 and Phase 2
0 (List 1-12) pre-recorded CLASS DRA Announcements in Eng-
0 lish and French can have all twenty (20) double density
0 DRA cards mounted on five (5) DRA modules and these five
0 (5) modules could be mounted onto one (1) TME frame.

0 Redundancy of announcements is available as an option in
0 the U.S. only. If redundancy is provided, ensure that
0 the announcement MTMs are on different power feeds.

0 The assignment rules for mounting Phase 1 and Phase 2
0 CLASS DRA Announcement cards onto DRA modules are the
0 same as the rules pertaining to the existing NT1X76__ DRA
0 Announcement cards. Cards NT1X76AP/AQ/AR/AS must be
0 mounted together onto the same DRA module. Cards
0 NT1X76AT/AU/AV/AW must be mounted together onto the same
0 DRA module. Similarly, cards NT1X76BP/BQ/BR/BS must be

0
0 RELEASE 28.01
0 93 12 03

0 mounted together onto the same DRA module and cards
0 NT1X76BT/BU/BV/BW must be mounted together onto the same
0 DRA module. Cards NT1X76GA/GB/GC/+"Personality" Card
0 must be mounted together onto the same DRA module. The
0 previous cards within each DRA module can be in any or-
0 der. (See DRA System Provisioning in this section for
0 further information on the DRA.)

0 (xi) Log messages are produced when a subscriber activates the
0 Customer Originated Trace (COT) feature. If the
0 customer/telco wants these log messages to be routed to a
0 dedicated TTY, then a separate I/O port (i.e. one port
0 off of a NT1X67BC card) is required. Otherwise, these
0 log messages will be routed along with other log messages
0 to the customer specified TTY.

0 (xii) Canadian customers will be able to obtain CLASS Terminals
0 from NTCL or from outside suppliers. To obtain CLASS
0 terminals (i.e. an integrated telephone set, such as
0 MAESTRO) from NTCL, Canadian customers will contact
0 London Terminal Division.

0 U.S. customers will obtain CLASS terminals from outside
0 suppliers.

0 2.3.2 Residential Enhancement Services

0 (a) General Description

0 The Residential Enhanced Services (RES) packages will provide
0 residential and small business customers with the opportunity to
0 upgrade their class of service from single line flat rate (1FR)
0 to RES by subscribing to a specific set of features which in-
0 cludes some IBN station features as well as other features avail-
0 able only through RES.

0 (b) Reference

0 None

0 (c) Provisioning Considerations

0 (i) An optional feature exists called Call Forward Remote Ac-
0 tivation. This feature requires announcements which the
0 Operating Company can record on their own or can provide
0 by ordering the NT1X76AM card. The NT1X76AK card is re-
0 quired when the NT1X76AM card is ordered and is recom-
0 mended to provide the numerical phrasing when a telco
0 records their own announcements. The NT1X76AM and
0 NT1X76AK should be assigned to the same DRA module. In a
0 Class Phase 1 English office, the NT1X76AM can be as-
0 signed to a DRA where the NT1X76AK card is existing and
0 there is room. Otherwise, in other offices or where the
0 DRAs with NT1X76AK cards are filled, an additional
0 NT1X76AK must be ordered. For CFRA, the requirement to
0 order the NT1X76AJ with the NT1X76AK does not apply.

0 Refer to the Digital Recorded Announcement (DRA) System
0 Provisioning in this section for more information on the
0 DRA.

0 (ii) To work properly, when the Call Forward Remote Activation
0 capability is required, software package NTXA43AA is re-
0 quired. The NT1X76AM card is required unless the telco
0 is recording their own announcements. The NT1X76AK card
0 is required when the NT1X76AM card is ordered and is re-
0 commended to provide the numerical phrasing when a telco
0 records their own announcements. Additional digitone re-
0 ceivers may be required to support CFRA in older periph-
0 eral modules (LMES or DCMS). The ideal number of

0 RELEASE 28.01
0 93 12 03
0

0 digitone receivers should equal the number of CFRA an-
0 nouncement members.

0 (iii) Looparound trunks must be provisioned to connect Call
0 Forward Remote Access announcements.

0 Loopback trunks are provisioned based on the Call Forward
0 Remote Access traffic. The loopback load (in CCS) is de-
0 termined by multiplying the call attempt rate (calls/sec)
0 by the average holding time for each CFRA call. Loopback
0 trunks are then provisioned for this level of traffic us-
0 ing standard loopback trunk provisioning procedures.

0 (iv) The required software packages are as follows:

0 For a POTS office:

0 Master package NTXD00AA - MASTER POTS TO RES CONVERTER
0 OR

0 Master package NTXD00AB - MASTER POTS TO RES CONVERTER
0 OR

0 Master package NTXD01AA - RES OFFICE CONVERSION (U.S.
0 MARKET)

0 Within the POTS to RES CONVERTER master package, the RES
0 BASE package - NTXA64AA, provides equivalent IBN features
0 for existing POTS features.

0 For an IBN office:

0 NTXA64AA - RES BASE

0 In addition to the above required packaging, the follow-
0 ing packages may be ordered:

0 NTX734AA - EAE0 - IBN PIC USING SERVORD

0 The EAE0 - IBN PIC USING SERVORD package is contained in
0 the Master Package NTXD01AA (US market). Because the RES
0 design is based on IBN, changing a line from POTS to RES
0 results in a change to the mode of PIC (Primary InterLATA
0 Carrier) editing for the line when using SERVORD or the
0 Table Editor. The POTS to RES conversion results in PIC
0 editing of RES lines being done by line group rather than
0 line-by-line, as it is with POTS lines. The feature pack-
0 age NTX734AA makes the change from POTS to RES transpar-

0
0 RELEASE 28.01
0 93 12 03

0 ent with respect to PIC editing. That is, it enables
0 SERVORD and the Table Editor to be used for changing PICs
0 on RES lines on a per line basis.

0 NTXA81AA - EXTENSION BRIDGED SERVICES

0 The EXTENSION BRIDGED SERVICES package enhances the Mul-
0 tiple Appearance Directory Number (MADN) feature so that
0 it may be used to allow a group of lines to more closely
0 simulate being extensions of a single line.

0 NTXA43AA - CALL FORWARD REMOTE ACTIVATION

0 The CALL FORWARD REMOTE ACTIVATION (CFRA) package allows
0 an MDC or RES subscriber with Call Forward Intragroup
0 (CFI), Call Forwarding Universal (CFU) or Call Forwarding
0 Fixed (CFF) to activate or deactivate these features from
0 a digitone line other than his own. This functionality
0 is applied on a per line basis.

0
0 RELEASE 28.01
0 93 12 03

0 2.3.3 Enhanced Coin Services

0 (a) General Description

0 This feature provides per call records of the revenue collected
0 on coin originated toll calls. The LAMA records required for
0 this purpose, include information concerning the revenue col-
0 lected on the call. This is reported as the number of five cent
0 deposits collected on each call. Records also store the number
0 of Operator Attached Intervals (OAI) during which the local
0 switching system was unable to monitor and record collected de-
0 posits because of circuit blockage or insufficient memory capac-
0 ity. If tone detection errors are detected within a particular
0 coin call, this information is also indicated within the LAMA re-
0 cord. Call code 136 has been assigned by Bellcore for these pur-
0 poses.

0 Trunk groups that carry the ACTS compatible calls are identified
0 through Table AMATKOPT. All coin calls going out over the trunks
0 datafilled in this table with the REVALL option will have LAMA
0 records generated if coins are collected during the call.

0 A separate pool of CDCs (Coin Detection Circuit) is required to
0 determine the number of 5¢ deposits collected on each call. A CDC
0 is connected in a one way speech path during each OAI. Upon com-
0 pletion of the OAI, the CDCs report on the deposits detected. At
0 termination of the call, a LAMA billing record is produced indi-
0 cating the total amount collected.

RELEASE 28.01
93 12 03

A pictorial representation looks like this:

Figure 35.3

(b) Reference

Chapter 2 Traffic Criteria and Capacities

(c) Provisioning Considerations

- (i) This feature requires Coin Detection Circuits (CDC), NT3X08AA. Provision the NT3X08AA circuits based on the following:

$$\text{CCS} = \frac{\text{Total ABSBH toll}}{\text{coin attempts}} \times \frac{\text{average receiver}}{\text{holding time}}$$

Required Look up CCS in the CCS Per Hour
trunk = Trunk Capacity Table - (Poisson Table)
circuits

$$\frac{\# \text{ of NT3X08AA}}{\text{circuits}} = \frac{\text{Required trunk circuits}}{8 \text{ trunk circuits per card}}$$

NOTE: The standard default value for the receiver holding time is 38 seconds.

NOTE: Assignment rules for the NT3X08AA are unaffected.

0
0 RELEASE 28.01
0 93 12 03

0 2.3.4 Common Peripheral Controller Equipment

0 (a) General Description

0 The Signalling Data Link (SDL) is channel on a T1 Carrier which
0 terminates on a DTC, DCM or LTC. ISDN trunks must terminate on a
0 DTC since they are only supported on DTCs.

0 (b) Reference

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations:

0 (i) The DTC may be used for SDL and ISDN trunks, however, for
0 reliability against failures, it is recommended to dis-
0 tribute the ISDN trunks and SDL across several peripher-
0 als.

0 (ii) CCS7 trunks must terminate on DTCs ONLY. Signalling Links
0 can terminate on DTCs, DCMs or LTCs. Signalling Links
0 and CCS7 trunks can be assigned to the same DTC.

0 (iii) CCS7 trunks can be mixed with PTS trunks on the same DTC,
0 however, both cannot be in the same trunk group.

0 (iv) Provision one (1) NT6X55AB DS0A Signaling Interface CP on
0 the DTC for each DS0A CCS7 signaling link. (Refer to
0 section 3.5 for more information.)

0 (v) DTC modules supporting CCS7 trunks must be equipped with
0 Extended Memory (NT6X46) and Enhanced Messaging (NT6X69).

0 (vi) The maximum number of DTCs utilizing CCS7 is 60 per of-
0 fice based on each DTC requiring 2 IPMLs per MSB7.

0 (vii) Each DTC utilizing CCS7, requires two continuity cards
0 NT6X70AA for continuity checking on ISUP trunks for BCS23
0 and earlier. In BCS24 and later, the software require-
0 ment for Continuity Cards was removed so that customers
0 requesting the cost reduction when testing is not re-
0 quired are not required to order the cards.

0 For U.S. applications only, since the NT6X70-- is re-
0 quired for the COT test, it is recommended that continu-

0
0 RELEASE 28.01
0 93 12 03

0 ity cards continue to be provisioned in most cases.
0 Provisioning Continuity Cards on CCS7 DTCs should be con-
0 sidered standard. Only per customer request can they be
0 omitted.

0 For Canadian applications only, many customers have a
0 high penetration of digital trunk facilities and do not
0 require the Continuity card. Provision these cards only
0 on DTCs whose trunks support analog facilities at some
0 point in the end-to-end connection of the trunk.

0 (viii) Refer to Section 3.5 for more information on the DTC, DCM
0 and LTC.

0 2.3.5 D-Channel Handler

0 (a) General Description

0 The D-Channel Handler separates call control signalling for the B
0 channels (used for encoded voice, circuit switched, or packet
0 data information) from user packet data. Signalling information
0 is passed to the Central Control, while packet data from several
0 D-Channels is multiplexed and routed to the packet handler.

0 (b) References

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 (i) The D channel handling function is performed by two cir-
0 cuit packs on the CPEI:

0 NTBX01AA - ISDN Signalling Pre-processor (ISP) CP

0 NTBX02AA - D Channel Handler CP

0 The ISDN Signalling Pre-processor CP is provisionable;
0 two (2) are required in the CPCI for all applications.

0 (ii) The D channel handler CP will be assigned to slots cur-
0 rently used by DS-1 interface circuit packs. Assignment
0 of a DCH card makes physically unavailable 2 DS-1 ports.

0 (iii) Each DCH circuit pack takes one peripheral port of the
0 twenty P-side ports available. The total of twenty P-
0 side ports are shared between the DS-1, DS-30A and DCH
0 links.

0 (iv) From BCS-28 onwards, one (1) of the DCH circuit packs
0 will be used as a spare to support N+1 redundancy. There
0 is no DCH sparing in BCS-27.

0 At least two DCH cards must be provided after BCS-28 (ie.
0 one plus one spare).

0 (v) Up to ten (10) DCH Circuit Packs may be provided per
0 CPCI. (Nine plus one spare). Refer to the Traffic Crite-

0 ria and Capacities (Chapter 2) to calculate the number of
0 DCH required to support the anticipated packet traffic.

0 (vi) Each DCH circuit pack has 32 "ports" available. One port
0 is dedicated to the ISP, and the remaining 31 ports are
0 capable of handling 4 multiplexed BRI D channels each, or
0 $31 \times 4 = 124$ BRI D channels maximum.

0 The ISP will occupy a free slot on the speech bus.

0 1.0 Common Channel Signalling Systems

0 1.1 Introduction

0 Common Channel Signalling (CCS) is the generic term for signalling system that separate the signalling and voice paths.

0 In a conventional Per Trunk Signalling (PTS) system, the address and supervisory signals are exchanged between Switching Offices (SO) on the trunks that carry the voice part of the call. This method is called in-band. For economic reasons the signalling part of a call is kept small and is restricted to signalling relevant to the current call. Therefore, PTS can be considered as a combination voice facility with a low grade signalling path.

0 CCS on the other hand exchange the address and supervisory signals on Signalling Links (SL) that may include a supporting signalling network as shown in Figure 315.1, leaving the voice trunks to be used for speech only. Because it is a separate path, data on the signalling link may contain information other than address and supervisory signals that can be included without a loss of call processing capacity. The voice part of a call is exchanged between SO on digital trunks (called voice trunks to differentiate them from trunks used for PTS traffic) that are dedicated to the system but independent of the signalling network.

0 CCS is implemented by the switch in one or more of the following
0 environments. (Refer to NTP 297-1001-137 and NTP 297-1001-141
0 for more information.)

0 * No. 6 Signalling System (N6LK) for use on the DMS-300 (Gate-
0 way) international switch

0 * Common Channel Interoffice Signalling No. 6 (CCIS6) for use
0 on the U.S. national switching system

0 * CCITT Signalling System No. 6 (CCITT6) for use on the
0 DMS-300 (Gateway) using the message switching buffer

0 * Signalling System 7 (SS7) for use on U.S. national switching
0 systems

0 * Common Channel Signalling No. 7 (CCS7) for use on Canadian
0 national switching systems

0 Signalling system 7 (SS7) is similar to Common Channel Signalling
0 Number 7 (CCS7). The difference between them is the Applications
0 Feature that they use. Throughout this section, the term CCS7 is
0 used to mean CCS7 and SS7.

0 DMS Hardware components for CCS

0 The major DMS hardware components for CCS is composed of the fol-
0 lowing: CCS speech circuits (voice only), trunk circuits with
0 voice and per trunk signalling, CCS Signalling Layer, Message
0 Switching Buffer (MSB), Signalling Terminals, modems (CCIS and
0 CCITT #6 only) and analog modem output (CCIS and CCITT #6 only).

0 The trunks for voice and per trunk signalling can be analog
0 trunks or digital trunks in DCM or DTC.

0 Each Signalling Layer has two (2) links. In normal operating
0 conditions, the two links in the pair will be working in load
0 sharing mode and each link acts as a back up for the mate link in
0 the event of failure in either link. The link is composed of two
0 transfer links (also known as Voice Frequency Links or VFL). The
0 transfer links are logically paired with one being active and the
0 other being in standby mode. The active and standby should be on
0 different facilities, for reliability.

0 The Transfer Link interface card can be located in appropriate
0 trunk modules (TM's), Digital Carrier Module (DCM) or Digital
0 Trunk Controller (DTC) in the DMS system. DMS will support the
0 digital interface of the transmission over specific time slots in
0 a T1 PCM carrier system.

0 Trunk circuits listed below can be used to interface the transfer
0 link and DMS:

0	PEC	Circuit Type
0	NT2X35AB	DCM Line Card
0	NT6X50AA	DS1 Interface CP
0	NT2X72AC	4W E&M 600 L GN E Supr. Contr.

0 Echo Suppression devices are not included in the Transfer Link.

0 Common Channel Interoffice Signalling No. 6

0 Common Channel Interoffice Signalling No. 6 (CCIS6) provides a SO
0 with the capability of handling Plain Ordinary Telephone Service
0 (POTS) calls with common channel signalling. CCIS6 uses the
0 quasi-associated mode of operation using only A-links or E-links.
0 CCIS6 includes a facility known as Direct Signalling (DS) for use
0 with advanced subscriber services. The version of CCIS adopted
0 for use by the DMS-100 Family includes DS.

0 The CCIS6 signalling network provides four alternate routes be-
0 tween SO for signalling messages. These routes form two levels
0 of redundancy in the event of a failure of a route. The first
0 level is a signalling layer consisting of two signalling links or
0 linksets. The second level is provided by two transmission links
0 to each signalling link.

0 Selection of a route through the signalling network is made by
0 the originating SO using one of two methods depending on the type
0 of signalling used. The first method, used for call processing,
0 is banded signalling which relies on a preassigned route. The
0 other, used for data base queries, is direct signalling which re-
0 lies on a destination address and does not require a preassigned
0 route.

0 RELEASE 28.01
0 93 12 03

0 CCITT Signalling System No. 6

0 CCITT Signalling System No. 6 (CCITT6) provides a S0 with the ca-
0 pability of handling national and international telephone service
0 calls with common channel signalling. The DMS-100 Family uses
0 CCITT6 as a gateway switch to the international telephone net-
0 work, using a combined associated and quasi-associated mode of
0 operation. A S0 interfaces with the signalling network using F-
0 links (associated mode) as the primary links, and A-links or E-
0 links (quasi-associated mode) as the back up links.

0 The CCITT6 signalling network provides alternate routes for sig-
0 nalling messages, between S0. These routes form a hierarchical
0 structure of redundancy in the event of one or more failure of
0 signalling routes between the S0.

0 Selection of a route through the signalling network is made by
0 the originating S0 using banded signalling. Banded signalling
0 relies on pre-assigned routes for all signalling messages.

0 RELEASE 28.01
0 93 12 03

0 Common Channel Signalling No. 7

0 Common Channel Signalling No. 7 (CCS7) (also Signalling System 7)
0 is an internationally recognized general purpose signalling sys-
0 tem designed to use existing digital facilities for Connection
0 Oriented and Connectionless signalling between Switching Offices
0 (SO) in telecommunications networks. rcp;There are three types
0 of nodes in a CCS7 network - the Service Switching Point (SSP),
0 Signal Transfer Point (STP), and Service Control Point (SCP).

0 The SSP is an ordinary end-office or access tandem switch,
0 equipped with hardware and software which allow it to interface
0 to the CCS7 network and interpret CCS7 messages. Section 1.3 of
0 Chapter 3, Section 3.15 describes the hardware and software re-
0 quired for the SSP.

0 An STP is a switch whose function is to accept incoming CCS7 mes-
0 sages and route them to the appropriate destination. It does not
0 source or sink messages or perform any traditional call process-
0 ing functions. An SCP is a node which functions as a real-time
0 transactional database. It receives queries from the CCS7 net-
0 work and issues a reply based on the results of a database
0 look-up.

0 The two forms of Common Channel Signaling are Associated and
0 Quasi-Associated signaling. With associated signaling, CCS7 mes-
0 sages are conveyed over a set of links interconnecting SSP of-
0 fices directly. With quasi-associated signalling, the messages
0 are conveyed via at least one STP before arriving at the ultimate
0 destination.

0 There are two modes of CCS7 operation. The inter-office common
0 channel signaling mode, through the Integrated Services User Part
0 (ISUP) protocol, provides the basic functions for inter-office
0 call set-up, supervision, and maintenance. This mode is also
0 known as trunk signaling mode. The query/response transaction
0 mode, through the Transaction Capabilities Application Part
0 (TCAP) protocol, provides the capability for remote operations
0 across the CCS7 network. Transaction Capabilities are functions
0 controlling non-circuit related information transfer between
0 nodes, such as database queries.

0 CCS7 allows Meridian Digital Centrex (MDC) features to operate
0 transparently across the network, a concept called Feature Net-
0 working. For example, Calling Line Identification (CLID) is
0 available with CCS7 Trunk Signaling. On calls originating from
0 MDC lines, the directory number of the line is transmitted to the

0 RELEASE 28.01
0 93 12 03
0

0 far end switching office as part of the Initial Address Message
0 via the CCS7 signaling links. This directory number can be dis-
0 played on an Electronic Business Set with the display option.

0 With NT6X66AC CCS7 Signaling Terminal CP, CCS7 Bert can be per-
0 formed. C7BERT is a facility to measure the quality of a digital
0 transmission path used for fault isolation on signaling data
0 links. C7BERT operates by transmitting a pseudo-random 2047-bit
0 test pattern out onto the link and comparing the returned pattern
0 with what was originally transmitted as outlined in CCITT Recom-
0 mendation 0.152. This test bit pattern is recommended for bit
0 rates in the range of 48 kbits/s to 168 kbits/s.

0 The path testable by the C7BERT is the CCS7 signaling link. For
0 the DMS-100 based CCS7 node this includes the Message Switch and
0 Buffer (MSB7) speech path, the network, the interface peripheral
0 (LTC, DTC, or DCM) speech, and the associated transmission facil-
0 ity (DS-1). For the Supernode based CCS7 node the testable path
0 includes the link termination paddleboard (PB) and the associated
0 transmission facility (DS-0 or V.35).

0 The CCS7 hardware architecture is illustrated in Figure 315.2.
0 The CCS7 digital signalling links (T1) from another SO or from a
0 Signalling Transfer Point (STP) (referred to as CCS7 network) en-
0 ter the office via a DTC, LTC or DCM and are switched via nailed
0 up connections into the MSB7. The signalling channels pass
0 through the MSB7's time switch and terminated on the ST. The ST
0 interfaces with the MSB7 via shared memory.

0 ISDN trunks are only supported on DTC's.

0 Connection Oriented signalling is the signalling associated with
0 the setup and takedown of ISDN trunks used for the transfer of
0 ISDN voice or data.

0 Connectionless Signalling carries messages between SOs and to
0 data bases for maintenance or administrative purposes. There are
0 no associated ISDN trunks with this type of signalling.

Figure 315.2

RELEASE 28.01
93 12 03

Digital Private Network Signalling System #1 (DPNSS)

Digital Private Network Signalling System #1 (DPNSS) is a UK common channel signalling standard for a network of digital PBX's. DPNSS allows advanced network features to be supported in a multi-vendor private network.

The hardware implementation of DPNSS is almost identical to domestic CCS7. See Figure 315.3.

IPML - Inter Peripheral Message Link
NUC - Nailed Up Connection

Figure 315.3

In the DPNSS configuration, Time Slot 16 of the incoming PCM-30 span carries the associated signalling information for the thirty (30) channels in the PCM-30 span. Therefore, the Signalling Terminal (ST) and Signalling Data Link (SDL) will handle only 30 trunks.

The maximum number of DPNSS signalling data links is 255, therefore, the DPNSS configuration is limited to a maximum of 30 x 255 = 7650 trunks.

0 93 12 03

0 1.2 Features

0 1.2.1 CCS7 Trunks Interconnection Supported

0 CCS7 supports the following trunk interconnections:

- 0 1) CCS7 Trunk to CCS7 Trunk InterLocal
- 0 2) CCS7 Trunk to CCS7 Trunk InterToll
- 0 3) CCS7 Trunk to PTS Trunk InterToll
- 0 4) CCS7 Toll Access to PTS InterToll
- 0 5) CCS7 InterToll to PTS Toll Completing
- 0 6) PTS Local to CCS7 Toll Access
- 0 7) PTS Toll Access to CCS7 InterToll
- 0 8) PTS InterToll to CCS7 Toll Completing
- 0 9) CCS7 Trunk to In Tandem
- 0 10) Incoming Call to TOPS/AOSS position via CCS7 Inter-Toll
- 0 11) Incoming Call to Directory Assistance
- 0 12) Incoming call from another operator in a different exchange for assistance
- 0 13) Outgoing call from a TOPS/AOSS position via CCS7 feature

0 1.2.2 MDC Line/CCS7 Trunks Interconnection

0 Calls originating from or terminating on standard and/or featured
0 Meridian Digital Centrex (MDC) POTS lines can be interconnected
0 directly with CCS7 trunks without utilizing loop-back trunks.
0 Most MDC line features are directly supported. There are a few
0 exceptions which require loop-back trunks between the MDC line
0 and the CCS7 trunk. Those features may include the following,
0 depending on BCS:

- 0 1) POTS lines equipped with basic 3-Way Calling feature require
0 loop-back trunks for interconnection with CCS7 trunks.
- 0 2) Coin lines with the Local Coin Overtime (LCO) option require
0 loop-back trunks for interconnection with CCS7 trunks. Coin
0 lines without this option will interconnect directly.
- 0 3) Calls originating from POTS lines equipped with Auto Identi-
0 fied Outward Dialing (AIOD) require loop-back trunks to
0 interconnect with CCS7 outgoing trunks. Incoming calls from
0 CCS7 trunks terminating on AIOD lines interface directly
0 without loop-back.
- 0 4) Calls incoming from CCS7 trunks terminating on POTS coin
0 lines with the Free Number Termination (FNT) option require
0 loop-back trunks for interconnection. Calls originating
0 from FNT lines may be interconnected directly with CCS7
0 trunks without utilizing loop-back.
- 0 5) Calls terminating on Emergency Service Lines (ESL) from CCS7
0 trunks require loop-back trunks for interconnection.
- 0 6) Calls terminating on Direct Inward System Access (DISA) di-
0 rectory numbers over a CCS7 trunk require loop-back trunks
0 at the terminating office.

0 RELEASE 28.01
0 93 12 03

0 1.2.3 Interconnections Not Supported

0 Only two call types are not supported with CCS7 signalling or
0 loop-back trunking. They are as follows:

0 1) CCS7 trunks/Emergency Service Bureau (ESB) line intercon-
0 nection is not supported.

0 2) Circuit Switched Digital Data Service (CSDDS) calls are not
0 supported. (Note: CSDDS is not the same as Datapath.
0 Datapath and the CCS7 Network are compatible.)

0 1.2.5 Loop-Back Trunk Requirement0 (a) General Description

0 Loop-back trunks are required in an office utilizing CCS7 Trunk
0 Signalling to accommodate lines equipped with incompatible fea-
0 tures in the CCS7 trunk.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) Provisioning calculations for loop-back trunks are as
0 follows:

$$\begin{array}{r} (A+B+C+D+E+F \text{ calls/hr}) \times \text{Avg Hold Time (sec)} \\ \hline 100 \end{array}$$

0 = CCS Loop-Back

0 Where:

0 A = HDBH calls utilizing CCS7 trunks that
0 originate from and terminate on POTS
0 and/or MDC lines equipped with Basic Three
0 Way Call.

0 B = HDBH calls utilizing CCS7 trunks that
0 originate on POTS lines with AIOD.

0 C = HDBH calls utilizing CCS7 trunks that
0 terminate on POTS and/or MDC lines with
0 FNT.

0 D = HDBH calls utilizing CCS7 trunks that
0 originate from coin lines with LCO
0 feature.

0 E = HDBH calls utilizing CCS7 trunks that
0 terminate on MDC lines via DISA.

0 F = HDBH calls utilizing CCS7 trunks that
0 terminate on ESAL lines.

0
0 RELEASE 28.01
0 93 12 03

0 Refer to traffic provisioning tables (Chapter 2) for
0 trunk capacities to determine the required trunk quanti-
0 ties for POTS/MDC loop-back trunks.

0 (ii) Loop-Back Trunk Requirements (BCS-24)

0 The following MDC features are incompatible with CCS7
0 trunks in BCS-24 and will require loop-back trunks be-
0 tween the MDC line and the CCS7 trunk:

- 0 1) Basic 3-Way Calling (3WC)
- 0 2) Free Number Termination (FNT)
- 0 3) Direct Inward System Access (DISA)

0 (iii) Loop-Back Trunk Requirements (BCS-25, BCS-26)

0 Loop-back trunking is required for the following condi-
0 tions:

- 0 1) ISUP to DISA (trunk is released after digits are col-
0 lected)
- 0 2) ISUP to LCO
- 0 3) ISUP to AIOD

0 (iv) Loop-Back Trunk Requirements (BCS-27+)

0 Loop-back trunking is required for the following condi-
0 tions:

- 0 1) ISUP to DISA (trunk is released after digits are col-
0 lected)
- 0 2) ISUP to LCO

0 (v) Loop-Back Trunk Requirements (BCS-31)

0 Loop-back trunking is required for the following condi-
0 tions:

- 0 1) ISUP to DISA (trunk is released after digits are col-
0 lected
0 - only if there are no UTRs provisioned on the DTC
0 terminating the ISUP trunk.

0 1.2.6 Console Features Requiring Loop-Back Trunks

0 (a) General Description

0 Loop-back trunks are required in an office utilizing a console
0 feature that is not compatible with an Integrated Digital Ser-
0 vices Network User Part (ISUP) trunk.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) Console Loop-Back Trunk Provisioning (BCS-24)

0 Loop-back trunks must be provisioned for all ISUP trunks
0 which require access to the console. These can be di-
0 vided into four categories:

- 0 1) ISUP trunk to console requiring call
0 extension
0 2) ISUP trunk to console not requiring call
0 extension
0 3) Console extended to an ISUP trunk
0 4) Console originated to an ISUP trunk

0 The call rate for console calls can be calculated based
0 on the number of Attendant Consoles (AC) in the office,
0 the average length of all console queues in the office
0 (QL) and the average time required for a console to proc-
0 ess a call (T), by using the following formulas:

0
$$\text{Terminating Call Rate} = \frac{\#AC + QL}{T}$$

0
$$\text{Originating Call Rate} = \frac{\#AC}{T}$$

0 These call rates can be multiplied by the percentage of
0 calls in each of the four categories to determine the
0 call rate for each category.

0

0 RELEASE 28.01
0 93 12 03
0

0 The holding times may be different for each of the four
0 call types.

0 1) For ISUP trunk to console calls that do require ex-
0 tending, the holding time is equivalent to the aver-
0 age holding time of the call plus the average console
0 call handling time (T).

0 2) For ISUP trunk to console calls that do not require
0 extending, the holding time is equivalent to the av-
0 erage console call handling time (T).

0 3) For console extending to an ISUP trunk, the holding
0 time is equivalent to the average holding time of an
0 ISUP trunk to console call that requires extension
0 less the average console call handling time.

0 4) For console originating to an ISUP trunk, the holding
0 time is equivalent to the average holding time of the
0 call plus the average console call handling time (T).

0 The total console loop-back load required can be calcu-
0 lated by adding the required load for each of the four
0 categories. The loop-back load for each category can be
0 calculated using the following:

0 Loop-Back Trunk Load = Call Rate X Holding Time
0 per Category

0 Total Loop-Back Load = Category 1 + Category 2
0 + Category 3 +
0 Category 4

0 After the total console loop-back load is determined, the
0 total number of trunks can be calculated using the
0 Poisson Tables. The number of loop-back trunks should
0 not exceed the number of ISUP trunks.

0 (iii) Console Loop-Back Trunk Provisioning (BCS-25)

0 For BCS-25, all attendant calls and features require
0 loop-back treatment only when the calls are being ex-
0 tended. The loop-back trunk requirement is reduced be-
0 cause the loop-back trunk is released after the call is
0 extended.

0 (iv) Console Loop-Back Trunk Provisioning (BCS-26 to BCS-31)

0
0 RELEASE 28.01
0 93 12 03

0 For BCS-26 to BCS-31, the loop-back requirement is re-
0 duced. The Code Calling feature, the Conference Hold &
0 Release feature, and the End-to-End Signaling feature is
0 the only requirement for loop-back treatment.

0 (v) Loop-Back Span Provisioning

0 No. Loop-Back T1 Spans =

0 #Console # POTS-MDC

0 1.2.7 Signalling Terminal0 (a) General Description

0 The Common Channel Signalling System Signalling Terminal (ST)
0 transmits and receives signalling data between the DMS-100 Family
0 switch and the CCS transmission links. It implements the link
0 protocol and monitors signalling link performance.

0 (b) Reference

0 NTP 297-1001-137 Common Channel Signalling CCIS6
0 and CCITT6 System Description
0 NTP 297-1001-141 Common Channel Signalling 7
0 Description
0 GS6X65 CCIS Signalling Terminal
0 GS6X66 CCS7 Signalling Terminal

0 (c) Provisioning Considerations:

0 (i) The following Signalling Terminal (ST) Cards are
0 provisionable on the ST6E/ST7E frame.

0 FOR ST6E FOR ST7E FOR DPNSS

0 ST CARDS NT6X65AA NT6X66AA NT6X66CA

0 (ii) Provide one Signalling Terminal CP per signalling link.
0 In CCIS #6, CCITT #6, and CCS7 signalling links are pro-
0 visioned in pairs (i.e. a signalling layer). The two (2)
0 ST CP's associated with a signaling layer must be pro-
0 vided on separate STA6/STA7 shelves within the same
0 MSB6/MSB7 module. The two ST CP's can mount on the same
0 ST7G shelf. For DPNSS, the signalling links are provi-
0 sioned individually - one per associated PCM-30 span.

0 (iii) The Data Transmission Rate of the various ST CP's are as
0 follows:

0 CCIS ST (NT6X65) 2400 bits/sec
0 CCS7 ST (NT6X66) 15 kbits/sec

0 (iv) The CCS7 ST can handle the full load of the 56 Kilo bits
0 per second (kbps) link running at 100%. (i.e. 112 kbps at
0 full duplex transmission).

0 RELEASE 28.01
0 93 12 03

0 For trunk signalling, the average message size is 20
0 octets (8 bits) and each call uses approximately 6 mes-
0 sages. Therefore, assuming a calling rate of 16
0 calls/hr/trunk, a pair of STs can handle up to 52,500
0 trunks at maximum capacity. However, links are engi-
0 neered at 35% under normal conditions and up to 60-70%
0 under failure conditions. Using these assumptions, the
0 ST should be engineered to handle a maximum of 9,187
0 trunks or 18,375 trunks per ST pair.

0 For database transactions, the average message size is
0 100 octets and each DB transaction uses an average of 2
0 messages. In this case, the ST should be engineered to
0 handle a maximum of 88,200 transactions/hr or 176,400
0 transactions/hr.

0 The ST should be provisioned based on the following three
0 equations:

0 (1) $(6 \times 20 \times A \times B) + (2 \times 100 \times C) \leq 35,280,000$
0 (per ST Pair)

0 (2) 72 STs per MSB7 (Physical Limit)

0 (3) $(6 \times A \times B \times D) + (4 \times C) \leq \text{MAX (MSB Limitation)}$

0 where:

0 A = Average call attempts/hr/trk
0 B = No. of ISDN User Part (ISUP) trunks sup-
0 ported by the ST pair
0 C = Database transactions/hr
0 D = Total number of STs on the MSB7 (1 or 2)
0 MAX = 900,000 Msg/hr for a 1 MSB configuration
0 = 720,000 Msg/hr for a 2 MSB configuration

0 Using "A" = 16, the number of ISUP trunks vs the number of
0 DB transactions per ST pair is shown in Figure 315.4.

0 Assumptions: 16 ISUP calls/hr/trk
0 20+ ISUP msg length = 20 octets
0 18+ 800+ msg length = 100 octets
0 No. 18+ Equal # of originating and
0 16+ terminating calls

0 RELEASE 28.01
0 93 12 03

0 1.2.8 Message Switch and Buffer

0 (a) General Description

0 The Message Switch and Buffer (MSB) performs signalling functions
0 between suitably-equipped Digital Trunk Controllers (DTC), in ac-
0 cordance with the procedures of Common Channel Signalling System.

0 The MSB provides and maintains a signalling path between the CCS
0 transmission link and the Signalling Terminals (ST). It also
0 performs message switching and distribution functions between the
0 DTC, handling the voice part of a call, and the associated ST
0 handling the signalling part of the call.

0 The MSB is fully duplicated with one unit active, performing all
0 call processing functions, and the other unit operating in a
0 standby mode, ready to take over in the event of a failure in the
0 active unit or when dictated by the call processing software.

0 (b) Reference

0 NTP 297-1001-137 Common Channel Signalling CCIS6
0 and CCITT6 System Description
0 NTP 297-1001-141 Common Channel Signalling 7
0 Description
0 GS6X07 Message Switching Buffer 6
0 GS6X32 Message Switch and Buffer 7

0 (c) Provisioning Considerations:

0 (i) The following Message Switch and Buffer (MSB) common cir-
0 cuit pack fills are available:

MSB TYPE	PEC	APPLICATION	FRAME TYPE	NOTE
MSB6	NT6X07AC	CCIS6/CCITT6	MS6E	2.
MSB7	NT6X32CC	CCS7	MS7E	1.
MSB7	NT6X32BA	DPNSS	MS7E	

0 NOTE:

0 1. NT6X32CC is used on new jobs so that BCS-27 expanded
0 memory requirement can be met.

0 RELEASE 28.01
0 93 12 03
0

0 2. NT6X07AC replaces NT6X07AB.

0 The Signalling Terminals (ST) are connected to the MSB
0 via a microprocessor bus. The MSB6 is capable of con-
0 necting a maximum of 64 STs while the MSB7 is capable of
0 connecting a maximum of 72 STs.

0 The maximum number of MSB7s on a DMS switch is four (4).

0 The maximum number of DPNSS MSB7's on a DMS switch is
0 five (5).

0 For MSB6, the minimum packfill for BCS-32/33 is NT6X07AC.

0 (ii) MSB7 Provisioning

0 DS30 Ports (MSB7)

0 The MSB7 peripheral communicates with the Central Control
0 (CC) and other peripherals via DS30 ports to the network.

0 The number of MSB7 DS30 ports to the network is determined
0 by the following calculation:

0 (# DTCs terminating) (# Signalling)
0 (CCS7 trk X 2) + (links/terminals)
0 -----
0 30 Channels/Port

0 A minimum of three DS30 ports are required and eight
0 ports are maximum.

0 (iii) Multiple MSB7 Provisioning

0 The maximum number of MSB7s per office is 4. The required
0 number of MSB7s can be determined using the following
0 calculations.

0 Abbreviations used:

0 ACB - Automatic Call Back
0 ACCS - Automatic Calling Card Service

0 93 12 03

0 1.2.9 Message Switching Equipment Frame

0 (a) General Description

0 The Message Switching 6 Equipment (MS6E) frame houses DMS Common
0 Channel Interoffice Signalling (CCIS) hardware and DMS CCITT #6
0 Signaling (for DMS-300 application) hardware. The Message Sig-
0 nalling 7 Frame (MS7E) houses the hardware key to CCS7 implemen-
0 tation on the DMS-100 family switches.

0 (b) Reference

0 NTP 297-1001-137 Common Channel Signalling CCIS6
0 and CCITT6 System Description
0 NTP 297-1001-141 Common Channel Signalling 7
0 Description

0 (c) Provisioning Considerations:

0 (i) Each MS6E (NT6X06AC) is composed of one (1) Message
0 Switch and Buffer 6 (MSB6), one (1) AC Modem Shelf (DSM)
0 and two (2) Inverters. The DSM holds up to 16 Modem CP.
0 Provide one Modem CP, A0302338 per ST provided in the
0 MSB6 of the same MS6E frame. The ST's and associated
0 modems are setup into two (2) groups of eight (8) on the
0 MS6E frame (therefore, a maximum of 16 ST per MS6E
0 Frame).

0 (ii) Each MS7E (NT6X31AA) is composed of one (1) Message
0 Switch and Buffer 7 (MSB7) and one (1) Signalling Termi-
0 nal 7 Group Shelf (ST7G). The MSB7 holds up to eight (8)
0 ST's while the ST7G holds up to 16 ST's. The MS7E frame
0 can house a maximum of 24 ST's.

0 (iii) If the number of ST's required for the office exceeds the
0 maximum number of ST's allowed in the MS6E/MS7E frame,
0 then a Signalling Terminal Extension Frame (STE) must be
0 provided (see next subsection).

0 Provide two (2) Signalling Terminal Interface CP
0 (NT6X68AA) per MS6E frame when a STE frame will be pro-
0 vided. Provide two (2) Signalling Terminal Interface
0 with Terminator CP when a STE frame is not provided.

0 Provide two (2) Signalling Terminal Interface CP
0 (NT6X68AC) per MSB7 when one or more ST7G shelf are asso-

0
0 RELEASE 28.01
0 93 12 03

0 ciated with this MSB7 unit. Provide two (2) Signalling
0 Terminal Interface CP for each STG (STG:0 and STG:1 make
0 up the ST7G) when the ST group is not the last in the of-
0 fice. Provide two (2) Signalling Terminal Interface with
0 Terminator CP (NT6X68AD) per MSB7 when the MSB7 shelf is
0 the last shelf on the MS7E, i.e., the ST requirements for
0 the office do not exceed eight (8) ST's. Provide two (2)
0 Signalling Terminal Interface with Terminator CP on the
0 last STG of the ST7G shelf, i.e., no STE frames will be
0 provide.

0 (iv) When ISG is being applied to an office, the MS7E frames
0 and their associated ST7E frames must be powered from the
0 same PDC frame. The MS6E frames and the ST6E frames do
0 not need to be powered from the same PDC frame.

0 (v) The NT6X66AC CCS7 Signalling Terminal CP replaces the
0 NT6X66AA for all applications of the MS7E frame, and also
0 has the C7BERT capability.

0 1.2.10 Signalling Terminal Extension Frame

0 (a) General Description

0 The Signalling Terminal Extension Frame (ST6E/ST7E) houses CCITT
0 No. 6/CCIS6/CCS7 signalling terminals. The ST6E/ST7E provides
0 the capacity to add up to 48 ST's (on 3 ST extension shelves) in
0 addition to the 16 ST's on the MS6E frame or the 24 ST's on the
0 MS7E frame. The Data Modem Extension Frame (DME) must always be
0 provisioned with the ST6E frame.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) The following Signalling Terminal Cards are provisionable
0 on the ST6E/ST7E frame.

0 ST Card	ST6E	ST7E	DPNSS
0 Sign. Terminal	NT6X65AA	NT6X66AA	NT6X66CA
0 ST with I/F	NT6X68AA	NT6X68AC	NT6X68AC
0 ST I/F Terminator	NT6X68AB	NT6X68AD	NT6X68AD

0 Each ST6E/ST7E frame can house up to six (6) ST groups.
0 Each ST group houses up to eight (8) ST's. Provide two
0 (2) Signalling Terminal Interface CP per ST group when
0 the ST group is not the last one associated with the
0 MSB6/MSB7. Provide two (2) Signalling Terminal Interface
0 with Terminator CP per ST group when the ST group is the
0 last shelf associated with the MSB6/MSB7.

0 (ii) The provisioning of the ST6E/ST7E frames are based on the
0 maximum number of ST's that can be controlled by the
0 MSB6/MSB7.

0 1.2.11 Data Modem Extension Frame

0 (a) General Description

0 The Data Modem Extension Frame (DME) houses analog 2400 baud mod-
0 ems which modulate/demodulate serial binary data (in dibits)
0 to/from the Phase Shift Keying (PSK). The PSK is used in the
0 CCIS/CCITT #6 environment to transmit serial binary data over an-
0 analog channels. An AC modem is dedicated to each ST. The DMS
0 frame is provisioned in conjunction with the ST6E frame.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

- 0 (i) Provide one (1) DME frame per ST6E frame.
- 0 (ii) Provide one (1) AC Modem CP A0302338 per ST provided (on
0 the ST6E frame).
- 0 (iii) Each DME can house a maximum of 48 AC Modem CP cards.

0 RELEASE 28.01
0 93 12 03

0 1.2.12 Signalling Data Links (SDL)

0 (a) General Description

0 A Signalling Link (SL) is a bi-directional transmission path for
0 transferring trunk signaling information from an end-office Ser-
0 vice Switching Point (SSP) to another SSP or a Signaling Transfer
0 Point (STP). Each SL is comprised of a Signalling Data Link
0 (SDL) and a Signalling Terminal (ST) (NT6X66). A linkset is a
0 set of links to be used as a group, each equally capable of car-
0 rying traffic between the origination point and a destination
0 point.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) For redundancy, a pair of SLs is composed of two Signal-
0 ling Terminal (ST) cards and two T1 links. The maximum
0 number of STs per MSB7 is 72. Therefore, the maximum num-
0 ber of redundant Signalling Links is 36.

0 (ii) A single pair of CCS7 links can handle the throughput of
0 a MSB7. Therefore, link quantities can be determined by
0 the quantity of MSB7s (minimum of one pair of links/MSB7)
0 and the number of nodes associated with the DMS-100
0 and/or DMS-200.

0 (iii) Signalling Links (Terminals) must be provided as redun-
0 dant pairs, therefore, the no. of ST cards (NT6X66AC)
0 equals the no. of Signalling Links x 2.

0 (iv) CCS7 signalling links utilize digital T1 trunks as the
0 physical transmission medium to the CCS7 Signalling Net-
0 work. These T1s may terminate on either a DTC, LTC or
0 DCM.

0	No. of	# of calculated Signalling	
0	DS-1	Links (Terminal)	X 2 (redundancy)
0	circuits =	-----	
0	required	24 Channels

0
0 RELEASE 28.01
0 93 12 03

0 1.2.13 Nailed-Up Connections

0 (a) General Description

0 Inter-Peripheral Message Links (IPML) are nailed-up connections
0 that allow the DTCs to communicate with the MSB7s through the
0 network. Each DTC utilizing CCS7, requires two IPMLs to each
0 network. The maximum number of Interperipheral Message Links
0 (IPML) per MSB7 is 120 based on the maximum number of channels on
0 the enhanced messageing card being 128. (8 ports reserved for
0 future use.)

0 Each ST requires one nailed-up connection.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) The total number of nailed-up connections required is
0 calculated as follows:

0 # DTC X 2 IPML X # MSB7 + Total # ST (all MSB7)

0 The maximum number of nailed-up connections is 768. To
0 ensure that degradation of network throughput does not
0 occur, no more than 100 nailed-up connections per network
0 paths should be utilized.

0
0 RELEASE 28.01
0 93 12 03

0 1.2.14 Common Peripheral Controller Equipment

0 (a) General Description

0 The Signalling Data Link (SDL) is channel on a T1 Carrier which
0 terminates on a DTC, DCM or LTC. ISDN trunks must terminate on a
0 DTC since they are only supported on DTCs.

0 (b) Reference

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations:

0 (i) The DTC may be used for SDL and ISDN trunks, however, for
0 reliability against failures, it is recommended to dis-
0 tribute the ISDN trunks and SDL across several peripher-
0 als.

0 (ii) CCS7 trunks must terminate on DTCs ONLY. Signalling Links
0 can terminate on DTCs, DCMs or LTCs. Signalling Links
0 and CCS7 trunks can be assigned to the same DTC.

0 (iii) CCS7 trunks can be mixed with PTS trunks on the same DTC,
0 however, both cannot be in the same trunk group.

0 (iv) Provision one (1) NT6X55AB DS0A Signaling Interface CP on
0 the DTC for each DS0A CCS7 signaling link. (Refer to
0 section 3.5 for more information.)

0 (v) DTC modules supporting CCS7 trunks must be equipped with
0 Extended Memory (NT6X46) and Enhanced Messaging (NT6X69).

0 (vi) The maximum number of DTCs utilizing CCS7 is 60 per of-
0 fice based on each DTC requiring 2 IPMLs per MSB7.

0 (vii) Each DTC utilizing CCS7, requires two continuity cards
0 NT6X70AA for continuity checking on ISUP trunks for BCS23
0 and earlier. In BCS24 and later, the software require-
0 ment for Continuity Cards was removed so that customers
0 requesting the cost reduction when testing is not re-
0 quired are not required to order the cards.

0 For U.S. applications only, since the NT6X70-- is re-
0 quired for the COT test, it is recommended that continu-

0
0 RELEASE 28.01
0 93 12 03

0 ity cards continue to be provisioned in most cases.
0 Provisioning Continuity Cards on CCS7 DTCs should be con-
0 sidered standard. Only per customer request can they be
0 omitted.

0 For Canadian applications only, many customers have a
0 high penetration of digital trunk facilities and do not
0 require the Continuity card. Provision these cards only
0 on DTCs whose trunks support analog facilities at some
0 point in the end-to-end connection of the trunk.

0 (viii) Refer to Section 3.5 for more information on the DTC, DCM
0 and LTC.

0 1.2.15 Link Interface Module (LIM)/Link Peripheral Processor (LPP)

0 (a) General Description

0 Software has been introduced to allow the Link Interface Module
0 (LIM), also known as Link Peripheral Processor (LPP), to support
0 CCS7 signaling links in Service Switching Point (SSP) and Signal-
0 ing Point (SP) end office applications.

0 The NT9X70__ LIM cabinet was introduced to support CCS7 signaling
0 links only in Signal Transfer Point (STP) offices initially. At
0 a Service Switching Point (SSP) or Signaling Point (SP) end of-
0 fice, trunk peripherals were provisioned to interface the signal-
0 ing links, and NT6X31__ MS7E frames were provisioned to perform
0 message handling functions. This configuration is illustrated in
0 Figure 315.5. Note the requirement for nailed connections
0 through the network between the MSB7 and trunk peripherals, thus
0 consuming network capacity. As well, additional hardware (LTC,
0 DTC or DCM ports) are required to interface the signaling links.
0 The MSB7 is the limiting component in CCS7 messaging capacity.

RELEASE 28.01
93 12 03

In BCS30, software is introduced which allows the LIM to interface CCS7 signaling links in an SSP/SP office. This configuration is illustrated in Figure 315.6. With a junctored network, ISUP call processing messages from the LIM are routed via the MS and "bounced" off the Computing Module, then through the network to the DTC. In Enhanced Network (E-Net) applications, messages bypass the CM and are routed directly through the Message Switch.

Figure 315.6 CCS7 Architecture with LIM in SSP/SP

(b) Reference

Chapter 3, Section 3.9 DMS Supernode and Network Subsystem

(c) Provisioning Considerations:

- (i) The LIM can be provisioned into an office which already contains MS7E frames, subject to the dependencies de-

0 RELEASE 28.01
0 93 12 03
0

0 scribed in the next section. The concurrent use of MSB7s
0 and LIMs will not be supported over BCS upgrades, how-
0 ever. All CCS7 links assigned to MSB7s must be moved
0 over to LIMs during the same BCS, and the MS7E frames set
0 to an inactive state and/or removed.

0 (ii) The LIM can only be provisioned into a Supernode-based
0 SSP/SP. Offices equipped with the NT40 core can only use
0 MS7E peripherals for CCS7 applications.

0 (iii) In the DMS-Core Message Switch, NT9X23BA paddleboards
0 must be used to interface DS-30 links from the LIM.

0 Provision four (4) NT9X17AA MS 4-Port CP (two CP per MS)
0 for every two LIM cabinets connected to the Message
0 Switch. The 4-Port cards must be provisioned in pairs on
0 the MS so that the DS-30 ports from a LIM cabinet may be
0 spread across adjacent 4-Port cards. Also provide one
0 (1) NT9X23BA DS-30 Paddleboard for each NT9X17AA MS
0 4-Port CP provisioned.

0 Two DS-30 ports are connected from each LMS (LMS0 and
0 LMS1) to each MS (MS0 and MS1) as shown in Figure 315.7.
0 A total of eight (8) ports i required per LIM. Each MS
0 port is shown with the specific port on the specific LIM
0 cabinet to which it connects. For example:

0 LMS1 01 indicates LMS Side 1 LIM 01
0 29R-0 CP Pos 29R Port 0

0 In an STP office, a dedicated DMS-Core with dedicated MS
0 is used to interface the LIMs. In an SSP/SP office, how-
0 ever, the existing DMS-Core is used and the DS-30 links
0 from the LIMs must share DS-30 ports with existing equip-
0 ment. Thus, the CP POS shown in Figure 315.7 will have
0 to be adjusted to suit the individua office being engi-
0 neered. In general, additional LIM cabinets will be con-
0 nected to additional DS-30 port cards using the same
0 pattern as shown in the figure.

0 RELEASE 28.01
0 93 12 03

0 Figure 315.7

0 MS DS-30 Port Connections from LMS (Two LIM Configuration)

0 Note: Port 0 of CP position 28R and 29R is reserved for an IOC con-
0 nection by the system boot software, and so cannot interface to the
0 LMS.

0 (iv) LIM hardware provisioning is the same as for STP applica-
0 tions; refer to the STP section of this document for de-
0 tails. This section discusses the provisioning of
0 signaling links and multiple LIM cabinets at the SSP/SP
0 office.

0 The CCS7 Network is classified in two ways; the FULLY AS-
0 SOCIATED NETWORK and the QUASI ASSOCIATED NETWORK. The
0 Fully Associated Network has every Service Switching
0 Point (SSP - End Office) connected directly to the other
0 SSPs. In this mode, the links are called F-links. The
0 number of F-links is equal to $n(n-1)$; where n = number of

0
0 RELEASE 28.01
0 93 12 03

0 SSP nodes. The Quasi Associated Network has every SSP
0 connected to other SSP through a Signaling Transfer Point
0 (STP). In this case, the STPs serve as the hub for the
0 signaling networks. The STP is configured in mated
0 pairs. An SSP/SP is connected to the Home STP pair with
0 A-links. The number of A-links is equal to $2n$; where n =
0 number of SSP nodes. The SSP may also be connected to a
0 Remote STP pair by E-links. Typically for SSP/SPs, it is
0 the A or E links that are provisioned based on traffic
0 figures.

RELEASE 28.01
93 12 03

QUASI-ASSOCIATED SIGNALING

FULLY-ASSOCIATED SIGNALING

Figure 315.8: CCS7 SIGNALING METHODS

Each CCS7 signaling link operates at 56 kbit/s in each direction. If subrate links are equipped, the calculations below can be modified according to the data transmission rate actually used. The signaling links are provisioned as redundant pairs per destination (STP pairs or other SSP/SP) to provide load sharing of message traffic. Each link is engineered to maximum 40% occupancy such that under a link failure condition, the failed link traffic can be routed to a parallel link or links. For example, if two links were engineered, with one failing, the parallel link would be able to continue to route traffic up to its maximum of 80% occupancy limit. Therefore, the message capacity of one link is:

0 RELEASE 28.01
0 93 12 03
0

0 (56 kbit/s x 2 directions x 40% occupancy)
0 ----- = 5600 octet/s
0 (8 bits per octet)

0 Telecom Canada uses an occupancy figure of 40%; the re-
0 sulting message capacity is then 5600 octet/s for this
0 application.

0 In the case of 100% ISUP calls, assuming 25 octets per
0 message (msg) and 11,200 octet/s link capacity, a signal-
0 ing pair can support:

0 11,200 octet/s

0 ----- = 448 ISUP msg/s maximum

0 25 octet/msg

0 11,200 octet/s
0 ----- = 140 msg/s (assuming TCAP msg length
0 80 octet/msg averages 80 octets)

0 The engineered capacity of one link is derated at 85% of
0 its maximum to account for message length variability.
0 As a result, the maximum engineered link limit is:

0 ISUP msgs/sec:

0 448 msgs/sec X 0.85 = 381 msgs/sec at 0.8E

0 TCAP msgs/sec:

0 140 msgs/sec X 0.85 = 119 msgs/sec at 0.8E

0 Links will be provisioned to operate at 0.4E so a minimum
0 of two (2) links will always be required.

0 Calculate the required number of signaling links as fol-
0 lows:

0 Abbreviations used:

0 ACB - Automatic Call Back
0 ACCS - Automatic Calling Card Service
0 AR - Automatic Recall
0 BNS - Billing Number Screening

0 F) ACB HDBHCA
0 ----- X (13 or 8) = ACB msg/sec
0 3600

0 NOTE: Use 13 for U.S. applications, or 8 for Canadian
0 applications.

0 G) AR HDBHCA
0 ----- X 2 = AR msg/sec
0 3600

0 H) CLI HDBHCA
0 ----- X 2 = CODP msg/sec
0 3600

0 I) DN Validation HDBHCA
0 ----- X 2 = DN Validation msg/sec
0 3600

0 J) NMS HDBHCA
0 ----- X 4 = NMS msg/sec
0 3600

0 K) B + C + D + E + F + G + H + I + J = TCAP msg/sec

0 L) The total links required to support the number of mes-
0 sages that will be generated as a result of HDBHCA and by
0 invoking features is calculated as follows:

0	Total ISUP msgs/sec	Total TCAP msgs/sec	Total # links
0	----- + -----		= at 0.8E
0	381 msgs/sec	119 msgs/sec	

0 Since links are provisioned at 0.4E,

0 Total # Links required = 2 X Total # links at 0.8E

0 NOTE: When provisioning A or E links to the STP pair, round
0 up the total number of links to the next EVEN number.

0 Provision LIM cabinets and LIU7s as required to support
0 the calculated quantity of links. Refer to the STP sec-
0 tion of this document for details.

0 RELEASE 28.01
0 93 12 03
0

0 (v) In the case where the minimum of 2 signaling links is
0 connected to another node, it is recommended for reli-
0 ability that they be assigned to different channel banks
0 and different DS1 facilities.

0 (vi) With an MSB7-based system, TCAP messages longer than 40
0 bytes have to be formatted into packets before passing
0 through the network. With a LIM-based system, full-
0 length messages can be sent, as is. The resulting real
0 time impact using the LIM is 0.550 milliseconds per TCAP
0 message.

0 The real time impact per ISUP message is as follows:

0 ISUP half call with short IAM: 1.053 milliseconds
0 ISUP half call with long IAM : 1.228 milliseconds

0 where:

0 ISUP half call = line to trunk or trunk to line call
0 IAM = Initial Address Message

0 (vii) It is necessary to synchronize all equipment to which
0 signaling links are interfaced, in order that the posi-
0 tion of the bits in the digital data stream can be recov-
0 ered.

0 In the special case in which all LIU7s in a LIM are
0 equipped with V.35 Interface Paddleboards; that is, all
0 links employ V.35 protocol, then there is no need for ex-
0 ternal timing. The timing signal for V.35 is imbedded in
0 the protocol.

0 However, where DS0 interfaces are employed, a master tim-
0 ing reference is required. Typical equipment in a DMS
0 office using DS0 interfaces includes:

- 0 - LIU7s on LIMs,
0 - Channel banks with data services,
0 - NT6X55AB DS0A Interface CP on DTCs.

0 One way of supplying timing is to designate one piece of
0 equipment as the master timing source and all others as
0 slaves. This method is not reliable because if the mas-
0 ter equipment fails then communication between all slave
0 equipment also fails.

The TSG should be located in or near the channel bank frame. Each Timing Output Card provides ten (10) ports. The following TSG equipment is required, and should be supplied by the telco.

Description	Part Number
DCD-400 Shelf Assembly	990-40000-01
Fuse & Alarm Card	990-40014-01
Clock Input Card	990-40010-01
Stratum 3 Clock	990-40013-01
Timing Output Card	990-40011-01
Timing Output Card (Hot Spare)	990-40011-01
Matrix Control Card	990-40015-01

For synchronization of the LIM, each NT9X78AA DS0A Paddleboard (PB) can be interfaced individually to the TSG, or timing can be supplied to the LMS for distribution to all LIU7s in the LIM. LIU7s equipped with NT9X78BA Enhanced DS0A Paddleboards do not have individual timing inputs; timing for this type of PB must be distributed via the LMS.

Where channel banks are used to interface signaling links to DS1 facilities, the channel banks and the LIM can both be timed from the same TSG. The office may have existing channel banks with spare channels that could be used for signaling links. Primary and secondary timing references for the TSG should be derived from the same DS1s that carry the signaling links. See Figure 315.9.

RELEASE 28.01
93 12 03

Figure 315.9 Timing Supply - LIM and Channel Banks

Alternatively, the internal Timing Supply Unit (TSU) card on the channel banks could be used as the timing reference, thus eliminating the need for an external TSG. This configuration has limited application since a maximum of two LIU7s can be equipped. Timing must be interfaced directly from the two channel banks to the two DS0A Interface PBs. Only NT9X78AA type paddleboards can be used. It is not permissible to route the timing to the LMS and feed more than two LIU7s, because timing from the two channel banks will be out of phase, and two timing references are required for reliability.

It is not permitted to synchronize the LIU7s from the timing output of NT6X55AB DS0A Interface CPs. This output is present for lab test purposes only. Should a failure occur in this configuration, there would be no way to associate it at the MAP with a CCS7 link failure.

0
0 RELEASE 28.01
0 93 12 03

0 1.2.16 Ethernet Interface Unit (EIU)

0 (a) General Description

0 1) The Ethernet Interface Unit is an interface between
0 DMS-BUS and an Ethernet Local Area Network (LAN). This
0 allows for support of a variety of industry standard ex-
0 ternal communications interfaces (i.e. synchronous, asyn-
0 chronous) and attachment of computers and work stations
0 to the switch. It is based on the industry standard IEEE
0 802.3 10BASE5.

0 These external processors (computers and work stations)
0 and communications interfaces make it possible to support
0 a number of applications. Examples are: Message Detailed
0 Recording for CCS7 Messages (MDR7) on a work station,
0 work station based Service Control Point (SCP) database
0 management, work station based Maintenance and Adminis-
0 tration Position (MAP), etc.

0 The EIU is thus a facilitator of flexible communications
0 between DMS and external systems.

0 Figure 315.10 shows a DMS SuperNode interfacing with an
0 Ethernet LAN.

0

RELEASE 28.01
93 12 03

Figure 315.10: A DMS SuperNode Interfacing With An Ethernet LAN

- 2) The Ethernet Interface Unit (EIU) acts as a "gateway" between the DMS-BUS and an Ethernet LAN supporting user data links. It acts as a concentration point between the peripherals (terminals and modems) and the DMS-BUS. The actual peripherals are not terminated on this unit, but on remote concentrators. These remote peripherals allow connection of HDLC (X.25, etc.) and asynchronous (MAP terminals, printers, etc.) terminal equipment to the system. The Ethernet also provides a linkage between DMS and workstations used for attached processing.

- 3) With the introduction of the EIU, each NT9X70AA can house up to twenty-four (24) individual LIU7s or EIUs, or a combination of both. Each NT9X70BA can house up to thirty-six (36) individual LIU7s or EIUs, or a combination of both.

A LIM cabinet containing an EIU is deployed in a DMS SuperNode to establish Ethernet connectivity. Figure 315.13 shows the placement of a LIM cabinet with an EIU on a DMS SuperNode.

RELEASE 28.01
93 12 03

Figure 315.11: A DMS SuperNode equipped with an EIU in a LIM (Local message switches not shown for clarity.)

(b) Reference

None

(c) Provisioning Considerations:

(i) Ethernet Addresses

One area of unique datafill pertains to the EIU. By industry convention, Ethernet addresses are to be unique everywhere. For this reason, a 48-bit number is used. It is divided into several fields to identify manufacturers and individual units. In typical workstation applications, the Ethernet address is burned into a PROM device on the interface circuit pack. In order to facilitate DMS manufacturing and operations, these numbers will be datafilled.

The manufacturer field consists of a 24 bit number assigned by the IEEE. NT has been assigned such a number.

0 RELEASE 28.01
0 93 12 03
0

0 This leaves 16 million Ethernet addresses to be assigned
0 to NT products. The remaining 24 bits are partitioned
0 internally by NT. EIUs have been assigned 20 bits
0 (greater than 1 million addresses) out of this range.
0 Addresses are datafilled on each SuperNode with EIUs as a
0 range of 16 addresses. This allows 65536 ranges of ad-
0 dresses (16 bits).

0 NTs IEEE address range is assigned to be:
0 00 00 AE F0 00 00 ---> 00 00 AE FF FF FF
0 where 00 00 AE = 0000 0000 0000 0000 1010 1110
0 = IEEE assigned 24 bit NT address

0 The IEEE-assigned, 24 bit NT address is (from least sig-
0 nificant to most significant bit):

0 0000 0000 0000 0000 1010 1110

0 which is the order that IEEE wants to see the bits on the
0 LAN.

0 However, when writing down the address for datafill, the
0 convention is to use HEXADECIMAL. Therefore, in HEX the
0 NT address is: 00 00 75 (i.e. Flip the bits in each byte
0 end for end).

0 Hence, NTs IEEE address range is assigned to be:

0 00 00 75 F0 00 00 ---> 00 00 75 FF FF FF.

0 Each Ethernet address needs to be partitioned with some
0 bits for the SuperNode portion and some for the EIU.

0 BNR has suggested 16 EIUs per SuperNode. This means that
0 the EIU number is within the range 00 ---> 1F. Therefore,
0 the SuperNode number is within the range:

0 00 00 75 F0 00 00 ---> 00 00 75 FF FF E0.

0 Note: 00 00 75 F0 00 00 : first SN
0 00 00 75 F0 00 20 : second SN
0 00 00 75 F0 00 40 : third SN
0 00 00 75 F0 00 60 : fourth SN
0 ...

0 This allows for 32K SuperNodes before a new block of ad-
0 dresses is needed.

0 RELEASE 28.01
0 93 12 03
0

0 Datafill restricts the datafill of data table LIUINV to
0 up to four (4) EIUs per SuperNode.

0 The Customer is responsible for providing the appropriate
0 Internet Protocol (IP) Addresses for his network.

0 (ii) The EIU has a relatively low throughput, as compared to
0 the bandwidth of the Ethernet LAN. Additional EIUs per
0 LAN or LANs may be required to reduce the traffic per EIU
0 to an acceptable level. These ratings are characterized
0 at an application level and the traffic loading is appli-
0 cation dependent.

0 In addition, since the EIU acts as a gateway between the
0 LAN and the LIM FBUS, traffic engineering may be required
0 for combinations of EIUs, LIU7s, Application Processor
0 Units (APUs), and Serial Interface Units (SIUs). Traffic
0 based provisioning is required for most configurations
0 using the full LIM cabinet where more than one shelf is
0 populated.

0 (iii) Don't order the software package for EIU.

0 The software packages of the applications which require
0 the EIU would be ordered. The individual packages which
0 make up the software package of a particular application
0 would not be ordered.

0 For example, the software package for the MDR7 (Message
0 Detailed Recording for CCS7 Messages) application is
0 NTXJ91AA. It consists of the following software pack-
0 ages:

0 NTXF19AA TCP/IP Protocols
0 NTXF05AA Ethernet Interface Unit (EIU)
0 NTXN18AA LIU/FBUS Base
0 NTXF20AA LMS on LPP
0 NTXF71AA SuperNode Enhanced Messaging

0 Hence, when the MDR7 application is needed, the fol-
0 lowing software packages are required:

0 NTXJ91AA MDR7

0 The other above software packages are not ordered be-
0 cause they are automatically pulled in via NTXJ91AA.

0
0 RELEASE 28.01
0 93 12 03

0 Check the appropriate software report for availabil-
0 ity and to confirm required supporting packages.

0 | (iv) Minimum BCS-30 software is required to use the NTEX22AA
0 IPF Integrated Processor and FBUS Interface CP.

0 NTXF05AA and NTXF19AA require BCS-31. As mentioned
0 in the above example, these software packages would
0 not be ordered. Instead, the software package of the
0 application which required the EIU would be ordered.

0 | (v) This product requires a DMS SuperNode in the office.

0 | (vi) For detailed provisioning information relating to the EIU
0 and Link Interface Module (LIM), see the section on the
0 Link Interface Module.

0 RELEASE 28.01
0 93 12 03

0 1.2.17 CCS7 Message Detail Recording (MDR7)

0 (a) General Description

0 The delivery of advanced network services often requires the
0 interaction of multiple CCS7 networks and the use of resources
0 owned by several telephone operating companies and/or their cus-
0 tomers. As a conduit for internetwork CCS7 traffic, the DMS-STP
0 provides a centralized location for the collection of statistical
0 information that can be used for usage sensitive CCS7 services.

0 The CCS7 Message Detail Recording feature allows the telco to
0 capture the detailed CCS7 message signaling units (MSUs) being
0 transported in the CCS7 network. Information provided by this
0 feature in turn supplies the data that allows recording of ser-
0 vices or allocations of resources among the networks that inter-
0 work to deliver advanced network services.

0 MDR7 uses the DMS-STP Gateway Screening feature (NTX840AA is a
0 prerequisite) to identify which messages are to be tracked. The
0 feature then takes a snapshot of the MTP, SCCP, and TCAP (or
0 ISUP) of the CCS7 message and sends the snapshot across the
0 DMS-Bus to the appropriate Ethernet Interface Unit (EIU), a
0 68020-based IEEE 802.3 interface card that resides in the LPP
0 cabinet. The EIU routes the snapshot over an Ethernet LAN to a
0 customer-provided store-and-forward processor (SFP), where it is
0 processed as required and then forwarded to the customer's
0 mainframe computer.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 | (i) For the initial (BCS31 and BCS32) MDR7 offering, only one
0 pair of Ethernet Interface Units and a single Store and
0 Forward Processor are supported.

0 | (ii) Each EIU pair supports a distinct set of LIU7s which are
0 determined by datafill. The LIU7s carrying the data of
0 interest must be identified and datafilled accordingly so
0 that this information is sent via the MDR7 Ethernet
0 Interface Units.

0

0 RELEASE 28.01
0 93 12 03

0 (iii) MDR7 requires the use of the Ethernet Interface Unit
0 mounted on a Link Interface Shelf in a Link Interface
0 Module (LIM) frame. (The LIM frame is also known as a
0 Link Peripheral Processor (LPP) frame.) The EIU requires
0 a cable (NT9X0190) to the bulkhead and cabling from the
0 bulkhead to the customer-provided Attachment Unit. This
0 cabling is available for standard cable duct applications
0 (NTNX36PZ) or for raised- floor/HVAC ductwork applica-
0 tions (NTNX36PU).

0 Either the two or three-slot EIUs may be used for MDR7.
0 If the office has a NT9X70AA LIM with space available, a
0 three-slot EIU can be used. Otherwise, the two slot EIU
0 should be provided. Refer to the section on EIU
0 provisionig (above) and under the Link Interface Module
0 in the next section.

0 (iv) During the BCS-31/32 Verification Office applications,
0 only a single pair of EIUs will be supplied for MDR7.

0 The Ethernet Interface Unit (EIU) mounts on a NT9X7201 or
0 NT9X7204 Link Interface Shelf and provides one port. Re-
0 fer to API-505 for EIU provisioning information.

0 The physical interface to the Ethernet system is the
0 NT9X85AA Ethernet Access Unit Interface which provides
0 the interface between the Ethernet controller and the Me-
0 dia Access Unit. This interface is compatible with all
0 implementations of Ethernet through external equipment.

0 The EIU throughput supported is as follows:

0 Let a = Busy hour traffic per link in MSU/sec
0 b = Fraction of MSUs recorded (0<b<1)
0 c = mean number of bytes copied per MSU.

0
$$\text{Links supported} = \frac{12 \cdot 1024 \cdot 0.4}{a \cdot b \cdot c}$$

0
$$\text{MSUs recorded/hour} = \frac{3600 \cdot 12 \cdot 1024 \cdot 0.4}{c}$$

0 (v) Up to four pairs of EIUs may be provisioned without con-
0 cern for LIM/LPP traffic engineering. Since the initial
0 MDR7 offering is limited to one EIU pair, LIM/LPP traffic

0
0 RELEASE 28.01
0 93 12 03

0 engineering is not currently required. The message
0 throughput of the EIU pair (12kb/sec) must not be ex-
0 ceeded. This must be managed by datafill, by selection
0 of message type to record and which LIU7s are monitored.

0 (vi) MDR7 is primarily a software feature. Physical details
0 for the hardware associated with MDR7 are documented in
0 the section on the Link Interface Module, under STP (fol-
0 lowing).

0 (vii) EIUs are provided in pairs with one active unit and one
0 hot spare unit which carries test traffic. In the event
0 of failure of the active unit, the spare takes over
0 within ten seconds.

0 (viii) The feature package for MDR7 is NTXJ91AA. The DMS-STP
0 Gateway Screening feature (NTX840AA) is a prerequisite,
0 since it is used to identify which messages are to be
0 tracked.

0 (ix) Traffic information for a specific LIU7 is assigned to
0 an EIU by datafill. The customer must determine which
0 LIU7s are carrying the information of interest and
0 datafill accordingly.

0 (x) The EIU has 4 Mbytes of memory which is dedicated to the
0 MDR7 application. MDR7 requires 4 Kbytes of memory in the
0 LIU7 and 410 Kbytes in the DMS Core.

0 2.0 Signalling Transfer Point

0 2.1 Introduction

0 The Signalling Transfer Point (STP) forms a node in a CCS7 network. The STP provides a message switching function between nodes in the network. It does not source or sink CCS7 messages. It performs message discrimination and routing along with signalling link and network management functions.

0 The STP is configured as a mated pair interconnected by signalling links. A minimum of two links should be provisioned between mated pairs. In the event of partial or complete failure of one STP, the mate STP will provide uninterrupted message transfer for all connected signalling points.

0 The STP is comprised of five major subsystems (reference Figure 315.12):

0 Link Interface Module (LIM) - This houses the individual Link Interface Units (LIU7s), the Local Message Switch (LMS), and one or more Ethernet Interface Units (EIU). A LIM cabinet containing an EIU is deployed in a DMS SuperNode to establish Ethernet connectivity. The LIM is also referred to as the Link Peripheral Processor (LPP).

0 Dual Plane Combined Core Cabinet (DPCC) - This is a standard DMS-Core configuration consisting of a Computing Module (CM), two Messages Switches (MS) (one per plane) and a System Load Module (SLM).

0 Input/Output Equipment - This is the standard DMS-100 IOE frame. It is equipped with a disk drive, mag tape drive plus some additional I/O terminal controller cards to interface printers/VDUs etc.

0 OAS - Office Alarm System. A Trunk Module Equipment (TME) frame will be equipped with an Alarm Cross Connect (AXU) shelf and two (2) Maintenance Trunk Modules (MTM) to provide alarming functions for the STP office.

0 DSNE - A Double Shelf Network Equipment frame will be equipped with one (1) duplicated network (one network module per plane) to interface the MTM shelves to the Enhanced Core Message Switch.

0 The STP will operate under the same environmental conditions as all DMS-100 family equipment.

0 2.2 Features

0 None

0 2.3 Equipment Provisioning

0 2.3.1 Dual Plane Combined Core (DPCC)

0 (a) General Description

0 The Dual Plane Combined Core Cabinet (DPCC) is a standard
0 DMS-Core configuration consisting of a Computing Module (CM), two
0 Message Switches (MS) (one per plane) and a System Load Module
0 (SLM).

0 Provision the following equipment as required for STP applica-
0 tion. Provide additional equipment as detailed in Section 3.9
0 DMS Supernode and Network Subsystems.

0 (b) Reference

0 Chapter 3, Section 3.9 DMS Supernode and Network Subsystems

0 (c) Provisioning Considerations:

0 (i) Use current memory provisioning processes for determining
0 memory requirements.

0 (ii) System Load Unit

0 The DPCC cabinet comes equipped with the SLM Ext Shelf
0 Assembly. The SLM must always be provisioned for STP ap-
0 plications. Equip as detailed in Section 3.9 DMS Super-
0 node and Network Subsystems.

0 (iii) Message Switch

0 Provide four (4) (two per MS) NT9X17AA MS 4-port CP to
0 interface the message links from the network and the IOC
0 shelf. Provide four (4) NT9X23AA DS-30 Paddleboards (one
0 per NT9X17AA).

0 In addition, provide four (4) NT9X17AA (two per MS) for
0 each two LIM cabinets connected to the Message Switch.

MS DS-30 Port Connections For Two LIM Configuration

Figure 315.13

0 RELEASE 28.01
0 93 12 03

0 2.3.2 Link Interface Module

0 (a) General Description

0 The Link Interface Module (LIM) houses the individual Link Inter-
0 face Units (LIU7s) and the Local Message Switch (LMS). It is
0 also referred to as the Link Peripheral Processor (LPP). The
0 NT9X70BA Link Interface Module (LIU7/DCP) Cabinet can mount up to
0 36 LIU7s and is an enhancement to the NT9X70AA Link Interface
0 Module Cabinet which can mount up to 24 LIU7s.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) Local Message Switch Shelf

0 Provide one (1) Local Message Switch Common CP, NT9X71AB
0 to equip LMS shelf. This CP fill equips the LMS for PBUS
0 Parity Protection.

0 Provide two (2) NT9X13DB CPU CP per LMS Shelf. Offices
0 must be equipped with BCS28 or higher. The NT9X13DB re-
0 places NT9X13DA on existing offices when PBUS Protection
0 Parity is required.

0 (ii) Link Interface Shelf (LIS)

0 1) Provision one (1) NT9X72AD, Link Interface Unit Shelf
0 Common Circuit Pack Fill to equip each LIS on the
0 NT9X70AA Cabinet for use with the 2-slot LIU. This
0 packfill is for new equipment only. Note that all
0 three shelves must be equipped with Common CP. Each
0 LIS shelf can support up to eight (8) LIU7s.

0 Provision one (1) NT9X72BA, Link Interface Unit Shelf
0 Common Circuit Pack Fill to equip each LIS on the
0 NT9X70BA Cabinet. Note that all three shelves must
0 be equipped with Common CP. Each LIS shelf can sup-
0 port up to 12 LIU7s.

0 2) For the bottom-most LIS on the frame, provision two
0 (2) NT9X79BA, F-Bus Extender Paddleboard with termi-

0
0 RELEASE 28.01
0 93 12 03

0 nation. On each of the other two LIS provision two
0 (2) NT9X79AA, F-Bus Extender Paddleboard.

- 0 3) The Signalling Data Links (SDLs) are load sharing and
0 they are always provisioned in pairs; one for the STP
0 and one for the mate STP. The figures for message
0 length (octets per message) are NT recommended esti-
0 mates and can be revised per customer input. To cal-
0 culate the required quantity of paired SDLs, use the
0 following formula:

0 Let A = HDBH Trunk Signaling = input
0 Call Attempts

0 B = Trunk Signalling Octets = 25
0 per message

0 C = HDBH 800 Database Query = input
0 Call Attempts

0 D = 800 Database Query = 80
0 Octets per message

0 E = HDBH ACB/AR Call = input
0 Attempts

0 F = ACB/AR Octets per = 80
0 message

0 G = HDBH Ring Again Call = input
0 Attempts

0 H = Ring Again Octets per = 80
0 message

0 I = HDBH Private Virtual = input
0 Networking (PVN) without
0 Personnal ID Number (PIN)
0 Call Attempts

0 J = PVN without PIN Octets = Table 1
0 per message

0 K = HDBH PVN with PIN Call = input
0 Attempts

0 L = PVN with PIN Octets per = Table 1
0 message

0 M = Average Octets per = input
0 message

0 RELEASE 28.01

0 SCP requests PIN NUMBER

0 1) Message to SSP = 34

0 2) Response to SCP = 37

0 4) The individual SDLs terminate at the Link Interface
0 Unit (LIU7). One (1) LIU7 will support one (1) SDL.
0 One NT9X7201 LIS will support up to eight (8) LIU7s
0 up to a maximum of 24 LIU7s per NT9X70AA LIM cabinet.
0 One NT9X7204 LIS will support up to 12 LIU7s up to a
0 maximum of 36 LIU7s per NT9X70BA LIM cabinet. Addi-
0 tional LIM cabinets may be provisioned up to a maxi-
0 mum of 17 LIMs. The office is currently limited to a
0 maximum of 408 signalling links.

0 To support the signalling links, provisionable inter-
0 face paddleboards are required. There are two types
0 of paddleboards, one to interface V.35-protocol sig-
0 nalling links, the other to interface DS0A-protocol
0 signalling links. The two types may be mixed within
0 the LIS.

0 The NT9X77AA V.35 Interface Paddleboard supports one
0 V.35 signalling link. It can operate at the full
0 V.35 rate (56 kbit/s) or at the following subrate
0 speeds: 2.4, 4.8, 9.6 and 19.2 kbit/s. Optional
0 software is required for subrate opera- tion (see
0 Software Packages). V.35 Data Sets, if required, are
0 to be furnished by the customer for this application.

0 The NT9X78AA DS0A Interface Paddleboard supports one
0 DS0A signalling link.

0 The NT9X78BA Enhanced DS0A Interface Paddleboard sup-
0 ports one DS0A signalling link. It is enhanced from
0 the NT9X78AA paddleboard by the addition of DS0A
0 loopback and BERT capabilities for testing purposes.
0 The External Composite Clock Terminator included in
0 the NT9X78AA CP was removed in the NT9X78BA. Pro-
0 vision the NT9X78BA paddleboard only when interfacing
0 a DS0A signalling link and when Enhanced Maintenance
0 feature is required (BCS28 or higher). Otherwise,
0 provision NT9X78AA.

0 RELEASE 28.01
0 93 12 03
0

0 Each 2-slot LIU7 is composed of the following CPs:

0 - One (1) NT9X78AA, DS0A Interface Paddleboard,
0 OR One (1) NT9X78BA, Enhanced DS0A Interface
0 Paddleboard,
0 OR One (1) NT9X77AA, V.35 Interface Paddleboard,

0 AND:

0 - One (1) NT9X76AA, STP - Signaling Terminal CP
0 - One (1) NTEX22AA, IPF Integrated Processor and
0 FBUS CP

0 These three cards make up a single Link Interface
0 Unit.

0 Each 3-slot LIU7 is composed of the following CPs:

0 - One (1) NT9X78AA, DS0A Interface Paddleboard,
0 OR One (1) NT9X78BA, Enhanced DS0A Interface
0 Paddleboard,
0 OR One (1) NT9X77AA, V.35 Interface Paddleboard,

0 AND:

0 - One (1) NT9X76AA, STP - Signaling Terminal CP
0 - One (1) NT9X13CA, Link General Processor CP
0 - One (1) NT9X75AA, F-Bus Interface CP

0 These four cards make up a single Link Interface
0 Unit.

0 The 2-slot (shrink) LIU7s can mount on the existing
0 NT9X70AA LIM cabinets or the NT9X70BA cabinets. The
0 3-slot LIU7s can mount on the NT9X70AA LIM cabinets
0 only; not on the NT9X70BA cabinets.

0 5) Provide one (1) NT9X0145 DS30 Cable Assembly per each
0 DS0A Interface PB, Enhanced DS0A Interface PB, or
0 V.35 Interface PB. This cable connects the
0 paddleboard to the LIM cabinet bulkhead (on the
0 NT9X70AA Cabinet only). Note that switchboard cabl-
0 ing is also required from the outside of the
0 bulkhead.

0 Provide one (1) NT9X0193 DS30 Cable Assembly per each
0 DS0A Interface PB, Enhanced DS0A Interface PB, or
0 V.35 Interface PB. This cable connects the

0 RELEASE 28.01
0 93 12 03
0

0 paddleboard to the LIM cabinet bulkhead (on the
0 NT9X70BA Cabinet only).

0 6) Provide two (2) NT9X19AA Filler Face plates and one
0 (1) NT9X19BA Paddleboard filler plate for each une-
0 quipped LIU7 position on a LIS shelf equipped with
0 the NT9X72BA CP fill.

0 Provide three (3) NT9X19AA Filler Face plates and one
0 (1) NT9X19BA Paddleboard filler plate for each une-
0 quipped LIU7 position on a LIS shelf equipped with
0 the NT9X72AA/AC fill.

0 (iii) Ethernet Interface Unit (EIU)

0 1) The EIU consists of a three-card slot entity (not
0 counting the paddleboard) on the NT9X70AA and a two-
0 card slot entity (not counting the paddleboard) on
0 the NT9X70BA.

0 2) The three-card slot EIU entity consists of two (2)
0 circuit packs, one (1) filler face plate, and one (1)
0 paddleboard:

0 NTEX22AA Integrated Processor and FBUS Interface CP
0 NT9X84AA Ethernet Interface CP
0 NT9X19AA Filler Face Plate
0 NT9X85AA Ethernet Access Unit Interface PB

0 The EIU mounts on the Link Interface Shelf (LIS) of
0 the NT9X70AA cabinet.

0 On the NT9X70AA, each LIS shelf can mount up to eight
0 (8) EIUs or LIU7s, or a combination of both.

0 For each EIU, one (1) NT9X0190 Ethernet Cable Assem-
0 bly is required to cable from each EIU Paddleboard to
0 the LIS Bulkhead.

0 For field applications only, if EIUs will be mounted
0 on NT9X70AA, one (1) NT9X70AZ Product Change Kit for
0 EIU Retrofit is required per NT9X70AA. This will
0 provide the proper bulkheads (on each LIS shelf)
0 which will be compatible with the 15-pin D-type con-
0 nector.

0 RELEASE 28.01
0 93 12 03
0

- 0 3) The two-card slot EIU entity consists of two (2) circuit packs and one (1) paddleboard:
0

0 NTX22AA Integrated Processor and FBUS Interface CP
0 NT9X84AA Ethernet Interface CP
0 NT9X85AA Ethernet Access Unit Interface PB

0 The EIU mounts on the Link Interface Shelf (LIS) of
0 the NT9X70BA cabinet.

0 On the NT9X70BA, each LIS shelf can mount up to
0 twelve (12) EIUs or LIU7s, or a combination of both.

0 For each EIU, one (1) NT9X0190 Ethernet Cable Assembly is required to cable from each EIU Paddleboard to the LIS Bulkhead.
0

0 Provisioning of EIUs is application-dependent. That is, the quantities required and their configuration is determined by a combination of product, software, and traffic engineering criteria.
0

0 The NT9X84AA will support one (1) Ethernet communications link.
0

- 0 4) The NT9X85AA is a paddleboard located behind the NT9S84AA. The physical interface to the Ethernet system, it is a 25-pin D-type connector which provides the interface between the Ethernet controller and the Media Access Unit (MAU).
0

0 There is an industry standard 15-pin AUI connector located at the LIS Bulkhead. This is a generic interface and is supported as an industry standard (IEEE 802.3 10BASE5 implementation). Note that this interface is compatible with all implementations of Ethernet through external equipment.
0

0 The NT9X0190 Ethernet Cable Assembly is a cable with a 25-pin connector at one end and a 15 pin connector at the other end. It cables from the NT9X85AA to the LIS Bulkhead.
0

0 (iv) C-Link Provisioning

0 RELEASE 28.01

0 2.3.3 Input/Output Equipment Frame

0 (a) General Description

0 The Input/Output Equipment Frame (NT0X43AD) is the standard
0 DMS-100 IOE frame. It is equipped with a disk drive, mag tape
0 drive plus some additional I/O terminal controller cards to
0 interface printers/VDUs etc.

0 (b) Reference

0 Section 3.6 Input/Output

0 (c) Provisioning Considerations:

0 (i) Provide one (1) Disk Drive Unit (DDU). A second DDU may
0 be provided for reliability to back up the first DDU.
0 Refer to the Input/Output Device Requirements in Section
0 3.6 for more information on the DDU.

0 (ii) Provide one (1) Cook Mag Tape Drive. Refer to the Mag-
0 netic Tape Storage in Section 3.6 for more information.

0 (iii) Provide two (2) Input/Output Controller (IOC) shelf as-
0 semblies and two (2) IOC circuit pack fills. Provide two
0 (2) NT1X62CA I/O MSG Controller (one per IOC shelf).
0 Provide I/O Controller Cards as required for DDU, MTD and
0 miscellaneous I/O equipment.

0 (iv) Provide as an option, one (1) NT1X89AA Multiprotocol Con-
0 troller CP to provide two (2) RS-232 Interfaces to ex-
0 ternal Operations Support Systems, or for downloading
0 software patches.

0 (v) Additional I/O equipment that may be required are two
0 VDUs, and a printer.

0 (vi) I/O Frame(s) will be configured according to the amount
0 of equipment provided. Existing STP installations using
0 one 14" DDU may be configured as shown in Figure 315.14.
0 Initial STP jobs using 8" DDUs can be configured as per
0 the example in Figure 315.15.

IOE 00
Figure 315.14

IOE 00
Figure 315.15

0 2.3.4 Office Alarm System0 (a) General Description

0 An Office Alarm System (OAS) is a Trunk Module Equipment (TME)
0 frame equipped with an Alarm Cross Connect (AXU) shelf and two
0 (2) Maintenance Trunk Modules (MTM) to provide alarming functions
0 for the STP office.

0 (b) Reference

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations:

0 (i) MTM 00 will act as the primary alarm MTM. MTM 01 will be
0 designated as the secondary alarm MTM. The following
0 should be provisioned to ensure that the primary and sec-
0 ondary MTMs are powered from different power feeds:

0 One (1) NT0X82WB FSP Strapping Information
0 One (1) A0324131 TB Jumper
0 Two (2) NT0X95CL Cable Assemblies
0 One (1) NT7X3406 Cable Assembly

0 (ii) Equip the primary MTM as follows:

QTY	PEC	DESCRIPTION
1	NT3X82AB	OAU Dead System Alarm with Common Audible
	or	
1	NT3X83AA	Remote Alarm Transfer (if remote alarm transfer feature is required)
1	NT0X10AA	Miscellaneous Scan Point Card
1	NT2X57AA	Signal Distribution Card

0 Equip the secondary MTM with one (1) NT3X82-- OAU Dead
0 System Alarm circuit pack (must be the same as on the
0 primary MTM) per customer requirements.

0 In addition, provide one (1) NT0X63__ Alarm Control &
0 Display Panel (NT0X63AA or NT0X63AC) per customer re-
0 quirements. The NT0X63AA is ordered when the OAS Dead
0 System with Unique Audible NT3X82AA is equipped; NT0X63AC

0
0 RELEASE 28.01
0 93 12 03

0 is ordered when the OAS Dead System with Common Audible
0 NT3X82AB is equipped.

0 (iii) Miscellaneous Service Circuits

0 Provide one (1) Transmission Test Trunk (TTT) consisting
0 of one (1) PCM Test Signal Generator NT1X90AA and one (1)
0 PCM Level Meter NT2X96AA. Equip these on an MTM shelf to
0 allow in-service testing of the MTMs.

0 (iv) For more information on Trunk Modules, refer to Section
0 3.5 Peripheral Modules - Host.

0 2.3.5 Double Shelf Network Equipment

0 (a) General Description

0 A Double Shelf Network Equipment (DSNE) frame (NT8X10AA) will be
0 equipped with one (1) duplicated network (one network module per
0 plane) to interface the MTM shelves to the Enhanced Core Message
0 Switch.

0 (b) Reference

0 Section 3.9 DMS Supernode and Network Subsystems

0 (c) Provisioning Considerations:

0 (i) The DSNE frame is provisioned according to the rules
0 found in Section 3.9 on the Network Module.

0 One network module per plane will be equipped.

0 (ii) Provide two (2) NT3X76AC Network Clock (DMS-Core) CP and
0 two (2) NT3X74BB Network Central Processor (DMS-Core) CP
0 to equip the DSN for applications with DMS-Core.

0 (iii) Speech Links

0 For STP application, the speech links from the TME frame
0 (MTM shelves) must be connected to the Double Shelf Net-
0 work. In a DMS-100 office the speech links would be con-
0 nected through a speech link connection frame. For this
0 application, they may be cabled directly, thereby elimi-
0 nating the need for speech link connecting panels and
0 frames.

0 Provision the following cables:

QTY	PEC	DESCRIPTION
1/TME Frame	NT0X96AJ	TME (C05) to DSNE Plane 0
1/TME Frame	NT0X96AJ	TME (C06) to DSNE Plane 1

0 | 2.3.6 DataSPAN (Frame Relay Service)

0 (a) General Description

0 The Frame Relay Service (FRS) is a new high speed, connection
0 oriented, switched packet data service. DATASPAN is the Northern
0 Telecom trade name for this service.

0 Customers may use Frame Relay Service to transfer data in
0 packetized format from one location to another via a Datapath
0 connection, a DDS (Digital Datapath Service) channel, or from a
0 LAN via a T1 line.

0 Datapath is a Northern Telecom feature on the DMS 100 or DMS 250
0 providing dial-up data circuits operating at 56 kbs. DDS is an
0 AT&T developed private line digital data service operating at 56
0 kbs. Token Ring and Ethernet are types of LAN (local area net-
0 works) for connecting computer peripherals together. All these
0 types of data services can now be connected using Frame Relay
0 Service to transmit and receive data.

0 Figure 315.16 shows the connections of these type services to a
0 DMS-100. A Datapath subscriber is connected through the DMS
0 switching network to a FRS access channel as shown in Figure
0 315.18. DDS subscribers must be multiplexed on to a T1 line which
0 can be connected directly to a FRS access channel. A LAN can be
0 connected via a non-channelized T1 line directly to a FRS access
0 channel.

0 Figure 315.17 shows the connections of these type services to a
0 DMS-250. Datapath subscribers access channels would terminate on
0 a DTC for switching through the DMS network to a FRS access chan-
0 nel. DDS and LAN access are the same as for the DMS-100.

0 FRS is available on the DMS-100 LEC (Local Exchange Carrier) and
0 the DMS-250 IEC (Inter Exchange Carrier) from BCS 32 and beyond.

0 An FRS subscriber is connected to the frame relay switch via an
0 access channel on which multiple logical link connections (LLC)
0 to a number of other subscribers may exist. Each logical link
0 connection operates independently of other logical links on the
0 access channel.

0 The types of connection allowed are:

0

0 RELEASE 28.01
0 93 12 03

0 * Private - Customer FRS agent (logical link) to another FRS agent
0 owned by the same customer.

0 * Non-private - Customer FRS agent to another FRS agent owned by
0 a different customer.

0 Each logical link permits a full duplex exchange of frames and
0 the order of frames is preserved in each direction. FRS limits
0 the maximum frame size to 1600 bytes.

0 The initial release of FRS supports only permanent logical link
0 connections (PLLC) which are set up at Telco subscription time.
0 The throughput on a single logical link connection can be in ex-
0 cess of 1 megabit/second with an internal switch one way transit
0 delay less than 3 ms. The two access channel speeds supported in
0 the initial release are :

0 * 56 kbps over DATAPATH and DDS circuits.

0 * 1.536 Mbps over T1 line (non-channelized)
0 circuits.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 (i) DATAPATH Support:

0 DATAPATH provides access via a local loop, a DMS remote
0 peripheral, or a D4 channel bank. DATAPATH uses the DMS
0 hotline feature to automatically connect the DTE to the
0 frame relay service when the DTE comes on line. Only 56
0 kbps rates will be supported. T-link sub-rate encoding is
0 not supported. The customer is required to use the High
0 Speed Data Unit (HSDU) which supports the V.35 physical
0 interfaces. Refer to ECM 270, Datapath Modem Pooling.

0 (ii) DDS support: Digital Data Service (DDS) is an AT&T de-
0 veloped private line digital data service. Only the 56
0 Kbps non-error correcting form of this service will be
0 supported. Individual DS0 must be multiplexed onto a T1
0 prior to connecting to Supernode . A maximum of 24 56

0 RELEASE 28.01
0 93 12 03
0

0 kbps access connections are supported on a single T1 ac-
0 cess circuit.

0 (iii) Non-channelized T1: The non-channelized mode uses all 192
0 bits of information in a T1 frame to carry data associ-
0 ated with a single frame relay frame.

0 (iv) All customer access protocols must use HDLC framing plus
0 either LAPB/SDLC or LAPD logical link identification.

0 Refer to Figures 315.16 and 315.17 for access channel
0 configurations.

0 (v) Dataspan T1 Trunking

0 Separate LPP cabinets in the Dataspan networks can be
0 connected via non-channelized T1 trunks. The trunks can
0 connect LPP cabinets in the same office or in two differ-
0 ent offices. These trunks are in trunk groups. The trunks
0 can be of two types, standard or enhanced. The trunk
0 groups can be of two types, shared or non-shared.

0 Standard trunks offer a basic node-to-node transport me-
0 dium using the frame relay standard as it exists today
0 (the ANSI T1S1 standard). They are connected to suppliers
0 of end office equipment other than Northern Telecom, and
0 could be used to expand the network to areas not serviced
0 by DMS Supernodes. Standard trunks may not be placed in
0 trunk groups of more than one member.

0 Enhanced trunks offer the standard service plus a fault
0 resistant capability. Enhanced trunk members may be
0 grouped together into trunk groups of more than one mem-
0 ber, and connections can be given a secondary route over
0 a separate trunk member within the group. Connection
0 duplication greatly improves reliability, and allows a
0 trunk member in a multiple member group to be taken out
0 of service for maintenance without seriously disrupting
0 service for customers. Because of this enhancement, end-
0 to-end sequencing of frames is done; that is; frames are
0 guaranteed ordered from one access point to the eventual
0 destination even in the case of trunk member failure
0 (although with perhaps some frame loss).

0 A shared trunk group has members which may carry frames
0 belonging to any customer who purchases connections
0 across the trunk.

0 A non-shared trunk group is one in which all of the con-
0 nections assigned to the group belong to a single cus-
0 tomer. This customer , in effect, purchases the trunk
0 group for his own private use.

0 Connections using trunks may be datafilled in such a way
0 that they are tandem to an office. With this ability, a
0 network need not be engineered to have maximum
0 conectivity.

0 RELEASE 28.01
0 93 12 03

0 (vi) The DMS-100 and DMS-250 switch must be a Supernode and be
0 equipped with an LIM(LPP). If Frame Relay Services via
0 DATAPATH lines is required, the switch must also be
0 equipped with DATAPATH and any network upgrades required
0 by that product.

0 (vii) A two-slot FRIU will be available for use on the 36 unit
0 LIM(LPP) (NT9X70BA) only.

0 (viii) BCS 32 Frame Relay Services must use LIM (LPP) dedicated
0 to FRIU.

0 The FRIU may co-exist on the LIM (LPP) with other DCP
0 (Digital Communications Processor) such as the LIU7 and
0 the EIU in BCS 33 and beyond subject to engineering rules
0 to be specified later.

0 (ix) Any T1 connected to the the LIM (LPP) must be connected
0 to the appropriate DS1 terminating equipment for the re-
0 quired central office protection.

0 (x) The FRIU on the LIM(LPP) for FRS channel access must have
0 the following CP mounted with the new FRAP (NTEX31AA) and
0 the new T1 paddleboard (NTEX30AA).

0 * NTEX22AA IPF Proc and F-Bus I/F CP

0 (xi) A FRIU consists of three (3) circuit packs which mount on
0 a 36 unit LIM(LPP). These circuit packs are:

0 * NTEX22AA IPF Proc and F-Bus I/F CP

0 * NTEX31AA Frame Relay Access Processor CP

0 * NTEX30AA T1 Access Paddleboard

- 0 (xii) Provide one (1) FRIU for each twenty-four (24) DATAPATH
0 customer access channels required. Also provide one (1)
0 T1 port on a DTC/LTC per FRIU provided for DATAPATH ac-
0 cess channels.
- 0 (xiii) Provide one (1) FRIU for each channelized T1 line carry-
0 ing DDS service requiring FRS.
- 0 (xiv) Provide one (1) FRIU for each non-channelized T1 line re-
0 quiring FRS.
- 0 (xv) Two (2) NT9X0191 Cable Assemblies are required per FRIU.
0 This cable assembly connects the paddleboard to the cable
0 bulkhead.
- 0 (xvi) Traffic Provisioning
- 0 The following information provides the method of provi-
0 sioning FRIU and LPP for Dataspan service based on data
0 traffic calculations.

0 Assumptions

0 The first objective of this section is to give a brief
0 overview of the factors which determine the maximum
0 throughput of an LPP. Second the impact of the DataSPAN
0 application on these factors is discussed. Next, the as-
0 sumptions required to engineer an LPP to support the
0 DataSPAN application are stated. Finally some comments
0 are made regarding network architecture.

0 This information presented is limited to engineering an
0 LPP to handle only the DataSPAN application. Mixed ap-
0 plication engineering assumptions will be added in the
0 next release of this document.

0 LPP Throughput Overview

0 From a traffic engineering point of view there are six
0 factors that may limit total throughput of an LPP: the
0 utilization of the links terminating on the LPP, the max-
0 imum throughput of the DCPs, the number of DCPs sup-
0 ported, the maximum throughput of the FBUS, the maximum
0 throughput of the LMS and the maximum throughput of the
0 DS30 links.

0 RELEASE 28.01
0 93 12 03
0

0 An LPP frame can hold up to 36 DCPs. Each DCP terminates
0 one link. The LPP has two FBUSs and two LMSs. The
0 FBUS/LMS pairs operate in a load sharing mode. The FBUS
0 is used to connect the DCPs to the LMS. Each FBUS has a
0 bandwidth of 32 Mbps (8 bits wide running at 4 Mhz). Each
0 DCP has access to both FBUSs and therefore both LMSs. The
0 LMSs control the flow of traffic between DCPs in the LPP
0 and traffic between DCPs and the DMS-Bus. Each LMS has a
0 bandwidth of 128 Mbps (32 bits wide running at 4 Mhz).
0 The LPP is connected to the DMS-Bus by 8 DS30 links (2
0 links from each LMS to each unit of the DMS-Bus).

0 DataSPAN Application Impact

0 For the DataSPAN application, traffic enters the system
0 as a data frame on a T1 span. This T1 span can be either
0 an access line carrying data from one or more customer
0 sites or a T1 trunk carrying data from another LPP. The
0 access lines can be either channelized (24 individual 64
0 Kbps channels) or unchannelized (one 1.536 Mbps channel).
0 The T1 spans are terminated by an FRIU (the DCP for the
0 DataSPAN application). After processing by the FRIU (a
0 CRC check and DLCI translation), the frame travels 'up'
0 the FBUS to the LMS. The frame then traverses the LMS
0 and is routed back 'down' the FBUS to the appropriate
0 FRIU. This FRIU then transmits the frame on its T1 span.
0 This T1 span can again be either an access line or a T1
0 trunk with one exception.

0 The key points to note about how the LPP handles DataSPAN
0 traffic are as follows:

- 0 * DataSPAN traffic does not impact the DS30 links. The
0 impact of the traffic is confined to the LPP itself.
0 The throughput of the DS30 links will therefore not
0 be a limiting factor for the DataSPAN application.
- 0 * Each DataSPAN frame handled makes two trips across
0 the FBUS and one trip across the LMS. Since the LMS
0 handles each DataSPAN frame only once and has a
0 higher bandwidth than the FBUS, the throughput of the
0 LMS will not be a limiting factor for the DataSPAN
0 application.

0 This leaves four potentially limiting factors for
0 DataSPAN traffic throughput:

0 RELEASE 28.01
0 93 12 03
0

- 0 * The utilization of the T1 spans.
- 0 * The maximum throughput of an FRIU.
- 0 * The number of FRIUs supported.
- 0 * The maximum throughput an FBUS.

0 DataSPAN Engineering Assumptions

0 The following statements summarize the traffic engineer-
0 ing assumptions made regarding the factors which may
0 limit LPP throughput for the DataSPAN application:

- 0 1) T1 Trunks can be engineered to a maximum of 65% of
0 their bandwidth (1 Mbps in each direction).
- 0 2) For Access Lines, the utilization of the T1 is deter-
0 mined by the traffic requirements of the customer.
0 The access load used in the engineering calculations
0 which follow should represent the mean peak busy hour
0 utilization of the link.

0 The utilization assumed for an access line should not
0 exceed 65% of the T1's bandwidth.
- 0 3) An FRIU is engineered to handle 800 frames per second
0 in each direction for a total of 1600 frames per sec-
0 ond.
- 0 4) The LPP can support a maximum of 36 FRIUs. Each FRIU
0 terminates a single T1 span (either an Access Line or
0 a T1 Trunk).
- 0 5) The DMS is engineered to handle single faults of du-
0 plicated equipment with no loss of service. For the
0 DataSPAN application this means that the LPP is engi-
0 neered to handle a single FBUS/LMS failure. The
0 throughput of the system is therefore limited by the
0 throughput of a single FBUS.
- 0 6) An FBUS is engineered to 65% of its total bandwidth
0 (20.8 Mbps).

0 FRIU throughput (item 3 above) is generally not limiting
0 for the DataSPAN application. For longer frames, the
0 throughput of the FRIU will be limited by the bandwidth

0 RELEASE 28.01
0 93 12 03
0

0 of the T1 and not the processing power of the FRIU. For
0 shorter frames, however, it is possible that the through-
0 put of the FRIU will be the limiting factor. While the
0 engineering rules presented in the next section do not
0 directly address this issue, it is possible to compensate
0 for this possibility by adjusting the maximum utilization
0 of a T1 span (both access line and T1 trunk) based on the
0 mean frame length anticipated in the DataSPAN network.
0 The table below presents the maximum T1 utilization to
0 use for various mean message lengths.

0 Maximum T1 Utilization vs Mean Frame Length

0 Mean Frame Size	Maximum T1 Utilization
0 50	20%
0 100	41%
0 150	62%
0 156 and up	65%

0 Network Architecture Considerations

0 Consider the following when planning a DataSPAN network:

- 0 * DataSPAN frame tandeming is not supported.
- 0 * If there is a known community of interest (COI) for a
0 virtual private network then it should be considered
0 when planning the network (for instance, all the ac-
0 cess lines of a VPN should be put on a single LPP if
0 possible).
- 0 * With T1 trunking, DataSPAN networks are limited to
0 approximately 5 LPP. Multiple parallel DataSPAN net-
0 works can be deployed for networks that have multiple
0 VPNs which do not have a COI between them.
- 0 * If a VPN has a remote site with one access line and
0 no other traffic is passing on other VPN, then back-
0 haul the T1 carrier to a different LPP.

0 (xvii) DataSPAN Engineering Procedure

0 Engineering a frame relay network is an iterative proc-
0 ess. The first step in the process is to define the ma-
0 jor network elements: the number of sites, the number of

0 RELEASE 28.01
0 93 12 03
0

0 access lines per site and the traffic level per access
0 line. With this information, an initial estimate is made
0 of the number of LPPs required. Using this estimate, ac-
0 cess lines are distributed across the available LPPs and
0 inter LPP trunking requirements are determined. This
0 completely defines the network.

0 With this information, the number of FRIUs required and
0 the FBUS traffic load can be determined for each LPP in
0 the network. These values are then compared with the ap-
0 propriate engineering standards. If there are no vio-
0 lations then the process is complete. If one or more of
0 the LPPs violate the engineering rules then additional
0 LPPs must be added to the network and the process re-
0 peated until all the engineering rules are satisfied.

0 From an LPP engineering point of view, there is little
0 difference between co-located LPPs and LPPs located in
0 different sites. The only important difference is that
0 access lines can be allocated as desired between co- lo-
0 cated LPPs. Once the access lines are assigned, however,
0 the LPP engineering rules (specifically the T1 trunking
0 rules) treat each LPP as a separate entity.

0 Step 1 - Network Definition

0 The purpose of this step is to collect the background
0 data required to engineer the network. Specifically the
0 following information is required:

- 0 1) Number of sites in the network. This should not be
0 confused with the number of LPPs.
- 0 2) Number of access lines per site.
- 0 3) Incoming load of each access line. This is defined
0 as the incoming customer traffic measured in Mbits
0 per second.

0 Step 2 - Initial LPP Estimate

0 The goal of this step is to make an initial estimate of
0 the number of LPPs required using the data collected in
0 Step 1. LPPs are allocated on a site by site basis. For
0 each site, the number of LPPs allocated must satisfy the
0 following rules:

0 RELEASE 28.01

0 93 12 03

0 1) Number Number of Access Lines
 0 of LPPs >= -----
 0 Allocated 36

0 2) Number 2 * Site Access Line Load (Mbits/sec)
 0 of LPPs >= -----
 0 Allocated 20.8 (Mbits/sec)

0 The first rule represents the physical limits of the LPP
 0 frame. The second rule represents the bandwidth limits
 0 of a single working FBUS. In this equation, the 'site
 0 access line load' is calculated by summing up the 'incom-
 0 ing load of each access line' assigned to that site. The
 0 factor of two is included to account for the fact that
 0 for both intra LPP traffic and T1 trunking traffic every
 0 incoming frame makes two trips across the FBUS.

0 These two rules do not take into account any trunk traf-
 0 fic requirements. This will be handled later. To shorten
 0 the engineering process an extra LPP may be added to
 0 those sites that are close to requiring an additional LPP
 0 based solely on the access line requirements.

0 Step 3 - Access Lines Allocation

0 This is the first step in the iterative part of the engi-
 0 neering process. If the initial allocation of LPPs
 0 proves to be insufficient and therefore additional LPPs
 0 are allocated then the process will be restarted at this
 0 point.

0 In this step access lines are allocated to LPPs. In those
 0 sites with only one LPP this is a simple process (all ac-
 0 cess lines are assigned to that one LPP). In sites with
 0 multiple LPPs, access lines belonging to a community of
 0 interest (COI) should be assigned to the same LPP. This
 0 will reduce the intra site T1 trunking requirements. If
 0 there are no known COIs, then the access lines should be
 0 allocated to best balance the access line load across the
 0 available LPPs. Beyond these two suggestions the network
 0 planner is free to assign the access links to LPPs as de-
 0 sired.

0 Once this process is complete, calculate the following
 0 values for each LPP in the network:

0 RELEASE 28.01
0 93 12 03

- 0 1) Access Lines{*i*} = num of access lines assigned to LPP '*i*'
0 2) Access Load{*i*} = tot 'incoming load of each access line'
0 assigned to LPP '*i*' (Mbits per second)

0 Using this information, calculate the following two net-
0 work wide values:

- 0 1) NLPP = num of LPPs in the network
0 2) Network Access Load = Sum (*i* = 1 to NLPP) of (Access Load{*i*}
0 (Mbits per second)

0 The second values represents the total incoming access
0 line load on the network.

0 Step 4 - T1 Trunking Load

0 The purpose of this step is to determine the T1 trunk
0 traffic load between every two LPPs in the network. This
0 information will be used in the next step to determine
0 the number of inter LPP trunks required. The inter LPP
0 trunking load will be defined as follows:

0 T1 Load{*i*,*j*} = the tot.T1 trunk traffic load from LPP '*i*' to
0 LPP '*j*' (Mbits per second)

0 Note that there is no requirement that T1 Load{*i*,*j*} equal
0 T1 Load{*j*,*i*}. This means that the traffic load is not
0 required to be the same in each direction on a trunk
0 route.

0 To define the T1 trunk load the following definition will
0 be used:

0 Mix{*i*,*j*} = the fraction of the access line load incoming to LPP '*i*'
0 that is destined for access lines assigned to LPP '*j*'

0 The network planner must supply the values for the 'Mix'
0 variable. This should be based on any known COIs in the
0 network. There is no single 'best' method for determin-
0 ing the proper values to use. If necessary, the planner
0 may need to determine the traffic mix for every individ-
0 ual access line in the network and then sum the results

0 RELEASE 28.01
0 93 12 03

0 by LPP. Regardless of the method used, the following two
0 statements must hold true:

- 0 1) $Mix\{i,i\}$ = the fraction of intra LPP traffic for LPP 'i'.
0 2) $\text{Sum (for } j = 1 \text{ to NLPP) of } (Mix\{i,j\}) = 1.0$ for all i.

0 The first statement is true by definition. The second
0 rule requires that exactly 100% of the incoming access
0 line traffic to each LPP is accounted for.

0 If there are no known COIs then the following method can
0 be used to estimate the traffic split (i.e. 'Mix' values)
0 for each LPP.

0 $Mix\{i,j\} = \text{Access Load}\{j\} / \text{Network Access Load}$

0 This method assumes that incoming traffic from each ac-
0 cess line is to be distributed over the entire network
0 and that each access line will receive traffic in direct
0 proportion to the amount of traffic it inputs to the net-
0 work. Using this method ensures that for all access
0 lines the incoming traffic load will equal the outgoing
0 traffic load.

0 Note that, using this method, the results depend only on
0 the access line load of the receiving LPP ('j'). There-
0 fore, if LPP 1 sends 10% of its traffic to LPP 2 then all
0 LPPs in the network will send 10% of their traffic to LPP
0 2. In addition 10% of the access line load for LPP 2
0 will be intra LPP traffic.

0 With $Mix\{i,j\}$ defined for all LPPs in the network, the T1
0 trunk load from LPP 'i' to LPP 'j' can be calculated as
0 follows:

0 $T1 \text{ Load}\{i,j\} = \text{Access Load}\{i\} * Mix\{i,j\}$

0 Step 5 - T1 Trunking Requirements

0 The purpose of this step is to determine the number of T1
0 trunks required between each pair of LPPs in the network.
0 These calculations do not depend upon whether the LPPs to
0 be interconnected are in the same or different sites. The

0 RELEASE 28.01
0 93 12 03

0 number of trunks allocated between any two pair of LPPs
0 is defined as follows:

0 T1 Trunks{*i*,*j*} = the number of trunks allocated between LPP '*i*' and
0 LPP '*j*'

0 By definition the following statement is true:

0 T1 Trunks{*i*,*j*} = T1 Trunks{*j*,*i*}

0 There are several factors to consider when determining
0 the number of T1 trunks required. First, trunks are en-
0 gineered to 65% of their bandwidth (1.0 Mbits per second
0 in each direction). Second, the number of trunks allo-
0 cated must be sufficient to handle the trunking load in
0 both directions. Third, trunks between two sites can be
0 organized into trunk groups with a maximum size of 6 T1
0 trunks per trunk group. Finally, T1 trunking reliability
0 can be improved by making use of the Enhanced Trunking
0 feature.

0 Enhanced Trunking allows for the assignment of a second-
0 ary route to each logical connection carried by a trunk
0 group. This allows the system to be engineered so that
0 it can survive a single T1 trunk failure with no loss of
0 service. If Enhanced Trunking is desired between two
0 LPPs in the network then an extra T1 trunk, above and be-
0 yond the number required to handle the estimated trunk
0 traffic load, should be assigned to the trunk group con-
0 necting those two LPPs.

0 The number of trunks assigned between each pair of LPPs
0 should satisfy the following rule:

0 $T1\ Trunks\{i,j\} \geq \max(T1\ Load\{i,j\}, T1\ Load\{j,i\}) / 1.0$
0 for each pair of LPPs in the network

0 The 1.0 factor represents the engineerable bandwidth of
0 each T1 trunk. The Max function is used to determine
0 which direction is the most limiting.

0 If Enhanced Trunking is not required then the number of
0 trunks assigned between each pair of LPPs should be the
0 minimum number of trunks required to satisfy the rule
0 given above. If Enhanced Trunking is required, then an

0 RELEASE 28.01
0 93 12 03

0 additional trunk should be allocated. If this yields a
0 total of more than 6 T1 trunks between any two LPPs then
0 the trunking load between those two LPPs will need to be
0 spread across multiple trunk groups and each trunk group
0 will need to be assigned a spare trunk.

0 Step 6 - LIU Requirements

0 The purpose of this step is to determine the number of
0 LIUs required by each LPP in the network. This quantity
0 will be defined as follows:

0 $LIU\{i\}$ = the number of LIUs required by LPP 'i'

0 This includes the FRIUs required to meet both the access
0 line and T1 trunking requirements of each LPP. It is
0 calculated as follows:

0 $LIU\{i\} = \text{Access Line}\{i\} + \text{Sum}(j \neq i) \text{ of } (T1 \text{ Trunk}\{i,j\})$

0 Step 7 - FBUS Loading

0 The purpose of this step is determine the total load on
0 the FBUS of each LPP in the network. The load on the
0 FBUS will be defined as follows:

0 $FBUS \text{ Load}\{i\}$ = the total load on the FBUS of LPP 'i'
0 (Mbits per second)

0 The FBUS load calculations are based on the incoming load
0 from both the access lines and T1 trunks. It is calcu-
0 lated as follows:

0 $FBUS \text{ Load}\{i\} = 2 * (\text{Access Load}\{i\} + \text{Sum}(j \neq i) \text{ of } (T1 \text{ Load}\{j,i\}))$

0 The factor of two is included to account for the fact
0 that for both intra LPP traffic and T1 trunking traffic
0 every incoming frame makes two trips across the FBUS. The
0 summation expression adds to the access line load the T1
0 trunking load received from every other LPP in the net-
0 work.

0 Step 8 - Configuration Verification

0 The network has now been completely defined. The purpose
0 of this step is to ensure that the engineering rules have
0 been satisfied. For the current configuration to be ac-
0 ceptable, the following two engineering rules must be
0 satisfied for all the LPPs in the network:

- 0 1) LIU{i} <= 36
0 2) FBUS Load{i} <= 20.8 (Mbits per Second)

0 As in Step 2, the first rule represents the physical lim-
0 its of the LPP frame and the second rule represents the
0 bandwidth limits of a single FBUS.

0 If these engineering rules are satisfied for all the LPPs
0 in the network then the process is complete and the cur-
0 rent network configuration is acceptable. If one or more
0 or the LPPs in the network are found to be in violation
0 of the engineering rules then additional LPPs are re-
0 quired. Specifically, any site with one or more LPPs in
0 violation must add at least one LPP. The process is then
0 restarted at Step 3, the point where the access lines are
0 allocated across the available LPPs, and it continues un-
0 til no LPPs are found to be in violation of the engineer-
0 ing rules.

0 (xviii) DataSPAN Network Engineering Example

0 To illustrate the procedure presented above, this section
0 presents a network engineering example. The sample prob-
0 lem proceeds step by step and demonstrates the iterative
0 nature of the procedure.

0 Step 1 - Network Definition

0 Figure 2-1 shows the example network. In this network
0 there are three sites (labeled A, B and C) with 32, 18
0 and 19 access lines respectively. All 69 access lines
0 are assumed to be channelized access links with a mean
0 busy hour link utilization of 20% (this implies an incom-
0 ing load of 0.27 Mbits/sec per access line).

0 Step 2 - Initial LPP Estimate

0 RELEASE 28.01
0 93 12 03

0 To estimate the number of LPPs required, consider first
0 Site A. The initial estimate of the number of LPPs re-
0 quired must satisfy the following rules:

0 1) Number of LPPs Allocated $\geq 32 / 36 = 0.89$

0 2) Number of LPPs Allocated $\geq 2 * (32 * 0.27) / 20.8 =$
0 0.83

0 Therefore at least one LPP is required at Site A. It
0 might be wise to initially allocate two LPPs at Site A
0 since it is close to needing a second LPP just to satisfy
0 the access line requirements, but, to make the example
0 problem more comprehensive this will not be done.

0 The other two sites are smaller than Site A and therefore
0 will also be allocated one LPP each.

0 Step 3 - Access Lines Allocation

0 Given the initial estimate of one LPP per site, the net-
0 work will contain 3 LPPs and the access line assignments
0 are clear. Based on this information, the table below
0 summarizes the calculation of the required access line
0 data.

0 Sample Problem Access Line Data

0 Table 1

0 Site	0 LPP 0 Index 0 'i'	0 Access 0 Lines 0 {i}	0 Access Load{i} 0 (Mbits per Second)
0 A	0 1	0 32	0 $32 * 0.27 = 8.64$
0 B	0 2	0 18	0 $18 * 0.27 = 4.86$
0 C	0 3	0 19	0 $19 * 0.27 = 5.13$
0 Total	0 3	0 69	0 18.63

0 Step 4 - T1 Trunking Load

0 In this example, it will be assumed that there are no
0 known COIs and the traffic split (the 'Mix' values) will
0 be calculated using the default method discussed in the
0 procedure above. The T1 trunk load values can therefore
0 be calculated as follows:

0 $T1 \text{ Load}\{i,j\} = \text{Access Load}\{i\} * \text{Mix}\{i,j\}$

0 RELEASE 28.01
0 93 12 03

$$\begin{array}{l} 0 \\ 0 \\ 0 \quad T1 \text{ Load}\{i,j\} = \text{Access Load}\{i\} * \frac{\text{Access Load}\{j\}}{\text{Network Access Load}} \\ 0 \end{array}$$

0 For example, consider the T1 trunk load from LPP 1 to LPP
0 2.

$$\begin{array}{l} 0 \quad T1 \text{ Load}\{1,2\} = 8.64 * (4.86 / 18.63) \\ 0 \quad \quad \quad = 2.25 \end{array}$$

0 The table below summarizes the complete set of results.
0 Sample Problem T1 Trunk Load Data
0 (Mbits per Second)

0 Table 2

0 0 Originating 0 LPP 'i'	Terminating LPP 'j'			
	1	2	3	Total
0 1	4.01	2.25	2.38	8.64
0 2	2.25	1.27	1.34	4.86
0 3	2.38	1.34	1.41	5.13
0 Total	8.64	4.86	5.13	18.63

0 Note that by assuming no COIs and using the method for
0 calculating Mix{i,j} outlined above, the trunk load is
0 the same in each direction (i.e T1 Load{i,j} = T1
0 Load{j,i}).

0 Step 5 - T1 Trunking Requirements

0 In this example, it will be assumed that Enhanced Trunk-
0 ing is required. As an example of the T1 trunking calcu-
0 lations, consider the trunking requirements between LPP 1
0 and LPP 2.

$$\begin{array}{l} 0 \quad T1 \text{ Trunks}\{1,2\} \geq \text{Max}(2.25 , 2.25) / 1.0 \\ 0 \quad \quad \quad \geq 2.25 \end{array}$$

0 RELEASE 28.01
0 93 12 03

0 This means that a minimum of 3 trunks are required be-
0 tween LPP 1 and LPP 2 to support the traffic load. Since
0 Enhanced Trunking is required a fourth trunk should be
0 allocated to the trunk group. In a similar manner the
0 rest of the network trunking requirements can be deter-
0 mined. The table below summarizes the complete set of
0 results.

0 Sample Problem T1 Trunking Requirements

0 Table 3

LPP {i}	LPP {j}	T1 Trunks{i,j}
1	2	$\text{Max}(2.25, 2.25) / 1.0 + 1 \leq 3 + 1 = 4$
1	3	$\text{Max}(2.38, 2.38) / 1.0 + 1 \leq 3 + 1 = 4$
2	3	$\text{Max}(1.34, 1.34) / 1.0 + 1 \leq 2 + 1 = 3$

0 Step 6 - LIU Requirements

0 The LIU requirement calculations are summarized in the
0 following table.

0 Sample Problem LIU Requirements

0 Table 4

LPP{i}	LIU{i}
1	$32 + 4 + 4 = 40$
2	$18 + 4 + 3 = 25$
3	$19 + 4 + 3 = 26$

0 Step 7 - FBUS Loading

0 The FBUS loading calculations are summarized in the fol-
0 lowing table.

0 Sample Problem FBUS Loading

RELEASE 28.01
93 12 03

Table 5

LPP{i}	FBUS Load{i} (Mbits per Second)
1	$2 * (8.64 + 2.25 + 2.38) = 26.54$
2	$2 * (4.86 + 2.25 + 1.34) = 16.90$
3	$2 * (5.13 + 2.38 + 1.34) = 17.70$

Step 8 - Configuration Verification

Comparing the data presented in Tables 4 and 5 to the engineering standards reveals that both LPP 2 and LPP 3 meet the engineering requirements and that LPP 1 is in violation of both rules. Since LPP 1 is located at Site A, an additional LPP needs to be allocated at Site A. The process now needs to return to Step 3.

Repeat Step 3 - Access Lines Allocation

With the new estimate of 2 LPPs for Site A, the access lines for this site need to be reallocated. Since there are no known COIs and all 32 access lines have the same assumed traffic level (0.27 Mbits per second), one logical allocation would be to assign each of the Site A LPPs half the access lines (i.e. 16 access lines each). To make the example more general it will be assumed the network planner decides to instead assign 20 links to the one LPP and the remaining 12 links to the other LPP.

Given this information, the table below summarizes the calculation of the required access line data.

Sample Problem Access Line Data

Table 6

Site	LPP Index 'i'	Access Lines {i}	Access Load{i} (Mbits per Second)
A	1	20	$20 * 0.27 = 5.40$
	2	12	$12 * 0.27 = 3.24$
B	3	18	$18 * 0.27 = 4.86$
C	4	19	$19 * 0.27 = 5.13$

0 RELEASE 28.01
0 93 12 03

0
0 Total 4 69 18.63

0 Note that the LPP indexes have changed from the last pass
0 through Step 3. For example the index of the LPP at Site
0 C is now '4' instead of '3'.

0 Repeat Step 4 - T1 Trunking Load

0 Again no COIs will be assumed and the access line traffic
0 will be spread across the entire network using default
0 method for defining the 'Mix' values.

0 For example, consider the T1 trunk load from LPP 1 to LPP
0 2. This is an intra site T1 trunking route, but it is
0 handled in exactly the same manner as inter site T1
0 trunking route.

0
$$\text{T1 Load}\{1,2\} = 5.40 * (3.24 / 18.63)$$

0
$$= 0.94$$

0 The table below summarizes the complete set of results.

0 Sample Problem T1 Trunk Load Data
0 (Mbits per Second)

0 Table 7

Orig. LPP 'i'	Terminating LPP 'j'				
	1	2	3	4	Total
1	1.57	0.94	1.40	1.49	5.40
2	0.94	0.56	0.85	0.89	3.24
3	1.40	0.85	1.27	1.34	4.86
4	1.49	0.89	1.34	1.41	5.13
Total	5.40	3.24	4.86	5.13	18.63

0 Repeat Step 5 - T1 Trunking Requirements

0 Again, it will be assumed that Enhanced Trunking is re-
0 quired. The table below summarizes the T1 trunking re-
0 quirement calculations.

0 Sample Problem T1 Trunking Requirements

0 Table 8

LPP {i}	LPP {j}	T1 Trunks{i,j}
1	2	$\text{Max}(0.94, 0.94) / 1.0 + 1 \leq 1 + 1 = 2$
1	3	$\text{Max}(1.40, 1.40) / 1.0 + 1 \leq 2 + 1 = 3$
1	4	$\text{Max}(1.49, 1.49) / 1.0 + 1 \leq 2 + 1 = 3$
2	3	$\text{Max}(0.85, 0.85) / 1.0 + 1 \leq 1 + 1 = 2$
2	4	$\text{Max}(0.89, 0.89) / 1.0 + 1 \leq 1 + 1 = 2$
3	4	$\text{Max}(1.34, 1.34) / 1.0 + 1 \leq 2 + 1 = 3$

0 Repeat Step 6 - LIU Requirements

0 The new LIU requirement calculations are summarized in
0 the following table.

0 Sample Problem LIU Requirements

0 Table 9

LPP{i}	LIU{i}
1	$20 + 2 + 3 + 3 = 28$
2	$12 + 2 + 2 + 2 = 18$
3	$18 + 3 + 2 + 3 = 26$
4	$19 + 3 + 2 + 3 = 27$

0 Repeat Step 7 - FBUS Loading

0

0 RELEASE 28.01
0 93 12 03

0 The new FBUS loading calculations as summarized in the
0 following table.

0 Sample Problem FBUS Loading

0 Table 10

LPP{i}	FBUS Load{i} (Mbits per Second)
1	$2 * (5.40 + 0.94 + 1.40 + 1.49) = 18.46$
2	$2 * (3.24 + 0.94 + 0.85 + 0.89) = 11.84$
3	$2 * (4.86 + 1.40 + 0.85 + 1.34) = 16.90$
4	$2 * (5.13 + 1.49 + 0.89 + 1.34) = 17.70$

0 Repeat Step 8 - Configuration Verification

0 Comparing the data presented in Tables 9 and 10 to the
0 engineering standards reveals that all four LPPs meet the
0 engineering requirements. This means that this is valid
0 configuration and the engineering process is complete.

0 RELEASE 28.01
0 93 12 03

0 3.0 Service Control Point

0 3.1 Introduction

0 The DMS - Service Control Point (DMS-SCP) is a node in a CCS7
0 network which provides a real-time transactional environment from
0 which to answer database queries. The initial applications which
0 are supported are as follows:

- 0 - 800 Plus Service (800+ in Canada, E008 in Australia. 800+
0 refers to both services unless otherwise specified.)
- 0 - Automated Calling Card Service (ACCS)
- 0 - Billed Number Screening (BNS) (Telecom Canada only)

0 The CCS7 Network is classified in two ways; the FULLY ASSOCIATED
0 NETWORK and the QUASI ASSOCIATED NETWORK. The Fully Associated
0 Network has every Service Switching Point (SSP - End Office) con-
0 nected directly to the SCP(s). The Quasi Associated Network has
0 every SSP connected to the SCP through a Signaling Transfer Point
0 (STP).

0 Figure 315.20: CCS7 Network Classification

0 FULLY ASSOCIATED NETWORK

0 QUASI ASSOCIATED NETWORK

0 There is at least one provisionable CCS7 "F" Link Set from
0 each SSP to each SCP node in the Fully Associated Network. In the
0 Quasi Associated Network, the CCS7 "A" link pairs exists from

0
0 RELEASE 28.01
0 93 12 03

0 each Toll SSP to the corresponding regional STPs and "A" link
0 pairs exist from each SCP to corresponding regional STP pairs.

0 The DMS-SCP network is made up of one SCP Transaction Processors
0 (SCP-TP) and one or two SCP Operations, Administration and Main-
0 tenance (SCP-OAM) machines. The SCP-TP is made up of two (2) DVS
0 cabinet lineups and performs the actual query processing and real
0 time functions by responding to incoming database queries from
0 the network. The SCP-OAM consists of one (1) DVS cabinet lineup.
0 It updates the application databases and handles the OA&M func-
0 tions of the system.

0 The SCP-OAM is capable of handling OA&M functions for up to two
0 SCP-TP machines. In addition, OA&M functions may be distributed
0 over several SCP-OAM machines.

0 Each DMS-SCP site must also be equipped with a "Minisys" software
0 update machine. The Minisys can be used for save and restore of
0 system data, backup tape verification, Master/Slave audit, ETAS
0 Dial-in, and installation of Network Software Release (NSR)/SCP
0 Software updates.

0 RELEASE 28.01
0 93 12 03

0 3.1.1 SCP-TP Hardware Description

0 The SCP-TP architecture is illustrated in figure 2 and is made up
0 of the following components:

- 0 - Link Interface Module (LIM)/Link Peripheral Processor (LPP)
- 0 - Message Switch and Buffer (MSB7) (replaced by the LIM)
- 0 - Data-Voice System (DVS)
- 0 - DMS-Core (Dual Plane Combined Core Cabinet)
- 0 - Speech Link Connector (SLC)
- 0 - Double Shelf Network (DSN)
- 0 - Digital Network Interconnect (DNI)
- 0 - Digital Trunk Controller (DTC) (replaced by the LIM)
- 0 - Input/Output Equipment (IOE)
- 0 - Trunk Module Equipment (TME)
- 0 - Power Distribution Center (PDC)
- 0 - Miscellaneous Equipment (MIS)
- 0 - Maintenance Spares Storage (MSS)
- 0 - Meridian Storage Frame

0 The MSB7 is a dedicated peripheral module responsible for dis-
0 tributing messages between the SCP-TP components and the CCS7
0 network (Message Transfer Part (MTP) signalling message handling
0 and Signalling Connection Control Part (SCCP)). It is provi-
0 sioned with Signalling Terminals (STs) which interface to the
0 CCS7 links. For more information on the MSB7, refer to Message
0 Switch and Buffer in this section.

0 The LIM, which interfaces directly with the DMS SuperNode
0 DMS-BUS, also interfaces CCS7 signalling links. LIMs are to be
0 provided for new jobs and for extensions where the maximum capac-
0 ity of the MSB7-based system is exceeded.

0 For Telecom Australia, V.35 signalling links interface with the
0 LIM through a MUX. Refer to Figure 315.21.

0
0 | Figure 315.21: TELECOM AUSTRALIA SIGNALLING LINKS TO SCP
0 (BCS-30)

0 For more information on the LIM, refer to the section on the Sig-
0 nalling Transfer Point (STP).

0 The TP1 and TP2 lineups are Slave Database modules responsible
0 for database querying, Transaction Capabilities Application Part
0 (TCAP) encoding/decoding, and remote operation server functions.
0 Each TP lineup consists of up to ten cabinets equipped with
0 Shared Resource Units (SRUs), each of which performs a specific
0 hardware function.

0 The DMS SuperNode equipment consists of the DMS-CORE and the
0 DMS-BUS housed in a single cabinet:

0 The DMS-CORE consists of a Computing Module (contains dupli-
0 cated DMS SuperNode CPUs) and System Load Module SLM. It is
0 responsible for the overall control of all components except
0 the TP1 and TP2.

0 The DMS-BUS performs the routing of messages within the
0 SCP-TP.

0 The SLC is a digital cross-connect, connecting the network side
0 of the MSB7, DTC and MTM to the peripheral side of the DSN.

0 The DSN is used to nail-up connections between the DTC and MSB7.
0 It also carries maintenance messages and alarms to and from the
0 MTM, DTC and MSB7.

0 The optional DNI provides a patch cord junctor cross connect fa-
0 cility for the DSNs.

0 The DTC is a dedicated peripheral module which interfaces the
0 CCS7 links to the SCP-TP. In other words, it is responsible for
0 the data link function of the Message Transfer Part (MTP). (The
0 DTC is replaced by the LIM on new jobs or extensions where the
0 maximum capacity of the MSB7-based system is exceeded.)

0 The IOE supports various devices including disk, tape and MAP
0 terminals required to load and operate the DMS SuperNode.

0 The TME houses the MTMs which support service circuits, test fa-
0 cilities and office alarm circuits. The latter facility provides
0 visual and audible indication of trouble conditions in the DMS

0
0 RELEASE 28.01
0 93 12 03

0 equipment. The TME also houses the Alarm Cross-connect Unit
0 (AXU).

0 The PDC houses the interface between the -48V office batteries
0 and the other DMS-SCP frames and equipment.

0 The MIS frame provides rack space for housing modems, DVS Lan
0 Interface Units (LIUs), power inverters and other equipment.

0 The MSS cabinet offers storage space for DMS Supernode spare cir-
0 cuit packs. The Meridian Storage frame offers storage space for
0 the DVS SRU equipment.

0 RELEASE 28.01
0 93 12 03

0 3.1.3 Dual Plane Combined Core (DPCC)

0 (a) General Description

0 The Dual Plane Combined Core Cabinet (DPCC) is a standard
0 DMS-Core configuration consisting of a Computing Module (CM), two
0 Message Switches (MS) (one per plane) and a System Load Module
0 (SLM).

0 Provision the following equipment as required for SCP applica-
0 tion. Provide additional equipment as detailed in Section 3.9
0 DMS Supernode and Network Subsystems.

0 (b) Reference

0 Chapter 3, Section 3.9 DMS Supernode and Network Subsystems

0 (c) Provisioning Considerations:

0 (i) One (1) DPCC is required per SCP-TP configuration. Note
0 that combined CCS7 products are not currently supported.
0 Thus, DMS-SCP requires its own dedicated DPCC.

0 PER UNIT COMPONENT CAPACITY:

0 Each DMS-BUS: 9,000 Q/S
0 Each DMS-CORE: 200 Q/S (Combined 800+/ACCS/BNS)
0 180 Q/S (ACCS/BNS)
0 225 Q/S (800+)

0 (ii) The provisionable circuit packs for the DMS-BUS are the
0 number of 4-Port cards (NT9X17AA) and associated paddle
0 boards (NT9X23AA). In addition to the always provided
0 number of NT9X17AA cards, the following equation should
0 be used to calculate the number of NT9X17AA and NT9X23AA
0 to provision the MS for DMS-SCP:

0
$$\#NT9X17AA = \#NT9X23AA = \# \text{ Network Modules (NM)} / 4$$

0
$$+ \# \text{ IOCs} / 4$$

0
$$+ \# \text{ DS-30 SRUs} / 4$$

0 (Rounded up to the next integral number)
0 (Note: NM is a single plane)

0 Note: The DS-30 SRU is a Data Voice System component.

0
0 RELEASE 28.01
0 93 12 03

0 (iii) If the DMS Synchronizable Clock / Stratum II is employed
0 in the DMS-SCP system, related equipment must be provi-
0 sioned on the IOE (see Input/Output Equipment Frame sec-
0 tion below).

0 (iv) Refer to Section 3.9 for more details on DMS SuperNode
0 Provisioning.

0 3.1.4 Link Interface Module0 (a) General Description

0 The Link Interface Module (LIM) houses the individual Link Inter-
0 face Units (LIU7s) and the Local Message Switch (LMS). It is
0 also referred to as the Link Peripheral Processor (LPP).

0 (b) Reference

0 None.

0 (c) Provisioning Considerations:

0 (i) The number of LIU7s required is based on the query rate
0 and length of CCS7 query messages.

$$\begin{array}{l} 0 \qquad \qquad \qquad \text{Total HDBH Query Traffic} \quad \text{(Round up to} \\ 0 \quad \# \text{ LIU7} = \frac{\qquad \qquad \qquad}{\text{LIU7 Capacity at 0.4 Erlangs}} \quad \text{the next} \\ 0 \qquad \qquad \qquad \qquad \qquad \qquad \qquad \text{even integer)} \end{array}$$

0 Where:

0 Total HDBH Query Traffic is taken at the SCP for
0 Quasi Associated Networks; at the SSP for Fully Asso-
0 ciated Networks.

$$\begin{array}{l} 0 \qquad \qquad \qquad \qquad \qquad \qquad \text{Data} \\ 0 \quad \text{LIU7} \quad \quad \quad 0.4 \text{ Erlangs} \times \text{Transmission Rate} \times 2 \\ 0 \quad \text{Capacity} = \frac{\qquad \qquad \qquad}{\qquad \qquad \qquad} \\ 0 \qquad \qquad \qquad \# \text{ of bits/Octect} \times \text{message} \times \text{msgs/query} \\ 0 \qquad \qquad \qquad \qquad \qquad \qquad \text{length} \end{array}$$

0 2 is due to a full duplex link

0 # of bits/Octect = 8 bits

0 Typical SS7 message lengths:

0 800+ Applications: 100 Octets

0 ACCS/BNS Applications: 130 Octets

0 # of messages per query for 800+/ACCS/BNS = 2

0 The calculation above represents the number of LIU7s
0 assigned to the SCP in the Quasi Associated Networks;
0 the number of LIU7s assigned to an SSP in the Fully
0 Associated Network.

0
0 RELEASE 28.01
0 93 12 03

- 0 (ii) The number of links in a Linkset is 1/2 the total number
0 of LIU7s (as calculated in the formula above).
- 0 (iii) A LIM can hold 24 or 36 LIU7s. Refer to Link Interface
0 Module of the Signal Transfer Point (above) for more LIM
0 engineering information.
- 0 (iv) The LIMs are to be provided instead of the DTC and MSB7
0 for new jobs and for extensions where the maximum capac-
0 ity of the MSB7-based system is exceeded.

0 3.1.5 Input/Output Equipment Frame

0 (a) General Description

0 The Input/Output Equipment Frame (NT0X43AD) is the standard
0 DMS-100 IOE frame. It is equipped with a disk drive, mag tape
0 drive plus some additional I/O terminal controller cards to
0 interface printers/VDUs etc.

0 (b) Reference

0 Chapter 3, Section 3.6 Input/Output

0 (c) Provisioning Considerations:

0 (i) Provide Input/Output Equipment (IOE) as required. Refer
0 to Section 3.6 for more provisioning information for the
0 IOE.

0 (ii) Two IOCs per SCP-TP are required along with their associ-
0 ated disk, tape and terminal requirements. If Stratum
0 clock synchronization (Stratum II or Stratum 2.5) is re-
0 quired for the DMS-SCP, a Remote Oscillator Shelf and as-
0 sociated circuit packs are required. Refer to the
0 Input/Output Equipment Frame of the Signalling Transfer
0 Point (above) for more information.

0 3.1.7 Double Shelf Network Equipment

0 (a) General Description

0 A Double Shelf Network Equipment (DSNE) frame (NT8X10AA) will be
0 equipped with one (1) duplicated network (one network module per
0 plane) to interface the MTM shelves to the Enhanced Core Message
0 Switch.

0 (b) Reference

0 Chapter 3, Section 3.9 DMS Supernode and Network Subsystems

0 (c) Provisioning Considerations:

0 (i) Provide one Double Shelf Network (DSN) for every two (2)
0 MSB7s provisioned; that is,

$$\begin{array}{l} \text{\# of NM units (DSN)} = \frac{\text{No. of MSB7s}}{2} \text{ or } \frac{\text{Traffic Load}}{45 \text{ Q/S}} \end{array}$$

0 (which ever is greater)
0 (round up to the next integer)

0 Where:

0 45 Q/S is the Component Capacity.

0 Allocation of messaging links must be spread across the
0 four network subgroups; that is, the 4 links from every
0 two MSB7s must connect one to each of the 4 network sub-
0 groups.

0 (ii) Refer to Section 3.9 for provisioning rules for the DSN.
0 Depending on the number of network modules provided, a
0 Digital Network Interconnect (DNI) frame may also be re-
0 quired.

0 (iii) Speech Link Connector (SLC) Frame

0 Provide Speech Link Connector (SLC) frames as required.
0 Depending on the number of peripheral-side links it is
0 usual to provide the single-bay Speech Link Connector
0 Combined (SLCC) frame. Refer to Engineering Manual Sec-

0
0 RELEASE 28.01
0 93 12 03

0 tion EMA3-02-000 for provisioning information for the
0 SLC/SLCC.

0 3.1.8 Data Voice System Equipment

0 (a) General Description

0 The DVS portion of an DMS-SCP is a standard DVS (Data Voice Sys-
0 tem) hardware configuration with disk, tape, printer, terminal
0 services and communications links. Figure 315.19 illustrates the
0 configuration of a typical DMS-SCP for QUASI Associated CCS7 Net-
0 work.

0 The computing power of an DMS-SCP is contained in the various Ap-
0 plication Processor (AP) System Resource Units (SRU's). Each of
0 these contains a processor and memory and is loaded with a number
0 of Program Resource Units (PRU's) to execute the required func-
0 tions.

0 Service Orders to update a database are inputted at an SCP-OAM.
0 Service Orders are additions, changes, and deletions to an Appli-
0 cation Database. Updates to the databases are done in two (2)
0 ways; Deferred Transaction and Immediate Transaction.

0 Deferred Transaction carries out the Service Orders (SO) at a
0 specified low traffic time. The SOs are grouped together in an
0 Update File in the SCP-OAM and sent to the TP ahead of designated
0 time. At the designated time, both the SCP-OAM and the TPs up-
0 date their databases.

0 Through Immediate Transactions, the databases are updated imme-
0 diately (in 15 minutes) by sending transactions to the RAM of the
0 DS-30 SRUs. At the next designated update, the transactions in
0 RAM are applied to the databases stored in hard disks.

0 Service Orders are entered via terminals. Bulk input is done
0 through a 9-Track Tape format or a Remote File Transfer (RTF)
0 interface (which is used to transfer batch files from a remote
0 host).

(b) Reference

0 RELEASE 28.01
0 93 12 03

0 NTP 450-1061-101 DMS-SCP General Description

0 (c) Provisioning Considerations:

0 (i) Refer to NTP 450-1061-101 DMS - Service Control Point
0 General Description for information on the DVS equipment.

0 (ii) BIX Cross-Connect Panel

0 The BIX Cross-Connect Panel A0332547 is a self-contained
0 wall mounted cross-connect system that is required by the
0 DVS for connections to stand-alone equipment. It is
0 equipped with five 50-pin teledapt connectors across the
0 top allowing termination of up to five (5) LANLINK or
0 Datanet SRUs; one SRU per connector. Inputs are required
0 for the Datanet SRU's in order to connect the Local
0 Datanet link between TP1 and TP2. Below this there are
0 five panels which will each accept 12 teledapt connec-
0 tors. Each panel is associated with one of the five
0 50-pin connectors on the top row. Thus 12 ports for each
0 of the five (5) LANLinks (max) for a maximum of 60 ports.

0 (iii) Miscellaneous Equipment Frame

0 Provide as required for housing modems, LIUs, power
0 inverters and BIX panels. The LIUs are to be oriented
0 vertically on standard NT3X25AA Common Equipment Shelves
0 (maximum 5 LIUs per shelf). LIUs are to be powered from
0 protected AC via an inverter unit.

0 (iv) Maintenance Spares Storage

0 Provide NT1M40AN (A0363241) Meridian Storage Frame for
0 storage of spare DVS SRUs. The Meridian Storage Frame is
0 to be equipped with doors and end panels, and can house
0 up to 40 1/4 SRUs.

0

0

0

0

The Link Interface Module (LIM) was initially introduced as a 24-Link Cabinet. However, the 36-Link Cabinet was later introduced as the standard LIM offering. The two cabinets are shown below in Figure 1:

Figure 1: LIM Cabinets

0 RELEASE 28.01
0 93 12 03

0 The upper shelf of the LIM (Sh 39) contains the duplicated load-
0 sharing Local Message Switch (LMS). The LMS connects to the
0 DMS-BUS using DS-30 for maintenance and administration, and for
0 inter-LIM communication.

0 The lower three shelves of the LIM (Sh 26,13,00) contain the Ap-
0 plication Specific Units (ASUs). An FBUS is cabled from the LMS
0 shelf to the three ASU shelves and provides the path for messages
0 to/from the various ASUs.

0 The Channelized Access ASUs (NIUs) are unique among ASUs as there
0 are only two places in shelf positions 26, 13 and 00 where they
0 can be mounted.
0 The left NIU mounts in circuit pack position 17, for a 24 link
0 frame and circuit pack position 18 for a 36 link frame.
0 The right NIU mounts in circuit pack position 20, for 24 and 36
0 link frames.

0 Examples of ASUs are LIU7, EIU, FRIU, XLIU and NIU. The 24-Link
0 Cabinet holds a maximum of 24 ASUs, and the 36-Link Cabinet holds
0 a maximum of 36 ASUs.

0 4.1 HARDWARE PROVISIONING

0

0 4.1.1 HARDWARE USAGE RESTRICTIONS

0

0 Hardware Usage Restrictions for STP

0

0 Not applicable.

0

0

0
0 RELEASE 28.01
0 93 12 03

0 Hardware Usage Restrictions for SSP/SEP

0
0 The LIM can be provisioned into an office which already contains
0 MS7E frames, subject to the dependencies described in the next
0 section. However, the concurrent use of MSB7s and LIMs will not
0 be supported over BCS upgrades. All CCS7 links assigned to MSB7s
0 must be moved over to LIMs during the same BCS, and the MS7E
0 frames set to an inactive state and/or removed.

0 Hardware Usage Restrictions for EIU

0
0 Not Applicable

0 Hardware Usage Restrictions for MDR7

0
0 For the initial (BCS31 and BCS32) MDR7 offering, only one pair of
0 EtherNet Interface Units and a single Store and Forward Processor
0 are supported. Each EIU pair supports a distinct set of LIU7s
0 which are determined by datafill.

0 Hardware Usage Restrictions for FRIU

0
0 The DMS-100 switch must be a Supernode and be equipped with an
0 LIM(LPP). If Frame Relay Services via DATAPATH lines is required,
0 the switch must also be equipped with DATAPATH and any network
0 upgrades required by that product.
0
0 BCS 32 Frame Relay Services must use LIM(LPP) dedicated to FRIU.

0 RELEASE 28.01
0 93 12 03

0 The FRIU may co-exist on the LIM(LPP) with other ASU such as the
0 LIU7 and the EIU in BCS 33 and beyond subject to engineering
0 rules to be specified later. FRIU shall not be mounted on an LPP
0 in an STP only office.

0 Since each power supply serves six FRIUs, FRIUs should be added
0 to the LPP so that they are spread as evenly as possible across
0 the six power supplies (or half shelves). In addition, no more
0 than one trunk in a trunk group should be served by any single
0 power supply. With Enhanced Trunking this will ensure that a sin-
0 gle power supply failure does not simultaneously disable both the
0 primary and secondary route of an LLC.

0 56 Kbs DataSPAN access channels cannot be combined with 384 Kbs
0 access channels on a T1 span. 384 Kbs channels on a T1 span can-
0 not be concatenated to form larger bandwidth DataSPAN access
0 channels.

0 The NTEX22BB/NTEX31BA FRIU must replace the NTEX22AA/ NTEX31AA at
0 BCS 34 and beyond. The NTEX22BB/NTEX31BA is not backwards compat-
0 ible with the NTEX22AA/NTEX31AA.

0 The LSSGR (TR-TSY-000509), Section 9.1.2.4, states that no single
0 hardware fault should cause a loss of service to groups of more
0 than 64 switching network terminations. If this criteria is ap-
0 plied to the DataSPAN application, this means that no power sup-
0 ply should control the availability of more than 64 access
0 channels. (All other shared components of the system are dupli-
0 cated.)

0 Hardware Usage Restrictions for DMS-PH

0
0 Each DMS Switch can have a MAXIMUM of eleven (11) XLIUs,
0 X.25/X.75 Link Interface Unit.

0

0

0

0
0 RELEASE 28.01
0 93 12 03

0 Hardware Usage Restrictions for NIU

0
0 NIUs can be provisioned on the 3-slot LIU LIM cabinet (9X70AA) or
0 the 2-slot LIU LIM cabinet (9X70BA).
0 Two (2) NIUs must be provided for each LIS shelf requiring
0 channelized access.
0 The two NIUs must occupy the two central ASU positions in each
0 LIS shelf.

0 The NTEX22AA (4 Meg) Integrated Processor and FBUS Interface Card
0 cannot be used for NIU applications.
0 The NTEX22BB (8 Meg Enhanced) circuit pack must be used for NIU
0 applications.
0 The reason for this restriction is that the NIU software load ex-
0 ceeds 4 Meg of memory, hence the 8 meg circuit pack must be used
0 to provide sufficient memory for the NIU application.

0 Hardware Usage Restrictions for SEP

0
0 SEP utilizes only the LIM/LPP, making conversion from MSB7 equip-
0 ment not applicable. When used for SEP, the LIU7 cardset includes
0 the NT9X76CA in place of the NT9X76AA. The SEP always utilizes
0 Channelized Access (NIU) as the interface to the LIU7.

0 All restrictions for NIU as documented in section 2.2.7 are ap-
0 plicable, with the following exceptions:

- 0 - SEP utilizes only NT9X70BA and newer vintage LPP cabinets.

0 DISCRIMINATION NUMBERING

0

0 Hardware Dependencies for STP

0

0 Timing reference for the STP LIM can be referenced to an ex-
0 ternal, customer-provided Timing Service Generator (TSG) or Sig-
0 nal Reference Distribution (SRD) system. Cabling to the TSG/SRD
0 is documented in CA0X06. Maximum distance from the LMS shelf to
0 the TSG/SRD is 457 meters (1500 feet).

0 Interconnection to the TSG/SRD should be engineered to ensure
0 minimum impact on the operation of the LIM if there are failures
0 in the TSG/SRD unit. For example, when there is more than one
0 output port card available on the TSG/SRD, the link from each LMS
0 plane (LMS 0 and LMS 1) should be assigned to a different port
0 card.

0

0 RELEASE 28.01
0 93 12 03

0 The TSG should be located in or near the channel bank. Each Tim-
0 ing Output Card provides ten (10) ports. The following TSG equip-
0 ment is required and should be supplied by the telco:

0 Description	Part Number
0 -----	-----
0 DCD-400 Shelf Assembly	990-40000-01
0 Fuse & Alarm Card	990-40014-01
0 Clock Input Card	990-40010-01
0 Stratum 3 Clock	990-40013-01
0 Timing Output Card	990-40011-01
0 Timing Output Card (Hot Spare)	990-40011-01
0 Matrix Control Card	990-40015-01

0 (Equipment manufactured by Telecom Solutions.)

0 Hardware Dependencies for SSP/SEP

0

0 The LIM can only be provisioned into a Supernode-based SSP/SEP.
0 Offices equipped with the NT40 core can only use MS7E peripherals
0 for CCS7 applications.

0 It is necessary to synchronize all equipment to which signaling
0 links are interfaced, in order that the position of the bits in
0 the digital data stream can be recovered.

0 In the special case in which all LIU7s in a LIM are equipped with
0 V.35 Interface Paddleboards; that is, all links employ V.35 pro-
0 tocol, then there is no need for external timing. The timing
0 signal for V.35 is imbedded in the protocol.

0 However, where DS0 interfaces are employed, a master timing ref-
0 erence is required. Typical equipment in a DMS office using DS0
0 interfaces includes:

- 0 - LIU7s on LIMs,
- 0 - Channel banks with data services,
- 0 - DS0A Interface CP on DTCs.

0

0
0 RELEASE 28.01
0 93 12 03

0 The preferred method is to use a Timing Supply Generator (TSG),
0 also known as Signal Reference Distribution (SRD), which supplies
0 all equipment with the required timing signal. For reliability,
0 the components of the TSG are fully duplicated with hot standby
0 capability. In an SSP/SP office, the TSG can be an inexpensive
0 type, of low Stratum standard, without impacting reliability of
0 the CCS7 links. The Stratum standard of the TSG does not have to
0 agree with the Stratum standard of the SSP/SP office. The TSG is
0 to be supplied by the telco.

0 For synchronization of the LIM, each NT9X78AA DS0A Paddleboard
0 (PB) can be interfaced individually to the TSG, or timing can be
0 supplied to the LMS for distribution to all LIU7s in the LIM.
0 LIU7s equipped with NT9X78BA Enhanced DS0A Paddleboards do not
0 have individual timing inputs; timing for this type of PB must be
0 distributed via the LMS.
0 The NT9X78CA requires BCS33 and higher software.

0 Where channel banks are used to interface signaling links to DS1
0 facilities, the channel banks and the LIM can both be timed from
0 the same TSG. The office may have existing channel banks with
0 spare channels that could be used for signaling links. Primary
0 and secondary timing references for the TSG should be derived
0 from the same DS1s that carry the signaling links.

0

0

RELEASE 28.01
93 12 03

Figure 2: Timing Supply - LIM and Channel Banks

Alternatively, the internal Timing Supply Unit (TSU) card on the channel banks could be used as the timing reference, thus eliminating the need for an external TSG. This configuration has limited application since a maximum of two LIU7s can be equipped. Timing must be interfaced directly from the two channel banks to the two DS0A Interface PBs. Only NT9X78AA type paddleboards can be used. It is not permissible to route the timing to the LMS and feed more than two LIU7s, because timing from the two channel banks will be out of phase, and two timing references are required for reliability.

It is not permitted to synchronize the LIU7s from the timing output of DTC DS0A Interface CPs. This output is present for lab test purposes only. Should a failure occur in this configura-

0 RELEASE 28.01
0 93 12 03

0 tion, there would be no way to associate it at the MAP with a
0 CCS7 link failure.

0 Hardware Dependencies for EIU

0
0 Not Applicable

0 Hardware Dependencies for MDR7

0
0 MDR7 requires the use of the Ethernet Interface Unit mounted on a
0 Link Interface Shelf in a Link Interface Module (LIM) frame. The
0 EIU requires a cable (NT9X0190) to the bulkhead and cabling from
0 the bulkhead to the customer-provided Attachment Unit. This cabl-
0 ing is available for standard cable duct applications or for
0 raised- floor/HVAC ductwork applications.

0 Either two or three slot EIUs may be used for MDR7.

0 Hardware Dependencies for FRIU

0
0 The FRIU on the LIM(LPP) for FRS channel access for BCS 33 or
0 earlier includes the NTEX22AA IPF, NTEX31AA FRAP and NTEX30AA
0 T1PB.

0 The FRIU on the LIM(LPP) for FRS channel access for BCS 34 or
0 later includes the NTEX22BB IPF, NTEX31BA EFRAP and NTEX30AA
0 T1PB.

0 LIS shelves on LPP frames equipped with FRIU(s) must be equipped
0 with NT9X74DA FBUS/CBUS I/F CP.

0 Hardware Dependencies for NIU

0
0 The DMS-BUS at the Central Office host site that is connected to
0 the LPP that requires channelized access, must be configured with
0 at least two (2) Inter-Message Switch Links (IMSLs).

0 Refer to NTP297-1001-451, Table MSILINV for datafill provisioning
0 guidelines.

0 Refer to ECM-626, DMS Core or ECM-632, SuperNode SE for provi-
0 sioning information related to the Inter-Message Switch Links
0 (IMSLs).
0 Inter-Message Switch links are provisioned in a different manner
0 on a standard SuperNode versus SuperNode SE.

0 Hardware Dependencies for SEP

0
0 All dependencies for SSP/SP as documented in section 2.3.2 are
0 applicable, with the following exceptions:

- 0 - SEP applies to Supernode offices only.
- 0 - SEP utilizes Channelized Access (NIU) interface only.

0 All dependencies for NIU as documented in section 2.3.7 are ap-
0 plicable.

0 In addition, the following requirement must be met:

- 0 - SEP always utilizes PCM30 type CCS7 trunks (voice
0 channels), which must have NT6X70AA Continuity Tone
0 Detector CP's equipped in the trunk peripherals.

0

0 The individual SDLs terminate at the Link Interface Unit (LIU7).
0 One (1) LIU7 will support one (1) SDL.

0 To support the signalling links, provisionable interface
0 paddleboards are required. There are two types of paddleboards,
0 one to interface V.35-protocol signalling links, the other to
0 interface DS0A-protocol signalling links. The two types may be
0 mixed within the LIS.

0 The NT9X77AA V.35 Interface Paddleboard supports one V.35 signal-
0 ling link. It can operate at the full V.35 rate (56 kbit/s) or
0 at the following subrate speeds: 2.4, 4.8, 9.6 and 19.2 kbit/s.
0 Optional software is required for subrate operation (see Software
0 Packages). V.35 Data Sets, if required, are to be furnished by
0 the customer for this application.

0 The NT9X78AA DS0A Interface Paddleboard supports one DS0A signal-
0 ling link.

0 The NT9X78BA Enhanced DS0A Interface Paddleboard supports one
0 DS0A signalling link. It is enhanced from the NT9X78AA
0 paddleboard by the addition of DS0A loopback and BERT capabili-
0 ties for testing purposes.

0 The NT9X78CA Enhanced DS0A Interface Paddleboard supports one
0 DS0A signalling link. It provides all the capabilities of the
0 NT9X78BA plus the added feature of 56 kb/s and 64 kb/s trans-
0 mission rates. The NT9X78BA and NT9X78AA only support a single
0 transmission rate of 56 kb/s.

0 The NT9X78CA paddleboard works for International Applications at
0 64Kbs. If the NT9X78CA is ordered for domestic applications, it
0 can be datafiled as a NT9X78BA and does function, but it cannot
0 provide 64Kbs rates for the domestic application.

0 The NT9X78CA requires BCS33 and higher software along with the
0 software package:

0 NTXN19AA - LIU7 for LPP Based CCS7 Applications.

0 The External Composite Clock Terminator included in the NT9X78AA
0 CP was removed in the NT9X78BA. Provision this paddleboard only
0 when interfacing a DS0A signalling link and when Enhanced Mainte-
0 nance feature is required (BCS28 or higher). Otherwise, provision
0 NT9X78AA.

0

0

0 RELEASE 28.01
0 93 12 03

0 C-Link Provisioning

0 C-Links are the provisioned signalling links between mated STP
0 pairs. A minimum of two links must be provisioned and assigned as
0 follows:

0 If there are two or more LIM cabinets in an office, the C-Links
0 should be assigned to different cabinets for reliability.

0 If there is only one LIM cabinet in the office, the two C-Links
0 should be assigned to a different LIS and assigned to different
0 halves of the shelf because the two halves are powered from dif-
0 ferent feeds.

0 In some situations it may be necessary to provision more than two
0 links. Enough links should be provisioned to carry all of the
0 traffic between the two largest nodes attached to the STP. In the
0 event of a multiple link failure, the C-Links would be required
0 to support this traffic.

0 Service Switching Pt (SSP)/Signaling Pt (SP)

0
0 The LIM cabinet was introduced to support CCS7 signaling links
0 only in Signal Transfer Point (STP) offices initially. At a Ser-
0 vice Switching Point (SSP) or Signaling Point (SP) end office,
0 trunk peripherals were provisioned to interface the signaling
0 links, and MS7E frames were provisioned to perform message hand-
0 ling functions. This configuration is illustrated in Figure 4.
0 Note the requirement for nailed connections through the network
0 between the MSB7 and trunk peripherals, thus consuming network
0 capacity. As well, additional hardware (LTC, DTC or DCM ports)
0 are required to interface the signaling links. The MSB7 is the
0 limiting component in CCS7 messaging capacity.

0

0

0

RELEASE 28.01
93 12 03

In BCS30, software is introduced which allows the LIM to interface CCS7 signaling links in an SSP/SP office. This configuration is illustrated in Figure 5. With a junctored network, ISUP call processing messages from the LIM are routed via the MS and "bounced" off the Computing Module, then through the network to the DTC. In Enhanced Network (E-Net) applications, messages bypass the CM and are routed directly through the Message Switch.

Figure 5: CCS7 Architecture with LIM in SSP/SP

LIM hardware provisioning is the same as for STP applications. This section discusses the provisioning of signaling links and multiple LIM cabinets at the SSP/SP office.

RELEASE 28.01
93 12 03

The CCS7 Network is classified in two ways; the FULLY ASSOCIATED NETWORK and the QUASI ASSOCIATED NETWORK. The Fully Associated Network has every Service Switching Point (SSP - End Office) connected directly to the other SSPs. In this mode, the links are called F-links. The number of F-links is equal to $n(n-1)$; where n = number of SSP nodes. The Quasi Associated Network has every SSP connected to other SSP through a Signaling Transfer Point (STP). In this case, the STPs serve as the hub for the signaling networks. The STP is configured in mated pairs. An SSP/SP is connected to the Home STP pair with A-links. The number of A-links is equal to $2n$; where n = number of SSP nodes. The SSP may also be connected to a Remote STP pair by E-links. Typically for SSP/SPs, it is the A or E links that are provisioned based on traffic figures.

QUASI-ASSOCIATED SIGNALING

FULLY-ASSOCIATED SIGNALING

Figure 6: CCS7 SIGNALING METHODS

0
0 RELEASE 28.01
0 93 12 03

0

0 Provision LIM cabinets and LIU7s as required to support the cal-
0 culated quantity of links based on Traffic Provisioning.

0 In the case where the minimum of 2 signaling links is connected
0 to another node, for reliability they will be assigned to differ-
0 ent channel banks and different DS1 facilities.

0 The Ethernet Interface Unit (EIU) acts as a "gateway" between the
0 DMS-BUS and an Ethernet LAN supporting user data links. It acts
0 as a concentration point between the peripherals (terminals and
0 modems) and the DMS-BUS. The actual peripherals are not termi-
0 nated on this unit, but on remote concentrators. These remote
0 peripherals allow connection of HDLC (X.25, etc.) and asynchro-
0 nous (MAP terminals, printers, etc.) terminal equipment to the
0 system. The Ethernet also provides a linkage between DMS and
0 workstations used for attached processing. Future versions of
0 the EIU will provide standard synchronous and asynchronous inter-
0 faces directly on the switch.

0 One of the main components of the STP is a Link Interface Module
0 (LIM) Cabinet. An LIM cabinet containing an EIU is deployed in a
0 DMS SuperNode to establish Ethernet connectivity. Provisioning
0 of EIUs is application dependent. That is, the quantities re-
0 quired and their configuration is determined by a combination of
0 product, software, and traffic engineering criteria.

0 Each EIU will support one (1) Ethernet communications link
0 (port).

0 The EIU consists of a three-card slot entity on the 24-Link Cabi-
0 net, and a two-card slot entity on the 36-Link Cabinet.

0 The three-card slot EIU entity consists of the following:

0 Integrated Processor and FBUS Interface CP
0 Ethernet Interface CP
0 Filler Face Plate
0 Ethernet Access Unit Interface PB

0 The two-card slot EIU entity consists of the following:

0 Integrated Processor and FBUS Interface CP
0 Ethernet Interface CP
0 Ethernet Access Unit Interface PB

0 The Ethernet Interface CP will support one (1) Ethernet communi-
0 cations link.

0 The EIU Paddleboard is the physical interface to the Ethernet
0 system. It is a 25-pin D-type connector that provides the inter-
0 face between the Ethernet controller and the Media Access Unit
0 (MAU).

0 RELEASE 28.01
0 93 12 03
0

0
0 There is an industry standard 15 pin AUI connector located at the
0 LIS Bulkhead. This is a generic interface and is supported as an
0 industry standard (IEEE 802.3 10BASE5 implementation). Note that
0 this interface is compatible with ALL implementations of Ethernet
0 through external equipment.

0 For each EIU, one (1) Ethernet Cable Assembly is required to ca-
0 ble from each EIU Paddleboard to the LIS Bulkhead. The Ethernet
0 Cable Assembly is a cable with a 25 pin connector at one end and
0 a 15 pin connector at the other end. It cables from the EIU
0 Paddleboard to the LIS Bulkhead.

0 If EIUs are to be mounted on the 24-Link Cabinet, one (1)
0 NT9X70AZ Product Change Kit for LIS Retrofit is required per
0 24-Link Cabinet. This will provide the proper bulkheads (on each
0 LIS shelf) which will be compatible with the 15-pin D-type con-
0 nector.

0 Data Assignment Of Ethernet Addresses

0 One area of unique datafill pertains to the EIU. By industry
0 convention, Ethernet addresses are to be unique everywhere. For
0 this reason, a 48 bit number is used. It is divided into several
0 fields to identify manufacturers and individual units. In typical
0 workstation applications, the Ethernet address is burned into a
0 PROM device on the interface circuit pack.

0 Datafill restricts the datafill of data table LIUINV to up to
0 four (4) EIUs per SuperNode.

0 Data Engineering Process (Northern Telecom Department S642,
0 Bramalea) is responsible for providing and distributing all
0 global EIU ethernet addresses.

0 For information on datafilling ethernet addresses and other
0 ethernet related datafill on the SuperNode, reference:

0 Message Detail Recording (MDR7)

0
0 The delivery of advanced network services often requires the
0 interaction of multiple CCS7 networks and the use of resources
0 owned by several telephone operating companies and/or their cus-
0 tomers. As a conduit for internetwork CCS7 traffic, the DMS-STP
0 provides a centralized location for the collection of statistical
0 information that can be used for usage sensitive CCS7 services.

0 The CCS7 Message Detail Recording feature allows the telco to
0 capture the detailed CCS7 message signaling units (MSUs) being
0 transported in the CCS7 network. Information provided by this
0 feature in turn supplies the data that allows recording of ser-
0 vices or allocations of resources among the networks that inter-
0 work to deliver advanced network services.

0 MDR7 uses the DMS-STP Gateway Screening feature (NTX840AA is a
0 prerequisite) to identify which messages are to be tracked. The
0 feature then takes a snapshot of the MTP, SCCP, and TCAP (or
0 ISUP) of the CCS7 message and sends the snapshot across the
0 DMS-Bus to the appropriate EtherNet Interface Unit (EIU), a
0 68020-based IEEE 802.3 interface card that resides in the LPP
0 cabinet. The EIU routes the snapshot over an EtherNet LAN to a
0 customer-provided store-and-forward processor (SFP), where it is
0 processed as required and then forwarded to the customer's
0 mainframe computer. Refer to the EIU Section for EIU provisioning
0 information.

0 The physical interface to the Ethernet system is the NT9X85AA
0 Ethernet Access Unit Interface which provides the interface be-
0 tween the Ethernet controller and the Media Access Unit. This
0 interface is compatible with all implementations of Ethernet
0 through external equipment.

0 RELEASE 28.01
0 93 12 03

0 Frame Relay Interface Unit (FRIU)

0
0 Refer to section 1.4 for abbreviation definitions.

0 The Frame Relay Service (FRS) is a new high speed, connection
0 oriented, switched packet data service. DATASPAN is the Northern
0 Telecom trade name for this service.

0 Customers may use Frame Relay Service to transfer data in
0 packetized format from one location to another via a Datapath
0 connection, a DDS (Digital Datapath Service) channel, or from a
0 LAN via a T1 line.

0 Datapath is a Northern Telecom feature on the DMS 100 or DMS 250
0 providing dial-up data circuits operating at 56 kbps. DDS is an
0 AT&T developed private line digital data service operating at 56
0 kbps. Token Ring and Ethernet are types of LAN (local area net-
0 works) for connecting computer peripherals together. All these
0 types of data services can now be connected using Frame Relay
0 Service to transmit and receive data.

0 Figure 8 shows the connections of these type services to a
0 DMS-100. A Datapath subscriber is connected through the DMS
0 switching network to a FRS access channel as shown in Figure 10.
0 DDS subscribers must be multiplexed on to a T1 line which can be
0 connected directly to a FRS access channel. A LAN can be con-
0 nected via a non-channelized T1 line directly to a FRS access
0 channel.

0 Figure 9 shows the connections of these type services to a
0 DMS-250. Datapath subscribers access channels would terminate on
0 a DTC for switching through the DMS network to a FRS access chan-
0 nel. DDS and LAN access are the same as for the DMS-100.

0 FRS is available on the DMS-100 LEC (Local Exchange Carrier) and
0 the DMS-250 IEC (Inter Exchange Carrier) from BCS 32 and beyond.

0 An FRS subscriber is connected to the frame relay switch via an
0 access channel on which multiple logical link connections (LLC)
0 to a number of other subscribers may exist. Each logical link
0 connection operates independently of other logical links on the
0 access channel.

0 The types of connection allowed are:

0 RELEASE 28.01
0 93 12 03

0 * Private - Customer FRS agent (logical link) to another FRS
0 agent owned by the same customer.

0 * Non-private - Customer FRS agent to another FRS agent owned by
0 a different customer.

0 Each logical link permits a full duplex exchange of frames and
0 the order of frames is preserved in each direction. FRS limits
0 the maximum frame size to 1600 bytes.

0 The initial release of FRS supports only permanent logical link
0 connections (PLLC) which are set up at Telco subscription time.
0 The throughput on a single logical link connection can be in ex-
0 cess of 1 megabit/second with an internal switch one way transit
0 delay less than 3 ms. The three access channel speeds supported
0 in the initial release are :

0 * 56 kbps over DATAPATH and DDS circuits.

0 * 1.344 Mbps SF over T1 line (non-channelized) circuits

0 * 1.536 Mbps ESF over T1 line (non-channelized) circuits

0 DATAPATH Support: DATAPATH provides access via a local loop, a
0 DMS remote peripheral, or a D4 channel bank. DATAPATH uses the
0 DMS hotline feature to automatically connect the DTE to the frame
0 relay service when the DTE comes on line. Only 56 kbps rates will
0 be supported. T-link sub-rate encoding is not supported. The cus-
0 tomer is required to use the High Speed Data Unit (HSDU) which
0 supports the V.35 physical interfaces. Refer to ECM 270, Datapath
0 Modem Pooling.

0 DDS support: Digital Data Service (DDS) is an AT&T developed pri-
0 vate line digital data service. Only the 56 Kbps non-error cor-
0 recting form of this service will be supported. Individual DS0
0 must be multiplexed onto a T1 prior to connecting to Supernode .
0 A maximum of 24 56 kbps access connections are supported on a
0 single T1 access circuit.

0 Non-channelized T1: The non-channelized mode uses all 192 bits of
0 information in a T1 frame to carry data associated with a single
0 frame relay frame.

0 All customer access protocols must use HDLC framing plus either
0 LAPB/SDLC or LAPD logical link identification.

0 Refer to Figure 8 and Figure 9 for access channel configurations.

0 RELEASE 28.01
0 93 12 03

0 Dataspan T1 Trunking

0 Separate LPP cabinets in the Dataspan networks can be connected
0 via non-channelized T1 trunks. The trunks can connect LPP cabi-
0 nets in the same office or in two different offices. These trunks
0 are in trunk groups. The trunks can be of two types, standard or
0 enhanced. The trunk groups can be of two types, shared or non-
0 shared.

0 Standard trunks offer a basic node-to-node transport medium using
0 the frame relay standard as it exists today (the ANSI T1S1 stand-
0 ard). They are connected to suppliers of end office equipment
0 other than Northern Telecom, and could be used to expand the net-
0 work to areas not serviced by DMS Supernodes. Standard trunks may
0 not be placed in trunk groups of more than one member.

0 Enhanced trunks offer the standard service plus a fault resistant
0 capability. Enhanced trunk members may be grouped together into
0 trunk groups of more than one member, and connections can be
0 given a secondary route over a separate trunk member within the
0 group. Connection duplication greatly improves reliability, and
0 allows a trunk member in a multiple member group to be taken out
0 of service for maintenance without seriously disrupting service
0 for customers. Because of this enhancement, end-to-end sequencing
0 of frames is done; that is; frames are guaranteed ordered from
0 one access point to the eventual destination even in the case of
0 trunk member failure (although with perhaps some frame loss).

0 A shared trunk group has members which may carry frames belonging
0 to any customer who purchases connections across the trunk.

0 A non-shared trunk group is one in which all of the connections
0 assigned to the group belong to a single customer. This customer
0 , in effect, purchases the trunk group for his own private use.

0 Connections using trunks may be datafilled in such a way that
0 they are tandem to an office. With this ability, a network need
0 not be engineered to have maximum conectivity.

0 The enhancement of DataSPAN (Frame Relay Services) for Fractional
0 T1 and ESF support is accomplished through the introduction of
0 the EFRAP (ESF Frame Relay Applications Processor) circuit pack.
0 The EFRAP replaces the FRAP introduced in BCS 33 as part of the
0 FRIU (Frame Relay Interface Unit). The EFRAP, like the FRAP, is
0 mounted on the LPP(LIM).

0

0 Fractional T1 supports four 384 Kbs hyper-channels for end-user
0 access. With fractional T1 access, end-users who require greater
0 than 56 Kbps for access, can also select a 384 Kbps channel to
0 support their applications. Any unused T1 channels cannot be used
0 for voice services. The DataSPAN product requires that the T1
0 carry only data.

RELEASE 28.01
93 12 03

DATAPATH Connection to FRIU for Frame Relay Service

Connection of the DATAPATH line to the FRIU is accomplished via the hotline feature. The FRIU channel is assigned a DN in a single member trunk group for this purpose.

Figure 10

0 RELEASE 28.01
0 93 12 03

0 DMS Integrated Packet Handler (DMS-PH)

0
0 Presently, packet services are provided by the DPN-based Packet
0 Handler (DPN PH) which is connected to the DMS via DS1 links. The
0 DMS Packet Handler (DMS PH) is being introduced to provide X.25
0 packet service for DMS-100 Integrated Services Digital Network
0 (ISDN) as an integral component of the DMS Switch.

0 The DMS PH is based on the Link Interface Module (LIM) platform.
0 The LIM provides the protocol processors required for packet
0 switching. It relies on the common DMS operations, maintenance
0 and provisioning systems to provide all OAM functions. To provide
0 for simplified and consistent call services, the DMS PH will rely
0 on the Call Processor of the DMS-Core to provide functions such
0 as Digit translation and Hunt Group processing.

0 The DMS PH uses two types of Application Specific Units (ASU).
0 These are the XLIU and the NIU, and are detailed as follows:

0 A) The X.25/X.75 Link Interface Unit (XLIU) provides interface to
0 the X.25/X.75 Protocols. The XLIU handles physical, data
0 link, and network level protocol services. One (1) Link
0 Interface Shelf (LIS) will support up to ten (10) XLIUs; up to
0 a maximum of thirty (30) XLIUs per LIM Cabinet. In order to
0 keep Packet Handler traffic off the DMS-Bus, all the XLIUs
0 must be located in the same LIM Cabinet.

0 Each XLIU should be provisioned using the following rules:

0 Traffic load of 130 data packets per second.
0 Maximum of 512 X.25 D-channel terminals.
0 Maximum of 31 DS-0 channels where each DS-0 can carry:
0 - one (1) X.75/X.75' trunk, OR
0 - one (1) B-channel port, OR
0 - up to sixty-four (64) D-channel terminals

0 The XLIU must be provisioned for either X.25 lines or
0 X.75/X.75' trunks. For X.25 service, a mixture of B-channel
0 and D-channel terminals can be provisioned on the same XLIU.
0 Each B-channel port consumes one of the 31 XLIU channels. D-
0 channel terminals can be statistically multiplexed at a ratio
0 of up to 64 on each XLIU channel to the maximum of 512 per

0 RELEASE 28.01
0 93 12 03
0

0 XLIU. Similarly, both X.75 and X.75' trunks can be terminated
0 on the same XLIU, one trunk for each XLIU channel. Traffic
0 should be estimated on a per channel basis and then channel
0 allocation may be done on a per XLIU basis (Refer to SEB
0 90-05-002).

0 Each X.25/X.75 Link Interface Unit (XLIU) occupies two slots
0 on the LIS and is composed of the following:

0 Integrated Proc and FBUS I/F (IPF)
0 HDLC Frame Processor (HFP)
0 CBUS Interface Paddleboard (CIP)

0 B) The Network Interface Unit (NIU) allows the LIM to be con-
0 nected to the switching network such that the Application Spe-
0 cific Units (ASU) can have direct access to network channels.

0 The NIU must be provisioned for each LIS shelf containing any
0 XLIUs. The NIU must be assigned to the CP position specified.
0 Other applications (LIU7, EIU, FRIU, etc) shall be relocated
0 if the need arises.

0 One (1) NIU will support ten (10) XLIUs. One (1) Link Inter-
0 face Shelf (LIS) will support one (1) NIU; up to a maximum of
0 three (3) NIUs per LIM Cabinet. However, the NIU can only
0 mount on a Link Interface Shelf (LIS) that has been equipped
0 for Channel Bus (Cbus) Access. This is accomplished by equip-
0 ping the LIS with the NT9X74DA, FBus Repeater CP.

0 The Network Interface Unit (NIU) consists of two units called
0 UNIT:0 and UNIT:1. UNIT:0 provides the interface to Network
0 Plane:0 and UNIT:1 provides the interface to Network Plane:1.

0 UNIT:0 of the Network Interface Unit (NIU) is composed of the
0 following:

0 Integrated Proc and FBUS I/F (IPF)
0 Channel Bus Controller (CBC) Unit 0
0 DS30 Link Interface Paddleboard (LPB)

0 UNIT:1 of the Network Interface Unit (NIU) is composed of the
0 following:

0 Integrated Proc and FBUS I/F (IPF)
0 Channel Bus Controller (CBC) Unit 1
0 DS30 Link Interface Paddleboard (LPB)

0

0 C) Provide four (4) DS-30 Links per Switching Network Plane for
0 each NIU provisioned.

0 The DMS Packet Handler also requires that the DMS-Bus be
0 equipped with the following:

0
0
0
0
0
0
0
0
0

BCS Level	Memory Req.
BCS-34	10 MBytes of Memory
BCS-35	7 MBytes of Memory

0 RELEASE 28.01
0 93 12 03

0 Network Interface Unit (NIU)

0
0 LPP (Link Peripheral Processor) channelized access provides access to the LPP over the network without the need of an external OEM Channel Bank.

0 An OEM channel bank was previously required to interface 56/64 Kbps LIU7 to the PCM30.

0 Channelized Access also provides the advantage of LIU sparing and also increases the number of applications available through the LPP.

0 The LPP interface to the network is provided by the Network Interface Unit (NIU) that resides in the LIS shelf of the LPP cabinet.

0 The NIU is a warm spare peripheral with a DS-30 interface towards the network with the Channel Bus (CBUS) on the LIU7 side. LIUs that reside on a shelf with NIUs (plane 0,1) can have access to the CBUS through the Channel Bus Interface paddleboard and thus to the DMS network. The NIU must be provided on all shelves where channel access is required, as the CBUSs are not extended between shelves.

0 Channelized access on LPP are supported on both the 2 slot and 3 slot LIU shelves. Channelized access on the LPP is available for the following applications:

0 SSP - Service Switching Point

0 ISDN - Integrated Packet Handler

0 SEP - Signaling End Point

0

0

0

0

0

0
0 RELEASE 28.01
0 93 12 03

0 Signaling End Point (SEP)

0
0 The Signaling End Point (SEP) in the Japan network is equivalent
0 to an SSP/SP in the North American network operating in the
0 Quasi-Associated Signaling mode, as shown in Figure 6. The sig-
0 naling data links and their end points share the North American
0 terminology; for example, A-Links and STP.

0 The SEP always includes Channelized Access (NIU) as the interface
0 to the LIU7. SEP functionality is known as Japan ISUP in NT/BNR
0 documentation.

0 All provisioning considerations for SSP/SP and NIU, as documented
0 in sections 2.4.2 and 2.4.7, are applicable, with the following
0 exceptions:

- 0 - SEP utilizes the 36 link LPP (NT9X70BA and newer vintage) only
- 0 - SEP utilizes NT9X76CA instead of NT9X76AA in the LIU7 cardset
0 in figure 15.
- 0 - SEP LIU7/SDL signaling rates and protocols are different than
0 North American rates and protocols, therefore use
0 NTP 297-5121-101J to verify planned link quantities.

0 The NIU is made up of the following cards as shown in Figure 13.
0 The left unit, UNIT:0 uses the CBC NTEX25AA CP while the right unit,
0 UNIT:1 uses the NTEX25BA CP.

0 Figure 13: NIUs
0 -----

0 Provide one (1) NTEX25AA for the left unit, UNIT:0 and one (1)
0 NTEX25BA for the right unit, UNIT:1 for each LIS shelf that requires
0 channelized access. The Channel Bus Controller (NTEX25AA/BA) does
0 plane selection and controls the CBUS. The Channel Bus Controller
0 (CBC) also receives and transmits data to and from the CBUS and the
0 DMS network.

0 Provide two (2) NTEX28AA per LIS shelf (one for each unit). The Link
0 Interface Paddleboard (NTEX28AA) interfaces four (4) DS-30 links and
0 also interfaces to both CBCs (Channel Bus Controllers).

0 Provide two (2) NTEX22BB per LIS shelf (one for each unit). The Inte-
0 grated Processor and FBUS I/F is an integration of the NT9X13CA and
0 NT9X75AA developed for LIU shrink.

```

0 Provide four (4) NT9X7020 DS-30 Cable Assemblys per LIS shelf. Each
0 cable connects an LPB (NTEX28AA) to its designated position on the
0 bulkhead. The DS-30 cable connection allows the transmission of data
0 from the network over four (4) DS-30 links.
0 The network data is transferred to the Channel Bus Controller
0 (NTEX25AA/BA) through the LPB.

```

Page 7-171

0 Provide two (2) NT9X74DA per LIS shelf, one (1) at each end of the
0 shelf, for channelized access.
0 The CBUS Repeater/Terminator Card (NT9X74DA) provides terminations for
0 the intra shelf CBUS.

0

0 Provision up to a maximum of six (6) LIUs per shelf for the 3-slot LIU
0 LPP cabinet (NT9X70AA) or 10 LIUs per shelf for the 2-slot LIU LPP
0 cabinet (NT9X70BA/BB) for an LPP requiring channelized access as shown
0 in Figure 12.

0 Figure 15: LIU configuration requiring channelized access
0

0 Provide one (1) NTEX26AA for each LIU requiring channelized access.
0 The Channel Bus Interface Paddleboard (NTEX26AA) provides an interface
0 from the CBUS to the ST (Signalling Terminal) card (NT9X76AA), and
0 hence, does not have any external cable connections to it.
0 When in receive mode, the CBI selects data from the CBUS, selects the
0 proper channel then transfers the data serially to the NT9X76AA. In
0 transmit mode, the CBI drives the proper channels on both CBUSs. The
0 CBI also provides CBUS functions related to fault detection and iso-
0 lation.

0
0 RELEASE 28.01
0 93 12 03

0 Provide one (1) NT9X76AA (ST) card for each LIU.
0 or
0 provide one (1) NT9X76CA (TTC7 ST) card for each LIU when 48K rate
0 ISUP capability is required for SEP applications.
0 The only paddleboard that can be used with the NT9X76CA type LIU7 is
0 the NTEX26AA. This is because the only application that the NT9X76CA
0 can be used for is a Channelized Access application. That is, the
0 ISUP SEP LIU7 can only be used on a shelf that the NIU has been provi-
0 sioned on.

0 AND

0 Provide one (1) NTEX22AA

0 OR

0 Provide one (1) NTEX22BA Integrated FBUS I/F card for each 2-slot LIU
0 as shown in Figure 15.

0 For a 3-slot LIU, provision a 2-slot LIU,
0 and add:
0 one (1) NT9X19AA Filler pack.
0 in addition to all the items provided for a 2-slot LIU.

0

0 36-Link LIM Cabinet NT9X70BB

0

0 The following describes the characteristics of the NT9X70BB
0 36-Link LIM Cabinet:

0 Input Voltage.....-48VDC
0 Power Consumption.....3832 watts (+/- 10%) fully equipped
0 Current Drain.....80 Amps
0 Thermal Dissipation.....-NA- BTU/hr
0 Fusing Requirements.....Eight (8) 20A Fuses - two per Shelf
0 (at PDC) (LMS and LIS)
0 Two (2) 10Amp Fuses - Cooling Unit

0 MECHANICAL DIMENSIONS

0 Height 72in. Width 42in. Depth 28in.

0 Weight 1400lbs. (Full)

0 Max current drain for a fully-equipped LIS shelf = 173.3A at 5V.

0 Max power dissipation for a fully-equipped LIS shelf = 990W.

0 4.2.2 EMI/EARTHQUAKE INFORMATION

0
0 No additional bracing or stiffening hardware will be required for
0 the enhanced cabinet in normal installations. The cabinet must
0 be bolted to the floor in four (4) places through anchor holes
0 provided in the base of the cabinet. When the cabinet is bolted
0 in place, the optional leveling feet must not be installed.
0 Leveling will be accomplished through the use of non-conductive
0 shims.

0 For raised floor installations, a sub-structure support between
0 the concrete sub-floor and the raised floor will be required. A
0 qualified seismic engineer should be consulted regarding the re-
0 quired additional bracing.

0 93 12 030 4.2.3 SPARING INFORMATION

0

0 Use standard sparing algorithms for all applications on the LIM,
0 unless otherwise specified in a 4.3 sub-section.

0 Sparing Information for STP

0

0 FOR U.S. OFFICES - use standard sparing algorithms to determine
0 spare equipment quantities.0 FOR CANADIAN OFFICES - provide spares for the STP unique circuit
0 packs as follows. Note: these quantities are based on a 95% con-
0 fidence level and a turnaround time (T) as shown. Sparing for
0 the remaining LIM circuit packs and the DMS-Core circuit packs is
0 calculated using standard sparing algorithms or PAQS100.

0 4.3 SOFTWARE PROVISIONING

0

0 4.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

0 Required Software for STP

0

0 The following software packages are applicable to STP. Check the
0 appropriate SMS (Software Management System) report for avail-
0 ability and to confirm required supporting packages.

0 A) Required Packages:

0 NTX832AA STP Base (Master package)(through BCS-29)

0 The Master package software for STP was removed from BCS-30 pend-
0 ing a reorganization. Modified packaging has been added back into
0 BCS-31 as follows:

0 NTX832AB STP Base (Master package)(BCS-31 and up)

0 NTX960AC DMS SUPERNODE Series 20 Processor (Master Pkg.)

0 The following software is also required:

0 NTX833AA STP Operations

0 NTX048AA Synchronization

0 NTX056AA Enhanced Administration

0 NTX074AA Disk Data Storage System

0 NTX445AB OM Selective Output

0 B) Optional Packages

0

0
0 Host - Signalling Interface Equipment
0 Chapter 7

0 RELEASE 28.01
0 93 12 03

0

0 NTX834AA DS1S6 Translation (for Nynex customer only)

0 NTX835AA DMS-STP SEAS Interface (release 1.1)

0 NTX836AA STP - V.35 Subrate Links
0 This package is required only if the V.35 Interface
0 Paddleboard is provided, and operation at subrate
0 speeds is required. Operation at a full 56 kbit/s
0 is included in mandatory package NTX833AA.

0 NTX839AA STP - Enhanced Maintenance and BERT OR
0 NTX839AB LPP - Enhanced Maintenance and BERT (requires BCS-31)
0 This package requires the NT9X78BA Enhanced DS0A
0 Paddleboard.

0 NTX840AA STP - Gateway Message Screening

0 NTXE55AA SEAS Interface (release 2.0)

0 NTXE24AA SEAS - Gateway Screening (release 3.0)

0 NTXE32AA MTP - Preventive Cyclic Retransmission

0 NTX292AB/BA - Enhanced Security Package

0 NTXR37AA CCS7 Increased Route Sets
0 If this package is used for increased routing then
0 the NTEX22BA card must be used. The NTXR37AA software
0 package will be available and optional in BCS35.

0 NTXS04AA MTP Routing Enhancement
0 If this package is used then the NTEX22BA card is
0 required. The NTXS04AA software package will be
0 available and optional in BCS35.

0 Required Software for SSP/SP

0

0 Provision the following packages to support the LIM in an SSP/SP
0 office. Refer to the appropriate Software Management System
0 (SMS) report for package status and interdependencies:

0 Host - Signalling Interface Equipment
0 Chapter 7

0
0 RELEASE 28.01
0 93 12 03

0 Provide master package:

0 NTXD44AA LPP on DMS Supernode SSP

0 This master package contains:

0 NTXF20AA LMS on LPP

0 NTXF71AA Supernode Enhanced Messaging

0 NTXN18AA FBUS-LIU Base

0 Provide feature packages:

0 NTXN19AA LIU7 on SSP

0 NTX041AB CCS7 MTP/SCCP

0 (for all MSB7s, and existing LPPs at BCS33 or below)

0 NTXR72AA CCS7 MTP/SCCP on LPP

0 (for LPP initials and BCS34 upgrades)

0 The NT9X78CA requires BCS33 and higher software along with the
0 software package:

0 NTXN19AA LIU7 on SSP

0 The NT9X78CA paddleboard only works for International Applica-
0 tions. If the NT9X78CA is ordered for domestic applications, it
0 can be datafiled as a NT9X78BA and does function, but it cannot
0 provide the 64Kbs rate for domestic applications.

0

0

0
0 RELEASE 28.01
0 93 12 03

0 Required Software for EIU

0
0 The software package for EIU is not to be ordered.

0 The software packages of the applications which require the EIU
0 would be ordered. The individual packages which make up the
0 software package of a particular application would not be or-
0 dered.

0 For example, the software package for the MDR7 (Message Detailed
0 Recording for CCS7 Messages) application is NTXJ91AA. It consists
0 of the following software packages:

0 NTXF19AA TCP/IP Protocols
0 NTXF05AA Ethernet Interface Unit (EIU)
0 NTXN18AA LIU/FBUS Base
0 NTXF20AA LMS on LPP
0 NTXF71AA SuperNode Enhanced Messaging

0 Hence, when the MDR7 application is needed, the following soft-
0 ware packages are required:

0 NTXJ91AA MDR7

0 The other above software packages are not ordered because they
0 are automatically pulled in via NTXJ91AA.

0 Check the appropriate SMS (Software Management System) report for
0 availability and to confirm required supporting packages.

0 Required Software for MDR7

0
0 The feature package for MDR7 is NTXJ91AA. The DMS-STP Gateway
0 Screening feature (NTX840AA) is a prerequisite, since it is used
0 to identify which messages are to be tracked. Refer to the SMS
0 database for interdependencies and additional information.

0

0
0 RELEASE 28.01
0 93 12 03

0 Required Software for FRIU

0
0 For BCS 32 and 33, the following package is required for basic
0 Frame Relay Services:

0 NTXF25AA Frame Relay Basic.

0 For BCS 34 and later, the following package is required for basic
0 Frame Relay Services:

0 NTXF25AB Frame Relay Base (Upgrade of NTXF25AA)

0 Package NTXF25AB contains the Extended Superframe Format support
0 feature.

0 The NTXF25AB is MD'd and is replaced with NTXF25AC and NTXR28AA
0 from BCS 35 onwards.

0 For BCS 33 and later, the following packages are optional for
0 Frame Relay Services:

0 NTXQ34AA Frame Relay Billing Base Package

0 NTXQ35AA Frame Relay LEC Billing

0 For BCS 34 and later, the following packages are optional for
0 Frame Relay Services:

0 NTXR28AA Fractional T1 Access

0 Refer to the SMS database for package content, inter-dependencies
0 and availability.

0

0

0
0 RELEASE 28.01
0 93 12 03

0 Required Software for DMS-PH

0
0 The DMS Packet Handler is being introduced in BCS-34 (VO and Limited Availability offices), and will be Generally Available in BCS-35. The DMS Packet Handler requires the following software packages:

0 NTXD44 - LPP Master Package
0 NTXF93 - ISDN Provisioning SERVORD
0 NTX750 - ISDN Basic Access

0 NTXH77 - NIU Software Base
0 NTXP47 - DMS PH Software Base
0 NTXP75 - ISDN DMS PH SERVORD

0 Refer to SMSQUERY for the Software Interdependencies of the above packages.

0 Required Software for NIU

0
0 Refer to the individual applications for S/W requirements when channelized Access is needed.

0
0 Required Software for SEP

0
0 All required software for SSP/SEP as documented in section 4.1.2 is applicable.

0 In addition to the above, SEP utilizes the following software according to NT/BNR design documentation:

0

0
0 Host - Signalling Interface Equipment

0 Software Usage Restrictions for FRIU

0
0 The following software restrictions apply:

- 0 * 256,000 connections allowed to be programmed per office
- 0 * 1000 customers per office
- 0 * 2200 FRS agents allowed
- 0 * 992 connections allowed on each FRS agent (non-channelized)
- 0 * 254 connections allowed on each FRS agent (channelized)
- 0 * LAPD range of DLCI = 0 - 1023
- 0 * Customer may only own 10,000 connections

0 An FRS agent is defined as the logical termination of a frame re-
0 lay service. Each FRIU can have up to 24 FRS agents in the
0 channelized mode. As stated above the current limit for all FRS
0 agents is 2200.

0 The NTEX31BA or NTZZ30LA can operate at 24 x 64 Kbs channels but
0 software will only allow 24 x 56 Kbs channels.

0 For FRIU at BCS 34 and later, the NTEX22BB/NTEX31BA

0 Software Usage Restrictions for DMS-PH

0
0 Not Applicable.

0

0

0

0 Software Usage Restrictions for NIU

0

0 4.3.3 MEMORY PROVISIONING

0

0 Memory Provisioning for STP

0
0 For Computing Module memory calculations, use the MEMCALC pro-
0 gram.

0 Memory Provisioning for SSP/SP

0
0 A new office parm is introduced into parm table OFCOPT. Parameter
0 CCS7_NODE_ATTRIBUTES should be set to CCS7_SSP (the default).
0 This new parm consumes 30 words of data store.

0 Other permissible parameter values, CCS7_STP and CCS7_SCP, do not
0 apply to an SSP/SP office.

0 Memory Provisioning for EIU

0
0 Not Applicable.

0 Memory Provisioning for MDR7

0

0

0 RELEASE 28.01
0 93 12 03

0 The EIU has 4 Mbytes of memory which is dedicated to the MDR7 ap-
0 plication. MDR7 requires 4 Kbytes of memory in the LIU7 and 410
0 Kbytes in the DMS Core.

0 Memory Provisioning for FRIU

0
0 Refer to the MEMCALC program.

0 Memory Provisioning for DMS-PH

0
0 Refer to the MEMCALC program.

0 The DMS Packet Handler requires that the DMS-Bus be equipped with
0 the following:

0

BCS Level	Memory Req.
BCS-34	10 MBytes of Memory
BCS-35	7 MBytes of Memory

0

0 Refer to the following documents for the provisioning rules of
0 the DMS-Bus:

0 ECM-626 BBlock Eng - Supernode In S/DMS Cabinet

0 Memory provisioning is impacted by the number of Call Condensed
0 Blocks (CCBs) required for LPP-based Packet Services. Traditional
0 calculation of CCB requirement does not apply to packet service.
0 Initial view of CCB requirement for LPP-based Packet Service is
0 stated as 200 CCBs per XLIU.

0 RELEASE 28.01
0 93 12 03

0 5.0 Fiberized LIS (FLIS or Single Shelf LPP)

0 The Fiberized LIS ((F)LIS) is designed to provide a small number of
0 Link Interface Units (LIUs) in a SuperNode office in a cost-effective
0 manner. Up to two Link Interface Shelves (LISs) with a maximum total
0 of twenty-four LIUs may be provisioned.

0 The existing (non-fiberized) LIS shelves are housed in a Link Inter-
0 face Module (LIM) cabinet and require Local Message Switch (LMS)
0 shelves to interface to the Message Switch (MS).

0 The fiberized LIS uses a new FBUS controller circuit pack and a new
0 fiber interface paddleboard to support a direct connection between the
0 LIS and the MS.

0 The (F)LIS uses the Enhanced Multi-Purpose Cabinet (EMC) or C42
0 (S/DMS) Cabinet to house up to two LIS shelves. The first shelf re-
0 sides in shelf position 26 and the second shelf, if provisioned, re-
0 sides in shelf position 13. (Shelf positions 39 and 00 contain filler
0 shelves and are reserved for future applications.)

0 FLIS in C42(S/DMS) cabinet is a cost and functionally enhanced version
0 of the existing FLIS cabinet. The S/DMS cabinet is 42 inches wide com-
0 pared with Streamline's width of 28 inches. This new cabinet supports
0 features such as modified framework based on Streamline,
0 "horizontal"(through line-up) cabling, and "hot slide" capability.
0 "Horizontal" cabling meaning, cables running through a hole in the
0 side of a cabinet and into the next cabinet(s) in the same lineup.
0 "Hot slide" is the process of moving an operating cabinet into an ex-
0 isting lineup of equipment. The following diagram gives a pictorial
0 representation of this cabinet:

0

0 FLIS in EMC or C42 Cabinet

0 5.1 HARDWARE PROVISIONING

0

0 5.1.1 HARDWARE USAGE RESTRICTIONS

0
0 No more than twenty-four LIUs may be provisioned using (F)LIS.
0 If additional LIUs are required, a LIM cabinet must be used.

0 The NT9X62BA CANNOT be used for the Inter-MS Link(IML) feature.

0

0

0
0 RELEASE 28.01
0 93 12 03

0 5.1.2 HARDWARE DEPENDENCIES

0
0 The (F)LIS requires the use of the following:

- 0 - NT9X13DC MS processor with 10 MBytes of memory.
- 0 - Two inter-MS links.

0 The power and ground cabling of the S/DMS cabinet depends on the
0 site configuration. Installations that do not utilize horizontal
0 cabling, require the power cables entering the cabinet to be fed
0 through Electromagnetic Compatibility(EMC) filters. On the other
0 hand, use of S/DMS cabinet in a Streamline lineup do not need the
0 power filters.

0 P AND C SIDE PORT REQUIREMENTS

0
0 Not applicable

0 DMS BUS PORT REQUIREMENTS

0
0 Refer to section 2.4.2 Inter-MS Link Provisioning.

0 CIRCUITS PER CARD

0 93 12 03

0 DISCRIMINATION NUMBERING

0
0 Not applicable

0 5.1.3 PROVISIONING CONSIDERATIONS

0

0 (F)LIS Provisioning

0
0 If one to twelve LIUs are required, provision one LIS shelf in
0 shelf position 26. This shelf is referred to as LIS 1.

0 If thirteen to twenty-four LIUs are required, provision two LIS
0 shelves in shelf positions 26 and 13. These shelves are referred
0 to as LIS 1 and LIS 2, respectively.

0 Each Link Interface Unit (LIU) is composed of two circuit packs
0 and one paddleboard. The first circuit pack is the NTEX22BA IPF
0 Processor and F-Bus Interface and is provisioned in an even-
0 numbered slot from 8F to 30F. The second circuit pack is the
0 NT9X76AA STP Signalling Terminal and is provisioned in the next
0 highest (odd-numbered) slot (from 9F to 31F). The paddleboard is
0 either an NT9X77AA V.35 Interface or an NT9X78BA Enhanced DS0A
0 Interface and is provisioned behind the NT9X76AA (in an odd-
0 numbered slot from 9R to 31R).

0 These three cards make up a single Link Interface Unit.

0 Refer to Figure.

Page 7-206

0 RELEASE 28.01
0 93 12 03

0 To support the signalling links, provisionable interface
0 paddleboards are required. There are two types of paddleboards,
0 one to interface V.35-protocol signalling links, the other to
0 interface DS0A-protocol signalling links. The two types may be
0 mixed within the LIS.

0 The NT9X77AA V.35 Interface Paddleboard supports one V.35 signal-
0 ling link. It can operate at the full V.35 rate (56 kbit/s) or
0 at the following subrate speeds: 2.4, 4.8, 9.6 and 19.2 kbit/s.
0 Optional software is required for subrate operation (see Software
0 Packages). V.35 Data Sets, if required, are to be furnished by
0 the customer for this application.

0 NTZZ30WA (CCS7 Link Interface Unit (V.35 2 Slot))

0 The NTZZ30WA provides one Signaling Data Link for interface to
0 other SS7 offices. Each LIU7 provides one V.35 link.

0 The NT9X78BA Enhanced DS0A Interface Paddleboard supports one
0 DS0A signalling link. It is enhanced from the NT9X78AA
0 paddleboard by the addition of DS0A loopback and BERT capabili-
0 ties for testing purposes.

0 For reliability the LIU7s must be assigned to shelf positions 26,
0 and 13 in the order that is described in the rules section.

0 NTZZ30UA (CCS7 Link Interface Unit (E-DS0A 2 Slot))

0 The NTZZ30UA provides one Signaling Data Link for interface to
0 other SS7 offices. Each LIU7 provides one E-DS0A link. Enhanced
0 maintenance is available with the use of this type DS0A link.

0 Each LIS shelf requires two ports on the MS. The MS should pro-
0 vide these ports via the NT9X17AC 4-Port MS Interface Circuit
0 Pack and the NT9X62BA 4-Link SR512 Paddleboard.

0 RELEASE 28.01
0 93 12 03

0 The DMS packet Handler (DMS PH) provides integrated X.25 packet
0 service for the DMS-100 family of ISDN nodes. For the DMS packet
0 handler application, the ASU is the X.25/X.75/X.75' Link Inter-
0 face Unit (XLIU), which provides the X.25 and X.75 protocol proc-
0 essing for the DMS PH.

0 The XLIU is a three-card unit that includes the following cards:

- 0 1) NTEX22 IPF for layer 3 processing and F-Bus access.
- 0 2) NTFX10 HFP for layer 2 processing.
- 0 3) NTFX09 CIP for channel bus access to provide the HFP with the
0 channelized data

0 The XLIU is configured for redundant access to the C-bus. Note
0 that LIS MUST be provisioned with NIUs to use the DMS Packet Han-
0 dler configuration, and NIUs cannot be split over two shelves.

0 The NIU pair is a six-card redundant unit consisting of two of
0 each of the following cards:

- 0 1) NTEX25 CBC interfaces the network planes with parallel C-bus
0 to the XLIU and other ASUs. Two different models of CBC card are
0 supplied with the NIU pair, one for NIU unit 0 and the other for
0 NIU unit 1.
- 0 2) NTEX22 IPF
- 0 3) NTEX28AA DS-30 link interface paddle board supports four (4)
0 DS30 links for the DMS PH.

0 RELEASE 28.01
0 93 12 03

0 Inter-MS Link Provisioning

0
0 The two inter-MS links (IMLs) required for (F)LIS to connect MS
0 plane 0 to MS plane 1 and provide a path for messages in event of
0 a failure. These links utilize DS-30 links and should be provi-
0 sioned as follows:

0 For applications NOT using Streamline cabinets, and where DS-30
0 inter-MS links are required, provision two (2) NTEX5022 Inter-MS
0 DS-30 Cable Assemblies. (one NTEX5022 cable per IML)

0 For Streamline cabinet applications where DS-30 inter-MS links
0 are required, provision two (2) NTEX5023 Inter-MS DS-30 Cable As-
0 semblies. (one NTEX5023 cable per IML)

0 Each DS-30 IML can be provisioned on any un-used DS-30 port on
0 either an NT9X23AA or an NT9X23BA or an NT9X69BA paddleboard sub-
0 ject to the following restrictions:

0 The DS-30 ports selected for the two links must be on different
0 paddleboards. That is, if the only free DS-30 ports are on the
0 same paddleboard they cannot both be used for the IMLs; another
0 port must be freed up on another paddleboard in order to equip
0 the second link.

0 The paddleboards and ports selected must be the same on each MS.
0 For example, if port 3 on paddleboards in slots 16 and 17 are se-
0 lected in MS 0, then port 3 on paddleboards in slots 16 and 17 in
0 MS 1 must be used.

0 The paddleboards and ports selected can be in any slot or port in
0 which DS-30 paddleboards are allowed except port 0 on
0 paddleboards in slots 28 and 29.

0 Provisioning of DS-30 IMLs is currently limited to the SuperNode
0 in standalone and Streamline cabinets. No requirements have been
0 identified for the support of IMLs on the Meridian Cabinets,
0 MSL100 and SL100 products. Hence, this is not currently sup-
0 ported.

0 RELEASE 28.01
0 93 12 03

0 C42(S/DMS) Cabinet Provisioning

0
0 The S/DMS cabinet is very similar to the existing cabinet, items
0 such as packs, shelf assemblies, interconnect cables, and
0 bulkhead packs do not change. The differences from the existing
0 Supernode cabinet are listed below.

0 1) The Cabinet changes from NT9X0113 to NT9X95AA

0 2) The Kick plate is not required with the S/DMS cabinet.

0 3) Power wiring is optional. If the cabinet is in a Stream-
0 line lineup, the cables will be equipped to take advantage
0 of "horizontal" cabling. If the cabinet is in a Standalone
0 lineup, power cables will be similar to existing power
0 cables, so filters will have to be provisioned.

0 5.1.4 OFFICE LAYOUT INFORMATION

0
0 The S/DMS cabinet will be shipped with the doors, shelves, circuit
0 packs, FSP, and cooling unit installed. The bus bar will be in-
0 stalled and appropriate connections will be made at the factory.
0 The bulkheads form part of the Electromagnetic Compatibility(EMC)
0 cage around the equipment and provide a place to mount filter
0 PCBs and optional power filters. The rear of the cabinet is
0 equipped with two removeable bulkhead panels near the bottom of
0 the cabinet. When these panels are removed, the cabinet can be
0 installed in, or removed from, a lineup equipped with horizontal
0 cabling. The cabinet may be slid "FORWARD" only.

0 Refer to ECM600 for office layout restrictions when this cabinet
0 is applied in a DMS-100 Cabinetized lineup.

0

0 RELEASE 28.01
0 93 12 03

0 5.1.5 TRAFFIC TABLES

0
0 Not applicable.

0 5.2 PRODUCT/SYSTEM SPECIFICATION

0

0 5.2.1 PHYSICAL CHARACTERISTICS

0
0 MECHANICAL DIMENSIONS

0 Height 72in. Width 42in. Depth 28in.

0 Weight Approximately 800 lbs.

0 5.2.2 EMI/EARTHQUAKE INFORMATION

0
0 End panels are required to complete the EMC enclosure for cabi-
0 nets located at the end of a lineup. In earthquake installa-
0 tions, the S/DMS cabinet must be bolted to the floor in four(4)
0 places through anchor holes provided in the base of the cabinet.
0 The cooling unit must be removed for access to the bolts. When
0 the cabinet is bolted in place, the optional leveling feet must
0 not be installed. Leveling will be accomplished through the use
0 of non-conductive shims. The bolts must be tightened with a
0 torque wrench to ensure adequate pretension.

0 For raised floor installations, a sub-structure support between
0 the concrete sub-floor and the raised floor will be required. A
0 qualified seismic engineer should be consulted regarding the re-
0 quired additional bracing.

0

0 RELEASE 28.01
0 93 12 03

0 5.2.3 SPARING INFORMATION

0
0 For U.S. applications use standard sparing algorithms.

0 For Canadian and other applications the following may be used.

0 a) LIS Shelf:

0	0	0	0
0	0	NO.	FOR
0	0	SPARES	ENGINEERED
0	0		INVENTORY
0	PEC		
0	NTEX20AA	1	1
0	NTEX20BA	1	1
0	NT9X96AA	1	2
0	NT9X98AA	1	2

0 b) Version 2, C42 Cooling Unit:

0 -----

0 Blowers 660,000 hrs MTBF in its useful life of 10 years.
0 MTM cards 4,700,000 hrs MTBF
0 Relay 100,000,000 hrs MTBF

0 Note that the blower's useful life is about 10 years. Around
0 that time, failures are to be expected. Good practice might dic-
0 tate replacement of operating blowers around that time (analagous
0 to replacing your car's engine belts before they break).

0 5.2.4 POWER FEED AND FUSING REQUIREMENTS

0
0 The following fuses and feeds are required:

0 Fusing for the NTEX01AA is as follows:
0 Two (2) 20 Amp fuses per LIS shelf and
0 four (4) 5 Amp fuses for cooling blowers.

0

0
0 RELEASE 28.01
0 93 12 03

0 Fusing for the NTEX01AB is as follows:

0 Two (2) 20 Amp fuses per LIS shelf and
0 Two (2) 10 Amp fuses for cooling blowers.

0 5.2.5 CURRENT DRAIN INFORMATION

0
0 The following describes the characteristics of the NTEX01AA FLIS
0 cabinet:

0 Input Voltage.....-48VDC
0 Power Consumption.....1720 watts(+/- 10%) for 2 shelves
0 Current Drain.....72 Amps
0 Thermal Dissipation.....-NA- BTU/hr

0 5.3 SOFTWARE PROVISIONING

0

0 5.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0
0 The (F)LIS requires the following software package(s):
0 NTXD87AA - Master Package. It consists of the following Packages.

0 NTXF71AB Super Node Enhanced Messaging
0 NTXN18AA FBUS - LIU Base
0 NTXN83AA LIS Support over SR512 Interface
0 NTXQ51AA Support For LIS-Resident LIS Controller
0 NTX945AA MS Base Link Maintenance

0
0 Host - Signalling Interface Equipment
0 Chapter 7

0 6.0 Network Interface Changes

0 The purpose of this ECM is to provide information required to in-
0 troduce the DMS Supernode into a DMS central office equipped with
0 old networks (i.e. NT0X48AA/AB/AC/AG/AH/AJ and NT5X13AA/BA).
0 These Network frames must be modified for use with the DMS Core.

0 6.1 HARDWARE PROVISIONING

0

0 6.1.1 HARDWARE USAGE RESTRICTIONS

0

0 Canadian Applications Only

0 The NT5X13AA NETC frame should not be ordered for new jobs. Its
0 status is going to be changed to A&M.

0

0 6.1.2 HARDWARE DEPENDENCIES

0

0 Canadian Applications Only

0 The circuit pack fill will be selected based on the applica-
0 tion: domestic applications - NT5X13AC and international applica-
0 tions - NT5X13BB. In addition, the following circuit packs must
0 be provisioned for domestic applications:

0 NT3X76AA - Non DMS-Core applications
0 NT3X76AC - DMS-Core applications
0 NT3X74AA - Non DMS-Core applications
0 NT3X74AB - DMS-Core applications
0 NT3X70AA - when gain feature is not required
0 NT3X70AB - when gain feature is required (IOS application only)
0 NT3X75AA - Non ISDN applications & ISDN applications w/o remotes

0

0

0 RELEASE 28.01
0 93 12 03

0 NT3X75AB - ISDN applications with remotes

0 The DC cooling unit, NT3X90AC will now be provisionable on the
0 NETC frame.

0

0 6.1.3 PROVISIONING CONSIDERATIONS

0

0
0 NET Frames

0

0 To provide the capability for introducing the DMS SuperNode
0 into a DMS central office equipped with old networks (i.e. NET
0 frames NT0X48AA/AB/AC/AG/AH/AJ), the following product change
0 kits have been created:

0 NT0X48AK - Network Change Kit (DMS SuperNode)
0 NT0X48AL - Network Change Kit (DMS SuperNode)

0 Both product change kits are required to provide the necessary
0 modifications to the NET frame to enable it to operate with
0 DMS SuperNode in a DMS Central Office.

0 Provide one each of NT0X48AK and NT0X48AL per NET frame per
0 plane when DMS SuperNode is introduced into a DMS central of-
0 fice.

0 NOTE (for Canadian Applications Only)

0 The Change Application department will field upgrade all of-
0 fices, which have existing NET frames, with product change kit
0 NT0X48AK (i.e. Systems Application Engineering will NOT order
0 this kit). However, after Change Application field upgrades
0 an office, Systems Application Engineering will update the of-
0 fice records accordingly.

0

0 RELEASE 28.01
0 93 12 03

0 Hence, for future office extensions, when a DMS office with
0 existing NET frames is retrofitted with SuperNode, Systems Ap-
0 plication Engineering must apply product change kit NT0X48AL.

0 If Systems Application Engineering discovers that product
0 change kit NT0X48AK had not been previously applied, they
0 should inform Change Application of the deficiency, and re-
0 quest Change Application to issue an 88K order which will have
0 material delivered to meet the SuperNode schedule.

0 Reference the attached Engineering Manual sections for further
0 details.

0
0 NETC Frames

0
0 Canadian Applications Only

0 The NT5X13BA NETC frame should be ordered instead of the
0 NT5X13AA. Previously this frame was used for international ap-
0 plications. It will now be used for all applications. The
0 NT5X13BA will have an RTO date for domestic applications in
0 Canada of wk 03/87. The RTS date for Canada is wk 30/87. The
0 NT5X13AA should not be ordered for Canadian jobs that 'D' af-
0 ter week 30. The NT5X13 NETC frame will be replaced by the
0 NT8X10AA DSNE frame. Order the NT8X10AA DSNE frame rather
0 than the NT5X13 NETC frame when it is available.

0 7.0 Integrated Services Digital Network (ISDN)

0 ISDN (Integrated Services Digital Network) related services offered by
0 the DMS-100 Hardware/Software are defined as Bearer Services and
0 TeleServices communicated over a Non-Switched, Switched, and/or the
0 packet switched network. Refer to Figure #3a, 3b, and 3c for an over-
0 view of the ISDN Configuration. :dl tsize= 20. :dthd.SERVICE
0 :ddhd.SERVICE DESCRIPTION :dt.BEARER :dd.This service represent the
0 digital connections used for communication and may be circuit switched
0 or packet connections.

0 Supplementary bearer services represent different ways of manipulating
0 these connections to provide features e.g. call forwarding etc.
0 :dt.TELESERVICES :dd.These are higher level services, such as voice or
0 text messaging, which use the Bearer Services for connections and run
0 messaging protocols over these connections to control the service op-
0 eration. :edl.

0 Users have access to these services through two multi-purpose
0 user-network interfaces BRI & PRI: :sl compact. :li.Basic Rate
0 Interface (BRI), :li.Primary Rate Interface (PRI), :li.Packet
0 Switch Access, and :li.Customer Premise Equipment (CPE). :esl.

0 7.1 HARDWARE PROVISIONING

0

0 7.1.1 HARDWARE USAGE RESTRICTIONS

0
0 The following hardware usage restrictions must be addressed prior
0 to provisioning this equipment. Specific areas addressed are:

- 0 |
0 * XPM Plus and EDCH Usage Restrictions
0 * Use of NT6X46BB and NT6X62AB on DMS250 PMs equipped with
0 NT6X02AI/LE.
0 | * SMUI Restrictions

0

0

0
0 RELEASE 28.01
0 93 12 03

0 XPM Plus and EDCH Usage Restrictions

0
0 XPM Plus and EDCH usage restrictions are expressed below in terms
0 of the DMS-100, DMS-250, and RSCI:

0 * The difference between the DCH and EDCH PM Loads are as fol-
0 lows:

0 - The DCH load has a limit of 1MByte which can run in ei-
0 ther the DCH (NTBX02AA) or the EDCH (BX02BA) hardware
0 platform. Due to memory constraint, the BCS35 DCH load
0 is the LAST load containing new features. The EDCH load
0 will contain any new functionality starting in BCS36 as
0 well as any debugging tools which were removed from the
0 DCH load due to memory constraints. The EDCH load can
0 only run on EDCH platform.

0 - UPGRADE STRATEGY

0 - The Upgrade Strategy consists of freezing the DCH load
0 for 3 BCS before it is Manufacture Discontinued (forward
0 compatibility) or of making the EDCH BCS gating meaning
0 that no freeze load is required. We should use similar
0 strategies which will be adopted by XPMPLUS project.

0 - If one element of the switch is upgraded to a new BCS,
0 all elements must be upgraded. The telco can only up-
0 grade in no more than a 3 BCS jump.

0 - During the BCS application, elements are upgraded from
0 the pside elements to the CC. Thus, the upgrade is done
0 in the following sequence: DCH, LCME, XPM, MS, CM. DCH
0 is backward compatible with up to 3 previous XPM and CC
0 loads.

0 - EDCH hardware can either run the DCH or the EDCH load
0 starting in BCS35. This means that pre-BCS35 loads will
0 not run on EDCH platform.

0 - EDCH load can only return to service if the XPM is up-
0 graded to UP-EISP.

0 - Loading a NTBX02AA circuit pack with an EDCH load may
0 fail. RTSing this DCH will fail.

0 RELEASE 28.01
0 93 12 03
0

- 0 - Sparing from a NTB02BA circuit pack with an EDCH load to
0 a NTB02AA circuit pack is not permitted.
- 0 - Sparing from a NTB02BA circuit pack with a DCH load to a
0 NTB02AA circuit pack is permitted.
- 0 - Sparing from a DCH to an EDCH circuit pack is permitted.
0 |
- 0 - Sparing from an EDCH to an EDCH circuit pack with the
0 different load types is only permitted; if performing a
0 spare from a DCH load to a EDCH load.
0 |

0 XPM Plus Restrictions

0
0 The following restrictions apply to XPM+ provisioning:

- 0 | 1. Application of XPM PLUS to LGCI, LTCI modules is mandatory
0 (BCS Gating) for BCS-34. Application of XPM PLUS to DTCI mod-
0 ules is mandatory for BCS-39. All initial orders will be on
0 the NT601AD frame.
0 |
- 0 2. BCS-34 is required to provide XPM+ pm tje DTC. DTC7, and DTCI
0 modules. This applies to both new shipments and upgrades.

0 DMS-250 Specific Restrictions

0
0 The following restrictions apply to provisioning modules for
0 DMS-250 applications:

0 |

- 0 1. NT602AI/LE Modules with NT646BB/NT662AB

0

0
0 RELEASE 28.01
0 93 12 03

0 Modules equipped with the NT6X02AI and or NT6X02LE will not
0 function properly with the NT6X46BB and NT6X62AB installed on
0 the same PM. Provision the PMs as follows:

- 0 a. Provision the NT6X46BA and NT6X62AB combination for all
0 applications unless the LCME is subtending.
- 0 b. Provision the NT6X46BB and NT6X62AA when LCMEs are sub-
0 tending and or when Blue Box Fraud is required.

0 SMUI Specific Restrictions

0
0 The following restrictions apply to provisioning SMUI modules:

- 0 1. Multi-Point Embedded Operations Channel (MP-EOC) and 3-DS0
0 Time Division Multiplex (TDM) Services are not supported.
- 0 2. All DS-1 links from a particular DMS-1U must terminate on the
0 same SMUI.

0 7.1.2 HARDWARE DEPENDENCIES

0
0 The software development for 2B1Q will be done in two phases. In
0 Phase I (BCS31): The LCME will support only ISDN lines. In Phase
0 II (BCS32): The LCME will support ISDN lines POTS, EBS, and
0 DATAPATH lines.

0 DMS 100 ISDN XPM Plus LGCI/LTCI/DTCI modules must be equipped
0 with the NTB01AB Enhanced ISDN Signal Pre-processor CP. Existing
0 LGCI/LTCI/ DTCI peripheral modules equipped with NTB01AA ISDN
0 Signal Pre-processor CP will have those CPs replaced by the
0 NTZZ99AH XPM Plus Packfill Change Kit

0 DMS 250 ISDN XPM Plus DTCI modules must be equipped the NTB01AB
0 Enhanced ISDN Signal Pre-processor CP. Existing DTCI modules
0 changed to XPM Plus with the NT6X02XA Kit must also have two
0 NTB01AB EISP CP and associated labels provisioned to replace the

0 RELEASE 28.01
0 93 12 03

0 DISCRIMINATION NUMBERING

0
0 Prior to BCS-31, in an office equipped with both ISDN and
0 non-ISDN peripheral controllers, the CPCI modules could be as-
0 signed the same discrimination numbers as existing non-ISDN mod-
0 ules. For example, LGC 01 and LGCI 01 could co-exist in an
0 office. The same is not true for LCME/LCMI versus LCM bays.

0 For BCS-31 and above, discrimination numbering of ISDN peripher-
0 als has been changed, requiring them to be consecutive with
0 non-ISDN modules. Frame level naming and numbering is unchanged
0 and the frame type is still determined by the bottom module in
0 the frame. At the MAP, ISDN modules are no longer called
0 LGCI/LTCI. Instead, only LGC/LTC are allowed. (Note that DTCI has
0 not been changed to DTC at the MAP). As a result of this change,
0 at BCS-31, existing ISDN peripheral controllers (LGCI/LTCI) will
0 need to be renumbered to be consecutive with non-ISDN control-
0 lers. For example, an office with existing LGC 00-05 and LGCI
0 00-01 will require renumbering the ISDN modules to LGCI 06-07 at
0 BCS-31. New labels for the ISDN controllers will be required.

0 DTC and DTCI numbering will not be changed due to the complexity
0 of changing in-service trunks and the lack of a software tool for
0 this activity. Numbering for DTC/DTCI modules will be unchanged
0 from pre-BCS31 practices.

0 At the MAP, modules can still be identified as ISDN or non-ISDN
0 by referring to the ISP16 table.

0 7.1.3 PROVISIONING CONSIDERATIONS

0
0 The following items must be considered when provisioning a host
0 office with ISDN services:

- 0 * The Frame/Cabinet to be used for ISDN peripheral controller
0 Modules
- 0 * Provisioning ISDN peripheral controller Modules based on the
0 access mode required.

0 RELEASE 28.01
0 93 12 03

- 0 * ISDN Module Upgrade requirements
- 0 * Packet Network Access Provisioning
- 0 * Provisioning ISDN Line Modules. Refer to ECM-685 to provision these modules.
- 0 * Traffic requirement/limitations for the ISDN Controller Modules. Refer to ECM-497 for Traffic Provisioning Rules.
- 0 * DMS-1U To Host Office Access

0 ISDN Frame/Cabinet Provisioning

0 One of three ISDN Common Peripheral Controller housing units (CPEI Frame or Cabinet) may be provisioned today. The available units are: NT6X01AB (ISDN Only Frame), NT6X01AD (ISDN or POTS Frame), or NTZZ22CA (ISDN or POTS Cabinets). Refer to ECM-373 for provisioning requirements for the POTS units provisionable on the NT6X01AD Frame and NTRX36AB/NTZZ22CA Cabinet.

0 The ISDN Common Peripheral Controller Equipment frame is illustrated in Figure #4. This frame is based on the standard LTE frame with some changes to the FSP and the shelf backplane wiring.

0 Upgrade kits will NOT be available to apply ISDN capability to existing LGE/LTE/DTE/SME frames.

0 Figure 4: ISDN Common Peripheral Controller Equipment Frame

0 Note: The NT6X0223 shelf replaced the NT6X0215
0 Shelf on release 19 of the NT6X01AB frame.

RELEASE 28.01
93 12 03

The frame and its modules and shelves are assigned functional names depending on the ISDN access modes supported. Depicted in the chart below are the Frame to Module and Module to Access Mode relationships.,

ACCESS MODES	EQUIPMENT	NAME	ABBREVIATION
DS-30A links to LCM/LCME/LCMIs, DS-1 links to Packet Handler	Frame	ISDN Line Group Equipment	LGEI
	Modules	ISDN Line Group Controller	LGCI
	Shelves	ISDN Line Group Array	LGAI
DS-30A links to LCM/LCME/LCMIs, DS-1 Links To Packet Handler, Non-ISDN DS-1 Trunks	Frame	ISDN Line Trunk Equipment	LTEI
	Modules	ISDN Line Trunk Controller	LTCI
	Shelves	ISDN Line Trunk Array	LTAI
DS-1 links to DMS-1U's	Frame	ISDN Subscriber Module Equipment	SMEI
	Modules	ISDN Subscriber Module for DMS-1U	SMUI
	Shelves	ISDN Subscriber Module Array	SMAI

Planned availability of these functions is as follows:

LGEI In BCS-27, LTEI in BCS-28. In addition, PRI DS-1 links are to be supported on LTEI in BCS-30.

SMUI Initial introduction with BCS 34. The following Upgrade Scenarios apply:

* Effective BCS 34, the SMUI utilizes the Extended Master Processor Memory, Extended Signal Processor Memory, XPM

0 RELEASE 28.01
0 93 12 03

0 Processor Cards and New Messaging circuit packs. En-
0 hanced ISDN Pre-Processor circuit packs are also re-
0 quired.

0 * Effective with BCS 36, the SMUI can be field upgraded to
0 utilizes the Unified Process (UP) - NTMX77 on the
0 NT6X01AB frame. New orders of SMUI with XPM Plus must
0 use the NT6X01AD frame.

0 XPM+ For DMS 100 offices only, the LGCI/LTCI/DTCI must be changed
0 to XPM Plus modules at BCS 34.

0 XPM+ For DMS 250 offices, equipped with BCS 34 or later, the DTCI
0 may be upgraded to an XPM Plus module.

0 Note:

- 0 1. The LTCI/LGCI/DTCI DMS 250 DTCI must also be equipped with
0 the Enhanced ISDN Signal Pre-Processor. The Enhanced ISDN
0 Signal Pre-Processor in part of the NT6X02XA upgrade kit.
- 0 2. Refer to the attached Engineering Manual sections for fur-
0 ther provisioning details.

0 Provisioning ISDN Modules

0
0 Provisioning Considerations are detailed in this section for the
0 following CPE/CPEI Modules:

- 0 1. DTC - DMS-250 Digital Trunk Controller
- 0 2. DTCI - Digital Trunk Controller ISDN
- 0 3. LGCI - Line Group Controller ISDN
- 0 4. LTCI - Line/Trunk Controller ISDN
- 0 5. SMUI - Subscriber Module Urban ISDN

0 The CPE/CPEI Modules has 20 P-Side ports that are provisioned as
0 required to support the following:

- 0 * DS-30A links from LCMs and LCMEs;
- 0 * DS-1 links to the Packet Handler;
- 0 * DS-1 links for PRI or non-ISDN trunks;
- 0 * DS-1 To DMS-1U for Special Services, BRI, and MBS Lines.

0 RELEASE 28.01
0 93 12 03

0 * D-channel handlers.

0 The maximum number of each type of link, and the minimum software
0 release that supports it is:

0 * LCM/LCME - CPEI DS-30A links: up to 18 (BCS-27 or higher)
0 * CPEI - Packet Handler DS-1 links: up to 16 (BCS-27 or higher)
0 * Non-ISDN trunks - up to 16 (BCS-28 or higher)
0 * PRI trunks - up to 16 (BCS-29 or higher)
0 * SMUI - DS-1 Links to DMS-1U that support BRI, Special Ser-
0 vices, and MBS Lines (BCS-34 or higher)

0 There are no restrictions on the assignment of Bb or Bd channels to
0 packet handler DS-1 link channels. Note that the CPEI statmux maximum
0 is 64:1 for Bd channels.

0 DTC - DMS-250 Digital Trunk Controller

0 Digital Trunk Controller for DMS-250

0 The DTC NT6X02AI for DMS-250 can be mounted on the CPCE frame
0 (for Richardson applications only). This module will handle
0 non-ISDN trunking (employing A/B bit signaling) required for
0 DMS-250 applications but will not handle ISDN PRI. The DTC can
0 be converted at a later date to a DTCI in order to handle ISDN
0 PRI.

0 Provide one (1) NT6X01WC DTC Wiring Options (NT6X01AB) per each
0 non-ISDN module which is mounted on the CPCE frame. This option
0 provides a wire strap of the backpanel (NT6X0103) Slot 12 be-
0 tweens pins 7A and 8A to modules used for non-ISDN applications.

0 Provide the necessary circuit packs, normally provided on the
0 DTC, required for DMS-250 applications. Refer to the Engineering
0 Manual sections for more information on which PECs are Always
0 Provided (AP) with the NT6X02AI DTC CP Fill and which PECs are
0 provisionable.

0 RELEASE 28.01
0 93 12 03

0 | A single PRI D channel may provide signalling for up to 16 DS-1
0 links (479 B channels). All of these DS-1 facilities must be
0 present on the same ISDN peripheral.

0 The CPEI has twenty (20) peripheral ports. These are divided be-
0 tween the PRI DS-1 links and provisioned DS-1 links to the Packet
0 Handler. On the LGEI/LTEI only, p-side ports are reserved for
0 DS-30A links from LCE and LCEI frames (BRI or combined BRI/PRI
0 access).

0 PRI Equipment

0 For the CPCI peripheral controller:

- 0 1. Provide one (1) NT6X01AB, or NT6X01AD, or NTRX36AB ISDN Com-
0 mon Peripheral Controller Equipment Cabinet or frame.
- 0 2. Provide one (1) NT6X02NA ISDN Common CP Fill for each module
0 to be equipped.
- 0 3. Provide one (1) NT6X50AB to accommodate two DS-1 links up to
0 a maximum of ten circuit packs (20 DS-1 links) per DTCI mod-
0 ule.

0 If the module is only equipped for PRI it will be called DTCI,
0 and if equipped for BRI/PRI it will be called LTCI. D-channel
0 Handler (DCH/EDCH) CP are not required on the DTCI.

0 LGCI - Line Group Controller ISDN

0 LTCI - Line/Trunk Controller ISDN

0 SMUI - Subscriber Module Urban ISDN

0 The ISDN Subscriber Module Urban (SMUI), also referred to as En-
0 hanced SMU is an evolution of the Subscriber Module Urban (SMU)
0 to support ISDN BRA and/or MBS services to and from a DMS-1 Urban
0 (DMS-1U). The SMUI module mounts on the NT6X01AB, NT6X01AD, and
0 or NTRX36AB frames/cabinets. When the lower module in a CPEI
0 frame/cabinet is a SMUI the frame/cabinet will be stamped as a
0 SMEI frame. NOTE: The DMS-1U is sometimes referred to as an RCU.

0 The following circuits are provisionable on the SMUI:

0 RELEASE 28.01
0 93 12 03
0

- 0 * DS-1 Interface circuit packs and D-Channel Handlers are to be
0 provisioned per engineering manual rules and job require-
0 ments.
- 0 * The SMUI may interface the Network via up to 16 DS-30 Copper
0 speech links (C-Side Ports) . In this case DS-30 Network
0 Interface packs shall be provisioned. When fiber interface
0 to the Enhanced Network is required, the SMUI is to be con-
0 figured with DS-512 Network Interface packs.
- 0 * The Universal Tone Receiver (UTR) is not available on the
0 SMUI until BCS 35. Digitone Receivers must be provisioned for
0 lines at the RCU.
- 0 * The CLASS Modem Resource circuit pack must be provisioned
0 when the Calling Number Delivery feature is to be supported.
- 0 * P-Side Ports
- 0 Up to 20 P-Side Ports total may be provisioned. These ports
0 may be assigned as:
- 0 - DS-1 Ports, Max 20. All DS-1 links from a particular
0 DMS-1U must terminate on the same SMUI.
- 0 - Non-Switched Specials (NSS) via Channel Banks
- 0 One Channel (DS-0) is required per NSS. One DS-1 has 24
0 Channels (DS-0s) that may be assigned for the NSS
0 functionality.
- 0 - One (1) P-Side port is required per EDCH/DCH CP assigned
0 and One (1) additional port is made unavailable by the
0 EDCH/DCH CP, therefore, 2 Ports are consumed per DCH/EDCH
0 CP.
- 0 * The number of P-Side ports available to be assigned as DS-1
0 ports to a DMS-1U may be expressed as follows:
- 0
$$\#DS-1s = (20 - (\#CNSS/24 \text{ RU}) - (2 * \#EDCH/DCH))$$
- 0 Note: RU = Round Up.
- 0 * The following four examples demonstrate the application of
0 the formula above:
- 0 - Example #1

0 RELEASE 28.01
0 93 12 03
0

0 SMUI not supporting ISDN or MBS lines (DCH/EDCH CPs are
0 not required, and not supporting Non-Switched Specials
0 (NSS):

0 $\#DS-1s = (20 - (\#CNSS/24 \text{ RU}) - (2 * \#EDCH/DCH))$
0 $\#DS-1s = (20 - (0/24) - (2 * 0))$
0 $\#DS-1s = 20$

0 In this case, all 20 P-side ports are available for DS-1
0 connections between the DMS-1Us and the supporting SMUI.
0 Therefore, a maximum of ten DMS-1Us (2 DS-1 links each)
0 can interface an SMUI that does not support ISDN lines or
0 MBS lines or non-switched specials.

0 - Example #2

0 SMUI requires 48 Channels for non-switched specials, but
0 not supporting ISDN or MBS lines:

0 $\#DS-1s = (20 - (\#CNSS/24 \text{ RU}) - (2 * \#EDCH/DCH))$
0 $\#DS-1s = (20 - (48/24 \text{ RU}) - (2 * 0))$
0 $\#DS-1s = (20 - 2 - (2 * 0))$
0 $\#DS-1s = 18$

0 In this case, two P-Side ports are taken up by nailed up
0 connections, then up to 18 ports are left for DS-1 con-
0 nections between the DMS-1Us and the supporting SMUI.
0 P-side ports not taken by the Non-Switched Specials(NSS)
0 or sometimes referred to as nailed-up connections are not
0 available for DS-1 links.

0 - Example #3

0 SMUI supporting ISDN and/or MBS lines, but not supporting
0 Non-Switched Specials. A minimum of two D-Channel Han-
0 dler circuit packs (one active and one spare) are provi-
0 sioned in the SMUI to support ISDN and/or MBS lines.

0 $\#DS-1s = (20 - (\#NSS/24 \text{ RU}) - (2 * \#EDCH/DCH))$
0 $\#DS-1s = (20 - (0/24 \text{ RU}) - (2 * 2))$
0 $\#DS-1s = (20 - (0) - (4))$
0 $\#DS-1s = 16$

0 In this case, each D-channel Handler makes two P-side
0 ports unavailable for DS-1 connections. Therefore, a max-
0 imum of 16 ports are left available for the DS-1 con-
0 nections between the DMS-1Us and the supporting SMUI.

0
0 RELEASE 28.01
0 93 12 03

0 - Example #4

0 The SMUI is supporting 48 Channels for Nailed-Up Con-
0 nections or Non-Switched Specials and supporting ISDN
0 and/or MBS Lines. A minimum of two D-Channel Handlers
0 are provisioned.

0 #DS-1s = (20 - (#CNSS/24 RU) - (2 * #EDCH/DCH))
0 #DS-1s = (20 - (48/24 RU) - (2 * 2))
0 #DS-1s = (20 - (2) - (4))
0 #DS-1s = 14

0 In this case, a maximum of 14 P-side ports are left
0 available for the DS-1 connections between the DMS-1Us
0 and the supporting SMUI. Provisioning two EDCH/DCH CPs
0 consumed four P-Side ports. Two more ports were assigned
0 to Non-Switched Specials (Nailed-Up Connections).

0 * P-Side Ports To DMS-1U or RCU are configured based on the
0 following:

0 - Each RCU supports up to 528 lines and connects to its
0 supporting SMUI by 2-8 DS-1 facilities.

0 - 5280 POTS lines (Coin Lines Included), 324 ISDN Lines, or
0 324 MBS Meridian Business Set lines.

0 - When ISDN and/or MBS lines are supported, a minimum of
0 two D-Channel Handler circuit packs must be provisioned
0 in the SMUI module.

0 * Two fully configured DMS-1 Urbans (8 DS-1s/RCU) and can sup-
0 port up to ten minimally equipped Urbans (2 DS-1s/RCU).

0 * Special Services, including 4WSS, 2WSS, ISDN B-Channels, and
0 packets of D Channel data out of the DMS-100 to a Channel
0 Bank, to a Digital Cross Connect system (DCS) or to a Packet
0 Switch.

0 * Refer to appropriate Engineering Manual Inserts for detail
0 and Building Block packfills required as well as
0 provisionable circuit pack codes and rules.

0

0 RELEASE 28.01
0 93 12 03

0 The diagram below, depicts a typical example of SMUI P-Side port
0 utilization per Examples 1 thru 4:

0 Figure 5: SMUI supporting Non-Switched Specials, ISDN, and/or MBS
0 lines

0 The terms used in the formula above are defined as:

0 $\#NSS = \#$ Non-Switched Specials

0 $\#EDCH/DCH = \#$ DCH or EDCH CPs provisioned. Multiplied by
0 two (2) equals the $\#$ ports made unavailable by
0 DCHs or EDCHs.

0 RELEASE 28.01
0 93 12 03

0 Concentration: The RCU is used in a concentrating mode. Blocking in
0 the RCU is due to contention for channels at the DS-1 links.

0 The SMUI is used in a non-concentrating mode.

0 ISDN Channel Routing: The following diagram shows the ISDN Channel
0 Routing for the RCU/SMUI:

0 Figure 8: ISDN CHANNEL ROUTING (C-Side Packet Configuration)

0 Explanation Of Acronyms Used:

- 0 B Channels - Channels that are switched through the network module.
- 0 Bb Channels - Channels that are dedicated high speed packet traffic.
0 These channels are switched to the packet handler via
0 the network module.
- 0 Dd Channels - Channels that are looped back to the D-Channel handler
0 (DCH) via a hair-pinned connection.
- 0 Bd channels - Channels used for low speed packet data concentrated
0 in the DCH) are switched to the packet handler via the
0 network module.

0 RELEASE 28.01
0 93 12 03

0 Refer to ECM 497 for further SMUI/RCU traffic provisioning rules.
0

0
0 D-Channel Handler

0 NTBX02AA - D Channel Handler (DCH) CP
0 NTBX02AA - Enhanced D Channel Handler (EDCH) CP is
0 applicable at BCS 34 and above

0 The D channel handling function is performed by two circuit packs
0 on the CPEI Module:

0 NTBX01AA - ISDN Signalling Pre-processor (ISP) CP
0 NTBX02AA - D Channel Handler CP
0 - OR -

0 NTBX01AB - Enhanced ISDN Signalling Pre-processor (EISP)
0 CP
0 NTBX02AA - Enhanced D Channel Handler (EDCH)

0 The ISDN Signalling Pre-processor CP is provisionable; two (2)
0 are required in the CPCI Module for all applications which re-
0 quire ISDN.

0 The D channel handler CP will be provisioned subject to the fol-
0 lowing rules:

- 0 1. The D channel handler CP will be assigned to slots currently
0 used by DS-1 interface circuit packs. Assignment of a
0 DCH/EDCH card makes unavailable 2 DS-1 ports - physically and
0 1 DS-1 Port - electrically.
- 0 2. Each DCH/EDCH circuit pack takes one peripheral port of the
0 twenty P-side ports available. The total of twenty P-side
0 ports are shared between the DS-1, DS-30A and DCH links.
- 0 3. From BCS-28 onwards, one (1) of the DCH/EDCH circuit packs
0 will be used as a spare to support N+1 redundancy. There is
0 no DCH sparing in BCS-27. EDCH only shall be provisioned
0 from BCS-34 forward for LGCI/LTCI application and BCS-36 for
0 SMUI applications. The EDCH is currently not provisionable
0 on the TMS CPEI Module.

0 RELEASE 28.01
0 93 12 03

- 0 4. At least two DCH/EDCH cards must be provided after BCS-28
0 (ie. one plus one spare).
- 0 5. Up to ten (10) DCH/EDCH CPs may be provided per CPCI. (Nine
0 plus one spare). Refer to ECM- 497 to calculate the number
0 of DCH/EDCH CPs required to support the anticipated packet
0 traffic.
- 0 6. Each DCH/EDCH circuit pack has 32 "ports" available. One port
0 is dedicated to the ISP/EISP CP, and the remaining 31 ports
0 are capable of handling 4 multiplexed BRI D channels each, or
0 $31 \times 4 = 124$ BRI D channels maximum.
- 0 7. The ISP/EISP will occupy a free slot on the speech bus.

0 DPN EQUIPMENT PROVISIONING

0
0 The following information is intended as an aid to Customer Engi-
0 neering to determine the Digital Packet Network (DPN) equipment
0 requirements.

0 The DSD Customer Engineer will be ultimately responsible for the
0 engineering of the entire ISDN office including the DPN equip-
0 ment. The generation of material equipment lists and configura-
0 tion drawings for the DPN equipment, however, will be done in
0 conjunction with a Data Networks Division (DND) engineer.

0 For Canadian jobs, the DSD System Application Engineer will be
0 responsible for the overall office engineering including the
0 power distribution and grounding hardware for the DPN equipment.
0 Also, any cabling from DMS to DPN equipment will be engineered by
0 the DSD engineer.

0 This information will not be entered into CADES because a fully
0 integrated process whereby specs for DPN hardware can be gener-
0 ated is not presently feasible.

0 For U.S. offices, the System Application Engineer (SAE) has pri-
0 mary responsibility for the ISDN office. The SAE must contact
0 DND to ensure the participation of both divisions at the time of
0 order capture. DND will assist by completing the Packet Handler
0 section of the NT8630 order capture document.

0 After order capture DND will complete a "Hardware Configuration"
0 which is to be turned over to the SAE before the release of the
0 NT8630. The SAE must include the "Hardware Configuration" in the
0 Main Equipment List (MEL) as notes to the ISDN section.

0 The order capture (CI), release of order capture (DCI), Delivery
0 (D), Installation Start (H) and Cutover (K) dates for the Packet
0 Handler Equipment must match the same dates for the DMS equip-
0 ment.

0 DIU Provisioning

0 The Digital Interworking Unit (DIU) provides the DS-1 interface
0 for the DPN packet switch.

0 The quantity of DS-1 links from the DMS is used to determine the
0 quantity of DIU systems (shelves) and sub-systems required. Each
0 sub-system supports a single DS-1 link, and the number of inter-
0 face cards in the sub-system is determined by the number of Bb
0 and Bd channels provisioned on the DS-1 link.

0 On the CPCI, DS-1 links and individual channels within the links
0 may be allocated to Bb or Bd as required. Bb and Bd should be
0 distributed as equally as possible over all the links from the
0 same CPCI.

0 A DIU system consists of one shelf equipped with two (2) Supervi-
0 sory Processor Module (SPM), two (2) SPM Paddle Cards (SPMPC),
0 two (2) power converters and one (1) Alarm Termination Paddle
0 Card (ATPC). DIU subsystems can be added until the shelf is
0 full. The number of DIU subsystems to be provisioned is equal to
0 the number of DS-1 links presented to the DIU. A total of 16
0 slots per shelf are available for DIU subsystems.

0 Each DIU subsystem is composed of one T1 Interface Module (TIM),
0 and from one to three Serial Interface Modules (SIM) and Access
0 Module Interface Paddle Cards (V.35 AMIPC). The DS-1 link termi-
0 nates on the TIM, and the 24 channel DS-1 bit stream is demulti-
0 plexed into 24 individual 64 kbit/s data streams. The reciprocal
0 is true for data transmission in the other direction. These in-
0 dividual streams are then input to the SIM. Each SIM can handle
0 up to eight 64 kbit/s channels; thus, there are up to three SIMs
0 required per TIM. Associated with each SIM is one V.35 AMIPC to
0 interface to the Resource Module.

0

[illegible]

RELEASE 28.01
93 12 03

PEC	DESCRIPTION	RULE
QMY556B	DIU Shelf Assembly	Provision in G24 and higher; see note 3
QPA165	Power Converter	Provision two (2) per DIU Shelf
NT8P37	Supervisory Processor Module (SPM)	Provision two (2) per DIU Shelf. (One is always provided with QMY556B.) See note 3.
NT8P36	SPM Paddle Card (SPMPC)	Provision two (2) per DIU Shelf. One (1) is always provided with QMY556B.
NT9P05	T1 Interface Module (TIM)	Provision one (1) per DS-1 link from DMS CPCI
NT9P07	TIM Paddle Card (TIMPC)	Provision one (1) per TIM
NT9P04	Serial Interface Module (SIM)	See note 1
NT9P06	Access Module Interace Paddle Card (AMIPC)	Provision one (1) per SIM
NT8P44	V.35 PC	Provision one (1) per SIM
NT9P25	Alarm Termination Paddle Card (ATPC)	One AP on DIU Shelf
NT9P02	Filler Plate	See note 2
NT0X96AQ	LGCI - DIU Cable	Provision one per TIMPC
QCAD235F	OA&M Cable	Provision one per SPMPC
NT9P16AB	EIA Cable (used only with AMIPC and 4-port PI)	Provision as required; One (1) per Bb, one (1) per Bd channel.
NT9P97	EIA Cable (used with V.35 PC and 8-port V.35 PI)	Provision as required; One (1) per Bb, one (1) per Bd channel.

0 RELEASE 28.01
0 93 12 03

0	NT9P2113	Inter-SPM Cable	Provision one (1) per DIU
0			
0	AP: These items are always provided with the DIU shelf.		
0			

0 Note:

- 0 1. Quantity of SIMs in a DIU sub-system depends on whether the
0 associated TIM is assigned a DS-1 link from an optimal or a
0 residual CPCI. (Refer to ECM-413 for an explanation of op-
0 timal and residual CPCI.) One SIM is required for every
0 eight Bd and/or Bb channels on the DS-1 link. The total
0 number of SIMs required in the DIU is the sum of all SIMs in
0 every DIU sub-system.
 - 0 2. Provide one Filler Plate for every unequipped slot on the
0 DIU shelf (front and back slots). Each SPM, SPMP, TIM,
0 TIMPC, SIM, and AMIPC card takes one slot. There is a total
0 of 36 slots available on the DIU shelf (front and back) for
0 these cards.
 - 0 3. Each DIU Shelf has 16 slots available for DIU sub-systems.
0 Each DIU sub-system requires one TIM slot plus one to three
0 SIM slots. Assign DIU sub-systems to the available slots to
0 determine the total number of DIU Shelves required. Do not
0 assign a TIM and its associated SIMs to different DIU
0 Shelves.
- 0 One DIU shelf may accommodate up to four fully utilized
0 (i.e. three SIM cards per DS-1) DS-1 spans or eight minimum
0 configuration DS-1 spans (i.e. only one SIM - eight channels
0 used).

0 Resource Module (RM) Provisioning

0 The RM portion of the DPN-PH is a fully redundant module, includ-
0 ing two (2) office Processing Elements (PE), two (2) Call Servers
0 PEs, two (2) DIU servers, and two (2) Disk drives. In addition,
0 the RM contains the necessary hardware to support the OAM and
0 subscriber service connections.

0 The base DPN-PH has one LAPD service PE which uses a V.35 Periph-
0 eral Interface (PI) and will support two (2) LAPD ports with 50
0 D-channel terminals per port (100 terminals total). It also has
0 one LAPB PE, also using the V.35PI which can support up to eight
0 (8) B-channel terminals.

0
0 RELEASE 28.01
0 93 12 03

0 The DPN-PH has two PEs which are used to support the OAM X.25
0 connections (ex. to the DIU, to the OAMP). These PEs, which use
0 8-port V.24 PIs can also support X.32 dial-in service. X.32
0 dial-out service can be added to the DPN-PH with the addition of
0 an X.32 Server PE.

0 The DPN-PH contains an Async PE/PI (V.24) set which is used to
0 support asynchronous modem pooling.

0 Also included in the base DPN-PH is one PE/PI (V.35) set used for
0 X.75/X.75' and one PE/PI (V.35) set used for Trunking (UTP). X.75
0 or X.75' can be used to connect the DPN-PH to a Telco PPSN, or to
0 a PH of another vendor, or a carrier's PSPDN. Up to eight (8)
0 X.75/X.75' links can be supported on the PE/PI provided (speed
0 and traffic dependent). The trunks can be used to connect the
0 DPN-PH to other DPN-PHs. Up to three 64 Kbps trunks can be sup-
0 ported on the PE/PI provided. With only a software change, these
0 PE/Pis can both be used for either UTP or X.75/X.75' if desired.

0 Network Links are neither supplied nor necessary for the DPN-PH.

0 Two PEs are required for the office (OFC) function. One is al-
0 ways provided in the RM package, and the other will be supplied
0 with the RM Redundancy package. The SCSI PI for the office PE
0 must be supplied separately since it is not included with either
0 of these packages.

0 Two (2) DIU Server PEs are to be equipped in the DPN-PH.

0 The DPN-PH contains two NCS Server PEs (at G26) which are not re-
0 dundant, but may both be required depending on the NCS configura-
0 tion desired.

0 Processor Elements and Peripheral Interface cards are provisioned
0 as per the following table:

PEC	DESCRIPTION	RULE
NT9P26	Processor element (PE)	Provide as required for NCS Server, LAPB, LAPD, Async, Call Server, X.75, OAM, and DIU Server functions.
QPA137	Peripheral Interface (PI)	Provide one (1) for each OFC PE provided.
NT8P31	Peripheral Interface (PI)	Provide one (1) for each

RELEASE 28.01
93 12 03

	(8-Port V.35)	LAPB, LAPD PE provided, and one for each X.75/X.75' or UTP PE provided.
QPA164	Peripheral Interface (PI) (8-Port V.24)	Provide one (1) for each OAM/X.32 PE provided, and one for each Async PE provided.

Once the total quantity of PEs has been determined, the quantity of RM Servers can be determined. Each RM shelf can support 14 PEs and a dual shelf RM can support up to 28 PEs. All new applications should use the DPN-PH configurations as shown in Figure 13. The initial DPN-PH configuration selected depends on initial capacity and future growth requirements. Where possible, two-RM-per-cabinet DPN configurations are preferred to better utilize RM common resources.

Note that DPN-100 cabinets and shelves are not the same as DPN-10/15 equipment; thus, AMs from the older DPNs cannot be assigned to DPN-PH cabinets.

Since the number of Network Link and X.75 Link PEs (and thus the number of RMs) cannot be known in advance of the DND engineering effort, this ECM will not go into detail on this aspect of RM provisioning. The DND engineer should take the total set of required PE/Pis and select the most appropriate configuration in consultation with the System Application Engineer. Refer to NTP 241-1001-156 for detailed RM engineering information.

0 RELEASE 28.01
0 93 12 03

0
0

COOLING

0 Figure 18 DMS-100 To Data Packet Network Packet Handler (DPN-PH)

0 Network Module (NM)

0 This document will not go into detail about the provisioning of
0 the Network Module.

0 Before G26, the NM is required to provide Network Control System
0 (NCS) and data spooling for Network Management functions. It is
0 designated as a Network Management Module (NMM). For details
0 about NM and NMM engineering and provisioning, refer to NTP
0 241-1001-154.

0 Customer Premise Equipment (CPE)

0
0 Network Termination One (NT1)

0 The Network Termination One (NT1) will provide the interface be-
0 tween 2B+D 2-wire U-interface and the customers 4-wire S/T inter-
0 face.

0 One NTB11AB NT1 is required for each ISDN 'U' Line Card. All
0 standalone NT1 units are to be Merchandise Ordered by the cus-
0 tomer.

0 Offices utilizing the ISDN 'U' line card should provide one NT1
0 unit, one NT1 Power Supply and one P0706571 mounting plate to
0 provide the capability to do acceptance testing and to test these
0 ISDN lines during normal maintenance. This equipment must be Mer-
0 chandise Ordered by the customer.

0 The NT1 is an AC-powered device located at the customer's prem-
0 ise.

0 The T-Side termination hardware will be supplied by the customer
0 to connect from one to eight terminals.

0 The physical dimensions of the NT1 are 1.5"H x 7.8"W x 6.7" L. It
0 has a separate power supply always provided with dimensions 3.9"H
0 x 2.4"W x 2.3"L

0 The supply is connected directly to an AC outlet. It will supply
0 voltages of +5v, +15v and -15v via a cable to the NT1.

0 The NT1 is not required for loops using the ISDN 'S/T' Line Card.

0 M5317T/M5209T ISDN Terminal

0 All ISDN Terminals and their feature options are to be Merchan-
0 dise Ordered. Normally, each terminal requires one B-channel.
0 When the circuit-switched Data Option feature is ordered for the
0 M5317T, however, both B-channels on the BRI loop are used. A
0 maximum of two (2) B-channel LTIDs can be provisioned per loop.
0 Therefore, the total number of BRI loops may have to be increased
0 to accomodate this feature. For example, a customer with two
0 M5317T terminals assigned to one loop will require an additional
0 BRI loop if either set is upgraded with the Data Option feature.

0 The M5209T ISDN Terminal offers a choice of two data configura-
0 tion; one for packet-data services only, and another for select-
0 able circuit-/packet-switched data services. Packet service is
0 provided over a D channel at 110 to 9600 bps from an X.25 packet
0 assembler/disassembler (PAD). The circuit switched service is
0 provided over a B-channel at 110 to 19,200 bps using T-link rate
0 adaption and the Hayes 1200 command set.

0 XPM Plus Provisioning

0
0 Provisioning of XPM Plus is defined below in the following areas:

0 * DMS100

- 0 - New Orders of XPM Plus In LGCI/LTCI/DTCI/SMUI on NT6X01AD
- 0 - Adding XPM Plus To Existing Orders/Extensions
- 0 LGCI/LTCI/DTCI/SMUI Using Building Block Engineering
- 0 (BBE)
- 0 - Adding XPM Plus To Existing Orders/Extensions
- 0 LGCI/LTCI/DTCI/SMUI Using Detailed Engineering

0 RELEASE 28.01
0 93 12 03

0 * DMS-250

- 0 - New Order of XPM Plus on DTC, DTC7, and DTCI
- 0 - Adding XPM Plus To Existing Orders/Extensions of DTC,
0 DTC7, and DTCI

0 * RSCI

- 0 - Adding XPM Plus To Existing Orders/Extensions
0 LGCI/LTCI/DTCI Using Building Block Engineering (BBE)
- 0 - New Orders RCCI Detailed Engineering
- 0 - Changes To Existing Orders/Extensions RCCI

0 XPM Plus In DMS-100

0 * New Orders of XPM Plus

0 Provisioning of new production LGCI/LTCI/DTCI XPM Plus pe-
0 ripheral modules on the NT6X01AD frame at BCS 35 and above.
0 At BCS36 the SMUI may be ordered new on the NT6X01AD frame
0 with XPM Plus.

0 * BBE Adding XPM Plus To Existing LGCI/LTCI/DTCI/SMUI Modules

0 For DMS 100 offices with LGCI/LTCI/DTCI/SMUI modules that are
0 to be changed to XPM Plus LGCI/LTCI/DTCI/SMUI modules, pro-
0 vide the following if ordering with Building Block PEC codes:

- 0 - BCS 35 or later software load.
- 0 - BCS 36 or later software load for the SMUI
- 0 - NTXR34AA XPM Plus Basic software package
- 0 - One NTZZ99AH XPM Plus Packfill Change Kit.
- 0 - One NT6X02XA XPM Plus Packfill Change Kit for the SMUI
- 0 - Adequate filler face plates for slots emptied by the XPM
0 Plus Packfill Kit. Refer to the NTZZ99AH/6X02XA XPM Plus
0 Packfill Change Kit Engineering Manual section.

0 * Detailed Engineering Adding XPM Plus In LGCI/LTCI/DTCI/SMUI
0 Modules

0 For DMS 100 offices with LGCI/LTC/DTCI modules that are to be
0 changed to XPM Plus LGCI or LTCI modules, provide the follow-
0 ing if ordering with detail PEC codes:

- 0 - BCS 35 or later software load (BCS36 or later for SMUI)
- 0 - NTXR34AA XPM Plus Basic software package

0 RELEASE 28.01
0 93 12 03
0

- 0 - One NT6X02XA XPM Plus Packfill Change Kit
- 0 - Two NTB01AB Enhanced ISDN Signal Pre-processor CP
- 0 - Two designation labels for NTB01AB
- 0 - Adequate filler face plates for slots emptied by the XPM
- 0 Plus Packfill Kit. Refer to the NT6X02XA XPM Plus
- 0 Packfill Change Kit Engineering Manual section and to the
- 0 NT6X01AB CPEI Frame Engineering Manual section.

0 For BCS 34 offices, only LGCI and LTCI CPCI peripheral
0 modules can be changed to LGCI and LTCI XPM Plus CPCI pe-
0 ripheral modules.

0 XPM Plus In DMS-250

0 * DMS 250 - New Orders of DTC or DTC7

0 For DMS 250 offices adding new DTC or DTC7 XPM Plus periph-
0 eral modules, provide the following:

- 0 - BCS 35 or later software load
- 0 - NTXL79AA XPM Plus For DTC7/DTCI software package
- 0 - One DTC common CP pack fill
- 0 - Two NTMX77AA Universal Processor CP
- 0 - Two designation labels for NTMX77AA
- 0 - Two NTMX71AA XPM Plus Terminator Paddleboards
- 0 - Additional provisionable CP, filler face plates, and des-
0 ignation labels per the NT6X01AB CPEI Frame Engineering
0 Manual section.

0 * DMS-250 Ordering new DTCIs with XPM Plus

0 For DMS 250 offices adding new DTCI XPM Plus peripheral mod-
0 ules, provide the following:

- 0 - BCS 35 or later software load
- 0 - NTXL79AA XPM Plus For DTC7/DTCI software package
- 0 - One DTCI common CP pack fill
- 0 - Two NTMX77AA Universal Processor CP
- 0 - Two designation labels for NTMX77AA
- 0 - Two NTMX71AA XPM Plus Terminator Paddleboards
- 0 - Two NTB01AB Enhanced ISDN Signal Preprocessor CP
- 0 - Two designation labels for NTB01AB
- 0 - Additional provisionable CP, filler face plates, and des-
0 ignation labels per the NT6X01AB CPEI Frame Engineering
0 Manual section.

0 RELEASE 28.01
0 93 12 03

0 * DMS-250 Adding XPM Plus To Existing DTCs or DTC7s

0 For DMS 250 offices; for each DTC or DTC7 XPM peripheral mod-
0 ule to be changed to a DTC or DTC7 XPM Plus peripheral module
0 provide the following:

- 0 - BCS 35 or later software load
- 0 - NTXL79AA XPM Plus For DTC7/DTCI software package
- 0 - One NT6X02XA XPM Plus Packfill Kit
- 0 - Adequate filler face plates for slots emptied by the XPM
0 Plus Packfill Kit. Refer to the NT6X02XA XPM Plus
0 Packfill Change Kit Engineering Manual section.

0 * DMS-250 Adding XPM Plus To Existing DTCIs

0 For DMS 250 offices; for each DTCI XPM peripheral module to
0 be changed to a DTCI XPM Plus peripheral module provide the
0 following:

- 0 - BCS 35 or later software load
- 0 - NTXL79AA XPM Plus For DTC7/DTCI software package
- 0 - One NT6X02XA XPM Plus Packfill Kit
- 0 - Two NTB01AB Enhanced ISDN Signal Preprocessor CP
- 0 - Two designation labels for NTB01AB
- 0 - Adequate filler face plates for slots emptied by the XPM
0 Plus Packfill Kit. Refer to the NT6X02AB XPM Plus
0 Packfill Change Kit Engineering Manual section.

0 XPM Plus In RSCI

0 * RSCI - New Orders Of XPM Plus BBE PECs

0 For new RSCI offices whose host office has a BCS 34 or later
0 software load, provide the following if ordering Building
0 Block PEC codes:

- 0 - NTXR34AA XPM Plus Basic software package (in the Host)
- 0 - One NTZZ12NB RCCI XPM Plus Common CP pack fill
- 0 - Provisionable CP, filler face plates, and designation la-
0 bels per the NTZZ12MA RCEI Frame Engineering Manual sec-
0 tion.

0 * RSCI - New Orders Of XPM Plus Detailed PECs

0

0 RELEASE 28.01
0 93 12 03

0 For new RSCI offices whose host office has a BCS 34 or later
0 software load, provide the following if ordering detail PEC
0 codes:

- 0 - NTXR34AA XPM Plus Basic software package (in the Host)
- 0 - One NT6X12DE RCCI XPM Plus Common CP pack fill
- 0 - Provisionable CP, filler face plates, and designation la-
0 bels per the NT6X10AD RCEI Frame Engineering Manual sec-
0 tion.

0 * RSCI - Adding XPM Plus To Existing RCCI BB or Detailed Engr.

0 For all RSCI offices, whose Host office has a BCS 34 or later
0 software load, for which a RCCI XPM peripheral module is to
0 be changed to a RCCI XPM Plus peripheral module provide the
0 following if ordering detail or Building Block PEC codes:

- 0 - NTXR34AA XPM Plus Basic software package (in the Host)
- 0 - One NT6X12ZE RCCI XPM Plus Packfill Change Kit
- 0 - Adequate filler face plates for slots emptied by the XPM
0 Plus Packfill Kit.

0 Note: Refer to the Engineering Manual sections for the
0 NT6X12ZE RCCI XPM Plus Packfill Change Kit and the
0 NT6X10AD RCEI Frame or the NTZZ12MA RCEI Frame.

0 Provisioning EDCH

0
0 When provisioning the EDCH the following issues must be consid-
0 ered: (1) Timing/Feature Availability, (2) Upgrades, and New Or-
0 ders:

0 * EDCH Timing Feature Availability

0 The NTB02BA (Enhanced D-Channel Handler (EDCH)) circuit pack
0 is in BCS-35 for VOs Only. New base software (such as DCH
0 patcher) will be provided in the BCS36/BCS37 timeframe. The
0 Enhanced DCH Integration in ISDN LTC feature in BCS-35 pro-
0 vides the firmware and software changes required to integrate
0 the EDCH circuit pack into ISDN LGC/LTC peripherals. The re-
0 commended architecture for BCS-36 onwards is the Unified

0 RELEASE 28.01
0 93 12 03

0 Processor (UP), the Enhanced ISDN Signal Preprocessor (EISP),
0 and the EDCH combination.

0 Even though the EDCH is provisionable for VOs offices in
0 BCS-35, the EDCH will act as a DCH only - that is none of the
0 EDCH enhancements will be available (e.g. only 1 meg of the
0 available 4 meg is usable and the 25% increase in Real Time
0 will not be realized).

0 * EDCH Upgrade Scenarios

0 The BRI upgrade for LGCI or LTCI MUST BE in place to deploy
0 NI-2 functionality beginning in BCS-37. Therefore the hard-
0 ware changeouts must be in place, prior to the insertion of
0 BCS-37 to provide an NI-2 XPM platform (i.e. XPM+, EISP,
0 EDCH).

0 EDCH Upgrade Scenarios are defined below in terms of (1) Re-
0 quired Hardware and Software, (2) Change Tracking, (3) PRI On
0 DTCI Change, and (4) MIXED PRI and BRI on LTCI:

0 - Required Software For Hardware Support

0 The following changes are to be made to allow tracking of
0 office deployments:

0 UP (XPM+) NTXR34AA, NTXR42AA w/EISP NTX750AC

0 EISP NTX750AC w/XPM+ NTXR34AA, NTXR42AA

0 EDCH NTX750AD w/XPM+ NTXR34AA, NTXR42AA (includes
0 EISP)

0 The resulting S/W package matrix is:

	34	35	36	37	38	H/W
NTX750AB	GA	MD	MD	MD	-	MP/SP/ISP/DCH
NTX750AC	LTD	GA	A/M	MD	-	UP/EISP/DCH
NTX750AD	-	LTD	GA	GA	GA	UP/EISP/EDCH

0 This results in the following upgrade scenario's to
0 BCS37+:

0 UPGRADE FROM UPGRADE TO

0 pre-BCS34 Provision BCS36 & NTX750AD prior to BCS37

0 RELEASE 28.01
0 93 12 03

0 BCS34 Provision BCS36 & NTX750AD prior to BCS37
0 (Note: The 3-BCS Rule restriction applies) or
0 upgrade to NTX750AC prior to BCS37

0 BCS35/36 upgrade to NTX750AC or AD prior to BCS37

0 To allow NTX750AC upgrades to BCS37 (EDCH not included),
0 the EDCH will be tested to allow insertion prior to BCS
0 upgrade (ie: without NTX750AD S/W). This will avoid prob-
0 lems with the short availability of the NTX750AD package.

0 - NI-2 Service Compliance for PRI on DTCI

0 PRI is dependant on the base ISDN package NTX750AB. Up-
0 dates to the DTCI H/W will be tracked via the NTX790 or
0 other package. NI-2 features for PRI include BRI
0 functionality being introduced in the NTX750AC/AD pack-
0 ages. This will have to be determined as the PRI incre-
0 mental program is defined at a later date. Presently, no
0 impact on PRI from NTX750 package updates.

0 - NI-2 Service Compliance On Mixed BRI/PRI Offices

0 A single LTCI with mixed BRI/PRI service will function
0 properly with the XPM+ and EISP H/W and associated
0 NTX750AC/AD packages. Also, a basic XPM cannot be up-
0 graded to ISDN without wiring and backplane changes. This
0 reduces the possibility that an existing XPM would be
0 "changed" to ISDN without the required XPM H/W upgrade
0 since the process involves more than the normal "add a
0 circuit pack, change a load" method.

0 In summary, as far as this H/W upgrade is concerned, an
0 LGCI and a LTCI are the same thing, and are totally
0 independant of the DTCI H/W. Every LGCI/LTCI must be
0 changed at the same time when an upgrade is applied, ie:

	MP/SP	UP	EISP	EDCH
0 LGCI	NTX750AB	NTXR34AA	NTX750AC	NTX750AD
0 LTCI	NTX750AB	NTXR34AA	NTX750AC	NTX750AD
0 DTCI	NTX790AC	N/A	N/A	N/A

0 * EDCH UPGRADE STRATEGY

0 The introduction of this new circuit pack to the XPM environ-
0 ment, includes certain rules that XPM upgrades are going to
0 have to meet. When installing the EDCH pcb, it will occupy
0 one of the DS1 slots that a spare DCH used to occupy. To make

0 NOTE: For the cases where the EDCH circuit pack can be loaded
0 with the DCH load ... this will only apply to DCH loads
0 created in BCS35 and on.0 7.1.4 OFFICE LAYOUT INFORMATION0
0 The 2B1Q product has been designed to fully meet ANSI and
0 BELLCORE Loop Requirements (number 1 to 15). In terms of loop
0 loss at 40 kHz, the U-loop length restrictions as follows:0
0

26 gauge loop length (in kilo-feet)	Description
16.5	Operational Loss - Loop reached with 49 disturbers in cable
14.5	Application Loss - Loop reached with 49 disturbers in cable plus 6 db margin

0
00 The loop length restriction for the ISDN S/T loop is 3 kilo-feet
0 (point-to-point).0 7.1.5 TRAFFIC TABLES0
0 The traffic engineering rules for the ISDN LCME will be based on
0 the provisioning of the DS-30A links to the LGCI/LTCI. Refer to
0 ECM-497 Simplified Traffic Provisioning.0 Refer to ECM 413 ISDN Traffic Provisioning. This ECM contains
0 worksheets and tables for engineering the required quantity of

0
0 RELEASE 28.01
0 93 12 03

0 DMS-100 ISDN peripherals and DPN packet handler equipment based
0 on carried traffic and Grade of Service considerations.

0 Refer to ECM 497 (issue 05 and above) for SMUI Traffic provision-
0 ing rules.

0 Their is no change to traffic provisioning information for XPM
0 Plus peripheral modules.

0 7.2 PRODUCT/SYSTEM SPECIFICATION

0

0 7.2.1 PHYSICAL CHARACTERISTICS

0

0 Power Requirements

0

0 7.2.2 EMI/EARTHQUAKE INFORMATION

0

0 Not applicable.

0 7.2.3 SPARING INFORMATION

0

0

0

0
0 RELEASE 28.01
0 93 12 03

0 DPN Sparing

0
0 DPN equipment sparing is based on such factors as turn-around
0 time, geographic location of depot and DPN cabinets, and the
0 amount of equipment concentrated at a single location.

0 As a rule of thumb, provision as spare a minimum of one of each
0 item of DPN equipment, up to a maximum of 10% of the total count
0 of that item. Include cards, power converters, and cables in the
0 sparing.

0 7.2.4 POWER FEED AND FUSING REQUIREMENTS

0

0 ISDN CPEI Frame

0
0 Fusing will be the same as a conventional CPCE frame (NT6X01AA).

0 Packet Handler

0
0 The following gives the necessary provisioning for powering
0 the Packet Handler (PH) equipment and the DIU from the office
0 PDC.

0 Each Access Module (AM) of the packet handler uses one(1) 35 amp
0 fuse NT0X42AV.

0 Each Resource Module (RM) of the packet handler uses one(1) 35
0 amp fuse NT0X42AV.

0
0 RELEASE 28.01
0 93 12 03

0 DIU

0
0 Each DIU requires one (1) 20 Amp fuse NT0X42AV.

0 These fuses are mounted on a special fuse panel on the PDC frame
0 NT0X42AU. This panel is 8 inches high and may be mounted at po-
0 sitions 21 and 29.

0 The fuses may be assigned to positions 0-2 on the fuse panel.
0 Positions 0-2, A feed and positions 0-2, B feed are to be used.

0 Each Network module (NM) requires two 30 Amp fuses NT0X42AS.
0 These are assigned to the conventional fuse panels.

0 Prior to software Generic G24, each DIU requires one (1) 20 Amp
0 fuse NT0X42AK, assigned to a conventional fuse panel.

0 When assigning 'A' and 'B' power feeds, the following should be
0 considered:

0 a) The Packet Handler Resource Modules/Network Modules
0 should be divided evenly between 'A' powered and 'B' powered.

0 b) The Access Module is to be powered off of the same feed
0 ('A' or 'B') as the Resource Module/Network Module to which
0 its primary Network Link is connected.

0 c) The DIU is to be powered off of the same feed ('A' or
0 'B') as the Access Module to which its links or the majority
0 of its links are connected.

0 d) For an office with only one (1) Resource Module/Network Module,
0 the DIUs and Access Modules (if more than one) may be assigned
0 to different power feeds ('A' or 'B') if required to balance
0 the 'A' and 'B' power requirements.

0 7.2.5 CURRENT DRAIN INFORMATION

0
0 ISDN CPEI Frame Current Drain is as follows:

0
0 RELEASE 28.01
0 93 12 03

0 Current drain - 35 Amps

0 Heat Dissipation - 1700 Watts

0 7.3 SOFTWARE PROVISIONING

0

0 7.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

0 Provision ISDN software packages as follows:

	34	35	36	37	38	H/W
0 NTX750AB	GA	MD	MD	MD	-	MP/SP/ISP/DCH
0 NTX750AC	LTD	GA	A/M	MD	-	UP/EISP/DCH
0 NTX750AD	-	LTD	GA	GA	GA	UP/EISP/EDCH
0 NTXS36AA	-	GA	GA	GA	GA	DTCI W/WO DWS

0 The necessary packages to support XPM PLUS (XPM+) on DTCI modules are:

0 NTXR34AA	(allow XMP+)
0 NTX750AC	(allow XPM+ on ISDN)
0 NTXS36AA	(for DMS100 DTCI only)
0 NTXL79AA	(for DMS250 DTCI only)

0 For Basic Rate Interface (BRI):

0 NTX750 - ISDN BASIC ACCESS
0 NTX753AA - ISDN ADVANCED SIGNALING

0 For BRI Functional Signaling:

0 NTX754AA - ISDN ELECTRONIC KEY TELEPHONE SERVICE
0 NTX755AA - ISDN SUPPLEMENTARY SERVICES COMPLIANCE

0 For Primary Rate Interface:

0 NTX790AA/AB - ISDN Primary Rate Interface Base
0 NTX791AA - ISDN Primary Rate Interface Networking

0 Note: If a DTCI is used for MF Trunks only, the NTX790AA/AB ISDN Pri-
0 mary Rate Interface Base software package must still be provided in
0 order to datafill the module as DTCI.

0

0 RELEASE 28.01
0 93 12 03

0 Package NTX790AA is MD as of BCS-30 and replaced by NTX790AB. Two (2)
0 new software packages have been created. These are:

0 NTX793AA - PRI Intergrated Services Access
0 NTX794AA - PRI CCS7 Interworking

0 Any offices ordering NTX790AA in BCS-29 or earlier is to be upgraded
0 to NTX790AB, NTX793AA, and NTX794AA in conjunction with their next
0 scheduled BCS-30 or higher load.

0 2B1Q capabilities will be provided under the standard ISDN NTX750AB
0 feature package.

0 BCS-31 will enable the LCME to support only ISDN lines. BCS-32 will
0 enable the LCME to support in addition to ISDN lines POTS, EBS, and
0 DATAPATH lines.

0 The software feature package needed to provide ISDN and MBS services
0 for SMUI is NTX387AC.

0 Check the appropriate SMS (Software Management System) report for
0 availability and to confirm required supporting packages.

0 For XPM Plus the following packages are required in addition to other
0 ISDN packages:

0 NTXR34AA XPM Plus Basic (DMS 100) (Rate Change Pending)
0 Note: NTRX34AA is rated MD effective BCS-35 and replaced by
0 NTRX34AB

0 NTXL79AA XPM Plus for DTCI (DMS 250)

0

0 7.3.2 SOFTWARE USAGE RESTRICTIONS

0

0 The software development for 2B1Q will be done in two phases. In
0 the first phase (BCS31), the LCME will support only ISDN lines.
0 In the second phase (BCS32), the LCME will support in addition to
0 ISDN lines POTS, EBS, and DATAPATH lines.

0

0
0 RELEASE 28.01
0 93 12 03

0 Software Packages NTX793AA and NTX794AA are provisioned based on
0 customer requirements. For example, if an ISDN office does not
0 support CCS7, the NTX794AA software package need not be ordered
0 when the offices is being upgraded to BCS-30.

0 NOTE: Package NTX550AA - CCS7 - TRANSACTION SERVICE SUPPORT is
0 needed in an ISDN office if CCS7 interworking is to be available
0 in that office.

0 BCS-31 MTU software load must be installed for a MTU to work with
0 2B1Q lines. If ALT (Automatic Loop Testing) is required, a dedi-
0 cated MTU must have the ALTUSE field in MTAHORIZ table selected
0 as YES. Any LTUs that have access to the LCMEs on the MTA verti-
0 cals must have the ALTUSE field selected as NO.

0 The SMUI will not support E911 PSAP calls. An enhanced SMU may
0 be distinguished from a non-ISDN/MBS SMU by the fact that it has
0 a EISP provisioned on it in table LTCINV. The DMS-100 software
0 will not allow a Public Safety Answering Point (PSAP) which is
0 used for terminating E911 calls, to be provisioned on a SMU with
0 a EISP provisioned on it. Also, a EISP will not be allowed to be
0 provisioned on a SMU that has one or more PSAPs provisioned on
0 it.

0
0 7.3.3 MEMORY PROVISIONING

0
0 Memory provisioning for the DTCTI, LGCI, LTCTI, LCME is as follows:

0	Module	Data Store Datafill Words Required
0	-----	-----
0	DTCTI	717
0	LGCI	1428
0	LTCTI	1428
0	LCME	4511

0 Memory provisioning for the SMUI is as follows:

0 PS - 23 kbytes

0
0 RELEASE 28.01
0 93 12 03

0 DS - 1.5 kwords
0 Datafill DS - 1.5 kwords

0 7.4 REAL TIME IMPACT

0

0 7.4.1 Real Time Engineering (BRI)

0

0 LGCI/LTCI Real Time Engineering (BRI)

0
0 The following chart illustrates the call types which impact Real
0 Time Engineering of the Master Processor in the LGCI provisioned
0 with Basic Rate Interface (BRI). Currently, the Master Processor
0 is the only processor which requires Real Time Engineering.

CALL TYPE	BCS	
	27	28+
-----	--	---
ISDN Circuit Switched	Y	Y
B Channel Packet Switched	N	N
D Channel Packet Switched	N	N
Electronic Business Set	Y	Y
Datapath	Y	Y
Other (POTS and MDC)	N	Y

0 Refer to System Engineering Bulletin (SEB) 90-05-002 for BCS Ab-
0 breviated Real Time Engineering Guidelines for the LGCI/LTCI.

0 SMUI Real Time Call Attempt Capacity

0

0

0 RELEASE 28.01
0 93 12 03
0

0 The table below shows the maximum Calls Per Hour (CPH) that the
0 SMUI can handle at the HDBH engineered maximum for each
0 processor. The Master Processor is engineered to 80% and the
0 Signal Processor is engineered to 90%. The processor that is
0 limiting can vary with the call mix that is used by each partic-
0 ular site. Again, the CPH numbers represent Originations + Ter-
0 minations. Each call mix assumes a 50/50 split of
0 Originating/Terminating traffic.

0		Master	Signal
0	POTS DT	15,100	14,900*
0	ISDN	7,100*	12,700
0	MBS	9,750*	13,976

0 * = Limiting Processor

0 Refer to System Engineering Bulletin (SEB) 92-05-002 Enhanced SMU
0 Performance Guidelines for more detailed information on the SMUI.

0 7.4.2 Real Time Engineering (PRI)

0
0 Refer to System Engineering Bulletin (SEB) 89-10-001 for PRI/BRI
0 CC Real Time.

0 RELEASE 28.01
0 93 12 03

0 8.0 Integrated ISDN OAM Processor System

0 The Integrated Services Digital Network (ISDN) system combines
0 the circuit switching capabilities of the DMS-100 and the packet
0 switching capabilities of Digital Packet Network (DPN) equipment.

0 Currently, there are three separate interfaces for managing the
0 Operations, Administration and Maintenance (OAM) of the ISDN
0 node:

- 0 - Maintenance and Administration Position (MAP), for perform-
0 ing OAM of circuit switching equipment,
- 0 - Network Control System (NCS), for querying and activating
0 changes to packet services on the DPN packet handler (PH), and
- 0 - Network Administration System (NAS), resident on a mainframe
0 computer, for provisioning and configuring packet services.

0 To integrate these functions into a single user interface, the
0 Integrated ISDN OAM system is being introduced (hereinafter re-
0 ferred to as the "OAM system"). The OAM system consists of links
0 between DMS and DPN equipment, allowing the DMS MAP terminal to
0 access packet handler configuring functions. For example, the
0 MAP operator can assign DS-1 links to the Digital Interworking
0 Unit (DIU), and then configure ports from the DIU to the Access
0 Module. DMS-style service orders are translated into changes to
0 the packet handler Master Configuration File. This translation
0 is done by the OAM Processor (OAMP), a workstation-based process-
0 ing engine. The OAM system configuration is illustrated in Fig-
0 ure 1.

0 A standard MAP terminal is used to access the ISDN OAM system
0 from the DMS. The OAM link between the DMS and DPN is a 9600
0 bits/sec RS-232C (V.24) connection. At the DMS, it is connected
0 to an NT1X89AA Multiprotocol Controller (MPC) CP. At the DPN
0 end, this link connects to a standard Peripheral Interface (PI)
0 and LAPB Processing Element (PE) combination.

0 The OAMP workstation is currently based on a Sun Microsystems
0 Model 3/80 processor unit, equipped with disk drives but no key-
0 board or monitor. A separate VDU terminal is required with the
0 OAMP for performing maintenance functions. A 1/4-inch tape drive
0 with a SCSI interface to the processor unit supports the loading
0 of software cartridge tapes.

0

RELEASE 28.01
93 12 03

The processor is connected to the DPN packet switch via the same PI/PE set as the DMS-DPN link. The OAMP link is an RS-232C (V.24) link running at 19200 bits/sec. Modems, data units or other local data sets are required on the DMS-to-DPN link and the OAMP-to-DPN link to comply with Isolated System Grounding (ISG).

At present, the OAM system only supports a single link between DMS and DPN, as illustrated. In the event of link failure, warning logs are generated and corrective action is taken by maintenance personnel.

0
0 RELEASE 28.01
0 93 12 03

0 8.1 HARDWARE PROVISIONING

0

0 8.1.1 HARDWARE USAGE RESTRICTIONS

0

0 Each ISDN node, consisting of one DMS switch and one DPN switch,
0 can have only one (1) OAMP.

0 8.1.2 HARDWARE DEPENDENCIES

0

0 The ISDN OAM system combines existing MAP and NCS functions, re-
0 moving the need for separate NCS terminals. The DMS MAP
0 position(s) become the primary man-machine interface for the en-
0 tire ISDN node.

0 ISDN packet service provisioning using the OAM system is compat-
0 ible with existing NAS provisioning activities. The two systems
0 co-operate by merging changes to PH configuration before activat-
0 ing them on the packet switch.

0 See Provisioning section for details of DMS and DPN hardware re-
0 quired to support the OAMP.

0 8.1.3 PROVISIONING CONSIDERATIONS

0

0 | This product is no longer orderable. This information is for ex-
0 isting product support only.

0 Engineer the ISDN OAM system as follows:

0

0 Host - Signalling Interface Equipment
0 Chapter 7

Page 7-270

0 Order one (1) NTB95AA Sun Microsystems Model 3/80 CPU. The OAMP
0 processor unit is packaged together with a 208 MB hard disk, 8
0 MByte memory, and other hardware and software options under a
0 single ordering code.

0 Order one (1) A0351570 1/4" SCSI ISDN-OAMP Software Tape. One (1)
0 Sun Tape Drive A0368521 must be ordered so that the 1/4" SCSI S/W
0 tape can be loaded onto the system. The tape contains download
0 utility software required for the Sun workstation to enable com-
0 munication between the OAMP and to the DMS. To order the tape
0 for Canadian applications, contact the V/O Software Production
0 Department S645/7Q43 (Manager: Rick Barre).

0 One (1) approved VT-100-compatible or VT-220-compatible VDU ter-
0 minal is required for loading software and performing commission-
0 ing tests on the OAMP unit. Additional MAP terminals may be
0 provided as required by the telco. If the telco requests NT to
0 provide the terminals, refer to ECM440 or ECM372 for VDUs that
0 are approved and tested with the OAMP system.

0 Provision one (1) NT1X89AA Multiprotocol Controller (MPC) CP in a
0 DMS IOC shelf as needed. Each MPC card has two ports. A MDC
0 card should be dedicated to the DMS-DPN link.

0 Modems are to be used on the DMS-DPN link in order to support ISG
0 isolation. Provide 9600 baud synchronous modems as per ECM313
0 (UDS Modems) or ECM349 (Case Rixon Modems). Two (2) such modems
0 are required on the DMS-DPN link. On the OAMP-DPN link, the cus-
0 tomer is to provide two (2) 19200 baud modems.

0 In place of modems on either link, the Telco can merchandise-
0 order Low Speed Data Units (ie. NT4X25__) from NT. These are
0 available in standalone or rack-mount configuration. In the
0 U.S., Data Units may also be ordered on a COEO basis. Maximum
0 cable distance allowed between Data Units depends on cable gauge
0 used:

Gauge	Maximum Distance
-----	-----
26	4.0 km (2.5 miles)
24	5.5 km (3.4 miles)
22	5.7 km (3.5 miles)

0 Refer to ECM418, DPN Equipment Provisioning section, for informa-
0 tion regarding DPN engineering responsibilities. For the OAM
0 system, one (1) 8-port V.24 Peripheral Interface (PI) card and
0 one (1) LAPB Processor Element (PE) card are required. This pair

0 RELEASE 28.01
0 93 12 03

0 of cards will handle both the DMS and the OAMP links. They are
0 already included in new minimum packet handler configurations.
0 In existing offices with spare port capacity, a 4-port PI card is
0 acceptable.

0 When an 8-port PI card is used, NT8P67__ cables are to be engi-
0 neered by DND to appropriate length between the PI card and the
0 modem. This cable is equipped with a standard male RS-232C con-
0 nector at the modem end. When a 4-port PI card is used, refer to
0 CA drawings for cabling details.

0 8.1.4 OFFICE LAYOUT INFORMATION

0
0 DMS-100 equipment, DPN-100 equipment, and OAMP unit must be lo-
0 cated within the maximum distance limitations of the data commu-
0 nications method employed. Refer to Provisioning Information for
0 details. The OAM processor unit is normally co-located with the
0 DMS for ease of access to software loading and maintenance equip-
0 ment.

0 Dimensions of the NTB95AA processor unit are as follows:

0 2.8" H x 16.0" W x 16.0" D (7.1cm H x 40.6cm W x 40.6cm D)

0 These dimensions are too large to permit housing the processor
0 unit on a standard MIS frame Common Equipment Shelf. Instead, it
0 may be positioned on a desktop near the MAP.

0 8.2 PRODUCT/SYSTEM SPECIFICATION

0

0 8.2.1 PHYSICAL CHARACTERISTICS

0

0 CURRENT DRAIN

0

0 For reliability, the OAMP and all modems or data units can be
0 powered from DC to AC inverters. Particularly, the OAMP must be
0 powered from essential AC (eg. from an Uninterruptible Power Sup-
0 ply (UPS)) to prevent problems during disk write operations due
0 to power glitches and interruptions. Modems which interface di-
0 rectly to the MPC card or PI card must be powered from isolated
0 inverters, mounted on a dedicated MIS frame. The OAMP unit and
0 its VDU are powered from inverters referenced to the DMS frame
0 ground. This ground reference is chosen because the OAMP unit
0 will probably be located near the DMS MAP, and it is desirable
0 that the MAP and OAMP equipment be at the same ground potential
0 to avoid shock hazard. Refer to ECM289 Isolated System Grounding
0 for further information.

0 A standard A0367433 LaMarche inverter can be provisioned to power
0 the OAMP and its VDU, which consume a total of 85 watts at 110
0 volts AC.

0 8.2.2 EMI/EARTHQUAKE INFORMATION

0

0 Not applicable.

0
0 RELEASE 28.01
0 93 12 03

0 8.2.3 SPARING INFORMATION

0
0 Standard DMS and DPN sparing algorithms apply. Spare hardware
0 for the OAMP workstation is not mandatory.

0 8.3 SOFTWARE PROVISIONING

0

0 8.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0
0 Software for the OAMP system has been packaged under a master
0 package (which is distributed as standard PM load and docu-
0 mented):

0 NTXD15AC replaces NTXD15AB ISDN INTEGRATED OAM

0 Contains: NTXF92AA ISDN OAM Base - STATUS MD
0 NTXF93AA ISDN Provisioning - Reused for DMS PH
0 NTXF94AB ISDN NCS Passthru - STATUS MD
0 NTXF95AA ISDN OAM Processor* - STATUS MD
0 NTXJ48AA ISDN Integrated PH Maintenance with
0 OAMP Required - STATUS MD

0 * Package NTXF95AA contains the software which runs on the Sun
0 processor. The other packages are standard DMS packages.

0 OAMP29 software is no longer supported; OAMP30 is the minimum
0 base. At BCS31 RTM, the OAMP software will be OAMP31 base.

0 Check the appropriate SMS report for availability and to confirm
0 required supporting packages.

0

0

0
0 RELEASE 28.01
0 93 12 03

0 8.3.2 SOFTWARE USAGE RESTRICTIONS

0
0 Minimum BCS29 DMS software and G25 DPN hardware and software is
0 required to run the OAM system. If a Digital Equipment Corpo-
0 ration (DEC) VAX is the host computer for the NAS system, it must
0 be equipped with minimum release 5.01 software.

0 8.3.3 MEMORY PROVISIONING

0
0 Refer to the Memcalc tool for memory provisioning calculations.

0 8.4 REAL TIME IMPACT

0 This product has no impact on call processing capacity of the
0 DMS.

0 9.0 International Frame LGE/DTE/LTE

0 The first application for the NT6X01AC International Frame LGE/DTE/LTE
0 Fiber ISDN is the Australia DMS-100 Intelligent Network.

0 The NT6X01AC International Common Peripheral Controller Equipment
0 Frame was developed for the DMS-100 Intelligent Network product for
0 the international market. The NT6X01AC design is based on the domes-
0 tic NT6X01AB ISDN peripheral controller, adapted for applications out-
0 side North America ("International"). It supports PCM30 links, ISDN
0 services, and Common Channel Signaling 7 (CCS7) features on two inde-
0 pendent peripheral modules.

0 9.1 HARDWARE PROVISIONING

0

0 9.1.1 HARDWARE USAGE RESTRICTIONS

0

0 NT6X01AC International Peripheral Controller Equipment Frame

0 The NT6X01AC International Peripheral Controller Equipment frame
0 supports two peripheral module types: PCM-30 LGC and DTC.

0 PCM-30 LGC - Supports ISDN, Centrex, EBS, IBN and POTS services
0 on standard Line Concentrating Module types

0 - Has PCM-30 P-side links for PRLCM and International
0 Remote Switching Center interface

0 - Operation as a non-ISDN peripheral is not yet imple-
0 mented in software, meaning that the NTB01AA ISDN
0 Pre-Preprocessor CP is required even if no ISDN fea-
0 tures are used

0 - Supports AMI interface to the NT1. 2B1Q is not sup-
0 ported for this interface

0 PCM-30 DTC - Supports CCS7 and R1 signaling in International ap-
0 plications, using PCM-30 links.

0 - ISDN services like Primary Rate Interface are not
0 supported

0 Modules of different types may be mixed on the frame if required.

0 NTB02AA D-Channel Handler CP are not required for PCM-30 DTC ap-
0 plications, nor where the PCM-30 LGC supports only non-ISDN LCMs.

0 NTB01AA ISDN Pre-Processor CP are always required on PCM-30 LGC
0 (until such time as software supports purely non-ISDN operation).
0 This CP is not required on PCM-30 DTC.

0

0 9.1.2 HARDWARE DEPENDENCIES

0
0 All PCM-30 links from a PRCC must terminate on the same host
0 PCM-30 LGC. Only the PCM-30 LGC peripheral type can terminate
0 PRCC host links.

0 9.1.3 PROVISIONING CONSIDERATIONS

0
0 NT6X01AC International Frame LGE/DTE/LTE ISDN

0 Common Circuit Packfill:

0 NT6X01AC is a general purpose Common Peripheral Controller Equip-
0 ment Frame for applications outside North America ("Internat-
0 tional"). It houses two dual shelf peripheral modules which
0 support PCM30 links, ISDN services, and Common Channel Signaling
0 7 (CCS7) features. Each peripheral module is housed on two adja-
0 cent shelves (ie. a pair of shelves on positions 65 and 51 and a
0 pair of shelves on positions 32 and 18).

0 Each of the two modules in the frame may be configured as:

- 0 - LGCO Line Group Controller Offshore Non-ISDN,
- 0 - LGC0I Line Group Controller Offshore ISDN,
- 0 - DTC0 Digital Trunk Controller Offshore Non-ISDN,
- 0 - DTC0I Digital Trunk Controller Offshore ISDN, or
- 0 - TMS (TOPS Message Switch) for
 - 0 - TPC (TOPS Position Controller) interface,
 - 0 - Data base access, and
 - 0 - Inter DCH (D-Channel Handler) for
- 0 ORDB (Operator Reference Database).

0 Cooling Inverter Unit:

0 Provide for each frame,

- 0 - one (1) NT3X90AC Cooling Inverter Unit.

0 Isolated System Grounding:

0 When extending existing offices not equipped with Isolated System
0 Grounding (ISG), provide:

- 0 - one (1) NT0X0009 Logic Return Cable Assembly.

0

0

0 RELEASE 28.01
0 93 12 03

0 Common Circuit Packfill:

0 Provide per customer requirements:

0 - maximum two (2) NT6X02UB LGC/DTC Common CPs (International).

0 NT6X02UB replaces NT6X02UA.

0 Filler Faceplates for Unequipped Modules:

0 When shelves 18-32 or 51-65 are not equipped with any circuit
0 packs, provide for each module:

0 - one (1) NT6X02AB CPC Filler Faceplates.

0 Filler Faceplates for Unequipped CP Slots:

0 For each unequipped circuit pack position on the module, provide:

0 - one (1) NT0X50AA filler faceplate.

0 ISDN Applications:

0 When ISDN BRA functions are required (ISDN functions on sub-
0 scriber lines) for each equipped LGC module, provide:

0 - up to nine (9) NTB02AA D Channel Handler CPs.

0 In BCS-28 or later, provide for use as a hot spare:

0 - one (1) additional NTB02AA D Channel Handler CP.

0 Note that NTB01AA/AB and NTB02AA ISDN CPs may not be provi-
0 sioned on a DTC which is provisioned with NT6X70AAs to handle
0 CCIS/CCS7 voice trunking.

0 DCH CP are not required on a PCM-30 DTC module nor where a PCM-30
0 LGC module supports only non-ISDN LCMs.

0 For TMS (TOPS Message Switch) applications, provide:

0 - four (4) NTB02AA D Channel Handler CPs.

0 Each NTB02AA supports up to 124 BRI D-Channels. The spare DCH
0 CP should not be counted when determining the number of NTB02AA
0 required to support D-channel traffic.

0
0 RELEASE 28.01
0 93 12 03

0 Each NTB02AA DCH, including the spare, requires one (1) peripheral port on the PCM-30 LGC module. Assign NTB02AA cards to shelf and slot positions in the following order. The spare DCH should be assigned last:

DCH PACK PROVISIONED	SHELF POSITION	CP POSITION	ASSIGN TO LOGICAL PORT NUMBER
1st DCH CP Provisioned:	X+14	1	19
2nd DCH CP Provisioned:	X	1	17
3rd DCH CP Provisioned:	X+14	2	15
4th DCH CP Provisioned:	X	2	13
5th DCH CP Provisioned:	X+14	3	11
6th DCH CP Provisioned:	X	3	09
7th DCH CP Provisioned:	X+14	4	07
8th DCH CP Provisioned:	X	4	05
9th DCH CP Provisioned:	X+14	5	03
10th DCH CP Provisioned:	X	5	01

0 Where:

0 For the lower module in the frame
0 shelf position X=18, X+14=32

0 For the upper module in the frame
0 shelf position X=51, X+14=65

0 RELEASE 28.01
0 93 12 03

0 PCM-30 Interface CPs:

0 Provide for each equipped LGC or DTC module, as per customer re-
0 quirements:

0 - maximum eight (8) NT6X27AC/BB PCM-30 Interface CPs.

0 For each TMS module,

- 0 - For TPC (TOPS Position Controller) interface,
 - 0 - for up to 64 operators, provide:
 - 0 - two (2) NT6X27AC/BB PCM-30 Interface CPs
 - 0 in CP slots 5 of both shelves, and
 - 0 - for more than 64 operators and up to 96 operators,
 - 0 provide an additional:
 - 0 - one (1) NT6X27AC/BB PCM-30 Interface CP
 - 0 in CP slot 4 of shelf 0,
- 0 - For data base access, provide:
 - 0 - two (2) NT6X27AC/BB PCM-30 Interface CPs
 - 0 in CP slot 4 of shelf 1 and
 - 0 in CP slot 3 of shelf 0, and
- 0 - For inter DCH ORDB, provide:
 - 0 - one (1) NT6X27AC/BB PCM-30 Interface CP
 - 0 in CP slot 3 of shelf 1.

0 Otherwise provide for each unequipped CP slot:

- 0 - one (1) NT0X50AA Filler Faceplate.

RELEASE 28.01
93 12 03

Provide one (1) NT6X27AC/BB for every two PCM 30 ports required.

Peripheral port/pack location relationship is as follows:

CP POS	5	4	3	2
SHELF POS X+14	PORTS 2, 3	PORTS 6, 7	PORTS 10, 11	PORTS 14, 15
SHELF POS X	PORTS 0, 1	PORTS 4, 5	PORTS 8, 9	PORTS 12, 13

Where:

For the lower module in the frame
shelf position X=18, X+14=32

For the upper module in the frame
shelf position X=51, X+14=65

Assign NT6X27AC/BB to module starting at port 0 and continue in sequential order to port 15.

Each NTB02AA already assigned to CP pos 2 to 5 physically makes the two PCM 30 ports shown above unavailable for assignment to PCM 30.

LCM Interface CPs:

For PCM-30 LGC applications, to interface links from LCMI and/or LCM, provide:

- four (4) NT6X48AA DS30A LCM Interface CPs.

The NT6X48AA CP are assigned in pairs for reliability. One member of the pair interfaces the same DS30A ports as the other member. Each member of the pair occupies the same CP position, with one CP assigned to LGAI/LTAI 0 (lower shelf of the module) and the other assigned to LGAI/LTAI 1 (upper shelf of the module).

0 The two pairs of NT6X48AA provide interfaces for up to twenty
0 (20) DS30A ports (links) from LCMEs, LCMIs, and/or LCMs.

0 The following is a listing of DS30A ports per DS30A LCM Interface
0 CP, NT6X48AA location:

0			
0			
0		CP POS 6	CP POS 7
0	PORT	2	0
0	PORT	3	1
0	PORT	6	4
0	PORT	7	5
0	PORT	10	8
0	PORT	11	9
0	PORT	14	12
0	PORT	15	13
0	PORT	18	16
0	PORT	19	17

0 The ports for DS30A must be selected from the those ports that
0 remain after assignment of port circuits.

0 Assign ports to DS30A in the following sequence: 19, 17, 18, 16,
0 15, 13, 14, 12, 11, 9, 10, 8, 7, 5, 6, 4, 3, 1, 2 and 0 (if un-
0 used by DCH or DS-1). In an extension job, when adding new DCH
0 ports, the DS30A ports may have to be reconfigured in accordance
0 with this rule.

0 RELEASE 28.01
0 93 12 03

0 Two Processor XPM (MP/SP) or XPM Plus (UP):

0 For offices with the XPM (MP/SP) feature, provide for each
0 equipped LGC or DTC module:

- 0 - four (4) NT6X45BA LGC/DTC Processor CPs,
- 0 - two (2) NT6X47AC 4MB MP Memory CPs,
- 0 - two (2) NT0X50AA Filler Face Plates in slot 10, and
- 0 - two (2) NT6X46BA/BB Signal Processor Memory Plus CPs.

0 Also provide NTB01AAs per 2) below.

0 Alternatively, for offices with the XPM Plus (UP) feature, pro-
0 vide for each equipped LGC or DTC module:

- 0 - two (2) NTMX77AA XPM Plus Processor CPs,
- 0 - two (2) NTMX71AA XPM Plus Paddleboards,
- 0 - one (1) NT6X01WE Wiring List XPM Plus, and
- 0 - eight (8) NT0X50AA Filler Face Plates
- 0 in slots 8, 9, 10, and 11.

0 Also provide NTB01ABs per 2) below.

0 In offices with the XPM (MP/SP) feature, provide:

- 0 - for each equipped LGC module:
 - 0 - two (2) NTB01AA ISDN Sig. Preproc. CPs.
 - 0 (Note that NTB01AAs must be provisioned for LGC
 - 0 even when ISDN services are not required).
- 0 - for each equipped DTC module:
 - 0 - when ISDN services are required,
 - 0 - two (2) NTB01AA ISDN Sig. Preproc. CPs, or
 - 0 - when ISDN services are not required,
 - 0 - two (2) NT0X50AA Filler Face Plates.

0 Note that NTB01AA ISDN CPs may not be provisioned on a DTC which
0 is provisioned with NT6X70AAs to handle CCIS/CCS7 voice trunking.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 In offices with the XPM Plus (UP) feature, provide:

- 0 - for each equipped LGC module:
 - 0 - two (2) NTB01AB ISDN Sig. Preproc. CPs.
 - 0 (Note that NTB01ABs must be provisioned for LGC
 - 0 even when ISDN services are not required).
- 0 - for each equipped DTC module:
 - 0 - when ISDN services are required,
 - 0 - two (2) NTB01AB ISDN Sig. Preproc. CPs, or
 - 0 - when ISDN services are not required,
 - 0 - two (2) NT0X50AA Filler Face Plates.

0 Note that NTB01AB ISDN CPs may not be provisioned on a DTC which
0 is provisioned with NT6X70AAs to handle CCIS/CCS7 voice trunking.

0 For existing modules being converted from XPM to XPM Plus pro-
0 vide:

- 0 - for each equipped LGC module:
 - 0 - one (1) NT6X02XB XPM Plus Change Kit and
 - 0 NT0X50AA Filler faceplates per EMS
 - 0 EMA2-99-XPM-9 for NT6X02XB.
- 0 - for each equipped DTC module:
 - 0 - In a Non-ISDN environment,
 - 0 - one (1) NT6X02XA XPM Plus Change Kit and
 - 0 NT0X50AA Filler faceplates per EMS
 - 0 EMA2-99-XPM-6 for NT6X02XA, or
 - 0 - In an ISDN environment,
 - 0 - one (1) NT6X02XB XPM Plus Change Kit and
 - 0 NT0X50AA Filler faceplates per EMS
 - 0 EMA2-99-XPM-9 for NT6X02XB.

0 (NT6X02XB has the same parts as NT6X02XA plus two (2) NTB01ABs)

0 Wiring Option for Non-ISDN:

0 Provide one (1) NT6X01WD Wiring Option when ISDN features are not
0 required on the frame. The option adds a wire strap to the back-
0 panel NT6X0103 Slot XX-12 between pins 7A and 8A to allow for
0 non-ISDN operation.

0
0 RELEASE 28.01
0 93 12 03

0 Continuity Tone Detector CPs:

0 When this module is handling CCIS/CCS7 voice trunking, provision
0 for each PCM-30 DTC module:

- 0 - two (2) NT6X70AA Continuity Tone Detector CPs.

0 Note that NT6X70AAs for CCIS/CCS7 voice trunking, may not be pro-
0 visioned on a DTC which is provisioned with NTB01AA/AB ISDN CPs.

0 This CP supports a Continuity Test (COT), and is recommended
0 whenever analog facilities are employed in part or all of the
0 transmission path.

0 When the facility is end-to-end digital, this CP is not required
0 since digital facilities employ other means of fault detection.

0 An LGC may not be provisioned with NT6X70AA CPs.

0 Calling Number Display Feature CPs:

0 When the module is handling CMS Calling Number Display feature,
0 provide for each PCM-30 LGC module:

- 0 - two (2) NT6X78AA/AB CLASS Modem Resource CPs.

0 Universal Time Switch CPs:

0 Provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT6X44EA Universal Time Switch (UK) CPs.

0 Universal Tone Receiver CPs:

0 When analog (POTS) lines are to be supported, or when non-ISDN
0 trunks (A/B bit signalling) are interfaced to a PCM-30 DTC mod-
0 ule, provide the following Universal Tone Receiver (UTR) CP for
0 each PCM-30 LGC module:

- 0 - maximum two (2) NT6X92CA UTR CPs.

0 RELEASE 28.01
0 93 12 03

0 Message Protocol and Downloadable Tone CPs:

0 Provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT6X69LB Msg Protcl & Downldbl Tone CPs.

0 The NT6X69LB is recommended for use in all applications in place
0 of the NT6X69LA. However, depending on availability, the
0 NT6X69LA may be used when fiber network interface is not re-
0 quired.

0 Network Interface CPs:

0 When DS30 copper network interface is required in a non-ENET of-
0 fice, provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT6X40AC packs DS30 Network Interface CPs.

0 Otherwise, when fiber network interface is required in an ENET
0 office, provide for each PCM-30 LGC/DTC module:

- 0 - one (1) NT6X02BU Fiber I/F H/W Assembly,
0 - two (2) NT6X40FA DS512 Network Interface CPs,
0 - two (2) NT6X40GA DS512 Paddle Boards, and
0 - two (2) P0736273 Optical Fiber Danger Labels.

0 Depending on availability, NT6X40CA and NT6X40DA functional pair
0 may be used in place of the preferred NT6X40FA and NT6X40GA func-
0 tional pair. The paddleboards and circuit packs cannot be mixed
0 because they do not function in mismatched pairs.

0 Also both pairs in a module must be NT6X40FA and NT6X40GA or both
0 NT6X40CA and NT6X40DA. In other words if one of the pairs in the
0 module is NT6X40FA and NT6X40GA, the other pair in the module may
0 not be NT6X40CA and NT6X40DA.

0 Power Conversion CPs:

0 Provide for each PCM-30 LGC/DTC module:

- 0 - two (2) NT2X70AE Power Conv +/-5V & 12V CPs.

0 Designation Labels for CPs:

0 Provide the appropriate designation label for each CP provided.

0
0 RELEASE 28.01
0 93 12 03

0 PCM-30 Signaling CPs:

0 For each equipped LGC/DTC which supports PCM30 links (NT6X27
0 PCM-30 Interface CPs), or for each equipped LGC module which sup-
0 ports links to an LCM (NT6X48 DS30A LCM Interface CPs provided),
0 and the LCM is equipped with a PCM30 line drawer such as the
0 NT6X05CA, provide:

0 - two (2) NT6X28AA PCM-30 Signaling CPs.

0 CPC Coax Panel:

0 When PCM30 feature is required, provide for each PCM-30 LGC/DTC
0 module:

0 - one (1) NT6X01ZA CPC Coax Panel.

0 When this feature is to be field installed, then the NT6X01ZA CPC
0 Coax Panel will require the following supporting documents:
0 PC6X01ZB and SRJ6X01AC.

0 10.0 International Frame Remote Controller ISDN

0 The first application for the NT6X10AE International Frame Remote
0 Controller ISDN is the Australia DMS-100 Intelligent Network.

0 The NT6X10AE International Frame Remote Controller ISDN (RCEI) is
0 based on the domestic NT6X10AD ISDN RCE, adapted for Interna-
0 tional (outside of North America) markets. For remote applica-
0 tions it supports POTS, Centrex and limited ISDN services on
0 standard International and ISDN Line Concentrating Modules
0 (LCMs). PCM30 trunks link the RCEI to the host peripheral con-
0 troller.

0 10.1 HARDWARE PROVISIONING

0

0 10.1.1 HARDWARE USAGE RESTRICTIONS

0

0 NT6X10AE International Remote Controller Equipment Frame

0 Unlike its domestic equivalent, the international RCEI frame
0 houses only one (1) Remote Maintenance Module (RMM) shelf. The
0 Remote Cluster Controller shelf is abbreviated "PRCC" (PCM-30 Re-
0 mote Cluster Controller).

0 Note that the following features are NOT supported on the Inter-
0 national RCEI:

0 - P-side PCM-30 links

0 - ISDN Primary Rate Interface (PRI)

0 - Emergency Standalone (ESA) - planned for a future BCS

0 - Intraswitched calls (all calls must be switched via the host
0 office; this must be taken into account when provisioning
0 host links)

0 - Dual RCC

0 - Remote off remote

0 - Data Unit line cards

0 In BCS-31, ISDN Basic Rate Interface (BRI) is not supported. This
0 restriction is removed in BCS-32, at which time LCMI and LCME
0 modules may be interfaced to the PRCC.

0

0

0

0
0 RELEASE 28.01
0 93 12 03

0 10.1.2 HARDWARE DEPENDENCIES

0
0 All PCM30 links from a PRCC must terminate on the same host PLGC.
0 Only the PLGC peripheral type can terminate PRCC host links.

0 93 12 03

0 10.1.3 PROVISIONING CONSIDERATIONS

0
0 The International versions of the Common Peripheral Controller
0 Equipment Frame and Remote Controller Equipment Frame are provi-
0 sioned the same as their domestic counterparts (subject to the
0 usage restrictions). The primary difference is the use of PCM-30
0 interfaces instead of DS-1 interfaces. A maximum of sixteen (16)
0 PCM-30 interfaces may be equipped on the PLGC/PDTC versus twenty
0 (20) DS-1 interfaces on the North American product. Provision one
0 (1) NT6X27AC/BB PCM-30 Interface CP for every two PCM-30 inter-
0 faces required. Certain other circuit pack vintages are differ-
0 ent between domestic and International products; refer to the
0 Engineering Manual sections for details. Refer to ECM418 Inte-
0 grated Services Digital Network for NT6X01AB/AC provisioning, and
0 ECM463 ISDN Remote Switching Center for NT6X01AD/AE provisioning.

0 The XPM Plus (UP) processor complex composed of NTMX77AA Unified
0 Processor and NTMX71AA XPM Plus Terminator Paddleboard replaces
0 the old XPM (MP/SP) processor complex consisting of NT6X45BAs,
0 NT6X46BA/BBs, and NT6X47ACs.

0 NTB01AB Preprocessor CP is used in conjunction with the XPM Plus
0 (UP) feature where NTB01AA was used in conjunction with the XPM
0 (MP/SP) feature.

0 Change Kit NT6X02XA for non-ISDN DTC and NT6X02XB for LGC and
0 ISDN DTC provide the parts required to replace the old XPM
0 (MP/SP) processor complex with the new XPM Plus (UP) processor
0 complex.

0 11.0 International Cabinet LGE/DTE/LTE ISDN

0 The Australian DMS-300 International Gateway Switch is based on
0 the DMS-300 supplied to Turkey with the following enhancements:

- 0 - Signalling systems necessary to introduce the product
0 into the Australian National Network.
- 0 - Enhancements to the Call Detail Recording, Operational
0 Measurements and Call Progression tone systems.

0 Similarly, the DMS-300 Gateway Switch for Madley-B Digital Inter-
0 national Switching Centre (DISC) in the United Kingdom is based
0 on existing technology, adapted for that market.

0 The NTFX33CA International Cabinet LGE/DTE/LTE ISDN houses one or two
0 International PCM-30 LGC/DTC/LTC ISDN or not dual shelf modules in a
0 cabinet configuration for applications not requiring fiber network
0 interfaces.

0 Not applicable0 11.1.3 PROVISIONING CONSIDERATIONS0
0 The NTFX33CA International Cabinet LGE/DTE/LTE ISDN is provi-
0 sioned as follows:0 The shelves within the LTEM cabinet are provisioned in the same
0 way as the domestic ISDN frame NT6X01AB, except that PCM-30

0 RELEASE 28.01
0 93 12 03

0 interfaces are used instead of DS-1 and some circuit pack vin-
0 tages are different for the Offshore market.

0 Refer to the Engineering Manual sections for details on circuit
0 pack vintages and cabinet hardware provisioning.

0 Common Circuit Pack:

0 Provision up to two (2) NT6X02UB PCM-30 LGC/DTC Common Circuit
0 Pack (Offshore) per LTEM.

0 PCM-30 Interface:

0 Provision up to eight (8) NT6X27AC/BB PCM-30 Interface CP per
0 PCM-30 LGC/DTC module, to interface up to sixteen PCM-30 links (2
0 links per CP).

0 The NT6X27BB Enhanced PCM-30 Interface circuit pack is backward
0 compatible with the NT6X27AC/BA circuit packs. It is also a re-
0 placement for the NT6X27AA/AB circuit packs, although it cannot
0 be mixed with the NT6X27AA/AB in the same frame or cabinet.

0 The NT6X27BB includes enhancements over the NT6X27AA/AB such as:

- 0 - Full compliance to CCITT,
0 - Improved alarm handling, and
0 - Support for DCME.

0 The initial application for the NT6X27BB is all the frames and
0 cabinets where the NT6X27AC/BA are provisioned. The manufacture
0 of the NT6X27AC/BA is being discontinued.

0 PCM-30 Signaling Interface:

0 For each equipped LGC/DTC which supports PCM30 links or for each
0 equipped LGC module which supports links to an LCM which is
0 equipped with a PCM30 line drawer such as the NT6X05CA, provide:

0 two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 CND Feature:

0 When the Calling Number Delivery/Calling Number Display (CND)
0 feature is required, provision two (2) NT6X78AB CLASS Modem Re-
0 source CPs for each PCM-30 LGC/DTC module.

0 Network Interface:

0
0 RELEASE 28.01
0 93 12 03

0 In an office with the Enhanced Network (ENET) provide a fiber
0 interface per module as follows:

0 two (2) NT6X40FA DS-512 Link Control CPs,
0 two (2) NT6X40GA DS-512 Link Control Paddleboards,
0 two (2) NT6X69LB DS-512 CPP Protocol & Downld CPs, and
0 one (1) P0736273 Fiber Cable Warning Label.

0 And for each cabinet

0 one (1) NTN33SD DS-512 Fiber Interface to Network Kit.

0 Depending on availability, NT6X40CA and NT6X40DA functional pair
0 may be used in place of the preferred NT6X40FA and NT6X40GA func-
0 tional pair. The paddleboards and circuit packs cannot be mixed
0 because they do not function in mismatched pairs.

0 In a non-ENET office, provide a copper interface as follows:

0 two (2) NT6X40AC DS30 Network Interface CPs
0 two (2) NT6X69LA/LB CPP Protocol & Downld CPs.

0 The NT6X69LA may be used for non-fiberised peripherals when the
0 preferred NT6X69LB is not available.

0 12.1.3 PROVISIONING CONSIDERATIONS

0
0 The NTN33GA International Cabinet LGE/DTE Fiber ISDN (FCTM-ISDN)
0 is provisioned as follows:

0 The shelves within the FCTM-ISDN cabinet are provisioned the same
0 as the domestic ISDN frame (NT6X01AB), except that PCM-30 inter-
0 faces are used instead of DS-1, and some circuit pack vintages
0 are different for the International market. Maximum eight (8)
0 PCM-30 Interface CP (supporting 16 PCM-30 links) may be equipped.
0 Refer to the Engineering Manual sections for details on circuit
0 pack vintages and cabinet hardware provisioning.

0 Provision up to two (2) NTN33GB LGCI/DTCI Fiber Common CP
0 (International) per FCTM-ISDN.

0 Provision up to eight (8) NT6X27AC/BB PCM-30 Interface CP per
0 PCM-30 LGC/DTC module, to interface up to sixteen PCM-30 links (2
0 links per CP).

0 The NT6X27BB Enhanced PCM-30 Interface circuit pack is backward
0 compatible with the NT6X27AC/BA circuit packs. It is also a re-
0 placement for the NT6X27AA/AB circuit packs, although it cannot
0 be mixed with the NT6X27AA/AB in the same frame or cabinet.

0 The NT6X27BB includes enhancements over the NT6X27AA/AB such as:

- 0 - Full compliance to CCITT,
0 - Improved alarm handling, and
0 - Support for DCME.

0 The initial application for the NT6X27BB is all the frames and
0 cabinets where the NT6X27AC/BA are provisioned. The manufacture
0 of the NT6X27AC/BA is being discontinued.

0 When the Calling Number Delivery/Calling Number Display (CND)
0 feature is required, provision two (2) NT6X78AB CLASS Modem Re-
0 source CPs for each PCM-30 LGC/DTC module.

0 For each equipped LGC/DTC which supports PCM30 links or for each
0 equipped LGC module which supports links to an LCM which is

0

0| equipped with a PCM30 line drawer such as the NT6X05CA, provide:
0 two (2) NT6X28AA PCM-30 Signaling Interface CPs.

0 12.1.4 OFFICE LAYOUT INFORMATION

The diagram illustrates the CCS7 STP architecture. It shows the flow of signaling information from the NETWORK to the MSB7 (Master Signaling Block 7). The MSB7 contains a TIME and a SWITCH. The SWITCH is connected to a Signaling Link, which is covered by C7BERT coverage. The SWITCH is also connected to a DTC (Data Transfer Control) block. The DTC is connected to the IPML (Inter-Process Message Link) and the CALL (Call) block. The DTC outputs CCS7 (ISUP) and TRUNKS to the PROCESSING CONTROL block.

FIGURE 1. CCS7 CONFIGURATION MODEL

0 Digital Private Network Switching System #1

0 Digital Private Network Signalling System #1 (DPNSS #1) is a UK
0 common channel signalling standard for a network of digital
0 PBX's. DPNSS allows advanced network features to be supported in
0 a multi-vendor private network.

0 The hardware implementation of DPNSS is almost identical to do-
0 mestic CCS7 see Figure 2.

0 IPML - Inter Peripheral Message Link

0 NUC - Nailed Up Connection

0 Figure 2. DPNSS #1 MODEL

0

0

0
0 RELEASE 28.01
0 93 12 03

0 In the DPNSS configuration, Time Slot 16 of the incoming PCM-30
0 span carries the associated signalling information for the thirty
0 channels in the PCM-30 span. Therefore, the Signalling Terminal
0 (ST) and Signalling Data Link (SDL) will handle only thirty
0 trunks.

0 The maximum number of DPNSS signalling data links is 255, there-
0 fore, the DPNSS configuration is limited to a maximum of 30 x 255
0 = 7650 trunks.

0 Provision one (1) NT6X66CA DPNSS Signalling Terminal CP for each
0 PCM-30 span. Note that the DPNSS signalling terminals are not
0 provisioned in pairs as is the case in domestic CCS7.

0 The MSB7 Common CP fill for DPNSS is NT6X32BA. Provide one (1)
0 NT6X32BA to equip each MSB7. Each MSB7 can accommodate up to 72
0 ST's. The maximum number of DPNSS MSB7's on a DMS switch is
0 five. Each MSB7 can support up to thirty-five PDTC modules.

0 The IDTC (PDTC) circuit pack fill that should be ordered for
0 DPNSS applications is NT6X02BN. This includes new messaging pro-
0 tocol and tones circuit pack NT6X69DA and NT6X40AC, DS30 Network
0 Interface CP.

0 13.1 HARDWARE PROVISIONING

0

0 13.1.1 HARDWARE USAGE RESTRICTIONS

0
0 When utilizing CCS7, the following restrictions must be consid-
0 ered:

- 0 1) CCS7 trunks must terminate on DTCs ONLY. Signaling Links can
0 terminate on LTCs, DTCs or DCMs. Signaling links and CCS7
0 trunks can be assigned to the same DTC.
- 0 2) CCS7 trunks can be mixed with PTS trunks on the same DTC,
0 however both cannot be in the same trunk group.

0

0 RELEASE 28.01
0 93 12 03

- 0 3) DTC modules supporting CCS7 trunks must be equipped with Ex-
0 tended Memory and Enhanced Messaging.
- 0 4) Currently, a maximum of four MSB7s is allowed per office.

0 13.1.2 HARDWARE DEPENDENCIES

0
0 CCS7 trunk signaling requires Message Signaling 7 and DTC hard-
0 ware.

0 Message Signaling 7 Equipment

0 The MS7E Frame is composed of one MSB7 and up to one signaling
0 terminal 7 Group Shelf to house up to 24 signaling terminals.

0 The Signaling Terminal Extension Frame (NT6X09AA) is required
0 when the number of Signaling Terminals (ST) exceeds 24. This
0 frame accommodates an additional 48 STs.

0 The MSB7, which contains enhanced messaging circuit packs, must
0 be updated in BCS27 for expanded memory. The NT6X32CA, which con-
0 tains the NT6X46BA, satisfies this requirement. New MSB7s should
0 be provisioned with NT6X32CC. The PC Kit NT6X02ZJ is used to up-
0 grade existing NT6X32AA to the NT6X32AB for BCS27 expanded memory
0 requirement.

0 Digital Trunk Controllers (DTC)

0 Maximum number of DTCs utilizing CCS7, is 60 per office based on
0 each DTC requiring 2 IPMLs per MSB7.

0 In an LPP based office, there is a maximum of 140 DTCs utilizing
0 CCS7.

0 DTCs utilizing CCS7, must be equipped with Enhanced Messaging
0 (NT6X69), Extended Signal Processor Memory (NT6X46) and in BCS 27
0 Extended Master Processor Memory (NT6X47). Refer to ECMS 211, 241
0 and 373 for more detailed information on the DTCs.

0 Product change kits must be ordered for existing offices to up-
0 grade the DTCs with Enhanced Messaging and Extended Memory. Refer

0 RELEASE 28.01
0 93 12 03
0

0 to the following ECMs for more detailed information on DTC provi-
0 sioning;

0 1) ECM 211 New Circuit Pack Fills for DTC,LTC,LGC

0 2) ECM 241 PC Kit for New Circuit Pack Fills

0 3) ECM 373 Peripheral Controller Module
0 Initials (NT6X02IA,LA,MA)
0 Extensions (NT6X02AS,AT,AU)

0 For applications in BCS23 and earlier, each DTC utilizing CCS7
0 requires two NT6X70AA Continuity Tone Detector CP for continuity
0 checking on ISUP trunks. In BCS24 and later, the software re-
0 quirement for Continuity Cards was removed so that customers re-
0 questing the cost reduction when testing is not required are not
0 required to order the cards.

0 For U.S. applications only, since the NT6X70-- is required for
0 the COT test, it is recommended that continuity cards continue to
0 be provisioned in most cases. Provisioning Continuity Cards on
0 SS7 DTCs should be considered standard. Only per customer request
0 can they be omitted.

0 For Canadian applications only, many customers have a high pene-
0 tration of digital trunk facilities and do not require the Conti-
0 nuity card. Provision these cards only on DTCs whose trunks
0 support analog facilities at some point in the end-to-end con-
0 nection of the trunk.

0 DISCRIMINATION NUMBERING

0
0 N/A

0 13.1.3 PROVISIONING CONSIDERATIONS

0
0 The NT6X66AC replaces NT6X66AA for all applications of the MS7E
0 frame and also has the C7BERT capability.

0 13.1.4 PROVISIONING CONSIDERATIONS

0
0 The following information is used to provision CCS7 and the asso-
0 ciated components of the network.

0 | The new NT6X32DB MS7B (DPNSS) packfill which uses the NT6X69LB
0 | Message Interface circuit pack to allow the module to function in
0 | ENET applications. The NT6X32DB packfill is provisioned to the
0 | NT6X31AA Message Switching 7 Equipment (MS7E) frame.

0 | In order for customers with existing NT6X32DA packfills (which
0 | use the NT6X69AA Message pack) to upgrade to the new NT6X32DB
0 | packfill, a new NT6X32ZA Product Change (PC) Kit has been created
0 | and introduced in this ECM. This will allow the packfill to be
0 | used in ENET applications.

0
0 RELEASE 28.01
0 93 12 03

0 Finally, this engineering change provisions the NT6X69LB Message
0 Interface to the existing NT6X32CC (CCS7) common packfill. This
0 packfill previously used either NT6X69MA or NT6X69AC circuit
0 packs. Allowing the use of the NT6X69LB pack will reduce cus-
0 tomer spares by them not having to stock NT6X69ACs.

0 MDC LINE/CCS7 TRUNK INTERCONNECTION

0
0 Calls originating from or terminating on standard and/or featured
0 MDC POTS lines can be interconnected directly with CCS7 trunks
0 without utilizing loop-back trunks. Most MDC line features are
0 directly supported. There are a few exceptions which require
0 loop-back trunks between the MDC line and the CCS7 trunk. Those
0 features may include the following, depending on BCS:

0 1) POTS lines equipped with basic 3-Way Calling feature
0 require loop-back trunks for interconnection with CCS7
0 trunks.

0 2) Coin lines with the Local Coin Overtime (LCO) option
0 require loop-back trunks for interconnection with CCS7
0 trunks. Coin lines without this option will interconnect
0 directly.

0 3) Calls originating from POTS lines equipped with Auto
0 Identified Outward Dialing (AIOD) require loop-back trunks
0 to interconnect with CCS7 outgoing trunks. Incoming calls
0 from CCS7 trunks terminating on AIOD lines interface di-
0 rectly without loop-back.

0 4) Calls incoming from CCS7 trunks terminating on POTS
0 coin lines with the Free Number Termination (FNT) option
0 require loop-back trunks for interconnection. Calls origi-
0 nating from FNT lines may be interconnected directly with
0 CCS7 trunks without utilizing loop-back.

0 5) Calls terminating on Emergency Service Lines (ESL) from
0 CCS7 trunks require loop-back trunks for interconnection.

0 6) Calls terminating on Direct Inward System Access (DISA)
0 directory numbers over a CCS7 trunk require loop-back
0 trunks at the terminating office.

0 RELEASE 28.01
0 93 12 03

0 Provisioning calculations for loop-back trunks are as follows:

$$\begin{array}{l} 0 \quad (A+B+C+D+E+F \text{ calls/hour}) \times \text{Average Hold Time (sec)} \\ 0 \quad \text{-----} = \text{CCS Loop-Back} \\ 0 \quad \quad \quad 100 \end{array}$$

0 Where:

0 A = HDBH calls utilizing CCS7 trunks that originate from
0 and terminate on POTS and/or MDC lines equipped with
0 Basic Three Way Call.

0 B = HDBH calls utilizing CCS7 trunks that originate from
0 coin lines with LCO feature.

0 C = HDBH calls utilizing CCS7 trunks that originate on
0 POTS lines with AIOD.

0 D = HDBH calls utilizing CCS7 trunks that terminate on
0 POTS and/or MDC lines with FNT.

0 E = HDBH calls utilizing CCS7 trunks that terminate on
0 MDC lines via DISA.

0 F = HDBH calls utilizing CCS7 trunks that terminate on
0 ESL lines

0 Refer to traffic provisioning tables for trunk capacities to to
0 determine the required trunk quantities for POTS/MDC loop-back
0 trunks.

0 LOOP-BACK TRUNK REQUIREMENT (BCS-24)

0 The following MDC features are incompatible with CCS7 trunks in
0 BCS-24 and will require loop-back trunks between the MDC line and
0 the CCS7 trunk:

0 1) Basic 3-Way Calling (3WC)

0 2) Free Number Termination (FNT)

0
0 RELEASE 28.01
0 93 12 03

0 3) Direct Inward System Access (DISA)

0
0 LOOP-BACK TRUNK REQUIREMENT (BCS-25)

0
0 Loop-back trunking is required for the following conditions;
0 1) ISUP to DISA (trunk is released after digits are collected)
0 2) ISUP to LCO
0 3) ISUP to AIOD

0 LOOP-BACK TRUNK REQUIREMENT (BCS-26)

0
0 Loop-back trunking is required for the following conditions;
0 1) ISUP to DISA (trunk is released after digits are collected)
0 2) ISUP to LCO
0 3) ISUP to AIOD

0 LOOP-BACK TRUNK REQUIREMENT (BCS-27+)

0
0 Loop-back trunking is required for the following conditions;
0 1) ISUP to DISA (trunk is released after digits are collected)
0 2) ISUP to LCO

0

0
0 RELEASE 28.01
0 93 12 03

0 LOOP-BACK TRUNK REQUIREMENT (BCS-31)

0
0 Loop-back trunking is required for the following conditions;
0 1) ISUP to DISA (trunk is released after digits are collected)
0 only if there are no UTRs provisioned on the DTC
0 terminating the ISUP trunk.

0
0 INTERCONNECTIONS NOT SUPPORTED

0
0 Only two call types are not supported with CCS7 signaling or
0 loop- back trunking. They are as follows;
0 1) CCS7 trunks/Emergency Service Bureau (ESB) line intercon-
0 nection is not supported.
0 2) Circuit Switched Digital Data Service (CSDDS) calls are not
0 supported (Note: CSDDS is not the same as Datapath. Datapath
0 and the CCS7 network are compatible).

0 INCOMPATIBLE CONSOLE FEATURE

0
0 When a console feature that is not compatible with an Integrated
0 Services Network User Part (ISUP) trunk is activated, a loop-back
0 trunk is required.

0

0

0

0 RELEASE 28.01
0 93 12 03

0 CONSOLE LOOP-BACK TRUNK PROVISIONING (BCS-24)

0
0 Loop-Back trunks must be provisioned for all ISUP trunks which
0 require access to the console. These can be divided into four
0 categories;

- 0 1) ISUP trunk to console requiring call extension
0 2) ISUP trunk to console not requiring call extension
0 3) Console extended to an ISUP trunk
0 4) Console originated to an ISUP trunk

0 The call rate for console calls can be calculated based on the
0 number of attendant consoles (AC) in the office , the average
0 length of all console queues in the office (QL) and the average
0 time required for a console to process a call (T), by using the
0 following formulas;

0
$$\text{Terminating Call Rate} = \frac{\#AC \times QL}{T}$$

0
$$\text{Originating Call Rate} = \frac{\#AC}{T}$$

0 These call rates can be multiplied by the percentage of calls in
0 each of the four categories to determine the call rate for each
0 category.

0 The holding times may be different for each of the four call
0 types.

- 0 1) For ISUP Trunk to console calls that do require extending,
0 the holding time is equivalent to the average holding time of
0 the call plus the average console call handling time (T).

0 2) For ISUP trunk to console calls that do not require extend-
0 ing, the holding time is equivalent to the average console
0 call handling time (T).

0 3) For console extending to an ISUP trunk, the holding time is
0 equivalent to the average holding time of an ISUP trunk to
0 console call that requires extension less the average console
0 call handling time.

0
0 RELEASE 28.01
0 93 12 03

0 4) For console originating to an ISUP trunk, the holding time
0 is equivalent to the average holding time of the call plus the
0 average console call handling time (T).

0 The total console loop-back load required can be calculated by
0 adding the required load for each of the four categories. The
0 loop-back load for each category can be calculated using the fol-
0 lowing;

0 Loop-Back Trunk Load per Category = Call Rate X Holding Time

0 Total Loop-Back Load = Category 1 + Category 2 + Category 3
0 + Category 4

0 After the total console loop-back load is determined, the total
0 number of trunks can be calculated using the Poisson Tables. The
0 number of loop-back trunks should not exceed the number of ISUP
0 trunks.

0 CONSOLE LOOP-BACK TRUNK PROVISIONING (BCS-25)

0
0 For BCS 25, all attendant calls and features require loop-back
0 treatment only when the calls are being extended. The loop-back
0 trunk requirement is reduced because the loop-back trunk is re-
0 leased after the call is extended.

0 CONSOLE LOOP-BACK TRUNK PROVISIONING (BCS-26 to BCS-31)

0
0 For BCS 26 to BCS 31, the loop-back requirement is reduced. The
0 Code Calling feature, the Conference Hold & Release feature
0 (AD0363) (AD0363), and the End-to-End Signaling feature (AD0363)
0 is the only requirement for loop-back treatment.

0 MSB7 PROVISIONING INFORMATION

0

0
0 DS30 Ports (MSB7)

0
0 The MSB7 Peripheral communicates with the Central Control (CC)
0 and other peripherals via DS30 ports to the network.

0 The number of MSB7 DS30 ports to the Network is determined by the
0 following calculation;

0 (No.DTC's terminating CCS7 trks X 2) + (No. Signaling links)
0 -----
0 30 Channels/Port

0 A minimum of three DS30 ports are required and eight ports
0 are maximum.

0

0

0 RELEASE 28.01
0 93 12 03

0 MULTIPLE MSB7 PROVISIONING

0
0 The maximum number of MSB7s per office is 4. The required number
0 of MSB7s can be determined using the following calculations.

0 A) ISUP HDBHCA ----- X (6 or 12) =
0 ISUP msg/sec 3600

0 NOTE: When calculating the ISUP msg/sec in an Access Tandem
0 office, 12 msg/CA must be used due to the incoming and
0 outgoing portions of the message for the MSB7 in the
0 Access Tandem office. For an end office, 6 msg/sec must
0 be used.

0 B) DB Query HDBHCA ----- X 2
0 = DB Query msg/sec 3600

0 NOTE: Types of DB Query messages may include the following:

0 E800/800+/E008 ACCS BNS

0 C) PVN wo PIN HDBHCA ----- X 2
0 = PVN wo PIN msg/sec 3600

0 D) PVN with PIN HDBHCA ----- X 4
0 = PVN with PIN msg/sec 3600

0

0

0

0

0
0 RELEASE 28.01
0 93 12 03

0 SIGNALING DATA LINKS (SDL)

0
0 A Signaling Link (SL) is a bi-directional transmission path for
0 transferring trunk signaling information from an end-office Ser-
0 vice Switching Point (SSP) to another SSP or a Signal Transfer
0 Point (STP). Each SL is comprised of a Signaling Data Link (SDL)
0 and a Signaling Terminal (ST) (NT6X66). A linkset is a set of
0 links to be used as a group, each equally capable of carrying
0 traffic between the origination point and a destination point.

0 For redundancy, a pair of SLs is composed of two Signaling Termi-
0 nal (ST) cards and two T1 links. The maximum number of STs per
0 MSB7 is 72. Therefore, the maximum number of redundant Signaling
0 Links is 36.

0 A single pair of CCS7 links can handle the throughput of an MSB7.
0 Therefore, link quantities can be determined by the quantity of
0 MSB7s (minimum one pair of links/MSB7) and the number of nodes
0 associated with the DMS 100 and/or DMS 200.

0 Signaling Links (Terminals) must be provided as redundant pairs,
0 therefore the number of ST cards (NT6X66AC) equals the number of
0 Signaling Links times 2.

0 CCS7 signaling links utilize digital T1 trunks as the physical
0 transmission medium to the CCS7 Signaling Network. These T1's
0 may terminate on either a DTC, LTC, or DCM.

0 The number of DS1 circuits required =

0 No. of calculated Signaling links (terminals) X 2 (redundancy)
0 -----
0 24 Channels

0 NOTE: Refer to SEB 89-05-001 (U.S. applications) or SEL
0 89-01-014 (Canadian applications) for CCS7/MSB7 throughput
0 and capacity data.

0

0

0
0 RELEASE 28.01
0 93 12 03

0 NAILED-UP CONNECTIONS

0
0 Inter-Peripheral Message Links (IPML) are nailed-up connections
0 that allow the DTCs to communicate with the MSB7s through the
0 network. Each DTC utilizing CCS7, requires two IPMLs to each
0 MSB7. The maximum number of Interperipheral Message Links (IPML)
0 per MSB7 is 120 based on the maximum number of channels on the
0 enhanced messaging card being 128. (8 ports reserved for future
0 use)

0 Each ST requires one nailed-up connection.

0 The total number of nailed-up connections required is calculated
0 as follows;

0 $(\# \text{ of DTCs} \times 2 \times \# \text{ of MSB7s}) + (\text{Total } \# \text{ of STs (all MSB7s)})$

0 The maximum number of nailed-up connections is 768. To ensure
0 that degradation of network throughput does not occur, no more
0 than 100 nailed-up connections per network module should be uti-
0 lized.

0 ROUTING INFORMATION

0
0 Routing information for calls utilizing a CCS7 trunk is trans-
0 ferred between Switching Offices via the CCS7 Signaling Data
0 Links rather than via the actual voice trunk as with PTS. The-
0 oretically, the average hold time for CCS7 trunk calls should be
0 slightly less than for PTS trunk calls. However, theoretical
0 studies and actual measurements have not been performed to quan-
0 tify the reduction. Therefore, existing PTS circuit provisioning
0 should be used in the interim. Actual CCS7 trunk circuit provi-
0 sioning information will be published as soon as studies are per-
0 formed.

0 13.3.3 MEMORY PROVISIONING

0
0 For memory provisioning, use the MEMCALC tool.

0 13.4 REAL TIME IMPACT

0 Processing is distributed over the Central Processing Unit (CPU)
0 and the Peripheral Processors (PP) in the peripheral modules.
0 Real Time is one of the measurement that is utilized to determine
0 the loading characteristics of these devices for specific appli-
0 cations. Real Time is the amount of time required for these
0 processors to perform a function such as establish a call or ac-
0 tivate a feature.

0 For a detailed calculation of CPU real time, use the REAL::TIME
0 program issue 4A or later. Refer to System Engineering Bulletin
0 (SEB) 87-02-004 for more details on REAL::TIME and operational
0 instructions. For a detailed calculation of PP real time, use
0 the PRTCALC program issue 1C or later. Refer to SEB 86-10-004 for
0 more details on PRTCALC and operational instructions.

0 To measure the CPU real time for an inservice switch, use the AC-
0 TIVITY TOOL. Refer to SEB 86-11-005 for more details on the AC-
0 TIVITY TOOL and operational instructions. To measure the PP real
0 time for an inservice switch, use the NEW PERIPHERAL ACTIVITY and
0 PERFORMANCE TOOL for the new peripherals. Refer to SEB 87-02-004
0 for more details in the NEW PERIPHERAL ACTIVITY and PERFORMANCE
0 TOOL.

0 Refer to SEB 86-11-001 (U.S. applications) or SEL 88-01-015 and
0 SEL 88-10-018 (Canadian applications) for a complete listing of
0 CPU call timings.

0 Refer to SEB 88-06-001 (U.S. applications) for a complete listing
0 of BCS 25 call timings for the new peripherals. Refer to SEL
0 89-01-23 (Canadian applications) for CCS7 DTC/LTC call timings.

0 14.0 International Cabinetized Message Switch 7

0 This document describes engineering and provisioning considerations
0 for the International Cabinetized Message Switch 7 (CMS7 NTRX48AA) in-
0 troduced for the European Community and Australian markets, where the
0 power supply is 48VDC, to meet safety and global electromagnetic radi-
0 ation EN Class A requirements.

0 The Dimensions of the CIPE cabinet, DMS-100 C28, are shown in Figure
0 1.

0 |<-----28"----->|

0 Cabinet is 28" deep.

0 14.1.4 PROVISIONING CONSIDERATIONS

0
0 The NTRX48AA cabinet houses a dual-shelf Message Switch Buffer 7
0 (MSB7) module and two STG7 shelves. The MSB7 shelves are con-
0 nected to each plane of the CDSN Network through the CSLC via
0 bulkhead DS30 cabling. Each of the MSB7 and STG7 shelves sup-
0 ports 4 and 16 NT6X66 Signaling Terminal (ST) circuit packs re-
0 spectively, for a total of 40 STs per cabinet.

0 NT6X66AA and NT6X66CA STs are provisionable for CCS7 and DPNSS7
0 respectively.

0 In the top of the cabinet is the FSP which distributes power,
0 control and alarms to the cabinet.

0 The cabinet is forced air cooled with a fan unit integrated into
0 the base of the cabinet.

0 The NTRX48AA is always provided in building block NTZZ37HA Inter-
0 national CMS7.

0 15.0 Building Block Engineering - MS7E

0 The purpose of this ECM is to document Building Block Engineering
0 for the MS7E frame

0 There are three main components to this ECM:

- 0 1. MS7E Customer Questions
- 0 2. MS7E Calculations
- 0 3. MS7E Configuration

0 MS7E Customer Question: Worksheet of Telco inputs required at the
0 time of order capture.

0 MS7E Calculations: Worksheet of provisioning algorithms driven
0 from the results of the Customer Question
0 section to determine the number of MSB7s
0 required, based on messaging.

0 MS7E Configuration: Signaling Terminals required for customer
0 application are spread across the MSB7s
0 determined above and configured on each
0 MSB7 per algorithms provided.

0 15.1 HARDWARE PROVISIONING

0

0 15.1.1 HARDWARE USAGE RESTRICTIONS

0
0 Not applicable.

0 15.1.2 HARDWARE DEPENDENCIES

0
0 Not applicable.

0
0 RELEASE 28.01
0 93 12 03

0 15.1.3 PROVISIONING CONSIDERATIONS

0
0 The Message Switch and Buffer (MSB) building block concept deals
0 with a higher level of Product Engineering Code (PEC) engineering
0 order process. Optional to the basic MSB equipped with two (2)
0 Signalling Terminals (ST), additional ST's can be provided.

0 The ST7E Frame has not been re-issued in the Building Block for-
0 mat due to the lack of a practical need for this frame due to the
0 real time limitations of the MSB7.

0 NTZZ05AA (Message Signalling 7 Frame)

0 The NTZZ05AA contains the basic MS7E frame components and one (1)
0 pair of Signalling Terminal CP's. Each NTZZ05AA includes all
0 Power Converters, Processors, Filler Panels, etc. to make a fully
0 functional MSB. The MSB frame will be ISG compliant and contain
0 a universal framework. The MSB will always be provided with
0 three (3) ports to the Network. An office can contain a maximum
0 of four (4) MSB's. Additional ST's can be provided on an op-
0 tional basis.

0 NTZZ05BA (CCS7 Signalling Terminal)

0 The NTZZ05BA contains the circuit packs to provide two (2) addi-
0 tional Signalling Terminals and designation strips. These will
0 be provided on an as needed basis when the requirements exceed
0 the two (2) always provided STs in the NTZZ05AA building block.

0 NTZZ05CA (Signalling Terminal 7 Group Shelf)

0 The NTZZ05CA contains the shelf required when the number of sig-
0 nalling terminals exceed 8 or 4 pairs. The shelf comes equipped
0 with one pair of ST's and all functionally required equipment. It
0 can contain up to 16 or 8 pairs of STs.

0 NTZZ05DA (Signalling Terminal I/F with Terminator)

0 The NTZZ05DA contains the pair of ST Interface packs required on
0 the last shelf that contains Signalling Terminals.

0 NTZZ05EA (Signalling Terminals for STG7 Shelf)

0

0
0 RELEASE 28.01
0 93 12 03

0 The NTZZ05EA contains a pair of ST packs for use on the STG7
0 shelf (position 51).

0 NTZZ05FA (Signalling Terminal I/F)

0 The NTZZ05FA contains a pair of ST Interface packs for use on the
0 next to last shelf containing Signalling Terminals.

0 NTZZ05GA (ST Filler Faceplates)

0 The NTZZ05GA contains filler faceplates for use on unequipped ST
0 positions.

0 NTZZ05HA (Message Signalling 7 Frame (US))

0 The NTZZ05HA contains the basic MS7E frame components and one (1)
0 pair of Signalling Terminal CP's. Each NTZZ05HA includes all
0 Power Converters, Processors, Filler Panels, etc. to make a fully
0 functional MSB. The MSB frame will be ISG compliant and contain
0 a common framework. The MSB will always be provided with three
0 (3) ports to the Network. An office can contain a maximum of
0 four (4) MSB's. Additional ST's can be provided on an optional
0 basis.

0 NTZZ05JA (Earthquake MS7E Frame (US))

0 The NTZZ05JA contains the same components as the NTZZ05HA except
0 for the common framework. NTZZ05JA contains the NT0X2AH earth-
0 quake framework.

0

0

0
0 RELEASE 28.01
0 93 12 030 MS7E CALCULATIONS0 There can be a maximum of four (4) MSB7s per office. The following
0 calculations establish the number required.

0 $A = (Q1 / 3600) * 6$ _____

0 $B = (Q2 / 3600) * 12$ _____

0 $C = (Q3 / 3600) * 6$ _____

0 $D = (Q4 / 3600) * 2$ _____

0 $E = (Q5 / 3600) * 2$ _____

0 $F = (Q6 / 3600) * 2$ _____

0 $G = (Q7 / 3600) * 4$ _____

0 $H = (Q8 / 3600) * 4$ _____

0 $I = (Q9 / 3600) * 13$ _____

0 $J = (Q10 / 3600) * 2$ _____

0
0 $ISUP = A + B + C \quad OR \quad Q11$ _____

0 $TCAP = D + E + F + G + H + I + J \quad OR \quad Q12$ _____

0 Total ISUP msg/sec. + (2*TCAP msg/sec.) < = 135 AND
0 Total TCAP Messages per second < = 30 requires one MSB7.0 Total ISUP msg/sec. + (2*TCAP msg/sec.) < = 205 AND
0 Total TCAP Messages per second < = 46 requires two MSB7s.0 Total ISUP msg/sec. + (2*TCAP msg/sec.) < = 340 AND
0 Total TCAP Messages per second < = 76 requires three MSB7s.0 Total ISUP msg/sec. + (2*TCAP msg/sec.) < = 460 AND
0 Total TCAP Messages per second < = 107 requires four MSB7s.

0 P = Number of MSB7s Required (determined above) _____

0 RELEASE 28.01
0 93 12 03
0

0 CUSTOMER CONFIGURATION

0 5A: Number of STs required per MS7E = $Q13 / P$ (Round up) _____
0 (Maximum 12 pairs per MS7E)

0 (If $Q13/P$ was rounded up, the result shall determine
0 the configuration of all the frames required except
0 the last which shall be configured as $5A - 1$).

0 Example: $Q13 = 23$ (23 CCS7 links required) and $P = 3$
0 (3 MS7E frames required).

0 $Q13/P = 23/3 = 7.66$ (Round up) = 8

0 With $5A = 8$, the first two MS7E frames would
0 be configured as $5A = 8$, as shown below, but
0 the last MS7E frame would be configured as
0 $5A = 7$, as shown below ($5A - 1$).

0 If $5A = 1$, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, six
0 NTZZ05GA, one NTZZ05DA, and one NT0X84AA.

0 If $5A = 2$, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, one
0 NTZZ05BA, four NTZZ05GA, one NTZZ05DA, and one NT0X84AA.
0 (For U.S. applications provide 2 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA).

0 If $5A = 3$, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, two
0 NTZZ05BA, two NTZZ05GA, one NTZZ05DA, and one NT0X84AA.
0 (For U.S. applications provide 4 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA).

0 If $5A = 4$, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, three
0 NTZZ05BA, one NTZZ05DA, and one NT0X84AA.
0 (For U.S. applications provide 6 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA).

0 IF $5A = 5$, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, three
0 NTZZ05BA, one NTZZ05CA, one NTZZ05FA, and fourteen
0 NTZZ05GA.
0 (For U.S. applications provide 6 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA).

0 If $5A = 6$, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, three
0 NTZZ05BA, one NTZZ05CA, one NTZZ05EA, one NTZZ05FA,
0 and twelve NTZZ05GA.

0
0 RELEASE 28.01
0 93 12 03

0 (For U.S. applications provide 8 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA and NTZZ05EA).

0 If 5A = 7, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, three
0 NTZZ05BA, one NTZZ05CA, two NTZZ05EA, one NTZZ05FA,
0 and ten NTZZ05GA.
0 (For U.S. applications provide 10 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA and NTZZ05EA).

0 If 5A = 8, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, three
0 NTZZ05BA, one NTZZ05CA, three NTZZ05EA, one NTZZ05FA, and
0 eight NTZZ05GA.
0 (For U.S. applications provide 12 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA and NTZZ05EA).

0 If 5A = 9, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, three
0 NTZZ05BA, one NTZZ05CA, four NTZZ05EA, one NTZZ05FA, and
0 six NTZZ05GA.
0 (For U.S. applications provide 14 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA and NTZZ05EA).

0 If 5A = 10, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, three
0 NTZZ05BA, one NTZZ05CA, five NTZZ05EA, one NTZZ05FA, and
0 four NTZZ05GA.
0 (For U.S. applications provide 16 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA and NTZZ05EA).

0 If 5A = 11, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, three
0 NTZZ05BA, one NTZZ05CA, six NTZZ05EA, one NTZZ05FA, and
0 two NTZZ05GA.
0 (For U.S. applications provide 18 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA and NTZZ05EA).

0 If 5A = 12, provide one NTZZ05AA, NTZZ05HA, or NTZZ05JA, three
0 NTZZ05BA, one NTZZ05CA, seven NTZZ05EA, and one NTZZ05FA.
0 (For U.S. applications provide 20 NT6X66AA or NT6X66AC
0 rather than the NTZZ05BA and NTZZ05EA).

0 RELEASE 28.01
0 93 12 03

0 MS7E CUSOMER QUESTIONS

0 Office MSB7 Messaging Requirement

0 Office provisioning must be based on either estimated call at-
0 tempts or actual office measurements but not both. Answer
0 questions under either Section I or II, depending on the basis
0 for provisioning which applies.

0 SECTION I:

0 If an estimate of the High Day Busy Hour call attempts will be
0 the basis for office provisioning, the following questions must
0 be answered:

0 Q1 : Line to CCS7 Trunk HDBH Call Attempts _____

0 Q2 : CCS7 Trunk to CCS7 Trunk HDBH Call Attempts _____

0 Q3 : MF/DP Trunk to CCS7 Trunk HDBH Call Attempts _____

0 Q4 : E800 HDBH Call Attempts _____

0 Q5 : Exchange Alternate Billing Service HDBH Call Attempts _____

0 Q6 : PVN w/o PIN HDBH Call Attempts _____
0 (PIN is Personal Identification Number)

0 Q7 : PVN w/ PIN HDBH Call Attempts _____

0 Q8 : RAG (Network Ring Again) HDBH Call Attempts _____

0 Q9 : Automatic Call Back HDBH Call Attempts _____

0 Q10: Automatic Recall HDBH Call Attempts _____

0 SECTION II:

0 Actual message counts can be obtained on an inservice system by
0 reading registers from OM groups ISUPUSAG and TCAPUSAG.

0 If office Operational Measurements are to be the basis for provi-
0 sioning, the following questions must be answered:

0 Q11: Total ISUP messages per second

0 RELEASE 28.01
0 93 12 03

0 (ISMSGOUT + ISMSGOT2 + ISMSGIN + ISMSGIN2)
0 ----- = _____
0 3600

0 Q12: Total TCAP messages per second

0 (TCMSGOUT + TCMGOU2 + TCMSGIN + TCMSGIN2)
0 ----- = _____
0 3600

0
0 Q13: Signaling Terminal pairs required per office _____

0 RELEASE 28.01
0 93 12 03

0 17.0 NT6X50EC - DS1 Interface with Echo Cancellation

0 The NT6X50EC is to provide echo cancellation inside the DMS envi-
0 ronment. This function is now being done outside of the switch
0 using equipment not provided by NORTHERN TELECOM. Integration of
0 echo cancellation is required due to the high cost of operation
0 and maintenance of these external devices.

0 The NT6X50EC cancels the echo created by the impedance mismatch
0 in the near end hybrid. The cancellation prevents the far end
0 talker from hearing the echo of their own voice. Echo cancellers
0 are useful only where the delay is long enough for the echo to be
0 noticed.

0 17.1 HARDWARE PROVISIONING

0

0 17.1.1 HARDWARE USAGE RESTRICTIONS

0
0 The NT6X50EC does not perform the permanent loop back for an in-
0 active port, therefore it cannot be used in the remote line con-
0 centrating module (RLCM)

0 This circuit pack cannot be installed on a trunk that is provi-
0 sioned with an echo suppressor.

0 17.1.2 HARDWARE DEPENDENCIES

0
0 If the NT6X50EC is to be installed in a DTE frame, an Auxiliary
0 Fuse Panel (AFP, NT6X0131) must be used. The AFP will allow -48V
0 power to be run up to the card slot of the NT6X01AA frame. The
0 NT6X0130 will include all cabling needed to power the card slots.

0

0
0 RELEASE 28.01
0 93 12 03

0 17.1.3 POWER/HEAT DISSIPATION

0
0 This circuit pack connects to 5V, +/- 12V and -48V power sup-
0 plies. The majority of the power is derived from the -48V supply,
0 thereby reducing the demand on the existing 5V supply.

0 There will be a kit developed to run -48V up to the CP slots.
0 There is no pec code for this kit as of this release.

0 17.1.4 PROVISIONING CONSIDERATIONS.

0
0 The DTC and DTCI can be provisioned with up to 10 NT6X50EC cp's.

0 The NT6X50EC and NT6X50AB can be mixed on the same shelf. This
0 will allow the customer to chose wich trunks will have the echo
0 cancellation feature.

0 17.1.5 OFFICE LAYOUT INFORMATION

0
0 Not Applicable

0 17.1.6 TRAFFIC TABLES

0
0 The NT6X50EC traffic studies are the same as the NT6X50AB. The
0 only difference is that the NT6X50EC has echo cancellation.

0 17.3 SOFTWARE PROVISIONING

0

0 17.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCY

0

0 The software for the NT6X50EC will be incorporated into the BCS
0 30 software load.

0

0
0 RELEASE 28.01
0 93 12 03

0 17.3.2 SOFTWARE USAGE RESTRICTIONS

0
0 Integrated echo cancellation is supported by BCS30 and later re-
0 leases. The new CC and XPM software required for use and control
0 of the NT6X50EC trunk interface will be integrated into the ex-
0 isting software structure with minimal impact. The software will
0 be backwards compatible, such that it will operate with either
0 the NT6X50AB/EC trunk interface cards. The table control modifi-
0 cations and new tables will be consistent with existing DMS-250
0 table control interface. New MAP displays will be built upon the
0 existing MAP hierarchy. The LOGS, alarm, and OM'S will all con-
0 form to the existing standards.

0 17.3.3 MEMORY PROVISIONING

0
0 Not Applicable

0 17.4 REAL TIME IMPACT

0 To perform echo cancellation, in each frame (125 usec) a single
0 DSP must perform 64 multiplies of 100ns each 8 channels.
0 $64 \times 100 \times 8 = 51.2 \text{ usec}$
0 51.2 usec is required for multiply/accumulate operations for echo
0 cancellation alone. Coefficient adaption requires another 51.2
0 usec for multiply accumulate operations. This leaves 22.6 usec
0 (18%) of each frame for overhead and other tasks. In order to
0 achieve this level of performance, the echo canceller is limited
0 to processing a maximum of two hybrids on a DS0 line at the same
0 time. Thus, the echo canceller can cancel echos for three-way
0 calling, but not for larger conference groups.

0 RELEASE 28.01
0 93 12 03

0 18.0 Dialable Wideband Service Phase I

0 Dialable Wideband Service (DWS) is a multi-rate, switched service
0 aimed at satisfying end-user needs for flexible, wideband connectivity
0 in the public switched network. It offers a dialable, real-time
0 switched service that allows the end-user to establish network con-
0 nections with rates from 128 kbps to 1.536 Kbps in 64 kbps increments.
0 Rates higher than 1536 Kbps currently are not supported. DWS provides
0 the end-user with the convenience of dialing a directory number to es-
0 tablish a digital Wideband connection across the switched network to
0 any other bandwidth-compatible and protocol compliant DWS subscriber.
0 This network connection is transparent to user information (e.g.
0 voice, data, video or image), and is established in real-time by the
0 originating, terminating, and tandem switching nodes. The rate, or
0 bandwidth, is user-selectable on a per-call basis.

0 DWS is being introduced on Northern Telecom's DMS-100 Family of public
0 network switches. DWS creates a new class of subscribers - wideband
0 subscribers - identified uniquely by the North American Numbering Plan
0 to the Public Switched Telephone Network (PSTN). Intercompany com-
0 munications at wideband speeds is thus facilitated for key applica-
0 tions such as videoconferencing and data communications. DWS provides
0 a new revenue opportunity to both Local Exchange Carriers (LECs) and
0 Interexchange Carriers (IECs) as wideband subscribers call each other
0 at bandwidths from 128 kbps to 1.536 Kbps. Since the North American
0 Numbering Plan folds directly into the World Numbering Plan, DWS sub-
0 scribers may connect beyond North America into Japan, the United
0 Kingdom, Germany, and other countries where high-bandwidth communi-
0 cation is needed.

0 18.1 HARDWARE PROVISIONING

0

0 18.1.1 HARDWARE USAGE RESTRICTIONS

0
0 For new installations, the Enhanced Network is required; the DTC7
0 and/or the DTCI must have the Enhanced Time Switch as well.

0

0
0 RELEASE 28.01
0 93 12 03

0 18.1.2 HARDWARE DEPENDENCIES

0
0 DWS requires that the DMS-100 configuration be SuperNode based,
0 including ENET, which provides the non-blocking constant delay
0 matrix, and DTCI and/or DTC7 peripherals which will require the
0 Enhanced Time Switch and will also provide the constant delay.

0 DISCRIMINATION NUMBERING

0
0 Not Applicable

0

0
0 RELEASE 28.01
0 93 12 03

0 18.1.3 PROVISIONING CONSIDERATIONS

0

0 GENERAL INFORMATION

0
0 The switch hardware necessary to implement DWS is as follows: for
0 PRI access, the DTCI with the Enhanced Time Switch; for constant
0 delay switching, the ENET (Enhanced Network); and for outbound
0 trunks, the DTC7 with the Enhanced Time Switch. The Enhanced Time
0 Switch guarantees constant delay across the peripherals (DTC7 and
0 DTCI) and trunks, and ENET guarantees constant delay across the
0 switch matrix.

0 Each DTC7 and DTCI which will control wideband trunks, will be
0 provided with the Enhanced Time Switch for constant delay. In de-
0 termining the quantity of DTC7 modules and DTCI modules which
0 will be equipped with the Enhanced Time Switch, several traffic
0 factors must be taken into consideration: traffic will be highly
0 peaked due to reserved videomeet rooms, very long holding times
0 (hours vs minutes), per call bandwidth, and that all channels
0 which comprise an instance of wideband call termination must be
0 located on the same physical carrier facility and in the same
0 trunk group.

0 Access to the central office from the customer premises will be
0 ISDN Primary Rate Interface (PRI) with Q.931 signaling with ex-
0 tensions for Dialable Wideband Service. The physical interface
0 offered to the customer's premises may be copper (T-1) or fiber
0 transport facilities, but must employ the DS-1 protocol. For T-1,
0 the connection to the Channel Service Unit (CSU) is a 4 wire DS-1
0 appearance. The T-1 will terminate on an upgraded Digital Trunk
0 Controller, ISDN (DTCI) of the DMS-100 Family Switch.

0 The DTCI, in turn, connects the PRI access into the Enhanced Net-
0 work (ENET). ENET is an NxDS0 switching fabric which provides
0 channel switching greater than 64kbps through the DMS SuperNode.
0 Wideband calls are switched through ENET to the outgoing wideband
0 trunk on a modified Digital Trunk Controller CCS7 (DTC7). Both
0 the DTCI and DTC7 are upgraded with the Enhanced Time Switch

0
0
0

0 RELEASE 28.01
0 93 12 03

0 which ensures channel order in the peripherals and trunks for the
0 wideband call.

0 While ENET provides the base switch matrix functionality, the
0 DTCI and DTC7 connect to the ENET at one end and provide the
0 connectivity to the PRI access loops and wideband trunks at the
0 other end. Current DTCI and DTC7 models must be modified in order
0 to implement the DWS capability. The Enhanced Time Switch is
0 needed to provide constant time delay for the peripherals as ENET
0 does for the Switch matrix. Together the ENET, DTCI and the DTC7
0 ensure time slot sequence integrity so the channel order from the
0 origination end user to the destination end user is not changed
0 by the DMS-100 Family Switch. DTCI and DTC7 each serve 10 T-1s
0 per shelf, 20 T-1s per module. Shelves are grouped into pair mod-
0 ules for sparing purposes.

0 For DWS, the DTCI is modified by the replacement of the standard
0 Time Switch with the Enhanced Time Switch. Field modifications
0 may be done. While DWS requires the DTCI to be upgraded with the
0 Enhanced Time Switch, regular PRI interfaces will also interwork
0 on this peripheral with the ETS. This allows more services to
0 utilize the DTCI.

0 The basic functions of the DTCI and the DTC7 are not altered in
0 any way by DWS. The Master Processor still provides the periph-
0 eral call processing for DWS as well as other DTCI and DTC7 sup-
0 ported services.

0 When adding DWS to an existing office, the cards in the Periph-
0 eral may need to be changed in order to maximise the ENET utili-
0 zation of ports. Extended Peripheral Modules (XPM: LGC, DTC,
0 DTCI ect) interface the Enhanced Network using DS-512 fiber
0 speech links or using existing DS-30 speech links. Due to the
0 underutilization of the cross-point circuit pack with the DS-30
0 speech link interface, it is expected that most Extended Periph-
0 eral Modules will be equipped for the DS-512 fiber speech link
0 interface to the Enhanced Network.

0 HARDWARE PROVISIONING INFORMATION

0
0 The NT6X44AA Time Switch and the NTAX78AA Enhanced Time Switch
0 are now both provisionable on the NT6X01AB. For DWS applications,

0 RELEASE 28.01
0 93 12 03
0

0 the NT6X01AB that contains DTCI modules that will handle DWS
0 traffic, should be configured with the NT6X02NA packfill and the
0 NTAX78AA Enhanced Time Switch. For non-DWS applications, the
0 NT6X02NA packfill will still be provided along with the NT6X44AA
0 Time Switch.

0 The NT6X01AA will not be provided on initial DWS applications but
0 can be upgraded in the field to support DWS. Initial applica-
0 tions will utilize the NT6X01AD frame.

0 HARDWARE UPGRADE PROVISIONING INFORMATION

0
0 The following information applies to field upgrades only.

0 NT6X01AA Common peripheral Controller Equipment Frame

0 The DTC on an NT6X01AA Common Peripheral Controller Equipment
0 Frame must be upgraded with the NT6X02YS Product Change Kit to
0 allow the NTAX78AA ETS to function on the DTC7 modules. The
0 NT6X02YS Product Change Kit converts the current NT6X02IC DTC
0 Packfill to an NT6X02IG DTC Packfill.

0 The NT6X02YS Product Change Kit adds approximately 22 wiring
0 straps to the backplane of the NT6X02 modules. This Product
0 Change Kit also replaces the NT6X44AA Time Switch with the
0 NTAX78AA Enhanced Time Switch in slot 14.

0 The NTZZ22AA / NTZZ22BA / NTZZ22DA Common Peripheral Controller
0 Equipment Frame (NT6X01AA) must also be upgraded with the
0 NT6X02YS Product Change Kit to allow the NTAX78AA ETS to function
0 on the DTC7 modules. The NT6X02YS Product Change Kit converts the
0 current NTZZ04BA DTC Packfill to an NTZZ04BB DTC Packfill.

0 NT6X01AB Common peripheral Controller Equipment Frame

0 The NT6X01AB ISDN Common Peripheral Controller Equipment Frame
0 must be upgraded with the NT6X01WC Wiring Options Kit to allow
0 for non-ISDN applications to support DWS.

0 The NT6X01WC Wiring Options Kit enables a wire strap to be added
0 to the backpanel (NT6X0223) Slot XX-12 between pins 7A and 8A to

0
0 RELEASE 28.01
0 93 12 03

0 allow for non-ISDN applications. The Kit includes a jumper which
0 is installed on the backplane and is required to support DWS.

0 The NTAX78AA Enhanced Time Switch Packs must then be provisioned
0 to replace the NT6X44AA Time Switch Packs.

0 The NTZZ17AA / NTZZ17KA / NTZZ17LA Common Peripheral Controller
0 Equipment Frame (NT6X01AB) must be upgraded with the NTZZ99AM
0 Product Change Kit.

0 The NTZZ99AM Product Change Kit removes the NT6X44AA Time Switch
0 Packs and the Designation Labels from the NTZZ17GB ISDN CPCI Com-
0 mon Peripheral Control Module and adds the NTAX78AA Enhanced Time
0 Switch Packs which converts the NTZZ17GB to an NTZZ17DA ISDN Com-
0 mon Peripheral Control Module.

0 Only the Modules which are going to handle DWS traffic will be
0 required to be updated per the above information. Again, the
0 above information applies to field upgrades only.

0 18.3 SOFTWARE PROVISIONING

0 DWS fills the gap in digital communication services by providing
0 users with dialable, constant-delay, multi-rate transmission sup-
0 ported by the public network. It makes transmission at speeds
0 greater than 64 kbps (e.g. 6 x 64 kbps = 384 kbps) as easy as a
0 standard phone call. Users may make a wideband call by simply
0 dialing the other party's telephone number and a code to indicate
0 the desired bandwidth.

0 The selection of channels which are combined to provide the de-
0 sired rate or bandwidth may also vary. The channel selection
0 schemes are fixed, floating, and flexible and are defined as fol-
0 lows:

0 * Fixed - channel selection normally applies to rates of 384
0 Kbps or 1536 Kbps, but could be extended to include other
0 rates. This scheme involves grouping contiguous channels and
0 partitioning these groups into logical, higher bandwidth
0 channels. Only these logical channels may be selected. For
0 example, for the 384 Kbps rate the logical channels are
0 formed by grouping channels 1-6, 7-12, 13-18 and 19-24 on a
0 DS-1 to form 4 logical channels, (6 channels each).

0 * Floating channel selection allows for the selection of any
0 contiguous channels and applies to all rates.

0

0
0 RELEASE 28.01
0 93 12 03

0 * Flexible channel selection lifts all restrictions and pro-
0 vides for selection of any channel on a given carrier facil-
0 ity.

0 18.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0
0 The following S/W packages are required to support DWS. Refer to
0 SMS or SOLID for information on the interdependencies of the
0 software packages.

0 NTXR49AA - Dialable Wideband Service
0 NTXS28AA - DWS Intertoll ISUP
0 NTXS26AA - DWS PRI Base
0 NTX09AAC - DWS ISUP Base
0 NTXS25AA - DWS Base

0 The following S/W packages are optional for DWS.

0 NTXS27AA - DWS PRI Test Tool
0 NTXR65AA - Flexible DWS Access

0 Not Applicable

0 18.3.3 MEMORY PROVISIONING

0
0 Refer to MEMCALC for memory provisioning.

0 This product introduces no additional data store requirements. An
0 estimated 300 Kbytes of program store will be consumed in the
0 DMS-Core. In addition to this, 500 words will be consumed by
0 each Wideband Extension Block allocated (determined by the value
0 of MAX_WIDEBAND_CALLS in Table OFCENG). This value determines the
0 maximum number of simultaneous active wideband calls.

0 Data store requirements on DMS SuperNode are imposed by tables
0 TRKSIG, TRKFEAT, and TRKDIAL which are necessary for support of
0 wideband trunk types. Memory is allocated dynamically for these
0 tables in blocks of 320 words which can store up to 16 entries.
0 Once this number of entries is exceeded for a given block, an-
0 other block is allocated. The total consumption is dependent upon
0 the number of different signaling or feature set or dialing plan
0 entries required for TRKSIG, TRKFEAT, and TRKDIAL, respectively.
0 Note that many trunk groups may use the same signalling entry,
0 ect.

0 An estimated 1 kbytes will be consumed in the DTC7 by the DWS
0 product.

0 An estimated 1 kbytes will be consumed in the DTCI by the DWS
0 product.

0 18.4 REAL TIME IMPACT

0

0 18.4.1 DMS-core

0

0 The impact of DWS on a given call is expected to be approximately
0 30 milliseconds for a 384 kbps call and approximately 70 milli-
0 seconds for a 1.536 kbps call (Series 20 processor).

0 The impact of enabling DWS for a given trunk is approximately 200
0 microseconds for a narrowband call. The impact of DWS
0 developement on narrowband calls is less than 50 microseconds.

0 18.4.2 Digital Trunk Controller (DTC7)

0

0 The impact of DWS on a given CCS7 ISUP call in the Master
0 Processor (MP) is expected to be approximately 128 milliseconds
0 for a 384 kbps call and approximately 188 milliseconds for a
0 1.536 Mbps call. These figures are based upon POWER development.

0 18.4.3 Digital Trunk Controller (DTCI)

0

0 The impact of DWS on a given PRI call in the Master Processor
0 (MP) is expected to be approximately 244 milliseconds for a 384
0 Kbps call and approximately 399 milliseconds for a 1536 Kbps
0 call. These figures are based upon Sprint development.

0
0 RELEASE 28.01
0 93 12 03

0 19.0 Dialable Wideband Service Phase II

0 Dialable Wideband Service (DWS) is a multi-rate, switched service
0 aimed at satisfying end-user needs for flexible, wideband connectivity
0 in the public switched network. It offers a dialable, real-time
0 switched service that allows the end-user to establish network con-
0 nections with rates from 128 kbps to 1.536 Mbps in 64 kbps increments.
0 Rates higher than 1536 Kbps currently are not supported. DWS provides
0 the end-user with the convenience of dialing a directory number to es-
0 tablish a digital Wideband connection across the switched network to
0 any other bandwidth-compatible and protocol compliant DWS subscriber.
0 This network connection is transparent to user information (e.g.
0 voice, data, video or image), and is established in real-time by the
0 originating, terminating, and tandem switching nodes. The rate, or
0 bandwidth, is user-selectable on a per-call basis.

0 DWS is being introduced on Northern Telecom's DMS-100 Family of public
0 network switches. DWS creates a new class of subscribers - wideband
0 subscribers - identified uniquely by the North American Numbering Plan
0 to the Public Switched Telephone Network (PSTN). Intercompany com-
0 munications at wideband speeds is thus facilitated for key applica-
0 tions such as videoconferencing and data communications. DWS provides
0 a new revenue opportunity to both Local Exchange Carriers (LECs) and
0 Interexchange Carriers (IECs) as wideband subscribers call each other
0 at bandwidths from 128 kbps to 1.536 Mbps. Since the North American
0 Numbering Plan folds directly into the World Numbering Plan, DWS sub-
0 scribers may connect beyond North America into Japan, the United
0 Kingdom, Germany, and other countries where high-bandwidth communi-
0 cation is needed.

0 20.0 IEC Billing Server using APC Cabinet

0 The SuperNode Multicomputing Base (SMB) provides the platform to
0 create a Billing Server which will relieve the DMS-Core of the
0 formatting, storing and teleprocessing of billing data. Also, it
0 will provide a means to replace two different hardware products;
0 Distributed Peripheral Processor (DPP) and Enhanced Input/Output
0 Controller (EIOC) with a single hardware platform. S/DMS Billing
0 Server (SBS) will provide the same billing functions provided by
0 the EIOC and DPP.

0 The initial configuration of the Billing Server will utilize a
0 File Processor, DMS-Core/DMS-Bus and an Ethernet Interface Unit
0 (EIU). Billing Server will be the platform used to gather (from
0 many sources), format, save to disk and teleprocess billing data.

0 Some of the capabilities provided by the Billing Server are:

- 0 - Distributed billing to relieve the DMS-Core of
- 0 formatting, storing and teleprocessing
- 0 - High capacity billing data storage
- 0 - Disk shadowing (duplicating)
- 0 - Fault tolerance
- 0 - Modular, flexible architecture
- 0 - Digital Audio Tape (DAT) backup of billing
- 0 - File Transfer Access and Management (FTAM)

0 This document describes the Base and IEC Billing Server software
0 and functionality, and hardware developed in the SMB program
0 (APC) which the Billing Server uses.

0 20.1 HARDWARE PROVISIONING

0

0 20.1.1 HARDWARE USAGE RESTRICTIONS

0 Refer to API 294 for restrictions in Application Processor Cabi-
0 net (APC) configuration.

0 Billing Server will not operate on NT40 switches.

0 RELEASE 28.01
0 93 12 03
0

0 The Billing Server does not use devices which belong to IOC or
0 the SLM/SLMII file systems. It will only utilize FTFS (Fault
0 Tolerant File System) devices (dedicated SDs on the APC/Billing
0 Server Cabinet for Billing Server use only).

0 An EIU (Ethernet Interface Unit) running FTAM will not handle an-
0 ything except Billing Server. The EIU's provided for the Billing
0 Server will be dedicated to it.

0 20.1.2 HARDWARE DEPENDENCIES

0
0 Billing Server application of Applications Processor Cabinet can
0 only be provisioned in a SuperNode office.

0 Billing Server application requires the 8MEG EIU which is planned
0 for availability in BCS34.

0|

0 20.1.3 PROVISIONING CONSIDERATIONS

0
0 The Billing Server will be the processing and storage vehicle for
0 billing data in large SuperNode switches. This will be imple-
0 mented using FP (File Processor located at top of Billing Server
0 APC cabinet), DMS-Core/DMS-Bus and EIU (mounted on LPP) to
0 offload the formatting and teleprocessing of the billing data
0 from the call processing engine. Billing Server will use the
0 common SMB hardware - APC cabinet NT9X80BA.

0 Operating software for the File Processor (FP) of the Billing
0 Server will be downloaded from the Computing Module. The Billing
0 Server FP is a SOS (Sonet Operating System) based processor.

0

0

0 Host - Signalling Interface Equipment
0 Chapter 7

Page 7-385

0 RELEASE 28.01
0 93 12 03

0 File Processor (FP) & SDs mounted on APC

0
0 The File Processor (FP) and storage devices (SDs) are housed in
0 the Application Processor Cabinet (APC). The FP is linked to SDs
0 through Small Computer Standard Interface (SCSI) links. One DAT
0 drive allows backing up of the billing data to tape. Refer to
0 API 294 for more information on Application Processor Cabinet.

0 The Billing Server will use the FP's capability to store data to
0 a set of two disks simultaneously. This feature is called disk
0 shadowing. Disk shadowing provides a means to keep 2 disk drives
0 in sync. Each drive will have an exact copy of the same data.
0 Volumes allocated for use by the Billing Server must reside on
0 shadowed sets of 2 members (disks). The standard for the Billing
0 Server will be 5 shadowed sets of 2 disks per set in the APC cab-
0 inet.

0 SCSI CABLES

0
0 In the Billing Server configuration of the APC, all storage de-
0 vices are cabled to File Processor 00 by SCSI cables. SCSI cables
0 required (per API 294-1, International Applications Processor
0 Cabinet) for the Billing Server configuration (illustrated in
0 Figure 2) are as follows:

0	Qty	PEC	Length
0	3	NT9X0443	55 "
0	4	NT9X0444	60 "
0	3	NT9X0445	65 "
0	5	NT9X0446	70 "
0	1	NT9X0447	75 "

0 Refer to API 294, Section 2.4 for further information about SCSI
0 Bus cabling and connections to File Processor.

0

0 RELEASE 28.01
0 93 12 03

0 DMS-Core/DMS-Bus

0
0 The DMS SuperNode equipment consists of the DMS-Core and the
0 DMS-Bus housed in a single cabinet:

0 The DMS-Core consists of a Computing Module (contains dupli-
0 cated DMS SuperNode CPUs) and System Load Module (SLMII).

0 The DMS-Bus is a Message Switch (MS), which performs the rout-
0 ing of messages for the Billing Server.

0 MS Port assignments are undefined at this time and as further in-
0 formation becomes available, this document will be updated. We
0 do know that the Billing Server standard configuration will call
0 for a single FP (which, duplicated, takes up a half shelf)
0 mounted on shelf position 39 on the APC. Each plane of the FP 00
0 has a port 0 & a port 1. The two ports of the two planes of the
0 FP (total of four FP ports) will require four MS ports; two on MS
0 00 and two on MS 01.

0 EIU (Ethernet Interface Unit) Mounted On LPP

0
0 The S/DMS Billing Server protocol software will reside on the
0 Ethernet interface Unit. The EIU required is an eight megabyte
0 peripheral which resides on the Link I/F Shelf (LIS) of the Link
0 Peripheral Processor (LPP) cabinet. By changing the software load
0 on the EIU to run the S/DMS Billing Server protocol, we have
0 changed the functionality of the EIU and can now refer to the
0 software-modified EIU as an Open System Interconnection Unit
0 (OSIU). This EIU (or OSIU) is dedicated to Billing Server use
0 only.

0 The number of EIUs required for Billing Server is two. The second
0 EIU is required for redundancy.

0 An EIU consists of the following:

0 Qty 1 NTEX22BB Integrated Processor & FBUS I/F Ckt Pack
0 Qty 1 NT9X84AA Ethernet I/F Pack

0
0 RELEASE 28.01
0 93 12 03

0 Qty 1 NT9X85AA Ethernet Access Unit I/F Paddleboard
0 Also;
0 Qty 1 NT9X0190 Ethernet Cable Assy (from EIU Paddleboard
0 NT9X85AA to Link I/F Shelf (LIS) bulkhead)
0 Qty 1 P0711662 EIU Ident'n Label-Front (EX22BA & 9X84AA)
0 Qty 1 P0711661 Designation Label (NT9X85AA)

0 Please refer to ECM 505 for assignment details and further infor-
0 mation on the LPP, LIS and EIU.

0 HUB/MAU Interface

0
0 MAU - Media Access Unit (A0378106)

0 Hub - Multi-port repeater unit permitting attachment of multiple
0 LAN devices. (A0378105)

0 Adapter on Hub (A0380807)

0 Information on the precise configuration of the MAU and the Hub
0 is yet to be determined for IEC customers. When customer input
0 determines the configuration, that confirmed information will be
0 added to an update of this document.

0 Refer to ECM 408 for more information.

0 The SS7 Network can be configured in two ways; the FULLY ASSOCI-
0 ATED NETWORK and the QUASI ASSOCIATED NETWORK. The Fully Associ-
0 ated Network has every Service Switching Point (SSP - End Office)
0 connected directly to the SCP(s). The Quasi Associated Network
0 has every SSP connected to the SCP through a Signaling Transfer
0 Point (STP).

0 The first generation DMS-SCP is based on the Data Voice System (DVS)
0 hardware platform, and is documented in ECM-426. This ECM describes

0
0 RELEASE 28.01
0 93 12 03

0 provisioning of the second generation DMS-SCP II, which is based on
0 the SuperNode Multicomputing Base (SMB) platform. Physical hardware
0 configuration is detailed in ECM-512 and API-202.

0 The DMS-SCP II is comprised of DMS SuperNode equipment, including one
0 or more Application Processor Cabinets. It performs the actual query
0 processing and real time functions by responding to incoming database
0 queries from the network. OAM functions such as database adminis-
0 tration will be handled by terminals connected to the Input/Output
0 Equipment in BCS-34. Beginning in BCS-34 the telco will interface
0 their Service Management System (SMS) to the DMS-SCP II via Ethernet
0 links and routers.

0 21.1 HARDWARE PROVISIONING

0

0 21.1.1 HARDWARE USAGE RESTRICTIONS

0
0 Refer to ECM512 for restrictions in Application Processor Cabinet
0 (APC) configuration.

0 21.1.2 HARDWARE DEPENDENCIES

0
0 None.

0 21.1.3 PROVISIONING CONSIDERATIONS

0

0

0 RELEASE 28.01
0 93 12 03

0 LPP PROVISIONING GUIDELINES

0
0 Each LPP physically supports 36 Interface units. For the
0 DMS-SCPII these can be the LIU7 or EIU Interfaces.

0 The NT9X70BA LIM can be equipped with up to 36 LIU7s or EIUs in
0 any combination. It replaces the NT9X70AA LIM which can hold 24
0 LIU7s or EIUs in any combination.

0 Due to the nature of this predominantly software driven project,
0 there are no hardware modifications required. As a result this
0 document will provide the user the means to determine the re-
0 quired quantities of hardware necessary for DMS-SCP II. To avoid
0 redundancy reference will be made to the respective APIs and
0 ECMS.

0 EIU PROVISIONING

0 The EIU is required on the DMS-SCPII to provide the communi-
0 cations interface to the SMS. Two (2) EIUs provide sufficient
0 bandwidth and redundancy for the DMS-SCPII to SMS Interface re-
0 quirements.

0 Provision two (2) EIU on the LPP. Refer also to ECM505 for EIU
0 Provisioning information.

0 LIU7 PROVISIONING

0 LIU7s are required on the DMS-SCPII to provide the communi-
0 cations interface to the CCS7 Network. The number of LIU7 re-
0 quired depends on a number of factors such as:
0 | - CCS7 Network Signalling Config. (Associated or Quasi-Assoc)
0 - CCS7 Network Traffic
0 - LIU7 Capacity
0 - Query and Response Messages Length
0 - Number of Messages Per Query
0 - CCS7 Link Speed

0 LINK PROVISIONING

0 a.) Associated CCS7 Network

0 RELEASE 28.01
0 93 12 03

0 In an Associated CCS7 Network, all SSP's communicate with SCP's via
0 direct CCS7 links (F-Links).

0 For Associated CCS7 Network, F-Links need to be provisioned from
0 each SSP to all the SCPs in the CCS7 Network.

0 In normal mode of operation each F-Link should not exceed 40%
0 occupancy or 0.4 Erlangs.

0 Thus the number of F-Links required at the SSP end is:

0 Number of F-LINKS= Total SSP HDBH TRAFFIC
0 at SSP ----- (round up
0 F-Link Capacity at 0.4 Erlangs to next integer)

0 Where :

0 F-Link Capacity = 0.4 Erlang x Link Speed x 2 Directions
0 -----
0 # Bits per Octet x Msgs Length x Msgs per Query

0 At the DMS-SCP II end, the number of F-Links required is:

0 Number of F-Links at SCP = Sum of total number of F-Links being
0 directed to the SCP from each SSP in
0 the Network.

0 For LPPs each F-Link represents a LIU7 Card

0 Therefore:

0 Total Number of LPP's = Total number of LIU7 Cards (round up to
0 ----- next integer)
0 36

0 If the number LIU7s calculated from the above formula is 8 then:

0 For a Fully Associated Network

0 +-----+ 4 +-----+ # of LIU7s
0 | SSP |-----| SCP 1 | required at
0 +-----+ +-----+ SCP1 is 4.
0 # LIU7s = 8 | 4 +-----+ # of LIU7s

0 RELEASE 28.01
0 93 12 03

0 |_____| SCP 2 | required at
0 +-----+ SCP2 is 4.

0 Note: On the first LPP only 34 LIU7 Interfaces are available due to
0 2 Interface slots required for the EIU Interface.

0 b.) Quasi-Associated CCS7 Network

0 In a Quasi-Associated CCS7 Network, all SSP's communicate with
0 SCP's via regional STP's. Thus each SCP type will assume to have
0 A-Links to its regional STP pairs.
0 For Quasi-Associated CCS7 Network, A-Links need to be provisioned
0 from STP pair to all SCPs in the CCS7 Network. In normal mode of
0 operation each A-Link should not exceed 40% occupancy or 0.4
0 Erlangs.

0 For an application type, we will assume that the STP backbone of a
0 Quasi-Associated CCS7 Network can evenly distribute the Application
0 Traffic over all the SCP for that Application when operating
0 normally.

0 CCS7 defines a single and mated NODE configurations for STPs and SCP.
0 For reliability purposes, both SCPs and STPs are typically deployed
0 in the mated pair configuration so that, in the event of a complete
0 CCS7 Node Outage, the mate can take over and handle the entire CCS7
0 traffic load without impacting service.

0 For provisioning purposes, each A-link should be provisioned so that
0 it is operating at 80% occupancy(0.8 Erlang) when 1 SCP Node is down.
0 Thus for an DMS-SCPII Node, the number of A-Links required is:

0 Total Number = Total Network HDBH Traffic
0 of A-Links ----- (round up to next
0 A-Link Capacity at 80% Occupancy even integer)

0 Where :

0 |
0 LIU7 A-Link Capacity = 0.8 Erlang x Link Speed x 2 Directions
0 at 80 % -----
0 # Bits per Octet x Msgs Length x Msgs per Query

0 RELEASE 28.01
0 93 12 03

0
0 For LPPs each A-Link represents a LIU7 Card

0 Therefore:

0 Total Number of LPP's = Total number of LIU7 Cards
0 -----
0 36

0 Note: On the first LPP only 34 LIU7 Interfaces are available due to
0 2 Interface slots required for the EIU Interface.

0 STP LINKS

0 All the links on the DMS-SCPII are directed to a regional STP pair.
0 Therefore each STP Node receives only half the number of A-Links
0 from each DMS-SCP II Node.

0 Thus for an STP Node, the number of A-Links required is:

0 Total Number of A-Links = 2 x A-Links from each SCP Node
0 at STP Node
0 = Total of A-Links at each SCP Node

0 Therefore:

0 Total Number of LPP's = Total number of LIU7 Cards
0 at STP -----
0 36

0 EXAMPLE:

0 The following chart illustrates the LIU7 Capacity with some variable
0 parameters.

0	0	LINK SPEED	LINK USAGE	MESSAGE LENGTH in BYTES			
				50	100	150	279
0	0	56 KBit/S	0.4 Erlang	56 Q/sec	28 Q/sec	18 Q/sec	10 Q/sec
0	0	56 KBit/S	0.8 Erlang	112 Q/sec	56 Q/sec	37 Q/sec	20 Q/sec

0 RELEASE 28.01
0 93 12 03

0 64 KBit/S 0.4 Erlang 64 Q/sec 32 Q/sec 21 Q/sec 11 Q/sec
0 64 KBit/S 0.8 Erlang 128 Q/sec 64 Q/sec 42 Q/sec 22 Q/sec

0 For a Quasi Associated Network

0 Service Management System (SMS)

0 The telco is to provide the SMS and related Ethernet hardware.
0 This section describes the general requirements for the inter-
0 face.

0 The Ethernet Local Area Network (LAN) can be implemented using
0 either 10Base5 (Thick Coax) or IEEE 802.3 10BaseT (Unshielded
0 Twisted Pair/UTP) standard. The latter is preferred.

0 When using IEEE 802.3 10BaseT standard, a Medium Access Unit
0 (MAU) and Hub are required. The MAU provides a connection be-
0 tween the EIU and the UTP, while the Hub is a multi-port repeater
0 unit permitting attachment of multiple LAN devices. MAUs and
0 Hubs from various vendors may be used provided that they conform
0 to the IEEE 802.3 10BaseT standard. The Hewlett Packard
0 EtherTwist Hub and MAU set have been tested to operate with the
0 EIU.

0 To connect a distant LAN to the EIU (Wide Area Network or WAN ap-
0 plication), a synchronous serial link can be used. A router
0 should be used in the connection to provide range extension over

0
0 RELEASE 28.01
0 93 12 03

0 standard communication facilities and to provide fault isolation
0 between the LAN segments. Routers from various vendors may be
0 used provided that they support TCP/IP (Transmission Control Pro-
0 tocol/ Internet Protocol) and provide link speeds within the 56
0 kbit/s to 1.544 Mbit/s range. The Cisco AGS router, equipped
0 with the Multi-port Communication Interface (MCI) card, has been
0 tested to connect a distant 10BaseT LAN to the EIU.

0 Refer to Figure 2 for a diagram of these configurations.

0 DMS SuperNode Equipment

0
0 DMS-SCP will use a dedicated Dual Plane Combined Core Cabinet
0 (DPCC) NT9X01JB. This cabinet contains two MS shelves and one CM
0 shelf. One (1) DPCC is required per DMS-SCP II.

0 PER UNIT COMPONENT CAPACITY:

0 Each MS: 9,000 Q/S
0 Each CM: 225 Q/S (800+ service)

0 The MS is provisioned with NT9X17AC Port cards and associated
0 paddleboards. There are three types of paddleboards, selected
0 based on the type of equipment to be interfaced to the MS:

0 PEC	Description	Used to Interface:
0 -----	-----	-----
0 NT9X23AA	4-port DS-30 PB	IOC, DSN
0 NT9X23BA	4-port DS-30 PB	LIM
0 NT9X62BA	4-port Subrate DS-512 PB	File Processors in
0		Application Processor Cabinet
0	On the Message Switch of the SuperNode Core you MUST have Inter	
0	MS Links. (refer to ECM 626 for provisioning details)	

0 The number of NT9X17AA 4-port CPs is equivalent to the total num-
0 ber of NT9X23__ paddleboards. Refer to ECM-512 for NT9X17AD Port
0 CP provisioning with the NT9X62BA paddleboard, (for BCS36) and
0 NT9X17DA with the NT9X62BA for BCS 36 and below. Refer to
0 ECM-626, ECM-386, and ECM-512 for port provisioning and assign-
0 ment considerations for each type of paddleboard.

0 If the DMS Synchronizable Clock / Stratum is employed in the
0 DMS-SCP system, related equipment must be provisioned on the IOE
0 (see IOE section below).

0 System Load Module Provisioning

0 Provision two (2) SLM II units.

0 Refer to ECM-626 for more details on DMS SuperNode Provisioning.

0

0
0 RELEASE 28.01
0 93 12 03

0 Trunk Module Equipment (TME)

0
0 In each DMS-SCP provide one TME equipped with at least two MTM
0 shelves. Refer to Engineering Manual Section EMA2-01-000 for en-
0 gineering information for the MTM/AXU. Refer also to ECM-386
0 Signal Transfer Point "Office Alarm System" section for recom-
0 mended provisioning of MTM cards in a dedicated SS7 node.

0 Double Shelf Network

0
0 Provide minimum one (1) Double Shelf Network (DSN) to interface
0 the MTMs.

0 | Refer to ECM604 for provisioning rules for the DSN. Depending on
0 the number of network modules provided, a Digital Network Inter-
0 connect (DNI) frame may also be required.

0 Input/Output Equipment

0
0 Provide Input/Output Equipment (IOE) as required. Refer to the
0 Engineering Manual section EMA5-01-000 for provisioning informa-
0 tion for the IOE. Two IOCs per DMS-SCP are required along with
0 their associated disk, tape and terminal requirements. If Stratum
0 clock synchronization (Stratum II or Stratum 2.5) is required for
0 the DMS-SCP, a Remote Oscillator Shelf and associated circuit
0 packs are required. Refer to ECM-317 Synchronization for DMS-Core
0 Offices for further information.

0 Power Distribution Center

0
0 | Refer to ECM631 for provisioning rules for the PDC to power the
0 DMS equipment.

0 Miscellaneous Equipment Frame

0
0 Provide MIS frames as required for housing modems, power
0 inverters, and other miscellaneous equipment as required. Refer
0 to Engineering Manual section EMA13-01-000 for more details on
0 the MIS frame.

0 Maintenance Spares Storage

0
0 | Provide as required for storage of spare DMS SuperNode circuit
0 packs. Refer to ECM-614 for provisioning information.

0 Application Processor Cabinet

0
0 |
0 Application Processor Cabinets (APCs) are to be provisioned with
0 File Processors (FPs) and associated Storage Devices (SDs) con-
0 nected via a SCSI bus. All FPs are to be provisioned with a full
0 complement of Memory CPs. Enhanced 800+ Service supports up to a
0 eleven (11) File Processors on the DMS-SCPII Platform.

0 There are two functions performed by the File Processors in a
0 DMS-SCP II system. One or more FPs are designated as Query

0 RELEASE 28.01
0 93 12 03

0 Processors (QPs); these FPs support the SCP query processing ser-
0 vices. The other FPs are designated as Update Processors (UPs).
0 The UP validates database updates, distributes them to the Query
0 Processors, and supports database maintenance functions such as
0 backup and restore from disk or tape.

0 Query Processor (QP) Provisioning

0 The QP performs the SCP database query transaction processing.

0 Provisioning Update Processors(UPs)

0 1. Provisioning Update Processors(UPs)

0 Each UP maintains a local master copy of one SCP application da-
0 tabase. Provision one UP per application. The following are ex-
0 amples of different applications: 800+, Automated Calling Card
0 Service (ACCS), and Billing Number Screening (BNS). Services
0 within these applications (for example, 800+ Variable Call Rout-
0 ing) are not considered to be different applications.

0 Provision one (1) File Processor per UP.
0 # of Update Processors = _____

0 2. Provisioning of Storage Devices.

0 The quantity of Disk Storage Devices in each UP depends on the
0 size of the application database each supports. Each UP is al-
0 ways equipped with an online copy of the master database. Op-
0 tionally, a backup copy of the master database can be equipped by
0 providing a second equivalent set of Storage Devices. Although
0 the online database copy employs duplicated ("shadowed") disk de-
0 vices for reliability, the backup copy allows fast recovery in
0 the event of serious database corruption and failure of the on-
0 line copy. In addition, one shadowed Disk SD is configured as a
0 support disk to store update batch files, update response files,
0 and transaction logs. Database records are not stored on this
0 disk, to ensure data reliability.

0 Use the following to calculate the number of 600 MByte Disk Stor-
0 age Devices per UP:

0

0 RELEASE 28.01
0 93 12 03

$$\begin{array}{l} 0 \\ 0 \quad \# \text{ Online Disks} = \quad \frac{((\text{Application Database Size in MBytes}))}{(\quad \quad \quad 600 \quad \quad \quad)} \\ 0 \end{array}$$

0 (Round UP to next higher integer)

0 Where : Application Database Size = Service Database Storage +
0 Update File Storage +
0 Response File

0 DAT drives are provided to support database backup and restore
0 functions. Use the following to calculate the number of 1.3
0 GByte DAT Storage Devices per UP:

$$\begin{array}{l} 0 \\ 0 \quad \# \text{ DAT Storage Devices} = \frac{(\text{Application Database Size in MBytes})}{1300} \\ 0 \end{array}$$

0 (Round UP to next higher integer)

0 Total # of Storage Devices = TOTAL DISKS + # DAT Storage Devices

0 Refer to ECM512 for provisioning of the circuit packs.

0 Provisioning Query Processors(QPs)

0 The Number of Query Processors Required is:

$$\begin{array}{l} 0 \quad \text{Query Processors Required} = \frac{\text{Total Service HDBH Query Capacity}}{\text{Query Capacity}} \\ 0 \end{array}$$

0 (Round UP)

0 Where : Total Service HDBH(High Day Busy Hour) Query Capacity.
0 (maximum traffic of the CCS7 Network Interconnected to
0 DMS-SCP II Nodes)

0 Number of Storage Devices.

0

0
0 RELEASE 28.01
0 93 12 03

0 Use the following to calculate the number of 600 MByte Disk Stor-
0 age Devices per QP:

$$\begin{array}{l} 0 \quad \quad \quad ((\text{Application Database Size in MBytes})) \\ 0 \quad \# \text{ Online Disks} = \left(\frac{\quad}{\quad} \right) \\ 0 \quad \quad \quad (\quad \quad \quad 600 \quad \quad \quad) \end{array}$$

0 (Round UP to next higher integer)

0 To provide optional shadow (duplicate) disks for added reliabil-
0 ity, double the above quantity.

0 If Shadowing is required then

0 Total # of Disks = 2 * #Online Disks

0 22.0 Application Processor Cabinet

0 22.1 HARDWARE PROVISIONING

0

0 22.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The Application Processor Cabinet is highly flexible by virtue of
0 its provisionable shelves, devices and SCSI cabling. To facili-
0 tate system installation and field maintenance, and to avoid
0 weight distribution and heat dissipation problems, several rules
0 MUST be followed in configuring the cabinet:

0 1. Assign maximum four (4) FPs beginning from shelf 39 (top of
0 cabinet) moving downwards, and left to right across each
0 shelf. Allot space for SDs from shelf 00 (bottom of cabinet)
0 moving upwards, and left to right across each shelf. Within
0 the constraints of Rule 3, leave no gaps (eg. for "growth") in
0 the assignment sequence.

0 2. Assign SCSI buses in order from the longest to the shortest,
0 beginning at the bottom of the cabinet. In other words, the
0 SCSI bus with the greatest number of devices must be assigned
0 first, followed by the next largest bus, and so on.

0 3. Provision the Storage Devices according to the permissible
0 configurations outlined in the ECM. SCSI cabling cannot leave
0 the cabinet.

0 4. Within each SD space allotment, Power Converters, SCSI Device
0 Interface Paddleboards, and SCSI cables must be equipped ini-
0 tially. The Storage Devices themselves can be provisioned in
0 a future extension. Any type of SD may be provisioned in an
0 allotted quadrant, or a quadrant may be left unequipped. How-
0 ever, it is recommended to position the two members of a shad-
0 owed pair side by side within a half shelf.

0 5. Disk storage devices are more sensitive to vibration than DAT
0 storage devices. Where possible, disk drives should be lo-
0 cated lower in the cabinet than DAT drives.

0

Figure 3 shows some of the configurations permitted by the rules. The first digit in the device number indicates the SCSI bus to which it is connected; the second digit indicates the device number on that bus. For example, SD2 0 is the first storage device on the SCSI bus connected to FP2.

AP	AP	FP0	FP1	FP0	FP1	FP0	FP1	FP0	Blank

AP	AP	SD0 0	SD1 0	SD0 0	SD0 1	SD0 0	SD0 1	SD0 0	SD0 1

22.1.2 HARDWARE DEPENDENCIES

22.1.3 PROVISIONING CONSIDERATIONS

Page 7-423

0 RELEASE 28.01
0 93 12 03
0

- 0 1. Determine the space allotment for SDs as required by the ap-
0 plication, using the space allotment increments allowed by the
0 Usage Restrictions. For example, if three SDs are required
0 for an application, allot a 4-quadrant SD space. Also deter-
0 mine the number of APs required.
- 0 2. Assign into cabinets the Application Processor Shelves and
0 Storage Device Shelves to house the APs, FPs, and SD space al-
0 lotments in accordance with the Hardware Usage Restrictions.
- 0 3. Provision the AP and FP circuit packs, and the actual number
0 of storage devices required by this particular job. Provision
0 SD circuit packs to support all allotted SD quadrants. This
0 allows devices to be added to the chain later without disrupt-
0 ing service. Provision Filler Face Plates or Filler Panels
0 for all unallotted quadrants and unequipped shelf spaces.
- 0 4. Provision the required SCSI cable lengths to interconnect the
0 FPs and all SD space allotments (whether equipped with devices
0 or not) in each chain. Note that SCSI cabling cannot pass
0 from one cabinet to another.
- 0 5. Provision the fiber links between the AP/FPs and the DMS-Core
0 Message Switch (MS), and the circuit packs in the MS.

0 Application Processor (AP) Provisioning

0
0 APs are assigned to the NT9X8101 Application Processor Shelf. A
0 maximum of two (2) APs may be provisioned per shelf. APs and FPs
0 may be mixed on a single shelf.

0 Currently, the only available CPU is the NT9X13LA 68030 40 MHz
0 CPU CP. Provision two (2) per AP to equip both planes.

0 Provision minimum one (1) maximum four (4) NT9X14DB 24 MByte Mem-
0 ory CP per plane to fulfil the memory requirements of the appli-
0 cation. Maximum memory available is 96 Mbytes per plane. The
0 application may designate one of the memory cards as a hot spare;
0 this is optional.

0 Provision two (2) NT9X26AB RTIF CP, of the same type that are
0 currently equipped on the DMS-Core in the office (this avoids

0 RELEASE 28.01
0 93 12 03

0 stocking more than one vintage of spare). New core applications
0 should use NT9X26AB.

0 Provision common circuit packs and filler faceplates as detailed
0 in the Engineering Manual sections.

0 File Processor (FP) Provisioning

0
0 FPs are assigned to the NT9X8101 Application Processor Shelf. A
0 maximum of two (2) FPs may be provisioned per shelf. FPs and APs
0 may be mixed on a single shelf.

0 FP provisioning is almost identical to that of the AP. One (1)
0 of the Memory CPs in each plane is replaced by an NT9X87AA Dual
0 Access Buffer Memory CP, thus reducing the maximum memory avail-
0 able to 72 MBytes per plane. Two of the rear filler faceplates
0 in each plane are replaced by two (2) NT9X88AA Dual SCSI Inter-
0 face Processor (SIP) paddleboards. These paddleboards provide
0 two (2) SCSI ports each, one for the outgoing SCSI link to the
0 first SD and one for the incoming SCSI link from the last SD in
0 the chain. The two SIPs in a plane are designated as the primary
0 SIP and the secondary SIP for that plane. Separate SCSI con-
0 nections are made from the primary and secondary SIPs to the cor-
0 responding primary and secondary paddleboards of the storage
0 device. This ensures maximum reliability.

0 Storage Device (SD) Provisioning

0
0 SDs are assigned to the NT9X8301 Storage Device Shelf. A maximum
0 of four (4) SDs may be provisioned per shelf. APs and FPs are
0 not permitted on Storage Device Shelves.

0 A quadrant on the SD shelf may be assigned any type of SD, or it
0 can be unequipped. Provision NT9X90AA 600 MByte Disk Storage
0 Units and/or NT9X90BA 1.3 GByte DAT Storage Units in the SD as
0 required. Provision DG60M blank tape cartridges for the DAT SD

0 RELEASE 28.01
0 93 12 03

0 as needed. Each removable cartridge can store up to 1.3 GBytes
0 of data.

0 Provision four (4) SCSI Device Interface Paddleboards (SDIPs) and
0 two (2) Storage Device Power Converters for each half-shelf that
0 supports allotted SD space. The two SDIPs associated with an SD
0 are designated as the primary SDIP and the secondary SDIP. Sepa-
0 rate SCSI connections are made to the primary and secondary
0 SDIPs, so there are always four SCSI links running to and from
0 each SD for maximum reliability.

0 There are two types of SDIP: The NT9X89AA SCSI Device Interface
0 (Shelf) PB, and the NT9X89BA SCSI Device Interface (Half-Shelf)
0 PB. The differences between these are the key to understanding
0 how the SCSI bus is physically configured.

0 The NT9X89BA is equipped when an SD space allotment of 2 quad-
0 rants is required. It has two SCSI connectors; one to accept the
0 incoming SCSI link from the FP and one to send the returning SCSI
0 link back to that FP. All connections to the NT9X89BA are made
0 with provisionable SCSI cabling.

0 The NT9X89AA is equipped when an SD space allotment of 4, 8, or
0 12 quadrants is required. It has one SCSI connector and a back-
0 plane SCSI connection. The connector is used in one of four ways
0 depending where the SD is in the SCSI bus and where it is phys-
0 ically located:

- 0 - Accepts the incoming SCSI link from the FP if it is the first
0 SD in the chain; or,
- 0 - Accepts the SCSI link from the previous SD in the chain, lo-
0 cated in the shelf below; or,
- 0 - Sends a link to the next SD in the chain, located in the shelf
0 above; or,
- 0 - Sends the returning link to the FP if it is the last SD in the
0 chain.

0 The backplane SCSI connection links the two halves of the Storage
0 Device Shelf together to complete the chain. The various possi-
0 ble links between paddleboards are illustrated in Figure 4. For
0 clarity, only one connection in one plane is shown. In reality,
0 there are identical connections between primary and secondary
0 paddleboards in plane 0 and in plane 1.

0 RELEASE 28.01
0 93 12 03

0
0 Figure 4 - SCSI Connections to Paddleboards in FP and SD
0 (High Reliability configuration)

0 SCSI Cable Provisioning

0 SCSI cables are selected based on the physical length from one
0 SIP or SDIP paddleboard connector to the next. Figure 4 illus-
0 trates how the cables are connected. Table 1 shows all possible
0 configurations of FPs and SDs based on the assignment rules. Each
0 diagram in the table depicts a cabinet configuration with shelves
0 39, 26, 13 and 00 shown from top to bottom. "FP" represents a
0 File Processor, "SD" a space allotted for a Storage Device, and
0 "-" a blank space or Application Processor. The digit following
0 FP or SD indicates which SCSI bus the device belongs to (eg. SD0
0 is a Storage Device on SCSI bus 0. It is connected to all other
0 SD0 devices and FP0.)

0 Select the configuration with the desired quantity of FPs and
0 SDs, and provision the quantity of cable PECs indicated.

0 Connectorized power cabling is always provided with the cabinet
0 for all shelf positions.

0 Message Switch (MS) and Port Provisioning

0

0 MEMORY PROVISIONING on the MESSAGE SWITCH

0 The memory on the Message Switch of the SuperNode can be provi-
0 sioned ACCORDING TO THE TYPE OF APPLICATION being used. The fol-
0 low are permissible.

0 a.) For 7MEG of Memory on the Message Switch:

0 Provision two (2) NT9X13DB CPU 16MHZ CP Shelf (26,39) slot 9F
0 Provision two (2) NT9X14BB 6 MB Memory Shelf (26,39) slot 10F

0 b.) For 10MEG of Memory on the Message Switch:

0 Provision two (2) NT9X13DC CPU 16MHZ CP Shelf (26,39) slot 9F
0 Provision two (2) NT9X14BB 6 MB Memory Shelf (26,39) slot 10F

0 c.) For 25MEG of Memory on the Message Switch:

0 Provision two (2) NT9X13DB CPU 16MHZ CP Shelf (26,39) slot 9F
0 Provision two (2) NT9X14DB 24MB Memory Shelf (26,39) slot 10F

0 d.) For 28MEG of Memory on the Message Switch:

0
0 RELEASE 28.01
0 93 12 03

0
0 Provision two (2) NT9X13DC CPU 16MHZ CP Shelf (26,39) slot 9F
0 Provision two (2) NT9X14DB 24MB Memory Shelf (26,39) slot 10F

0
0 Message Switch and File Processor Link Provisioning

0
0 Each AP and FP is provisioned with two (2) NT9X62AA 2-Port Sub-
0 rate DS-512 paddleboards(one per plane). There are two fiber link
0 connections(port 0 and port 1) on each NT9X62AA.

0 Therefore one (1) File or Application Processor has:

0 On the DMS Core Message Switch, NT9X62BA 4-Port Subrate DS-512
0 paddleboards are provisioned. In BCS-33, only two connections
0 (ports 0 and 1) are available. Also, the only subrates available
0 in BCS-33 are 256 on the NT9X62AA and 256,512 on the NT9X62BA. In
0 BCS-34 or higher there are 4 connections (ports 0,1,2,3) avail-
0 able on each NT9X62BA.

0 One (1) MS Port CP is provisioned at the front of the MS shelf in
0 the same CP position as the rear NT9X62BA PB. Provision NT9X17AD
0 MS 4-port CP when available. Prior to NT9X17AD availability,
0 provision NT9X17DA MS 64-port CP. Each port card only supports
0 one channels-per-link configuration; that is, you cannot mix 64-,
0 128- and 256-channel links on a single port card.

0 To Summarise the Use of NT9X17DA/AD CARD

0

0 Inter MS Links(on the DMS-CORE)

0

0 In APC applications IT IS NECESSARY to provision Inter-MS Links
0 (IMLs) for reliability. These links connect MS plane 0 to MS
0 plane 1 and provide a path for messages in event of a failure.
0

0

0 For DS-512 Inter-Ms Fiber links, provision two (2) NT9X17DA Port
0 Card and two (2) NT9X20BB Fiber Paddleboard for each Message
0 Switch. Card position is not restricted, but the cards residing
0 in each message switch must be connected to its counterpart in
0 the opposite message switch in the same slot. For example,
0 Inter-MS link 0 could use slot 21 with NT9X17DAs in both Message
0 Switches, slot 21F and NT9X20BB in slot 21R and connecting fibres
0 between them.

0

0 For Fiber inter-MS links, provision two (2) A0352268 Fiber Cables
0 (62") per link.

0 22.1.4 DMS SuperNode Equipment

0
0 The DMS SuperNode MUST BE provisioned with the two (2) NT9X49CB
0 MS P-BUS Terminator CP (Tracer Cards). This is to allow for trac-
0 ing of messages and aid in fault dignostics and MS maintenance.

0 The DMS SuperNode MUST BE provisioned with the one (1) NT9X53AC
0 Combined Clock CP. If there are previous vintages (ie.
0 NT9X53AB,NT9X53AA) then replace the old one with the NT9X53AC.
0 The NT9X53AC has clock robustness and downloadable FW capability
0 which are not available on previous vintages.

0 See ECM 331 DMS-CORE for further information.

0 22.1.5 OFFICE LAYOUT INFORMATION

0
0 The Application Processor Cabinet is a standard SuperNode style
0 cabinet. Refer to ECM331 DMS-Core for details of office layout
0 considerations.

0 22.1.6 TRAFFIC TABLES

0
0 Not applicable. Individual provisioning documents for software
0 applications of the APC will define traffic engineering parame-
0 ters as appropriate.

0 22.3 SOFTWARE PROVISIONING

0

0 22.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0
0 Refer to the provisioning document for the specific software ap-
0 plication of the APC for software provisioning information.

0 22.3.2 SOFTWARE USAGE RESTRICTIONS

0
0 Not applicable.

0 22.3.3 MEMORY PROVISIONING

0
0 Provisioning of memory cards in the AP and FP units is dependent
0 upon the specific application. Refer to the appropriate provi-
0 sioning document for information.

0

0
0 RELEASE 28.01
0 93 12 03

0 22.4 REAL TIME IMPACT

0 The addition of AP and FP components should have minimal impact
0 on call processing. Additional background time, at a lower pri-
0 ority than call processing, is required to maintain the addi-
0 tional components.

0 22.5 APC CUSTOMER QUESTIONS

0 1. CABINET QUESTIONS

0 a. Number of Application Processor Cabinets(APC) required ? _____

0 For each APC required answer the following questions:

0 b. Is it a new core installation ? _____

0 c. Is this the last cabinet in the lineup ? _____

0 d. Is the spare cabinet(NT9X01FA) located between _____
0 the NT9X80BA and end of lineup ?

0 e. Is the color of the exterior cabinet brown ? _____

0 f. Is the color of the exterior cabinet grey ? _____

0 g. Is overhead cabling used ? _____

0 2. SHELF and CIRCUIT PACK Questions(for each APC Cabinet)

0 For each APC required repeat the Shelf and Circuit PACK questions

0 Q1. Is the APC to contain Application Processors ? _____

0 Amount of memory required for application processor ? _____
0 (this will depend on the type of application)

0 Q2. Is the APC to contain File Processors ? _____

0 RELEASE 28.01
0 93 12 03

0 Amount of memory required for file processor ? _____
0 (this will depend on the type of application)

0 Q3. Is the APC to contain Storage Devices ? _____

0 Q4. If Q2 is 'YES' then,

0 Enter the number of File Processors required ? _____
0 (Maximum allowed is four (4) per APC)

0 Q5.If Q1 is 'YES' then,

0 Enter the number of Application Processors required ? _____

0 Q6.If Q3 is 'YES' then,

0 a.If one (1) File Processor(FP) is specified in Q4 then
0 enter the following:

File Processor (FP)	#Hard Disk	#Digital Audio Tape	#Blanks for future use	
FP0				Total #Devices for FP0 SD0 = _____
	Total # Hard Disk HDISK = _____	Total # Audio Tape DDISK = _____		

0 b.If two (2) File Processor is specified in Q4 then
0 enter the following:

File Processor (FP)	#Hard Disk	#Digital Audio Tape	#Blanks for future use	
FP0				Total #Devices for FP0 SD0 = _____

0 RELEASE 28.01
0 93 12 03

0	+	-----	+	+	+	+	+
0		FP1					Total #Devices for FP1 SD1 = _____
0	+	+	+	+	+	+	+
0			Total # Hard Disk	Total # Audio Tape			
0			HDISK = _____	DDISK = _____			
0	+	+	+	+	+	+	+

0 c.If three (3) File Processor is specified in Q4 then
0 enter the following:

0	+	-----	+	+	+	+	+
0		File Processor (FP)	#Hard Disk	#Digital Audio Tape	#Blanks for future use		
0	+	+	+	+	+	+	+
0		FP0				Total #Devices for FP0 SD0 = _____	
0	+	+	+	+	+	+	+
0		FP1				Total #Devices for FP1 SD1 = _____	
0	+	+	+	+	+	+	+
0		FP2				Total #Devices for FP2 SD2 = _____	
0	+	+	+	+	+	+	+
0			Total # Hard Disk	Total # Audio Tape			
0			HDISK = _____	DDISK = _____			
0	+	+	+	+	+	+	+

0 d.If four(4) File Processor is specified in Q4 then
0 enter the following:

0	+	-----	+	+	+	+	+
0		File Processor	#Hard Disk	#Digital Audio	#Blanks for future		
0	+	+	+	+	+	+	+

0 APPLICATION PROCESSOR CABINET BUILDING BLOCK DEFINITION

0 The Application Processor Cabinet building block concept deals with a
0 higher level of Product Engineering Code (PEC) ordering and simplifies
0 the engineering ordering process.

0 NTZZ35BA (APC Application Processor Left)

0 Each NTZZ35BA contains CPU Processors, Power Converter, Faceplates,
0 Paddleboards, Bus Terminators to be inserted on the left half shelf of
0 the cabinet to equip one (1) Application Processor.

0 NTZZ35CA (APC File Processor Left)

0 Each NTZZ35CA contains CPU Processors, Power Converter, Faceplates,
0 Paddleboards, Bus Terminators to be inserted on the left half shelf of
0 the cabinet to equip one (1) File Processor.

0

0

0
0 RELEASE 28.01
0 93 12 03

0 NTZZ35DA (APC Application Processor Right)

0 Each NTZZ35DA contains CPU Processors, Power Converter, Faceplates,
0 Paddleboards, Bus Terminators to be inserted on the right half shelf
0 of the cabinet to equip one (1) Application Processor

0 NTZZ35EA (APC File Processor Right)

0 Each NTZZ35EA contains CPU Processors, Power Converter, Faceplates,
0 Paddleboards, Bus Terminators to be inserted on the right half shelf
0 of the cabinet to equip one (1) File Processor

0 NTZZ35FA (APC Storage Device Left)

0 NTZZ35FA contains the circuit packs such as Power Converters,
0 Paddleboards, Faceplates necessary for the storage devices. This is
0 placed on the left half shelf of the cabinet.

0 NTZZ35GA (APC Storage Device Right)

0 NTZZ35GA contains the circuit packs such as Power Converters,
0 Paddleboards, Faceplates necessary for the storage devices. This is
0 placed on the right half shelf of the cabinet.

0 NTZZ35HA (APC Storage Device Full)

0 NTZZ35HA contains the circuit packs such as Power Converters,
0 Paddleboards, Faceplates necessary for the storage devices on a full
0 shelf in the cabinet.

0 NTZZ35JA (APC Pack Fill Right)

0 NTZZ35JA contains the circuit packs such as Filler Faceplates,
0 Paddleboards, etc. necessary for the right side of the cabinet. It is
0 used only on the right half side of a application processor shelf and
0 only when that right half shelf is empty.

0 NTZZ35KA (Storage Device Pack Fill Right With Paddleboard)

0 NTZZ35KA contains the circuit packs such as Filler Faceplates,
0 Paddleboards, etc. necessary for the right side of the cabinet. It is
0 used in tandem with the NTZZ35HA(Storage Device Full).

0 RELEASE 28.01
0 93 12 03

0 23.0 Advanced Intelligent Networking (AIN) Rel. 0.0

0 Advanced Intelligent Networking (AIN) is an application on the Service
0 Switch Point (SSP) in a CCS7 Network. The AIN software provides the
0 ability to send, receive, process, and bill for queries/responses
0 from/to a Service Control Point (SCP) database depending upon specific
0 triggering events. AIN will also offer deployment of services in a
0 centralized database accessible from all switches via standard inter-
0 faces and better provisioning, operations, and administration capabil-
0 ities.

0 The AIN Network architecture is comprised of the Network Access Point
0 (NAP), the Service Switch Point (SSP), the Signal Transfer Point
0 (STP), and the Service Control Point (SCP).

0 The NAP is an End Office (EO) which supports AIN functionality but
0 does not have the capability to access the SCP using the CCS7 Trans-
0 action Capability Application Part (TCAP) messages. Therefore, it
0 must pass all AIN calls to the SSP either by way of Multi-Frequency
0 (MF) Equal Access or CCS7 ISDN User Part (ISUP) trunk signalling. The
0 SSP is the EO responsible for formulating the TCAP query to the SCP
0 for subscribers connected directly to it or connected to subtending
0 NAPs. Upon receiving a response from the SCP, the SSP routes the call
0 to its appropriate destination based on information received from the
0 SCP in the response message.

0
0 RELEASE 28.01
0 93 12 03

0 The STP is responsible for routing the CCS7 TCAP messages to the appropriate SCP, based on Global Title Translations(GTT).

0 The SCP contains all the information required to provide the services to the customer. Once it receives the query from the SSP, it determines the service to be provided to the subscriber and provides the information required by the SSP to proceed with the call.

0 23.1 HARDWARE PROVISIONING

0

0 23.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The NT1X75BA DRAM controller card for AIN announcement delivery must be used in any offices that contain BCS 34 and above. The NT1X75AA controller card cannot support AIN 0.0 announcement delivery in BCS 34 and beyond.

0 AIN will be implemented using the DMS SuperNode only.

0 AIN CCS7 Messaging:

0 AIN will have an affect on the messaging capabilities of DMS CCS7 messaging peripherals (LIU7/LPP - Link Interface Unit No. 7 on Link Peripheral Processor and MSB7 - Message Switch and Buffer No. 7). The LPP is a Series 3 SOS-based peripheral whose performance characteristics have been documented in System Engineering Bulletin No. 90-06-001. The MSB7 is a Series 2 XPM peripheral whose performance characteristics have been documented in System Engineering Bulletin No. 90-08-001. These SEBs discuss the real time and messaging performance limitations/characteristics of both peripherals. They describe how to account for PVN messaging traffic when provisioning or analyzing the product. Since PVN is the forerunner/associate to AIN, the inputs to all engineering guidelines which call for PVN also apply to AIN. Specifically, the MSB7 has critical TCAP messaging capabilities/limitations which must be analyzed in conjunction with any AIN CM real time analysis. Please reference these SEBs for further specific LIU7 and MSB7 performance calculations.

0

0 RELEASE 28.01
0 93 12 03

0 23.1.2 HARDWARE DEPENDENCIES

0
0 Not applicable.

0 23.1.3 PROVISIONING CONSIDERATIONS

0
0 AIN does not include any new or specific hardware. It is
0 strictly software only and uses hardware already available in the
0 DMS.

0 The following describes the technical performance characteristic
0 to support the near-term goals of Advanced Intelligent Network
0 (AIN). The NT AIN project is primarily targetted to Ameritech
0 and detailed specifications produced by them. The only develop-
0 ment work under- taken by BNR/NT is in the SSP (Service Switching
0 Point). The development in the DMS SSP allows Ameritech's tele-
0 phone companies the ability to formulate, send, and receive in-
0 formation to/from an SCP (Service Control Point). The purposes
0 of these transactions would typically be one of the following:
0 request instructions, receive and process routing instructions,
0 receive instructions to play announcements, and receive special
0 billing instructions.

0 The product that NT is delivering for the AIN Release 0.0 project
0 is a DMS SSP with enhanced software to support the required AIN
0 functionality. An overview of the functionality is as follows:

0 Triggers: The DMS SSP will support a number of "triggers" that
0 are points in the processing of a call where the SSP formulates a
0 TCAP (Transaction Capabilities Application Part) message to be
0 sent to the SCP. Typical information sent in a query are: call-
0 ing number and called number (among others) that are required to
0 drive service logic in the SCP. The SCP typically responds to
0 these queries with appropriate instructions or further requests
0 for information regarding the disposition of the call in
0 progress.

0 Routing Instruction Processing: The usual response to a query is
0 one to route the call somewhere. The SCP can specify the TCAP

0
0 RELEASE 28.01
0 93 12 03

0 interface that the call be routed over either public or private
0 facilities. The former is achieved by specifying an appropriate
0 carrier and routing number, the latter is achieved by specifying
0 a routing index and an outpulse number. It is the SSP's respon-
0 sibility to act on either of these recommendations.

0 Announcements: The SCP can instruct the SSP to play an announce-
0 ment for the user, for the purposes of terminating the call, or
0 for collecting a piece of information from the user via the DTMF
0 dialpad. It is the SSP's responsibility to play the announcement
0 as instructed and report back any information collected to the
0 SCP for further processing.

0 Billing: Upon completion of a call, the SCP can instruct the SSP
0 how to bill the call, in terms of what BellCore AMA Call Code to
0 be used when generating the billing record.

0 Termination Notification: The SCP can instruct the SSP to send
0 what is known as termination information once the call is com-
0 pleted. Typical information is connect time, answer indication,
0 etc., and is sent to the SCP from the SSP only when the call is
0 completed. The SCP can use this information for whatever purpose
0 it desires.

0 Call Gapping: As a form of overload control, the SCP can in-
0 struct the SSP to restrict calls from a particular NPA-NXX for a
0 specified time. This mechanism allows the SCP a method by which
0 to flow-control queries from particular central offices or ge-
0 ographic locations.

0 Error Handling: As a general statement, the SSP is responsible
0 for handling all errors in messages that may be sent by the SCP.
0 This includes protocol error handling (mis-encoded parameters,
0 missing mandatory parameters, timeouts, out-of-sequence messages,
0 etc.), and application level error handling. Also, the SSP must
0 handle internal failures at the protocol and application level.

0 The background of the existing DMS SSP to support AIN
0 functionality goes back to the days prior to the awarding of the
0 contract for the U.S. Federal General Service Administration.
0 This project was called FTS-2000. The DMS implementation of
0 capabilities in the SSP to support the functionality required for
0 this bid was the Private Virtual Networking (PVN) project and its
0 associated BCS 24 - BCS 28 software. The PVN project was never
0 taken to V0. Subsequently, in BCS 32, features are being intro-
0 duced built upon that PVN platform.

0 23.3.2 SOFTWARE USAGE RESTRICTIONS

0
0 Not applicable.

0 23.3.3 MEMORY PROVISIONING

0
0 No significant CC DS or PS memory impacts have been noted to date
0 for PVN or AIN.

0 23.4 REAL TIME IMPACT

0 The following generic performance information is for AIN Rel 0.0
0 triggering. Specific AIN capabilities/features will be evaluated
0 as applicable.

0 The AIN SSP-SCP query/response messaging functionality is the
0 critical DMS performance criterion when analyzing AIN offices be-
0 cause of its' additional real time impact to the base Super Node
0 Compute Module (CM) Central Processing Unit (CPU) call timings.
0 For AIN Release 0.0, the estimated SuperNode MC68020 (SR20) CM
0 CPU real time additive for processing the AIN portion for any ap-
0 plicable call type is approximately +7.0 ms per TCAP message
0 added to any base call timing. For example, a two message TCAP
0 query/response AIN messaging exchange would mean an additional
0 +14 ms.

0 Refer to SEA 91-03-002 for further information

0 24.0 CCIS, CCITT No. 6 Equipment - MS6E, ST6E, DME

0 The Message Switching 6 Equipment (MS6E) houses DMS Common Channel
0 Interoffice Signalling (CCIS) hardware and DMS CCITT #6 Signalling
0 (for DMS-300 application) hardware. The MS6E is composed of the Mes-
0 sage Switch and Buffer 6 (MSB6), Signalling Terminals (ST), modems
0 and inverters. The Signalling Terminals and associated modems are
0 setup into two groups of eight (8) on the MS6E frame. The MSB6 commu-
0 nicates with the Digital Trunk Controllers (DTC) via up to 8 net-
0 work ports per plane. The MSB6 switches signalling messages between
0 the ST's and the CCIS or CCITT #6 trunks on the DTC's via the
0 Inter-Peripheral Message Links (IPML's). The signalling terminal
0 provides the interface function between the DMS and the signalling
0 network.

0 The Signalling Terminal Extension Frame houses CCITT
0 No.6/CCIS6/CCS7 signalling terminals. The ST6E/ST7E provides the ca-
0 pacity to add up to 48 ST's (on 3 ST extension shelves) in addition
0 to the 16 ST's on the MS6E (NT6X06AB) frame or the 24 ST's on the MS7E
0 (NT6X31AA) frame. The Data Modem Extension Frame (DME) NT6X29
0 must always be provisioned with the ST6E frame.

0 24.1.3 PROVISIONING CONSIDERATIONS

0
0 The Signalling Terminal 6 Equipment (ST6E) frame is used in CCITT
0 #6 when more than 16 links are required. The Data Modem Ex-
0 tension (DME) frame houses a 2400 baud modem which
0 modulates/demodulates serial binary data to/from Phase Shift
0 Keying (PSK). The DME frame is provisioned in conjunction with
0 the ST6E frame.

0 RELEASE 28.01
0 93 12 03

0 25.1 Hardware Provisioning

0

0 25.1.1 Hardware Usage Restrictions

0

0 The following limitations and engineering rules apply to OA&M ap-
0 plications:

0 Currently, only 4 EIU's can be provisioned per switch.

0 Mount the MAUs directly to the bulkhead of the LPP and directly
0 to the HP 710 workstation base. The cable from the EIU to the
0 bulkhead, NT9X0190, is included in the EIU Building Block.

0 The MAU to Hub cable is limited to 100 metre. This cable length
0 is custom engineered to length in the range 1 to 100 metre.

0 Ethernet Hubs and MAUs from different vendors shall not be mixed
0 on the same LAN.

0 The HP 710 workstation operates reliably when powered directly
0 from commercial power. However an AC UPS power supply may be
0 used, for greater reliability, if required.

0 The Patching Modem must be located within 10 feet of the work-
0 station because the 1CATSM8 cable is limited to 10 feet.

0 In applications in which the Workstation or any other devices
0 connected to the same Ethernet Hub are not used directly in call
0 processing functions, e.g. as in the ADAS application, the
0 Ethernet Hub should be co-located with the HP 710 workstation and
0 should be placed on a desktop if the distance from the EIU to the
0 workstation is 100 metres or less.

0 Mounting the Ethernet Hub on a desk top allows the use of very
0 short cables between the Hub and additional X-terminals or work-
0 stations. Mounting the Hub in this manner eliminates the need
0 for a separate mounting frame. Note the 12 Port Hub includes
0 miscellaneous mounting hardware for an EIA 19 inch width frame
0 and rubber feet for desktop mounting. This hardware is used with
0 a Hub Mounting bracket for mounting the Hub in a LAN Bay shelf.

0
0 RELEASE 28.01
0 93 12 03

0 | Cable Length Restrictions

0
0 NT9X8510 (CPC: B0237649) Crossover Cable (MAU to MAU or Hub to
0 Hub) is restricted to between 1 meter and 225 meters in length.
0 This cable can be up to 225 meters only when used as a MAU to MAU
0 cable with HP28685B MAU's, with the "long cable" switch on the
0 MAU's selected. The cable length restriction is 100 meters in
0 any other configuration.

0 NT9X8511 (CPC: B0237650) MAU to Hub Cable is restricted from 1
0 meter to 100 meter length. These Cables are engineered according
0 to the CARX15 drawing.

0 1.0 Meridian Business Services (MBS)

0 1.1 Introduction

0 Meridian Business Services utilize the data handling capabilities
0 of a DMS-100 Family office to provide a centralized telephone
0 communications exchange service. Telephone lines from a customer
0 group subscribing to MBS are connected directly to a DMS-100
0 switch. The functions performed by the DMS-100 switch are deter-
0 mined by MDC feature programs which in turn determine the treat-
0 ment the customer group lines receive. One DMS-100 switch can be
0 devoted to the use of one very large customer group or up to 4095
0 different customer groups can be served by one DMS-100 switch.

0 Line Concentrating Device Provisioning

0 Prior to BCS28, the maximum number of LCDs allowed in an office
0 was 254 with the maximum number of real LCDs limited to 200.
0 Changes in BCS 28 allow up to 254 real LCDs. The use of virtual
0 LCDs will lower the number of real LCDs allowed. For BCS30 and
0 above, the calculation of LCDs per SLC will be changed to 8 SLCs
0 per real LCD.

0 Virtual IDs are assigned to Business Sets. Refer to the Line
0 Concentrating Module, Section 3.5 Peripheral Modules - Host, for
0 more information on how the virtual IDs are assigned to effect
0 the LCD provisioning.

0 1.3 Equipment Provisioning

0 1.3.1 Business Service Attendant Console (BSAC)

0 (a) General Description

0 The Business Service Attendant Console is used in Business Ser-
0 vices applications. It is used to answer calls placed to the
0 listed directory number, don't answer recalls, intercepted calls,
0 station dial "0" calls, etc. The attendant can both complete in-
0 coming calls and originate calls. The attendant can also dial
0 the access code to a trunk group for a station who is waiting
0 off-hook, release from the call and permit the station to dial
0 the called number.

0 - Console Attendant's Manual

0 NTP 297-2001-103 Integrated Business Network Services
0 - Features Description

0 (c) Provisioning Considerations

- 0 (i) The provisioning method used for determining the number
0 of attendant consoles is based on the CCS method derived
0 from the Erlang C formula.
- 0 (ii) The number of attendant consoles to be provisioned should
0 be based on the following criteria:
- 0 (a) the attendant console activated CCS
 - 0 (b) the speed of answer objectives
 - 0 (c) and the average attendant work time (AWT)

0 RELEASE 28.01
0 93 12 03
0

0 Each attendant subgroup will have its own queue of idle
0 occupied positions and its own call queue. Calls will be
0 queued on the FIFO (first in first out) basis.

0 (iii) The attendant console activated CCS can then be referred
0 to Table S, Attendant Console Traffic Capacity Table, in
0 Chapter 2 to obtain the attendant console requirements.
0 The formula from which this table was constructed in-
0 cludes the proper variation in available time for the ac-
0 tual team size and attendant work time per call
0 encountered to meet a certain grade of service (speed of
0 answer) objective.

0 (iv) As team size becomes larger, attendant occupancy rises.
0 Occupancy is that portion of an hour during which the at-
0 tendant in a team can be occupied handling calls and
0 still be available for enough of the hour to provide the
0 speed of answer objective. Attendant occupancy will be
0 limited to 92 percent.

0 (v) The grade of service objectives will be stated in terms
0 of average speed of answer or probability of delay
0 greater than t seconds. These objectives are useful or
0 of meaning only up to the point (team size) where the
0 limiting occupancy is reached. Beyond that point occu-
0 pancy must be the guide.

0 (a) Average speed of answer objective:

0 $d = 4$ seconds

0 (b) Probability of delay greater than t
0 seconds objective:

0 $P(\text{delay} > 10 \text{ sec}) = 8\%$

0 (vi) If the average attendant work times for various types of
0 calls are unknown, such as is the usual case on an ini-
0 tial job, it may be obtained from a similar installation
0 or determined by using Table R, Console Attendant Work
0 Times In Seconds, in Chapter 2 and an estimate of the
0 number of each type of call expected to be processed by
0 the attendant. Table R lists the more common types of
0 average attendant work times. Call types not listed
0 should be estimated by comparison to similar types
0 listed.

0 RELEASE 28.01
0 93 12 03
0

0 Following is the detailed calculation for determining the
0 number of Attendant Consoles required:

- 0 1. Determine the number of calls by call type. Re-
0 fer to Table R.
- 0 2. Determine average attendant work time (AWT) per
0 call type. Refer to Table R.
- 0 3. Calculate the attendant console activated CCS by
0 using the following formula:

$$\begin{array}{lcl} \text{Attendant console} & \text{No. of calls/call type X AWT/call type} & \\ \text{activated CCS} & = \frac{\text{-----}}{100} & \end{array}$$

- 0 4. Calculate the Total number of calls (ie. the
0 total of all calls in item 1.)
- 0 5. Calculate the total attendant console activated
0 CCS (ie. total of step 3 for all call types)
- 0 6. Divide the total attendant console activated CCS
0 by 36.
- 0 7. Calculate the average attendant work time for
0 the attendant consoles using the following for-
0 mula:

$$\begin{array}{lcl} \text{AWT} & = \frac{\text{Attendant console activated CCS X 100}}{\text{Total number of calls}} & \end{array}$$

0 Refer to Table S and pick the closest appropri-
0 ate value to AWT.

- 0 8. Based on the total attendant console activated
0 CCS divided by 36, a speed of answer objective
0 of four (4) seconds, and an average attendant
0 work time, refer to Table S and derive the at-
0 tendant console value. Interpolation may be re-
0 quired.
- 0 9. The number of attendant consoles required is
0 equal to the total attendant console activated
0 CCS divided by 36 plus the attendant console

0 RELEASE 28.01
0 93 12 03

0 value derived from step 8. The number is
0 rounded up to the next higher integer.

0 With an upper limit for attendant console occu-
0 pancies of no greater than 92% (or 33.12
0 CCS/attendant), the number of attendant consoles
0 required (for values of attendant console acti-
0 vated CCS/36 to the left of the line in Table S)
0 is equal to the total attendant console CCS di-
0 vided by 33.12. The number is rounded up to the
0 next higher integer.

0 (vii) The attendant console can be ordered as an English ver-
0 sion (NT4X09BB) or as a French version (NT4X09BC).

0 (viii) If required, Canadian offices shall order one of the fol-
0 lowing headsets/headset accessories per BSAC:

0	PEC	DESCRIPTION
0	QSR2F2	Hset w/T Mark Std w/o Acc
0	QSR2G1	Hset Std w/15 ft cord
0	QKP1A	Headset Acc Kit

0 If required, U.S. offices shall order one of the follow-
0 ing headsets per BSAC:

0	PEC	DESCRIPTION
0	HS0552-1	Supra Monaural Headset
0	HS0554-1	Supra Binaural Headset

0 (ix) The attendant console is connected to an LCM/RLCM/RLM/LM
0 via three (3) Type A Line Cards, one (1) for voice and
0 two (2) for Frequency Shift Keying data. These cards
0 must be assigned in the same line drawer. Standard 1300
0 ohm loops are to be used. Attendant consoles should be
0 spread over all line modules.

0 Provide three (3) Type A Line Cards for each BSAC.

0 (x) Each attendant console requires a digital modem circuit.
0 Two circuit packs, NT3X02AA and NT3X03AA, provided to-
0 gether (called a DMODEM pair) provide four (4) digital
0 modem circuits. A maximum of two (2) DMODEM pairs can be
0 assigned to one MTM.

0
0 RELEASE 28.01
0 93 12 03

0 (xi) Provide a minimum of one (1) Call Waiting Tone Generator
0 card per Central Office equipped with Meridian Business
0 Services. A second card may be provided for increased
0 reliability. Each card contains four (4) circuits. Ref-
0 erence Section 3.5 for provisioning details.

0 (xii) Provide one (1) Six Port Conference Circuit (NT3X67AA)
0 per one (1) or two (2) attendant consoles. When the
0 NT3X67AA card is to be used as two three-port conference
0 circuits, then provide one card per two attendant con-
0 soles, otherwise provide one card per one BSAC. Each card
0 contains two (2) three-port circuits. The circuits to be
0 used is selected from a pool.

0 Three Port Conference Circuits associated with the At-
0 tendant console Digital Modems may be provisioned on the
0 same MTM. Conference circuit packs utilized for six port
0 or 3 way call chaining must not be provisioned on the
0 same MTM as the Attendant console Digital Modems. Refer
0 to Section 3.5 for more provisioning details.

0 (xiii) One NT3X68AB DTMF Sender CP is optionally required when
0 the Attendant Console must output DTMF to some other
0 switching system. Note this circuit is provisionable on
0 a one per office basis two maximum for redundancy.

0 (xiv) Currently the attendant receives messages on the alphanu-
0 meric display in response to call processing and feature
0 processing events. These are system defined English mes-
0 sages. For a listing of these standard messages, see NTP
0 297-2101-451 DMS-100 Local Customer Data Schema, Section
0 169.

0 The optional flexible Display Language feature which is
0 part of software package NTX175AA (see NTP 297-1001-80
0 Software Feature Package Reference Manual) will provide
0 the ability to input equivalent messages for the standard
0 English messages in other languages. With this feature,
0 the customer can order 1, 4 or 7 additional language al-
0 ternatives to the standard English display.

0 For example, if the customer requires three (3) addi-
0 tional languages, then he would have to choose the option
0 that provides four (4) additional languages. Hence, he
0 would have the standard English messages plus the ability
0 to provide equivalent messages in four (4) additional
0 languages.

0 The number of additional language alternatives (i.e.
0 1,4,7) can be changes only at the software load build
0 time.

0 1.3.2 Power Supply For BSAC

0 (a) General Description

0 The BSAC is powered by -48V DC. Power may be obtained from the
0 switch through a cable connection or from a local power supply.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 (i) The attendant console is powered from -48V office bat-
0 tery. It draws a nominal .45A at -52V and a worst case
0 of .64A at -36V. The console comes equipped with a six
0 (6) foot connectorized cable that has leads for voice,
0 data and power. The wiring beyond the six foot cable is
0 to be engineered according to the CA4X09 drawing, Digital
0 Multiplex Switching System DMS-100 Cabling Information
0 For Business Service Attendant Console.

0 (ii) The maximum power cable length from the FSP fuse to the
0 console is 266.7 M (875 ft).

0 (iii) For cases where the console is more than 875 feet from
0 the power source or fuse, a local 120V AC/-48V DC power
0 supply unit must be provided at the BSAC site.

0 (iv) For these cases, the maximum cable length from this aux-
0 iliary power supply unit to the console is 137.2 M (450
0 ft).

0 (v) For these cases, the power supply unit to be used is a
0 Pylon system.

0 (vi) The Pylon Power Supply Unit can provide power to up to
0 two (2) BSAC's.

0 (vii) The input to the power supply is from a regular AC out-
0 let. The power supply comes equipped with a six (6) foot
0 AC cord.

0 (viii) The BSAC power system with battery back up is to be or-
0 dered as the "Pylon NF-3 System". This consists of:

0 RELEASE 28.01
0 93 12 03
0

- 0 (a) The Pylon KTS-3 power supply
- 0 (b) The Pylon NF-3 interface unit
- 0 (c) The Pylon LB-3 battery holder
- 0 (less batteries).

0 The optional battery back up is to be used in conjunction
0 with the power supply, in case of AC power failures.

- 0 (ix) The BSAC power system without battery back up shall con-
0 sist of the following:

- 0 (a) The Pylon KTS-3 power supply
- 0 (b) The Pylon NF-3 interface unit.

- 0 (x) For the optional battery back up, the type of battery to
0 be used with the Pylon NF-3 System is:

0 Qty of four (4) Gates "X" Cells No. 0800-0008.

- 0 (xi) Both the BSAC power system with battery back up and the
0 BSAC power system without battery back up can be in-
0 stalled on the wall or on a 19" or 23" relay rack. The
0 former will require 17.5" of mounting space on the relay
0 rack, the latter will require 9" of mounting space on the
0 relay rack.

0 1.3.3 Electronic Business Set (EBS)

0 (a) General Description

0 The DMS-100 Electronic Business Set (EBS), designed to operate
0 with Northern Telecom's Meridian Digital Centrex (MDC) software,
0 provides subscribers with pushbutton access to a host of business
0 features. The software assignable keys and the modular add-on
0 units of the EBS allow users to customize the set with the fea-
0 tures that best suit their particular needs. Feature assignment
0 is completely flexible because features are programmable in the
0 DMS-100 Family system software.

0 (b) References

0 NTP 297-2011-100 Business Set Feature Description
0 and Operation
0 NTP 297-2011-180 Business Set Line Engineering
0 NTP 297-2011-200 Business Set General Description,
0 Installation, Maintenance and
0 Ordering Information

0 (c) Provisioning Considerations

0 (i) Two models of DMS-100 Electronic Business Set are avail-
0 able:

- 0 (1) A Basic Business Set
0 (2) A Display Business Set

0 (ii) The Basic Business Set is equipped with the following:

- 0 1) a standard 12-button telephone key pad
0 2) eight assignable feature keys with
0 associated Liquid Crystal Display (LCD)
0 indicators
0 3) one assignable feature key without an LCD
0 indicator
0 4) dedicated volume up feature key
0 5) dedicated volume down feature key
0 6) dedicated hold feature key
0 7) dedicated release feature key

0 (iii) The Basic Business Set provides voice and "above voice
0 band" signalling transmission over a 2-wire line. Voice
0 and signalling are frequency division multiplexed, with

0 RELEASE 28.01
0 93 12 03
0

0 binary data transmitted via absence or presence of an 8
0 KHz carrier. All feature activation is via this trans-
0 mission.

0 (iv) The Display Business Set has all the features of the
0 Basic Business Set plus a 32 character alphanumeric digit
0 LCD display. The display, made up of two lines of 16
0 characters centered above the key pad, is controlled by
0 an internal microprocessor and shows information such as
0 the following:

- 0 1) called number
0 2) calling number
0 3) time
0 4) feature programming

0 (v) To further enhance a customer's Business Set, a hands
0 free speakerphone and 20 key/16 LCD add-on modules are
0 available.

0 (vi) Up to three 20 key or button add-on modules may be at-
0 tached to the right side of the Business Set providing up
0 to 69 keys (56 of which have associated LCD indicators)
0 which can be programmed with any combination of features
0 and directory numbers. LCD indicators are used to mini-
0 mize power consumption.

0 (vii) The Hands Free Unit may be attached to the left side of
0 the Business Set.

0 (viii) With the Hands Free Unit, the following features are
0 available:

- 0 1) accepting incoming calls on either the
0 Hands Free Unit or the associated
0 telephone set
- 0 2) transferring calls between the Hands Free
0 Unit and the associated telephone set
- 0 3) dialing outgoing calls with the handset
0 either on-hook or off-hook
- 0 4) automatic cutoff of the Hands Free Unit
0 when the handset is lifted off-hook for
0 handset operation

0
0 RELEASE 28.01
0 93 12 03

0 (ix) The Auto Answer Back feature is provided via a module
0 which plugs into the Business Set. The Business Set must
0 be equipped with a Hands Free Unit when this feature is
0 assigned.

0 (x) The available versions of the Business Set are as fol-
0 lows:

0 1) NT4X20AA/AL Basic Business Set,
0 no digit display
0 - cord equipped with Teladapt
0 connectors

0 2) NT4X20AE/AR Basic Business Set, no digit
0 display
0 - cord equipped with spade
0 tips

0 3) NT4X20AB/AM Display Business Set equipped
0 with digit display
0 - cord equipped with Teladapt
0 connectors

0 4) NT4X20AT Display Business Set equipped
0 with digit display
0 - cord equipped with Teladapt
0 connectors
0 - used with Automatic Call
0 Distribution (ACD) feature

0 5) NT4X20AF Display Business Set equipped
0 with digit display
0 - cord equipped with spade
0 tips

0 (xi) The Teladapt connector is a connectorized jack (at the
0 wall outlet side).

0 (xii) The spade tip is a horseshoe shaped connector which is
0 screwed down (at the wall outlet side).

0 (xiii) NT4X20AG 20 Button Add-On Module

0 The NT4X20AG is a 20 button add-on module which extends
0 the capability of a Business Set by adding more feature
0 keys. It features two rows of 10 buttons; the top two
0 buttons in each row are not equipped with LCD and are

0 RELEASE 28.01
0 93 12 03
0

0 used for features which do not require LCD display. The
0 add-on module attaches to the right side of the Business
0 Set. Up to three modules may be used with each Business
0 Set.

0 In cases where the NT4X20AC add-on unit exists in the of-
0 fice and the EBS feature capability must be extended,
0 provide a maximum of two (2) NT4X20AGs. Use the NT4X20AC
0 as the last add-on module for a maximum of three (3)
0 add-on modules per EBS.

0 (xiv) NT1L00AA Hands Free Unit

0 The NT1L00AA Hands Free Unit is an optionally available
0 module which may be connected to the left side of the
0 Business Set.

0 (xv) NT4X20AJ Auto Answer Back Module

0 The NT4X20AJ Auto Answer Back Module is an optionally
0 available module which may be plugged into the Business
0 Set to give it the Auto Answer Back feature. As a pre-
0 requisite, the Business Set must be equipped with a Hands
0 Free Unit.

0 (xvi) ETS Line Card, NT6X21AB

0 The Electronic Telephone Set (ETS) Line Card, NT6X21AB,
0 is required to receive and interpret the Business Set
0 signalling information and is supported by the DMS-100
0 advanced peripherals (i.e. Line Concentrating Module, Re-
0 mote LCM and Remote Switching Center). It will only sup-
0 port the Business Set.

0 (xvii) The Business Set operates over a 2-wire (single pair) un-
0 loaded loop connected to an ETS Line Card located in ei-
0 ther a DMS-100/MDC host office or a DMS-100 remote.

0 (xviii) Each loop (ETS line card) can support a Business Set hav-
0 ing the capability of carrying a maximum of three 20 but-
0 ton add-on modules and a Hands Free Unit.

0 (xix) NTX822AA - EBS As A Message Center: As of BCS-23 S/W
0 package NTX822AA became generally available. Upon acti-
0 vation Incoming Trunk or Internal Calls are automatically
0 routed to the EBS assigned the Message Center function,
0 if they are not answered at the original station. The EBS

0 1.3.4 Power Requirements For Business Sets

0 (a) General Description

0 The Electronic Telephone Set and associated add-ons can be loop
0 powered or locally powered, depending on the type of ETS, type
0 and number of add-ons, and the cable resistance.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 (i) The Basic Electronic Telephone Set is loop powered in all
0 cases.

0 (ii) The Display Set requires local DC power if the loop re-
0 sistance is greater than 250 Ohms.

0 (iii) The Handsfree Unit will require local AC power in all
0 cases. The required AC transformer and T adapter are in-
0 cluded with the Handsfree Unit. The Handsfree power sup-
0 ply may also be used to power add-on units.

0 (iv) Various Electronic Telephone Set and Add-On Module con-
0 figurations are possible, and the associated power supply
0 requirements are outlined in Table 34.1 below:

0 1.3.5 Cable Characteristics For Electronic Business Sets

0 (a) General Description

0 The Electronic Business Set operates over a 2-wire (single pair)
0 loop to an ETS line card (NT6X21) controlled by the DMS-100 Fam-
0 ily system.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 (i) In order for the Business Set to perform satisfactorily,
0 the outside plant cable must meet certain requirements.

0 (ii) The cable to the Business Set should be non-loaded.

0 (iii) The operational range for the ETS, with or without add-
0 ons, is determined by one of two factors - either the DC
0 Loop Range or the Signal attenuation at 8Khz.

0 For successful EBS operation, the following limits cannot
0 be exceeded:

0 Loop Resistance: 1230 Ohms Maximum

0 Signal Attenuation at 8 Khz: 24 db Maximum

0 The factor which reaches the maximum limit first will de-
0 termine the loop range for the Electronic Telephone Set
0 (ETS).

0 (iv) The above DC loop resistance limit assumes that the cen-
0 tral office battery voltage is between 42.75 volts and 56
0 volts. The associated cable and cabling distances used
0 within the resistance limits above are:

0

0 1.3.6 NTX411AA VMX Interface

0 (a) General Description

0 The NTX411AA VMX Interface package provides an interface between
0 the DMS-100 and a Voice Message Exchange (VMX) system. It is
0 only available to Meridian Business Services subscribers.

0 The VMX is a system manufactured by the VMX Corporation for stor-
0 ing spoken messages and providing the called party with the abil-
0 ity of playing these messages back at a later time. Voice
0 messages are sent, stored and retrieved using a microprocessor
0 which is interfaced to the host DMS-100 through 2-way, 4-wire E&M
0 trunks.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 (i) A VMX system is available in 8, 16, 24, 32, 48 or 64
0 voice port configurations. Each voice port is
0 bidirectional and interfaces with a 4-wire E&M NT2X72AA
0 trunk circuit or a digital through a channel bank. One
0 (1) trunk circuit is required for each voice port.

0 (ii) In addition, two (2) physical trunk circuits are required
0 for each voice port as loop around trunks to isolate the
0 VMX calls to only the Meridian Business Services trunk
0 group.

0 (iii) The VMX interface when configured with an external alarm
0 interface provides major and minor alarm indications by a
0 relay contact closure. Provide two (2) scan points for
0 VMX alarm detection.

0 1.3.7 Business Network Management (BNM) Interface

0 (a) General Description

0 Business Network Management (BNM) is a networks product that sup-
0 plements the DMS-100F Meridian Digital Centrex (MDC) by providing
0 MDC analysis and control features. Specifically, a BNM system
0 collects information from DMS-100 Business switches, processes
0 the information collected and controls the Centrex network. Major
0 BNM features are:

0 (1) Data Collection

- 0 - Station Message Detail Recording (SMDR) Data
- 0 - Operational Measurements
- 0 - Automatic Trunk Testing Reports
- 0 - Killer Trunk Reports

0 (2) Data Analysis

0 (3) Station moves and changes

0 A DNC-500 BNM system interfaces with several DMS-100F MDC
0 switches via Network Operations Protocol (NOP) data links to
0 gather and process data relevant to MDC customers subscribing to
0 the BNM services. In addition, end user access can be extended
0 by utilizing remote dial up links to the DNC-500 or by utilizing
0 and end user premise DNC-100 system. A DNC-100 is dedicated to a
0 particular MDC customer and collects data from the DNC-500. Also
0 available is the DNC-50 BNM system which provides SMDR capabili-
0 ties only. Data types requiring transfer to the BNM DNC-500 sys-
0 tem include:

- 0 - Station Message Detail Recording (SMDR)
- 0 - Killer Trunk (KT) Reports
- 0 - Automatic Trunk Testing (ATT) Reports
- 0 - Operational Measurements (OM's)

0 All of the above data types must be stored on disk in the DMS-100
0 where upon request the data is transmitted to the DNC.

0 Data may be transferred to the DNC-500 system using one of three
0 methods:

0 Continuous Collection - Upon receipt of a request from the
0 DNC-500 the DMS-100 sends data records as soon as they are re-

0 RELEASE 28.01
0 93 12 03

0 ceived by DIRP. Data transmission will continue until a request
0 to stop is received.

0 Polling - The DNC-500 will poll the DMS-100 at a specified time
0 requesting data transmission. This method can be used to defer
0 data transfer until low traffic periods.

0 Demand Transfer - The DMS-100 responds to a request from the
0 DNC-500 system to retransmit a particular data record.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 (i) Data is transferred to the BNM DNC-500 system via X.25
0 based Network Operations Protocol (NOP) data links. The
0 number of data links required is based on the data trans-
0 fer rate and link speed/throughput. The number of links
0 is also based on the type of Input/Output Terminal Con-
0 troller Card (NT1X67DB or NT1X89AA) used.

0 (ii) The data transfer rate must include the following:

0 (a) High Day Busy Hour SMDR data transfer

$$\begin{aligned} & \text{HDBH entries} * 39 \text{ bytes/call} \\ & = \frac{\quad}{3600 \text{ seconds}} \end{aligned}$$

0 (b) Operational Measurements data transfer

$$\begin{aligned} & = \text{No. of Trunk Groups transferred} \times \\ & \quad 200 \text{ bytes/second} \end{aligned}$$

0 (c) Passthru MAP data transfer (if Passthru
0 MAP feature (NT5N39AA) is present).

$$\begin{aligned} & = \text{No. of simultaneously active MAP} \\ & \quad \text{sessions} \times 140 \text{ bytes/second} \end{aligned}$$

0 Killer Trunk and Automatic Test data is considered negli-
0 gible.

0

0 RELEASE 28.01
0 93 12 03
0

0 After calculating the data transfer rates for each data
0 type, sum all transfer rates to determine the total BNM
0 data transfer required.

0 (iii) The total BNM transfer rate for NT1X67BD at 9600
0 bits/second is 120 bytes/second. Therefore,

0 Total NT1X67DBs = Total BNM Transfer Rate
0 (bytes/second)
0
0

120 bytes/second

0 (iv) The NT1X89AA Multiprotocol Controller has the following
0 BNM data transfer rates:

0 9600 bits/seconds = 770 bytes/sec throughput
0 19.2 Kbits/seconds = 1078 bytes/sec throughput

0 Therefore,

0 No. NT1X89AA Data = Total BNM Transfer Rate
0 (bytes/second)
0
0

Data Transfer Thruput
0 (bytes/second)

0 Using the NT1X89AA MPC greatly increases data link effi-
0 ciency and subsequently increases thruput in comparison
0 to the NT1X67DB.

0 (v) When more than one (1) MPC port is required, provision a
0 minimum of two (2) NT1X89AA's. The MPC cards are spread
0 evenly across the Input/Output Control Modules with sepa-
0 rate power feeds.

0 1.3.8 BNM Data Transmission

0 (a) General Description

0 Data Transmission between the DMS-100 and the DNC-500 may utilize
0 dedicated or switched facilities as detailed in the following
0 provisioning considerations.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 (i) Dedicated point to point transmission options that may be
0 used are listed below:

0 1) 4-wire analog point to point - Provision one (1) ana-
0 log private line modem per data line. The maximum
0 bit rate of a Northern Telecom approved analog pri-
0 vate line modem is 9600 bits/second. If bit rates
0 above 9600 BPS are used the Telco must provide the
0 modem.

0 2) Point to point digital facility utilizing Data Path
0 and Data Path and back to back DU's - back to back
0 DU's - Provision one (1) NT4X25 low speed data unit
0 for each data line. The maximum loop length between
0 Data Units is 3 miles.

0 3) Point to point digital facility utilizing Data Path,
0 DataPath Extension (DPX) and NT4X25 low speed data
0 units to extend the loop length beyond 3 miles.
0 DataPath Extension (DPX) uses D4 Channel Banks
0 equipped with NTQPP628A DPX channel units to extend
0 the loop length via DS-1 carrier. The DPX channel
0 unit is a specialized 4W E&M card equipped with an
0 NT6X71AB Data Line Card (DLC) that converts the Time
0 Compression Multiplexing (TCM) signal transmitted by
0 the Data Unit into a DS-0 channel on a DS-1 link.
0 Provision one (1) NT4X25 low speed data unit for each
0 data line and software package NTX250AA (Data Path).
0 The TELCO is responsible for providing the channel
0 bank and one (1) NTQPP628A per data line.

0

0
0 RELEASE 28.01
0 93 12 03

0 4) Other options are available such as using Digital
0 Data Service, etc. Data modems must be supplied as
0 required based on transmission characteristics.

0 (ii) Switched facilities may also be deployed using NT4X25 low
0 speed data units and the DMS-100. Provision one (1)
0 NT4X25 and one (1) NT6X71AB Data Line Card for each data
0 link. Other switched facilities such as a Packet Network
0 may also be used. The data modems must be provisioned
0 according to transmission characteristics.

0 1.3.9 Meridian Business Services Miscellaneous

0 (a) General Description

0 Detailed below are several miscellaneous provisioning consider-
0 ations for MBS offices.

0 (b) References

0 Chapter 3, Section 3.9 DMS Supernode and Network Subsystem

0 (c) Provisioning Considerations

0 (i) All DMS-100 and SL-100 Canadian systems with Meridian
0 Business Services software are to order a CS03-1315 DOC
0 Certification Sticker which shows that offices have met
0 Government of Canada Department of Communications CS03
0 standards for PBX applications.

0 The CPC code for the sticker is: P0663265.

0 Only one sticker per system is to be ordered. It will go
0 on the FSP panel of the CCC and will not obscure any ex-
0 isting labels, logos or indicators.

0 (ii) Offices equipped with Meridian Business Services should
0 have a maximum of two pairs (NT3X02AA, NT3X03AA) of dig-
0 ital modem cards per MTM, providing a maximum of eight
0 modem circuits per MTM.

0 (iii) Synchronizable offices equipped with MBS consoles must
0 have the NT3X14BC Synchronizable Master Clock Counter
0 equipped on the CCC frame. If the office is equipped
0 with an earlier vintage NT3X14 circuit pack, it must be
0 retrofit with a NT3X14BC when the MBS extension is ap-
0 plied.

0 For further information, refer to Central Control Complex
0 of DMS SuperNode and Network Subsystems, Section 3.9 of
0 this NTP.

0 RELEASE 28.01
0 93 12 03

0 1.3.10 Simplified Message Desk Interface (SMDI)

0 (a) General Description

0 The Simplified Message Desk Interface (SMDI) will provide a Telco
0 with a system integration between the DMS-100 and a customer's
0 message desk. Thus providing end user's with the appearance of a
0 single communications system. (Figure 34.3)

0 Utilizing the SMDI feature and a message center (automated or
0 manual) message service can be provided to lines served by a host
0 or remote office (i.e. Remote Switching Center (RSC) or Remote
0 Line Concentrating Module (RLCM)), however, the message service
0 will not be available under Emergency Stand Alone (ESA) condi-
0 tion.

0 A typical SMDI example consists of three (3) major steps:

- 0 . Call Forwarding
- 0 . Datalink Interface
- 0 . Message Waiting

0 Call Forwarding

0 A user of the SMDI service will forward his calls to the
0 Message Desk.

0 Datalink Interface

0 The DMS-100 utilizes the datalink as a communication bus to
0 send/receive acknowledgements on the user's status at the
0 Message Desk.

0 Message Waiting

0 The Message Desk will accept the called party's message and
0 turn on the message indicator (i.e. message waiting lamp or
0 stuttered dial tone) via a request over the datalink (which
0 interacts with the message center software feature
0 NTX119AA). The called party will accept his messages by di-
0 aling the Call Request Retrieve feature access code.

0

0

RELEASE 28.01
93 12 03

Figure 34.3 Simplified Message Desk I/F

Message Desk

The Message Desk is customer provided equipment that must meet the interface requirements Bell System Technical Reference PUB 61100 and Bell Communications Research TR-TSY-000283. The Message Desk must send/receive ASCII protocol. The Message Desk stations will be identified as part of a Uniform Call Distribution (UCD) group to evenly distribute incoming calls. The Message Desk will have two (2) interface types, voice and data.

The voice line cards will be arranged in a Uniform Call Distribution (UCD) group and will be loop or ground start subscriber lines.

The data interface is used to transfer messaging information from the DMS-100 and the Message Desk. The data link will be dedicated 1200 or 4800 baud RS-232 full duplex.

0 RELEASE 28.01
0 93 12 03

0 (b) References

0 None

0 (c) Provisioning Considerations

0 (i) Existing DMS-100 hardware will be utilized to activate
0 the SMDI feature as follows:

- 0 - NT1X67FA - IOC Terminal Control
0 (one port per Message Desk)
- 0 - NT1X89AA - Multi-Protocol Controller (MPC)
0 (two ports per Card)
- 0 - Modem - Dedicated 1200 baud full duplex (w/
0 NT1X67FA) or up to 4800 baud full duplex
0 (w/ NT1X89AA)
- 0 - Type 'A', 'B', 'C' or 'E' line cards for user stations
- 0 - Type 'A' or 'B' line cards for the Message Desk

0 The NT1X67FA is equipped with two (2) C-Side ports to the
0 DMS CPU and one (1) P-Side port to interface with a Voice
0 Message System (VMS). One of the C-Side ports is dedi-
0 cated to processing outgoing SMDI messages while the
0 other is dedicated to processing incoming SMDI messages.
0 The NT1X67FA is only for use in SMDI applications.

0 The NT1X89AA (MPC) is equipped with two (2) C-Side ports
0 to the DMS CPU and two (2) asynchronous P-Side port to
0 interface with a VMS. The MPC CP will provide a higher
0 bandwidth (up to 4800 baud), reduced real time in the
0 DMS, and additional performance and reliability
0 capabilities over the NT1X67FA CP.

0 The SMDI application is compatible with the NT1X67FA and
0 the NT1X89AA CPs - both are simultaneously supported.

0 (ii) The SMDI message handling software and the NT1X67FA I/O
0 Terminal Controller is capable of transferring data si-
0 multaneously in both directions (incoming and outgoing)
0 over a single link at a bit rate of 960 bits per second
0 full duplex. The offered Busy Hour SMDI message load for
0 a single NT1X67FA data link should not exceed this capac-
0 ity.

0
0 RELEASE 28.01
0 93 12 03

0 The following is a comparison of the link capacities for
0 the NT1X67BD and the NT1X67FA CPs:

0 NT1X67FA	NT1X67BD
0 -----	-----

0 Calls/Hr - 11,520 (per link)	1860 (per link)

0 Bit Rate - 960 bps (per link)	225 bps (per link)

0 (iii) The software feature package for SMDI is as follows:

0 NTX732AA - Simplified Message Desk Interface

0 (Refer to Section 3.2 - Software in this document for
0 feature package interdependencies.)

0 1.3.11 DMS Integrated Access Local Area Network (DIALAN)0 (a) General Description

0 DIALAN service allows the telco to provide Integrated Voice and
0 Data (IVD) service to Meridian Digital Centrex customers over ex-
0 isting voice lines and the public switched telephone network.
0 DIALAN service offers the telcos easy, cost-effective IVD imple-
0 mentation, integration with existing DMS operations, adminis-
0 tration and maintenance capabilities and full interworking with
0 ISDN and all DMS-100 DATAPATH products.

0 The DIALAN implementation uses a customer-supplied Integrated
0 Voice Data Modem (IVDM), which is available from a variety of
0 vendors. This allows the telcos the flexibility to choose a pre-
0 ferred vendor from the many which offer DIALAN compatible IVDMs.
0 These modules use a single two wire loop to transmit both voice
0 and data.

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations

0 (i) Integrated Voice Data Modems are available with various
0 features and formats. The DIALAN feature uses the
0 NT6X76AA Asynchronous Interface Line Card or the NT6X76AC
0 Enhanced Asynchronous Intergrated Line Card to terminate
0 the data portion of the integrated voice/data and this
0 card utilizes the RS422 data format. As a result, the
0 choice of IVDM can cause compatibility problems unless
0 this is considered. If the IVDM selected for use with
0 DIALAN has an RS422 output, it may be connected directly
0 to the NT6X76AA as shown in Figure 34.4. If the data
0 output of the selected IVDM is in RS232 format, it must be
0 converted to RS422 format by a customer-supplied con-
0 verter. Refer to Figure 34.5.

0 The NT6X76AA/AC is used to provide the DIALAN system with
0 the data connection to the telephone network, and a voice
0 line card is used to provide the voice connection. The
0 Enhanced Asynchronous Interface Line Card NT6X76AC con-
0 tains all of the basic functionality of the original
0 AILC, NT6X76AA, plus support for the following:

0 RELEASE 28.01
0 93 12 03
0

- 0 1. DIALAN Messaging Protocol
- 0 2. Profile Download Enhancement for DIALAN
- 0 3. DATAPATH Closed User Group
- 0 4. Idle Timeout for Call Disconnection

0 Note that these enhancements are only available with
0 BCS-29 and subsequent software releases.

0 The NT6X76AC is completely compatible with the NT6X76AA.
0 If the NT6X76AC is not configured for the additional
0 functions mentioned above, it is functionally equivalent
0 to an NT6X76AA.

- 0 (ii) The NT6X76AA AILC is a two slot line card similar to reg-
0 ular data unit line cards except that it draws more of
0 the 15V current supply per slot than normally allowed.
0 The total 15V power capability of a line drawer would be
0 consumed by twenty-one (21) NT6X76AAs.

- 0 (iii) If data penetration in an office is equal to or less than
0 10% (total NT6X71 and NT6X76AA cards = or < 10% of total
0 lines), then the NT6X76AA can be treated as a regular 2
0 slot circuit pack and all remaining line card slots can
0 be provisioned as required. If data penetration exceeds
0 10%, the NT6X76AA must be treated as a three (3) slot
0 circuit pack to prevent overextending the power supply in
0 a partial failure mode.

0 This line card mix rule is based on 15V power consumption
0 only and further consideration must be given to traffic
0 factors.

- 0 (iv) The RS422 driver in the NT6X76AC has been changed to a
0 low power CMOS unit so that the circuit pack can be pro-
0 visioned as a standard two-slot line card. The NT6X76ACs
0 should be spread evenly across the available line drawers
0 but special power restrictions no longer apply.

- 0 (v) Use the DMS-100 Traffic Provisioning "The Credit System"
0 to determine appropriate traffic provisioning for all
0 DIALAN applications.

0 RELEASE 28.01
0 93 12 03

0 1.3.12 Automatic Call Distribution (ACD)

0 (a) General Description

0 Automatic Call Distribution (ACD) is an optional feature in the
0 DMS-100/MSL-100 that provides an equal distribution of calls to a
0 predesignated set of answering positions referred to as agent po-
0 sitions. This feature permits businesses to handle large volume
0 of incoming calls. All calls are handled on a first-in first-out
0 basis and the agent that has remained idle the longest period of
0 time receives the next available call. If all agents are busy,
0 the calls are queued in their order of arrival in an incoming
0 queue that has programmable priority.

0 Figure 34.6 - ACD System Configuration

0 As illustrated, the various components are discussed under the
0 headings:

0 RELEASE 28.01
0 93 12 03
0

0 ACD Telephone Set Interface
0 ACD Feature Specific Hardware
0 ACD Management Report Data Stream
0 ACD Load Management.

0 ACD contains the enhancements for Management Information Systems
0 (MIS) reporting. These features are controlled by the Supervisor
0 and the Senior Supervisor. The parameters are programmable such
0 that the system can be custom-tailored for specific customer ap-
0 plications. (MIS is applicable in the U.S. only.)

0 Feature Operation and Testing

0 (c) Provisioning Considerations

0 (i) When provisioning an ACD system, there are specific
0 guidelines that must be considered. These guidelines are
0 as follows:

0 Maximum Number of ACD Groups	- 256 per DMS-100
0 Maximum Number of Subgroups	- 255 per ACD Group
0 Maximum Number of ACD Directory Numbers (DN)	- 17 per ACD Group
0 Maximum Number of Supervisor Sets	- 255 per ACD Group
0	- 1 Supervisor per
0	Subgroup
0 Maximum Number of Agents	- 4000
0 Maximum Number of Groups an Agent can be a	- 1
0 member of	
0 Maximum Number of Agent Keys or Status Lamps	- 48 per Supervisor
0	Set
0 Maximum Number of Calls in Queue	- 511 per ACD Group
0 Maximum Number of Queue Status Lamps	- 1 per ACD Group
0 Range of incoming call priorities	- 0-3
0	(0 is the highest
0	& 3 is the lowest)

0 ACD Telephone Set Interface

0 RELEASE 28.01
0 93 12 03
0

0 (ii) Although any Business Set (i.e. NT4X20 series, M5000 se-
0 ries) can be used, the recommended telephone set is the
0 NT4X20AT. Each ACD set requires a NT6X21AC line card.
0 Refer to Electronic Business Sets, found in this section,
0 for further information.

0 The ACD feature is not currently available on the
0 500/2500 type telephone sets.

0 These telephone sets are to be obtained by the customer
0 on a merchandise order basis only.

0 (iii) The 20 Button Add-On Module NT4X20AG extends the capabil-
0 ity of an Electronic Telephone Set by adding more feature
0 keys. The 20 button add-on module is required so that
0 the supervisor position can be equipped with supervisory
0 features such as ACD agent status lamps.

0 This module attaches to the right side of the Electronic
0 Telephone Set. Up to three modules may be used with each
0 ETS by plugging the second or third module into the pre-
0 vious one.

0 These modules are to be obtained by the customer on a
0 merchandise order basis only.

0 ACD Feature Specific Hardware

0 (iv) An ACD customer can provide an announcement to callers
0 queued in an incoming call queue to explain the delay
0 they are experiencing or reroute ACD calls received while
0 in a night service mode to an announcement that specifies
0 the customer's hours of operation. There are no pre-
0 programmed announcements for the ACD feature. The cus-
0 tomer must program each announcement for their specific
0 application. The ACD announcement traffic is added to the
0 total office announcement traffic. To determine the ad-
0 ditional circuits required for the ACD announcement, di-
0 vide the ACD announcement time (seconds) by 31 seconds.

0 The hardware used to store these announcements is a DRA
0 (i.e. MTM DRA NT2X58CB/AK/AG, DRA Controller CP
0 NT1X75AA/BA, DRA Recordable Memory Cards NT1X77AA, DRA
0 Recordable Memory Cards NT1X79AA).

0 (v) The ACD Queue Status Lamp (QSL) feature enables supervi-
0 sors and/or agents to determine which ACD groups need ad-

0 RELEASE 28.01
0 93 12 03
0

0 additional agents or redistribution of existing agents.
0 This allows calls to be handled more efficiently.

0 The QSL feature provides a visual indication, approxi-
0 mately once a minute, for calls that are being deflected
0 because the incoming ACD call queue has overflowed. An
0 overflow occurs when the maximum number of calls are
0 queued and/or maximum call queued wait time has been ex-
0 ceeded. If an overflow condition exists, a lamp is lit
0 on an external display panel. Each lamp is associated
0 with one ACD group. All ACD groups with the QSL option
0 can be monitored, up to a maximum of 256 groups.

0 One Signal Distributor (SD) point is required for each
0 ACD group that utilizes the Queue Status Lamp feature.
0 Each SD card (NT2X57AA) has 14 points that can be provi-
0 sioned. Each SD Card requires one slot in the Maintenance
0 Trunk Module (MTM).

0 The Central Alarm Display Panel (NT5X72AA) can be used as
0 an external display panel for ACD groups requiring the
0 QSL option in a local arrangement. Each NT5X72AA has 15
0 lamps and can accommodate 15 groups. One Central Alarm
0 Applique Circuit (NT5X72AB) is required for each
0 NT5X72AA.

- 0 (vi) The Observe Agent feature enables an observer to obtain a
0 monitoring path between the ACD agent and the caller or
0 join in the conversation by depressing CALL AGENT key.
0 This feature enables an ACD supervisor to control the
0 quality of service offered to callers or to provide
0 training. The Observe Agent feature can only be assigned
0 to supervisor sets.

0 The agent position to be observed must be in the ACD
0 group that the Observe Agent key is associated with.

0 The Observe Agent feature can optionally have a warning
0 tone to notify the agent that the ACD call is being moni-
0 tored. This warning tone will be heard by the ACD agent
0 at the beginning of each call that the supervisor ob-
0 serves.

0 The Call Waiting Tone Generator CP, NT3X68AC, provides
0 the observe agent warning tone. Since the traffic re-
0 quirements for the warning tone for this feature are con-
0 sidered to be minimal, any existing NT3X68AC cards in the

0 RELEASE 28.01
0 93 12 03
0

0 DMS office will be sufficient to handle the requirements
0 for this feature. Otherwise, provide one (1) NT3X68AC
0 card per office.

0 (vii) The ACD Emergency Key feature enables an ACD agent to
0 conference in an ACD supervisor and/or an auxiliary de-
0 vice (eg. tape recorder) via a single key depression. The
0 ACD supervisor would receive the call on his ACD Answer
0 Emergency Key (AEMK) and the auxiliary device would be
0 called like any single line oriented device.

0 If both emergency lines are datafilled and a six port
0 conference circuit is available (NT3X67), both lines will
0 be called. If both lines are datafilled but only a three
0 port conference circuit is available (NT1X31), the AEMK
0 will be called. If it is unavailable, the auxiliary de-
0 vice will be called.

0 If only one emergency line is datafilled and a three port
0 conference circuit is not available, a six port confer-
0 ence circuit is used.

0 When performing traffic provisioning calculations, the
0 ACD conference traffic should be considered as part of
0 the overall DMS requirements.

0 ACD Management Report Data Stream

0 (viii) The ACD Management Report Data Stream Interface enables
0 the Down Stream Processor (DSP) to provide the ACD cus-
0 tomer with timely and accurate statistics relevant to the
0 ACD operation. These statistics allow the customer to
0 monitor changing ACD traffic loads and levels of service
0 being provided.

0 Agent position event messages and ACD call-related data
0 are reported as they occur. These messages will be sent
0 to the DSP via a X.25 datalink. This information is then
0 used by the DSP to generate realtime screens and histor-
0 ical reports concerning ACD calls.

0 The ACD Management Reports Data Stream Interface only en-
0 ables the passing of ACD related data over a datalink to
0 the DSP.

0

0 RELEASE 28.01
0 93 12 03

0 The transmission speed of the datalink is limited by the
0 capacity of the NT1X89AA multi-protocol controller card
0 (i.e. NT1X89AA for X.25 interface).

0 A maximum of fifteen (15) datalinks are supported per ACD
0 application.

0 It is currently intended for the ACD Management Report
0 Data Stream Interface to be a dedicated X.25 link to a
0 DSP as illustrated below:

0 With this configuration, each DSP will require one (1)
0 port on a Multi-Protocol Controller card, NT1X89AA. Each
0 card has four (4) ports or circuits, however, only ports
0 2 and 3 can be used. Each card mounts on an IOC module,
0 NT1X61AB.

0 Since the Remote Operations (RO) service interface of the
0 NOP (Network Operations Protocol) structure, limits the
0 number of simultaneous application sessions to 15, then
0 up to eight (8) controller cards can be provided. How-
0 ever, this limitation is per switch and therefore, the
0 number of MPC cards to be provisioned must be considered
0 in light of any other applications that require an MPC
0 interface (i.e. DMS Passthrough Map Application on a
0 DNC).

0 DEC PDP 11/83

0 The ACD Down Stream Processor required for the Management
0 Reports System will be a Digital Equipment Corporation
0 Micro PDP 11/83 processor.

0 This equipment must be obtained by the customer from Dig-
0 ital Equipment Corporation (DEC).

0 RELEASE 28.01
0 93 12 03

0 The equipment configuration will be as follows:

0	QTY.	DESCRIPTION	ORDER NUMBER
0	1	11/83 CPU, H9642 and 2 Mbyte Memory	183QE-D2
0	1	2 Mb Memory Card	MSV11-JE
0	1	Tape Controller	TQK50-AA
0	1	95 Mb Tape Drive	TK50-AA
0	1	Disk Controller	RQDX3-AA
0	1	32 Mb Disk Drive	RD32A-AA
0	1-3	8 Line Asynch MUX	DHV11-M
0	1	40 Port RS232 Panel	70-23239-01
0	1-16	VT220 Video Display Terminals	VT220-D2/D3
0	1	LA210 Reports Printer	LA210-AA
0	1	LA210 System Console	LA210-AA

0 MEMOTEC PAD SP830

0 A Packet Assembler Disassembler (PAD) device is required
0 to interface the NT1X89AA to the PDP 11/83 processor. One
0 MEMOTEC PAD SP830 is required for each PDP 11/83.

0 The MEMOTEC PAD SP830 is a desk top unit that will be
0 colocated with the PDP 11/83. It has the following char-
0 acteristics:

0 Physical Dimensions: Height - 3.5"
0 Width - 9.5"
0 Depth - 9.0"

0 Input Ports - asynchronous 1-4 ports
0 - EIA RS-232 interface

0 Output Line - 1 synchronous port
0 - EIA RS-232/V.24 interface
0 - up to 19.2 Kbps connection to X.25 network.

0 This PAD will be ordered by the Customer Engineer.

0 IBM AT Compatible PC

0 The ability of the ACD Management Reports System to
0 interface to an IBM AT compatible Personal Computer (PC)
0 Down Stream Processor is currently under development. The
0 interface link will be an X.25 datalink.

0 RELEASE 28.01
0 93 12 03
0

0 ACD Load Management.

- 0 (ix) ACD Load Management is an administrative feature which
0 allows senior ACD personnel (Senior Supervisors) to tai-
0 lor their own ACD configuration. ACD Load Management is
0 comprised of the following features:

0 ACDSHOW - which provides Command Interpreter (CI) com-
0 mands that

0 allow the Senior Supervisor to display various
0 ACD
0 specific information.

0 LOADMGMT - which provides CI commands that allow the Sen-
0 ior

0 Supervisor to modify various ACD configuration
0 parameters.

0 The ACD Load Management interface will be to a MAP (eg.
0 DEC VT220 VDU or DEC LA120 Printer).

0 Each VDU or printer device will require one (1) port on
0 an I/O Terminal Controller card, NT1X67BC/BD. Each card
0 has four (4) ports or circuits and mounts on IOC Module,
0 NT1X61AB.

0 Restrictions on the MAP interface are as follows:

0 1) An EIA RS-232 interface can be used if the MAP is lo-
0 cated within 50 feet of the terminal controller card.

0 2) A loop current interface is required when this dis-
0 tance exceeds 50 feet, but is less than 1200 feet.

0 3) In order to provide sufficient flexibility in locat-
0 ing MAPs, loop current interface is recommended for
0 all local MAPs (i.e. co-located with the DMS ma-
0 chine) which are within 1200 feet of the terminal
0 controller card.

0 4) If this distance exceeds 1200 feet, modems (data
0 sets) must be used.

- 0 (x) The ACD MANAGEMENT INFORMATION SYSTEM (MIS) (U.S. Appli-
0 cations only) provides the ACD customer with timely and
0 accurate statistics relevant to the ACD operation. These

0 RELEASE 28.01
0 93 12 03
0

0 statistics allow the customer to monitor changing ACD
0 traffic loads and levels of service being provided.

0 The Management Information System consists of a Compaq
0 386 or NT386 Personal Computer (PC), which is connected
0 to a Memotec SP830 Asynchronous Packet
0 Assembler/Disassembler (PAD) via an RS232 interface. The
0 PAD is connected to a Data Unit via an RS232 interface.
0 The two Data Units (NT4X25AF or NT4X25AH) are connected
0 by a Network Operations Protocol (NOP) X.25 link (two-
0 wire circuit). The second Data Unit is connected to the
0 switch via an RS232 interface to a Multi-Protocol Con-
0 troller (MPC) Card NT1X89AA located in the IOC shelf. The
0 Data Units operate at 4800 baud. Although the second
0 port on the NT1X89AA card can be used at the same time as
0 the first port, it is recommended that a second NT1X89AA
0 card be used to connect a second Data Unit.

0 The PC can have up to eleven (11) color screen monitors
0 extended to other locations. These monitors are the IBM
0 PS/2 Model 25/35. These require Data Units when they are
0 located more than 50 feet from the PC.

0 Currently, the Compaq 386 or NT386 with Xenix Operating
0 System version 2.2 is the recommended PC. The recommended
0 software for this PC is the RT100 which is manufactured
0 by Perimeter Technology. If the IBM monitors are used,
0 each monitor must have the RT100T software supplied.

0 The PC, PAD and IBM PS/2 Units are customer provided
0 equipment. The MPC card, RT100 software, RT100T software
0 and one Data Unit are supplied by NTI. The second Data
0 Unit (CPE end) must be provided by either the customer or
0 NTI (customer option).

0 It is HIGHLY recommended that the host PC be equipped
0 with an Uninterruptable Power Supply (UPS) to provide se-
0 veral minutes of system operation during power failures.

0 Refer to Figure 34.7 for more configuration details on
0 this system.

0
0 RELEASE 28.01
0 93 12 03

0 1.3.13 NTX101AA - Feature ACD Music on Delay

0 (a) General Description

0 The ACD Music on Delay (or Music on Hold - MOH) feature is used
0 in conjunction with the Attendant Console to connect calls on
0 hold to announcements or music while they are waiting.

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations

0 (i) A minimum of one of the following must be provided for
0 MOH:

0 - The MTM mounted Digital Recorded Announce Machine
0 (See Section 3.5)

0 - Audiochron Recorded Announcement Machine, and/or

0 - Broadcast Trunk Interface.

0 (ii) NT supports hardware provisioning of the broadcast trunk
0 interface card (NT2X88AA) only. However, if the telco
0 requires this configuration, the following must be pro-
0 vided by the Telco:

0 - A 900 Ohm Interface approved by the FCC/CS03 for
0 US/CDN jobs respectively

0 - A music or announcement source such as an FM radio
0 approved by UL/CSA for US/CDN jobs respectively.

0 NOTE: The guaranteed nominal input range for the
0 NT2X88AA trunk card is -12 dbm to +3 dbm.

0 2.0 DATAPATH

0 2.1 Introduction

0 DATAPATH is a family of products and a set of features which pro-
0 vide advanced end-to-end digital full-duplex asynchronous and
0 synchronous circuit switched data transmission at various user-
0 selectable speeds (300-19,200 bps asynchronous; 1200-64,000 bps
0 synchronous) on the DMS-100.

0 Standard voice frequency modems merely transform the data into
0 voice frequency signals which appear to the telephone switch as a
0 standard voice call. However, DATAPATH provides enhanced loop
0 access technology so that the bandwidth and feature power inher-
0 ent in the digital switch can be brought to the subscriber.

0 DATAPATH uses standard A & B bit signaling on the trunk side, and
0 industry standard RS232C and V.35 interfaces to the end user's
0 Data Terminal Equipment (DTE).

0 The principal products in the DATAPATH family are the Data Line
0 Card, the Data Unit, and the Coax Eliminator.

0 2.2 Features

0 NTX250AA DATAPATH Basic
0 NTX253AA DATAPATH - Coax Eliminator (BCS-18)

0 2.3 Equipment Provisioning

0 2.3.1 Data Unit

0 (a) General Description

0 The Data Unit provides an all digital switched path connecting
0 subscriber data communications equipment to a DMS-100 host or re-
0 mote office. It will be the physical termination of the data ac-
0 cess loop at the subscriber end of the loop.

0 The standard data unit is equipped with a keypad with two verti-
0 cal rows of four feature keys, and a loudspeaker for call
0 progress tone feedback. User controls are under a lift-up flap
0 on the cover of the data unit.

0 Feature Enhanced Elastomer Keyboard data units are equipped with
0 two extra keypad keys and an array of LED indicators for setting
0 operating parameters.

0 (iii) The high speed model data unit offers transmission speeds
0 from 48000 to 64000 bits per second.

0 (iv) The line card required to interface with the Data Unit is
0 a Type D data line card NT6X71. One line card supports
0 one Each data unit requires one Type D line card. One
0 line card supports one data unit. It occupies two slots
0 in the line drawer.

0 Feature Enhanced Elastomer Keyboard data units require
0 the enhanced data line card NT6X71AB in order to provide
0 the Profile and Speed Restriction features. Otherwise,
0 the NT6X71AA line card may be used.

0 (v) Different data unit types can coexist on a switch.

0 (vi) The Data Units are to be ordered on a merchandise order
0 basis.

0 2.3.2 Coax Eliminator Data Unit

0 (a) General Description

0 The official name for the NT4X25DA/NT4X25DB Coax Eliminator Data
0 Unit system is 3194 Network Switched Access (3194 NSA).

0 The official name for the NT4X25AL/NT4X25AM Coax Eliminator Data
0 Unit system is 3270 Network Switched Access (3270 NSA).

0 The function of the Coax Eliminator Data Unit system is to pro-
0 vide a means of connecting IBM 3194 DFT and IBM 3270 CUT type
0 terminals to IBM 3174 and IBM 3270 type control units respec-
0 tively via twisted pair cable and the DMS/SL-100 switched net-
0 work. Hence, the coax eliminator system is a combined data unit
0 and coax terminal adaptor system. This system also allows for
0 back-to-back (dedicated) as well as DMS/SL-100 switched-circuit
0 (dialup) operation.

0 Normally, such connections are made by directly connecting the
0 IBM terminal and control unit with up to 1500 meters (5000 feet)
0 of coaxial cable. See Figure 34.8.

0 The concept of the Coax Eliminator is to break the coax run and
0 replace it with special purpose interface devices which are con-
0 nected via twisted pair and the DMS/SL-100. The interface de-
0 vices are two separate data units: one to interface to the IBM
0 3194/3270 type terminal called the Coax Eliminator Terminal
0 Interface, NT4X25DB/AL, and one to interface to an IBM 3174/3270
0 type control unit called the Coax Eliminator Control Unit Inter-
0 face, NT4X25DA/AM. See Figure 34.9.

0 The NT4X25AL TIF supports Control Unit Terminal (CUT) devices.
0 Such devices include 3178 monochrome, 3278 mod 2-5 monochrome
0 terminals. Other CUT mode terminals are listed in the Provision-
0 ing Considerations section. The NT4X25AL TIF coupled with a
0 NT4X25AM CUIF replace a dedicated type "A" (BISYNC) coax link be-
0 tween terminal and controller.

0 The NT4X25DB TIF supports CUT mode devices just as the NT4X25AL
0 does. In addition, the NT4X25DB supports Distributed Function
0 Terminal (DFT) devices. These include the IBM 3194 Intelligent
0 Display Station and the 3270 PC in the DFT operating mode. The
0 NT4X25DB TIF must be paired with the NT4X25DA CUIF in order to
0 support DFT devices.

[illegible]

The interface at the DMS/SL-100 is the standard data line card, line card type D, NT6X71AA/AB. See Figure 34.8

Standard IBM 3270 Control Unit to IBM 3270 Terminal Connection

0 3270 Network Switched Access With 3194
0 Distributed Function Terminals Support
0 Installation and Maintenance

0 (c) Provisioning Considerations:

- 0 (i) The NT4X25DB/AL is a device which emulates a control unit
0 in communication with the terminal. It functionally con-
0 verts the protocols associated with the twisted pair TCM
0 loop to a format on coax which is accepted by the termi-
0 nal.
- 0 (ii) The NT4X25DB/AL connects via coax to the terminal and is
0 normally co-located with the terminal, although a coax
0 separation of up to 1500 meters can technically be real-
0 ized.
- 0 (iii) The connection between NT4X25DB/AL and the IBM terminal
0 is made via a length of customer provided coaxial cable
0 (RG62A/U).
- 0 (iv) The NT4X25DB/AL is compatible with the following IBM ter-
0 minal types:
- 0 * 3278 mod 2-5 monochrome
 - 0 * 3279 colour display without convergence
 - 0 * 3178 monochrome
 - 0 * 3191 and 3192 display stations
 - 0 * 3194 Intelligent Display Station (CUT mode)
 - 0 * IBM PC with IRMA (up/downloading is not supported)
- 0 (v) The NT4X25DB is also compatible with the following termi-
0 nal types:
- 0 * 3194 Intelligent Display Station (DFT mode)
 - 0 * 3270 PC (DFT mode)
- 0 (vi) The following features are also supported on the above
0 mentioned terminals:
- 0 * Extended Attributes (eg. 7 colours on 3279)
 - 0 * Light Pen Interface

0

0
0 RELEASE 28.01
0 93 12 03

- 0 (vii) NT4X25DB/AL comes with an external power supply which
0 plugs into a standard 110 VAC wall outlet.
- 0 (viii) The Coax Eliminator Control Unit Interface, NT4X25DB/AM,
0 is a device which emulates a terminal in communication
0 with the control unit. It functionally converts the pro-
0 tocols associated with the control unit to the TCM link
0 format and message set.
- 0 (ix) The NT4X25DA/AM connects via coax to the control unit and
0 is normally located in the host computer room to allow
0 local attachment of the control units.
- 0 (x) The connection between NT4X25DA/AM and the control unit
0 is made via a length of customer provided coaxial cable
0 (RG62A/U).
- 0 (xi) The NT4X25DA/AM is compatible with the IBM 3174, 3274 and
0 3276 type control units configured for one of the ac-
0 cepted terminal types.
- 0 (xii) The NT4X25DA/AM is a circuit pack which mounts on the
0 Coax Eliminator Shelf, NT4X25BS. It receives power from
0 the shelf back plane. It requires one slot per card. It
0 has one logical circuit per card.
- 0 (xiii) Each NT4X25DA/AM requires one line card type D,
0 NT6X71AA/AB.
- 0 (xiv) The Coax Eliminator Shelf, NT4X25BS, may be mounted with
0 up to 16 NT4X25DA/AM cards; i.e. slot positions 01 to 16.
0 A minimum of two (2) NT4X25DA/AM cards must be installed
0 in the shelf to satisfy the minimum load requirements of
0 the shelf power supply.
- 0 (xv) The NT4X25BS shelf is a 19 inch rack mount shelf which is
0 to be mounted on a customer provided standard 19 inch bay
0 (relay rack). The shelf is 14 inches high. The rack
0 must be a minimum of 22 inches deep to accommodate the
0 shelf.
- 0 (xvi) To reduce the length of coaxial cable required, locate
0 the rack that houses the NT4X25BS as close to the IBM
0 control unit as possible.
- 0 (xvii) If the NT4X25BS shelf is mounted with another NT4X25BS
0 shelf or other equipment, customer provided cooling

0 baffles or fans must be installed to allow for sufficient
0 ventilation and cooling. If inclined cooling baffles are
0 used, a minimum allowance of 4.5 inches must be provided
0 between each NT4X25BS shelf and other equipment shelves.
0 If forced air cooling is used, a minimum of 65 cfm air
0 flow, evenly distributed throughout the shelf, is re-
0 quired to restrict the maximum internal temperature rise
0 to 15 Celsius degrees (27 Fahrenheit degrees).

0 (xviii) The NT4X25BS plugs into a standard 110 VAC wall outlet.

0 (xix) An alternate connection configuration is allowed with
0 coax eliminator hardware in which the NT4X25DB/AL and the
0 NT4X25DA/AM are connected directly by twisted pair in a
0 "back to back" (dedicated) configuration.

```

0      This is suitable for dedicated lines where no switching
0      is required and it is desirable to simply replace the
0      coax run with twisted pair.

```

```
0      This configuration is set up by setting the appropriate
0      switches on the NT4X25DA/AM. The NT4X25DB/AL automat-
0      ically adjusts to this mode.
```

```
0      There are two reasons to run a coax eliminator in back to
0      back mode.  The first is to replace the relatively bulky
0      coax cable with twisted pair.
```

```
0      The other reason is to increase the separation between
0      control unit and terminal from the 1500 meter coax maxi-
0      mum to the standard loop length range; i.e.
```

0	26 Awg. - 4.0 km. (13120 ft.)
0	24 Awg. - 5.5 km. (18040 ft.)
0	22 Awg. - 5.7 km. (18696 ft.)

0
0 RELEASE 28.01
0 93 12 030 2.3.3 Data Unit Rackmount Shelf0 (a) General Description

0 The Data Unit Rackmount Shelf is designed to house Data Units in
0 a rackmounted configuration. It is suitable for use in applica-
0 tions that require a high physical concentration of data circuits
0 such as computer rooms.

0 (b) References

0 None

0 (c) Provisioning Considerations:

0 (i) The NT4X25BH Data Unit Rackmount Shelf is designed to
0 house up to sixteen (16) rackmount Data Units or Loop Ex-
0 tension Line Interface Cards in any configuration. The
0 Rackmount Shelf may be used in a customer premise or cen-
0 tral office application where a high concentration of
0 datapath equipment is required. Systems Application Engi-
0 neering should only order this shelf for central office
0 applications.

0 (ii) The Rackmount Shelf will house up to sixteen cards. The
0 following card types are available for mounting in the
0 shelf (mixing allowed):

0 Rackmount Low Speed Data Unit (DU)	NT4X25AD
0 Rackmount High Speed DU	NT4X25AV
0 Loop Ext. Low Speed Line I/F Unit	NT4X25AR
0 Loop Ext. High Speed Line I/F Unit	NT4X25AS
0 Rackmount Low Speed EIA Controlled	NT4X25CH
0 Loop Back DU	
0 Filler Face Plate	NT0X50AL

0 (iii) The NT4X25AD Rackmount Low Speed Data Unit is a func-
0 tional replacement to the stand-alone Low Speed Data Unit
0 and is designed to fit into the Rackmount Shelf. The
0 Rackmount Low Speed Data Unit can be ordered by the cus-
0 tomer for customer premise datapath applications or it
0 may be ordered by the Telco for DATAPATH Modem Pooling
0 applications. This unit is replaced by NT4X25CH.

0 (iv) The NT4X25AV Rackmount High Speed Data Unit is a func-
0 tional replacement to the stand-alone High Speed Data

0 RELEASE 28.01
0 93 12 03
0

0 Unit and is designed to fit into the Rackmount Shelf. The
0 Rackmount High Spped Data Unit may be ordered by the cus-
0 tomer for customer premise datapath applications.

0 (v) The NT4X25AR Loop Extension Low Speed Line Interface Unit
0 (LIU) is part of a DATAPATH Data Unit loop extension sys-
0 tem that increases the loop length beyond the 4.6 km lim-
0 itation. The LIU is located at the central office
0 providing the data services and operates in conjunction
0 with a Data Terminating Unit at the customer premise. The
0 Loop Extension Low Speed LIU is designed for use with a
0 Low Speed DTU and mounts in the Rackmount Shelf. Pro-
0 vision one (1) Loop Extension Low Speed LIU for each Low
0 Speed DATAPATH loop requiring loop extension beyond 4.6
0 km. It is the responsibility of the customer to provide
0 the Data Terminating Unit. Refer to Figure 34.10.

0 (vi) The NT4X25AS Loop Extension High Speed Line Interface
0 Unit is the high speed equivalent to the NT4X25AR.

0 (vii) The NT4X25CH Rackmount Low Speed EIA Controlled Loop Back
0 Data Unit is a functional replacement for the NT4X25AD
0 and is designed to fit into the Rackmount Shelf. The ad-
0 ditional capabilities of the Rackmount Loop Extension EIA
0 Controlled Loop Back DU over the Rackmount Low Speed Data
0 Unit is the EIA controlled loop back (V.54) and the syn-
0 chronous automatic call (V.25) features. This is prima-
0 rily a non switched maintenance capability.

0 The EIA Data Unit can be ordered by the customer for cus-
0 tomer premise datapath applications or it may be ordered
0 by the Telco for DATAPATH Modem Pooling applications.

0 (viii) Dimensions of the Rackmount Shelf are as follows:

0 Width = 19"
0 Height = 8" Depth = 13.25"

0 (ix) In Canada, the Rackmount Shelf is mounted into a Modem
0 Equipment (MOE) frame, NT0X43BA. In the United States,
0 the Rackmount Shelf is mounted into a Miscellaneous (MIS)
0 frame equipped with Isolated System Grounding topology.

0 (x) The Rackmount Shelf requires 117V AC, 60Hz power.

0 In C.O. applications, the Rackmount Shelf should be pow-
0 ered via a NT0X87AA 200 watt inverter. One 200 watt

0
0 RELEASE 28.01
0 93 12 03

0 inverter can accomodate the power requirements for two
0 (2) Rackmount shelves. Provide the LaMarche Model
0 Inverter A0367433 instead of the NT0X87AA for U.S. appli-
0 cations only.

0 (xi) One screw terminal block per slot location (TB1 - TB16)
0 is provided to connect the T&R pairs and MI/MIC leads
0 from the Data Unit. The screw size on the terminal block
0 is 6-32. These terminal blocks are for modem pooling ap-
0 plications only.

0 One RS232 25 pin female connector per slot location (odd
0 no. P3-P33) is provided for Data Terminal Equipment (DTE)
0 input. This connection is for low speed interface only.

0 T&R pairs for each slot are also available on two 50 pin
0 telephone connectors(C0,C1). These connectors are used
0 to cable the voice and data pairs to the Main Distribut-
0 ing Frame. Refer to CA0X15 01 14.

0 Always provided with the Rackmount Shelf is a V.35 2X18
0 connector adapter that plugs into the RS232 connector.
0 This V.35 adapter is required to convert the 25 pin con-
0 nector to the 36 pin 2X18 V.35 interface.

0 2.3.4 Modem Pooling

0 (a) General Description

0 DATAPATH uses the End-to-End Data Unit communication protocol to
0 transmit and receive data over digital facilities. When trans-
0 mitting data between two data units over analog facilities, mod-
0 ems must be inserted into the call path. This is accomplished via
0 the Outbound Modem Pooling (OMP) and the Inbound Modem Pooling
0 (IMP) features.

0 Modem pools are groups of similiar modems which are individually
0 wired to a Data Unit (DU). In reaction to the DU, the modem func-
0 tions as if it were connected to the Data Terminal Equipment
0 (DTE). The DU also reacts to the modem as if it was the DTE.

0 An entire modem pool may be divided into groups of one or more
0 modem/DU pairs and each group is uniquely identified by a Common
0 Language Location Identifier (CLLI). The pools may be inbound or
0 outbound depending upon whether they are used at the originating
0 or terminating end of the data call. The outbound modem pooling
0 facility allows the originator to select from a variety of modem
0 pools with different speeds and/or modes to match the specific
0 customer requirements. The inbound modem pooling facility pro-
0 vides an analog modem when a DU is called by a modem, or is
0 called over analog facilities. The terminating DMS-100 activates
0 the inbound modem pool feature when it determines that the termi-
0 nator is a DU and that a modem or some analog facility is used at
0 any point in the data call.

0 Figure 34.11 shows the transmission path between a customer's DU
0 and a modem or analog trunk, through a single element of a modem
0 pool (one modem/DU pair).

0 Modem pooling can be used for interoffice and intraoffice appli-
0 cations.

0 The Data Unit user gets access to the outbound modem pool either
0 by being dedicated to a specific modem pool or by dialing prefix
0 digits to select a pool. There is no prefix type modem pooling
0 for inbound modem pooling. More than one MDC customer group can
0 access a specific modem pool.

0 A modem pool member at different times is connected to different
0 trunk groups. Different modem pool members of a specific modem
0 pool may be connected to different trunk groups.

TC - Trunk Card

Figure 34.11: Transmission Path Through a Modem Pool Element

0 RELEASE 28.01
0 93 12 03

0 Types Of Modem Pools:

0 There are four (4) types of modem pools which are: Inbound, Out-
0 bound, Bidirectional, and Maintenance. These modem pool types are
0 defined as follows (Refer to Figure 34.12 for a pictorial repre-
0 sentation of Inbound, Outbound, and Bidirectional MPs, or Figure
0 34.13 for all type of Maintenance Modem Pools (MPs).

0 TYPE	DESCRIPTION
0 INBOUND	0 The analog side of the connection path originates 0 the data call, and the digital side answers. In- 0 bound Modem Pooling (IMP) inserts an appropriate 0 IMP element (modem/DU pair) in the call path when 0 a terminating DU is called by either an analog 0 modem, or by another DU over an analog trunk. 0 IMPs may consist of one (1) or more modem/Data 0 Unit (DU) pairs.
0 OUTBOUND	0 The digital (subscriber DU) originates the data 0 call. Outbound Modem Pooling (OMP) inserts a 0 modem pool element (modem/DU pair) into the con- 0 nection path when a DATAPATH user calls either an 0 analog modem, or the call is routed over analog 0 facilities.
0 BI-DIRECTIONAL	0 If the modems in a modem pool are capable of 0 switching automatically between 'originate' and 0 'answer' mode, the modem pool can be designated 0 as both Inbound and Outbound. The elements 0 within such a pool are automatically assigned on 0 an individual basis by the DMS as either inbound 0 or outbound. The direction assigned to a give 0 element at any time is determined by subscriber 0 requirements at that time.
0 MAINTENANCE	0 The known-working modem pool elements are re- 0 served for maintenance purposes by the Telco. 0 They are grouped together to form a Maintenance 0 Modem Pool (MMP). The hardware used in MMPs are 0 identical to that used in a regular modem pool. 0 However, MMP elements are reserved for testing 0 and are not used for regular call processing. A 0 number of MMPs can be established. Each MMP must 0 be configured with the same transmission charac- 0 teristics as the pools it will be testing. An in-

0
0 RELEASE 28.01
0 93 12 03

0 bound modem pool is tested by an outbound MMP and
0 visa versa. MMPs may be configured for Bi-
0 Directional operation. Refer to Figure 34.14 an
0 illustration of the Maintenance Modem Pool trans-
0 mission path.

0 Refer to Figure 34.12 which shows an example of the basic con-
0 nection difference between the Inbound, Outbound and
0 Bidirectional modem pools, namely the use of MI (Mode Indicator)
0 and MIC (Mode Indicator Common) control leads.

0 (c) Provisioning Considerations:

0 (i) The following table summarizes when modem pooling is re-
0 quired and when it is not:

0 Table 34.2 - Modem Pooling Requirements

0 CALL TYPE	0 ORIGINATOR	0 TERMINATOR	0 ANALOG	0 MODEM
0 INTRA/INTER	0 DU/MODEM	0 DU/MODEM	0 TRUNKING	0 POOLING
0 OFFICE			0 YES/NO	0 OMP/IMP
0 -----	0 -----	0 -----	0 -----	0 -----
0 INTRA	0 DU	0 DU	0 N/A	0 NONE
0 INTRA	0 DU	0 MODEM	0 N/A	0 OMP
0 INTRA	0 MODEM	0 DU	0 N/A	0 IMP
0 INTER	0 DU	0 DU	0 NO	0 NONE
0 INTER	0 DU	0 DU	0 YES	0 OMP+IMP
0 INTER	0 DU	0 MODEM	0 NO	0 OMP
0 INTER	0 DU	0 MODEM	0 YES	0 OMP
0 INTER	0 MODEM	0 DU	0 NO	0 IMP
0 INTER	0 MODEM	0 DU	0 YES	0 IMP

0 (ii) Each modem pool is of a specific baud rate (speed), spe-
0 cific direction (inbound, outbound) and uses specific
0 modems compatible with the originating end in the case of
0 OMP, and with the terminating end in the case of IMP.

0 (iii) The modem pool is composed of modem pool members. Each
0 modem pool member consists of one data line card Type D,
0 one low speed data unit, one modem and one voice line
0 card Type A. The number of modem pool members in a modem
0 pool is equal to the maximum number of simultaneous calls
0 handled by that modem pool.

0 (iv) Data line card Type D can only be in an LCM. However, the
0 voice line card Type A can be either in the LCM or
0 LM/RLM. Each modem pool member hardware type used for a
0 specific modem pool must be spread over as many
0 LCM/LM/RLM/LC as possible. The data line card and voice
0 line card must be located on the same LGC in the
0 DMS-100F. The data unit/data line card originating or
0 terminating the call must also be on the same LGC.

0 RELEASE 28.01
0 93 12 03
0

0 (v) The Line Cards Type A residing in LM/RLM and belonging to
0 specific modem pool must be assigned such that about half
0 are A powered and about half are B powered.

0 (vi) Provide the IBERT Line Card (NT6X99AA) as required for
0 Maintenance Modem Pools only; however, a minimum of two
0 is required.

0 (vii) In Canadian applications only, modem pooling equipment
0 (DUs/modems) will be mounted on the Modem Equipment
0 Frame. (Refer to Modem Equipment Frame in this section
0 of the 450.)

0 (viii) In United States applications only, the use of rack mount
0 equipment is recommended. The following Rack Mount
0 equipment shall be provided for Modem Pooling:

0 Miscellaneous Equipment Frame (MIS - NT0X02AB)

0 Modem pooling equipment (DU's/modems) will be mounted on
0 Miscellaneous Equipment Frames (MIS). The number of MIS
0 frames required will depend on the number of modem pools
0 required. One MIS frame dedicated to Modem Pooling hard-
0 ware can house up to two (2) NT4X25BH, two (2) modem
0 shelves, and two (2) NT0X87AA/A0367433. The MIS frame
0 must be configured in accordance with established ISG
0 guidelines. (Refer to Section 3.8 Miscellaneous Equip-
0 ment for more information on the MIS frame ISG.)

0 UDS RM16M Modem Shelf (62005220)

0 NOTE: The modem shelf and the data unit shelf leads MI &
0 MIC for each modem/DU pair must be reversed for the
0 proper operation of Modem Pooling.

- 0 - Modem UDS RM16M-201B/C (62015166) Synchronous opera-
0 tion only.
0 - Modem UDS RM16M-202S/D (62025211)
0 - Modem UDS RM16M-208A/B (62085083)
0 - Modem UDS RM16M-212A (62125086)
0 - Modem UDS RM16M-212A/D (62125084)

0 The 212A/D is the 212-modem of choice for the 1200BPS
0 Modem Pooling application

0 Rack Mounted Data Units (DU):

0 RELEASE 28.01
0 93 12 03
0

0 - NT4X25BH - Data Unit Shelf

0 The NT4X25BH DU shelf may house up to 16 DUs, how-
0 ever, for Modem Pooling provided the following Rack
0 mounted Low Speed DU only:

0 NT4X25CH- Low Speed Autoloop Rkmtg Data Unit (RLDU)

0 (ix) Standalone/Desk Mounted Hardware Provisioning (U.S. ap-
0 plications only):

0 The standalone modems and DUs may be provisioned for in-
0 stallation on a desk, tabletop, or in an Miscellaneous
0 Equipment Frame (MIS). To provision a modem pool using
0 desktop type of equipment, you will need the following:

0 * Provide NT4X25AF DU as required. The NT4X25AF DU re-
0 quires profile downloading. Each DU is supplied
0 equipped with its own AC power supply and NT D4B4
0 Teladapt line cord.

0 Note: The low speed data unit with elastomer keypad
0 (NT4X25AF) can only be configured as a modem pool DU
0 via a profile download. One NT6X71AB Data Line Card
0 is required per NT4X25AF DU to facilitate profile
0 downloading.

0 * analog modem that meets the modem pool requirements
0 (one per DU)

0 * RS-232C rollover cable to connect the DU and modem
0 (one per DU/Modem pair)

0 * NT6X71AB data line card (one per DU).

0 * NT6X17AA, NT6X17AB, or NT6X17AC voice line card (one
0 per modem)

0 * non-reversed TELADAPT line cord (one per modem)

0 * A minimum of two NT6X99AAs (IBERT Line Card) when the
0 modem pool is used as a maintenance modem pool

0 The NT3X25AA Common Equipment Shelf can accomodate up to
0 three (3) standalone modems or DUs. The MIS frame can
0 house up to five (5) shelves. Provide two Inverters to
0 the MIS frame; one is required, the second is optional.

0 RELEASE 28.01
0 93 12 03

0 2.3.5 Modem Equipment Frame

0 (a) General Description

0 The Modem Equipment Frame (MOE) is provided in host offices
0 equipped with Isolated System Grounding (ISG) for the mounting of
0 modem equipment. All modem shelves mounted on the frame must be
0 isolated from the framework with the chassis tied to the logic
0 return bar. Any customer provided modem shelves must be isolated
0 from the frame and similarly connected to the logic return bar.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 (i) Modem equipment must not be equipped on a Miscellaneous
0 Equipment (MIS) frame.

0 (ii) Remote offices (RLM,RSC,RLCM and OPMs) do not require the
0 MOE frame. However, all modem equipment and their asso-
0 ciated inverters must reside in the same Remote Miscella-
0 neous Frame (RME).

0 (iii) Host office extensions that are upgraded with ISG must
0 relocate all modem equipment to either a MOE frame or an
0 Input Output Equipment (IOE) frame.

0 (iv) Modem equipment may be mounted on an IOE frame in exist-
0 ing offices, however, for all new host offices a MOE
0 frame must be provided.

0 (v) For mounting modems on IOE frames the following rules ap-
0 ply:

0 a) DC Modem Shelves must be isolated from the equipment
0 frame and modem shelf chassis must be connected to
0 the logic return busbar. One (1) NT4X2591 Data Unit
0 Grounding and Mounting Kit must be provided per DC
0 Modem Shelf provisioned to isolate the shelf from the
0 frame and to connect the chassis to the logic return
0 busbar. DC Modem Shelves ust be powered directly to
0 the Power Distribution Center (PDC).

0

0
0 RELEASE 28.01
0 93 12 03

- 0 b) All AC Modem Shelves must be powered from an inverter
0 that is mounted on the same frame. The inverter must
0 be isolated from the framework and its chassis must
0 be connected to the logic return busbar.
- 0 c) Provision one (1) NT0X0009 Cable Assembly for an
0 inverter located in position 04 on the IOE frame to
0 connect the inverter to the logic return busbar.
- 0 d) Provision one (1) NT0X4309 Cable Assembly for an
0 inverter located in any other position on the IOE
0 frame.
- 0 (vi) Only current loops may be connected directly to the IOC
0 modules from devices (i.e. VDU or printers). EIA ports
0 must be connected through modems. No direct connections
0 from devices (i.e. VDU or printers) to EIA ports are al-
0 lowed. If a local EIA modem to modem connection is de-
0 sired, both the DMS modem and the device end modem cannot
0 co-exist in the DMS. The device modem must be located
0 away from any DMS frame.
- 0 (vii) Modem Pooling Configurations
- 0 Three standard configurations have been identified for
0 modem pooling. These configurations are shown in Figure
0 34.15.
- 0 Modem Equip. Fr. Modem Pooling Configuration A
0 - 1 modem shelf
- 0 Modem Equip. Fr. Modem Pooling Configuration B
0 - 2 modem shelves, no redundant power
- 0 Modem Equip. Fr. Modem Pooling Configuration C
0 - 2 modem shelves, redundant power

0 3.0 Input/Output Device Requirements

0 3.1 Introduction

0 The Input/Output (I/O) system enables the CC to control the over-
0 all operation of the DMS-100 system and to direct the actions of
0 each PM. To do so, the I/O System allows the PMs and the CC to
0 communicate with each other by exchanging messages. Messages
0 contain either data or control information. The I/O System is
0 concerned only with the transmission of information between the
0 CC and the PMs; it is not concerned with the information itself.

0 3.2 Features

0 There are four major users of the I/O System.

0 3.2.1 The File System

0 The File System provides a utility to write and retrieve data
0 from the various I/O devices (for example, magnetic-tape drives,
0 disk drives and terminals).

0 3.2.2 Call Processing

0 Calling Processing looks after all aspects of a call by coordi-
0 nating PM functions (for example, initiating dial tone, collect-
0 ing digits and establishing a Switching Network connection).

0 3.2.3 I/O Maintenance

0 I/O Maintenance maintains the various components of the I/O Sys-
0 tem including the system hardware and reports any problems that
0 cannot be resolved.

0 3.2.4 Telephony Maintenance

0 Telephony Maintenance maintains the lines, trunks and service
0 circuits.

0 3.3 Equipment Provisioning

0 3.3.1 Input/Output Controller Module (IOC)

0 (a) General Description

0 The Input/Output Controller (IOC) provides an interface between
0 the NT40 (CCC) or SuperNode and up to nine device controller Cir-
0 cuit Packs.

0 Each IOC performs serial to parallel and parallel to serial con-
0 versions to the Data to and from Device Controllers on two (2)
0 2.56Mb/s serial ports to a pair of Message Device Controllers (on
0 NT40) or Message Switches (on SuperNode).

0 The IOC consists of the following card types:

0 I/O Message Processor - Contains a microprocessor, associated
0 memory serial link I/F logic, parallel
0 bus I/F logic.

0 Device Controllers - Contains a microprocessor and associated
0 memory for the I/O device (i.e. MTD, DDU,
0 VDU, etc.)

0 IOC Terminator - Contains terminating resistors for the
0 IOC's parallel bus.

0 Power Converter - Supplies Voltages required for the IOC
0 message controller and other IOC Circuit
0 Packs.

0 (b) References

0 Chapter 3, Section 3.9 CCC and Network Subsystems

0 (c) Provisioning Considerations

0 (i) The I/O Controller Module (NT1X61AD) is made up of an I/O
0 Shelf Assembly (NT1X6112) and a Common Circuit Pack Fill
0 NT1X61AE. The provisionable I/O Message Controllers are
0 NT1X62AB for NT-40 applications and NT1X62CA for
0 SuperNode applications.

0
0 RELEASE 28.01
0 93 12 03

- 0 (ii) A minimum of two I/O Controller Modules (IOC:00, IOC:01)
0 is required per system. These may be provisioned either
0 as functional modules within the Central Message I/O Con-
0 troller shelf (MDC) (NT2X76BA) for NT40 applications
0 only or as independent shelves. Note that for SuperNode
0 applications independent shelves must be provisioned.

0 If provisioned as independent shelves then provide two
0 (2) NT1X61AD.

0 Each shelf accommodates up to nine I/O device controller
0 cards.

- 0 (iii) The maximum number of IOC modules in an DMS-100 family
0 office is dependent on the number of network modules and
0 the number of Central Message Controller (CMC) Peripheral
0 Interface CP provisioned (on the CCC frame). Each pair
0 of CMC I/F cards provides 10 ports; enough for five (5)
0 network modules (one per each plane) or 10 IOCs or a com-
0 bination of both. A maximum of seven (7) pairs can be
0 provided per office. For example, an office equipped
0 with 32 network modules requires 64 CMC interface ports
0 (2 X 32). With the maximum number of CMC I/F cards al-
0 lowed (seven (7) pairs), the maximum number of ports is
0 70. Therefore, the maximum number of IOCs allowed in
0 this office is 6 (70 - 64).

0 For more information on the CMC I/F card, refer to Sec-
0 tion 3.9.

- 0 (iv) The IOC shelf and the devices (MTD, DDU, MAP etc.) it
0 interfaces should be cabled to the same power feed on the
0 Power Distribution Center (PDC).

- 0 (v) Provide one (1) PC Kit NT1X61AX when converting an ex-
0 isting IOC Module (NT1X61AA or AB) for DMS-Core applica-
0 tions.

- 0 (vi) At a Telco's request, when available, the NT2X70AZ PC Kit
0 can be provisioned to modify the NT1X61AD IOC with the
0 NT2X70AE Power Converter

- 0 (vii) Standard sparing criteria will be maintained for the IOC.

0 3.3.2 Input/Output Controller Pack

0 (a) General Description

0 This section describes the baud rate capabilities of the various
0 versions of the NT1X67 Input/Output Controller Pack. Each pack
0 or group of packs with the same baud rate capability will be dis-
0 cussed separately.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 (i) NT1X67AB and NT1X67CB 0 (status of these cards is A&M)

0 These cards have four separate ports used for peripheral
0 terminal devices such as VDUs, printers, modems etc.
0 These ports can support one device per port at variable
0 baud rates using either the EIA or 20mA current loop mode
0 of operation. The current Northern Telecom specifica-
0 tions dictate that no single port on these cards will ex-
0 ceed 1200 baud. However, it is possible in special
0 applications for these cards to support a baud rate of up
0 to 4800 baud on a single port if the following conditions
0 are met:

0 - The terminal must be able to support the
0 higher baud rates.

0 - The sum of the baud rates for ALL ports
0 on a single card must not exceed 4800
0 baud.

0 Refer to Figure 36.1 for examples of port configurations.
0 Even though these capabilities exist, any configuration
0 that specifies a single port supporting a baud rate
0 greater than 1200 baud will be at the customer's dis-
0 cretion and/or risk. Northern Telecom will NOT guarantee
0 data integrity.

0 As a separate issue, terminals used for the operator po-
0 sition must be configured for a maximum baud rate of 1200
0 baud due to potential communication problems that may be

0 RELEASE 28.01
0 93 12 03

0 created during emergency situations if higher baud rates
0 are used.

0 (ii) NT1X67BC and NT1X67BD

0 These cards succeed the above mentioned cards and also
0 have four separate ports for peripheral terminal devices.
0 However, these cards have had firmware modifications that
0 allow terminals to communicate at higher speeds on all
0 ports. The current Northern Telecom specification for
0 these cards dictates that no single port shall exceed
0 2400 baud. The modifications alter the processing speed
0 of the card as a whole but do not change the maximum baud
0 rate capabilities of a single port. The maximum baud
0 rate that can be supported by a single port in a special
0 application is 4800 baud. When any single port on a card
0 exceeds 2400 baud the following conditions must be met:

- 0 - The terminal must be able to support the
0 higher baud rates.
- 0 - The sum of the baud rates for ALL ports on
0 a single card must not exceed 4800 baud.

0 Refer to Figure 36.2 for examples of port configurations.
0 Even though these capabilities exist, any configuration
0 that specifies a single port supporting a baud rate
0 greater than 2400 baud will be at the customer's dis-
0 cretion and/or risk. Northern Telecom will NOT guarantee
0 data integrity.

0 As an added issue, terminals used for operator positions
0 should still be configured for 1200 baud.

0 The NT1X67BD card is a firmware updated version of the
0 NT1X67BC card and is only for use with the Auto Dialback
0 (ADB) feature NTX293 or special Line Editing Functions.
0 NT1X67BD is backwards compatible with the NT1X67BC and
0 should not be used for standard I/O terminal device
0 interface.

0 (iii) NT1X67BB and NT1X67DB

0 The NT1X67BB and NT1X67DB are special cards designed for
0 special applications. They are not functionally similar
0 to the other NT1X67 cards and cannot be used as a substi-
0 tute. Each card has a single port that will support a

0 RELEASE 28.01
0 93 12 03
0

0 baud rate of up to 9600 baud and communicates using EIA
0 only. These cards are not currently used for U.S. appli-
0 cations but were applied to early offices using the
0 DNC-500. This application now uses the NT1X89AA Multi-
0 protocol Converter. Refer to Figure 36.3.

0 (iv) NT1X67EA

0 The NT1X67EA is a single port, high speed, output-only,
0 asynchronous terminal controller. This circuit pack is a
0 single channel, high capacity 9600 baud version that was
0 introduced to meet customer requirements for realtime
0 tracking of call distribution reports. Currently for
0 Richardson application only. Refer to Figure 36.4.

0 NOTE: NT1X67EA is provisionable on the MDC
0 shelf NT2X76BA only.

0 (v) NT1X67FA

0 The NT1X67FA card is for Simplified Message Desk Inter-
0 face (SMDI) applications only. It is not functionally
0 similar to the other NT1X67 cards and cannot be used as a
0 substitute. Each card has a single port that will support
0 a baud rate of up to 1200 full duplex. Refer to Figure
0 36.5.

### 0 3.3.3 Polling Device Requirements

#### 0 (a) General Description

0 The UDC (Universal Data Converter) is used as a buffer and data  
0 converter for OM (Operational Measurements) polling from the  
0 DMS-100 Family of switches to a centralized data collection cen-  
0 ter (typically Alston ATEMIS or TeleSciences AUTRAX).

0 The base configuration of the UDC consists of two I/O channels.  
0 Channel 2 is connected to a DMS I/O terminal controller and Chan-  
0 nel 1 is connected "downstream" for data polling.

#### 0 (b) References

0 None

#### 0 (c) Provisioning Considerations

0 ( i) The UDC may be strapped to output the following data for-  
0 mats:

- 0 1) TeleSciences Model TE-300-2000F
- 0 2) Alston Model 600BX (5 digit reading)

0 ( ii) One of four polling options (strap selectable) are avail-  
0 able:

- 0 1) UDC dumps OM data upon receiving a polling command  
0 (dedicated line).
- 0 2) UDC dumps OM data upon receiving a polling command  
0 after answering a dial up polling call (switched  
0 line).
- 0 3) UDC dumps OM data upon buffer flip at 15, 30 or 60  
0 minute intervals (dedicated line).
- 0 4) UDC dumps OM data upon answer of a dial up polling  
0 call (switched line).

0 ( iii) The Editing option allows the user to make modifications  
0 to the RMT (Register Mapping Table) which controls the  
0 processing of incoming OM data and the conversion to nu-  
0 meric data for polling. Data may be output in either a

0 RELEASE 28.01  
0 93 12 03  
0

0 "fixed" or "variable" format. In the "fixed" format,  
0 specific OM tables may be mapped to specific memory lo-  
0 cations. In the "variable" format, OM tables are ap-  
0 pended to one another in UDC memory in the order in which  
0 they are dumped from the DMS switch (this order is fixed  
0 in DMS but specific tables may be dumped via input to the  
0 OM Management Tables). When the UDC is not equipped with  
0 the Editing option, the output assumes a variable format.

0 ( iv) The Alarm option allows for an office alarm output (via a  
0 scan point) should a power failure or hardware/software  
0 fault be detected by the UDC. With the 4K UDC, the alarm  
0 option is included with Editing.

0 ( v) Full interactive with the UDC is optionally available  
0 through either channel 0 or channel 3. Channel 0 permits  
0 the connection of a local teleprinter while channel 3 may  
0 be equipped with a 110/300 baud modem to allow remote  
0 system interaction.

0 Notes:

0 Remote system interaction is also available over channel  
0 1 only if this channel is equipped with a 110/300 baud  
0 modem.

0 It is recommended that the UDC be equipped with either  
0 channel 0 or channel 3.

0 This option is a prerequisite for Editing.

0 The following connecting cables for local teleprinter  
0 connection (port 0 option) are available:

0 1) EIA cable, male connection (75067)

0 2) EIA cable, female connection (75062)

0 3) current loop cable (75061)

0 4) external modem connecting cable (75055)

0 Channel 1 must be equipped with one of the following mod-  
0 ems:

0 1) transmit only, 1200 baud, no polling command (84420)

0 RELEASE 28.01  
0 93 12 03  
0

0 2) transmit-receive, 1200 baud, accepts polling command  
0 (84424)

0 3) transmit-receive, 110/300 baud, accepts polling com-  
0 mand (84419)

0 If channel 3 option is required it must be equipped with  
0 a 110/300 baud modem (84419).

0 ( vi) The basic UDC is available in two memory configurations.  
0 One configuration consists of 4K dual traffic data regis-  
0 ters (84447) and is expandable to 8K with an 84425 card.  
0 The other configuration consists of 16K dual traffic reg-  
0 isters (84448) and is expandable to 32K with an 84426  
0 card.

0 ( vii)

| PEC   | DESCRIPTION       | EQUIP WITH |            |
|-------|-------------------|------------|------------|

0 RELEASE 28.01  
0 93 12 03

0 (viii) The Full Maintenance Spares Kit (4K reg), 84434, includes  
0 one of every circuit card type included in 84447, spare  
0 control program card plus spare power supplies. When this  
0 kit is specified, the following orderable options are in-  
0 cluded and need not be ordered separately as spares:

- 0 (a) Spare I/O Channel 84405  
0 (b) Spare Control Program Card 8447X  
0 (c) Spare 4K Dual Traf Data Register Cd 84425

0 The Full Maintenance Spares Kit (16K reg), 84433, in-  
0 cludes one of every circuit card type included in 84448,  
0 spare control program card plus spare power supplies.  
0 When this kit is specified, the following orderable  
0 options are included and need not be ordered separately  
0 as spares:

- 0 (a) Spare I/O Channel 84405  
0 (b) Spare Control Program Card 8447X  
0 (c) Spare 4K Dual Traf Data Register Cd 84426

0 Spares may be mounted on a UDC Maintenance Spare Storage  
0 Shelf, 80013 (includes rack adapters for mounting on  
0 Maintenance Spares Storage Frame).

0 The required spares shall be ordered in NT8600 Section 9,  
0 DMS Office Maintenance.

#### 0 3.3.4 Magnetic Tape Storage

##### 0 (a) General Description

0 Magnetic tapes are used in DMS as external storage devices and as  
0 a medium for transferring bulk data and operating software into  
0 and out of the system. The read-write device for magnetic tapes  
0 is the MTD. These are discussed in NTP 297-1001-153, DMS-100  
0 Family Input/Output Configuration, and NTP 297-1001-118, Magnetic  
0 Tape User's Guide.

0 Magnetic tapes are used for the following functions:

- 0 1) Office Image (system software backup)
- 0 2) Trouble Diagnostics and Reports
- 0 3) Automatic Message Accounting (AMA)
- 0 4) Operational Measurements (OM) if required
- 0 5) Data Modification Orders (DMO) bulk
- 0 6) Service Analysis (SA) if required
- 0 7) Call Detail Recording (DMS-300 only)
- 0 8) Peripheral Loads (to re-load peripherals)

##### 0 (b) References

0 NTP 297-1001-156 Disk Maintenance Subsystem  
0 Reference Manual

##### 0 (c) Provisioning Considerations

- 0 ( i) The number of MTD's required will depend on the features  
0 to be supported and the Telco administrative policy. A  
0 separate MTD is not required for each feature: for exam-  
0 ple OM, SA and Trouble Diagnostics and Reports may be as-  
0 signed to the same drive.
- 0 ( ii) A minimum of two (2) MTD's is required per system. An  
0 additional two (2) are required for AMA/LAMA/CAMA. This  
0 function can be provided on a Distributed Processor Pe-  
0 ripheral (DPP). An extra MTD may be provided for separate  
0 Operational Measurement (OM) support. Other drives are  
0 provided consistent with Telco requirements. Note that  
0 MTD need not be used for dumping OM and SA reports. Re-  
0 ports can be routed directly to a printer or via a data  
0 port of polling adapter to a Telco data centre. NTL will  
0 advise on the best configuration.

0  
0 RELEASE 28.01  
0 93 12 03

0 Provide a maximum of ten (10) MTD's per system.

0 ( iii) The standard DMS MTD is the Cook Electric Co., model 2200  
0 transport, NT0X44AB.

0 ( iv) Provide one (1) MTD Mounting hardware NT0X44AC to to  
0 mount a customer-provided Hewlett Packard MTD. The HP  
0 MTD (model 7970E) may not be ordered from NTL by our cus-  
0 tomers. Provide one (1) NT0X44AC MTD Mounting Hardware  
0 to mount a customer-provided HP drive (formerly provided  
0 if 979E-151-048 MTD was drop-shipped by NT).

0 ( v) Customers may provide their own MTD and mounting hardware  
0 if the Cook Electric drive is not suitable.

0 (vi) In offices where the HP MTD is retrofitted with DDU, pro-  
0 vide one (1) R0107733 HP MTD Packing box for shipping and  
0 storing purposes.

0 RELEASE 28.01  
0 93 12 03

0 3.3.5 Disk Drive Unit (DDU)

0 (a) General Description

0 The 5.25" Disk Drive Unit (228.7 Mbytes formatted) is now the  
0 only provisionable DDU. It replaces both the 8" and 14" DDU's in  
0 all circumstances where new or replacement disk drive units are  
0 required.

0 One MTD is retained primarily to enable physical transportation  
0 of data to and from the office and secondarily as a backup to the  
0 DDU.

0 Disk application will also permit reductions in program store and  
0 data store memory by accommodating programs and data which do not  
0 require permanent residence in memory.

0 Disk drives when combined in an office with automatic remote  
0 transmission of OM and AMA data allows for a fully unattended re-  
0 motely controlled DMS application.

0 Data files recorded on disk can be manually copied on to magnetic  
0 tape for long term storage or transportation if necessary.

0 Data Recording Management

0 Data Recording Management involves functions relating to the De-  
0 vice Independent Recording Package (DIRP). DIRP controls the  
0 data flow from originating subsystems (i.e. OM,AMA,JF) to the de-  
0 vices (i.e. Tape or DDU) where the data is stored.

0 The DDU will be used to store data previously committed to tape,  
0 including:

- 0 o Office Image
- 0 o Auto Messaging Accounting (AMA)
- 0 o Parallel AMA
- 0 o Operational Measurements (OM)
- 0 o Journal File (JF)
- 0 o Peripheral Module (PM) loads
- 0 o Non-Resident Software
- 0 o Batch Data Modification Orders (DMO)
- 0 o Scan Log
- 0 o Scratch Area
- 0 o Killer Trunks (KT)

0 (b) References

0  
0 RELEASE 28.01  
0 93 12 030 NTP 297-1001-526 Disk Maintenance Subsystem  
0 Reference Manual0 (c) Provisioning Considerations

0 The 5.25" DDU has been developed to replace the 8" DDU which re-  
0 placed the 14" DDU. In new offices, one or two 5.25" DDU are to  
0 be provisioned on a NT4X00AF shelf. In existing offices, when  
0 replacement is necessary, the 5.25" DDU should be provided. To  
0 replace a 14" DDU, a NT4X00AZ DDU Enhancement Kit shall be pro-  
0 vided along with a 5.25" DDU on the NT4X00AA, NT4X00AB or  
0 NT4X00AC DDU shelf to provide the proper cabling and mounting  
0 equipment. To replace an existing 8" DDU, one 5.25" DDU should  
0 be ordered for the NT4X00AA, NT4X00AB or NT4X00AC shelf and one  
0 or two DDUs should be ordered for the NT4X00AF shelf. A NTZZ99AG  
0 Univ 5.25" DDU Upgrade Kit must be provided with each 5.25" DDU  
0 provided to replace an 8" DDU.

0 (ii) The 8" DDU is no longer available for ordering. Provide  
0 the 5.25" DDU for all offices.

0 The following hardware is required for 5.25" DDU assign-  
0 ment in a new DMS-100F office. (The 8" DDU is no longer  
0 available.)

0 |

0 NT4X00AG 5.25" DDU - (228.7 Mbytes formatted) -  
0 Maximum 2 per NT4X00AF shelf.

0 NT4X0038 Mercury Disk Hardware Kit - Provide one (1)  
0 per 5.25" or 8" DDU.

0 NT4X00AF Dual Disk Drive Shelf Assembly - supports  
0 two (2) 5.25" or two (2) 8" DDUs.

0 NT1X55DA Disk Drive Controller CP.  
0 Provide one (1) per DDU.

## 0 Notes:

0 1) For all offices, provide the 5.25" DDUs. The 8"  
0 DDU is no longer available.

0 2) The 1st DDU shall be located on the left  
0 side (slot 10) of the NT4X00AF Dual Disk Drive  
0 shelf (located in shelf Position 04). If a 2nd

0  
0  
0

0 RELEASE 28.01  
0 93 12 03  
0

0 DDU is required on the same shelf, it shall  
0 be located on the right side (slot 18).

0 3) DDUs can only be provisioned in the IOE on shelf pos.  
0 04 with shelf pos. 18 left vacant. This is due to  
0 heating restrictions with the DDU and a fusing  
0 limitation on the IOE's FSP.

0 4) Provide one additional NT0X36AB in the IOE Frame  
0 Supervisory Panel (FSP) when the NT4X00AF Shelf is  
0 provisioned.

0 (iii) The following hardware is required to replace an existing  
0 14" DDU on an NT4X00AA, AB, or AC shelf with a 5.25"  
0 DDU. The 8" DDU is no longer available.

0 NT4X00AG 5.25" DDU - Maximum one (1) per NT4X00AA, NT4X00AB  
0 or NT4X00AC shelf.

0 NT4X00AZ B0155066 - DDU Enhancement Kit

0 Notes:

0 1) Provide the 5.25" DDU for all offices. The 8" DDU is no  
0 longer available.

0 2) The NT4X00AZ Enhancement Kit provides appropriate  
0 cabling and mounting equipment to allow the replacement  
0 of a 14" DDU shelf with a 5.25" DDU. The 8" DDU is no longer  
0 available and the NT4X00AY Enhancement Kit is no longer available.

0 ( iv) The following hardware is required to replace existing 8"  
0 DDU(s) on an NT4X00AA, AB, AC or NT4X00AF shelf with  
0 5.25" DDU(s).

0 Per Customer request, the NT4X0046 Cable Assembly supplied in the  
0 NT4X00AY 14 Inch DDU Enhancement Kit during a 14" DDU replacement by an  
0 8" DDU or the two NT4X0039 Cable Assemblies of an existing NT4X00AF can  
0 be replaced with the NT4X0048 cable assembly. For all new 14" DDU to  
0 5.25" DDU replacements provide the NT4X00AZ DDU Enhancement Kit. The

0 NT4X00AG 5.25" DDU - Maximum one (1) per NT4X00AA, AB or AC  
0 Shelf. Maximum two (2) per NT4X00AF shelf.

0 NTZZ99AG Univ. 5.25" DDU Upgrade Kit (One per 5.25" DDU is required.)

0 Notes:

Per Customer request, the NT4X0046 Cable Assembly supplied in the NT4X00AY 14 Inch DDU Enhancement Kit during a 14" DDU replacement by an 8" DDU or the two NT4X0039 Cable Assemblies of an existing NT4X00AF can be replaced with the NT4X0048 cable assembly. For all new 14" DDU to 5.25" DDU replacements provide the NT4X00AZ DDU Enhancement Kit. The

0 |  
0 |  
0 |  
0 |  
0 |  
0 |  
0 |

( v) When mounted on the NT4X00AF shelf, the 5.25" and 8" DDUs can only be provisioned in the IOE shelf position 4 with shelf position 18 left vacant. This is due to heating restrictions with the DDUs and a fusing limitation on the IOE's FSP. You can replace 14" DDUs with 5.25" on a one-to-one basis, with the existing shelves remaining in place. The 8" DDUs are no longer available.

0 |  
0 |

(vi) To support DDUs: package NTX074AA - Data Disk Storage is needed.

0 |  
0 |  
0 |  
0 |

(vii) A DDU is physically allocated in blocks. Each "DDU block" contains 1024 Bytes. Two (2) "DDU blocks" make up a "DIRP block" of 2048 Bytes. A "DIRP file segment" contains 256 DIRP blocks for a total of 524,288 Bytes.

0 |  
0 |  
0 |  
0 |  
0 |  
0 |  
0 |

A volume is an area of the DDU. Volumes are used for each area of Data Recording Management. An overhead of 2,148,352 Bytes are required per volume. The overhead consists of 51,200 Bytes (50 blocks) for volume and file control and 2,097,152 Bytes (2048 blocks) for low space conditions. A DDU volume is physically defined by the multiple number "DIRP file segments" it contains plus the required overhead.

0 |

The following are volume summary guidelines:

0 |  
0 |

o All DDU's and subsystems should be provisioned evenly across IOC's

0 |  
0 |

0  
0 RELEASE 28.01  
0 93 12 03

- 0 o The minimum size of a volume is 2,672,640 Bytes
- 0 (2610K blocks)
- 0 o The maximum size of a volume is 67,108,864 Bytes (64M
- 0 blocks)
- 0 o One volume must be located in one DDU (i.e. a single
- 0 volume cannot span 2 DDUs)
- 0 o The maximum number of volumes for each DIRP subsystem
- 0 is 24
- 0 o Each volume for a DIRP subsystem must be the same
- 0 size
- 0 o DIRP will use space evenly to all volumes allocated
- 0 to a subsystem
- 0 o Volumes must be spread evenly over the DDUs provi-
- 0 sioned
- 0 o There must be at least two (2) volumes per DDU

0 (viii) Available disk capacity is that capacity remaining after  
0 power-up and formatting:

0 66 MByte Disk - 60,513,280 bytes available  
0 154 MByte Disk - 144,615,424 bytes available  
0 8" Disk Drive Unit - 240,020,000 bytes available

0 ( ix) DDUs should be provisioned for a five year period by us-  
0 ing five-year forecasted traffic figures. The DDU provi-  
0 sioning must be re-evaluated for another five year period  
0 with each office extension.

0 ( x) Office Image System Volume Size

0 The Office Image is formed by the total combined Program  
0 Store and Data Store requirements. It is recommended  
0 that a full 67,108,864 byte volume (maximum usable volume  
0 plus overhead) be reserved for the Office Image. A volume  
0 of this size provided adequate storage for an office con-  
0 taining 8 megawords of Program Store (PS) and 16 mega-  
0 words if Data Store (DS) per side plus 50 percent spare  
0 for five-year growth.

0 Actual Office Image requirements may also be calculated  
0 using the following formula:

0 Office Image Volume Size =  
0 2,148,352 Bytes + (.75 (PS (bytes) + DS (bytes))

0 where 2,148,352 bytes is for Disk volume maintenance

0 RELEASE 28.01  
0 93 12 03  
0

0 This formula takes into account 50 percent spare for  
0 five-year growth and the prediction that only half of the  
0 provisionable PS and DS memory is Office Image.

0 This formula is valid for NT40 offices and SuperNode of-  
0 fices without a System Load Module (SLM). The SLM con-  
0 tains SuperNode office images and thus would not require  
0 redundant images to reside on disk.

0 Each DDU can contain only one Office Image volume. The  
0 maximum number of DDUs containing an Office Image volume  
0 is three.

#### 0 Automatic Message Accounting (AMA)

0 AMA records should be stored on DDU:00 and DDU:01  
0 equipped with power interlock. AMA entries for the total  
0 retention period are recorded over DDU:00 and DDU:01  
0 (half on DDU:00 and half on DDU:01).

0 The required period of AMA record retention is specified  
0 in the number of days. Valid entries are 0 days to 499  
0 days. An example of four days retention is as follows:

0 First Day: Recorded on DDU:00  
0 Second Day: Recorded on DDU:01  
0 Third Day: Recorded on DDU:00  
0 Fourth Day: Recorded on DDU:01

0 The AMA subsystem on DDU:00 and DDU:01 should be set up  
0 for a minimum of two volumes each. AMA/Local Call Detail  
0 Recording (LCDR) and Station Message Detail Recording  
0 (SMDR) data may be contained in the same volume if NT  
0 format is utilized. This data may also be recorded in  
0 separate volumes. The factor 1.3 included in calcu-  
0 lations throughout this document consists of a dedicated  
0 area for volume and file control.

0 If a Distributive Processing Peripheral (DPP) or Billing  
0 Media Converter (BMC) is used, primary AMA is not stored  
0 on the disk.

#### 0 NT Format AMA

0 RELEASE 28.01  
0 93 12 03

0  $\frac{\quad}{\text{Number SMDR Volumes}}$  + 2,148,352  
0 bytes  
0 (overhead)

0 The minimum volume size for SMDR is 2,672,640 bytes. The  
0 maximum volume size for SMDR is 67,108,864. The recom-  
0 mended minimum of SMDR volumes is four. The maximum num-  
0 bers of volumes is 24.

0 Bellcore AMA Format

0 The following calculations are used to determine storage  
0 requirements for AMA in the Bellcore record format.

0 Basic Average                      See  
0 High Day Entries \* 55 Bytes + Notes = K

0 Note 1: If the office is optionally equipped  
0 with software for Equal Access (Equal  
0 Access End Office NTX186AA or Access  
0 Tandem NTX386AA), then add 10 bytes to  
0 the multiple 55 bytes above. Ensure  
0 that High Day entries contain both  
0 originating and terminating calls if  
0 recorded.

0 Note 2: If the office is optionally equipped  
0 with the NTX703AA Deferred Bellcore  
0 AMA formatting package (without the  
0 NTX243AA AMATPS features and with or  
0 without the Equal Access software),  
0 then add 61 bytes to the multiple 55  
0 bytes above.

0  
0 RELEASE 28.01  
0 93 12 03

0 Additive for Switch Supervisory Unit (SSU) for line and  
0 trunk if feature NTX076AA AMA Enhanced is turned on:

0 L = High Day Entries \* 8 bytes

0 Additive for MDC customer dialed account number (package  
0 NTX102AA)

0 M = High Day Entries \* 10 bytes

0 Reduction due to compression (high runner call types:  
0 message rate, flat rate, station paid calls are com-  
0 pressed by 10 bytes)

0 N = High Day Entries \* 10 bytes

0 P = Subtotal Bellcore AMA Format = (K+L+M) - N

0 Number of AMA Volumes      Total Bellcore AMA  
0 (round up to the      =  $\frac{\quad}{\quad}$   
0 nearest even integer)      volume size (in bytes)

0 AMA/Volume = Total Bellcore AMA Format  
0  $\frac{\quad}{\quad}$   
0 Number AMA Volumes

0 + 2,148,352 bytes (overhead)

0 (Factor 1.2 estimates variable structure code information  
0 per call code.)

0 The minimum AMA bytes per volume is 2,672,640 bytes. The  
0 maximum volume size for AMA is 67,108,864. The recom-  
0 mended minimum of AMA volumes is four. The maximum num-  
0 bers of volumes is 24.

0 Combined AMA and SMDR Volumes (NT Format Only)

0 (Do not calculate here if calculated separately.)

0 AMA/Volume = Total NT AMA + Total SMDR  
0  $\frac{\quad}{\quad}$   
0 Number of AMA Volumes

0 + 2,148,352 bytes (overhead)

0 Expanded Bellcore AMA Format (EBAF)

0 EBAF uses new base structure codes and appended modules  
0 to record AMA information. EXAMPLE: A 0+ call origi-  
0 nation on a TOPS trunk group with the calling party re-  
0 questing person-to-person. The call is then billed and  
0 completed. Record size for pre-EBAF = 69 bytes; with  
0 EBAF = 84 bytes.

0 Parallel Volumes

0 Parallel recording is optional for any subsystem on Mag  
0 Tape or disk. If parallel recording is done on disk it  
0 should be done on one that does not have regular AMA vol-  
0 umes (i.e. active/stand-by). It is recommended that par-  
0 allel volumes should be sized at a full 67,108,864 bytes.

0 RELEASE 28.01  
0 93 12 03

0 Operational Measurement Volume

0 The number of Common Language Location Identifiers (CLLI)  
0 includes pseudo maintenance CLLI, spares, interoffice  
0 CLLI, and growth CLLI. The minimum number of CLLI is  
0 120.

0 Basic OM on Trunk Groups (Single Precision)

0  $Q = \text{Number of CLLI's} * 18 \text{ bytes} * \text{number of}$   
0  $\text{dumps/day (max. 48)}$

0 Repeat for all classes used. The maximum number of  
0 classes is 30.

0 Basic OMs on Trunk Groups (Double Precision)

0  $R = \text{Number of CLLI's} * 36 \text{ bytes} * \text{number of}$   
0  $\text{dumps/day (max. 48)}$

0 Repeat for all classes used.

0 MDC OMs (Single Precision)

0  $S = \text{Number of Customer Groups} * 175 \text{ bytes} *$   
0  $\text{number of dumps/day (max. 48)}$

0 MDC OM's (Double Precision)

0  $\text{Number of OM Volumes} = \frac{\text{Total OM}}{\text{volume size (in bytes)}}$   
0  $(\text{round up to the nearest even integer})$

0  $\text{OM/Volume} = \text{Total OM}$

0 RELEASE 28.01  
0 93 12 03  
0

0 \_\_\_\_\_ + 2,148,352 bytes  
0 No. OM Volumes (overhead)

0 The minimum volume size for OM is 2,672,640 bytes. The  
0 maximum volume size for OM is 67,108,864. The recommended  
0 minimum of OM volumes is two. The maximum numbers of  
0 volumes is 24.

0 Journal file Volume

0 The Journal File (JF) subsystem provides a means of re-  
0 cording Data Modification Orders (DMOs) allowing their  
0 addition to the office image on respective disk drives  
0 after an office reload.

0 In a two DDU office, the expected worst case number of  
0 days retention for DDU:00 is seven days. DDU:01 has the  
0 image taken at the time the office was last booted in.  
0 If the image is older than 61 days, the following options  
0 are possible:

- 0 1) DMOs that are older than 61 days are only stored on  
0 magnetic tape, not disk. The number of days re-  
0 tention is 61 days for DDU:01.
- 0 2) The DMOs that are older than 61 days are stored on  
0 DDU. The number of days retention is optional up to  
0 as much as six months to one year.

0 In a three DDU office, the expected worst case number of  
0 days retention for DDU:00 & 01 is 14 days. For DDU:02  
0 the number of days retention is the same as for DDU:01 in  
0 a two DDU office (see above).

0 RELEASE 28.01  
0 93 12 03

0 JF Volume

0 Total JF = No. of DMOs \* 512 bytes \* factor  
0 1.3 \* no. of days retention

0 Duplicate the PM loads on two DDUs on separate IOC's.  
0 Minimum PM volume size is 2,672,640 bytes.

0 Non-Resident Software Volume

0 All Non-Resident software is supplied to the TELCO on a  
0 tape. Thus, volume space on a DDU is not required.

0 Batch Data Modification Order Volume

0 Externally created Data Modification Orders (DMOs) may be  
0 bulk loaded into the system. DMOs can be written to DDUs  
0 either from magnetic tape or through a communication link  
0 with remote batch input terminal.

0 Batch DMO Volume = No. of DMOs \_\_\_\_ \* 128 \* 1.3

0 The suggested minimum is 250 DMOs. If this feature is  
0 used, then the recommended volume size is 2,672,640  
0 bytes.

0

0

0

0 RELEASE 28.01  
0 93 12 03  
0

0 Scan Log Volume Size (Log Analyzer)

0 Scan Log is a tool that can be used to analyze log mes-  
0 sages. A recommended low value is 5,242,880 bytes. At  
0 the operating company's option this can go up to a vol-  
0 ume. (Maximum volume size is 2,672,640 bytes.)

0 Scratch Area Volume Size

0 Allocate the unused area on each DDU as a scratch area.  
0 Size the scratch area on each DDU into approximately  
0 2,097,152 or 3,145,728 byte volumes.

0 Note: A scratch area volume name must be  
0 between one to four characters in  
0 order to be usable by DIRP in an  
0 emergency situation.

0 Killer Trunk Reports To DIRP

0 Determine the required DDU storage requirements for  
0 Killer Trunk (KT) Reports using the following formula:

0 
$$\text{KT Storage} = N * (36 \text{ bytes} + (12 \text{ bytes} * M) +$$
  
0 
$$20 \text{ bytes}$$

0 Where: N = Number of reports generated per day  
0 M = Number of MDC trunk members to test

0 Multiply the total bytes required by the number of days  
0 retention.

0 
$$\text{Total KT} = \text{KT Storage} * 1.3 * \text{number of days}$$
  
0 
$$\text{retention}$$
  
0 
$$(\text{round up to the nearest multiple}$$
  
0 
$$\text{of } 524,288)$$

0 
$$\text{Number of KT Volumes} = \frac{\text{Total KT}}{\text{volume size (in bytes)}}$$
  
0 (round up to the  
0 nearest even integer)

RELEASE 28.01  
93 12 03

$$\text{KT per Volume} = \frac{\text{Total KT}}{\text{No. KT Volumes}} \div 2,672,640 \text{ bytes}$$

The minimum KT per volume is 2,672,640 records or bytes.

#### Automatic Trunk Testing Reports To DIRP

Determine the required DDU storage for Automatic Trunk Test Reports using the following formula:

$$\text{ATT Storage} = 240 \text{ bytes} + (P * 70 \text{ bytes}) * Q + 20 \text{ bytes} + (R * 10 \text{ bytes})$$

Where:

P = No. of MDC trunk group members / trunk grp

Q = No. of MDC trunk groups

R = Number of restarts

Multiply the total bytes required by the number of days retention.

$$\text{Total ATT} = \text{Storage ATT} * 1.3 * \text{number of days retention} \\ \text{(round up to the nearest multiple of 524,288)}$$

$$\text{Number of ATT Volumes} = \frac{\text{Total ATT}}{\text{volume size (in bytes)}} \\ \text{(round up to the nearest even integer)}$$

$$\text{ATT / Volume} = \frac{\text{Total ATT}}{\text{No. ATT Volumes}} \div 2,672,640 \text{ bytes}$$

The minimum volume size for ATT and KT is 2,672,640 bytes. The maximum volume size for ATT and KT is 67,108,864. The recommended minimum of ATT and KT volumes is two. The maximum numbers of volumes is 24.

#### Summary

Total all DDU requirements and divide by total usable volume space (66 or 154 Mbyte) to determine required number of DDUs.

0 93 12 03

0 3.3.6 Distributed Processing Peripheral (DPP) AMATPS Application

0 3.3.7 Distributed Processing Peripheral (DPP) AMATPS Application

0 (a) General Description

0 The Distributed Processor Peripheral (DPP) allows remote polling  
0 of AMA data information as specified by Automatic Message Ac-  
0 counting Teleprocessing System (AMATPS) requirements. AMA data  
0 is collected and stored on the DPP's internal Disk Drive Units  
0 for forwarding, upon request, to a host collector. Disk sizes  
0 available are 140, 380, and 760 MByte 5-1/4" Winchester. (NOTE:  
0 the 760 MByte requires a minimum of BCS-30.) Currently, AMATPS  
0 is the only application of the DPP, with only one DPP unit being  
0 provisioned per office.

0 The 56K/Compression DPP introduces the implementation of Firmware  
0 Data Compression Feature (FDCF) for Automatic Message Accounting  
0 Transmitter (AMAT). FDCF will be added to the Communications  
0 Processor (CP) NT6M94BA pack and will not be a part of the BCS  
0 software release. The 56K/Compression feature is compatible with  
0 BCS-29 and higher DMS-100 offices that are equipped with the  
0 NTXF14AA feature package. This feature will implement the AT&T  
0 LZW algorithm to achieve a nominal compression ratio of 2.8:1.  
0 This is equivalent to polling non-compressed data at 27K baud  
0 over dial up phone lines. The host collector must be capable of  
0 receiving compressed data and expanding that data. The data is  
0 stored at the DPP disk and collector end in a non-compressed  
0 form. Standard disk sizes available are the 140MB, 380MB and  
0 760MB. Existing DPP's can be field upgraded to support  
0 56K/Compression.

0 The DPP is provided in a redundant configuration. The redundant  
0 DPP is a duplicated unit equipped with cross-over circuitry to  
0 ensure continuous operation in the event of a component failure.  
0 Interface to the DMS-100F is via NT1X68AC Mag Tape Controller  
0 Cards for AMA records and NT1X67BC/BD I/O Cards for connection to  
0 the MAP. The serial I/O port handles maintenance commands to the  
0 DPP, maintenance responses from the DPP, log messages from the  
0 DPP and down load capabilities. Communications between the DPP  
0 and the MAP utilizes the DMS MMI protocol. A second serial I/O  
0 port is required to provide redundant capabilities. The config-  
0 uration of the controllers is such that each controller is lo-  
0 cated on a different IOC for reliability.

RELEASE 28.01  
93 12 03

The DPP utilizes a modem interface for transmission of data to the host collector at speeds up to 56K bits per second. The 56 Kbps polling option is standard with the 760 MByte Disk, offered as an option to the 380 MByte Disk, but not available to the 140 MByte Disk. The 56K/Compression option is polled at a maximum rate of 9.6K baud via RS-232 interface from AMAT to Modem. DPP's equipped with compression hardware maybe polled at higher speeds (56K) when compression feature is turned off. The 56K feature requires a V.35 interface from AMAT to the modem. Teleprocessing is performed using the Bellcore BX.25 protocol.

The 140, 380, and 760 MByte Disk Drives are now provisionable to the DPP in a U.L. compliant chassis under a single Product Engineering Code (PEC) (NT8X48AD).

None

(c) Provisioning Considerations

( i) Distributed Processing Peripheral

The available disk call record capacity for each different DPP type, with call records in the AMATPS format, are as follows:

| DPP SIZE         | DISK CALL RECORD CAPACITY |              |
|------------------|---------------------------|--------------|
|                  | AMA RECORDS               | AMA STORAGE  |
| 72 MByte         | 464,152 AMA               | 28.8 MBytes  |
| 140 MByte        | 939,848 AMA               | 58.3 MBytes  |
| 380 MByte        | 2,603,328 AMA             | 161.4 MBytes |
| w/o 56K polling  |                           |              |
| 380 MByte        | 3,341,520 AMA             | 207.1 MBytes |
| with 56K polling |                           |              |
| 760 MByte        | 6,336,200 AMA             | 392.7 MBytes |

Note: These figures represent 66% of actual maximum storage values. DPP warning threshold alarms will be present as these values are approached.

0  
0 RELEASE 28.01  
0 93 12 03

0 Determine the required disk size (140, 380, or 760) by  
0 using the formula:

0 No. of AMA HD calls \* No. of Days Retention =  
0 No. of AMA Records

0 Multiplying the number of AMA records by 65 will express  
0 the AMA storage in terms of bytes.

0 ( ii) All new DPP offices will be supplied in a U.L. compliant  
0 chassis under a single PEC (NT8X48AD) in which the  
0 140,380, or 760 MByte Disk drives are now provisionable.

0 Existing DPP offices that are retrofit with any larger  
0 disk drive, or faster polling option will utilize the PEC  
0 NT8X48AB.

0 A Product Change Kit (PC Kit), NT8X48AC, will be provi-  
0 sioned with BCS20 upgrades for existing NT8X48AA and  
0 NT8X48BA DPP units. This PC Kit contains Designation La-  
0 bels converting the DPP to the NT8X48AB PEC.

Table 36.1b: PEC Quantity per DPP Application

0 RELEASE 28.01

0 93 12 03

0 Note - Existing NT6M72AC and NT6M72AD CP will work with the 140  
0 MByte Disk, but will not work with the 380 MByte Disk.

0 - Existing 72 MByte Disk offices which are upgrading to a  
0 140 MByte Disk will not remove the existing NT6M66AC CP.

0 \* - Only apply PC Kit NT8X48AC to existing NT8X48AA and  
0 NT8X48BA DPPs. Offices containing the NT8X48AB DPP or  
0 the NT8X48AD DPP do not require PC Kit NT8X48AC.

0 The descriptions of the PECs mentioned above are as fol-  
0 lows:

0 NT6M48AA 56K Crossover CP  
0 NT6M54AL 56K Mounting Panel  
0 NT6M63CH EPROM (BCS-25)  
0 NT6M63CJ EPROM 380/760 56K CP (BCS-29)  
0 NT6M63CL EPROM (56K BCS21-28 or non-56K BCS29)  
0 NT6M66AC Disk Interface CP  
0 NT6M66AH Disk Interface CP  
0 NT6M66AL Disk Interface CP  
0 NT6M66BA Disk Interface 380/760 CP  
0 NT6M72AC Disk II Crossover CP  
0 NT6M72AD Disk II Crossover CP  
0 NT6M72AE Disk II Crossover CP  
0 NT6M72BA 140 MB Disk Unit  
0 NT6M72DA 380 MB Disk Unit  
0 NT6M72EA 760 MB Disk Unit  
0 NT6M73AJ 56K Crossover Interface Cable Assembly  
0 NT6M73AK 56K Crossover Interface Cable Assembly  
0 NT6M85CA 56K Crossover Interface Cable Assembly  
0 NT6M93AA Disk Crossover CP  
0 NT6M94AA 56K Interface CP  
0 NT8X48AC DPP Product Change Kit  
0 NT8X48AD DPP U.L. Chassis

0 ( iv) A DPP unit may be equipped in the same frame that has an  
0 8" DDU Unit provided, or a Remote Oscillator Shelf pro-  
0 vided, or any equipment provisioned on an IOE Frame when  
0 no more than four (4) Battery Return (BR) connections are  
0 required on FSP TB1 terminal block.

0 | A B | A B A | | A B A |  
0 -48V Battery Return SW PWR

0 TB1 Terminal Block

0 The 380 MB DPP Disks require a minimum of BCS-25.

0 The 760MB Disk and the 56Kbps Polling option are planned  
0 to be verified in BCS 29 and Generally Available with BCS  
0 30.

0 The 56Kbps Polling option is available only on 380 & 760  
0 MB Disk DPP offices.

0 The 56K/Compression option is available on the 140 MByte,  
0 380 Mbyte, and 760 MByte DPP offices. This data com-  
0 pression feature is designed to be run at a polling rate  
0 of 9.6K baud. Significantly faster data cannot be main-  
0 tained and still achieve the desired compression time.

- 0 ( v) The Compression option requires a modem capable of up to  
0 9.6K and RS-232 must be used to interface the AMAT and  
0 the modem. The Automatic Message Accounting Transmitter  
0 (AMAT) must be configured properly for the selected  
0 interface.

0 Compressing AMATs will be able to work properly with non  
0 compression type collectors. Non compression type collec-  
0 tors will be able to poll data in non compressed mode  
0 only. To be able to poll in compressed mode, the collec-  
0 tor must conform to the AT&T LZW data compression spec-  
0 ifications.

- 0 ( vi) The following figure outlines the Product Engineering  
0 Code of PC Kits required to upgrade an existing DPP to  
0 56K/Compression polling. Each PEC stock list contains  
0 all the hardware required to upgrade DPP as shown.

Figure 36.6:  
DPP UPGRADE TO COMPRESSION CONFIGURATIONS  
=====

- ( vii) Cook Mag Tape Controller CP (NT1X68AC)  
Provide two (2) per each equipped NT8X48AD/AB. These two cards should be located on separate IOC modules.
- (viii) I/O Terminal Controller CP (NT1X67BC/BD)

0 RELEASE 28.01  
0 93 12 03

0 Provide two (2) ports per each equipped DPP. These two  
0 ports should be located on separate IOC modules.

0 ( ix) Power Control and Alarm CP (NT0X36AB)

0 Provide one (1) for each IOE/MTC frame with a DPP.

0 ( x) Scan Detector Circuit (NT0X10AA)

0 For offices with DPPs and BCS-23 or greater one dedicated  
0 scan circuit must be provided for each DPP. Provide as  
0 required.

0 ( xi) Provide 1200, 2400, 4800 and 9600 baud rate modems as re-  
0 quired for polling. The near and far end modems must be  
0 compatible.

0 NOTE: The Customer is responsible for modem compatibility  
0 with any automatic call back unit that they provide  
0 for DPP polling. NT does not provide an automatic  
0 call back unit for DPP polling.

0 ( xii) Provision one (1) NT8M99AB Cable Assembly per DPP for  
0 CANADIAN applications. This 50 foot (15.2 metre) null  
0 modem cable, equipped with a standard, female DB25 con-  
0 nector, is used to connect an Emergency Access Terminal  
0 (EAT) for emergency maintenance purposes. The customer  
0 is to supply a suitable terminal equipped with a keyboard  
0 and a printer for recording key input and response mes-  
0 sages; the Teletype Model 53 is recommended. Video dis-  
0 play terminals without print capability are not  
0 recommended.

0 For U.S. applications, provide one (1) NT8M99AB Cable As-  
0 sembly per customer request to connect an EAT for emer-  
0 gency maintenance purposes.

0 (xiii) The DPP and interface box mount together as one unit us-  
0 ing 26 inch mounting brackets provided with the DPP. It  
0 is designed to mount in an IOE/MTC frame, position 18 or  
0 51 using 28 inches of vertical space.

0 ( xiv) SOFTWARE PACKAGES

0 Software package NTXF14AA is required for either the  
0 56Kbps or the 760MB Disk.

0  
0 RELEASE 28.01  
0 93 12 03

0 DPP will require package NTX243AA for all applications

0 Also required is one (1) or both of the following pack-  
0 ages:

0 NTX098AA AT&T CAMA Format  
0 NTX159AA AT&T LAMA Format

0 RELEASE 28.01  
0 93 12 03

0 ( xv) AC Mounting Plate (NT0X07AU)

0 Provide one (1) for each equipped NT8X48AB. This plate  
0 is required to mount the duplex outlets providing commer-  
0 cial AC power to the DPP clocks. The commercial AC  
0 source provides a steady sixty cycle source to the CPP  
0 internal oscillator for accuracy.

0 The requirement for commercial AC input into the DPP is  
0 not mandatory. The crystal oscillator internal to the  
0 DPP provides Time-of-Day stamping for log messages, etc.  
0 and does not provide synchronization. The crystal  
0 oscillator has a maximum drift range of -6.06 to +11.22  
0 seconds per day without the AC supply. The Telco should  
0 specify their preference of supplying an AC source to the  
0 DPP Time-of-Day clock or settling for the on board clock  
0 without the AC source.

0 ( xvi) In addition to the battery supply, a commercial 'AC'  
0 (non-generator) supply may be optionally provisioned to  
0 drive the DPP clocks. Building Studies Engineering will  
0 provide two ED3516-30 Group 30 duplex outlets for this  
0 purpose. The outlet will be placed in the MIS frame  
0 nearest the IOE using a NT0X07AU mounting plate. Building  
0 Studies shall run TEC 90 cable from a customer supplied  
0 commercial 'AC' source to the duplex outlet. Two 'AC'  
0 circuits are required per DPP. This AC supply is op-  
0 tional based on Telco requirements.

0 (xvii) Sparing

0 Spares for the DPP are ordered in Kits and Circuit Packs  
0 based on size of Disk equipped, 56K/Compression features  
0 and BCS level of the office.

0 NT6M95AK - Spares Kit Minimum (does not include Disk  
0 Drive)

0 NT6M95AL - Spares Kit Maximum (does not include Disk  
0 Drive)

0 Individual Circuit Packs must be ordered in addition to  
0 the Spares Kits. These Individual Circuit Packs are pro-  
0 visioned per standard algorithms.

0 Stocklists for the spares kits are as follows:

0  
0 RELEASE 28.01  
0 93 12 03

0 NT6M95AK (QTY 1 each)

0 NT6M96AA Fuse Kit  
0 NT6M65AA Error Control II CP  
0 NT6M70AC Data Stream Interface CP  
0 NT6M84BA Power/Alarm Communication CP

0 NT6M95AL (QTY 1 each)

0 NT6M95AK Minimum Spare Parts Kit  
0 NT6M60BA Quad SIO CP (4 MHZ)  
0 NT6M62BA CPU CP  
0 NT6M609AB Error Control Jumper II CP  
0 NT6M64AA Expanded Memory CP (128K DRAM)  
0 NT6M68AA Bus Terminator CP  
0 NT6M71AB Power Supply ASSY  
0 - Also includes a spare 48V fan and  
0 assorted LEDs.

0 For only information purposes, the Spares Kits for the  
0 NT8X48AA & BA are detailed as follows.

0 Note - For new DPP (NT8X48AB/AD) units, the NT6M95AA-AF  
0 Spare Kits are not orderable.

0 Spares Provisioning:

0 NT6M95AA A0325840 Spares kit min w/72MB disk assembly(NT8X48AA)  
0 NT6M95AB A0325841 Spares kit min w/o disk assembly (NT8X48AA)  
0 NT6M95AC A0325842 Spares kit max w/72MB disk assembly(NT8X48AA)  
0 NT6M95AD A0325843 Spares kit max w/o disk assembly (NT8X48AA)  
0 NT6M95AE A0328608 Spares kit min w/140MB disk assembly (NT8X48BA)  
0 NT6M95AF A0328609 Spares kit max w/140MB disk assembly (NT8X48BA)

0 RELEASE 28.01  
0 93 12 03

0 (xviii) DPP Disk Sizing

0 There are two (2) types of capacity usage available (by  
0 selection of PM load) as follows;

0 Method 1

0 \* As a threshold of 70% total capacity is reached, a  
0 minor alarm indicating the fill level is generated.

0 \* The disk subsystem will begin to write over the pres-  
0 ently stored secondary (polled) data with addi-  
0 tionally collected

0 primary (unpolled) AMA. This operation will continue  
0 until all the secondary (unpolled) data has been  
0 overwritten.

0 \* If no polling takes place, the disks continue to fill  
0 to 90% capacity, at which point a major alarm will be  
0 generated.

0 \* Finally, at 100% capacity, one disk is put off-line  
0 and the other disk is cleared of data, in preparation  
0 for storing data in a non-redundant mode.

0 Method 2

0 \* As a threshold of 70% total capacity is reached, a  
0 minor alarm indicating the fill level is generated.

0 \* The disk subsystem will continue to fill with primary  
0 and secondary data beyond 70% to a maximum of 90%.

0 \* At 90% total capacity a major alarm is generated in-  
0 dicating the fill level reached. The disk subsystem  
0 will begin to overwrite the oldest secondary (polled)  
0 data with new primary (unpolled) AMA data. This op-  
0 eration will continue until all the secondary data  
0 has been overwritten.

0 \* Finally, at 100% capacity, one disk is put off-line  
0 and the other disk is cleared of data, in preparation  
0 for storing data in a non-redundant mode.

0  
0 RELEASE 28.01  
0 93 12 03

0 This would be an unusual situation since large traffic generating  
0 offices are assumed to be polled every hour, thus preventing data  
0 from being overwritten.

0 Storage capacity of the DPP is shown below:

| 0 | DPP      | Total storage(bytes) | Total storage  |
|---|----------|----------------------|----------------|
| 0 | MODEL    |                      | (call records) |
| 0 | 760Mbyte | 366,000,000 at 70%   | 4,874,000      |
| 0 |          | 470,000,000 at 90%   | 6,270,000      |
| 0 |          | 523,000,000 at 100%  | 6,969,000      |
| 0 | 380MByte | 193,000,000 at 70%   | 2,570,000      |
| 0 | w/ 56k   | 248,000,000 at 90%   | 3,310,000      |
| 0 |          | 276,000,000 at 100%  | 3,600,000      |
| 0 | 380MByte | 150,000,000 at 70%   | 2,000,000      |
| 0 | w/o 56k  | 193,500,000 at 90%   | 2,579,000      |
| 0 |          | 215,000,000 at 100%  | 2,866,000      |
| 0 | 140MByte | 64,000,000 at 70%    | 850,000        |
| 0 | w/ 56k   | 82,500,000 at 90%    | 1,100,000      |
| 0 |          | 91,500,000 at 100%   | 1,220,000      |
| 0 | 140MByte | 54,200,000 at 70%    | 722,000        |
| 0 | w/o 56k  | 69,750,000 at 90%    | 933,000        |
| 0 |          | 78,000,000 at 100%   | 1,037,000      |
| 0 | 72MByte  | 26,800,000 at 70%    | 357,000        |
| 0 |          | 34,500,000 at 90%    | 462,000        |
| 0 |          | 38,600,000 at 100%   | 514,000        |

0 One call record equals 75 bytes. The storage capacity will in-  
0 crease with a corresponding reduction in the number of bytes per  
0 record.0 The average Bytes per call record is determined after removing  
0 the 12 Byte expansion field (containing the recording office type  
0 and ID) which is not stored on disk.

0 RELEASE 28.01  
0 93 12 03

0 (xix) 56 Kbps Link Transfer Rate

0 The 56 Kbps link that is associated with AMATPS has maxi-  
0 mum baud rate of 25,200,000 bytes per hour (7000 bytes  
0 per sec X3600 seconds). An associated overhead of 20% is  
0 attributed to X.25 link protocol for the communications  
0 between the HOC (Host Office Collector) and the DMS of-  
0 fice being polled. The effective polling rate of the 56  
0 Kbps link is then reduced to 20,000,000 bytes per hour or  
0 expressed in terms of call records would equate to  
0 268,800 call records per hour. (rated at 75 bytes per  
0 call)

0 For comparison of various link speeds the following chart  
0 will present the effective throughput utilizing X.25 pro-  
0 tocol:

| 0 | LINK SPEED               | RECORDS PER HOUR |
|---|--------------------------|------------------|
| 0 | 9600 bps w/o compression | 46,000           |
| 0 | 9600 bps w/ compression  | 129,000          |
| 0 | 19,200 bps               | 92,000           |
| 0 | 56,000 bps               | 268,800          |

0 Retention period

0 The following example office illustrates the retention  
0 period of the 760 Mbyte DPP:

| 0 Office Data                | Retention Period |            |
|------------------------------|------------------|------------|
|                              | One disk         | Two disk   |
| 0 Polled data (70% level)    | 5.85 days*       | N.A.       |
| 0 Unpolled data (100% level) | 8.37 days        | 16.74 days |

0 \*Includes up to one day of unpolled data

0 Given :

- 0 a. 100,000 HDBH records
- 0 b. 75 (average) bytes for all call records
- 0 c. HDBH is considered 12% of the days activity

0

0 RELEASE 28.01  
0 93 12 03

0  
0 (100,000 x 75)  
0 MBytes per day = ----- = 62.5 MByted/day  
0 (1,000,000 x 12%)

0 For a 760 MByte Disk DPP,

0 at 70% AMA capacity

0 Retention period = 366 MBytes / 62.5 MBytes per day

0 = 5.85 days

0 at 100% AMA capacity

0 Retention period = 523 MBytes / 62.5 MBytes per day

0 = 8.37 days

0 The two disk figure is shown only for illustration pur-  
0 poses. The recommendation would be to utilize the DPP in  
0 a redundant mode in order for duplicate records to be  
0 maintained.

0 The average Bytes per call record is determined after re-  
0 moving the 12 Byte expansion field (containing the re-  
0 cording office type and ID) which is not stored on disk.

0 ( xx) Enhanced Bellcore AMA Format (EBAF)

0 While EBAF provides for new structure codes and call type  
0 codes, the other impact is in the increased size of AMA  
0 records that will be utilized. The following examples  
0 provide for a comparison of the existing and proposed  
0 changes:

0 Example 1 is a 0-minus call originating on a TOPS trunk  
0 group. The call is marked for station paid.

0 Example 2 is an MCCS call that originated on a TOPS  
0 trunk. A LIDB query is performed.

0 Example 3 is a 1+ coin call originating on a TOPS trunk  
0 group, rated by the on-line rating service and all monies  
0 collected.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Example 4 is a 0+ call originating on a TOPS trunk group  
0 with the calling party requesting person-to-person. The  
0 call is then billed and completed.

0 Example 5 is a 0+ call originating on a TOPS trunk group  
0 that is requesting bill to third party. A query to the  
0 Billing Validation Authority (BVA) is sent and received  
0 with the call successfully completed.

0 Example 6 is a 411 that employs the use of a database and  
0 is billed as a Station Paid.

0 Example 7 is a 0+ carrier call billed to Third Party. BVA  
0 is employed for verification and the operator completes  
0 the call with the aid of TOPS InterLATA Carrier Service  
0 (TICS).

0 Example 8 is a Remote Operator Number Identification  
0 (RONI) call.

0 Example 9 is a 1+ CAMA call that is completed without op-  
0 erator intervention.

0 Example 10 is a 1+ CAMA call that is completed by the op-  
0 erator. ANI failure brought the call to position.

0  
0 CROSS REFERENCE OF RECORD SIZES

| 0 | EXAMPLE | PRE -EBAF | w/EBAF    |
|---|---------|-----------|-----------|
| 0 | Ex. 1   | 69 bytes  | 84 bytes  |
| 0 | Ex. 2   | 82 bytes  | 113 bytes |
| 0 | Ex. 3   | 75 bytes  | 94 bytes  |
| 0 | Ex. 4   | 69 bytes  | 89 bytes  |
| 0 | Ex. 5   | 82 bytes  | 103 bytes |
| 0 | Ex. 6   | 69 bytes  | 107 bytes |
| 0 | Ex. 7   | 105 bytes | 129 bytes |
| 0 | Ex. 8   | 60 bytes  | 77 bytes  |
| 0 | Ex. 9   | 69 bytes  | 60 bytes  |
| 0 | Ex. 10  | 69 bytes  | 84 bytes  |

0 The following example is to be used as an aid in comput-  
0 ing the total number of AMA records in bytes known or  
0 anticipated for the particular office in question:

0 EXAMPLE:

|   |                                            |             |
|---|--------------------------------------------|-------------|
| 0 | 1. Number of High Day Busy Hour calls with |             |
| 0 | AMA records.                               | 100,000     |
| 0 | 2. % Busy Hour Calls versus 24 Hr Total    | 12%         |
| 0 | 3. Number of bytes per AMA record          | 75          |
| 0 | 4. Number of days of retention             | 5.0         |
| 0 | 5. Total storage required(bytes)           | 312,500,000 |

0 To calculate:  $(1/2) \times 3 \times 4 =$  TOTAL STORAGE

0 \*\* If a DMS-100 Family switch already exists, a 24 hour OM  
0 class can be created to accumulate the AMAENT field. \*\*

0 93 12 03

0 3.3.8 Auxiliary Operator Services System Voice Response Directory  
0 Assistance System (AOSSVR-DAS) Interface

0 (a) General Description

0 The Directory Assistance System (DAS) will enable the Telco to  
0 automate selected portions of its Directory Assistance and Inter-  
0 cept services. Various suppliers provide this facility, conse-  
0 quently, several implementations for this service exist.

0 The AOSSVR-DAS Interface is the link between AOSS and the DAS.  
0 The interface handles messaging over the datalink.

0 The AOSSVR-DAS Interface will include a DAS Gateway Processor  
0 which will allow multiple AOSSVR offices to simultaneously con-  
0 nect to DAS.

0 (b) References

0 Chapter 3, Section 3.3 Operator Services

0 (c) Provisioning Considerations

0 ( i) AOSSVR will access this Gateway via a Multiple Protocol  
0 Controller (MPC) card, NT1X89AA which manages messaging  
0 over a BX.25 datalink. Message traffic will be distrib-  
0 uted evenly over all available NT1X89AA cards.

0 ( ii) Two datalinks may be connected to each NT1X89AA card  
0 (i.e. ports 2 and 3). Baud rate is 9600 baud per  
0 datalink. These datalinks will be point to point, thus  
0 will access only one DAS.

0 There can be a maximum of sixteen (16) datalinks per DMS  
0 switch.

0 At least two (2) NT1X89AA cards will be employed in case  
0 of failure, and are spread over at least two (2)  
0 IOCs/MDCs.

0 ( iii) The number of Multiple Protocol Controller Cards  
0 (NT1X89AA) required for AOSSVR-DAS Interface is equal to  
0  $TL/2$  (rounded up to the next highest integer) where:

0  $TL$  = the total number of X.25 datalinks required

0 RELEASE 28.01  
0 93 12 03  
0

$$= NC \times NM \times NB \times 8 \times 100/25/LS \times 2$$

$$= TOT/3600$$

0 where TOT = No. of 411 DA calls (ABSBH)  
0 + No. of intercept calls (ABSBH)  
0 + No. of 131 calls (ABSBH)  
0 + No. of HNPA DA calls (ABSBH)  
0 + No. of FNPA DA calls (ABSBH)

0 NC = the number of calls per second using  
0 the NT1X89AA card (variable)

0 NM = the number of messages per call  
0 = 4 (constant)

0 NB = the number of bytes per message  
0 = 25 (constant)

0 8 = the number of bits per byte

0 100 = 100% line occupancy

0 25 = 25% line occupancy

0 LS = line speed per X.25 datalink  
0 (assumes all links at same speed)  
0 = 9600 baud

0 2 = the redundancy factor

0 Hence, TL = NC (4 x 25 x 8 x 100/25/9600 x 2)  
0 = (NC/3) x 2 (round up to the  
0 nearest integer)

0 Note that several IOCs in an office will reduce the re-  
0 dundancy or sparing factor. The redundancy factor of 2  
0 is the worst case. For example, if you needed 4  
0 datalinks and had 5 IOCs, then one link per IOC would  
0 give adequate redundancy or sparing.

0  
0 RELEASE 28.01  
0 93 12 03

### 0 3.3.9 Automatic Dial Back Feature

#### 0 (a) General Description

0 The Automatic Dial Back feature, package NTX293AA, provides a  
0 second level of access security of dialup ports using a dual  
0 login procedure. The first login is a special DIALBACK login  
0 which requires a special DIALBACK ID and PASSWORD. The second  
0 login is the normal login currently used to gain access to the  
0 system.

0 The end user dials into a pool of answer-only intelligent modems  
0 and enters his special DIALBACK ID. The DIALBACK ID is used as a  
0 key into the software table DIALBACK where the password is held  
0 along with the directory number needed to make the return call.  
0 After receiving this password, the system disconnects the modem  
0 and places it back into the answer mode. After a short delay of  
0 at least 30 seconds to allow the originator to hang up, the sys-  
0 tem automatically dials back the originator using the DN held in  
0 the DIALBACK table. This dial back is through another intelli-  
0 gent modem located in an autodial modem pool. The originator is  
0 then required to login again. Only after this second login is  
0 the user allowed access to the DMS.

0 The modems grouped into the autodial modem pool are not dedicated  
0 to a particular remote user. When a dial-back modem is required,  
0 the system chooses an available modem from the pool.

#### 0 (b) References

0 Chapter 2 Traffic Criteria and Capacities  
0 Chapter Office Miscellaneous

#### 0 (c) Provisioning Considerations

0 ( i) All terminal controller cards used in conjunction with  
0 Automatic Dialback must be NT1X67BD. In BCS-18 offices  
0 utilizing this security feature, all terminal controllers  
0 in the office must be NT1X67BDs, therefore, a retrofit is  
0 required to replace all existing I/O terminal control-  
0 lers. In offices with BCS-19 and higher, the NTX293AA  
0 still requires the NT1X67BD, but other application may  
0 use other vintages of the NT1X67.

0 ( ii) Intelligent modems for both pools should be calculated as  
0 follows:

0 RELEASE 28.01  
0 93 12 03  
0

## 0 1) Answer Modem Pool

$$\frac{\text{Busy Hour Attempts} \times \text{Login Hold Time}}{100} = \text{CCS}$$

0 Busy Hour Attempts - Telco provided (sum  
0 of all remote  
0 locations)

0 Login Holding Time - Equal to the maximum  
0 login time as  
0 specified by the Telco  
0 (The LOGINCONTROL  
0 command with the  
0 MAXLOGINTIME option is  
0 used to specify a  
0 maximum login time. If  
0 the user has not  
0 completed the login  
0 procedure before the  
0 maximum time expires,  
0 the port is  
0 disconnected and the  
0 modem is returned to  
0 the pool).

## 0 2) Autodial Modem Pool

$$\frac{\# \text{ Busy Hour Users} \times \text{Holding Time}}{100} = \text{CCS}$$

0 Number of busy hour users provided by Telco  
0 (Sum of all remote locations)

0 Average holding time provided by the Telco  
0 (Sum of all remote locations)

0 Using the calculated CCS for each modem pool, provision  
0 the number of modems required within each pool per the  
0 traffic tables at P.001 (Table V in Section 450/2).

0 ( iii) For U.S. Applications third party modems provisioned with  
0 the DMS shall be a Case Rixon/Datatel or Universal Data  
0 Systems (UDS) products. For Canadian Applications pro-  
0 vide Case Rixon or GDC modems as required. Refer to Of-

0 RELEASE 28.01  
0 93 12 03  
0

0 fice Miscellaneous Section 450/38 for UDS and Case  
0 Rixon/Datatel products.

0 For Canadian offices with a BCS-18 load, the only intel-  
0 ligent modem compatible with the Automatic Dialback fea-  
0 ture is the General Datacom (GDC) Companion CTS212AH.

0 U.S. offices equipped with BCS-18 load must be upgraded  
0 to BCS 19 as GDC modems are not provisionable in the U.S.

0 When determining which modems will be compatible with  
0 this feature, four modem properties must be considered.

0 Hayes Cmd Set The modem should be fully compatible with  
0 the Hayes Cmd Set which provides the as it  
0 provides the Disconnect, Autodial,  
0 Autoanswer, and Modem Ready functionality  
0 defined below.

0 disconnect It should be possible to disconnect the  
0 modem by toggling the DTR line of the  
0 RS232C interface. The use of a control  
0 character sequence to disconnect is not re-  
0 commended.

0 Note: Modem disconnection will occur if  
0 the modem detects noise on the line or the  
0 physical connection between the user's  
0 modem and the DMS is broken. Modems dis-  
0 connected in this way may be hung. It will  
0 be necessary to BSY and RTS these modems  
0 before they will again be available. In  
0 some cases, these modems may be hung indef-  
0 initely. It is therefore recommended that  
0 telephone lines to which the modems are  
0 connected should not have the call-waiting  
0 feature since it produces an audible tone  
0 which the modem regards as noise.

0 autodial The modem should be capable of autodialling  
0 any number without the need for manual  
0 intervention.

0 autoanswer The ability to answer incoming calls is a  
0 necessary property. It should also be pos-  
0 sible to toggle the modem into and out of

0  
0 RELEASE 28.01  
0 93 12 03

0 autoanswer mode by using control charac-  
0 ters.

0 modem ready It should be possible to force the modem's  
0 DSR line of the RS232C interface on.

0 ( iv) Software Dependencies

0 The Automatic Dialback feature is provided in software  
0 package NTX293AA Enhanced Security Package. Also required  
0 in the office is software package NTX292AB Enhanced Secu-  
0 rity w/Password Encryption (invisible password at login)  
0 or NTX292BA Enhanced Security w/o Password Encryption.

0 RELEASE 28.01  
0 93 12 03

0 3.3.10 Cook Division Billing Media Converters II

0 (a) General Description

0 The Billing Media Converters (BMC) provide for the acquisition,  
0 storage, and forwarding of data from the DMS100F. The BMC ac-  
0 cepts billing data from the DMS100F, temporarily stores the col-  
0 lected data on hard disk, and when requested retrieves,  
0 reformats, and sends the stored data to the Host Collector.  
0 (Note: If the HOC is not a Cook BMC 'POLLSTAR' device, then an  
0 I/F Analysis must be performed to ensure BMC to HOC  
0 compatibility.)

0 The BMC is available in three general configurations:

0 1) BMCA: The Billing Media Converter for Automatic Mes-  
0 sage Accounting (BMCA) is a redundant, single user, dual  
0 shelf BMC used for Automatic Message Accounting (AMA)  
0 data to a central collection point for one entire DMS100  
0 Family office. The call record format from the DMS100F to  
0 the BMCA may be either LSSGR or NT formats using the fol-  
0 lowing communication protocols:

0 \* BISYNC  
0 \* HDLC  
0 \* HDLC Lap-B  
0 \* BX.25

0 2) BMCS: The Billing Media Converter for Station Message  
0 Detail Recording (BMCS) is a redundant, single user, dual  
0 shelf BMC used for the collection, storage, retrieval, and  
0 forwarding of Station Message Detailed Recording (SMDR)  
0 data to a central collection point for one Customer Group  
0 (CG) within a DMS100F office. The call record format be-  
0 tween the DMS100F and the BMC is SMDR using the BISYNC  
0 protocol only.

0 3) BMCD: The Billing Media Converter Deuce (BMCD) is a  
0 simplex, dual user, single shelf BMC used for the col-  
0 lection, storage, retrieval, and forwarding of Station  
0 Message Detailed Recording (SMDR) data to up to two (2)  
0 different collection points; one for each of two (2) sep-  
0 arate customer groups (CG) within a DMS100F office.

0 (b) References

0 RELEASE 28.01  
0 93 12 03  
0

0 Chapter 3, Section 3.8 Office Miscellaneous

0 (c) Provisioning Considerations

0 ( i) In all applications where a Cook Billing Processor unit  
0 is not used as the Host Collector (Cook "Pollstar"), then  
0 NT must initiate a compatibility analysis in conjunction  
0 with the Cook Electric Division to insure Host-To-BMC  
0 compatibility.

0 ( ii) 60Hz AC Clock Option

0 The BMC contains a clock for time stamping BMC log mes-  
0 sages. The clock originates from one of two sources:

- 0 1. DC powered crystal oscillator internal to the BMC, or  
0 a
- 0 2. commercial 110VAC (60Hz) signal through Cook supplied  
0 AC transformers to the BMC.

0 In offices configured for Isolated System Grounding (ISG)  
0 do not connect the clock circuit AC transformer. This  
0 connection introduces an ISG violation.

0 The 60Hz AC clock is prime when wired. If it is not  
0 used, then the internal DC clock provides the signal for  
0 the clock which generates the log message time stamps.

0 Transformers and connectors for wiring the AC clock op-  
0 tion are always provided with BMC's. The 110Vac 60Hz  
0 source must be commercial, NON-GENERATOR. The AC clock  
0 and internal DC clock circuits accuracy is approximately  
0 equal and accurate to +/- 4 seconds per day.

0 If the AC Clock option is required (in spite of the ISG  
0 violation) then provide one NT0X07AU (AC Mounting Plate).  
0 NOTE: Two AC circuits are required for a redundant BMC  
0 and one for the BMC Deuce. Cook Division supplies a kit  
0 (NT6M96AG) which includes 120-19VAC trans- formers and  
0 BMC connectors. Local cable is used between the BMC and  
0 the supplied transformers.

0 ( iii) The DMS100F must be equipped with the NTX103AA (IBN -  
0 SMDR Enhanced) software package only if SMDR data is to  
0 be collected. This package is not required for AMA.

0 RELEASE 28.01  
0 93 12 03  
0

0 office requirements for magnetic tape drives. The BMCA  
0 and BMCS units require two NT1X68 cards. The BMCD unit  
0 requires one NT1X68 card.

0 (viii) DMS To BMC Interface

0 Provide two NT1X68AC/BC IOC Cards per BMCA or BMCS or  
0 provide one NT1X68AC/BC IOC Card per BMCD. Provide two  
0 each NT0X96AA/DB (READ), NT0X96AB/DC(WRITE), and  
0 NT0X96AC/DD (CONTROL) cables to interface the IOC cards  
0 to the BMC interface box for BMCA & BMCS. Provide only  
0 one cable each for BMCD applications.

0 Interface of each BMC unit to each NT1X68, Magnetic Tape  
0 Drive controller Card is via three cables to the Inter-  
0 face Box. The BMCA/S units require two (2) each READ  
0 (NT0X96AA/DB), WRITE (NT0X96AB/DC), and CONTROL  
0 (NT0X96AC/DD) cables which must be ordered separately  
0 (length is job engineered) and must not exceed 25 feet.  
0 This must be accounted for when defining the location of  
0 the IOC shelf and the location of the BMC. The BMCD  
0 units require 1 each Read, Write, and Control cables. The  
0 BMCA/S units and the Interface Box occupy the same amount  
0 of vertical rack space as one Cook Division MagTape Drive  
0 unit, plus 2.5 inches. The BMCD and the Interface Box  
0 occupy 14.5 inches. The Interface Box is used to convert  
0 from switch board cabling to ribbon cabling. The BMC  
0 unit is powered indirectly from the PDC via the FSP.  
0 Note: The Interface Box does not require AC or DC power.

0 ( ix) Transmission to Host Collector

0 The BMC utilizes at least one (1) modem interface for  
0 transmitting data to the processing center (Host). This  
0 requirement can be fulfilled by provisioning Rixon/UDS  
0 201, 208A/B, or T212 type modems. Cook Division supplies  
0 modem cables (NT8M99AG) with every BMC. These cables are  
0 designed for standard modems; 9600 max. baud. Refer to  
0 Section 3.8 for more information on the modems.

0 The TURBO BMC's (PEC's NT8M04EE & NT8M04FE) are capable  
0 of polling speeds up to 56K baud. Where this high speed  
0 polling is required, a dedicated link between the modem  
0 at the BMC and the modem at the Host is required. Also,  
0 the cable between the DMC and the 56K modem is dependent  
0 on the modem manufacturer:

0 RELEASE 28.01  
0 93 12 03  
0

|   |                |           |
|---|----------------|-----------|
| 0 | 56K Modem Type | Cable PEC |
| 0 | UDS            | NTNX36BG  |
| 0 | GDC            | NTNX69AA  |
| 0 | AT&T           | NTNX69AD  |

0 (The length of these 56K modem cables is job engineered.)

0 CAUTION: Do Not Provide UDS modems for any BMC applica-  
0 tion that includes the Automatic Dial-Up (ADU) option.  
0 Until further notice the UDS modems will not work with  
0 the BMC ADU option only.

0 ( x) Hardcopy Output

0 The BMC utilizes a KSR printer for installation, testing,  
0 and maintenance purposes. This printer must be EIA  
0 RS-232-C and be located within 25 feet of the BMC. A re-  
0 mote KSR printer may also be used as a maintenance device  
0 utilizing a Rixon or UDS modem. The baud rate of this  
0 link must not exceed 1200 baud. A CRT may also be at-  
0 tached to this port, in which case baud rates to 9600 are  
0 acceptable. Cook Division supplies an RS-232 terminal ca-  
0 ble (NT8M99AB) with every BMC. This cable fits all  
0 standard RS-232-C terminal devices.

0 ( xi) Remoting DMS/BMC Alarms

0 The BMC offers the capability of monitoring several BMC  
0 alarm conditions through the DMS-100F alarm system. The  
0 BMC alarm signals may be implemented via the NT0X10AA,  
0 Miscellaneous Scan Detector Card. Cook Division supplies  
0 a connector kit (NT6M96AD) for the BMC side of the cable.  
0 Local cable is used between the BMC to the MDF and the  
0 MDF to the Scan Detector Card. The BMC requires six (6)  
0 scan points.

0 ( xii) The redundant BMC unit requires two (2) -48V inputs fused  
0 at 10 amps, one (1) for each BMC Processor. The BMC  
0 Deuce unit requires one (1) -48V input fuse at 10amps.

0 (xiii) BMCA / BMCS Disk Drive Sizing

0 Raw data for these calculations is provided by the Telco.

|   |                  |                   |                      |
|---|------------------|-------------------|----------------------|
| 0 | Average Busy     | Customer defined  | Capacity Requirement |
| 0 | Day Volume (in X | # of days of disk | = (in Call Records)  |
| 0 | Call Records)    | back-up           |                      |

RELEASE 28.01  
93 12 03

The Capacity Requirement translates to disk size via the following Table:

\* Select average number of Call Records per block...

(If number of Call Records/block for this office is not shown use the next higher number.)

18 20 26  
22 28  
24 30

\* Enter the Table at the left side. Find the appropriate number Records per block. Read to the right to find the Capacity Requirements next greater than or equal to the calculated value. Read down bottom of the Table to find the disk size.

| CALL RECORDS<br>PER BLOCK | 70 % CAPACITY REQUIREMENTS*<br>(in number of Call Records) |         |         |          |
|---------------------------|------------------------------------------------------------|---------|---------|----------|

Table 36.2b: Capacity Requirements per Disk Size

Capacity Requirements exceeding those shown in the Table 36.2 are beyond the current capacity of the BMC.

\*Maximum Capacity Numbers are available from Cook Division.

#### SIMPLEX/NON-REDUNDANT BMC PROVISIONING

##### COOK BMC II DEUCE (BMCD)

( xiv) The The Cook Billing Media Converter II Deuce (BMCD) is a dual user, single shelf, simplex device that stores and transmits Station Recording (SMDR) records, for up to two customer groups. The BMCD is powered from the PDC via one 10 amp fuse. This unit permits the Telco's end user to poll DMS100F SMDR data is via an IBM PC/XT/AT or compatible equipped with a synchronous interface board, standard 3780 Binary Synchronous Communications (BSC/BISYNC) protocol, and a third party PC pollable Call Accounting Software package. This NTP does not define the Customer Premise Equipment (CPE).

( xv) The BMCD features and properties are defined below:

a) BMC II/Deuce Features:

RELEASE 28.01  
93 12 03

- \* 72 or 140MB disk drive (stores 1M/2M Call record respectively)
- \* Partitioning for two Customer Groups (CGs)
- \* Simplex operation and storage
- \* User selectable disk storage per CG
- \* SMDR data collection (DMS 100)
- \* 3780 BSC protocol
- \* Two access links via dial-up lines
- \* Three level alarm (User Definable)

## b) BMC II/DEUCE Power Requirements:

Input power to the unit will be one -48Vdc input from the PDC fused at 10amps. The minimum grounding requirements will be isolated logic and frame grounds.

- ( xvi) The BMCD is capable of storing SMDR data for two Customer Groups on a single DDU. Therefore, the BMC Deuce is capable of partitioning disk storage and ensure sufficient space is available of each group.

Storage Capacity Computations: Data storage is flexible to provide growth. A storage parameter setting allows the Telco to restrict the maximum amount of disk space used by each customer group (e.g. 70% for CG1 & 30% for CG2). The storage medium is based on hard disk technology using a 72 or 140 megabyte disk drive.

The chart below depicts typical disk storage capacity given: A 48 byte average record and 18 call records per line per day. Keep in mind, the storage capacity of BMC DDUs is limited by the BMC system overhead. Therefore, Maximum Call Record Storage is as indicated in the chart below:

| DISK<br>SIZE | MAXIMUM<br>CALL RECORD<br>STORAGE | AGGREGATE<br># OF LINES | APPROXIMATE<br>DAYS OF STORAGE |
|--------------|-----------------------------------|-------------------------|--------------------------------|
| =====        | =====                             | =====                   | =====                          |
| 72           | 1M                                | 1,000                   | 55                             |
| 72           | 1M                                | 3,000                   | 18                             |
| 140          | 2M                                | 4,000                   | 28                             |
| 140          | 2M                                | 6,000                   | 18                             |

The formula for calculating the aggregate number of days of SMDR data storage follows:

0  
0 RELEASE 28.01  
0 93 12 03

0 a) Total Storage / # of Records per day = Days of Stor-  
0 age

0 1,000,000/18(1,000) = 55.55 days storage

0 1,000,000/18(3,000) = 18.51 days storage

0 2,000,000/18(4,000) = 27.77 days storage

0 2,000,000/18(6,000) = 18.51 days storage

0 b) (Total storage - % allocated to CG1)/48 = Line Capac-  
0 ity

0 For Example:

0 (1,000,000 - 70% Storage for CG#1)/48  
0 = 6250 Lines

0 NOTE: The above table is for BMCD only.

## 0 4.0 Maintenance and Administration Position (MAP) Equipment

### 0 4.1 Introduction

0 The Maintenance and Administration Position (MAP) is the primary  
0 man/machine interface between the Telco personnel and the DMS  
0 system for performing I/O functions. Hardware requirements vary  
0 with functions to be performed and a single MAP can be dedicated  
0 to more than one function. This section will describe the equip-  
0 ment associated with the MAP.

0 The Maintenance and Administrative Position consists of the fol-  
0 lowing equipment:

- 0 - CRT + keys
- 0 - Visual Display Units (VDU)
- 0 - position furniture
- 0 - Jack sets
- 0 - Voice Communication module
- 0 - printer (or teletype)
- 0 - Data set to connect to IOC if the position is remote. Data sets  
0 depend on baud rate: min. 110, max. 300 for dial access. Dedi-  
0 cated facilities dictate maximum baud rate.

0 Connection between the jacks on MAP and the DMS switch is subject  
0 to normal trunking limits.

0 Reference to the MAP is made elsewhere within the Maintenance  
0 Section (3.7) of this document.

### 0 4.2 Features

0 The features of the MAP is described in NTP 297-1001-110, Mainte-  
0 nance and Administration Position.

0 4.3 Equipment Provisioning

0 4.3.1 MAP Voice Communication Module

0 (a) General Description

0 The MAP Voice Communication Module (VCM) is the basis of the  
0 Maintenance Administration Position (MAP). The telephone set  
0 component provides the MAP operator with telephone links into and  
0 out of the DMS100F. Communication and 101-type trunks as well as  
0 CO and internal lines are handled.

0 The MAP Voice Communication Module may consist of:

- 0 - Telephone Set
- 0 - Head Sets
- 0 - Hands-free Unit
- 0 - Automatic Dialer

0 (b) References

0 None.

0 (c) Provisioning Considerations

0 ( i) The NT Logic Phones serve as the Telephone set component  
0 of the Map Voice Communication Module. These units  
0 interface the DMS System via communications trunks, 101  
0 test lines, and communications lines all of which termi-  
0 nate on the telset. They are provided only on MAP type  
0 positions used for general maintenance and trunk testing  
0 functions.

0 The communications trunks (toll office only) are used by  
0 maintenance personnel to originate calls. Two communi-  
0 cations trunks are associated with every MAP used for  
0 trunk testing functions. The communications lines (local  
0 and toll) are tie lines and normal office telephone  
0 lines.

| <u>0 LINE ASSIGNMENT</u>  | <u>DESCRIPTION</u>                                                                                                                                                                                                                     |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 Line Zero               | Assigned to the Key System's HOLD function                                                                                                                                                                                             |
| 0 Line One                | HeadSet Monitor assignment is provided for<br>0 service analysis monitors and test monitors<br>0 at the MAP, and loading the DRAM. Use the<br>0 NT5X30AA for North American jobs or the<br>0 NT5X30BA for International jobs.          |
| 0 Lines Two & Five        | 101 Test Line - Two Key Set lines are as-<br>0 signed to this function, one for incoming<br>0 traffic and the other for outgoing traffic<br>0 -- use the NT5X30AA for North American jobs<br>0 or the NT5X30BA for International jobs. |
| 0 Lines Three & Four      | Local Talk Line - Two Key Set lines are as-<br>0 signed to this function for local communi-<br>0 cations between the FSPs and the MAP.                                                                                                 |
| 0 Lines six - Twenty-Nine | These Key Set lines are available for Telco<br>0 assignments as required                                                                                                                                                               |

0 ( ii) When provisioning Logic Phones for MAP, TTP or any other  
0 application which requires the Logic Phone to interface a  
0 Headset or Portable Tape Recorder (for loading DRAM), a  
0 Logic 20 phone must be ordered which contains a Headset  
0 Jack Assembly for connection to Northern Telecom equip-  
0 ment.

0 ( iii) The following Hardware is approved for DMS100F Logic  
0 Phone Applications:

0 \* Logic 10 Phones and its associated accessories are  
0 not to be used in the US Market as the principal  
0 Logic Phone. This is due to internal changes in the  
0 Logic 10 phone, which render it incapable of being  
0 modified to accept a Headset Jack Assembly. The  
0 headset jack assembly is required for the communi-  
0 cation line labeled 'HeadSet Monitor'. The Headset  
0 Monitor line is used to interface the telephone to a  
0 Headset or Portable Tape Recorder for loading the MTM  
0 mounted Digital Recorded Announcement Machine (DRAM).

0 \*\* Check for the availability of these units prior to  
0 provisioning them. Provisioning of the REFURBRISHED  
0 Logic 20 Telset and its' accessories shall continue  
0 until supplies have been depleted.

0 Note: The Line Cord no longer comes equipped with any of  
0 the NT manufactured Logic Phones, therefore, they  
0 must be ordered separately.

0 4.3.2 Norstar Key System

0 (a) General Description

0 The NorStar Key System Unit (NKSU) is a digital key system which  
0 replaces the currently provisioned analog MAP Communication Mod-  
0 ule. The NKSU is not backwards compatible with the 1A2 Key System  
0 or the Logic 10/20 or ITT/Comdial 30 button phones. The purpose  
0 of this system is to provide a method of communications between  
0 the MAP positions as well as to the outside world via lines from  
0 this switch or another switch.

0 The NorStar is designed on a modular concept which offers plug-in  
0 modules to provide a number of features, however, only those ap-  
0 proved for the MAP application are listed below:

- 0 - 2 or 6-Port Expansion Cartridge which allows the addition of
- 0 two or six modules (either trunk or station modules).
- 0 - Trunk Module which allows the addition of three Trunk Car-
- 0 tridges (12 CO Lines).
- 0 - Station Module which increases the number of NorStar telephone
- 0 sets that can be connected to the NorStar by a factor of 16.
- 0 - Telephone Set (M7324)
- 0 - Telephone Set (M7310)
- 0 - Telephone Set (M7308)
- 0 - NorStar Trunk Module
- 0 - NorStar Station Module
- 0 - Technical Manual
- 0 - Headset

0 The NorStar Key Service Unit (KSU) consists of three  
0 provisionable modules, which are:

- 0 - 8 X 24 Main KSU Module (NT5B20DB)
- 0 - NorStar Trunk Module (NTM)
- 0 - NorStar Station Module (NSM)

RELEASE 28.01  
93 12 03

Refer to Figure 36.10 for a block diagram of the system.

UPS = Uninterruptible Power Supply (Telco Provided)

Figure 36.10 Norstar Key System Unit Block Diagram

(b) References

None.

(c) Provisioning Considerations

- ( i) The NorStar KSU may be provisioned by equipping the NTZX18AB base unit and accessories, or by providing all components separately.
- ( ii) The NorStar KSU requires an Uninterruptible Power Supply (UPS) to be provided by the customer. The A.C. outlet must be located within 4.9 feet of the NKSU.
- ( iii) Provide one NT5B20DB-93 Main KSU Module (8 X 24) to terminate up to eight (8) CO-lines and twenty-four (24) NorStar Telsets.
- ( iv) Provide either one 2-Port expansion unit (NT5B26GA-93) to permit adding up to two (2) add on modules (NTM or NSM) in any combination, or one 6-Port expansion unit (NT5B27GA-93) to permit adding up to six (6) add on modules (NTM or NSM) in any combination.

0  
0 RELEASE 28.01  
0 93 12 03

0 ( v) The NT5B32FA-93 Norstar Trunk Module (NTM) is provided to  
0 enable the NorStar KSU to terminate more CO-Lines, as the  
0 Base Unit terminates eight CO-Lines. A maximum of six  
0 add on modules may be provide per base KSU in any combi-  
0 nation of NTMs and NSMs.

0 The NTM may be thought of as a card cage which requires  
0 circuit packs to enable the desired functions.

0 Provide up to three (3) NT5B35GA-93 (Trunk Cartridge) per  
0 NTM. One Trunk Cartridge increases the CO-Line termi-  
0 nation capability of the base KSU by a factor of four  
0 (4). Provisioning a NTM with a full compliment of Trunk  
0 Cartridges increases the base NorStar KSU CO-Line termi-  
0 nating capability by a factor of 12, enabling the KSU to  
0 terminate a total of 20 CO-Lines.

0 ( vi) The NT5B50FA-93 Norstar Station Module (NSM) is used to  
0 permit an additional sixteen (16) telsets to be connected  
0 to the base unit (NT5B20DB-93). The base unit can  
0 accomodate twenty-four (24) Telsets without the addition  
0 of a NSM.

0 ( vii) The NorStar KSU mounting location in the DMS-100 Central  
0 Office (CO) is restricted to a dedicated CO Communi-  
0 cations Room (e.g. Broom Closet). It shall not be  
0 mounted in the same room with the DMS-100 Switching  
0 Equipment.

0 (viii) The NorStar KSU requires an Uninterruptable Power Supply  
0 (UPS) to be provided by the customer. The A.C. outlet  
0 must be located within 4.9 feet of the NKSU.

0 ( ix) The NorStar KSU cannot be mounted in the DMS-100 Switch  
0 Room due to inflamibility issues. It may be mounted on a  
0 wall outside the Switch Room but still convenient to MAP  
0 location. NKSU should be located at least 4m (13.1 ft.)  
0 from equipment such as copiers, electrical motors, and  
0 other equipment that can produce electromagnetic, radio  
0 frequency and electrostatic interference.

0 4.3.3 Data Sets (Phones)0 (a) General Description

0 This section provides the provisioning information for the Data  
0 Phones.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) When data phones are required, provision either the Rixon  
0 Logic - 6 or the Unity I telephone set interfacing to  
0 the Rixon T212A or Auto Executive 212 modem as shown in  
0 Figure 36.11. The Logic 6 is a six button, five line set  
0 and the Unity I is a single line telephone set.

0 \* - This is the Recommended Configuration

0 Figure 36.11: Telephone Sets vs Rixon Modem

0 ( ii) The following telephone sets are approved for Canadian  
0 use. These phones are sourced from the Telecom Terminals  
0 Division (TTD) in London, Ontario:

0 4.3.4 Furniture

0 (a) General Description

0 Furniture is provided as an option. It is recommended for all  
0 non-portable positions. Emergency lighting is provided on the  
0 furniture as an option and is recommended for all general maintenance positions.

0 The MAP furniture configurations are based on three principal support sections (panels):

- 0 - A corner panel supporting a corner work surface on which the  
0 VDU and keyboard are located.
- 0 - A 62 in. (1.55 m) high modular panel that carries storage  
0 shelves, work surface with storage drawers, and tackboard.
- 0 - A 48 in. (1.2 m) high module panel that carries a work surface  
0 and counterpane (interaction panel).

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) The CENTER section consists of a terminal surface on  
0 which the VDU is seated. Units are available with test  
0 jacks (NT0X57AB) and without test jacks (NT0X57AA). Each  
0 position used for trunk testing must be equipped with  
0 test jacks for connecting portable test sets to test  
0 trunks.

0 ( ii) The book SHELF section (NT0X57AD), with shelf lighting  
0 mounted under the shelf. Below the shelf is a work surface with two drawers underneath. The work surface is adjustable in height.

0 ( iii) The COUNTER section (NT0X57AC) height is also adjustable. Shelf lighting is provided above the counter. The communications module or Logic 10/20 sits on the work surface of either the SHELF section or the COUNTER section.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 ( iv) Provide one (1) A0500 (MAP support leg) per NT0X57AD/AC  
0 for stand alone applications in which MAP Center Section  
0 NT0X57AA/AB is not provided.

0 ( v) A connectorized Test Trunk Jack Box (NT0X57AF) is avail-  
0 able for furniture not provided by NTL. One unit should  
0 be provided per position.

0 4.3.5 Other Hardware Requirements

0 (a) General Description

0 Additional hardware requirements required for the MAP is de-  
0 scribed in this section.

0 (b) References

0 NTP 297-1001-110 DMS-100 Family Maintenance and  
0 Administration Position  
0 Chapter 3, Section 3.9 DMS Supernode and Network Subsystems

0 (c) Provisioning Considerations

0 ( i) The following VDUs and Teleprinters are recommended for  
0 use with DMS.

| 0 | TYPE | MAKE/MODEL           | BAUD RATE   | EMI |
|---|------|----------------------|-------------|-----|
| 0 | VDU  | Digital Equip. Corp. | 1200        | No  |
| 0 |      | HP700/44             | up to 38.4K |     |
| 0 |      | Visual 102           | 1200        | Yes |
| 0 |      | Vision 1000          | 1200        | Yes |
| 0 |      | ColorTrend C+220R    | 300-19.2K   |     |
| 0 | T-P  | DEC                  | 1200/300    |     |
| 0 |      | LA120 R0/,S/R        |             |     |
| 0 |      | LA120 DA             |             | Yes |
| 0 |      | Datacom 1200 S/R     | 1200/300    |     |
| 0 |      | Texas Instruments    | 1200/300    |     |
| 0 |      | OMNI 810 R/O         |             |     |
| 0 |      | OMNI 820 S/R         |             | Yes |

0 Hewlett Packard Model HP700/44 VDU

0 The Hewlett Packard Model HP700/44 VDU is functionally  
0 compatible for EIA or 20mA Current Loop operation with  
0 the DMS-100 and DMS-Supernode.

0 The HP700/44 is functionally a direct replacement for the  
0 HP700/22, which has been MD (manufacture discontinued),  
0 as well as the DEC VT-220, VT-100, and VT-52 VDUs. The  
0 interface connectors are identical, which allows existing  
0 cable PECs to be used without modifications. This unit  
0 has been tested and approved for the following applica-  
0 tions:

- 0 - DMS-100 MAP Terminal in both EIA and Current Loop
- 0 Configurations
- 0 - DMS-Supernode RTIF Terminal in both EIA and Current
- 0 Loop Configurations.

0 The DMS100 hardware required to support this unit is de-  
0 pendent upon the application as follows:

0 MAP Terminal - NT1X67 Cards are required on the IOC or  
0 CMC

0 RTIF Terminal - NT9X26 RTIF I/F PCB

0 Power Source - NT0X87AA Inverter Unit (Canada only)

0 - Lamarche Inv A31-500-48V-A6 (U.S. only)

0 Provide the HP700/44 Series VDUs as required by the Telco  
0 for use as MAP terminal, portable MAP terminal, or Super-  
0 node RTIF Terminal.

0 The HP700/44 is the preferred terminal for use with the  
0 current loop interfaces of standard DMS I/O ports (i.e.  
0 NT1X67BC and NT9X26AB RTIF local port). The DEC VT320 is  
0 recommended only as a second choice or backup terminal  
0 for use with the NT1X67BC. It is not recommended for use  
0 with the NT9X26AB.

0 This unit may operate in an EIA RS-232C or a 20mA Cur-  
0 rent Loop configuration. If used as an EIA device the  
0 VDU must be within 50-feet of IOC. If use in a 20mA Cur-  
0 rent Loop configuration then the max distance from the  
0 IOC or RTIF Computing Module is 1200-feet. For more in-  
0 formation on the RTIF, refer to Section 3.9.

0 RELEASE 28.01  
0 93 12 03  
0

0 ( iii) Printers which are local are to be equipped with a cur-  
0 rent loop interface. Printers which are remote are to be  
0 equipped with EIA interface and operated through a data  
0 set.

0 ( iv) Terminal Controllers are equipped with two types of  
0 transmission interfaces. Type selected for use will de-  
0 pend on the cabling distance between the I/O device and  
0 the IOC as follows:

| 0 | CABLING  |                    | MODEM    |
|---|----------|--------------------|----------|
| 0 | DISTANCE | INTERFACE TYPE     | REQUIRED |
| 0 | (feet)   |                    |          |
| 0 | < 50     | EIA - RS 232       | No       |
| 0 | <= 1200  | EIA - Current Loop | No       |
| 0 | > 1200   | EIA - RS 232       | Yes      |

0 Modems are arranged for either dial-up or private line  
0 operation.

0 ( v) A modem (dataset) is required at either end of a DMS I/O  
0 data link if the cable run between the IOC and terminal  
0 device exceeds 1200 feet.

0 Modems could be provided as dedicated (DD), dial up (DU)  
0 or local (LCL).

0 Furnishing the far end modems is usually the responsibil-  
0 ity of the Telco. The DMS end is usually provided by  
0 NTL.

## 0 5.0 Engineering and Administration Data Acquisition System (EADAS)

### 0 5.1 Introduction

0 The Engineering and Administrative Data Acquisition System  
0 (EADAS) is an AT&T minicomputer based Operational Support System  
0 that provides the Telco with centralized data collection and sur-  
0veillance capabilities for many switching systems. A switching  
0 system is connected to EADAS via one (1) dedicated, synchronous  
0 2400 bit/second data link. Communication over this data link uti-  
0 lizes the BX.25 Protocol. Refer to Figure 36.12.

0 Figure 36.12 EADAS

0 The Engineering and Administrative Data Acquisition System Net-  
0 work Management (EADAS/NM) is a software feature that provides  
0 network managers with centralized real-time surveillance and con-  
0 trol of the switching network. The EADAS/NM center interfaces to  
0 a switch via the EADAS center which, in this case, acts as a  
0 front-end concentrator for EADAS/NM. Based on data collected ev-  
0 ery 5 minutes, the EADAS/NM center can keep the switching network  
0 operating near maximum efficiency and help the network maintain  
0 network integrity during overloads or facility failures.

0  
0 RELEASE 28.01  
0 93 12 03

0 5.2 Features

0 The DMS-100F software package NTX218AA provides the interface be-  
0 tween the DMS-100F and EADAS. This includes formatting the Opera-  
0 tional Measurements (OM) information into the exact format  
0 required by EADAS and receiving polls from the EADAS minicomputer  
0 and transmitting responses back to the EADAS minicomputer.

0 The NTX455AB software package provides the interface between the  
0 DMS-100F and EADAS/NM. The EADAS/NM center sends it's command  
0 and audit request messages to the DMS-100F through the EADAS/DC  
0 center and the DMS-100F responds.

0 5.3 Equipment Provisioning

0 5.3.1 EADAS

0 (a) General Description

0 The data collected is in the form of traffic measurements from  
0 various components of a switching system providing Peg Count and  
0 usage information to the network administrators. This information  
0 is used to aid the network administrator in maintaining good  
0 telephone service to the user and to ensure that existing equip-  
0 ment is being efficiently utilized. This effort requires accurate  
0 and timely traffic measurements from the switch. EADAS provides  
0 the centralized medium for gathering switch performance informa-  
0 tion by polling the switch over the dedicated link and collecting  
0 data on 30 minute, 60 minute, and 24 hour intervals.

0 EADAS messages are sent to a switching system in the form of a  
0 poll or request for data, or in the form of a request for acti-  
0 vation when the EADAS center is instructed to do so from a EADAS  
0 Network Management center. The messages relating only to EADAS  
0 Data Collection (EADAS/DC) are:

- 0 1) 30 Minute Data Request - Sent every half-hour to re-  
0 quest the switch to send its traffic data.
- 0 2) Hourly DOR Data Request - Sent every hour to request  
0 the switch to send its Division Of Revenue (DOR) hourly  
0 totals.
- 0 3) 24 Hour Data Request - Sent every day to request the  
0 switch to send its DOR summation, service measurements  
0 and/or maintenance measurements data.
- 0 4) Time Request - Sent to request the switch to send its  
0 current time-of-day clock value to enable EADAS to de-  
0 tect gross synchronization errors.
- 0 5) EADAS Planned Down Indication - Sent to indicate to the  
0 switch that EADAS is being taken down.

0 93 12 03

0 (c) Provisioning Considerations

- 0 ( i) The DMS-100F interfaces to the EADAS minicomputer over a  
0 dedicated, synchronous 2400 bit/second data link. This is  
0 accomplished by using one (1) RS232 synchronous commu-  
0 nication link on the NT1X89AA Multi-Protocol Controller  
0 (MPC) CP (link 2 or 3). In order for the MPC to operate  
0 with EADAS, the MPC must be loaded with the BX.25 Proto-  
0 col Support and the EADAS/DC Application Support firmware  
0 which is included with the NTX273AA package.
- 0 ( ii) It is recommended by BNR that at least two (2) MPC commu-  
0 nication links be provisioned per office. These two (2)  
0 links must be located on separate IOC modules and sepa-  
0 rate power feeds. Two (2) links are recommended to allow  
0 the transfer of the active MPC link to a wired spare MPC  
0 link when an error condition occurs. The transfer to the  
0 spare MPC is done by: 1) disabling the current MPC link  
0 using the EADAS\_ENABLED parameter, 2) changing to the  
0 spare MPC link using the EADAS\_MPC\_AND\_LINK parameter,  
0 and 3) re-enabling EADAS. This transfer does NOT require  
0 a restart and may be done at any time. It is the Telco's  
0 responsibility to provide the necessary mechanism to  
0 transfer the actual EADAS minicomputer and dedicated data  
0 link to the spare MPC.
- 0 ( iii) A 2400 bit/second synchronous modem is required for data  
0 transmission to EADAS. The modem available for ordering  
0 from Northern Telecom is the Rixon 201 modem. Provision  
0 one (1) modem for the active MPC data link and one (1)  
0 for the wired spare MPC if provisioned. If the far end  
0 modem is not 201 compatible, the Telco must be responsi-  
0 ble for provid- ing the appropriate modems.

## 0 6.0 DMS Building Block - IOE Engineering

0 The purpose of this ECM is to document the DMS Building Block approach  
0 for capturing the provisioning of the IOE.

0 There are two (2) components to this ECM,  
0 IOE Customer Questions  
0 IOE Calculations

0 IOE Customer Questions - Worksheet of Telco inputs derived at the time  
0 of order capture.

0 IOE Calculations - Worksheet of provisioning algorithms driven from  
0 the results of DTE Customer Questions.

## 0 Input/Output Equipment Building Block Definition

0  
0 The Input/Output Equipment (IOE) building block method deals with  
0 a higher level of Product Engineering Code (PEC) ordering and  
0 simplifies the engineering process. The IOE provides the man to  
0 machine interface with the DMS-100F switch. The IOE essentially  
0 provides the working interface between the DMS office personnel  
0 and the DMS machine. This equipment includes the MAP, Magnetic  
0 Tape drive units, Disk Drive Units, miscellaneous I/O terminals  
0 and modems, and the I/O Controller modules which interface these

0 RELEASE 28.01  
0 93 12 03

0 with the Central Control subsystem. The I/O Controller cards are  
0 the provisionable interfaces which mount on the IOC.

0 NTZZ09AA (Input/Output Equipment Frame)

0 The NTZZ09AA contains the frame which will house all the  
0 Input/Output devices. The frame contains universal framework and  
0 is ISG compliant. The frame is equipped with the frame supervi-  
0 sory panel and cover. Optional equipment to the IOE will be de-  
0 rived from questions used to provide the required equipment.  
0 Existing rules for assignments to the IOE are still applicable.

0 NTZZ09BB (Dual Disk Drive Unit Shelf)

0 The NTZZ09BB supports up to two (2) 5.25 inch Disk Drive Units.  
0 Each NTZZ09BB contains the shelf assembly, one (1) power con-  
0 verter, one (1) designation label, cable assemblies, and other  
0 associated equipment for a fully functional dual disk drive sys-  
0 tem.

0 NTZZ09UA (228MB Disk Drive)

0 The NTZZ09UA contains a single 228.7 MByte (formatted) 5.25" hard  
0 disk drive with associated mounting hardware, for use on the Dual  
0 Disk Drive Unit Shelf.

0 NTZZ09CA/CB (Input/Output Controller Module - SuperNode)

0 The NTZZ09CA/CB contains the Input/Output Module used to house  
0 the controller cards. A maximum of 9 provisionable circuit packs  
0 can mount on the module. Each NTZZ09CA/CB includes the shelf as-  
0 sembly, Common Circuit Packs, Designation Labels, Power Convert-  
0 ers, and other associated equipment. This IOC is compatible with  
0 the SuperNode core. NTZZ09CA is replaced by NTZZ09CB.

0 NTZZ09VA/VB (Input/Output Controller Module - NT40)

0 The NTZZ09VA/VB contains the Input/Output Module used to house  
0 the controller cards. A maximum of 9 provisionable circuit packs  
0 can mount on the module. Each NTZZ09VA/VB includes the shelf as-  
0 sembly, Common Circuit Packs, Designation Labels, Power Convert-  
0 ers, and other associated equipment. This IOC is compatible with  
0 the NT40 core. NTZZ09VA is replaced by NTZZ09VB.

0 NTZZ09DA (I/O Terminal Controller Card)

0

0 RELEASE 28.01  
0 93 12 03  
0

0 The NTZZ09DA contains one (1) NT1X67BC I/O Controller Circuit  
0 Pack and designation label. The controller card provides up to  
0 four ports. Each port can operate at baud rates up to 2400 baud.  
0 All four ports can be assigned as 2400 baud ports. For special  
0 applications, a single port can exceed 2400 baud up to a maximum  
0 of 4800 baud. If a single port exceeds 2400 baud, then the total  
0 assigned baud rate for all four ports cannot exceed 4800 baud. A  
0 maximum of 9 of these controller cards can mount in an IOC  
0 (NTZZ09CA/CB or NTZZ09VA/VB).

0 NTZZ09EA (I/O Terminal Controller CP w/Automatic Dial-Back)

0 The NTZZ09EA contains one (1) NT1X67BD I/O controller circuit  
0 Pack and designation label. The controller card provides up to  
0 four ports. Each port can operate at baud rates up to 2400 baud.  
0 All four ports can be assigned as 2400 baud ports. For special  
0 applications, a single port can exceed 2400 baud up to a maximum  
0 of 4800 baud. If a single port exceeds 2400 baud, then the total  
0 assigned baud rate for all four ports cannot exceed 4800 baud.  
0 This controller card must be used for applications requiring the  
0 automatic dial back feature. This controller can also be used for  
0 all standard applications in the place of NTZZ09DA. A maximum of  
0 9 of these controller cards can mount in an IOC (NTZZ09CA/CB or  
0 NTZZ09VA/VB).

0 NT1X67FA (SMDI Interface)

0 The NT1X67FA provides one Simplified Message Desk Interface port.  
0 A maximum of one device can be served from the card, with data  
0 transmission rate variable from 110 to 1200 baud. A maximum of 9  
0 of these cards can mount on the IOC Building Block.

0 NTZZ09GA (I/O Multi-Protocol Controller)

0 The NTZZ09GA contains one (1) I/O Controller Circuit Pack and  
0 designation label. This circuit pack is provided to serve the  
0 Multi-Protocol feature. A maximum of 9 of these circuit packs  
0 can be assigned to an IOC Building Block.

0 NTZZ09HA (9 Track Tape Controller CP (COOK MTD))

0 The NTZZ09HA contains one 9 track controller circuit pack and  
0 designation label. This circuit pack is provided to serve the  
0 Cook Magnetic Tape drives equipped in the office. One of these  
0 circuits is required for each Magnetic Tape drive. A maximum of  
0 nine (9) of these circuit packs can be assigned to an IOC Build-  
0 ing Block.

0 RELEASE 28.01  
0 93 12 03  
0

0 NTZZ09JA (Disk Drive Unit Controller CP)

0 The NTZZ09JA contains one Disk Drive Unit controller Circuit Pack  
0 and designation label. This circuit pack is provided to serve  
0 one DDU and a maximum of 9 of these circuit packs can be assigned  
0 to an IOC Building Block.

0 NTZZ09KA (Enhanced I/O Multi-Protocol Controller)

0 The NTZZ09KA contains one I/O controller circuit pack and desig-  
0 nation label. This circuit pack is provided to serve the En-  
0 hanced Multi-Protocol feature. A maximum of 9 of these circuit  
0 packs can be assigned to an IOC Building Block.

0 NTZZ09LA (DPP Shelf (56Kbps))

0 The NTZZ09LA contains the common circuit packs required for the  
0 DPP unit. The high speed polling (56Kbps) hardware is always pro-  
0 vided with NTZZ09LA. The customer can choose between the 380 and  
0 760 MByte disk drives.

0 NTZZ09RA (Distributed Processing Peripheral (DPP) 380 MByte)

0 The NTZZ09RA contains the common circuit packs and two 380 MByte  
0 disk drives required for the 380 MByte DPP unit. The high speed  
0 polling (56 Kbps) hardware is always provided with NTZZ09RA. This  
0 is a Canadian only Building Block.

0 NTZZ09SA (Distributed Processing Peripheral (DPP) 760 MByte)

0 The NTZZ09SA contains the common circuit packs and two 760 MByte  
0 disk drives required for the 760 MByte DPP unit. The high speed  
0 polling (56 Kbps) hardware is always provided with NTZZ09SA. This  
0 is a Canadian only Building Block.

0 NTZZ09MA (Stratum II Shelf)

0 The NTZZ09MA provides a shelf equipped with an oscillator for use  
0 as an external clock for synchronization of the Supernode. This  
0 clock is rated at Stratum II. The shelf is equipped with redun-  
0 dant clock circuit packs. The shelf may optionally be equipped  
0 with "hot" spare circuit packs.

0 NTZZ09NA (Stratum 2.5 Shelf) (Canadian offices only)

0 The NTZZ09NA provides a shelf equipped with an oscillator for use  
0 as an external clock for synchronization of the Supernode. This

0 RELEASE 28.01  
0 93 12 03  
0

0 clock has a capability that is not stratum rated; in terms of ac-  
0 curacy, it falls between Stratum II and Stratum III. The shelf is  
0 equipped with redundant clock circuit packs. The shelf may op-  
0 tionally be equipped with "hot" spare clock circuit packs.

0 NTZZ99AG (Univ 5.25" DDU Upgrade Kit)

0 The NTZZ99AG contains the material required to replace one 8"  
0 Priam or Mercury Disk Drive Unit with one 5.25 Disk Drive Unit.  
0 The 5.25 DDU (NT4X00AG) must be provided in addition to the  
0 NTZZ99AG.

0 NTZZ09XA (DPP Shelf)

0 The NTZZ09XA contains the common circuit packs required for the  
0 DPP unit. The customer can choose between 140 and 380 MByte disk  
0 drives. This Building Block is for U.S. application only.

0 NTZZ09YA (DPP Shelf (Compression))

0 The NTZZ09YA contains the common circuit packs required for the  
0 DPP as well as the circuit packs and hardware for the Compression  
0 option. The customer can choose between 140, 380, or 760 MByte  
0 disk drives. This Building block is for U.S. application only.

0 NTZZ09TB (Input/Output Equipment Frame (US))

0 The NTZZ09TB contains the frame which will house all the  
0 Input/Output devices. The frame is equipped with the frame su-  
0 pervisory panel and cover and is ISG compliant. The frameworks  
0 are provisionable. Optional equipment to the IOE will be derived  
0 from questions used to provide the required equipment. Existing  
0 rules for assignments to the IOE are still applicable. This  
0 Building Block is md'd and replaced by NTZZ09AA.

0 IOE CUSTOMER QUESTIONS

0 (A) DISTRIBUTED PROCESSOR PERIPHERAL (DPP) REQUIREMENTS

0 1. Is DPP remote polling of AMA required (Y/N) ? \_\_\_\_\_  
0 (If no, go to section (B) Automatic Dial-Back Provisioning)

0 2. Which of the following is a required polling option:

0 2.1 Compression \_\_\_\_\_

0 2.2 56 Kbps \_\_\_\_\_

0 2.3 neither \_\_\_\_\_

0 3. Is DPP disk drive size to be specified or calculated ?

0 3.1 Specified \_\_\_\_\_

0 3.2 Calculated \_\_\_\_\_

0 4. If DPP disk drive size is to be specified, specify the size.

0 4.1 140 Mbyte (not valid w/56 Kbps option) \_\_\_\_\_

0 4.2 380 Mbyte (valid with any option) \_\_\_\_\_

0 4.3 760 Mbyte (valid w/56 Kbps or compression) \_\_\_\_\_

0 5. If DPP disk drive size is to be calculated :

0 5.1 Number of High Day calls with AMA entries. \_\_\_\_\_

0 5.2 Number of days of retention. \_\_\_\_\_

0 6. How many modems will NT supply for DPP application ?

0 6.1 One (only near-end) \_\_\_\_\_

0 6.2 Two (near and far-end) \_\_\_\_\_

0 IOE CUSTOMER CALCULATIONS0 NTZZ09AA - IOE Frame

0 The required quantity of IOE frames is calculated from the required  
0 number of shelves. IOE frames NTZZ09AA is provided for all applica-  
0 tions.

0 If P1 = Yes, US jobs shall be provisioned with NTZZ09AA and equipped  
0 with NT0X25AH Universal framework. Refer to the IOE frame Engineering  
0 Manual sections for valid combinations.

0 The following table lists all available shelves and their required  
0 mounting positions on an IOE frame. The IOE contains five (5) avail-  
0 able 14" mounting positions. Filler panels shall occupy all unused  
0 14" mounting positions.

| Module   | Number of 14 inch<br>shelves | Number of 14 inch<br>fillers |
|----------|------------------------------|------------------------------|
| NTZZ09BB | 1                            | 1                            |
| NTZZ09CA | 1                            | 0                            |
| NTZZ09CB | 1                            | 0                            |
| NTZZ09VA | 1                            | 0                            |
| NTZZ09VB | 1                            | 0                            |
| NTZZ09LA | 2                            | 0                            |
| NTZZ09RA | 2                            | 0                            |
| NTZZ09SA | 2                            | 0                            |

0 NTZZ09UA - 228MB Disk Drive Unit

0 Provide a quantity equal to E2.

0 NTZZ09BB - Disk Drive Unit Shelf

0 Provide a quantity equal to the number of 228MB Disk Drive Units di-  
0 vided by two and rounded up.

0  
0 RELEASE 28.01  
0 93 12 03

0 NTZZ09CA/CB/VA/VB - Input/Output Controller Shelf

0 Provide a quantity of NTZZ09CA/CB/VA/VB equal to NTZZ09DA + NTZZ09EA +  
0 NT1X67FA + NTZZ09GA + NTZZ09HA + NTZZ09JA + NTZZ09KA divided by nine  
0 and rounded up. (Use NTZZ09CA/CB in SuperNode offices, NTZZ09VA/VB in  
0 NT40 offices). (A minimum of two NTZZ09CA/CB/VA/VB are required per  
0 office.

0 NT0X50AA - Filler Face Plate

0 Provide a quantity of NT0X50AA equal to NTZZ09DA + NTZZ09EA + NTZZ09GA  
0 + NTZZ09HA + NTZZ09JA + NTZZ09KA subtracted from the quantity of of  
0 NTZZ09CA/CB or NTZZ09VA/VB required multiplied by nine.

0 NTZZ09DA or NTZZ09EA - I/O Terminal Controller CP

0 Provide a quantity of NTZZ09DA or NTZZ09EA equal to  $(C1 + 2(\text{If ques-}$   
0  $\text{tion A1 = yes}))/4$  and rounded up. (A minimum of two NTZZ09DA or  
0 NTZZ09EA are required per office for standard applications).

0 NTZZ09EA - I/O Terminal Controller CP

0 Provide a quantity of NTZZ09EA for the automatic dial back feature per  
0 the calculations that follow:

0  $(B1.1 \times B1.2)/100 = \text{CCS}$ . Refer to attached Table Y with CCS to deter-  
0 mine the quantity of ports required. (PORTS1)

0  $(B2.1 \times B2.2)/100 = \text{CCS}$ . Refer to attached Table Y with CCS to deter-  
0 mine the quantity of ports required. (PORTS2)

0  $(\text{PORTS1} + \text{PORTS2})/4$  (rounded up) = Quantity of NTZZ09EA required.

0 NT1X67FA - SMDI Interface

0 Provide a quantity equal to L1 (unless NTZZ09GA is used to provide the  
0 interface to Simplified Message Desk).

0 NTZZ09YA - Distributed Processing Peripheral (Compression)

0 For U.S. application, provide one NTZZ09YA when A2 equals Compression.

0 NTZZ09LA - DPP Shelf 56 Kbps

0 For U.S. application, provide one NTZZ09LA when A2 equals 56 Kbps.

0 NTZZ09XA- DPP Shelf

0 For U.S. application, provide one NTZZ09XA when A2 equals neither.

0 DPP Disk Drive

0 If 140 Mbyte DDU is specified (4.1);

0 Provide 2 NT6M72DE and 2 NT6M66BC if NTZZ09YA is provided, or provide  
0 2 NT6M66AL and 2 NT6M72BA if NTZZ09XA is provided.

0 If 380 Mbyte DDU is specified (4.2);

0 For Canadian application, provide one NTZZ09RA

0 For U.S. application, provide 2 NT6M72DD and 2 NT6M66BA if NTZZ09YA is  
0 provided, or provide 2 NT6M72DD if NTZZ09LA is provided, else, provide  
0 2 NT6M66AH and 2 NT6M72DA if NTZZ09XA is provided.

0 If 760 Mbyte DDU is specified (4.3);

0 For Canadian application, provide one NTZZ09SA

0 For U.S. application, provide 2 NT6M72EA and 2 NT6M66BA if NTZZ09YA is  
0 provided, or provide 2 NT6M72EA if NTZZ09LA is provided.

0 If DDU size is to be calculated, use A5.1 and A5.2 in customer  
0 questions section and refer to ECM 306 (Real Time Impact section) for  
0 calculation information to determine disk size.

0 Modems for DPP application

0 For modem provisioning, refer to ECM 633 and provide correct modem  
0 based on polling speed, number required, and whether dial-up or pri-  
0 vate line is selected.

0 DPP Spares kit

0 If minimum spare option (9.1) is selected, provide one NT6M95AK.

0 If maximum spare option (9.2) is selected, provide one NT6M95AL.

## 0 7.0 I/O Controller Module NT1X61AD

0 The Input/Output Controller (IOC) provides an interface between the  
0 NT40 (CCC) or SuperNode and up to nine device controller Circuit  
0 Packs.

0 |

0 Each IOC performs serial to parallel and parallel to serial conver-  
0 sions to the Data to and from Device Controllers on two (2) 2.56Mb/s  
0 serial ports to a pair of Message Device Controllers (on NT40) or Mes-  
0 sage Switches (on SuperNode).

0 The IOC consists of the following card types:

0 I/O Message Processor - Contains a microprocessor, associated memory  
0 serial link I/F logic, parallel bus I/F logic.

0 Device Controllers - Contains a microproc. and associated memory  
0 for the I/O device (i.e. MTD, DDU, VDU, etc.)

0 IOC Terminator - Contain terminating resistors for the IOC's  
0 parallel bus.

0 Power Converter - Supplies Voltages req'd for the IOC message  
0 controller and other IOC Circuit Packs.

0 The I/O Controller Module (NT1X61AD) is made up of an I/O Shelf Assem-  
0 bly (NT1X6112) and a Common Circuit Pack Fill NT1X61AE. The  
0 provisionable I/O Message Controller are NT1X62AB for NT-40 applica-  
0 tions and NT1X62CA for SuperNode applications. Both NT1X61AB and  
0 NT1X62CA are manufactory discontinued and replaced by NT1X62CB for  
0 both SuperNode or NT-40 applications. The Power Converter (NT2X70AE)  
0 is now provisionable by the NT1X61AE Common CP Fill (Check availabil-  
0 ity reports for the status of the NT2X70AE CP). The NT1X61AD IOC Mod-  
0 ule is replaced by NT1X61AG IOC Module in IOE frame (NT0X43AD), and it  
0 will be replaced by NT1X61AG for all applications.

0 For offices with existing NT1X61AA and NT1X61AB IOC, a Product Change  
0 Kit (PC Kit) NT1X61AX must be provisioned to modify the IOC to inter-  
0 face with SuperNode.

0 At a Telco's request, when available, the NT2X70AZ PC Kit can be provi-  
0 sioned to modify the NT1X61AD IOC with the NT2X70AE Power Converter  
0 (Check availability reports for the status of the NT2X70AZ PC Kit).

0 Not applicable.

## 0 DISCRIMINATION NUMBERING

0  
0 Not applicable.

0 7.1.3 PROVISIONING CONSIDERATIONS

0  
0 From BCS26 onwards, a DMS office can have maximum of thirteen  
0 (13) IOC's except for DMS-MTX offices which may allow up to  
0 twenty (20) IOC's. For each office, the maximum number of IOC's  
0 depends on how a system is configured (for example, the number of  
0 network modules and the number of CMC/MS interface circuit packs  
0 provisioned) and the limitation for software to support maintenance  
0 functions for IOCs and connected devices without impacting  
0 System's performance.

0 A minimum of two I/O Controller Modules (IOC:00, IOC:01) is required  
0 per system. These may be provisioned either as functional  
0 modules within the Central Message I/O Controller shelf (MDC)  
0 (NT2X76BA) for NT40 applications only or as independent shelves.  
0 Note that for SuperNode applications independent shelves must be  
0 provisioned.

0 If provisioned as independent shelves then provide two (2)  
0 NT1X61AD.

0 Each shelf accommodates up to nine I/O device controller cards.

0 The IOC shelf and the devices (MTD, DDU, MAP etc.) it interfaces  
0 should be cabled to the same power feed on the Power Distribution  
0 Center (PDC).

0  
0 RELEASE 28.01  
0 93 12 03

0 Provide one (1) PC Kit NT1X61AX when converting an existing IOC  
0 Module (NT1X61AA or AB) for DMS-Core applications.

0 At a Telco's request, when available, the NT2X70AZ PC Kit can be  
0 provisioned to modify the NT1X61AD IOC with the NT2X70AE Power  
0 Converter (Check availability reports for the status of the  
0 NT2X70AZ PC Kit).

0 7.2.3 SPARING INFORMATION

0  
0 Standard sparing criteria will be maintained for the IOC.

0 7.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 Each IOC will have dissipation based on its contents. The fol-  
0 lowing is an outline of the major IOC component dissipations.

0 NT1X61 - 24.0 Watts  
0 NT1X67 - 12.6 Watts  
0 NT1X89AA - 12.6 Watts  
0 NT1X55 - 12.6 Watts

0 The IOC Shelf requires one (1) 20 Amp fuse.

0 7.2.5 CURRENT DRAIN INFORMATION

0  
0 An empty IOC shelf without any provisionable I/O Device control  
0 card will have a current drain of 0.5 Amps.

0 8.0 Modem Equipment Frame (MOE) Canadian Offices Only

0 Modem Equipment Frame (MOE) NT0X43BA

0 The Modem Equipment Frame (MOE) is provided in host offices equipped  
0 with Isolated System Grounding (ISG) for the mounting of modem equip-  
0 ment. All modem shelves mounted on the frame must be isolated from  
0 the framework with the chassis tied to the logic return bar. Any cus-  
0 tomer provided modem shelves must be isolated from the frame and simi-  
0 larly connected to the logic return bar.

0| CIRCUITS PER CARD

0  
0| Not applicable.

0| DISCRIMINATION NUMBERING

0  
0| Not applicable.

0 8.1.3 PROVISIONING CONSIDERATIONS

0  
0 Modem equipment must not be equipped on a Miscellaneous Equipment  
0 (MIS) frame.

0 Remote offices (RLM,RSC,RLCM and OPMs) do not require the MOE  
0 frame. However, all modem equipment and their associated  
0 inverters must reside in the same Remote Miscellaneous Frame  
0 (RME).

0 Host office extensions that are upgraded with ISG must relocate  
0 all modem equipment to either a MOE frame or an Input Output  
0 Equipment (IOE) frame.

0 Modem equipment may be mounted on an IOE frame in existing of-  
0 fices, however, for all new host offices a MOE frame must be pro-  
0 vided.

0 RELEASE 28.01  
0 93 12 03

0 For mounting modems on IOE frames the following rules apply:

- 0 1) DC Modem Shelves must be isolated from the equipment frame  
0 and modem shelf chassis must be connected to the logic return  
0 busbar. One (1) NT4X2591 Data Unit Grounding and Mounting  
0 Kit must be provided per DC Modem shelf provisioned to iso-  
0 late the shelf from the frame and to connect the chassis to  
0 the logic return busbar. DC Modem shelves must be powered  
0 directly to the Power Distribution Center (PDC).
- 0 2) All AC Modem Shelves must be powered from an inverter that is  
0 mounted on the same frame. The inverter must be isolated  
0 from the framework and its chassis must be connected to the  
0 logic return busbar.
- 0 3) Provision one (1) NT0X0009 Cable Assembly for an inverter lo-  
0 cated in position 4 on the IOE frame to connect the inverter  
0 to the logic return busbar.
- 0 4) Provision one (1) NT0X4309 Cable Assembly for an inverter lo-  
0 cated in any other position on the IOE frame.

0 Only current loops may be connected directly to the IOC modules from  
0 devices (i.e. VDU or printers). EIA ports must be connected through  
0 modems. No direct connections from from devices (i.e. VDU or print-  
0 ers) to EIA ports are allowed. If a local EIA modem to modem con-  
0 nection is desired, both the DMS modem and the device end modem cannot  
0 co-exist in the DMS. The device modem must be located away from any  
0 DMS frame.

0 Reference CA0X04 01 24 and CA0X15 01 14 for switchboard cabling per-  
0 taining to the MOE frame.

#### 0 Modem Pooling Configurations

0 Three standard configurations have been identified for modem pooling.  
0 These configurations are shown in Figure 1.

0 Modem Equipment Frame Modem Pooling Configuration A  
0 - 1 modem shelf

0 Modem Equipment Frame Modem Pooling Configuration B  
0 - 2 modem shelves, no redundant power

0 Modem Equipment Frame Modem Pooling Configuration C  
0 - 2 modem shelves, redundant power

0 9.0 DMS-100 Provisionable Modems For RTP

0 This NTP defines the terms used in Data Communications and defines the  
0 provisionable modem products from all RTP approved sources (i.e.  
0 Case/Datatel (CASE), Universal Data Systems (UDS), and General  
0 DataComm (GDC)) and relates those products to specific applications.

0 Data Communications is required whenever one has a need to transmit  
0 data or information from one location to another. In order to com-  
0 plete this task, three elements are required:

0 Terminals / Computers (DTE Equipment)  
0 Modems / Data Sets (DCE Equipment)  
0 Transmission Facilities / Lines (Media)

0 In Voice communications when a telephone call is made, there are again  
0 three elements required to make the phone connections to the point  
0 where two people can talk to each other. These elements are:

0 People (DTE Equipment)  
0 Telephones (DCE Equipment)  
0 Transmission Facilities / Lines (Media)

0 Therefore, Telecommunications and Data Communications are very simi-  
0 lar. The Telephones perform the same function as do modems and data-  
0 sets, namely they convert information from a form created by humans  
0 into a signal suitable for transmission over the telephone facility  
0 and then converts it back to a form intelligible to humans.

0 A modem is used whenever transmission of data is required utilizing a  
0 telephone line provisioned to carry analog signals. The word modem is  
0 actually a contraction for the terms modulator-demodulator. It is used  
0 in telephone circuits designed to transmit analog signals which fall  
0 within the audio spectrum used in human speech. The  
0 terminals/computers produce digital pulses and the modem interfaces  
0 these digital pulses with the analog tones carried on the Telephone  
0 facilities. Very simply, a modem converts machine output digital  
0 signals into an analog wave form and then converts this analog wave  
0 form back into digital signals for input into another machine.

0 Whenever transmission of data is required utilizing a telephone line  
0 provisioned to carry digital pulses only, then a dataset is needed

0  
0 RELEASE 28.01  
0 93 12 03

0 instead of a modem. A dataset is made up two units called a DSU and a  
0 CSU. A DSU, or digital service unit, provides a standard interface to  
0 a user's terminal and handles the signal translation, regeneration,  
0 reformatting, and timing. A CSU, or channel service unit, provides  
0 the connection to the digital telephone line and is capable of provid-  
0 ing local loop equalization, transient protection, isolation and cen-  
0 tral office loopback testing capability.

0 We now know that modems are used on analog facilities and datasets  
0 (DSU/CSU's) are used on digital facilities.

0 In the case of analog facilities there are two types of facilities  
0 that can be provisioned; either a dial-up circuit or analog switched  
0 facility, and a leased line or private line.

0 Dial-up circuits permit contact with any terminal/CPU which has access  
0 to the telephone network. Whenever an operator wants to transfer data  
0 from one location to another, they dial the telephone number of the  
0 remotely located terminal/CPU. The telephone central office estab-  
0 lishes a connection between the dialing party and the dialed party.  
0 Once communication is set up, the terminal/CPU at each end conduct the  
0 data transfer. When the data transfer is completed, the connection  
0 is broken and the modem/telephone is placed on hook allowing for a  
0 call to be made to another location or at another time. With today's  
0 technology it is possible to transmit at speeds from 75bps up to  
0 28,800bps utilizing dial-up services.

0 A leased line is used when two locations have a high volume data  
0 transfer requirement and the time required to transfer this data via  
0 dial-up facilities is cost prohibitive. A leased line is a circuit  
0 which is nailed up or fixed between two locations, and is normally re-  
0 ferred to as 3002 type service. A leased line can be conditioned to  
0 reduce errors in transmission as well as permit ease in determining  
0 the location of error conditions since its routing is known. The  
0 transmission speeds available on analog leased lines are from 110bps  
0 to 19,200bps. Even though technology permits up to 28,800bps, the  
0 modem providers have not developed a leased line modem capable of  
0 transmitting at these speeds. This is because fewer and fewer analog  
0 leased lines are being provisioned today and the trend is to move into  
0 digital services for leased/private line requirements.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 Unlike analog facilities, digital facilities accept and transmit dig-  
0 ital pulses, therefore no conversion of the transmitted signal is re-  
0 quired. Also, digital facilities are available only in leased/private  
0 line services. All of the properties of an analog leased line apply  
0 to digital leased lines, except for the transmission speeds available.  
0 Common transmission speeds used today are from 2400bps up to 45Mbps.  
0 Common Digital Service types available today are DDS (2400bps up to  
0 64Kbps), T1 (1.544Mbps) and T3 (45Mbps).

0 | 9.1.3 PROVISIONING CONSIDERATIONS

0  
0 See Engineering Manual Section Table Z for selecting NT Approved  
0 modems for specific applications.

0 Modems must be matched to the application being provisioned and  
0 the existing Far End Modem (if applicable). Modems located at  
0 the DMS Site are generally referred to as the Near End Modem.

0 In cases where the modems are configured in a back to back ar-  
0 rangement - the modem directly connected to the Device/Device  
0 controller (1X67/89, DPP, BMC, etc.) is considered the Near End  
0 Modem.

0 When selecting modems for an existing network it is often neces-  
0 sary to mix modems from different suppliers. In these cases it

0 RELEASE 28.01  
0 93 12 03

0 is necessary for the modems to be compatible (be able to talk to  
0 each other).

0 COMPATIBILITY

0 Compatibility between modems depends greatly on the exactness  
0 with which their Modulation Techniques conform to the specifica-  
0 tion (e.g. AT&T or CCITT) in question. TABLE 1 outlines stand-  
0 ard AT&T/CCITT specifications for modems at the various operating  
0 speeds.

0 The term "HANDSHAKING" is all important in determining modem  
0 compability as it describes the exchange of control signals that  
0 establish a connection between two modems. Standards (e.g. BELL  
0 108, 103, 208A/B, etc. or CCITT V.22, 22 bis, 29, etc) govern the  
0 signals required to set up, transmit, and terminate calls. For a  
0 handshake to occur the two modems must be compatible.

0 AT&T Compatibility

0 There are two governing bodies, AT&T and CCITT. Modems built to  
0 AT&T (commonly refered to as BELL or WECO) standard are likely to  
0 be compatible. However, manufactures of modems to the BELL spec-  
0 ifications have added convience features to the basic specifica-  
0 tion, such as - Automatic Answer, Automatic Dial, The ability to  
0 be controlled from a computer console or AT command set.

0 However, some manufactures have refined their products to such a  
0 degree that they are no longer compatible with the original AT&T  
0 product. For the most part, manufactures claiming AT&T  
0 compability are in fact compatible.

0 CCITT Compatibility

0 CCITT V.XX standards are directed primarily at the European Tele-  
0 phone facility. However, North American modem manufactures and  
0 Communications Network operators are moving toward the CCITT  
0 standards for data communications. This is due in part to AT&T  
0 getting out of the business and the need to be compatible with  
0 the European Market.

0 CCITT standards call for newer and faster modems to be backward  
0 compatible with their earlier counterparts.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 For Example: A 2400bps V.22 bis modem will be compatible with  
0 its 1200 bps V.22 counterpart at the V.22 bis fallback operating  
0 speed of 1200bps. It will also be compatible with the AT&T 212A  
0 modem specification operating at 1200bps since the standards are  
0 closely related.

0 Many Dial-up (DU) or Public Switched Telephone Network (PSTN) and  
0 Private Lease Line (PLL) modems conform to CCITT specifications,  
0 the most popular being:

- 0 \* V.22 and V.22 bis for medium speed dial-up modems
- 0 \* V.32 for 4800 bps and 9600 bps for dial-up modems
- 0 \* Others in use are V.26, V.27, V.29, V.33, and their alterna-  
0 tives.

#### 0 Hayes Compatibility

0 Another type of compability involves the Hayes AT Command Struc-  
0 ture. The Hayes AT Structure relates to the modem commands,  
0 modem responses, and the ability to provide settings that are  
0 compatible with various communications programs.

0 For Example:

0 Modems compatible with the Hayes SMARTMODEM 1200 obey the 22  
0 modem commands and 16 register settings stipulated for that de-  
0 vice. Hayes compatibility also involves compatibility with the  
0 AT&T 103 operating standard at 0 to 300 bps and the AT&T 212  
0 standard at 1200 bps.

0 Hayes compatible products have speakers for audibly following  
0 call progress, front panel status lights on external units, and  
0 auto dial, auto answer, manual dial, and manual answer features  
0 for asynchronous operation.

0 10.0 Building Block Engineering - CompuCALL

0 The block diagram on Figure 1 on page 8-223 illustrates in outline a  
0 typical hardware configuration required for operating the CompuCALL  
0 feature.

0 CompuCALL is a Central Office (CO) service using an Open System Inter-  
0 connection (OSI) based application level interface between the CO  
0 DMS-100 switch and external equipment such as a computer located at a  
0 service providers premises. CompuCALL is considered to be a software  
0 feature because no new hardware is introduced for CompuCALL.

0 CompuCALL software comprises applications residing in the DMS and in  
0 the service providers host computer, both of which exchange messages  
0 relating to call processed in the DMS. The Switch Computer Applica-  
0 tions Interface (SCAI) messaging protocol is used.

0 A CompuCALL application requires one or more data links from the IOC  
0 (Input Output Controller) to the Service Providers Premises. The num-  
0 ber of links installed in a particular DMS switch providing CompuCALL  
0 service depends upon the following factors:

- 0 \* Number of service providers premises served.
- 0 \* Expected data traffic per Session per Service Provider

0

0

0

## 0 Circuits per Card

0

## 0 Discrimination Numbering

0

0 10.1.3 Provisioning Considerations

0

## 0 CompuCALL Sessions

0

0 CompuCALL Link provisioning is based upon CompuCALL sessions. The  
0 provisioning characteristics of a session are as follows:

0 \* One (1) CompuCALL application per session. (MADC is an exam-  
0 ple of a CompuCALL application)

0 \* One (1) session per ACD Group

0 \* Multiple sessions per host (service provider) application.

0 \* Multiple ACD groups per session

0 The relationships between CompuCALL Applications, service provider ap-  
0 plications and sessions are illustrated in Figure 2 on page 8-226.

0

0

## CompuCALL Links

0 RELEASE 28.01  
0 93 12 03  
0

0 A compucall link is a logical Switched Virtual Circuit (SVC)  
0 which carries messages between a DMS 100 application, e.g., MADC,  
0 and a service provider's host computer.

0 Up to and including BCS 34, a session is carried by a maximum of  
0 one SVC and a maximum of one session is carried by one SVC. Refer  
0 to Section 2.4.1 for the definition of a session.

0 From and including BCS 35, a session may be carried by more than  
0 one SVC. This capability may be used to improve CompuCALL reli-  
0 ability.

0 SVCs are set up on X.25 physical links. Currently, CompuCALL  
0 links are restricted to one (1) SVC per X.25 physical link.

0 MACD CompuCALL/SMDI (Simplified Message Desk Interface)

0  
0 The AUXCP scheduler class was originally introduced for the in-  
0 coming message processing function of SMDI. This scheduler class  
0 is therefore shared with SMDI if this feature is present in the  
0 switch. The sum of guaranteed CP real time allocated to both MACD  
0 CompuCALL messaging and SMDI shall result in a setting of no  
0 greater than 25% for the office parameter AUXP\_CP\_SHARE.

0 RELEASE 28.01  
0 93 12 03

0 For each Service Provider, answer the following questions:

0 (1) Max. number of simultaneous CompuCALL Sessions  
0 required <MAX SESSIONS> =\_\_\_\_\_

0 For each Session, answer the following questions, based on HDBH  
0 traffic:

0 (2) Inbound MACD COMPUCALL CA (Call Attempts)/Hour  
0 (HDBH) w/o redirection option

0 < MACD CCALL IN W/O REDIRECT CA/HOUR> =\_\_\_\_\_

0 (3) Inbound MACD COMPUCALL CA/Hour (HDBH)  
0 W/ redirection option  
0 zero (0) redirects/call

0 < MACD CCALL IN W/ REDIRECT (0) CA/HOUR> =\_\_\_\_\_

0 (4) Inbound MACD COMPUCALL CA/Hour (HDBH) W/ redirection  
0 option one (1) redirect/call

0 < MACD CCALL IN W/ REDIRECT (1) CA/HOUR> =\_\_\_\_\_

0 (5) Outbound MACD COMPUCALL CA/Hour  
0 < MACD CCALL OUT CA/HOUR> =\_\_\_\_\_

0 (6) X.25 Link Bandwidth

0 Check one

0 a) Bandwidth <9600 bits/s> \_\_\_\_\_  
0 b) Bandwidth <19200 bits/s> \_\_\_\_\_  
0 c) Bandwidth <56000 bits/s> \_\_\_\_\_

0 <DATA SPEED> =  
0 If a) = yes, then 9600 bits/s  
0 else if b) = yes then 19200 bits/s  
0 else if c) = yes then 56000 bits/s =\_\_\_\_\_

0 (6) Service Provider Premises Data Modem Requirements

0 Answer yes or no:

0 Are Service Provider premises data modems to be  
0 supplied, <SUPPLY CP MODEMS> ? \_\_\_\_\_

0 RELEASE 28.01  
0 93 12 03

0 d) CO Modem Provisioning Requirements

0 Answer yes or no:

0 Are CO located data modems to be  
0 supplied, <SUPPLY CO MODEMS> ? \_\_\_\_\_

## 0 Provisioning Calculations

0 Perform the calculations in a) to f) below for each Service Pro-  
0 vider:

0 a) Required Number of X.25 Links

0 Refer to answers to questions in section 2.4.4 c) Service Pro-  
0 vider Information. To determine the number of X.25 links, for  
0 each Service Provider, calculate expected message traffic for  
0 each Session required by the Service Provider, as follows:

0 <TOTAL MESSAGES/SEC> =  
0 (MACD CCALL IN W/O REDIRECT CA/HOUR/3600) x 4  
0 + (MACD CCALL IN W/ REDIRECT (0) CA/HOUR/3600) x 5  
0 + (MACD CCALL IN W/ REDIRECT (1) CA/HOUR/3600) x 10  
0 + (MACD CCALL OUT CA/HOUR/3600) x 3 = \_\_\_\_\_

0 <AVERAGE MESSAGE LENGTH> (bytes) =  
0 {[ (MACD CCALL IN W/O REDIRECT CA/HOUR/3600) x 4] x 82  
0 + [ (MACD CCALL IN W/ REDIRECT (0) CA/HOUR/3600) x 5] x 66  
0 + [ (MACD CCALL IN W/ REDIRECT (1) CA/HOUR/3600) x 10] x 53  
0 + [ (MACD CCALL OUT CA/HOUR/3600) x 3] x 46}  
0 divided by TOTAL MESSAGES/SEC (round up) = \_\_\_\_\_

0 <X.25 LINK CAPACITY> =  
0 lookup Figure 3 , for AVERAGE MESSAGE  
0 SIZE, and DATA SPEED (messages per second) = \_\_\_\_\_

RELEASE 28.01  
93 12 03

|   |       | AVERAGE MESSAGE SIZE IN BYTES |    |    |    |    |    |    |
|---|-------|-------------------------------|----|----|----|----|----|----|
|   |       | 95                            | 80 | 65 | 60 | 55 | 50 | 45 |
|   | SPEED | MESSAGES PER SECOND           |    |    |    |    |    |    |
| 1 | 9600  | 11                            | 13 | 16 | 17 | 18 | 19 | 20 |
| 2 | 19200 | 20                            | 20 | 22 | 22 | 23 | 25 | 25 |
| 3 | 56000 | 20                            | 19 | 20 | 21 | 22 | 23 | 23 |

Figure 3. X.25 Link Capacity (MACD CompuCALL)

<NO OF X.25 LINKS> (needed for session) =  
If BCS 35 or Greater, then  
(TOTAL MESSAGES/SEC)/(X.25 LINK CAPACITY)  
(round up)  
else 1 =\_\_\_\_\_

<SUB-TOT X.25 LINKS>  
(needed for Service Provider) =  
Sum NO OF X.25 LINKS =\_\_\_\_\_

Note..If BCS is not BCS 35 or greater, check that the selected  
X.25 link bandwidth is adequate for the expected  
traffic, as follows

<BANDWIDTH> =  
If (TOTAL MESSAGES/SEC)/(X.25 LINK CAPACITY) > 1  
Then TOO NARROW  
Else OK

If BANDWIDTH is TOO NARROW then DATA SPEED must be increased to  
accommodate the estimated traffic for the Session. If DATA SPEED  
cannot be increased Session traffic must be reduced.

#### b) Enhanced Multi Protocol Controller Card Provisioning

For each Service Provider calculate the number of EMPC cards re-  
quired as follows:

<NUMBER OF EMPC> = SUB-TOT X.25 LINKS =\_\_\_\_\_

0  
0 RELEASE 28.01  
0 93 12 030 c) Link Protection0 From BCS 35 onwards, CompuCALL will have the capability of per-  
0 mitting one Session to be carried on more than one SVC. This ena-  
0 bles the provisioning of additional SVCs, to provide protection  
0 against link failure. Protection should be engineered to provide  
0 protection per CompuCALL Session.0 d) Number of 9.6 kbs Modems Required0 Calculate the number of 9.6 kbs modems required for  
0 each service provider as follows:0 <MODEMS 9.6 KBS> = if DATA SPEED = 9600  
0 then if SUPPLY CP MODEMS = yes  
0 then SUB-TOT X.25 LINKS  
0 else 0  
0 + if DATA SPEED = 9600  
0 and if SUPPLY CO MODEMS = yes,  
0 then SUB-TOT X.25 LINKS  
0 else 0

=\_\_\_\_\_

0 e) Number of 19.2 kbs Modems Required0 <MODEMS 19.2 KBS> = if DATA SPEED = 19200  
0 then if SUPPLY CP MODEMS = yes  
0 then SUB-TOT X.25 LINKS  
0 else 0  
0 + if DATA SPEED = 19200  
0 and if SUPPLY CO MODEMS = yes,  
0 then SUB-TOT X.25 LINKS  
0 else 0

=\_\_\_\_\_

0 f) Number of 56 kbs Modems Required0 <MODEMS 56 KBS> = if DATA SPEED = 56000  
0 then if SUPPLY CP MODEMS = yes  
0 then SUB-TOT X.25 LINKS  
0 else 0  
0 + if DATA SPEED = 56000  
0 and if SUPPLY CO MODEMS = yes,  
0 then SUB-TOT X.25 LINKS  
0 else 0

=\_\_\_\_\_

0 g) Total EMPC Required0 <TOT EMPC'S> = Sum of the NUMBER OF EMPC'S  
0 calculated for each Service Provider

0 RELEASE 28.01  
0 93 12 03

0 (refer to 2.6.1) =\_\_\_\_\_

0 h) Total Number of 9.6 kbs Modems Required

0 <TOT MODEMS 9.6 KBS> = Total the number of  
0 MODEMS 9.6 KBS calculated for  
0 each Service Provider =\_\_\_\_\_

0 j) Total Number of 19.2 kbs Modems Required

0 <TOT MODEMS 19.2 KBS> = Total the number of  
0 MODEMS 19.2 KBS calculated for  
0 each Service Provider =\_\_\_\_\_

0 h) Total Number of 56 kbs Modems Required

0 <TOT MODEMS 56 KBS> = Total the number of  
0 MODEMS 56 KBS calculated for  
0 each Service Provider =\_\_\_\_\_

0 10.2 Product/System Specification

0 The data protocol (layer 1, physical) used on the interface be-  
0 tween the CompuCALL data link EMPC and the Data Unit or Synchro-  
0 nous Modem, refer to Figure 1 on page 8-223 may be any of the  
0 following:

0 \* RS232-C

0 \* V.35

0 10.2.1 Physical Characteristics

0  
0 Refer to the Engineering Manual.

0 10.2.2 EMI/Earthquake Information

0  
0 Refer to the Engineering Manual.

0 10.2.3 Sparing Information

0  
0 Standard sparing algorithms apply.

0 10.2.5 Current Drain Information

0

0 10.3 Software Provisioning

0 Software provisioning requirements for the MACD CompuCALL appli-  
0 cation are given below.

0 10.3.1 Required Software Packages and Interdependencies

0

0 The following software master package is required:

0 \* NTXR39 The Meridian ACD CompuCALL Options Master Package

0 The above master package has limited deployment in BCS33 and is  
0 available for Canada Market only.

0 For the US market area, the following packages are required:

0 \* NTXJ59AB CompuCALL Base (NTXJ59AC LTD in BCS35)

0 | \* NTXJ60AB CompuCALL Coordinated Voice and Data

0 | \* NTXR89AA Centrex Coordinated Voice and Data

0 Package NTXJ65AA X.25 Transport is required in applications prior  
0 to BCS34.

0 The following packages are optional:

0 \* NTXJ62AA Third Party Call Control

0  
0 RELEASE 28.01  
0 93 12 03

0 \* NTXJ63AA Voice Processing Integration

0 10.3.2 Software Usage Restrictions

0  
0 None identified.

0 10.3.3 Memory Provisioning

0  
0 The memory requirements for CompuCALL includes separate require-  
0 ments for the SCAI base and for each of the applications. For CC  
0 memory requirements of MADC with CompuCALL use MEMCALC.

0 10.4 Real Time Impact

0 MADC CompuCALL real time impact may be considerable. Estimate  
0 MADC CompuCALL impact on real time using the REAL::TIME, version  
0 6.4 or later.

0 11.0 Data Unit Rackmount Shelf

0 The NT4X25DH Data Unit Rackmount Shelf is designed to house up to six-  
0 teen (16) rackmount Data Units or Loop Extension Line Interface Cards  
0 in any configuration. The NT4X25DH may be used in a customer premise  
0 or central office application where a high concentration of datapath  
0 equipment is required. Customer Engineering should only order this  
0 shelf for central office applications.

0 11.1 HARDWARE PROVISIONING

0

0 11.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The NT4X25DH may be used in a customer premise or central office  
0 application where a high concentration of datapath equipment is  
0 required. Customer Engineering should only order this shelf for  
0 central office applications.

0 11.1.2 HARDWARE DEPENDENCIES

0

0 The NT4X25DH when equipped with the NT4X25DK AC-DC Power Supply  
0 should be powered via an inverter. One (1) NT0X87AA can accommo-  
0 date the power requirements for two (2) NT4X25DH shelves. One  
0 LaMarche Inverter can accommodate the power requirements for five  
0 (5) NT4X25DH shelves.

0 11.1.3 PROVISIONING CONSIDERATIONS

0  
0 The NT4X25DH will house up to sixteen cards. The following card  
0 types are available for mounting in the shelf (mixing allowed):

|                                                |          |
|------------------------------------------------|----------|
| 0 Data Unit Rackmount Low Speed                | NT4X25AD |
| 0 Data Unit Rackmount High Speed               | NT4X25AV |
| 0 Data Unit Loop Interface Low Speed           | NT4X25AR |
| 0 Data Unit Loop Interface High Speed          | NT4X25AS |
| 0 Low Speed Rackmount Auto Loop Back Data Unit | NT4X25CH |
| 0 Filler Face Plate                            | NT0X50AL |
| 0 AC-DC Power Supply                           | NT4X25DK |
| 0 DC-DC Power Supply                           | NT4X25DL |

0 RELEASE 28.01  
0 93 12 03

0 NT4X25DK Designation Label P0733972  
0 Data Unit Ground and Mounting Hardware NT4X2591

0 The NT4X25AD Rackmount Low Speed Data Unit is a functional re-  
0 placement to the stand-alone Low Speed Data Unit and is designed  
0 to fit into the NT4X25DH shelf. The NT4X25AD can be ordered by  
0 the customer for customer premise datapath applications or it may  
0 be ordered by the Telco for Datapath Modem Pooling applications.  
0 This unit is replaced by NT4X25CH.

0 The NT4X25AV Rackmount High Speed Data Unit is a functional re-  
0 placement to the stand-alone High Speed Data Unit and is designed  
0 to fit into the NT4X25DH shelf. The NT4X25AV may be ordered by  
0 the customer for customer premise datapath applications.

0 The NT4X25AR Loop Extension Low Speed Line Interface Unit is part  
0 of a Datapath Data Unit loop extension system that increases the  
0 loop length beyond the 4.6 km limitation. The Line Interface  
0 Unit is located at the central office providing the data services  
0 and operates in conjunction with a Data Terminating Unit at the  
0 customer premise. The NT4X25AR is designed for use with a Low  
0 Speed DTU and mounts in the NT4X25DH shelf. Provision one (1)  
0 NT4X25AR for each Low Speed Datapath loop requiring loop exten-  
0 sion beyond 4.6 km. It is the responsibility of the customer to  
0 provide the Data Terminating Unit. Refer to Figure 1.

0 The NT4X25AS Loop Extension High Speed Line Interface Unit is the  
0 high speed equivalent to the NT4X25AR.

0 The NT4X25CH Rackmount Low Speed EIA Controlled Loop Back Data  
0 Unit is a functional replacement for the NT4X25AD and is designed  
0 to fit into the NT4X25DH shelf. The additional capabilities of  
0 the NT4X25CH over the NT4X25AD are the EIA controlled loop back  
0 (V.54) and the synchronous automatic call (V.25) features. This  
0 is primarily a non switched maintenance capability.

0 The NT4X25CH can be ordered by the customer for customer premise  
0 datapath applications or it may be ordered by the Telco for  
0 Datapath Modem Pooling applications.

0 The NT4X25DK is an AC-DC power supply. This power supply is used  
0 in applications where there is access to an inverter. The  
0 NT4X25DK power supply would be used in "computer room" applica-  
0 tions.

0 RELEASE 28.01  
0 93 12 03

0 The NT4X25DL is a DC-DC power supply. This power is used in ap-  
0 plications where there is not access to an inverter. The NT4X25DL  
0 power supply would be used in Central Office applications.

## 0 CABLING

0  
0 One screw terminal block per slot location (TB1 - TB16) is pro-  
0 vided to connect the T&R pairs and MI/MIC leads from the Data  
0 Unit. The screw size on the terminal block is 6-32. These ter-  
0 minal blocks are for modem pooling applications only.

0 One RS232 25 pin female connector per slot location (odd no.  
0 P3-P33) is provided for Data Terminal Equipment (DTE) input. This  
0 connection is for low speed interface only.

0 T&R pairs for each slot are also available on two 50 pin tele-  
0 phone connectors(C0,C1). These connectors are used to cable the  
0 voice and data pairs to the Main Distributing Frame. Refer to  
0 CA0X15.

0 Always provided with the NT4X25DH is a V.35 2X18 connector  
0 adapter that plugs into the RS232 connector. This V.35 adapter  
0 is required to convert the 25 pin connector to the 36 pin 2X18  
0 V.35 interface for connection to a high speed unit.

## 0 12.0 Feature Enhanced Elastomer Keyboard Data Units

0 The Feature Enhanced Elastomer Keyboard Data Units (i.e. Low Speed  
0 NT4X25AF, NT4X25AH; and High Speed NT4X25AG, NT4X25AK) replace the  
0 Feature Enhanced Data Units (i.e. Low Speed NT4X25AN, High Speed  
0 NT4X25AP) respectively.

0 These data units are equipped with an enhanced keypad and rotary baud  
0 rate switch. The two DIP switch packages have been removed and re-  
0 placed by two new keypad keys (SETTINGS and ALTERNATE) and an array of  
0 LED indicators. The Data Units' operating parameters are set via the  
0 keypad. The new LED indicators show the currently selected Data Unit  
0 operating parameters and are used when setting the parameters.

### 0 12.1 HARDWARE PROVISIONING

0

#### 0 12.1.1 HARDWARE USAGE RESTRICTIONS

0  
0 The Feature Enhanced Elastomer Keyboard Data Unit must be con-  
0 nected to the enhanced data line card, line card type D, NT6X71AB  
0 or Single Slot Data Line Card NT6X71BA, in order to provide the  
0 Profile and Speed Restriction features. The Single Slot Data  
0 Line Card NT6X71BA replaces NT6X71AA/AB for offices with BCS-32  
0 or higher. NT6X71AB will continue to be provided for offices with  
0 BCS-31 or lower.

#### 0 12.1.2 HARDWARE DEPENDENCIES

0  
0 Each data unit (i.e. NT4X25AF/AH/AG/AK) requires one line card  
0 type D (i.e. NT6X71AA/AB/BA).

0 Data units NT4X25AF/AH/AG/AK may coexist on a switch with other  
0 types of data units.

0 12.1.3 PROVISIONING CONSIDERATIONS

0  
0 There are two (2) versions of the Feature Enhanced Elastomer Key-  
0 board Data Unit:

- 0 1. Low Speed Feature Enhanced Elastomer Keyboard Data Unit  
0 NT4X25AF and NT4X25AH

0  
0 RELEASE 28.01  
0 93 12 03

0 The NT4X25AF has an Electronic Business Set (EBS) Grey  
0 plastic case whereas the NT4X25AH has a Chameleon Grey  
0 plastic case. Otherwise, both units are the same.

0 2. High Speed Feature Enhanced Elastomer Keyboard Data Unit  
0 NT4X25AG and NT4X25AK

0 The NT4X25AG has an EBS Grey plastic case whereas the  
0 NT4X25AK has a Chameleon Grey plastic case. Otherwise,  
0 both units are the same.

0 These data units support all features of the Feature Enhanced  
0 Data Units (i.e. NT4X25AN and NT4X25AP) they are replacing.

0 12.2 PRODUCT/SYSTEM SPECIFICATION

0

0 12.2.1 PHYSICAL CHARACTERISTICS

0

0 The Data Unit is a stand-alone module, equipped to transmit and  
0 receive data. It provides keypad dialing to establish asynchro-  
0 nous or synchronous calls. A standard 500/2500 telephone set may  
0 operate normally via the Data Unit to a standard 500 set line  
0 card in the DMS-100 Family switch for making voice calls.

0 The Data Unit connects to the DMS-100 Family switch via a  
0 4-conductor line cord which eventually terminates on a data line  
0 card.

0 The Data Unit interfaces with the Data Terminal Equipment (DTE)  
0 in one of two ways:

0 a) EIA RS232 Interface - The RS232C interface is for connection  
0 to data terminal equipment (DTE) for serial binary data trans-  
0 mission. It utilizes a DB25 type mechanical connector, which is  
0 a 25 pin interface. It is recommended for operation at data  
0 transmission speeds up to 19.2 kbps.

0 The low speed data units NT4X25AA/AN/AT/AD/AF/AX have the RS232C  
0 interface.

0 b) CCITT V.35 Interface - The V.35 Interface is for connection to  
0 DTE for serial binary synchronous data transmission. The inter-  
0 face is implemented on a DB25 mechanical connector or NT data  
0 units. An adapter cable is also provided to connect to terminals  
0 that have the 37 pin V.35 plug interface. The V.35 interface  
0 must be used for high speed synchronous data transmission up to  
0 64 kbps.

0 The high speed data units NT4X25AG/AK/AP/AU/AV have the V.35  
0 interface.

## 0 13.0 Business Network Management

0 Business Network Management (BNM) is a Networks product that sup-  
0 plements DMS-100F Meridian Digital Centrex (MDC) by providing MDC  
0 network analysis and control features. Specifically, a BNM sys-  
0 tem collects information from DMS-100 Business switches, proc-  
0 esses the information collected and provides reports associated  
0 with the Centrex network. This document provides engineering in-  
0 formation for Business Network Management (BNM) release NSR28-32.  
0 The NSR-32 software release of BNM provides the following system  
0 enhancements:

- 0 \* Increases the number of DMS nodes supported to 20.
- 0 \* The eight (8) customer limitation for Operational Measurement  
0 (OM), Automatic Trunk Test (ATT) and Killer Trunk (KT) report  
0 data collection is removed and limited by the provisioning  
0 capacity of the system involved. There is however a datafill  
0 limitation of 64.
- 0 \* Increases available disk storage area for OM/KT/ATT data by a  
0 dedicated SCSI File Processor and up to 4 SCSI 160 MByte disk  
0 drives.
- 0 \* Increases system performance in large systems by offloading  
0 OM/KT/ATT collection file server activity to the dedicated  
0 File Processor.

## 0 13.1 HARDWARE PROVISIONING

0 RELEASE 28.01  
0 93 12 03

0 13.1.2 HARDWARE DEPENDENCIES

0  
0 If a DMS MIS Frame is provisioned for a BNM office, then a miscellaneous hardware kit must also be provided. Refer to ECM-406  
0 for available hardware kits.

0 13.1.3 PROVISIONING CONSIDERATIONS

0

0 BNM Base Enhancements

0

0 2.4.1.1 Audible/Visual Alarm Enhancement

0 The NSR28-32 release allows two (2) Alarm LANLink Interface  
0 Units (ALIU's) to be provisioned to visually and audibly indicate alarm conditions in the BNM system. Previously only one  
0 ALIU could be provisioned.

0 2.4.1.2 Operational Measurements Collection/Reporting

0 The NSR-27 Disk Utilization and Monitoring feature utilizes  
0 two Program Replaceable Units (PRUs) OMC and OMR. The NSR28-32  
0 release provides minor enhancements to these PRUs which change  
0 the amount of processor memory required. Refer to System Engineering Bulletin (SEB) 90-12-002 for PRU provisioning.

#### 0 2.4.1.3 Processor CPU and Disk Performance Monitoring

0 A system performance monitoring tool is provided in NSR28-32  
0 allowing a user to monitor the percent utilization of  
0 processor Central Processing Units (CPUs) and the percent  
0 utilization of multiple disk drives during feature operation.  
0 Processors that may be monitored include the Primary  
0 Processor, multiple Application Processors and multiple File  
0 Processors.

0 Implementing the CPU monitoring capability requires an addi-  
0 tional 2 kbytes of code to be added to each Application  
0 Processor, File Processor and Primary Processor operating in  
0 the system. The processor RAM buffer should be adequate to  
0 absorb this requirement.

0 Additionally a 68010-3 Application Processor should be provi-  
0 sioned for execution of a monitoring program called MXP. MXP  
0 is responsible for processor CPU utilization measurements and  
0 imposes a CPU utilization load of approximately 5 to 10 per-  
0 cent and requires approximately 200 kbytes of RAM. This  
0 processor must be reserved for performance monitoring pur-  
0 poses.

0 The above Application Processor may also execute the Disk Mon-  
0 itoring module called MXD. MXD is responsible for generating  
0 disk utilization measurements and requires 175 kbytes of  
0 processor RAM. The CPU impact of MXD is negligible.

0 In addition to the above software requirements, a PRU called  
0 XSRU Boss is required for interaction with MXP and MXD. XSRU  
0 Boss requires 251 kbytes of RAM and should be placed on the  
0 processor with MXD and MXP.

0

0

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 2.4.1.4 OM Collection File Processor Requirements

0 With NSR-32, new functionalities are available allowing OM,  
0 ATT, and KT data to be collected via a dedicated SCSI File  
0 Processor (FP) with up to four SCSI disk drives daisy chained  
0 together. This option is available to those systems whose Pri-  
0 mary :LOCAL disk can no longer contain both the NSR system  
0 load and the OM, ATT, KT storage requirements. This option  
0 also offloads the Primary Processor of data collection File  
0 Server activity.

0 The SCSI 160 MByte disk drives after formatting have an ap-  
0 proximate storage capacity of 158 MBytes. Thus the four units  
0 daisy chained have a storage capacity of 632 MBytes storage  
0 capacity for OM, ATT and KT data. The SCSI 350 MByte disk  
0 drives after formatting have an approximate storage capacity  
0 of 250 MBytes. Thus the four units daisy chained have a stor-  
0 age capacity of 1000 MBytes storage capacity for OM, ATT and  
0 KT data.

0 Enhancements To Station Administration

0

0 2.4.2.1 Station Administration Service Order History

0 The Station Administration Service Order Processor (SO) PRU  
0 has been enhanced to add the capability to create service or-  
0 der history records. This capability allows user entered ser-  
0 vice orders to be retained for later access/reference. Only  
0 those service orders that are successfully processed are re-  
0 corded in the history file.

0 2.4.2.2 Station Administration Recent Change Audit

0 The Station Administration Database Upload (DU) PRU is en-  
0 hanced in NSR28-32 to provide a Station Administration Recent  
0 Change (SARC) database audit capability. This audit task is  
0 invoked by any BNM DVIX feature requiring access to a custom-  
0 er's SARC files. Basically this audit task retrieves the spe-  
0 cific customer's SARC records and formats those records into a  
0 format compatible with DVIX features. An example of a DVIX  
0 feature requiring access to SARC files would be the BNM/COSMOS  
0 Interface feature and the BNM User Connect Time Data Col-  
0 lection feature.

0 2.4.2.3 Name Display Control

0 The DMS/BNM Station Administration database upload and data-  
0 base synchronization capabilities were enhanced in the  
0 NSR-28/BCS-28 software release to include the Name and Sup-  
0 press features on Electronic Business sets.

0

0

0 RELEASE 28.01  
0 93 12 03

## 0 2.4.2.4 ISDN Station Administration

0 The (BNM) Integrated Services Digital Network (ISDN) Station  
0 Administration (SA) feature is an enhancement to Meridian  
0 Digital Centrex Business Network Management Station Adminis-  
0 tration allowing users to centrally administer their ISDN  
0 stations/terminals, along with Meridian Digital Centrex  
0 stations, that are spread across multiple ISDN nodes. Major  
0 ISDN SA enhancements include:

0 \* Support of ISDN voice terminals with line class code  
0 ISDNKSET (B and Bd). Functions supported are:

- 0 - Assign and delete secondary DNS
- 0 - Add and delete station, DN and code access features
- 0 - Change feature parameters
- 0 - Swap B type stations
- 0 - Change customer group, NCOS
- 0 - Add MADN member

0 \* The capability to administer Data Packet Terminals is also  
0 provided via an interface to the Data Packet Network (DPN)  
0 Network Administration System (NAS) Interface.

- 0 - The BNM system must also communicate with the DPN NAS  
0 system to implement changes required in the packet  
0 network. An X.25 protocol interface has been  
0 developed for this purpose. For the initial release  
0 of this feature only NAS on an IBM 370 mainframe is  
0 supported.

0

0

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 2.4.2.5 BNM Hardware Requirements For Station Administration

0 The ISDN Station Administration feature is executed on a  
0 standard BNM hardware system, and the following hardware is  
0 required in the BNM system to support the ISDN Station Admin-  
0 istration features:

0 1) 68010-6/68020-7 SCSI File Processor

0 Provision one (1) per BNM system to support the Station Admin-  
0 istration feature database. This processor controls the  
0 read/write activity for storage of DMS-100 Line Equipment Num-  
0 ber (LEN) information and batch service orders. This processor  
0 is only required when the disk drive connected to the Primary  
0 Processor is not sufficient to store the LEN and service order  
0 data.

0 If the ISDN Station Administration feature is being added to  
0 an in-service system and a File Processor already exists for  
0 standard Station Administration, then the existing File  
0 Processor will be utilized for ISDN Station Administration  
0 also. In this case do not provisioned an additional  
0 processor.

0 2) SCSI Disk Drive

0 Provide one (1) SCSI Disk Drive for retention of Station Ad-  
0 ministration DMS-100 LEN information. This disk drive con-  
0 nects to the above Station Administration File Processor. As  
0 mentioned above, this disk is only required when additional  
0 storage area is required for Station Administration. In small  
0 BNM systems the disk drive connected to the Primary may be  
0 sufficient.

0 If ISDN Station Administration is being added to an in-service  
0 system and a disk drive exists for standard Station Adminis-  
0 tration, then this disk unit will also be used to retain data  
0 on ISDN terminals. In this case do not provision an addi-  
0 tional disk drive.

0

0

0 RELEASE 28.01  
0 93 12 03  
0

0 3) 68010/68020 Application Processors

0 Appropriate Application Processors are required to support the  
0 associated PRUs. Refer to the Software Provisioning section  
0 and the Performance/Memory Engineering section for Application  
0 Processor provisioning guidelines.

0 If ISDN Station Administration is being added to an in-service  
0 system equipped with standard Station Administration then Ap-  
0 plications Processors already exist to support all required  
0 PRUs except for the PC PRU. However the memory requirements  
0 for some of the PRUs have changed because of ISDN support mod-  
0 ifications, therefore, be sure to ensure that sufficient  
0 processor memory is available to support the ISDN Station Ad-  
0 ministration addition.

0 4) Data Links

0 One dedicated 9600 bit/second synchronous data link is re-  
0 quired between the BNM system and each DPN NAS system in the  
0 network when ISDN Station Administration feature package  
0 NTG240 is implemented. Each data link requires a LIU loaded  
0 with the X.25 protocol personality and a 9600 bps synchronous  
0 modem to be provisioned on the BNM end.

0 One dedicated 9600 or 19,200 bit/second X.25 data link is re-  
0 quired between the BNM system and each DMS-100F ISDN switch in  
0 the network when the NTG240 package is ordered. Each data  
0 link requires a LIU port loaded with the X.25 protocol person-  
0 ality and a 9600/19,200 bps synchronous modem.

0

0

0

0

0

0

0

0

0        Each DMS-100 ISDN switch with customers utilizing the BNM ISDN  
0        Station Administration feature will require an X.25 data link  
0        to the BNM system via the Multi-Protocol Controller (MPC) cir-  
0        cuit pack. Additionally, a dedicated 9600 or 19,200  
0        bit/second modem (synchronous) is required per link.

```
0 Business Network Management
0 ISDN Station Administration
```

0  
0 RELEASE 28.01  
0 93 12 03

## 0 To SMDR Data Spooling

0

0 The NSR28-32 software release of the Business Network Management  
0 (BNM) system provides enhancements to the SMDR Data Spooling fea-  
0 ture allowing multiple instances of the Data Spooler (DS) Program  
0 Replaceable Unit (PRU) to be provisioned in a BNM system. Prior  
0 to the NSR-28 release the maximum number of DS PRUs allowed was  
0 one.

0 A single DS PRU can transfer collected SMDR records to a customer  
0 premise device for up to eight (8) SMDR customers simultaneously.  
0 The NSR-28 BNM release allows up to a maximum of four (4) DS  
0 PRUs. Thus the maximum number of spooling ports that can spool  
0 records simultaneously is increased to thirty-two (32).

0 The actual number of DS PRUs required in a given BNM system is  
0 based on the number of simultaneously active Spooling ports re-  
0 quired at any given time. This value is then equal to the number  
0 of Spooling customers that must receive their SMDR records in the  
0 same time interval.

0 # DS PRUs = # Simultaneous Ports  
0 ----- (round up to whole no.)  
0 8 ports/PRU

0 Each DS PRU must be assigned to an Application Processor accord-  
0 ing to processor CPU real time requirements. The real time load  
0 imposed on an Application Processor by the DS is calculated as  
0 follows:

0 ( Average 11.25% \* # active ports) \* 100

0 Assuming that active spooling ports will be distributed evenly  
0 across DS PRUs, the number of active ports to be inserted in the  
0 above formula will be the total number of required ports divided  
0 by the required number of DS PRUs as calculated above.

0

0 RELEASE 28.01  
0 93 12 03

0 Utilizing the above formula it is determined that eight simul-  
0 taneously active ports will utilize 90% of the processor CPU ca-  
0 pacity. This is above the recommended engineering limit of 80%,  
0 however, the processor will operate sufficiently at this load  
0 level. The 80% maximum engineering load incorporates a 5% proc-  
0 essing overhead requirement and a 15% buffer. This 15% buffer  
0 was imposed to ensure that multiple PRUs on the same Application  
0 Processor would not overload the CPU. In the case of the DS PRU  
0 operating at maximum capacity, only the DS PRU may be loaded on a  
0 given Application Processor. When eight ports are spooling data  
0 simultaneously the CPU will run at 90% occupancy. When a given  
0 DS PRU requires less than 80% real time capacity other PRUs may  
0 be assigned with it on the same Application Processor as long as  
0 the engineering limit of 80% real time capacity is not exceeded.

0 It is assumed that the Spooling Supervisor (SS) PRU will not uti-  
0 lize significant processor real time capacity.

0 Of Station Administration Billing

0

0 The Business Network Management (BNM) Station Administration  
0 Billing feature provides the capability to bill the end-user for  
0 the daily usage of Station Administration. Billing records are  
0 generated based on user connect time, station feature counts,  
0 Marketing Service Center (MSC) work, activation of "Hot Spare"  
0 Directory Numbers (DN), Integrated Services Digital Network  
0 (ISDN) Packet Data changes. All billing data is transferred to  
0 magnetic tape for distribution to the Customer Record Information  
0 System (CRIS).

0 2.4.4.1 Connect Time Billing

0 The user connect time billing portion of this feature main-  
0 tains a database recording connect and disconnect logon activ-  
0 ity on a per customer basis. Utilizing this database a  
0 monthly connect time summary is then generated for each cus-  
0 tomer.

0 A new Program Replaceable Unit (PRU) called the BNM Customer  
0 Billing (CB) PRU is introduced in NSR28 to provide the user  
0 connect time billing functionality.

0 The CB PRU utilizes the Dynamic Network Control (DNC) Security  
0 Agent capability, which validates and maintains information  
0 about user logons, to obtain information regarding identifica-  
0 tion of those users logging on to and logging off of the BNM  
0 system. This information is obtained by regularly polling the  
0 Security Agent and thus generating records of session connect  
0 times. These records are maintained on a daily basis identi-  
0 fying every customer connect and disconnect to BNM Station Ad-  
0 ministration.

0

0

0  
0

0 RELEASE 28.01  
0 93 12 03  
0

#### 0 2.4.4.2 Feature Count/MSB Billing

0 The feature count capability keeps track of the total number  
0 of features assigned to a Directory Number on a daily basis.  
0 At the end of the day the maximum number of features assigned  
0 to each DN is retained and sorted into ten categories represent-  
0 ing lines with zero, one, two, three, four, five, six,  
0 seven, eight, and nine or more features. On the billing date  
0 for each customer all daily totals for each of the ten categories  
0 are totaled and divided by thirty. These totals are then  
0 sent to the Customer Record Information System (CRIS).

0 In addition to the above billing capabilities, billing records  
0 are generated for primary Integrated Services Digital Network  
0 (ISDN) directory number MSC work. These billing records are  
0 generated each time a customer requests MSC to make changes.  
0 Information pertaining to the date of a primary DN change, the  
0 actual DN and the number of changes processed by the MSC is  
0 provided.

0 "Hot Spare" directory numbers are billed based on the length  
0 of time they are activated. Changes regarding a hot spare DN  
0 are recorded on a per customer basis. Daily billing occurs  
0 based on this retained data.

0 Upon initializing the feature and activating a customer, an  
0 Audit process activates the Station Administration Recent  
0 Change Audit capability to reformat the customer's Station Ad-  
0 ministration Recent Change (SARC) station database into a format  
0 compatible with DVIX billing processes. Directory Number  
0 feature counts and MSC work counts are tracked via this database.  
0

0 A daily billing process executes once per day to read all customer  
0 databases and process daily feature counts and daily MSC  
0 counts. The output of this process is written to daily feature  
0 files.

0 All of the processes required to implement billing of  
0 feature/MSB counts are DVIX features executing on a 68020 SCSI  
0 File Processor equipped with the DVIX Operating System.

0

0

0  
0 RELEASE 28.01  
0 93 12 03

#### 0 2.4.4.3 ISDN Packet Data Billing

0 The ISDN Packet Data Billing functionality provides the Telco  
0 with the ability to bill customers based on the number of  
0 Packet B and Packet D Closed User Groups (CUGs) and on the  
0 number of Logical D channels. This functionality is imple-  
0 mented by modifying the Service Order (SO) PRU to add the  
0 basic procedures required to compile Packet Data Service Order  
0 recent change files.

0 An audit file generation procedure has been incorporated to  
0 enable the BNM system to obtain a snapshot of the customer's  
0 Network Administration System (NAS) database. This retrieval  
0 is initiated by the user when initializing a given customer.  
0 The recent change information is compiled after a change has  
0 been made to ISDN Data Network Addresses (DNAs) via service  
0 orders affecting CUGs and logical channels. Change records  
0 are retained in a file called Packet Data Recent Change  
0 (PDRC).

0 Actual billing occurs via a DVIX process responsible for proc-  
0 essing the PDRC files on a daily basis and generating a single  
0 accounting record for each customer. On a monthly basis, the  
0 daily billing records are processed to generate a monthly  
0 billing summary which is submitted to the Customer Record In-  
0 formation System (CRIS).

0 2.4.4.4 BNM Hardware Requirements For Station Administration Billing

0 The Station Administration Billing feature operates on a  
0 DNC-500 BNM system, and the following hardware is required in  
0 the BNM system to support this feature:

0 1) 68020-7 SCSI File Processor

0 Provision one per DNC-500 BNM system when the NTG243 feature  
0 is required. This processor must be equipped with the DVIX  
0 operating system. This processor is designated the Billing  
0 File Processor.

0 2) SCSI Disk Unit

0 Provision one per DNC-500 BNM system when the NTG241/NTG243  
0 features are provisioned. This disk unit is connected to the  
0 above SCSI File Processor to retain all customer billing data.  
0 This disk unit is designated the Billing Disk.

0 3) SCSI 9-Track Magnetic Tape Drive 6250 BPI

0 A minimum of one per DNC-500 BNM system is required to be used  
0 to record billing records on MAG Tape for subsequent transfer  
0 to the CRIS. If one already has been provisioned for other  
0 purposes then an additional tape drive is not required.

0 4) 68010/68020 Application Processor

0 An Application Processor is required to support the CB PRU.  
0 CB may be placed on the same processor as the PC PRU. It may  
0 also be placed onto a processor with other PRUs based on RAM  
0 and real time requirements.

## 0 Of BNM/COSMOS Interface

0

0 The BNM/COSMOS interface is the first interface application uti-  
0 lizing the Host Mediation Services (HMS) capability. HMS is a  
0 customizable interface feature allowing BNM applications to  
0 interact with various remote Host devices and Man-Machine Inter-  
0 face (MMI) terminals via a uniform Network Operations Protocol  
0 (NOP) interface. The BNM/COSMOS Interface feature customizes the  
0 HMS interface application allowing BNM to transfer Station Admin-  
0 istration Service Order information to the Telco's COSMOS system  
0 via a NOP interface.

### 0 2.4.5.1 BNM Hardware Requirements For BNM/COSMOS Interface

0 The BNM/COSMOS Interface feature operates on a standard BNM  
0 system, and the following hardware is required in the BNM sys-  
0 tem to support this feature:

#### 0 1) 68020-7 File Processor

0 Provision one (1) 68020-7 File Processor to support the  
0 BNM/COSMOS Interface feature software. This processor must be  
0 equipped with the DVIX operating system software and addi-  
0 tionally executes all of the DVIX application software modules  
0 associated with this feature. Be sure to order the appropri-  
0 ate DVIX software/license as indicated in the software provi-  
0 sioning section.

#### 0 2) SCSI Disk Unit

0 Provision one (1) 160 Mbyte Disk Only Unit to be used in con-  
0 junction with the above 68020 File Processor to store neces-  
0 sary Change Files. The 160 Mbyte Disk provides approximately  
0 158 Mbytes of formatted storage area. If storage requirements  
0 exceed 95% of the formatted 160 Mbyte capacity provision a 350  
0 Mbyte Disk Unit.

0

One LIU port equipped with the Asynchronous Programmable Input/Output (APIO) personality and a compatible modem is required per link.

```
graph LR; DVIX[DVIX FILE PROCESSOR] --- DISK[160/350 MB DISK]; STA[STATION ADMIN FILE PROCESSOR] --- SARCS[160/350 MB SARCS FILES]; DVIX --- DVS_BUS[DVS BUS]; STA --- DVS_BUS; DVS_BUS --- LAN_LINK[LAN LINK]; LAN_LINK --- LIU[LIU]; LIU --- MODEM[MODEM]; MODEM --> COSMOS[To COSMOS System];
```

The diagram illustrates the architecture of the COSMOS System. It features two main processing units at the top: the DVIX FILE PROCESSOR and the STATION ADMIN FILE PROCESSOR. Each is connected to a local storage device (160/350 MB DISK and 160/350 MB SARCS FILES, respectively). Both processors are connected to a central DVS BUS. The DVS BUS is further connected to a LAN LINK, which then connects to a LIU (Local Interface Unit). The LIU is connected to a MODEM, which finally connects to the COSMOS System.

0 RELEASE 28.01  
0 93 12 03

0 Of Call Detail Records Collection

0

0 The Business Network Management (BNM) system prior to the NSR-28  
0 software release was only able to collect Station Message Detail  
0 Recording (SMDR) records from Northern Telecom DMS-100 Family  
0 switching systems. With the release of NSR-28 a new feature is  
0 available allowing Call Detail Records (CDR) to be collected from  
0 other vendor switching systems and most major PBX's.

0 This feature is implemented utilizing a record converter manufac-  
0 tured by TSB International called the CC3. This hardware unit  
0 collects CDR utilizing a polling process, converts the records  
0 into CC3 format and forwards the data to the BNM system. The BNM  
0 system is then scheduled to retrieve the received data, format  
0 the CC3 CDR into DMS SMDR format and store the converted SMDR re-  
0 cords on disk. The BNM CDR collection feature is then compatible  
0 with the CC3 CDR format. NTI is not responsible for compatibil-  
0 ity issues between the CC3 and other vendor switching systems.  
0 Any vendor switch or PBX that is compatible with the CC3 may be a  
0 candidate for BNM CDR.

0 The software incorporated into the BNM system to poll the TSB CC3  
0 collection devices and receive the CDR records is called Switch  
0 PBX Poller (SPP). BNM Man-Machine Interfaces have been modified  
0 to allow BNM users to schedule the CC3 polling intervals.

0 BNM DVIX processes have been developed to periodically retrieve  
0 the received CDR records from disk and convert the CDR records  
0 into DMS-100 format SMDR records. Blocks of converted SPP CDR  
0 are filed onto disk on a per node and per customer basis where  
0 access by other SMDR features, such as SMDR Spooling and Call  
0 Tracking, can be achieved.

0 RELEASE 28.01  
0 93 12 03

0 2.4.6.1 BNM Hardware Requirements For CDR Collection

0 The Call Detail Records (CDR) Collection feature operates on a  
0 standard BNM system, and the following hardware is required in  
0 the BNM system to support this feature:

0 1) 68020-7 File Processor

0 Provision one per system to execute the required DVIX proc-  
0 esses as described in latter sections of this document. This  
0 processor may be designated the SPP File Processor.

0 2) SCSI Disk Unit

0 Provision one per system when the above File Processor is pro-  
0 visioned for this feature. This disk unit stores the incoming  
0 CDR records prior to conversion to SMDR records. This disk  
0 unit operates via the above File Processor and may be desig-  
0 nated the SPP Disk Unit.

0 If the 160 Mbyte storage area is not sufficient as determined  
0 using the disk storage calculations, provision one 350 Mbyte  
0 disk unit.

0 The converted CDR records are stored in the form of SMDR re-  
0 cords on the same disk unit as the standard DMS-100 SMDR re-  
0 cords. This disk unit is either the one interfacing the File  
0 Server :LOCAL or the disk unit(s) interfacing the :LOCSMDR  
0 File Server. In any case, ensure that adequate :LOCAL or  
0 :LOCSMDR disk storage area is available for both the standard  
0 DMS-100 SMDR records and the SMDR Records converted via this  
0 feature.

0 If an initial BNM system is being configured ensure that at  
0 least a second 160 Mbyte/350 Mbyte disk unit and associated  
0 processor (Primary or File Processor) is provisioned to retain  
0 the converted SMDR records. Refer to the NSR-27 Engineering  
0 guidelines for details on the :LOCSMDR File Server and the  
0 various processor/disk combinations.

0

0

0 3) Application Processor

0 The new HS PRU, as described in the following sections, operates on a 68010 or 68020 Application Processor. HS may be assigned on any Application Processor with other PRUs as required utilizing the processor memory/real time data provided in latter sections. Therefore it is not necessary to provision an Application Processor specifically for this feature unless it is deemed necessary.

0 4) Data Links

0 One asynchronous data link, either dial-up or dedicated, is required for each non-DMS node interfacing BNM. In association with this link, one Asynchronous Programmable Input Output (APIO) Lan Interface Unit (LIU) port and one asynchronous modem is required per data link. A 9600 bps data link is recommended, however, speeds of 300, 1200, 2400 and 4800 bits per second are supported.

## 0 FUSING REQUIREMENTS

0  
0 All systems that are co-located with a DMS-100F must be powered  
0 via -48VDC direct from the Power Board to ensure that Central Of-  
0 fice Isolated System Ground (ISG) requirements are met.

0 -48VDC Source: Nominal Input: -48VDC  
0 Minimum Input: -42VDC  
0 Maximum Input: -56VDC

0 2 Cabinets - Fused at 25A  
0 3 Cabinets - Fused at 38A  
0 4 Cabinets - Fused at 57A  
0 5 Cabinets - Fused at 63A  
0 6 Cabinets - Fused at 75A  
0 7 Cabinets - Fused at 89A  
0 8 Cabinets - Fused at 100A

0 AC Powered: 115VAC, 15 Amp (2-4 Cabinets)  
0 220VAC, 20 Amp (2-8 Cabinets)  
0 240 Watts/Cabinet (NT4G13DA)  
0 320 Watts/Cabinet (NT4G13FA)  
0 Constant Power required  
0 Single Outlet  
0 9 Ft. Power Cord

0 If a MIS Frame is provisioned for BNM LIUs and inverters, then  
0 the MIS Frame must be co-located with the BNM System and the cus-  
0 tomer is responsible for providing the power. This MIS Frame  
0 cannot be powered from a PDC in the DMS office.

0 If a DMS MIS Frame is provisioned for a BNM office, then a mis-  
0 cellaneous hardware kit must also be provided. Refer to ECM-406  
0 for available hardware kits.

0 13.3 SOFTWARE PROVISIONING

0

0 13.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

## 0 Station Administration

0

## 0 4.1.1.1 BNM Software Requirements

0 The following BNM feature packages are required to provision  
0 the ISDN Station Administration feature:

0 NTG240 ISDN Station Administration

0 All of the remaining Station Administration enhancements are  
0 included in the NSR28-32 release of the NTG102 software pack-  
0 age.

0 The ISDN Station Administration feature requires the following  
0 software packages interdependencies:

|   |        |                              |
|---|--------|------------------------------|
| 0 | NTG102 | Station Administration       |
| 0 | NTG000 | Data Voice System Base       |
| 0 | NTG001 | Dynamic Network Control Base |
| 0 | NTG002 | DNC-500 Base                 |

## 0 4.1.1.2 DMS-100F Software Requirements

0

0  
0 RELEASE 28.01  
0 93 12 03

0 The following DMS-100 software packages are required to allow  
0 the BNM system to administer ISDN Station service orders:

0 NTX273 Multi-Protocol Controller  
0 NTX560 Network Operations Protocol  
0 NTX563 Station Administration

0 The NTX563 software package has been modified in the BCS-27  
0 software release to allow ISDN stations/terminal service or-  
0 ders to be implemented remotely via the BNM system. Therefore  
0 all DMS-100 ISDN switches with customers utilizing the BNM  
0 ISDN Station Administration feature will require the above  
0 software and BCS-27.

0 In order to implement the Name and Suppress capabilities each  
0 applicable DMS-100F must be equipped with BCS-28.

## 0 Station Administration Billing

0

## 0 4.1.2.1 BNM Software Requirements

0 The following software packages and the associated  
0 interdependencies are required to implement the Station Adminis-  
0 tration Billing feature:

|   |          |                                         |        |
|---|----------|-----------------------------------------|--------|
| 0 | NTG241   | BNM Connect Time Data Collection        | NOTE 1 |
| 0 | NTG243   | ISDN Billing & CRIS Interface (DVIX)    | NOTE 1 |
| 0 | NTG163   | Foreign Operating System Manager (FOSM) | NOTE 2 |
| 0 | NT4G91FF | DVIX Operating System (03.20) & License | NOTE 3 |
| 0 | NT4G94FF | DVIX License Only                       | NOTE 4 |

0 NOTE 1: These packages are always required to implement  
0 the subject features.

0 NOTE 2: Provision the NTG163 package when any DVIX  
0 software feature is ordered. NTG163 is only  
0 required one time, therefore, if it already exists  
0 it is not necessary to order it again.

0 NOTE 3: Order one (1) NT4G91FF DVIX 3.01 license and  
0 software for the first 68020 File Processor  
0 running DVIX application software. If NT4G91FF  
0 was or is already ordered for a previous DVIX  
0 feature, it is not necessary to order this PEC  
0 again.

0 NOTE 4: Order one (1) NT4G94FF DVIX License for  
0 each 68020 processor running DVIX application  
0 software that is provisioned above and beyond  
0 the first processor as described in NOTE 2.

0 The developer of the DVIX operating software has stipulated  
0 that each processor running DVIX applications must be li-

0  
0 RELEASE 28.01  
0 93 12 03

0 censed. Northern Telecom has developed an ordering/pricing  
0 structure allowing us to pay the licensing fee on a per  
0 processor basis on behalf of the customer. The NT4G91 PEC  
0 numbers provide the actual DVIX software tape and a license  
0 fee for one processor. When additional processors are running  
0 DVIX applications in the same BNM system, the NT4G94 PEC must  
0 be ordered for each additional processor dedicated to DVIX.  
0 The Station Administration Billing feature requires the fol-  
0 lowing software package interdependencies:

|   |        |                              |
|---|--------|------------------------------|
| 0 | NTG000 | Data Voice System Base       |
| 0 | NTG001 | Dynamic Network Control Base |
| 0 | NTG002 | DNC-500 BNM Base             |
| 0 | NTG102 | Station Administration II    |
| 0 | NTG240 | ISDN Station Administration  |

| 0 | NTG248   | OSI Mediation Interface for BNM/COSMOS  | NOTE 1 |
| 0 | NTG249   | OSS Automatic Station Admin. Update     | NOTE 1 |
| 0 | NTG163   | Foreign Operating System Manager (FOSM) | NOTE 2 |
| 0 | NT4G91FF | DVIX Operating System (03.20) & License | NOTE 3 |
| 0 | NT4G94FF | DVIX License Only                       | NOTE 4 |

0 NOTE 1: This software package is always required to  
0 implement the BNM/COSMOS Interface feature.

0 NOTE 2: This software package must be provisioned when  
0 any DVIX application feature is provisioned.  
0 If NTG163 has already been provisioned for  
0 a DVIX feature, it is not necessary to order it  
0 again for BNM/COSMOS Interface.

0 NOTE 3: Order one (1) NT4G91FF DVIX 3.20 license and  
0 software for the first 68020 File Processor  
0 and/or Application Processor running DVIX  
0 application software. If NT4G91FF  
0 was or is already ordered for a previous DVIX  
0 feature, it is not necessary to order this PEC  
0 again.

0 NOTE 4: Order one (1) NT4G94FF DVIX License for  
0 each 68020 processor running DVIX  
0 application software that is provisioned above  
0 and beyond the first processor as described in  
0 NOTE 3.

0  
0 RELEASE 28.01  
0 93 12 03

0

0 The developer of the DVIX operating software has stipulated  
0 that each processor running DVIX applications must be li-  
0 censed. Northern Telecom has developed an ordering/pricing  
0 structure allowing them to pay the licensing fee on a per  
0 processor basis on behalf of the customer. The NT4G91 PEC  
0 numbers provide the actual DVIX software tape and a license  
0 fee for one processor. When additional processors are running  
0 DVIX applications in the same BNM system, the NT4G94 PEC must  
0 be ordered for each additional processor dedicated to DVIX.

0 The BNM/COSMOS Interface feature requires the following soft-  
0 ware package interdependencies:

0 NTG000 Data Voice System Base  
0 NTG001 Dynamic Network Control Base  
0 NTG102 Station Administration  
0 NTG002 DNC-500 Base

## 0 Call Detail Records (CDR) Collection

0

## 0 4.1.4.1 BNM Software Requirements

0 The CDR collection features operate on a standard BNM system  
0 equipped with the Data Voice System (DVS) base, Dynamic Net-  
0 work Control (DNC) base and BNM base software.

0 The following software packages and the associated  
0 interdependencies are required to implement the Call Detail Re-  
0 cords (CDR) Collection feature:

|   |          |                                      |        |
|---|----------|--------------------------------------|--------|
| 0 | NTG212   | Network Node SMDR Collection         | NOTE 1 |
| 0 | NTG213   | Interface To PBX for SMDR Collection | NOTE 2 |
| 0 | NTG163   | Foreign Operating System Manager     | NOTE 3 |
| 0 | NT4G91FF | DVIX 3.20 Operating System (68020)   | NOTE 4 |
| 0 | NT4G94FF | DVIX License                         | NOTE 5 |
| 0 | NT4G91EE | Turbo Informix                       | NOTE 6 |
| 0 | NT4G91DE | Informix 4GL Runtime                 | NOTE 6 |
| 0 | NT4G91BX | Informix 4GL                         | NOTE 6 |
| 0 | NT4G91FU | Informix ESQL/C License              | NOTE 7 |
| 0 | NT4G91FN | C-ISAM License                       | NOTE 7 |

0 NOTE 1: Provide this package when Call Detail Recording  
0 record collection is required from a non-DMS-100F  
0 switching system. For NSR28-32 the only supported  
0 switch types are any that are compatible with the  
0 CC3 device from TSB.

0 NOTE 2: Provide this package when Call Detail Recording  
0 record collection is required from a PBX. For a  
0 list of compatible PBX's refer to NTP-450-1021-131.

0 NOTE 3: Provision the NTG163 package when any DVIX  
0 software feature is ordered. NTG163 is only

0 RELEASE 28.01  
0 93 12 03  
0

0 required one time, therefore, if it already exists  
0 it is not necessary to order it again.

0 NOTE 4: Order one (1) NT4G91FF DVIX 3.20 license and  
0 software package for the first 68020 File  
0 Processor or Application Processor running a DVIX  
0 Feature. If NT4G91FF was or is already ordered  
0 for a previous DVIX feature, it is not necessary  
0 to order this PEC again. In this application the  
0 NTG212 and NTG213 packages are both DVIX features.

0 NOTE 5: Order one (1) NT4G94FF DVIX License for  
0 each 68020 processor running DVIX  
0 application software that is provisioned above  
0 and beyond the first processor as described in  
0 NOTE 3.

0 NOTE 6: Order one (1) NT4G91EE Turbo Informix software  
0 package when NTG212 and/or NTG213 is ordered.  
0 Also, order one (1) NT4G91DE Informix 4GL Runtime  
0 and one (1) NT4G91BX Informix 4GL software package  
0 when NTG212 and/or NTG213 is ordered. These codes  
0 include the software and lincense fee for the SPP  
0 File Processor.

0 NOTE 7: Order one (1) each of these referenced license  
0 codes when the NTG212 and/or NTG213 software  
0 packages are provisioned. These licenses are  
0 required because the NTG212 and NTG213 features  
0 utilize portions of this Informix software.  
0 It is only necessary to ensure that the  
0 proper license fees are paid.

0 The developer of the DVIX operating software has stipulated  
0 that each processor running DVIX applications must be li-  
0 censed. Northern Telecom has developed an ordering/pricing  
0 structure allowing us to pay the licensing fee on a per  
0 processor basis on behalf of the customer. The NT4G91 PEC  
0 numbers provide the actual DVIX software tape and a license  
0 fee for one processor. When additional processors are running  
0 DVIX applications in the same BNM system, the NT4G94 PEC must  
0 be ordered for each additional processor dedicated to DVIX.

0 13.3.3 MEMORY PROVISIONING

0  
0 BNM requires memory to be provisioned for various PRUs and  
0 Storage Disks. These requirements are dependent on the type of  
0 software features ordered. Refer to the appropriate System Engi-  
0 neering Bulletin (SEB) for detailed information:

0 89-03-007 NSR-28 BNM Base Enhancements  
0 89-03-003 Station Administration Enhancements  
0 89-03-004 SMDR Data Spooling Enhancements  
0 89-03-005 Station Administration Billing  
0 89-03-002 BNM/COSMOS Interface  
0 89-03-001 Call Detail Records (CDR) Collection  
0 90-12-002 Business Network Management (BNM) NSR-32  
0 Engineering Guidelines.

0 13.4 REAL TIME IMPACT

0 Real time impact is dependent on the type and quantity of PRUs  
0 provisioned. Refer to the appropriate System Engineering Bulle-  
0 tin (SEB) for detailed information:

0 89-03-007 NSR-28 BNM Base Enhancements  
0 89-03-003 Station Administration Enhancements  
0 89-03-004 SMDR Data Spooling Enhancements  
0 89-03-005 Station Administration Billing  
0 89-03-002 BNM/COSMOS Interface  
0 89-03-001 Call Detail Records (CDR) Collection  
0 90-12-002 Business Network Management (BNM) NSR-32  
0 Engineering Guidelines.

0 RELEASE 28.01  
0 93 12 03

#### 0 14.0 Disk Drive Unit Provisioning

0 Available disk capacity is that capacity remaining after  
0 power-up and formatting:

0 66 MByte Disk - 60,513,280 bytes available  
0 154 MByte Disk - 144,615,424 bytes available  
0 8" Disk Drive Unit - 240,020,000 bytes available

0 DDU's should be provisioned for a five year period by using five-  
0 year forecasted traffic figures. The DDU provisioning must be  
0 re-evaluated for another five year period with each office exten-  
0 sion.

#### 0 Data Recording Management

0 Data Recording Management involves functions relating to the De-  
0 vice Independent Recording Package (DIRP). DIRP controls the  
0 data flow from originating subsystems (i.e. OM,AMA,JF) to the de-  
0 vices (i.e. Tape or DDU) where the data is stored.

0 Disk Drive Unit sizing is divided into the following major areas

- 0 o General Provisioning Information
- 0 o Subsystem volume sizes (which are as follows)
  - 0 o Office Image
  - 0 o Auto Messaging Accounting (AMA)
  - 0 o Parallel AMA
  - 0 o Operational Measurements (OM)
  - 0 o Journal File (JF)
  - 0 o Peripheral Module (PM) loads
  - 0 o Non-Resident Software
  - 0 o Batch Data Modification Orders (DMO)
  - 0 o Scan Log
  - 0 o Scratch Area
  - 0 o Killer Trunks (KT)

#### 0 GENERAL PROVISIONING INFORMATION

0 A DDU is physically allocated in blocks. Each "DDU block" con-  
0 tains 1024 Bytes. Two (2) "DDU blocks" make up a "DIRP block" of  
0 2048 Bytes. A "DIRP file segment" contains 256 DIRP blocks for a  
0 total of 524,288 Bytes.

0 A volume is an area of the DDU. Volumes are used for each area  
0 of Data Recording Management. An overhead of 2,148,352 Bytes are  
0 required per volume. The overhead consists of 51,200 Bytes (50

0  
0 RELEASE 28.01  
0 93 12 03

0 blocks) for volume and file control and 2,097,152 Bytes (2048  
0 blocks) for low space conditions. a DDU volume is physically de-  
0 fined by the multiple number "DIRP file segments" it contains  
0 plus the required overhead.

0 The following are volume summary guidelines;

- 0 o All DDU's and subsystems should be provisioned evenly across
- 0 IOC's
- 0 o The minimum size of a volume is 2,672,640 Bytes (2610K blocks)
- 0 o The maximum size of a volume is 67,108,864 Bytes (64M blocks)
- 0 o One volume must be located in one DDU (i.e. a single volume
- 0 cannot span 2 DDUs)
- 0 o The maximum number of volumes for each DIRP subsystem is 24
- 0 o Each volume for a DIRP subsystem must be the same size
- 0 o DIRP will use space evenly to all volumes allocated to a
- 0 subsystem
- 0 o Volumes must be spread evenly over the DDUs provisioned
- 0 o There must be at least two (2) volumes per DDU

0 14.1.3 PROVISIONING CONSIDERATIONS

0

0 Office Image System Volume Size

0 The Office Image is formed by the total combined Program Store  
0 and Data Store requirements. It is recommended that a full  
0 67,108,864 byte volume (maximum usable volume plus overhead) be  
0 reserved for the Office Image. A volume of this size provides  
0 adequate storage for an office containing 8 megawords of Program  
0 Store (PS) and 16 megawords of Data Store (DS) per side plus 50  
0 percent spare for five-year growth.

0 Actual Office Image requirements may also be calculated using the  
0 following formula:

0 Office Image Volume Size =

0 2,148,352 Bytes +  
0  $(.75 * (\text{Program Store (bytes)} + \text{Data Store (bytes)}))$

0 Where 2,148,352 bytes is for Disk volume maintenance

0 This formula takes into account 50 percent spare for five-year  
0 growth and the prediction that only half of the provisionable PS  
0 and DS memory is Office Image.

0 This formula is valid for NT40 offices and SuperNode offices  
0 without a System Load Module (SLM). The SLM contains SuperNode  
0 office images and thus would not require redundant images to re-  
0 side on disk.

0 Each DDU can contain only one Office Image volume. The maximum  
0 number of DDU's containing an Office Image volume is three.

0 Automatic Message Accounting (AMA)

0 AMA records should be stored on DDU:00 and DDU:01 equipped with  
0 power interlock. AMA entries for the total retention period are  
0 recorded over DDU:00 and DDU:01 (half on DDU:00 and half on  
0 DDU:01).

0

0

0 RELEASE 28.01  
0 93 12 03  
0

0 The required period of AMA record retention is specified in the  
0 number of days. Valid entries are 0 days to 499 days. An example  
0 of four days retention is as follows:

0 First Day: Recorded on DDU:00  
0 Second Day: Recorded on DDU:01  
0 Third Day: Recorded on DDU:00  
0 Fourth Day: Recorded on DDU:01

0 The AMA subsystem on DDU:00 and DDU:01 should be set up for a  
0 minimum of two volumes each. AMA/Local Call Detail Recording  
0 (LCDR) and Station Message Detail Recording (SMDR) data may be  
0 contained in the same volume if NT format is utilized. This data  
0 may also be recorded in separate volumes. The factor 1.3 included  
0 in calculations throughout this document consists of a dedicated  
0 area for volume and file control.

0 If a Distributive Processing Peripheral (DPP) or Billing Media  
0 Converter (BMC) is used, primary AMA is not stored on the disk.

0 NT Format AMA

0 The following calculations are used to determine storage require-  
0 ments for AMA in the NT format. Entries should be answered calls  
0 unless the Telco is recording unanswered attempts, in which case  
0 entries should be call attempts.

0 A = AMA DDD High Day Entries \* 22 bytes  
0 B = Lcdr High Day Entries \* 22 bytes  
0 C = AMA IDDD High Day Entries \* 25 bytes  
0 D = Tops High Day Entries \* 45 bytes

0 E = Optional Trunk ID extension High Day Entry \* 9 bytes

0 F = Subtotal NT AMA = A+B+C+D+E

0 Total NT AMA = F \* 1.3 factor \* number of days retention

0 (rounded up to the nearest multiple of 524,288)

0 Number of AMA Volumes = Total NT AMA

0 -----  
0 volume size (in bytes)

0 (rounded up to the nearest even integer)

0 Host - Input/Output Equipment  
0 Chapter 8

0 RELEASE 28.01  
0 93 12 03

0 AMA/volume = Total NT AMA (bytes)  
0 ----- + 2,148,352 bytes (overhead)  
0 number of AMA volumes

0 The minimum volume size for AMA is 2,672,640 Bytes. The maximum  
0 volume size for AMA is 67,108,864 Bytes. The recommended minimum  
0 of AMA volumes is four. The maximum number of volumes is 24.

0 SMDR (IBN Lines)

0 The following calculations are used to determine storage require-  
0 ments for SMDR records.

0 S =  
0 SMDR (dialed digits less than 12) \* High Day entries \* 33 bytes

0 T =  
0 SMDR (dialed digits 12 or greater) \* High Day entries \* 39 bytes

0 H = Additive for High Day entries \* 13 bytes

0 (for calls if the dialed digits are different than the outputted  
0 digits and the option is activated to record outputted digits.)

0 J = Subtotal SMDR = S+T+H

0 Total SMDR = J \* 1.3 factor \* number of days retention.

0 (round up to the nearest multiple of 524,288)

0 Number of SMDR Volumes = Total SMDR  
0 -----  
0 volume size (in Bytes)

0 (round up to the nearest even integer)

0 SMDR/volume = Total SMDR in bytes  
0 ----- + 2,148,352 bytes (overhead)  
0 number of SMDR volumes

0 The minimum volume size for SMDR is 2,672,640 Bytes. The maximum  
0 volume size for SMDR is 67,108,864 Bytes. The recommended minimum  
0 of SMDR volumes is four. The maximum number of volumes is 24.

0 RELEASE 28.01  
0 93 12 03

0 Combined AMA and SMDR Volumes (NT Format Only)

0 (Do not calculate here if calculated separately.)

0 AMA/Volume =

0 Total NT AMA + Total SMDR  
0 ----- + 2,148,352 bytes (overhead)  
0 number of AMA volumes

0 Bellcore AMA Format

0 The following calculations are used to determine storage require-  
0 ments for AMA in the Bellcore record format.

0 Basic Average High Day entries \* 55 bytes + See notes = K

0 Note 1:

0 If the office is optionally equipped with software for Equal  
0 Access (Equal Access End Office NTX186AA or Access Tandem  
0 NTX386AA), then add 10 bytes to the multiple 55 bytes above.  
0 Ensure that High Day entries contain both originating and  
0 terminating calls if recorded.

0 Additive for Switch Supervisory Unit (SSU) for line and trunk if  
0 feature NTX076AA AMA Enhanced is turned on:

0 L = High Day Entries \* 8 bytes

0 Additive for IBN customer dialed account number(package NTX102AA)

0 M = High Day entries \* 10 bytes

0 Reduction due to compression (high runner call types: message  
0 rate, flat rate, station paid calls are compressed by 10 bytes.)

0 N = High Day entries \* 10 bytes

0 P = Subtotal Bell Core AMA Format = (K+L+M) - N

0 Total Bell Core AMA Format = P \* factor 1.2 \* number of days  
0 retention \* 1.3

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 (round up to the nearest multiple of 524,288)

0 Number of AMA volumes = total Bell Core AMA  
0 -----  
0 volume size (in Bytes)

0 (round up to the nearest even integer)

0 AMA/Volume =

0 Total Bell Core AMA Format  
0 ----- + 2,148,352 bytes (overhead)  
0 number of AMA volumes

0 (Factor 1.2 estimates variable structure code information per  
0 call code.)

0 The minimum volume size for AMA is 2,672,640 Bytes. The maximum  
0 volume size for AMA is 67,108,864 Bytes. The recommended minimum  
0 of AMA volumes is four. The maximum number of volumes is 24.

0 RELEASE 28.01  
0 93 12 03  
0

0 Expanded Bellcore AMA Format (EBAF)

0 EBAF uses new base structure codes and appended modules to record  
0 AMA information. Refer to SEB: 89-12-002 for a cross reference  
0 of record sizes.

0 Example: A 0+ call originating on a TOPS trunk group with the  
0 calling party requesting person-to-person. The call is then  
0 billed and completed. Record size for pre-EBAF = 69 bytes, with  
0 EBAF = 84 bytes.

0 Parallel Volumes

0 Parallel recording is optional for any subsystem on Mag Tape or  
0 disk. If parallel recording is done on disk it should be done on  
0 one that does not have regular AMA volumes (i.e.  
0 active/stand-by). It is recommended that parallel volumes should  
0 be sized at a full 67,108,864 Bytes.

0 Operational Measurement Volume

0 The number of Common Language Location Identifiers (CLLI) in-  
0 cludes pseudo maintenance CLLI, spares, interoffice CLLI, and  
0 growth CLLI. The minimum number of CLLI is 120.

0 Basic OM on Trunk Groups (Single Precision)

0  $Q = \text{Number of CLLI's} * 18 \text{ bytes} * \text{number of dumps/day (max.48)}$   
0 Repeat for all classes used. The maximum number of classes is 30.

0 Basic OM's on Trunk Groups (Double Precision)

0  $R = \text{Number of CLLI's} * 36 \text{ bytes} * \text{number of dumps/day (max. 48)}$   
0 Repeat for all classes used.

0 IBN OM's (Single Precision)

0  $S =$   
0 Number of Customer Groups \* 175 bytes \* no. of dumps/day (max.48)  
0 Repeat for all classes used. The maximum number of classes is 30.

0 IBN OM's (Double Precision)

0  $T =$   
0 Number of Customer Groups \* 350 bytes \* no. of dumps/day (max.48)  
0 Repeat for all classes used.

0 RELEASE 28.01  
0 93 12 03

0

0 Journal File Volume

0 The Journal File (JF) subsystem provides a means of recording  
0 Data modification Orders (DMO's) allowing their addition to the  
0 office image on respective disk drives after an office reload.

0 In a two DDU office, the expected worst case number of days re-  
0 tention for DDU:00 is seven days. DDU:01 has the image taken at  
0 the time the office was last booted in. If the image is older  
0 then 61 days, the following options are possible.

0 (1) DMO's that are older than 61 days are only stored on  
0 magnetic tape, not disk. The number of days retention  
0 is 61 days for DDU:01.

0 (2) The DMO's that are older than 61 days are stored on DDU.  
0 The number of days retention is optional up to as much as  
0 6 months to one year.

0 In a three DDU Office, the expected worst case number of days re-  
0 tention for DDU:00 & 01 is 14 days. For DDU:02 the number of  
0 days retention is the same as for DDU:01 in a two DDU office (see  
0 above.)

0 JF Volume

0 Total JF =

0 No. of DMO's \* 512 bytes \* factor 1.3 \* No. of days retention  
0 (round up to the nearest multiple of 524,288)

0 Number of days retention equals the age of the office image in  
0 days.

0 JF/Volume = Total JF + 2,148,352 bytes (Overhead)  
0 (minimum 2,672,640 bytes)

0 Repeat for each DDU.

0 Duplicate the PM loads on two DDU's on separate IOC's.  
0 Minimum PM volume size is 2,672,640 bytes.

0 RELEASE 28.01  
0 93 12 03

0 Non-Resident Software Volume

0 All Non-Resident Software is supplied to the Telco on a tape.  
0 Thus volume space on a DDU is not required.

0 Batch Data Modification Order Volume

0 Externally created Data Modification Orders (DMOs) may be bulk  
0 loaded into the system. DMOs can be written to DDUs either from  
0 magnetic tape or through a communication link with remote batch  
0 input terminal.

0 Batch DMO Volume = Number of DMOs\_\_\_\_\_ x 128 x 1.3

0 The suggested minimum is 250 DMOs. The Maximum number of DMO's is  
0 4096. If this feature is used, then the recommended volume size  
0 is 2,672,640 bytes.

0 Scan Log Volume Size (Log Analyzer)

0 Scan Log is a tool that can be used to analyze log messages. A  
0 recommended low value is 5,242,880 bytes. At the operating com-  
0 pany's option this can be increased.(Maximum volume size is  
0 67,108,864 Bytes)

0 Scratch Area Volume Size

0 Allocate the unused area on each DDU as a scratch area. Size the  
0 scratch area on each DDU into approximatley 2,097,152 or  
0 3,145,728 byte volumes.

0 Note: A scratch area volume name must be between one to four  
0 characters in order to be usable by DIRP in an emergency  
0 situation.

0 Killer Trunk Reports To DIRP

0 Determine the required DDU storage requirements for Killer Trunk  
0 (KT) Reports using the following formula:

0  $KT \text{ Storage} = N * (36 \text{ bytes} + (12 \text{ bytes} * M) + 20 \text{ bytes}$

0 Where: N = Number of reports generated per day.

0 M = Number of IBN trunk members to test

0 Multiply the total bytes required by the number of days retention.

0 RELEASE 28.01  
0 93 12 03

0

0 Total KT = KT Storage \* 1.3\* number of days retention

0 (round up to the nearest multiple of 524,288)

0 Number of KT volumes = Total KT

0

0 -----  
0 Volume Size (in Bytes)

0 (round up to the nearest even integer)

0 KT per volume = Total KT

0

0 ----- + 2,672,640 bytes

0 Number of KT Volumes

0 The minimum KT per volume is 2,672,640 records or bytes.

0 | \* For a definition of Killer Trunks, refer to NTP-297-1001-451  
0 | Customer Data Schema: table TRKGRP.

0 Automatic Trunk Testing Reports to DIRP

0 Determine the required DDU storage for Automatic Trunk Test re-  
0 ports using the following formula.

0 ATT Storage =

0 240 bytes + (P \* 70 bytes) \* Q + 20 bytes + (R \* 10 bytes)

0 Where:

0 P = Number of IBN trunk group members per trunk group.

0 Q = Number of IBN trunk groups.

0 R = Number of restarts

0 Multiply total bytes required by the number of days retention.

0 Total ATT = Storage ATT \* 1.3 \* number of days retention

0 (round up to the nearest multiple of 524,288)

0

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 JNumber of ATT volumes = Total ATT  
0 -----  
0 volume size (in Bytes)

0 (round up to the nearest even integer)

0 ATT per volume =  $\frac{\text{Total ATT}}{\text{Number of ATT Volumes}} + 2,672,640 \text{ bytes}$   
0  
0

0 The minimum ATT per volume is 2,672,640 bytes

0 ATT and KT reports should be separate volumes.

0 The minimum volume size for ATT and KT is 2,672,640 Bytes. The  
0 maximum volume size for OM is 67,108,864 Bytes. The recommended  
0 minimum of ATT and KT volumes is two. The maximum number of vol-  
0 umes is 24.

0 Summary

0 Total all DDU requirements and divide by total usable volume  
0 space to determine required number of DDU's.

## 0 15.0 Magnetic Tape Drive (MTD) and

### 0 Magnetic Tape Drives

0 Magnetic tapes are used in DMS as external storage devices and as a  
0 media for transferring bulk data and operation software into and out  
0 of the system. The read-write device for magnetic tapes is the MTD.  
0 Magnetic tapes are used for the following functions:

- 0 1) Office Image (system software backup)
- 0 2) Trouble Diagnostics and Reports
- 0 3) Automatic Message Accounting (AMA)
- 0 4) Operational Measurements (OM) if required
- 0 5) Data Modification Orders (DMO) bulk
- 0 6) Service Analysis (SA) if required
- 0 7) Call Detail Recording (DMS-300 only)
- 0 8) Peripheral Loads (to re-load peripherals)

### 0 Disk Drive Units

0 NT's Disk Drive Unit (DDU) is included in the Input/Output Device  
0 (IOD) subsystem of the DMS-100 Family of switches. Its applica-  
0 tion is similar to MTDs when used for storage or retrieval of in-  
0 formation. The following are some of the types of information  
0 that can be stored on a disk:

- 0 - The office image
- 0 - Non-resident software commands
- 0 - Automatic Message Accounting (AMA), Operational Measurements  
0 (OMs), and Journal File (JF) data.

0 Refer to ECM 300 for calculation of DDU volume size.

## 0 15.1 HARDWARE PROVISIONING

0

### 0 15.1.1 HARDWARE USAGE RESTRICTIONS

0

0 When mounted in the NT4X00AF shelf, the 5.25" and 8" DDUs can  
0 only be provisioned in the IOE shelf position 04 with shelf posi-  
0 tion 18 left vacant. This is due to heating restrictions with

0  
0 RELEASE 28.01  
0 93 12 03

0 the DDUs and a fusing limitation on the IOE's FSP. 8" DDUs are  
0 no longer available.

0 A NT4X00AZ DDU Enhancement Kit must be provided with a 5.25" DDU  
0 when the 5.25" DDU is provided to replace a 14" DDU on a  
0 NT4X00AA, NT4X00AB or NT4X00AC DDU shelf.

0 A NTZZ99AG Univ 5.25" DDU Upgrade Kit must be provided with a  
0 5.25" DDU when the 5.25" DDU is provided to replace an 8" Priam  
0 or Mercury DDU on a NT4X00AA, NT4X00AB, NT4X00AC or NT4X00AF DDU  
0 shelf.

#### 0 15.1.2 HARDWARE DEPENDENCIES

0  
0 Provide one additional NT0X36AB in the IOE Frame Supervisory  
0 Panel (FSP) when the NT4X00AF Shelf is provisioned.

#### 0 15.1.3 PROVISIONING CONSIDERATIONS

##### 0 0 Magnetic Tape Drives

0 For an office which will have MTDs only, Magnetic Tape Drive  
0 Units are provisioned as follows:

- 0 - A minimum of two (2) is required per system, one for mainte-  
0 nance and one for back-up or image/spare.
- 0 - An additional two (2) may be required for LAMA/CAMA. This  
0 function can be provided on a Distributed Processor Periph-  
0 eral (DPP).
- 0 - An extra MTD may be provided for separate Operational Meas-  
0 urement (OM) support.
- 0 - Provide a maximum of ten (10) MTD per system.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 In a disk office one MTD is retained primarily to enable physical  
0 transportation of data to and from the office and secondarily as  
0 a back up to the DDU.

0 The standard DMS MTD is the Cook Electric drive, 209800-153 or  
0 NT0X44AB. If the MTD is to be drop-shipped, separately order the  
0 the drive (209800-153) and its mounting hardware (NT0X44AD) on  
0 the appropriate specs. If MTD is not to be drop-shipped, the  
0 combined drive and hardware is ordered using NT0X44AB. The  
0 Hewlett Packard 7970E-151-048 MTD has been rated MD and can no  
0 longer be ordered by Northern Telecom. Provide one (1) NT0X44AC  
0 MTD Mounting Hardware to mount a customer-provided HP drive (for-  
0 merly provided if 7970E-151-048 MTD was drop-shipped by NT).  
0 Customers may provide their own MTD and mounting hardware if the  
0 Cook Electric drive is not suitable. In offices where the HP MTD  
0 is retrofitted with DDU, provide one (1) R0107733 HP MTD Packing  
0 Box for shipping and storing purposes.

0 Disk Drive Units

0 The 5.25" DDU has been developed to replace the 8" DDU which re-  
0 placed the 14" DDU. In new offices, one or two 5.25" DDU are to  
0 be provisioned on a NT4X00AF shelf. In existing offices, when  
0 replacement is necessary, the 5.25" DDU should be provided. To  
0 replace a 14" DDU, a NT4X00AZ DDU Enhancement Kit shall be pro-  
0 vided along with a 5.25" DDU on the NT4X00AA, NT4X00AB or  
0 NT4X00AC DDU shelf to provide the proper cabling and mounting  
0 equipment. To replace an existing 8" DDU, one 5.25" DDU should  
0 be ordered for the NT4X00AA, NT4X00AB or NT4X00AC shelf and one  
0 or two DDUs should be ordered for the NT4X00AF shelf. A NTZZ99AG  
0 Univ 5.25" DDU Upgrade Kit must be provided with each 5.25" DDU  
0 provided to replace an 8" DDU.

0 The 8" DDU is no longer available for ordering. Provide the  
0 5.25" DDU for all offices.

0 The following hardware is required for 5.25" DDU assignment in a  
0 new DMS-100F office. (The 8" DDU is no longer available)

0 PEC CPC

0 NT4X00AG B0232823 - 5.25" DDU - (228.7 Mbytes formatted) -  
0 Maximum 2 per NT4X00AF shelf.

0 NT4X0038 B0227231 - Mercury Disk Hardware Kit - Provide one  
0 (1) per 5.25" or 8" DDU.

0 NT4X00AF B0225620 - Dual Disk Drive Shelf Assembly -  
0 supports two (2) 5.25" or two (2)  
0 8" DDUs.

0 NT1X55DA B0226492 - Disk Drive Controller CP.  
0 Provide one (1) per DDU.

0 Notes: 1) For all offices, provide the 5.25" DDUs. The 8"  
0 DDU is no longer available.

0 2) The 1st DDU shall be located on the left  
0 side (slot 10) of the NT4X00AF Dual Disk Drive  
0 shelf (located in shelf Position 04). If a 2nd  
0 DDU is required on the same shelf, it shall  
0 be located on the right side (slot 18).

0 3) DDUs can only be provisioned in the IOE on shelf  
0 pos. 04 with shelf pos. 18 left vacant. This is  
0 due to heating restrictions with the DDU and a  
0 fusing limitation on the IOE's FSP.

0 4) Provide one additional NT0X36AB in the IOE Frame  
0 Supervisory Panel (FSP) when the NT4X00AF Shelf is  
0 provisioned.

0 The following hardware is required to replace an existing 14" DDU  
0 on a NT4X00AA, NT4X00AB or NT4X00AC shelf with a 5.25" DDU. The  
0 8" DDU is no longer available.

0 PEC CPC

0 NT4X00AG B0232823 - 5.25" DDU - Maximum one (1) per  
0 NT4X00AA, NT4X00AB or NT4X00AC shelf.

0 NT4X00AZ B0234738 - DDU Enhancement Kit

0 Notes: 1) For all offices, provide the 5.25" DDU. The 8"  
0 DDU is no longer available.

0

0 Host - Input/Output Equipment  
0 Chapter 8

0 RELEASE 28.01  
0 93 12 03  
0

0 2) The NT4X00AZ Enhancement Kit provides appropriate  
0 cabling and mounting equipment to allow the  
0 replacement of a 14" DDU on a NT4X00AA, NT4X00AB  
0 or NT4X00AC DDU shelf with a 5.25" DDU. The 8"  
0 DDU is no longer available and the NT4X00AY  
0 Enhancement Kit is no longer available.

0 The following hardware is required to replace existing 8" DDU(s)  
0 on an NT4X00AA, NT4X00AB, NT4X00AC or NT4X00AF shelf with 5.25"  
0 DDU(s).

0 PEC CPC

0 NT4X00AG B0232823 - 5.25" DDU - Maximum one (1) per  
0 NT4X00AA, NT4X00AB or NT4X00AC shelf.  
0 Maximum two (2) per NT4X00AF shelf.

0 NTZZ99AG B0235777 - Univ 5.25" DDU Upgrade Kit (One per  
0 5.25" DDU is required)

0 Notes: 1) Existing shelf cabling used for the 8" DDU(s)  
0 will be used for the 5.25" DDU(s).

0 2) On the NT4X00AF shelf, where two 8" DDUs are  
0 existing, it is possible to replace only one  
0 of the 8" DDUs with the 5.25" DDU, resulting  
0 in one (1) 5.25" DDU and one (1) 8" DDU on the  
0 shelf together.

0 Per Customer request, the NT4X0046 Cable Assembly supplied in the  
0 NT4X00AY 14 Inch DDU Enhancement Kit during a 14" DDU replacement  
0 by an 8" DDU or the two NT4X0039 Cable Assemblies of an existing  
0 NT4X00AF can be replaced with the NT4X0048 cable assembly. For  
0 all new 14" DDU to 5.25" DDU replacements provide the NT4X00AZ  
0 DDU Enhancement Kit. The NT4X00AY DDU Enhancement Kit is no  
0 longer available.

0 15.1.4 OFFICE LAYOUT INFORMATION

0  
0 5.25" DDUs can only be provisioned in the IOE on shelf position  
0 04 and shelf position 18 must be left vacant. This is due to  
0 heating restrictions with the DDUs and a fusing limitation on the  
0 IOE's FSP. When replacing 14" DDU's with 5.25" DDUs, they can be  
0 replaced on a one to one basis with the existing shelves remain-  
0 ing in place. The 8" DDUs are no longer available.

## 0 16.0 NTX251 - Datapath Modem Pooling

0 In order to fully comprehend the capabilities of Modem Pooling it is  
0 essential that the user have a thorough working knowledge of DATAPATH.  
0 A synopsis of DATAPATH is as follows:

0 DATAPATH allows users to connect their computers and terminals  
0 through the DMS100F in circuit switched digital networks.  
0 DATAPATH provides full-duplex asynchronous and synchronous data  
0 transmission at various user-selectable speeds (300-19,200 bps  
0 asynchronous and 1200-64,000 bps synchronous).

0 It also uses a standard, non-loaded 2Wire subscriber loop for  
0 distances as defined below:

| CABLE GAUGE | MAX CABLE LENGTH<br>FOR 42db LOSS | MAX CABLE LENGTH<br>FOR 31.25 MS Delay |
|-------------|-----------------------------------|----------------------------------------|
| =====       | =====                             | =====                                  |
| 22          |                                   | 5.7Km(18.5Kft)                         |
| 24          |                                   | 5.4Km(17.5Kft)                         |
| 26          | 4.0Km(13.1Kft)                    |                                        |

0 As indicated in the above chart the limiting factor for 22 &  
0 24AWG cable is Transmission Delay and for 26 AWG cable the lim-  
0 iting factor is Transmission Loss.

0 DATAPATH uses standard A & B bit signaling on the trunk side,  
0 and industry standard RS-232C and V.35 interfaces to the end us-  
0 er's Data Terminal Equipment (DTE). DATAPATH provides users  
0 with a number of DMS system and station features.

0 DATAPATH provides the main advantages of dial-up and point-to-  
0 point systems because it provides access through a switched net-  
0 work. It operates continuously in digital mode, from call setup  
0 time to call completion. Additionally, DATAPATH offers such ca-  
0 pabilities as:

- 0 \* voice and data 2wire pair in a single jack
- 0 \* use of existing subscriber loop
- 0 \* efficient use of trunks and lines (no dedicated facilities)
- 0 \* multiple device access from data terminal equipment
- 0 \* sharing of modems among users and trunks

0 RELEASE 28.01  
0 93 12 03

0 \* efficient use of computer ports through the queuing and  
0 hunting features of the DMS system

0 \* use of the DMS system and station features

0 DATAPATH uses the End-to-End digital data communications be-  
0 tween user-site Data Units (DU) via the DMS100F. Modem Pooling  
0 expands the connectivity of DATAPATH by allowing low speed dig-  
0 ital DATAPATH users to communicate with analog trunks or modems.  
0 This is accomplished by converting the data from digital to ana-  
0 log, and visa versa, at the DMS100F.

## 0 16.1 HARDWARE PROVISIONING

0

### 0 16.1.1 HARDWARE USAGE RESTRICTIONS

0

0 Currently known hardware usage restrictions are as follows:

#### 0 \* Maintenance Modem Pools

0 Modem pool elements using half-duplex modems can not be  
0 tested by maintenance modem pools, or used in maintenance  
0 modem pools.

#### 0 \* Variable Speed Modems

0 A single Modem/Data Unit pair cannot be used to handle multi-  
0 ple transmission speeds (e.g. 1200, 2400, 4800, and 9600 bps)  
0 even though the modem is capable of providing this service.  
0 This is not the way Modem Pooling was designed. Each Datapath  
0 modem pool element (Modem/Data unit) must be datafilled for a  
0 single speed in the DMS-100, and have a constant speed set in  
0 their configuration.

0

0

0

0

0

0 16.1.2 HARDWARE DEPENDENCIES

0  
0 The low speed data unit with elastomer keypad (NT4X25AF) can only  
0 be configured as a modem pool DU via a profile download.

0 93 12 03

0 16.1.3 PROVISIONING CONSIDERATIONS

0  
0 The number of elements (DU/modem pairs) in a modem pool is deter-  
0 mined by traffic requirements for that particular pool. Each  
0 modem pool group can have up to 256 elements (Data Unit/Modem  
0 pairs). The total number of modem pools is constrained by the  
0 number of available common language location identifiers (CLLIs).  
0 Several pools with different operating characteristics may be  
0 configured for use in different applications. Each modem pool is  
0 configured to handle inbound calls, outbound calls, or both, i.e  
0 bidirectional (inbound and outbound) calls.

0 Provide inbound modem pools when the analog (analog modem) side  
0 of the connection path originates the call, or when an analog fa-  
0 cility is used at some point in the transmission path. The ter-  
0 minating digital switch activates the modem pool when it  
0 determines that the terminator is a DU and that a modem or analog  
0 facility is used at some point in the transmission path.

0 Provide outbound modem pools when the digital (subscriber DU)  
0 side of the connection path originates the call. An analog modem  
0 is provided when the user's DU calls an analog modem or when the  
0 call must go out over an analog trunk.

0 A modem pool that is designated as both inbound and outbound  
0 (bidirectional) can handle inbound or outbound calls.

0 A Maintenance Modem Pool is a modem pool reserved for testing  
0 purposes. It is not used in normal call processing. Each main-  
0 tenance modem pool is designated to test the elements of one or  
0 more specific modem pools that require distinct transmission  
0 characteristics (speed and data format). The elements within a  
0 particular maintenance modem pool are configured to meet the re-  
0 quirements of the corresponding modem pool.

0 Maintenance modem pools allow the craftperson to test the modem  
0 pool equipment from the Maintenance and Administration Position  
0 (MAP) of the DMS-100 Family switch via integrated test equipment.

## 0 RACK MOUNTED MODEM POOL

0  
0 The use of rack mounted equipment is recommended. This allows a  
0 more efficient use of frame space, ease of installation, and a  
0 more visually appealing configuration.

0 The following Rack Mounted equipment shall be provided for Modem  
0 Pooling:

0 \* Miscellaneous Equipment Frame (MIS) dedicated to modems

0 Note 1: The dedicated MIS frame must be configured in accord-  
0 ance with established ISG guidelines (See API-130 for exten-  
0 sions or ECM-289 for initial offices).

0 Note 2: One MIS frame dedicated to Modem Pooling hardware,  
0 can house up to 2-Data Unit Shelves, 2-Modem Shelves, and  
0 2-LaMarche Inverters.

0 \* UDS RM16M Modem Shelf

0 Note: The modem shelf and the data unit shelf leads MI &  
0 MIC for each modem/DU pair must be reversed for the proper  
0 operation of Modem Pooling.

0 \* Modems tested for use with Modem Pooling

0 \* Data Unit Shelf

0 - NT4X25DH (60Hz AC) or NT4X25DH (DC-Powered) Data Unit  
0 Shelf

0 The NT4X25DH DU shelf may house up to 16 DUs, however,  
0 for Modem Pooling provide the following Rack mounted Low  
0 Speed DU only.

0 - NT4X25CH - Low Speed Autoloop Rkmtg Data Unit (RLDU)

0 Note: Refer to ECM-277 for Data Unit Provisioning

0 \* Inverter

0 The newly introduced DC-Power Data Unit shelf makes provi-  
0 sioning of the inverter optional and the least desired alter-

0 RELEASE 28.01  
0 93 12 03

0 native. Therefore, detailed discussion of Rack mounted Modem  
0 Pools will center on a complete DC-Powered package.

## 0 MODEM SPECIFICATIONS

0  
0 A modem to be used with a DU in a modem pool must conform to cer-  
0 tain specifications. These requirements are different for in-  
0 bound, outbound, and bidirectional modem pools.

### 0 \* Modem Specifications For Inbound Modem Pools:

- 0 - two-wire switched network operation
- 0 - speed to match the service application designated for the  
0 modem pool
- 0 - call termination via DTR (data terminal ready) off, loss  
0 of carrier detect, or both
- 0 - 1 start bit, 5, 6, 7, or 8 data bits, 1, 1.5 or 2 stop  
0 bits for asynchronous operation
- 0 - external clock option for synchronous operation
- 0 - auto-answer when physical ringing is applied

### 0 \* Modem Specifications For Outbound Modem Pools:

- 0 - two-wire switched network operation
- 0 - speed to match the service application designated for the  
0 modem pool
- 0 - call termination via DTR off, loss of carrier detect, or  
0 both
- 0 - 1 start bit, 5, 6, 7, or 8 data bits, 1, 1.5 or 2 stop  
0 bits for asynchronous operation
- 0 - external clock option for synchronous operation

0

0 RELEASE 28.01  
0 93 12 03

- 0 - MI and MIC (Mode Indicator and Mode Indicator Common)  
0 leads
- 0 \* Modem Specifications For Bidirectional Modem Pools:
  - 0 - two-wire switched network operation
  - 0 - speed to match the service application designated for the  
0 modem pool
  - 0 - call termination via DTR off, loss of carrier detect, or  
0 both
  - 0 - 1 start bit, 5, 6, 7, or 8 data bits, 1, 1.5 or 2 stop  
0 bits for asynchronous operation
  - 0 - external clock option for synchronous operation
  - 0 - MI and MIC (Mode Indicator and Mode Indicator Common)  
0 leads
  - 0 - auto-answer when physical ringing is applied
  - 0 - automatic switching between originate and answer mode

#### 0 CASE RIXON DATATEL RACK MOUNTED MODEMS

0  
0 This Information Shall Be Provided On A Subsequent Issue Of The  
0 ECM.

#### 0 POWER SUPPLY

0  
0 The inverter is optional with the introduction of the DC-Powered  
0 Data Unit shelf. However, when the inverter is used locate it at  
0 the bottom of the frame (See Figure 5 & 6). It is required to  
0 supply protected AC to the AC Powered NT4X25DH and/or AC Powered

0  
0 RELEASE 28.01  
0 93 12 03

0 Modem shelves. A second Inverter may be provisioned as a backup.  
0 In this case each DU shelf is connected to each inverter.

0 In offices with two or more frames, configured for ISG you can  
0 provision the elements of a modem pool in several frames and thus  
0 provide one pool with access to several inverters for back-up.

## 0 DMS INTERFACE CIRCUITS

0  
0 The following line cards may be provided:

- 0 \* NT6X17AA - Std Type-A Voice Line Card (VLC)
- 0 \* NT6X17AB - Std Type-A Voice Line Card (VLC)
- 0 \* NT6X17AC - Std Type-A Voice Line Card (VLC)
- 0 \* NT6X71AA - Data Line Card (DLC) (rated MD)
- 0 \* NT6X71AB - Data Line Card (DLC) (rated A&M)
- 0 \* NT6X71BA - Single Slot Data Line Card
- 0 \* NT6X99AA - IBERT Line Card (ILC)

0 Line cards are provisioned per the following rules:

- 0 \* Provide one DLC (NT6X71) per Data Unit.
- 0 \* Provide one VLC (NT6X17) per modem.
- 0 \* Provide ILC (NT6X99) as required for Maintenance Modem Pools  
0 only, however a minimum of two is required. Refer to ECM274  
0 for detailed engineering requirement for the ILC (See Figure  
0 4).

0 RELEASE 28.01  
0 93 12 03

## 0 STANDALONE/DESK MOUNTED MODEM POOLS

0  
0 The standalone modems and DUs may be provisioned for installation  
0 on a desk, tabletop, or in an Miscellaneous Equipment Frame  
0 (MIS). To provision a modem pool using desktop type of equip-  
0 ment, you will need the following:

## 0 \* The Miscellaneous Equipment Frame (MIS)

0 Provision the MIS Frame to house the desktop DUs and modems  
0 (if desired). The MIS bay can house the following:

- 0 - Five NT3X25AA shelves for DUs or modems
- 0 - one NT0X88AF frame supervisory panel
- 0 - two Inverters (one is required; the second is optional)

0 See Figure 6 for a typical layout of the MIS frame  
0 mounted desktop units.

## 0 \* NT3X25AA - Common Equipment Shelf

0 In the Dedicated MIS frame, shelf mounting positions 50 thru  
0 52 are invalid for this shelf. The shelf can accomodate up  
0 to 3 standalone modem or DUs and 15 telco provided Teladapt  
0 jacks (three on each shelf) which provide the connections  
0 from the DUs and modems to the distribution frame.

## 0 \* Standalone Data Unit

0 Provide NT4X25AF DU as required. The NT4X25AF DU requires  
0 profile downloading, which requires the Data Line Card. Each  
0 DU is supplied equipped with its own AC power supply and NT  
0 D4B4 Teladapt line cord.

0 \* Analog Modem - Provision one per DU that meets the modem  
0 pool requirements. NTI Tested and approved modems are listed  
0 in paragraph 2.4.9.

0 \* RS-232C rollover cable to connect the DU and modem (one per  
0 DU/modem pair)

0 \* NT6X71AB/BA data line card (one per DU).

0  
0 RELEASE 28.01  
0 93 12 03

- 0 \* NT6X17AA, NT6X17AB, or NT6X17AC voice line card (one per  
0 modem)
- 0 \* non-reversed TELADAPT line cord (one per modem)
- 0 \* A minimum of two NT6X99AAs (IBERT Line Card) when the modem  
0 pool is used as a maintenance modem pool (See ECM274 for de-  
0 tailed engineering information).

0 16.1.6 CUSTOMER QUESTIONNAIRE

0  
0 The following questions numbered 1 thru 7 required to direct pro-  
0 visioning of Modem Pooling. Note: The questions below are  
0 referred to in the Calculations Section as Q1 thru Q7 (e.g. Q3  
0 meaning Question #3):

- 0 1. Rack Mount Configuration Required - Y/N
- 0 2. Maintenance Modem Pools (MMP) Required - Y/N
- 0 3. Quantity Of Maintenance Modem Pools Required per Modem Pool  
0 Type  
0 Range = 0 - 3, Default = 1  
0 Enter Quantity: \_\_\_\_\_
- 0 4. Select Modem Vendor
- 0 a. UDS \_\_\_\_\_
- 0 5. Goto Table 1 and Select the Required SPEED, MODEL, and Quan-  
0 tity as Required for Inbound Modem Pools (IMP):

|      | <u>SPEED</u>                 | <u>MODEL</u> | <u>QUANTITY</u> |
|------|------------------------------|--------------|-----------------|
| 0 a. | 300 bps _____                | _____        | _____           |
| 0 b. | 1200 bps _____               | _____        | _____           |
| 0 c. | 2400 bps _____               | _____        | _____           |
| 0 d. | 4800 bps _____               | _____        | _____           |
| 0 e. | 9600 bps _____               | _____        | _____           |
| 0 f. | TOTAL Modems Required: _____ |              |                 |

- 0 6. Goto Table 1 and Select the Required SPEED, MODEL, and Quan-  
0 tity as Required for Outbound Modem Pools (OMP):

|  | <u>SPEED</u> | <u>MODEL</u> | <u>QUANTITY</u> |
|--|--------------|--------------|-----------------|
|--|--------------|--------------|-----------------|

# 0 16.1.7 CALCULATIONS TO CUSTOMER QUESTIONS

0 The following calculations will provide the modems, data units,  
0 data unit shelf, MIS frame and common equipment shelves if re-  
0 quired. These calculations support the provisioning of DC pow-  
0 ered units only.

| 0 | RULE | PARAMETER | CALCULATION                                                                                         | RESULT  |

## 0 17.0 NSD Billing Media Converter II

0 The Billing Media Converter (BMC) is available from Northern Telecom's  
0 NSD. The BMC provides for the acquisition, storage, and forwarding of  
0 data from the DMS100F. The BMC accepts billing data from the DMS100F,  
0 temporarily stores the collected data on hard disk, and when requested  
0 retrieves, reformats, and sends the stored data to the Host Office  
0 Collector (HOC). (NOTE: If the HOC is not a BMC 'POLLSTAR' device -  
0 then an I/F Analysis must be performed to ensure BMC to HOC compat-  
0 ibility).

0 The BMC is currently available in several configurations and option  
0 packages where the variables include:

- 0 \* the disk drive size,
- 0 \* the number of users per system,
- 0 \* the communications protocol used,
- 0 \* the maximum rate of data between the BMC & HOC, and
- 0 \* the Automatic Dial-Up (ADU) option.

0 The various BMC configurations are grouped into two divisions:  
0 Redundant or Simplex.

0 The Simplex unit is a single processor, single shelf configura-  
0 tion. It accepts Station Message Detail Records (SMDR) from the  
0 DMS100F. The Redundant unit is equipped with redundant compo-  
0 nents (dual processors, dual shelf configuration) and is avail-  
0 able in several different configurations that accept SMDR, Lata  
0 Switching System Generic requirements (LSSGR), or Northern  
0 Telecom (NT) Call Record Format.

## 0 \* Redundant Billing Media Converter Configurations

0 BMCA The Billing Media Converter for Automatic Message  
0 Accounting (BMCA) is a redundant, single user, dual  
0 shelf BMC used for the collection, storage,  
0 retrieval, and forwarding of Automatic Message Ac-  
0 counting (AMA) data to a central collection point  
0 for one entire DMS100F office. The call record  
0 format from the DMS100F to the BMCA may be either  
0 LSSGR, or NT format.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 BMCS The Billing Media Converter for Station Message De-  
0 tail Recording (BMCS) is a redundant, single user,  
0 dual shelf BMC used for the collection, storage,  
0 retrieval, and forwarding of Station Message Detail  
0 Record (SMDR) data to a central collection point  
0 for one Customer Group (CG) within a DMS100F of-  
0 fice. The call record format between the DMS100F  
0 and the BMC is SMDR.

0 \* Simplex (Non-Redundant) Billing Media Converter Deuce

0 BMCD The Billing Media Converter Deuce (BMCD) is a  
0 simplex, dual user, single shelf BMC used for the  
0 collection, storage, retrieval, and forwarding of  
0 Station Message Detailed Recording (SMDR) data to  
0 up to two (2) different collection points; one for  
0 each of two (2) separate customer groups (CG)  
0 within a DMS100F office.

0 17.1 HARDWARE PROVISIONING

0

0 17.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The following hardware usage restrictions apply to all version of  
0 NSD Billing Media Converter (BMC):

0 \* 60Hz AC Clock Option

0 The BMC contains a clock for time stamping BMC log messages.  
0 The clock originates from one of two sources:

- 0 1. A DC powered crystal oscillator internal to the BMC, or a  
0 2. A commercial 110VAC (60Hz) signal through NSD supplied AC  
0 transformers to the BMC.

0 In offices configured for Isolated System Grounding (ISG) do  
0 not connect the clock circuit AC transformer. This connection  
0 introduces an ISG violation.

0 The 60Hz AC clock is prime when wired. If it is not used,  
0 then the internal DC clock provides the signal for the clock  
0 which generates the log message time stamps.

0 Transformers and connectors for wiring the AC clock option  
0 are always provided with BMC's. The 110Vac 60Hz source must  
0 be commercial, NON-GENERATOR. The AC clock and internal DC  
0 clock circuits accuracy is approximately equal and accurate  
0 to +/- 4 seconds per day.

0 \* Physical Location Limits

0 The distance between the MTD controller card (NT1X68) and the  
0 main BMC unit must not exceed 25 feet.

0 \* Modem Selection with Specific Options

0 Do Not Provide UDS modems for any BMC application that in-  
0 cludes the Automatic Dial-Up (ADU) option. Until further no-

0 RELEASE 28.01  
0 93 12 03

0 tice the UDS modems do not work with the BMC ADU option. UDS  
0 modems do work with non-ADU applications.

0 \* Host Collector Compatibility

0 In all applications where a BMC unit is not used as the Host  
0 Collector (NSD 'Pollstar'), then the SAE must initiate a Com-  
0 patibility Analysis to be performed by:

- 0 - Department 3321 in conjunction with NT Peripheral TAS to  
0 insure Host-To-BMC compatibility for U.S. jobs, or
- 0 - Department S684 in conjunction with NT Peripheral TAS to  
0 insure Host-To-BMC compatibility for Canadian jobs.

0 17.1.2 HARDWARE DEPENDENCIES

0 The following DMS-100F supporting hardware is required for the  
0 BMCA/S/D as applicable:

0 \* DMS To BMC Interface

0 Provide two NT1X68AC/BC IOC Cards per BMCA or BMCS or provide one  
0 NT1X68AC/BC IOC Card per BMCD. Provide two each NT0X96AA/DB  
0 (READ), NT0X96AB/DC (WRITE), and NT0X96AC/DD (CONTROL) cables to  
0 interface the IOC cards to the BMC interface box for BMCA & BMCS.  
0 Provide only one each cable for BMCD applications.

0 See Table B, 'I/O Controller Module Provisionable Cards' for de-  
0 vice controller card assignment rules.

0 \* Transmission to Host Collector

0 The BMC utilizes at least one (1) modem interface for transmitting  
0 data to the processing center (Host). This requirement can be  
0 fulfilled by provisioning Rixon/UDS 201, 208A/B or T212 type mod-  
0 ems Refer CM-633 for detailed engineering information on Rixon and  
0 UDS modems respectively). NSD supplies modem cables (NT8M99AG)  
0 with every BMC. These cables are designed for standard modems;  
0 9600 max. baud.

0 RELEASE 28.01  
0 93 12 03

0 The TURBO BMC's (PEC's NT8M04EE & NT8M04FE) are capable of polling  
0 speeds up to 56K baud. Where this high speed polling is required,  
0 a dedicated link between the modem at the BMC and the modem at the  
0 Host is required. Also, the cable between the BMC and the 56K  
0 modem is dependent on the modem manufacturer:

|   |                |           |
|---|----------------|-----------|
| 0 | 56K Modem Type | Cable PEC |
| 0 | UDS            | NTNX36BG  |
| 0 | GDC            | NTNX69AA  |
| 0 | AT&T           | NTNX69AD  |

0 (The length of these 56K modem cables is job engineered.)

0 \* Hardcopy Output

0 The BMC utilizes a KSR printer for installation, testing, and  
0 maintenance purposes. This printer must be EIA RS-232-C and be  
0 located within 25 cable feet of the BMC. A remote KSR printer may  
0 also be used as a maintenance device utilizing a Rixon or UDS  
0 modem. The baud rate of this link must not exceed 1200 baud. A  
0 CRT may also be attached to this port, in which case baud rates to  
0 9600 are acceptable. NSD supplies a 25' RS-232 terminal cable  
0 (NT8M99AB) with every BMC. This cable fits all standard RS-232-C  
0 terminal devices.

0 \* Remoting DMS/BMC Alarms

0 The BMC offers the capability of monitoring several BMC alarm con-  
0 ditions through the DMS-100F alarm system. The BMC alarm signals  
0 may be implemented via the NT0X10AA, Miscellaneous Scan Detector  
0 Card. NSD supplies a connector kit (NT6M96AD) for the BMC side of  
0 the cable. Local cable is used between the BMC to the MDF and the  
0 MDF to the Scan Detector Card. The BMC requires six (6) scan  
0 points.

0 \* 60Hz AC Clock Option Support

0 If the AC Clock option is required (in spite of the ISG violation)  
0 then provide one NT0X07AU (AC Mounting Plate). NOTE: Two AC cir-  
0 cuits are required for a redundant BMC and one for the BMC Deuce.  
0 NSD Division supplies a kit (NT6M96AG) which includes 120-19VAC  
0 trans- formers and BMC connectors. Local cable is used between  
0 the BMC and the supplied transformers.

0 2. Station Message Detailed Recording (SMDR) Configuration  
0 referred to as the Billing Media Converter for SMDR  
0 (BMCS). The BMCS configuration supports SMDR data col-  
0 lection and polling with the BISYNC or ASCII protocol.

## 0 Simplex/Non-Redundant BMC Provisioning

0  
0 The NSD Billing Media Converter II Deuce (BMCD) is a dual  
0 user, single shelf, simplex device that stores and transmits  
0 Station Message Detail Recording (SMDR) records, for up to two  
0 Customer Groups (CGs).

0 The NT8M04\_G permits two of the Telco's CGs to poll DMS100F  
0 SMDR data via an IBM PC/XT/AT (or compatible) equipped with a  
0 synchronous interface board, standard 3780 Binary Synchronous  
0 Communications (BSC/BISYNC) protocol, and a third party PC  
0 pollable Call Accounting Software package.

0 The NT8M04\_L permits two of the Telco's CGs to poll DMS100F  
0 SMDR data via any Polling Device capable of handling ASCII  
0 data.

0 NOTE: This ECM does not define this Customer Premise Equip-  
0 ment (CPE). The ECM does define the DMS100F installed  
0 hardware and software requirements for the BMCD.

0 The BMCD offers the following features:

- 0 \* 72 or 140MB Disk Drive (Stores 1M/2M Call Record Respec-  
0 tively)
- 0 \* Partitioning For Two Customer Groups (CGs)
- 0 \* Simplex Operation And Storage
- 0 \* User Selectable Disk Storage Per CG

0 RELEASE 28.01  
0 93 12 03

- 0 \* SMDR Data Collection (DMS 100)
- 0 \* 3780 Bisync or ASCII protocol
- 0 \* Two Access Links Via Dial-Up Lines For Polling
- 0 \* One Access Links Via Dial-Up Lines For Software Downloads
- 0 \* Three Levels Of User Definable Alarms

## 0 Selecting The Correct BMC

0  
0 The SAE must determine which of the many BMC CONFIGURATIONS  
0 BEST MATCHES THE TELCO'S REQUIREMENTS. These requirements are  
0 determined as follows:

- 0 1. Determine the format of the call records to be  
0 stored/forwarded, e.g. LSSGR, SMDR, or NT Call Record  
0 Format.
- 0 2. If "SMDR (NT)" call record format is chosen, determine the  
0 number of customer groups to be support by a single BMC.
- 0 3. Determine if the Automatic Dial-Up (ADU) option is re-  
0 quired.
- 0 4. Determine the polling protocol required.
- 0 5. Determine the polling speed required for modem provision-  
0 ing.
- 0 6. Determine the disk drive size required.
- 0 7. Refer to paragraphs 2.2 and 2.3 to provision BMC  
0 supporting/interface hardware as required.

0 The BMC provides the capability of polling DMS billing data  
0 from a remote location. The BMC receives the billing data  
0 through the NT1X68AC or NT1X68BC, NSD Magnetic Tape Drive Con-  
0 troller Cards. The BMC provides total magnetic tape drive em-  
0 ulation, and accordingly, can reduce office requirements for  
0 magnetic tape drives. The BMCA and BMCS units require two

0 RELEASE 28.01  
0 93 12 03

0 NT1X68 cards and the BMCD (defined later) requires one NT1X68  
0 card.

0 Interface of each BMC unit to each NT1X68, Magnetic Tape Drive  
0 Controller Card is via three cables to the Interface Box. The  
0 BMCA/S units require 2 each Read (NT0X96AA/DB), Write  
0 (NT0X96AB/DC), and Control (NT0X96AC/DD) cables which must be  
0 ordered separately, length is job engineered and must not ex-  
0 ceed 25 feet. This must be accounted for when defining the lo-  
0 cation of the IOC shelf and the location of the BMC. The BMCD  
0 units require 1 each Read, Write, and Control cables. The  
0 BMCA/S units and the Interface Box occupy the same amount of  
0 vertical rack space as one NSD Divison MagTape Drive unit,  
0 plus 2.5 inches. The BMCD and the Interface Box occupy 14.5  
0 inches. The Interface Box is used to convert from switch  
0 board cabling to ribbon cabling. The BMC unit is powered in-  
0 directly from the PDC via the FSP. Note: The Interface Box  
0 does not require AC or DC power.

#### 0 BMCA / BMCS Disk Drive Sizing

0  
0 Raw data for these calculations is provided by the Telco.

0 Average Busy X Customer defined # Capacity Requirement  
0 Day Volume of days of disk = (in Call Records)  
0 (in Call Records) back-up

0 The Capacity Requirement translates to disk size via the fol-  
0 lowing Table:

0 \* Select average number of Call Records per block...

0 (If number of Call Records/block for this office is not  
0 shown use the next higher number.)

0 18 20 26  
0 22 28  
0 24 30

0 \* Enter the Table at the left side. Find the appropriate  
0 number Records per block. Read to the right to find the  
0 Capacity Requirements next greater than or equal to the

RELEASE 28.01  
93 12 03

calculated value. Read down bottom of the Table to find the disk size.

| CALL RECORDS<br>PER BLOCK | 70 % CAPACITY REQUIREMENTS<br>(in number of Call Records) |         |         |          |
|---------------------------|-----------------------------------------------------------|---------|---------|----------|

| SELECT DISK-><br>SI%E     | 30MB                                                                       | 72MB    | 140MB     | 380MB<br>w/o 56K<br>Polling | 380MB<br>w/56K<br>Polling | 760MB<br>w/56K<br>Polling |

Capacity Requirements exceeding those shown in the Table are beyond the current capacity of the BMC.

(\*\* Maximum Capacity Numbers are available from NSD, Morton Grove, Illinois.)

#### BMCD Disk Drive Sizing

The BMCD is capable of storing SMDR data for two Customer Groups on a single DDU. Therefore, the BMC Deuce is capable of partitioning disk storage and ensure sufficient space is available of each group.

Storage Capacity Computations: Data storage is flexible to provide growth. A storage parameter setting allows the Telco to restrict the maximum amount of disk space used by each customer group (e.g. 70% for CG1 & 30% for CG2). The storage medium is based on hard disk technology using a 72 or 140 megabyte disk drive.

The chart below depicts typical disk storage capacity given: A 48 byte average record and 18 call records per line per day. Maximum Call Record Storage is indicated in the chart below:

0  
0 RELEASE 28.01  
0 93 12 03

| 0 | DISK SIZE | MAXIMUM<br>CALL RECORD<br>STORAGE | AGGREGATE<br># OF LINES | APPROXIMATE<br>DAYS OF STORAGE |
|---|-----------|-----------------------------------|-------------------------|--------------------------------|
| 0 | =====     | =====                             | =====                   | =====                          |
| 0 | 72        | 1M                                | 1,000                   | 55                             |
| 0 | 72        | 1M                                | 3,000                   | 18                             |
| 0 | 140       | 2M                                | 4,000                   | 28                             |
| 0 | 140       | 2M                                | 6,000                   | 18                             |

0 The formula for calculating the aggregate number of days of SMDR  
0 data storage follows:

0 a) Total Storage / No. of Records per day = Days of Storage

0 1,000,000/18(1,000) = 55.55 days of storage

0 1,000,000/18(3,000) = 18.51 days of storage

0 2,000,000/18(4,000) = 27.77 days of storage

0 2,000,000/18(6,000) = 18.51 days of storage

0 b) (Total storage - % allocated to CG#1)/48 = Line Capacity

0 Example:

0 (1,000,000 - 70% Storage for CG#1)/48 = 6250 Lines

0 NOTE: The above table si for BMC Duece only.

## 0 18.0 Attendant Consoles

0 The BSAC (Business Services Attendant Console) is defined as an op-  
0 tional feature of the Meridian Digital Centrex (MDC). It is used to  
0 answer calls placed to a specific directory number (DN), dial "0"  
0 calls from within a customer group, intercept calls, and "don't an-  
0 swer" recalls. The console operates in a switch loop mode, and is  
0 connected to the DMS-100F switch via standard three-pair cable through  
0 three standard line cards.

0 Note, the console is not connected directly to the line and  
0 trunk circuits; a virtual loop concept is used. Refer to Figure  
0 1 and 2 for a conceptual block diagram of the Attendant  
0 Console/DMS system configuration.

0 The BSAC terminal is used in DMS100 Switching offices as an  
0 interface between the operator and the switch. The operator to  
0 DMS interface is via a keyboard, for sending information to the  
0 DMS and a combination, 16 segment display for receiving informa-  
0 tion from the DMS. At the same time the operator is in voice  
0 communication with the customer.

0 Additionally, this ECM consolidates and supercedes all existing  
0 Attendant Console ECM's and API's which include the following:

0 API-038 API For BSAC

0 ECM-090 Power Supply For BSAC & BSAC Provisioning

0 ECM-098 Power Supply For BSAC W/O Battery Backup

0 ECM-147 New BSAC And Battery Backup

0 ECM-21804 NT4X09AH & NT4X09AG BSAC

0 18.1 HARDWARE PROVISIONING

0

0 18.1.1 HARDWARE USAGE RESTRICTIONS

0

0 The physical location of the Attendant Console from the DMS is  
0 the only known usage restriction. In that; if the unit is placed  
0 greater than 600 feet from the nearest MIS Frame FSP then the  
0 Pylon power supply must be provided as defined herein.

0 18.1.2 HARDWARE DEPENDENCIES

0

0 Additional BSAC support hardware required at the host office fol-  
0 lows:

- 0 \* Conference Circuits
- 0 \* Digital Modems
- 0 \* Tone Generator Circuit Packs

0 18.1.3 PROVISIONING CONSIDERATIONS

0

0 The Attendant Console may be provisioned for any DMS-IBN System.  
0 However, different versions exist to support the different market  
0 requirements. The BSAC is shipped with a 8 foot connectorized  
0 cable assembly.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 The provisioning method used for determining the number of at-  
0 attendant consoles is based on the CCS method derived from the  
0 Erlang C formula.

0 The number of attendant consoles to be provisioned should be  
0 based on the following criteria:

- 0 \* the attendant console activated CCS
- 0 \* the speed of answer objectives
- 0 \* and the average attendant work time (AWT).

0 The NT4X09BB and NT4X09BC BSAC's will be provisioned in the same  
0 way as the NT4X09AG and NT4X09AH attendant consoles. Section  
0 450/310 of NTP 297-1001-450 outlines all of the provisioning con-  
0 siderations for Canadian Engineering. The NT8620 Reference Man-  
0 ual outlines all of the provisioning for U.S. Engineering.

0 Provide BSAC Unit NT4X09BB for all U.S. requirements and Canadian  
0 English speaking customer requirements or NT4X09BC for French  
0 keyboard characters

0 The following BSAC support hardware required at Host Office:

- 0 1. Conference Circuits
- 0 2. Digital Modems
- 0 3. Tone Generator Circuit Packs

0 The above support hardware is provisioned as follows:

- 0 \* Conference Circuits

0 Provide one (1) NT3X67AA (Six Port Conference Circuit)  
0 per one (1) or two (2) BSACS provided as per customer re-  
0 quirements. If customer requires the NT3X67AA be used in  
0 a three (3) port configuration, then provide one (1)  
0 NT3X67AA per two (2) BSACs, otherwise provide one (1)  
0 NT3X67AA per BSAC.

- 0 \* Digital Modems

0 Provide one (1) NT3X02 & NT3X03 modem pair per BSAC. This  
0 modem pair provides four (4) digital modem circuits.

- 0 \* Tone Generator CP

0 RELEASE 28.01  
0 93 12 03  
0

0 Provide one Call Waiting Tone Generator Card per Central  
0 Office (CO). A second card may be provided per customer  
0 request for increased reliability. The card is equipped  
0 with four (4) circuits.

0 \* Head Sets

0 Due to logistics U.S. and Canadian jobs are not supplied  
0 with head sets from the same manufacturer. Provide  
0 headset as follows:

0 For Canadian jobs order:

- 0 - QSR2F2 - Hset w/T Mark Std w/o Acc
- 0 - QSR2G1 - Hset Std w/15ft cord
- 0 - QKP1A - Headset Acc Kit

0 For U.S. jobs order:

- 0 - HSB552-1 - Supra Monaural Headset

0 The following headsets have been Manufacture Discon-  
0 tinued (MD'ed):

- 0 - HS0552-1 - Supra Monaural Headset - Status MD'ed
- 0 - HS0554-1 - Supra Binaural Headset - Status MD'ed

0 \* DTMF Sender CP

0 One NT3X68AB - DTMF SENDER CP is optionally required when  
0 the Attendant Console must output DTMF to some other  
0 switching system. This circuit is provisionable on a one  
0 per office basis two max for redundancy.

0 \* Power Supply

0 The attendant console requires -48V for the Central Of-  
0 fice when the console is located less than 875 feet from  
0 the power source. If the console is located greater than  
0 875 feet from the power source then provide the Pylon  
0 Power Supply with or without battery back-up. One Pylon  
0 power supply can accommodate up to two (2) attendant con-  
0 soles.

0 Note:

0 The strap between terminals 7 and 8 must be con-  
0 nected on the KTS-3 power supply. The strap will be  
0 in place on the Pylon Nevafail (NF-3) as it comes  
0 from the factory.

0  
0 RELEASE 28.01  
0 93 12 03

0 \* Line Cards

0 Each attendant console requires three (3) Type-A Line  
0 Cards to connect to the integrated business network, one  
0 for Voice, Data Transmit, and Data Receive.

0 Facilities connecting the console to the assigned line  
0 cards shall be 2-wire 1300 ohms and not greater than 8db  
0 loss with a maximum loop-length of 4,877m (16,000 ft.).

0 19.0 Meridian Business Sets (MBS)

0 The DMS100F Meridian Business Set (MBS), is designed to operate with  
0 Northern Telecom's Meridian Digital Centrex (MDC) Software, which pro-  
0 vides subscribers with pushbutton access to a host of business fea-  
0 tures. Feature assignment is completely flexible because features are  
0 programmable in the DMS-100F system software.

0 For further information, refer to the following:

0 NTP 297-2011-100 Business Set Feature Description and Operation  
0 NTP 297-2011-180 Business Set Line Engineering  
0 NTP 297-2011-200 Business Set General Description, Installation,  
0 Maintenance and Ordering Information

0 The MBS operates over a 2-wire (single pair) loop to a line card  
0 (NT6X21) controlled by the DMS-100F switching system. The extensive  
0 loop length allows the EBS to be located up to 15,000 feet (4.8 km)  
0 from the host or remote office using standard 26-guage wire.

0 The M5009 Meridian Business Set (MBS) is equipped with a standard  
0 12-button telephone keypad, nine assignable keys which have LCD indi-  
0 cators and four dedicated feature keys for Volume Up, Volume Down,  
0 Hold, and Release.

0 The M5112 Meridian Business Set (MBS) is equipped with a standard  
0 12-button telephone keypad, 12 feature keys with LCD indicators and  
0 four dedicated feature keys for Volume Up, Volume Down, Hold, and Re-  
0 lease. The M5112 also provides handsfree speakerphone capability  
0 which can be controlled with 2 of the feature keys for handsfree and  
0 mute.

0 The M5209 Meridian Business Set (MBS) is equipped with a standard  
0 12-button telephone keypad, nine assignable keys which have LCD indi-  
0 cators and four dedicated feature keys for Volume Up, Volume Down,  
0 Hold, and Release. There is a 48 character LCD tiltable display,  
0 which is made up of two lines of 24-characters. The display is con-  
0 trolled by an internal microprocessor, and shows information such as  
0 calling name, calling number, reason display, time and programming in-  
0 formation.

0 The M5312 Meridian Business Set (MBS) is equipped with a standard  
0 12-button telephone keypad, 12 assignable keys which have LCD indica-

0  
0 RELEASE 28.01  
0 93 12 03

0 tors and four dedicated feature keys for Volume Up, Volume Down, Hold,  
0 and Release. There is a 48 character LCD tiltable display, which is  
0 made up of two lines of 24-characters. The display is controlled by  
0 an internal microprocessor, and shows information such as calling  
0 name, calling number, reason display, time and programming informa-  
0 tion. The M5312 also provides handsfree speakerphone capability which  
0 can be controlled with two of the feature keys for handsfree and mute.

0 The M5212 ACD Meridian Business Set (MBS) is equipped with a standard  
0 12-button telephone keypad, 12 assignable keys which have LCD indica-  
0 tors and four dedicated feature keys for Volume Up, Volume Down, Hold,  
0 and Release. There is a 48 character LCD tiltable display, which is  
0 made up of two lines of 24-characters. The display is controlled by  
0 an internal microprocessor, and shows information such as calling  
0 name, calling number, reason display, time and programming informa-  
0 tion. The M5212 also supports both Carbon and Electret headsets and  
0 provides hookswitch bypass for ACD agents.

0 ADD ON MODULES: To further enhance a user's MBS, add on modules which  
0 provide additional features and functions, are available for the the  
0 entire MBS family. These modules include the (M518 18 Button Add-on)  
0 and the M536 (36 Button Add-on).

0 19.1.4 PROVISIONING CONSIDERATIONS

0  
0 ETS Line Card:

0 A special Electronic Telephone Set (ETS) Line Card (NT6X21) is  
0 required to receive and interpret ETS signalling information. The  
0 ETS line card is supported by the DMS100F advanced peripherals  
0 LCM, RLCM, and RSC.

0 Loop Range and Signal Attenuation:

0 The operational range for the ETS, with or without add-ons is de-  
0 termined by one of two factors - either the DC Loop Range or the  
0 Signal attenuation at 8Khz.

0 1) For successful ETS operation, the following limits cannot be  
0 exceeded:

0 Loop Resistance: 1230 Ohms Maximum

0 Signal Attenuation at 8 Khz: 24 db Maximum

0 2) The factor which reaches the maximum limit first will deter-  
0 mine the loop range for the Electronic Telephone Set (ETS).

0 3) The above DC loop resistance limit assumes that the central  
0 office battery voltage is between 42.75 volts and 56 volts.  
0 The associated cable and cabling distances used within the  
0 resistance limits above are:

| <u>GAUGE</u> | <u>LENGTH(Feet/Meters)</u> | <u>RESISTANCE (OHMS)</u> |
|--------------|----------------------------|--------------------------|
| 22           | 7500/2300                  | 250                      |
| 24           | 4800/1500                  | 250                      |
| 26           | 3000/1000                  | 250                      |
| 28           | 2000/600                   | 250                      |

0 Power Supply Requirements:

0 The Meridian Business Set and associated add-ons can be loop  
0 powered or locally powered. When locally powered the set  
0 provides all display, handsfree and add on capabilities.

0  
0 RELEASE 28.01  
0 93 12 03

0 When CO loop powered or during power failure mode (also loop  
0 powered) only the basic feature capabilities of button ac-  
0 cess and receiving and making calls are available.

0 20.0 RT-1000 Engineering (MIS for NACD)

0 The non-DMS Central Office portion of this product is NOT to be  
0 ordered through NTACCESS/CADES, but will be ordered through a  
0 Purchase Planner.

0 20.1 HARDWARE PROVISIONING

0

0 20.1.1 HARDWARE USAGE RESTRICTIONS

0  
0 The ACD nodes (MACDs and/or MACD Servers) interface to the RTDB  
0 Server (through the X.25 gateway) via EMPC (Enhanced Multi-  
0 Protocol Controller) cards. Only one of the two links on the  
0 EMPC can be active; therefore, one EMPC is required for each  
0 link from a DMS-100 to the X.25 gateway of the RT-1000 system.  
0 Refer to the Engineering Manual Section to determine the number  
0 of links.

0 The unused port of the EMPC can NOT be used for other  
0 applications. Port 2 or 3 of the EMPC must be used for the  
0 connection to RT-1000.

0 20.1.2 HARDWARE DEPENDENCIES

0  
0 MPCs can NOT be used; EMPCs must be used.

0 20.1.3 PROVISIONING CONSIDERATIONS

0  
0 The capacities of the RT-1000 system are:

- 0 - 60 Controllers
- 0 - 180 Supervisor Terminals
- 0 - 4 Login Terminals (1 local, 3 remote)
- 0 - 7500 Agents
- 0 - 192,000 Calls Per Hour
- 0 - 12 Links (to MACDs and/or MACD Servers)

0

0 Host - Input/Output Equipment  
0 Chapter 8

0  
0 RELEASE 28.01  
0 93 12 03

0 20.1.4 OFFICE LAYOUT INFORMATION

0  
0 The RT-1000 MIS will not be co-located with the switch, although  
0 it may be in the same building.

0 20.1.5 TRAFFIC TABLES

0  
0 Each 9600 baud DMS EMPC link can support up to 24 NACD event  
0 messages per second. Since an average call requires 4 event  
0 messages, a link can handle 6 calls per second. If the traffic  
0 from any single ACD node (DMS-100) will exceed 6 calls per  
0 second, an additional link (or links) must be provisioned for  
0 that node.

0 Total messages from the ACD nodes to the RT-1000 MIS must not  
0 exceed 216 per second. Therefore, the total calls for the system  
0 must not exceed 54 per second. Refer to the Systems Engineering  
0 Bulletin 93-02-001, MACD, for additional information on messaging  
0 and link capacity.

0  
0 Provide spares per customer preference.

0 20.2.4 POWER FEED AND FUSING REQUIREMENTS

0  
0 Not applicable

0 20.2.5 CURRENT DRAIN INFORMATION

0  
0 Not applicable

0 20.3 SOFTWARE PROVISIONING

0

0 20.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0

0 DMS-100 and MACD Server Nodes

0  
0 In addition to ACD software, the following additional packages  
0 must be added. Refer ACD ECM for ACD software provisioning.

0 ACD - Supergroup (NTXE22)

0  
0 Host - Input/Output Equipment  
0 Chapter 8

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 One of the following two packages is also required.

0 Networked ACD on CCS7 (NTXN46)  
0 Networked ACD on PRA (NTXN47)

0 Refer to the SMS database for more information on software pack-  
0 aging.

#### 0 RT-1000 Hosts (HP)

0  
0 The HP UX (UNIX) operating system is included with the RT-1000 HP  
0 host hardware. It does not need to be ordered separately.

0 RT-1000H (application software for the HP hosts) includes soft-  
0 ware for all four HP hosts. One (1) RT-1000H software package is  
0 required per RT-1000 system, NOT one for each of the four HP  
0 hosts.

0 RT-1000H software is delivered on DAT (Digital Audio Tape). It  
0 is a universal load (the same software is installed at each  
0 site).

#### 0 RT-1000 Controllers (PCs)

0  
0 The SCO XENIX operating system is included with the Controller.

0 RT-1000C (application software for the controller) is included  
0 with the Controller. RT-1000C software is delivered on high den-  
0 sity floppy diskette (both 3.5" and 5.25").

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 RT-1000 Terminals (PCs)

0  
0 DOS version 3.3 or higher is required. The DOS operating system  
0 is included with the Terminal.

0 RT-1000T (application software for the RT-1000 Terminals) is in-  
0 cluded with the Terminals. RT-1000T software is delivered on  
0 high density floppy diskettes (both 3.5" and 5.25").

0 20.3.2 SOFTWARE USAGE RESTRICTIONS

0  
0 All ACD nodes connected to the RT-1000 MIS must use the same data  
0 stream. RT-1000 supports BCS-30, BCS-31, and BCS-32 data  
0 streams. Since a BCS release allows the use of an earlier data  
0 stream (up to two releases back), the DMS-100 ACD nodes connected  
0 to the RT-1000 could be at different BCS releases. For example,  
0 one node could be running BCS-32 with BCS-30 data stream, and an-  
0 other node could be running BCS-31 with BCS-30 data stream.

0 20.3.3 MEMORY PROVISIONING

0  
0 All RT-1000 MIS components (HP hosts, controllers, terminals,  
0 X.25 gateway, and communications server) come with a standard  
0 memory configuration. Memory in these components is not  
0 provisionable.

0 Refer to MEMCALC for information on memory provisioning in the  
0 DMS- 100 (for NACD).

0

0

0 20.4 REAL TIME IMPACT

0 Refer to the Systems Engineering Bulletin 93-02-001, MACD, for  
0 information on the switch side real time impact.

0 Real-time capacity of the RT-1000 HP host computers will not be  
0 exceeded if the RT-1000 configuration does not exceed the capaci-  
0 ties given in section 2.4

0 1.0 Trunk Modules

0 1.1 Introduction

0 The Trunk Module (TM) encodes and multiplexes incoming speech  
0 from a maximum of 30 analog trunks into an eight-bit PCM format.  
0 The TM then combines them with internal control signals as well  
0 as the trunk supervisory and control for transmission at 2.56  
0 Mb/s to the network.

0 In the other direction, the 30 digital speech signals and the two  
0 control channel signals received from the network are demulti-  
0 plexed and decoded by the TM into 30 individual channels of com-  
0 bined analog speech and signalling.

0 DMS maintenance and test circuits and interface trunk circuits  
0 for stand alone test equipment mount on DMS Maintenance Trunk  
0 Modules and Trunk Modules. Normally these circuits are not  
0 PIPable and specified quantities should reflect requirements for  
0 the busy season prior to exhaust. The Remote Service Module  
0 (RSM) houses office maintenance, alarm and service circuits re-  
0 quired for remote offices employing RLMS.

0 In an office served by more than one DF, the Telco is advised for  
0 administrative reasons to terminate all MTM on the same DF. For  
0 similar reasons the Telco may wish to associate all TM-mounted  
0 circuits provisioned in this section with the same DF, including  
0 MTM.

0 1.2 Features

0 1.2.1 Service Circuits

0 DMS service circuits are packaged in printed circuit cards which  
0 generally mount on Maintenance Trunk Module (MTM). The exceptions  
0 are:

- 0 1. digital echo suppression cards which mount on Digital  
0 Echo Suppressor Shelves (DES),
- 0 2. three-port conference circuit cards and MF and Digitone  
0 receiver cards which mount both on TMs and MTMs. (Note:  
0 six-port conference circuit cards mount only on MTMs.)

0 With the exception of digital echo suppression cards, service  
0 circuits are not PIPable and specified quantities should reflect  
0 requirements for the busy season prior to exhaust.

0 1.2.2 Testing and Diagnostic Requirements

0 A number of DMS test circuits are multi-functional units which,  
0 under software control, can cater to a variety of testing and di-  
0 agnostic requirements, including test source functions for 100  
0 series standard tests, 100 series test line functions and DMS  
0 manual and automated test routines. In such instances it is not  
0 necessary to provision these circuits on a one-to-one basis re-  
0 lating to individual tests but rather on a pooled basis relating  
0 to demand. For example DMS automated tests (purchased feature)  
0 are scheduled to run at night leaving common test resources  
0 available for other applications during the day.

0 Refer to NTP 297-1001-516 Trunks Maintenance Reference Manual,  
0 NTP 297-1001-121 Automatic Trunk Testing Description and NTP  
0 297-2101-516 Line Maintenance Reference Manual for information on  
0 the Test Line Test Types. Table 35.1 lists the DMS hardware re-  
0 quired for standard test lines and test source applications.

## 0 Table 35.1 Notes:

0 TTT: Transmission Test Trunk consists of the pair of MTM  
0 mounted cards, Test Signal Generator and PCM Level Meter.  
0 See Transmission Test Trunk, Section 1.3.3 for more in-  
0 formation.

0 ROTL: Remote Office Test Line. DMS supports Au-  
0 tomation Produces Co. model 1066-ROTL/52A interfaced via:

0 NT3X91AA Remote Office Test Line I/F Trunk,  
0 (Section 1.3.1)

0 NT0X10AA Miscellaneous Scanner

0 NT2X57AA SD Card I

0 101TT: 101 Communication Test Trunk (Section 1.3.10)

0 T102: 102 Test Trunk (Milliwatt) (Section 1.3.5)

0 TLPA: Loop Around Test Line (Section 1.3.2)

0 TTTT: Transmission Termination Test Trunk (Section 1.3.8)

0 1. DMS terminates on external equipment:

0 NE 105 Test Line (1) A311-12-900,  
0 NT 105 Responder (1) TTS1050C,  
0 via:  
0 NT2X88AA, 4W E&M trunk interface.

0 2. DMS terminates on external equipment:

0 SD2Y67, 108 termination,  
0 SD-95277-02-01, milliwatt supply,  
0 via:  
0 NT2X88AA, 4W E&M trunk interface.

0 3. DMS originates from external ROTL equipment via:

0 NT3X91AA, Remote Office Test Line I/F trunk.

0 4. External equipment interfaced to the DMS by means of  
0 4-wire E&M trunks are used for 105 and 108 tests. See  
0 Section 3.7, Office Maintenance for more information.

0 1.2.3 Time Switch Broadcasting

0 Time Switch Broadcasing (TSB) is a process employed in DMS to  
0 distribute certain tones and recorded messages via the network  
0 simultaneously to many users from a single source. The speech  
0 channel incoming to the network from each source can be connected  
0 in a broadcast mode to all outgoing speech channels within the  
0 same network incoming time switch. A number of service circuits  
0 utilize this process.

0 Old Network

0 It is necessary to limit the number of simultaneous connections  
0 in order to reduce the possibility of Network Subgroup (NSG)  
0 blocking. This maximum is normally specified in translations and  
0 should not exceed 16 per NSG in the network without deloading.  
0 These additional 16 channels are the signalling channels which  
0 are available for speech connections within the network module.

0 With NSG deloading, the maximum number of simultaneous con-  
0 nections can be up to a maximum of 256.

0 New Network

0 Same criteria as above except that the maximum number of simul-  
0 taneous connections should not exceed 32 per NSG in the network  
0 without deloading.

0 With NSG deloading, the maximum number of simultaneous con-  
0 nections can be up to a maximum of 512.

0 From a traffic standpoint each TSB source can be viewed as being  
0 a trunk group in which the number of servers equals the above  
0 specified maximum number of connections.

0 1.2.4 Multi-Party Bridged Services

0 A Plain Ordinary Telephone Service (POTS) software feature pack-  
0 age called "Multi-Party Bridged (MPB) Services (NTX297AA)" allows  
0 a group of subscriber lines to simulate being a single line or a  
0 multi-party line. This feature associates together a group of  
0 lines (MPB Group) so they appear to the subscribers to be differ-  
0 ent parties of a multi-party line. This feature makes it possi-  
0 ble to bridge (by software) up to four (4) lines which cannot be  
0 bridged physically because they have no analog appearance in the  
0 CO.

0 MPB is available on lines connected to any module (LM, LCM,  
0 DMS-10, SLC-96, DMS-1R). Members of an MPB Group each have a  
0 unique Directory Number (DN) and a unique Line Equipment Number  
0 (LEN).

0 Bridging is supported through software and conference circuit  
0 cards (NT3X67). Six Port Conference Circuits are used when two,  
0 three or four members of a MPB Group are bridged. A useful ap-  
0 plication for Bridged Services is to set up conference calls.

0 1.2.5 Analog Trunks

0 (a) General Description

0 Trunk cards provide features that are required to achieve the  
0 necessary functional compatibility for each analog trunk group.  
0 Applique circuits are used as adapters to provide an interface  
0 between a DMS-100 Family trunk circuit and a specific item of  
0 Northern Telecom (NT) or other manufacturer's equipment, or for  
0 special purpose (e.g. Board-to-Board Testing).

0 (b) References

0 NTP 297-1001-152 Trunk Selection and Compatibility  
0 NTP 297-2101-516 Line Maintenance Reference Manual

0 Chapter 3, Section 3.7 Office Maintenance

0 (c) Provisioning Considerations:

0 ( i) Refer to NTP 297-1001-152, DMS-100 Family Trunk Selection  
0 and Compatibility for a list of available applique cir-  
0 cuits, trunk cards and the features provided by the trunk  
0 hardware of each card.

0 ( ii) One Balance Network plug-in (daughter board) must be pro-  
0 visioned for each 2-wire trunk circuit on each card as  
0 follows:

0 a) For H88 loaded cable select Precision Balance Network  
0 - H88, NT2X80AA,

0 b) For International applications select the following  
0 Balanced Networks:

0 10) Echo Suppressor Control:

0 Echo Suppressor Control (ESC) can be provided for  
0 4-wire E&M and CCITT No. 5 and No. 6 trunks.

0 DMS-100 Family Digital Echo Suppressors (DES) can be  
0 provided where the transmission round trip delay ex-  
0 ceeds 45 msecs.

0 ( iv) The input/output (I/O) test trunk is a NT2X90 card  
0 mounted in an 8-wire Trunk Module (TM) at the host of-  
0 fice, in a RMM at a RLCM or in a RSM at a RLM. It pro-  
0 vides a DMS interface with non-DMS local testing  
0 equipment such as:

- 0 - #14 Local Test Desk
- 0 - #3 Local Test Cabinet
- 0 - Centralized Automatic Loop Reporting System

0 It enables the maintenance personnel who operate the  
0 non-DMS test equipment to access subscriber lines via the  
0 MTA. Provide one I/O Test Trunk for each test trunk  
0 which DMS interfaces mentioned above.

0 The LTP Talk/Monitor MTA interface provides an alternate  
0 interface connection to a subscriber line without going  
0 through the line circuit for purposes of monitoring and  
0 testing. Access is via the Metallic Test Access Unit  
0 (MTA) and the line card access relay. Normally multiples  
0 to the line side of the Line Test Unit (LTU). One I/O  
0 Test Trunk is required for each LTU ordered.

0 For more information, refer to NTP 297-2101-516.

0 Operator Verification Access provides a high impedance  
0 monitor-only connection between an incoming operator ver-  
0 ification trunk and a subscriber line via the MTA and the  
0 line card access relay. It is recommended that one ac-  
0 cess interface circuit (I/O Test Trunk) be provided for  
0 each operator verification trunk required. Correspond-  
0 ingly one MTA test multiple must be provided for each  
0 interface required. See MTA, Section 1.3.9 and Section  
0 3.7, Office Maintenance for more information on the MTA  
0 provisioning.

0 RELEASE 28.01  
0 93 12 03  
0

0 ( v) DMS supports the Automation Products Co., model  
0 1066-ROTL/52A ROTL and 105 Test Line. Each ROTL can  
0 serve up to 640 trunks per day based on an eight hour  
0 test shift. The interface circuit is the ROTL I/F Trunk  
0 NT3X91AA which has two (2) circuits per card.

0 Three trunk circuits are required for each ROTL; one for  
0 each of two test ports plus one for a standard 105 Test  
0 Line port.

0 One additional trunk circuit is required for each addi-  
0 tional 105 Test Line provided; up to a total of six.

0 For more information on the ROTL unit, refer to Section  
0 3.7, Office Maintenance.

0 ( vi) One Trunk Card NT2X83AA (two circuits per card) is to be  
0 provided for each interface trunk circuit required to  
0 interface the Automatic Number Announcement (ANA) system.  
0 For more information on ANA circuit, refer to Section  
0 3.7, Office Maintenance.

0 ( vii) Jack ended 4-wire trunk appearances are extended to each  
0 Maintenance and Administration Position (MAP) used for  
0 line testing (LTP) and (or) trunk testing (TTP) to facil-  
0 itate the connection of portable test sets into the sys-  
0 tem.

0 For DMS-100 and DMS-100/200 offices Jack Ended Trunk,  
0 NT1X54AA, (2 circuits per card) must be provided.

0 For DMS-200 offices NT1X54AA cards may be used on TM8's  
0 or MTM's, or the 4-wire E&M trunk, NT2X72AA (2 circuits  
0 per card) may be provided only if mounted on TM8.

0 Refer to the Input/Output Section (3.6) for more informa-  
0 tion on Jack Ended Trunks.

0 (viii) One CAMA Position signalling Trunk, NT2X65AA (one circuit  
0 per card, mounts on TM8) and one CAMA CW SUSP LT TRK,  
0 NT2X66AA (one circuit per card, mounts on TM2, TM4, TM8)  
0 is required per CAMA position.

0 ( ix) Analog trunks can be used to provide and interface be-  
0 tween the TOPS positions and the DMS switching network  
0 and the TOPS TTY's and the DMS switching network. Two  
0 analog trunks, one for voice and one for data, are re-

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 quired for each TOPS position. An exception is the Force  
0 Management Position which requires only one trunk for  
0 data, no voice. One analog trunk is required for each  
0 TOPS TTY (with the exception of the SNAC TTY which re-  
0 quires one I/O port appearance instead). Refer to the  
0 Operator Services section (3.5) to determine whether the  
0 TOPS position or the TOPS TTY will interface with the DMS  
0 switching network via analog trunks or not. Use the  
0 4-wire E&M trunk NT2X72 (two circuits per card) which  
0 mounts on the TM8.

0 1.2.6 Loop Around Test Line

0 a) General Description

0 The Loop Around Test Line circuit card enables the measurement of  
0 near-to-far trunk losses from class 4 or 5 offices in a DMS-100  
0 Family switching network. The loop around method of trunk trans-  
0 mission testing requires two trunks to be connected together  
0 (looped) at a distant office so that a measurement can be made at  
0 the originating office.

0 The circuit card occupies one card position in a Maintenance  
0 Trunk Module (MTM) and requires two trunk appearances.

0 b) References

0 None

0 c) Provisioning Considerations:

0 ( i) Versions of the card currently available are as follows:

0 NT2X75AA Loop Around Test Line Mu-Law  
0 NT2X75BA Loop Around Test Line A-Law

0 There is one loop around circuit (two trunk appearances)  
0 per card.

0 ( ii) The Loop Around Transmission Test Line Card is required  
0 for DMS-100, DMS-100/200 and DMS-200 offices. Two cir-  
0 cuits are recommended per office.

0 ( iii) The Loop Around Transmission source interface is the  
0 Transmission Test Trunk (TTT).

0

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 1.2.7 Transmission Test Trunks

0 (a) General Description

0 The TTT is a 104 test line and test sour consisting of a test  
0 signal generator and a level meter operating digitally samples.  
0 Used also for 100, 102, 103, Synchronous, Non-synchronous and  
0 Transmission Loop Around test line originations. Access is via  
0 the Network.

0 (b) References

0 NTP 297-1001-121 Automatic Trunk Testing Description  
0 NTP 297-1001-516 Trunks Maintenance Reference Manual  
0 NTP 297-2101-516 Line Maintenance Reference Manual

0 (c) Provisioning Considerations:

0 ( i) Each TTT circuit consists of a pair of cards as follows:

- 0 1. PCM Test Signal Generator, NT1X90AA/BA.
- 0 - Generate single freq test tones 0-3996
  - 0 Hz in 4 Hz increments
  - 0 - tone levels 0 to -12.5 dBm @  $\pm 0.1$  dB
  - 0 or +3 to -67.5 dBm @  $\pm 0.5$
  - 0 - filters for quiet termination, 1010 Hz
  - 0 notch and C-msg weighting.
  - 0 - NT1X90AA is for North American
  - 0 application.
  - 0 - NT1X90BA is for International (A-Law)
  - 0 applications.

- 0 2. PCM Level Meter, NT2X96AA/BA
- 0 - measure single frequency tones (zero-
  - 0 crossing detector)
  - 0 - level meter +6 to -88.8 dBm  $\pm 0.01$  dBm
  - 0 - freq meter 0 to 4 KHz @  $\pm 16$  Hz with
  - 0 resolution variable with centre freq
  - 0 - NT2X96AA is for North American
  - 0 applications.
  - 0 - NT2X96BA is for International (A-Law)
  - 0 Applications.

0 ( ii) Provisioned for DMS-100 and DMS-200 offices.

0 RELEASE 28.01  
0 93 12 03  
0

0  
0 ( iii) Provisioning is based on the requirement DMS Automatic  
0 Trunk Testing (ATT) which is normally scheduled for oper-  
0 ation during off-peak hours. ATT is an optional feature  
0 of DMS-100 and DMS-200 offices. TTT circuits provisioned  
0 per ATT requirements will also satisfy daily manual test  
0 and diagnostic requirements including standard test line  
0 functions. This provisioning will also satisfy the in-  
0 creased requirements of manual testing in a non-ATT of-  
0 fice.

0 ( iv) The following assumptions apply:

0 Automatic trunk testing will be scheduled to run daily  
0 for the entire office.

0 Assume that every active ATT process effectively ties up  
0 one TTT for the duration of its execution regardless of  
0 the test being performed.

0 TTT average holding time per test 20 seconds.

0 Test Interval is the number of continuous hours per day  
0 reserved for ATT testing. Six hours is recommended.

0 ( v) Number of TTT's to be provided is based on the number of  
0 outgoing trunks in the office.

0 # TTT = No. O/G Trunks \* Holding Time/Test  
0 -----  
0 3600 \* Test Interval

0 If the number of TTT is greater than 15, then testing  
0 must be split over two nights with half the trunks tested  
0 each night. In this case half the calculated TTT's are re-  
0 quired.

0 ( vi) Provide a minimum of 2 maximum 15 TTT's per office.

0 Note: Includes the O/G portion of 2 WY trunks.

0 RELEASE 28.01  
0 93 12 03

0 1.2.8 Transmission Test Unit (TTU)

0 a) General Description

0 The TTU is a programmable digital signal generator and processor  
0 which is capable of performing a variety of transmission measure-  
0 ments and related maintenance functions on line circuits and  
0 trunk circuits. It is utilized in diagnostic routines applied to  
0 Digitone and MF receivers. Access is via the switching network.

0 The NT2X47-- & NT2X56-- Circuit Pack, which mount on a Mainte-  
0 nance Trunk Module (MTM), form the Transmission Test Unit (TTU).  
0 The NT2X47 Circuit Pack interfaces to the Central Control (CC)  
0 which specifies the type of testing procedure required of the  
0 TTU. Once specified by the CC, the NT2X47 will control the gen-  
0 eration and reception of tones necessary for the test and pass  
0 them on to the Digital Filter CP (NT2X56). The NT2X56 will fil-  
0 ter, process and execute the instructions and generated tones re-  
0 ceived from the NT2X47.

0 b) References

0 NTP 297-1001-121 Automatic Trunk Testing Description  
0 NTP 297-1001-455 DMS-100 Office Parameters Reference Manual  
0 NTP 297-1001-516 Trunks Maintenance Reference Manual  
0 NTP 297-2101-516 Line Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) Each TTU circuit consists of a Control Signal Generator  
0 Card and a Digital Filter. The TTU mounts on a MTM.

0 Transmission Test Unit Control Signal Generator,  
0 NT2X47AA/AB/AC/BA:

- 0 - generates single frequency test tones 4 to
- 0 3996 Hz, in steps of 4 Hz
- 0 - tone levels -60 dBm to +3 dBm at  $\pm 0.25$  dB
- 0 - quiet termination

0 Transmission Test Unit Digital Filter, NT2X56AA/AB/BA:

- 0 - processes tone data in the frequency range
- 0 4 Hz to 4 KHz
- 0 - can process combinations of 10 filter

0 RELEASE 28.01  
0 93 12 03  
0

0 functions simultaneously.

0 ( ii) The following pair of interconnected cards can be provi-  
0 sioned together to form a TTU for the listed test proce-  
0 dure type.

| 0 | CP       | DF       | Test Proceedure Type         |
|---|----------|----------|------------------------------|
| 0 | NT2X47AA | NT2X56AA | ATME2 (Rated MD)             |
| 0 | NT2X47AB | NT2X56AA | ATME2 (DMS-300 Offices)      |
| 0 | NT2X47AC | NT2X56AB | ATME2 (104 Test Line) &      |
| 0 |          |          | ATMS (105 Test Line)         |
| 0 | NT2X47AD | NT2X56AB | ALT (Automatic Line Testing) |
| 0 |          |          | ATMS (105 Test Line)         |
| 0 | NT2X47BA | NT2X56BA | International (A-Law)        |
| 0 |          |          | ATMS.                        |
| 0 | NT2X47AB | NT2X56BA | International (A-Law)        |
| 0 |          |          | ATME2.                       |

0 1. The NT2X47AD and NT2X56AB cards can functionally re-  
0 place the existing NT2X47AA, NT2X56AA and the  
0 NT2X47AC,NT2X56AB TTU cards. All three pairs of  
0 these cards can exist together in the same office.  
0 However, NT2X47AA must be paired with NT2X56AA;  
0 NT2X47AC with NT2X56AB; and NT2X47AD with NT2X58AB.

0 2. The addition of Echo Return Loss (ERL) and Singing  
0 Return Loss (SRL) tests to the Automatic Transmission  
0 Measurement System (ATMS) (i.e. 105 Test line) has  
0 prompted the introduction of the Transmission Test  
0 Unit Control Processor (NT2X47AD). The ERL & SRL in-  
0 volve measuring the return loss of a bandlimited  
0 white noise signal over a trunk circuit.

0 The optional feature, ATMS, can be provided to exist-  
0 ing offices by only adding packs (NT2X47AD, NT2X56AB)  
0 sufficient for ATMS. Existing TTU packs (NT2X47AA,  
0 NT2X56AA and NT2X47AC, NT2X56AB) need not be  
0 retrofited in order to provide the ATMS feature.

0 3. Although the ATMS packs can be selected for regular  
0 TTU functions, this will only be allowed when  
0 non-ATMS TTU packs are not available.

0 4. The ATMS feature will be available in BCS 10 as an  
0 optional feature package. The only pre-requisite is

0 RELEASE 28.01  
0 93 12 03  
0

0 that the Common Basic feature package must also be  
0 provided.

0 5. All initial and extension offices will provision the  
0 NT2X47AD and NT2X56AB for TTU requirements.

0 6. The NT2X47AB and NT2X56AA cards are required for the  
0 Automatic Transmission Measuring and Signalling Test-  
0 ing Equipment (ATME) feature in a DMS-300 Gateway of-  
0 fice.

0 7. The NT2X47BA and NT2X56BA cards are required for the  
0 standard A-law TTU for International offices. The  
0 ATMS feature can be provided for this International  
0 TTU. NT2X47BA does not support the ATME2 test. In-  
0 stead, the Mu-law TTU for domestic offices, NT2X47AB,  
0 in combination with the NT2X56BA A-law Transmission  
0 Test Filter, is to be provided for this application.

0 ( iii) Provisioning of TTU's for Automatic Line Testing (ALT)

0 The ALT has two (2) versions of diagnostics. Short and  
0 extended. In order to check the Pulse Coded Modulation  
0 (PCM) path to and from the line cards, as well as the an-  
0 analog path of the Voice Frequency (VF) transformer the  
0 short diagnostic routine performs the following tests;

- 0 o Trans-hybrid loss test
- 0 o Attenuation 7DB pad test
- 0 o Noise (notch & weighted) test
- 0 o Ring Supervision (ring relay) test

0 It is suggested to provide the maximum of one (1) TTU per  
0 LTU (for both Host and Remote LTUs), or:

0 TTU for ALT Total No. of Lines X Holding Time/Test  
0 (short diag = -----  
0 test) 3600 X Test Interval

0 where,

0 Total No. of lines includes all Local, Remote and  
0 Subscriber Carrier lines to be tested by the short  
0 diagnostic routine.

0 RELEASE 28.01  
0 93 12 03  
0

0 Holding Time/Test is seven (7) seconds for a short  
0 diagnostic test.

0 Test interval is in hours (6 hours are recommended).

0 The Extended diagnostic routine will check all of the  
0 line circuit for correct operation while performing the  
0 following tests.

0 o Trans-hybrid loss test  
0 o Attenuation 7DB pad test  
0 o Noise (notch & weighted) test  
0 o Ring Supervision (ring relay) test  
0 o Cutoff relay test  
0 o Battery feed resistor test  
0 o Loop detector test  
0 o Reversal relay test  
0 o Ground start relay test  
0 o Ground start detector test

0 RELEASE 28.01  
0 93 12 03

0 1.2.9 102 Test Trunk (Milliwatt)

0 a) General Description

0 The 102 Test Trunk (Milliwatt) provides either a 1004 Hz milli-  
0 watt at 1004 Hz or a quiet termination for maintenance applica-  
0 tions in a DMS-100 and DMS-200 office.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) The 102 Test Trunk (Milliwatt) cards available are:

|   |                                   |          |
|---|-----------------------------------|----------|
| 0 | 102 Test Trunk                    | NT1X00AA |
| 0 | 102 Test Trunk                    | NT1X00AB |
| 0 | International 102 Test Trunk      | NT1X00AE |
| 0 | 102 Terminating - 10 dB Test Line | NT1X00AF |
| 0 | 102 Terminating - 20 dB Test Line | NT1X00AG |
| 0 | 102 Terminating - 15 dB Test Line | NT1X00AH |
| 0 | 102 Test Trunk (China)            | NT1X00KA |

0 ( ii) Each card contains one test circuit which can be con-  
0 nected to either or both of two trunk appearances. The  
0 card occupies one card position in a Maintenance Trunk  
0 Module (MTM) which connects up to 30 trunk appearances to  
0 one Network port.

0 ( iii) The features of the 102 test trunk cards are:

0 1. Maintenance applications include:

0 - Common office milliwatt supply  
0 - General testing and calibration  
0 - Trunk and line tests  
0 - Test position requirements  
0 - Automatic testing

0 2. Stable milliwatt test tone level.  
0 No variation.

0 3. Connection of test circuit and application of  
0 tests under software control, via signal  
0 distributions (sd) from MTM.

0 1.3 Line Test Unit (LTU)/Multi-line Test Unit (MTU)

0 a) General Description

0 These circuits are used to perform DC and AC voltage measurements  
0 as well as resistance, capacitance and frequency measurements on  
0 subscriber loops and line circuits. Connection is DC-metallic  
0 via the DMS Metallic Test Access Network (MTA) and the access re-  
0 lay in the line card.

0 The Multi-line Test Unit (MTU) is to replace the existing Line  
0 Test Unit. The Multi-line Test Unit will perform all of the  
0 functions of the existing LTU with greater speed and accuracy.  
0 In addition it may be used to test Electronic Business Set (EBS)  
0 lines and it may be used for OPM battery maintenance.

0 The LTU is used for North American applications only. The MTU is  
0 applicable to the Canadian Markets only and for ISDN applications  
0 in the U.S. only.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) Applies to DMS-100 and DMS-100/200 offices only.

0 ( ii) Each LTU circuit consists of a pair of interconnected  
0 cards:

0 NT2X10AB Line Test Unit - Analog  
0 NT2X11AC/AD Line Test Unit - Digital Card

0 Each MTU circuit consists of a pair of interconnected  
0 cards:

0 NT2X10BA Multi-line Test Unit - Analog  
0 NT2X11BA Multi-line Test Unit - Digital Card

0 The NT2X11AD provides the feature of supplying battery  
0 voltage to the EBS sets while their line card is being  
0 tested, thus preventing the volume reset of the EBS. The  
0 NT2X11AD is backward compatible with all previous ver-  
0 sions of the NT2X11 and should be ordered for all new ap-  
0 plications (for U.S. applications only). Existing offices  
0 using software package NTX106AA should be upgraded to  
0 NT2X11AD circuit packs.

0 RELEASE 28.01  
0 93 12 03

0 The MTU may be added to offices with existing LTU's (for  
0 Canadian applications only). A host office must be  
0 equipped with BCS-19 or later software to support the  
0 MTU. A remote office must be equipped with BCS-21 or  
0 later software. The MTU circuit packs require a -48V SP  
0 connection that the LTU does not require.

0 ( iii) MTU for 2B1Q Lines on a LCME.

0 For every MTA that has a LCME on the vertical there must  
0 be at least one MTU on a horizontal of that MTA. Each MTU  
0 (NT2X10BA and NT2X11BA card set) has two test access  
0 ports; that is two (2) sets of tip and ring. Thus it can  
0 test two 2B1Q lines at the same time. A LTU that has ac-  
0 cess to an MTA that has a LCME on the vertical will NOT  
0 be used to perform any metallic testing on the 2B1Q  
0 lines. Any rover test units (ones shared across MTAs)  
0 that has access to the MTA that has a LCME on it must be  
0 a MTU for it to be used on the LCME.

0 For the U.S. market, the MTUs are to be used for 2B1Q ap-  
0 plications only. No LTUs can be assigned to an MTA that  
0 has an LCME on the vertical. No MTA that has an LCME on  
0 the vertical can be daisy-chained to other MTAs that does  
0 not have an LCME on the vertical.

0 The physical installation of MTUs in MTMs is no different  
0 for 2B1Q than for POTS.

0 ( iv) The LTU analog card and the LTU digital card each occu-  
0 pies one card slot. They are mounted on a Maintenance  
0 Trunk Module (MTM), or a Remote Service Module (RSM) (in  
0 a RLM) or a Remote Maintenance Module (RMM) (in a RLCM,  
0 RSC, OPM).

0 The MTU analog card and the MTU digital card each occu-  
0 pies one card slot. They are mounted on a Maintenance  
0 Trunk Module (MTM), or a Remote Maintenance Module (RMM)  
0 (in a RLCM, RSC, OPM).

0 ( v) Provisioning of Line Test Unit (LTU) utilizing NT2X46AB  
0 MTA.

$$\begin{array}{rcccl} \text{LTU} & = & \text{No. SMS S/W Sites} & & \text{No. SMU S/W Sites} \\ & & \underline{\hspace{2cm}} & + & \underline{\hspace{2cm}} & + \\ & & 20 & & 20 & \end{array}$$

RELEASE 28.01  
93 12 03

$$\frac{\text{No. SMR}}{20} + \frac{\text{No. LCM}}{10} + \frac{\text{No. LM}}{10} + 1$$

Provisioning of Line Test Unit (LTU utilizing NT3X09BA 8 X 8 Metallic Test Access CP.

$$\text{LTU} = \frac{\text{No. SMS S/W Sites}}{16} + \frac{\text{No. SMU S/W Sites}}{16} +$$

$$\frac{\text{No. SMR}}{16} + \frac{\text{No. LCM}}{8} + \frac{\text{No. LM}}{8} + 1$$

( vi) Provisioning of Multi-line Test Unit (LTU):

#### Method 1

It is recommended that one (1) MTU circuit be assigned as a dedicated MTU for two NT3X09BA Metallic Test Access cards. This will serve up to eight (8) LCMs. In addition provision one (1) non-dedicated (rover) MTU circuit per office.

For RLCM and OPM offices provision one (1) dedicated MTU circuit (the rover MTU is not required).

For RSC offices provision as per host office.

$$\# \text{ of MTU Circuits} = \frac{\# \text{ of LCMs}}{8} + 1$$

$$\# \text{ of NT2X10BA/NT2X11BA Pairs} = \frac{\# \text{ of MTU Circuits}}{2}$$

#### Method 2

Telco requirements may dictate that all of the lines in an office be testable in a given time for test. This will require provisioning enough MTU circuits to meet this requirement based on the following formula:

$$\# \text{ MTU} = \frac{\# \text{ of Lines} \times \text{Test Hold Time (Secs)}}{\text{}} + 1$$

0 RELEASE 28.01  
0 93 12 03

0 1.3.1 International Metallic Test Unit (IMTU)

0 a) General Description

0 These circuits are used to perform DC and AC voltage measurements  
0 and metering signals measurements as well as resistance,  
0 capacitance and frequency measurements on subscriber loops and  
0 line circuits. Connection is DC-metallic via the DMS Metallic  
0 Test Access Network (MTA) and the access relay in the line card.

0 The IMTU is for International applications only.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) The IMTU consist of a pair of interconnected cards:

0 NT4X97AA Metallic Test Unit Controller  
0 NT4X98BB Metallic Test Unit Analog  
0 (NT4X98AA is to be replaced by NT4X98BB.)

0 The IMTU has two separate tip and ring appearances that  
0 time share the same measurement circuits. This time  
0 sharing is transparent to the system and, as a result,  
0 the IMTU appears as two separate measurement circuits.

0 ( ii) The MTU analog card and the MTU control card each occupy  
0 1 card slot. They are mounted as a functional pair on a  
0 International Maintenance Trunk Module (IMTM) (located at  
0 Host) or a Remote Maintenance Module (RMM) (located at  
0 IRLCM, IOPM).

0 ( iii) It is recommended that one (1) IMTU circuit be assigned  
0 as a dedicated IMTU for two NT3X09BA Metallic Test Access  
0 cards. This will serve up to eight (8) LCMs. In addition,  
0 provision one (1) non-dedicated (rover) IMTU circuit  
0 per office.

0 For IRLCM offices provision a minimum of one (1) IMTU  
0 pair per site. A non-dedicated IMTU (rover) is not required  
0 for single IRLCM configurations. For multiple  
0 IRLCM configurations, provision the number of IMTUs (including  
0 a rover circuit) based on the following methods:

0  
0 RELEASE 28.01  
0 93 12 030 Method 10 # of LCMs  
0 # of IMTU Circuits = ----- + 1  
0 80 # of IMTU Circuits  
0 # of NT4X97/NT4X98 Pairs = -----  
0 20 Method 20 Telco requirements may dictate that all of the lines in  
0 an office be testable in a given time for test. This will  
0 require provisioning enough IMTU circuits to meet this  
0 requirement based on the following formula. Be sure to  
0 ensure that Method 1 (above) has been observed.0 # Lines x Test Hold Time (Secs)

0 RELEASE 28.01  
0 93 12 03

0 1.3.2 Transmission Termination Test Trunk

0 a) General Description

0 The NT2X71AA Transmission Termination Test Trunk has two func-  
0 tions:

0 a) To test DMS-100 and DMS-200 offices using open  
0 and short circuit terminations.

0 b) To provide a balanced test termination for a  
0 DMS-100 office.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) The NT2X71AA occupies one card position in a Trunk Module  
0 (TM) and may be plugged into a 2-wire, 4-wire or 8-wire  
0 TM.

0 ( ii) Required for DMS-100, DMS-100/200 and DMS-200 offices.

0 ( iii) One circuit of each type per office is recommended.

0 ( iv) Features of the NT2X71AA:

0 - Provides open circuit, AC short circuit or  
0 909 ohm + 2.15 uF terminations.

0 - Software selectable pads, 1 to 7 db in 1 db  
0 steps.

0 - One circuit, open and short, per card.

0 ( v) Used in both the test source and the test office. In the  
0 DMS test source office the MAP/TTP monitor facility is  
0 used to detect the presence of a singing condition.

0

0

0 RELEASE 28.01  
0 93 12 03

0 1.3.3 Metallic Test Access (MTA)

0 a) General Description

0 The MTA provides a dc path between the line circuit and test  
0 equipment, such as a LTU or a #14 Local Test Desk (LTD), via the  
0 test access bus. When subscriber lines are tested, the path is  
0 via a digital line and an applique circuit.

0 The MTA can also be used to access subscriber loops, while by-  
0 passing the line card, and to connect a jack to the loop. Simi-  
0 larly, a tone can be transmitted on the subscriber loop while  
0 bypassing the line card.

0 The MTA is used in domestic and international DMS-100 and  
0 DMS-100/200 offices.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) The MTA may be configured in either of two ways:

0 A NT2X46AB minibar switch mounted in a miscellaneous  
0 equipment frame (MIS) in the host office or a Remote Ser-  
0 vice Equipment Frame (RSE) at a Remote Line Module (RLM).  
0 It is used in conjunction with a NT2X50AB driver card  
0 that is mounted in a MTM or RSM.

0 A NT3X09AA or NT3X09BA type driver card are each equipped  
0 with a network of relays that comprise a matrix. The  
0 NT3X09AA card has 8 horizontal connections for test  
0 equipment and 4 vertical connections for LCD. The  
0 NT3X09BA card has 8 horizontal connections for test  
0 equipment and 8 vertical connections for LCD. The  
0 NT3X09AA Remote Metallic Access card is mounted on a RMM  
0 at a RLCM, a IRLCM, a RSC, or an OPM. The NT3X09BA 8X8  
0 metallic test access card is mounted in a MTM in a host  
0 office, a RSM at a RLM or a RMM at a RLCM, a IRLCM, a RSC  
0 or an OPM. (Presently NT3X09BA is not applicable to RLCM  
0 and IRLCM for Canadian Offices).

0 ( ii) The NT3X09BA is designed to replace the MTA Unit  
0 (NT2X46AB) and the Remote MTA Card (NT3X09AA) where ap-

FIGURE 35.1

0 RELEASE 28.01  
0 93 12 03

0 ( v) Currently, one Line Test Unit (LTU) is assigned to hori-  
0 zontal number zero of each minibar switch (NT2X46AB) on a  
0 dedicated basis. Hence, on each NT2X46AB, this LTU will  
0 have test access to up to ten (10) LM's and/or LCM's.

0 For NT3X09BA, one LTU is assigned to horizontal number  
0 zero of the first NT3X09BA card and multiplied to hori-  
0 zontal number zero of the next NT3X09BA card in the next  
0 column. Hence, one dedicated LTU is assigned to two (2)  
0 NT3X09BA cards such that this LTU will have test access  
0 to up to eight (8) LM's and/or LCM's. For every two (2)  
0 NT3X09BA cards, provide one (1) LTU.

0 Each additional LTU can be assigned to horizontal numbers  
0 from two (2) on upwards.

0 ( vi) Provisioning a NT2X46AB MTA.

$$\begin{aligned} \text{MTA} &= \frac{\text{No. SMS S/W Sites}}{20} + \frac{\text{No. SMU S/W Sites}}{20} + \\ &\quad \frac{\text{No. SMR}}{20} + \frac{\text{No. LCM}}{10} + \frac{\text{No. LM}}{10} \end{aligned}$$

0 Provisioning a NT3X09BA 8 X 8 Metallic Test Access.

$$\begin{aligned} \text{MTA} &= \frac{\text{No. SMS S/W Sites}}{8} + \frac{\text{No. SMU S/W Sites}}{8} + \\ &\quad \frac{\text{No. SMR}}{8} + \frac{\text{No. LCM}}{4} + \frac{\text{No. LM}}{4} \end{aligned}$$

0 ( vii) Intermediate Distribution Frame (IDF) Implementation  
0 (U.S. Application Only)

0 The existing cabling method does not support the testing  
0 of non-integrated SLC 96 subscriber loop carrier systems  
0 using an AT&T test tool called Pair Gain Test Controller  
0 (PGTC).

0 To allow the testing of the universal SLC 96 subscriber  
0 carrier system using a PGTC, the total NT3X09BA multiple  
0 cable length must not exceed the figures shown in Table

0  
0 RELEASE 28.01  
0 93 12 03

0 35.2 of this document. Otherwise, an Intermediate Dis-  
0 tribution Frame (IDF) (i.e. Customer provided) close to  
0 the DMS line-up will be required.

0 The total multiple cable length is the sum of all multi-  
0 ple cables to the distribution frame, both horizontal and  
0 vertical.

0 The overall MTA circuit distance must be calculated based  
0 on the longest metallic path from any PGTC to any uni-  
0 versal SLC 96 Central Office Terminal Channel Unit (COT  
0 CU) in the central office.

0 The MTA multiple cables can be minimized by placing the  
0 TME that house the MTAs close to the cable racks and the  
0 MDF as much as possible.

| 0                                                                   | closer to COT CU                                                    | 900                                                                      | 1150                                                                     |
| 0 2100                                                              | closer to PGTC                                                      | 1050                                                                     | 1150                                                                     |
| 0                                                                   | closer to COT CU                                                    | 1150                                                                     | 1400                                                                     |
| 0 1800                                                              | closer to PGTC                                                      | 1350                                                                     | 1450                                                                     |
| 0                                                                   | closer to COT CU                                                    | 1350                                                                     | 1600                                                                     |
| 0 1500                                                              | closer to PGTC                                                      | 1600                                                                     | 1600                                                                     |
| 0                                                                   | closer to COT CU                                                    | 1650                                                                     | 1850                                                                     |
| 0 1200                                                              | closer to PGTC                                                      | 1750                                                                     | 1900                                                                     |
| 0                                                                   | closer to COT CU                                                    | 1800                                                                     | 2050                                                                     |
| 0 900                                                               | closer to PGTC                                                      | 2100                                                                     | 2100                                                                     |
| 0                                                                   | closer to COT CU                                                    | 2100                                                                     | 2250                                                                     |
| 0 600                                                               | closer to PGTC                                                      | 2400                                                                     | 2300                                                                     |
| 0                                                                   | closer to COT CU                                                    | 2400                                                                     | 2450                                                                     |
| 0 300                                                               | closer to PGTC                                                      | 2550                                                                     | 2550                                                                     |
| 0                                                                   | closer to COT CU                                                    | 2550                                                                     | 2650                                                                     |

0 Table showing maximum MTA cabling limitations  
0 from any PGTC to any universal SLC 96 COT CU

0 Table 35.2

0 \* The total multiple cable length is the sum of all multiple cables  
0 to the distribution frame, both horizontal and vertical.

0 \*\* The overall MTA circuit distance must be calculated based on the  
0 longest metallic path from any PGTC (Pair Gain Test Controller)  
0 to any universal SLC 96 COT CU (Central Office Terminal Channel  
0 Unit) in the central office.

0 1.3.4 Wideband Test Access

0 a) General Description

0 The Wideband Test Access (WTA) Panel will replace the use of the  
0 Main Distributing Frame (MDF) for metallic cross-connecting of  
0 test circuits (such as the Line Test Unit/Multiline Test Unit  
0 (LTU/MTU)), Metallic Test Access (MTA), and line equipment in DMS  
0 offices.

0 The WTA Panel is a cross-connect panel which will provide the me-  
0 tallic cross-connect capability for the testing of DMS wideband  
0 subscriber services such as ISDN and Datapath as well as existing  
0 voice frequency DMS-100 subscriber services. It is mandatory for  
0 the testing of ISDN and is recommended for the testing of  
0 Datapath service. The existing MDF cabling method will not be  
0 able to support the testing of these services mainly because of  
0 the transmission impairment caused by the excessive switching of-  
0 fice cabling.

0 This method of cross-connecting office wiring for the test cir-  
0 cuits, MTA, and test access cables will drastically reduce the  
0 amount of office cabling resulting from the existing MDF method.

0 This panel will mount on the Miscellaneous Equipment (MIS) Frame  
0 NT0X02AB. With the panel mounted on an MIS frame within the DMS  
0 equipment frame lineups, all the cabling to the MDF will be elim-  
0 inated and this will result in much shorter office wiring for the  
0 testing of subscriber services.

0 b) References

0 c) Provisioning Considerations:

0 ( i) The Wideband Test Access (WTA) Panel will replace the use  
0 of the Main Distributing Frame (MDF) for metallic cross-  
0 connecting of test circuits (such as the Line Test  
0 Unit/Multiline Test Unit (LTU/MTU)), Metallic Test Access  
0 (MTA), and line equipment in DMS offices.

0 The WTA Panel is a cross-connect panel which will provide  
0 the metallic cross-connect capability for the testing of  
0 DMS wideband subscriber services such as ISDN and  
0 Datapath as well as existing voice frequency DMS-100 sub-  
0 scriber services. It is mandatory for the testing of  
0 ISDN and is recommended for the testing of Datapath ser-

0 RELEASE 28.01  
0 93 12 03  
0

0 vice. The existing MDF cabling method will not be able  
0 to support the testing of these services mainly because  
0 of the transmission impairment caused by the excessive  
0 switching office cabling.

0 This method of cross-connecting office wiring for the  
0 test circuits, MTA, and test access cables will dras-  
0 tically reduce the amount of office cabling resulting  
0 from the existing MDF method.

0 ( ii) There are two (2) versions of the WTA Panel:

0 NT7X76AA WTA Panel

0 NT7X76BA WTA Panel (Dedicated LTU/MTU)

0 NT7X76AA will allow the cross-connection of up to 30  
0 NT3X09BA MTA circuits in a matrix of three (3) horizontal  
0 NT3X09BA rows by ten (10) vertical NT3X09BA columns. This  
0 is equivalent to the cross-connection of 24 horizontal  
0 test appearances to 80 vertical appearances. The NT3X09BA  
0 card has 8 horizontals and 8 verticals.

0 NT7X76AA will allow the cross-connection of up to 30  
0 NT3X09AA MTA circuits in a matrix of three (3) horizontal  
0 NT3X09AA rows by ten (10) vertical NT3X09AA columns. This  
0 is equivalent to the cross-connection of 24 horizontal  
0 test appearances to 40 vertical appearances. The NT3X09AA  
0 card has 8 horizontals and 4 verticals.

0 NT7X76BA is similar to NT7X76AA with one exception. The  
0 first horizontal test appearance of the 24 horizontal  
0 test appearances of the NT7X76BA panel is grouped into  
0 five (5) subgroups, each with two (2) horizontal 0's and  
0 16 verticals (if NT3X09BA cards are used for cross-  
0 connection purposes) or 8 verticals (if NT3X09AA cards  
0 are used for cross-connection purposes). Each horizontal  
0 subgroup can have a dedicated LTU/MTU. Hence, up to five  
0 (5) dedicated LTU/MTUs can be connected to NT7X76BA. If  
0 NT3X09BA cards are used, each dedicated LTU/MTU will have  
0 access to 16 verticals or 8 Line Concentrating Modules  
0 (LCMs) within each horizontal subgroup 0. If NT3X09AA  
0 cards are used, each dedicated LTU/MTU will have access  
0 to 8 verticals or 4 LCMs within each horizontal subgroup  
0 0.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 (iii) The NT7X76AA WTA Panel will not be used for the dedicated  
0 LTU/MTU function.

0 The NT7X76BA WTA Panel (Dedicated LTU/MTU)  
0 will be used for the dedicated LTU/MTU function.

0 The NT7X76AA will also be used if the office requires  
0 more than one (1) (horizontal) row of WTA Panels or more  
0 than 24 horizontal test appearances.

- 0 (iv) The number of WTA Panels can be expanded horizontally (in  
0 rows) and/or vertically (in columns) in a matrix.

0 For offices without dedicated LTU/MTUs, only NT7X76AA  
0 would be required for expansion both horizontally and  
0 vertically.

0 For offices with dedicated LTU/MTUs, the first row of WTA  
0 Panels would be of the NT7X76BA type. If connection to  
0 more dedicated LTU/MTUs was required, NT7X76BA Panels  
0 would be used for the second row of WTA Panels. Other-  
0 wise, the NT7X76AA Panel should be used. Our current  
0 standard is to have dedicated LTU/MTUs on the first row  
0 of the matrix of WTA Panels (i.e. NT7X76BA) and not to  
0 have dedicated LTU/MTUs on the second and all subsequent  
0 rows of the matrix of WTA Panels (i.e. NT7X76AA).

- 0 ( v) The WTA Panel will replace the Intermediate Distribution  
0 Frame (IDF) for the testing of the universal SLC 96 sub-  
0 scriber loop carrier system which uses an AT&T test tool  
0 called Pair Gain Test Controller (PGTC).

0 The existing engineering rules for the use of the IDF  
0 should be applied to the use of the WTA Panel. For more  
0 information, see ECM-276 on subject 8X8 Metallic Test Ac-  
0 cess Circuit Pack, NT3X09BA.

- 0 ( vi) The WTA panel will mount on the Miscellaneous Equipment  
0 (MIS) Frame NT0X02AB. With the panel mounted on an MIS  
0 frame within the DMS equipment frame lineups, all the ca-  
0 bling to the MDF will be eliminated and this will result  
0 in much shorter office wiring for the testing of sub-  
0 scriber services.

0 For initial and extension offices requiring new MIS  
0 Frames, the WTA Panels should be mounted on standard  
0 shelf positions 65,51,32,18, and 04 first on the front

0 RELEASE 28.01  
0 93 12 03  
0

0 and then on the back of the MIS Frame. Hence, up to a  
0 maximum of ten (10) WTA Panels can be equipped on one (1)  
0 MIS Frame.

0 For ease of engineering cables, the WTA Panels will be  
0 assigned from the top position down on the MIS Frame.

0 Although a Frame Supervisory Panel (FSP) is not required  
0 for the WTA Panel, an FSP can be mounted in shelf posi-  
0 tion 45 if other devices (which can mount on the MIS  
0 Frame) require an FSP. Hence, if the MIS Frame is not  
0 fully provisioned with WTA Panels, other valid hardware  
0 units can be mounted.

0 For installation on existing MIS Frames in existing of-  
0 fices, the WTA Panels can be mounted on any available  
0 shelf position of the MIS Frame, preferably the top shelf  
0 positions.

- 0 ( vii) To minimize the office wiring required for line testing,  
0 the Maintenance Trunk Modules (MTM) that are provisioned  
0 with NT3X09AA/BA cards and LTU/MTUs should be reduced to  
0 a minimum and placed in the adjacent TME/DCE Frames next  
0 to the MIS Frames containing WTA Panels.

0 The Line Concentrating Equipment Frames (LCE) and ISDN  
0 Line Concentrating Equipment Frames (LCEI) should be  
0 clustered around the MIS Frames containing WTA Panels in  
0 order to minimize the cabling to these panels.

0 Hence, the signal loss caused by office wiring should be  
0 reduced to the minimum that is possible. The signal loss  
0 should be less than one (1) db in most offices.

0 (viii) Discrimination Numbering

0 WTA Panels NT7X76AA/BA will be numbered from 000 on up  
0 (e.g. WTA 000, WTA 001, etc.).

- 0 ( ix) For offices larger than 75,000 lines and requiring more  
0 than three (3) WTA Panels, the straight forward WTA ma-  
0 trix configuration cannot be used due to the software  
0 limitation of a maximum of 32 multiples which can be  
0 datafilled for each horizontal subgroup.

0 RELEASE 28.01  
0 93 12 03  
0

0 The way to solve this problem is to split the total num-  
0 ber of multiples into either groups of 32 (using Method  
0 1) or groups of 31 (using Method 2).

0 WTA Panel Configuration for Offices with Line Size >  
0 75,000

0 Method 1

0 Using Method 1, the multiples can be divided evenly into  
0 two (2) groups of up to 32 multiples within each group.  
0 Each WTA Panel allows the cross-connection of up to ten  
0 (10) multiples except for the fourth panel which will  
0 only have two (2) multiples. Hence, WTA Panels  
0 "B", "C", "D", and "E" will provide cross-connections for  
0 32 multiples.

0 Access to the line circuits is provided via the extended  
0 verticals of WTA Panel "A" as illustrated. Therefore, the  
0 test circuits connected to WTA Panel "A" will have access  
0 to more than 75,000 lines by using the extended vertical  
0 and horizontal connections.

0 WTA Panel Configuration for Offices with Line Size >  
0 75,000

0 Method 2

0 Using Method 2, WTA Panel "A" is connected to WTA Panel  
0 "B" in such a way as to provide for the cross-connections  
0 for the first group of 31 multiples via WTA Panels  
0 "A", "B", "C", and "D" as in a normal matrix configuration.

0 For the second group of 32 multiples via WTA Panels  
0 "F", "G", "H", and "I", the extended verticals are used.

0 Differences Between Methods 1 and 2

0 Method 1 will require one (1) more WTA Panel which is  
0 panel "E" and three (3) more NT3X09BA cards, six (6) in-  
0 stead of three (3), connected to panel "A".

0 Using Method 1, line testing involving the first and sec-  
0 ond groups of 32 multiples will be subjected to the mul-  
0 tiple cabling within the group or a maximum of 32  
0 multiple cables. Using Method 2, line testing involving  
0 the second group of 32 multiples will also involve the

0  
0 RELEASE 28.01  
0 93 12 03

0 first group of 31 multiples or will be subjected to a  
0 maximum of 63 multiple cables.

0 Generally, Method 1 would be preferred over Method 2 due  
0 to the effect on line testing. However, Method 2 may be  
0 worth considering if an LCE expansion is done properly to  
0 reduce the effect of multiple cabling on line testing.

### Method 1

WTA Panels D and E (to the right of WTA Panel C) and WTA Panels H and I (to the right of WTA Panel G) are not shown.

The connections between WTA Panels "A" and "B" and between WTA Panels "A" and "F" are for illustration purposes only. That is, the first group of eight (8) verticals on WTA "A" will be datafilled as extended verticals and connected to the first group of eight (8) horizontal datafilled as extended horizontal on WTA "B". The second group of eight (8) verticals of WTA "A" will be connected to the first group of eight (8) horizontal of WTA "F". Similarly, the third and fourth group of eight (8) verticals on WTA "A" will be connected to the second group of eight (8) horizontal of WTA "B" and "F" respectively. The fifth and sixth group of eight (8) verticals on WTA "A" will be connected to the third group of eight (8) horizontal on WTA "B" and "F" respectively. The actual connections are made from connectors P43 to P44 of WTA "A" to connectors P31 to P42 and P97 to P108 of WTA "B" and "F".

0 WTA Panel Configuration for Offices with Line Size >  
0 75,000

0 Method 2

0 WTA Panel D (to the right of WTA Panel C) and WTA Panels  
0 H and I (to the right of WTA Panel G) are not shown.

0  
0 RELEASE 28.01  
0 93 12 03

0 The connections between WTA Panels "A" and "F" are for  
0 illustration purposes only. That is, the first group of  
0 eight (8) verticals datafilled as extended verticals on  
0 WTA "A" is connected to the first group of eight (8) hor-  
0 izontals datafilled as extended horizontals on WTA "F".  
0 Similarly, the second group of eight (8) verticals on WTA  
0 "A" is connected to the second group of eight (8) hori-  
0 zontals on WTA "F". The third group of eight (8) verti-  
0 cals on WTA "A" is connected to the third group of eight  
0 (8) horizontals on WTA "F". The actual connections will  
0 be made from connectors P43 to P48 on WTA "A" to connec-  
0 tors P31 to P42 and connectors P97 to P108 on WTA "F".

0  
0 RELEASE 28.01  
0 93 12 03

0 1.3.5 101 Communication Test Line

0 a) General Description

0 The 101 Communication Test Line (CTL) circuit provides a 2-wire  
0 voice and signaling interface between the Trunk Module (TM) and a  
0 Maintenance and Administration Position (MAP) configured as a  
0 Line Test Position (LTP) or a Trunk Test Position (TTP). The Map  
0 may be at the same location as the TM or remote from it.

0 The Circuit is used in all DMS-100 Family offices as an originat-  
0 ing communication trunk or as a terminating type 101 trunk.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual  
0 NTP 297-2101-516 Line Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) There are two versions of the circuit:

0 NT5X30AA Used in North American applications.

0 NT5X30BA Used in International applications.

0 ( ii) Each circuit card contains one CTL circuit, and is  
0 plugged into a 2-wire, 4-wire, or 8-wire TM.

## 0 ( iii) Features:

|   |                       |          |             |
|---|-----------------------|----------|-------------|
| 0 |                       | NT5X30AA | NT5X30BA    |
| 0 | -Impedance            | 900 Ohms | complex     |
| 0 | -Compatibility with   |          |             |
| 0 | Telephone Set         | 500 Type | BT700 Type  |
| 0 | Key equipment         | 1A2      | UK Approved |
| 0 | Foreign Exchange      | Yes      | No          |
| 0 | carrier channel units |          |             |
| 0 | -Built in ringing     | 20 Hz    | 25 Hz       |
| 0 | supply                |          |             |
| 0 | -Forward disconnect   | Yes      | No          |
| 0 | (re-ring)             |          |             |

0 Each card contains transmission and signaling functions  
0 to enable outgoing calls to be originated from a LTP or a  
0 TTP, and for incoming calls to be completed to it.

## 0 ( iv) Applications of NT5X30

## 0 1. 101 Test Line (Terminating)

0 As a minimum requirement provide one circuit per Main-  
0 tenance and Administration Position (MAP) which is to  
0 be used for trunk testing (TTP). Each Trunk to have  
0 access to all such positions.

## 0 2. 101 Communication Trunk (Originations)

## 0 Local Offices:

0 As a minimum requirement provide one circuit for each  
0 MAP which is to be used for general maintenance or  
0 line testing.

## 0 Toll Offices

0 As a minimum requirement provide one circuit for each  
0 MAP which is to be used for general maintenance or  
0 trunk testing.

0

0 RELEASE 28.01  
0 93 12 03

0 MAP/Headset Monitor Interface

0 One interface circuit is required for each headset  
0 provided for service analysis monitors and test mon-  
0 itors at the MAP (See Section 3.6, I/O Devices for  
0 more information).

0 ( v) For NT5X30AA one compromise balance network NT2X77, of  
0 the appropriate type must be provided for each card or-  
0 dered (see Section 3.5 (1.3.1 Analog Trunks) for more in-  
0 formation on the compromised Balance Networks).

0 For NT5X30BA one compromise balance network NT2X77BB must  
0 be provided for each card ordered.

0 Schema  
0 NTP 297-2301-451 DMS-300 Gateway Customer Data  
0 Schema  
0 Section 3.7 Office Maintenance

0 c) Provisioning Considerations:

0 ( i) Three switch selectable detector modes:

- 0 - loop detector  
0 - ground detector  
0 - battery detector

0 ( ii) Each DMS miscellaneous scan card provides fourteen scan  
0 points configured as two scan circuits known as "Scan  
0 Groups" with seven points per group. In certain applica-  
0 tions software limitations restricts a group to a spe-  
0 cific function and unused points in that group cannot be  
0 assigned to other functions.

0 ( iii) DMS supports a maximum of 1024 scan points (146 scan  
0 groups). This includes seven scan points (one scan  
0 group) associated with each standard alarm card provi-  
0 sioned:

0 NT3X82AA  
0 NT3X82AB  
0 NT3X83AA  
0 NT3X84AA  
0 NT3X85AA

0 For more information on the Standard Alarm cards, refer  
0 to Section 3.7, Office Maintenance.

0 ( iv) Miscellaneous Scan Card is NT0X10AA. One slot per card.  
0 Mounts on MTM, OAU, RSM.

0 ( v) For alarms which require scan points, see NTP  
0 297-1001-451 DMS-100 Family Common Customer Data Schema,  
0 Section 034 Alarm Scan Group Table.

0 ( vi) For line features which require scan points, see the Scan  
0 Group Table, Section 127 in the following NTPs:

0 NTP 297-2101-451  
0 NTP 297-2141-451  
0 NTP 297-2151-451  
0 NTP 297-2181-451

0 The quantity of scan points required for line features is  
0 divided by seven (7) to determine the number of scan cir-  
0 cuits or groups required.

0 ( vii) For network management functions which require scan  
0 points, see the Network Management Scan Table, Section  
0 039 in the following NTPs:

0 NTP 297-1001-451  
0 NTP 297-2141-451  
0 NTP 297-2151-451  
0 NTP 297-2181-451  
0 NTP 297-2301-451

0 The quantity of scan points required for network manage-  
0 ment functions is divided by seven (7) to determine the  
0 number of scan circuits or groups required.

0

0

0 (viii) Each A.P.C. ROTL unit, model 1066-ROTL/52A, comes  
0 equipped with two ROTL test ports.

0 One scan group (four points plus three dedicated spares)  
0 must be provided for each A.P.C. ROTL test port. Provide  
0 one additional scan point per ROTL unit if an alarm  
0 interface is required.

0 ( ix) For more information on the provisioning of Scan  
0 Points, refer to Section 3.7, Office Maintenance.

0 Schema  
0 NTP 297-2201-451 DMS-200 Toll Customer Data Schema  
0 Section 3.7 Office Maintenance

0 c) Provisioning Considerations:

0 ( i) Four (4) SD modes selected by switches:

0 ( i) normally open ground operation  
0 ( ii) normally closed ground operation  
0 (iii) normally open loop operation  
0 ( iv) normally closed loop operation

0 ( ii) Each DMS SD card provides fourteen SD points configured  
0 as two SD circuits known as "SD Groups" with seven points  
0 per group. In certain applications software restricts a  
0 group to a specific function and unused points in that  
0 group cannot be assigned to other functions.

0 ( iii) DMS supports a maximum of 1024 SD points (146 SD groups).  
0 This includes the SD groups associated with each standard  
0 alarm card provided:

0 NT3X82AB  
0 NT3X83AA  
0 NT3X84AA  
0 NT3X85AA

0 For more information on the Standard Alarm Cards, refer  
0 to Section 3.7, Office Maintenance.

0 ( iv) Signal Distribution Card types are as follows:

0 Signal Distribution Card, Type I: NT2X57AA  
0 SD Card with OAU Monitor Circuit: NT2X57AB  
0 Signal Distribution Card, Type II: NT2X55AA

0 SD Card Type I and SD Card Type II mount on the Mainte-  
0 nance Trunk Module (MTM, Remote Maintenance Module (RMM)  
0 and Remote Service Module (RSM).

0 The Type I SD card is fitted with miniature flat-spring  
0 board-mounted relays for applications requiring lower  
0 output contact ratings and resistive loads.

0 OAU monitor circuit (code NT2X57AB only) provides an out-  
0 put to external equipment if communication between OAU  
0 and CCC is interrupted.

0 the Type II SD card is fitted with mercury-wetted-contact  
0 relays for applications requiring higher output contact  
0 ratings.

0 ( v) For alarms which require SD points. see NTP 297-1001-451  
0 DMS-100 Family Common Customer Data Schema, Section 036,  
0 Alarm Signal Distributor Group Table.

0 ( vi) For line features which require SD points, see Signal  
0 Distributing Group Table, Section 128, in the following  
0 NTPs:

0 NTP 297-2101-451  
0 NTP 297-2141-451  
0 NTP 297-2151-451  
0 NTP 297-2181-451

0 The quantity of SD points required for line features is  
0 divided by seven (7) to determine the number of SD cir-  
0 cuits or groups required.

0  
0 RELEASE 28.01  
0 93 12 03

0 ( vii) One SD point for each line hunt group that requires a re-  
0 mote line overflow hardware register is to be provided.

0 (viii) Each A.P.C. ROTL unit, model 1066-ROTL/52A, comes  
0 equipped with two ROTL test ports.

0 One SD group (four points plus three dedicated spares)  
0 for each A.P.C. ROTL test port is to be provided.

0 ( ix) For network management functions which require SD points,  
0 see NTP 297-2201-451 DMS-200 Customer Data Schema, Sec-  
0 tion 217, Network Management Signal Distributor Table.

0 The quantity of SD points required is divided by seven  
0 (7) to determine the number of SD circuits required.

0 RELEASE 28.01  
0 93 12 03

0 1.3.8 Multi-Frequency (MF) Receiver

0 a) General Description

0 MF receivers, when connected to incoming trunks (analog and dig-  
0 ital) via the network, receive and interpret multi-frequency ad-  
0 dress signalling on these trunks.

0 b) References

0 Chapter 3, Section 3.5 Peripheral Modules  
0 NTP 297-1001-132 DMS-100 Family Blue Box Fraud  
0 Detection Feature Description

0 c) Provisioning Considerations:

0 ( i) Receiver access required for all incoming MF calls on all  
0 incoming and 2-way trunks.

0 ( ii) One receiver dedicated to each CAMA position.

0 ( iii) One to three receivers dedicated whenever the Blue Box  
0 Fraud Detection feature is activated. See NTP  
0 297-1001-132 DMS-100 Family Blue Box Fraud Detection Fea-  
0 ture Description.

0 ( iv) Versions of the card currently available are as follows:

0 NT2X48AA MF Receiver, Mu-law applications,  
0 two card position  
0 NT2X48BA MF Receiver, Mu-law applications,  
0 single card position  
0 NT2X48CA MF Receiver, A-law applications, two  
0 card position

0 ( v) The MF receivers can be mounted in either a Maintenance  
0 Trunk Module (MTM) or Trunk Module (TM) of the DMS-100  
0 Family of switching equipment.

0 ( vi) The Universal Tone Receiver (UTR) is a combined service  
0 circuit that can perform the function of a Digitone Re-  
0 ceiver for lines and a MF Receiver for trunks. (Refer to  
0 the Universal Tone Receiver subsection within this chap-  
0 ter for more information on the UTR.) MF Receivers are  
0 still required to service the following:

0  
0 RELEASE 28.01  
0 93 12 03

- 0 - analog trunk groups existing on TM/MTM
- 0 shelves
- 0 - lines equipped on LM modules
- 0 - trunk groups equipped on DCM modules
- 0 - Mechanized Calling Card Service (MCCS)
- 0 - Subscriber Carrier Modules (SMS,SMR,SMU)
- 0 - incoming and the incoming portion of two way
- 0 service and test circuits (i.e. Remote
- 0 Office Test Line and Blue Box Fraud
- 0 Prevention)
- 0 - incoming RONI grunk groups
- 0 - Super CAMA - two way incoming DP outgoing DP
- 0 trunk groups

0 ( vii) MF Receivers are provisioned based on traffic. Refer to  
0 Chapter 2 Table N, MF Receiver - CCS Capabity Tables and  
0 Table M, MF Receiver Holding Time.

0 1.3.9 Digitone Receiver

0 a) General Description

0 These circuits receive and interpret the digitone signals pulsed  
0 on a customer line equipped with the digitone feature.

0 b) References

0 Chapter 3, Section 3.5 Peripheral Modules

0 c) Provisioning Considerations:

0 ( i) Digitone Receiver required for all originating digitone  
0 signalling.

0 ( ii) Receiver provisioned to handle total load for all calls  
0 generated by digitone lines.

0 ( iii) Versions of the card currently available are as follows:

0 NT2X48AB Digitone Receiver, Mu-law  
0 applications, two card position  
0 NT2X48BB Digitone Receiver, Mu-law  
0 applications, single card position  
0 NT2X48CB Digitone Receiver, Mu-law  
0 applications, British Telecom, two  
0 card position  
0 NT2X48CC Digitone Receiver, A-Law  
0 applications, two card position

0 Each card contains four (4) Digitone Receiver Circuits.

0 ( iv) The digitone receivers can be mounted in either a Maintenance Trunk Module (MTM) or Trunk Module (TM) of the DMS-100 Family of switching equipment.

0 ( v) The Universal Tone Receiver (UTR) is a combined service circuit that can perform the function of a Digitone Receiver for lines and a MF Receiver for trunks. (Refer to the Universal Tone Receiver subsection within this chapter for more information on the UTR.) Digitone Receivers are still required to service the following:

0 - analog trunk groups existing on TM/MTM  
0 shelves

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - lines equipped on LM modules
- 0 - trunk groups equipped on DCM modules
- 0 - Mechanized Calling Card Service (MCCS)
- 0 - Custom Charge Calling (CCC)
- 0 - Subscriber Carrier Modules (SMS,SMR,SMU)
- 0 - incoming and the incoming portion of two way
- 0 service and test circuits (i.e. Remote
- 0 Office Test Line and Blue Box Fraud
- 0 Prevention)
- 0 - any FX type trunks (e.g. DS1FX0, FX0GS,
- 0 FX0LS, FXSGS, FXSLS)

0 ( vi) To support CCC it is necessary to provide digitone re-  
0 ceivers that are attached as service circuits to a CCC  
0 call during periods when digitone signalling is permitted  
0 or expected.

0 Typically, DMS toll TOPS offices and the toll side of  
0 local/toll TOPS offices are not provisioned with digitone  
0 receivers. The introduction of CCC will necessitate the  
0 inclusion of this new resource in DMS toll offices.

0 The digitone receiver used is the NT2X48AB.

0 A separate group of digitone receivers dedicated to CCC  
0 should be engineered in each office.

0 ( vii) Digitone Receivers are provisioned based on traffic. Re-  
0 fer to Chapter 2, Table P, Digitone Receivers - CCS Ca-  
0 pacity Tables and Table O, Digitone Receiver Holding  
0 Time.

0 Digitone receivers serving CCC traffic will be provi-  
0 sioned on a loss basis in DMS toll TOPS and local/toll  
0 TOPS offices. Use Poisson Table V in Chapter 2. The CCC  
0 traffic used is calculated as follows:

0

0

0

0

0 RELEASE 28.01  
0 93 12 03  
0

$$\begin{array}{l} \text{CCC Traffic} = \text{WAHT} \times \text{ABSBHA} \\ \hline 100 \end{array}$$

0 where

$$\text{WAHT} = (\text{P(W/O)} \times \text{HT1}) + (\text{P(W)} \times \text{HT2})$$

0 = Weighted Average Holding Time of  
0 digitone receivers

0 ABSBHA is the total Average Busy Season Busy Hour At-  
0 tempts (ABSBHA) for all 0+, 01+, ANI traffic with an in-  
0 dication of CCC capable. This will be the sum of all  
0 incoming trunk groups as well as local originating traf-  
0 fic in the case of DMS-100/200/TOPS.

0 P(W/O) is the probability that the 0+ or 01+ call marked  
0 as CCC capable is actually a subscriber dialed CCC call.  
0 This is difficult to predict and a value of 0.15 to 0.60  
0 can be used.

0 P(W) is the probability that the 0+ or 01+ call marked as  
0 CCC capable is an operator handled call. The sum of P(W)  
0 and (PW/O) should be one.

0 HT1 = digital receiver holding time for CCC  
0 calls

0 = 22.05 seconds if the sequence calling  
0 feature is disabled

0 or = 42.55 seconds if the sequence calling  
0 feature is enabled

0 HT2 = digital receiver holding time for non-  
0 CCC calls when marked as CCC capable

0 = 4 seconds

0  
0 RELEASE 28.01  
0 93 12 03

0 1.3.10 Conference Circuit Provisioning

0 a) General Description

0 Conference circuit is required to provide centrex or MDC custom-  
0 ers with transfer, consultation hold, call add-on, to provide  
0 POTS customers with 3-way calling or 6-way calling. Also required  
0 for TOPS positions, Service Analysis positions and Attendant Con-  
0 soles.

0 b) References

0 Chapter 2 Traffic Criteria and Capacities

0 Chapter 3, Section 3.3 Operator Services  
0 Section 3.4 Meridian Business Services

0 c) Provisioning Considerations:

0 ( i) There are two (2) versions of the circuit:

0 NT3X67AA used in North American applications  
0 NT3X67BA used in International applications

0 The NT3X67BB is fully backwards compatible to NT3X67BA  
0 which it replaces. In addition, it provides the Toll  
0 Break In (TBI) tone required to implement the Toll Break  
0 In - Background Tone feature. This feature is supported  
0 in BCS-25 or later software.

0 There is one (1) circuit per card. Each card occupies  
0 three (3) card slots in a Maintenance Trunk Module (MTM)  
0 or Trunk Module (TM) and requires six 4-wire PCM trunk  
0 appearances.

0 ( ii) The 6-party Conference Circuit provides a conference fa-  
0 cility on a single card for use with DMS-100 Family of-  
0 fices. Up to five conference circuits can be tandemed to  
0 permit conference connections for three to twenty-six  
0 parties.

0 ( iii) The Conference Circuit card is designed to function as  
0 one (1) 6-port conference circuit or two (2) 3-port con-  
0 ference circuits.

0

0  
0 RELEASE 28.01  
0 93 12 03

- 0 ( iv) One 3-port conference circuit is required per service  
0 analysis position.

0 One 3-port conference circuit is required per Attendant  
0 Console. One circuit is required per console. See MBS,  
0 Section 3.4, for more information.

0 Conference Circuits are required for TOPS positions. See  
0 Operator Equipment, Section 3.3, for more information.

- 0 ( v) The 3-Way Call Chaining feature is provided in software  
0 packages NTX820AA (MDC offices) and NTX808AA (POTS of-  
0 fices). This feature will allow a non-controlling party  
0 in a simple 3-way call or existing chain to flash hook  
0 and initiate another 3-way call provided the non-  
0 controlling party either has the 3-Way Calling (3WC) line  
0 option or a call transfer option datafilled on his line  
0 or customer group.

0 Number of 3-Port Conference Circuits required for 3-Way  
0 Call Chaining = Number of 3-Way Call Chaining Groups  
0  $\times (D-2)$ .

0 where:

0 Number of 3-Way Call Chaining Groups =  
0  $(A * B * C) / D$   
0 (round up to next integer)

0 A = the number of lines with 3-Way Calling  
0 capability

0 B = the % Feature Penetration for 3-Way Call  
0 Chaining from the number of lines in (A)  
0 (i.e. % of lines in (A) that are normally  
0 in use)

0 C = the % Feature Activation for 3-Way Call  
0 Chaining

0 D = the average number of conferees in a 3-Way  
0 Call Chaining Group.

0 \* Features of Group Intercom All Calls under NTX878AC are  
0 affected in the same way.

0  
0 RELEASE 28.01  
0 93 12 03

0 ( vi) Provision the NT3X67AA Six Port Conference CP per the  
0 following formula whenever more than one (1) member of a  
0 Bridge Group is to be bridged together using Multi-Party  
0 Bridged (MPB) Services (NTX297AA). These Six Port Con-  
0 ference CPs shall be configured as two (2) Three Port  
0 Conference Circuits.

0 # Six Port Conf. CP =  $(0.5 \times A) + (B) + (1.5 \times C)$

0 Where A = Number of Two (2) Party MPB Groups  
0 B = Number of Three (3) Party MPB Groups  
0 C = Number of Four (4) Party MPB Groups

0 Round up to the nearest whole number for the total  
0 NT3X67AA Six Port Conference CPs that are required for  
0 each office that requires Multi-Party Bridged Services.

0 ( vii) Refer to Traffic Table V in the Traffic Criteria and Ca-  
0 pacity section, in Chapter 2, for the number of confer-  
0 ence circuits required for traffic based on ABSBH usage  
0 (Refer to Chapter 2, Item 2.4 for Conference Circuit  
0 Grade of Service Objectives.)

0 1.3.11 Tone Generator

0 a) General Description

0 The Tone Generator Circuit (TGC) provides tones for general pur-  
0 pose use. The circuit card is mounted on a MTM.

0 The TGC generates tones for the following purposes:

- 0 - permanent signal
- 0 - conference calling
- 0 - Dual Tone Multifrequency (DTMF) signalling (SSMF-4)
- 0 - call waiting

0 b) References

0 Chapter 2 Traffic Criteria and Capacities

0 Section 3.2 - Software

0 Chapter 3, Section 3.4 Meridian Business Services

0 GS3X68 Tone Generator

0 c) Provisioning Considerations:

- 0 ( i) Versions of the Tone Generator Circuit cards are as fol-  
0 lows:

| 0 Product               |          |         |          |
|-------------------------|----------|---------|----------|
| 0 Description           | Code     | Uses    |          |
| 0 Dual Tone             | NT3X68AB | General | (Mu-law) |
| 0 Multifrequency (DTMF) |          |         |          |
| 0 Generator             |          |         |          |
| 0 Call Waiting Tone     | NT3X68AC | General | (Mu-law) |
| 0 Generator             |          |         |          |

0 For more information, refer to GS3X68.

- 0 ( ii) Digitone (DTMF) senders are used in Integrated Business  
0 Network offices to outpulse digits on the trunks and on  
0 CO trunks to a Class 5 office.

0 The DTMF sender grade of service is based on delay or  
0 loss criteria:

0 RELEASE 28.01  
0 93 12 03

0 a) ABSBH p=0.001, of Table V, Trunk Capacity Tables CCS  
0 Per Hour (Poisson Theory) (Chapter 2).

0 b) HDBH p=0.01, of Table V, Trunk Capacity Tables CCS  
0 Per Hour (Poisson Theory) (Chapter 2).

0 When provisioning DTMF Senders for a DMS100 MDC office  
0 using the Outpulsing DTMF On A Line feature and/or the  
0 Attendant Console End-T0-End Signaling (ACEES) feature  
0 both of which are contained in S/W Pkg NTX101AA, then the  
0 following formula shall be used:

$$\begin{array}{l} \text{DTMFS} \\ \text{CCS} = \end{array} \left[ \frac{\text{TT}(\% \text{ OG ABSBH CCS})100}{\text{TT-AVG-HT}} \right] + \left[ \frac{\text{ACEES-ABSBH-CCS}}{\text{ACEES-AVG-HT}} \right] \times \text{AVG-DTMFS-HT}$$

0 RELEASE 28.01  
0 93 12 03

0 where,

0 DTMFS CCS DTMF Senders requirements in CCS.

0 ACEES-ABSBH-CCS The sum of the traffic during the Aver-  
0 age Busy Hour Busy Season in CCS from  
0 all Attendant Consoles equipped with the  
0 Attendant Console End-To-End Signaling  
0 (ACEES) feature

0 ACEES-AVG-HT The Average Holding Time of all calls  
0 originating from all Attendant Consoles  
0 equipped with the ACEES feature in sec-  
0 onds.

0 TT Total Tie Trunks Traffic in CCS (TT) requiring Out-  
0 pulsing DTMF on a Line

0 % OG ABSBH CCS The percentage of Total Tie Trunk traf-  
0 fic that is Outgoing (OG), during Aver-  
0 age Busy Season Busy Hour (ABSBH), which  
0 require the outpulsing of DTMF.

0 TT-AVG-HT The Average Holding Time of the Total  
0 Tie Trunks

0 AVG-DTMFS-HT The Average Holding Time of the DTMF  
0 Senders (DTMFS). (Average sender hold-  
0 ing time of three seconds is assumed.)

0 If the number of senders for traffic figures exceed 25  
0 circuits, then the number of circuits should be deter-  
0 mined using the following formula:

0 #DTMF Senders = DTMFS CCS  
0 -----  
0 AVG-DTMFS-HT

0 DTMF sender card has four circuits per card. Two slots  
0 per card. Mounts on MTM.

0 DMS-250 trunks which are mounted on DCMs, DTCs or LTCs  
0 and require DTMF outpulsing do not require the DTMF  
0 Sender Card NT3X68AB.

0  
0 RELEASE 28.01  
0 93 12 03

0 As of BCS-16 (or later) for other DMS applications, dig-  
0 ital trunks which require DTMF outpulsing on the DTC or  
0 LTC do not required the DTMF Sender Card NT3X68AB.

0 The required tones for the above two situations will be  
0 outpulsed from the respective peripheral modules.

0 ( iii) The Call Waiting Tone Generator CP is required to provide  
0 the following call progression tones for Plain Old Tele-  
0 phone Service (POTS) Custom Calling, Meridian Data  
0 Centrex (MDC) and DMS Private Branch Exchange (PBX) ap-  
0 plications:

- 0 a) Account  
0 b) Busy Verification  
0 c) Call Waiting  
0 d) Camp-On  
0 e) Confirmation (350 + 440 Hz)  
0 f) Queue Recall (350 + 440 Hz)  
0 g) Special Dial (350 + 440 Hz)  
0 h) Teen Service

0 Time switch broadcasting is used to distribute tones to  
0 multiple users.

0 Each Call Waiting Tone Generator Circuit Pack contains  
0 four circuits and requires two Maintenance Trunk Module  
0 (MTM) card slots.

0 For redundancy purposes, a minimum of eight circuits (two  
0 CPs) are to be provided for non-MDC offices and a minimum  
0 of twelve circuits (three CPs) are to be provided for MDC  
0 offices.

0 ( iv) For calling tone in Custom Calling Services, provide one  
0 Tone Generator Call Waiting card per office.

0 The capacity of the Call Waiting Tone Generator card pro-  
0 vided for Custom Calling Services is sufficient to handle  
0 the requirements for Attendant Consoles (see Section  
0 3.4).

0 ( v) The number of Call Waiting Tone Circuit (CWT) required  
0 for POTS offices:

0 # of calls  
0 % of terminating

Page 9-71

0 
$$\# \text{ of CWT for Camp-ON} = \frac{(1 + (B/100)) \times A \times C}{D \times 3,600,000 \text{ ms}} \quad (\text{round up to next integer})$$

0 
$$\# \text{ of CWT for CWD/CWO} = \frac{J \times K \times Q}{L \times 3,600,000 \text{ ms}} \quad (\text{round up to next integer})$$

0 
$$\# \text{ of CWT for CWT} = \frac{R \times J \times P}{L \times 3,600,000 \text{ ms}} \quad (\text{round up to next integer})$$

0 
$$\# \text{ of CWT for IED} = (\# \text{ of CWT for CWT} \times 0.2) \times 2$$

0 Where:

0 A = # of Attendant Camp-On calls in one hour.  
0 B = % of Attendant Camp-On calls that will be recalled.  
0 C = Length of the Camp-On tone in milliseconds.  
0 (maximum 1500 ms., recommended default = 300ms)  
0 D = Average # of connections on a Camp-On tone circuit  
0 during the ABSBH.  
0 E = # of lines with Dial Call Waiting (CWD)  
0 F = # of lines with Call Waiting Originating (CWO)  
0 G = # of MDC lines  
0 H = # of Originating-Terminating calls per ABSBH that reach  
0 a busy MDC line.  
0 J = Average # of Call Waiting tones applied per call.  
0 (minimum 1, maximum 2, recommended default = 1.8)  
0 K = Length of the CWD/CWO tone in milliseconds.  
0 (maximum 1500 ms., recommended default = 300ms)  
0 L = Average # of connections on a Call Waiting tone circuit  
0 during the ABSBH.  
0 M = # of MDC lines with Call Waiting Terminating.  
0 N = # of lines in the office.  
0 O = # of Terminating calls per ABSBH that reach a busy line.  
0 P = Length of the Call Waiting Terminating tone in milli-  
0 seconds. (maximum 1500 ms., recommended default = 300ms)  
0 Q = (F + (E x 0.25)) x H / G (round up to next integer)  
0 R = (O x M) / N (round up to next integer)

0

0

0 RELEASE 28.01  
0 93 12 03

0 The number of Call Waiting Tone Generator Circuit Packs  
0 for an MDC office is equal to the number of CWT circuits  
0 required for POTS office ((v) above) plus the number of  
0 CWT required for MDC office (above) divided by 4 (i.e.,  
0 four circuits per card). The minimum number of CWT cir-  
0 cuit packs to provision per MDC office is 3.

0 (vii) If TEEN Service software is provided, Call Waiting Tone  
0 Generator cards are required (minimum of one (1) card per  
0 Secondary Directory Numbers (SDN) must be provided; it is  
0 recommended that one card per SDN be provided for a total  
0 of four (4) cards per office). Refer to the Software  
0 Feature section (3.2) for more information on TEEN Ser-  
0 vice.

0 The calculation for CWT on the Primary Directory Number  
0 (PDN) is the same as provisioning CWT for POTS lines ((v)  
0 above).

0 The number of CWT circuits required for the Secondary Di-  
0 rectory Number number 1 (SDN1) is:

$$\begin{array}{rcl} \text{\# of SDN1 calls} & & \\ \text{\# of CWT} & \begin{array}{l} \text{getting call} \\ \text{waiting (ABSBH)} \end{array} & \times \text{Holding Time} \\ \text{for SDN1} = & \text{-----} & \\ & 3,600,000 \text{ ms} & \end{array}$$

0 Where:

$$\begin{array}{rcl} \text{Holding Time} = & \begin{array}{l} \text{duration of} \\ \text{tone for SDN1} \end{array} & \times \begin{array}{l} \text{Avg call} \\ \text{wait tones} \\ \text{-----} \\ \text{calls} \end{array} \\ & = 300 \text{ ms} \times 1.8 & \\ & = 540 \text{ ms} & \end{array}$$

0 A minimum of one CWT cards are required for SDN1 lines.  
0 (There are four CWT circuits per card).

0

0

0

0 RELEASE 28.01  
0 93 12 03

0 The number of CWT circuits required for the Secondary Di-  
0 rectory Number number 2 (SDN2) is:

$$\begin{array}{l} \text{\# of SDN2 calls} \\ \text{getting call} \quad \times \quad \text{Holding Time} \\ \text{\# of CWT waiting (ABSBH)} \\ \text{for SDN2} = \frac{\text{-----}}{\text{3,600,000 ms}} \end{array}$$

0 Where:

$$\begin{array}{l} \text{Holding Time} = \frac{\text{duration of tone for SDN2} \times \text{Avg call wait tones}}{\text{calls}} \\ = 500 \text{ ms} \times 1.8 \\ = 900 \text{ ms} \end{array}$$

0 A minimum of one CWT cards are required for SDN2 lines.  
0 (There are four CWT circuits per card).

0 The number of CWT circuits required for the Secondary Di-  
0 rectory Number number 3 (SDN3) is:

$$\begin{array}{l} \text{\# of SDN3 calls} \\ \text{getting call} \quad \times \quad \text{Holding Time} \\ \text{\# of CWT waiting (ABSBH)} \\ \text{for SDN3} = \frac{\text{-----}}{\text{3,600,000 ms}} \end{array}$$

0 Where:

$$\begin{array}{l} \text{Holding Time} = \frac{\text{duration of tone for SDN3} \times \text{Avg call wait tones}}{\text{calls}} \\ = 700 \text{ ms} \times 1.8 \\ = 1260 \text{ ms} \end{array}$$

0 A minimum of one CWT cards are required for SDN3 lines.  
0 (There are four CWT circuits per card).

0 RELEASE 28.01  
0 93 12 03

0 1.3.12 Receiver Off Hook (ROH) Tone Generator

0 a) General Description

0 These circuits are required to provide receiver off-hook tones to  
0 subscriber lines in an attempt to alert subscribers by annoying  
0 tones of existing permanent signal conditions caused by receivers  
0 being left off the hook

0 b) References

0 Chapter 2 Traffic Criteria & Capacities

0 c) Provisioning Considerations:

0 ( i) The cards available are as follows:

0 Receiver Off-Hook Tone NT1X00AC

0 ( ii) Time Switch Broadcasting (TSB) is used to distribute tone  
0 simultaneous to multiple users.

0 ( iii) The maximum number of simultaneous connections per tone  
0 source is limited to 16 for old networks (NT0X48) and to  
0 32 for new networks (NT5X13) (i.e. for a non deloading  
0 NSG).

0 ( iv) If an office has both old and new networks, the maximum  
0 number of simultaneous connections per tone source is  
0 limited to 16 for a non deloading NSG.

0 ( v) Receiver Off Hook Tone card is NT1X00AC. Two circuits  
0 per card. One slot per card. Mounts on MTM.

0 ( vi) The number of ROH circuits can be calculated by using the  
0 following formula:

0 Use of ROH Circuits = ROH Tone Attempts/Hour x  
0 ROH Holding Time

0 ROH tone grade of service (ABSBH) criterion is:

0  $P(t > 0) = 0.009$  (Erlang C)

0 Therefore, use Table V, Chapter 2 to determine required  
0 number of ROH tone connections.

0 Divide total ROH tone connections by 16 or 32 as applica-  
0 ble to obtain total number of ROH tone circuits.

0 1.3.14 Digital Tone Detector and Sender Series NT5X29

0 a) General Description

0 The NT5X29 series of Digital Tone Detector and Sender cards provides multi-purpose, multi-channel service circuits for identifying and generating standard single or two-frequency tones.

0 The card contains independently controlled detector and sender circuits, which operate in conjunction with the Maintenance Trunk Module (MTM) of the DMS-100 Family digital switching system.

0 The tone detector receives various single and two frequency tones in Pulse Code Modulated (PCM) digital format from the MTM, identifies them, and signals the level, frequency and type of the tone back to the MTM.

0 The tone sender generates standard test or signalling tones in PCM format, on receipt of the appropriate control data work from the MTM.

0 The card is located in certain preferred positions in the MTM shelf, and plugs into the shelf backplane connectors.

0 b) References

0 GS5X29 Digital Tone Detector and Sender  
0 Series NT5X29

0 c) Provisioning Considerations:

0 ( i) Versions of the card currently available and their applications are as follows:

0 NT5X29AA: Tone detector and generator for Common Channel  
0 Interoffice Signalling (CCIS) continuity  
0 checker.

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 NT5X29AB: Tone detector for service observing circuits.  
0 Used by Remote Operator Number Identification  
0 (RONI) and AB01.1032 DMS-100 equipment with  
0 Traffic Operator Position System (TOPS).

0 NT5X29AC: Tone detector for audible ringing, answer and  
0 digitone multi-frequency tones.

0 NT5X29BA: Audio Tone Detector (ATD) for U.K. (Mercury  
0 Centrex).

0 ( ii) The Digital Tone Detector and Sender has the following  
0 features:

0 - All-digital operation, compatible with  
0 DMS-100 equipment.

0 - Simultaneously processes 16 channels of  
0 tonal data in PCM format.

0 - Can process a single-frequency tone or  
0 determine the difference frequency of a  
0 two-frequency tone signal.

0 - Generates standard signalling or test tones  
0 on command.

0 ( iii) When an Audio Tone Detector CP NT5X29AC is mounted on an  
0 MTM, then either TM Processor CP NT0X70AC or TM Control-  
0 ler CP NT4X65A is required. The NT0X70AA must be re-  
0 placed with an NT0X70AC for BCS-28 or higher.

0 1.3.15 Digital Recorded Announcement (DRA) System Provisioning

0 a) General Description

0 Digital Recorded Announcement (DRA) system provides recorded an-  
0 nouncement messages. It consists of a Speech Processor, a Micro-  
0 processor Controller and Speech Memory. The permanent Speech  
0 Memory is on NT1X76 PROM cards. Non volatile recordable Speech  
0 Memory is on the NT1X79 EEPROM card. Recordable Speech Memory is  
0 on NT1X77 RAM cards. The Speech Processor and Microprocessor  
0 Controller are both on the NT1X75 DRA Controller Board. One DRA  
0 Controller Board plus one or more (up to a maximum of eight (8))  
0 PROM, EEPROM and (or) RAM Speech Memory cards are equipped on a  
0 special MTM shelf.

0 b) References

0 Chapter 2 Traffic Criteria and Capacities  
0 Chapter 3, Section 3.3 Operator Services  
0 NTP 297-1001-527 Digital Recorded Announcement Machine  
0 Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) The controller CP can address up to one megabyte (M-byte)  
0 is speech memory (eight cards) and can be configured (by  
0 means of switches) to function either as an 8, 16, 24 or  
0 30 circuit (speech channel) interface. The selected  
0 quantity represents the number of different announcements  
0 (types) which can be simultaneously connected to sub-  
0 scribers. All announcements from the source DRA are con-  
0 fined to the same time switch or Network Sub Group (NSG)  
0 (the one to which the MTM housing the DRA is connected).  
0 Circuit assignment is flexible and a given announcement  
0 type can be assigned to more than one circuit.

0 ( ii) One controller card is required per DRA system and can  
0 accommodate up to a maximum of eight DRA ROM and (or) RAM  
0 memory cards. The various types of controller cards are  
0 as follows:

|                                 |          |
|---------------------------------|----------|
| 0 Digital Recorded Announcement | NT1X75AA |
| 0 Controller                    |          |
| 0 Enhanced DRA Controller       | NT1X75BA |
| 0 A-Law DRA controller          | NT1X75DA |

0 RELEASE 28.01  
0 93 12 03  
0

0 ( iii) The NT1X76 card can be either a 128K or 256K EPROM card.  
0 128K represents about 32 seconds of speech plus silence,  
0 test tone, prompt tone and 32 Special Information Tones  
0 (SIT). The 32 seconds can be divided into segments or  
0 subphrases as small as 32ms to allow building of more  
0 than 32 seconds of announcements. This is accomplished  
0 by recording only once standard announcement subphrases  
0 required in several announcements such as "We're sorry"  
0 or "The number you have dialed", that may be desired in  
0 many announcements.

0 ( iv) The various types of DRA PROM memory cards are as fol-  
0 lows:

0 Digital Recorded Announcement PROM NT1X76AA  
0 Memory  
0 (Standard English Announcements)

0 Digital Recorded Announcement PROM NT1X76BA  
0 Memory  
0 (Standard French Announcements)

0 Digital Recorded Announcement PROM NT1X76AB  
0 Memory  
0 (U.S. Bell Standard Announcements)

0 Digital Recorded Announcement PROM NT1X76AE  
0 Memory  
0 (ACTS Standard Announcements)

0 Digital Recorded Announcement PROM NT1X76CA  
0 Memory  
0 (Standard MCCS English Announcements)

0 Digital Recorded Announcement PROM NT1X76AF  
0 Memory  
0 (AOSSVR English Announcements-Part 1)

0 Digital Recorded Announcement PROM NT1X76AG  
0 Memory  
0 (AOSSVR English Announcements-Part 2)

0 Digital Recorded Announcement PROM NT1X76BF  
0 Memory  
0 (AOSSVR French Announcements -Part 1)

0 Digital Recorded Announcement PROM NT1X76BG

0 RELEASE 28.01  
0 93 12 03  
0

0 Memory  
0 (AOSSVR French Announcements -Part 2)

0 The pre-recorded standard announcements for each card  
0 type can be found in NTP 297-1001-527.

0 If bilingual announcement are required, then both  
0 NT1X76AA and NT1X76BA cards must be associated with the  
0 same DRA controller card.

0 ( v) NT1X77AA DRA Recordable Memory

0 Each RAM card can be used to store messages recorded on-  
0 line. It can hold up to 31 seconds of recording (based  
0 on 4 bits/sample and 8K samples/second). RAM speech mem-  
0 ory is provisioned based on a total recording time in  
0 seconds per DRA system. An announcement can run over two  
0 NT1X77AA cards.

0 ( vi) NT1X79AA DRA Electrically Erasable PROM (EEPROM) Card

0 Electrically Erasable Programmable Real Only Memory  
0 (EEPROM) is used as memory, allowing the customer to re-  
0 cord or rerecord messages. This card can hold up to 31  
0 seconds of recording. EEPROM speech memory is provi-  
0 sioned based on total recording time in seconds per DRA  
0 system. An announcement can run over two NT1X79AA cards  
0 associated with the same controller card. However, it  
0 must not be split over two controllers.

0 ( vii) For AOSS Voice Response, the DRA modules will consist of  
0 a controller card and four (4) double density PROM speech  
0 cards. (AOSSVR is for Canadian applications only.)

0 Provide one (1) DRA Controller Card, NT1X75BA.

0 If English announcements are required, provide one card  
0 each of NT1X76AF and NT1X76AG.

0 If French announcements are required, provide one card  
0 each of NT1X76BF and NT1X76BG.

0 If both English and French announcements are required,  
0 provide one card each of NT1X76AF, NT1X76AG, NT1X76BF and  
0 NT1X76BG.

0 RELEASE 28.01  
0 93 12 03  
0

0 To determine the maximum number of AOSSVR announcement  
0 cards that may be engineered onto one MTM shelf, use the  
0 following chart. For each of the speech memory cards  
0 supplied for one shelf, add the virtual card credit (128K  
0 - eight bit). The total must not exceed eight (8). For  
0 example, one card each of NT1X76AF, NT1X76AG, NT1X76BF  
0 and NT1X76BG total eight, so no more cards may be added.

0 AOSSVR Speech Memory Card

| CARD | PEC      | VCARD CREDIT |
|------|----------|--------------|
| ROM  | NT1X76AF | 2            |
| ROM  | NT1X76AG | 2            |
| ROM  | NT1X76BF | 2            |
| ROM  | NT1X76BG | 2            |

0 A DRA Module used for the AOSS Voice Response feature  
0 cannot be used for other applications. Features such as  
0 Mechanized Calling Card Service (MCCS) and Automatic Coin  
0 Toll Service (ACTS) must use different DRA devices.

0 For AOSS Voice Response, the Telco cannot make up his own  
0 customized voice announcements.

0 For more information on AOSSVR, refer to Section 3.3, Op-  
0 erator Services.

- 0 (viii) One DRA machine is required per Mechanized Credit Card  
0 Service (MCCS) announcement machine. One Enhanced DRA  
0 Controller Card and one MCCS Standard Announcement CP  
0 Card is required per MCCS announcement machine. The DRA  
0 EEPROM card is an optional circuit pack, required only if  
0 the customer wishes to offer voice responses not included  
0 on the MCCS Standard Announcement circuit pack.

0 To determine the maximum number of MCCS announcement  
0 cards that may be engineered onto one MTM shelf, use the  
0 following chart. For each of the speech memory cards  
0 supplied for one shelf, add the virtual card credit (128K  
0 - eight bit). The total must not exceed eight. For ex-  
0 ample, one NT1X76CA plus five NT1X79AA cards total seven,  
0 so one more card may be added if its vcard credit is only  
0 one.

0 CARD PEC VCARD CREDIT

0 ROM NT1X76CA 2

0 EEPROM NT1X79AA 1

0 Each MCCS announcement machine has 30 service circuit  
0 ports but one of the 30 is dedicated to maintenance use.  
0 The number of MCCS announcement machines required for  
0 traffic is equal to the number of MCCS announcement ser-  
0 vice circuits required divided by 29 and rounded up to  
0 the next whole number. An additional one MCCS announce-  
0 ment machine is added in order to provide service pro-  
0 tection in the event of failure of one of the MCCS  
0 announcement machines.

0 For more information on the provisioning of the DRA for  
0 the MCCS, refer to Section 3.3 , Operator Services.

0 ( ix) The Automatic Coin Toll Service (ACTS) DRAM will provide  
0 pre-programmed announcements for the initial contact of  
0 time and charges for the call, to quote and collect over-  
0 time charges and to give customer notification of elapsed  
0 time. Each ACTS DRAM requires one Enhanced DRA Control-  
0 ler Card and one DRA PROM Memory ACTS Standard Announce-  
0 ment Card. To determine the maximum number of ACTS  
0 announcement cards that may be engineered onto one ACTS  
0 DRA MTM, use the following chart. The total virtual card  
0 credit for the DRA must not exceed eight.

0 ACTS Speech Memory Card

0 CARD PEC VCARD CREDIT

0 ROM NT1X76AE 2

0 EEPROM NT1X79AA 1

0 For more information on the provisioning of the DRA for  
0 the ACTS, refer to Section 3.3, Operator Services.

- 0 ( x) The Custom Local Area Signalling Services (called CLASS  
0 in the US) or the Call Management Services (called CMS in  
0 Canada) DRA (hereafter referred to as CLASS DRA) will pro-  
0 vide announcements available for CLASS features to indi-  
0 cate successful or denied operation.

0 For BCS-27, the NT1X75BA DRAM Controller must be provi-  
0 sioned for all CLASS applications.

0 There are two (2) groups of announcements, Phase 1 CLASS  
0 DRA announcements and Phase 2 CLASS DRA announcements.  
0 If the CLASS/CMS feature is required, at least one group  
0 of announcements (i.e. Phase 1 or Phase 2) must be pro-  
0 vided. The Customer can either have Phase 1 announce-  
0 ments or Phase 2 announcements or both.

0 For more information on the provisioning of the DRA for  
0 the CLASS/CMS feature, refer to the Peripheral Modules  
0 Features in this section.

- 0 ( xi) An announcement type will appear at a network port over a  
0 single time slot connection from an MTM. Network broad-  
0 casting will be used to distribute each announcement type  
0 to the various lines and trunks requesting this service.

- 0 ( xii) Grade of Service Objective

0 If not specified by the customer, assume the following  
0 G.O.S. per announcement type:

0 Less than 1% (ABSBH) or 5% (HDBH) of attempts should see  
0 all circuits busy. This assumes that failures overflow  
0 to tone circuits. In a toll office, this applies on a  
0 10HDBH basis.

- 0 (xiii) The maximum number of simultaneous connections that can  
0 be made to announcements should not exceed 16 plus 8, 16,

0 RELEASE 28.01  
0 93 12 03

0 24 or 30 for the old network and 32 plus 8, 16, 24 or 30  
0 for the new network for the non deloading option.

0 ( xiv) Each announcement type will be considered as a separate  
0 trunk group.

0 ( xv) Traffic Capacity Per DRA

0 (1) Without The Network Deloading Option

0 Network deloading is not required if the traffic load  
0 on the DRA does not exceed the traffic limits shown  
0 in Tables T and U, Total DRA Traffic (CCS) For Net-  
0 work (NT0X48) and Total DRA Traffic (CCS) For Network  
0 (NT5X13) respectively, in Chapter 2, for the number  
0 of ports deloaded per NSG equal to 0 for the old and  
0 new network respectively.

0 (2) With The Network Deloading Option

0 Traffic capacities for the DRA with a different num-  
0 ber of ports deloaded per NSG are shown in Tables T  
0 and U for the old and new network respectively.

0 For the non deloading option, if more than one DRA  
0 system is required per office, each should be as-  
0 signed to a different network module.

0 ( xvi) The number of DRA systems to be provisioned will be es-  
0 tablished as a function of:

0 (1) Number of Announcements

0 Note that the maximum number of announcements per DRA  
0 system is 30.

0 (2) Total Number of Recording Seconds

0 Note that the recording time available per DRA system  
0 given that all the memory cards are RAM cards is 248  
0 seconds (8 RAM cards x 31 seconds = 248 seconds).

0 (3) Traffic Capacity

- 0 (a) Traffic load per announcement
- 0 (b) Maximum traffic load per NSG
- 0 (c) Grade of service (G.O.S.) objectives

0 RELEASE 28.01  
0 93 12 03  
0

0 (4) Reliability

0 We recommend that our standard offering should be a  
0 single DRA system. However, each DRA system may be  
0 duplicated for reliability/maintenance purposes if  
0 requested by the customer.

0 (xvii) In summary, the number of DRA required per office is the  
0 maximum of one of the three formulas below:

0 1) Total No. of Announcements Required/Office

0 30

0 = No. of DRAs  
0 (round up to next highest integer)

0 2) Total No. of Recording Seconds

0 248 Seconds

0 = No. of DRAs  
0 (round up to next highest integer)

0 3) Total Usage (CCS) For All Announcements

0 Traffic Capacity (CCS) Per DRA

0 = No. of DRAs  
0 (round up to next highest integer)

0 (xviii) The CCC DRA machine will provide digitally recorded an-  
0 nouncements for use during handling of automated credit  
0 card calls.

0 Each CCC announcement machine has thirty service circuit  
0 ports but one of the thirty is dedicated to maintenance  
0 use. The number of CCC announcement machines required  
0 for traffic is equal to the number of CCC announcement  
0 service circuits required divided by twenty-nine and  
0 rounded up to the next whole number. An additional one  
0 CCC announcement machine is added in order to provide  
0 service protection in the event of failure of one of the  
0 CCC announcement machines.

0 Provide one Enhanced Digital Recorded Announcement Con-  
0 troller CP NT1X75BA per CCC announcement machine.

0  
0 RELEASE 28.01  
0 93 12 03

0 One CCC Standard English Announcement CP, NT1X76AH or one  
0 CCC Standard French Announcement CP, NT1X76BH is required  
0 per CCC announcement machine. If both English and French  
0 announcements are required, then provide NT1X76AH and  
0 NT1X76BH. These circuit packs contain all the voice mes-  
0 sages to support the CCC feature set. The memory used is  
0 double density, Erasable Programmable Read Only Memory  
0 (EPROM).

0 The Custom Announcement CP NT1X79AA is an optional cir-  
0 cuit pack, required only if the customer wishes to office  
0 voice responses not included on the CCC Standard An-  
0 nouncement circuit pack. The number of seconds of re-  
0 cording time required divided by thirty-one seconds is  
0 equal to the number of Custom Announcement CP required  
0 per CCC group.

0 To determine the maximum number of CCC announcement cards  
0 that may be engineered onto one MTM shelf, use the fol-  
0 lowing chart. The total virtual call credit must not ex-  
0 ceed eight.

0 RELEASE 28.01  
0 93 12 03

0 1.3.16 Enhanced DRAM (EDRAM)

0 a) General Description

0 The Enhanced Digital Recorded Announcement Machine (EDRAM) is a  
0 single slot circuit pack DMS peripheral module used for providing  
0 voice messages or instructions to the subscriber, thus reducing  
0 the need for an operator's assistance. Announcements are stored  
0 in digital format in memory using PCM coding so as to allow fast  
0 and random access of announcements, both in playback or recording  
0 stages.

0 The EDRAM card will replace the existing Digital Recorded An-  
0 nouncement (DRA) Module for providing voice messages and recorded  
0 announcements in all DMS-100 Family switches.

0 The EDRAM provides the equivalent functions and capabilities of  
0 the existing Digital Recorded Announcement (DRA) Module; i.e.  
0 exactly the same duration of announcement time as for the DRA  
0 (4.3 minutes) and 30 announcement channels for announcement  
0 playback/recording.

0 The EDRAM is a stand alone peripheral module (PM), having its own  
0 DS-30 link interface with the network (i.e. having a network port  
0 appearance on the network). It can be plugged into one (1) of  
0 the twelve (12) provisionable trunk card slots on the MTM/DRA  
0 shelf. The DS-30 cable for EDRAM is plugged directly into the  
0 backplane pins at the back of the shelf corresponding to the slot  
0 of the EDRAM.

0 Although the EDRAM can mount onto existing DRA shelves, no new  
0 DRA shelves should be ordered. For new and existing offices,  
0 provision only MTM shelves to mount the EDRAM.

0 The current DRA Module consists of the DRA shelf and circuit  
0 packs. The DRA shelf is a modified version of the Maintenance  
0 Trunk Module (MTM). It must be equipped with the appropriate MTM  
0 controller circuit packs and power converter circuit packs to  
0 provide the basic MTM functions.

0 The announcement functions are provided by the provisionable DRA  
0 controller and announcement cards. Each DRA Module consists of a  
0 DRA controller card (NT1X75\_\_) and up to eight (8) single density  
0 or four double density provisionable announcement memory cards.  
0 Each single density memory card provides 30 seconds of announce-

0 RELEASE 28.01  
0 93 12 03  
0

0 ment capacity; each double density memory card provides 60 sec-  
0 onds of announcement capacity.

0 - NT1X75BA - DRA controller card

0 - NT1X76XX - contains standard factory programmed an-  
0 nouncements in non-alterable memories (EPROM). The an-  
0 nouncements are identified by the "XX" PEC code suffix  
0 and these announcements cannot be altered.

0 - NT1X77AA - provides storage for on-site customer re-  
0 corded announcements in volatile memory (RAM).

0 - NT1X79AA - provides storage for on-site customer re-  
0 corded announcements in non-volatile memory (EEPROM).

0 Each fully equipped DRA Module provides 30 announcement channels  
0 and 4 minutes of announcement time.

0 The single card slot EDRAM Module is equivalent to a fully  
0 equipped DRA Module.

0 The EDRAM will provide a super-set of features that in-  
0 clude or is equivalent to all existing features of the DRA shelf.  
0 The features can be categorized into the following areas:

0 -Loader features  
0 -MTM features  
0 -DRA features

0 The loader will download the EDRAM application firmware load, and  
0 the specified announcement load from the DMS tape/disk to the  
0 EDRAM memory.

0 The loader will provide management of announcement files. Up to  
0 a maximum of any eight (8) announcement files can be loaded to a  
0 specified EDRAM. Each announcement file corresponds to a version  
0 of NT1X76 card. Hence, announcements no longer need to be iden-  
0 tified by the NT1X76 DRA EPROM PEC code. The factory recorded  
0 announcements on the NT1X76 DRA EPROM cards are replaced with an-  
0 nouncement files on DMS tape that can be downloaded to the EDRAM.  
0 This provides the flexibility of changing announcements at any  
0 time without retrofitting the DRA EPROM cards which contain fac-  
0 tory programmed announcements.

0 The EDRAM will emulate the Maintenance Trunk Module (MTM) fea-  
0 tures required for DRA applications, which includes:

0 RELEASE 28.01  
0 93 12 03  
0

- 0 -Loading and executing PM EXECs
- 0 -Setting up speech connections needed for call processing
- 0 -Performing PM sanity functions such as sending Who-Am-I, I-Am-  
0 Here messages to Central Control (CC)
- 0 -Network integrity and parity generation/checking
- 0 -Perform CC instructions through CC-PP primitives execution and  
0 handle command protocol violation checking
- 0 -PM load checksum tests.

0 The EDRAM will emulate all existing required DRA features, which  
0 includes:

- 0 -On site recording of announcements
- 0 -Playing announcements
- 0 -Configuration query
- 0 -Trunk level diagnostics.

0 The EDRAM is a second generation DRA circuit pack. It introduces  
0 the concept of a single circuit pack Peripheral Module (PM) which  
0 has the dual appearance as a PM as well as a trunk. Although it  
0 is located on an MTM/DRA shelf, it is directly connected to the  
0 network through a DS-30 link. Hence, it will have two (2) Main-  
0 tenance & Administration Position (MAP) appearances on the same  
0 hardware. It will appear as a PM, just like the MTM/DRA, since  
0 it is directly connected to the network, and it will also appear  
0 as a trunk, just like other provisionable trunk cards on the  
0 MTM/DRA, since it mounts on the MTM/DRA.

0 The EDRAM has its own pair of DS-30 links for connecting to both  
0 planes of the Network Module (NM), and communicates with the Cen-  
0 tral Control/Central Message Controller (CC/CMC) directly via the  
0 message channel of this DS-30 link.

0 It is to be plugged into any one of the twelve (12) provisionable  
0 trunk slots of the MTM/DRA shelf and uses this shelf for the pur-  
0 poses of housing, logic power, and cable mounting. In order to  
0 keep within the maximum power dissipation of 110 watts per  
0 MTM/DRA shelf, there can be up to a maximum of eleven (11) EDRAM  
0 cards.

0 The DS-30 cable for the EDRAM can be plugged directly into the  
0 pins at the back of the MTM/DRA backplane at the slot correspond-  
0 ing to the position of the EDRAM. The other end of the DS-30 ca-  
0 ble is terminated at the Peripheral Speech Link (PSL) Panel  
0 mounted on the Speech Link Connecting (SLC) Frame or at the En-  
0 hanced Network (ENET) depending on office requirements.

## None

( i) The EDRAM will be provisioned using the same provisioning rules as for the existing DRA Module as given in the Engineering Manual and NTP 297-1001-450 entitled DMS-100 Family Provisioning.

0 RELEASE 28.01  
0 93 12 03  
0

- 0 ( ii) The EDRAM Module provides 30 announcement channels and  
0 4.3 minutes of announcement time for announcement  
0 playback/recording.
- 0 ( iii) For each DMS office, provision the number of EDRAM as re-  
0 quired to accommodate the standard announcements.
- 0 ( iv) Depending on the optional recorded announcement features  
0 ordered by the Customer for his office, provision addi-  
0 tional EDRAM Modules as required. The optional features  
0 are: Auxiliary Operator Service System Voice Response  
0 (AOSS VR), Custom Charge Calling (CCC), Automatic Coin  
0 Toll Service (ACTS), Mechanized Calling Card Service  
0 (MCCS), and Automatic Intercept Service (AIS). Since each  
0 of the preceding features requires all 30 announcement  
0 channels of the EDRAM, each feature requires an exclusive  
0 EDRAM Module that cannot be used for other announcements.  
0 For further information, refer to Section 1.3 Cross-  
0 Reference Publications.
- 0 ( v) Other optional features that need additional announce-  
0 ments are Call Forward Remote Activation (CFRA) in  
0 BCS-28, Custom Local Area Signalling Services (CLASS)  
0 features Phase I in BCS-28, and CLASS features Phase II  
0 in BCS-30. For further information, refer to ECM-473 on  
0 subject Residential Enhanced Services and ECM-332 on sub-  
0 ject CLASS - U.S./CMS - Canada.
- 0 ( vi) As a Customer requested option, each EDRAM may be dupli-  
0 cated for reliability. It is mostly needed for toll of-  
0 fices where it is important to get the message sent to  
0 the subscriber.
- 0 (vii) The EDRAM card is to be inserted into one (1) of the  
0 twelve (12) provisionable trunk card slots of the MTM/DRA  
0 shelf. In order to keep within the maximum power dissipa-  
0 tion of 110 watts per MTM/DRA shelf, there can be up to  
0 a maximum of eleven (11) EDRAM cards.
- 0 ( viii) Although the EDRAM can mount onto existing DRA shelves,  
0 no new DRA shelves should be ordered. For new and exist-  
0 ing offices, provision only MTM shelves to mount the  
0 EDRAM.
- 0 ( ix) The EDRAM has its own pair of DS-30 links for connecting  
0 to both planes of the Network Module (NM), and communi-  
0 cates with the Central Control/Central Message Controller

0  
0 RELEASE 28.01  
0 93 12 03

0 (CC/CMC) directly via the message channel of this DS-30  
0 link.

0 ( x) The DS-30 cable for the EDRAM can be plugged directly  
0 into the pins at the back of the MTM/DRA backplane at the  
0 slot corresponding to the position of the EDRAM. The  
0 other end of the DS-30 cable is terminated at the Periph-  
0 eral Speech Link (PSL) Panel mounted on the Speech Link  
0 Connecting (SLC) Frame or at the Enhanced Network (ENET)  
0 depending on office requirements.

0 ( xi) MECHANICAL DIMENSIONS

0 Height 12.50 in. (317.5 mm)  
0 Width 1.125 in. (29 mm)  
0 Depth 10.00 in. (254 mm)

0 Power 10.0 Watts (from +5V/-5V logic power)

0 The circuit pack can mount onto one (1) of the twelve  
0 (12) provisionable trunk slots in MTM/DRA shelves. In  
0 order to keep within the maximum power dissipation of 110  
0 watts per MTM/DRA shelf, there can be up to a maximum of  
0 eleven (11) EDRAM cards.

0 ( xii) The addition of this peripheral module should have mini-  
0 mal impact on memory provisioning. Refer to the normal  
0 memory algorithms.

0 RELEASE 28.01  
0 93 12 03

0 1.3.17 Digital Tone Transceiver

0 a) General Description

0 The Digital Tone Transceiver Circuit Pack (NT3X08AA) functions as  
0 an essential component of the Automatic Coin Toll Service (ACTS).  
0 Its General purpose is to count coin deposits from coin operated  
0 telephones (coin stations) and report the amount collected to the  
0 DMS-100 Central Control (CC). Refer to Section 3, Operations  
0 Equipment for more information on ACTS.

0 b) References

0 Chapter 3, Section 3.3 Operator Services

0 c) Provisioning Considerations:

- 0 ( i) The coin detection circuit pack (CDC - NT3X08AA) will  
0 physically occupy one card slot on a MTM.
- 0 ( ii) The CDC will use eight time slots and therefore four (4)  
0 consecutive card slots are required. A maximum of three  
0 (3) CDC circuit packs can be housed in any MTM. If it is  
0 desired, the CDC card can be placed on a MTM with other  
0 cards provided the next three slots following the CDC are  
0 empty and provisioning rules for these other packs are  
0 followed.
- 0 ( iii) Digitone or rotary coin stations may be used, however,  
0 all stations MUST be able to provide dual frequency coin  
0 deposit signals to allow detection by the CDC circuit  
0 pack.
- 0 ( iv) The CDC contains eight (8) circuits provisionable for  
0 ACTS on each circuit pack.
- 0 ( v) Mu-law/A-law capability.
- 0 ( vi) The CDC requires no distributing frame cabling.
- 0 ( vii) For more information on the CDC card, refer to ACTS in  
0 Section 3.3, Operator Services.

0 RELEASE 28.01  
0 93 12 03

0 1.3.18 Automatic Identification of Outward Dialling (AIOD) Data  
0 Receiver

0 a) General Description

0 The NT2X01AA Automatic Identification of Outward Dialling (AIOD)  
0 Data Receiver Trunk Circuit is used to terminate a data channel  
0 between a Private Branch Exchange (PBX) and a Central Office  
0 (CO). It provides the signalling supervision and data receiver  
0 required to accept, via the C25 type signalling mode, the infor-  
0 mation required to identify the PBX station number of the station  
0 originating an outgoing call. It also provides an incoming sig-  
0 nalling and voice grade facility interface between a Maintenance  
0 Trunk Module (MTM) of a DMS-100 Family switch and the data send-  
0 ing circuit of the far-end or connecting PBX.

0 b) References

0 Section 3.2 Software

0 c) Provisioning Considerations:

0 ( i) The AIOD Data Receiver - C25 (NT2X01AA) circuit pack is  
0 required to support the AIOD feature.

0 One NT2X01AA card has four (4) circuits. Each circuit  
0 terminates a data channel or link between a PBX and a  
0 central office, providing the signalling supervision and  
0 data receiver required to accept, via the C25 type sig-  
0 nalling mode, the information required to identify the  
0 PBX station number of the station originating the outgo-  
0 ing call.

0 The circuit provides an incoming signalling and voice  
0 grade facility interface between a MTM of a DMS-100 Fam-  
0 ily switch and the data sending circuit of the far end or  
0 connecting PBX.

0 The circuit is designed to interface with the 118A Inter-  
0 connecting Unit or equivalent PBX AIOD equipment which  
0 utilizes C25 signalling.

0 eg. typical connecting circuit SD1E239-01

0

0 RELEASE 28.01  
0 93 12 03  
0

0 ( ii) Each NT2X01AA card provides four (4) incoming 2-wire  
0 trunk type appearances for four (4) data channels and oc-  
0 cupies the space of two (2) card slots in a MTM.

0 ( iii) Each PBX requires a minimum of one (1) data channel.

0 ( iv) A maximum of six (6) AIOD circuit packs, i.e. 24 AIOD  
0 receivers, can be accommodated in a MTM. DMS will sup-  
0 port a maximum of sixty data links.

0 Based on average PBX traffic samples, a MTM equipped with  
0 the maximum of six (6) NT2X01AA packs will support ap-  
0 proximately 460,000 PBX lines or stations.

0 ( v) Limitations on the capacity of the AIOD feature for DMS  
0 may arise within the PBX ANI equipment or the particular  
0 connecting arrangement provided. For example, BXP  
0 463-380-101 for the 118A Interconnecting Unit states "One  
0 Connecting Arrangement C25 and its associated voice grade  
0 private line has the capacity to handle the identifica-  
0 tion for up to 250 outgoing trunks depending upon the  
0 call attempts and the traffic load on the CO".

0 ( vi) Based on a typical PBX line to outgoing trunk ratio of 10  
0 to 1, the maximum capacity of the C25 Connecting Arrange-  
0 ment (as quoted above), and the traffic load on the CO,  
0 the full MTM with 24 data links would handle  $250 \times 24 =$   
0 6000 trunks (for 60,000 PBX lines or stations). With  
0 sixty data links, this would increase to a maximum of  
0 15,000 trunks.

0 ( vii) Provisioning of the AIOD Data Receiver C25 card is de-  
0 pendent upon the security or backup arrangement selected  
0 by the customer. Four arrangements are supported by DMS:

0 1) Single Data Line, Single Receiver

0 In this configuration, a single data link is provided  
0 between the PBX and the DMS office, with a single  
0 AIOD receiver servicing that link.

0 Should an unrecoverable fault condition occur on a  
0 particular data channel, the channel is taken out-of-  
0 service, and billing assigned to the default PBX  
0 billing number for the duration of the fault. Main-  
0 tenance action is required to replace the card (all

0 RELEASE 28.01  
0 93 12 03  
0

0 four data channels on the card being affected) and to  
0 return the AIOD receiver to service.

0 The disadvantage of this method is that when one PBX  
0 channel fails, all four (4) channels on the AIOD card  
0 must be affected to replace the faulty card.

0 However, the reliability of the equipment is expected  
0 to be high enough to justify this approach, and sin-  
0 gle channel faults are expected to be rare.

## 0 2) Single Data Link, Parallel Wired Standby Receiver

0 This method provides a standby AIOD receiver, in ad-  
0 dition to the active receiver, dedicated to each in-  
0 service data link. The standby is located in a  
0 separate MTM (preferably powered from a different bus  
0 than the 'active MTM'), but wired in parallel from  
0 the MDF to all four (4) data links. The receiver  
0 channels, when in a standby mode, are disabled.

0 When a fault occurs in an active receiver channel, CC  
0 software redirects the AIOD data to the standby re-  
0 ceiver by setting the faulty circuit man-busy and re-  
0 turning the standby to service (and raises an alarm  
0 condition). Maintenance action consists of forcing  
0 all four (4) channels onto their standby receivers in  
0 order to change the faulty card without degrading the  
0 service of the other three (3) channels.

0 This method does not, however, protect against data  
0 link faults occurring remotely to any particular re-  
0 ceiver channel.

## 0 3) Duplicate Data Link and Receiver

0 This method supports more than one AIOD data link for  
0 a particular PBX.

0 Depending upon the logic of the PBX AIOD sending  
0 equipment, the second data link may be used in a  
0 standby mode, as in method 2, and also allows a PBX  
0 to maintain AIOD traffic even when one data link is  
0 down.

## 0 4) Duplicated Data Link and Receiver, Parallel Wired 0 Standby Receiver

0  
0 RELEASE 28.01  
0 93 12 03

0 In this configuration, an active receiver and a  
0 standby receiver are provided for each of the dupli-  
0 cated data links. This method is a combination of  
0 method 2 and method 3.

0 1.3.19 Control Processor and Digital Signal Processor Cards

0 a) General Description

0 The Control Processor Card and the Digital Signal Processor Cards  
0 provides communication between an analog modem, digital modem or  
0 terminal and the DMS switch.

0 b) References

0 Chapter 3, Section 3.3 Operator Services  
0 Chapter 3, Section 3.4 Meridian Business Services

0 c) Provisioning Considerations:

0 ( i) The Control Processor NT3X02AA, is a four port I/O con-  
0 troller capable of handling duplex communication to four  
0 modems or terminals simultaneously.

0 The Digital Signal Processor NT3X03AA is a four port dig-  
0 ital interface used to enable the NT3X02AA Control  
0 Processor to handle duplex communications simultaneously  
0 to four modems or terminals via TM or DCM to Digital  
0 Channel Bank trunks.

0 ( ii) A Control Processor (NT3X02AA) and a Digital Signal  
0 Processor (NT3X03AA) plugs into two adjacent slots within  
0 a Maintenance Trunk Module (MTM).

0 ( iii) The NT3X02AA can be utilized in stand alone mode, without  
0 the NT3X03AA, by connecting either analog modems or ter-  
0 minals, with RS-232 compatible interfaces, directly to  
0 the four channel RS-232 interface on board the NT3X02AA.

0 Selection of the four channel RS-232 interface is accom-  
0 plished by the absence of the NT3X03AA in the adjacent  
0 slot. Conversely, selection of the digital network path  
0 interface is automatic with the insertion of the  
0 NT3X03AA.

0 ( iv) A digital modem provides a data interface between Busi-  
0 ness Service Attendant Consoles (BSAC) and the Central  
0 Processing Unit (CPU).

0 The digital modem is comprised of a Control Processor  
0 card, NT3X02AA, and a Digital Signal Processor card,

0  
0 RELEASE 28.01  
0 93 12 03

0 NT3X03AA. Together, each pair of cards make up four dig-  
0 ital modems and are mounted on two adjacent slots on an  
0 MTM. Maximum of two (2) pairs per MTM in MDC offices.

0 ( v) A digital modem provides a data interface between TOPS  
0 positions and TOPS teletypewriters (TTY) and the Central  
0 Processing Unit (CPU).

0 The digital modem is comprised of a pair of cards, a Con-  
0 trol Processor card, NT3X02AA and a Digital signal  
0 Processor card, NT3X03AA. Together, each pair of cards  
0 make up four digital modems and are mounted on two adja-  
0 cent slots on an MTM. Maximum of four (4) pairs per MTM  
0 in TOPS offices or a maximum of two (2) pairs in combined  
0 MDC/TOPS offices.

0 ( vi) The Dial-Up Autoquote feature uses the NT3X02AA Signal  
0 Processor in conjunction with an analog modem.

0 The NT3X02AA is used in a stand alone configuration,  
0 therefore, a NT3X03AA must not be provisioned and the TM  
0 card slot to the right of the NT3X02AA must be vacant.  
0 The NT3X02AA is equipped with four (4) EIA ports and  
0 therefore, one (1) NT3X02AA CP can handle up to four (4)  
0 dial-up autoquote circuits.

0 1.3.20 Circuit Switched Digital Data Service (CSDDS)

0 a) General Description

0 The Circuit Switched Digital Data Service (CSDDS) provides data  
0 switching service via the digital portion of the DDD network.  
0 Refer to NTP 297-2111-100 for a description of the DMS Circuit  
0 Switched Digital Data Service feature.

0 b) References

0 NTP 297-2111-100 DMS Circuit Switched Digital Data  
0 Service

0 c) Provisioning Considerations:

0 ( i) Data is interfaced through a Digital Data Line Card  
0 (DDLC), NT3X05AC.

0 The DDLC interfaces a 4-wire unconditioned facility with  
0 a subscriber terminal unit or a DATAROUTE\*\* facility. It  
0 is used in conjunction with a voice line card to provide  
0 the necessary 6-wire interface required by CSDDS.

0 ( ii) One DDLC occupies one card position in a Maintenance  
0 Trunk Module (MTM) and requires one trunk appearance. Up  
0 to twelve DDLC can be located in one MTM. It cannot  
0 mount on an MTM which already houses TTT cards (i.e.  
0 NT1X90AA and NT2X96AA).

0 ( iii) There is one circuit per DDLC card. Two interface cir-  
0 cuits are required between each subscriber loop and the  
0 DMS-100 for the CSDDS feature.

0

0

0

0

0 (\*\* DATAROUTE is a trademark of Bell Canada)  
0 Host - Maintenance and Misc. Equipment  
0 Chapter 9

0  
0 RELEASE 28.01  
0 93 12 03

0 ( iv) The features of the DDLC are as follows:

- 0 - Provides full duplex synchronous data  
0 transmission at 2.4, 4.8 and 9.6 KB/sec bit  
0 rates over 4-wire unconditioned loops.
- 0 - DC isolation via 1:1 transformer.
- 0 - Automatic line equalization.
- 0 - Signalling error detection.
- 0 - Front panel access to DDLC or loop.
- 0 - Line protection on loop side.
- 0 - Meets metallic specification for transmit  
0 levels.
- 0 - Inout/Output impedance of the 4-wire  
0 interface is 135 ohms.
- 0 - Software selectable bit rate control.

0  
0 RELEASE 28.01  
0 93 12 03

0 1.3.21 Dialable Line Circuit Identification (NTX277AA)

0 a) General Description

0 Software package NTX277AA contains the Dialable Cable Locator  
0 Tone feature and the Dialable Short Circuit feature.

0 The Dialable Cable Locator Tone feature eliminates the need for  
0 manual intervention at the central office when tracing a specific  
0 tip and ring cable pair. This feature is activated by dialing,  
0 from a line circuit, an access code plus a seven digit Directory  
0 Number (DN). Once activated, a tone is supplied over the dialed  
0 DN.

0 The dialable Short Circuit feature eliminates the need for manual  
0 intervention at the central office when placing a short across  
0 the tip and ring leads of a desired line. This feature is also  
0 activated by dialing, from a line circuit, an access code plus a  
0 seven digit Directory Number (DN). Once activated a timed short  
0 circuit is supplied over the dialed DN.

0 b) References

0 None

0 c) Provisioning Considerations:

0 ( i) DMS-100 or DMS-100/200 offices containing software pack-  
0 age NTX277AA must be provisioned with the following hard-  
0 ware:

- 0 1) One (1) Incoming/Outgoing Test Trunk (NT2X90AD)  
0 2) One (1) Horizontal on a Metallic Test Access Unit  
0 3) An external tone Generator capable of generating a  
0 frequency between 480 Hz and 1300 Hz (it is recom-  
0 mended that the Telco provide this Tone Generator and  
0 the Telco must provide matching tone Locator Probes).

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 1.3.22 Trunk Modules

0 a) General Description

0 The Trunk Module provides the interface between analog trunks and  
0 the Network.

0 The TM performs tasks such as digit reception from dial pulse in-  
0 coming trunks, control tasks of dial pulse transmission on outgo-  
0 ing trunks and digital tone distribution.

0 The TM accommodates service circuits such as MF receivers, an-  
0 nouncement trunks, and test circuits either on a dedicated TM or  
0 in common with analog trunks. Each TM has the capacity of inter-  
0 facing 30 analog trunks or device circuits with one 32-channel  
0 2.56 Mb/s speech link to the network. A maximum of five are ac-  
0 commodated in a bay.

0 b) References

0 c) Provisioning Considerations:

0 ( i) Each module is contained in a single equipment shelf and  
0 interfaces the network via one speech link.

0 ( ii) Each TM can accommodate up to fifteen analog trunk cards  
0 and handle up to thirty circuits. Since it interfaces  
0 the NET via one speech link (thirty channels), there is  
0 no concentration and therefore is not sensitive to traf-  
0 fic.

0 ( iii) TM Types

0 Three basic TM types are specified as dictated by the  
0 TM-to-DF cabling arrangement:

0 1. Trunk Module 2 Wire (TM2)

- 0 - 30 pairs of leads cabled to the DF
- 0 - 4 leads per card slot
- 0 - intended for trunks with 2 leads

0 2. Trunk Module 4 Wire (TM4)

- 0 - 60 pairs of leads cables to the DF

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - 8 leads per card slot
- 0 - intended for trunks with 4 & fewer leads

0 3. Trunk Module 8 Wire (TM8)

- 0 - 120 pairs of leads cabled to the DF
- 0 - 16 leads per card slot
- 0 - intended for trunks with 8 & fewer leads

0 4. International Trunk Module 8 Wire (ITM8)

- 0 - same as the TM8
- 0 - used for International applications

0 These TM arrangements are intended to reduce DF size and  
0 TM-to-DF cable runs and their respective costs by reduc-  
0 ing redundant loads and terminations.

0 The ATM, T8A and T8A (TME) are special versions of the  
0 TM8 shelf. The DMS-300 Gateway offices use the T8A  
0 shelves. The Integrated Business  
0 Services (IBS) use the T8A (TM8) shelves (these shelves  
0 are used to house NT5X25AA cards only).

0 ( iv) TM-DF Association

0 Since DF cabling is arranged on a TM basis, trunks which  
0 terminate on different DF complexes cannot be connected  
0 to the same TM. Therefore, determination of the number  
0 of TM and trunk cards has to be done on a per DF basis.

0 For service reliability it is recommended that a minimum  
0 of two (2) TM8 (or its equivalent) be provided per of-  
0 fice.

0 Trunk Modules are provisioned for total terminations  
0 based on the forecast of analog trunk requirements for  
0 the busy season prior to exhaust.

0 ( v) These slots will be provided by new TMs. It should be  
0 noted that empty slots on a TM8 can house cards which can  
0 go on TM4 or TM2 shelves, etc.

0 ( vi) A minimum of two Tm8 shelves or its equivalent should be  
0 provided per DF for service reliability.

0  
0 RELEASE 28.01  
0 93 12 03

0 (vii) Assignment is restricted to either one NT2X48AA or one  
0 NT2X48AB or two NT1X31AA cards per TM.

0 1.3.23 Maintenance Trunk Module

0 a) General Description

0 The Maintenance Trunk Module is similar to the TM in operation,  
0 however, its primary function is to interface service, test and  
0 maintenance circuits and scanner and signal distributor cards.  
0 There is also a Digital Recorded Announcement Module (DRAM) which  
0 operates like the MTM, however, this shelf is primarily intended  
0 to house Digital Recorded Announcement (DRA) cards. Assignment  
0 restrictions are imposed on certain other cards which function in  
0 pairs.

0 b) References

0 c) Provisioning Considerations:

0 ( i) The principal differences of the MTM from the TM module  
0 are:

- 0 1. fewer provisionable card slots (12 instead of 15)
- 0 2. more powerful 5V supply to handle more complex card  
0 functions
- 0 3. cables to the DF on a slot basis, as required, with  
0 many more leads per slot
- 0 4. different Peripheral Software load supports different  
0 circuit types and functions
- 0 5. inter-card bus supports circuits whose function is  
0 split over two cards

0 Each module is contained in a single equipment shelf  
0 and interfaces the network via one speech link.

0 ( ii) Card slots are cabled to the DF only when necessary to  
0 satisfy interface requirements.

0 In an office served by more than one DF, the Telco is ad-  
0 vised for administrative reasons to terminate card slots  
0 of a particular MTM on the same DF.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 ( iii) MTM mounted cards on average have higher power dissipation making it possible to exceed the maximum set for the shelf. To avoid this, MTM shelves must be provisioned and cards assigned so as to limit card dissipation to 110 watts per shelf.

0 ( iv) Trunk enable lines control the Trunk Logic Circuit (TLC) and hence the function of TM and MTM mounted cards (enables, TLC and circuit per card are closely related). Thirty (30) enable lines are distributed to the provisionable slots in a pre-defined cyclic pattern.

0 As a result each card requires one card slot for every two enable lines it must connect to avoid duplicate connections to the same enable line. The next higher numbered slot or slots must be left empty when required. The exceptions are:

0 a) cards which function in pairs

0 b) slot 16, the last slot in the MTM, can accommodate cards requiring up to eight enables (not valid for cards with more than eight circuits and cards which physically require more than one slot)

0 ( v) A minimum of two MTM shelves must be provided for service reliability.

## 0 1.0 Host - Service Circuits

0 1.1 Equipment Provisioning0 1.1.1 TOPS Tone and Scrambler0 (a) General Description

0 The purpose of the TOPS Tone & Scrambler is to scramble the  
0 speech of a subscriber as heard by the operator during verifica-  
0 tion and to introduce an alerting tone to the subscriber when an  
0 operator must "barge-in" on an established connection.

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations

0 ( i) Provisioning of the Tone & Scrambler circuit is based on  
0 the actual verification traffic as given by the customer.  
0 The holding time of the circuit is approximately equal to  
0 the average holding time of the line under verification  
0 by the operator. Provide the required quantity of  
0 NT3J00AB circuits per calculations using given parameters  
0 at P.001.

0 ( ii) The NT3J00AA card cage is used to house the Tone &  
0 Scrambler circuit packs. Provide one 91) shelf for every  
0 ten (10) NT3J00AB.

0 ( iii) As an interface to the circuit, provide one (1) NT2X88  
0 4-W E&M trunk (2 circuits) for each NT3J00AB.

0 ( iv) One (1) scan point per NT3J00AA is required to detect an  
0 alarm condition on the unit.

0 For further information on the scan points, refer to Pe-  
0 ripheral Modules - Host, Section 3.5 of this NTP.

0 ( v) In order to ensure limited Operator Verification capabil-  
0 ities in the event of an "A" or "B" power failure, the  
0 following decommmendations may be offered to the customer:

0  
0 RELEASE 28.01  
0 93 12 03

- 0  
0  
0 1. Provide a minimum of two (2) NT3J00AA card  
cages per office and power all card cages  
from alternating power feeds.
- 0  
0 2. Provide a minimum of two (2) NT3J00AB  
scrambler CPs per office.
- 0  
0 3. Spread all scrambler CPs evenly over all  
card cages.
- 0 ( vi) Full tone & scrambler redundancy is not required. Instead  
0 ensure that the calculated scrambler requirements are  
0 distributed evenly between the "A" and "B" feeds. Recom-  
0 mendations 1 and 2 are not requirements and therefore  
0 should only be offered as an option.
- 0 ( vii) The NT3J00AA card cage will be mounted in a standard MIS  
0 frame and is seven (7) inches high and twenty-six (26)  
0 inches wide. the NT3J00AB is packaged on a double wide  
0 circuit pack and should be located in odd slots 03  
0 through 21. A NT3J0044 power supply is always provided  
0 in slot 01 of the card cage.
- 0 (viii) TOPS Tone & Scrambler feature is contained in package  
0 NTX030CC.

0 2.0 Trunk Modules

0 2.1 Introduction

0 The Trunk Module (TM) encodes and multiplexes incoming speech  
0 from a maximum of 30 analog trunks into an eight-bit PCM format.  
0 The TM then combines them with internal control signals as well  
0 as the trunk supervisory and control for transmission at 2.56  
0 Mb/s to the network.

0 In the other direction, the 30 digital speech signals and the two  
0 control channel signals received from the network are demulti-  
0 plexed and decoded by the TM into 30 individual channels of com-  
0 bined analog speech and signalling.

0 DMS maintenance and test circuits and interface trunk circuits  
0 for stand alone test equipment mount on DMS Maintenance Trunk  
0 Modules and Trunk Modules. Normally these circuits are not  
0 PIPable and specified quantities should reflect requirements for  
0 the busy season prior to exhaust. The Remote Service Module  
0 (RSM) houses office maintenance, alarm and service circuits re-  
0 quired for remote offices employing RLMS.

0 In an office served by more than one DF, the Telco is advised for  
0 administrative reasons to terminate all MTM on the same DF. For  
0 similar reasons the Telco may wish to associate all TM-mounted  
0 circuits provisioned in this section with the same DF, including  
0 MTM.

0 2.2 Features

0 2.2.1 Service Circuits

0 DMS service circuits are packaged in printed circuit cards which  
0 generally mount on Maintenance Trunk Module (MTM). The exceptions  
0 are:

- 0 1. digital echo suppression cards which mount on Digital  
0 Echo Suppressor Shelves (DES),
- 0 2. three-port conference circuit cards and MF and Digitone  
0 receiver cards which mount both on TMs and MTMs. (Note:  
0 six-port conference circuit cards mount only on MTMs.)

0 With the exception of digital echo suppression cards, service  
0 circuits are not PIPable and specified quantities should reflect  
0 requirements for the busy season prior to exhaust.

0 2.2.2 Signal Distributor Card

0 a) General Description

0 Signal Distributor circuits enable the DMS Central Control to  
0 control external equipment by activating relays, lamps, audibles  
0 etc.

0 b) References

0 NTP 297-1001-451 DMS-100 Family Common Customer Data  
0 Schema  
0 NTP 297-2101-451 DMS-100 Local Customer Data Schema  
0 NTP 297-2181-451 DMS-100 International Customer Data  
0 Schema  
0 NTP 297-2201-451 DMS-200 Toll Customer Data Schema  
0 Section 3.7 Office Maintenance

0 c) Provisioning Considerations:

0 ( i) Four (4) SD modes selected by switches:

0 ( i) normally open ground operation  
0 ( ii) normally closed ground operation  
0 (iii) normally open loop operation  
0 ( iv) normally closed loop operation

0 ( ii) Each DMS SD card provides fourteen SD points configured  
0 as two SD circuits known as "SD Groups" with seven points  
0 per group. In certain applications software restricts a  
0 group to a specific function and unused points in that  
0 group cannot be assigned to other functions.

0 ( iii) DMS supports a maximum of 1024 SD points (146 SD groups).  
0 This includes the SD groups associated with each standard  
0 alarm card provided:

0 NT3X82AA  
0 NT3X82AB  
0 NT3X83AA  
0 NT3X84AA  
0 NT3X85AA

0 For more information on the Standard Alarm Cards, refer  
0 to Section 3.7, Office Maintenance.

0 ( iv) Signal Distribution Card types are as follows:

0 Signal Distribution Card, Type I: NT2X57AA  
0 SD Card with OAU Monitor Circuit: NT2X57AB  
0 Signal Distribution Card, Type II: NT2X55AA

0 SD Card Type I and SD Card Type II mount on the Mainte-  
0 nance Trunk Module (MTM, Remote Maintenance Module (RMM)  
0 and Remote Service Module (RSM).

0 The Type I SD card is fitted with miniature flat-spring  
0 board-mounted relays for applications requiring lower  
0 output contact ratings and resistive loads.

0 OAU monitor circuit (code NT2X57AB only) provides an out-  
0 put to external equipment if communication between OAU  
0 and CCC is interrupted.

0 the Type II SD card is fitted with mercury-wetted-contact  
0 relays for applications requiring higher output contact  
0 ratings.

0 ( v) For alarms which require SD points. see NTP 297-1001-451  
0 DMS-100 Family Common Customer Data Schema, Section 036,  
0 Alarm Signal Distributor Group Table.

0 ( vi) For line features which require SD points, see Signal  
0 Distributing Group Table, Section 128, in the following  
0 NTPs:

0 NTP 297-2101-451  
0 NTP 297-2141-451  
0 NTP 297-2151-451  
0 NTP 297-2181-451

0 The quantity of SD points required for line features is  
0 divided by seven (7) to determine the number of SD cir-  
0 cuits or groups required.

0  
0 RELEASE 28.01  
0 93 12 03

0 (vii) One SD point for each line hunt group that requires a re-  
0 mote line overflow hardware register is to be provided.

0 (viii) Each A.P.C. ROTL unit, model 1066-ROTL/52A, comes  
0 equipped with two ROTL test ports.

0 One SD group (four points plus three dedicated spares)  
0 for each A.P.C. ROTL test port is to be provided.

0 (ix) For network management functions which require SD points,  
0 see NTP 297-2201-451 DMS-200 Customer Data Schema, Sec-  
0 tion 217, Network Management Signal Distributor Table.

0 The quantity of SD points required is divided by seven  
0 (7) to determine the number of SD circuits required.

0 2.2.3 Multi-Frequency (MF) Receiver

0 a) General Description

0 MF receivers, when connected to incoming trunks (analog and dig-  
0 ital) via the network, receive and interpret multi-frequency ad-  
0 dress signalling on these trunks.

0 b) References

0 Chapter 3, Section 3.5 Peripheral Modules  
0 NTP 297-1001-132 DMS-100 Family Blue Box Fraud  
0 Detection Feature Description

0 c) Provisioning Considerations:

0 ( i) Receiver access required for all incoming MF calls on all  
0 incoming and 2-way trunks.

0 ( ii) One receiver dedicated to each CAMA position.

0 ( iii) One to three receivers dedicated whenever the Blue Box  
0 Fraud Detection feature is activated. See NTP  
0 297-1001-132 DMS-100 Family Blue Box Fraud Detection Fea-  
0 ture Description.

0 ( iv) Versions of the card currently available are as follows:

0 NT2X48AA MF Receiver, Mu-law applications,  
0 two card position  
0 NT2X48BA MF Receiver, Mu-law applications,  
0 single card position  
0 NT2X48CA MF Receiver, A-law applications, two  
0 card position

0 ( v) The MF receivers can be mounted in either a Maintenance  
0 Trunk Module (MTM) or Trunk Module (TM) of the DMS-100  
0 Family of switching equipment.

0 ( vi) The Universal Tone Receiver (UTR) is a combined service  
0 circuit that can perform the function of a Digitone Re-  
0 ceiver for lines and a MF Receiver for trunks. (Refer to  
0 the Universal Tone Receiver subsection within this chap-  
0 ter for more information on the UTR.) MF Receivers are  
0 still required to service the following:

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - analog trunk groups existing on TM/MTM
- 0 shelves
- 0 - lines equipped on LM modules
- 0 - trunk groups equipped on DCM modules
- 0 - Mechanized Calling Card Service (MCCS)
- 0 - Subscriber Carrier Modules (SMS,SMR,SMU)
- 0 - incoming and the incoming portion of two way
- 0 service and test circuits (i.e. Remote
- 0 Office Test Line and Blue Box Fraud
- 0 Prevention)
- 0 - incoming RONI trunk groups
- 0 - Super CAMA - two way incoming DP outgoing DP
- 0 trunk groups

0 ( vii) MF Receivers are provisioned based on traffic. Refer to  
0 Chapter 2 Table N, MF Receiver - CCS Capabity Tables and  
0 Table M, MF Receiver Holding Time.

0 2.2.4 Digitone Receiver

0 a) General Description

0 These circuits receive and interpret the digitone signals pulsed  
0 on a customer line equipped with the digitone feature.

0 b) References

0 Chapter 3, Section 3.5 Peripheral Modules

0 c) Provisioning Considerations:

0 ( i) Digitone Receiver required for all originating digitone  
0 signalling.

0 ( ii) Receiver provisioned to handle total load for all calls  
0 generated by digitone lines.

0 ( iii) Versions of the card currently available are as follows:

0 NT2X48AB Digitone Receiver, Mu-law  
0 applications, two card position  
0 NT2X48BB Digitone Receiver, Mu-law  
0 applications, single card position  
0 NT2X48CB Digitone Receiver, Mu-law  
0 applications, British Telecom, two  
0 card position  
0 NT2X48CC Digitone Receiver, A-Law  
0 applications, two card position

0 Each card contains four (4) Digitone Receiver Circuits.

0 ( iv) The digitone receivers can be mounted in either a Mainte-  
0 nance Trunk Module (MTM) or Trunk Module (TM) of the  
0 DMS-100 Family of switching equipment.

0 ( v) The Universal Tone Receiver (UTR) is a combined service  
0 circuit that can perform the function of a Digitone Re-  
0 ceiver for lines and a MF Receiver for trunks. (Refer to  
0 the Universal Tone Receiver subsection within this chap-  
0 ter for more information on the UTR.) Digitone Receivers  
0 are still required to service the following:

0 - analog trunk groups existing on TM/MTM  
0 shelves

0 RELEASE 28.01  
0 93 12 03  
0

- 0 - lines equipped on LM modules
- 0 - trunk groups equipped on DCM modules
- 0 - Mechanized Calling Card Service (MCCS)
- 0 - Custom Charge Calling (CCC)
- 0 - Subscriber Carrier Modules (SMS,SMR,SMU)
- 0 - incoming and the incoming portion of two way
- 0 service and test circuits (i.e. Remote
- 0 Office Test Line and Blue Box Fraud
- 0 Prevention)
- 0 - any FX type trunks (e.g. DS1FX0, FX0GS,
- 0 FX0LS, FXSGS, FXSLS)

0 ( vi) To support CCC it is necessary to provide digitone re-  
0 ceivers that are attached as service circuits to a CCC  
0 call during periods when digitone signalling is permitted  
0 or expected.

0 Typically, DMS toll TOPS offices and the toll side of  
0 local/toll TOPS offices are not provisioned with digitone  
0 receivers. The introduction of CCC will necessitate the  
0 inclusion of this new resource in DMS toll offices.

0 The digitone receiver used is the NT2X48AB.

0 A separate group of digitone receivers dedicated to CCC  
0 should be engineered in each office.

0 ( vii) Digitone Receivers are provisioned based on traffic. Re-  
0 fer to Chapter 2, Table P, Digitone Receivers - CCS Ca-  
0 pacity Tables and Table O, Digitone Receiver Holding  
0 Time.

0 Digitone receivers serving CCC traffic will be provi-  
0 sioned on a loss basis in DMS toll TOPS and local/toll  
0 TOPS offices. Use Poisson Table V in Chapter 2. The CCC  
0 traffic used is calculated as follows:

0

0

0

0

0 RELEASE 28.01  
0 93 12 03  
0

$$\begin{array}{l} \text{CCC Traffic} = \text{WAHT} \times \text{ABSBHA} \\ \hline 100 \end{array}$$

0 where

$$\text{WAHT} = (\text{P(W/O)} \times \text{HT1}) + (\text{P(W)} \times \text{HT2})$$

0 = Weighted Average Holding Time of  
0 digitone receivers

0 ABSBHA is the total Average Busy Season Busy Hour At-  
0 tempts (ABSBHA) for all 0+, 01+, ANI traffic with an in-  
0 dication of CCC capable. This will be the sum of all  
0 incoming trunk groups as well as local originating traf-  
0 fic in the case of DMS-100/200/TOPS.

0 P(W/O) is the probability that the 0+ or 01+ call marked  
0 as CCC capable is actually a subscriber dialed CCC call.  
0 This is difficult to predict and a value of 0.15 to 0.60  
0 can be used.

0 P(W) is the probability that the 0+ or 01+ call marked as  
0 CCC capable is an operator handled call. The sum of P(W)  
0 and (PW/O) should be one.

0 HT1 = digital receiver holding time for CCC  
0 calls

0 = 22.05 seconds if the sequence calling  
0 feature is disabled

0 or = 42.55 seconds if the sequence calling  
0 feature is enabled

0 HT2 = digital receiver holding time for non-  
0 CCC calls when marked as CCC capable

0 = 4 seconds

0  
0 RELEASE 28.01  
0 93 12 03

0 2.2.5 Conference Circuit Provisioning

0 a) General Description

0 Conference circuit is required to provide centrex or MDC custom-  
0 ers with transfer, consultation hold, call add-on, to provide  
0 POTS customers with 3-way calling or 6-way calling. Also required  
0 for TOPS positions, Service Analysis positions and Attendant Con-  
0 soles.

0 b) References

0 Chapter 2 Traffic Criteria and Capacities

0 Chapter 3, Section 3.3 Operator Services  
0 Section 3.4 Meridian Business Services

0 c) Provisioning Considerations:

0 ( i) There are two (2) versions of the circuit:

0 NT3X67AA used in North American applications  
0 NT3X67BA used in International applications

0 The NT3X67BB is fully backwards compatible to NT3X67BA  
0 which it replaces. In addition, it provides the Toll  
0 Break In (TBI) tone required to implement the Toll Break  
0 In - Background Tone feature. This feature is supported  
0 in BCS-25 or later software.

0 There is one (1) circuit per card. Each card occupies  
0 three (3) card slots in a Maintenance Trunk Module (MTM)  
0 or Trunk Module (TM) and requires six 4-wire PCM trunk  
0 appearances.

0 ( ii) The 6-party Conference Circuit provides a conference fa-  
0 cility on a single card for use with DMS-100 Family of-  
0 fices. Up to five conference circuits can be tandemed to  
0 permit conference connections for three to twenty-six  
0 parties.

0 ( iii) The Conference Circuit card is designed to function as  
0 one (1) 6-port conference circuit or two (2) 3-port con-  
0 ference circuits.

0

0 RELEASE 28.01  
0 93 12 03  
0

- 0 ( iv) One 3-port conference circuit is required per service  
0 analysis position.

0 One 3-port conference circuit is required per Attendant  
0 Console. One circuit is required per console. See MBS,  
0 Section 3.4, for more information.

0 Conference Circuits are required for TOPS positions. See  
0 Operator Equipment, Section 3.3, for more information.

- 0 ( v) The 3-Way Call Chaining feature is provided in software  
0 packages NTX820AA (MDC offices) and NTX808AA (POTS of-  
0 fices). This feature will allow a non-controlling party  
0 in a simple 3-way call or existing chain to flash hook  
0 and initiate another 3-way call provided the non-  
0 controlling party either has the 3-Way Calling (3WC) line  
0 option or a call transfer option datafilled on his line  
0 or customer group.

0 Number of 3-Port Conference Circuits required for 3-Way  
0 Call Chaining = Number of 3-Way Call Chaining Groups  
0  $\times (D-2)$ .

0 where:

0 Number of 3-Way Call Chaining Groups =  
0  $(A * B * C) / D$   
0 (round up to next integer)

0 A = the number of lines with 3-Way Calling  
0 capability

0 B = the % Feature Penetration for 3-Way Call  
0 Chaining from the number of lines in (A)  
0 (i.e. % of lines in (A) that are normally  
0 in use)

0 C = the % Feature Activation for 3-Way Call  
0 Chaining

0 D = the average number of conferees in a 3-Way  
0 Call Chaining Group.

0 \* Features of Group Intercom All Calls under NTX878AC are  
0 affected in the same way.

0  
0 RELEASE 28.01  
0 93 12 03

0 2.2.6 Tone Generator

0 a) General Description

0 The Tone Generator Circuit (TGC) provides tones for general pur-  
0 pose use. The circuit card is mounted on a MTM.

0 The TGC generates tones for the following purposes:

- 0 - permanent signal
- 0 - conference calling
- 0 - Dual Tone Multifrequency (DTMF) signalling (SSMF-4)
- 0 - call waiting

0 b) References

0 Chapter 2 Traffic Criteria and Capacities

0 Section 3.2 - Software

0 Chapter 3, Section 3.4 Meridian Business Services

0 GS3X68 Tone Generator

0 c) Provisioning Considerations:

- 0 ( i) Versions of the Tone Generator Circuit cards are as fol-  
0 lows:

| 0 Product               |          |         |          |
|-------------------------|----------|---------|----------|
| 0 Description           | Code     | Uses    |          |
| 0 Dual Tone             | NT3X68AB | General | (Mu-law) |
| 0 Multifrequency (DTMF) |          |         |          |
| 0 Generator             |          |         |          |
| 0 Call Waiting Tone     | NT3X68AC | General | (Mu-law) |
| 0 Generator             |          |         |          |

0 For more information, refer to GS3X68.

- 0 ( ii) Digitone (DTMF) senders are used in Integrated Business  
0 Network offices to outpulse digits on the trunks and on  
0 CO trunks to a Class 5 office.

0 The DTMF sender grade of service is based on delay or  
0 loss criteria:

0 RELEASE 28.01  
0 93 12 03

0 a) ABSBH p=0.001, of Table V, Trunk Capacity Tables CCS  
0 Per Hour (Poisson Theory) (Chapter 2).

0 b) HDBH p=0.01, of Table V, Trunk Capacity Tables CCS  
0 Per Hour (Poisson Theory) (Chapter 2).

0 When provisioning DTMF Senders for a DMS100 MDC office  
0 using the Outpulsing DTMF On A Line feature and/or the  
0 Attendant Console End-T0-End Signaling (ACEES) feature  
0 both of which are contained in S/W Pkg NTX101AA, then the  
0 following formula shall be used:

$$\begin{array}{l} \text{DTMFS} \\ \text{CCS} = \end{array} \left[ \frac{\text{TT}(\% \text{ OG ABSBH CCS})100}{\text{TT-AVG-HT}} \right] + \left[ \frac{\text{ACEES-ABSBH-CCS}}{\text{ACEES-AVG-HT}} \right] \times \text{AVG-DTMFS-HT}$$

0 RELEASE 28.01  
0 93 12 03  
0

0 where,

0 DTMFS CCS DTMF Senders requirements in CCS.

0 ACEES-ABSBH-CCS The sum of the traffic during the Aver-  
0 age Busy Hour Busy Season in CCS from  
0 all Attendant Consoles equipped with the  
0 Attendant Console End-To-End Signaling  
0 (ACEES) feature

0 ACEES-AVG-HT The Average Holding Time of all calls  
0 originating from all Attendant Consoles  
0 equipped with the ACEES feature in sec-  
0 onds.

0 TT Total Tie Trunks Traffic in CCS (TT) requiring Out-  
0 pulsing DTMF on a Line

0 % OG ABSBH CCS The percentage of Total Tie Trunk traf-  
0 fic that is Outgoing (OG), during Aver-  
0 age Busy Season Busy Hour (ABSBH), which  
0 require the outpulsing of DTMF.

0 TT-AVG-HT The Average Holding Time of the Total  
0 Tie Trunks

0 AVG-DTMFS-HT The Average Holding Time of the DTMF  
0 Senders (DTMFS). (Average sender hold-  
0 ing time of three seconds is assumed.)

0 If the number of senders for traffic figures exceed 25  
0 circuits, then the number of circuits should be deter-  
0 mined using the following formula:

0 #DTMF Senders = DTMFS CCS  
0 -----  
0 AVG-DTMFS-HT

0 DTMF sender card has four circuits per card. Two slots  
0 per card. Mounts on MTM.

0 DMS-250 trunks which are mounted on DCMs, DTCs or LTCs  
0 and require DTMF outpulsing do not require the DTMF  
0 Sender Card NT3X68AB.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 As of BCS-16 (or later) for other DMS applications, dig-  
0 ital trunks which require DTMF outpulsing on the DTC or  
0 LTC do not required the DTMF Sender Card NT3X68AB.

0 The required tones for the above two situations will be  
0 outpulsed from the respective peripheral modules.

0 ( iii) The Call Waiting Tone Generator CP is required to provide  
0 the following call progression tones for Plain Old Tele-  
0 phone Service (POTS) Custom Calling, Meridian Data  
0 Centrex (MDC) and DMS Private Branch Exchange (PBX) ap-  
0 plications:

- 0 a) Account  
0 b) Busy Verification  
0 c) Call Waiting  
0 d) Camp-On  
0 e) Confirmation (350 + 440 Hz)  
0 f) Queue Recall (350 + 440 Hz)  
0 g) Special Dial (350 + 440 Hz)  
0 h) Teen Service

0 Time switch broadcasting is used to distribute tones to  
0 multiple users.

0 Each Call Waiting Tone Generator Circuit Pack contains  
0 four circuits and requires two Maintenance Trunk Module  
0 (MTM) card slots.

0 For redundancy purposes, a minimum of eight circuits (two  
0 CPs) are to be provided for non-MDC offices and a minimum  
0 of twelve circuits (three CPs) are to be provided for MDC  
0 offices.

0 ( iv) For calling tone in Custom Calling Services, provide one  
0 Tone Generator Call Waiting card per office.

0 The capacity of the Call Waiting Tone Generator card pro-  
0 vided for Custom Calling Services is sufficient to handle  
0 the requirements for Attendant Consoles (see Section  
0 3.4).

0 ( v) The number of Call Waiting Tone Circuit (CWT) required  
0 for POTS offices:

0 # of calls  
0 % of terminating

0 RELEASE 28.01  
0 93 12 03

$$\begin{array}{l} \text{lines} \quad \text{to a busy} \\ \# \text{ of CWT} = \text{with CWT} \times \text{line (ABSBH)} \times 540\text{ms} \\ \hline 3,600,000 \text{ ms} \end{array}$$

0 Each Call Waiting tone is 300 milliseconds, and on aver-  
0 age we apply 1.8 tones per call wait call. The total  
0 tone duration is (300 X 1.8) or 540 milliseconds. Multi-  
0 ply 1e by 540 and divide by the number of milliseconds in  
0 an hour (One hour = 60 minutes X 60000 milliseconds =  
0 3600000 milliseconds) to determine the number of Call  
0 Waiting Tone circuits required.

0 The number of Call Waiting Tone Generator Circuit Packs  
0 required for a non-MDC office is equal to the number of  
0 CWT circuits (calculated above) divided by 4 (i.e., four  
0 circuits per card). The minimum number of CWT circuit  
0 packs to provision for a non-MDC office is 2.

- 0 ( vi) The number of Call Waiting Tone Circuits (CWT) required  
0 for MDC is equal to the quantity required for Camp-ON,  
0 Dial Call Waiting and Call Waiting Originating (CWD/CWO),  
0 Call Waiting Terminating tones (CWTT), and Internal/ Ex-  
0 ternal Distinctive Call Waiting Tones (IED).

0 RELEASE 28.01  
0 93 12 03

0 
$$\# \text{ of CWT for Camp-ON} = \frac{(1 + (B/100)) \times A \times C}{D \times 3,600,000 \text{ ms}} \quad (\text{round up to next integer})$$

0 
$$\# \text{ of CWT for CWD/CWO} = \frac{J \times K \times Q}{L \times 3,600,000 \text{ ms}} \quad (\text{round up to next integer})$$

0 
$$\# \text{ of CWT for CWT} = \frac{R \times J \times P}{L \times 3,600,000 \text{ ms}} \quad (\text{round up to next integer})$$

0 
$$\# \text{ of CWT for IED} = (\# \text{ of CWT for CWT} \times 0.2) \times 2$$

0 Where:

0 A = # of Attendant Camp-On calls in one hour.  
0 B = % of Attendant Camp-On calls that will be recalled.  
0 C = Length of the Camp-On tone in milliseconds.  
0 (maximum 1500 ms., recommended default = 300ms)  
0 D = Average # of connections on a Camp-On tone circuit  
0 during the ABSBH.  
0 E = # of lines with Dial Call Waiting (CWD)  
0 F = # of lines with Call Waiting Originating (CWO)  
0 G = # of MDC lines  
0 H = # of Originating-Terminating calls per ABSBH that reach  
0 a busy MDC line.  
0 J = Average # of Call Waiting tones applied per call.  
0 (minimum 1, maximum 2, recommended default = 1.8)  
0 K = Length of the CWD/CWO tone in milliseconds.  
0 (maximum 1500 ms., recommended default = 300ms)  
0 L = Average # of connections on a Call Waiting tone circuit  
0 during the ABSBH.  
0 M = # of MDC lines with Call Waiting Terminating.  
0 N = # of lines in the office.  
0 O = # of Terminating calls per ABSBH that reach a busy line.  
0 P = Length of the Call Waiting Terminating tone in milli-  
0 seconds. (maximum 1500 ms., recommended default = 300ms)  
0 Q =  $(F + (E \times 0.25)) \times H / G$  (round up to next integer)  
0 R =  $(O \times M) / N$  (round up to next integer)

0

0

0 RELEASE 28.01  
0 93 12 03

0 The number of Call Waiting Tone Generator Circuit Packs  
0 for an MDC office is equal to the number of CWT circuits  
0 required for POTS office ((v) above) plus the number of  
0 CWT required for MDC office (above) divided by 4 (i.e.,  
0 four circuits per card). The minimum number of CWT cir-  
0 cuit packs to provision per MDC office is 3.

0 (vii) If TEEN Service software is provided, Call Waiting Tone  
0 Generator cards are required (minimum of one (1) card per  
0 Secondary Directory Numbers (SDN) must be provided; it is  
0 recommended that one card per SDN be provided for a total  
0 of four (4) cards per office). Refer to the Software  
0 Feature section (3.2) for more information on TEEN Ser-  
0 vice.

0 The calculation for CWT on the Primary Directory Number  
0 (PDN) is the same as provisioning CWT for POTS lines ((v)  
0 above).

0 The number of CWT circuits required for the Secondary Di-  
0 rectory Number number 1 (SDN1) is:

$$\begin{array}{rcl} \text{\# of SDN1 calls} & & \\ \text{getting call} & \times & \text{Holding Time} \\ \text{\# of CWT waiting (ABSBH)} & & \\ \text{for SDN1} = & \text{-----} & \\ & 3,600,000 \text{ ms} & \end{array}$$

0 Where:

$$\begin{array}{rcl} \text{Holding Time} = & \text{duration of} & \text{Avg call} \\ & \text{tone for SDN1} & \text{wait tones} \\ & & \text{-----} \\ & & \text{calls} \\ & = 300 \text{ ms} \times 1.8 & \\ & = 540 \text{ ms} & \end{array}$$

0 A minimum of one CWT cards are required for SDN1 lines.  
0 (There are four CWT circuits per card).

0

0

0

0 RELEASE 28.01  
0 93 12 03  
0

0 The number of CWT circuits required for the Secondary Di-  
0 rectory Number number 2 (SDN2) is:

$$\begin{array}{rcl} \text{\# of SDN2 calls} & & \\ \text{getting call} & \times & \text{Holding Time} \\ \text{\# of CWT waiting (ABSBH)} & & \\ \text{for SDN2} = & \text{-----} & \\ & 3,600,000 \text{ ms} & \end{array}$$

0 Where:

$$\begin{array}{rcl} \text{duration of} & & \text{Avg call} \\ \text{Holding Time} = \text{tone for SDN2} \times & \text{-----} & \text{wait tones} \\ & \text{calls} & \\ & = 500 \text{ ms} \times 1.8 & \\ & = 900 \text{ ms} & \end{array}$$

0 A minimum of one CWT cards are required for SDN2 lines.  
0 (There are four CWT circuits per card).

0 The number of CWT circuits required for the Secondary Di-  
0 rectory Number number 3 (SDN3) is:

$$\begin{array}{rcl} \text{\# of SDN3 calls} & & \\ \text{getting call} & \times & \text{Holding Time} \\ \text{\# of CWT waiting (ABSBH)} & & \\ \text{for SDN3} = & \text{-----} & \\ & 3,600,000 \text{ ms} & \end{array}$$

0 Where:

$$\begin{array}{rcl} \text{duration of} & & \text{Avg call} \\ \text{Holding Time} = \text{tone for SDN3} \times & \text{-----} & \text{wait tones} \\ & \text{calls} & \\ & = 700 \text{ ms} \times 1.8 & \\ & = 1260 \text{ ms} & \end{array}$$

0 A minimum of one CWT cards are required for SDN3 lines.  
0 (There are four CWT circuits per card).

0  
0 RELEASE 28.01  
0 93 12 03

0 2.2.7 Receiver Off Hook (ROH) Tone Generator

0 a) General Description

0 These circuits are required to provide receiver off-hook tones to  
0 subscriber lines in an attempt to alert subscribers by annoying  
0 tones of existing permanent signal conditions caused by receivers  
0 being left off the hook

0 b) References

0 Chapter 2 Traffic Criteria & Capacities

0 c) Provisioning Considerations:

0 ( i) The cards available are as follows:

0 Receiver Off-Hook Tone NT1X00AC

0 ( ii) Time Switch Broadcasting (TSB) is used to distribute tone  
0 simultaneous to multiple users.

0 ( iii) The maximum number of simultaneous connections per tone  
0 source is limited to 16 for old networks (NT0X48) and to  
0 32 for new networks (NT5X13) (i.e. for a non deloading  
0 NSG).

0 ( iv) If an office has both old and new networks, the maximum  
0 number of simultaneous connections per tone source is  
0 limited to 16 for a non deloading NSG.

0 ( v) Receiver Off Hook Tone card is NT1X00AC. Two circuits  
0 per card. One slot per card. Mounts on MTM.

0 ( vi) The number of ROH circuits can be calculated by using the  
0 following formula:

0 Use of ROH Circuits = ROH Tone Attempts/Hour x  
0 ROH Holding Time

0 ROH tone grade of service (ABSBH) criterion is:

0  $P(t > 0) = 0.009$  (Erlang C)

0 Therefore, use Table V, Chapter 2 to determine required  
0 number of ROH tone connections.

0 2.2.9 Digital Tone Detector and Sender Series NT5X29

0 a) General Description

0 The NT5X29 series of Digital Tone Detector and Sender cards provides multi-purpose, multi-channel service circuits for identifying and generating standard single or two-frequency tones.

0 The card contains independently controlled detector and sender circuits, which operate in conjunction with the Maintenance Trunk Module (MTM) of the DMS-100 Family digital switching system.

0 The tone detector receives various single and two frequency tones in Pulse Code Modulated (PCM) digital format from the MTM, identifies them, and signals the level, frequency and type of the tone back to the MTM.

0 The tone sender generates standard test or signalling tones in PCM format, on receipt of the appropriate control data work from the MTM.

0 The card is located in certain preferred positions in the MTM shelf, and plugs into the shelf backplane connectors.

0 b) References

0 GS5X29 Digital Tone Detector and Sender  
0 Series NT5X29

0 c) Provisioning Considerations:

0 ( i) Versions of the card currently available and their applications are as follows:

0 NT5X29AA: Tone detector and generator for Common Channel  
0 Interoffice Signalling (CCIS) continuity  
0 checker.

0

0

0

0  
0 RELEASE 28.01  
0 93 12 03

0 NT5X29AB: Tone detector for service observing circuits.  
0 Used by Remote Operator Number Identification  
0 (RONI) and AB01.1032 DMS-100 equipment with  
0 Traffic Operator Position System (TOPS).

0 NT5X29AC: Tone detector for audible ringing, answer and  
0 digitone multi-frequency tones.

0 NT5X29BA: Audio Tone Detector (ATD) for U.K. (Mercury  
0 Centrex).

0 ( ii) The Digital Tone Detector and Sender has the following  
0 features:

0 - All-digital operation, compatible with  
0 DMS-100 equipment.

0 - Simultaneously processes 16 channels of  
0 tonal data in PCM format.

0 - Can process a single-frequency tone or  
0 determine the difference frequency of a  
0 two-frequency tone signal.

0 - Generates standard signalling or test tones  
0 on command.

0 ( iii) When an Audio Tone Detector CP NT5X29AC is mounted on an  
0 MTM, then either TM Processor CP NT0X70AC or TM Control-  
0 ler CP NT4X65A is required. The NT0X70AA must be re-  
0 placed with an NT0X70AC for BCS-28 or higher.

0 2.2.10 Digital Tone Transceiver

0 a) General Description

0 The Digital Tone Transceiver Circuit Pack (NT3X08AA) functions as  
0 an essential component of the Automatic Coin Toll Service (ACTS).  
0 Its General purpose is to count coin deposits from coin operated  
0 telephones (coin stations) and report the amount collected to the  
0 DMS-100 Central Control (CC). Refer to Section 3, Operations  
0 Equipment for more information on ACTS.

0 b) References

0 Chapter 3, Section 3.3 Operator Services

0 c) Provisioning Considerations:

- 0 ( i) The coin detection circuit pack (CDC - NT3X08AA) will  
0 physically occupy one card slot on a MTM.
- 0 ( ii) The CDC will use eight time slots and therefore four (4)  
0 consecutive card slots are required. A maximum of three  
0 (3) CDC circuit packs can be housed in any MTM. If it is  
0 desired, the CDC card can be placed on a MTM with other  
0 cards provided the next three slots following the CDC are  
0 empty and provisioning rules for these other packs are  
0 followed.
- 0 ( iii) Digitone or rotary coin stations may be used, however,  
0 all stations MUST be able to provide dual frequency coin  
0 deposit signals to allow detection by the CDC circuit  
0 pack.
- 0 ( iv) The CDC contains eight (8) circuits provisionable for  
0 ACTS on each circuit pack.
- 0 ( v) Mu-law/A-law capability.
- 0 ( vi) The CDC requires no distributing frame cabling.
- 0 ( vii) For more information on the CDC card, refer to ACTS in  
0 Section 3.3, Operator Services.

0 RELEASE 28.01  
0 93 12 03

0 2.2.11 Alarm Scan and Signal Distribution Points

0 (a) General Description

0 Alarm and control inputs are generated by hardwired alarm con-  
0 tacts in the DMS hardware, by the operation of manual control  
0 switches, or by the alarm circuits of miscellaneous associated  
0 equipment. These are detected through Scan Points and interfaced  
0 to the alarm system software. The software responds to an alarm  
0 condition or a control actuation by operating or releasing the  
0 appropriate Signal Distribution Points. This initiates or termi-  
0 nates the corresponding audible and visual alarm or control func-  
0 tion.

0 (b) References

0 NTP 297-1001-122 DMS-100 Family Alarm  
0 System Description

0 (c) Provisioning Considerations

- 0 ( i) The operating company must provide data for assignment of  
0 alarm scan and signal distribution points detailing the  
0 number of points required, the type of alarm, and the de-  
0 sired severity treatment (critical, major or minor).
- 0 ( ii) For basic alarm system provide a minimum of one Signal  
0 Distributor (SD) Card Type I (NT2X57AA) per system and  
0 assign to a slot on MTM(1).
- 0 ( iii) A second NT2X57AA, providing 14 spare SD points, may be  
0 provided if required.
- 0 ( iv) For basic alarm system, provide a minimum of one Miscel-  
0 laneous Scan Detector Card (NT0X10AA) per system and as-  
0 sign to a slot on MTM (1).
- 0 ( v) Provide an additional NT0X10AA if a remote distribution  
0 bay (RDB) is to be provided and/or if any of equipment  
0 rows G, H, J through M are to be equipped.
- 0 ( vi) Provide another NT0X10AA if any of rows N, P through Z,  
0 AA, BB are to be equipped.
- 0 ( vii) Provide another NT0X10AA if at least one of the rows CC  
0 through HH, JJ through NN and PP through RR is to be  
0 equipped.

0  
0 RELEASE 28.01  
0 93 12 03

0 (viii) Additional scan points for alarms external to DMS may be  
0 assigned, preferably to the alarm MTMs. If space is not  
0 available, any MTM may be used but note that an MTM with-  
0 out a Dead System Card (NT3X82AA/AB) has no OAU shelf  
0 monitor.

0 ( ix) Note that DMS currently supports a total maximum of 1024  
0 scan points.

## 0 1.0 Host - Toll Specials

0 1.1 Equipment Provisioning0 1.1.1 Analog Trunks0 (a) General Description

0 Trunk cards provide features that are required to achieve the  
0 necessary functional compatibility for each analog trunk group.  
0 Applique circuits are used as adapters to provide an interface  
0 between a DMS-100 Family trunk circuit and a specific item of  
0 Northern Telecom (NT) or other manufacturer's equipment, or for  
0 special purpose (e.g. Board-to-Board Testing).

0 (b) References

0 NTP 297-1001-152 Trunk Selection and Compatibility  
0 NTP 297-2101-516 Line Maintenance Reference Manual

0 Chapter 3, Section 3.7 Office Maintenance

0 (c) Provisioning Considerations:

0 ( i) Refer to NTP 297-1001-152, DMS-100 Family Trunk Selection  
0 and Compatibility for a list of available applique cir-  
0 cuits, trunk cards and the features provided by the trunk  
0 hardware of each card.

0 ( ii) One Balance Network plug-in (daughter board) must be pro-  
0 visioned for each 2-wire trunk circuit on each card as  
0 follows:

0 a) For H88 loaded cable select Precision Balance Network -  
0 H88, NT2X80AA,

0 b) For International applications select the following Bal-  
0 anced Networks:

0

0

- c) For other loaded or non-loaded arrangements select **Compromise Balance Network, NT2X77** as follows:

| DISTANCES<br>UP TO | TRUNK IMPEDANCE |          |
|--------------------|-----------------|----------|
|                    | 600 OHM         | 900 OHM  |
| 750 feet           | NT2X77AD        | NT2X77AC |
| 9000 feet          | NT2X77AB        | NT2X77AA |

( iii) The following trunk functions and features help determine the selection of the correct trunk card. These functions and features are common to all trunks within a trunk group:

- 1) Number of trunks in the trunk group.
- 2) Trunk Function:

0

0 10) Echo Suppressor Control:

0 Echo Suppressor Control (ESC) can be provided for  
0 4-wire E&M and CCITT No. 5 and No. 6 trunks.

0 DMS-100 Family Digital Echo Suppressors (DES) can be  
0 provided where the transmission round trip delay ex-  
0 ceeds 45 msecs.

0 ( iv) The input/output (I/O) test trunk is a NT2X90 card  
0 mounted in an 8-wire Trunk Module (TM) at the host of-  
0 fice, in a RMM at a RLCM or in a RSM at a RLM. It pro-  
0 vides a DMS interface with non-DMS local testing  
0 equipment such as:

- 0 - #14 Local Test Desk
- 0 - #3 Local Test Cabinet
- 0 - Centralized Automatic Loop Reporting System

0 It enables the maintenance personnel who operate the  
0 non-DMS test equipment to access subscriber lines via the  
0 MTA. Provide one I/O Test Trunk for each test trunk  
0 which DMS interfaces mentioned above.

0 The LTP Talk/Monitor MTA interface provides an alternate  
0 interface connection to a subscriber line without going  
0 through the line circuit for purposes of monitoring and  
0 testing. Access is via the Metallic Test Access Unit  
0 (MTA) and the line card access relay. Normally multiples  
0 to the line side of the Line Test Unit (LTU). One I/O  
0 Test Trunk is required for each LTU ordered.

0 For more information, refer to NTP 297-2101-516.

0 Operator Verification Access provides a high impedance  
0 monitor-only connection between an incoming operator ver-  
0 ification trunk and a subscriber line via the MTA and the  
0 line card access relay. It is recommended that one ac-  
0 cess interface circuit (I/O Test Trunk) be provided for  
0 each operator verification trunk required. Correspond-  
0 ingly one MTA test multiple must be provided for each  
0 interface required. See MTA, Section 1.3.9 and Section  
0 3.7, Office Maintenance for more information on the MTA  
0 provisioning.

0 RELEASE 28.01  
0 93 12 03  
0

0 ( v) DMS supports the Automation Products Co., model  
0 1066-ROTL/52A ROTL and 105 Test Line. Each ROTL can  
0 serve up to 640 trunks per day based on an eight hour  
0 test shift. The interface circuit is the ROTL I/F Trunk  
0 NT3X91AA which has two (2) circuits per card.

0 Three trunk circuits are required for each ROTL; one for  
0 each of two test ports plus one for a standard 105 Test  
0 Line port.

0 One additional trunk circuit is required for each addi-  
0 tional 105 Test Line provided; up to a total of six.

0 For more information on the ROTL unit, refer to Section  
0 3.7, Office Maintenance.

0 ( vi) One Trunk Card NT2X83AA (two circuits per card) is to be  
0 provided for each interface trunk circuit required to  
0 interface the Automatic Number Announcement (ANA) system.  
0 For more information on ANA circuit, refer to Section  
0 3.7, Office Maintenance.

0 ( vii) Jack ended 4-wire trunk appearances are extended to each  
0 Maintenance and Administration Position (MAP) used for  
0 line testing (LTP) and (or) trunk testing (TTP) to facil-  
0 itate the connection of portable test sets into the sys-  
0 tem.

0 For DMS-100 and DMS-100/200 offices Jack Ended Trunk,  
0 NT1X54AA, (2 circuits per card) must be provided.

0 For DMS-200 offices NT1X54AA cards may be used on TM8's  
0 or MTM's, or the 4-wire E&M trunk, NT2X72AA (2 circuits  
0 per card) may be provided only if mounted on TM8.

0 Refer to the Input/Output Section (3.6) for more informa-  
0 tion on Jack Ended Trunks.

0 (viii) One CAMA Position signalling Trunk, NT2X65AA (one circuit  
0 per card, mounts on TM8) and one CAMA CW SUSP LT TRK,  
0 NT2X66AA (one circuit per card, mounts on TM2, TM4, TM8)  
0 is required per CAMA position.

0 ( ix) Analog trunks can be used to provide and interface be-  
0 tween the TOPS positions and the DMS switching network  
0 and the TOPS TTY's and the DMS switching network. Two  
0 analog trunks, one for voice and one for data, are re-

0  
0 RELEASE 28.01  
0 93 12 03

0  
0 quired for each TOPS position. An exception is the Force  
0 Management Position which requires only one trunk for  
0 data, no voice. One analog trunk is required for each  
0 TOPS TTY (with the exception of the SNAC TTY which re-  
0 quires one I/O port appearance instead). Refer to the  
0 Operator Services section (3.5) to determine whether the  
0 TOPS position or the TOPS TTY will interface with the DMS  
0 switching network via analog trunks or not. Use the  
0 4-wire E&M trunk NT2X72 (two circuits per card) which  
0 mounts on the TM8.

0 1.1.2 International Metallic Test Unit (IMTU)

0 a) General Description

0 These circuits are used to perform DC and AC voltage measurements  
0 and metering signals measurements as well as resistance,  
0 capacitance and frequency measurements on subscriber loops and  
0 line circuits. Connection is DC-metallic via the DMS Metallic  
0 Test Access Network (MTA) and the access relay in the line card.

0 The IMTU is for International applications only.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) The IMTU consist of a pair of interconnected cards:

0 NT4X97AA Metallic Test Unit Controller  
0 NT4X98BB Metallic Test Unit Analog  
0 (NT4X98AA is to be replaced by NT4X98BB.)

0 The IMTU has two separate tip and ring appearances that  
0 time share the same measurement circuits. This time  
0 sharing is transparent to the system and, as a result,  
0 the IMTU appears as two separate measurement circuits.

0 ( ii) The MTU analog card and the MTU control card each occupy  
0 1 card slot. They are mounted as a functional pair on a  
0 International Maintenance Trunk Module (IMTM) (located at  
0 Host) or a Remote Maintenance Module (RMM) (located at  
0 IRLCM, IOPM).

0 ( iii) It is recommended that one (1) IMTU circuit be assigned  
0 as a dedicated IMTU for two NT3X09BA Metallic Test Access  
0 cards. This will serve up to eight (8) LCMs. In addition,  
0 provision one (1) non-dedicated (rover) IMTU circuit  
0 per office.

0 For IRLCM offices provision a minimum of one (1) IMTU  
0 pair per site. A non-dedicated IMTU (rover) is not required  
0 for single IRLCM configurations. For multiple  
0 IRLCM configurations, provision the number of IMTUs (including  
0 a rover circuit) based on the following methods:

0 RELEASE 28.01  
0 93 12 03

0 Method 1

0 # of LCMs  
0 # of IMTU Circuits = ----- + 1  
0 8

0 # of IMTU Circuits  
0 # of NT4X97/NT4X98 Pairs = -----  
0 2

0 Method 2

0 Telco requirements may dictate that all of the lines in  
0 an office be testable in a given time for test. This will  
0 require provisioning enough IMTU circuits to meet this  
0 requirement based on the following formula. Be sure to  
0 ensure that Method 1 (above) has been observed.

0 # Lines x Test Hold Time (Secs)  
0 # IMTU Ckts = ----- + 1  
0 3600 \* Time-For-Test (Hrs)

0 # IMTU Circuits  
0 # of NT4X97/NT4X98 Pairs =-----  
0 2

0 Typical Test Hold Times

0 1.1.3 Receiver Off Hook (ROH) Tone Generator

0 a) General Description

0 These circuits are required to provide receiver off-hook tones to  
0 subscriber lines in an attempt to alert subscribers by annoying  
0 tones of existing permanent signal conditions caused by receivers  
0 being left off the hook

0 b) References

0 Chapter 2 Traffic Criteria & Capacities

0 c) Provisioning Considerations:

0 ( i) The cards available are as follows:

0 Receiver Off-Hook Tone NT1X00AC

0 ( ii) Time Switch Broadcasting (TSB) is used to distribute tone  
0 simultaneous to multiple users.

0 ( iii) The maximum number of simultaneous connections per tone  
0 source is limited to 16 for old networks (NT0X48) and to  
0 32 for new networks (NT5X13) (i.e. for a non deloading  
0 NSG).

0 ( iv) If an office has both old and new networks, the maximum  
0 number of simultaneous connections per tone source is  
0 limited to 16 for a non deloading NSG.

0 ( v) Receiver Off Hook Tone card is NT1X00AC. Two circuits  
0 per card. One slot per card. Mounts on MTM.

0 ( vi) The number of ROH circuits can be calculated by using the  
0 following formula:

0 Use of ROH Circuits = ROH Tone Attempts/Hour x  
0 ROH Holding Time

0 ROH tone grade of service (ABSBH) criterion is:

0  $P(t > 0) = 0.009$  (Erlang C)

0 Therefore, use Table V, Chapter 2 to determine required  
0 number of ROH tone connections.

0  
0 RELEASE 28.01  
0 93 12 03

0 Divide total ROH tone connections by 16 or 32 as applica-  
0 ble to obtain total number of ROH tone circuits.

0 1.1.4 Digital Tone Detector and Sender Series NT5X29

0 a) General Description

0 The NT5X29 series of Digital Tone Detector and Sender cards provides multi-purpose, multi-channel service circuits for identifying and generating standard single or two-frequency tones.

0 The card contains independently controlled detector and sender circuits, which operate in conjunction with the Maintenance Trunk Module (MTM) of the DMS-100 Family digital switching system.

0 The tone detector receives various single and two frequency tones in Pulse Code Modulated (PCM) digital format from the MTM, identifies them, and signals the level, frequency and type of the tone back to the MTM.

0 The tone sender generates standard test or signalling tones in PCM format, on receipt of the appropriate control data work from the MTM.

0 The card is located in certain preferred positions in the MTM shelf, and plugs into the shelf backplane connectors.

0 b) References

0 GS5X29 Digital Tone Detector and Sender  
0 Series NT5X29

0 c) Provisioning Considerations:

0 ( i) Versions of the card currently available and their applications are as follows:

0 NT5X29AA: Tone detector and generator for Common Channel  
0 Interoffice Signalling (CCIS) continuity  
0 checker.

0

0 NT5X29AB: Tone detector for service observing circuits.  
0 Used by Remote Operator Number Identification  
0 (RONI) and AB01.1032 DMS-100 equipment with  
0 Traffic Operator Position System (TOPS).

0 NT5X29AC: Tone detector for audible ringing, answer and  
0 digitone multi-frequency tones.

0 NT5X29BA: Audio Tone Detector (ATD) for U.K. (Mercury  
0 Centrex).

0 ( ii) The Digital Tone Detector and Sender has the following  
0 features:

0 - All-digital operation, compatible with  
0 DMS-100 equipment.

0 - Simultaneously processes 16 channels of  
0 tonal data in PCM format.

0 - Can process a single-frequency tone or  
0 determine the difference frequency of a  
0 two-frequency tone signal.

0 - Generates standard signalling or test tones  
0 on command.

0 ( iii) When an Audio Tone Detector CP NT5X29AC is mounted on an  
0 MTM, then either TM Processor CP NT0X70AC or TM Control-  
0 ler CP NT4X65A is required. The NT0X70AA must be re-  
0 placed with an NT0X70AC for BCS-28 or higher.

0 1.1.5 Universal Tone Receivers

0 (a) General Description

0 The Universal Tone Receiver (UTR) is a combined service circuit  
0 that can perform the function of a Digitone Receiver for lines  
0 and a MF Receiver for trunks.

0 The Universal Tone Receiver (UTR) circuit pack is provisioned for  
0 R2 call setup. Each UTR pair has thirty circuits. For more in-  
0 formation on the UTR, refer to Section 3.5.

0 (b) Reference

0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 ( i) The UTR is provisionable in pairs (maximum two (2) pairs)  
0 on the DTC, LGC, (IDTC, ILGC) and LTC modules. All lines  
0 and trunks connected to the module will be serviced by  
0 the UTR within the module. This includes all lines in  
0 LCMS, RLCMS, and OPMS.

0 ( ii) UTRs will slightly reduce the DTC/LGC/LTC and RSC periph-  
0 eral real time capacity. A real time work up should be  
0 performed to ensure sufficient capacity. Refer to Sys-  
0 tems Engineering Letter, Issue #01, Subject "Guidelines  
0 for XPM Real Time Capacity Study - BCS-22" (Date: May 22,  
0 1987).

0 ( iii) Lines and trunks on a RSC are serviced by UTR cards lo-  
0 cated in the RCC module of the RSC. There is no traffic  
0 overflow to the host office.

0 ( iv) Although the UTR can perform the function of a Digitone  
0 Receiver (NT2X48AA) and the function of a MF Receiver  
0 (NT2X48AB), there is no traffic overflow from UTRs onto  
0 existing Digitone Receivers nor existing MF Receivers.  
0 The Digitone Receivers and MF Receivers mounted on MTMs  
0 and TMs are still required to service the following:

- 0 - analog trunk groups existing on TM/MTM shelves
- 0 - lines equipped on LM modules
- 0 - trunk groups equipped on DCM modules
- 0 - Mechanized Calling Card Service (MCCS)

0 RELEASE 28.01

0| Any incoming or incoming portion of a 2 way trunk group  
0| requiring a receiver not listed above will require  
0| Digitone or MF receivers.

0| ( vi) The number of UTR circuits is obtained by calculating the  
0| UTR holding time and multiplying by the average number of  
0| calls per hour. In general it is always safe to provide  
0| two (2) pairs of UTR cards if unsure of the traffic de-  
0| mands.

0| For incoming R2 calls the UTR holding time is as follows:

0| 1. From seizure to final digit collection  
0| plus

0 RELEASE 28.01  
0 93 12 03

- 0 2. From final digit collection to - trunk  
0 selection if R1 or N5 outgoing, - seize  
0 acknowledgement if R2 outgoing.

0 For outgoing R2 calls the UTR holding time is as follows:

- 0 1. The UTR is held until told to release by  
0 the far office or timeout if we are the  
0 controlling signal office (i.e. R1 to R2  
0 calls).

0 The number of UTRs used on average is given by the fol-  
0 lowing formula:

$$\begin{array}{lcl} \# \text{ of UTR} & & \text{SI} & & \text{S0} \\ \text{Circuits} = \text{NI} \times \text{-----} \times \text{EI} + \text{NO} \times \text{-----} \times \text{EO} \\ \text{required} & & \text{HI+SI} & & \text{HO+S0} \end{array}$$

0 where,

0 NI = Number of incoming R2 trunks (or 2-way  
0 used as incoming)

0 SI = Signalling time in seconds of incoming  
0 trunks

0 HI = Holding time (talking) of incoming trunks  
0 in seconds

0 EI = Erlang occupancy figure of incoming  
0 trunks

0 NO = Number of outgoing R2 trunks (or 2-way  
0 used as outgoing)

0 S0 = Signalling time in seconds of outgoing  
0 trunks

0 HO = Holding time (talking) of outgoing trunks  
0 in seconds

0 EO = Erlang occupancy figure of outgoing trunks

- 0 ( vii) This circuit pack is only required for CCITT No. 6 Sig-  
0 nalling.

## 0 1.0 Host - Maintenance Trunk Test Circuits

0 1.1 Equipment Provisioning0 1.1.1 TOPS Loop Around Requirements0 (a) General Description

0 When TOPS is equipped on a DMS-100/200 configuration, loop around  
0 trunks (NT6X50AA for TOPS, NT6X27AA for ITOPS) must be provi-  
0 sioned to route traffic between the DMS-100 and the DMS-200 por-  
0 tion of the switch. Provisioning of the number of loop around  
0 trunks is based upon the traffic requirements. All line-to-TOPS  
0 and TOPS-to-line calls must be routed via the loop around  
0 trunks).

0 The provisioning of TOPS loop around trunks in DMS-100/200 TOPS  
0 offices is required to support all TOPS to line traffic and a  
0 portion of the line to TOPS traffic.

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules - Host  
0 Chapter 2 Traffic Criteria and Capacities

0 (c) Provisioning Considerations

0 ( i) The attached charts detail loop around requirements.  
0 Calculate the total traffic in CCS for each station type  
0 requiring loop around trunks. Refer to the applicable  
0 grade of service tables to determine the required number  
0 of loop around trunks.

## 0 ( ii) Loop Around Provisioning

0 1. Outgoing operator traffic can be obtained in the fol-  
0 lowing ways:

- 0 a) Directly from Telco/Customer
- 0 b) Calculation based on data from the Questionnaire
- 0 (0-, 0+ 5 to 10D, 01 + 12D. 1+CAMA). Use Table
- 0 33.5 to calculate percent of lines requiring loop
- 0 around:

0 
$$\frac{(\text{IFR lines} + \text{MBS lines} + \text{ONI/ANIF}) \times \text{traffic}}{\text{outgoing outgoing}} \times \frac{\text{origin.}}{(\text{CCS})}$$

- 0 c) Approximate Method:

0 
$$\frac{\text{Total origin.}}{\text{lines} \times \text{traffic} \times .05\% (\text{traffic to operator})} \times \frac{\text{Total (50\%)}}{\text{in CCS}}$$

0 RELEASE 28.01  
0 93 12 03  
0

0 2. Incoming operator traffic can be obtained in the fol-  
0 lowing ways:

0 a) Approximate Method: 10% of toll completing traf-  
0 fic.

0 b) Calculation based on data from the Questionnaire  
0 (0-, 0+5, 7D). Use Table 33.6 to calculate per-  
0 cent of lines requiring loop around:

$$\left[ \begin{array}{l} \text{IFR} \quad \quad \times .15 \times \quad \text{toll} \\ \text{incoming} \quad \quad \quad \text{completing} \\ \quad \quad \quad + \text{MBS incoming} + \text{VFY} \end{array} \right] \times \text{incoming traffic (CCS)}$$

0 3. Calculation of loop around trunks:

0 a) Add line to TOPS (outgoing operator) and TOPS to  
0 line (incoming operator) traffic

0 b) Use Table V, Trunk Capacity (Poisson Theory)  
0 (Chapter 2) with grade of service 0.005 (P0.005).

0 ( iii) For further information on the loop around trunks, refer  
0 to Peripheral Modules - Host, Line Equipment, Section 3.5  
0 of this NTP.

0  
0 RELEASE 28.01  
0 93 12 03

0 1.1.2 Loop Around Test Line

0 a) General Description

0 The Loop Around Test Line circuit card enables the measurement of  
0 near-to-far trunk losses from class 4 or 5 offices in a DMS-100  
0 Family switching network. The loop around method of trunk trans-  
0 mission testing requires two trunks to be connected together  
0 (looped) at a distant office so that a measurement can be made at  
0 the originating office.

0 The circuit card occupies one card position in a Maintenance  
0 Trunk Module (MTM) and requires two trunk appearances.

0 b) References

0 None

0 c) Provisioning Considerations:

0 ( i) Versions of the card currently available are as follows:

0 NT2X75AA Loop Around Test Line Mu-Law  
0 NT2X75BA Loop Around Test Line A-Law

0 There is one loop around circuit (two trunk appearances)  
0 per card.

0 ( ii) The Loop Around Transmission Test Line Card is required  
0 for DMS-100, DMS-100/200 and DMS-200 offices. Two cir-  
0 cuits are recommended per office.

0 ( iii) The Loop Around Transmission source interface is the  
0 Transmission Test Trunk (TTT).

0

0 93 12 03

0 1.1.3 Transmission Test Trunks

0 (a) General Description

0 The TTT is a 104 test line and test sour consisting of a test  
0 signal generator and a level meter operating digitally samples.  
0 Used also for 100, 102, 103, Synchronous, Non-synchronous and  
0 Transmission Loop Around test line originations. Access is via  
0 the Network.

0 (b) References

0 NTP 297-1001-121 Automatic Trunk Testing Description  
0 NTP 297-1001-516 Trunks Maintenance Reference Manual  
0 NTP 297-2101-516 Line Maintenance Reference Manual

0 (c) Provisioning Considerations:

0 ( i) Each TTT circuit consists of a pair of cards as follows:

- 0 1. PCM Test Signal Generator, NT1X90AA/BA.
- 0 - Generate single freq test tones 0-3996
  - 0 Hz in 4 Hz increments
  - 0 - tone levels 0 to -12.5 dBm @  $\pm 0.1$  dB
  - 0 or +3 to -67.5 dBm @  $\pm 0.5$
  - 0 - filters for quiet termination, 1010 Hz
  - 0 notch and C-msg weighting.
  - 0 - NT1X90AA is for North American
  - 0 application.
  - 0 - NT1X90BA is for International (A-Law)
  - 0 applications.

- 0 2. PCM Level Meter, NT2X96AA/BA
- 0 - measure single frequency tones (zero-
  - 0 crossing detector)
  - 0 - level meter +6 to -88.8 dBm  $\pm 0.01$  dBm
  - 0 - freq meter 0 to 4 KHz @  $\pm 16$  Hz with
  - 0 resolution variable with centre freq
  - 0 - NT2X96AA is for North American
  - 0 applications.
  - 0 - NT2X96BA is for International (A-Law)
  - 0 Applications.

0 ( ii) Provisioned for DMS-100 and DMS-200 offices.

0 RELEASE 28.01  
0 93 12 03  
0

0  
0 ( iii) Provisioning is based on the requirement DMS Automatic  
0 Trunk Testing (ATT) which is normally scheduled for oper-  
0 ation during off-peak hours. ATT is an optional feature  
0 of DMS-100 and DMS-200 offices. TTT circuits provisioned  
0 per ATT requirements will also satisfy daily manual test  
0 and diagnostic requirements including standard test line  
0 functions. This provisioning will also satisfy the in-  
0 creased requirements of manual testing in a non-ATT of-  
0 fice.

0 ( iv) The following assumptions apply:

0 Automatic trunk testing will be scheduled to run daily  
0 for the entire office.

0 Assume that every active ATT process effectively ties up  
0 one TTT for the duration of its execution regardless of  
0 the test being performed.

0 TTT average holding time per test 20 seconds.

0 Test Interval is the number of continuous hours per day  
0 reserved for ATT testing. Six hours is recommended.

0 ( v) Number of TTT's to be provided is based on the number of  
0 outgoing trunks in the office.

0 # TTT = No. O/G Trunks \* Holding Time/Test  
0 -----  
0 3600 \* Test Interval

0 If the number of TTT is greater than 15, then testing  
0 must be split over two nights with half the trunks tested  
0 each night. In this case half the calculated TTT's are re-  
0 quired.

0 ( vi) Provide a minimum of 2 maximum 15 TTT's per office.

0 Note: Includes the O/G portion of 2 WY trunks.

0 RELEASE 28.01  
0 93 12 03

0 1.1.4 Transmission Test Unit (TTU)

0 a) General Description

0 The TTU is a programmable digital signal generator and processor  
0 which is capable of performing a variety of transmission measure-  
0 ments and related maintenance functions on line circuits and  
0 trunk circuits. It is utilized in diagnostic routines applied to  
0 Digitone and MF receivers. Access is via the switching network.

0 The NT2X47-- & NT2X56-- Circuit Pack, which mount on a Mainte-  
0 nance Trunk Module (MTM), form the Transmission Test Unit (TTU).  
0 The NT2X47 Circuit Pack interfaces to the Central Control (CC)  
0 which specifies the type of testing procedure required of the  
0 TTU. Once specified by the CC, the NT2X47 will control the gen-  
0 eration and reception of tones necessary for the test and pass  
0 them on to the Digital Filter CP (NT2X56). The NT2X56 will fil-  
0 ter, process and execute the instructions and generated tones re-  
0 ceived from the NT2X47.

0 b) References

0 NTP 297-1001-121 Automatic Trunk Testing Description  
0 NTP 297-1001-455 DMS-100 Office Parameters Reference Manual  
0 NTP 297-1001-516 Trunks Maintenance Reference Manual  
0 NTP 297-2101-516 Line Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) Each TTU circuit consists of a Control Signal Generator  
0 Card and a Digital Filter. The TTU mounts on a MTM.

0 Transmission Test Unit Control Signal Generator,  
0 NT2X47AA/AB/AC/BA:

- 0 - generates single frequency test tones 4 to
- 0 3996 Hz, in steps of 4 Hz
- 0 - tone levels -60 dBm to +3 dBm at  $\pm 0.25$  dB
- 0 - quiet termination

0 Transmission Test Unit Digital Filter, NT2X56AA/AB/BA:

- 0 - processes tone data in the frequency range
- 0 4 Hz to 4 KHz
- 0 - can process combinations of 10 filter

0 RELEASE 28.01  
0 93 12 03  
0

0 functions simultaneously.

0 ( ii) The following pair of interconnected cards can be provi-  
0 sioned together to form a TTU for the listed test proce-  
0 dure type.

| 0 | CP       | DF       | Test Proceedure Type         |
|---|----------|----------|------------------------------|
| 0 | NT2X47AA | NT2X56AA | ATME2 (Rated MD)             |
| 0 | NT2X47AB | NT2X56AA | ATME2 (DMS-300 Offices)      |
| 0 | NT2X47AC | NT2X56AB | ATME2 (104 Test Line) &      |
| 0 |          |          | ATMS (105 Test Line)         |
| 0 | NT2X47AD | NT2X56AB | ALT (Automatic Line Testing) |
| 0 |          |          | ATMS (105 Test Line)         |
| 0 | NT2X47BA | NT2X56BA | International (A-Law)        |
| 0 |          |          | ATMS.                        |
| 0 | NT2X47AB | NT2X56BA | International (A-Law)        |
| 0 |          |          | ATME2.                       |

0 1. The NT2X47AD and NT2X56AB cards can functionally re-  
0 place the existing NT2X47AA, NT2X56AA and the  
0 NT2X47AC,NT2X56AB TTU cards. All three pairs of  
0 these cards can exist together in the same office.  
0 However, NT2X47AA must be paired with NT2X56AA;  
0 NT2X47AC with NT2X56AB; and NT2X47AD with NT2X58AB.

0 2. The addition of Echo Return Loss (ERL) and Singing  
0 Return Loss (SRL) tests to the Automatic Transmission  
0 Measurement System (ATMS) (i.e. 105 Test line) has  
0 prompted the introduction of the Transmission Test  
0 Unit Control Processor (NT2X47AD). The ERL & SRL in-  
0 volve measuring the return loss of a bandlimited  
0 white noise signal over a trunk circuit.

0 The optional feature, ATMS, can be provided to exist-  
0 ing offices by only adding packs (NT2X47AD, NT2X56AB)  
0 sufficient for ATMS. Existing TTU packs (NT2X47AA,  
0 NT2X56AA and NT2X47AC, NT2X56AB) need not be  
0 retrofited in order to provide the ATMS feature.

0 3. Although the ATMS packs can be selected for regular  
0 TTU functions, this will only be allowed when  
0 non-ATMS TTU packs are not available.

0 4. The ATMS feature will be available in BCS 10 as an  
0 optional feature package. The only pre-requisite is

0 RELEASE 28.01  
0 93 12 03  
0

0 that the Common Basic feature package must also be  
0 provided.

0 5. All initial and extension offices will provision the  
0 NT2X47AD and NT2X56AB for TTU requirements.

0 6. The NT2X47AB and NT2X56AA cards are required for the  
0 Automatic Transmission Measuring and Signalling Test-  
0 ing Equipment (ATME) feature in a DMS-300 Gateway of-  
0 fice.

0 7. The NT2X47BA and NT2X56BA cards are required for the  
0 standard A-law TTU for International offices. The  
0 ATMS feature can be provided for this International  
0 TTU. NT2X47BA does not support the ATME2 test. In-  
0 stead, the Mu-law TTU for domestic offices, NT2X47AB,  
0 in combination with the NT2X56BA A-law Transmission  
0 Test Filter, is to be provided for this application.

0 ( iii) Provisioning of TTU's for Automatic Line Testing (ALT)

0 The ALT has two (2) versions of diagnostics. Short and  
0 extended. In order to check the Pulse Coded Modulation  
0 (PCM) path to and from the line cards, as well as the an-  
0 analog path of the Voice Frequency (VF) transformer the  
0 short diagnostic routine performs the following tests;

- 0 o Trans-hybrid loss test
- 0 o Attenuation 7DB pad test
- 0 o Noise (notch & weighted) test
- 0 o Ring Supervision (ring relay) test

0 It is suggested to provide the maximum of one (1) TTU per  
0 LTU (for both Host and Remote LTUs), or:

0 TTU for ALT Total No. of Lines X Holding Time/Test  
0 (short diag = -----  
0 test) 3600 X Test Interval

0 where,

0 Total No. of lines includes all Local, Remote and  
0 Subscriber Carrier lines to be tested by the short  
0 diagnostic routine.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 Holding Time/Test is seven (7) seconds for a short  
0 diagnostic test.

0 Test interval is in hours (6 hours are recommended).

0 The Extended diagnostic routine will check all of the  
0 line circuit for correct operation while performing the  
0 following tests.

0 o Trans-hybrid loss test  
0 o Attenuation 7DB pad test  
0 o Noise (notch & weighted) test  
0 o Ring Supervision (ring relay) test  
0 o Cutoff relay test  
0 o Battery feed resistor test  
0 o Loop detector test  
0 o Reversal relay test  
0 o Ground start relay test  
0 o Ground start detector test  
0 o Flux cancellation circuitry test  
0 o +48V relay test  
0 o Ring supervision (ring relay) test  
0 o Test access relay test  
0 o Subscriber loop test  
0 o Loop signalling at line card  
0 o Loop signalling at key set  
0 o LCM buffer full flag high test  
0 o LCM buffer full flag low test

0 The holding time to execute an extended diagnostic test  
0 is 25 seconds.

0 TTU for ALT Total No. of Lines X Holding Time/Test  
0 (extended = -----  
0 diag test) 3600 X Test Interval

0 where,

0 Total No. of lines includes all Local, Remote and  
0 Subscriber Carrier lines to be tested by the extended  
0 diagnostic routine.

0 Holding Time/Test is 25 seconds for a extended diag-  
0 nostic test.

0 RELEASE 28.01  
0 93 12 03  
0

0

0 Test interval is in hours.

0 If ALT has been activated then, at any point in time, several different test resources will be in operation. Manual testing of lines has precedence for the completion of system resources. Thus, ALT will be suspended for the duration of the manual test. On completion of the manual test the ALT will resume.

0 The ALT software feature is contained as part of package NTX054AA - Line Test Position (LTP). For U.S. offices, the LTP software is contained in all DMS-100 & DMS-100/200 Master Package Selections.

0 ( iv) Provisioning of TTU's for an Office Requiring Automatic Transmission Measurements System (ATMS) (i.e. 105 Test Line).

0 ATMS provides 2 way transmission loss and noise measurements on an outgoing or an outgoing portion of a 2 way trunk to the distant 105 terminating test line.

0 Total No. Forecast Outgoing Trunks  
0 ----- X Holding Time/Test  
0 TTU for 5  
0 ATMS (105 = -----  
0 test) 3600 X Test Interval

0 where,

0 Total No. of outgoing or outgoing portion of 2 way trunks. This quantity is divided by five (5) so that one fifth of the trunks will be tested per day.

0 Holding Time/Test is 20 seconds for an ATMS test.

0 Test interval is in hours.

0 ATMS will measure the following;

0 o Transmission loss  
0 o Noise  
0 o Echo return loss

0

0 Host - Maintenance Trunk Test Circuits  
0 Chapter 12

0  
0 RELEASE 28.01  
0 93 12 03

- 0 o Singing point return loss  
0 o High and low frequency loss

0 ATMS or 105 test line software is optionally available in  
0 the following packages;

0 NTX136AA - Automatic Transmission Measurement  
0 System  
0 NTX903AA - Transmission Measurements  
0 NTX052AB - Remote Office Test Line

0 ( v) For A DMS-200 office (toll only) without the ATMS fea-  
0 ture, provide one TTU. This is required only for MF re-  
0 ceiver diagnostics.

0 ( vi) Total quantity of TTU's to be provided for an office with  
0 or without the ALT feature and with the ATMS feature is  
0 equal to the quantity determined in item (iii) plus the  
0 quantity determined in item (iv).

0 1.1.5 102 Test Trunk (Milliwatt)

0 a) General Description

0 The 102 Test Trunk (Milliwatt) provides either a 1004 Hz milli-  
0 watt at 1004 Hz or a quiet termination for maintenance applica-  
0 tions in a DMS-100 and DMS-200 office.

0 b) References

0 NTP 297-1001-516 Trunks Maintenance Reference Manual

0 c) Provisioning Considerations:

0 ( i) The 102 Test Trunk (Milliwatt) cards available are:

|   |                                   |          |
|---|-----------------------------------|----------|
| 0 | 102 Test Trunk                    | NT1X00AA |
| 0 | 102 Test Trunk                    | NT1X00AB |
| 0 | International 102 Test Trunk      | NT1X00AE |
| 0 | 102 Terminating - 10 dB Test Line | NT1X00AF |
| 0 | 102 Terminating - 20 dB Test Line | NT1X00AG |
| 0 | 102 Terminating - 15 dB Test Line | NT1X00AH |
| 0 | 102 Test Trunk (China)            | NT1X00KA |

0 ( ii) Each card contains one test circuit which can be con-  
0 nected to either or both of two trunk appearances. The  
0 card occupies one card position in a Maintenance Trunk  
0 Module (MTM) which connects up to 30 trunk appearances to  
0 one Network port.

0 ( iii) The features of the 102 test trunk cards are:

0 1. Maintenance applications include:

0 - Common office milliwatt supply  
0 - General testing and calibration  
0 - Trunk and line tests  
0 - Test position requirements  
0 - Automatic testing

0 2. Stable milliwatt test tone level.  
0 No variation.

0 3. Connection of test circuit and application of  
0 tests under software control, via signal  
0 distributions (sd) from MTM.

0 1.1.6 Mechanized Loop Testing (MLT)

0 (a) General Description

0 Mechanized Loop Testing (MLT) refers to the interface of the  
0 Western Electric Mechanized Loop Testing System (MLT 1 or MLT 2)  
0 to a DMS-100F Switch. This interface is required so that the  
0 Western Electric MLT 1 or MLT 2 can gain metallic access and test  
0 subscriber lines working out of a DMS-100F. This interface and  
0 test trunk arrangements support all MLT 1 or MLT 2 tests. The  
0 tests run on the subscriber loops include measuring foreign AC  
0 and DC voltage, resistance, etc.

0 (b) References

0 Chapter 3, Section 3.5 Peripheral Modules

0 (c) Provisioning Considerations

0 ( i) The Western Electric Mechanized Loop Testing System (MLT  
0 1 or MLT 2) will interface to the DMS-100F Switch via a  
0 modified test trunk. A NT2X90AD test multiple will pro-  
0 vide all functions currently supported by previous vin-  
0 tages of the NT2X90 CP and will support the Subscriber  
0 Carrier module loop testing requirements. Subscriber Car-  
0 rier modules refer to the SMS, SMR, and SMU peripheral  
0 modules in a DMS office.

0 ( ii) For DMS offices containing line cards only, the test mul-  
0 tiple CP is the only requirement for mechanized line  
0 testing.

0 ( iii) For DMS offices containing Subscriber Carrier modules  
0 (with or without line cards), in addition to the test  
0 multiple CP, an applique circuit must also be provisioned  
0 to support line testing results to the Mechanized Loop  
0 Testing system (MLT). The applique will provide DC  
0 signals required to report channel test results to the  
0 MLT system.

0 ( iv) For applique requirements in a DMS office, the engineer  
0 should order the NT3J00BA applique shelf and the  
0 NT3J00BB applique circuit pack. The applique shelf will  
0 house ten (10) applique circuit packs. Offices containing  
0 SMS, SMR and SMU peripherals may share applique facili-  
0 ties. The applique CP is required for any interface test

0 RELEASE 28.01  
0 93 12 03  
0

0 multiple CP which utilizes Mechanized Loop Testing (MLT)  
0 on subscriber carrier modules SMU, SMS, and SMR.

0 ( v) An applique circuit pack contains two (2) circuits. Each  
0 circuit will interface one test multiple CP provisioned  
0 for line testing to the remote terminals for loop test-  
0 ing. An applique CP is required for each NT2X90AD test  
0 trunk connecting to a MLT.

0 ( vi) A Signal Distribution circuit, (NT2X57AA) is required for  
0 each applique circuit pack provisioned to operate relays  
0 on the CP.

0 ( vii) Access to the subscriber carriers is interfaced via the  
0 DMS metallic test access (MTA). One MTA vertical can ac-  
0 cess one subscriber carrier site. Each site can have a  
0 maximum of ten (10) SLC-96's or ten (10) DMS-1R's.

0 When using the NT2X46AB MTA configuration, if there are  
0 no more than ten (10) SLC-96's per site, one connector  
0 (C01-C10) should be cabled to the DF for every two sites.  
0 One connector can access two MTA verticals. This option  
0 shall only be used for offices having available connec-  
0 tors on existing MTA units.

0 The NT3X09BA MTA configuration shall be used on all ini-  
0 tials and offices adding MTAs. Refer to Section 3.5 Pe-  
0 ripheral Modules for more information.

0 (viii) The applique shelf is mounted in a standard MIS frame and  
0 is seven (7) inches high by twenty six (26) inches wide.  
0 The applique circuit pack is packaged on a double wide  
0 circuit pack. Cards are to be located in odd slots 03  
0 through 21. An NT3J00BC applique power supply is always  
0 provided in slot 01 of the shelf.

0 ( ix) The applique shelf should be fused at 1 1/3 amps with  
0 power terminations at TB1-1 (-48V) and TB1-2 (GRD) using  
0 22 AWG wire.

0 ( x) The applique shelf is cabled to the distributing frame ia  
0 four (4) NT0X26UE 50 pin connectorized cables. These ca-  
0 bles terminate on the following shelf connectors:

0 Connector J1 - cabling circuits 01-06, slots 03,05,07  
0 Connector J2 - cabling circuits 07-12, slots 09,11,13  
0 Connector J3 - cabling circuits 13-18, slots 15,17,19

0  
0 RELEASE 28.01  
0 93 12 03

0 Connector J4 - cabling circuits 19-20, slot 21

0 Leads for each individual circuit are T, R, TT, RR, SD1,  
0 SD2, SD3, SD4.

0 An 812A cable should also be provided from the NT3J00BA  
0 card cage to the DF for the alarm leads (NO,C).

0 ( xi) Provide one (1) Applique CP and one (1) Applique Power  
0 Supply CP as spares (recommended).

## 0 2.0 Integrated Bit Error Rate Test Facility

### 0 2.1 Introduction

0 The Integrated Bit Error Rate Test Facility or IBERT is an optional maintenance feature which can be ordered for testing the data loops in a DMS office (i.e. office with DATAPATH features).

0 IBERT is necessary to fulfill two distinct requirements: Datapath bit error rate testing, and Datapath Extension (DPX) maintenance messaging.

0 In conjunction with Datapath maintenance software, Datapath bit error rate testing will provide the DMS craftsperson with the ability to monitor and diagnose from the MAP, the data transmission quality of a selected Datapath line. Current methods of testing Datapath circuits and equipment requires the use of cumbersome external test sets, inaccessible from a MAP and outside the control of any automated DMS/SL-100 maintenance process.

0 A Bit Error Rate Test is a test used to measure the transmission quality of a loop. The basic idea of a BERT is to send a known stream of data over a given loop, and to have this data reflected back to the sender. The received data is then compared with the sent data thereby giving a measure of the transmission quality. By looping back data at different points in the loop and measuring the quality of transmission at each point, faults which may exist on the loop can be isolated.

0 With an external BERT, a piece of test equipment which is not a part of the DMS, regular methods are used to establish a connection between a line to be tested and the test equipment. However, an integrated BERT is a resident piece of equipment in the DMS which is accessed by means of a single command located at the LTPMAN level of the MAP. The benefits of this feature are a simpler method of testing Datapath loops as well as dropping the need for any external test equipment.

0 The IBERT will also be used as a 64 kbps inband signalling interface to the Datapath Extension System (DPX) based on the DE-4E channel bank, providing a maintenance messaging channel between the DMS/SL-100 central control and the DPX. This will give the MAP-situated craftsperson the ability to diagnose the DPX card and the associated Data Unit/Data Line Card (DU/DLC) facility with diagnostics similar to the existing Datapath maintenance or to test the error rate performance of the entire DS1/DPX/DLC/DU facility.

0  
0 RELEASE 28.01  
0 93 12 03

0 The IBERT can be used to test virtually any type of data line  
0 connected to the DMS which supports the TLINK protocol. This in-  
0 cludes Data Unit, AIM, Data Above Voice, coax eliminator Data  
0 Units and loop extended Data Units (those extended using the Line  
0 Interface Unit and Data Terminating Unit method).

0 Note that the intent of providing an integrated BERT is to en-  
0 hance the maintenance capabilities for Datapath. This is not  
0 meant to be used as a tool for networks or speech links within  
0 the DMS. No attempt is made by this feature to provide a BERT  
0 while a data unit is involved in a call with another data unit.  
0 For this type of testing, an external BERT must still be used.

## 0 2.3 Equipment Provisioning

### 0 2.3.1 Integrated Bit Error Rate Test Facility

#### 0 (a) General Description

0 The IBERT will perform the following functions:

- 0 - Transmit standard 511 or 2047-bit data test pattern at  
0 50 bps to 19.2 kbps asynchronous or 1.2 kbps to 64 kbps  
0 synchronous using T-link
- 0 - Transmit standard 511 or 2047-bit data test pattern at  
0 64 kbps without T-link handshaking
- 0 - Transmit standard 511 or 2047-bit data test pattern at  
0 56 kbps with a ones density suitable for T-carrier,  
0 without T-link handshaking
- 0 - Receive data in any of the above formats and detect bit  
0 errors and sync losses in the bit stream
- 0 - Count the number of error free seconds and total number  
0 of seconds in a test
- 0 - Derive data timing from the 64 kbps channel rate with  
0 the option to derive clocking from the received data  
0 stream if the far end uses external clocking (indicated  
0 in T-link handshake)
- 0 - When in T-link mode adapt the data transmission and re-  
0 ception rate to the far end equipment
- 0 - Allow the MAP user to do the following:
  - 0 - activate a loopback at the line card or set to be  
0 tested
  - 0 - start BERT as one of the following:
    - 0 1. 64 kbps (no T-link handshake)
    - 0 2. 56 kbps (no T-link handshake)
    - 0 3. T-link adaptive data rate

RELEASE 28.01  
93 12 03

Typical Datapath Bit Error Rate Test Setup

Figure 37.16

The loopbacks labelled A, B and C in the figure are respectively a 64 Kilo-bit loopback at the Data Line Card (DLC), a 64 Kilo-bit loopback at the Data Unit (DU) and a loopback at the RS-232C interface of the Data Unit. These loopbacks correspond respectively to the LOOPBK DLC, LOOPBK DU\_64K and LOOPBK DU commands at the LTPMAN level of the MAP.

As can be seen from the diagram, the 511 bit pattern is sent from the IBERT through the network, out to the line in question and is looped back from wherever the loopback is set (either A, B or C) through the network to the IBERT where it is compared with the pattern that was sent.

Optionally, no loopback may be set. This is referred to as a straight away test. In this case, an external BERT is

0 connected to the Data Unit being tested. An external BERT  
0 takes care of receiving the bit pattern sent by the IBERT  
0 and sending its own bit pattern back. This scenario is  
0 generally used for verifying the accuracy of the IBERT.  
0 The external BERT would be used in this case to inject er-  
0 rors into the pattern sent back to the IBERT so that it  
0 can be verified that in fact the IBERT detected the error  
0 and reported it. Note that in this case the external BERT  
0 used must conform to CCITT standards so that it will gen-  
0 erate the same 511 bit pattern used by the IBERT.

0 A list of Datapath products and the loopback points sup-  
0 ported by each is shown in Figure 37.17

| High Speed Data Unit | DLC cutoff relay            | DU TCM interface             | V35 interface              |
| Coax Eliminator      | DLC cutoff relay            | DU TCM interface             | Not Supported              |
| AIM/AILC             | AILC cutoff relay           | Not Supported                | RS422 firmware I/F         |
| DPX                  | DLC cutoff relay            | DU TCM interface             | DU RS232/V35 interface     |
| LIU/DTU              | DLC cutoff relay            | LIU TCM interface            | DTU RS232/V35 interface    |

Note: The LIU/DTU combination also supports several other loopbacks including loopbacks within the loop extension data facility. For more information see "Datapath Loop Extension Maintenance", by J. Henderson, FDOC BV1342, October 1985.

#### Datapath Products and Supported Loopback Locations

Figure 37.17

RELEASE 28.01  
93 12 03

A pictorial representation of a DPX Maintenance Messaging setup is shown in Figure 37.18.

Typical DPX Maintenance Messaging Setup

Figure 37.18

To perform maintenance diagnostics on the DPX/DLC/DU facility shown in Figure 37.18, the craftsperson would post the associated DU on the MAP and enter the diagnostic command. The maintenance software recognizing this as a DPX would automatically connect an available IBERT to the DPX. All maintenance messages are subsequently sent to the IBERT but addressed to the far end DPX, DLC, or DU and encoded in the W78 bulk data transfer format. The IBERT removes the messages from the bulk data transfer format and passes them on transparently to the DPX via the inband signalling protocol. All messages addressed to the DLC or the DU are passed on transparently by the DPX.

In this example the DLC/DU configuration illustrated could refer to a DLC/low speed DU, DLC/high speed DU, or DLC/coax eliminator.

0 (c) Provisioning Considerations

0 ( i) The hardware of the Integrated BERT (NT6X99AA) resides in  
0 the line drawer (NT6X05AA) of an LCM in a Host office, in  
0 an RSC site, or in an OPM site (or RLCM) taking the phys-  
0 ical space of a two slot line card. The two vertical  
0 slots in the LCM line drawer must be in the same logical  
0 line drawer subgroup (i.e., in the same line subgroup  
0 (LSG)).

0 ( ii) The IBERT must be located in a Line Concentrating Module  
0 (LCM) or Remote Line Concentrating Module (RLCM) which  
0 may or may not be the same LCM or RLCM as the one which  
0 the line it is testing resides. Even though the IBERT  
0 may be located on the same LCM as the line which it is  
0 testing, intraswitching for the connection is not used.  
0 This means that a connection between the IBERT and the  
0 line it is testing will be established through the DMS  
0 network. No connection between the IBERT and the line it  
0 is testing in the LCM, without going through the DMS net-  
0 work, can be established at the present time.

0 ( iii) Although the appearance of the IBERT is that of a line  
0 card, the IBERT is NOT a line card in the normal sense as  
0 there is no subscriber loop or set associated with it.  
0 The only interaction with an IBERT is achieved from a MAP  
0 through the DMS/IBERT messaging interface.

0 ( iv) While BER testing can be performed by either the NT6X99AA  
0 card, which mounts in an LCM, or by the NT4X23AA card,  
0 which mounts in an MTM, there is a software problem that  
0 prevents the NT4X23AA from successfully testing Datapath  
0 Extension trunks. Therefore, it is recommended that the  
0 NT6X99AA be used for DMS-100 and DMS-100/200 offices (lo-  
0 cal and local/toll applications) and the NT4X23AA be used  
0 for DMS-200 offices (toll applications).

0 ( v) A minimum of one (1) NT6X99AA per LCM or 24 per office  
0 (whichever is larger) should be provisioned for basic

0 RELEASE 28.01  
0 93 12 03

0 test capability in DMS-100 or DMS-100/200 offices. Higher  
0 quantities of test cards will provide faster office cov-  
0 erage.

0 ( vi) For datapath loop testing, due to a high volume of mes-  
0 saging traffic, it is recommended that one (1) IBERT  
0 line card (NT6X99AA) be provisioned per LCM equipped with  
0 a data line card.

0 ( vii) For switch bit error rate testing (in NTX881AC) it is re-  
0 commended that one (1) IBERT line card (NT6X99AA) be pro-  
0 visioned per LCM for every LCM in the office.

0 (viii) Up until BCS-24, the maximum number of IBERT line cards  
0 (NT6X99AA) and DTU BERT Unit (NT4X23AA) circuits (i.e., 2  
0 circuits per card) allowed in an office (Host plus all  
0 associated remotes) is 64.

0 As of BCS-25, the maximum number of NT6X99A cards and  
0 NT4X23AA circuits allowed in an office is 128.

0 For Canadian applications only, if the IBERT line card  
0 requirement exceeds the above software limitations (of 64  
0 and 128 respectively in an office), it is permissible to  
0 perform the associated tests by restructuring the associ-  
0 ated software data tables accordingly (i.e. perform the  
0 required test for the first group of 64 or 128 IBERT line  
0 cards, restructure applicable software data tables for  
0 the next group of 64 or 128 IBERT line cards, perform the  
0 required test, and so on).

( ix) The data rates supported by IBERT are the following:

| Data Rate<br>(bps) | Asynchronous | Synchronous |
|--------------------|--------------|-------------|
| 50                 | *            |             |
| 75                 | *            |             |
| 110                | *            |             |
| 134.5              | *            |             |
| 150                | *            |             |
| 300                | *            |             |
| 600                | *            |             |
| 1200               | *            | *           |
| 1800               | *            |             |
| 2000               | *            |             |
| 2400               | *            | *           |
| 3600               | *            |             |
| 4800               | *            | *           |
| 7200               | *            |             |
| 9600               | *            | *           |
| 19200              | *            | *           |
| 48000              |              | *           |
| 56000              |              | *           |
| 64000              |              | *           |

( x) The applicable software is in the following software packages:

NTX259AA DATAPATH Extension - DPX

\* NTX881AC Switch Bit Error Rate Maintenance  
(Upgrade of NTX881AB)

\* NTX885AB Switch Path Diagnostics (SPD)  
(Upgrade of NTX885AA)

\* NTXP13AA ENET Switch Path Diagnostics (SPD)

\* When ordering software package NTX881AC, it is recommended that NTX885AB/NTXP13AA be ordered as well.

When ordered by the Customer, the Switch Path Diagnostics (SPD) software package is to be furnished as NTX885AB for non-ENET SuperNode and NT-40 offices and furnished as NTXP13AA for ENET SuperNode offices.

0 RELEASE 28.01  
0 93 12 03  
0

0 If software package SPD exists in a DMS office prior to  
0 an ENET upgrade, then both NTX885AB and NTP13AA are to  
0 be provided in the retrofit software load to provide both  
0 Network Module (NM) and ENET coverage. NTX885AB is to be  
0 removed on the next BCS application following the up-  
0 grade.

0 The above rules are an example of unautomated rules which  
0 are stored in a document entitled "SW Package Ordering  
0 Rules - Not Automated" in the SMS Documentation Menu in  
0 CODA.

0 RELEASE 28.01  
0 93 12 03

0 2.3.3 Loop-Back Trunk Requirement

0 (a) General Description

0 Loop-back trunks are required in an office utilizing CCS7 Trunk  
0 Signalling to accommodate lines equipped with incompatible fea-  
0 tures in the CCS7 trunk.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 ( i) Provisioning calculations for loop-back trunks are as  
0 follows:

$$\frac{(A+B+C+D+E+F \text{ calls/hr}) \times \text{Avg Hold Time (sec)}}{100}$$

0 = CCS Loop-Back

0 Where:

0 A = HDBH calls utilizing CCS7 trunks that  
0 originate from and terminate on POTS  
0 and/or MDC lines equipped with Basic Three  
0 Way Call.

0 B = HDBH calls utilizing CCS7 trunks that  
0 originate on POTS lines with AIOD.

0 C = HDBH calls utilizing CCS7 trunks that  
0 terminate on POTS and/or MDC lines with  
0 FNT.

0 D = HDBH calls utilizing CCS7 trunks that  
0 originate from coin lines with LCO  
0 feature.

0 E = HDBH calls utilizing CCS7 trunks that  
0 terminate on MDC lines via DISA.

0 F = HDBH calls utilizing CCS7 trunks that  
0 terminate on ESAL lines.

0  
0 RELEASE 28.01  
0 93 12 03

0 Refer to traffic provisioning tables (Chapter 2) for  
0 trunk capacities to determine the required trunk quanti-  
0 ties for POTS/MDC loop-back trunks.

0 ( ii) Loop-Back Trunk Requirements (BCS-24)

0 The following MDC features are incompatible with CCS7  
0 trunks in BCS-24 and will require loop-back trunks be-  
0 tween the MDC line and the CCS7 trunk:

- 0 1) Basic 3-Way Calling (3WC)
- 0 2) Free Number Termination (FNT)
- 0 3) Direct Inward System Access (DISA)

0 ( iii) Loop-Back Trunk Requirements (BCS-25, BCS-26)

0 Loop-back trunking is required for the following condi-  
0 tions:

- 0 1) ISUP to DISA (trunk is released after digits are col-  
0 lected)
- 0 2) ISUP to LCO
- 0 3) ISUP to AIOD

0 ( iv) Loop-Back Trunk Requirements (BCS-27+)

0 Loop-back trunking is required for the following condi-  
0 tions:

- 0 1) ISUP to DISA (trunk is released after digits are col-  
0 lected)
- 0 2) ISUP to LCO

0 ( v) Loop-Back Trunk Requirements (BCS-31)

0 Loop-back trunking is required for the following condi-  
0 tions:

- 0 1) ISUP to DISA (trunk is released after digits are col-  
0 lected  
0 - only if there are no UTRs provisioned on the DTC  
0 terminating the ISUP trunk.

0 2.3.4 Console Features Requiring Loop-Back Trunks

0 (a) General Description

0 Loop-back trunks are required in an office utilizing a console  
0 feature that is not compatible with an Integrated Digital Ser-  
0 vices Network User Part (ISUP) trunk.

0 (b) Reference

0 None

0 (c) Provisioning Considerations:

0 ( i) Console Loop-Back Trunk Provisioning (BCS-24)

0 Loop-back trunks must be provisioned for all ISUP trunks  
0 which require access to the console. These can be di-  
0 vided into four categories:

- 0 1) ISUP trunk to console requiring call  
0 extension
- 0 2) ISUP trunk to console not requiring call  
0 extension
- 0 3) Console extended to an ISUP trunk
- 0 4) Console originated to an ISUP trunk

0 The call rate for console calls can be calculated based  
0 on the number of Attendant Consoles (AC) in the office,  
0 the average length of all console queues in the office  
0 (QL) and the average time required for a console to proc-  
0 ess a call (T), by using the following formulas:

$$\begin{array}{l} 0 \qquad \qquad \qquad \#AC + QL \\ 0 \text{ Terminating Call Rate} = \frac{\text{-----}}{T} \\ 0 \end{array}$$

$$\begin{array}{l} 0 \qquad \qquad \qquad \#AC \\ 0 \text{ Originating Call Rate} = \frac{\text{---}}{T} \\ 0 \end{array}$$

0 These call rates can be multiplied by the percentage of  
0 calls in each of the four categories to determine the  
0 call rate for each category.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 The holding times may be different for each of the four  
0 call types.

0 1) For ISUP trunk to console calls that do require ex-  
0 tending, the holding time is equivalent to the aver-  
0 age holding time of the call plus the average console  
0 call handling time (T).

0 2) For ISUP trunk to console calls that do not require  
0 extending, the holding time is equivalent to the av-  
0 erage console call handling time (T).

0 3) For console extending to an ISUP trunk, the holding  
0 time is equivalent to the average holding time of an  
0 ISUP trunk to console call that requires extension  
0 less the average console call handling time.

0 4) For console originating to an ISUP trunk, the holding  
0 time is equivalent to the average holding time of the  
0 call plus the average console call handling time (T).

0 The total console loop-back load required can be calcu-  
0 lated by adding the required load for each of the four  
0 categories. The loop-back load for each category can be  
0 calculated using the following:

0 Loop-Back Trunk Load = Call Rate X Holding Time  
0 per Category

0 Total Loop-Back Load = Category 1 + Category 2  
0 + Category 3 +  
0 Category 4

0 After the total console loop-back load is determined, the  
0 total number of trunks can be calculated using the  
0 Poisson Tables. The number of loop-back trunks should  
0 not exceed the number of ISUP trunks.

0 ( iii) Console Loop-Back Trunk Provisioning (BCS-25)

0 For BCS-25, all attendant calls and features require  
0 loop-back treatment only when the calls are being ex-  
0 tended. The loop-back trunk requirement is reduced be-  
0 cause the loop-back trunk is released after the call is  
0 extended.

0 ( iv) Console Loop-Back Trunk Provisioning (BCS-26 to BCS-31)

0  
0 RELEASE 28.01  
0 93 12 03

0 For BCS-26 to BCS-31, the loop-back requirement is re-  
0 duced. The Code Calling feature, the Conference Hold &  
0 Release feature, and the End-to-End Signaling feature is  
0 the only requirement for loop-back treatment.

0 ( v) Loop-Back Span Provisioning

0 No. Loop-Back T1 Spans =

0 #Console # POTS-MDC  
0 Loop-Back Trunks + Loop-Back Trunks  
0 ----- (Round Up)  
0 24

0 #Total T1 Spans Req'd = #Loop-Back T1 Spans X 2

0 3.0 Maintenance Trunk Module / Remote Service Module Prov.

0 The MTM and RSM are part of the DMS-100 Family line of products.

0 3.1 HARDWARE PROVISIONING

0

0 3.1.1 HARDWARE USAGE RESTRICTIONS

0  
0 This document introduces several MTM/DRA Common CP fills. In  
0 Canada, the shelves to which these fills are assigned have been  
0 superseded by shelves which support the TM Control CP, NT4X65AB.  
0 Refer to ECM430 for details regarding the latest MTM/DRA shelves  
0 and Common CP fills for new Canadian applications.

0 In the U.S. and International markets, the NT4X65AB TM Control CP  
0 is not used. The MTM/DRA Common CP fills in this ECM thus still  
0 apply to the U.S. and International markets.

0 The Remote Service Module (RSM) shelf and Common CP fill intro-  
0 duced by this ECM apply to both the Canadian and U.S. markets.

0 Change Kit to Provide NT0X70AC, must be provided to replace  
0 NT0X70AA with an NT0X70AC.

#### 0 2.4.2 Multi-Circuit Cards

0 The MTM backplane is designed to access up to 30 enable signals  
0 (circuits). Each provisionable MTM slot has access to these 30  
0 enable signals per the following chart.

| 0 | SLOT | ENABLE/CIRCUIT | ENABLE/CIRCUIT ACCESS | TOTAL ENABLES |
|---|------|----------------|-----------------------|---------------|
| 0 | 05   | 00             | 00-29                 | 30            |
| 0 | 06   | 02             | 02-29                 | 28            |
| 0 | 07   | 04             | 04-29                 | 26            |
| 0 | 08   | 06             | 06-13                 | 8             |
| 0 | 09   | 08             | 08-15                 | 8             |
| 0 | 10   | 10             | 10-17                 | 8             |
| 0 | 11   | 12             | 12-19                 | 8             |
| 0 | 12   | 14             | 14-21                 | 8             |
| 0 | 13   | 16             | 16-23                 | 8             |
| 0 | 14   | 18             | 18-25                 | 8             |
| 0 | 15   | 20             | 20-27                 | 8             |
| 0 | 16   | 22             | 22-29                 | 8             |

0 o The ENABLE/CIRCUIT column represents the initial circuit  
0 the slot has access to.

0 o The ENABLE/CIRCUIT ACCESS column represents the entire  
0 range of enable/circuits the slot has access to.

0 o The TOTAL ENABLES column represents the total number of  
0 enable/circuits the slot has access to.

0 The enable signals on the backplane are arranged to allow  
0 2-circuit cards to be placed in adjacent slots, 4-circuit cards  
0 to be placed in alternating slots, and 8-circuit cards to be  
0 placed in every fourth slot, etc. Circuit packs that use less  
0 than the available enables for that slot will access the lowest  
0 available enables.

0 Slots 05,06 and 07 are the only slots that have access to more  
0 than eight (8) enable signals. Therefore, cards such as the  
0 NT5X29 that utilize 16 circuits may only be assigned to slots  
0 05,06 or 07. If the NT5X29 is assigned to slot 05, the next  
0 available slot is 13. If the NT5X29 is assigned to slot 06, the  
0 next available slot is 14. The NT5X29 can not be provisioned to

0 RELEASE 28.01  
0 93 12 03

0 use less than 16 circuits when it is located in slots 05-07 be-  
0 cause it will always use the 16 enables if it has access to them.  
0 It is possible, however, to assign the NT5X29 to a card slot that  
0 accesses 8 enable signals allowing only 8 circuits on the NT5X29  
0 to be accessed. This would allow more of the MTM to be used for  
0 other cards. When an 8 slot 16 circuit card is located in slot  
0 05 then slots 13-16 are still available for other cards if enough  
0 enables are available. Remember that the MTM PM load should be  
0 verified prior to mixing NT5X29's with any other CP.

#### 0 2.4.3 RSM Shelves

0 Provide the following items per customer and office requirements  
0 (one RSM CP Fill is required for each RSM shelf ordered):

0 NT2X58CF Remote Service Module.....replaces the NT2X58AE  
0 NT2X58CM RSM Common CP.....replaces the NT2X58CE

0 Provisioning rules remain the same. Refer to the attached Engi-  
0 neering Manual sections for details.

0 The NT2X70AE CP shall be the standard Power Converter for all new  
0 RSM shelves. Per Telco request, existing RSM shelves can be up-  
0 graded to the NT2X70AE CP via the NT2X70AZ Power Converter Kit.

0 4.0 Integrated Bit Error Rate Test Facility (IBERT)

0 1. Introduction

0 1.1 The Integrated Bit Error Ratio Test Facility or IBERT is an op-  
0 tional maintenance feature which can be ordered for testing the  
0 data loops in a DMS office (i.e. office with DATAPATH features).

0 1.2 IBERT is necessary to fulfill two distinct requirements:

0 1) Datapath Bit Error Rate Testing

0 2) and Datapath Extension (DPX) Maintenance Messaging.

0 1.3 Datapath Bit Error Rate Testing

0 1) In conjunction with Datapath maintenance software, it will  
0 provide the DMS craftsperson with the ability to monitor and  
0 diagnose from the MAP, the data transmission quality of a se-  
0 lected Datapath line. Current methods of testing Datapath  
0 circuits and equipment requires the use of cumbersome ex-  
0 ternal test sets, inaccessible from a MAP and outside the  
0 control of any automated DMS/SL-100 maintenance process.

0

0

0

0

0

0 RELEASE 28.01  
0 93 12 03  
0

0 2) A Bit Error Rate Test is a test used to measure the trans-  
0 mission quality of a loop. The basic idea of a BERT is to  
0 send a known stream of data over a given loop, and to have  
0 this data reflected back to the sender. The received data is  
0 then compared with the sent data thereby giving a measure of  
0 the transmission quality. By looping back data at different  
0 points in the loop and measuring the quality of transmission  
0 at each point, faults which may exist on the loop can be iso-  
0 lated.

0 3) At present, the only capabilities provided are for an ex-  
0 ternal BERT. An external BERT is a piece of test equipment  
0 which is not a part of the DMS. Regular methods are used to  
0 establish a connection between a line to be tested and this  
0 external piece of test equipment. An integrated BERT, i.e.  
0 resident piece of equipment in the DMS, has been developed.  
0 The purpose of this feature will be to provide access to this  
0 integrated BERT by means of a single command located at the  
0 LTPMAN level of the MAP. The benefit of this will be a sim-  
0 pler method of testing Datapath loops as well as dropping the  
0 need for any external test equipment.

#### 0 1.4 Datapath Extension (DPX) Maintenance Messaging

0 1) The IBERT will also be used as a 64 kbps inband signalling  
0 interface to the Datapath Extension System (DPX) based on the  
0 DE-4E channel bank, providing a maintenance messaging channel  
0 between the DMS/SL-100 central control and the DPX. This will  
0 give the MAP-situated craftsperson the ability to diagnose  
0 the DPX card and the associated Data Unit/Data Line Card  
0 (DU/DLC) facility with diagnostics similar to the existing  
0 Datapath maintenance or to test the error rate performance of  
0 the entire DS1/DPX/DLC/DU facility.

0 1.5 The IBERT can be used to test virtually any type of data line  
0 connected to the DMS which supports the TLINK protocol. This in-  
0 cludes Data Unit, AIM, Data Above Voice, coax eliminator Data  
0 Units and loop extended Data Units (those extended using the Line  
0 Interface Unit and Data Terminating Unit method).

0 1.6 Note that the intent of providing an integrated BERT is to en-  
0 hance the maintenance capabilities for datapath. This is not  
0 meant to be used as a tool for networks or speech links within  
0 the DMS. No attempt is made by this feature to provide a BERT  
0 while a data unit is involved in a call with another data unit.  
0 For this type of testing, an external BERT must still be used.

0 RELEASE 28.01  
0 93 12 03

0 2. Product Features

0 2.1 The IBERT will perform the following functions:

- 0 1) transmit standard 511 or 2047-bit data test pattern at 50 bps  
0 to 19.2 kbps asynchronous or 1.2 kbps to 64 kbps synchronous  
0 using T-link
- 0 2) transmit standard 511 or 2047-bit data test pattern at 64  
0 kbps without T-link handshaking
- 0 3) transmit standard 511 or 2047-bit data test pattern at 56  
0 kbps with a ones density suitable for T-carrier, without T-  
0 link handshaking
- 0 4) receive data in any of the above formats and detect bit er-  
0 rors and sync losses in the bit stream
- 0 5) count the number of error free seconds and total number of  
0 seconds in a test
- 0 6) derive data timing from the 64 kbps channel rate with the op-  
0 tion to derive clocking from the received data stream if the  
0 far end uses external clocking (indicated in T-link hand-  
0 shake)
- 0 7) when in T-link mode adapt the data transmission and reception  
0 rate to the far end equipment
- 0 8) allow the MAP user to do the following:
  - 0 - activate a loopback at the line card or set to be tested
  - 0 - start BERT as one of the following:
    - 0 1. 64 kbps (no T-link handshake)
    - 0 2. 56 kbps (no T-link handshake)
    - 0 3. T-link adaptive data rate
    - 0 4. default to (1),(2), or (3) according to type of  
0 loopback selected
  - 0 - inject error(s) in the transmitted data pattern
  - 0 - stop BERT
  - 0 - display test results (bit error count, sync loss count,  
0 total number of bits, etc.)

0 3. Product Description

0 3.1 Datapath Bit Error Rate Testing

0 3.1.1 A pictorial representation of an Integrated BERT is as follows:

0 Typical Datapath Bit Error Rate Test Setup

0 Figure 1

0  
0 RELEASE 28.01  
0 93 12 03

0 3.1.2 The loopbacks labelled A, B and C are respectively a 64 Kilo-bit loopback at the Data Line Card (DLC), a 64 Kilo-bit loopback at the Data Unit (DU) and a loopback at the RS-232C interface of the Data Unit. These loopbacks correspond respectively to the LOOPBK DLC, LOOPBK DU\_64K and LOOPBK DU commands at the LTPMAN level of the MAP.

0 3.1.3 As can be seen from the diagram, the 511 bit pattern is sent from the IBERT through the network, out to the line in question and is looped back from wherever the loopback is set (either A, B or C) through the network to the IBERT where it is compared with the pattern that was sent.

0 3.1.4 Optionally, no loopback may be set. This is referred to as a straight away test. In this case, an external BERT is connected to the Data Unit being tested. An external BERT takes care of receiving the bit pattern sent by the IBERT and sending its own bit pattern back. This scenario is generally used for verifying the accuracy of the IBERT. The external BERT would be used in this case to inject errors into the pattern sent back to the IBERT so that it can be verified that in fact the IBERT detected the error and reported it. Note that in this case the external BERT used must conform to CCITT standards so that it will generate the same 511 bit pattern used by the IBERT.

RELEASE 28.01  
93 12 03

3.1.5 A list of Datapath products and the loopback points supported by each is shown as follows:

| Datapath Product     | Loopback A:<br>DLC Loopback | Loopback B:<br>64kb Loopback | Loopback C:<br>DU Loopback |
|----------------------|-----------------------------|------------------------------|----------------------------|
| Low Speed Data Unit  | DLC cutoff relay            | DU TCM interface             | RS232 interface            |
| High Speed Data Unit | DLC cutoff relay            | DU TCM interface             | V35 interface              |
| Coax Eliminator      | DLC cutoff relay            | DU TCM interface             | Not Supported              |
| AIM/AILC             | AILC cutoff relay           | Not Supported                | RS422 firmware I/F         |
| DPX                  | DLC cutoff relay            | DU TCM interface             | DU RS232/V35 interface     |
| LIU/DTU              | DLC cutoff relay            | LIU TCM interface            | DTU RS232/V35 interface    |

Note: The LIU/DTU combination also supports several other loopbacks including loopbacks within the loop extension data facility. For more information see "Datapath Loop Extension Maintenance", by J. Henderson, FDOC BV1342, October 1985.

## 0 3.2 Datapath Extension (DPX) Maintenance Messaging

0 3.2.1 A pictorial representation of a DPX Maintenance Messaging setup  
0 is as follows:

0 Typical DPX Maintenance Messaging Setup

0 Figure 3

0 3.2.2 To perform maintenance diagnostics on the DPX/DLC/DU facility  
0 shown above, the craftsperson would post the associated DU on  
0 the MAP and enter the diagnostic command. The maintenance  
0 software recognizing this as a DPX would automatically connect  
0 an available IBERT to the DPX. All maintenance messages are  
0 subsequently sent to the IBERT but addressed to the far end  
0 DPX, DLC, or DU and encoded in the W78 bulk data transfer for-  
0 mat. The IBERT removes the messages from the bulk data trans-  
0 fer format and passes them on transparently to the DPX via the  
0 inband signalling protocol. All messages addressed to the DLC  
0 or the DU are passed on transparently by the DPX.

0 3.2.3 In this example the DLC/DU configuration illustrated could re-  
0 fer to a DLC/low speed DU, DLC/high speed DU, or DLC/coax elim-  
0 inator.

0 4.1.3 PROVISIONING CONSIDERATIONS

0  
0 1.1 The hardware of the Integrated BERT (NT6X99AA) resides in the  
0 line drawer (NT6X05AA) of an LCM in a Host office, in an RSC  
0 site, or in an OPM site (or RLCM) taking the physical space of a  
0 two slot line card. The two vertical slots in the LCM line  
0 drawer must be in the same logical line drawer subgroup (i.e., in  
0 the same line subgroup (LSG)).

0 1.2 The IBERT must be located in a Line Concentrating Module (LCM) or  
0 Remote Line Concentrating Module (RLCM) which may or may not be  
0 the same LCM or RLCM as the one which the line it is testing re-  
0 sides. Even though the IBERT may be located on the same LCM as  
0 the line which it is testing, intraswitching for the connection  
0 is not used. This means that a connection between the IBERT and  
0 the line it is testing will be established through the DMS net-  
0 work. No connection between the IBERT and the line it is testing  
0 in the LCM, without going through the DMS network, can be estab-  
0 lished at the present time.

0 1.3 Although the appearance of the IBERT is that of a line card, the  
0 IBERT is NOT a line card in the normal sense as there is no sub-  
0 scriber loop or set associated with it. The only interaction  
0 with an IBERT is achieved from a MAP through the DMS/IBERT mes-  
0 saging interface.

0 RELEASE 28.01  
0 93 12 03

0 1.4 While BER testing can be performed by either the NT6X99AA card,  
0 which mounts in an LCM, or by the NT4X23AA card, which mounts in  
0 an MTM, there is a software problem that prevents the NT4X23AA  
0 from successfully testing Datapath Extension trunks. Therefore,  
0 it is recommended that the NT6X99AA be used for DMS-100 and  
0 DMS-100/200 offices (local and local/toll applications) and the  
0 NT4X23AA be used for DMS-200 offices (toll applications).

0 1.5 A minimum of one (1) NT6X99AA per LCM or 24 per office (whichever  
0 is larger) should be provisioned for basic test capability in  
0 DMS-100 or DMS-100/200 offices. Higher quantities of test cards  
0 will provide faster office coverage.

0 1.6 For datapath loop testing, due to a high volume of messaging  
0 traffic, it is recommended that one (1) IBERT line card  
0 (NT6X99AA) be provisioned per LCM equipped with a data line card.

0 1.7 For switch bit error rate testing (in NTX881AC) it is recommended  
0 that one (1) IBERT line card (NT6X99AA) be provisioned per LCM  
0 for every LCM in the office.

0 1.8.1 Up until BCS-24 the maximum number of IBERT line cards  
0 (NT6X99AA) and DTU BERT Unit circuits (NT4X23AA) (i.e. 2 cir-  
0 cuits per card) allowed in an office (Host plus all associated  
0 remotes) is 64.

0 For more information on DTU BERT Unit card (NT4X23AA), see  
0 ECM-352 on subject Digital Test Unit BERT Unit CP, NT4X23AA.

0 1.8.2 As of BCS-25, the maximum number of NT6X99AA cards and NT4X23AA  
0 circuits allowed in an office is 128.

0 1.8.3 For Canadian Applications Only

0 If the IBERT line card requirement exceeds the above software  
0 limitations of 64 and 128 respectively in an office, it is per-  
0 missible to perform the associated tests by restructuring the  
0 associated software data tables accordingly (i.e. perform the  
0 required test for the first group of 64 or 128 IBERT line  
0 cards, restructure applicable software data tables for the next  
0 group of 64 or 128 IBERT line cards, perform the required test,  
0 and so on).

0 1.9 The data rates supported by IBERT are the following:

|           |                                                     |           |  |
|-----------|-----------------------------------------------------|-----------|--|
| 0         |                                                     |           |  |
| 0         | <table><tr><td>Data Rate</td><td></td></tr></table> | Data Rate |  |
| Data Rate |                                                     |           |  |

| (bps) | Asynchronous | Synchronous |
|-------|--------------|-------------|
| 50    | *            |             |
| 75    | *            |             |

0 4.3 SOFTWARE PROVISIONING

0 4.3.1 REQUIRED SOFTWARE PACKAGES AND INTERDEPENDENCIES

0  
0 1. The applicable software is in the following software packages:

0 NTX259AA DATAPATH Extension - DPX

0 \* NTX881AC Switch Bit Error Rate Maintenance  
0 (Upgrade of NTX881AB)

0 \* NTX885AB Switch Path Diagnostics (SPD)  
0 (Upgrade of NTX885AA)

0 \* NTPX13AA ENET Switch Path Diagnostics (SPD)

0 \* When ordering software package NTX881AC, it is recommended that  
0 NTX885AB/NTPX13AA be ordered as well.

0 When ordered by the Customer, the Switch Path Diagnostics (SPD)  
0 software package is to be furnished as NTX885AB for non-ENET  
0 SuperNode and NT-40 offices and furnished as NTPX13AA for ENET  
0 SuperNode offices.

0 If software package SPD exists in a DMS office prior to an ENET  
0 upgrade, then both NTX885AB and NTPX13AA are to be provided in  
0 the retrofit software load to provide both Network Module (NM)  
0 and ENET coverage. NTX885AB is to be removed on the next BCS ap-  
0 plication following the upgrade.

0 The above rules are an example of unautomated rules which are  
0 stored in a document entitled "SW Package Ordering Rules - Not  
0 Automated" in the SMS Documentation Menu in CODA.

## 0 5.0 NT1X67 Baud Rate Summary

0 This Engineering Change Memo (ECM) is issued to clarify the baud rate  
0 capabilities of the various versions of the NT1X67 Input/Output con-  
0 troller pack.

0 5.1 HARDWARE PROVISIONING

0

0 5.1.1 HARDWARE USAGE RESTRICTIONS

0  
0 Not applicable.

0 5.1.2 HARDWARE DEPENDENCIES

0  
0 Not applicable.

0 5.1.3 PROVISIONING CONSIDERATIONS

0  
0 The following is a summary of the baud rate capabilities of the  
0 various versions of the NT1X67 I/O controller pack. Each pack,  
0 or group of packs with the same baud rate capability, will be  
0 discussed separately.

## BAUD RATE SUMMARY

-----

0 NT1X67AB and NT1X67CB (status of these cards is A&amp;M)

0 -----

0 These cards have four separate ports used for peripheral terminal  
0 devices such as VDUs, printers, modems, etc. These ports can support  
0 one device per port at variable baud rates using either the EIA or

0 RELEASE 28.01  
0 93 12 03

0 20mA current loop mode of operation. The current Northern Telecom  
0 specifications dictate that no single port on these cards will  
0 exceed 1200 baud. However, it is possible in special applications for  
0 these cards to support a baud rate of up to 4800 baud on a single  
0 port if the following conditions are met:

- 0 - The terminal must be able to support the higher baud rates.
- 0 - The sum of the baud rates for all ports on a single card  
0 must not exceed 4800 baud. ---

0 Refer to Figure 1 for examples of port configurations. Even though  
0 these capabilities exist, any configuration that specifies a single  
0 port supporting a baud rate greater than 1200 baud will be at the  
0 customer's discretion and/or risk. Northern Telecom will not  
0 guarantee data integrity. ---

0 As a separate issue, terminals used for the operator position must  
0 be configured for a maximum baud rate of 1200 baud due to potential  
0 communication problems that may be created during emergency  
0 situations if higher baud rates are used.

#### 0 NT1X67BC and NT1X67BD

0 -----

0 These cards succeed the previous cards and also have four sepa-  
0 rate ports for peripheral terminal devices. However, these cards  
0 have had firmware modifications that allow terminals to communi-  
0 cate at higher speeds on all ports. The current Northern Telecom  
0 specification for these cards dictates that no single port shall  
0 exceed 2400 baud. The modifications alter the processing speed of  
0 the card as a whole but do not change the maximum baud rate capa-  
0 bilities of a single port. The maximum baud rate that can be  
0 supported by a single port in a special application is 4800  
0 baud. When any single port on a card exceeds 2400 baud the follow-  
0 ing conditions must be met:

- 0 - The terminal must be able to support the higher baud rates.
- 0 - The sum of the baud rates for all ports on a single card  
0 must not exceed 4800 baud. ---

0 Refer to Figure 2 for examples of port configurations. Even though  
0 these capabilities exist, any configuration that specifies a sin-  
0 gle port supporting a baud rate greater than 2400 baud will be at  
0 the customer's discretion and/or risk. Northern Telecom will not  
0 guarantee data integrity. ---

0

0  
0 As an added issue, terminals used for operator positions should  
0 still be configured for 1200 baud.

0 The NT1X67BD card should be used in all Auto Dial Back applica-  
0 tions and for special Line Editing functions. The NT1X67BD card  
0 does not replace the NT1X67BC card as the standard I/O Terminal  
0 Controller.

0 NT1X67BB and NT1X67DB  
0 -----

0 The NT1X67BB and NT1X67DB are special cards designed for special  
0 applications. They are not functionally similar to the other  
0 NT1X67 cards and cannot be used as a substitute. Each card has a  
0 single port that will support a baud rate of up to 9600 baud and  
0 communicates using EIA only. These cards are not currently used  
0 for U.S. applications but were applied to early offices using the  
0 DNC-500. This application now uses the NT1X89AA Multiprotocol  
0 Converter. Refer to Figure 3.

0 NT1X67EA  
0 -----

0 The NT1X67EA is a single port, high speed, output-only, asynchronous  
0 terminal controller. This circuit pack is a single channel, high  
0 capacity 9600 baud version that was introduced to meet customer  
0 requirements for realtime tracking of call distribution reports.  
0 Currently for Richardson application only. Refer to Figure 4.

0 NT1X67FA  
0 -----

0 The NT1X67FA card is for Simplified Message Desk Interface (SMDI)  
0 applications only. It is not functionally similar to the other  
0 NT1X67 cards and cannot be used as a substitute. Each card has a  
0 single port that will support a baud rate of up to 1200 full du-  
0 plex. Refer to Figure 5.

RELEASE 28.01  
93 12 03

## Example A

|      |   |                      |
|------|---|----------------------|
| PORT | 0 | -- 1200 Baud maximum |
| PORT | 1 | -- 1200 Baud maximum |
| PORT | 2 | -- 1200 Baud maximum |
| PORT | 3 | -- 1200 Baud maximum |

## Example B

|      |   |              |
|------|---|--------------|
| PORT | 0 | -- 600 Baud  |
| PORT | 1 | -- 600 Baud  |
| PORT | 2 | -- 2400 Baud |
| PORT | 3 | -- 1200 Baud |

## Example C

|      |   |              |
|------|---|--------------|
| PORT | 0 | -- 300 Baud  |
| PORT | 1 | -- 600 Baud  |
| PORT | 2 | -- 1200 Baud |
| PORT | 3 | -- 2400 Baud |

## Example D

|      |   |                  |
|------|---|------------------|
| PORT | 0 | -- No Connection |
| PORT | 1 | -- 2400 Baud     |
| PORT | 2 | -- No Connection |
| PORT | 3 | -- 2400 Baud     |

## Example E

|      |   |                  |
|------|---|------------------|
| PORT | 0 | -- No Connection |
| PORT | 1 | -- No Connection |
| PORT | 2 | -- No Connection |
| PORT | 3 | -- 4800 Baud     |

Note 1: These are examples only and not set co

Note 2: Note that the sum of the baud rates for each card does not exceed 4800 baud.

Note 3: Example A illustrates the normal operating condition. All others are for special applications.

## 0 1.0 Office Alarms

0 1.1 Introduction

0 The DMS Office Alarms system is a collection of hardware devices  
0 and software modules which implement audible and visual indi-  
0 cations of trouble conditions detected within the DMS or its as-  
0 sociated equipment. These indications alert maintenance  
0 personnel and help them to locate and identify the trouble.

0 1.2 Features

0 Office alarms are managed from an alarm control panel which al-  
0 lows the maintenance personnel to control the alarm system.  
0 Alarms can be silenced, transferred to another location, or  
0 grouped from several floors in the building. Visual displays can  
0 be located at the Maintenance and Administration Position (MAP)  
0 and at the exit doors from each floor, in conjunction with audi-  
0 ble alarm panels.

0 1.3 Equipment Provisioning

0 1.3.1 General Considerations: Host and Remote Offices

0 Alarm hardware is required for a host office, with hardware  
0 choices dependent on office size and customer preference. Alarm  
0 hardware is optional for a remote office. Figures 37.2 through  
0 37.7 on the following pages show the choices for alarm configura-  
0 tions. Rules follow to explain options within the figures. Use  
0 the following decision tree to determine which figures apply to a  
0 particular office.

0 FIGURE 37.1 ALARM PROVISIONING DECISION TREE

0 The following figures depict alarm configurations. Refer to the rules  
0 following the figures for explanation of optional hardware within the  
0 figures.

0 Figure 37.2

0 Figure 37.6

0 Figure 37.6 depicts the alarm arrangement when two NT0X66AA panels are required. It must work with Figure 37.4.

0 Figure 37.7

0 Figure 37.7 depicts the alarm arrangement for a remote office. The second NT0X64AA panel is optional.

0  
0 RELEASE 28.01  
0 93 12 03

0 Refer to the following rules to determine how the optional hardware  
0 depicted in the figures should be ordered.

0 Rules

0 Req These circuits or panels are minimal requirements to  
0 make an alarm system operate.

0 Rule 1 The NT0X66AA Audible Alarm Panel is optional. They are  
0 orderable per customer requirement.

0 Rule 2 The NT0X63AB Alarm Display Panels are optional. They are  
0 orderable per customer requirement.

0 Rule 3 The NT0X61AB TTP Audible Alarm is optional and is  
0 orderable when TTPs are present in an office.

0 Rule 4 The NT0X64AA Exit Alarm Display is optional and may be  
0 ordered as required to allow exit alarm display at main  
0 exit doors on floors of a multi-floored office. A maxi-  
0 mum of four may be provisioned per office. This maximum  
0 may be extended to 14 with the use of an Audible and  
0 Visual Alarm Extension Unit, NT5X85AA.

0 For remote offices, a maximum of five NT0X64AA can be  
0 provisioned. The Alarm Extension Panel, NT5X92AB must  
0 be provided and mounted on an RSE/RME frame if at least  
0 one NT0X64AA is provided for a remote office.

0 Rule 5 The NT5X85AA Alarm Extension Circuit is optional and is  
0 to be ordered when from three to six NT0X66AA Audible  
0 Alarm Panels are required or (and) when five (four for  
0 OAS Version 1) to 14 NT0X64AA Exit Alarm Display Panels  
0 are required in an office. A maximum of one NT5X85AA  
0 circuit can be provisioned per office.

0 Rule 6 The NT5X86AA Alarm Cutoff Control Circuit is optional  
0 and is to be ordered when from two to six NT0X66AA Audi-  
0 ble Alarm Panels are required in an office.

0

0 RELEASE 28.01  
0 93 12 03  
0

0 Rule 7 The NT5X86AB Alarm Cutoff Keypunch should be ordered  
0 with the NT5X86AA circuit.

0 Rule 8 The NT0X63AC Alarm Control and Display Panel is optional  
0 for a remote office, but is the only alarm system choice  
0 at a remote site. This panel may also be used in a  
0 small host office, replacing the NT0X63AA panel.

0 Rule 9 The following cards may apply to a host or a remote of-  
0 fice, but will be assigned in the host office.

0 Two Dead System Alarm Circuits are required per office,  
0 one on the primary MTM and one on the secondary MTM.  
0 Either two NT3X82AA Dead System Alarm Circuit cards,  
0 used with the NT0X63AA panel, or two NT3X82AB Dead Sys-  
0 tem Alarm Circuit Common Audible cards, used with the  
0 NT0X63AC panel, are to be provided.

0 Either one NT3X83AA Alarm Transfer Circuit or one  
0 NT3X84AA Alarm Sending Circuit is required per office.  
0 The NT3X83AA circuit is used to transfer major/minor  
0 alarms to a remote office receiving circuit; the  
0 NT3X84AA circuit is used to send a dead system alarm  
0 tone to a distance operator position.

0 One NT3X85AA Alarm Grouping Circuit may be provided in  
0 offices that occupy multiple floors. This card should  
0 be located on a different MTM than the MTM used for the  
0 NT3X83AA or NT3X84AA card.

0 One NT0X10AA Miscellaneous Scan Card Circuit Pack and  
0 one NT2X57AA Signal Distribution Card are required to  
0 mount on the primary MTM for visual and audible alarm  
0 indication. Additional NT0X10AAs may be provisioned as  
0 required. The first NT0X10AA will handle the first six  
0 equipment rows. The second NT0X10AA will handle equip-  
0 ment rows 7-12. The third and fourth NT0X10AA will each  
0 handle 14 additional equipment rows.

0 Remote offices require one NT0X10AA for every 14 scan  
0 points required in the office and one NT2X57AA for every  
0 14 signal distributor points required in the office.

0 Rule 10 One NT0X63AB Alarm Display Panel can be supported

0 RELEASE 28.01  
0 93 12 03

0 1.3.2 Alarm Control and Display Panels

0 (a) General Description

0 The Alarm Control and Display Panel functions as the main alarm  
0 control and display center. It contains a set of lamps which  
0 display the type and class of alarms detected by the alarm sys-  
0 tem, and a set of switches to provide manual control of alarm  
0 system facilities. The Alarm Display Panel provides detailed  
0 alarm display at various co-located areas, but it has no control  
0 capabilities except Audible Alarm Reset. The Dead System alarm  
0 panels provide a hardware generated alarm to alert maintenance  
0 personnel when the DMS system software is not functioning.

0 (b) References

0 NTP 297-1001-122 DMS-100 Family Alarm  
0 System Description

0 (c) Provisioning Considerations

- 0 ( i) Normally provide one Alarm Control and Display Panel  
0 (NT0X63AA) per system and locate it near the MAP.
- 0 ( ii) Provide Alarm Control and Display Panel with Common Audi-  
0 ble (NT0X63AC) instead of NT0X63AA if the following con-  
0 ditions are met:
- 0 - office is small enough for audible tone to be
  - 0 heard from any location on the floor
  - 0 - unique audibles (different sounds for different
  - 0 alarm types) are not required
  - 0 - alarm grouping with other floors is not required
  - 0 - local data loop switching is not required
- 0 ( iii) Up to three Alarm Display Panels (NT0X63AB) may be provi-  
0 sioned for detailed alarm display when NT0X63AA is pro-  
0 vided.
- 0 ( iv) Normally provide two Dead System with Unique Audible  
0 Alarms (NT3X82AA).
- 0 ( v) Each NT3X82AA requires two slots in the MTM. Assign one  
0 card to each MTM.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 ( vi) Provide two Dead System with Common Audible Alarm  
0 (NT3X82AB) instead of NT3X82AA if the following condi-  
0 tions are met:

- 0 - unique audibles (different sounds for different
- 0 alarm types) are not required
- 0 - office local talk lines (two office telephone
- 0 lines which terminate at the MAP voice communi-
- 0 cation module) are not required
- 0 - office is not a toll or local/toll office and
- 0 therefore will not have a Trunk Test Centre (TTC)
- 0 chime.

0 ( vii) Each NT3X82AB requires one slot on the MTM. Provide two  
0 NT3X82AB per office. Assign one card to each MTM.

0 RELEASE 28.01  
0 93 12 03

0 1.3.3 Audible Alarm Panels

0 (a) General Description

0 The audible alarm panel provides an audible signalling device for  
0 indication of trouble conditions within the DMS office.

0 (b) References

0 NTP 297-1001-122 DMS-100 Family Alarm  
0 System Description

0 (c) Provisioning Considerations

0 ( i) The basic DMS alarm system supports a maximum of 2 Audi-  
0 ble Alarm Panels (NT0X66AA). The first unit is usually  
0 mounted at the MAP. The second unit is optional and is  
0 mounted where required.

0 ( ii) Selective alarm cutoff for up to six Audible Alarm Panels  
0 can be accomplished if desired by provisioning an Audible  
0 Alarm Cutoff Control Circuit (NT5X86AA) which mounts on  
0 the MIS frame, and an Audible Alarm Cutoff Key Panel  
0 (NT5X86AA) which can be located at the MAP (near the  
0 Alarm Control and Display Panel).

0 ( iii) The Trunk Test Centre (TTC) audible alarm panel  
0 (NT0X61AB) provides a TTC chime which signals an incoming  
0 call on a 101 Communication Test Line. Provide a minimum  
0 of one per toll or local/toll office. The DMS alarm sys-  
0 tem can support a maximum of 3 such panels.

0 ( iv) The Common Audible Alarm Panel (NT5X92AA) can be provided  
0 in a remote office when an audible alarm is required at a  
0 location different from the Alarm Control and Display  
0 Panel with Common Audible. A maximum of ten Common Audi-  
0 ble Alarm Panels can be supported per remote office. One  
0 Alarm Extension Panel is required whenever the Common Au-  
0 dible Alarm Panel is provided.

0 1.3.4 Alarm Extension Circuits

0 (a) General Description

0 The Audible and Visual Alarm Extension Circuit is an applique  
0 circuit which, when mounted on the miscellaneous frame, allows  
0 additional Alarm Control and Display Panels, Audible Alarm Panels  
0 and Exit Alarm Panels to be added to the alarm system.

0 The Alarm Extension Panel is used in remote offices to support  
0 the Common Audible Alarm Panel and Exit Alarm Panels and to allow  
0 additional Alarm Control and Display Panels to be provided.

0 (b) References

0 NTP 297-1001-122 DMS-100 Family Alarm  
0 System Description

0 (c) Provisioning Considerations

0 ( i) The Audible and Visual Alarm Extension Circuit (NT5X85AA)  
0 mounts on the Miscellaneous Equipment Frame (MIS).

0 ( ii) DMS Audible Alarm Panel support can be increased to a  
0 maximum of six by provisioning the Audible and Visual  
0 Alarm Extension Circuit.

0 ( iii) A Pylon RG-2 Ringing Generator, mounted on the MIS frame,  
0 or equivalent 20 Hz ringing generator must be provided  
0 with the Audible and Visual Alarm Extension Circuit when  
0 more than two Audible Alarm Panels are provided.

0 ( iv) Exit Alarm Panel support can be increased to a maximum of  
0 14 by provisioning the Audible and Visual Alarm Extension  
0 Circuit.

0 ( v) The Alarm Extension Panel (NT5X92AB) is used in remote  
0 offices. It mounts on the Remote Service Equipment  
0 (RSE)/Remote Miscellaneous Equipment (RME) frame.

0 ( vi) Provide the Alarm Extension Panel whenever more than one  
0 (maximum two) Alarm Control and Display Panels are re-  
0 quired.

0

0  
0 RELEASE 28.01  
0 93 12 03

0 ( vii) The Alarm Extension Panel is required whenever Common Au-  
0 dible Alarm Panels or Exit Alarm Panels are used in the  
0 remote office.

0 1.3.5 Exit Alarm Panels

0 (a) General Description

0 Exit Alarm Panels are located near the main exit door of each DMS  
0 floor in a multi-floored office. Lights on each panel are illu-  
0 minated corresponding to an alarm condition on a particular  
0 floor.

0 (b) References

0 NTP 297-1001-122 DMS-100 Family Alarm  
0 System Description

0 (c) Provisioning Considerations

0 ( i) The basic DMS alarm system supports 4 Exit Alarm Panels  
0 (NT0X64AA).

0 ( ii) The number of Exit Alarm Panels can be increased to a  
0 maximum of 14 by using the Audible and Visual Alarm Ex-  
0 tension Circuit.

0 RELEASE 28.01  
0 93 12 03

0 1.3.6 Alarm Grouping0 (a) General Description

0 The Alarm Grouping circuit provides the capability to group  
0 alarms originating in the DMS office with those originating on  
0 preceding (lower) and succeeding (upper) floors which have com-  
0 patible office alarm systems.

0 (b) References

0 NTP 297-1001-122 DMS-100 Family Alarm  
0 System Description

0 (c) Provisioning Considerations

0 ( i) Provide one OAU Alarm Grouping circuit pack (NT3X85AA)  
0 per system if grouping of alarms with succeeding and pre-  
0 ceding floors is to be provided.

0 93 12 03

0 1.3.7 Alarm Remoting

0 (a) General Description

0 The Remote Alarm Transfer circuit facilitates the transfer of  
0 major and minor alarm indications from the DMS office and power  
0 plant to a remote alarm receiving circuit in a distant office.  
0 This permits the local office to be unattended. Since the re-  
0 mote alarm receiving circuit monitors only two classes of  
0 alarms, major and minor, the DMS critical alarms are transferred  
0 to the remote location as majors. If alarm grouping is in  
0 effect, alarms originating on preceding and succeeding floors are  
0 also transferred to the remote location. Dead system alarms can  
0 also be transferred, with facility to dial up and check the se-  
0 verity of the alarm from a remote location.

0 (b) References

0 NTP 297-1001-122 DMS-100 Family Alarm  
0 System Description

0 (c) Provisioning Considerations

- 0 ( i) One OAU Remote Alarm Transfer circuit pack (NT3X83AA)  
0 should always be provided to enable transfer of alarms to  
0 a remote location.
- 0 ( ii) If, in addition to system software-generated alarms, Dead  
0 System alarms are to be transferred as well, provide one  
0 OAU Alarm Sending circuit pack (NT3X84AA) instead of the  
0 NT3X83AA.
- 0 ( iii) Two non-dedicated trunks should be allocated for OAU  
0 Alarm Sending, to enable sending and checking alarms via  
0 operator verification trunks.

0 RELEASE 28.01  
0 93 12 03

0 1.3.8 Alarm Scan and Signal Distribution Points

0 (a) General Description

0 Alarm and control inputs are generated by hardwired alarm con-  
0 tacts in the DMS hardware, by the operation of manual control  
0 switches, or by the alarm circuits of miscellaneous associated  
0 equipment. These are detected through Scan Points and interfaced  
0 to the alarm system software. The software responds to an alarm  
0 condition or a control actuation by operating or releasing the  
0 appropriate Signal Distribution Points. This initiates or termi-  
0 nates the corresponding audible and visual alarm or control func-  
0 tion.

0 (b) References

0 NTP 297-1001-122 DMS-100 Family Alarm  
0 System Description

0 (c) Provisioning Considerations

- 0 ( i) The operating company must provide data for assignment of  
0 alarm scan and signal distribution points detailing the  
0 number of points required, the type of alarm, and the de-  
0 sired severity treatment (critical, major or minor).
- 0 ( ii) For basic alarm system provide a minimum of one Signal  
0 Distributor (SD) Card Type I (NT2X57AA) per system and  
0 assign to a slot on MTM(1).
- 0 ( iii) A second NT2X57AA, providing 14 spare SD points, may be  
0 provided if required.
- 0 ( iv) For basic alarm system, provide a minimum of one Miscel-  
0 laneous Scan Detector Card (NT0X10AA) per system and as-  
0 sign to a slot on MTM (1).
- 0 ( v) Provide an additional NT0X10AA if a remote distribution  
0 bay (RDB) is to be provided and/or if any of equipment  
0 rows G, H, J through M are to be equipped.
- 0 ( vi) Provide another NT0X10AA if any of rows N, P through Z,  
0 AA, BB are to be equipped.
- 0 ( vii) Provide another NT0X10AA if at least one of the rows CC  
0 through HH, JJ through NN and PP through RR is to be  
0 equipped.

0  
0 RELEASE 28.01  
0 93 12 03

0 (viii) Additional scan points for alarms external to DMS may be  
0 assigned, preferably to the alarm MTMs. If space is not  
0 available, any MTM may be used but note that an MTM with-  
0 out a Dead System Card (NT3X82AA/AB) has no OAU shelf  
0 monitor.

0 ( ix) Note that DMS currently supports a total maximum of 1024  
0 scan points.

0 1.3.9 Inactive System Timing

0 (a) General Description

0 The Inactive System Timing circuit records the duration of dead  
0 system downtime should it occur.

0 (b) References

0 None

0 (c) Provisioning Considerations

0 ( i) If this feature is required, provide one Inactive System  
0 Timing Circuit (NT5X69AA) to be mounted on the Miscella-  
0 neous Equipment Frame.

0 1.3.10 RSC Alarms

0 The Remote Alarm Panel (NT0X63AC) may now be provided for a RSC  
0 Site.

0  
0 1.3.11 Remote Miscellaneous Equipment (RME) Frame (NT0X02AB)

0 The hardware which normally mounts on the RSE frame when used in  
0 conjunction with the old RLM equipment is also valid for use with  
0 the RSC except for the following:

0 1. Metallic Test Access (MTA), NT2X46AB.

0 For use with the RSC, this item has been replaced by the  
0 RMTA, NT3X09AA which mounts on the RMM on the RCE frame.

0 2. Remote Service Module (RSM), NT2X58AE.

0 For use with the RSC, this item has been replaced by the  
0 RMM which mounts on the RCE frame.

0 See Section 3.12, Remote Service Equipment (RSE) Frame  
0 Summary for hardware which can mount on the RME frame.

0  
0 1.3.12 Office Alarm System

0 (a) General Description

0 An Office Alarm System (OAS) is a Trunk Module Equipment (TME)  
0 frame equipped with an Alarm Cross Connect (AXU) shelf and two  
0 (2) Maintenance Trunk Modules (MTM) to provide alarming functions  
0 for the STP office.

0 (b) Reference

0 Chapter 3, Section 3.5 Peripheral Modules - Host

0 (c) Provisioning Considerations:

0 RELEASE 28.01  
0 93 12 03  
0

0 ( i) MTM 00 will act as the primary alarm MTM. MTM 01 will be  
0 designated as the secondary alarm MTM. The following  
0 should be provisioned to ensure that the primary and sec-  
0 ondary MTMs are powered from different power feeds:

0 One (1) NT0X82WB FSP Strapping Information  
0 One (1) A0324131 TB Jumper  
0 Two (2) NT0X95CL Cable Assemblies  
0 One (1) NT7X3406 Cable Assembly

0 ( ii) Equip the primary MTM as follows:

| QTY | PEC      | DESCRIPTION                                                                |
|-----|----------|----------------------------------------------------------------------------|
| 1   | NT3X82AB | OAU Dead System Alarm with<br>Common Audible                               |
|     | or       |                                                                            |
| 1   | NT3X83AA | Remote Alarm Transfer<br>(if remote alarm transfer<br>feature is required) |
| 1   | NT0X10AA | Miscellaneous Scan Point Card                                              |
| 1   | NT2X57AA | Signal Distribution Card                                                   |

0 Equip the secondary MTM with one (1) NT3X82-- OAU Dead  
0 System Alarm circuit pack (must be the same as on the  
0 primary MTM) per customer requirements.

0 In addition, provide one (1) NT0X63\_\_ Alarm Control &  
0 Display Panel (NT0X63AA or NT0X63AC) per customer re-  
0 quirements. The NT0X63AA is ordered when the OAS Dead  
0 System with Unique Audible NT3X82AA is equipped; NT0X63AC  
0 is ordered when the OAS Dead System with Common Audible  
0 NT3X82AB is equipped.

0 ( iii) Miscellaneous Service Circuits

0 Provide one (1) Transmission Test Trunk (TTT) consisting  
0 of one (1) PCM Test Signal Generator NT1X90AA and one (1)  
0 PCM Level Meter NT2X96AA. Equip these on an MTM shelf to  
0 allow in-service testing of the MTMs.
