Not applicable.

## Explanation Of Parameters

**FROM** - From  
**TO** - To

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |

| <b>1321-1352</b> | <b>1481-1512</b> | <b>1641-1672</b> | <b>1801-1832</b> |
| <b>1361-1392</b> | <b>1521-1552</b> | <b>1681-1712</b> | <b>1841-1872</b> |
| <b>1401-1432</b> | <b>1561-1592</b> | <b>1721-1752</b> | <b>1881-1912</b> |
| <br>Unit<br>13   | <br>Unit<br>14   | <br>Unit<br>15   | <br>Unit<br>16   |
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number for beginning of NPC range

**wxkqr** - Hierarchical TO NPC number for end of NPC range

The valid values are listed below:

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number

**jjj** - TO channel number

**eee** - FROM channel number denoting the end of a channel range.

**kkk** - TO channel number denoting the end of a channel range.

000-030 CEPT type NPCs grown as CAS

000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**INCL** - Inclusive

To disconnect a circuit or range of circuits including one or more circuits marked either RDC or CUS, use the optional INCL keyword. If this keyword is not used, the message will be denied if any circuits in the range are red circuits or customer controlled circuits.

**OOS** - Out-of-service

An Out-Of-Service disconnect may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnect will be denied.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**DCC** - Disconnect code

If DCC is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the <tc> field of the TCON command that initially connected the channels. If the DCC option is not used, the disconnect code specified in the GRTH NPC command will be used.

**RDC** - Red circuit

**CUS** - Customer

Customer-controlled circuit

Terminations cross-connected using the optional CUS keyword retain their CUS status when disconnected. If the terminations are reconnected without the CUS or INCL keyword, the command will be denied. When they are reconnected with the INCL keyword, they lose their customer controlled status.

**mmm, nnn**

- Channel number involved in denial. Otherwise the same as ddd.

**d** - Direction

| <i>d</i> | <i>Explanation</i> |
|----------|--------------------|
| F        | From               |
| T        | To                 |
| B        | Both               |

**st** - Status

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |

### Explanation Of Parameters

- [s]abc** - The 3- or 4-digit non-hierarchical non-channelized FROM NPC number  
**[t]ghi** - The 3- or 4-digit non-hierarchical non-channelized TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical number of non-channelized FROM NPC

**wxkqr** - Hierarchical number of non-channelized TO NPC

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The values are listed below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**INCL** - Inclusive  
Required for a customer-controlled circuit or a red circuit

**OOS** - Out-of-Service  
May be specified if one or both NPCs are out of service

**RDC** - Red circuit  
Disconnection of Red circuit

**RDLD** - Red lined

**CUS** - Customer  
Disconnection of Customer-controlled circuit

**PRIOUT** - Priority Output  
This keyword is used on the command line to prioritize the output response.

**st** - Status of denial

**d** - Direction {F-from | T-to | B-both}

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |
|-----------|--------------|-----------------------------------------------------------------------|
| <b>04</b> | <b>INERR</b> | No NPC's out of service and OOS keyword used                          |
| <b>12</b> | <b>MCOND</b> | Active CCN side not IS or failed or pested or hardware OOS            |
| <b>13</b> | <b>MCOND</b> | UNIT not equipped, not in service, or failed                          |
| <b>14</b> | <b>MCOND</b> | CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS |
| <b>15</b> | <b>MCOND</b> | FTMI not equipped, not in service, or failed                          |
| <b>16</b> | <b>MCOND</b> | FC not eqd, not IS, or failed or inactive side FC not eqd or not IS   |
| <b>17</b> | <b>MCOND</b> | TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS |
| <b>FF</b> | <b>ROLL</b>  | Termination is in process of being rolled                             |
| <b>E0</b> | <b>MCOND</b> | ETSI not equipped, not in service, or failed                          |

| <b>st</b>      | <b>d</b>       | <i>Explanation</i>                  |
|----------------|----------------|-------------------------------------|
| <b>CUS</b>     | <b>{F T B}</b> | Customer-controlled Circuit         |
| <b>FAIL</b>    | <b>{F T B}</b> | Failed                              |
| <b>INVLD</b>   | <b>{F T B}</b> | Invalid NPC type                    |
| <b>NOMTH</b>   | <b>{F T B}</b> | No Match                            |
| <b>NPCTA</b>   | <b>{F T B}</b> | NPC used for Test Access            |
| <b>OOS</b>     | <b>{F T B}</b> | Out-of-service                      |
| <b>RDC</b>     | <b>{F T B}</b> | Red Circuit                         |
| <b>UNPASGN</b> | <b>{F T B}</b> | Unassigned or Not Properly Assigned |
| <b>UEQD</b>    | <b>{F T B}</b> | Unequipped                          |
| <b>UTST</b>    | <b>{F T B}</b> | Under Test                          |

## **OVERLOAD,MP,CI,UNIT,UC,TN,PROCESSOR**

### **OVERLOAD**

#### **Explanation Of Command**

**This troubleshooting message is used only by the DACS II developers** and occurs when the indicated CPU processor has reported an internal error from which recovery is not possible. The error may be in the CPU hardware or related software. The resulting troubleshooting data can be useful in isolating software problems.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

## Explanation Of Parameters

---

**pa** - Priority of action field.

**pa**      *Explanation*

**I**      Information  
**\***      Minor alarm  
**\*\***      Major alarm  
**\*C**      Critical alarm

### OVERLOAD

- Overload

**DATA** - Data

**\*\*** - Major Alarm

**MP** - Main processor

**CI** - Communications interface

**UC** - Unit controller

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**MC** - Main controller

**TN** - Transaction

**dddd** - Transaction number

The TN number can be specified in UTL::QRY,ERR to retrieve the contents of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

The following interpretations are listed in alphabetical order by the capitalized names

**LOCAL** - Local

LOCAL STACK DATA interpretation

**dx**      *Explanation*

01      user stack pointer (A7)  
02-32      dump of stack data (in reverse order)

**MEMORY** - Memory

MEMORY DATA interpretation

**dx** *Explanation*

- 01 Address of bad memory segment
- 02 Number of attached memory segments
- 03 Memory size
- 04-08 Not used
- 09-32 Memory dump

This displays the memory attached to the process at the time of the OVERLOAD. If the memory address and memory dump section contain zeros, this indicates that there was no memory corruption. Otherwise, if corruption was detected, the address of the bad segment along with a memory dump of that segment will be displayed.

**PAUSE** - Pause

**QUEUE** - Queue

PAUSE QUEUE interpretation

**d01-d16**

- process name (ASCII)

This displays the processes that were in the pause queue at the time of the OVERLOAD.

## PROCESSOR

- Processor

### PROCESSOR DATA interpretation

This displays all relevant data about the processor at the time of the OVERLOAD. Note that pcb stands for process control block.

| <b>dx</b> | <i>Explanation</i>  |
|-----------|---------------------|
| 01        | process name        |
| 02        | stack pc            |
| 03        | pcb address         |
| 04        | pack id             |
| 05        | exception vector    |
| 06        | status register     |
| 07        | special status word |
| 08        | fault address       |
| 09        | usp                 |
| 10        | fp                  |
| 11        | A5                  |
| 12        | A4                  |
| 13        | A3                  |
| 14        | A2                  |
| 15        | A1                  |
| 16        | A0                  |
| 17        | D7                  |
| 18        | D6                  |
| 19        | D5                  |
| 20        | D4                  |
| 21        | D3                  |
| 22        | D2                  |
| 23        | D1                  |
| 24        | D0                  |
| 25        | pcb memory segs     |
| 26        | pcb ssp             |
| 27        | pcb pc              |
| 28        | pcb return addr     |
| 29        | pcb usp             |
| 30        | pcb events          |
| 31        | pcb tslice          |
| 32        | pcb sr              |
| 33        | pcb signals         |
| 34        | pcb prior           |
| 35        | pcb mode            |
| 36        | pcb dflag           |
| 37        | pcb status          |

**PROGRAM**

- Program

**TEXT** - Text

PROGRAM TEXT interpretation

**d01-d32**

- disassembled listing of program text (ASCII)

This displays the disassembled listing of the program text. The display contains up to 254 ASCII characters starting at the value of the program counter (pc) at the time the OVERLOAD occurred.

**READY** - Ready

READY QUEUE interpretation

**d01-d16**

- process name (ASCII)

This displays the processes that were in the ready-to-run queue at the time of the OVERLOAD.

**STACK** - Stack

**TRACE** - Trace

STACK TRACE interpretation

*dxx      Explanation*

01      previous stack 1 (A6)  
02      program counter  
03-08   stack dump

09      previous stack 2 (A6)  
10      program counter  
11-16   stack dump

17      previous stack 3 (A6)  
18      program counter  
19-24   stack dump

25      previous stack 4 (A6)  
26      program counter  
27-32   stack dump

This message dumps the previous four function calls prior to the function where the OVERLOAD occurred.

---

## **RESET — RMV**

---

### **RESET — RMV**

This section documents the commands **RESET** through **RMV**.

## **RESET,DATE,TOD,FORMAT,MDY,DMY**

### **ERROR RECOVERY**

#### **Explanation Of Command**

This autonomously generated message is used to inform the craft that the system clock has been recovered automatically by the frame. The field can either be date of the year, time of day, or both.

The date and time will default to 12/31/9999 and 00:00:00, respectively.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01393]

I hh:mm:ss xy,ww RESET {DATE|TOD|TOD DATE} hr:mn:sc \  
{mo/da/yr FORMAT MDY|da/mo/yr FORMAT DMY} COMPL

### **Explanation Of Parameters**

---

**RESET** - Reset

**TOD** - Time of day

**DATE** - Date

**mo/da/yr**

- date DACS II is reset to

**da/mo/yr**

- date DACS II is reset to

**yr** - 4- digit calendar year  
**mo** - month (01 through 12)  
**da** - day (01 through 31)

**hr:mn:sc**

- time DACS II is reset to

**hr** - hour (00 through 23)  
**mn** - minute (00 through 59)  
**sc** - second (00 through 59)

**FORMAT** - Date display format

**MDY** - Month/Day/Year format  
**DMY** - Day/Month/Year format

## **RESET, STOPPED**

### **STARTUP**

#### **Explanation Of Command**

This autonomous message indicates that the reset procedure has not successfully completed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01251]

**RESET STOPPED**

## **RMV,CCB**

### **REMOVE CROSS-CONNECT BUFFER**

#### **Explanation Of Command**

This command applies only to the noncapacity expansion frame (NCEF).

It requests the removal of the cross-connect buffer from service.

#### **Command**

|-----------|--------------------|
| I         | Information        |
| *         | Minor alarm        |
| **        | Major alarm        |
| *C        | Critical alarm     |

#endlist

il - Intervention level.

| il  | Explanation                  |
|-----|------------------------------|
| AMI | Immediate maintenance action |
| AMD | Deferred maintenance action  |
| SI  | No intervention              |

PMC Prompt Maintenance Action Critical  
PMA Prompt Maintenance Action Major  
DMA Deferred Maintenance Action Minor  
MI Maintenance Information

This command is applicable only to the capacity expansion frame (CEF).

It requests that the clock and control interface (CCI) in side s be removed from service.

When a CCI pack is removed from service, its two corresponding bus terminator (BT) packs are also removed.

### **Command**

**ETSI** - Expanded time slot interchangers

**ECCN** - Expanded cross-connect network

**s** - Side number (0 or 1)

**kk** - Total number of ETSlS equipped in side s (01 through 16).

**r** - Indication of the completion or denial of the removal for each individual ETSI pack.

*r*      *Explanation*

C      Completed

D      Denied

-      ETSI not equipped

**nn** - Hexadecimal condition code for the particular ETSI.

For r = C

*nn*      *Explanation*

00      No condition

For r = D

*nn*      *Explanation*

04      Subject entity is out of service

"nn" will be shown as "--" if "r" is "-".      **cc**      - Hexadecimal condition code

**cc**      *Explanation*

**02**      Subject entity is not equipped

**04**      Subject entity is out of service

**19**      Mate CCN side is out of service

**CE**      CCI is out of service

## **RMV, LINK**

### **REMOVE LINK**

#### **Explanation Of Command**

This message requests the removal of the administrative link from service.

**DMA** Deferred Maintenance Action Minor

**MI** Maintenance Information

**cc** - Hexadecimal condition code

**cc** *Explanation*

**04** Subject entity is out of service

## **RMV,NPC,SIDE,INCL**

### **REMOVE NPCs**

#### **Explanation Of Command**

This command removes a single Network Processing Circuit (NPC) or a range of NPCs within a unit from service.

The NPCs can belong to a Facility Terminating Unit, a DS3 Unit, a HDS3 Unit or a Digital Signal Processing Unit. For TH type NPCs, the NPC numbers which are divisible by four with a remainder of zero are not valid THxyz NPCs. However, the range of THxyz type NPC numbers is still supported with the understanding that there may be gaps in the NPC number range.

Digital Signal Processing Platform (DSPP) NPCs in Facility Terminating Units may also be removed by this command. Please note also that DSPP NPCs are always odd and the next higher even NPC number is not used.

A range of NPCs cannot be specified for Digital Signal Processing Unit NPCs in a DSPU. When a range of NPCs is being removed, execution of this command may be aborted by entering **ABT**.

The **INCL** keyword is required for removal of one or more cross-connected Network Processing Circuits with customer or red circuit marking.

**Note:** **INCL** is also required for subrate Network Processing Circuits with established channels (i.e., channels connected by the **SECH** command). The **INCL** keyword is required for removal of one or more cross-connected Network Processing Circuits with customer or red circuit marking.

**Note:** **INCL** is also required for C-bit processing DSPU packs with C-bit connected channels.

One message segment is output for each Network Processing Circuit requested and successfully removed.

For NPCs with a Digital Signal Processing Unit (DSPU), this command results in the removal of all NPCs in the circuit pack on only one of the duplicated sides.

When an NPC remove command addresses a range of NPCs, the removal of two or more consecutive NPCs in the range or even an entire Facility Terminating Module (FTM) of NPCs can be skipped, with a summary message, for the following conditions: A range command addressing NPCs within a Unit crosses an FTM boundary and the FTM is unequipped; Addressed NPCs are unequipped; Addressed NPCs are out-of-service; Addressed NPCs have other conditions not involving a failure condition determined by diagnostics.

Specifically:

- Remove commands where the address range crosses a Unit boundary shall be denied.
- For remove commands which address a range of NPCs, denials for sets of two or more NPCs shall be output in a summary command. The summary denial shall use a floating window denial:

#### **Floating Window Denial Message**

- When a remove command for a range of NPCs is denied for successive NPCs in the range for the same reason, a summary denial message shall be output, identifying the relevant range of NPCs and the reason. The generation of additional completion or denial responses for reasons other than diagnostic failure resumes at the next NPC and continues to the end of the range.

### Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number (beginning of the range).

**[t]def** - The 3- or 4-digit nonhierarchical NPC number (end of the range).

The allowable values are presented below:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

If NPC numbers are expressed in three digits, the valid values are:

SD type NPC numbers listed by unit number, within a **North American module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-039</b> | <b>161-199</b> | <b>321-359</b> | <b>481-519</b> | <b>641-679</b> | <b>801-839</b> |
| <b>041-079</b> | <b>201-239</b> | <b>361-399</b> | <b>521-559</b> | <b>681-719</b> | <b>841-879</b> |
| <b>081-119</b> | <b>241-279</b> | <b>401-439</b> | <b>561-599</b> | <b>721-759</b> | <b>881-919</b> |

**uvmnp** - Hierarchical NPC number (beginning of the range).

**uvkqr** - Hierarchical NPC number (end of the range).

**uv** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

The allowable values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

CB type NPC numbers listed by unit, module, and NPC Number  
Unit Type DP (DSPU)

| Unit         | Module     | NPC       |
|--------------|------------|-----------|
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**SIDE** - Side

**s** - Side of duplicated DSPU circuit to be removed (0 or 1)

**INCL** - Inclusive

This keyword is required for removal of one or more NPCs which have cross-connections marked as customer or red. It is also required for C-bit processing DSPU packs with C-bit connected channels. For CEPT circuit packs, there is only one NPC per circuit pack.

**pa** - Priority of action

**pa**      *Explanation*

**\*C**      Critical

**\*\***      Major

**\***      Minor

**A**      Autonomous

**il** - Intervention level.

*il*      *Explanation*

**AMI**      Immediate maintenance action

**AMD**      Deferred maintenance action

**SI**      No intervention

**PMC** - Prompt Maintenance Action Critical

**PMA** - Prompt Maintenance Action Major

**DMA** - Deferred Maintenance Action Minor

**MI** - Maintenance Information

**[s]ghi** - The 3- or 4-digit nonhierarchical number of a successfully removed NPC.

(**[s]abc** through **[t]def**)

**[s]jkl** - The 3- or 4-digit nonhierarchical number of an NPC whose removal is denied.

If used in a range, it denotes the first NPC of the range.

(**[s]abc** through **[t]def**)

**[t]mno** - The 3- or 4-digit nonhierarchical number of an NPC whose removal is denied.

It denotes the last NPC of a range. (**[s]abc** through **[t]def**)

**uvghi** - Hierarchical number of a successfully removed NPC.

(**uvmnp** through **uvkqr**)

**uvjkl** - Hierarchical number of an NPC whose removal is denied.

If used in a range, it denotes the first NPC of the range.

(**uvmnp** through **uvkqr**)

**uvmno** - Hierarchical number of an NPC whose removal is denied.

It denotes the last NPC of a range. (**uvmnp** through **uvkqr**)

**uv** - Unit number

**m, g, k, j**

- Module number

**np, qr, hi, kl, no**

- NPC number within the module

**TYPE** - Type

**mnxyz** - NPC-type identifier

**mn** Explanation

**SD** Digital Signal Processing Application Circuit Pack

**CB** C-bit processor (CPR) NPC

**PA** CEPT NPC (75- or 120-ohm)

**PB** CEPT NPC (120-ohm twisted pair)

**PC** CEPT NPC (75-ohm coaxial)

**SD-type xyz fields (Digital Signal Processing Platform (DSPP) Applications)**

**SD111** X.50/X.57 International substrate application

**SD311** Digital Multipoint Bridge application

**SD411** North American DDS Substrate and MJU application

**SDxyz** Possible future applications with specific values for xyz

**CB-type xyz fields**

- x** - Fixed at 1  
**y** - Fixed at 0  
**z** - Network timer value  
**z** *Value in milliseconds*  
**0** 600 to 750  
**1** 1500 to 1650  
**2** 2400 to 2550  
**3** 4650 to 4800

**PB- and PC-type xyz fields**

**Table 15-1. NPC Provisioning Options**

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                         |
|--------------|------------|--------------|------------------------------------------------------------------------|
| x            | a          | 0            | CRC multiframe in TS0                                                  |
|              |            | 1            | Non-CRC framing in TS0                                                 |
|              | b          | 0            | NPC is not used as a synchronization source                            |
|              |            | 1            | NPC is used as a synchronization source                                |
|              | c          | 0            | CCITT G.732 (hardware controlled) Consequent Actions, AIS in signaling |
|              |            | 1            | Firmware controlled Consequent <i>Actions</i> <sup>[c]</sup>           |
|              | d          | 0            | Non-signaling associated (NSA)                                         |
|              |            | 1            | 16-state channel associated signaling (CAS)                            |

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                                              |
|--------------|------------|--------------|---------------------------------------------------------------------------------------------|
| y            | e          | 0            | Telephone channel numbering                                                                 |
|              |            | 1            | Channel timeslot numbering                                                                  |
|              | f          | 0            | Convert the <i>abcd</i> bits of TS16 to 1111 if 0000                                        |
|              |            | 1            | Transmit the 0000 in the <i>abcd</i> bits transparently                                     |
|              | g          | 0            | AIS applied to received TS16 on detection of RAI, RAIS, or R16                              |
|              |            | 1            | AIS not applied to received TS16 on detection of RAI, RAIS, or R16                          |
|              | h          | 0            | NFW bit 5=Synchronization Failure Indication (SFI) unaffected by Synchronizer Holdover (SH) |
|              |            | 1            | NFW bit 5=SFI inverted on SH on output and detected on input                                |

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                                                                                         |
|--------------|------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| z            | jkl        | 000          | NFW bit 3=RAI set in < 2 ms,                                                                                                           |
|              |            | 001          | NFW bit 3=RAI set in time $T^{[c']}$                                                                                                   |
|              |            | 010          | NFW bit 4=RAIS in time $T^{[c']}$ and RAI in < 2 ms                                                                                    |
|              |            | 011          | Enable BER calculations, BER alarm level = DMA, NFW bit 4=RBER, RAI set in < 2 ms, for c=1 (SFDT=2496 ms, CACT=624 $ms^{[jkl]}$ ),     |
|              |            | 100          | NFW bit 4=RAIS and RAI in time $T^{[c']}$ (TRANSMIC 2G)                                                                                |
|              |            | 101          | Enable BER calculations, BER alarm level = DMA, NFW bit 4=disabled, RAI set in < 2 ms, for c=1 (SFDT=2496 ms, CACT=624 $ms^{[jkl]}$ ), |
|              |            | 110          | NFW bits 3-8,in time 144ms (TRANSMIC 1G)                                                                                               |
|              |            | 111          | Unassigned                                                                                                                             |
|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                          |
|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:
- in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the **jkl** options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when** *jkl=011* or *jkl=101*. **For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option *g* has meaning only if the NPC is provisioned for CAS; that is, option *d=1*, otherwise it is ignored. If option *g=0* is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option *g=1* is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and *h=1*, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option *h* was selected as either 0 or 1, unless it is later set to 0 by setting parameter *e=0* in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of *xyz* the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option *h=1*.

If both *b=1* and *h=1* and the NPC (used as synchronization source) receives

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

**[jkl'] minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

**c=0** hardware timing

**c=1** firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

The option bit "m" is unassigned. Its default value is "0".  
The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

## PA-Type xyz fields

The provisioning values of x, y, and z for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (x, y or z) provisioning value):

**Table 15-2. Provisioning values for  $x$**

| <b>x value</b> | <b>CRC-4 Mode</b> | <b>Automatic CRC-4</b> | <b>Far-End PM</b> | <b>NPC used as Sync Source</b> | <b>TS0 Bit 5 used for SFI</b> |
|----------------|-------------------|------------------------|-------------------|--------------------------------|-------------------------------|
| <b>0</b>       | Y                 |                        |                   |                                |                               |
| <b>1</b>       | Y                 |                        | Y                 |                                | Y                             |
| <b>2</b>       | Y                 |                        |                   |                                | Y                             |
| <b>3</b>       | Y                 |                        | Y                 |                                |                               |
| <b>4</b>       | Y                 |                        |                   | Y                              |                               |
| <b>5</b>       | Y                 |                        | Y                 | Y                              | Y                             |
| <b>6</b>       | Y                 |                        |                   | Y                              | Y                             |
| <b>7</b>       | Y                 |                        | Y                 | Y                              |                               |
| <b>8</b>       |                   | Y                      | Y                 |                                |                               |
| <b>9</b>       |                   | Y                      | Y                 |                                | Y                             |
| <b>A</b>       |                   |                        |                   |                                | Y                             |
| <b>B</b>       |                   |                        |                   |                                |                               |
| <b>C</b>       |                   | Y                      | Y                 | Y                              |                               |
| <b>D</b>       |                   | Y                      | Y                 | Y                              | Y                             |
| <b>E</b>       |                   |                        |                   | Y                              | Y                             |
| <b>F</b>       |                   |                        |                   | Y                              |                               |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 15-3. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 15-4. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8.  $z$  values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options ( $z = 6-7$  or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

**$z=6$  or A** hardware timing

**$z=7$  or B** firmware timing  
(SFDT=2496 ms,  
CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for  $z=6$  or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

### Specific Options for z= A or B

- [vii] RBER unalarmed
- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 15-5. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |

**3E** DSPI failed

**cc Explanation**

**5C** NPC providing timing to inservice SSP  
**9B** INCL must be specified for SRDC ckts  
**F2** Invalid NPC number specified  
**FD** NPC range crosses unit boundary  
**A0** The selected MXR associated with the NPC is  
Out-Of-Service  
**B7** The associated MXR is In-Service but pested

## **RMV,SMEM,PMEM**

### **REMOVE PMEM OR SMEM**

#### **Explanation Of Command**

This message removes the Primary Memory card (PMEM) or Secondary Memory card (SMEM) from service.

The SMEM card can be alarmed but the PMEM card cannot.

The PMEM card may only be removed when the main controller (MC) is in maintenance condition (MCOND). The SMEM card may be removed when the MC is in service (IS) or MCOND.

If either card fails autonomously, they are removed by software. However, if the PMEM fails autonomously, the MC will first go into MCOND.

If the SMEM is removed manually, it is removed by software also. Removing the SMEM card will not change the state of the MC. When the MC is IS, all writes to the card will be completed before the this command completes.

## **RMV,SYNC,TLI,SSP**

### **REMOVE SYNCHRONIZER'S TLI OR SSP**

#### **Explanation Of Command**

Input Command:

This command requests the removal from service of a synchronizer's timing link interface(TLI) if the TLI is grown as a distributor or the removal from service of a SSP if the TLI was grown as an extractor. If the timing link interface was configured as a timing extractor, synchronizer sync Port 0 or 1 must also be specified.

Autonomous Removal:

The same autonomous removal message will be used to indicate that either a TLI is being removed or that a SSP is being removed. If a SSP is identified in the output, the message is indicating that a SSP is being removed and the alarm level used will be that assigned to TREF in Alarm Severity. If the SSP is not identified in the output, the message is indicating that the TLI is being removed and the alarm level used will that assigned to TLI in Alarm Severity.

## **RMV,TSIS,CCN,ALL**

### **REMOVE**

#### **Explanation Of Command**

This command is applicable only to a noncapacity expansion frame (NCEF).

It requests the removal of all in-service time slot interchanges in the cross-connect network side.

This message will be denied if the cross-connect network side specified is the active side and any time slot interchange on the inactive side is out of service. The exception to this is if there are no cross-connected circuits in the system.

---

## **RMV,TSIS,CCN,UNIT,CONN**

---

### **REMOVE**

#### **Explanation Of Command**

---

This command is applicable only to a noncapacity expansion frame (NCEF).

This message allows removal of all time slot interchanges (TSI) that connect the specified unit to the indicated units, one of which may be the specified unit in cross-connect network side 0 or 1 through use of the optional field. If the field is omitted, then all TSIs connected to the specified unit are removed.

Note that if the TSI on the other CCN side has already been removed, this command will be executed only if no circuits are cross-connected through the TSI. The reason for allowing removal on both sides is to degrow the UNIT or change its connectivity.

#### **Command**

---

[I.33231]

## **RMV,UNIT,FLI**

### **REMOVE FACILITY LINE INTERFACE**

#### **Explanation Of Command**

This command requests and reports the removal of one facility line interface (FLI) in a DS3 unit (DS3U) or a Hybrid DS3 Unit (HDS3U). The removal can be caused by either a manual request or autonomously by error recovery.

A request for removal of a FLI will cause a protection switch. A request to remove an unprotected FLI will be denied unless no service multiplexer (MXR) or hybrid multiplexer (HMXR) or protection MIU is equipped and the protection MMFG is out-of-service in that DS3U or HDS3U.

This message also reports an unsuccessful automatic attempt to remove an unprotected FLI, which will cause a critical alarm.

### **REMOVE FORMATTER**

#### **Explanation Of Command**

This command requests and reports the removal of one formatter (FMT) or Hybrid Formatter (HFMT) in a DS3 unit or Hybrid DS3 unit (HDS3U). The removal can be either manually by a command or autonomously by error recovery.

A successful request to remove an FMT or HFMT will automatically cause a switch to the other cross-connect side. A request for removal of an FMT or HFMT will be denied if the switch to the other cross-connect side is not possible. The output of this command also reports an unsuccessful automatic attempt to remove an unprotected FMT or HFMT. The removal of both FMTs/HFMTs will automatically come into effect when the unit is degrown.

## **RMV,UNIT,MMFG,FRC,INCL**

### **REMOVE MMFG**

#### **Explanation Of Command**

This command requests and reports the removal of the circuit packs of one or more Multiplexer - Multiplexer Interface Unit Functional Group (MMFG). The removal of an MMFG can be caused either by manual command or autonomous DACS II error recovery action.

An **RMV MMFG** command will remove the Multiplexer (MXR) or Hybrid Multiplexer (HMXR) and the Multiplexer Interface Unit (MIU) if the MIU is in-service. Note that MIU currently is not supported by HDS3U, therefore, MIU does not exist in an MMFG with the HMXR.

A manual removal request of an MMFG will cause protection switching if protection is available. However, the automatic switch to protection (or the automatic switchback from a protection MMFG) can be inhibited by specifying the FRC option, which can result in loss of service. The FRC option must be used to request the unprotected removal of an MMFG. Any resulting loss of service will not cause an alarm. An attempt to remove more than one MMFG without the FRC option will be denied.

The Inclusive (INCL) keyword must be used if at least one of the DS3's tributary NPCs is in service. This option will remove the NPCs together with the MMFG.

This command also reports the unsuccessful automatic attempt to remove an unprotected MMFG, which will cause a critical alarm. An **RMV IN PROGRESS** message will be generated at 20-second intervals while this command is being executed. There will be one completion or denial output message for each circuit pack removed.

#### **Command**

[O.33421.01]

\*Chh:mm:ss xy,ww RMV UNIT [q]q MMFG a[ FRC[ INCL]] COND cc \\  
DNY

### **Explanation Of Parameters**

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**MMFG** - Multiplexer-Multiplexer Interface Unit functional group.

**c, d** - The number of the MMFG within the unit (P,1 through 6) (P means the protection MMFG)

**a** - The number of the MMFG that is removed or denied (c or d)

**FRC** - Force

This keyword will force a manual removal (in the case that protection is not available) and will prevent automatic protection switching from accompanying the removal, thus forcing the removal of all the DS1 facilities served by the MMFG.

**INCL** - Inclusive

This keyword will cause all tributary NPCs which are still in service to be removed. A command with the INCL keyword must also contain the FRC keyword or it will be denied by DACS II.

**\*C** - Critical priority of action

**\*\*** - Major priority of action

**M** - Manual priority of action

**MXR** - Multiplexer (MXR) or Hybrid Multiplexer (HMXR)

**a** - MXR or HMXR identifier (P, 1 through 6)

**TYPE** - Type

**mnxyz** - The DS3 format processed by the MXR:

**mn** - DS3 type

**mn** *Explanation*

**MX** The original R4.0 DS3 facility type supported by the Multiplexer (MXR) circuit pack (KCR-1).

**EX** The enhanced R6.0 DS3 facility type supported by the Enhanced Multiplexer (EMXR) circuit pack (KCR-5).

**HX** The hybrid facility type supported by the Hybrid Multiplexer (HMXR) circuit pack (KCR-8).

If the unit is a regular DS3U of unit type DT100, then the default is the MX type for backward compatibility.

If the unit is a Hybrid DS3U of unit type HT100, then the default is HX.

**MIU** - Multiplexer interface unit

**a** - MIU identifier (P, 1 through 6)

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

**11** UC is out of service

**12** UC is in service but failed

**24** Unit type error

**A9** INCL not specified and at least one NPC In Service

**AA** Range entered without FRC keyword

## **RMV,UNIT,UC**

### **REMOVE UNIT CONTROLLER**

#### **Explanation Of Command**

This message requests removal of the specified unit controller from service. Only the unit controller for the IFTU and DSPU will have a changeable alarm severity and intervention level.

## **RST**

---

## **RST**

---

This section documents the **RST** command.

## **RST,CCB**

### **RESTORE CROSS-CONNECT BUFFER**

#### **Explanation Of Command**

This command applies only to the noncapacity expansion frame (NCEF).  
It requests the restoration of the specified cross-connect buffer to service.

#### **Command**

[I.34202]

**RST:FRM xy,SEQ ww:CCB sf!**

#### **Completion Message**

[O.34202]

**M hh:mm:ss xy,ww n[vv] RST CCB sf COND cc COMPL**

#### **Denial Message**

[O.34202.01]

**M hh:mm:ss xy,ww n[vv] RST CCB sf COND cc DNY**

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**CCB** - Cross-connect buffer

**s** - Side number (0 or 1)

**f** - CCB number (1 through 6)

**COND** - Condition

**cc** - Completion condition code (hexadecimal)

To interpret values see cc.

**cc** - Hexadecimal condition code

## **RST,CCI**

### **RESTORE CONTROL AND CLOCK INTERFACE**

#### **Explanation Of Command**

This command applies only to the capacity expansion frame (CEF).

It requests that the clock and control interface pack of side s be restored to service. The two bus terminator packs of side s are also restored along with the CCI pack.

#### **Command**

[I.34251]

**RST:FRM xy,SEQ ww:CCI s!**

#### **Completion Message**

[O.34251]

**M hh:mm:ss xy,ww n[vv] RST CCI s COND cc COMPL**

#### **Denial Message**

[O.34251.01]

**M hh:mm:ss xy,ww n[vv] RST CCI s COND cc DNY**

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**CCI** - Clock and control interface

**s** - Side number (0 or 1)

**COND** - Condition

**cc** - Completion condition code (hexadecimal)  
To interpret values see cc below.

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>Explanation</b> |
|-----------|--------------------|
|-----------|--------------------|

| <b>CF</b> | <b>SYNC is inservice but failed</b>  |

## **RST,CCNI**

### **RESTORE CROSS-CONNECT NETWORK INTERFACE**

#### **Explanation Of Command**

This command is applicable only to the noncapacity expansion frame (NCEF).

It allows restoral of a cross-connect network interface to service.

#### **Command**

[I.34201]

**RST:FRM xy,SEQ ww:CCNI s!**

#### **Completion Message**

[O.34201]

**M hh:mm:ss xy,ww n[vv] RST CCNI s COND cc COMPL**

#### **Denial Message**

[O.34201.01]

**M hh:mm:ss xy,ww n[vv] RST CCNI s COND cc DNY**

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**CCNI** - Cross-connect network interface.

**s** - Side No. (0 or 1).

**COND** - Condition

**cc** - Completion condition code

To interpret values see cc.

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>Explanation</b> |
|-----------|--------------------|
|-----------|--------------------|

|           |                                      |

| <b>1B</b> | <b>CCN side s is in service</b>      |
| <b>CF</b> | <b>SYNC is inservice but failed</b>  |

## **RST,ETSI**

### **RESTORE EXPANDED TIME SLOT INTERCHANGER**

#### **Explanation Of Command**

This command is applicable only to the capacity expansion frame (CEF).

It requests that an expanded time slot interchanger (ETSI) be restored to service.

#### **Command**

[I.34261]

**RST:FRM xy,SEQ ww:ETSI sqq!**

#### **Completion Message**

[O.34261]

**M hh:mm:ss xy,ww n[vv] RST ETSI sqq COND 00 COMPL**

#### **Denial Message**

[O.34261.01]

**M hh:mm:ss xy,ww n[vv] RST ETSI sqq COND cc DNY**

#### **Autonomous Message**

Not applicable.

---

### Explanation Of Parameters

---

**ETSI** - Expanded time slot interchanger

**s** - Side number (0 or 1)

**qq** - Unit number (01 through 16)

Note that the unit number qq must always be shown with two digits in both the input and output. The leading 0 is required.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**02** Subject entity is not equipped

**03** Subject entity is in service

**0A** DGN on subject entity failed

**0B** BOOT on subject entity failed

**16** SYNC TB is not equipped

**17** SYNC is out of service

**CE** CCI is out of service

**CF** SYNC is inservice but failed

**D1** CCI is not present

**D4** CCI is inservice but failed

## **RST,ETISIS,ECCN,ALL**

### **RESTORE ALL ETISIS**

#### **Explanation Of Command**

This command is applicable only to the capacity expansion frame (CEF).

It requests that all equipped expanded time slot interchangers (ETISIs) in side s of the expanded cross-connect network (ECCN) be restored to service.

#### **Command**

[I.34271]

**RST:FRM xy,SEQ ww:ETISIS,ECCN s,ALL!**

#### **Completion Message**

[O.34271]

**M hh:mm:ss xy,ww n[vv] RST ETISIS ECCN s ALL 5 LN MSG:**

**TOTAL ETISIS kk**

**s01 r nn s02 r nn s03 r nn s04 r nn s05 r nn s06 r nn**

**s13 r nn s14 r nn s15 r nn s16 r nn \**

**COND cc COMPL**

#### **Denial Message**

[O.34271.01]

**M hh:mm:ss xy,ww n[vv] RST ETISIS ECCN s ALL COND cc DNY**

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**ETSiS** - Expanded time slot interchangers

**ECCN** - Expanded cross-connect network

**s** - Side number (0 or 1)

**kk** - Total number of ETSiSs equipped (01 through 16)

**r** - Restore status

Indication of the completion or denial of the restoration for each individual ETSi pack.

| <i>r</i> | <i>Explanation</i> |
|----------|--------------------|
|----------|--------------------|

|   |           |
|---|-----------|
| C | Completed |
|---|-----------|

|   |        |

#### **Autonomous Message**

[O.34011]

**A hh:mm:ss xy,ww RST LINK j COND cc COMPL**

### **Explanation Of Parameters**

---

**LINK** - Link

**j** - Administrative link number (1 through 6)

**cc** - Hexadecimal condition code

**cc Explanation**

**00 No conditions**

**03 Subject entity is in service**

**0A DGN on subject entity failed**

## **RST,MC,MCOND,NOJRNL,FRC,CLR,ALL**

### **RESTORE MAIN CONTROLLER**

#### **Explanation Of Command**

The RST::MC command provides different functions when different keywords are entered. DACS II responses to each keyword entered are explained below:

1. **RST:FRM xy,SEQ ww:MC,MCOND!**

The MCOND keyword transfers the DACS II Main Controller (MC) from the normal in-service state to the Maintenance Condition (MCOND) state. MCOND is a state of the MC in which it is not fully OOS but is in a restricted mode to allow certain maintenance operations. Network traffic carried by the system will not be affected by MCOND.

2. **RST:FRM xy,SEQ ww:MC!**

This command restores the MC to the normal in-service state from either the OOS or the MCOND state by using the data base on the PMEM. Therefore, if the primary memory data base contains the state existing prior to entering the OOS or MCOND state, the system will return to the original state without affecting service, that is, no network traffic disruption. Normal in-service or original state imply that only states provisioned by the user are recorded in the data base and will be used for restoral; transient states will not be recorded or used for restoral. This command should be used to restore the system for normal operations.

Any test groups and ports established prior to entering the RST::MC command will be autonomously released by this command. Upon completion of the command a test group release message will be issued for the last test group released as a result of the RST::MC. No messages will be issued for any test ports released during command execution.

3. **RST:FRM xy,SEQ ww:MC,NOJRNL!**

The NOJRNL keyword causes the system to be restored without the data base journals on the PMEM. At the completion of this command the system returns to the state of the last data base backup from RAM to PMEM. The effect of the commands entered after the last data base backup is destroyed. Therefore, if cross-connect commands were executed after the last backup, the resulting cross-connections will be disconnected by this command. This command is useful for system restoration after the system fails to boot due to JOURNAL failure.

4. **RST:FRM xy,SEQ ww:MC,FRC!**

The FRC keyword forces the system to be restored when there is an empty data base in the PMEM. At the completion of the command the MC will be in IS state.

**WARNING:**

The use of the NOJRNL or FRC keywords can also affect existing services. DACS II treats the following commands as restricted commands (See Message 36103 for RMON privilege):

**RST:FRM xy,SEQ ww:MC,NOJRNL!**  
**RST:FRM xy,SEQ ww:MC,FRC!**

That is, these commands are restricted to only the users who have the RMON privilege. In addition, to prevent users from accidentally destroying services, when any of these commands is entered, DACS II will respond with:

**ARE YOU SURE?(YES/NO)**

When the RST::MC,FRC command is entered, DACS II will respond with:

**WARNING:**

**EXECUTION OF THIS COMMAND WILL RESULT IN LOSS OF SERVICE  
AND WILL REQUIRE REPROVISIONING OF THE FRAME.**

**DO YOU STILL WANT THIS COMMAND EXECUTED?(YES/NO)**

Only if the answer is **YES**, will the command be executed. If **NO**, DACS II will display the **COMMAND ABORTED** response.

## **Command**

---

For Normal Operations:  
[I.34001]

**RST:FRM xy,SEQ ww:MC[, {MCOND|NOJRNL|FRC}] !**

For Installation and Product Evaluation Only:  
(Can be used only if the Lucent Technologies security warning feature bit is set)

[I.34001]

**RST:FRM xy,SEQ ww:MC,CLR[, ALL] !**

## **Completion Message**

---

For Normal Operations:  
[O.34001]

**M hh:mm:ss xy,ww n[vv] RST MC[ {MCOND|NOJRNL|FRC}] COND cc COMPL**

For Installation and Product Evaluation Only:  
(Will be available only if the Lucent Technologies security warning feature bit is set)  
[O.34001]

**M hh:mm:ss xy,ww n[vv] RST MC CLR[ ALL] COND cc COMPL**

## **Denial Message**

---

For Normal Operations:  
[O.34001.01]

**M hh:mm:ss xy,ww n[vv] RST MC[ {MCOND|NOJRNL|FRC}] COND cc DNY**

For Installation and Product Evaluation Only:  
(Will be available only if the Lucent Technologies security warning feature bit is set)  
[O.34001.01]

**M hh:mm:ss xy,ww n[vv] RST MC CLR[ ALL] COND cc DNY**

## **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

**MC** - Main controller

**MCOND** - Maintenance condition

**NOJRNL** - No Journal

Boot frame without journals.

**FRC** - Force

Force the frame to boot when there is an empty  
data base in the PMEM.

Note that the FRC option is a restricted command.

**cc** - Hexadecimal condition code

### **cc Explanation**

**cc Explanation**

- EF SSC circuit pack is still equipped; pull-out/remove SSC**
- F1 PMEM and SMEM synchronization fail**
- F2 Not a DACS II compatible Flash Card**
- F3 Flash Card is empty**
- F4 PMEM and SMEM are different**
- F5 Flash Card is not present**
- F6 Flash Card is bad**

## **RST,NPC,MON**

### **RESTORE NPC MONITOR**

#### **Explanation Of Command**

This message restores the *Monitor* function on the C-bit processing pack after the condition of the buffer overflow has occurred (See Message O.65221). Use this message only for CB-type NPCs in a DSPU.

The autonomous form of this message is not an alarm. The output message reports that all C-bit channels designated for monitoring (via the **CHG: :DD,TO** commands) are enabled.

The completion (**COMPL**) message may take some time (up to seconds) before it is sent. This is due to the incremental enabling of the monitored circuits. The circuit pack will start monitoring the received C-bits as soon as the first group of 256 bits is enabled.

## **RST,NPC,SIDE**

### **RESTORE NPCs**

#### **Explanation Of Command**

This command restores Facility Terminating Unit (FTU/IFTU/IFTU2), DS3 Unit (DS3U), Hybrid DS3 Unit (HDS3U), or Digital Signal Processing Unit (DSPU) Network Processing Circuits (NPC) to service. This command also restores applications on Digital Signal Processing Platform (DSPP) NPCs (TG193) which have been grown in Facility Terminating Units. DSPP NPCs are always odd.

A range of FTU (IFTU or IFTU2), DS3U and HDS3U NPCs may be specified, but DSPU NPCs must be individually restored.

One output message, either completion or denial, is printed for each NPC addressed in the restore command.

DSPU NPCs are duplicated and are associated with the DACS II Cross-Connect Network (CCN) sides. DSPU NPCs are addressed with a side number, and are restored one side at a time. A single DSPU NPC restore command restores only the one addressed side of the duplicated DSPU NPC.

Execution of this command may be stopped by entering the **ABT** command.

For a Network Processing Circuit provisioned with the Minor Bit Error Rate (MBER) feature, the command will be denied if the installed hardware of the addressed NPC does not support the MBER Feature.

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number (beginning of the range).

**[t]def** - The 3- or 4-digit nonhierarchical NPC number (end of the range).

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

If NPC numbers are expressed in three digits, the valid values are:

SD type NPC numbers listed by unit number, within a **North American module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

**SIDE** - Side

**s** - Side of duplicated DSPU circuit to be removed (0 or 1)

**[s]ghi** - The 3- or 4-digit nonhierarchical number of a successfully restored NPC.  
(**[s]abc** through **[t]def**)

**[s]jkl** - The 3- or 4-digit nonhierarchical number of an NPC whose restoral is denied.  
If used in a range, it denotes the first NPC of the range.  
(**[s]abc** through **[t]def**)

**[t]mno** - The 3- or 4-digit nonhierarchical number of an NPC whose restoral is denied.  
It denotes the last NPC of a range. (**[s]abc** through **[t]def**)

**uvghi** - Hierarchical number of a successfully restored NPC.

(**uvmnp** through **uvkqr**)

**uvjkl** - Hierarchical number of an NPC whose restoral is denied.

If used in a range, it denotes the first NPC of the range.

(**uvmnp** through **uvkqr**)

**uvmno** - Hierarchical number of an NPC whose restoral is denied.

It denotes the last NPC of a range. (**uvmnp** through **uvkqr**)

**uv** - Unit number

**m, g, k, j**

- Module number

**np, qr, hi, kl, no**

- NPC number within the module

**TYPE** - Type of NPC

**mnxyz** - NPC-type identifier

*mn*      *Explanation*

CB      C-bit processor (CPR) NPC

PA      CEPT NPC (75- or 120-ohm)

PB      CEPT NPC (120-ohm twisted pair)

PC      CEPT NPC (75-ohm coaxial)

SD      Digital Signal Processing Application Circuit Pack

#### **SD-type xyz fields (Digital Signal Processing Platform (DSPP) Applications)**

**SD111** X.50/X.57 International subrate application

**SD311** Digital Multipoint Bridge application

**SD411** North American DDS Subrate and MJU application

**SDxyz** Possible future applications with specific values for xyz

**CB-type xyz fields**

**x** - Fixed at 1  
**y** - Fixed at 0  
**z** - Network timer value  
**z** *Value in milliseconds*  
**0** 600 to 750  
**1** 1500 to 1650  
**2** 2400 to 2550  
**3** 4650 to 4800

**PB- and PC-type xyz fields**

**Table 16-1. NPC Provisioning Options**

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                         |
|--------------|------------|--------------|------------------------------------------------------------------------|
| x            | a          | 0            | CRC multiframe in TS0                                                  |
|              |            | 1            | Non-CRC framing in TS0                                                 |
|              | b          | 0            | NPC is not used as a synchronization source                            |
|              |            | 1            | NPC is used as a synchronization source                                |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
 if  $jkl \neq 011$  and  $jkl \neq 101$   
 in **2496 ms**  
 if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway cross-connection* the insertion word always defaults to AIS.

mxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option h=1.

If both b=1 and h=1 and the NPC (used as synchronization source) receives

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

**[jkl'] minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

**c=0** hardware timing

**c=1** firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

- [vii] RBER unalarmed
- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

- [m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

### PA-Type xyz fields

The provisioning values of x, y, and z for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (x, y or z) provisioning value):

**Table 16-2. Provisioning values for  $x$** 

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |
| B            |               |                    |               |                            |                           |
| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 16-3. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 16-4. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
- HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
- FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

**z=6 or A** hardware timing

**z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

- [vii] RBER unalarmed

- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 16-5. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations                                                               | Explanation                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz<br>9Cz<br>CCz<br>DCz                                                                       | Framed clear 2Mbit/s ( $y$ value C) is valid for all $x$ options except those invoking automatic CRC-4 interworking.<br>The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 0Dz<br>1Dz<br>2Dz<br>3Dz<br>4Dz<br>5Dz<br>6Dz<br>7Dz<br>8Dz<br>9Dz<br>ADz<br>CDz<br>DDz<br>EDz | Unframed clear 2Mbit/s ( $y$ value D) is only valid for $x$ values B and F. These are the only $x$ options which do not require decoding of TS0 content.                                                                           |

**Table Notes:**

1. If framed clear 2Mbit/s is selected with Far-End PM enabled  $z$  values 1, 3, 5 and 7) only the receive side of the feature shall be turned on. No outgoing E-bits may be transmitted during clear signal operation.
2. If framed clear 2Mbit/s is selected with Synchronization Failure Indication (SFI) enables ( $x$  values 1, 2, 5, 6, A and E) only the receive side of the feature shall be turned on. No outgoing SFI may be transmitted in Bit 5 during clear signal operation.

**Table 16-6. Combinations of *y* and *z* Values**

| Invalid<br>xyz<br>Combinations                                                                               | Explanation                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Autonomous Message

Not applicable.

## Explanation Of Parameters

[s]abc - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>B2</b> | MXR is out of service                             |

## **RST,PMEM,SMEM,CLR,FRC,BKGRND**

### **RESTORE PMEM AND/OR SMEM**

#### **Explanation Of Command**

This message restores the primary memory card (**PMEM**) or secondary memory card (**SMEM**) to service. The **PMEM** card may be restored manually when the main controller (MC) is in maintenance condition (MCOND). The **SMEM** card may be restored manually when the MC is in-service (IS) or in MCOND.

The options **CLR**, **FRC**, and **BKGRND** can only be used with **SMEM**. In addition, the option **CLR** can only be used when the main controller is in MCOND. The options **FRC** and **BKGRND** can only be used when the main controller is IS. The options do the following:

1. The **CLR** option is used when the frame administrator wants to create a blank card. The executables and the database will be erased from the card. The **CLR** option cannot be used together with the **FRC** or **BKGRND** option.
2. The **FRC** option is used when an **SMEM** card is to be synchronized but one or more items on the **SMEM** card are incompatible with the same item on the **PMEM** card. The purpose of the **FRC** option is to allow the frame administrator to force synchronization, even though an incompatibility has been detected.
3. The **FRC** option may be used together with **BKGRND** option. It is incompatible with the **CLR** option.
4. The **BKGRND** option is used when the frame administrator wants to allow the execution of a certain set of commands to proceed while the synchronization of the **SMEM** card is proceeding in the background. The **BKGRND** keyword is incompatible with the **CLR** keyword, but it may be used together with the **FRC** keyword.

#### **Command**

[I.34211]

**RST:FRM xy,SEQ ww:{PMEM|SMEM[{,CLR|[,FRC][,BKGRND]}}]!**

[O.34211]

**I hh:mm:ss xy,ww n[vv] RST SMEM BKGRND COMPL**

Error message when command issued during Boot procedure terminates abnormally

[O.34211.01]

**A hh:mm:ss xy,ww n[vv] RST SMEM BKGRND COND cc DNY**

### **Explanation Of Parameters**

---

**PMEM** - Primary memory card.

**CLR** - Clear

The CLR option will cause all volumes on the card inserted in the SMEM slot to be initialized. It is not allowed for the PMEM option.

If the **CLR** keyword is entered, DACS II will respond:

**ARE YOU SURE?(YES/NO)**

If **YES**, the command request will be submitted to DACS II. After completion, all of the file volumes on the SMEM card will be initialized and all information stored previously will be cleared.

If **NO**, DACS II will respond as indicated under the Completion or Denial Message.

**SMEM** - Secondary memory card.

If the MC is in MCOND, the SMEM card will be restored without any transfer of databases or executables to the card. It will be restored if it passes hardware diagnostics and is recognized as a DACS II compatible memory card.

If the MC is IS, restoring an SMEM card will result in the following actions:

1. The card will go through hardware diagnostics and a check to ensure it is a DACS II compatible card.
2. The SMEM card will be made bit-for-bit identical to the PMEM card.
3. The system software will ensure that subsequent writes to the PMEM card will also be written to the SMEM card, so that the contents of the PMEM and SMEM cards will always be synchronized.

**FRC** - Force.

If the MC is IS and the SMEM has passed hardware diagnostics and is a compatible card, then the following conditions are checked on the SMEM:

- a) blank or uninitialized card
- b) a frame ID mismatch between the PMEM and SMEM cards
- c) a unique ID mismatch between the PMEM and SMEM cards
- d) a release version mismatch between the PMEM and SMEM cards
- e) the database on the SMEM is corrupted, missing or unrecognizable
- f) the PMEM and SMEM cards do not contain identical DSP Platform applications

If any of the above conditions exist, the frame will generate a warning message listing the condition and deny the command as follows:

**Warning: The SMEM Card being restored has the following problems!**

**<message describing the problem>**

**IF YOU STILL WISH TO PROCEED, USE FRC OPTION**

If the user re-issues the command with the FRC option, then the following message will appear:

**ARE YOU SURE? (YES/NO)**

A response of YES will cause the command to be executed. Any other response, or a 60-second time interval, will cause the command to be aborted.

**BKGRND** - Background

The BKGRND command is used when the main controller is In Service and is only valid when used with SMEM.

The following is a list of commands that are available while the backup procedure is running in the background.

[I.11001] TCON, FROM, TO, RDC, CUS, INCL  
[I.11011] TCON, FROM, TO, RDC, CUS, INCL (clear DS1/clear 2M bps)

[O.34121.01]

**M hh:mm:ss xy,ww n[vv] RST SYNC a TLI m[ SSP b] COND cc DNY**

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**a** - SYNC number (0 or 1)

**TLI** - Timing link interface

**m** - TLI number (1 through 4)

**SSP** - Synchronizer synchronization port

**b** - SSP number (0 or 1)

**cc** - Hexadecimal condition code

#### **cc Explanation**

**02** Subject entity is not equipped

**03** Subject entity is in service

**0A** DGN on subject entity failed

**16** SYNC TB is not equipped

**17** SYNC is out of service

**33** Wrong TLI type

**5D** Sync source NPC is not inservice

**5E** Sync source NPC is not equipped

**CF** NPC already grown as non-  
synchronization source

## **RST,TSI**

### **RESTORE TIME SLOT INTERCHANGE**

#### **Explanation Of Command**

This command is applicable only to the noncapacity expansion frame (NCEF).

It requests the restoration of the time slot interchange to service.

#### **Command**

[I.34221]

**RST:FRM xy,SEQ ww:TSI sft!**

#### **Completion Message**

## **RST,UNIT,FLI**

### **RESTORE FACILITY LINE INTERFACE**

#### **Explanation Of Command**

This command requests and reports the restoration of one facility line interface (FLI) in a DS3 unit (DS3U) or a Hybrid DS3 unit (HDS3U).

#### **Command**

[I.34401]

**RST:FRM xy,SEQ ww:UNIT [q]q,FLI k!**

#### **Completion Message**

[O.34401]

**M hh:mm:ss xy,ww n[vv] RST UNIT [q]q FLI k COMPL**

#### **Denial Message**

[O.34401.01]

**M hh:mm:ss xy,ww n[vv] RST UNIT [q]q FLI k COND cc DNY**

#### **Autonomous Message**

Not applicable.

## Explanation Of Parameters

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FLI** - Facility line interface

**k** - FLI identifier

**k** *Explanation*

**S** Service side

**P** Protection side

**cc** - Hexadecimal condition code

**cc** *Explanation*

**02** Subject entity is not equipped

**03** Subject entity is in service

**0A** DGN on subject entity failed

**0B** BOOT on subject entity failed

**10** Unit is not equipped

**11** UC is out of service

**12** UC is in service but failed

**16** SYNC TB is not equipped

**17** SYNC is out of service

**18** CCNI is out of service

**CE** CCI is out of service

**CF** SYNC is inservice but failed

**D1** CCI is not present

**D2** ETSI is not present

**D3** CCNI is inservice but failed

**D4** CCI is inservice but failed

**D5** CCB is not equipped

**D6** CCB is out of service

**D7** CCB is inservice but failed

**D8** ETSI is not equipped

**D9** ETSI is out of service

**DA** ETSI is inservice but failed

## **RST,UNIT,FMT**

### **RESTORE FORMATTER**

#### **Explanation Of Command**

This command requests and reports the restoration of one Formatter (FMT) in a DS3 Unit or Hybrid Formatter (HFMT) in a Hybrid DS3 (HDS3) Unit. If the restoration of the FMT or HFMT causes all the packs in the associated side to be in service, the side will be marked In-Service. If an attempt is made to restore an FMT in an HDS3 or an HFMT in a DS3 unit, then a diagnostic failure will result.

#### **Command**

[I.34411]

**RST:FRM xy,SEQ ww:UNIT [q]q,FMT s!**

#### **Completion Message**

[O.34411]

**M hh:mm:ss xy,ww n[vv] RST UNIT [q]q FMT s COMPL**

#### **Denial Message**

[O.34411.01]

**M hh:mm:ss xy,ww n[vv] RST UNIT [q]q FMT s COND cc DNY**

#### **Autonomous Message**

Not applicable.

## Explanation Of Parameters

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FMT** - Formatter or Hybrid Formatter

**s** - FMT/HFMT side

**s** *Explanation*

**0** Side 0

**1** Side 1

**cc** - Hexadecimal condition code

**cc** *Explanation*

**02** Subject entity is not equipped

**03** Subject entity is in service

**0A** DGN on subject entity failed

**0B** BOOT on subject entity failed

**10** Unit is not equipped

**11** UC is out of service

**12** UC is in service but failed

**16** SYNC TB is not equipped

**17** SYNC is out of service

**18** CCNI is out of service

**0D** Unpesteing error registers for subj. entity failed

**CE** CCI is out of service

**CF** SYNC is inservice but failed

**D1** CCI is not present

**D2** ETSI is not present

**D3** CCNI is inservice but failed

**D4** CCI is inservice but failed

**D5** CCB is not equipped

**D6** CCB is out of service

**D7** CCB is inservice but failed

**D8** ETSI is not equipped

**D9** ETSI is out of service

**DA** ETSI is inservice but failed

## **RST,UNIT,FTMI,DSPI**

**RESTORE FTMI or DSPI**

### **Explanation Of Command**

This command allows restoral of a facility terminating module interface or a digital signal processor interface to service.

### **Command**

[I.34321]

**RST:FRM xy,SEQ ww:UNIT [q]q,{FTMI d|DSPI}!**

### **Completion Message**

[O.34321]

**M hh:mm:ss xy,ww n[vv] RST UNIT [q]q,{FTMI d|DSPI} COND 00  
COMPL**

### **Denial Message**

[O.34321.01]

**M hh:mm:ss xy,ww n[vv] RST UNIT [q]q {FTMI d|DSPI} COND cc DNY**

### **Autonomous Message**

Not applicable.

## **Explanation Of Parameters**

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FTMI** - Facility terminating module interface

**d** - FTMI number (1 through 4).

**DSPI** - Digital signaling processing interface

**COND** - Condition

**cc** - Hexadecimal condition code

| <b>cc</b> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|           |                                |
|-----------|--------------------------------|
| <b>02</b> | Subject entity is not equipped |
| <b>03</b> | Subject entity is in service   |
| <b>0A</b> | DGN on subject entity failed   |
| <b>0B</b> | BOOT on subject entity failed  |
| <b>10</b> | Unit is not equipped           |
| <b>11</b> | UC is out of service           |
| <b>12</b> | UC is in service but failed    |
| <b>16</b> | SYNC TB is not equipped        |
| <b>17</b> | SYNC is out of service         |
| <b>18</b> | CCNI is out of service         |
| <b>CE</b> | CCI is out of service          |
| <b>CF</b> | SYNC is inservice but failed   |
| <b>D1</b> | CCI is not present             |
| <b>D2</b> | ETSI is not present            |
| <b>D3</b> | CCNI is inservice but failed   |
| <b>D4</b> | CCI is inservice but failed    |
| <b>D5</b> | CCB is not equipped            |
| <b>D6</b> | CCB is out of service          |
| <b>D7</b> | CCB is inservice but failed    |
| <b>D8</b> | ETSI is not equipped           |
| <b>D9</b> | ETSI is out of service         |
| <b>DA</b> | ETSI is inservice but failed   |

## **RST,UNIT,UC**

### **RESTORE UNIT CONTROLLER**

#### **Explanation Of Command**

This message requests the restoration of the unit controller to service.

#### **Command**

[I.34311]

RST:FRM xy,SEQ ww:UNIT [q]q,UC!

#### **Completion Message**

[O.34311]

M hh:mm:ss xy,ww n[vv] RST UNIT [q]q UC COND cc COMPL

[O.34312]

M hh:mm:ss xy,ww n[vv] RST IN PROGRESS

#### **Denial Message**

[O.34311.01]

M hh:mm:ss xy,ww n[vv] RST UNIT [q]q UC COND cc DNY

#### **Autonomous Message**

Not applicable.

## Explanation Of Parameters

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**UC** - Unit controller

**COND** - Condition

**cc** - Completion condition code (hexadecimal)

To interpret values of cc see cc below

**cc** - Hexadecimal condition code

**cc**    *Explanation*

**02**    Subject entity is not equipped

**03**    Subject entity is in service

**0A**    DGN on subject entity failed

**0B**    BOOT on subject entity failed

**42**    RST failed to boot program

**47**    Failed to boot DB

**48**    Failed to boot journal--recurrence indicates database corruption

**49**    Failed to boot unit

**51**    General boot failure (vanilla flavor)

**18**    DSPI not in service or failed

**43**    RST failed to boot DB

**C4**    XMIT continuity test won't be run: no XMIT timeslots available

**C6**    No available timeslots on any of the inservice NPCS associated with  
FC/FMT

### **Notice**

Every effort was made to ensure that the information in this document was complete and accurate at the time of printing. However, information is subject to change.

### **Security Statement**

In rare instances, unauthorized individuals make connections to the telecommunications network through the use of remote access features. In such event, applicable tariffs require that the customer pay all network charges for traffic. Lucent Technologies cannot be responsible for such charges, and will not make any allowance or give any credit for charges that result from unauthorized access.

### **Documentation Ordering Information**

The ordering number for this document is 365-353-242. To order this document, call the Lucent Technologies Customer Information Center in Indianapolis, Indiana, on 1-888-582-3688. For more ordering information, refer to "How to Order Documentation" in the section "About this Document."

### **Technical Support Telephone Number**

The Lucent Technologies Regional Technical Assistance Center (RTAC) provides a technical assistance telephone number which is staffed 24 hours a day. For technical assistance, simply call 1-800-225-RTAC.

### **Documentation Support Telephone Number**

Lucent Technologies provides a telephone number for you to report errors or to ask questions about the information in this document. The support telephone numbers are:

Outside North Carolina - 1-800-334-0404  
Inside North Carolina - 1-919-727-6681.

# How Are We Doing?

Document Title: DACS II Release 8.2.3, PDS 2.048-Mb/s Interface Command and Message Manual Volume III

Document No.: 365-353-242

Issue 1

Date: February 1999

Lucent Technologies welcomes your feedback on this document. Your comments can be of great value in helping us improve our documentation.

1. Please rate the effectiveness of this document in the following areas:

|                      | Excellent | Good | Fair | Poor | Not Applicable   |
|----------------------|-----------|------|------|------|------------------|
| Ease of Use          |           |      |      |      | //////////////// |
| Clarity              |           |      |      |      | //////////////// |
| Completeness         |           |      |      |      | //////////////// |
| Accuracy             |           |      |      |      | //////////////// |
| Organization         |           |      |      |      | //////////////// |
| Appearance           |           |      |      |      | //////////////// |
| Examples             |           |      |      |      |                  |
| Illustrations        |           |      |      |      |                  |
| Overall Satisfaction |           |      |      |      | //////////////// |

2. Please check the ways you feel we could improve this document:

- |                                                            |                                                                     |
|------------------------------------------------------------|---------------------------------------------------------------------|
| <input type="checkbox"/> Improve the overview/introduction | <input type="checkbox"/> Make it more concise/brief                 |
| <input type="checkbox"/> Improve the table of contents     | <input type="checkbox"/> Add more step-by-step procedures/tutorials |
| <input type="checkbox"/> Improve the organization          | <input type="checkbox"/> Add more troubleshooting information       |
| <input type="checkbox"/> Include more figures              | <input type="checkbox"/> Make it less technical                     |
| <input type="checkbox"/> Add more examples                 | <input type="checkbox"/> Add more/better quick reference aids       |
| <input type="checkbox"/> Add more detail                   | <input type="checkbox"/> Improve the index                          |

Please provide details for the suggested improvement. \_\_\_\_\_

## About This Document

---

### Purpose

---

The *DACS II Release 8.2.3 Command and Message Manual* describes the input commands and output messages of Release 8.2.3 of the Digital Access and Cross-Connect System II (DACS II). In addition, it provides full support for previous product releases.

**⇒ NOTE:**

Those customers using this manual with Releases 3 through 7.0.3 software should be aware that all features of a particular message shown for Release 8.2.3 may or may not apply to previous releases.

This manual consists of three volumes as follows:

- **Volume I** - This volume contains general information about the document, a detailed introduction that defines DACS II messages, relates how to communicate with DACS II, introduces the administrative links, and discusses in detail NPC addressing, on-line help feature, system configuration and features a listing of related documentation. Message listings in this volume include alphabetical and numerical, summary list of input commands and a list of autonomous messages. A comprehensive presentation of input commands and output messages (ABT through DGN) concludes this volume.
- **Volume II and III** - These two volumes contain input commands and output messages in the following order:
  - **Volume II** - DGRTH through RST
  - **Volume III** - SAVE through UTL and the Glossary

---

## **Reason for Issue**

---

The *DACS II Release 8.2.3 Command and Message Manual* has been issued to include updated and new commands applicable to Release 8.2.3.

## **Intended Audiences**

---

This manual is a catalog of messages intended for reference by a technician or craftperson who needs additional details about a message. It provides the user with supplemental information for the Digital Access and Cross-Connect System II (DACS II) that is programmed in the Program Documentation Standards (PDS) language. An example of a user is someone performing a task from an operation and maintenance manual who needs the definition of a specific keyword to complete the task.

## **How to Order Documentation**

---

To order additional copies of this document, send or call in an order as follows:

- To order by Mail:

Lucent Technologies  
Customer Information Center  
Attention: Order Entry Section  
2855 N. Franklin Road  
P. O. Box 19901  
Indianapolis, IN 46219

- 
- To order by Telephone (Monday through Friday);

Within the United States of America:

**1-800-LUCENT8 (582-3688)** (7:30 a.m. to 6:30 p.m. EST)

From Canada:

**1-800-255-1242**

Worldwide:

Toll: **1-317-352-8557**

FAX: **1-317-352-8484**

For RBOC/BOC customers, process orders through your Company Documentation Coordinator.

For commercial customers, a check, money order, purchase order number, or charge card number is required with all orders. Make checks payable to Lucent Technologies.

Lucent Technologies entities should use Form IND 1-80.80 FA, available through the Customer Information Center.

One-time orders include a binder (if applicable) and the document contents for the current issue in effect at the time of order. After placing a one-time order, you can request a standing order for any document revisions *of that software release*. Documents for new software releases do *not* go to standing-order customers. You will only get those documents if you order the new software release.

## **How to Comment on This Document**

A feedback form is located at the beginning of this publication, immediately after the title page. Please fill out the feedback form and return it (postage free) to the address on the back.

If the feedback form is missing, send comment on this publication to:

## **SAVE — SW**

---

## **SAVE — SW**

---

This section documents the commands **SAVE** through **SW**.

## **SAVE**

---

### **SAVE COMPONENT COMMANDS**

#### **Explanation Of Command**

---

This command is used to save the contents of a macro while in the macro session.

#### **Command**

---

[I.19081]

SAVE[:FRM xy,SEQ ww:]!

#### **Completion Message**

---

[O.19081]

M hh:mm:ss xy,ww n[vv] SAVE <macro name> SPACE sss \  
USED uuu COMPL

#### **Denial Message**

---

[O.19081.01]

M hh:mm:ss xy,ww n[vv] SAVE <macro name> SPACE sss \  
USED uuu COND cc DNY

#### **Autonomous Message**

---

Not applicable.

---

### Explanation Of Parameters

---

macro name

- The name of the macro to be saved

**SPACE** - Space

**sss** - Number representing the percent of total disk space allocated to macro storage

**USED** - Used

**uuu** - Number representing the percent of the allocated disk space (sss) being used to store macros

**cc** - Hexadecimal condition code

**cc**    *Explanation*

**60**    User macro/map space is full

**61**    System macro/map space is full

**65**    Command invalid while backup in progress

**6E**    No edit session active

**6C**    File is empty

## **STOP,MACRO,LINK**

### **STOP MACRO**

#### **Explanation Of Command**

This command is used to stop the execution of a macro.

A regular DACS II user can use the link number option to stop macro execution on the link he or she is currently using. A frame administrator may use this option to stop macro execution on any link.

If this command was entered by the frame administrator then output from this command will be sent only to the link on which the frame administrator entered the command.

#### **Command**

[I.39311]

**STOP:FRM xy,SEQ ww:MACRO[,LINK l[mm]]!**

#### **Completion Message**

[O.39311]

**M hh:mm:ss xy,ww n[vv] STOP MACRO <macro name>[ l[mm]] COMPL**

#### **Denial Message**

[O.39311.01]

**M hh:mm:ss xy,ww n[vv] STOP MACRO <macro name>[ l[mm]] \  
COND cc DNY**

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**MACRO** - Macro

**LINK** - Link

**l[mm]** - Administrative link number

**l** - Physical link number (1 through 6)

**mm** - Virtual circuit number (01 through 16)

Variable m is the virtual circuit number in the administrative link.  
mm may only be specified when l is 5 or 6.

**COND** - Condition

**cc** - Hexadecimal condition code

**cc**    *Explanation*

**6A**    No macro is currently executing

**D0**    Command is Frame administrator (DAX) only.

## **SW,BCAST,OLD,NEW,INCL**

### **DS0 CIRCUIT ROLL - BRIDGE COMMAND**

#### **Explanation Of Command**

This command is used to perform the Bridge step of the DS0 (64kbit/s) Roll operation. (For DS1 or 2 Mbit/s Roll operations use the commands I.14061, I.14071, and I.14081.)

Test signals may exist on the new DS0. If allowed to remain they will overwrite the signal transferred from the old DS0.

Use the UTL::QRY,TSIG,NPC command, prior to executing this command, to verify that no test signals exist on the new DS0.

The DS0 (64kbit/s) Roll procedure consists of three commands:

1. Bridge

This step will bridge the transmit data by broadcasting to the new DS0 as well as the old DS0. Use this command.

2. Roll

This step rolls the service by switching the receive data from the old DS0 to the new DS0. Use command I.14031.

3. Cut

This step takes down the bridge by disconnecting the transmit data from the old DS0. Use command I.14041.

**NOTE:** The ROLL procedure will re-direct ALL cross-connections associated with the DS0 signal being rolled.

### **Command**

---

#### **Nonhierarchical**

---

[I.14021]

SW:FRM xy,SEQ ww:BCAST,OLD [s]abcddd[-eee],NEW [t]ghijjj\  
[-kkk][,INCL]

#### **Hierarchical**

---

[I.14021]

SW:FRM xy,SEQ ww:BCAST,OLD uvmnpddd[-eee],NEW wxqrrjjj\  
[-kkk][,INCL]

### **Completion Message**

---

#### **Nonhierarchical**

---

[O.14021]

M hh:mm:ss xy,ww n[vv] SW BCAST [s]abcddd[-eee],[t]ghijjj[-kkk]\  
[ INCL] COMPL

#### **Hierarchical**

---

[O.14021]

M hh:mm:ss xy,ww n[vv] SW BCAST uvmnpddd[-eee],wxqrrjjj[-kkk]\  
[ INCL] COMPL

### **Denial Message**

---

#### **Nonhierarchical**

---

[O.14021.01]

M hh:mm:ss xy,ww n[vv] SW BCAST [s]abcddd[-eee],[t]ghijjj[-kkk]\  
[ INCL][ mmm,nnn] COND cc DNY

## **Hierarchical**

---

[O.14021.01]

M hh:mm:ss xy,ww n[vv] SW BCAST uvmnpddd[-eee],wxkqrjjj[-kkk]\  
[ INCL][ mmm,nnn] COND cc DNY

## **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

**BCAST** - Broadcast

**OLD** - Old

The bridge step does not need the OLD NPC to be in service, however the roll step does. Therefore, it is possible that the bridge step will be allowed when the subsequent roll step will be denied.

For the hierarchical unit entities, however, the bridge step needs both the OLD NPC hierarchy and the NEW NPC hierarchy to be in service. Otherwise, the bridge step will be denied.

**NEW** - New

**[s]abc** - The 3- or 4-digit nonhierarchical OLD NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical NEW NPC number

**Note:** Valid types for old and new NPC's are PAxyz, PBxyz and PCxyz, except for the following cases:

- Either NPC is of type PAxyz where y=C or y=D (Clear 2Mb/s).
- The old NPC supports Channel Associated Signaling (CAS) and the new NPC does not.
- The old NPC supports Non-Signaling Associated, the new NPC supports CAS, and CTS16 is being rolled to CTS16.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical OLD NPC number  
**wxkqr** - Hierarchical NEW NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd, jjj**  
- Channel numbers for beginning of channel range

**eee, kkk**  
- Channel numbers for end of channel range

To connect a range of channels, use the optional fields eee and kkk.

**INCL** - Inclusive

A circuit designated as a customer controlled circuit, a red circuit or a substrate T1 circuit cannot be modified without using the inclusive keyword in the message. Also, an NPC which supports these circuits cannot be manually removed unless the INCL keyword is given in the remove message.

**mmm** - The OLD channel number involved in denial (ddd through eee).

**nnn** - The NEW channel number involved in denial (jjj through kkk).

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                     |

## **SW,BCAST,OLD,NEW,INCL**

### **FACILITY ROLL - BRIDGE COMMAND**

#### **Explanation Of Command**

This input command is used to perform the Bridge step of the DS1 or 2Mbit/s Roll operation. (For DS0 Roll operations use the commands I.14021, I.14031, and I.14041.)

Test signals may exist on the new DS0. If allowed to remain they will overwrite the signal transferred from the old DS0.

Use the UTL::QRY,TSIG,NPC command, prior to executing this command, to verify that no test signals exist on the new DS0.

This command will be denied with a condition code of **73** if one or more pairs of channels within the old NPC are cross-connected to each other. This command will also be denied with the same condition code if a channel is looped back on itself.

The error message that corresponds to condition code **73** is:

#### **Channel has a FAR, which is within the range**

The term **FAR** in that error message refers to the other channel that is cross-connected to a channel on the NPC that is being rolled, but the other channel of the cross-connection must not be rolled, thus the error message occurs for a cross-connection that connects two channels on the same NPC.

The DS1 or 2Mbit/s Roll procedure consists of three commands:

1. Bridge

This step will bridge the transmit data by broadcasting to the new NPC as well as the old NPC. Use this command.

2. Roll

This step rolls the service by switching the receive data from the old NPC to the new NPC. Use command I.14071.

### 3. Cut

This step takes down the bridge by disconnecting the transmit data from the old NPC. Use command I.14081.

Not applicable.

### **Explanation Of Parameters**

---

**BCAST** - Broadcast

**OLD** - Old

The bridge step does not need the OLD NPC to be in service, however the roll step does. Therefore, it is possible that the bridge step will be allowed but the subsequent roll step will be denied.

For the hierarchical unit entities, however, the bridge step needs both the OLD NPC hierarchy and the NEW NPC hierarchy to be in service. Otherwise, the bridge step will be denied.

**NEW** - New

**[s]abc** - The 3- or 4-digit nonhierarchical OLD NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical NEW NPC number

**Note:** Valid types for old and new NPC's are PAXyz,  
PBxyz and PCxyz.

**Note:** The valid combinations of old/new NPCs are as follow:

- When the old NPC is of type PBxyz/PCxyz, the new NPC is of type PBxyz/PCxyz and the xyz values of the old and new NPCs are the same.
- When the old NPC is of type PBxyz/PCxyz, the new NPC is of type PAxyz, and the xyz values of the old and new NPCs are equivalent. The characteristics in the PBxyz/PCxyz are present in the PAxyz type, even though the xyz values are different.
- When the old NPC is of type PAxyz, the new NPC is of type PAxyz and the xyz values of the old and new NPCs are the same.

The roll procedure will be denied based upon the valid combinations rules, the service status of the old/new NPCs, the new NPC under PBA, channels on the old/new NPCs under test or loopback. The denial messages will explain the denial condition.

If a channel is involved in C-bit monitoring (i.e. its C bits is being monitored by the C-bit processor), the roll still takes place, the CTS16 cross-connection to the C-bit processor on the old NPC remains unimpacted, and the rolled channel will not automatically be C-bit monitored on the new NPC.

At the facility level, however, 2Mbit/s roll will be denied if the CTS16 is cross-connected to the C-bit processor.

Some information is carried forward from the old to the new NPC. Some information is NOT carried forward with the roll.

**Information being carried forward to the new NPC:**

- Channel Timeslot 0 (CTS0) alarm bit settings (e.g. alarm bits 3,4,5 can be set to 0 or 1).
- Spare bit settings for CTS0 to CTS0 cross connection. (dictate how the spare bits will be treated: passthrough, invert, etc.)
- Spare bit settings for CTS0 to non CTS0 cross connection.
- The Pseudo Frame Word (PFW) or the NFW (Mode 2) mode.
- All circuit parameters (e.g. RDLC, CUS, trunk conditioning, etc.) are retained for all channels.

It is important to note that if a roll procedure is reversed, the copying of the CTS0 settings to the new NPC will NOT be reversed. Therefore, the copied CTS0 settings on the new NPC will remain there.

**Information NOT being carried forward to the new NPC:**

- Alarm severity level information (alarms can be provisioned to be informational, minor, major, etc.)
- Threshold parameters, including THMODE state.
- Since xyz must be the same (or equivalent) between the old and new NPCs, if the old NPC is provisioned to be a possible Synchronization source, the new NPC must also be provisioned as one. However, the roll will not cause the new NPC to be an **active** sync source, even if the old one is.

In addition, it should be noted that all of the CTS0-related settings on the old NPC will not be affected by the roll. They will remain unchanged.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**uvmnp** - Hierarchical OLD NPC number

**wxkqr** - Hierarchical NEW NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**INCL** - Inclusive

A circuit designated as a customer controlled circuit, a red circuit or a substrate T1 circuit cannot be modified without using the inclusive keyword in the message.

Also, an NPC which supports these circuits cannot be manually removed unless the INCL keyword is given in the remove message.

**cc** - Hexadecimal condition code

| <b>7A</b> | Testport/testgroup channel cannot be rolled                            |

**cc**    *Explanation*

- 7B**    Channel out-of-bounds in a Broadcast or Virtual circuit.
- 7C**    Parity channel out of bound on new
- 7D**    Not first channel in a BCON/virtual conf
- 9B**    Termination is under test or is a test port or group
- 9C**    Parity channel cannot be within the range of a DS0 command.

## **SW,DISC,OOS**

### **DS0 CIRCUIT ROLL - DISCONNECT COMMAND**

#### **Explanation Of Command**

This input command is used to perform the Cut step of the DS0 (or 64kbit/s) Roll operation. (For DS1 or 2 Mbit/s Roll operations use the commands I.14061, I.14071, and I.14081.)

The DS0 (or 64kbit/s) Roll procedure consists of three commands:

1. Bridge

This step will bridge the transmit data by broadcasting to the new DS0 as well as the old DS0. Use command I.14021.

2. Roll

This step rolls the service by switching the receive data from the old DS0 to the new DS0. Use command I.14031.

3. Cut

This step takes down the bridge by disconnecting the transmit data from the old DS0. Use this command.

**NOTE:**

The ROLL procedure will re-direct ALL cross-connections associated with the DS0 signal being rolled.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**DISC** - Disconnect

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

**Note:** Valid NPC types are PAxyz, PBxyz, and PCxyz, except for the following cases:

- Either NPC is of type PAxyz where y=C or y=D (Clear 2Mb/s)
- The old NPC supports Channel Associated Signaling (CAS) and the new NPC does not.
- The old NPC supports Non-Signaling Associated (NSA), the new NPC supports CAS and CTS16 is being rolled to CTS16.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|

---

### **FACILITY ROLL - DISCONNECT COMMAND**

#### **Explanation Of Command**

---

This input command is used to perform the Cut step of the DS1 or 2Mbit/s Roll procedure. (For DS0 Roll operations use the commands I.14021, I.14031, and I.14041.)

The DS1 or 2Mbit/s Roll procedure consists of three commands:

1. Bridge

This step will bridge the transmit data by broadcasting to the new NPC as well as the old NPC. Use command I.14061.

2. Roll

This step rolls the service by switching the receive data from the old NPC to the new NPC. Use command I.14071.

3. Cut

This step takes down the bridge by disconnecting the transmit data from the old NPC. Use this command.

## **Explanation Of Parameters**

---

**DISC** - Disconnect

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

**Note:** Valid NPC types are PAxyz, PBxyz, and PCxyz.

**Note:** The valid combinations of old/new NPCs are as follow:

- When the old NPC is of type PBxyz/PCxyz, the new NPC is of type PBxyz/PCxyz and the xyz values of the old and new NPCs are the same.
- When the old NPC is of type PBxyz/PCxyz, the new NPC is of type PAxyz, and the xyz values of the old and new NPCs are equivalent. The characteristics in the PBxyz/PCxyz are present in the PAxyz type, even though the xyz values are different.
- When the old NPC is of type PAxyz, the new NPC is of type PAxyz and the xyz values of the old and new NPCs are the same.

The roll procedure will be denied based upon the valid combinations rules, the service status of the old/new NPCs, the new NPC under PBA, channels on the old/new NPCs under test or loopback. The denial messages will explain the denial condition.

If a channel is involved in C-bit monitoring (i.e. its C bits is being monitored by the C-bit processor), the roll still takes place, the CTS16 cross-connection to the C-bit processor on the old NPC remains unimpacted, and the rolled channel will not automatically be C-bit monitored on the new NPC.

At the facility level, however, 2Mbit/s roll will be denied if the CTS16 is cross-connected to the C-bit processor.

Some information is carried forward from the old to the new NPC. Some information is NOT carried forward with the roll.

**Information being carried forward to the new NPC:**

- Channel Timeslot 0 (CTS0) alarm bit settings (e.g. alarm bits 3,4,5 can be set to 0 or 1).
- Spare bit settings for CTS0 to CTS0 cross connection. (dictate how the spare bits will be treated: passthrough, invert, etc.)
- Spare bit settings for CTS0 to non CTS0 cross connection.
- The Pseudo Frame Word (PFW) or the NFW (Mode 2) mode.
- All circuit parameters (e.g. RDLC, CUS, trunk conditioning, etc.) are retained for all channels.

It is important to note that if a roll procedure is reversed, the copying of the CTS0 settings to the new NPC will NOT be reversed. Therefore, the copied CTS0 settings on the new NPC will remain there.

**Information NOT being carried forward to the new NPC:**

- Alarm severity level information (alarms can be provisioned to be informational, minor, major, etc.)
- Threshold parameters, including THMODE state.
- Since xyz must be the same (or equivalent) between the old and new NPCs, if the old NPC is provisioned to be a possible Synchronization source, the new NPC must also be provisioned as one. However, the roll will not cause the new NPC to be an **active** sync source, even if the old one is.

In addition, it should be noted that all of the CTS0-related settings on the old NPC will not be affected by the roll. They will remain unchanged.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**uvmnp** - Hierarchical OLD NPC number

**wxkqr** - Hierarchical NEW NPC number

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**OOS** - Out of service

The OOS keyword is used to force a disconnect from an NPC which is out of service.

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 02** Subject entity is not equipped
- 04** Subject entity is out of service
- 01** Invalid range for specified NPC type
- 12** Active CCN side not IS or failed or pested or hardware OOS
- 13** UNIT not equipped, not in service, or failed
- 14** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS
- 15** FTMI not equipped, not in service, or failed
- 16** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS
- 17** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS
- 18** DSPI not equipped, not in service, or failed
- C8** Exceeded depth limit of 6 on broadcast conference concatenation
- 1A** Required FLI not equipped, not in service, or failed
- 1B** Required MXR not equipped, not in service, or failed
- 1C** Reqd FMT not eqd,not IS,or failed,or inact side FMT not eqd, or not IS
- 1D** Required MIU not equipped, not in service, or failed
- A9** Cross-connect not consistent with feature package
- B7** No DSP unit equipped
- B8** No CBTYPE NPC equipped
- B9** No CBTYPE NPC capacity remaining
- BA** Inactive side NPC out of service and inactive side in service
- 0A** All CBTYPE NPCs out of service or failed
- E0** ETSI not equipped, not in service, or failed
- 67** Improper roll command sequence
- 6B** No mapped channel on old
- 75** Old and new channels have not been paired by a BCAST command.
- 76** Channel or NPC not bridged
- 79** DCTN conference channel cannot be rolled
- 7A** Testport/testgroup channel cannot be rolled

**cc**    *Explanation*

- 7B**    Channel out-of-bounds in a Broadcast or Virtual circuit.
- 7C**    Parity channel out of bound on new
- 7D**    Not first channel in a BCON/virtual conf
- 9C**    Parity channel cannot be within the range of a DS0 command.

## **SW,ROLL,OLD,NEW,INCL,FRC,OOS**

### **DS0 CIRCUIT ROLL- ROLL COMMAND**

#### **Explanation Of Command**

This input command is used to perform the Roll step of the DS0 (or 64kbit/s) Roll operation. (For DS1 or 2 Mbit/s Roll operations use the commands I.14061, I.14071, and I.14081.)

The DS0 (or 64kbit/s) Roll procedure consists of three commands:

1. Bridge

This step will bridge the transmit data by broadcasting to the new DS0 as well as the old DS0. Use command I.14021.

2. Roll

This step rolls the service by switching the receive data from the old DS0 to the new DS0. Use this command.

3. Cut

This step takes down the bridge by disconnecting the transmit data from the old DS0. Use command I.14041.

**NOTE:**

The ROLL procedure will re-direct ALL cross-connections associated with the DS0 signal being rolled.

## **SW,ROLL,OLD,NEW,INCL,FRC,OOS,TWAY**

### **FACILITY ROLL - ROLL COMMAND**

#### **Explanation Of Command**

This input command is used to perform the Roll step of the DS1 or 2Mbit/s Roll procedure. (For DS0 Roll operations use the commands I.14021, I.14031, and I.14041.)

The DS1 or 2Mbit/s Roll procedure consists of three commands:

1. Bridge

This step will bridge the transmit data by broadcasting to the new NPC as well as the old NPC. Use command I.14061.

2. Roll

This step rolls the service by switching the receive data from the old NPC to the new NPC. Use this command.

3. Cut

This step takes down the bridge by disconnecting the transmit data from the old NPC. Use command I.14081.

Not applicable.

## **Explanation Of Parameters**

---

**ROLL** - Roll

**OLD** - Old  
The old termination

**NEW** - New  
The new termination

**[s]abc** - The 3- or 4-digit nonhierarchical OLD NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical NEW NPC number

**Note:** Valid types for old and new NPC's are PAxyz, PBxyz, and PCxyz.

**Note:** The valid combinations of old/new NPCs are as follow:

- When the old NPC is of type PBxyz/PCxyz, the new NPC is of type PBxyz/PCxyz and the xyz values of the old and new NPCs are the same.
- When the old NPC is of type PBxyz/PCxyz, the new NPC is of type PAxyz, and the xyz values of the old and new NPCs are equivalent. The characteristics in the PBxyz/PCxyz are present in the PAxyz type, even though the xyz values are different.
- When the old NPC is of type PAxyz, the new NPC is of type PAxyz and the xyz values of the old and new NPCs are the same.

The roll procedure will be denied based upon the valid combinations rules, the service status of the old/new NPCs, the new NPC under PBA, channels on the old/new NPCs under test or loopback. The denial messages will explain the denial condition.

If a channel is involved in C-bit monitoring (i.e. its C bits is being monitored by the C-bit processor), the roll still takes place, the CTS16 cross-connection to the C-bit processor on the old NPC remains unimpacted, and the rolled channel will not automatically be C-bit monitored on the new NPC.

At the facility level, however, 2Mbit/s roll will be denied if the CTS16 is cross-connected to the C-bit processor.

Some information is carried forward from the old to the new NPC. Some information is NOT carried forward with the roll.

**Information being carried forward to the new NPC:**

- Channel Timeslot 0 (CTS0) alarm bit settings (e.g. alarm bits 3,4,5 can be set to 0 or 1).
- Spare bit settings for CTS0 to CTS0 cross connection. (dictate how the spare bits will be treated: passthrough, invert, etc.)
- Spare bit settings for CTS0 to non CTS0 cross connection.
- The Pseudo Frame Word (PFW) or the NFW (Mode 2) mode.
- All circuit parameters (e.g. RDLC, CUS, trunk conditioning, etc.) are retained for all channels.

It is important to note that if a roll procedure is reversed, the copying of the CTS0 settings to the new NPC will NOT be reversed. Therefore, the copied CTS0 settings on the new NPC will remain there.

**Information NOT being carried forward to the new NPC:**

- Alarm severity level information (alarms can be provisioned to be informational, minor, major, etc.)
- Threshold parameters, including THMODE state.
- Since xyz must be the same (or equivalent) between the old and new NPCs, if the old NPC is provisioned to be a possible Synchronization source, the new NPC must also be provisioned as one. However, the roll will not cause the new NPC to be an **active** sync source, even if the old one is.

In addition, it should be noted that all of the CTS0-related settings on the old NPC will not be affected by the roll. They will remain unchanged.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**INCL** - Inclusive

A circuit designated as a customer controlled circuit, a red circuit or a substrate T1 circuit cannot be modified without using the inclusive keyword in the message. Also, an NPC which supports these circuits cannot be manually removed unless the INCL keyword is given in the remove message.

**FRC** - Force

The FRC keyword is used to force a roll to an NPC which is in CGA.

**OOS** - Out of service

The OOS keyword is used to force a roll from an NPC which is out of service.

**TWAY** - Two-way

The TWAY keyword is used to request a two-way Roll (Bridge and Roll combined).

**cc** - Hexadecimal condition code

**cc**    *Explanation*

**A9**    Cross-connect not consistent with feature package

**B6**    C-bit operations are enabled

## **SW,UNIT,FLI,TOPRTN**

### **SWITCH FLI TO PROTECTION**

#### **Explanation Of Command**

This message requests and reports a switch from the selected facility line interface (FLI) on a DS3 unit (DS3U) or a Hybrid DS3 unit (HDS3U). This message only covers the direction of switch from the service FLI in a DS3U or HDS3U to protection. The other direction of the FLI switch is covered in Message I.35105. The output message reports the occurrence of autonomous protection switching.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

**11** UC is out of service

**12** UC is in service but failed

## **SW,UNIT,MMFG,TOPRTN,FRC**

### **SWITCH MMFG TO PROTECTION**

#### **Explanation Of Command**

This command requests and reports a switch from multiplexer-multiple interface unit functional group (MMFG) c to MMFG P on a DS3 or HDS3 unit. The input message can force MMFG P to serve the MMFG c facility, even though MMFG P was serving another facility which can result in that facility being out-of-service. Alarm reporting is discussed below in the case of a switch that results in that facility being out-of-service.

**Alarm reporting in the case of double MMFG failures:**

(For example, a unit is equipped with MMFG 1 , 2 and P).

Event           MMFG 1 fails  
Automatic protection switch occurs

Message       I hh:mm:ss xy,ww SW UNIT q MMFG 1 TOPRTN COMPL  
MMFG 1 is autonomously removed

Message       \*\*hh:mm:ss xy,ww RMV UNIT q MMFG 1 COMPL

Event           MMFG 2 fails

Message       \*C hh:mm:ss xy,ww RMV UNIT q MMFG 2 COND cc DNY

Event           The craft decides that MMFG-2 is more important and makes  
a switch

Command       SW:FRM xy,ww:UNIT q,MMFG 2,TOPRTN,FRC!

Message       M hh:mm:ss xy,ww[ n[vv]] SW UNIT q MMFG 1 TOPRTN FRC COMPL  
MMFG 1 will switch back to service automatically

Message       I hh:mm:ss xy,ww SW UNIT q MMFG 1 TOSRVC COMPL

Notice that after the switch to protection of MMFG 2, there will be no alarm reporting associated with loss of service of MMFG 1. The alarm condition, which is escalated to critical after loss of service of MMFG 2, actually covers both failures. If the FRC keyword is used, then the MMFG that **was** under protection will no longer be in alarm but will still need to be restored. When the FRC keyword is used, the alarm is idled on the MMFG that **was** under protection, even though it is still OOS. Note also that the autonomous switch message will precede the removal command on the first failure.

**Command**

## **SW,UNIT,MMFG,TOSRVC**

### **SWITCH MMFG TO SERVICE**

#### **Explanation Of Command**

This command requests and reports a switch from multiplexer-multiple interface unit functional group (MMFG) P to MMFG c on a DS3 or HDS3 unit. MMFG P was serving the DS3 or HDS3 facility associated with MMFG c. The output message also reports the occurrence of automatic switchback from protection.

#### **Command**

[I.35121]

**SW:FRM xy,SEQ ww:UNIT [q]q,MMFG c,TOSRVC!**

#### **Completion Message**

[O.35121]

**M hh:mm:ss xy,ww n[vv] SW UNIT [q]q MMFG c TOSRVC COMPL**

#### **Denial Message**

[O.35121.01]

**M hh:mm:ss xy,ww n[vv] SW UNIT [q]q MMFG c TOSRVC COND cc DNY**

#### **Autonomous Message**

[O.35121]

**I hh:mm:ss xy,ww SW UNIT [q]q MMFG c TOSRVC COMPL**

### **Explanation Of Parameters**

---

- UNIT** - Unit
- [q]q** - Unit number (1 through 16)
- MMFG** - Multiplexer-multiplexer interface unit functional group
- c** - The number of the service MMFG within the unit (1 through 6)
- TOSRVC** - To service
- Priority of action
- I** - Information
- M** - Manual
- cc** - Hexadecimal condition code
- | <b>cc</b> | <i>Explanation</i>          |
|-----------|-----------------------------|
| <b>10</b> | Unit is not equipped        |
| <b>11</b> | UC is out of service        |
| <b>12</b> | UC is in service but failed |

## **TCNT — TTST**

---

## **TCNT — TTST**

---

This section documents the commands **TCNT** through **TTST**.

---

## TCNT, FROM, TO, MPM, NAM, NTR, RDC, CUS, INCL

TWO-WAY CROSS-CONNECT TERMINATE,  
FROM, TO, MULTIPOINT MODE

### Explanation Of Command

This message requests the two-way terminated cross-connection of a leg to a multipoint circuit. The circuit will be set up in the terminated state with the disconnect channel code (DCC) inserted in both directions of transmission.

**Note:** Range values apply only to the FTU end of an FTU to Virtual NPC circuit.

### Command

#### Nonhierarchical

[I.12021]

```
TCNT:FRM xy,SEQ ww:FROM [s]abcddd[-eee],TO [t]ghijjj[-kkk],\
MPM(fmd,tmd)[,<tc>][,NAM][,NTR m][,RDC][,{CUS|INCL}]!
```

#### Hierarchical

[I.12021]

```
TCNT:FRM xy,SEQ ww:FROM uvmnpddd[-eee],TO wxkqrjjj[-kkk],\
MPM(fmd,tmd)[,<tc>][,NAM][,NTR m][,RDC][,{CUS|INCL}]!
```

## **Completion Message**

---

### **Nonhierarchical**

---

[O.12021]

## Autonomous Message

Not applicable.

## Explanation Of Parameters

[s]abc - The 3- or 4-digit nonhierarchical FROM NPC number  
[t]ghi - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

The list of valid values given below is limited by the equipage of the frame.

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

|           |          |              |                                 |
|-----------|----------|--------------|---------------------------------|
| Unit      | Module   | NPC          |                                 |
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**ddd,**  
**jjj** - Channel numbers  
**eee,**  
**kkk** - Channel numbers denoting the end of a range specification

Range variables eee and kkk apply only to the FTU end of an FTU to Virtual NPC circuit; that is, they cannot apply to the Virtual NPC end. Range variables do not apply to either end of an FTU to DMB or DMB to DMB circuit.

Channel numbers

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers  
001-500      (Virtual NPC)

Cross-connections may be between various Network Processing Circuit (NPC) types:

Facility Terminating Unit (IFTU/FTU)/DS3U NPC and DMB  
DMB and DMB  
IFTU/FTU/DS3U NPC and Virtual NPC  
**MPM**      - Multipoint mode  
**fmd**      - Multipoint mode of FROM end of the circuit  
**tmd**      - Multipoint mode of TO end of the circuit  
The direction of data flow is indicated by MPM (fmd,tmd)

For DMB circuits, there are four possible values for fmd and tmd:

| <b>fmd</b> | <b>tmd</b> | <i>Explanation</i>                                                                          |
|------------|------------|---------------------------------------------------------------------------------------------|
| SYM        |            | For legs of a symmetrical multipoint circuit (must be a DMB channel)                        |
| BRD        |            | For nonbackbone (tributary) legs of a broadcast multipoint circuit (must be a DMB channel)  |
| BBL        |            | For the backbone leg of a broadcast multipoint circuit (must be a DMB channel)              |
| LEG        |            | For the end that does not terminate on the multipoint circuit (must be an FTU/DS3U channel) |

For virtual NPC circuits, there are three possible values for fmd and tmd:

| <b>fmd</b> |                                                                                           |
|------------|-------------------------------------------------------------------------------------------|
| <b>tmd</b> | <i>Explanation</i>                                                                        |
| BRD        | For nonbackbone legs of a broadcast multipoint circuit (must be a virtual NPC channel)    |
| BBL        | For the backbone leg of a broadcast multipoint circuit (must be a virtual NPC channel)    |
| LEG        | For the end that does not terminate on the multipoint circuit (must be FTU/DS3U channels) |

The possible combinations are:

For within a DMB or virtual conference:

LEG,BBL  
LEG,BRD  
SYM,LEG (only for DMB)

For concatenation of conferences:

BRD,BBL  
BBL,BBL  
SYM,SYM

**Note:** To avoid possible transmission delays in the conferencers, DACS II will not allow DMB broadcast conferences to be concatenated more than six deep. However, each concatenated conference will support the maximum allowable number of legs. This allows conferences to branch out at any point in the daisy chain, as long as each branch does not concatenate more than six conferences from the backbone leg.

**Note:** Default values for noise guard (NG) and echo suppression (ES) are applied to symmetrical bridges (multipoint mode SYM) and polling circuits (multipoint mode BBL,BRD). These default values are:

|                     |            |            |
|---------------------|------------|------------|
| Symmetrical bridges | NG = -18db | ES = -18db |
| Polling circuits    | NG = 0db   | ES = 0db   |

**tc** - Trunk conditioning, which has the input form

**TRSP, {IW X'pq|TRB|MUX}**

Represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. The TRSP (transparent) signaling specification is the only one allowed.

The following signaling options are allowed:

| <i>signaling</i> | <i>Explanation</i>        |
|------------------|---------------------------|
| TRSP             | Transparent, no signaling |

The following insertion word options are allowed:

| <i>IW</i> | <i>Explanation</i>                                                                                                                       |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq   | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| TRB       | Standard trouble code, equal to IW X'E4, not valid for CEPT.                                                                             |
| MUX       | MUX out of sync code, equal to IW X'1A, not valid for CEPT.                                                                              |
| Omitted   | Only valid for CEPT, will default to IW-X-FF.                                                                                            |

All leg connections to multipoint circuits using a DMB NPC or a Virtual NPC must use TRSP signaling. The insertion word portion is user specified as noted above and may be varied from leg to leg.

For all multipoint to multipoint conference cross-connections (DMB concatenated conferences) the only allowable trunk conditioning specification is TRSP, and need not be specified, as it is the default. An insertion word is not valid for concatenated conferences.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**NTR** - No transmit

**m** - Direction in which transmission is shut off

| <i>m</i> | <i>Explanation</i> |
|----------|--------------------|
| F        | FROM               |
| T        | TO                 |

To set up one-way connections; that is, to shut off transmission towards a FROM or TO termination, use NTR and specify the direction in variable m. If NTR m is specified on the BBL (backbone leg) of a multipoint circuit, then the broadcast (BRD) legs of this circuit have their outward transmission turned off.

NTR m is optional if the virtual NPC is part of the circuit.

**NOBBL** - No backbone leg

If the type of circuit was a broadcast circuit, NOBBL indicates that no backbone leg is yet specified in either the FROM or TO direction. This argument will appear until a backbone leg is specified for this circuit.

*m*      *Explanation*

**F**      - From

**T**      - To

**CUS** - Customer

Customer-controlled circuit

The optional CUS keyword is used to flag a circuit as a customer controlled circuit. On output it indicates that the circuit is customer controlled.

All legs on a multipoint customer controlled circuit must be designated as CUS.

**RDC** - Red circuit

On input the optional RDC keyword is used to mark a circuit as a Red Circuit. On output it indicates that the circuit is a Red Circuit.

All legs on a multipoint Red Circuit must be designated RDC.

**INCL** - Inclusive

A termination designated as CUS or RDC cannot be disconnected or modified without using the INCL keyword in the message. Also, an NPC which supports these circuits cannot be manually removed unless the INCL keyword is given in the remove message.

A disconnected termination previously marked CUS remains a customer controlled termination. The INCL keyword must be used to reconnect this termination to other terminations. However, if they are reconnected without the CUS keyword, they lose their customer controlled status.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

**E1 to E1** Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

**E1 to DS1 or DS1 to E1** Same explanation as E1 to E1.

**DS1 to DS1** Not applicable.

**mmm** - FROM channel number involved in the denial (ddd through eee)

**nnn** - TO channel number involved in the denial (jjj through kkk)

**st** - Status of denial

**d** - Direction

**d** *Explanation*

**B** Both

**F** FROM

**T** TO

**cc** - Hexadecimal condition code

**cc st** *Explanation*

**06 INERR** Invalid range for specified FROM NPC type

**07 INERR** Invalid range for specified TO NPC type

**08 INERR** Invalid FROM NPC type for AIS insertion

**09 INERR** Invalid TO NPC type for AIS insertion

**12 MCOND** Active CCN side not IS or failed or pested or hardware OOS

**13 MCOND** UNIT not equipped, not in service, or failed

| <b>cc</b> | <b>st</b>      | <i>Explanation</i>                                                    |

## **TCNT, FROM, TO, NAM, CUS, INCL, RDC, PRIOUT**

### **TWO-WAY CROSS-CONNECTION TERMINATED**

#### **Explanation Of Command**

This command requests a set of terminated cross-connections over a range of specified From-direction and To-direction terminations.

If the user wants to cross-connect Nx64 kbits/s circuits, then the range feature of this command should be used.

The circuit will be formed in the terminated state with the disconnect code (DCC) inserted in both directions of transmission.

#### **Command**

##### **Nonhierarchical**

[I.12001]

```

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**FROM** - From

[s]abcddd

- Nonhierarchical termination in to direction

[s]abc - The 3- or 4-digit NPC number  
ddd - Channel number, beginning of range

**TO** - To

[s]ghijjj

- Nonhierarchical termination in from direction

[s]ghi - NPC number  
jjj - Channel number, beginning of range  
The values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

**uvmnpddd**

- Hierarchical termination in from direction

**wxkqrjjj**

- Hierarchical termination in to direction

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

**ddd, jjj**

- Channel number, beginning of range

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**eee, kkk**

- Channel numbers for end of channel range

To connect a range of channels, use the optional fields **eee** and **kkk**.

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

The following channels are not allowed in a channel range:

- Channel 000
- CAS (channel associated signaling) channel 031 (S16 of a CEPT type NPC)

**tc** - Trunk conditioning

Defines the cross-connected signaling and insertion word applied to the circuit during a failure condition. The signaling and insertion word are separately specified, using a comma as the delimiter using the form:

<tc\_sig>, <tc\_iw>

where: tc\_sig is the **signaling** portion of trunk conditioning and  
tc\_iw is the **insertion word** portion of trunk conditioning.

Valid values for two-way cross-connects are:

*4-state signaling*

**TC(ijkl, mnop), IW X'nn**

*16-state signaling*

**TC(efghijkl, mnopqrst), IW X'nn**  
**TC(X'uv, X'yz), IW X'nn**

*Transparent signaling*

**TRSP, IW X'nn**  
**TRSP**

**Note:** 4-state signaling will be expanded to 16-state by duplicating the bits.

**Note:** If <tc> is omitted and both terminations are Channel Associated Signaling (CAS) types, it will default to 16-state signaling with all ones and an insertion word of all ones.

Example:

**TC(X'FF, X'FF), IW X'FF**

**Note:** If <tc> is omitted, and one or both terminations are Non-Signaling Associated (NSA) types, it will default to transparent signaling with no insertion word.

Example:

**TRSP**

**ijkl** - 4-state binary signaling value - From direction

**mnop** - 4-state binary signaling value - To direction

**efghijkl**

- 16-state binary signaling value - From direction

**mnopqrst**

- 16-state binary signaling value - To direction

**uv** - 16-state hexadecimal signaling value - From direction

**yz** - 16-state hexadecimal signaling value - To direction

**nn** - Hexadecimal Insertion Word

**TRSP** - Transparent

Outgoing signaling will be fixed at **1101** (hex **D**) in slot 16 for Channel Associated Signaling (CAS) primaries. **TRSP** is the only allowable option for Non-Signaling Associated (NSA) primaries.

**Note:** When the provisioning insertion word (PIW) is assigned in the **GRTH: :NPC** command, a four-bit pattern is inserted into the associated portion of time slot 16 for CAS circuits when the circuit is disconnected.

Additional rules apply for 2.048 Mbit/s termination cross-connects.

The allowable signaling type and signaling consequent action are shown in the following table.

**Table 18-1. Allowable Signaling Type and Signaling Consequent Action**

| Primary Type<br>in<br>Cross-connect | Allowable<br><tc><br>Signaling<br>Specification | Resulting<br>Signaling<br>Code<br><br>FROM, TO    | Resulting<br>Signaling<br>Consequent<br>Action<br>(Hardware)<br>FROM, TO | Resulting<br>Signaling<br>Consequent<br>Action<br>(Firmware)<br>FROM, TO | Resulting<br>Disconnect<br>(When DCC used<br>in disconnect<br>command) |
|-------------------------------------|-------------------------------------------------|---------------------------------------------------|--------------------------------------------------------------------------|--------------------------------------------------------------------------|------------------------------------------------------------------------|
| CAS ↔ CAS                           | <b>TRSP</b>                                     | Fixed at <b>X'D</b>                               | Fixed at <b>X'D</b>                                                      | Fixed at <b>X'D</b>                                                      | <b>X'D</b>                                                             |
|                                     | <b>TC-X'uv, X'yz*</b>                           | CAS<br>(Passed Through)                           | <b>X'F</b>                                                               | <b>X'uv, X'yz</b>                                                        | <b>X'v, X'z</b>                                                        |
|                                     | Omitted                                         | CAS<br>(Passed Through)                           | <b>X'F</b>                                                               | <b>X'F</b>                                                               | <b>X'F</b>                                                             |
| NSA ↔ CAS                           | <b>TRSP/Omitted</b>                             | None (Fixed at<br><b>X'D</b> in CAS<br>direction) | Fixed at<br><b>X'D</b> in CAS<br>direction                               | Fixed at<br><b>X'D</b> in CAS<br>direction                               | <b>X'D</b> in CAS<br>direction                                         |
| NSA ↔ NSA                           | <b>TRSP/Omitted</b>                             | Not appl.                                         | Not appl.                                                                | Not appl.                                                                | Not appl.                                                              |

\* For TCON and TCNT TC is X'uv, X'yz.  
For OCON, OCNT and BCON TC is --, X'yz.

The allowable cross-connected time slot consequent action are shown in the following table.

**Table 18-2. Allowable Cross-Connected Time Slot Consequent Action**

| Allowable <tc><br>Insertion<br>Word | Resulting Cross-Connected<br>Time Slot Consequent Action<br>FROM, TO | Resulting Disconnect<br>Code (When DCC used<br>in disconnect command) |
|-------------------------------------|----------------------------------------------------------------------|-----------------------------------------------------------------------|
| Omitted                             | X'FF, X'FF                                                           | X'FF                                                                  |
| IW X'pq *                           | X'FF, X'FF                                                           | X'pq                                                                  |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC(abcd, efgh)**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Two-Point:*

- E1 to DS1      Gateway cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law conversion set as a default. The **NAM** keyword is used to disable the conversions.
- E1 to E1      Default, the **NAM** keyword may be used but there is no need to specify **NAM** explicitly since A-law to  $\mu$ -law and  $\mu$ -law to A-law conversion is not needed, and therefore not performed, for a pure E1 cross-connect.
- DS1 to DS1    Not applicable.

**CUS** - Customer

This optional keyword is used to flag a circuit as a customer controlled circuit. On output it indicates that the circuit is customer controlled.

**RDC** - Red circuit

This optional keyword is used to mark a circuit as a Red Circuit. On output it indicates that the circuit is a Red Circuit.

**INCL** - Inclusive

A termination designated as a customer controlled circuit or a red circuit cannot be disconnected or modified without using this keyword in the message. Also, an NPC which supports these circuits cannot be manually removed unless this keyword is given in the remove command.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**mmm** - The From-direction channel number involved in denial (**ddd** through **eee**).

**nnn** - The To-direction channel number involved in denial (**jjj** through **kkk**).

**d** - Direction

|          |                    |
|----------|--------------------|
| <b>d</b> | <i>Explanation</i> |
| <b>F</b> | FROM               |
| <b>T</b> | TO                 |

## **TCNT, FROM, TO, PFW, NFW**

### **TWO WAY CROSS-CONNECTION TERMINATE**

#### **Explanation Of Command**

This command requests the terminated connection of timeslot 0 (TS0) of one NPC to a timeslot other than TS0 (non-TS0) on another NPC. A cross-connect mode must be chosen to prevent the TS0 Frame Alignment Signal from being transmitted in a non-TS0 timeslot.

#### **Command**

##### **Nonhierarchical**

[I.12051]

```
TCNT:FRM xy,SEQ ww:FROM [s]abcddd,TO [t]ghijjj\
[, {PFW(abcdefg,ijklmno)|NFW}]!
```

##### **Hierarchical**

[I.12051]

```
TCNT:FRM xy,SEQ ww:FROM uvmnpddd,TO wxkqrjjj\
[, {PFW(abcdefg,ijklmno)|NFW}]!
```

## **Completion Message**

## **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**FRM** - Frame

**FROM** - From

**TO** - To

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number

**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Channel number for FROM NPC

**jjj** - Channel number for TO NPC

000-030 on CEPT type NPCs grown as CAS

000-031 on CEPT type NPCs grown as NSA

**Note:** One of the channel numbers specified (ddd or jjj) must be channel 000 (TS0), while the other channel number (jjj or ddd) must be a number other than channel 000 (non-TS0).

The NPC containing the TS0 channel must be a PA or TH type NPC, while the NPC containing the non-TS0 channel can be either a PA, PB, PC or TH type NPC.

Channel 000 is not allowed in a range of channels.

**PFW** - Pseudo Frame Word

The PFW parameter is used to select Mode 1 of TS0 Cross-Connect:  
In both directions of transmission the Frame Word is replaced  
by a Pseudo Frame Word.

**abcdefg**

- Value of the Pseudo Frame Word

This value replaces the Frame Alignment Signal (Bits 2 - 8) of the Frame  
Word being transmitted from the TO NPC to the FROM NPC.

The characters in the field represent the following bits:

|          |                           |
|----------|---------------------------|
| <b>a</b> | - Pseudo Frame Word Bit 2 |
| <b>b</b> | - Pseudo Frame Word Bit 3 |
| <b>c</b> | - Pseudo Frame Word Bit 4 |
| <b>d</b> | - Pseudo Frame Word Bit 5 |
| <b>e</b> | - Pseudo Frame Word Bit 6 |
| <b>f</b> | - Pseudo Frame Word Bit 7 |
| <b>g</b> | - Pseudo Frame Word Bit 8 |

Values for bits a - g:

|     |                                     |
|-----|-------------------------------------|
| "0" | - Sets the corresponding bit to "0" |
| "1" | - Sets the corresponding bit to "1" |

**ijklmno**

- Value of the Pseudo Frame Word

This value replaces the Frame Alignment Signal (Bits 2 - 8) of the Frame  
Word being transmitted from the FROM NPC to the TO NPC.

The characters in the field represent the following bits:

|          |                           |
|----------|---------------------------|
| <b>i</b> | - Pseudo Frame Word Bit 2 |
| <b>j</b> | - Pseudo Frame Word Bit 3 |
| <b>k</b> | - Pseudo Frame Word Bit 4 |
| <b>l</b> | - Pseudo Frame Word Bit 5 |
| <b>m</b> | - Pseudo Frame Word Bit 6 |
| <b>n</b> | - Pseudo Frame Word Bit 7 |
| <b>o</b> | - Pseudo Frame Word Bit 8 |

Values for bits i - o:

|     |                                     |
|-----|-------------------------------------|
| "0" | - Sets the corresponding bit to "0" |
| "1" | - Sets the corresponding bit to "1" |

**Note:** Bit 2 of timeslot 0 in a 2Mbit/s signal is used to distinguish the Frame Word from the Non Frame Word and it must always be '0' in the FW and '1' in the NFW. When defining the Pseudo Frame Word the user must make sure that the Pseudo Frame Word can be distinguished from the Non Frame Word.

**NFW** - Non frame word

The NFW parameter is used to select Mode 2 of TS0 Cross-Connect. In both directions of transmission the Frame Word is replaced by the Non Frame Word, thus repeating the content of the Non Frame Word in consecutive frames.

If no mode is selected in the command, the default shall be NFW, that is, the default mode of operation is Mode 2.

**d** - Direction

| <b>d</b> | <i>Explanation</i> |
|----------|--------------------|
| F        | From               |
| T        | To                 |
| B        | Both               |

**st** - Status

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |
|-----------|--------------|-----------------------------------------------------------------------|
| <b>06</b> | <b>INERR</b> | Invalid range for specified FROM NPC type                             |
| <b>07</b> | <b>INERR</b> | Invalid range for specified TO NPC type                               |
| <b>08</b> | <b>INERR</b> | Invalid FROM NPC type for AIS insertion                               |
| <b>09</b> | <b>INERR</b> | Invalid TO NPC type for AIS insertion                                 |
| <b>12</b> | <b>MCOND</b> | Active CCN side not IS or failed or pested or hardware OOS            |
| <b>13</b> | <b>MCOND</b> | UNIT not equipped, not in service, or failed                          |

| <b>20</b> | <b>MCOND</b> | Line format types are incompatible                                    |
| <b>21</b> | <b>MCOND</b> | Trunk conditioning is invalid                                         |
| <b>E8</b> | <b>INERR</b> | SC invalid for cross-connection specified                             |
| <b>EC</b> | <b>INERR</b> | Invalid channel 000 cross-connection specified                        |
| <b>FF</b> | <b>ROLL</b>  | Termination is in process of being rolled                             |
| <b>E0</b> | <b>MCOND</b> | ETSI not equipped, not in service, or failed                          |
| <b>3A</b> | <b>SCERR</b> | Invalid FPI value                                                     |

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                   |
|-----------|--------------|------------------------------------------------------|
| <b>8A</b> | <b>INERR</b> | Mismatch between channel 0 crossconnect and keywords |

## **TCNT, FROM, TO, RDC, CUS, INCL, PRIOUT**

### **TERMINATED TWO-WAY CROSS CONNECT**

#### **Explanation Of Command**

This message terminates two-way cross connections of non-channelized network processing circuits. The alarm-indication signal (AIS) is the idle code and does not need to be entered. Trunk condition options for 64 kbit/s cross connection are not allowed for non-channelized connections.

When a failure occurs or during an alarm state, the AIS is transmitted toward the TO NPC.

#### **Command**

Not applicable.

### **Explanation Of Parameters**

---

[s]abc - The 3- or 4-digit non-hierarchical non-channelized FROM NPC number

[t]ghi - The 3- or 4-digit non-hierarchical non-channelized TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

## **TCON, FROM, CB, CUS, RDC, INCL**

### **TWO-WAY C-BIT CROSS-CONNECTS**

#### **Explanation Of Command**

This message establishes a cross-connection between signaling timeslot 16 (channel 031) of the PB- or PC-type NPC provisioned for channel associated signaling and the C-bit (CB) type NPC on the DSPU. The software automatically assigns the CB number and the channel number on the CB.

## Explanation Of Parameters

**FROM** - From

FTU NPC identifier keyword

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

Values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**CB** - C-bit

C-bit processing NPC identifier keyword

**Note:** The CB number and the channel number on the CB are automatically assigned by software.

**CUS** - Customer

Specify that this cross-connect is customer controlled

**RDC** - Red circuit

Specify that this is a red circuit

**INCL** - Inclusive

Specify that red circuits and/or customer controlled circuits are to be included. A termination designated as a CUS or a RDC cannot be disconnected or modified without using the INCL keyword in the message. An NPC which supports these circuits cannot be manually removed unless the INCL keyword is given in the remove message.

**d** - Direction

**d**      *Explanation*

F      FROM

T      TO

B      Both

**st** - Status

**cc** - Hexadecimal condition code

**cc**    **st**      *Explanation*

**03**    **INERR**    No RDC or CUS circuits and INCL keyword used

**12**    **MCOND**    Active CCN side not IS or failed or pested or hardware OOS

**13**    **MCOND**    UNIT not equipped, not in service, or failed

**14**    **MCOND**    CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS

**15**    **MCOND**    FTMI not equipped, not in service, or failed

**16**    **MCOND**    FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**17**    **MCOND**    TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**18**    **MCOND**    DSPI not equipped, not in service, or failed

**30**    **INERR**    NPC not provisioned for CAS

**B7**    **MCOND**    No DSP unit equipped

**B8**    **MCOND**    No CBTYPE NPC equipped

**B9**    **MCOND**    No CBTYPE NPC capacity remaining

**BA**    **MCOND**    Inactive side NPC out of service and inactive side in service

**F1**    **INERR**    Parameter only valid with PA, PB, or PC type NPCs

**0A**    **OOS**      All CBTYPE NPCs out of service or failed

**FF**    **ROLL**      Termination is in process of being rolled

**E0**    **MCOND**    ETSI not equipped, not in service, or failed

**2C**                    not allowed for clear 2MB

| <b>st</b>   | <b>d</b> | <i>Explanation</i>          |
|-------------|----------|-----------------------------|
| <b>ASGN</b> | <b>F</b> | Termination assigned        |
| <b>CUS</b>  | <b>F</b> | Customer-controlled Circuit |
| <b>FAIL</b> | <b>F</b> | Failed                      |
| <b>OOS</b>  | <b>F</b> | Out-of-service              |
| <b>UEQD</b> | <b>F</b> | Unequipped                  |
| <b>UTST</b> | <b>F</b> | Under Test                  |

## **TCON, FROM, TO, MPM, NAM, NTR, RDC, CUS, INCL**

### **TWO-WAY CROSS-CONNECT FROM, TO MULTIPOINT MODE**

#### **Explanation Of Command**

This command requests a multipoint two-way cross-connection between the specified FROM and TO end terminations and is used to connect a DS0 leg to a multipoint circuit, or to cross-connect a leg, consisting of a single or a contiguous range of DS0 channels, to a multipoint circuit in the virtual network processing circuit. Cross-connections may be between various network processing circuit types.

If the user wants to cross-connect Nx64 kbits/s circuits, then the range feature of this command should be used.

| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number

Unit Type VI (Virtual)

|           |          |              |                                 |
|-----------|----------|--------------|---------------------------------|
| Unit      | Module   | NPC          |                                 |
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**ddd,**

**jjj** - Channel or conference numbers

**eee,**

**kkk** - Channel or conference numbers denoting the end of range specification

Channel numbers

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers  
001-500      (Virtual NPC)

Cross-connections may be between various Network Processing Circuit (NPC) types:

DMB and DMB

**MPM**    - Multipoint mode

**fmd**    - FROM mode

**tmd**    - TO mode

Multipoint modes of the FROM and TO ends of the circuit

For DMB circuits, there are four possible values for fmd and tmd:

**fmd**

**tmd**

**SYM**    For legs of a symmetrical multipoint circuit (must be a DMB channel)

**BRD**    For nonbackbone (tributary) legs of a broadcast multipoint circuit (must be a DMB channel)

**BBL**    For the backbone leg of a broadcast multipoint circuit (must be a DMB channel)

**LEG**    For the end that does not terminate on the multipoint circuit (must be an FTU/DS3U/HDS3U channel)

For virtual NPC circuits, there are three possible values for fmd and tmd:

**fmd**

**tmd**

- BRD For nonbackbone legs of a broadcast multipoint circuit (must be a virtual NPC channel)
- BBL For the backbone leg of a broadcast multipoint circuit (must be a virtual NPC channel)
- LEG For the end that does not terminate on the multipoint circuit (must be FTU/DS3U/HDS3U channels)

The valid combinations of fmd and tmd are:

For within a DMB or virtual conference:

LEG, BBL or BBL, LEG  
LEG, BRD or BRD, LEG  
SYM, LEG or LEG, SYM (only for DMB)

For concatenation of conferences:

BRD, BBL or BBL, BRD  
BBL, BBL  
SYM, SYM

**Note:** Default values for noise guard (NG) and echo suppression (ES) are applied to symmetrical bridges (multipoint mode SYM) and polling circuits (multipoint mode BBL, BRD). These default values are:

|                     |            |            |
|---------------------|------------|------------|
| Symmetrical bridges | NG = -18db | ES = -18db |
| Polling circuits    | NG = 0db   | ES = 0db   |

**Note:** To avoid possible transmission delays in the conferencers, DACS II will not allow DMB broadcast conferences to be concatenated more than six deep. However, each concatenated conference will support the maximum allowable number of legs. This allows conferences to branch out at any point in the daisy chain, as long as each branch does not concatenate more than six conferences from the backbone leg.

**tc** - Trunk conditioning, which has the input form

**TRSP, {IW X'pq|TRB|MUX}**

Represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. The TRSP (transparent) signaling specification is the only one allowed.

The following signaling options are allowed:

| <i>signaling</i> | <i>Explanation</i>        |
|------------------|---------------------------|
| TRSP             | Transparent, no signaling |

The following insertion word options are allowed:

| <i>IW</i> | <i>Explanation</i>                                                                                                                       |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq   | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| TRB       | Standard trouble code, equal to IW X'E4, not valid for CEPT.                                                                             |
| MUX       | MUX out of sync code, equal to IW X'1A, not valid for CEPT.                                                                              |
| Omitted   | Only valid for CEPT, will default to IW-X-FF.                                                                                            |

All leg connections to multipoint circuits using a DMB NPC or a Virtual NPC must use TRSP signaling. The insertion word is user specified and may be varied from leg to leg.

For all multipoint to multipoint conference cross-connections (DMB concatenated conferences) only TRSP signaling is allowed and is the default hence it need not be specified. The insertion word is not valid for concatenated conferences.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**NTR** - No Transmit

**m** - The direction toward which transmission is shut off

*m*      *Explanation*

F      FROM

T      TO

The NTR option is used to set up one-way connections; that is, to shut off transmission towards the specified FROM or TO termination. If NTR m is specified on the BBL (backbone leg) of a multipoint circuit, then the BRD (broadcast) legs of this circuit have their outward transmission turned off.

The NTR field is optional if the virtual NPC is part of the circuit. The direction of the data flow is indicated by the MPM (fmd,tmd) field.

**CUS** - Customer

All legs on a multipoint customer controlled circuit must be designated as CUS. A disconnected termination previously marked CUS remains as a customer controlled termination.

**INCL** - Inclusive

The INCL keyword must be used to reconnect a termination to other terminations. However, if they are reconnected without the CUS keyword, they lose their customer controlled status.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

E1 to E1      Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

E1 to DS1 or      Same explanation as E1 to E1.  
DS1 to E1

DS1 to DS1      Not applicable.

**RDC** - Red circuit

If the optional RDC field is present, the circuit will be flagged as a Red Circuit. All legs on a multipoint red circuit must be designated RDC.

**NOBBL** - No backbone leg

If the type of circuit was a broadcast circuit, the optional NOBBL indicates that no backbone leg is yet specified in either the FROM or TO direction. This argument will appear until a backbone leg is specified for this circuit.

**F** - From

**T** - To

**mmm** - FROM channel number involved in the denial (ddd through eee)

**nnn** - TO channel number involved in the denial (jjj through kkk)

**st** - Status

**d** - Direction

*d Explanation*

F FROM

T TO

B BOTH

**cc** - Hexadecimal condition code

*cc st Explanation*

**06 INERR** Invalid range for specified FROM NPC type

**07 INERR** Invalid range for specified TO NPC type

**08 INERR** Invalid FROM NPC type for AIS insertion

**09 INERR** Invalid TO NPC type for AIS insertion

**12 MCOND** Active CCN side not IS or failed or pested or hardware OOS

**13 MCOND** UNIT not equipped, not in service, or failed

**14 MCOND** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS

**15 MCOND** FTMI not equipped, not in service, or failed

**16 MCOND** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**17 MCOND** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**18 MCOND** DSPI not equipped, not in service, or failed

**20 MCOND** Line format types are incompatible

**21 MCOND** Trunk conditioning is invalid

**22 MCOND** FMC cannot be cross-connected in this format

| <b>cc</b> | <b>st</b>      | <i>Explanation</i>                                                   |

## **TCON, FROM, TO, NAM, CUS, INCL, RDC, PRIOUT**

### **TWO-WAY CROSS-CONNECTION**

#### **Explanation Of Command**

This command requests the two-point two-way connection of two specified cross-connect circuits or a range of cross-connected circuits.

If the user wants to cross-connect Nx64 kbits/s circuits, then the range feature of this command should be used.

#### **Command**

##### **Nonhierarchical**

[|.11001]

## Explanation Of Parameters

**FROM** - From

[s]abcdddd

- Nonhierarchical termination in from direction

[s]abc - The 3- or 4-digit NPC number

ddd - Channel number, beginning of range

**TO** - To

[s]ghijjj

- Nonhierarchical termination in to direction

[s]ghi - The 3- or 4-digit NPC number

jjj - Channel number, beginning of range

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uvmnpddd**

- Hierarchical termination in from direction

**wxkqrjjj**

- Hierarchical termination in to direction

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

**ddd, jjj**

- Channel number, beginning of range

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

If the channel being connected is an FDL (Facility Data Link), then **ddd** (**jjj**) is **000** and signaling type should be of type **TC(ijkl,mnop)**.

Only the FDL of a DE type NPC with ESF Format can be cross-connected.

**eee, kkk**

- Channel numbers for end of channel range

To connect a range of channels, use the optional fields **eee** and **kkk**.

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Channel 000 and channel 031 (that is, TS16 of a CEPT type NPC) are not allowed in a range of channel numbers.

**tc** - Trunk conditioning

Defines the cross-connected signaling and insertion word applied to the circuit during a failure condition. The signaling and insertion word are separately specified, using a comma as the delimiter using the form:

<tc\_sig>, <tc\_iw>

where: tc\_sig is the **signaling** portion of trunk conditioning and  
tc\_iw is the **insertion word** portion of trunk conditioning.

Valid values for two-way cross-connects are:

*4-state signaling*

**TC(ijkl, mnop), IW X'nn**

*16-state signaling*

**TC(efghijkl, mnopqrst), IW X'nn**  
**TC(X'uv, X'yz), IW X'nn**

*Transparent signaling*

**TRSP, IW X'nn**  
**TRSP**

**Note:** 4-state signaling will be expanded to 16-state by duplicating the bits.

**Note:** If <tc> is omitted and both terminations are Channel Associated Signaling (CAS) types, it will default to 16-state signaling with all ones and an insertion word of all ones.

Example:

**TC(X'FF, X'FF), IW X'FF**

**Note:** If <tc> is omitted, and one or both terminations are Non-Signaling Associated (NSA) types, it will default to transparent signaling with no insertion word.

Example:

**TRSP**

**ijkl** - 4-state binary signaling value - From direction

**mnop** - 4-state binary signaling value - To direction

**efghijkl**

- 16-state binary signaling value - From direction

**mnopqrst**

- 16-state binary signaling value - To direction

**uv** - 16-state hexadecimal signaling value - From direction

**yz** - 16-state hexadecimal signaling value - To direction

**nn** - Hexadecimal Insertion Word

**TRSP** - Transparent

Outgoing signaling will be fixed at **1101** (hex **D**) in slot 16 for Channel Associated Signaling (CAS) primaries. **TRSP** is the only allowable option for Non-Signaling Associated (NSA) primaries.

**Note:** When the provisioning insertion word (PIW) is assigned in the **GRTH: :NPC** command, a four-bit pattern is inserted into the associated portion of time slot 16 for CAS circuits when the circuit is disconnected.

Additional rules apply for 2.048 Mbit/s termination cross-connects.

The allowable signaling type and signaling consequent action are shown in the following table.

**Table 18-3. Allowable Signaling Type and Signaling Consequent Action**

| Primary Type<br>in<br>Cross-connect | Allowable<br><tc><br>Signaling<br>Specification | Resulting<br>Signaling<br>Code<br><br>FROM, TO    | Resulting<br>Signaling<br>Consequent<br>Action<br>(Hardware)<br>FROM, TO | Resulting<br>Signaling<br>Consequent<br>Action<br>(Firmware)<br>FROM, TO | Resulting<br>Disconnect<br>(When DCC used<br>in disconnect<br>command) |
|-------------------------------------|-------------------------------------------------|---------------------------------------------------|--------------------------------------------------------------------------|--------------------------------------------------------------------------|------------------------------------------------------------------------|
| CAS ↔ CAS                           | <b>TRSP</b>                                     | Fixed at <b>X'D</b>                               | Fixed at <b>X'D</b>                                                      | Fixed at <b>X'D</b>                                                      | <b>X'D</b>                                                             |
|                                     | <b>TC-X'uv, X'yz*</b>                           | CAS<br>(Passed Through)                           | <b>X'F</b>                                                               | <b>X'uv, X'yz</b>                                                        | <b>X'v, X'z</b>                                                        |
|                                     | Omitted                                         | CAS<br>(Passed Through)                           | <b>X'F</b>                                                               | <b>X'F</b>                                                               | <b>X'F</b>                                                             |
| NSA ↔ CAS                           | <b>TRSP/Omitted</b>                             | None (Fixed at<br><b>X'D</b> in CAS<br>direction) | Fixed at<br><b>X'D</b> in CAS<br>direction                               | Fixed at<br><b>X'D</b> in CAS<br>direction                               | <b>X'D</b> in CAS<br>direction                                         |
| NSA ↔ NSA                           | <b>TRSP/Omitted</b>                             | Not appl.                                         | Not appl.                                                                | Not appl.                                                                | Not appl.                                                              |

\* For TCON and TCNT TC is X'uv,X'yz.  
For OCON, OCNT and BCON TC is --,X'yz.

The allowable cross-connected time slot consequent action are shown in the following table.

**Table 18-4. Allowable Cross-Connected Time Slot Consequent Action**

| Allowable <tc><br>Insertion<br>Word | Resulting Cross-Connected<br>Time Slot Consequent Action<br>FROM, TO | Resulting Disconnect<br>Code (When DCC used<br>in disconnect command) |
|-------------------------------------|----------------------------------------------------------------------|-----------------------------------------------------------------------|
| Omitted                             | X' FF, X' FF                                                         | X' FF                                                                 |
| IW X' pq *                          | X' FF, X' FF                                                         | X' pq                                                                 |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC(abcd, efgh)**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Two-Point:*

E1 to DS1      Gateway cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law conversion set as a default. The **NAM** keyword is used to disable the conversions.

E1 to E1      Default, the **NAM** keyword may be used but there is no need to specify **NAM** explicitly since A-law to  $\mu$ -law and  $\mu$ -law to A-law conversion is not needed, and therefore not performed, for a pure E1 cross-connect.

DS1 to DS1      Not applicable.

**CUS** - Customer

This optional keyword is used to flag a circuit as a customer controlled circuit. On output it indicates that the circuit is customer controlled.

**RDC** - Red circuit

This optional keyword is used to mark a circuit as a Red Circuit. On output it indicates that the circuit is a Red Circuit.

**INCL** - Inclusive

A termination designated as a customer controlled circuit or a red circuit cannot be disconnected or modified without using this keyword in the message. Also, an NPC which supports these circuits cannot be manually removed unless this keyword is given in the remove command.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**mmm** - The From-direction channel number involved in denial (**ddd** through **eee**).

**nnn** - The To-direction channel number involved in denial (**jjj** through **kkk**).

**d** - Direction

**d**      *Explanation*

**F**      FROM

**T**      TO

**B**      Both

**st** - Status

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |

## **TCON, FROM, TO, PFW, NFW**

### **TWO-WAY CROSS-CONNECTIONS**

#### **Explanation Of Command**

This command requests a TS0 to non-TS0 cross-connection. A cross-connect mode must be chosen to prevent the TS0 Frame Alignment Signal from being transmitted in a non-TS0 timeslot.

#### **Command**

##### **Nonhierarchical**

[I.11051]

```
TCON:FRM xy,SEQ ww:FROM [s]abcddd,TO [t]ghijjj\
[, {PFW(abcdefg,ijklmno)|NFW}]!
```

##### **Hierarchical**

[I.11051]

```
TCON:FRM xy,SEQ ww:FROM uvmnpddd,TO wxkqrjjj\
[, {PFW(abcdefg,ijklmno)|NFW}]!
```

#### **Completion Message**

##### **Nonhierarchical**

[O.11051]

```
M hh:mm:ss xy,ww n[vv] TCON [s]abcddd,[t]ghijjj \
{PFW(abcdefg,ijklmno)|NFW} COMPL
```

### **Hierarchical**

Not applicable.

## Explanation Of Parameters

**FROM** - From

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**TO** - To

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |

| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Channel number for FROM NPC

**jjj** - Channel number for TO NPC

000-030 on CEPT type NPCs grown as CAS  
000-031 on CEPT type NPCs grown as NSA

**Note:** One of the channel numbers specified (ddd or jjj) must be channel 000 (TS0), while the other channel number (jjj or ddd) must be a number other than channel 000 (non-TS0).

The NPC containing the TS0 channel must be a PA or TH type NPC, while the NPC containing the non-TS0 channel can be either a PA, PB or PC or TH type NPC.

Channel 000 is not allowed in a range of channels.

**PFW** - Pseudo Frame Word

The PFW parameter is used to select Mode 1 of TS0 Cross-Connect:  
In both directions of transmission the Frame Word is replaced  
by a Pseudo Frame Word.

**abcdefg** - Value of the Pseudo Frame Word

This value replaces the Frame Alignment Signal (Bits 2 - 8) of the Frame  
Word being transmitted from the TO NPC to the FROM NPC.

The characters in the field represent the following bits:

- a** - Pseudo Frame Word Bit 2
- b** - Pseudo Frame Word Bit 3
- c** - Pseudo Frame Word Bit 4
- d** - Pseudo Frame Word Bit 5
- e** - Pseudo Frame Word Bit 6
- f** - Pseudo Frame Word Bit 7
- g** - Pseudo Frame Word Bit 8

Values for bits a - g:

- "0"** - Sets the corresponding bit to "0"
- "1"** - Sets the corresponding bit to "1"

**ijklmno** - Value of the Pseudo Frame Word

This value replaces the Frame Alignment Signal (Bits 2 - 8) of the Frame  
Word being transmitted from the FROM NPC to the TO NPC.

The characters in the field represent the following bits:

- i** - Pseudo Frame Word Bit 2
- j** - Pseudo Frame Word Bit 3
- k** - Pseudo Frame Word Bit 4
- l** - Pseudo Frame Word Bit 5
- m** - Pseudo Frame Word Bit 6
- n** - Pseudo Frame Word Bit 7
- o** - Pseudo Frame Word Bit 8

Values for bits i - o:

- "0"** - Sets the corresponding bit to "0"
- "1"** - Sets the corresponding bit to "1"

**Note:** Bit 2 of timeslot 0 in a 2Mbit/s signal is used to distinguish the Frame Word from the Non Frame Word and it must always be '0' in the FW and '1' in the NFW. When defining the Pseudo Frame Word the user must make sure that the Pseudo Frame Word can be distinguished from the Non Frame Word.

**NFW** - Non frame word

The NFW parameter is used to select Mode 2 of TS0 Cross-Connect. In both directions of transmission the Frame Word is replaced by the Non Frame Word, thus repeating the content of the Non Frame Word in consecutive frames.

If no mode is selected in the command, the default shall be NFW, that is, the default mode of operation is Mode 2.

**NORM** - Normal

NORM, NORM means that the cross-connection will come up in the normal state. The NORM keyword corresponds to the PDS TCON command.

**TERM** - Terminate

TERM, TERM means that the cross-connection will come up in the terminated state. The TERM keyword corresponds to the PDS TCNT command.

**d** - Direction

| <b>d</b> | <b>Explanation</b> |
|----------|--------------------|
| F        | From               |
| T        | To                 |
| B        | Both               |

**st** - Status

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |

## **TCON, FROM, TO, RDC, CUS, INCL, PRIOUT**

### **TWO-WAY NON-CHANNELIZED DIGITAL SIGNAL CROSS CONNECTION**

#### **Explanation Of Command**

This message is used to form a two-way cross-connection between two non-channelized network processing circuits (NPCs). It is also used to form a terminated two-way cross-connection. The idle code is the alarm-indication signal (AIS, all ones) and does not need to be specified. The disconnect code (DCC) for 64 kbit/s disconnection cannot be used for non-channelized NPCs.

When a failure occurs or during an alarm state, the AIS is transmitted toward the TO NPC.

NPCs with customer-controlled marking retain the CUS status when disconnected. When the NPCs are reconnected without CUS or inclusive (INCL) keyword, the command will be denied. If the NPCs are reconnected with INCL keyword, they lose the CUS status.

Red circuit marking is removed when the circuit is disconnected.

### Explanation Of Parameters

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| 2041-2072  | 2201-2232  | 2361-2392  | 2521-2552  |

**uvmp** - Hierarchical FROM NPC number

**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The values are listed below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

**RDC** - Red circuit

**CUS** - Customer

Indicates a customer-controlled Circuit

**INCL** - Inclusive

Inclusive option must be used to remove CUS marking

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**st** - Status of denial

**d** - Direction

**d** *Explanation*

F From

T To

B Both

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |

## **TDIS, FROM, CB, INCL, OOS**

### **DISCONNECTIONS**

#### **Explanation Of Command**

This message requests a disconnection between the Facility Terminating Unit (FTU) or Hybrid DS3 Unit (HDS3U) type NPC signaling time slot 16 and the C-Bit Processor (CB) type NPC on the Digital Signal Processing Unit (DSPU). The CB number and the channel number on the CB are automatically specified by software.

**uvmnp** - Hierarchical FROM NPC number

**uv** - Unit number

**m** - Module number

**np** - NPC number

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

An Out-Of-Service disconnect may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnect will be denied.

**d** - Direction {F-from | T-to | B-both}

**st** - Status

| <i>d</i> | <i>st</i> | <i>Explanation</i>               |
|----------|-----------|----------------------------------|

| <b>F1</b> | <b>INERR</b> | Parameter only valid with PA, PB, or PC type NPCs                     |
| <b>FF</b> | <b>ROLL</b>  | Termination is in process of being rolled                             |

## **TDIS, FROM, TO, INCL, OOS, DCC**

### **TWO-WAY DISCONNECTIONS**

#### **Explanation Of Command**

This message requests a disconnection between the specified FROM and TO end terminations and is used to disconnect a leg or legs from a multipoint circuit.

Disconnections may be between various Network Processing Circuit (NPC) types:

Facility Terminating Unit (FTU)/DS3U/HDS3U NPC and Digital Signal Processing (DSPU) Unit NPC

FTU/DS3U/HDS3U NPC and Virtual NPC

DSPU NPC and DSPU NPC

#### **Command**

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**FROM** - From termination  
**TO** - To termination

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

**uvmnp** - Hierarchical FROM NPC number for beginning of NPC range

**wxkqr** - Hierarchical TO NPC number for end of NPC range

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC                                   |
|-----------|----------|---------------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02 (DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06 (DACS II CEF frames)</b>     |

**Note:** The range of allowable NPC numbers is dependent on the equipage of the frame.

**ddd** - FROM channel or conference number

**jjj** - TO channel number or conference number

#### Channel Numbers

000-030          CEPT type NPCs grown as CAS  
000-031          CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

#### Conference Numbers

001-500          (Virtual NPC)

#### **INCL** - Inclusive

To disconnect a channel or range of channels including one or more channels marked as a Red Circuit, use the INCL (inclusive) option. If this option is not used, the message will be denied if any circuits in the range are Red Circuits.

#### **OOS** - Out-of-service

An Out-Of-Service disconnection may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnection will be denied.

#### **DCC** - Disconnect code

If DCC is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field of the TCON command that initially connected to the channels. If the DCC option is not used, the disconnect code specified in the GRTH NPC command will be used.

#### **mmm, nnn**

- Channel numbers involved in the denial. Otherwise, the same as ddd.

#### **CUS** - Customer

Indicates the circuit is a customer controlled Circuit.

**NOBBL** - No backbone leg

This optional field will appear if the multipoint circuit(s) FROM or TO is in the broadcast mode but has no backbone leg after the TDIS command.

**MPDIS** - Multipoint disconnect

Full disconnection of the multipoint circuits is indicated by MPDIS for FROM, TO, or BOTH.

**RDC** - Red circuit

RDC indicates that the disconnection was performed on a Red Circuit. This implies that the INCL keyword was given in the input message. If the disconnection was given on more than one circuit, then at least one of them was a Red Circuit.

**d** - Direction

*d*      *Explanation*

**F**      - From

**T**      - To

**B**      - Both

**st** - Status of denial

17              Required ETSI not equipped, not in service, or failed  
or inactive side ETSI not equipped or not in service

**cc** - Hexadecimal condition code

**cc**    **st**      *Explanation*

**04**    **INERR**      No NPC's out of service and OOS keyword used

**06**    **INERR**      Invalid range for specified FROM NPC type

**07**    **INERR**      Invalid range for specified TO NPC type

**12**    **MCOND**      Active CCN side not IS or failed or pested or hardware OOS

**13**    **MCOND**      UNIT not equipped, not in service, or failed

**15**    **MCOND**      FTMI not equipped, not in service, or failed

**16**    **MCOND**      FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**17**    **MCOND**      TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**18**    **MCOND**      DSPI not equipped, not in service, or failed

**71**    **CONFERR**      Try to delete a BBL leg from VC; however, VC has no BBL leg

**72**    **CONFERR**      The NPC of VC BBL leg doesn't match that in the input command

**73**    **CONFERR**      The first channel of VC BBL leg doesn't match that in the input command

| cc | st      | Explanation                                                             |

Not applicable.

## Explanation Of Parameters

**FROM** - From termination  
**TO** - To termination

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module  
The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd, jjj**  
- Channel numbers

**eee, kkk**  
- Channel numbers, denoting the end of a range.

000-030 CEPT type NPCs grown as CAS  
000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**INCL** - Inclusive

To disconnect a circuit or range of circuits including one or more circuits marked either RDC or CUS, use the optional INCL keyword. If this keyword is not used, the message will be denied if any circuits in the range are red circuits or customer controlled circuits.

**OOS** - Out of service

An Out-Of-Service disconnection may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnection will be denied. This keyword is not valid if the DSPP NPC is the only NPC out-of-service.

**DCC** - Disconnect code

If the Disconnect Code (DCC) option is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field of the cross connect command that initially connected the channels. Only the post 2.5 second signaling will be inserted in the disconnected channels. If the DCC option was specified on a fully transparent (TRSP with no insertion word) domestic circuit, DACS II will insert the default trouble code X'E4. If the DCC option is not used, the disconnect code specified in the grow NPC command will be used.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**CUS** - Customer

Customer-controlled circuit

Terminations cross-connected using the optional CUS keyword retain their CUS status when disconnected. If the terminations are reconnected without the CUS or INCL keyword, the command will be denied. When they are reconnected with the INCL keyword, they lose their customer controlled status.

**RDC** - Red circuit

**mmm, nnn**

- Channel number involved in the denial. Otherwise the same as ddd.

**d** - Direction

| <b>d</b> | <i>Explanation</i> |
|----------|--------------------|
| F        | From               |
| T        | To                 |
| B        | Both               |

**st** - Status of denial

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |
|-----------|--------------|-----------------------------------------------------------------------|
| <b>04</b> | <b>INERR</b> | No NPC's out of service and OOS keyword used                          |
| <b>06</b> | <b>INERR</b> | Invalid range for specified FROM NPC type                             |
| <b>07</b> | <b>INERR</b> | Invalid range for specified TO NPC type                               |
| <b>12</b> | <b>MCOND</b> | Active CCN side not IS or failed or pested or hardware OOS            |
| <b>13</b> | <b>MCOND</b> | UNIT not equipped, not in service, or failed                          |

## Explanation Of Parameters

**FROM** - From termination  
**TO** - To termination

**[s]abc** - The 3- or 4-digit non-hierarchical non-channelized FROM NPC number  
**[t]ghi** - The 3- or 4-digit non-hierarchical non-channelized TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

**INCL** - Inclusive

Required for a CUS circuit or a red circuit

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**OOS** - Out-of-Service

May be specified if one or both NPCs are out of service

**RDC** - Red circuit

Disconnection of Red circuit

**CUS** - Customer

Disconnection of Customer-controlled Circuit

**st** - Status of denial

**d** - Direction

*d Explanation*

F From

T To

B Both

**cc** - Hexadecimal condition code

**cc st Explanation**

**04 INERR** No NPC's out of service and OOS keyword used

**12 MCOND** Active CCN side not IS or failed or pested or hardware OOS

**13 MCOND** UNIT not equipped, not in service, or failed

**14 MCOND** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS

**15 MCOND** FTMI not equipped, not in service, or failed

**16 MCOND** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**17 MCOND** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**FF ROLL** Termination is in process of being rolled

**E0 MCOND** ETSI not equipped, not in service, or failed

**st d Explanation**

**CUS** {F|T|B} Customer-controlled Circuit

**FAIL** {F|T|B} Failed

**INVLD** {F|T|B} Invalid NPC type

**NOMTH** {F|T|B} No Match

**NPCTA** {F|T|B} NPC used for Test Access

**OOS** {F|T|B} Out-of-service

**RDC** {F|T|B} Red Circuit

**UNPASGN** {F|T|B} Unassigned or Not Properly Assigned

**UEQD** {F|T|B} Unequipped

**UTST** {F|T|B} Under Test

### **TIME SLOT ZERO RECEIVE NPC**

#### **Explanation Of Command**

This autonomous output message reports a change of state in the spare national and international bits being received in time slot zero of a network processing circuit. The change of state probably is incompatible provisioning by using time slot zero monitor.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

#### **Nonhierarchical**

[O.65201]

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**OLD** - Old time slot zero pattern keyword

**NEW** - New time slot zero pattern keyword

**abcdefgh**  
- Time slot zero bits

**Note:** The only bit values which will be output are those which have been provisioned for monitoring. All other bits will be output as "-" (dash).

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

## **TTST,HUB,TO,TG**

### **NX64Kbit/s TWO-WAY TEST ACCESS, HUB**

#### **Explanation Of Command**

To set up an Nx64Kbit/s hub test access connection via a test-access group to an Nx64Kbit/s TO termination. The TO termination consists of two Nx64Kbit/s bundles that will be connected to the test-access group's east and west bundles. These channel bundles must be of the same width as the test-access group. If all of the channels, starting at the number specified for the TO termination, are not available the first unavailable channel encountered will cause the command to be denied. The channel that caused the denial will be reported in the denial message.

## Explanation Of Parameters

**TG** - Test (access) group

**mmm** - Test access group number (001 through 400)

TG is designated as in the GRTH,TG,NPCTG command.

**HUB** - Hub

**[s]abc** - 3- or 4-digit non-hierarchical first TO NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical second TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|

**uvmnp** - Hierarchical first TO NPC number  
**wxkqr** - Hierarchical second TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Starting channel number of first TO NPC  
**jjj** - Starting channel number of second TO NPC  
**ppp** - First channel causing denial

001-030 Primary NPCs grown as Channel Associated Signaling (CAS)  
001-031 Primary NPCs grown as Non Signaling Associated (NSA)

**tc** - Trunk conditioning

For TGs supported by NSA NPCTG(s), the TO NPC(s) must be NSA type also. The default and the only allowed <tc> is TRSP IW FF. Any other input will result in denial.

For TGs supported by CAS NPCTG(s), the TO NPC(s) must be CAS type also. If TRSP is entered as <tc>, TRSP IW FF will be used as <tc>. If anything else or nothing is entered, TC(FF,FF) IW FF is used.

#### **sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

#### **SC(abcd,efgh)**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

#### *Bit*

#### *Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

#### **CGA** - Carrier group alarm

#### **PBA** - Primary block alarm

**fsb** - CGA or PBA state

f - First TO NPC CGA or PBA state

*f Explanation*

F First TO NPC is in CGA or PBA

0 First TO NPC is not in CGA or PBA

s - Second TO NPC CGA or PBA state

*s Explanation*

S Second TO NPC is in CGA or PBA

0 Second TO NPC is not in CGA or PBA

b - TG digroup CGA or PBA state

*b Explanation*

E East-bundle NPCTG in CGA or PBA

W West-bundle NPCTG in CGA or PBA

B NPCTG(s) supporting both bundles in CGA or PBA

0 NPCTG(s) not in CGA or PBA

**RDC** - Red circuit

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

**COND** - Condition

**NN** - TG width (1 through 31)

**cc** - Hexadecimal condition code

*cc Explanation*

**26** NPC type error

**12** Active CCN side not IS or failed or pested or hardware OOS

**13** UNIT not equipped, not in service, or failed

**14** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS

**15** FTMI not equipped, not in service, or failed

**16** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**17** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**18** DSPI not equipped, not in service, or failed

**cc**    *Explanation*

- 1A**    Required FLI not equipped, not in service, or failed
- 1B**    Required MXR not equipped, not in service, or failed
- 1C**    Req'd FMT not eq'd, not IS, or failed, or inact side FMT not eq'd, or not IS
- 1D**    Required MIU not equipped, not in service, or failed
- E0**    ETSI not equipped, not in service, or failed
- 3C**    TS0 specified with width not 1
- 3D**    Illegal test access mode for TS0
- 3E**    TS16 specified for test with width not 1
- 3F**    Illegal test access mode for TS16
- 47**    Invalid channel number
- 49**    test group unequipped
- 4A**    channel part of a TP or TG
- 4B**    channel already under test
- 4D**    Gateway test access not supported
- 51**    TG width incompatible with circuit
- 53**    inconsistent HUB width for specified TG
- 59**    Invalid TC specification
- 5A**    NPC not in service or failed
- 5D**    Inconsistent Signaling on CEPT NPCTGs
- 5E**    invalid test access mode
- 5F**    input channel out of range (SLC not supported)
- 60**    circuit contains mapped channels for HUB request
- 95**    TG East/West type inconsistent with each other or circuit
- 96**    incompatible HUB feature types

## **TTST,HUB,TO,TP,NAM**

### **TWO-WAY TEST ACCESS, HUB**

#### **Explanation Of Command**

This command requests a hubbing mode test access via a specified test port (TP) to the TO termination. In the hubbing mode, DACS II is used as a test access concentrator to connect a local TP to a remote TP. The cross-connection will be made between TP **kk** and two 64-kb/s channels, the TO end of which is specified in the command. Successive termination numbers **jjj** and **ddd** correspond to lower and upper channels of the test port, respectively. These two channels are from a test port in another DACS II or other test access device to be cross-connected. DACS II does not know if the requested access is, in fact, to a hubbed test port on another frame; however, the request will be denied if either channel is mapped, under test, or if channel **jjj** would be out of range on the NPC.

Trunk conditioning **<tc** may be specified, however, it only has an effect on Gateway (T1-E1) conversion circuits. For hub test access of non-Gateway circuits, any trunk conditioning values entered by the user will be overwritten by all one values for the circuit's signaling and insertion word.

### Autonomous Message

Not applicable.

### Explanation Of Parameters

**HUB** - Hub

**TO** - To

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 |

**uvmnp** - Hierarchical TO NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**jjj** - TO channel number

The TO channel number must correspond to a lower channel of a test port  
for CEPT and Primary digroups

**tc** - Trunk conditioning

tc represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. The signaling and the insertion word specification are entered separately, with a comma as the delimiter.

| <i>signaling</i>      | <i>Explanation</i>                                                                                                                                                                |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC(ijkl,mnop)         | 2-way, 4-state signaling in binary. For CEPT and ESF type framing format, software will expand 4-state to 16-state by duplicating the bits.                                       |
| TC(efghijkl,mnopqrst) | 2-way, 16-state in binary.                                                                                                                                                        |
| TC(X'ab,X'cd)         | 2-way, 16-state in hexadecimal.                                                                                                                                                   |
| TRSP                  | Transparent, no signaling.                                                                                                                                                        |
| Omitted               | Default is TC X'FF,X'FF if both terminations are channel associated signaling types (CAS). Default will be TRSP if one of the terminations is nonsignaling associated (NSA) type. |

| <i>insertion word</i> | <i>Explanation</i>                                                                                                                       |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| Omitted               | Will default to IW X'FF.                                                                                                                 |

**mmm** - Channel number

Variable mmm is equal to jjj + 1. Must be an even number.

**TP** - Test port

**kk** - Test port number (01 through 96)

**CGA** - Carrier group alarm

**f** - FROM CGA status

*f*      *Explanation*

F      FROM NPC is in CGA

0      FROM NPC is not in CGA

**t** - TO CGA status

*t*      *Explanation*

T      TO NPC is in CGA

0      TO NPC is not in CGA

**p** - Test port NPC CGA status

*p*      *Explanation*

P      Test port NPC is in CGA

0      Test port NPC is not in CGA

**Note:** FROM test port NPC will never appear in the CGA condition.

Signaling mode of port

**T** - Transparent

**R** - Robbed bit Signaling

**C** - Channel associated signaling (CAS)

**H** - Hubbing

**ASGN** - Assigned

The test port is already assigned.

**NMON** - Not monitor

The test port is not in monitor mode.

**st** - Status

**Note:** When st is set to "T NOT LOWER", for CEPT type NPCs, jjj must be one of the following channels:

005, 007, 009, 011, 013, 016, 018, 020, 022, 024, 026, or 028.

| <b>st</b>          | <i>Explanation</i>                                         |
|--------------------|------------------------------------------------------------|

## **TTST,LPD,TG**

### **NX64Kbit/s LOOPED TEST ACCESS**

#### **Explanation Of Command**

This command is used to place both bundles of a test-access group (TG) in the looped mode. If the TG is not provisioned or currently assigned the command will be denied.

#### **Command**

[I.29021]

TTST:FRM xy,SEQ ww:LPD,TG mmm[,<tc>]!

#### **Completion Message**

[O.29021]

M hh:mm:ss xy,ww n[vv] TTST LPD TG mmm NN <tc> COMPL

#### **Denial Message**

[O.29021.01]

M hh:mm:ss xy,ww n[vv] TTST LPD TG mmm COND cc DNY

#### **Autonomous Message**

Not applicable.

## Explanation Of Parameters

**LPD** - Looped

**TG** - Test (access) group

**mmm** - TG number (001 through 400)

**tc** - Trunk conditioning

If the static tc was not furnished in the growth TG command, it must be dynamically specified in this command or the test access will be denied. A dynamic tc will override any static tc. The effective tc will be used, and will be output.

**COND** - Condition

**NN** - TG width (1 through 31)

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 12** Active CCN side not IS or failed or pested or hardware OOS
- 13** UNIT not equipped, not in service, or failed
- 14** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS
- 15** FTMI not equipped, not in service, or failed
- 16** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS
- 17** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS
- 18** DSPI not equipped, not in service, or failed
- 1A** Required FLI not equipped, not in service, or failed
- 1B** Required MXR not equipped, not in service, or failed
- 1C** Reqd FMT not eqd,not IS,or failed,or inact side FMT not eqd, or not IS

- 3D** Illegal test access mode for TS0
- 3F** Illegal test access mode for TS16
- 49** test group unequipped
- 59** Invalid TC specification
- 5A** NPC not in service or failed
- 5D** Inconsistent Signaling on CEPT NPCTGs
- 5E** invalid test access mode

## **TTST,LPD,TP**

### **LOOPED TEST ACCESS**

#### **Explanation Of Command**

This message requests that both test port channels on a given test port be placed in the looped mode.

Trunk conditioning *may be specified* to loop a static test port **kk**. If specified it will override the specification given when the test port was equipped. If not specified it will default to the specification given when the test port was equipped.

Trunk conditioning *must be specified* to loop a dynamic test port **kk** since tc is dynamically set when any test access message makes the test port active. If trunk conditioning is omitted, the request will be denied.

**TTST : : TPR, TP** will undo this command.

The test port is mapped to predesignated channels of a network processing circuit for test ports (NPCTP) during the provisioning of that test port. All CEPT types that have been provisioned for channel associated signaling (CAS) can be provisioned as NPCTP. For the mapping between the test ports and the channels of the test NPCs, see the CRTE::TP message.

### Explanation Of Parameters

**LPD** - Looped

**TP** - Test port

**kk** - Test port number (01 through 96)

**tc** - Trunk conditioning

Represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. For example, TRSP,IW X'pq (input form).

The following signaling options are allowed:

| <i>signaling</i>      | <i>Explanation</i>                                                                                                                                                                                                     |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC(ijkl,mnop)         | 2-way,4-state signaling in binary. For CEPT type framing format, software will expand 4-state to 16-state by duplicating the format on the remaining frames on a superframe.                                           |
| TC(efghijkl,mnopqrst) | 2-way,16-state in binary. Only valid for CEPT framing format.                                                                                                                                                          |
| TC(X'ab,X'cd)         | 2-way,16-state in hexadecimal                                                                                                                                                                                          |
| TRSP                  | Transparent, no signaling                                                                                                                                                                                              |
| omitted               | Only valid for CEPT cross-connections, defaults to TC(X'FF,X'FF) if both terminations are channel associated signaling type. It will default to TRSP if one of the terminations is nonsignaling associated (NSA) type. |

The following insertion words options are allowed:

*insertion word   Explanation*

IW X'pq      The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted to the downstream direction of a failure on either line.

Omitted      Only valid for CEPT, will default to IW X'FF

For channel 016 on a CAS primary trunk conditioning defaults to TRSP,IW X'FF

and will override any trunk conditioning option provided in this message.

The following trunk conditioning usage applies:

- If trunk conditioning is omitted from this message and was omitted from GRTH::TP, the message will be denied.
- If trunk conditioning is omitted from this message but was provided in GRTH::TP, the trunk conditioning value provided in GRTH::TP, is applied.
- If trunk conditioning is provided in this message, it overrides the value, (if provided), in GRTH::TP.

**st**      - Status

**st**      *Explanation*

|                |                                                            |

### Explanation Of Parameters

**TG** - Test-access group

**mmm** - Test-access group number (001 through 400)

The TG is designated as in message 31421, and must have the same width as the number of channels specified in this message.

**MON** - Monitor

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM Channel numbers

001-031\* Primary NPCs grown as Channel Associated Signaling (CAS)  
001-031 Primary NPCs grown as Non Signaling Associated (NSA)

\*Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If TO channel is mapped to a channel 000, the circuit can only be tested as N = 1, the corresponding FROM channel ddd will be '000'.

**tc** - Trunk conditioning

For mapped circuits, <tc> will be omitted.  
For unmapped circuits, the effective <tc> will be output.

**SG** - Signaling

**g** - Signaling mode of the TG

*g*      *Explanation*

T      All channels are Transparent (TRSP)

C      One or more channels is CAS or non-TRSP

**CGA** - Carrier group alarm

**PBA** - Primary block alarm

**ftb** - CGA or PBA state

f - FROM CGA or PBA state

*f*      *Explanation*

F      FROM NPC is in CGA or PBA

0      FROM NPC is not in CGA or PBA

t - TO CGA or PBA state

*t*      *Explanation*

T      TO NPC is in CGA or PBA

0      TO NPC is not in CGA or PBA

b - TG digroup CGA or PBA state

*b*      *Explanation*

E      East-bundle NPCTG in CGA or PBA

W      West-bundle NPCTG in CGA or PBA

B      NPCTG(s) supporting both bundles in CGA or PBA

0      NPCTG(s) not in CGA or PBA

**RDC** - Red circuit

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

**ONEWAY** - One-way

The cross-connection tested is a one-way circuit.

**BCAST** - Broadcast

The cross-connection tested is part of a broadcast circuit.

**TLA** - Terminate and leave active

**S**

- Termination state of the circuit

*s Explanation*

R All channels are released

F One or more FROM channel is terminated

T One or more TO channel is terminated

B One or more of FROM and TO channels are terminated

**UMPD** - Unmapped

The circuit under test is unmapped.

**COND** - Condition

**cc** - Hexadecimal condition code

*cc Explanation*

**12** Active CCN side not IS or failed or pested or hardware OOS

**13** UNIT not equipped, not in service, or failed

**14** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS

**15** FTMI not equipped, not in service, or failed

**16** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**17** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**18** DSPI not equipped, not in service, or failed

**1A** Required FLI not equipped, not in service, or failed

**1B** Required MXR not equipped, not in service, or failed

**1C** Reqd FMT not eqd,not IS,or failed,or inact side FMT not eqd, or not IS

**1D** Required MIU not equipped, not in service, or failed

**E0** ETSI not equipped, not in service, or failed

**47** Invalid channel number

**49** test group unequipped

**5A** NPC not in service or failed

**5E** invalid test access mode

## **TTST,MON,TO,NAM,TP**

### **TWO-WAY TEST ACCESS, MONITOR**

#### **Explanation Of Command**

This command can be used to do one of two things:

1. To set up a previously unassigned test port to monitor a particular termination.
2. To change a previously assigned test port to monitor mode.

If the test port is already in the monitor mode, DACS II will deny the execution of the message.

The trunk conditioning (**tc**) specified in this command applies only when accessing an unmapped termination. For an access to a mapped circuit, **tc** is adopted from the circuit being accessed and, therefore, will be ignored if specified.

The DACS II test ports are either static or dynamic. A test port is defined as static when trunk conditioning is specified in a test port provisioning command otherwise it is a dynamic test port. If this test port is static, trunk conditioning must be specified.

If the test port is in the split mode, do not specify the TO NPC number.

For Broadcast (BCON) connections test access shall be denied except for the TS0 to non-TS0 connection.

This command does **not** monitor any connections inside a Digital Signal Processing Platform (DSPP) application, such as the DDS Subrate and MJU application, the X.50 International subrate application, or the DMB application. However, test ports may be established to any of the applications via application commands, and may then be used, again via application commands, to monitor or split circuits within the application. If a test port has been established to an application, then that test port will always appear as a split connection in an invocation of the UTL::QRY,TPS command, regardless of whether that test port is in monitor, split, or release mode inside the application.

Not applicable.

## Explanation Of Parameters

**TP** - Test port

**kk** - Test port number (01 through 96)

A test port is mapped to predesignated channels of a network processing circuit for test ports (NPCTP) during the provisioning of that test port.

Only NPC types that have been provisioned for channel associated signaling (CAS) can be provisioned as an NPCTP.

For the mapping between the test ports and the channels of the test NPCs, see the GRTH::TP Message

The DACS II test ports are either static or dynamic, as defined in the GRTH::TP message.

If the test port is in the split mode, TO [t]ghijj may not be specified.

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

**uvmnp** - Hierarchical TO NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**jjj** - TO Channel number

Channel numbers

000-030        CEPT type NPCs grown as CAS  
000-031        CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers  
001-085        (MB NPC)

**tc**    - Trunk conditioning

If the tc option was not furnished in the test port provisioning command, it must be furnished in this input command to provide a test connection for unmapped circuits; otherwise, the test access will be denied.

Represents the desired signaling and insertion word to be applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. For example, TRSP,IW X'pq (input form).

For channel 031 on a CAS primary, tc must take on the value TRSP, and will override any tc option provided in the input command.

**Note:** For mapped terminations, tc takes on the mapped cross-connect tc value and overrides any tc option provided in the input command.

For unmapped terminations, trunk conditioning will be applied as follows:  
If tc is omitted from this command and was omitted in the test port provisioning command, the command will be denied (unless CAS channel 031).

If tc is omitted from this command but was provided in the test port provisioning command, the tc value provided in the provisioning command is applied.

If tc is provided in this command, it overrides the value, (if provided), in the test port provisioning command.

| <i>signaling</i>      | <i>Explanation</i>                                                                                                                                                             |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC(ijkl,mnop)         | 2-way, 4-state signaling in binary. For CEPT and ESF type framing format, software will expand 4-state to 16-state by duplicating the bits.                                    |
| TC(efghijkl,mnopqrst) | 2-way, 16-state in binary.                                                                                                                                                     |
| TC(X'ab,X'cd)         | 2-way, 16-state in hexadecimal.                                                                                                                                                |
| TRSP                  | Transparent, no signaling.                                                                                                                                                     |
| Omitted               | Default is TC X'FF,X'FF if both terminations are channel associated signaling types. Default will be TRSP if one of the is terminations is nonsignaling associated (NSA) type. |

| <i>insertion word</i> | <i>Explanation</i>                                                                                                                       |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| Omitted               | Will default to IW X'FF.                                                                                                                 |

For 4-state signaling, the A/B signaling bits of both test port channels are specified by ijkl for the receive time slot interchange (RTSI), and by mnop for the transmit time slot interchange (TTSI).

For 16-state signaling, the A/B/C/D signaling bits of both test port channels are specified by efghijkl (or hexadecimal digits ab) for the RTSI, and by mnopqrst (or hexadecimal digits cd) for the TTSI.

**NAM** - No A to Mu (conversion)

This keyword is used to disable the A- to  $\mu$ -law conversions on CEPT type NPCs which can be either the tested circuit or a test port itself.

The NAM keyword will have this meaning only on the following three configurations; in other test access configurations the DACS II will provision the accessed circuits appropriately and therefore the NAM keyword will be ignored.

Unmapped domestic termination accessed via a CEPT test port

Unmapped CEPT termination accessed via a domestic test port

Mapped pure domestic circuit accessed via a CEPT test port

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[s]klm** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[t]pqr** - The 3- or 4-digit nonhierarchical TO NPC number

**uvmnp** - Hierarchical TO NPC number  
**wxkqr** - Hierarchical FROM NPC number.

Supports the termination that is cross-connected to channel ghijj.

**[s]klmnnn**  
- Nonhierarchical format termination being tested as FROM on test port kk otherwise the same as [s]abcd. If this field is all zeroes, test port kk is assigned to an unmapped termination.

**edhfgnnn**  
- Hierarchical format of [s]klmnnn

**pqrss**  
- Nonhierarchical format termination being tested as TO on test port kk; otherwise, the same as abcd.

**opjstsss**  
- Hierarchical format of [t]pqrss

**ddd** - FROM channel number of the termination that is cross-connected to  
**nnn** - FROM channel number of the termination that is cross-connected to channel [t]ghi-jjj.

**sss** - TO channel number

**SG** - Signaling

**g** - Signaling mode of test port kk

*g*      *Explanation*

C      Channel Associated Signaling (CAS)

R      Robbed Bit Signaling

T      Transparent

**CGA** - Carrier group alarm

**ftp** - PBA state

f - FROM PBA state

*f*      *Explanation*

F      FROM NPC is in PBA

0      FROM NPC is not in PBA

t - TO PBA state

## **TTST,MON,TO,TG**

---

### **NX64Kbit/s TWO-WAY TEST ACCESS, MONITOR**

#### **Explanation Of Command**

---

This command is used to request a monitor test access of a specified group of Nx64Kbit/s terminations. Monitor test access of a broadcast TS0 to non-TS0 connection will not use this command but will use I.21001 instead. The test access is made through the test-access group specified in the command line.

The N TO channels to be tested may be entered as a range, a list, or a combination of both, in ascending order. For two-point circuits, the numbers do not have to be consecutive, and the circuits may have been cross-connected separately. For a one-way circuit under test, the other direction of the same termination cannot be tested at the same time. For Nx64Kbit/s broadcast circuits, the channels have to be consecutive and must have been set up together for the same broadcast circuit.

The primary output line will not echo the input with range(s) of channels, but will show a list of all channels.

#### **Command**

---

##### **Nonhierarchical**

---

## Explanation Of Parameters

**MON** - Monitor

**TO** - To

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

For an unmapped TO termination, or a backbone leg (BBL) without return, the FROM NPC number will be shown as zeroes.

**ddd** - FROM Channel number  
**jjj, kkk, lll**  
- TO Channel numbers  
**ppp** - First TO Channel number causing denial

kkk is shown as an example of a range jjj-kkk of TO channels, and lll is an example of an item on a list of TO channels.

001-031\*      Primary NPCs grown as Channel Associated Signaling (CAS)  
001-031      Primary NPCs grown as Non Signaling Associated (NSA)

\* Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If channel jjj is mapped to a channel 000, the circuit can only be tested as N = 1, and the corresponding FROM channel ddd will be '000'.

**tc**      - Trunk conditioning

For mapped circuits, regardless of what is specified here, the circuit's tc will be used but not shown in the output response.

For unmapped circuits, if the static tc was not furnished when the TG was provisioned, it must be dynamically specified in this command or the test access will be denied. A dynamic tc will override any static tc. The effective tc will be used for all channels under test, and will be shown in the output.

For any unmapped circuits tested by NSA TGs, TRSP must be entered for tc or the command will be denied.

For channel 031 on a CAS primary, any tc value specified will be replaced by TRSP.

**TG**      - Test-access Group

**mmm**      - Test-access Group number (001 through 400)

The TG is designated as in GRTH::TG,NPCTG and must have the same width as the number of channels specified in this message.

**SG**      - Signaling

**g**      - Signaling mode of the TG

|          |                                         |
|----------|-----------------------------------------|
| <i>g</i> | <i>Explanation</i>                      |
| T        | All channels are Transparent (TRSP)     |
| C        | At least one channel is CAS or non-TRSP |

**CGA** - Carrier group alarm

**PBA** - Primary block alarm

**ftb** - CGA or PBA state

f - FROM CGA or PBA state

| <i>f</i> | <i>Explanation</i>            |
|----------|-------------------------------|
| F        | FROM NPC is in CGA or PBA     |
| 0        | FROM NPC is not in CGA or PBA |

t - TO CGA or PBA state

| <i>t</i> | <i>Explanation</i>          |
|----------|-----------------------------|
| T        | TO NPC is in CGA or PBA     |
| 0        | TO NPC is not in CGA or PBA |

b - TG digroup CGA or PBA state

| <i>b</i> | <i>Explanation</i>                             |
|----------|------------------------------------------------|
| B        | NPCTG(s) supporting both bundles in CGA or PBA |
| E        | East-bundle NPCTG in CGA or PBA                |
| W        | West-bundle NPCTG in CGA or PBA                |
| 0        | NPCTG(s) not in CGA or PBA                     |

**RDC** - Red circuit

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

**ONEWAY** - One-way

The cross-connection tested is a one-way circuit.

**BCAST** - Broadcast

The cross-connection tested is part of a broadcast circuit.

**TLA** - Terminate and leave active

**s**  
- Termination state of the circuit

| <i>s</i> | <i>Explanation</i>                             |
|----------|------------------------------------------------|
| R        | All channels are released                      |
| F        | At least one FROM channel is terminated        |
| T        | At least one TO channel is terminated          |
| B        | At least one FROM and TO channel is terminated |

**UMPD** - Unmapped

The circuit under test is unmapped.

**COND** - Condition

**cc** - Hexadecimal condition code

| <b>cc</b> | <i>Explanation</i>                                                    |
|-----------|-----------------------------------------------------------------------|
| 26        | NPC type error                                                        |
| 12        | Active CCN side not IS or failed or pested or hardware OOS            |

| 3C        | TS0 specified with width not 1                                        |
| 3D        | Illegal test access mode for TS0                                      |
| 3E        | TS16 specified for test with width not 1                              |
| 3F        | Illegal test access mode for TS16                                     |
| 45        | NPC not provisioned as DGA                                            |
| 46        | virtual SLC NPC not provisioned                                       |
| 47        | Invalid channel number                                                |
| 48        | Invalid SLC Mode-III channel number                                   |
| 49        | test group unequipped                                                 |
| 4A        | channel part of a TP or TG                                            |
| 4B        | channel already under test                                            |
| 4C        | BCON BBL has one or more legs under test                              |
| 4D        | Gateway test access not supported                                     |
| 4F        | inconsistent BCON width for test access                               |
| 50        | invalid channel designation for BCON                                  |
| 51        | TG width incompatible with circuit                                    |
| 52        | FDL selected with width not 1                                         |

**cc**    *Explanation*

- 57**    Designated TG or circuit to be tested in process of being rolled
- 59**    Invalid TC specification
- 5A**    NPC not in service or failed
- 5B**    channel is OCON in opposite direction
- 5C**    Inconsistent or invalid circuit type for Nx64Kbit TA
- 5D**    Inconsistent Signaling on CEPT NPCTGs
- 5E**    invalid test access mode
- 5F**    input channel out of range (SLC not supported)
- 61**    not all FROM channels on same NPC
- 95**    TG East/West type inconsistent with each other or circuit
- A9**    Circuits TCONed itself cannot be UTST

---

## TTST,SPL,TG

---

### NX64Kbit/s TWO-WAY TEST ACCESS, SPLIT

#### Explanation Of Command

---

This command is used to split each direction of transmission of an Nx64Kbit/s circuit that is currently under test access in monitor mode.

The optional keyword NOYLW is added to allow DACS II to disable the yellow alarm transmission while the facility is connected to a Test Group which is set to split mode via this command with NOYLW option.

**Note:** If the test-access group is connected to an unmapped Nx64Kbit/s termination, this command connects both directions of the unmapped termination to the test-access group's west bundle.

Not applicable.

## **Explanation Of Parameters**

---

TG - Test-access group

mmm - Test-access Group number (001 through 400)

The TG is designated as in message 31421

SPL - Split

[s]abc - 3- or 4-digit non-hierarchical FROM NPC number

[t]ghi - 3- or 4-digit non-hierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1  | Unit<br>2  | Unit<br>3  | Unit<br>4  | Unit<br>5  | Unit<br>6  |
|------------|------------|------------|------------|------------|------------|
| <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> |
| 001-032    | 161-192    | 321-352    | 481-512    | 641-672    | 801-832    |
| 041-072    | 201-232    | 361-392    | 521-552    | 681-712    | 841-872    |
| 081-112    | 241-272    | 401-432    | 561-592    | 721-752    | 881-912    |
| 121-152    | 281-312    | 441-472    | 601-632    | 761-792    | 921-952    |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1  | Unit<br>2  | Unit<br>3  | Unit<br>4  |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number

**wxkqr** - Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM Channel numbers

001-031\* Primary NPCs grown as Channel Associated Signaling (CAS)

001-031 Primary NPCs grown as Non Signaling Associated (NSA)

\*Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If TO channel is mapped to a channel 000, the circuit can only be tested as N = 1, the corresponding FROM channel ddd will be '000'.

**tc** - Trunk conditioning

For mapped circuits, <tc> will be omitted.

For unmapped circuits, the effective <tc> will be output.

**SG** - Signaling

**g** - Signaling mode of the TG

*g Explanation*

T All channels are Transparent (TRSP)

C One or more channels is CAS or non-TRSP

**CGA** - Carrier group alarm

**PBA** - Primary block alarm

**ftb** - CGA or PBA state

f - FROM CGA or PBA state

*f Explanation*

F FROM NPC is in CGA or PBA

0 FROM NPC is not in CGA or PBA

t - TO CGA or PBA state

*t Explanation*

T TO NPC is in CGA or PBA

0 TO NPC is not in CGA or PBA

b - TG digroup CGA or PBA state

*b Explanation*

E East-bundle NPCTG in CGA or PBA

W West-bundle NPCTG in CGA or PBA

B NPCTG(s) supporting both bundles in CGA or PBA

0 NPCTG(s) not in CGA or PBA

**RDC** - Red circuit

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

**TLA** - Terminate and leave active

**S** - Termination state of the circuit

| <i>s</i> | <i>Explanation</i>                                 |

| <b>5E</b> | invalid test access mode                 |

## **TTST,SPL,TP**

### **TWO-WAY TEST ACCESS**

#### **Explanation Of Command**

This command splits a mapped circuit in the normal circuit state. Also, in the normal circuit state, it connects both directions of an unmapped termination to test port **kk** (01 through 48). If the test port is connected to an unmapped termination, this command will connect both directions of an unmapped termination to the test port.

This command does **not** split any connections inside a Digital Signal Processing Platform (DSPP) application, such as the DDS Subrate and MJU application, the X.50 International subrate application, or the DMB application. However, test ports may be established to any of the applications via application commands, and may then be used, again via application commands, to monitor or split circuits within the application. If a test port has been established to an application, then that test port will always appear as a split connection in an invocation of the UTL::QRY,TPS command, regardless of whether that test port is in monitor, split, or release mode inside the application.

## Explanation Of Parameters

- TP** - Test port  
**kk** - Test port number (01 through 96)

The test port is mapped to predesignated channels of a network processing circuit for test ports (NPCTP) during the provisioning of that test port. The NPC types that can be provisioned as NPCTP are all domestic non-SLC NPC types and all CEPT types that have been provisioned for channel associated signaling (CAS). For the mapping between the test ports and the channels of the test NPCs, see Message No. 31411.

The DACS II test ports are either static or dynamic, as defined in Message No. I.31411.

- SPL** - Split

- [s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**uvmp** - Hierarchical TO NPC number  
**wxkqr** - Hierarchical FROM NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number  
**jjj** - TO channel number

The valid values are:

Channel numbers

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers  
001-085      (MB NPC)

**NOTE:** If the field [s]abccddd (or wxkqrddd in Hierarchical addressing) is all zeroes, then this test port is assigned to a unmapped termination.

**CUS**      - Customer  
Customer-controlled circuit.

**RDC**      - Red circuit

**TLA**      - Terminate and leave activate

**s**          - Termination state of the circuit:

| <i>s</i> | <i>Explanation</i>                   |
|----------|--------------------------------------|
| R        | RELEASED. Neither side is terminated |
| F        | FROM side is terminated              |
| T        | TO side is terminated                |
| B        | BOTH sides are terminated            |

**st**          - Status

| <b>st</b>        | <i>Explanation</i>                                         |
|------------------|------------------------------------------------------------|
| <b>F FAIL</b>    | FROM side NPC is marked failed                             |
| <b>F OOS</b>     | FROM side NPC (abc) is out of service                      |
| <b>MCOND</b>     | An entity in the network is OOS or failed                  |
| <b>NA</b>        | DACS CCN or UNIT involved cannot perform the cross-connect |
| <b>NMON</b>      | Not Monitor, the testport is not currently in monitor mode |
| <b>SIG TS NS</b> | Signaling timeslot (CAS TS16) cannot be split              |
| <b>T FAIL</b>    | TO side NPC is marked failed                               |
| <b>T OOS</b>     | TO side NPC is Out Of Service                              |

## **TTST,TGR,TG,OOS**

### **NX64Kbit/s TWO-WAY TEST ACCESS, TEST- ACCESS GROUP RELEASE**

#### **Explanation Of Command**

This command is used to release one or more currently active test-access groups, and restore any circuits under test to their normal, terminated, or unmapped state. The OOS keyword is required to release a test-access group in two cases:

1. The associated circuit under test is out-of-service.
2. One of both of the NPCs supporting the test-access group is out-of-service.

Where more than one test-access group is specified in the input command the completion message will list the test-access groups in ascending order by the test-access group number and provide information for all test-access groups. If an attempt is made to release a range of test-access groups and no test-access groups in the range have been provisioned the release will be denied. The output for test-access groups testing in other monitor or split modes is printed with a mapping of channels.

When an administrative link fails, all test-access groups associated with that link will be released; automatically. All circuits under test by those TGs will be restored to their normal state; mapped or unmapped. Any termination state entered before or during the test access will remain in effect.

If a failure in an entity involved in an autonomous test-access group release causes the release to fail the release may be performed manually by this command.

## Explanation Of Parameters

**TGR** - Test (access) group release

**TG** - Test (access) group

**mmm** - TG number (001 through 400)

**nnn** - TG number (001 through 400, greater than mmm)

Variable mmm is used to specify a single TG number or to specify the beginning of a range of TG numbers. Variable nnn is used to specify the end of a range of TG numbers.

so resettabs

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number or first TO NPC number if TG is in HUB mode

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number or second TO NPC number if TG is in HUB mode

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**uvmnp** - Hierarchical FROM NPC number or first TO NPC number if TG is in HUB mode

**wxkqr** - Hierarchical TO NPC number or second TO NPC number if TG is in HUB mode

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

For an unmapped TO termination, or a backbone leg (BBL) without a return, the FROM NPC number will be shown as zeroes.

**ddd** - FROM channel number or starting channel of first TO NPC in HUB mode

**jjj** - Starting channel of second TO NPC in HUB mode

001-031\*      Primary NPCs grown as Channel Associated Signaling (CAS)  
001-031        Primary NPCs grown as Non Signaling Associated (NSA)

\*    Circuits involving CAS channel 31 can only be tested for N = 1.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s).

If channel jjj is mapped to a channel 000 (N = 1 only), the corresponding FROM channel ddd will be '000'.

**OOS**    - Out-of-service

**RDC**    - Red circuit

The circuit is a red circuit

**CUS**    - Customer

The circuit is customer controlled

**TLA**    - Terminate and leave active

**s**        - Termination state of the circuit

s        Explanation

R        All channels are released

F        One or more FROM channel is terminated

T        One or more TO channel is terminated

B        One or more of FROM and TO channels are terminated

**NTR** - No Transmit  
Backbone leg with no return

**UASGN** - Unassigned  
TG is unassigned or idle

**LPD** - Looped

**UEQD** - Unequipped  
TG is not equipped

**HUB** - Hub  
TG is in Hub mode

**COND** - Condition

**NN** - TG width (1 through 31)

**cc** - Hexadecimal condition code

**cc**    *Explanation*

- 12**    Active CCN side not IS or failed or pested or hardware OOS
- 13**    UNIT not equipped, not in service, or failed
- 14**    CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS
- 15**    FTMI not equipped, not in service, or failed
- 16**    FC not eqd, not IS, or failed or inactive side FC not eqd or not IS
- 17**    TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS
- 18**    DSPI not equipped, not in service, or failed
- 1A**    Required FLI not equipped, not in service, or failed
- 1B**    Required MXR not equipped, not in service, or failed
- 1C**    Reqd FMT not eqd,not IS,or failed,or inact side FMT not eqd, or not IS
- 1D**    Required MIU not equipped, not in service, or failed
- E0**    ETSI not equipped, not in service, or failed
- 49**    test group unequipped
- 58**    NPC is OOS for a TGR command and OOS keyword not specified
- 5A**    NPC not in service or failed

## **TTST,TLA,NOT,TP**

### **TWO-WAY TEST ACCESS**

#### **Explanation Of Command**

This message is used to modify the terminate and leave activate status of one or both ends of the cross-connected channel associated with the specified test port. The test port is mapped to a predesignated channel of a network processing circuit for test ports during the provisioning of that test port. All domestic NPC types except SLC® NPCs can be provisioned as NPC test ports (NPCTP). All CEPT NPC types that have been provisioned with channel associated signaling may be provisioned as NPC test ports (NPCTP).

Not applicable.

### Explanation Of Parameters

---

**TLA** - Terminate and leave activate

**m** - The end of the tested circuit that must be put into the TLA state.  
Set m to one of the values given below:

| <i>m</i> | <i>Explanation</i>        |
|----------|---------------------------|
| F        | Apply TLA to the FROM end |
| T        | Apply TLA to the TO end   |
| B        | Apply TLA to BOTH ends    |

The following apply only to a DMB/conference

|   |                                          |
|---|------------------------------------------|
| L | Apply TLA on all legs towards facilities |
| G | Apply TLA on all legs towards bridge     |
| A | Apply TLA on all legs in both directions |

The end or ends of the channel to which termination has been applied will transmit the idle code specified in the insertion word entered in the GRTH::NPC message, or its default, instead of passing data from the other end of the circuit. If the growth insertion word is MUX (X'1A), the terminate transmit word is the UMC code (X'18).

This message will be denied if test port kk is not in the monitor or split mode or if the tested circuit is already in the specified termination state.

**[t]rst** - The 3- or 4-digit nonhierarchical NPC number of a termination that must not be affected by this command.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

**uvmnp** - Hierarchical TO NPC number of a termination that must not be affected by this command.

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

|           |          |              |                                 |
|-----------|----------|--------------|---------------------------------|
| Unit      | Module   | NPC          |                                 |
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**vvv** - Channel or conference number

Channel numbers

000-030        CEPT type NPCs grown as CAS  
000-031        CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers  
001-500        (Virtual NPC)

**NOT**    - Not

Not means that the following channel number must not be affected by this command. This field is only valid if the termination state is equal to L, G, or A.

**TP**    - Test port

**kk**    - Test port number (01 through 96)

The test port is mapped to predesignated channels of a Network Processing Circuit for test ports (NPCTP) during the provisioning of that test port.

For information on the mapping between the test ports and the channels of the test NPCs (NPCTP), see GRTH::TP kk[,<tc>].

**[s]abc**        - The 3- or 4-digit nonhierarchical FROM NPC number with the same valid values as [t]rst.

**[t]ghi**        - The 3- or 4-digit nonhierarchical TO NPC number with the same valid values as [t]rst.

**wxkqr**    - Hierarchical NPC number of the TO termination of the circuit assigned to the test port (with the same valid values as uvmnp).

**edhfg**    - Hierarchical NPC number side of the FROM termination of the circuit assigned to the test port. If the test port is assigned to an unmapped termination, this field will be all zeroes (with the same valid values as uvmnp).

**ed,wx**    - Unit number

**h,k**      - Module number

**fg,qr**    - NPC number

**jjj** - TO channel number with the same value as vvv.  
**ddd** - FROM channel number with the same value as vvv.

**s** - Termination state of the circuit

| <i>s</i> | <i>Explanation</i>                   |
|----------|--------------------------------------|
| B        | BOTH sides are terminated            |
| F        | FROM side is terminated              |
| R        | RELEASED. Neither side is terminated |
| T        | TO side is terminated                |

**RDC** - Red circuit

**CUS** - Customer  
Customer-controlled circuit

**T UASGN** - The test port is assigned to an unmapped termination.  
**PTLA** - The requested TLA state is the present TLA state.

**reason** - Denial reason

| <i>st</i>      | <i>Explanation</i>                                         |
|----------------|------------------------------------------------------------|
| <b>BADCCN</b>  | CCN OOS or failed                                          |

### NX64Kbit/s TWO-WAY TEST ACCESS, TERMINATE- AND-LEAVE-ACTIVE

#### Explanation Of Command

---

This command is used to terminate one or both ends of an Nx64Kbit/s cross-connection associated with a test-access group.

**Note:** In the terminated state the data normally transmitted over the circuit is replaced by the trunk conditioning specified when the cross-connection was made. The Nx64Kbit/s circuit must be an unterminated, mapped one-way or two-way circuit that is currently in the Monitor or Split test access mode.

Not applicable.

## Explanation Of Parameters

**TG** - Test-access Group

**mmm** - Test-access Group number (001 through 400)

The TG is designated as in message 31421

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM Channel numbers

|          |                                                          |
|----------|----------------------------------------------------------|
| 001-031* | Primary NPCs grown as Channel Associated Signaling (CAS) |
| 001-031  | Primary NPCs grown as Non Signaling Associated (NSA)     |

\*Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If TO channel is mapped to a channel 000, the circuit can only be tested as N = 1, the corresponding FROM channel ddd will be '000'.

**RDC** - Red circuit

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

**TLA** - Terminate and leave active

**m**

- Direction of the circuit to be terminated

|          |                           |
|----------|---------------------------|
| <i>m</i> | <i>Explanation</i>        |
| F        | FROM side is terminated   |
| T        | TO side is terminated     |
| B        | BOTH sides are terminated |

**S**

- Termination state of the circuit

*s Explanation*

F One or more FROM channel is terminated

T One or more TO channel is terminated

B One or more of FROM and TO channels are terminated

**UMPD** - Unmapped

Circuit under test is unmapped.

**COND cc**

- Condition code

**cc** - Hexadecimal condition code

*cc Explanation*

**12** Active CCN side not IS or failed or pested or hardware OOS

**13** UNIT not equipped, not in service, or failed

**14** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS

**15** FTMI not equipped, not in service, or failed

**16** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**17** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**18** DSPI not equipped, not in service, or failed

**1A** Required FLI not equipped, not in service, or failed

**1B** Required MXR not equipped, not in service, or failed

**1C** Reqd FMT not eqd,not IS,or failed,or inact side FMT not eqd, or not IS

**1D** Required MIU not equipped, not in service, or failed

**E0** ETSI not equipped, not in service, or failed

**44** Invalid direction specified for NTST TLA/TLR

**49** test group unequipped

**54** invalid mode for TLA/TLR

**55** circuit already terminated

**5A** NPC not in service or failed

## **TTST,TLR,NOT,TP**

### **TWO-WAY TEST ACCESS**

#### **Explanation Of Command**

This message is used to modify the Terminate and Leave Release status of one or both ends of the cross-connected channels associated with the specified test port. This message will be denied if the specified test port is not in the monitor or split mode or if the tested circuit is already in the specified termination release state. When used with the Subrate Feature for a circuit termination, the system response will be STST TLA TP or STST TLA MPTM TP. When used with the Subrate Feature for a circuit termination, the system response will be DISC TACC TS RLS or DISC TACC TS RLS MJU.

### Explanation Of Parameters

---

**TLR** - Terminate and leave release

**m** - The end of the tested circuit that must be put into the terminate and leave release state.

Set m to one of the values listed below:

| <i>m</i> | <i>Explanation</i> |
|----------|--------------------|
|----------|--------------------|

|   |                           |
|---|---------------------------|
| F | Apply TLR to the FROM end |
|---|---------------------------|

|   |                         |
|---|-------------------------|
| T | Apply TLR to the TO end |
|---|-------------------------|

|   |                        |
|---|------------------------|
| B | Apply TLR to BOTH ends |
|---|------------------------|

The following apply only to multipoint circuits

|   |                                          |
|---|------------------------------------------|
| L | Apply TLR on all legs towards facilities |
|---|------------------------------------------|

|   |                                      |
|---|--------------------------------------|
| G | Apply TLR on all legs towards bridge |
|---|--------------------------------------|

|   |                                          |
|---|------------------------------------------|
| A | Apply TLR on all legs in both directions |
|---|------------------------------------------|

**NOT** - Not

NOT means that the termination number following the NOT keyword is not to be affected by this command. This field is only valid for m values

L, G, or A.

**TP** - Test port

**kk** - Test port number (01 through 96)

The test port is mapped to predesignated channels of a network processing circuit for test ports (NPCTP) during the provisioning of that test port. All domestic nonSLC NPC types can be provisioned as NPCTP. For the mapping between the test ports and the channels of the test NPCs, see the GRTH::TP message.

**[t]rst** - The 3- or 4-digit Nonhierarchical NPC number of a termination that must not be affected by the command.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

**uvmnp** - Hierarchical NPC number of a termination that must not be affected by this command

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC                                   |
|-----------|----------|---------------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02 (DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06 (DACS II CEF frames)</b>     |

**vvv** - Channel or conference number

Channel numbers

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

|         |               |
|---------|---------------|
| 001-500 | (Virtual NPC) |
|---------|---------------|

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number with the same valid values as [t]rst.

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number with the same valid values as [t]rst.

**wxkqr** - The hierarchical NPC number of the TO termination of the circuit assigned to the test port with the same valid values as uvmnp.

**edhfg** - The hierarchical NPC number of the FROM termination of the circuit assigned to the test port. If the test port is assigned to an unmapped termination, this field will be all zeros (with the same valid values as uvmnp).

**ed,wx** - Unit number

**h,k** - Module number

**fg,qr** - NPC number

**jjj** - TO channel with the same valid values as vvv.

**ddd** - FROM channel with the same valid values as vvv.

**CUS** - Customer

The circuit is a Customer-controlled Circuit

**RDC** - Red circuit

The tested circuit is a protected circuit

**s** - Termination state of the circuit

*s Explanation*

F FROM side is terminated  
T TO side is terminated  
B BOTH sides are terminated  
R Neither side is terminated

**T UASGN**

- The test port is assigned to an unmapped termination

**NTLA** - The requested TLA state is the present TLR (RLS) state

**reason** - Denial reason

*st Explanation*

**SCERR D2** NOT NPC is not provisioned as DGA  
**SCERR D5** Corresponding NPC for NOT virtual channel is not provisioned  
**SCERR D8** Invalid NOT channel number  
**BADCCN** CCN OOS or failed  
**BADFC** FC OOS or failed  
**BADFLI** FLI OOS or failed  
**BADFMT** FMT (Formatter) OOS or failed  
**BADFTMI** FTMI OOS or failed  
**BADMIU** MIU OOS or failed  
**BADMXR** MXR OOS or failed  
**BADUNIT** UNIT OOS or failed  
**CHREST** CAS channel 031 not allowed  
**F FAIL** FROM side NPC is marked failed  
**F OOS** FROM side NPC (abc) is out of service  
**FAIL** Test port Group NPC failed  
**INERR** Input error in the specification of TLA direction  
**MCOND** An entity in the network is OOS or failed  
**NA** DACS CCN or UNIT involved cannot perform the cross-connect  
**OOS** Test port Group NPC out of service  
**T FAIL** TO side NPC is marked failed  
**T OOS** TO side NPC is Out Of Service

---

## **TTST,TLR,TG**

---

**NX64Kbit/s TWO-WAY TEST ACCESS, TERMINATE-  
AND-LEAVE-RELEASE**

### **Explanation Of Command**

---

This command is used to release one or both ends of an Nx64Kbit/s cross-connection associated with the specified test-access group. The circuit to be released must be a terminated, mapped one-way or two-way circuit, that is currently in the Monitor or Split test access mode. Upon release normal data transmission is restored in the direction specified in the command.

## Denial Message

[O.25521.01]

M hh:mm:ss xy,ww n[vv] TTST TLR m TG mmm COND cc DNY

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**TG** - Test-access group

**mmm** - Test-access Group number (001 through 400)

The TG is designated as in message 31421

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM Channel number

|          |                                                          |
|----------|----------------------------------------------------------|
| 001-031* | Primary NPCs grown as Channel Associated Signaling (CAS) |
| 001-031  | Primary NPCs grown as Non Signaling Associated (NSA)     |

\*Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If TO channel is mapped to a channel 000, the circuit can only be tested as N = 1, the corresponding FROM channel ddd will be '000'.

**RDC** - Red circuit

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

**TLR** - Terminate and leave released

**m**

- Direction of the circuit to be released

|          |                         |
|----------|-------------------------|
| <i>m</i> | <i>Explanation</i>      |
| F        | FROM side is released   |
| T        | TO side is released     |
| B        | BOTH sides are released |

**TLA** - Terminate and leave active

**S**

- Termination state of the circuit

*s Explanation*

R All channels are released

F One or more FROM channel is terminated

T One or more TO channel is terminated

**UMPD** - Unmapped

Circuit under test is unmapped.

**COND cc**

- Condition code

**cc** - Hexadecimal condition code

*cc Explanation*

**12** Active CCN side not IS or failed or pested or hardware OOS

**13** UNIT not equipped, not in service, or failed

**14** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS

**15** FTMI not equipped, not in service, or failed

**16** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**17** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**18** DSPI not equipped, not in service, or failed

**1A** Required FLI not equipped, not in service, or failed

**1B** Required MXR not equipped, not in service, or failed

**1C** Reqd FMT not eqd,not IS,or failed,or inact side FMT not eqd, or not IS

**1D** Required MIU not equipped, not in service, or failed

**E0** ETSI not equipped, not in service, or failed

**44** Invalid direction specified for NTST TLA/TLR

**49** test group unequipped

**56** circuit not terminated

**5A** NPC not in service or failed

## **TTST,TPR,ALL,OOS**

### **TEST PORT RELEASE**

#### **Explanation Of Command**

This command requests that all test ports set up by the link on which this command is input be restored to the released mode. An individual output message will be received for each test port released (see TTST,TPR,TP,OOS)

This output message will be received after all test ports have been released.

Substrate test sessions are also released by this command.

#### **Command**

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.27002]

I hh:mm:ss xy,ww TTST TPR ALL COND cc COMPL

### **Explanation Of Parameters**

---

**TPR** - Test Port Release

**ALL** - All

**OOS** - Out-of-service

The OOS keyword is used to release test ports on an out-of-service circuit. Any test port, regardless of the type of circuit accessed, will be released.

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

**00** No conditions

**01** No test ports were activated by link n

**02** One or more test ports could not be released

## **TTST,TPR,TP,OOS,FRC**

### **TWO-WAY TEST ACCESS**

#### **Explanation Of Command**

This command allows a circuit under test to be put in the release mode and to be restored to its mapped (terminated or normal) state. When the Subrate Feature is used for a circuit termination, the system response will be a Subrate test port release message.

The FRC keyword is only used for an emergency disconnect of a test port from a DSP Platform application in the unlikely event that an application cannot disconnect the test port itself using an application command. The FRC keyword may only be used by users who have the RMON (Restricted Maintenance privilege ON) privilege. After the use of this command with the FRC keyword, the user should use the DDIS command (I.15061) to disconnect the cross-connect that was used for the test port connection to the application. The UTL::QRY,CMAP command (I.52011) should be used to find the appropriate pair of application channel numbers **before** this command and command I.15061 are used to take the test port and then the cross-connection down.

[O.27001.01]

**I** hh:mm:ss xy,ww TTST TPR TP kk <reason> DNY

## **Explanation Of Parameters**

---

**TP** - Test port

**kk** - Test port number (01 through 96)

**OOS** - Out-of-service  
Used to release test ports on an out-of-service circuit

**FRC** - Force the disconnect  
This keyword is used only in an emergency, when a DSP Platform application (such as DDS Subrate, X.50 Subrate, or DMB) running on a TG193B circuit pack cannot disestablish a test port via an application command. This keyword is also restricted to users with the RMON privilege.

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

If NPC numbers are expressed in three digits, the valid values are:

SD type NPC numbers listed by unit number, within a **North American module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

**uvmnp** - Hierarchical TO NPC number of the circuit assigned to the test port.

**wxkqr** - Hierarchical FROM NPC number of the circuit assigned to the test port.

If the test port is assigned to an unmapped termination, this field will be all zeroes.

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC                                   |
|-----------|----------|---------------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02 (DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06 (DACS II CEF frames)</b>     |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**ddd** - FROM channel or conference number  
**jjj** - TO channel or conference number

Channel numbers

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

|         |               |
|---------|---------------|
| 001-500 | (Virtual NPC) |
|---------|---------------|

**TPR** - Test port release

**TLA** - Terminate and leave active

**s** - Termination state of the circuit

|          |                                      |
|----------|--------------------------------------|
| <b>s</b> | Explanation                          |
| <b>R</b> | RELEASED. Neither side is terminated |
| <b>F</b> | FROM side is terminated              |
| <b>T</b> | TO side is terminated                |
| <b>B</b> | Both sides are terminated            |

**RDC** - Red circuit

**CUS** - Customer  
Customer-controlled circuit

**NTR** - No transmit

|               |                                                                           |
|---------------|---------------------------------------------------------------------------|
| <b>st</b>     | <i>Explanation</i>                                                        |
| <b>F FAIL</b> | FROM side NPC is marked failed                                            |
| <b>F OOS</b>  | FROM side NPC (abc) is out of service                                     |
| <b>F UEQD</b> | The DACS unit supporting the FROM termination is out-of-service or failed |
| <b>FAIL</b>   | Test port Group NPC failed                                                |
| <b>MCOND</b>  | An entity in the network is OOS or failed                                 |
| <b>NA</b>     | DACS CCN or UNIT involved cannot perform the cross-connect                |
| <b>NUTST</b>  | Test port kk is presently idle                                            |
| <b>OOS</b>    | Test port Group NPC out of service                                        |
| <b>T FAIL</b> | TO side NPC is marked failed                                              |
| <b>T OOS</b>  | TO side NPC is Out Of Service                                             |
| <b>T UEQD</b> | The DACS unit supporting the TO termination is out-of-service or failed   |
| <b>UEQD</b>   | The test port Group NPC or the test port is not equipped                  |

## UTL

---

## UTL

---

This section documents the **UTL** command.

## **UTL,ACO**

---

### **ALARM CUTOFF**

#### **Explanation Of Command**

---

This message executes an audible alarm cutoff (ACO), silencing any currently active central office audible frame alarms. DACS II also illuminates the green ACO LED on the front status panel. The ACO remains active and the green LED remains illuminated until all frame alarms are retired or a new alarm appears on the system.

Note that executing an ACO **does not** inhibit subsequent audible alarms from being generated for additional failures. In addition, the ACO does not retire local or remote **visible** indications and does not cause the system to issue an alarm clear notification.

Executing an ACO by inputting this command is equivalent to pressing the status panel ACO push-button. When the ACO push-button is pressed, a message indicating that the ACO has been activated is generated by the system.

#### **Command**

---

[I.51111]

**UTL:FRM xy,SEQ ww:ACO!**

#### **Completion Message**

---

[O.51111]

**pahh:mm:ss xy,ww n[vv] UTL ACO {ACTIVE|INACT} COMPL**

#### **Denial Message**

---

Not applicable.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**ACO** - Alarm cutoff

**ACTIVE** - Active alarm

The appearance of this keyword indicates that the audible alarm cutoff has been activated in the system.

**INACT** - Inactive alarm

The appearance of this keyword indicates that there were no alarms on the system and the audible alarm cutoff was not activated.

## **UTL,BMTR,FROM,TO,EXCT,INCL,UPGRD**

### **BACKUP MEMORY TRANSFER**

#### **Explanation Of Command**

This command performs the following functions:

1. When the MC is in-service, it may be used to request a transfer of database information from random access memory (RAM) to the memory device (MEM) or devices that are in-service. The Primary Memory (PMEM) device will always be in-service. The Secondary Memory (SMEM) device may or may not be in-service. If SMEM is in-service, then a transfer of database information will be performed from RAM to SMEM.
2. When the MC is in maintenance condition (MCOND), it may be used to request a transfer of executables or database information between PMEM and SMEM or between SMEM and PMEM. If the optional EXCT keyword is **not** used, only database information will be transferred. If the EXCT keyword **is** used only executables will be transferred.
3. During a release upgrade procedure, when in MCOND, it transfers the database and DSP Platform Applications, if any, from SMEM to PMEM. The UPGRD keyword must be used in that case. Note that the UPGRD keyword is only available to user DAX with the frame in MCOND.

Restricted maintenance privilege is required for transfers of executables or database information from SMEM to PMEM.

Every ten minutes the state of the frame is checked to look for changes in provisioning and/or cross connections. If a change has occurred within that period, an autonomous request is made to transfer data base information from RAM to MEM.

If the user issues a command transferring database information or executables from PMEM to SMEM, the command is executed immediately; however, if the transfer occurs from SMEM to PMEM the following message will appear (see below when the UPGRD keyword is used):

**ARE YOU SURE? (YES/NO)**

Only if the answer is YES, will the command be executed. If the answer is not YES or the user does not respond within 60 seconds, the following will be displayed:

**COMMAND ABORTED**

When transferring executables between PMEM and SMEM in either direction, Digital Signal Processing Platform (DSPP) application executables (if present) are treated as follows:

1. If executables for a particular application are on the source card, but not on the destination card, the transfer of those application executables takes place.
2. If executables for a particular application are on the destination card, but not on the source card, the application executables are not erased, even if executables for another application are copied from source to destination card.
3. If executables of the same application (the "x" in SDxyz is the same) that have the same version identifiers are on both the source and the destination card, then both executables remain untouched and no transfer takes place for that application.
4. If different versions of the executables of the same application are on the source and the destination card respectively, then this command is denied. The user must invoke the INSTALL command to first list and then remove one or the other version of the application before invoking this command again.

The **UPGRD** keyword must only be used during an upgrade procedure for the purpose of copying the database and previously installed DSP Platform Applications from SMEM to PMEM. The following restrictions apply for the use of the UPGRD keyword.

1. Only a copy from SMEM to PMEM is allowed.
2. The EXCT keyword is not allowed.
3. The INCL keyword is not allowed.
4. The Main Controller must be in Maintenance Condition (MCOND).
5. The user must be user DAX.
6. The release identifier for the executables on the PMEM card must refer to a newer release than the release identifier of the database on the SMEM card; i.e., this must be a genuine upgrade situation.

At the beginning of the invocation of this utility with the UPGRD keyword the following message will appear:

**WARNING - YOU HAVE INVOKED THE "UPGRD" KEYWORD.  
THE "UPGRD" KEYWORD SHOULD ONLY BE USED DURING A GENERIC UPGRADE.  
DO YOU WISH TO CONTINUE? (YES/NO)**

The user should respond with a **YES** if and only if an upgrade for the DACS II generic is to be done.

During the execution of this copy utility during an upgrade procedure (i.e., with the UPGRD keyword), the database is copied from SMEM to PMEM and a retrofit of the size of the database takes place if needed. In addition, all the applications residing on SMEM, if any, are copied to PMEM.

New PMEM cards with new DACS II executable software should **not** have any application software on them. Therefore, if for some reason, a different version of the same application resides on the PMEM card that resides on the SMEM card, then this command will be denied.

### **Command**

A hh:mm:ss xy,ww UTL BMTR FROM <from> TO <to>[ EXCT] \  
COND cc DNY

### Explanation Of Parameters

---

**BMTR** - Backup memory transfer

**FROM** - From

**from** - Source for backup memory transfer

**TO** - To

**to** - Destination for backup memory transfer

RAM Random access memory  
PMEM Primary memory device  
SMEM Secondary memory device  
MEM PMEM, SMEM or both

**Note:** The only permissible combinations are listed below:

**from to**

RAM MEM  
PMEM SMEM  
SMEM PMEM

**EXCT** - Executable

Transfer generic executable software only. May not be used when transferring memory contents from RAM to MEM. Frame must be in maintenance condition state (MCOND) when transferring executable software from PMEM to SMEM or SMEM to PMEM. Additionally, SMEM to PMEM requires restricted maintenance (RMON) privileges.

**INCL** - Inclusive

The INCL keyword is used to request that the data base on PMEM be transferred to SMEM excluding the generic journal files. This keyword cannot be combined with the EXCT keyword. INCL may not be used when transferring RAM to MEM.

The INCL keyword is used only as a preparatory step before starting a generic upgrade. It makes sure that the database residing on the SMEM card has no journal files before the upgrade is started. This is different from an invocation of this utility to copy from RAM to MEM, which converts the journals to the database leaving the journal files empty, but which does not remove the journal files.

## UPGRD - Upgrade

The UPGRD keyword must be used only during a DACS II Release upgrade for the purpose of copying the database and any previously installed DSP Platform Applications from SMEM to PMEM. It is an assumption that the PMEM card has the new executables and nothing else, while the SMEM card contains the old executables, all installed DSPP Applications, and a complete database with no remaining journal entries. Only user DAX may use this keyword; also, the MC must be in MCOND.

## cc - Hexadecimal condition code

### cc Explanation

|           |                                                           |

| <b>FC</b> | Invalid executable on card                                |

**cc**    *Explanation*

**FD**    Problem occurred while accessing old\_tape  
**FE**    Fail transfer DB from old\_tape to SMEM  
**FF**    DB retrofit fail

## **UTL,BOOT,FRAME,CLR**

### **UTILITY BOOT**

#### **Explanation Of Command**

This command requests the transfer of the data base from the primary memory (PMEM) to the random access memory (RAM).

**Note:** No hardware circuit packs or memory cards should be removed from or inserted into the frame while a boot or reset is in progress.

The optional CLR keyword is unnecessary but it is allowed for compatibility with older software releases.

# parameter

- One chosen from the list below:

| Parameter | Explanation                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BER       | Bit Error Rate                                                                                                                                                               |
| BPV       | Bipolar Violation                                                                                                                                                            |
| COFA      | Change Of Frame Alignment                                                                                                                                                    |
| CRC       | Cyclic redundancy (CR) code<br>CR check block error events (CRC-4)                                                                                                           |
| ER        | Error Rate (same as BER for D4 framing)                                                                                                                                      |
| ERS       | Errored Seconds                                                                                                                                                              |
| FRER      | Framing Error                                                                                                                                                                |
| LOFA      | Loss of Frame Alignment Events                                                                                                                                               |
| MER       | Multiframe Alignment Error Events (Time slot 16)                                                                                                                             |
| OOF       | Out Of Frame                                                                                                                                                                 |
| SERS      | Severely Errored Seconds                                                                                                                                                     |
| SLIP      | Slip count                                                                                                                                                                   |
| PM        | Clears the following registers (CEPT):<br>DM - Degraded Minutes<br>SERS - Severely Errored Seconds<br>ERS - Errored Seconds<br>US - Unavailable Seconds<br>SLIP - Slip count |

**Note:** Only the BER and SLIP parameters are allowed for Clear-DS1 NPCs.  
SERS, ERS, and SLIP are only individually clearable for domestic NPCs.  
For CEPT NPCs they will be cleared by the PM parameter.

**UEQD** - Unequipped

**BADNPC** - Bad NPC

The selected parameter is not valid for this NPC.

**cc** - Hexadecimal condition code

| cc | Explanation                      |
|----|----------------------------------|
| 04 | Subject entity is out of service |
| 10 | Unit is not equipped             |
| 11 | UC is out of service             |
| 12 | UC is in service but failed      |
| 13 | FTMI is not equipped             |
| 14 | FTMI is out of service           |
| 1F | FTMI is in service but failed    |
| 24 | Unit type error                  |
| 26 | NPC type error                   |

**cc**    *Explanation*

**0B**    Invalid CEPT NPC

**46**    NPC Failed or Out of Service

**A1**    The parameter specified does not match with the NPC type

## **UTL,CLR,NPC,ALL,AI,MONDAT,MONTIM**

### **UTILITY CLEAR DA/TA/PA/TH NPC PARAMETERS**

#### **Explanation Of Command**

This message clears the facility performance monitoring parameter counts of DA, TA, TH, and PA type NPCs.

This command will handle NPC addressing in the input command as follows: If only a single NPC is addressed in the input command, then either a completion or denial response will be generated for the addressed NPC. DACS II will always deny invalid commands to specifically addressed NPCs.

If a range of NPCs is addressed or the ALL NPC keyword is used and the feature applies to one or more NPCs within the range, DACS II will perform the operation on the NPCs in the range that support the requested feature, but skip the NPCs which do not support the requested feature. DACS II provides a variety of line termination types which support different features and can be randomly mixed within the frame. If at least one of the NPCs in the addressed range supports the requested feature, DACS II will generate a completion response for the entire range of NPCs; individual denial responses will not be generated for NPCs within the range which do not support the feature. If *none* of the NPCs in the addressed range support the requested feature, DACS II will generate a range denial response. NPC - Network processing circuit

If an NPC range is specified in the input command, the following floating window rules apply:

1. Unequipped NPCs within the requested range will be skipped.
2. If a CEPT gap is within the requested range, the NPCs in the gap will be skipped.
3. If an endpoint of the requested range is in a CEPT gap, then the command will be denied."

## Command

---

### Nonhierarchical

---

[I.56071]

UTL:FRM xy,SEQ ww:CLR,{NPC [s]abc[-[t]def]|ALL},<parameter>,AI aaaaa \  
[,MONDAT dddd][,MONTIM tttt]!

### Hierarchical

---

[I.56071]

UTL:FRM xy,SEQ ww:CLR,{NPC uvmnp[-wxkqr]|ALL},<parameter>,AI aaaaa \

```

### **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**NPC** - Network processing circuit

**uvmnp** - Hierarchical NPC number

**wxkqr** - Hierarchical NPC number

**ALL** - All

This keyword is a valid option for NPCs rather than specifying a single or range of NPCs. It is used to clear a single parameter on all PA/TH type NPCs. If the ALL NPC option is selected, the input command must specify only a single facility parameter. An input command with the ALL NPC key word and any facility parameter groupings, i.e., ALLPM, ALLE or ALLF, will be denied.

[s]abc - The 3- or 4-digit nonhierarchical NPC number

[t]def - The 3- or 4-digit nonhierarchical NPC number

The valid values are:

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

**uvmnp** - Hierarchical NPC number

**wxkqr** - Hierarchical NPC number

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**parameter**

- Parameter name

The type of monitored parameter accumulation registers which are to be reset. If only a single NPC is specified in the input command, all types of its parameter accumulators may be reset (possibly restricted by the choices of other input parameters) by selecting the value ALLPM in the <parameter> field. If more than one NPC is specified in the input command, then ALLPM, ALLE, and ALLF are not valid values for parameter.

The values ALLE or ALLF may be selected to clear all Near-end or all Far-end parameters, respectively, as a group. The far-end parameters are: FEBE, FES, FSES, and FUAS. All other parameters are near-end parameters. **Note that parameters FEBE, FES, FSES and FUAS are not applicable for the TH type NPCs.**

**parameter**      *Explanation*

|       |                                      |
|-------|--------------------------------------|
| ALLE  | All Near-end parameters listed below |
| ALLF  | All Far-end parameters listed below  |
| ALLPM | All parameters listed below          |
| CRC   | CRC Block Errors                     |
| CSS   | Controlled Slip Seconds              |
| CV    | Coding Violations                    |
| ES    | Errored Seconds                      |
| FEBE  | Far End Block Errors                 |
| FES   | Far End Errored Seconds              |
| FRER  | Framing Errors                       |
| FSES  | Far End Severely Errored Seconds     |
| FUAS  | Far End Unavailable Seconds          |
| MER   | Multiframe Errors                    |
| OFS   | Out of Frame Seconds                 |
| SES   | Severely Errored Seconds             |
| UAS   | Unavailable Seconds                  |
| UATC  | Unavailable Time Count               |

**AI** - Accumulation interval

**aaaaa** - The accumulation time period for the specified parameter

If the ALLAI option is specified, the command will be applied to all 15-minute and daily accumulators. That is, all accumulators will be reset.

**aaaaa** *Explanation*

15MIN Parameter count from a 15-minute accumulator

ALLAI Parameter counts from both 15-minute and daily accumulators

DAILY Parameter count from a daily accumulator

**MONDAT** - Monitored Date

**dddd** - This option specifies the performance monitoring period to be reset. It is used to allow users to specify the counts of which 24-hour period (current or previous) are to be cleared. Therefore, this option is applicable only if the AI option is entered with "DAILY". If the "AI DAILY" option is entered without this "MONDAT" field, both the current and previous 24-hour counts will be cleared. The "MONDAT" option cannot be specified with the AI option being 15MIN or ALLAI.

**dddd** *Explanation*

CURD Current day

HIST Previous 24-hour period

**MONTIM** - Monitored Time

**tttt** - This option specifies the performance monitoring period to be reset and can be entered. It is used to allow users to specify the counts of which 15-minute period (current or previous) are to be cleared. Therefore, this option is applicable only if the AI option is entered with "15MIN". If the "AI 15MIN" option is entered without this "MONTIM" field, both the current and previous 15-minute counts will be cleared. The "MONTIM" option cannot be specified with the AI option being DAILY or ALLAI.

**tttt** *Explanation*

CURT Current 15-minute period

HIST Previous 15-minute period

**cc** - Hexadecimal condition code

**cc** *Explanation*

|           |                                                                 |
|-----------|-----------------------------------------------------------------|
| <b>04</b> | Subject entity is out of service                                |

## **UTL,CLR,NPC,PARAMS**

### **CLEAR FACILITY PERFORMANCE PARAMETERS**

#### **Explanation Of Command**

This message requests the facility performance parameters be cleared of the values or state for one network processing circuit (NPC).

This message clears all facility performance parameters except the loss of frame alignment (LOFA) parameter on one CEPT PB or PC type NPC.

#### **Command**

##### **Nonhierarchical**

[I.56051]

UTL:FRM xy,SEQ ww:CLR,NPC [s]abc,PARAMS!

### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**CLR** - Clear

**PARAMS** - Parameters

For CEPT NPCs, the parameters which will be cleared with this command are:

| <i>Parameter</i> | <i>Explanation</i>                               |
|------------------|--------------------------------------------------|
| CRC              | Cyclic Redundancy Code                           |
| FRER             | Framing Error                                    |
| MER              | Multiframe Alignment Error Events (time slot 16) |
| DM               | Degraded minutes                                 |
| ERS              | Errored Seconds                                  |
| SERS             | Severe Errored Seconds                           |
| US               | Unavailable seconds                              |
| SLIP             | Slip count                                       |

**Note:** BER condition is not clearable for CEPT type NPCs, even though it is clearable for domestic type NPCs.

**cc** - Hexadecimal condition code

| <b>cc</b> | <i>Explanation</i>               |
|-----------|----------------------------------|
| <b>02</b> | Subject entity is not equipped   |
| <b>04</b> | Subject entity is out of service |
| <b>10</b> | Unit is not equipped             |
| <b>11</b> | UC is out of service             |
| <b>12</b> | UC is in service but failed      |
| <b>13</b> | FTMI is not equipped             |
| <b>14</b> | FTMI is out of service           |
| <b>1F</b> | FTMI is in service but failed    |
| <b>46</b> | NPC Failed or Out of Service     |

## **UTL,DATE,FORMAT,INT**

### **SET DATE**

#### **Explanation Of Command**

This command sets the date (month-day-year or day-month-year) and the interval at which it will be printed for the DACS II clock.

#### **Command**

[I.51021]

UTL:FRM xy,SEQ ww:DATE <new-date>[,FORMAT ggg][,INT ii]!

#### **Completion Message**

[O.51021]

M hh:mm:ss xy,ww n[vv] UTL DATE aa/bb/cc FORMAT ggg INT ii COMPL

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

Not applicable.

## Explanation Of Parameters

**DATE** - Date

### new-date

- Date specified in one of the following formats:

| <i>new-date</i> | <i>Date format</i>                       |
|-----------------|------------------------------------------|
| moda[ce]yr      | Month, followed by day, followed by year |
| damo[ce]yr      | Day, followed by month, followed by year |

**mo** - month  
**da** - day  
**ce** - century  
**yr** - year

The 2-digit century (ce) field is optional. If the user enters a 2-digit number for the year field, DACS II assumes a default value of 19 for the century for the range of years between 86 and 99 and a default value of 20 for the century for the range between 00 and 85. Any 4-digit century-year entry from 1986 onward is also acceptable.

**INT** - Interval

**ii** - Interval at which DACS II will print the date

| <i>ii</i> | <i>Meaning</i>                                        |
|-----------|-------------------------------------------------------|
| 01        | Every hour on the hour                                |
| 02        | Every even hour on the hour                           |
| 04        | Every fourth hour on the hour: 04, 08, 12, 16, 20, 24 |
| 06        | Every sixth hour on the hour: 06, 12, 18, 24          |
| 08        | Every eighth hour on the hour: 08, 16, 24             |
| 12        | Twice daily on the hour: 12, 24                       |
| 24        | Once daily at midnight (default)                      |

**FORMAT** - Format

**ggg** - Date format

The format to be used for interpreting the date from the input message and printing it on PDS output messages.

|     |                                       |
|-----|---------------------------------------|
| ggg | Date format                           |
| MDY | Month/Day/Year (USA format)           |
| DMY | Day/Month/Year (International format) |

**DATE** - Date

**aa** - Month or day

**bb** - Day or Month

**cc** - Year (2 or 4 digits)

The DATE will be displayed in either the USA format or the International format, depending on the value of ggg.

## **UTL,INIT,ALM**

---

### **UTILITIES, ALARM REPORTING**

#### **Explanation Of Command**

---

This message sets the DACS II audio/visual alarm reporting method to either remote only (**a = 2**) or to local and remote (**a = 3**).

#### **Command**

---

[I.51101]

**UTL:FRM xy,SEQ ww:INIT,ALM a!**

#### **Completion Message**

Not applicable.

## Explanation Of Parameters

**LOC** - Location

Physical location

**entity** - Plug-in equipment entity

Main Controller Entities:

| <i>entity</i> | <i>Explanation</i>                              |                 |
|---------------|-------------------------------------------------|-----------------|
| MC            | Main controller                                 |                 |
| CPU           | Central processing unit                         |                 |
| BX            | Bus extender                                    | (SBF/Non-CEF)   |
| MTC           | Maintenance circuit pack                        | (SBF/Non-CEF)   |
| EBX           | Expanded bus extender                           | (CEF/ECEF/ESBF) |
| EMTC          | Expanded maintenance circuit pack               | (CEF/ECEF/ESBF) |
| CI            | Communications interface                        |                 |
| PMEM          | Primary Memory Card, within CPU board           |                 |
| DISK          | Secondary Memory Card, plugs into the CPU board |                 |
| STATUS PANEL  | (Note 1)                                        |                 |

**Note 1:** The location of this entity is not on the designation strip. The approximate location is returned in the output message.

The entity CPU cannot be used with UNIT to query the Unit Controller; instead only the entity UC can be used.

Synchronizer entities:

| entity                                                                                                                       | Explanation                                      |
|------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| SYNC 0<br>SYNC 1                                                                                                             | Synchronizer                                     |
| SYNC 0,TB<br>SYNC 1,TB                                                                                                       | Synchronizer Time Base                           |
| SYNC 0,TLI 1<br>SYNC 0,TLI 2<br>SYNC 0,TLI 3<br>SYNC 0,TLI 4<br>SYNC 1,TLI 1<br>SYNC 1,TLI 2<br>SYNC 1,TLI 3<br>SYNC 1,TLI 4 | Synchronizer Timing Link Interface               |
| SYNC,TLI 3,CRO                                                                                                               | Synchronizer Clock Reference Oscillator (Note 2) |

**Note 2:** The location of the CRO is not on the designation strip. It is a Time Base application for TLI slots 3 and 4 on sides 0 and 1.

Cross-Connect entities:

| <b>entity</b> | <b>Explanation</b>              |                    |
|---------------|---------------------------------|--------------------|
| CCN 0         | Cross-connect network           | (SBF/ESBF/Non-CEF) |
| CCN 1         |                                 |                    |
| CCNI 0        | Cross-connect network interface | (SBF/ESBF/Non-CEF) |
| CCNI 1        |                                 |                    |
| CCB 01        | Cross-connect buffer            | (SBF/ESBF/Non-CEF) |
| CCB 02        |                                 |                    |
| CCB 03        |                                 |                    |
| CCB 04        |                                 |                    |

FTU/IFTU/IFTU2 entities:

| <i>entity</i>    | <b>Explanation</b>                                         |
|------------------|------------------------------------------------------------|
| UNIT [q]q,UBX    | Unit bus extender                                          |
| UNIT [q]q,FTMI b | Facility terminating module interface<br>(b = 1 through 4) |
| UNIT [q]q,FC 0b  | Format converter                                           |
| UNIT [q]q,FC 1b  |                                                            |

DSPU entities:

| <i>entity</i>  | Explanation                         |
|----------------|-------------------------------------|
| UNIT [q]q,DSPI | Digital signal processing interface |

If the unit is equipped as a DS3 Unit or a Hybrid DS3 Unit:

UNIT Common Equipment entities:

| <b>entity</b>   | Explanation                                        |
|-----------------|----------------------------------------------------|
| UNIT [q]q       | Unit [q]q's Protection MXR (1 through 16)          |
| UNIT [q]q,UC    | Unit Controller                                    |
| UNIT [q]q,MXR d | Multiplexer/Hybrid Multiplexer (d = P,1 through 6) |
| UNIT [q]q,MIU d | Multiple Interface Unit                            |
| UNIT [q]q,FLI k | Facility Line Interface (k = S or P)               |
| UNIT [q]q,FMT s | Formatter/Hybrid Formatter (s = 0 or 1)            |

Network Processing Circuit entities of an FTU:

| <b>entity</b>       | <b>Explanation</b>         |
|---------------------|----------------------------|
| NPC [s]abc[-[t]def] | Nonhierarchical NPC number |
| NPC uvmpnp[-wxkqr]  | Hierarchical NPC number    |
| NPC [s]abc[-[t]def] | Nonhierarchical NPC number |
| NPC uvmpnp[-wxkqr]  | Hierarchical NPC number    |

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

If an NPC is in an FTU, the command will return the location of the Dual Digroup Card that processes the NPC.

The valid nonhierarchical FTU NPC numbers are:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |
| <b>0081-0112</b> | <b>0241-0272</b> | <b>0401-0432</b> | <b>0561-0592</b> |

| <b>1361-1392</b> | <b>1521-1552</b> | <b>1681-1712</b> | <b>1841-1872</b> |
| <b>1401-1432</b> | <b>1561-1592</b> | <b>1721-1752</b> | <b>1881-1912</b> |

| Unit<br>13       | Unit<br>14       | Unit<br>15       | Unit<br>16       |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

The valid hierarchical FTU NPC numbers are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

If an NPC is in a DS3/HDS3 Unit, the command will return the location of the Service MXR/HMXR that processes the NPC.

Network Processing Circuit entities of a DSPU:

*entity*

NPC [s]abc[-[t]def],SIDE-s  
NPC uvmnp[-wxkqr],SIDE-s

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

As shown above, the command will return the location of the DSPC pack including the side information, the value of "s" can be either 0 or 1.

The valid nonhierarchical DSPU NPC numbers are:

If NPC numbers are expressed in three digits, the valid values are:

CB type NPC numbers listed by unit number, Unit Type DP (DSPU)

| Unit<br>1  | Unit<br>2  | Unit<br>3  | Unit<br>4  | Unit<br>5  | Unit<br>6  |
|------------|------------|------------|------------|------------|------------|
| <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> |

The valid hierarchical DSPU NPC numbers are:

CB type NPC numbers listed by unit, module, and NPC Number  
Unit Type DP (DSPU)

| Unit         | Module     | NPC       |
|--------------|------------|-----------|
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

**b, c** - Bay number (1 through 7)

The bay in which the entity is located.

**[q]q** - Unit number (1 through 16)

**vv, uu** - Entity height, in inches.

For an FTU, the value is the number of inches from the bottom of the unit shelf to the center of the entity. The possible vv and uu values are:

02, 06, 10, 14, and 18 inches

For a DSPU the value of variables vv and uu can only be 06.

For a DS3U/HDS3U the value of variables vv and uu can only be 06.

**hhh, iii**

- Entity horizontal location in inches

Entity horizontal distance from the left front side of the bay, approximately 1-1/4 inches to the right of the bay upright, in 1/8 inch increments, to the center of the circuit pack slot of the entity (000 through 158).

The values for any entity will be the same as those shown on the designation strips for that entity, located above the entity. Note, however, that for duplicated entities the side (0 or 1) value precedes the name on the designation strip.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**97** Entity can't be addressed in this configuration

---

## UTL, QRY, ALL

---

### UTILITY QUERY ALL

#### Explanation Of Command

---

This message requests a printout on a specified facility performance parameter for all Network Processing Circuits (NPCs).

Note that DS3U message segment applies to both DS3 unit and Hybrid DS3 unit (HDS3U). The MXR applies to both MXR and Hybrid MXR.

#### Command

## Explanation Of Parameters

**ALL** - All

### parameter

- Facility performance parameter

The parameter values listed below are applicable only to PB or PC type NPCs. If there are PA or THNPCs in the FTM, dashes ("-") will be output in the position of these NPCs:

| <b>parameter</b> | <i>Explanation</i>                                 |
|------------------|----------------------------------------------------|
| <b>DM</b>        | Degraded minutes                                   |
| <b>SERS</b>      | Severely errored seconds                           |
| <b>ERS</b>       | Errored seconds                                    |
| <b>US</b>        | Unavailable seconds                                |
| <b>SLIP</b>      | Slip events                                        |
| <b>CRC</b>       | Cyclic redundancy check-4 check block error events |
| <b>FRER</b>      | Framing error events                               |
| <b>LOFA</b>      | Loss of frame alignment events                     |
| <b>MER</b>       | Multiframe alignment error events (Time slot 16)   |

**Note:** If the parameter reports threshold alarms (DM, SERS, ERS, US, or SLIP), the count represents the total for the last 24 hours (a rolling 24-hour count). The other parameter counts represent the total since local midnight.

The parameter value below is applicable to all CEPT NPC types, that is, PA, PB, PC and TH:

| <b>parameter</b> | <i>Explanation</i>                                            |
|------------------|---------------------------------------------------------------|
| <b>BER</b>       | Bit Error Rate<br>(Also MBER/RBER for NPCs with MBER feature) |

**Note:** For BER and RBER, the message reports NPCs that are currently in the BER state.

A message segment will be omitted for:

- Unequipped FTMs
- Equipped FTM with no equipped NPC
- Equipped FTM with all NPCs having zero value of <parameter>
- Equipped CEPT FTM with all NPCs being PA type but with a parameter other than BER.

xxxxxx - Parameter count values

Dashes ("-") will be output for NPCs that are not equipped or are provisioned with a type unapplicable to the parameter. If an entire FTM is unequipped or all its NPCs are dashes, the segment is skipped.

xx - BER states

xx represents a combination of the excessive error rate (EER), bit error rate (BER), and remote bit error rate (RBER). It is interpreted as either a prompt maintenance alarm-major (PMA), deferred maintenance alarm -minor(DMA), prompt maintenance alarm-critical (PMC), or clear.

| xx | EER/BER state                    | RBER state     |
|----|----------------------------------|----------------|
| CR | PMC                              |                |
| MJ | EER/PMA                          | Not applicable |
| MN | DMA                              | Inactive       |
| RN | DMA                              | Active         |
| CL | Clear*                           | Inactive       |
| RL | Clear*                           | Active         |
| -- | NPC unequipped or out of service |                |

\* Clear refers to a Facility type NPC whose received error rate is less than the Minor BER threshold.

without CRC ( $10^{-5}$ )  
with CRC ( $10^{-6}$ )

**Note:** EER has priority over the BER/RBER states. EER does not coexist with them; however, BER and RBER coexist with each other.

Unless the CHG::NPC,TS0 command is used to redefine the active value of bit 4 of CTS 0, the RBER values are:

*RBER Explanation*

|   |          |
|---|----------|
| 1 | Inactive |
| 0 | Active   |

NPC(S) - Network processing circuit(s)

**[s]abc** - The first 3- or 4-digit nonhierarchical NPC number in a module

**[t]def** - The last 3- or 4-digit nonhierarchical NPC number in a module

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number of the first NPC in a module

**uvmqr** - Hierarchical NPC number of the last NPC in a module

**uv,** - Unit number

**m,** - Module number

**np, qr** - NPC number within the module

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

The parameter value for the first NPC is listed in the first position (upper left corner) of the first line of each message segment. The value for the last NPC occurs in the last position (lower right corner).

**TOT** - Total

**nnnn** - Cumulative count of NPCs returning nonzero states or values

The last nnnn, the one printed out in the last message module, gives the total number of NPCs with nonzero states or values in the frame.

**RESET** - Reset

Indicates that one or more autonomous resets have occurred.

---

## UTL, QRY, ALL, COMMON

---

### QUERY ALL COMMON EQUIPMENT

#### Explanation Of Command

---

This message is used to request reports on the out-of-service, fail, or pest status of the common frame equipment. Common frame equipment includes the administrative links, cross-connects, clock and control interfaces or cross-connect network interfaces (CEF or nonCEF, respectively), synchronizers, clock reference oscillator, timing link interfaces, time slot interchangers and expanded time slot interchangers.

#### Command

---

[I.53104]

UTL:FRM xy,SEQ ww:QRY,ALL,COMMON!

#### Completion Message

---

[O.53104]

### Explanation Of Parameters

---

**ALL** - All

**COMMON** - Common

**OOS** - Out of service

**FAIL** - Fail

**PEST** - Pest

For the OOS, FAIL and PEST keywords, variables g through p each represent a frame entity. The values of these variables give the OOS, FAIL, or PEST status of the associated entity. Values are interpreted using the table below. The entity associated with a given variable is given following the explanation of PEST below.

| Value | OOS            | FAIL           | PEST           |
|-------|----------------|----------------|----------------|
| 1     | out-of-service | failed         | pested         |
| 0     | in service     | not failed     | unpested       |
| -     | not applicable | not applicable | not applicable |

to the particular entity. For example, an unequipped circuit would display a "-" in the position of its OOS, FAIL and PEST indicators g through p.

The keyword PEST is used to indicate that error reporting is disabled. Out-of-service (OOS) entities and entities related to a side that is out of service are pested to prevent error messages from being reported to the main controller. Error reporting is undesirable if an entity is OOS since it would interrupt normal operations by repeatedly interrupting the microprocessor.

**ff** - Total number of failed TSIs or ETSIs.

**pp** - Total number of pested TSIs or ETSIs.

## **UTL, QRY, ALL, UNIT**

---

### **QUERY ALL**

#### **Explanation Of Command**

---

This command is used to request reports on the out-of-service, failed, or pested status of the entire DACS II frame, including the common frame equipment, or the equipment in a specific unit.

The text of the output message varies depending on the input message format and immediately follows the input format.

The UNIT option is specified to query that unit only. The UNIT field must be omitted if the command is used for the entire frame. If the UNIT option is specified, only the information related to the equipment in that unit will be generated.

**Note:** The odd and even DSPU NPCs do not have independent service states.

**Note:** The DS3U message segment applies to both the DS3 unit and the Hybrid DS3 unit (HDS3U). Also, the MXR portion of the message applies to both MXR and Hybrid MXR.

#### **Command**

---

[I.53101]

**UTL:FRM xy,SEQ ww:QRY,ALL[,UNIT [q]q]!**

The output then continues with segments about the common equipment in the units. One module will be generated per unit, in ascending order by number. The unit equipped for a given unit number determines the output message printed.

The output segment for an FTU, IFTU, or IFTU2:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL FTU 3 LN MSG:
UNIT [q]q UC ofp FTMI ofp ofp ofp ofp [CCB ofp rst]
FC ofp rst ofp rst ofp rst ofp rst EOM
```

The output segment for a DSPU:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q UC ofp DSPU ofp [CCB ofp rst] EOM
```

Then, the output continues with information about individual NPCs. One output message will be printed for each equipped FTM (Facility Terminating Module) or unit in the case of a DSPU.

The output segment for a CEPT FTM is as follows. If any of the odd NPCs has been provisioned with a Digital Signal Processing Platform (DSPP) application (TG193), then the even NPC following it does not exist and dashes will be shown in its place:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL FTU NPCS [s]aaa-[t]bbb tt 5 LN MSG:
ofp ofp ofp ofp ofp ofp ofp ofp OOS oo FAIL ff PEST pp
ofp ofp ofp ofp ofp ofp ofp ofp
ofp ofp ofp ofp ofp ofp ofp ofp
ofp ofp ofp ofp ofp ofp ofp ofp EOM
```

The output segment for a DSPU:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL DSPU NPCS [s]aaa-[t]bbb tt 3 LN MSG:
[z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst
[z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst EOM
```

The output segment for an equipped FTM or DSPU with no failed, pested or out-of-service NPCs:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL {FTU|DSPU} NPCS [s]aaa-[t]bbb tt 2 LN MSG:
OOS 00 FAIL 00 PEST 00 EOM
```

The following segment is output to complete the message:

[O.53101]

M hh:mm:ss xy,ww n[vv] UTL QRY ALL COMPL

**For UTL::QRY ALL UNIT:**

For an FTU, IFTU, or IFTU2:

[O.53101]

M hh:mm:ss xy,ww n[vv] UTL QRY ALL FTU UNIT [q]q 3 LN MSG:  
UC ofp FTMI ofp ofp ofp ofp [CCB ofp rst]  
FC ofp rst ofp rst ofp rst ofp rst EOM

The above message is followed by up to 4 of the following segments depending on the CEPT FTM equipage. Please note, if any of the odd NPCs has been provisioned with a Digital Signal Processing Platform (DSPP) application (TG193), then the even NPC following it does not exist and dashes will be shown in its place:

M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q FTU NPCS [s]aaa-[t]bbb tt 5 LN MSG:  
ofp ofp ofp ofp ofp ofp ofp ofp OOS oo FAIL ff PEST pp  
ofp ofp ofp ofp ofp ofp ofp ofp  
ofp ofp ofp ofp ofp ofp ofp ofp  
ofp ofp ofp ofp ofp ofp ofp ofp EOM

For a DSPU:

M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q UC ofp DSPI ofp [CCB ofp rst] EOM  
  
M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q DSPU NPCS [s]aaa-[t]bbb tt 3 LN MSG:  
[z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst  
[z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst EOM

The output segment for an equipped FTM or DSPU with no failed, pested or out-of-service NPCs:

M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q {FTU|DSPU} NPCS [s]aaa-[t]bbb  
tt 2 LN MSG:  
OOS 00 FAIL 00 PEST 00 EOM

M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q COMPL

**For UTL::QRY ALL:**

[O.53101]

```

M hh:mm:ss xy,ww n[vv] UTL QRY ALL COMMON 4 LN MSG:
OOS g h i j k l m n o p
FAIL g h i j k l m n o p
PEST g h i j k l m n o p EOM

```

```

M hh:mm:ss xy,ww n[vv] UTL QRY ALL COMMON 4 LN MSG:
SYNC ofp rst CRO ofp
TLI ofp ofp ofp ofp ofp ofp ofp ofp rst rst rst rst rst rst rst rst
 a b c d e f g h i j k l m n o p EOM

```

For DACS II Non-CEF frames, the next segment describes the CCN hardware:

```

M hh:mm:ss xy,ww n[vv] UTL QRY ALL TOTAL TSIS tt oo ff pp 5 LN MSG:
11 ofp rst 12 ofp rst 13 ofp rst 14 ofp rst 15 ofp rst 16 ofp rst
21 ofp rst 22 ofp rst 23 ofp rst 24 ofp rst 25 ofp rst 26 ofp rst
31 ofp rst 32 ofp rst 33 ofp rst 34 ofp rst 35 ofp rst 36 ofp rst
41 ofp rst 42 ofp rst 43 ofp rst 44 ofp rst 45 ofp rst 46 ofp rst EOM

```

M hh:mm:ss xy,ww n[vv] UTL QRY ALL TOTAL TSIS tt oo ff pp 3 LN MSG:  
51 ofp rst 52 ofp rst 53 ofp rst 54 ofp rst 55 ofp rst 56 ofp rst  
61 ofp rst 62 ofp rst 63 ofp rst 64 ofp rst 65 ofp rst 66 ofp rst EOM

For DACS II CEF frames, the next segment describes the ECCN hardware:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL TOTAL ETSIS tt oo ff pp 5 LN MSG:
01 ofp rst 02 ofp rst 03 ofp rst 04 ofp rst
05 ofp rst 06 ofp rst 07 ofp rst 08 ofp rst
09 ofp rst 10 ofp rst 11 ofp rst 12 ofp rst
13 ofp rst 14 ofp rst 15 ofp rst 16 ofp rst EOM
```

The output then continues with segments about the common equipment in the units. One module will be generated per unit, in ascending order by number. The unit equipped for a given unit number determines the output message printed.

The output segment for an FTU, IFTU, or IFTU2:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL FTU 3 LN MSG:
UNIT [q]q UC ofp FTMI ofp ofp ofp ofp [CCB ofp rst]
FC ofp rst ofp rst ofp rst ofp rst EOM
```

The output segment for a DSPU:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q UC ofp DSPI ofp [CCB ofp rst] EOM
```

The output then continues with segments about the NPCs equipped in an FTM or a DSPU:

The output segment for NPCs in a CEPT FTM is as follows. Please note, if any of the odd NPCs has been provisioned with a Digital Signal Processing Platform (DSPP) application (TG193), then the even NPC following it does not exist and dashes will be shown in its place:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL FTU NPCS uvmnp-uxkqr tt 5 LN MSG:
ofp ofp ofp ofp ofp ofp ofp ofp 00S oo FAIL ff PEST pp
ofp ofp ofp ofp ofp ofp ofp ofp
ofp ofp ofp ofp ofp ofp ofp ofp
ofp ofp ofp ofp ofp ofp ofp ofp EOM
```

The output message for NPCs in a DSPU:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL DSPU NPCS uvmnp-uxkqr tt 3 LN MSG:
uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst
uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst EOM
```

The output segment for an equipped CEPT FTM or DSPU with no failing, pested or out-of-service NPCs using hierarchical addressing:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALL {FTU|DS3U|DSPU} NPCS uvmnp-uxkqr tt 2 LN MSG:
00S 00 FAIL 00 PEST 00 EOM
```

If an FTM or DSPU is not equipped, or if it is equipped but has no NPCs, then the message segment for that FTM or DSPU will not appear.

The following segment is output to complete the message:

M hh:mm:ss xy,ww n[vv] UTL QRY ALL COMPL

#### For UTL::QRY ALL UNIT:

For an FTU, IFTU, or IFTU2:

[O.53101]

M hh:mm:ss xy,ww n[vv] UTL QRY ALL FTU UNIT [q]q 3 LN MSG:  
UC ofp FTMI ofp ofp ofp ofp [CCB ofp rst]  
FC ofp rst ofp rst ofp rst ofp rst EOM

This output segment will be followed by up to 4 additional segments for each CEPT FTM depending on the FTM equipment as follows. Please note, if any of the odd NPCs has been provisioned with a Digital Signal Processing Platform (DSPP) application (TG193), then the even NPC following it does not exist and dashes will be shown in its place:

M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q FTU NPCS uvmnp-uxkqr tt 5 LN MSG:  
ofp ofp ofp ofp ofp ofp ofp ofp OOS oo FAIL ff PEST pp  
ofp ofp ofp ofp ofp ofp ofp ofp  
ofp ofp ofp ofp ofp ofp ofp ofp  
ofp ofp ofp ofp ofp ofp ofp ofp EOM

For a DSPU:

M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q UC ofp DSPI ofp [CCB ofp rst] EOM  
  
M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q DSPU NPCS uvmnp-uxkqr tt 3 LN MSG:  
uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst  
uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst EOM

If the CEPT FTM or DSPU has no failing, pested or out-of-service NPCs the following segment will be output:

M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q {FTU|DSPU} NPCS uvmnp-uxkqr tt 2 LN MSG:  
OOS 00 FAIL 00 PEST 00 EOM

If the FTM/DSPU is not equipped, or if it is equipped but has no NPCs, then the message segment for that FTM/DSPU will not appear.

The following segment is output to complete the message:

M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q COMPL

### **Denial Message**

---

[O.53101.01]

M hh:mm:ss xy,ww n[vv] UTL QRY ALL UNIT [q]q COND cc DNY

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

To aid referencing the parameters listed for a given message in a number of cases, the line containing the parameters is listed for those cases just before the explanation of that particular set of parameters is given.

**ALL** - All

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

The UNIT option is specified to query that unit. The UNIT field will be null when the command is used for the entire frame. If the UNIT option is specified, only the information related to the equipment in that unit will be generated.

**OOS** - Out of service

**FAIL** - Failed

**PEST** - Pested

For the OOS, FAIL and PEST keywords, variables g through p each represent a frame entity. The values of these variables give the OOS, FAIL, or PEST status of the associated entity. Values are interpreted using the table below. The entity associated with a given variable is given following the explanation of PEST below.

| Value | OOS            | FAIL           | PEST           |
|-------|----------------|----------------|----------------|
| 1     | out-of-service | failed         | pested         |
| 0     | in service     | not failed     | unpested       |
| -     | not applicable | not applicable | not applicable |

As shown above, a hyphen "-" indicates the parameter is not applicable to the particular entity. For example, an unequipped entity would display a "-" in the position of its OOS, FAIL and PEST indicators g through p.

The keyword PEST is used to indicate that error reporting is disabled. Out-of-service (OOS) entities and entities related to a side that is out of service are pested to prevent error messages from being reported to the main controller. Error reporting is undesirable if an entity is OOS since it would interrupt normal operations by repeatedly interrupting the microprocessor.

|             |                                |                              |
|-------------|--------------------------------|------------------------------|
| <b>OOS</b>  | <b>g h i j k l m n o p</b>     | (message line for reference) |
| <b>FAIL</b> | <b>g h i j k l m n o p</b>     | "                            |
| <b>PEST</b> | <b>g h i j k l m n o p EOM</b> | "                            |

The DACS II entities and their status fields are as follows:

|          |                                                     |

**DSPU** - Digital signal processing unit

**UC ofp DSPI ofp [CCB ofp, rst]** (message line for reference)

**DSPI** - Digital signal processing interface

**ofp** - UC, DSPI, and for non-CEFs, side 0 of the CCB

**rst** - for non-CEFs, side 1 of the CCB

**o, r** - Out of service

**f, s** - Failed

**p, t** - Pested

The following lines are message lines for reference.

**[z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst [z]zzz ofp rst EOM**

**uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst uvmnp ofp rst EOM**

**ofp** - Refers to side 0 DSPU NPC

**rst** - Refers to side 1 DSPU NPC

**o, r** - Out of service

**f, s** - Failed

**p, t** - Pested

**[s]aaa** - The first 3- or 4-digit nonhierarchical NPC number of an FTM, MXR, or DSPU

**[t]bbb** - The last 3- or 4-digit nonhierarchical NPC number of an FTM, MXR, or DSPU

**[z]zzz** - The 3- or 4-digit nonhierarchical DSPU NPC number

If NPC numbers are expressed in three digits, the valid values are:

CB type NPC numbers listed by unit number, Unit Type DP (DSPU)

**ON** - Intervention Level Feature ON

**OFF** - Intervention Level Feature OFF

**cc** - Hexadecimal condition code

**cc Explanation**

**00 No conditions**

## **UTL, QRY, ALMOPT, NPC, AIS**

### **UTILITY QUERY, ALARM OPTION, AIS**

#### **Explanation Of Command**

This command requests alarm indication signal (AIS) information for one or more facility terminating unit (FTU/IFTU/IFTU2), DS3 unit (DS3U) or Hybrid DS3 Unit (HDS3U) network processing circuits. The range can cross the unit boundary, and the two NPCs entered can be from different types of units. This command is not applicable to digital signal processing unit (DSPU) NPCs. DSPU NPCs will be skipped in the output message if they are within the range.

Digital Signal Processing Platform (DSPP) NPCs and the even numbered NPCs immediately following the actual DSPP NPCs will be skipped in the output by using dashes if they are within the range of this command.

**uvmnp** - Starting hierarchical NPC number

**wxkqr** - Ending hierarchical NPC number

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**[t]def** - The 3- or 4-digit nonhierarchical NPC number ([s]abc through [u]jkl)

**[u]jkl** - The 3- or 4-digit nonhierarchical NPC number ([t]def through [v]ghi)

**edfgh** - Hierarchical NPC number (uvmnp through ijklm)

**ijklm** - Hierarchical NPC number (edfgh through wxkqr)

- ed** - Unit number (uv through wx)
- f** - Module number
- gh** - NPC number
  
- e** - Number of lines in message  
The number of lines in the message depends on the number of equipped NPCs to be reported.
  
- nnn** - Total number of alarms
  
- TOT** - Total
  
- tttt** - AIS Alarm option programmed for the NPC
  - tttt** *Explanation*
  - INFO** Information message (for all domestic NPCs)
  - MJ** Major alarm (for all domestic NPCs)
  - MN** Minor alarm (for domestic non-SLC type NPCs)
  - MI** Information message (for CEPT NPCs)
  - PMA** Prompt maintenance alarm major (for CEPT NPCs)
  - PMC** Prompt maintenance critical alarm (for CEPT NPCs)
  - DMA** Deferred maintenance minor alarm (for CEPT NPCs)
  - Unequipped
  
- Digital Signal Processing Platform NPCs that run applications will also cause dashes to be produced for **tttt**.
  
- UEQD** - Unequipped
  
- cc** - Hexadecimal condition code
  - cc** *Explanation*
  - 60** Selectable AIS not valid for specified NPC(s) type
  - 61** All NPC(s) are either not valid or not grown

## **UTL,QRY,ALMS**

### **UTILITY QUERY ALARMS**

#### **Explanation Of Command**

This command reports the source of all alarms currently on the DACS II frame. For each entity that has been autonomously removed, the resulting alarm state is given.

If there are no alarms to report, a short line message is output indicating that the total number of alarms is **000**.

Note that the DS3U message segment applies to both the DS3 unit and the Hybrid DS3 unit (HDS3U). The MXR message applies to both MXR and Hybrid MXR.

Separate message segments will be shown for the "Alarm Severity - Intervention Level - Message Logging" feature as appropriate.

#### **Command**

[I.53111]

**UTL:FRM xy,SEQ ww:QRY,ALMS!**

#### **Completion Message**

#### **Nonhierarchical**

**When there are no alarms active on the frame, the following output appears:**

[O.53112]

**M hh:mm:ss xy,ww n[vv] UTL QRY ALMS TOTAL 000 COMPL**

**When there are alarms active on the frame, the following output appears:**

The individual message segments are shown in the order they appear.  
Explanatory text accompanies each message segment.

[O.53111]

1) The following segment appears only if the alarm severity, intervention level, and message logging features are present.

**M hh:mm:ss xy,ww n[vv] Alarm Severity Feature is {ON|OFF}**  
**M hh:mm:ss xy,ww n[vv] Intervention Level Feature is {ON|OFF}**

2) Summary line showing status of CR, MJ, MN, MC, and PWR alarms.

**M hh:mm:ss xy,ww n[vv] UTL QRY ALMS SUMMARY CR t MJu MN v \**  
**MC w PWR z EOM**

3) Summary line showing alarm status of the various power units within each FTU/IFTU/IFTU2/DSPU, the Synchronizer, the Main Controller, and CCN/ECCN.

For DACS II NonCEF frames (CCN),

**M hh:mm:ss xy,ww n[vv] UTL QRY PWR w w w w w w w w w w EOM**

For DACS II CEF frames (ECCN),

**M hh:mm:ss xy,ww n[vv] UTL QRY ALMS PWR 2 LN MSG:**  
**w w w w w w w w w w w w w w w w w w EOM**

4) Summary line showing status of alarms on the main controller and switch complex (CCN/ECCN).

For both DACS II NonCEF and CEF frames (CCN and ECCN)

**M hh:mm:ss xy,ww n[vv] UTL QRY ALMS a b c d e f g h i j k l m \**  
**n o p q r s EOM**

For DACS II nonCEF and CEF frames (CCN and ECCN) **with** the alarm severity, intervention level, and message logging feature present.

```

M hh:mm:ss xy,ww n[vv] UTL QRY ALMS a b c d e f g h i j k l m \

<data line for sixth equipped unit>  
EOM

For CEF frames:

M hh:mm:ss xy,ww n[vv] UTL QRY ALMS e LN MSG:  
<data line for first equipped unit>  
<data line for second equipped unit>  
<data line for third equipped unit>  
<data line for fourth equipped unit> EOM

M hh:mm:ss xy,ww n[vv] UTL QRY ALMS e LN MSG:  
<data line for fifth equipped unit>  
<data line for sixth equipped unit>  
<data line for seventh equipped unit>  
<data line for eighth equipped unit> EOM

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALMS e LN MSG:
<data line for ninth equipped unit>
<data line for tenth equipped unit>
<data line for eleventh equipped unit>
<data line for twelfth equipped unit> EOM
```

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALMS e LN MSG:
<data line for thirteenth equipped unit>
<data line for fourteenth equipped unit>
<data line for fifteenth equipped unit>
<data line for sixteenth equipped unit> EOM
```

*Data Lines For Summary Alarm Information On A Unit (FTU/IFTU/IFTU2, DSPU)*

Data line for a unit equipped as an FTU/IFTU/IFTU2:

```
UNIT [q]q UC a FTMI b c d e FC f g h i j k l m[CCB r s][00S]
```

Data line for a unit equipped as a DSPU:

```
UNIT [q]q UC a DSPI b [CCB r s][00S]
```

8) NPC alarm data per unit (FTU/IFTU/IFTU2, DSPU), shown in unit order (1,2,...). If a unit or module is unequipped or there are no NPC alarms, the corresponding message segment is skipped:

For a DS1 Facility Terminating Module (FTM) **without** the alarm severity, intervention level, and message logging feature present, or if present, with intervention levels turned off:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALMS FTU NPCS [s]aaa-[t]bbb \
tt[00S] 5 LN MSG:
x x x x x x x x x x ALMS nn
x x x x x x x x x x
x x x x x x x x x x
x x x x x x x x x x EOM
```

**Note:** If Digital Signal Processing Platform (DSPP) NPCs, which are always odd, are provisioned within the FTU/IFTU/IFTU2, then the even NPCs immediately following those DSPP NPCs will appear as being unequipped. Therefore, these even NPCs will always be shown as dashes.

For a DS1 Facility Terminating Module (FTM) **with** the alarm severity, intervention level, and message logging feature present and intervention levels turned on:

```
M hh:mm:ss xy,ww n[vv] UTL QRY ALMS FTU NPCS [s]aaa-[t]bbb \

```

### **Denial Message**

---

#### **Common**

---

Not applicable.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

To aid referencing the parameters listed for a given message, the line containing the parameters is listed below just before the explanation of that particular set of parameters is given.

When an FTM module has been provisioned as CEPT, then there will be 32 NPCs per Facility Terminating Module (FTM).

The DACS II frame alarm state summary is given at the beginning of the alarm report for these variables:

CR t MJ u MN v MC w PWR z

**CR** - Critical

**t** - Critical alarm status

**MJ** - Major

**u** - Major alarm status

- MN** - Minor  
**v** - Minor alarm status  
**MC** - Main controller  
**w** - Main controller alarm status  
**PWR** - Power  
**z** - Power alarm status

The value of variables t, u, v, w, and z determines the alarm status.  
These values and their meaning are given below for t through z.

*t-z Status*

- 1 Active  
0 Not Active

- w** - Power failure indicator

Each w in the output message corresponds to a particular power unit in the frame.  
The w's are numbered from left to right beginning with 1. If the frame is a non-CEF frame, the w's will end with 10. If the frame is a CEF, the w's will end with 20.

Determine the number associated with the w of interest then use the table below to determine the affected power unit.

The value of w determines the status of the power unit

| <i>w</i> | <i>Power unit status</i> |
|----------|--------------------------|
| M        | Power failure (Major)    |
| -        | No power failure         |

- |    |                                       |
|----|---------------------------------------|
| 1  | Power unit of unit 1                  |
| 2  | Power unit of unit 2                  |
| 3  | Power unit of unit 3                  |
| 4  | Power unit of unit 4                  |
| 5  | Power unit of unit 5                  |
| 6  | Power unit of unit 6                  |
| 7  | Synchronizer (SYNC) 0                 |
| 8  | SYNC 1                                |
| 9  | Cross-Connect Network (CCN or ECCN) 0 |
| 10 | CCN or ECCN 1                         |

For CEF frames,

- 11 power unit of unit 7
- 12 power unit of unit 8
- 13 power unit of unit 9
- 14 power unit of unit 10
- 15 power unit of unit 11
- 16 power unit of unit 12
- 17 power unit of unit 13
- 18 power unit of unit 14
- 19 power unit of unit 15
- 20 power unit of unit 16

ALMS a b c d e f g h i j k l m n o p q r s

**x** - Alarm Severity

- x** *Explanation*
- a** Autonomously removed
- Does not apply, or part of a larger failure group
- \*** Minor alarm
- M** Major alarm
- C** Critical alarm
- I** Information

The following y,z,and u parameters are printed only if the Intervention Level feature is ON.

**y** -Intervention level setting(1-6)

**z** -Intervention Level

- z** *Intervention Level*
- I** IMA (Immediate Maintenance Action)
- D** DMA(Deferred Maintenance Action
- N** NI(No Intervention)
- Not applicable

**u** - New Individual Alarm Status effected by Intervention Level

- *No alarm or unprovisioned*
- I** Information
- M** Major alarm
- C** Critical

**ALMS** - Alarms

Each of the letters a through s following the keyword ALMS represents an entity in the DACS II frame. The entities are listed following this paragraph by the letter used to represent them. The values these letters assume give the alarm status of the particular entity. These values are listed immediately following the entity listing. Some entities do not use the full range of values but their values are separately described in the list of entities.

- a** - MC (Main controller)
- b** - MP (Main processor)
- c** - CI/ECI (Communications interface)
- d** - SCC (Secondary source controller)
- e** - PMEM
- f** - SMEM
- g** - Link 1
- h** - Link 2
- i** - Link 3
- j** - Link 4
- k** - Link 5
- l** - Link 6
- m** - XC0 (Cross-Connect 0)
- n** - XC1 (Cross-Connect 1)
- o** - CCNI 0 (Cross-Connect Network Interface 0 for NonCEF frame)  
CCI 0 (Clock and Control Interface 0 for CEF frame)
- p** - CCNI 1 (Cross-Connect Network Interface 1 for NonCEF frame)  
CCI 1 (Clock and Control Interface 1 for CEF frame)
- q** - TOD (Time of Day) reset
- r** - DATE (Time of Day) reset
- s** - SMEM OOS

**Value** *Explanation*

- a** Autonomously removed
- Does not apply, or part of a larger failure group
- \*** Minor alarm
- M** Major alarm
- C** Critical alarm
- I** Information

"I" reports maintenance information for E1 signals. This state exists for the conditions listed below:

AIS - Alarm indication signal  
RAI - Remote alarm indication  
RBER - Remote bit error rate indication  
RAIS - Remote alarm indication signal  
SFI - Synchronization failure indication  
A16 - AIS in CTS 16  
R16 - RAI in CTS 16

The value "I" will appear in reports for E1s where performance monitoring thresholds have been exceeded if those thresholds were provisioned at the maintenance information (MI) level.

The value "\*" will appear in reports of a BER alarm on CEPT NPCs (E1s), in addition to reporting all the minor alarm conditions supported in previous releases.

If the embedded signals within a DS3 or a Hybrid DS3 signal are in AIS (Alarm Indication Signal), then an "I" is shown for that signal. In addition, when the entire DS3 or Hybrid DS3 is receiving AIS the embedded DS1 and E1 signals will show an "I".

Where a failure group includes more than one circuit pack and individual circuit pack information is available, the character "a" will be used to indicate removal or attempted removal of that pack.

A hyphen (-) indicates the alarm state is not applicable to the particular circuit. For example, an unequipped circuit would display a "-" in its status field.

SYNC x y

**SYNC** - Synchronizer

**x** - Side 0 alarm status of the synchronizer

**y** - Side 1 alarm status of the synchronizer

|          |                                                   |
|----------|---------------------------------------------------|
| <b>x</b> | <i>Explanation</i>                                |
| <b>a</b> | Autonomously removed                              |
| <b>-</b> | Does not apply, or part of a larger failure group |
| <b>*</b> | Minor alarm                                       |
| <b>M</b> | Major alarm                                       |
| <b>C</b> | Critical alarm                                    |
| <b>I</b> | Information                                       |

**CRO** - Clock reference oscillator

**x** - Side 0 alarm status of the oscillator

**x** *Explanation*

**a** Autonomously removed

**-** Does not apply, or part of a larger failure group

**\*** Minor alarm

**M** Major alarm

**C** Critical alarm

**I** Information

**TLI** **a b c d e f g h a b c d e f g h**

**TLI** - Timing link interface

**a** - TLI 1 or Synchronizer sync port (SSP) 0 of TLI 1 side 0

**b** - SSP 1 of TLI 1 side 0

**c** - TLI 2 or SSP 0 of TLI 2 side 0

**d** - SSP 1 of TLI 2 side 0

**e** - TLI 3 or SSP 0 of TLI 3 side 0

**f** - SSP 1 of TLI 3 side 0

**g** - TLI 4 or SSP 0 of TLI 4 side 0

**h** - SSP 1 of TLI 4 side 0

**a** - TLI 1 or SSP 0 of TLI 1 side 1

**b** - SSP 1 of TLI 1 side 1

**c** - TLI 2 or SSP 0 of TLI 2 side 1

**d** - SSP 1 of TLI 2 side 1

**e** - TLI 3 or SSP 0 of TLI 3 side 1

**f** - SSP 1 of TLI 3 side 1

**g** - TLI 4 or SSP 0 of TLI 4 side 1

**h** - SSP 1 of TLI 4 side 1

See the ALMS section given previously for the alarm status values.

For NonCEF frames only:

TSIS tt nn

**TSIS** - Time slot interchangers

**tt** - Total No. of equipped TSIs (1-36)

**nn** - Total No. of alarming TSIs (0-36)

**ft** - Unit numbers

**f** - FROM unit number (1-6)

**t** - TO unit number (1-6)

**x** - Side 0 alarm status of the TSI

**y** - Side 1 alarm status of the TSI

Variables x and y can assume one of the two alarm status values given below.

**a** *Autonomously removed*

- Does not apply, or part of a larger failure group

**\*** Minor alarm

**M** Major alarm

**C** Critical alarm

**I** Information

For CEF frames only:

ETSIS tt nn

**ETSIS** - Expanded time slot interchangers

**tt** - Total No. of equipped ETSIs (01 through 32)

**nn** - Total No. of alarming ETSIs (01 through 32)

UNIT [q]q UC a FTMI b c d e FC f g h i j k l m [CCB r s][ OOS]

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**UC** - Unit controller

**a** - UC status

The UC status values are the same as those given previously for entities a through s in the explanation of ALMS. This table follows the explanation of variable s.

FTMI b c d e

**FTMI** - Facility terminating module interface

- b** - Status for FTMI 1 of specified unit
- c** - Status for FTMI 2 of specified unit
- d** - Status for FTMI 3 of specified unit
- e** - Status for FTMI 4 of specified unit

See the ALMS section given previously for the alarm status values.

FC f g h i j k l m

**FC** - Format converter

- f** - Status for FC 01 of specified FTU
- g** - Status for FC 11 of specified FTU
- h** - Status for FC 02 of specified FTU
- i** - Status for FC 12 of specified FTU
- j** - Status for FC 03 of specified FTU
- k** - Status for FC 13 of specified FTU
- l** - Status for FC 04 of specified FTU
- m** - Status for FC 14 of specified FTU

See the ALMS section given previously for the alarm status values.

For NonCEF frames only:

CCB r s

**CCB** - Cross-connect buffer

- r** - Status for CCB 0q in CCN 0 for specified unit q
- s** - Status for CCB 1q in CCN 1 for specified unit q

See the ALMS section given previously for the alarm status values.

**OOS** - Out-of-Service

The OOS state applies to the Unit Controller.

DSPI b

**DSPI** - Digital signal processing interface

**b** - Status for DSPI (digital signal processing interface) of specified DSPU

See the ALMS section given previously for the alarm status values.

**rr** - Total number of **equipped** DS3 or HDS3 facilities in the frame  
NonCEF (01 through 36)  
CEF (01 through 96)

UNIT [q]q y y y y y ALMS gg

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**y** - DS3 facility alarm status.

The DS3 facility will be in a critical alarm if the incoming facility is in LOS, OOF, or BER. The DS3 facility will be in a major alarm if the incoming facility has a Remote Alarm Indication (RAI). There will be an informational "I" alarm, if AIS is received on the DS3 facility.

**gg** - Total number of alarming DS3 facilities in the frame  
NonCEF (01 through 36)  
CEF (01 through 96)

*FOR FTU AND DS3U/HDS3U NPC ALARM DATA LINES*

**[s]aaa** - The 3- or 4-digit nonhierarchical number of the first NPC in the module

**[t]bbb** - The 3- or 4-digit nonhierarchical number of the last NPC in the module

**[s]ccc** - The 3- or 4-digit nonhierarchical number of the last NPC in the module

**[t]ddd** - The 3- or 4-digit nonhierarchical number of the last NPC in the module

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |

**uvmnp** - Hierarchical number of the first NPC in the module

**wxkqr** - Hierarchical number of the last NPC in the module

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

CB type NPC numbers listed by unit, module, and NPC Number  
Unit Type DP (DSPU)

| Unit         | Module     | NPC       |
|--------------|------------|-----------|
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |

## **UTL, QRY, ALMS, DBASE**

### **UTILITY QUERY ALARMS**

#### **Explanation Of Command**

This message reports the following alarms:

- Critical frame alarms caused by duplex failures.
- Buffer overflow alarm on each of the eight C-bit processor (CPR) packs.
- Failed or out-of-service alarms for the FTU/IFTU/IFTU2 NPCs. This includes Digital Signal Processing Platform (DSPP) NPCs.
- Primary block failure alarm(s).
- Received time slot zero (TS0) failure for Transmic 1G.

#### **Command**

[I.53151]

## **Denial Message**

---

Not applicable.

## **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

**ALM(S)** - Alarm(s)

**DBASE** - Data base

Used to provide the output necessary to verify data base coherence between DACS II and the DACS controller.

**c** - Duplex frame alarm status

| <i>c</i> | <i>Explanation</i> |
|----------|--------------------|
|----------|--------------------|

|   |                    |
|---|--------------------|
| 1 | Duplex frame alarm |
|---|--------------------|

|   |                       |
|---|-----------------------|
| 0 | No Duplex frame alarm |
|---|-----------------------|

**CB** - C-bit

**NPC** - Network processing circuit

**BOFL** - Buffer overflow

The section of the message reporting buffer overflow is optional. It will only appear if there are C-bit Processor (CPR) circuit packs exhibiting a buffer overflow condition.

**e** - Number of lines in message (from 1 to 5 lines)

**FTU** - Facility terminating unit

Only alarmed FTU NPCs (including DSPP NPCs) will be reported. Hence the number of NPCs in the message and the number of lines will be variable.

**[s]ghi** - The 3- or 4-digit nonhierarchical CB type NPC number.

If NPC numbers are expressed in three digits, the valid values are:

CB type NPC numbers listed by unit number, Unit Type DP (DSPU)

| Unit<br>1  | Unit<br>2  | Unit<br>3  | Unit<br>4  | Unit<br>5  | Unit<br>6  |

If NPC numbers are expressed in three digits, the valid values are:

SD type NPC numbers listed by unit number, within an **International module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**BOFL** - Buffer overflow

**A00S** - Autonomous out-of-service (autonomous removal)

**PBA** - Primary block alarm

The primary block alarms are output only for those FTU NPCs for which the alarms have been reported and without regard for how the NPC is provisioned.

**k, l, m, . . .**

- Representation for multiple alarms

*k, l, or m (PBA) Explanation*

For PA type NPCs:

- A** Primary AIS - AIS received in all 32 time slots.
- B** BER - Bit error rate detected in received signal.
- C** LCMA - Loss of CRC4 multiframe alignment in TS0.
- E** RBER - Remote bit error rate detected in TS0 bit 4.
- F** LOF - Loss of Frame type Primary block failure.
- G** FLCMA - Far-end Loss of CRC4 multiframe alignment in TS0.
- I** RAIS - Remote AIS detected in TS0 bit 4.
- L** LMA - Loss of multiframe alignment in CAS TS16.
- M** R16 - RAI received in TS16 bit 6 of frame 0.
- P** PFWOOF - TS0 Pseudo Frame Word Out-Of-Frame
- R** LOS - Loss of Signal type Primary block failure.
- S** SFI - Synchronization failure indication in TS0 bit 5.
- V** A16 - AIS received in CAS TS16
- X** EER - Excessive error rate
- Y** RAI - Remote alarm indication received in TS0 bit 3.
- Z** RPSFI- Remote Power Supply Failure Indicator

For PB and PC type NPCs:

- A** Primary AIS - AIS received in all 32 time slots.
- B** BER - Bit error rate detected in received signal.
- E** RBER - Remote bit error rate detected in TS0 bit 4.
- I** RAIS - Remote AIS detected in TS0 bit 4.
- L** LMA - Loss of multiframe alignment in CAS TS16.
- M** R16 - RAI received in TS16 bit 6 of frame 0.
- R** PBF - Primary block failure caused by LOS or LOF.
- S** SFI - Synchronization failure indication in TS0 bit 5.
- V** A16 - AIS received in CAS TS16
- X** EER - EER - Excessive error rate
- Y** RAI - Remote alarm indication received in TS0 bit 3.
- Z** RPSFI- Remote Power Supply Failure Indicator

**TS0** - Time slot 0

abcdefgh

- Spare bits in TS0

"TS0-abcdefgh" will only appear in the message for NPCs that are provisioned for Transmic 1G.

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

Valid values for a through h are described below:

| <i>Bit value</i> | <i>Explanation</i>                                                |
|------------------|-------------------------------------------------------------------|
| <b>0</b>         | Transmitted bit set to binary "0"                                 |
| <b>1</b>         | Transmitted bit set to binary "1"                                 |
| <b>P</b>         | Pass-through: the received bit will be cross-connected unchanged. |

## **UTL,QRY,APPL,NPC,ALL**

### **RETRIEVE CROSS-CONNECT INFORMATION BETWEEN PLATFORM APPLICATIONS**

#### **Explanation Of Command**

This command retrieves the cross-connect information between platform application cards either for all application cards grown in the frame or for an individual application card.

The output message identifies:

1. The pseudo channel number for an individual connection that is used in the application-to-application cross-connect commands to identify the connection.
2. The NPC number and application assigned channel number for the first (FROM) application that is part of the connection.
3. The NPC number and application assigned channel number for the second (TO) application if available that is part of the connection.
4. The status of the connection, which is either:
  - fully connected, or
  - reserved.

A reserved connection can be identified by the missing channel number for the application that has not yet requested the connection or the application that has already disconnected the connection. A missing channel number is represented by "---".

Pseudo channel numbers are not real channel numbers; instead, they identify table entries in DACS II that contain the pairs of application channels that are cross-connected to each other. Each cross-connection between application card channels has a unique pseudo channel number that identifies it. Cross-connections between application cards are established by using the NPC number of the other application card that the first application card expects to be cross-connected to and the pseudo channel number. A command to each of the two applications referring to the other application in the command is required. DACS II matches the requests from the two applications that have requested to be cross-

connected by matching the pseudo channel numbers in both requests. For further information, see the manual(s) for the application(s) that you are using.

A cross-connection between applications is considered to be in the "reserved" state if at the time of executing this utility

1. only one application has made a request for the connection, or
2. one of the applications has already disconnected, but the other has not.

An actual physical cross-connect is only made when both applications have made matching requests. Also, the physical cross-connection between applications is taken down when the first of the two applications issues a disconnect command.

## **Explanation Of Parameters**

---

**APPL** - This utility refers to application cards

The following are currently available applications:

**Type**    *Application*

**SD111** X.50/X.57 Subrate Application

**SD311** Digital Multipoint Bridge (DMB) Application

**SD411** DDS Subrate and MJU Application

**SDxyz** Any other application created after issuing this manual

**NPC** - This command refers to an NPC of the application type

**[s]abc** - NPC number for the application card (3- or 4-digit),  
which must always be odd.

**uvmnp** - NPC number for the application card (hierarchical), "np" must always be odd.

If the NPC number is coded, then the command will generate output for only those application-to-application cross-connections that connect to that application card.

**ALL** - Output of the entire application-to-application card  
cross-connect table is requested.

**e** - number of lines in message (maximum of 10)

**PCHAN** - Pseudo Channel number column

**ddd** - Pseudo channel number for this connection, range 1-999

**APPL1** - Column for NPC number(s) of first application

**[s]abc** - NPC number of first application (3- or 4-digit)

**uvmnp** - NPC number of first application (hierarchical)

**CHAN1** - Column for channel number(s) assigned by first application

**eee** - Channel number assigned by first application

If the channel number is not present because the first application has already disconnected, then three dashes are shown as channel number.

**APPL2** - Column for NPC number(s) of second application

**[v]ghi** - NPC number of second application (3- or 4-digit)

**wxkqr** - NPC number of second application (hierarchical)

**CHAN2** - Column for channel number(s) assigned by second application

**jjj** - Channel number assigned by second application

If the channel number is not present because the second application has not yet requested the connection or the second application has already disconnected, then three dashes are shown as channel number.

**cc** - Hexadecimal condition code

**cc**    *Explanation*

**02**    Subject entity is not equipped

**6A**    No application NPCs grown in the frame

**6B**    No application-to-application connections present in the frame

**6D**    This application card does not connect to another application card

## **UTL,QRY,BC,NPC,ALL**

### **QUERY BIT-C NPC**

#### **Explanation Of Command**

This message queries the C-bit state and the pattern for all CAS-type channels for a network processing circuit (NPC), a range of NPCs or all NPCs.

#### **Command**

##### **Nonhierarchical**

[I.56351]

UTL:FRM xy,SEQ ww:QRY,BC s,{NPC [s]abc[-[t]def]|ALL}!

##### **Hierarchical**

[I.56351]

UTL:FRM xy,SEQ ww:QRY,BC s,{NPC uvmnp[-wxkqr]|ALL}!

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit starting nonhierarchical NPC number

**[t]def** - The 3- or 4-digit ending nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |
| <b>0081-0112</b> | <b>0241-0272</b> | <b>0401-0432</b> | <b>0561-0592</b> |
| <b>0121-0152</b> | <b>0281-0312</b> | <b>0441-0472</b> | <b>0601-0632</b> |
| Unit<br>5        | Unit<br>6        | Unit<br>7        | Unit<br>8        |
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0641-0672</b> | <b>0801-0832</b> | <b>0961-0992</b> | <b>1121-1152</b> |
| <b>0681-0712</b> | <b>0841-0872</b> | <b>1001-1032</b> | <b>1161-1192</b> |
| <b>0721-0752</b> | <b>0881-0912</b> | <b>1041-1072</b> | <b>1201-1232</b> |
| <b>0761-0792</b> | <b>0921-0952</b> | <b>1081-1112</b> | <b>1241-1272</b> |

| Unit<br>9        | Unit<br>10       | Unit<br>11       | Unit<br>12       |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1281-1312</b> | <b>1441-1472</b> | <b>1601-1632</b> | <b>1761-1792</b> |
| <b>1321-1352</b> | <b>1481-1512</b> | <b>1641-1672</b> | <b>1801-1832</b> |
| <b>1361-1392</b> | <b>1521-1552</b> | <b>1681-1712</b> | <b>1841-1872</b> |

| <br>             |                  |                  |                  |
| Unit<br>13       | Unit<br>14       | Unit<br>15       | Unit<br>16       |
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Starting hierarchical NPC number (PDS)

**wxkqr** - Ending hierarchical NPC number (PDS)

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**BC** - Bit-C

**s** - Direction of c-bit pattern to be queried

*s Explanation*

D to query the c-bit state Received by the CPR pack  
in the condensed format of output message O.56352  
R to query the c-bit state Received by the CPR pack  
T to query the c-bit state Transmitted by the CPR pack

When "BC D" is specified in the input command, then the output message

When "BC-D" is specified in the input command, then the output message  
will provide the c-bit pattern for all NPCs without regard to the Unit  
they reside in.

If "BC D" is specified in the input command then the ALL keyword is  
required;

When "BC R" or "BC T" is specified in the input command,  
then the NPC number(s) are required;

**ALL** - All NPCs

Valid only when s=D

**[t]ghi** - The 3- or 4-digit nonhierarchical NPC number that caused the denial.  
([s]abc ≤ [t]ghi ≤ [t]def)

**edhfg** - Hierarchical NPC number that caused the denial  
(uvmnp ≤ edhfg ≤ wxkqr)

**xxxxxx** - c-bit pattern being transmitted or received in the form:  
X'abcd

**xxxxxx** - c-bit pattern being transmitted or received in the form:

**xxxx** - c-bit pattern being transmitted or received in the form: abcd

Hexadecimal number output for those channels on which the c-bit pattern  
is present.

**zz** - State of c-bit processing for the channel

**zz** *Explanation*

for s = D or R

**ZO** Zero.  
Received c-bit channel is ALL 0 including the framing bits

**NA** Network Alarm.  
Framing pattern can not be established and is not ALL 0.

**UN** Undetermined.  
CPR hardware has not reported an initial c-bit pattern

for s = R or T

**UP** Unprovisioned.  
Not provisioned for Monitoring or Transmit.

**Note:** The UN state can be due to the fact that the CPR has just been provisioned to monitor a c-bit and because the network timer (NT) value can be as high as 4600 milliseconds and the state of that bit has not yet been found.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

**15** NPC is unequipped

**0B** Invalid CEPT NPC

**54** Cross-connect to CPR is required

**F1** Parameter only valid with PA, PB, or PC type NPCs

| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number(PDS)

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module  
Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Channel number  
Valid values are listed below:

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**BC** - Bit-C keyword

**s** - Direction of c-bit pattern to be queried  
Valid values are listed below:

| <i>s</i> | <i>Explanation</i>                                                                                  |
|----------|-----------------------------------------------------------------------------------------------------|
| D        | to query the c-bit state Received by the CPR pack in the condensed format of output message O.56352 |
| R        | to query the c-bit state Received by the CPR pack                                                   |
| T        | to query the c-bit state Transmitted by the CPR pack                                                |

When "BC D" is specified in the input command, then the output message

When "BC-D" is specified in the input command, then the output message will provide the c-bit pattern for all NPCs without regard to the Unit they reside in.

If "BC D" is specified in the input command then the ALL keyword is required;

When "BC R" or "BC T" is specified in the input command, then the NPC number(s) are required;

**abcd** - C-bit pattern (Hexadecimal) being transmitted or received by the CPR pack

**zz** - C-bit status

zz Explanation

NA Received pattern is the network alarm.

UN Received pattern is undetermined.

**Note:** The UN state can be due to the fact that the CPR has just been provisioned to monitor a c-bit and because the NT value can be as high as 4600 milli-seconds and the state of that bit has not yet been found.

UP Unprovisioned.

ZO Received pattern is all zeros.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**02** Subject entity is not equipped

**10** Unit is not equipped

**15** NPC is unequipped

**0B** Invalid CEPT NPC

**54** Cross-connect to CPR is required

**F1** Parameter only valid with PA, PB, or PC type NPCs

## Explanation Of Parameters

**BCAST** - Broadcast

**ALL** - All (NPCs)

**xx** - Number of data fields (terminations) in a segment (01 through 32)

**e** - Number of lines in a message segment (2 through 5)

**[s]rstjjj**

- Nonhierarchical termination number of a broadcast source

The termination number will be output as 0000000 if there is no source information for the termination.

**[s]rst** - The 3- or 4-digit nonhierarchical NPC number belonging to FTU, DS3U or HDS3U

**jjj** - Source channel number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

# **uvmnpjjj**

- Hierarchical NPC number of a broadcast source

The termination number will be output as 0000000 if there is no source information for the termination.

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module  
**jjj** - Source channel number

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**jjj** - Source channel number

000-031      CEPT

## **UTL,QRY,BCAST,FROM**

### **UTILITY QUERY BROADCAST**

#### **Explanation Of Command**

This command requests a listing of the tributaries (**TO**) connected to a specified broadcast type source (**FROM**).

The output message header line lists the full tributary, and the data lines list all the tributaries (**TOs**) connected to a broadcast type circuit with the specified source (**FROM**). Other **TOs** will appear in following lines, with sufficient lines to report all of the **TOs** involved, six per line. The last line of the message will be filled with zeros if there are less than eight **TOs** (or a multiple thereof) connected.

You must enter the first channel of the broadcast source for this command.

#### **Command**

## Explanation Of Parameters

[s]abcd

- Nonhierarchical FROM termination number

[s]abc - The 3- or 4-digit nonhierarchical FROM NPC number belonging to FTU (FT type), DS3U (DT type) or HDS3U (HT type)

ddd - Channel number denoting the first channel of a channel range specification

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |

**uvmnp** - Hierarchical FROM termination number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |
| 000-031      | CEPT       |              |

If a data line contains fewer tributaries than data fields the data fields without corresponding tributary information will be filled with zeros.

**[t]ghijjj**

- Nonhierarchical termination number

**[t]ghi** - The 3- or 4-digit nonhierarchical NPC number of the full tributary with the same valid values as [s]abc.

**jjj** - Channel number of the full tributary with the same valid values as ddd.

**[t]rstuuu**

- Nonhierarchical termination number

**[t]rst** - The 3- or 4-digit nonhierarchical NPC number of additional tributaries with the same valid values as [s]abc.

**uuu** - Channel number of additional tributaries with the same valid values as ddd.

**wxkqr** - Hierarchical TO termination number with the same valid values as uvmnp.

**edhfg** - Hierarchical TO termination number with the same valid values as uvmnp

**eee** - Channel number denoting the last channel of a range specification with the same valid values as ddd.

**xx** - Number of data fields in the current message segment (01 through 32)

**e** - Number of lines in the message (2 through 5)

**UEQD** - Unequipped

**NOBBL** - No backbone leg

The requested printout of all the tributaries connected to the DACS II broadcast source abcdde was denied because the source NPC was not a backbone leg.

**RT** - Remote terminal  
**ffff** - Bank identification number (0000 through 9999)  
**COND** - Condition  
**cc** - Hexadecimal condition code

| <b>cc</b> | <b>Explanation</b>                                                      |
|-----------|-------------------------------------------------------------------------|
| <b>62</b> | <b>Invalid channel number</b>                                           |
| <b>7F</b> | <b>NPC is not added</b>                                                 |
| <b>F7</b> | <b>Corresponding NPC for<br/>virtual channel is not<br/>provisioned</b> |
| <b>70</b> | <b>NPC invalid type</b>                                                 |

### Autonomous Message

Not applicable.

### Explanation Of Parameters

**BCAST** - Broadcast

**FROM** - From

Source network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical non-channelized source (FROM) NPC Number, whose tributaries will be listed

**[t]ghi** - The 3- or 4-digit full tributary (TO) NPC number

**[t]rst** - The 3- or 4-digit tributary (TO) NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**cc Explanation**

**15 NPC is unequipped**

**AD No BBL leg**

**B4 NPC is channelized type**

## **UTL, QRY, CMAP**

### **QUERY PARTIAL CROSS-CONNECT MAP**

#### **Explanation Of Command**

This command requests a printout of the DACS II cross-connect map for a single network processing circuit (NPC) or a range of NPCs in a facility terminating unit (FTU, IFTU, IFTU2), or digital signal processing unit (DSPU).

If a range of NPCs is specified in this command, DACS II will output the cross-connect maps for only those NPCs that are equipped and have at least one cross-connected channel.

The execution of the command and the generation of the output are aborted by entering ABT.

If the NPCs are unmapped, the TO NPC number is omitted.

For 64 kbit/s test access, the FROM and TO terminations under test by the corresponding active testport channels will be displayed rather than far-end mapped terminations.

For non-channelized digital signal test access, the FROM and TO NPCs of the circuit under test are listed, and if only one NPC is actually under test, it is listed first.

**Note:** No range is allowed for virtual NPCs.

This command will also generate cross-connect maps for application cards that have the type SDxyz (where xyz is a set of hexadecimal numbers that define a particular application). Even though the actual channel numbers of application cards are assigned by the application and not by the user, actual channel numbers are given by this command to ensure consistency.

If an SDxyz application is provisioned in a North American module of an FTU, IFTU, or IFTU2, the number of channels available to the application is 48. If an SDxyz application is provisioned in an international module of an FTU, IFTU, or IFTU2, the number of channels available to the application is 64. The output of this command reflects this difference. Please note that individual modules in an FTU, IFTU, or IFTU2 may be provisioned as international modules, even though the other three modules are provisioned as North American modules.

For application-to-application type cross-connects the user should issue command UTL::QRY,APPL (I.51201) to generate the correlation between pseudo channels that the user refers to in commands and the actual channels assigned by the application.

## Autonomous Message

---

Not applicable.

---

## Explanation Of Parameters

---

**CMAP** - Cross-connect map

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, the first number of a range

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, the last number of a range

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

If NPC numbers are expressed in four digits, the valid values are:

SD type NPC numbers listed by unit number, within a **North American module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            | 1            |                                                                                                                                              |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway cross-connection* the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option  $c=0$  is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the **jkl** options. Also see note [jkl].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0     **Both** remote and local alarms are declared and cleared in 144 ms.

c=1     Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when** *jkl=011* or *jkl=101*. **For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option *g* has meaning only if the NPC is provisioned for CAS; that is, option *d=1*, otherwise it is ignored. If option *g=0* is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option *g=1* is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and *h=1*, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option *h* was selected as either 0 or 1, unless it is later set to 0 by setting parameter *e=0* in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of *xyz* the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option *h=1*.

If both *b=1* and *h=1* and the NPC (used as synchronization source) receives NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure**. If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

**[jkl'] minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

c=0 hardware timing

c=1 firmware timing (SFDT=2496 ms,  
CACT=624 ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

- [vii] RBER unalarmed
- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

- NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.
- [m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

#### **PA-Type xyz fields**

The provisioning values of x, y, and z for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (x, y or z) provisioning value):

**Table 19-2. Provisioning values for  $x$** 

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |
| B            |               |                    |               |                            |                           |
| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 19-3. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 19-4. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
- HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
- FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B.**
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B.** **However,** for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for  $z = 4$  and 8) or 480 ms (for  $z = 5$  and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8.  $z$  values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options ( $z = 6-7$  or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms
- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:
 

|                              |                                                |
|------------------------------|------------------------------------------------|
| <b><math>z=6</math> or A</b> | hardware timing                                |
| <b><math>z=7</math> or B</b> | firmware timing (SFDT=2496 ms,<br>CACT=624 ms) |

- [iv] BER alarm level = DMA

**Specific Options for  $z=6$  or 7**

- [v] RBER alarm level = MI
- [vi] NFW bit 4=RBER:
  - DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.  
  
DACS II sets the RBER bit to its idle state, on clearing of the BER condition.
  - DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

[ix] To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of *xyz* for the PA type NPC.

**Table 19-5. Combinations of *x* and *y* Values**

| Invalid<br><i>xyz</i><br>Combinations | Explanation                                                                                                                                                                                                                                  |

**SD-type xyz fields (Digital Signal Processing Platform (DSPP) Applications)**

**SD111** X.50/X.57 International subrate application

**SD311** Digital Multipoint Bridge application

**SD411** North American DDS Subrate and MJU application

**SDxyz** Possible future applications with specific values for xyz

**CB-type xyz fields**

**x** - Fixed at 1

**y** - Fixed at 0

**z** - Network timer value

**z** *Value in milliseconds*

**0** 600 to 750

**1** 1500 to 1650

**2** 2400 to 2550

**3** 4650 to 4800

**VI-type xyz fields**

**x** - Fixed at 1

**y** - Fixed at 0

**z** - Fixed at 0

**DPLX** - Duplex  
Duplex equipped

**ccc-ddd**

- Channel number range

The channel number range varies with the NPC type. It is not printed for non-channelized NPCs

Conference numbers  
001-085 (MB NPC)

**[u]lmn** - The 3- or 4-digit nonhierarchical NPC number  
(with the same valid values as [s]abc)

**t** - type of connection

**t** *Type of connection*

**\*** One-way

**" "** Two-way (a blank)

**B** Broadcast (BCON)

**R** Roll

**T** Test Access\*

**P** DSP Platform Application connection, two-way

**Q** DSP Platform Application connection, one-way

\* T will not be displayed for mapped terminations.

**NPCTP** - Network processing circuit for test port  
PBxyz or PCxyz type NPC for DS0 Test Ports

**ROLL** - Roll  
Bridged facility in Roll procedure

**[v]ghi**jjj

- Nonhierarchical number of NPC and channel or conference port number/circuit ID. For a non-channelized cross-connect, the channel number jjj will not be shown.

**[v]ghi**

- Nonhierarchical NPC with the same valid values as [s]abc.

For an FAD, the tested NPC is listed first if only one of the two mapped NPCs is under test.

Some examples of [v]ghijjj are listed below:

[v]ghijjj Explanation

[0]000000 Unmapped channel

[v]ghi000 Mapped channel connected to an FDL of NPC [v]ghi

**r**

- Termination status

*r* Termination status

**T** Terminated

**blank** Not Terminated

**ghikl**jjj

- Hierarchical number of NPC and channel or conference port number/circuit ID. For a non-channelized cross-connection, the channel number jjj will not be shown.

**00000000**

- Unmapped channel

**[s]cbn**

- The 3- or 4-digit nonhierarchical CB type NPC number.

**cbnpq** - Hierarchical CB type NPC number.

**cb**

- Unit number

**n**

- Module number

**pq**

- NPC number

**[v]opq**

- The 3- or 4-digit nonhierarchical PA or PB or PC or ^ITH type NPC number

**opqrx** - Hierarchical PA or PB or PC or TH type NPC number

**op**

- Unit number

**q**

- Module number

**rx**

- NPC number

**[s]mbn**

- The 3- or 4-digit nonhierarchical MB type NPC number

**mbnop** - Hierarchical MB type NPC number

**mb** - Unit number  
**n** - Module number  
**op** - NPC number

**lll** - Number of legs for the multipoint termination (003 through 256)

**[s]vnp** - The 3- or 4-digit nonhierarchical virtual NPC number

**vnprs** - Hierarchical virtual NPC number

**vn** - Unit number  
**p** - Module number  
**rs** - NPC number

**xx** - Number of conferences reported in the segment (01 through 48)

**e** - Number of lines in the segment

**tnnn** - Virtual conference type and number

**t** - *Virtual conference type*

**t** Explanation

**\*** One-way

**" "** Two-way (a blank)

**nnn** - Virtual conference number (001 through 500)

**[w]mno** - The 3- or 4-digit nonhierarchical NPC number that  
that cause the denial ([s]abc through [t]def)

**edmno** - Hierarchical NPC number that caused the denial  
(uvmnp through wxkqr)

**cc** - Hexadecimal condition code

**cc** *Explanation*

**91** SR NPC was specified - not allowed

## **UTL, QRY, CNFGR**

---

### **UTILITY QUERY CONFIGURE**

#### **Explanation Of Command**

---

This command requests information about the configuration of a DACS II frame.

#### **Command**

---

[I.51091]

UTL:FRM xy,SEQ ww:QRY,CNFGR!

#### **Completion Message**

---

[O.51091]

M hh:mm:ss xy,ww n[vv] UTL QRY CNFGR 4 LN MSG:  
ID xy UID <uid> SS <ssn>  
BAY aa TYPE fff-fff UNITS bb CCN c HG d  
UNIT a a a a a a a a a a a a a a \  
NPCAD[ E][ X] H COMPL

#### **Denial Message**

---

Not applicable.

#### **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**ID** - Identifier (frame)

**xy** - Frame identifier (00 through ZZ)

**UID** - Unique identifier

**uid** - Unique (frame) identifier (1 to 20 alphanumeric characters)

**SS** - Software serial number

**ssn** - Software serial number value (1 to 10 alphanumeric characters)

The software serial number may be assigned by the user to identify a particular software package. This would eliminate problems in an office where the user has multiple frames and more than one software package is in use.

**BAY** - Bay

**aa** - Total number of bays, in decimal (01 through 07)

**TYPE** - Type

**fff-fff**

- Bay types (-, 1, or 2)

Variable fff-fff gives the bay type assigned to each bay in the frame. Bays are numbered from 1 through 7. When viewed from the front of the frame the bays are positioned in the frame in the same order as the bay numbers shown below. Consult this table to determine the bay associated with the position of a given f.

|             |               |
|-------------|---------------|
| Bay numbers | 6 4 1 2 3 5 7 |
| Assignment  | f f f - f f f |

| <i>f</i> | <i>Explanation</i> |
|----------|--------------------|
|----------|--------------------|

|   |                                          |
|---|------------------------------------------|
| - | Not configured or the Switch Bay (Bay 2) |
|---|------------------------------------------|

|   |                        |
|---|------------------------|
| 1 | Original Interface Bay |
|---|------------------------|

|   |                        |
|---|------------------------|
| 2 | Flexible Interface Bay |
|---|------------------------|

**UNITS** - Units

**bb** - Number of equipped units, in decimal (01 through 16)

**CCN** - Cross-connect network

**c** - Cross-connect network type

*c*      *Explanation*

1      Multibay CCN  
2      Single-bay CCN  
E      ECCN

**HG** - Height

**d** - Height of bay

*d*      *Explanation*

0      7'0" (2133mm)  
1      11'6" (3505mm)  
2      7'2.6" (2200mm)

**UNIT** - Unit

**a** - Unit type

*a*      *Explanation*

-      Not configured  
1      FTU  
2      DSPU  
3      DS3U(or HDS3U)  
4      IFTU  
5      IFTU2  
6      HDS3U

NOTE: The Unit type of 3 indicates DS3U or HDS3U because if the Unit is configured but not grown it can be either. If it is grown as a DS3U, the unit type will be 3. If it is grown as an HDS3U, the unit type will be 6.

**NPCAD** - Network processing circuit addressing

**E** - The 3-digit nonhierarchical (Extended) addressing scheme

**X** - The 4-digit nonhierarchical (Extended) addressing scheme

**H** - Hierarchical addressing scheme

## **UTL, QRY, DATE**

### **QUERY DATE**

#### **Explanation Of Command**

This message requests a printout of the current date (month, day, year) and the time interval at which DACS II prints the date.

#### **Command**

[I.51031]

UTL:FRM xy,SEQ ww:QRY,DATE!

#### **Completion Message**

[O.51031]

M hh:mm:ss xy,ww n[vv] UTL QRY DATE aa/bb/cc FORMAT ggg INT ii \  
COMPL

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.51031]

I hh:mm:ss xy,ww UTL QRY DATE aa/bb/cc FORMAT ggg INT ii COMPL

## Explanation Of Parameters

---

**INT** - Interval

**ii** - Interval at which DACS II will print the date.

ii      Meaning

01      Every hour on the hour.

02      Every even hour on the hour.

04      Every fourth hour on the hour: 04, 08, 12, 16, 20, 24

06      Every sixth hour on the hour: 06, 12, 18, 24

08      Every eighth hour on the hour: 08, 16, 24

12      Twice daily on the hour: 12, 24

24      Once daily at midnight (default).

**DATE** - Date

**aa** - Month or day

**bb** - Day or Month

**cc** - Year (2 or 4 digits)

The DATE will be displayed in the International format

**FORMAT** - Format

**ggg** - Date format

*ggg      Date format*

MDY      Month/Day/Year (USA format)

DMY      Day/Month/Year (International format)

---

### **Explanation Of Parameters**

---

**DD** - Director DACS

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |

| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Channel number for beginning of channel range

**fff** - Channel number for end of channel range

001-030 (CEPT type NPCs grown as CAS)

**m** - Monitor

**w** - Write

*m Explanation*

0 c-bit not provisioned as a DD for Monitor (default)  
1 c-bit provisioned as a DD for Monitor  
- Channel was not specified

*w Explanation*

0 c-bit not provisioned as a DD for Write (default)  
1 c-bit provisioned as a DD for Write  
- Channel was not specified

The output completion message shows provisioning for 15 channels per line, numbered 1 through 15 on the second line and 16 through 30 on the third line. For those channels which have not been encompassed in the range ddd through fff the "-" (dash) will be output.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

**15** NPC is unequipped

**0B** Invalid CEPT NPC

**54** Cross-connect to CPR is required

**F1** Parameter only valid with PA, PB, or PC type NPCs

## **UTL, QRY, DD, NPC, DDCT, ALL**

### **UTILITY QUERY DIRECTOR DACS NPC**

#### **Explanation Of Command**

This message queries a network processing circuit (NPC) or a range of circuits which are provisioned as the Director of DACS.

The output completion message shows the provisioning for 15 channels on the second line and channels 16 through 30 on the third line.

### Autonomous Message

Not applicable.

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit starting nonhierarchical NPC number

**[t]def** - The 3- or 4-digit ending nonhierarchical NPC number

Values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |

| <b>1321-1352</b> | <b>1481-1512</b> | <b>1641-1672</b> | <b>1801-1832</b> |
| <b>1361-1392</b> | <b>1521-1552</b> | <b>1681-1712</b> | <b>1841-1872</b> |
| <b>1401-1432</b> | <b>1561-1592</b> | <b>1721-1752</b> | <b>1881-1912</b> |
| <br>Unit<br>13   | <br>Unit<br>14   | <br>Unit<br>15   | <br>Unit<br>16   |
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Starting hierarchical NPC number  
**wxkqr** - Ending hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**DD** - Director DACS

**DDCT** - Director DACS with data base coherence feature.

**[t]ghi** - The 3- or 4-digit nonhierarchical NPC number that caused the denial.  
([s]abc ≤ [t]ghi ≤ [t]def)

**edhfg** - Hierarchical NPC number that caused the denial (PDS).  
(uvmnp ≤ edhfg ≤ wxkqr)

**ALL** - Query All NPCs

**mw** - Status of Director DACS setting for a given channel

*m Explanation*

|   |                             |
|---|-----------------------------|
| 0 | Not provisioned for monitor |
| 1 | Provisioned for Monitor     |
| - | Channel was not specified   |

*w Explanation*

|   |                           |
|---|---------------------------|
| 0 | Not provisioned for write |
| 1 | Provisioned for write     |
| - | Channel was not specified |

**xxxx** - Bit pattern sent on a c-bit.

"xxxx" is a the hexadecimal representation of the 14 bit pattern sent on a c-bit (abcd efgh ijkl mnop). Bits "a" and b" are always 0. Bits cdefghijklmnop are sent on a c-bit. For those channels in which no bit pattern is transmitted, the xxxx field contains "----".

**cc** - Hexadecimal condition code

*cc Explanation*

|           |                                                   |
|-----------|---------------------------------------------------|
| <b>10</b> | Unit is not equipped                              |
| <b>15</b> | NPC is unequipped                                 |
| <b>0B</b> | Invalid CEPT NPC                                  |
| <b>54</b> | Cross-connect to CPR is required                  |
| <b>F1</b> | Parameter only valid with PA, PB, or PC type NPCs |

## **UTL,QRY,DMAP**

### **QUERY FULL CROSS-CONNECT MAP**

#### **Explanation Of Command**

This command requests a printout of the DACS II map on ALL cross-connected channels.

The output lists all FROM and TO side identifiers for all equipped network processing circuits (NPCs). Unequipped and fully unassigned Network Processing Circuits will not be listed. The outputs are similar to the **UTL : :QRY, CMAP** output. This command may produce a large volume of output. To terminate the output enter the **ABT** command.

#### **Command**

[I.52031]

**UTL : [FRM xy, SEQ ww] : QRY, DMAP !**

## Completion Message

### Denial Message

Not applicable.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**DMAP** - Digroup map

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number  
For FT NPCs excluding non-channelized NPCs.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            | 1            |                                                                                                                                              |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option  $c=0$  is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the **jkl** options. Also see note [jkl].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0     **Both** remote and local alarms are declared and cleared in 144 ms.

c=1     Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when** *jkl=011* or *jkl=101*. **For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option *g* has meaning only if the NPC is provisioned for CAS; that is, option *d=1*, otherwise it is ignored. If option *g=0* is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option *g=1* is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and *h=1*, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option *h* was selected as either 0 or 1, unless it is later set to 0 by setting parameter *e=0* in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of *xyz* the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option *h=1*.

If both *b=1* and *h=1* and the NPC (used as synchronization source) receives NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure**. If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

**[jkl'] minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

c=0 hardware timing

c=1 firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

#### **PA-Type xyz fields**

The provisioning values of x, y, and z for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (x, y or z) provisioning value):

**Table 19-9. Provisioning values for  $x$** 

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |
| B            |               |                    |               |                            |                           |
| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 19-10. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 19-11. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |

| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:<sup>\*</sup>
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

<sup>\*</sup> Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

z=6 or A hardware timing

z=7 or B firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

- [vii] RBER unalarmed

- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

[ix] To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of *xyz* for the PA type NPC.

**Table 19-12. Combinations of *x* and *y* Values**

| Invalid<br><i>xyz</i><br>Combinations | Explanation                                                                                                                                                                                                                                  |

**SD-type xyz fields (Digital Signal Processing Platform (DSPP) Applications)**

**SD111** X.50/X.57 International subrate application

**SD311** Digital Multipoint Bridge application

**SD411** North American DDS Subrate and MJU application

**SDxyz** Possible future applications with specific values for xyz

**CB-type xyz fields**

**x** - Fixed at 1

**y** - Fixed at 0

**z** - Network timer value

**z** *Value in milliseconds*

**0** 600 to 750

**1** 1500 to 1650

**2** 2400 to 2550

**3** 4650 to 4800

**ccc** - Starting channel or conference number

**ddd** - Ending channel or conference number

Channel numbers

000-031 CEPT

Conference numbers

001-085 (MB NPC)

**tjklmddd**

- Hierarchical termination number

**t** - Type of connection  
**jk** - Unit number  
**l** - Module number  
**mn** - NPC number within the module  
**ddd** - Channel number  
**r** - Termination state

*r Explanation*

**T** Terminated  
**blank** Not Terminated

**NPCTP** - NPC for DS0 Test Ports

**NPCTG** - NPC for Nx64 kbit/s Test-access Groups

**ROLL** - bridged facility in Roll procedure

**t[v]ghiijjr**

- Nonhierarchical termination number and state

**t** - Type of connection  
**[v]ghi** - Nonhierarchical NPC number  
**jjj** - Channel/conference number  
**r** - Termination state

*t Explanation*

**\*** One-way  
**blank** Two-way  
**B** Broadcast  
**R** Bridged (from Roll)  
**T** Test access  
**P** DSP Platform Application connection, two-way  
**Q** DSP Platform Application connection, one-way

**[v]ghiijj**

- Nonhierarchical termination number

Number of NPC and channel or conference port number/circuit ID.

[0]000000 Unmapped termination number

|              |                    |

| <b>tghikl000</b> | Mapped termination number connected to an FDL |

**[s]mbn** - The 3- or 4-digit nonhierarchical MB type NPC number

**mbnop** - Hierarchical MB type NPC number

|           |                 |
|-----------|-----------------|
| <b>mb</b> | - Unit number   |
| <b>n</b>  | - Module number |
| <b>op</b> | - NPC number    |

The valid values are:

**lll** - Number of legs involved in the multipoint conference (000 through 256)

**[s]vnp** - The 3- or 4-digit nonhierarchical virtual NPC number

**vnprs** - Hierarchical virtual NPC number

|           |                 |
|-----------|-----------------|
| <b>vn</b> | - Unit number   |
| <b>p</b>  | - Module number |
| <b>rs</b> | - NPC number    |

The valid values are:

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC                                   |
|-----------|----------|---------------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02 (DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06 (DACS II CEF frames)</b>     |

**e** - Number of lines in the message segment

**tnnn** - Virtual conference type and number

**t** - Virtual conference type

**nnn** - Virtual conference number (001 through 500)

*t* Explanation

**\*** one-way

**blank** two-way

**DPLX** - Duplex

Duplex equipped

**[s]jkl** - The 3- or 4-digit non-hierarchical non-channelized NPC number

Values are identical to [s]abc

**edhfg** - Hierarchical non-channelized NPC number

**ed** - Unit number

**h** - Module number

**fg** - NPC number within the module

Valid values are identical to uvmnp

**[t][v]ghi[r]**

- Nonhierarchical termination number and state

**t** - Type of connection

**[v]ghi** - The 3- or 4- digit nonhierarchical NPC number

**r** - Termination state

Valid values are identical to [s]abc

**[t]ghikl[r]**

- Hierarchical termination number and state

**t** - Type of connection

**gh** - Unit number

**i** - Module number

**kl** - NPC number

**r** - Termination state

Valid values are identical to uvmnp

**Note:** For a non-channelized PTN that is under test, the tested NPC is listed first if only one of the two mapped NPCs is under test.

**[s]cbn** - The 3- or 4-digit nonhierarchical NPC number

The valid values are:

If NPC numbers are expressed in three digits, the valid values are:

CB type NPC numbers listed by unit number, Unit Type DP (DSPU)

| Unit<br>1  | Unit<br>2  | Unit<br>3  | Unit<br>4  | Unit<br>5  | Unit<br>6  |
|------------|------------|------------|------------|------------|------------|
| <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> |
| <b>001</b> | <b>161</b> | <b>321</b> | <b>481</b> | <b>641</b> | <b>801</b> |

### Explanation Of Parameters

**DS3** - Digital signal 3 (44.736 Mb/s rate)

**e** - Number of line in the segment (2 through 5)

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**LBO** - The line buildout setting provisioned per DS3 facility.

**bbb** - LBO setting for each DS3 facility

*bbb Explanation*

ON Line buildout is turned on

OFF Line build out is turned off

--- Service MXR or HMXR corresponding to the DS3 or Hybrid DS3 is not equipped

LBO is required as shown in the following table.

734A Cabling to DSX-3 KS-19224, L2 Cabling to DSX-3 LBO

|                 |                |     |
|-----------------|----------------|-----|
| 0 to 225 feet   | 0 to 75 feet   | ON  |
| 225 to 450 feet | 75 to 150 feet | OFF |

## **UTL, QRY, EQD, COMMON**

### **UTILITY QUERY EQUIPAGE, COMMON**

#### **Explanation Of Command**

This message requests reports on the equipage of common equipment in the frame.

In the output message each entity is represented by a single character alphabetic variable.  
The value of this variable gives the equipage status of the entity represented by the variable.

#### **Command**

**TLI 3, SSP 1**

**TLI 4, SSP 0**

**TLI 4, SSP 1**

**TSIS** - Time slot interchanges **NonCEF**

**ETSIS** - Expanded time slot interchangers **CEF**

**f** - FROM unit (1 through 6)

**t** - TO Unit (1 through 6)

**SYNC** - Synchronizer

**x** - Side 0 synchronizer equipage status

**y** - Side 1 synchronizer equipage status

**CR0** - Clock reference oscillator

**x** - CR0 equipage status

**tt** - Total number of equipped TSIs/ETSIs.

---

## UTL, QRY, EQD, CONN

---

### UTILITY QUERY, EQUIPMENT CONNECTIVITY

#### Explanation Of Command

---

This message requests a printout of all units that are equipped. This message provides a connectivity matrix showing a "1" at the intersection of rows and columns of units for which time slot cross-connections can be made. A "0" is shown where there is no connectivity. The matrix is thus also an equipage map of the time slot interchange on each side of the cross-connect network.

#### Command

---

### **Explanation Of Parameters**

---

**EQD** - Equipped state

**MXRS** - Service Multiplexers (MXR or HMXR)

Only units that are equipped as DS3 or HDS3 Units will have corresponding output lines.

**tt** - total number of equipped MXRs or HMXRs in the DACS frame (01 through 96) (not including Protection MXRs or HMXRs)

**e** - number of lines in a segment (2 through 5)

**a** - the number of equipped Service MXRs or HMXRs in a unit (1 through 6)

**mnxyz** - The DS3 format processed by the MXR:

**mn** - DS3 type

| <b>mn</b> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|           |                                                                                              |
|-----------|----------------------------------------------------------------------------------------------|
| <b>MX</b> | The original R4.0 DS3 facility type supported by the Multiplexer (MXR) circuit pack (KCR-1). |
|-----------|----------------------------------------------------------------------------------------------|

|           |                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------|
| <b>EX</b> | The enhanced R6.0 DS3 facility type supported by the Enhanced Multiplexer (EMXR) circuit pack (KCR-5). |
|-----------|--------------------------------------------------------------------------------------------------------|

|           |                                                                                           |
|-----------|-------------------------------------------------------------------------------------------|
| <b>HX</b> | The hybrid facility type supported by the Hybrid Multiplexer (HMXR) circuit pack (KCR-8). |
|-----------|-------------------------------------------------------------------------------------------|

If the unit is a regular DS3U of unit type DT100, then the default is the MX type for backward compatibility.

If the unit is a Hybrid DS3U of unit type HT100, then the default is HX.

**Note:** If a particular MXR or HMXR is not equipped, five hyphens(-----) will occupy the mnxyz field.

## **UTL,QRY,EQD,NPCS,TOTAL,UNIT**

### **QUERY EQUIPPED NPCS**

#### **Explanation Of Command**

This command reports the equipage state for each of the network processing circuits (NPCs) on the DACS II frame and can provide the total number of circuits that are equipped in the facility terminating units (FTU/IFTU/IFTU2), DS3 units (DS3U), Hybrid DS3 units (HDS3U) and digital signal processing units (DSPU).

Digital Signal Processing Platform (DSPP) NPCs that are provisioned within an FTU, IFTU, or IFTU2 will be displayed in the output message or will be counted in the total number of circuits as appropriate. One NPC will count as one circuit even though one NPC occupies a physical slot that normally is occupied by two NPCs.

The results of the output message are in fragment sequence starting with the lowest unit number and ending with the highest unit number.

Within a fragment, the information is listed in NPC number sequence, starting with the lowest number at the top left and increasing to the right. The next line starts with the next highest NPC number.

The output of a partially equipped frame should conform to these rules:

- Omit the output message fragments for half of facility terminating module (FTM) for which there are no equipped NPCs.
- In nonhierarchical addressing, omit the output message fragment for one DS3 or HDS3 FTM (MXR or HMXR) for which there are no equipped NPCs.
- In hierarchical addressing, omit the output message fragment for half a DS3 or HDS3 FTM (MXR or HMXR) for which there are no equipped NPCs.
- Unequipped unit or module will not be reported
- The output will report on NPCs in increasing unit number order, regardless of whether the units are equipped as FTU, DS3U, HDS3U or DSPU.
- If there are no DSPUs, the DSPU part is omitted.
- If there are no equipped FTUs, DS3Us, HDS3Us and DSPU NPCs, the output is given in message 53043.
- The DS3U or HDS3U keyword will only be generated in message 53043 if the DS3 feature bit is enabled in the software.
- The range of NPCs in one FTM will be spanned in two output segments.
- The range of nonhierarchical NPCs in one DS3 or HDS3 FTM will be spanned in one output segment.
- The range of hierarchical NPCs in one DS3 or HDS3 FTM will be spanned in two output segments.
- The range of NPCs in one DSPU will be spanned by one output segment.

This command reports the equipage state of each of the network processing circuit slots on the DACS II frame and the sixteen slots (eight duplicated pairs) in each of the two DACS II DSPUs. In the output message, the fields **mnxyz** are set to "-----" if the slot is unequipped or to the 5-character external type identifier of the NPC that occupies the slot if it is equipped.

## Command

[I.53041]

**UTL:FRM xy, SEQ ww:QRY, EQD, NPCS[, {TOTAL|UNIT [q]q}]!**

## Completion Message

---

### Nonhierarchical

---

Output message fragment for NPCs in one FTM:

[O.53041]

```

M hh:mm:ss xy,ww n[vv] UTL QRY EQD NPCS UNIT [q]q COND cc DNY

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**EQD** - Equipped

Request equipage status

**NPCS** - Network processing circuits

Request information on NPCs

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**TOTAL** - Total

Request summary information

**tt** - Total number of NPCs in a segment

**mnxyz** - The equipage state and type of the NPCs

**mnxyz** *Explanation*

----- Not equipped

**mn** - The type of NPC

Valid values are listed below:

| mn | Explanation |
|----|-------------|
|----|-------------|

|    |                           |
|----|---------------------------|
| PA | CEPT NPC (75- or 120-ohm) |
|----|---------------------------|

|    |                                 |
|----|---------------------------------|
| PB | CEPT NPC (120-ohm twisted pair) |
|----|---------------------------------|

|    |                           |
|----|---------------------------|
| PC | CEPT NPC (75-ohm coaxial) |
|----|---------------------------|

|    |                           |
|----|---------------------------|
| CB | C-bit processor (CPR) NPC |
|----|---------------------------|

|    |                                                    |
|----|----------------------------------------------------|
| SD | Digital Signal Processing Application Circuit Pack |
|----|----------------------------------------------------|

**xyz** - The parameters used to provision the NPC.

See CRTE, EQPT, NPC and CRTE, EQPT, NPC, IW, X, AIS, MI, PMA, DMA for values.

**SDxyz** - Digital Signal Processing Platform (DSPP) Applications

*SDxyz Type of Application*

SD111 X.50/X.57 International Subrate Application

SD311 Digital Multipoint Bridge (DMB) Application

SD411 DDS Subrate and MJU Application

SDxyz Future applications with specific values for x, y, and z

**[a]aaa** - The 3- or 4-digit nonhierarchical NPC number for DSPU NPCs

Valid values are listed below (or ---).

If NPC numbers are expressed in three digits, the valid values are:

CB type NPC numbers listed by unit number, Unit Type DP (DSPU)

| Unit<br>1  | Unit<br>2  | Unit<br>3  | Unit<br>4  | Unit<br>5  | Unit<br>6  |
|------------|------------|------------|------------|------------|------------|
| <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> |
| <b>001</b> | <b>161</b> | <b>321</b> | <b>481</b> | <b>641</b> | <b>801</b> |
| <b>021</b> | <b>181</b> | <b>341</b> | <b>501</b> | <b>661</b> | <b>821</b> |
| <b>041</b> | <b>201</b> | <b>361</b> | <b>521</b> | <b>681</b> | <b>841</b> |
| <b>061</b> | <b>221</b> | <b>381</b> | <b>541</b> | <b>701</b> | <b>861</b> |
| <b>081</b> | <b>241</b> | <b>401</b> | <b>561</b> | <b>721</b> | <b>881</b> |
| <b>101</b> | <b>261</b> | <b>421</b> | <b>581</b> | <b>741</b> | <b>901</b> |

**uvmnp** - Hierarchical NPC number

On either CEPT FTM, or DSP unit.

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

Valid values are listed below (or -----, -----).

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

CB type NPC numbers listed by unit, module, and NPC Number  
Unit Type DP (DSPU)

| Unit         | Module     | NPC       |
|--------------|------------|-----------|
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**nnnn** - Total number of FTU NPCs on the frame.

Dashes (----) will be shown if no unit is grown.

**fff** - Total number of NPCs on each FTU.

Dashes (---) will be shown if the unit is not grown or is not grown as an FTU.

**pppp** - Total number of DSPU NPCs on the frame.

Dashes (----) will be shown if no unit is equipped.

**qqq** - Total number of NPCs on each DSPU.

Dashes (---) will be shown if the unit is not grown or is not grown as a DSPU.

**e** - number of lines in a segment

**[c]ccc** - The 3- or 4-digit nonhierarchical NPC number for FTM

Valid values are listed below (or ---).

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

|                |                |                |                |                |                |

If NPC numbers are expressed in three digits, the valid values are:

SD type NPC numbers listed by unit number, within a **North American module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

**[d]ddd** - The 3- or 4-digit nonhierarchical NPC number for DS3U or HDS3U NPCs

Valid values are listed below (or ---).

**hhhh** - Total number of DS3U or HDS3U NPCs on the frame.

Dashes (----) will be shown if no unit is grown.

**ggg** - Total number of NPCs on each DS3U or HDS3U.

Dashes (---) will be shown if the unit is not grown or is not grown as a DS3U or HDS3U.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

---

## UTL, QRY, EQD, TSIS

---

### UTILITY QUERY EQUIPPED

#### Explanation Of Command

---

This message requests a printout for all the equipped time slot interchange (TSI) circuit packs.

A fully equipped Enclosed Single Bay Frame (ESBF) shows the following TSI equipage status:

11 15 51 55

A fully equipped non-ESBF frame shows the following TSI equipage status:

|                   |                   |
|-------------------|-------------------|
| 11 12 13 14 15 16 | 41 42 43 44 45 46 |
| 21 22 23 24 25 26 | 51 52 53 54 55 56 |
| 31 32 33 34 35 36 | 61 62 63 64 65 66 |

#### Command

---

[I.53021]

UTL:FRM xy,SEQ ww:QRY,EQD,TSIS!

#### Completion Message

---

[O.53021]

M hh:mm:ss xy,ww n[vv] UTL QRY EQD TSIS 5 LN MSG:  
TOTAL TSIS tt  
ft ft ft ft ft ft ft ft ft ft ft ft  
ft ft ft ft ft ft ft ft ft ft ft ft  
ft ft ft ft ft ft ft ft ft ft ft COMPL

### **Denial Message**

---

Not applicable.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**EQD** - Request equipage status

**TSIS** - Request information on TSI circuit packs

**tt** - Total number of equipped TSIs on the in-service side. The total number of equipped TSIs in the frame is twice this number.

**ft** - TSI equipage status:

| <i>ft</i> | <i>Explanation</i> |
|-----------|--------------------|
| 00        | Unequipped         |
| TSI No.   | Equipped           |

## **UTL,QRY,EQD,UNIT**

### **UTILITY QUERY ENTITY EQUIPAGE**

#### **Explanation Of Command**

This command is used to retrieve the state information associated with equipment.

The UNIT option is specified only when the EQPT modifier is used to query that unit. The UNIT field will be null when the command is used to query the whole frame.

#### **Command**

[I.53108]

**UTL:FRM xy,SEQ ww:QRY,EQD[,UNIT [q]q]!**

## **Completion Message**

### **Nonhierarchical**

**If the unit number is not entered, the following output messages will be generated:**

The output message starts with:

[O.53108]

M hh:mm:ss xy,ww n[vv] UTL QRY EQD g h i j k l m n o p EOM

M hh:mm:ss xy,ww n[vv] UTL QRY EQD 3 LN MSG:

SYNC x x CRO x

TLI x x x x x x x x x x x x x x EOM

**For DACS II Non-CEF frames, the next segment describes the CCN hardware:**

M hh:mm:ss xy,ww n[vv] UTL QRY EQD TOTAL TSIS tt 5 LN MSG:

11 x 12 x 13 x 14 x 15 x 16 x

21 x 22 x 23 x 24 x 25 x 26 x

31 x 32 x 33 x 34 x 35 x 36 x

41 x 42 x 43 x 44 x 45 x 46 x EOP

M hh:mm:ss xy,ww n[vv] UTL QRY EQD TOTAL TSIS tt 3 LN MSG:

51 x 52 x 53 x 54 x 55 x 56 x

61 x 62 x 63 x 64 x 65 x 66 x EOM

**For DACS II CEF frames, the segment describes the ECCN hardware:**

M hh:mm:ss xy,ww n[vv] UTL QRY EQD TOTAL ETSIS tt 3 LN MSG:

01 x 02 x 03 x 04 x 05 x 06 x 07 x 08 x

09 x 10 x 11 x 12 x 13 x 14 x 15 x 16 x EOM

The output then continues with segments that contain information about common equipment in the equipped units. If more than 4 units are equipped, the unit equipage output will be divided into multiple segments.

[O.53108]

```
[M hh:mm:ss xy,ww n[vv] UTL QRY EQD UNITS e LN MSG:]
[<data line for common equipment in the first equipped unit>]
[<data line for common equipment in the second equipped unit>]
[<data line for common equipment in the third equipped unit>]
[<data line for common equipment in the fourth equipped unit> EOM]
```

```
[M hh:mm:ss xy,ww n[vv] UTL QRY EQD UNITS e LN MSG:]
[<data line for common equipment in the fifth equipped unit>]
[<data line for common equipment in the sixth equipped unit>]
[<data line for common equipment in the seventh equipped unit>]

Output message format for a DSPU:

[O.53108]

```
M hh:mm:ss xy,ww n[vv] UTL QRY EQD UNIT [q]q UC a DSPI b[CCB r s] EOM

M hh:mm:ss xy,ww n[vv] UTL QRY EQD UNIT [q]q DSPU NPCS uvmnp-uxkqr tt 2 LN MSG:
zzzzz zzzzz zzzzz zzzzz zzzzz zzzzz zzzzz zzzzz EOM
```

After the above information is output, the following message will be generated to complete the response:

[O.53108]

```
M hh:mm:ss xy,ww n[vv] UTL QRY EQD UNIT [q]q COMPL
```

## Denial Message

[O.53108.01]

```
M hh:mm:ss xy,ww n[vv] UTL QRY EQD UNIT [q]q COND cc DNY
```

## Autonomous Message

Not applicable.

## Explanation Of Parameters

---

**EQD** - Equipped

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

The UNIT option is specified to query that unit. The UNIT field will be null when the command is used for the entire frame. If the UNIT option is specified, only the information related to the equipment in that unit will be generated.

For the equipped query, each entity in the DACS II frame is represented by a single character variable. This variable can have a value of 1 or 0 indicating the following status:

| Value | EQD or EQPD |
|-------|-------------|
| 1     | equipped    |
| 0     | unequipped  |

The DACS II entities and their status fields are as follows:

|          |                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------|
| <b>g</b> | - Link 1                                                                                                            |
| <b>h</b> | - Link 2                                                                                                            |
| <b>i</b> | - Link 3                                                                                                            |
| <b>j</b> | - Link 4                                                                                                            |
| <b>k</b> | - Link 5                                                                                                            |
| <b>l</b> | - Link 6                                                                                                            |
| <b>m</b> | - XC0 (cross-connect 0)                                                                                             |
| <b>n</b> | - XC1 (cross-connect 1)                                                                                             |
| <b>o</b> | - CCNI/CCI 0 (cross-connect network interface 0 for non-CEF frame)<br>(clock and control interface 0 for CEF frame) |
| <b>p</b> | - CCNI/CCI 1 (cross-connect network interface 1 for non-CEF frame)<br>(clock and control interface 1 for CEF frame) |

**SYNC** - Synchronizer

**CRO** - Clock reference oscillator

**TLI** - Timing link interface

The TLI entities are reported in the following order:

**TLI 1, SSP 0, Side 0**  
**TLI 1, SSP 1, Side 0**  
**TLI 2, SSP 0, Side 0**  
**TLI 2, SSP 1, Side 0**  
**TLI 3, SSP 0, Side 0**  
**TLI 3, SSP 1, Side 0**  
**TLI 4, SSP 0, Side 0**  
**TLI 4, SSP 1, Side 0**

**TLI 1, SSP 0, Side 1**  
**TLI 1, SSP 1, Side 1**  
**TLI 2, SSP 0, Side 1**  
**TLI 2, SSP 1, Side 1**  
**TLI 3, SSP 0, Side 1**  
**TLI 3, SSP 1, Side 1**  
**TLI 4, SSP 0, Side 1**  
**TLI 4, SSP 1, Side 1**

**TSIS** - Time slot interchangers NonCEF

**ETSIS** - Expanded time slot interchangers CEF

**f** - FROM unit (1 through 6)

**t** - TO Unit (1 through 6)

**x** - Equipage indication of an entity or of a side 0 entity if duplicated.

**x** - Equipage indication of a side 1 entity.

**UC** - Unit controller

**FTMI** - Facility terminating module interface

**FC** - Format converter

**FLI** - Facility line interface

**FMT** - Formatter or Hybrid Formatter

**MXR** - Multiplexer or Hybrid Multiplexer

**MIU** - Multiple interface unit

**DSPI** - Digital signal processing interface

- [a]aaa** - The first 3- or 4-digit nonhierarchical NPC number of an FTM/DSPU.  
**[b]bbb** - The last 3- or 4-digit nonhierarchical NPC number of an FTM/DSPU.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**[z]zzz** - The 3- or 4-digit nonhierarchical DSPU NPC number, the span refers to the odd DSPU circuit pack NPCs, and the total is the number of NPC pairs equipped.

**uvmnp** - The first hierarchical NPC number of an FTM/DSPU or a hierarchical DSPU NPC number.

**uxkqr** - The last hierarchical NPC number of an FTM/DSPU

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-39 |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

Unit Type DP (DSPU)

|              |            |           |
|--------------|------------|-----------|
| Unit         | Module     | NPC       |
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

**tt** - Total number of equipped NPCs

For FTU Entities:

- a** - Status for UC
- b** - Status for FTMI 1 of specified Unit
- c** - Status for FTMI 2 of specified Unit
- d** - Status for FTMI 3 of specified Unit
- e** - Status for FTMI 4 of specified Unit
- f** - Status for FC 01 of specified Unit
- g** - Status for FC 11 of specified Unit
- h** - Status for FC 02 of specified Unit
- j** - Status for FC 12 of specified Unit
- k** - Status for FC 03 of specified Unit
- m** - Status for FC 13 of specified Unit
- p** - Status for FC 04 of specified Unit
- q** - Status for FC 14 of specified Unit

**CCB** - Cross-connect buffer NonCEF

**r** - Status for CCB 0q in CCN 0 for specified Unit q

**s** - Status for CCB 1q in CCN 1 for specified Unit q

For DSPU Entities:

- a** - Status for UC
- b** - Status of DSPI for specified unit

**[x]xxx** - The 3- or 4-digit nonhierarchical FTU NPC number  
([a]aaa through [b]bbb)

**xxxxxx** - Hierarchical FTU NPC number (uvmnp through uxkqr)

**cc** - Hexadecimal condition code

**cc** *Explanation*

**02** Subject entity is not equipped

## **UTL, QRY, EQD, UNITS**

### **UTILITIES, EQUIPAGE STATUS**

#### **Explanation Of Command**

This message requests a printout of all units that are equipped.

#### **Command**

[I.53011]

UTL:FRM xy,SEQ ww:QRY,EQD,UNITS!

#### **Completion Message**

[O.53011]

M hh:mm:ss xy,ww n[vv] UTL QRY EQD UNIT 2 LN MSG:  
aa bb cc dd ee ff gg hh ii jj kk ll mm nn oo pp COMPL

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**EQD** - Request equipage status

**UNITS** - Request information on units

**aa** - Equipage status of Unit number 01  
**bb** - Equipage status of Unit number 02  
**cc** - Equipage status of Unit number 03  
**dd** - Equipage status of Unit number 04  
**ee** - Equipage status of Unit number 05  
**ff** - Equipage status of Unit number 06  
**gg** - Equipage status of Unit number 07  
**hh** - Equipage status of Unit number 08  
**ii** - Equipage status of Unit number 09  
**jj** - Equipage status of Unit number 10  
**kk** - Equipage status of Unit number 11  
**ll** - Equipage status of Unit number 12  
**mm** - Equipage status of Unit number 13  
**nn** - Equipage status of Unit number 14  
**oo** - Equipage status of Unit number 15  
**pp** - Equipage status of Unit number 16

If the unit is equipped, the unit number will be shown in its corresponding position. If the unit is not equipped, the number "00" will be shown.

## **UTL,QRY,ERR,SWER,HWER,INT,DATE,TOD,TN**

### **QUERY SOFTWARE/HARDWARE ERROR RECOVERY**

#### **Explanation Of Command**

This message requests a printout of the contents of the error recovery log file. The log file contains the past history of error recovery events and can be very large. Therefore, the printout can be aborted. Because the printout is of a technical nature, assistance may be necessary for interpretation.

At least one option must be specified in the input command or it will be denied.

**Note:** Both the USA date format and international date format are supported by this command. The date format is set by the UTL::DATE,FORMAT,INT command and this message must use the same format. The date format shown in the output for this command will match the current setting.

**Note:** In the 8-character Block number 10 output of the hardware error log file, the first 4 numbers display the unit number while the second four numbers equate to the NPC number. For the hardware error log, the number of NPCs per unit is 170 instead of 160. This is because the DACS II supports a flexible frame configuration. In each DS3 unit, there are 168 NPCs. To obtain the NPC number, convert the hexadecimal number to decimal and add 1 and then subtract 10 from the result for the NPCs in Unit 2, subtract 20 from the result for the NPCs in Unit 3, . . . , subtract 150 from the result for the NPCs in Unit 16. For example, the first NPC in Unit 1 (NPC 1) will be displayed as 0 (not 1) in hexadecimal format, the first NPC in Unit 2 (NPC 161) will be displayed as 170 (not 161) in hexadecimal format, the first NPC in Unit 3 (NPC 321) will be displayed as 340 (not 321) in hexadecimal format, and so on.

Therefore, the output for the hardware log will be:

|                        |                                                   |
|------------------------|---------------------------------------------------|
| 00000000 thru 000000a7 | for NPC 001 thru 16H (1 - 160, 16A - 16H)         |
| 000100aa thru 00010151 | for NPC 161 thru 32H (161 - 320, 32A - 32H)       |
| 00020154 thru 000201fb | for NPC 321 thru 48H (321 - 480, 48A - 48H)       |
| 000301fe thru 000302a5 | for NPC 481 thru 64H (481 - 640, 64A - 64H)       |
| 000402a8 thru 0004034f | for NPC 641 thru 80H (641 - 800, 80A - 80H)       |
| 00050352 thru 000503f9 | for NPC 801 thru 96H (801 - 960, 96A - 96H)       |

Not applicable.

## **Explanation Of Parameters**

---

**ALL** - Output the entire hardware and software log file.

The ALL keyword will cause the entire log file, both hardware and software log messages, to be output. The user should understand that this keyword may generate a large volume of output. No other optional keywords should be coded together with the ALL keyword.

**ERR** - Error recovery

Refers to the error recovery log file

**SWER** - Software error

Query the software error log file.

**HWER** - Hardware error

Query the hardware error log file.

**INT** - Time interval

The user may retrieve entries by specifying a past interval of time. This interval may be specified as the last 59 minutes or less or as the interval beginning at a specified date and time of day (see DATE and TOD keywords). If the time but not the optional date is specified, DACS II assumes the present date.

During a system boot the time on the system clock defaults to the time 00:00:00 and the date 12/31/1999 until the clock is initialized. Errors occurring during the boot process consequently are logged as though they occurred in the future when actually they occurred in the past. Because of this behavior a user requesting the errors over one of the intervals mentioned above may experience a large volume of error output listing errors that will (seemingly) occur in the future. These errors actually occurred before the system clock was initialized and should be interpreted as such.

**mn** - minutes (00 to 59)

**DATE** - date

moda[ce]yr

**mo** - Month (01 through 12)

**da** - Day (01 through 31)

**ce** - Century (19 or 20)

**yr** - Year (00 through 99)

**TOD** - time of day

**hrmns** - Hours, minutes, seconds  
hr-mn-sc

**hr** - hour (00 through 23)  
**mn** - Minutes (00 through 59)  
**sc** - seconds (00 through 59)

**TN** - Transaction

**X** - Hexadecimal

**dddd** - Transaction number

**EVENT** - Event

**eeee** - Event number

**ERCL** - Error class

This keyword applies only to queries of the hardware error log file (HWER option). It is not applicable to queries of the software error log file (SWER option) and it returns no data for the software case. The hardware log file may be queried for errors of either the hardware or transient error class.

**HARD** - Hard

Hardware error detected by Error Recovery

**TRANS** - Transient

Transient error detected by Error Recovery

**APPINT** - Application interrupt

Hardware error detected by applications

**ENTY** - Entity (hardware)

This keyword applies only to queries of the hardware error log file (HWER option). It is not applicable to queries of the software error log file (SWER option) and it returns no data for the software case. The hardware log file may be queried for entries related to particular DACS II hardware entities.

**entity** - Entity type

*entity Explanation*

|      |                                       |
|------|---------------------------------------|
| BX   | Bus extender                          |

#### **Autonomous Message**

Not applicable.

## **Explanation Of Parameters**

---

**ESR** - Error source register

**CCN** - Cross-connect network

**s** - Cross-connect network side (0 or 1)

**CCB** - Cross-connect buffer

### **abcdef, ghijkl**

- MAIN, CCB error source register information

- a is set to indicate an error has occurred on the synchronizer.
- b is set to indicate a parity error was detected on the address bus.
- c is set to indicate a parity error was detected on the low byte of data.
- d is set to indicate a parity error was detected on the high byte of data.
- e is set to indicate an error was detected on the BSR (Bus Status Register). This error indicates that there was a parity error over the work written in the register.
- f is set to indicate a parity error has occurred on autonomous

Switch Enable Circuit - ghijkl represents CCB 1 through 6.

**FTMI** - Facility terminating module interface

### **abcd, efgh, ijkl, mnop,qrst, uvwx**

- FTMI error source register information

**abcd** - FTMI 1 - 4 of Unit 1 (not used)

**efgh** - FTMI 1 - 4 of Unit 2 (not used)

**ijkl** - FTMI 1 - 4 of Unit 3 (not used)

**mnop** - FTMI 1 - 4 of Unit 4 (not used)

**qrst** - FTMI 1 - 4 of Unit 5 (not used)

**uvwx** - FTMI 1 - 4 of Unit 6 (not used)

**TSI** - Time slot interchange

<tsi a>, ..., <tsi f> - TSI error source register information.

Each register is six bits long. A bit set indicates the denoted entity is either out of frame or in frame but under alarm state.

**tsi a** - Denotes for TSI 1,1; 1,2; 1,3; 1,4; 1,5; 1,6

**tsi b** - Denotes for TSI 2,1; 2,2; 2,3; 2,4; 2,5; 2,6

**tsi c** - Denotes for TSI 3,1; 3,2; 3,3; 3,4; 3,5; 3,6

**tsi d** - Denotes for TSI 4,1; 4,2; 4,3; 4,4; 4,5; 4,6

**tsi e** - Denotes for TSI 5,1; 5,2; 5,3; 5,4; 5,5; 5,6

**tsi f** - Denotes for TSI 6,1; 6,2; 6,3; 6,4; 6,5; 6,6

**cc** - Hexadecimal condition code

**cc** *Explanation*

**04** Subject entity is out of service

## Explanation Of Parameters

**ESR** - Error source register

**e** - Number of lines in the segment (2 through 5)

**ECCN** - Expanded cross-connect network

**s** - ECCN side (0 or 1)

**qq** - Unit number (01 through 16)

**ETSI** - Expanded Time Slot Interchanger

The ESR data for a ETSI will be shown only if the ETSI is restored. If no ETSI in the ECCN side is restored, only the ESR data of the CCI will be shown.

**CCI** - Clock and Control Interface

**wd02,**

**wd01,**

**wd00** - Error source register data words for the CCI. Each word is a 4-digit hexadecimal number.

*wdx* *Definition*

wd00 CCI System Status Register

wd01 CCI Status Register

wd02 CCI Bus Status Register

**Note:** wd02 shows the active side; therefore, it is normal to have a non-zero value.

**aaaa,**

**bbbb,**

**cccc,**

**dddd** - CCI register for ETSI alarm information.

This 16 bit register is shown as four 4-bit binary numbers. Each bit represents one ETSI. The ETSIs are arranged by unit number in descending order from left to right. That is, the left-most bit reports alarm information for the unit 16 ETSI, while the right-most bit reports alarm information for the unit 1 ETSI.

**Descending order-->**

**aaaa bbbb cccc dddd**

**^**

**^**

**|**

**Unit 1 ETSI**

**Unit 16 ETSI**

**eeee,**  
**ffff,**  
**gggg,**  
**hhhh** - CCI register for ETSI equipage information  
See the explanation given for aaaa-dddd above.

**iiii,**  
**jjjj,**  
**kkkk,**  
**llll** - CCI register for ETSI ready timeout information  
See the explanation given for aaaa-dddd above.

**mmmm,**  
**nnnn,**  
**oooo,**  
**pppp** - CCI register for ETSI read high information  
See the explanation given for aaaa-dddd above.

**sqq** - Combined ECCN side and unit number  
See the definitions of s and qq above.

**wd05,**  
**wd04,**  
...,  
**wd00** - Error source register data words for the ETSI  
Each word is a 4-digit hexadecimal number representing the contents of  
the error source register listed in the table below.

| <i>wdxx</i> | <i>Definition</i>                   |
|-------------|-------------------------------------|
| wd00        | Circuit Pack Summary Register       |
| wd01        | Receive Status Register             |
| wd02        | Transmit Status Register            |
| wd03        | Control RAM Status Register         |
| wd04        | Control RAM Port Alarm Register     |
| wd05        | Control RAM Data RAM Alarm Register |

## Explanation Of Parameters

**ESR** - Error source register

**MP** - Main Processor

Variables aa, bb, cc, dd, ee, ff, gg, hh, and ii are two digit hexadecimal numbers representing error source registers. The bits in these registers are numbered as shown below:

hex hh = bbbbbb binary  
76543210 Bit numbering

**aa** - Error Source Bit (ESB) group. (hexadecimal)

*aa Function*

|    |                             |
|----|-----------------------------|
| a0 | SYNC 0 power supply ESB     |
| a1 | SYNC 1 power supply ESB     |
| a2 | CCN/ECCN 0 power supply ESB |
| a3 | CCN/ECCN 1 power supply ESB |
| a4 | Spare                       |
| a5 | Spare                       |
| a6 | Spare                       |
| a7 | Spare                       |

**bb** - Error Source Bit (ESB) group. (hexadecimal)

*bb Function*

|    |                                                   |
|----|---------------------------------------------------|
| b0 | UC 01 power supply ESB                            |
| b1 | UC 02 power supply ESB                            |
| b2 | UC 03 power supply ESB                            |
| b3 | UC 04 power supply ESB                            |
| b4 | UC 05 power supply ESB                            |
| b5 | UC 06 power supply ESB                            |
| b6 | UC 07 power supply ESB for CEF, Spare for Non-CEF |
| b7 | Spare                                             |

**cc** - Error Source Bit (ESB) group. (hexadecimal)

| <i>cc</i> | <i>Function</i>                      |
|-----------|--------------------------------------|
| c0        | UC 01 ESB                            |

| c6        | UC 07 ESB for CEF, Spare for Non-CEF |
| c7        | UC 08 ESB for CEF, Spare for Non-CEF |

**dd** - Error Source Bit (ESB) group. (hexadecimal)

| <i>dd</i> | <i>Function</i>       |
|-----------|-----------------------|
| d0        | MC CPU ESB            |
| d1        | MC CI ESB             |
| d2        | MC SSC ESB            |
| d3        | Spare                 |
| d4        | MC power supply 0 ESB |
| d5        | MC power supply 1 ESB |
| d6        | Spare                 |
| d7        | Spare                 |

**ee** - Error Source Bit (ESB) group. (hexadecimal)

| <i>ee</i> | <i>Function</i>                                                   |
|-----------|-------------------------------------------------------------------|
| e0        | Parity over Low Data Byte                                         |
| e1        | Parity over High Data Byte                                        |
| e2        | Error from Side 0 Bus Extension                                   |
| e3        | Error from Side 1 Bus Extension                                   |
| e4        | ECCN side 0 circuit not present for CEF, Spare for Non-CEF        |
| e5        | ECCN side 1 circuit not present for CEF, Spare for Non-CEF        |
| e6        | Write parity error over low byte data for CEF, Spare for Non-CEF  |
| e7        | Write parity error over high byte data for CEF, Spare for Non-CEF |

The following parameters (ff, gg, hh, ii) apply only to CEF frames:

**ff** - Error Source Bit (ESB) group. (hexadecimal)

| <i>ff</i> | <i>Function</i>        |
|-----------|------------------------|
| f0        | UC 08 power supply ESB |
| f1        | UC 09 power supply ESB |
| f2        | UC 10 power supply ESB |
| f3        | UC 11 power supply ESB |
| f4        | UC 12 power supply ESB |
| f5        | Spare                  |
| f6        | Spare                  |
| f7        | Spare                  |

**gg** - Error Source Bit (ESB) group. (hexadecimal)

| <i>gg</i> | <i>Function</i>        |
|-----------|------------------------|
| g0        | UC 13 power supply ESB |
| g1        | UC 14 power supply ESB |

Not applicable.

## Explanation Of Parameters

**ESR** - Error source register

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |

| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**SIDE** - Side

**s** - Side number (0 or 1)

Substrate type circuit packs are duplicated; therefore, the side must be specified in order to request the contents of the error source register. The side must not be specified when the NPC is a facility terminating NPC.

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**Note:** In the error source register listings below, the bits are each shown set individually (bit value = 1). In actual practice the bits may be set in combination. For example a value of 0C for register dd would be interpreted as follows:

X'0C = 00001100 binary

Bits 2 and 3 are set to one. An examination of the bits for register dd shows that X'0C means RAM diagnostic complete and power up ready.

**aa** - Communications Interface ESR 1 (Hexadecimal)

| <i>Bit</i> | <i>Value</i> | <i>Bit definition</i>            |
|------------|--------------|----------------------------------|
| 0          | 1            | Channel controller error         |
| 1          | 1            | Unassigned                       |
| 2          | 1            | Chip identification parity error |
| 3          | 1            | Sync error                       |
| 4          | 1            | Facility processor sanity error  |
| 5          | 1            | Hardware error                   |
| 6          | 1            | Transceiver A error              |
| 7          | 1            | Transceiver B error              |

**bb** - Not used

**cc** - Channel Controller ESR (Hexadecimal)

| <i>Bit</i> | <i>Value</i> | <i>Bit definition</i>               |
|------------|--------------|-------------------------------------|
| 0          | 1            | Exercise indicator                  |
| 1          | 1            | Receive data parity error           |
| 2          | 1            | Transmit data parity error          |
| 3          | 1            | Instruction RAM parity error        |
| 4          | 1            | Configuration register parity error |
| 5          | 1            | Processor error                     |
| 6          | 1            | Sync error                          |
| 7          | 1            | Loss of clock (8 MHz)               |

**dd** - Hardware error data from DDC shared RAM (Hexadecimal)

| <i>Bit</i> | <i>Value</i> | <i>Bit definition</i>   |
|------------|--------------|-------------------------|
| 0          | 1            | Not used                |
| 1          | 1            | Not used                |
| 2          | 1            | RAM diagnostic complete |
| 3          | 1            | Power up ready          |
| 4          | 1            | Not used                |
| 5          | 1            | Not used                |
| 6          | 1            | RAM diagnostic failure  |
| 7          | 1            | ROM checksum failure    |

**ee** - Transceiver A ESR (framer alarms) (Hexadecimal)

| <i>Bit</i> | <i>Value</i> | <i>Bit definition</i>                     |
|------------|--------------|-------------------------------------------|
| 0          | 1            | Device error Remote Frame Alignment       |
| 1          | 1            | Device error Remote Multiframe Alignment  |
| 2          | 1            | Device error Loss of Multiframe Alignment |
| 3          | 1            | Device error Framing Bit Error            |
| 4          | 1            | Not used                                  |
| 5          | 1            | Not used                                  |
| 6          | 1            | Not used                                  |
| 7          | 1            | Not used                                  |

**ff** - Transceiver A ESR (receive sync alarms) (Hexadecimal)

| <i>Bit</i> | <i>Value</i> | <i>Bit definition</i>             |
|------------|--------------|-----------------------------------|
| 0          | 1            | STOMP block device error          |
| 1          | 1            | ALU block device error            |
| 2          | 1            | ALU block device error            |
| 3          | 1            | Data link                         |
| 4          | 1            | Missing receive synchronizer sync |
| 5          | 1            | Signaling RAM parity error        |
| 6          | 1            | PCM RAM parity error              |
| 7          | 1            | E signaling bit error             |

**gg** - Transceiver A ESR (transmitter alarms) (Hexadecimal)

| <i>Bit</i> | <i>Value</i> | <i>Bit definition</i>                        |
|------------|--------------|----------------------------------------------|
| 0          | 1            | Transmit framing bit generator circuit       |
| 1          | 1            | Transmitter SLIP                             |
| 2          | 1            | Internal parity error                        |
| 3          | 1            | Missing transmit sync                        |
| 4          | 1            | Misaligned transmit sync                     |
| 5          | 1            | Transmit SLC®-96 carrier framer device alarm |
| 6          | 1            | Missing SLC 96 carrier Fs superframe sync    |
| 7          | 1            | Misaligned SLC 96 carrier Fs superframe sync |

**hh** - Transceiver A ESR (framer alarms) (Hexadecimal)

Values and explanations are the same as ee

**ii** - Transceiver B ESR (receive sync alarms) (Hexadecimal)

Values and explanations are the same as ff

**jj** - Transceiver B ESR (transmitter alarms) (Hexadecimal)

Values and explanations are the same as gg

The meaning of the bits for types MJ100 and SR100 depends upon the type reported in the output message.

#### TYPE SR100

##### defghijk

- First 8 bits of Substrate circuit pack error source register

| <i>Bit</i> | <i>Value</i> | <i>Fault</i>                                                                                                                   |
|------------|--------------|--------------------------------------------------------------------------------------------------------------------------------|
| d          | 1            | Parallel interface between the DSPU processor and the SR100                                                                    |
| e          | 1            | Data interface between the DSPU backplane and the SR100                                                                        |
| f          | 1            | Data path internal to the SR100 including the Error Correction Device (ECD)                                                    |
| g          | 1            | Data interface between the DSPU backplane and the SR100, or data path internal to the SR100 including the ECD, or PROM5 device |
| h          | 1            | Output block of SR100, or bus feeding the output block                                                                         |
| i          | 1            | Internal data RAM                                                                                                              |
| j          | 1            | Multiplexer state machine, or bus feeding the output block                                                                     |
| k          | 1            | Clock circuitry                                                                                                                |

##### lmnopqrs

- Second 8 bits of Substrate circuit pack error source register

| <i>Bit</i> | <i>Value</i> | <i>Fault</i>              |
|------------|--------------|---------------------------|
| l          | 1            | Built-in self test on ECD |
| m-s        | 0            | Unused                    |

#### TYPE MJ100

##### defghijk

- First 8 bits of Substrate circuit pack error source register

| <i>Bit</i> | <i>Value</i> | <i>Fault</i>                                                                                                                          |

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**ESR** - Error source register

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**aa** - FTU ESR

*aa Explanation*

A2 Error from FTMI 1

A4 Error from FTMI 2

A5 Error from FTMI 3

A6 Error from FTMI 4

**bbbb** - DS3U or HDS3U Interrupt holding register 0.  
Hexadecimal digits are numbered 3210 in left to right order.

*hex*

| digit | Bit  | Value | Definition                |
|-------|------|-------|---------------------------|
| 0     | 0    | 1     | Ram Parity Error          |
| 0     | 1    | 1     | Internal Bus Error        |
| 0     | 2    | 1     | Parallel Bus Parity Error |
| 0     | 3    | 1     | Series Bus Parity Error   |
| 1-3   | 4-15 |       | Unused                    |

**cccc** - DS3U or HDS3U Interrupt holding register 1  
Hexadecimal digits are numbered 3210 in left to right order.

| <i>hex</i><br>digit | Bit | Value | Definition                |
|---------------------|-----|-------|---------------------------|
| 0                   | 0   | 1     | MXR1 Power Loss Interrupt |
| 0                   | 1   | 1     | MXR2 Power Loss Interrupt |
| 0                   | 2   | 1     | MXR3 Power Loss Interrupt |
| 0                   | 3   | 1     | MXR4 Power Loss Interrupt |
| 1                   | 4   | 1     | MXR5 Power Loss Interrupt |
| 1                   | 5   | 1     | MXR6 Power Loss Interrupt |
| 1                   | 6   | 1     | MXRP Power Loss Interrupt |
| 1                   | 7   | 1     | SFLI Power Loss Interrupt |

## Explanation Of Parameters

**ESR** - Error source register

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FC** - Format converter

**s** - Side (0 or 1)

**b** - Format converter number (1 through 4)

**Note:** Data bytes aa through gg must be converted from hexadecimal to binary before the tables below can be used to interpret the data byte values. Each hexdigit converts to 4 binary digits. Bits are numbered from right to left starting from 0 as follows; 76543210.

For example if aa = 01 the binary equivalent of this is 0000 0001. Using the table for aa below this indicates that there is an alarm on the Receive formatter.

| Bit value | Explanation                 |
|-----------|-----------------------------|
| 0         | Indicates NO error or alarm |
| 1         | Indicates an error or alarm |

**aa** - Communications interface (CI) error source register 0 (ESR0) (Hexadecimal)

| <i>Bit</i> | <i>Explanation</i>                                                        |
|------------|---------------------------------------------------------------------------|
| 0          | Receive formatter summary (look at bytes bb, cc, dd , and ee for details) |
| 1          | Transmit formatter summary (look at byte ee for details)                  |
| 2          | Circuit ID error                                                          |
| 3          | Timing error                                                              |
| 4-7        | Not used                                                                  |

**bb** - Receive Formatter (RF) device ESR0 (Hexadecimal)

| <i>Bit</i> | <i>Explanation</i> |
|------------|--------------------|
| 0          | Port 0 alarm       |
| 1          | Port 1 alarm       |
| 2          | Port 2 alarm       |
| 3          | Port 3 alarm       |
| 4          | Port 4 alarm       |
| 5          | Port 5 alarm       |
| 6          | Port 6 alarm       |
| 7          | Port 7 alarm       |

**cc** - RF device ESR1 (Hexadecimal)

| <i>Bit</i> | <i>Explanation</i> |
|------------|--------------------|
| 8          | Port 8 alarm       |
| 9          | Port 9 alarm       |
| 10         | Port 10 alarm      |
| 11         | Port 11 alarm      |
| 12         | Port 12 alarm      |
| 13         | Port 13 alarm      |
| 14         | Port 14 alarm      |
| 15         | Port 15 alarm      |

**dd** - RF device ESR2 (Hexadecimal)

| <i>Bit</i> | <i>Explanation</i> |
|------------|--------------------|
| 0          | Port 17 alarm      |

## **UTL, QRY, ESR, UNIT, FLI**

### **QUERY ERROR SOURCE REGISTER FACILITY LINE INTERFACE**

#### **Explanation Of Command**

This message requests a print out of the error source register (ESR) on one facility line interface (FLI) circuit pack.

#### **Command**

[I.55801]

UTL:FRM xy,SEQ ww:QRY,ESR,UNIT [q]q,FLI k!

#### **Completion Message**

[O.55801]

M hh:mm:ss xy,ww n[vv] UTL QRY ESR UNIT [q]q FLI k 2 LN MSG:  
aa bb ee dd COMPL

#### **Denial Message**

[O.55801.01]

M hh:mm:ss xy,ww n[vv] UTL QRY ESR UNIT [q]q FLI k COND cc DNY

#### **Autonomous Message**

Not applicable.

## Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FLI** - Facility line interface

**k** - The identifier of the FLI:

*k*      *Explanation*

S      Service FLI

P      Protection FLI

**ESR** - Error source register

**aa, bb, ee, dd**

- The error register of the queried circuit pack

Variables aa, bb, ee, and dd are two-digit hexadecimal numbers representing error source registers. The bits in these registers are numbered as shown below:

76543210      Bit numbering

Bit values have the following meaning:

0      No error

1      Error

**aa** - Communication Interface (CI) ESR 1

*bit*      *Explanation*

0      Summary of facility line interface (FLI) ESR 1

1      Summary of FLI ESR 2

2      Chip identification parity error indicator

3      Sync absence or internal counter error indicator

4-7      Not used ( set to zero )

### Example:

aa = 05 (= 00000101 binary). At least one bit in the FLI ESR 1 is set, and a chip ID error has been identified.

**Note:** In practice, the bits may be set in combination.

**bb** - CI ESR 2

*bit*      *Explanation*

0      Address Parity Error

1-7      Not Used

**ee** - FLI ESR 1

| <i>Bit</i> | <i>Value</i> | <i>Explanation</i>                      |
|------------|--------------|-----------------------------------------|
| 0          | 1            | The LOC alarm for DS-3 # 1 is activated |
| 1          | 1            | The LOC alarm for DS-3 # 2 is activated |
| 2          | 1            | The LOC alarm for DS-3 # 3 is activated |
| 3          | 1            | The LOC alarm for DS-3 # 4 is activated |
| 4          | 1            | The LOC alarm for DS-3 # 5 is activated |
| 5          | 1            | The LOC alarm for DS-3 # 6 is activated |
| 6,7        |              | Not Used                                |

**dd** - FLI ESR 2

| <i>Bit</i> | <i>Value</i> | <i>Explanation</i>                        |
|------------|--------------|-------------------------------------------|
| 0          | 1            | The LOS alarm for DS-3 # 1 is activated   |
| 1          | 1            | The LOS alarm for DS-3 # 2 is activated   |
| 2          | 1            | The LOS alarm for DS-3 # 3 is activated   |
| 3          | 1            | The LOS alarm for DS-3 # 4 is activated   |
| 4          | 1            | The LOS alarm for DS-3 # 5 is activated   |
| 5          | 1            | The LOS alarm for DS-3 # 6 is activated   |
| 6          | 1            | Lock and Key procedure alarm is activated |
| 7          |              | Not Used                                  |

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 10** Unit is not equipped
- 11** UC is out of service
- 12** UC is in service but failed

## **UTL, QRY, ESR, UNIT, FTMI**

### **QUERY ERROR SOURCE REGISTER FTMI**

#### **Explanation Of Command**

This message requests a printout of the error source register for a facility terminating module interface in a unit.

#### **Command**

[I.55511]

UTL:FRM xy,SEQ ww:QRY,ESR,UNIT [q]q,FTMI d!

#### **Completion Message**

[O.55511]

M hh:mm:ss xy,ww n[vv] UTL QRY ESR UNIT [q]q FTMI d 2 LN MSG:  
aa bb cc dd ee ff gg COMPL

#### **Denial Message**

[O.55511.01]

M hh:mm:ss xy,ww n[vv] UTL QRY ESR UNIT [q]q FTMI d COND cc DNY

#### **Autonomous Message**

Not applicable.

## Explanation Of Parameters

**ESR** - Error source register

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FTMI** - Facility terminating module interface

**d** - Facility terminating module interface number (1 through 4)

**Note:** Data bytes aa through gg must be converted from hexadecimal to binary before the tables below can be used to interpret the data byte values. Each hex digit converts to 4 binary digits. Bits are numbered from right to left starting from 0 as follows; 76543210.

For example if aa = 01 the binary equivalent of this is 0000 0001. Using the table for aa below this indicates that there is an alarm on the Communications interface device C.

| Bit value | Explanation                 |
|-----------|-----------------------------|
| 0         | Indicates NO error or alarm |
| 1         | Indicates an error or alarm |

**aa** - FTMI error status register

| <i>Bit</i> | <i>Explanation</i>                                                                                      |
|------------|---------------------------------------------------------------------------------------------------------|
| 0          | Error summary bit from Communications interface device C (CIC)<br>(look at bytes bb and ee for details) |
| 1          | Error summary bit from CIB (look at bytes bc and ff for details)                                        |
| 2          | Error summary bit from CIA (look at bytes dd and gg for details)                                        |
| 3          | Bus error alarm                                                                                         |
| 4-7        | Not used                                                                                                |

**bb** - Communications interface (CI) device A error source register

| <i>Bit</i> | <i>Explanation</i>                    |
|------------|---------------------------------------|
| 0          | Chip identification comparison failed |
| 1          | Address parity error was detected     |
| 2          | Data Strobe signal was not presented  |
| 3          | Loss of timing alarm on the device    |
| 4-7        | Not used                              |

|                                               |                                       |

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**MXR** - Multiplexer

**HMXR** - Hybrid Multiplexer

**c** - The number of the MXR or HMXR within the unit ( $P, 1 \leq c \leq 6$ )

**ESR** - Error source register

**aa, bb, dd, ee, ff, gg, ii, jj, kk, nn, oo**

- The error register of the queried circuit pack. (Hexadecimal format)

**aa** - MXR ESR 1

| <i>Bit</i> | <i>Value</i> | <i>Bit definition</i>  |
|------------|--------------|------------------------|
| 0          | 1            | DS3 LOS / OOF detected |
| 1          | 1            | CC device #7 Error     |
| 2          | 1            | CC device #6 Error     |
| 3          | 1            | CC device #5 Error     |
| 4          | 1            | CC device #4 Error     |
| 5          | 1            | CC device #3 Error     |
| 6          | 1            | CC device #2 Error     |
| 7          | 1            | CC device #1 Error     |

## **UTL, QRY, FALMS, TYPE, ALL**

---

### **RETRIEVE FACILITY ALARM SEVERITY**

#### **Explanation Of Command**

---

This command retrieves the current system alarm severity for a single facility alarm or for all the facility alarms. This command is denied if the Alarm Severity feature is turn OFF. (I.38355 command turn the feature ON and OFF. This command does not check the validity of the facility alarm for the type specified. It assumes all facility alarms are available for all types.

#### **Command**

---

[I.53311]

UTL: [FRM xy, SEQ ww]: QRY, FALMS, TYPE {mn[xyz] | ALL}, {<fa`lm> | ALL}!

#### **Completion Message**

---

If a single facility alarm is requested for a specific NPC type:

[O.53311]

M hh:mm:ss xy, ww n[vv] UTL QRY FALMS TYPE mnxyz <fa`lm> sev COMPL

If a single facility alarm is requested for an NPC type:

[O.53311]

M hh:mm:ss xy, ww n[vv] UTL QRY FALMS TYPE mn DEFAULT <fa`lm> sev COMPL

If ALL facility alarms are requested for a NPC specific type:

[O.53311]

```
M hh:mm:ss xy,ww n[vv] UTL QRY FALMS TYPE mnxyz 6 lines
LOS sev RBER sev LOF sev EER sev
BER sev LCMA sev FLC sev RAI sev
SFI sev RAIS sev AIS sev POF sev
TAI sev LMA sev RABS sev RPSFI sev
PBF sev COMPL
```

If ALL facility alarms are requested for a NPC type:

[O.53311]

```
M hh:mm:ss xy,ww n[vv] UTL QRY FALMS TYPE mn DEFAULT 6 lines
LOS sev RBER sev LOF sev EER sev
BER sev LCMA sev FLC sev RAI sev
SFI sev RAIS sev AIS sev POF sev
TAI sev LMA sev RABS sev RPSFI sev
PBF sev COMPL
```

If the ALL type option is chosen, the message will give the current default for each PA, PB, or PC type and any changes from the default for specific xyz types.

If a single facility alarm is requested:

[O.53311]

```
M hh:mm:ss xy,ww n[vv] UTL QRY FALMS TYPE PA DEFAULT <fal> sev
M hh:mm:ss xy,ww n[vv] UTL QRY FALMS TYPE PB DEFAULT <fal> sev
M hh:mm:ss xy,ww n[vv] UTL QRY FALMS TYPE PC DEFAULT <fal> sev [COMPL]
[M hh:mm:ss xy,ww n[vv] UTL QRY FALMS TYPE mnxyz <fal> sev [COMPL]]
.
.
.
[M hh:mm:ss xy,ww n[vv] UTL QRY FALMS TYPE mnxyz <fal> sev COMPL]
```

If ALL facility alarms were requested:

[O.53311]

M hh:mm:ss xy,ww n[vv] UTL QRY FALMS TYPE PA DEFAULT 6 lines

## Explanation Of Parameters

**falm** - Facility Alarms

*falm*    *Explanation*

**RPSFI** Remote Power Supply Failure Indicator  
**LOS**    Loss of Signal  
**LOF**    Loss of Frame  
**AIS**    Alarm Indication Signal  
**EER**    Excessive Error Rate  
**BER**    Bit Error Rate  
**LCMA** Loss of CRC multiframe alignment  
**FLC**    Far End Loss of CRC Multiframe Alignment  
**RAI**    Remote Alarm Indication  
**RAIS** Remote AIS  
**RBER** Remote Bit Error Rate  
**SFI**    Sync Failure Indication  
**POF**    Pseudo Frame Word Out of Frame  
**TAI**    Ts-16 All Ones Alarm  
**LMA**    Loss of Multiframe Alignment  
**RABS** Remote Alarm bit 6, TS16  
**ALL**    ALL above identified shelf alarms

**sev**    - Severity

*sev*    *Explanation*

**PMACR** - Prompt Maintenance Action CRITICAL alarm severity  
**PMAMJ** - Prompt Maintenance Action MAJOR alarm severity  
**DMAMN** - Deferred Maintenance Action MINOR alarm severity  
**MI**    - MESSAGE INFORMATION alarm severity

**TYPE** - Type

*mn Explanation*

**PA** PA NPC Type

**PB** PB NPC Type

**PC** PC NPC Type

**PA-Type xyz fields**

The provisioning values of *x*, *y*, and *z* for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (*x*, *y* or *z*) provisioning value):

**Table 19-15. Provisioning values for *x***

| <b>x<br/>value</b> | <b>CRC-4<br/>Mode</b> | <b>Automatic<br/>CRC-4</b> | <b>Far-End<br/>PM</b> | <b>NPC used as<br/>Sync Source</b> | <b>TS0 Bit 5<br/>used for SFI</b> |
|--------------------|-----------------------|----------------------------|-----------------------|------------------------------------|-----------------------------------|
| <b>0</b>           | Y                     |                            |                       |                                    |                                   |
| <b>1</b>           | Y                     |                            | Y                     |                                    | Y                                 |
| <b>2</b>           | Y                     |                            |                       |                                    | Y                                 |
| <b>3</b>           | Y                     |                            | Y                     |                                    |                                   |
| <b>4</b>           | Y                     |                            |                       | Y                                  |                                   |
| <b>5</b>           | Y                     |                            | Y                     | Y                                  | Y                                 |

| <b>7</b>           | Y                     |                            | Y                     | Y                                  |                                   |
| <b>8</b>           |                       | Y                          | Y                     |                                    |                                   |
| <b>9</b>           |                       | Y                          | Y                     |                                    | Y                                 |
| <b>A</b>           |                       |                            |                       |                                    | Y                                 |
| <b>B</b>           |                       |                            |                       |                                    |                                   |
| <b>C</b>           |                       | Y                          | Y                     | Y                                  |                                   |
| <b>D</b>           |                       | Y                          | Y                     | Y                                  | Y                                 |
| <b>E</b>           |                       |                            |                       | Y                                  | Y                                 |
| <b>F</b>           |                       |                            |                       | Y                                  |                                   |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 19-16. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|

| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected ( $y$  value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected ( $y$  values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For  $y$  values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering ( $y=8$ ) or Timeslot Channel Numbering ( $y=9$ ) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface ( $y=C$ ) or as an unframed clear 2Mbit/s interface ( $y=D$ ). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 19-17. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )
3. z values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For z values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For z values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS

in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when z = 0, 1, 4, 5, 6, 7, A or B. **However**, for z values 2 and 8 the set time is 144 ms and for z values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for z = 4 and 8) or 480 ms (for z = 5 and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC, TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:
  - DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.
  - When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.
- [ii] RAI set in 2 ms
- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:
  - z=6 or A** hardware timing
  - z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

[iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 19-18. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2'ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496'ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mnxyz'bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2'ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2'ms. NFW'bit'3 of TS0 in enhanced CEPT is controlled by selecting the **jkl** options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144'ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW'bit'5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW'bit'5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic'1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit'5 when option h=1.

If both b=1 and h=1 and the NPC (used as synchronization source) receives

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

NFW bit'5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit'3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section'2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2'ms after detecting the failure.** If this option is not specified as 000, use of NFW bit'3 as RAI will remain unchanged except the time when NFW bit'3 is set can be changed to 144'ms as opposed to 2 ms after detecting the failure. NFW'bit'3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW'bit'4 when used as RAIS, and AIS is detected in the received signal, can only be set 144'ms after detecting this condition. Similarly, when the received NFW bit'4 is in the active state, consequent actions are taken 144'ms after detecting this condition.

NFW'bit'4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] minor bit error rate and signaling freeze delay time features:

jkl=011 or jkl=101

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

*c*=0 hardware timing

*c*=1 firmware timing (SFDT=2496'ms, CACT=624'ms)

[iv] BER alarm level = DMA

jkl=011

[v] RBER alarm level = MI

[vi] NFW'bit'4=RBER:

- DACS'II sends a remote indicator in bit'4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144'ms after detecting the minor bit error rate (BER) condition.
- “ DACS'II sets the RBER bit to its idle state, on clearing of the BER condition.
- DACS'II detects the remote setting of the received bit'4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144'ms after detecting this condition.
- “ DACS II generates an appropriate retirement message when the received bit'4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW'bit'4=disabled

NFW'bit'4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d'efgh'0110** or **ab1d'efgh'1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d'efgh'0110** or **ab0d'efgh'1010**.

NFW'bit'4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic'1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic'1G the abcdefgh=00111111.

**cc** - Hexadecimal condition code

In general a feature package identification code is a combination of several individual feature package numbers. To determine the individual features that make up a feature package it is necessary to decode the feature package identification code. This code is an eight digit hexadecimal number. Each hexadecimal number represents a four-bit binary number. Within this binary number each feature is associated with one particular bit. Consequently to determine the feature list from a feature package identification code it is necessary to convert each hexadecimal digit to its binary equivalent and look up the features in the list above. For example the feature package identification code 0000000F can be converted to the following binary number working from left to right one hex digit at a time.

0000 0000 0000 0000 0000 0000 0000 1111

This number contains eight binary numbers each representing one of the hexadecimal numbers in the feature package identification code 0000000F. The rightmost number of the code contains four features since there are four bits set to one. This would be decoded as follows using the table of features above.

|       | binary | hex | Feature                      |
|-------|--------|-----|------------------------------|
|       | 0001   | 1   | DS1                          |
|       | 0010   | 2   | CEPT                         |
|       | 0100   | 4   | Subrate                      |
|       | 1000   | 8   | Direct SLC                   |
| Total | 1111   | F   | (DS1 + CEPT + Subrate + SLC) |

- gg** - DACS II software release number
- pp** - DACS II software release point number
- r** - DACS II software PDI number

## **UTL,QRY,FROM**

---

### **UTILITY QUERY FROM**

#### **Explanation Of Command**

---

This command is used to query the FROM side of a one-way cross-connected circuit or a range of similar circuits. The results depend on (1) whether the termination is assigned, and (2) whether it is a test port termination. A test port termination requires the NPC type of this termination and the far-end it is mapped to (if any).

For this utility, DACS II terminations can be divided into two categories:

- Multipoint termination, which is a multipoint circuit on a real digital multipoint bridge (DMB) in the digital signal processing unit (DSPU), or on a virtual network processing circuit.
- All other terminations.

[s]abc - The 3- or 4-digit non-hierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**ddd** - Starting channel number  
**eee** - Channel number denoting the end of the range.

The valid values are listed below:

Channel numbers  
000-031 CEPT

Conference numbers  
001-085 (MB NPC)  
001-500 (Virtual NPC)

**TYPE** - Type

**mnxyz** - FROM termination NPC information

**mn** - FROM termination NPC type

Valid values are listed below:

**mn**      *Explanation*

PA      CEPT NPC (75- or 120-ohm)  
PB      CEPT NPC (120-ohm twisted pair)  
PC      CEPT NPC (75-ohm coaxial)

**xyz** - Options and formats for NPCs

#### PA-Type xyz fields

The provisioning values of *x*, *y*, and *z* for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (*x*, *y* or *z*) provisioning value):

**Table 19-22. Provisioning values for *x***

| <b>x<br/>value</b> | <b>CRC-4<br/>Mode</b> | <b>Automatic<br/>CRC-4</b> | <b>Far-End<br/>PM</b> | <b>NPC used as<br/>Sync Source</b> | <b>TS0 Bit 5<br/>used for SFI</b> |
|--------------------|-----------------------|----------------------------|-----------------------|------------------------------------|-----------------------------------|
| <b>0</b>           | Y                     |                            |                       |                                    |                                   |
| <b>1</b>           | Y                     |                            | Y                     |                                    | Y                                 |
| <b>2</b>           | Y                     |                            |                       |                                    | Y                                 |
| <b>3</b>           | Y                     |                            | Y                     |                                    |                                   |
| <b>4</b>           | Y                     |                            |                       | Y                                  |                                   |
| <b>5</b>           | Y                     |                            | Y                     | Y                                  | Y                                 |
| <b>6</b>           | Y                     |                            |                       | Y                                  | Y                                 |

| <b>9</b>           |                       | Y                          | Y                     |                                    | Y                                 |
| <b>A</b>           |                       |                            |                       |                                    | Y                                 |
| <b>B</b>           |                       |                            |                       |                                    |                                   |
| <b>C</b>           |                       | Y                          | Y                     | Y                                  |                                   |
| <b>D</b>           |                       | Y                          | Y                     | Y                                  | Y                                 |
| <b>E</b>           |                       |                            |                       | Y                                  | Y                                 |
| <b>F</b>           |                       |                            |                       | Y                                  |                                   |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled (*x* values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected (*x* values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected (*x* values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source (*x* values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected (*x* values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6. *x* value B does not enable any of the features shown in the Table; this is a valid option.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

**Table 19-23. Provisioning values for *y***

| <i>y</i><br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|-------------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0                 | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |

| 4                 | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6                 | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8                 |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9                 |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C                 |             |             |                        |                       |                   |                  | Y               |                   |
| D                 |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2. *y* values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For *y* values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected (*y* values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected (*y* values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected (*y* value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (*y* values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For *y* values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (*y*=8) or Timeslot Channel Numbering (*y*=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (*y*=C) or as an unframed clear 2Mbit/s interface (*y*=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).

- Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 19-24. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )
3. z values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For z values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For z values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*

HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.

FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when  $z = 7$  or B**.

6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when  $z = 0, 1, 4, 5, 6, 7, A$  or  $B$ . **However**, for  $z$  values 2 and 8 the set time is 144 ms and for  $z$  values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for  $z = 4$  and 8) or 480 ms (for  $z = 5$  and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8.  $z$  values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options ( $z = 6-7$  or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

[iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

z=6 or A hardware timing

z=7 or B firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

[ix] To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of xyz for the PA type NPC.

**Table 19-25. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz                              | Framed clear 2Mbit/s ( $y$ value C) is valid for all $x$ options except those invoking automatic CRC-4 interworking.<br>The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 9Cz                              |                                                                                                                                                                                                                                    |
| CCz                              |                                                                                                                                                                                                                                    |
| DCz                              |                                                                                                                                                                                                                                    |
| 0Dz                              | Unframed clear 2Mbit/s ( $y$ value D) is only valid for $x$ values B and F. These are the only $x$ options which do not require decoding of TS0 content.                                                                           |

#### Table Notes:

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2'ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496' ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway cross-connection* the insertion word always defaults to AIS.

mnxyz'bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2'ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2'ms. NFW'bit'3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144'ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW'bit'5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW'bit'5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic'1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit'5 when option h=1.

If both b=1 and h=1 and the NPC (used as synchronization source) receives

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

NFW bit'5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit'3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section'2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2'ms after detecting the failure.** If this option is not specified as 000, use of NFW bit'3 as RAI will remain unchanged except the time when NFW bit'3 is set can be changed to 144'ms as opposed to 2 ms after detecting the failure. NFW'bit'3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW'bit'4 when used as RAIS, and AIS is detected in the received signal, can only be set 144'ms after detecting this condition. Similarly, when the received NFW bit'4 is in the active state, consequent actions are taken 144'ms after detecting this condition.

NFW'bit'4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

**[jkl'] minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

**c=0** hardware timing

**c=1** firmware timing (SFDT=2496'ms, CACT=624'ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW'bit'4=RBER:

- DACS'II sends a remote indicator in bit'4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144'ms after detecting the minor bit error rate (BER) condition.
- “ DACS'II sets the RBER bit to its idle state, on clearing of the BER condition.
- DACS'II detects the remote setting of the received bit'4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144'ms after detecting this condition.
- “ DACS II generates an appropriate retirement message when the received bit'4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW'bit'4=disabled

NFW'bit'4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d'efgh'0110** or **ab1d'efgh'1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d'efgh'0110** or **ab0d'efgh'1010**.

NFW'bit'4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic'1G the **abcdefgh=11000000**.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic'1G the **abcdefgh=00111111**.

**[t]ppp** - The 3- or 4-digit nonhierarchical SLC carrier digroup P NPC number.

Valid values are identical to those for [s]abc.

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number.  
Valid values are identical to those for [s]abc.

**edhfg** - Hierarchical TO NPC number  
Valid values are identical to those for uvmnp

**jjj, kkk**  
- TO channel numbers  
Valid values are identical to those for ddd.

**ppqqq** - TO termination NPC information

**pp** - TO termination NPC type  
Valid values are listed below:

| <b>pp</b> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|    |                                 |
|----|---------------------------------|
| PA | CEPT NPC (75- or 120-ohm)       |
| PB | CEPT NPC (120-ohm twisted pair) |
| PC | CEPT NPC (75-ohm coaxial)       |

|            |                                            |
|------------|--------------------------------------------|
| VI         | Virtual NPC                                |
| <b>qqq</b> | - See xyz above for definition and values. |

**tc** - Trunk conditioning

Represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification.

pq is a user specified insertion word. The binary pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line.

**Note:** Because there is no signal from the FROM direction, ijk is replaced by ---- in the specification TC(ijk,mnop) and ab is replaced by -- in the specification TC(X'ab,X'cd).

*tc*  
TC(ijkl,mnop)  
TC(efghijkl,mnopqrst)  
TC(X'ab,X'cd)  
TRSP (DMB to DMB)  
Omitted

**Note:** If *tc* is omitted, defaults to TC(X'FF,X'FF) if both terminations are channel associated signaling type. TC will default to TRSP if one of the terminations is non-signaling associated type.

The following insertion word options are allowed:

| <i>Insertion word</i> | <i>Explanation</i>                                                                                                                       |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| Omitted               | Will default to IW X'FF.                                                                                                                 |

**RDC** - Red circuit

**CUS** - Customer  
Customer-controlled circuit

**UTST** - Under test  
Given termination is under test

**TP** - Test Port

**kk** - Test port number (01-96)

**TG** - Test Group

**mmm** - Test group number (001-400)

**TLA** - Terminate and leave active

**T** - To  
TO termination is in the terminate and leave state

**DCC** - Disconnect code

**UEQD** - Unequipped

**NOT** - Not

**COND** - Condition

**RNGIE** - Range input error

**UASGN** - Unassigned

**cc** - Hexadecimal condition code

**cc Explanation**

|           |                                                          |
|-----------|----------------------------------------------------------|
| <b>E3</b> | One way unassigned channel/NPC in QRY, TO                |
| <b>62</b> | Invalid channel number                                   |
| <b>7F</b> | NPC is not added                                         |
| <b>91</b> | SR NPC was specified - not allowed                       |
| <b>97</b> | Invalid NPC Type                                         |
| <b>F7</b> | Corresponding NPC for virtual channel is not provisioned |

### **Explanation Of Parameters**

---

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, the first NPC of a range specification.

**NOTE:** The NPC range is not valid for DSPU NPCs. If a range is specified for DSPU NPCs the command will be denied.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, the last NPC of a range specification.

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

```
M hh:mm:ss xy,ww n[vv] UTL QRY LIST MACRO <macro name>\
[USER <user id>] COND cc DNY
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**LIST** - List

**MACRO** - Macro

**macro name**

- Macro name (seven characters maximum length)

The name of a collection of DACS II commands executed as a group.

A macro name is a string of capitalized alphanumeric characters. There are two type of macros; public and private. A private macros is created by a user in space allocated to the user by the system administrator. Only the user that created it can execute or read (LIST) a private macro. A public macro is created by the system administrator and is executable and readable by all users. A public macro name must start with the letter "P". A private macro name must not start with the letter "P".

**USER** - User

user id - User identifier (two to eight alphabetic characters)

User login identification

A user can query their own macros but only the frame administrator can use the command to query macros owned by other users. The frame administrator must specify the user id to query other users' macros.

**l,**  
**m,**  
**n,**  
**s** - Macro command line numbers

**NONE** - The macro contains no commands

**cc** - Hexadecimal condition code

**cc**    *Explanation*

**62**    File is being accessed  
**64**    File doesn't exist/can't be accessed  
**D0**    Command is Frame administrator (DAX) only.  
**D3**    User does not exist  
**D5**    No user is logged in on the link/vc

## **UTL, QRY, LIST, MAP, USER**

### **UTILITY QUERY LIST MAP**

#### **Explanation Of Command**

This message lists the user's own login on which link and at what time.

Any user can query his/her own login identification but only the frame administrator can query a login owned by another user.

#### **Command**

[I.54101]

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

**MAP** - Alternate MAP

**name** - Name of the specified alternate MAP. A MAP name may have up to seven alphanumeric characters. The first character of a MAP name must be an alphabetic character. All alphabetic characters of a MAP name must be capitalized.

**USER** - User

**user id**  
- User login identification is two to eight alphabetic characters.

**STATS** - Status

**ab** - Status field

| <i>ab</i> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|    |                                 |
|----|---------------------------------|
| 00 | Map is valid (can be activated) |
|----|---------------------------------|

|    |                                                                               |
|----|-------------------------------------------------------------------------------|
| 01 | Map is not valid (contains conflicting circuits and thus cannot be activated) |
|----|-------------------------------------------------------------------------------|

|    |                                                                           |
|----|---------------------------------------------------------------------------|
| D0 | USER <id> is not your login name and your are not the frame administrator |
|----|---------------------------------------------------------------------------|

|    |                          |
|----|--------------------------|
| D3 | USER <id> does not exist |
|----|--------------------------|

|    |                                                  |
|----|--------------------------------------------------|
| D5 | The command cannot be entered without logging in |
|----|--------------------------------------------------|

**e** - Number of lines in the output segment

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 62** File is being accessed
- 64** File doesn't exist/can't be accessed
- D0** Command is Frame administrator (DAX) only.
- D3** User does not exist
- D5** No user is logged in on the link/vc

## **UTL,QRY,LOG,ALL**

### **QUERY LOG**

#### **Explanation Of Command**

This command is used to query DACS II for the link, user identifier, and date and time of login of the user issuing the command. The frame administrator uses the **ALL** keyword to list information on all current users.

Output from this command is sent only to the link on which the command was input.

#### **Command**

[I.54011]

**UTL:FRM xy,SEQ ww:QRY,LOG[,ALL]!**

## **Explanation Of Parameters**

---

**LOG** - Login

**ALL** - All

All user logins. Used only by the frame administrator.

**USER** - User

**user id**

- User identifier (two to eight alphabetic characters)

User login identification

**LINK** - Link

**j [mm]** - The link number the user is logged onto

**j** - Administrative link number (5 or 6)

**mm** - Virtual link number (1 through 16)

**DATE** - Date

mm/dd/yy, dd/mm/yy

- Date, current

**mm** Month number (01 through 12)

**dd** Day number (01 through 31)

**yy** Year number (00 through 99)

**FORMAT** - Date format

**MDY** - Month/Day/Year format

**DMY** - Day/Month/Year format

**TOD** - Time of day

**hh:mm:ss**

- Time of day in hours, minutes, and seconds

**hh** Hours number (00 through 23)

**mm** Minutes number (00 through 59)

**ss** Seconds number (00 through 59)

**NONE** - No user is logged in to DACS II

**cc** - Hexadecimal condition code

**cc** *Explanation*

**D0** Command is Frame administrator (DAX) only.

**D3** User does not exist

**D7** Cannot execute privileged command

**DF** Command and protocol are inconsistent

## **UTL,QRY,LPBK,NPC**

### **UTILITY QUERY LOOPBACK**

#### **Explanation Of Command**

This command requests a report indicating which Network Processing Circuits are in the loopback state. The message applies to PA, PB, and PC type NPCs. If other NPC types are encountered in a range of NPCs, these other NPC types will be skipped.

#### **Command**

## Explanation Of Parameters

---

**LPBK** - Loopback

**NPC** - Network processing circuit

If an NPC range is specified in the input command, the following floating window rules apply:

1. Unequipped NPCs within the requested range will be skipped.
2. If the first NPC in the range is a DA or TA type NPC, only those NPC types will be reported on.
3. If the first NPC in the range is a TE or TH type NPC on a Hybrid DS3U, then only those type of NPCs will be reported on.
4. If the first NPC in the range is a PA, PB, or PC type NPC, then only those NPC types will be reported on.

**TOT** - Total

**nnn** - Total Number of NPCs in the module that are in the loopback state

**COND** - Condition

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, start of NPC range  
**[t]def** - The 3- or 4-digit nonhierarchical NPC number, end of NPC range

**[u]ghi** - Lowest numbered NPC in the FTM that contains NPC [s]abc  
**[v]mno** - Lowest numbered NPC in the FTM that contains NPC [t]def

**[u]jkl** - Highest numbered NPC in the FTM that contains NPC [s]abc  
**[v]pqr** - Highest numbered NPC in the FTM that contains NPC [t]def

FTM is an acronym for Facility Terminating Module. For FTMs in FTUs or IFTUs, each row contains 10 values of output. For FTMs within DS3Us each row contains 7 values. For FTMs within HDS3Us each row contains 4 values.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

| 1921-1952  | 2081-2112  | 2241-2272  | 2401-2432  |
| 1961-1992  | 2121-2152  | 2281-2312  | 2441-2472  |
| 2001-2032  | 2161-2192  | 2321-2352  | 2481-2512  |
| 2041-2072  | 2201-2232  | 2361-2392  | 2521-2552  |

**uvmnp** - Hierarchical NPC number for beginning of NPC range

**wxkqr** - Hierarchical NPC number for end of NPC range

**uvmaa** - Lowest numbered NPC in the FTM that contains NPC uvmnp

FTM is an acronym for Facility Terminating Module.

The parameter value for NPC aa is in the first position, first line of the message.

**uvmbb** - Highest numbered NPC in the FTM that contains NPC uvmnp

The parameter value for NPC bb is just before EOM or COMPL.

**wxkaa** - Lowest numbered NPC in the FTM that contains NPC wxkqr

The parameter value for NPC aa is in the first position, first line of the message.

**wxkbb** - Highest numbered NPC in the FTM that contains NPC wxkqr

The parameter value for NPC bb is just before EOM or COMPL.

For FTMs in FTUs or IFTUs, each row contains 10 values of output. For FTMs within DS3Us each row contains 7 values. For FTMs within HDS3Us each row contains 4 values.

**uv, wx** - Unit number

**m, k** - Module number

**np, qr, aa, bb**

- NPC number within the module

The valid values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

The range of NPCs in the denial messages will be given either as module or unit boundaries depending upon the reason for the denial.

**d** - Loopback direction specifier

The optional "d" will only be output for PA NPCs. For PDS output, a "blank" space in the "d" position will be used for PB/PC NPCs to line-up the output if at least one PA type NPC is within the specified range. Otherwise, no "blank" space at the "d" position will be used for PB/PC NPCs. No "blank" space is used in the MML output format.

*d Explanation*

|   |                                                                                                                                                 |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------|
| F | Facility loopback, the F type loops the incoming 2 Mbit/s bipolar signal back to the facility.                                                  |
| E | Equipment loopback, the E type loops the outgoing 2 Mbit/s signal back to DACS II equipment. This type is not applicable to PB or PC type NPCs. |
| N | Not in a loopback state                                                                                                                         |
| - | NPC not equipped                                                                                                                                |
| 0 | NPC not specified in the input command, valid for range commands only                                                                           |

**t** - Signal transmission and PM processing specifier for loopback

Values of "t" are presented in NPC order, grouped within messages by Facility Terminating Module

*t Explanation*

|   |                                                                                            |
|---|--------------------------------------------------------------------------------------------|
| A | Loopback with AIS downstream/upstream and facility Performance Monitoring (PM) turned off. |
| B | Loopback with AIS downstream/upstream and PM turned on.                                    |
| C | Loopback with pass-through and PM turned off.                                              |
| T | Loopback with pass-through and PM turned on.                                               |
| N | Not in a loopback state                                                                    |
| - | NPC not equipped                                                                           |
| 0 | NPC not specified in the input command, valid for range commands only                      |

**cc** - Hexadecimal condition code

**cc** *Explanation*

|           |                      |

## **UTL,QRY,MACRO,ATTR,USER,ALL**

### **QUERY MACRO ATTRIBUTES**

#### **Explanation Of Command**

This message queries the macro attributes associated with all personally-owned macros and any public macros. The frame administrator can query ALL the macro attributes of any macro, public or private.

For each macro, DACS II lists:

- The macro name
- The user who owns the macro
- The number of parameters in the macro
- The language used
- The amount of space used by the macro.

### **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

**ATTR** - Attributes

**user id**

- Query the specified user's private and public macro attributes

User login identification is two to eight alphabetic characters.

**ALL** - Query all private and public macros' attributes (used by the frame administrator only)

**MACRO** - The keyword used to indicate that the "name" shown is a macro name. A Macro is a collection of DACS II commands that can be executed as a group.

**name** - The macro name which is a string of uppercase alphanumeric characters from one to seven characters long. The first character must be an alphabetic character.

A macro name start with the character "P" is a public macro. Only the frame administrator is allowed to create a public macro.

**LANG** - Language

**M** - Man-Machine Language

**P** - Program Documentation Standard

**PRMTR** - Macro parameters

**tt** - Total number of macro parameters used (01 - 10)

**SPACE** - Macro space

**nnn** - Macro space used by the macro in percentage of the user macro space allocation (000 - 100)

**NPCAD** - NPC addressing scheme

**E** - 3-digit extended (nonhierarchical) NPC addressing scheme

**X** - 4-digit extended (nonhierarchical) NPC addressing scheme

**H** - Hierarchical NPC addressing scheme, i.e., address the NPC by using the unit number, module number, and NPC number within the module.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**D0** Command is Frame administrator (DAX) only.

**D3** User does not exist

**D5** No user is logged in on the link/vc

## **UTL,QRY,MACRO,MAP,SPACE,USER,ALL**

### **UTILITY QUERY MACRO/MAP SPACE**

#### **Explanation Of Command**

This message requests the amount of space that the user's alternate map or macro requires and how much space is still available.

The frame administrator can query for all user's macro or alternate map space requirements and for the system space requirements and allocation.

In summary, a user can query his/her own alternate map or macro space, but only the frame administrator can use the ALL and SYSTEM options of the command to query space owned by another user.

#### **Command**

```

### Autonomous Message

---

Not applicable.

### **Explanation Of Parameters**

---

**MAP** - Map

**MACRO** - Macro

**USER** - User

**user id**

- query the specified user's macro/map space status.

User login identification is two to eight alphabetic characters.

**ALL** - query all users' macro/map space status.

**SYSTEM** - query the system macro/map space status.

**nnn** - percentage of macro/map space allocated (000 to 100%). If user ID or ALL option is used, nnn is the user macro/map space allocation percentage. If SYSTEM option is used, nnn is the percentage of system macro/map space allocated, and it is always 100 (i.e., 100%).

**AVAIL** - Percentage of space available.

**xxx** - percentage of user or system macro/map space still available (000 to 100%)

**cc** - Hexadecimal condition code

**cc** *Explanation*

**D0** Command is Frame administrator (DAX) only.

**D3** User does not exist

**D5** No user is logged in on the link/vc

## **UTL, QRY, MACRO, USER**

### **UTILITY QUERY MACRO**

#### **Explanation Of Command**

This command is used to query the attributes of a macro including the language, the number of macro parameters, the amount of user macro space used by the macro, the NPC addressing scheme used by the macro, and the total number of macro command lines in the macro.

A user can query his or her own macros but only the frame administrator can query macros owned by another user.

## **Explanation Of Parameters**

---

### **MACRO** - Macro

**name** - The macro name (seven characters maximum length)

The name of a collection of DACS II commands executed as a group.

A macro name is a string of capitalized alphanumeric characters. There are two type of macros; public and private. A private macros is created by a user in space allocated to the user by the system administrator. Only the user that created it can execute or read (LIST) a private macro. A public macro is created by the system administrator and is executable and readable by all users. A public macro name must start with the letter "P". A private macro name must not start with the letter "P".

### **USER** - User

#### **user id**

- User identifier (two to eight alphabetic characters)

User login identification

A user can query their own macros but only the frame administrator can use the command to query macros owned by other users. The frame administrator must specify the user id to query other users' macros.

### **LANG** - Language

**M** - Man-Machine language

**P** - Program documentation standards

### **PRMTR** - Parameter

**jk** - Total number of macro parameters used (01 through 10)

### **SPACE** - Space

**sss** - User macro or map space allocation (000 through 100 percent)

Variable sss represents the space allocated to user macros or maps for the entire DACS II system as a percentage of the system macro space.

### **TOTAL** - Total

#### **line total**

- Total number of macro command lines in the macro

### **NPCAD** - NPC addressing scheme

- E** - 3-digit extended (non-hierarchical) NPC addressing scheme
- X** - 4-digit extended (non-hierarchical) NPC addressing scheme
- H** - Hierarchical NPC addressing scheme, that is, address the NPC by using the unit number, module number, and NPC number within the module.
- cc** - Hexadecimal condition code

**cc**    *Explanation*

- 64**    File doesn't exist/can't be accessed
- D0**    Command is Frame administrator (DAX) only.
- D3**    User does not exist
- D5**    No user is logged in on the link/vc

## **UTL, QRY, MAP, ATTR, ALL, USER, MAPNM**

### **UTILITY QUERY MAP**

#### **Explanation Of Command**

This message requests the following information on the user's alternate map:

- User identifier
- Status of the map
- Amount of space used by the map.

Only the administrator can request information on other users or request ALL alternate maps on the DACS II frame.

#### **Command**

[I.54201]

UTL:FRM xy,SEQ ww:QRY,MAP,ATTR[, {ALL|USER <user id>|MAPNM <name>}]!

**Note:** Only the DACS II frame administrator can use the ALL option.

## Explanation Of Parameters

---

**MAP** - Map

**ATTR** - Attributes

**ALL** - All

**USER** - User

**user id**

- User identifier

User login identification is two to eight alphabetic characters.

The USER option is available to a regular DACS II user to query his or her own maps. Only the administrator can use the option to request information on other users or ALL alternate maps on the DACS II frame.

**MAPNM** - Alternate map name

**name** - The alternate map name which is a string of uppercase alphanumeric characters from one to seven characters long. The first character must be an alphabetic character.

A user can query his or her own maps but only the frame administrator can use the command to query maps owned by other users. To do so, the optional USER field must be entered.

**STATS** - Status of the alternate map

**bb** - Map Status

bb Explanation

00 Map is valid (can be activated)

01 Map is not valid (it contains conflicting circuits and therefore cannot be activated)

**SPACE** - Alternate map space

**nnn** - Alternate Map space used by the alternate map in percentage of the user alternate map space allocation (000 - 100)

**cc** - Hexadecimal condition code

**cc** *Explanation*

**64** File doesn't exist/can't be accessed

**D0** Command is Frame administrator (DAX) only.

**D3** User does not exist

**D5** No user is logged in on the link/vc

## **UTL, QRY, MARK**

### **UTILITY QUERY MARKINGS**

#### **Explanation Of Command**

This command is used to query a single or a range of network processing circuits (NPCs) in a facility terminating unit, a digital signal processing unit, a DS3 or a HDS3 unit. DSP Application circuit packs provisioned in a facility terminating unit are supported. This command can be aborted before the entire printout has completed.

When specifying a single NPC, the channel and conference or non-channelized circuit with markings (red circuit and/or customer controlled) are listed. The output for a channel or conference with markings is skipped. When the circuit does not contain markings, the output message indicates this with the NONE keyword. A denial message is printed when the NPC is unequipped.

When specifying a range of NPCs, the channel and conference or non-channelized circuit with markings (red circuit and/or customer controlled) are listed for each equipped NPC. The output for an unequipped or unmarked channel and conference or non-channelized NPC is skipped.

For a non-channelized circuit with markings, a one-line output message segment is printed for each NPC marked, but the channel or conference information is not printed.

For a disconnected channel which was previously used in both two-way and/or one-way cross-connections, the CUS marking is retained for the two-way cross-connection and output by default.

Outputs are skipped under the following conditions:

- NPC is unequipped
- Channel or conference point has no **RDC** or **CUS** marking.

## Explanation Of Parameters

**MARK** - Mark

One of the following:

**RDC** - Red circuit

**CUS** - Customer-controlled circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number denoting beginning of range specification

**[t]def** - The 3- or 4-digit nonhierarchical NPC number denoting end of range specification

The valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |

| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**[t]jkl** - The 3- or 4-digit NPC number in range [s]abc-[t]def, of a non-channelized NPC.

**edhfg** - Hierarchical non-channelized NPC number in range uvmnp-wxkqr

**TYPE** - Type

**mnxyz** - NPC type

*mnxyz Explanation*

CB10z C-bit Processor  
PAxyz Enhanced 2Mbit/s primary interface  
PBxyz CEPT primary interface (twisted pair termination)  
PCxyz CEPT primary interface (coaxial termination)  
SDxyz DSP Application  
Vlxyz Virtual circuit

**xx** - Total number of marked channels in the message segment (01 through 16)

**FDL** - Facility data link

**t** - Cross-connection type

*t Explanation*

B For broadcast cross-connection  
D For disconnection  
\* For one-way cross-connection

'' Blank for two-way cross-connection,

T A Facility Access Digroup (FAD) or a Test Port (TP) channel

**nnn** - Channel or conference number

**ccc** - CUS if customer controlled or --- if not customer controlled

**rrr** - RDC if red circuit or --- if not red circuit

**UEQD** - Unequipped

----- - Unknown NPC type

## **UTL,QRY,MARK**

---

### **QUERY CHANNEL MARKS**

#### **Explanation Of Command**

---

This command is used to query a network processing circuit for the channel and conference points that are **MARK**ed as red or customer controlled circuits.

The command can be entered to request a listing for a group of channels or conference points or for a single channel or conference point. This command can be aborted before the entire printout has completed.

For a disconnected channel which was previously used in both two-way and one-way cross-connections, the CUS marking retained for the two-way cross-connection is output by default.

Outputs are skipped under the following conditions:

- Unequipped NPC
- Channel/conference point has no red circuit or customer controlled marking.

### Autonomous Message

Not applicable.

### Explanation Of Parameters

**MARK** - Mark

Red circuit and customer controlled MARKings

**NONE** - None

This keyword indicates that no channel or conference point is marked as a red and/or customer controlled circuit.

**[s]abcjjj**

- Termination number

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

**jjj** - Channel or conference point number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,

If NPC numbers are expressed in four digits, the valid values are:

SD type NPC numbers listed by unit number, within a **North American module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module  
**jjj** - Channel or conference point number

The valid values follow:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC                                   |
|-----------|----------|---------------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02 (DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06 (DACS II CEF frames)</b>     |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**kkk** - Channel or conference point number

Conference numbers

001-085 (MB NPC)

001-500 (Virtual NPC)

**tnnnccrrr**

- Channel or conference information

**t** - Cross-connection type

**t** *Explanation*

|   |                                                                    |
|---|--------------------------------------------------------------------|
| * | One-way cross-connection                                           |
| B | Broadcast cross-connection,<br>Blank for two-way cross-connection, |
| D | Disconnection                                                      |

**nnn** - Channel or conference point number (jjj through kkk)

**ccc** - Customer controlled marking

**ccc** *Explanation*

|     |                         |
|-----|-------------------------|
| CUS | Customer controlled     |
| --- | Not customer controlled |

**rrr** - Red circuit marking

**rrr** *Explanation*

|     |                 |
|-----|-----------------|
| RDC | Red circuit     |
| --- | Not red circuit |

**xx** - Total number of data fields in the segment (01 through 16)

**UEQD** - Unequipped

**TYPE** - Type

**mnxyz** - NPC type

**mnxyz** *Explanation*

----- Unknown NPC type  
MBxyz Multipoint bridge  
PAxyz CEPT NPC (75-ohm or 120-ohm)  
PBxyz CEPT NPC (120-ohm twisted pair)  
PCxyz CEPT NPC (75-ohm coaxial)  
SDxyz DSP Application  
THxyz HDS3U CEPT NPC type

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

**01** Invalid range for specified NPC type  
**62** Invalid channel number  
**7F** NPC is not added  
**91** SR NPC was specified - not allowed  
**B5** CPR circuit pack specified in the command  
**F7** Corresponding NPC for virtual channel is not provisioned  
**70** NPC invalid type

## **UTL, QRY, MEMSTAT**

### **RETRIEVE MEMORY STATUS**

#### **Explanation Of Command**

This command identifies the current contents of the system memory devices. A separate line of information is provided for the Main Controller random access memory (RAM), Primary Memory Card (PMEM) and Secondary Memory Card (SMEM). The message response provides the following information for each particular memory device that can be accessed:

1. Software Release of the Executable Program
2. Software Release of the Database
3. Date and Time Stamps of the Database
4. Frame ID and Unique ID
5. Feature Package ID
6. Serial number of the database
7. Serial number of the SunDisk card (PMEM and SMEM only)
8. Service state of the card (PMEM and SMEM) and the service state of the RAM as it corresponds to the state of the MC. If the MC is in-service RAM is in-service, if the MC is in maintenance condition RAM is out-of-service.

In addition information about applications that reside on the memory cards is given as follows:

1. The type of the application in the form SDx, where "x" indicates the type.
2. The generic, issue, and release numbers that identify the version of the application
3. The date when this version of the application was generated.

The output format depends on what the MEMSTAT command finds on each memory card and whether a memory card is in its respective slot as follows:

1. Applications are listed separately in the output of the command. An application section is only created in the output command if applications actually reside on the memory cards.
2. The output for an application does not contain any information about an executable or a database, because it does not apply. The version information identifies the application.
3. If no memory card is in a particular slot, then the output for that slot will generate dashes for the data.
4. If the SMEM slot contains an application card (the PMEM slot should never have an application card), then SMEM is not mentioned in the main section of the output, but is mentioned only in the application section of the output message. In addition, the type field in the output for an application card has an asterisk at its end to identify the card as an application card.

This message may be executed either while the Main Controller is In-Service or in Maintenance Condition.

### **Command**

---

[I.51001]

**UTL : [FRM xy, SEQ ww] : QRY, MEMSTAT !**

## Completion Message

Normal case with no platform application card in SMEM and no applications residing on PMEM or SMEM, only main section (plus feature package section) is generated, no application section is generated.

[O.51001]

```

```

**Note:** The asterisk (\*) following the application type "SDx" in the application section of the message indicates that SMEM is an application card and not a regular 40 Mbyte memory card. Application cards are used for distributing applications to the customer.

### **Denial Message**

---

Not applicable.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

#### **MEMSTAT**

- Memory Status

**e** - number of lines in message

**DEV** - Device

**EXCT** - Executables

#### **gg.pp.r**

- Software release identifier.

This field identifies the software release of the executable program that is stored in the memory device. The software release ID is a three part number composed of a release number, a point number, and a version number. This field will appear as a set of dashes if no executable program can be found on the memory device. The software release number "gg.pp.r" is composed of:

**gg** - Software release number

**pp** - Point release number

**r** - Version number

**DBASE** - Database

**dd.rr.v**

- Database release identifier.

This field identifies the release of executable program that the database stored in the memory device is formatted for. A database is formatted for a particular executable program release; however, it is compatible with not only the shown release but all other executable program releases that have a greater release ID. The release ID is a three part number composed of a release number, a point number and a version number. This field will appear as a set of dashes if no database can be found on the memory device. The database release number "dd.rr.v" is composed of:

**dd** - Release number  
**rr** - Point release number  
**v** - Version number

**DATE** - Date

**aa/bb/yr**

- Date of last update to the database.

This field identifies the date that the database was created or last updated. In the RAM data line, this field shows the current system date. For the PMEM and SMEM data lines, this field shows the date that the most recent database backup to the Flash Card occurred.

The date field will appear as a set of dashes if no database can be found on the memory device. The date may be generated in either the month-day or the day-month format, depending on how the user has provisioned it using command I.51021, UTL::DATE.

**aa** Month or Day, depending on selected date format.  
**bb** Day or Month, depending on selected date format.  
**yr** Year

**TIME** - Time

**hr:mn:sc**

- Time of last update to the database.

This field identifies the time that the database was created or last updated. In the RAM memory data line, this field shows the current system time. In the PMEM and SMEM data lines, this field shows the time of day that the most recent database backup to the Flash Card occurred. This field will appear as a set of dashes if no database can be found on the memory device.

**hr** - Hour (00 through 23)  
**mn** - Minute (00 through 59)  
**sc** - Second (00 through 59)

**FID** - Frame ID

**fg** - Frame identifier of the memory device.

This field displays the two alphanumeric character frame identifier "fg" of the memory device. In the RAM memory line, the frame ID shown is that of the DACS II system. For the flash cards, PMEM and/or SMEM, the frame ID identifies the system that the memory card belongs to. This field will be shown as dashes if no frame ID can be found on the memory device.

**UID** - Unique ID

**<uid>** - Unique identifier of the memory device.

This field displays the unique identifier **<uid>**, up to 20 alpha-numeric characters, of the memory device. In the RAM memory line, the unique ID shown is that of the DACS II system. For the flash cards, PMEM and/or SMEM, the unique ID identifies the system that the flash card belongs to. This field will be shown as dashes if no unique ID can be found on the memory device.

#### APPLICATION TYPE

- Application Type

This field identifies the type of application "SDx" that resides on the application card, where "x" is a hexadecimal number that designates the application as shown in the list;

**SD1** X.50/X.57 Subrate application  
**SD3** Digital Multipoint Bridge application  
**SD4** DDS Subrate and Multipoint Junction application  
**SDx** Future application with a specific "x" value

#### VERSION

- Version

This field identifies the version number of an application. The version number is subdivided into four fields as follows:

**gen** Generic number of the application  
**iss** Issue number of the application  
**rel** Release number of the application

**FPKG** - Feature Package ID

**nnnnnnnn**

- Feature package identifier.

This field displays the eight character hexadecimal identifier of the feature package. In the RAM memory line, the feature package ID shown is that of the DACS II system. For the flash cards, PMEM and/or SMEM, the feature package ID identifies the system that the flash card belongs to. This field will be shown as dashes if no feature package ID can be found on the memory device.

For those customers that operate a non-CEF DACS II frame, such as an SBF or ESBF, the feature package identifier may show an anomaly that is harmless. PCMCIA cards are formatted with the CEF feature bit ("00000080" in hexadecimal) on. However, these PCMCIA cards may be used in a non-CEF frame. The program will automatically turn the CEF bit off in the Main Controller's random access memory (RAM), when it finds that it is not running on a CEF. For this reason, there may be a discrepancy between what the feature package ID is in random access memory and what the feature package ID is on the PCMCIA cards. For example, if the feature package ID is "00003822" in RAM, it may be "0038A2" on the PCMCIA cards.

**DBSN** - Database Serial Number

**0000000000**

- Database serial number.

This field displays the ten character numeric identifier of the serial number of the database. In the RAM memory line, the database serial number shown is that of the DACS II system. For the flash cards, PMEM and/or SMEM, the database serial number identifies the system that the flash card belongs to. This field will be shown as dashes if no serial number can be found on the memory device.

This field will be padded with blanks if necessary.

**FCSN** - Flash Card

**qqqqqqqqqqqqqqqqqqqqqq**

- Flash card serial number.

This field displays the 20 character alpha-numeric serial number of the flash card. In the RAM memory line, the flash card serial number shown is that of the DACS II system. For the flash cards, PMEM and/or SMEM, the serial number identifies the system that the flash card belongs to. This field will be shown as dashes if no serial number can be found on the memory device.

This field will be padded with blanks if necessary.

**STATE** - Service State

**<state>** - Identifies the state of the memory device.

This field displays the service state of the memory device. The valid states are:

**state** *Explanation*

**IS** In State

**00S** Out Of State

## **UTL,QRY,NFS,NPC**

### **QUERY NPC NON FRAME-WORD SETTING**

#### **Explanation Of Command**

This command displays the non Frame-Word Setting (NFS) of the spare international and national bits, that are being cross-connected from a timeslot 0 (TS0) to a non-TS0 timeslot. These bits are bit 1 of the Frame Word (FW) and bits 1-8 of the non Frame Word (NFW). The request can be made for the TS0 on one or a range of Network Processing Circuits (NPCs).

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, start of range

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, end of range

**[u]ghi** - The 3- or 4-digit nonhierarchical NPC number ([s]abc through [t]def)

**[v]jkl** - The 3- or 4-digit nonhierarchical NPC number ([s]abc through [t]def)

Values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**uvmnp** - Hierarchical NPC number, start of range

**wxkqr** - Hierarchical NPC number, end of range

**edhfg** - Hierarchical NPC number (uvmnp through wxkqr)

**opjst** - Hierarchical NPC number (uvmnp through wxkqr)

**uv,wx,ed,op**

- Unit number

**m,k,h,j**

- Module number

**np,qr,fg,st**

- NPC number

Values are listed below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**NFS** - Non-Frame-Word Setting

**abcdefghi**

- Variables representing the TS0 bits to which NFS is applied

For Clear-2Mbit/s NPCs, dashes ("-----") will be shown in place of NFS bits.

- a: Bit 1 of Frame Word (FW) - International spare bit
- b: Bit 1 of Non Frame Word (NFW) - International spare bit
- c: Bit 2 of NFW
- d: Bit 3 of NFW - Remote Alarm Indicator
- e-f: Bits 4-5 of Non Frame Word, National spare bits
- g: Bit 6 of Non Frame Word, RPSFI bit if provisioned for RPSFI  
otherwise National spare bit
- h-i: Bits 7-8 of Non Frame Word, National spare bits.

| Variable<br>Value | Action on corresponding TS0 bit:            |
|-------------------|---------------------------------------------|
| "0" or "1"        | Set TS0 bit to this value                   |
| "V"               | Received bit is inverted and passed through |
| "P"               | Received bit is passed through unchanged    |
| "-"               | Not applicable                              |

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 04** Subject entity is out of service
- 10** Unit is not equipped
- 11** UC is out of service
- 13** FTMI is not equipped
- 14** FTMI is out of service
- 15** NPC is unequipped
- 25** FTMI type error
- 26** NPC type error
- 0B** Invalid CEPT NPC
- 46** NPC Failed or Out of Service
- 3A** Invalid FPI value

---

## UTL,QRY,NPC

---

### QUERY NETWORK PROCESSING CIRCUIT PARAMETER

#### **Explanation Of Command**

---

This message requests a printout of the values for a specified facility performance parameter for a single network processing circuit (NPC), a range of circuits, or a SLC® carrier remote terminal or Digital Carrier Line Unit.

These values may be cleared at any time by using the UTL,CLR,ALL command. This message requests a printout of the values for a specified facility performance parameter for a single network processing circuit (NPC) or a range of circuits.

These values may be cleared at any time by using the INIT,REG,ALL command. This message also reports on the CEPT BER status of NPCs. The responses generated by this command are determined by the number of NPCs addressed in the command.

- If a single NPC is addressed in the input command then one message, either a completion or denial, will be generated for the addressed NPC. DACS II will always deny invalid commands to specifically addressed NPCs.
- If a range of NPCs is addressed in the input command, no denial response will be generated.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

- [s]abc** - The 3- or 4-digit nonhierarchical NPC number, the first number of a range  
**[t]def** - The 3- or 4-digit nonhierarchical NPC number, the last number of a range

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uvmnp** - Hierarchical NPC number the first NPC number of a range  
**wxkqr** - Hierarchical NPC number denoting end of an NPC range

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**parameter**

- Facility performance parameter

For CEPT frames, the parameter variable listed below are only applicable to PB or PC type NPCs. If there are PA NPCs in the FTM, dashes ("-") will be output in the position of these NPCs:

| <i>parameter</i> | <i>Explanation</i>                               |
|------------------|--------------------------------------------------|
| DM               | Degraded Minutes,                                |
| SERS             | Severely Errored Seconds,                        |
| ERS              | Errored Seconds,                                 |
| US               | Unavailable Seconds,                             |
| SLIP             | Slip Events                                      |
| CRC              | CRC-4 Check Block Error Events                   |
| FRER             | Framing Error Events                             |
| LOFA             | Loss of Frame Alignment Events                   |
| MER              | Multiframe Alignment Error Events (Time slot 16) |

**Note:** If the parameter reports threshold alarms (DM, SERS, ERS, US, or SLIP), the count represents the total for the last 24 hours (a rolling 24-hour count).

The other parameter counts represent the total since local midnight.

For CEPT frames, the parameter variable below is applicable to all CEPT NPC types, i.e., PA, PB, and PC:

| <i>parameter</i> | <i>Explanation</i>                                                  |
|------------------|---------------------------------------------------------------------|
| BER              | Excessive Error Rate<br>(Also MBER/RBER for NPCs with MBER feature) |

**Note:** For BER and RBER, the message reports NPCs that are currently in the BER state.

A message segment will be omitted for:

- Unequipped FTMs
- Equipped FTMs having no NPCs
- Equipped FTMs with NPCs having zero parameter values.
- DS3/HDS3 modules in case of BPV request
- Equipped CEPT FTM with all NPCs being PA type but with a parameter other than BER.

xxxxxx - Parameter count values

Note that dashes ("-") will be output for NPCs that are not equipped or are provisioned with a type inapplicable to the parameter. If an entire FTM is unequipped or all its NPCs are dashes, the segment is skipped.

xx - BER states

For xx representing CEPT BER/RBER states, the state represents a combination of the Excessive Bit Error Rate (EER), Bit Error Rate (BER), and Remote Bit Error Rate (RBER). It is interpreted as either a Prompt Maintenance Alarm (PMA), Deferred Maintenance Alarm (DMA), or Clear.

| xx | <i>EER/BER state RBER state</i>  |                |
|----|----------------------------------|----------------|
| MJ | EER/PMA                          | Not applicable |
| MN | DMA                              | Inactive       |
| RN | DMA                              | Active         |
| CL | Clear*                           | Inactive       |
| RL | Clear*                           | Active         |
| -- | NPC unequipped or out of service |                |

\* Clear refers to the Facility type NPC whose received error rate is less than the Minor BER threshold.

without CRC ( $10^{-5}$ )

with CRC ( $10^{-6}$ )

Note that EER has priority over the BER/RBER states. EER does not coexist with them; however, BER and RBER coexist with each other.

Unless the active value of bit 4 of channel time slot 0 has been redefined by use of the CHG::NPC,TS0 (1.38321) command,  
the RBER values are:

*RB ER Explanation*

1 Inactive  
0 Active

**[s]jjj** - The Lowest 3- or 4-digit nonhierarchical NPC number in the FTM/MXR/HMXR that contains NPC [s]abc

**[t]kkk** - The Highest 3- or 4-digit nonhierarchical NPC number in the FTM/MXR/HMXR that contains NPC [s]abc

**[s]ooo** - The Lowest 3- or 4-digit nonhierarchical NPC number in the FTM/MXR/HMXR that contains NPC [t]def

**[t]ppp** - The Highest 3- or 4-digit nonhierarchical NPC number in the FTM/MXR/HMXR that contains NPC [t]def

**uvmkl** - Lowest hierarchical NPC number in the FTM/MXR/HMXR that contains NPC uvmnp

**uvmppq** - Highest hierarchical NPC number in the FTM/MXR/HMXR that contains NPC uvmnp

**wxkfg** - Lowest hierarchical NPC number in the FTM/MXR/HMXR that contains NPC wxkqr

**wxkst** - Highest hierarchical NPC number in the FTM/MXR/HMXR that contains NPC wxkqr

**RESET** - Reset. Indicates that one of more autonomous resets have occurred

The parameter value for the first NPC is in the first position (upper left corner); first line of the message. The parameter value for the last NPC is located in the lower right corner.

**nnnn** - Cumulative count of NPCs returning nonzero states or values. The last nnnn, the one printed out in the message concluding with COMPL gives the total number of NPCs with nonzero states or values over the specified range.

**cc** - Hexadecimal condition code

**cc** *Explanation*

### **QUERY PERFORMANCE MONITORING DATA FOR DA, TA, TH AND PA TYPE NPCS**

#### **Explanation Of Command**

This message retrieves current and/or historical DS1 performance monitoring data from DA, TA, TH and PA type NPCS. The message response is output in two distinct formats depending on whether the input command is applied to ALL NPCS on the frame or a set of specifically addressed NPCS.

When the command is applied to ALL NPCS, DACS II responds with the current parameter counts of a single specified performance parameter for ALL NPCS. No output level thresholding is performed and all counts, whether they are zero or greater, are output. The output is formatted on a module-by-module basis for Facility Terminating Units, DS3 and Hybrid DS3 Units. If a particular NPC within a module is not a DA, TA TH or PA type NPC, its accumulator count will be printed as a string of dashes. Also for TH type NPCS in a hybrid DS3 unit the fourth NPC which does not exist will be printed as dashes.

When a single NPC or range of NPCS is specifically addressed in the input command, all of the optionally entered user parameters are programmable. DACS II outputs the requested data in a different format, which accommodates the various user options.

This command will handle NPC addressing as follows: If only a single NPC is addressed in the input command, then either a completion or denial response will be generated for the addressed NPC. DACS II will always deny invalid commands to specifically addressed NPCS.

If a range of NPCS is addressed and the feature applies to one or more NPCS within the range, DACS II will perform the command on the NPCS in the range that support the requested feature, but skip the NPCS which do not support the requested feature. DACS II does not output denial responses for a range of NPCS.

Restrictions are placed on the use of the "ALL" options for various keywords to constrain the amount of data that will be output for a single command. In particular,

1. If all parameters are requested, the input command is restricted to specifying a single NPC and a single monitored date and/or historical accumulation interval (monitored time).
2. If all daily accumulation registers are requested, the input command is restricted to specifying a single NPC and a single parameter.
3. If all 15-minute accumulation registers are requested, the input command is restricted to specifying a single NPC and a single parameter.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**NPC** - Network processing circuit  
**NPCS** - Network processing circuits

If an NPC range is specified in the input command, the following rules apply:

- Unequipped NPCs within the requested range will be skipped.
- A range across a unit boundary between a FTU and a DS3U(or HDS3U) will be denied.
- A range across a FTU (or IFTU) boundary is allowed, but if the range starts with a DA type NPC then the PA type NPCs will be skipped. Similiarly, a range that starts with a PA type NPC will skip DA type NPCs.

[s]abc - The 3- or 4-digit nonhierarchical NPC number  
[v]ghi - The 3- or 4-digit nonhierarchical NPC number  
[u]jkl - The 3- or 4-digit nonhierarchical NPC number  
[t]def - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**e** - Number of lines in the message

**ALL** - All

**PARAM** - Parameter

**parameter**

- Parameter name

**pppp** - Parameter value

For PA type NPCs:

The parameter whose value is requested and/or reported. The parameters ALLPM, ALLE and ALLF are input parameters only. If ALLPM, ALLE, or ALLF is specified on input then the following restrictions apply to the input command:

- 1) The command must specify only a single NPC; ranges, including the ALL option, are not allowed.
- 2) The MONTIM input parameter may not have a value of ALL.
- 3) The MONDAT input parameter may not have a value of ALL.
- 4) The optional LV input parameter must not be present in the command; it defaults to a value of 1-Up and parameter counts of zero are not shown.

| <b>parameter</b> | <i>Explanation</i>                                |
|------------------|---------------------------------------------------|
| <b>CRC</b>       | CRC Block Errors                                  |
| <b>FRER</b>      | Framing Errors                                    |
| <b>OFS</b>       | Out of Frame Seconds                              |
| <b>ES</b>        | Errored Seconds                                   |
| <b>SES</b>       | Severely Errored Seconds                          |
| <b>CSS</b>       | Controlled Slip Seconds                           |
| <b>CV</b>        | Coding Violations                                 |
| <b>UAS</b>       | Unavailable Seconds                               |
| <b>UATC</b>      | Unavailable Time Count                            |
| <b>MER</b>       | Multiframe Errors                                 |
| <b>FEBE</b>      | Far End Block Errors*                             |
| <b>FES</b>       | Far End Errored Seconds*                          |
| <b>FSES</b>      | Far End Severely Errored Seconds*                 |
| <b>FUAS</b>      | Far End Unavailable Seconds*                      |
| <b>ALLPM</b>     | All parameters listed above                       |
| <b>ALLE</b>      | All Near-end parameters listed above              |
| <b>ALLF</b>      | All Far-end parameters (marked by *) listed above |

**LV** - Level

**11111111**

- The discriminating level for the requested parameter

If 11111111 is not specified in the input command, it defaults to a value of 1-Up.

If "ALL" is specified in the input command a default value of 0-Up is applied. This provides the current counts (zero included, unfiltered) of the specified parameter for all NPCs on the frame.

Keywords LV and ALL are mutually exclusive.

| <b>11111111</b>               | <i>Explanation</i>                  |
|-------------------------------|-------------------------------------|
| <b>{000000000-345600000}U</b> | Discriminating Level-Up Direction   |
| <b>{000000000-345600000}D</b> | Discriminating Level-Down Direction |

**Up** - Parameters with values equal to or greater than the specified "discriminating level" are reported.

**Down** - Parameters with values equal to or less than the specified "discriminating level" are reported.

**AI** - Accumulation interval

**aaaaa** - The accumulation time period for the specified parameter

**aaaaa** *Explanation*

**15MIN** Parameter count from a 15-minute accumulator

**DAILY** Parameter count from a daily accumulator

**COUNT** - Count

**cccccccc**

- The accumulated value of a monitored parameter (nine digits)

All leading 0's will be output.

**cccccccc**

*Explanation*

**{000000000-345600000}**

Range of parameter counts

**COND** - Condition

**AI** - Accumulation interval

**aaaaa** - The accumulation time period for the specified parameter

**aaaaa** *Explanation*

**15MIN** Parameter count from a 15-minute accumulator

**DAILY** Parameter count from a daily accumulator

**hxxxxxxxxx**

- Threshold mode and parameter value

**h** - PA NPC thresholding mode

**xxxxxxxxxx**

- Accumulated value of a monitored parameter.

Nine digit field. All leading 0's will be output. (000000000-345600000)

**h** *Explanation*

**I** Inhibited

**A** Allowed

**MONDAT** - Monitored date

**dddd** - Performance monitoring period (24 hour)

This parameter specifies the requested 24-hour performance monitoring period. If this optional input parameter is not present in the command, it defaults to a value of CURD.

The value ALL is an option only for input commands. Selecting the value ALL retrieves both previous and current 24-hour accumulation registers of the selected NPC. If the value ALL is selected, only a single NPC can be specified in the input command. This parameter must not appear in input commands which specify 15-minute accumulation intervals (AI = 15MIN). When the parameter ALLPM, ALLE or ALLF is specified, MONTIM and MONDAT cannot be ALL.

**dddd** *Explanation*

**HIST** Previous 24-hour accumulators

**CURD** Current 24-hour accumulators

**ALL** ALL Current and previous daily accumulators

**MONTIM** - Monitored Time

**tttt** - Performance monitoring period (15 minute)

This parameter specifies the requested 15-minute performance monitoring period. If this optional input parameter is not present in the command, it defaults to a value of CURT.

The value ALL is an option only for input commands. Selecting the value ALL retrieves both previous and current 15-minute accumulation registers of the selected NPC. If the value ALL is selected, only a single NPC can be specified in the input command. This parameter must not appear in input commands which specify daily accumulation intervals (AI = DAILY). When the parameter ALLPAR, ALLE or ALLF is specified, MONTIM and MONDAT cannot be ALL.

**tttt** *Explanation*

**HIST** Previous 15-minute accumulators

**CURT** Current 15-minute accumulators

**ALL** All Current and previous 15-minute accumulators

**THMODE** - Thresholding Mode

**hhh** - This output keyword indicates the thresholding mode of the PA NPC.

**hhh** *Explanation*

**INH** Inhibited

**ALW** Allowed

**cc** - Hexadecimal condition code

**cc** *Explanation*

**04** Subject entity is out of service

**11** UC is out of service

**12** UC is in service but failed

**14** FTMI is out of service

**15** NPC is unequipped

**1F** FTMI is in service but failed

**26** NPC type error

**0B** Invalid CEPT NPC

**0C** The MONDAT and MONTIM parameters can not both be specified

**A0** The selected MXR associated with the NPC is Out-Of-Service

**A1** The selected MXR associated with the NPC is In-Service but failed

**B7** The associated MXR is In-Service but pested

**A1** The parameter specified does not match with the NPC type

**0E** Only one parameter is allowed

**1B** Historical data can not be specified

**1D** Level field is not allowed

**1E** Monitored Date field is not allowed

**20** Only DAILY for accumulation interval is allowed

**21** Only 15MIN for accumulation interval is allowed

**22** FTMI is PESTED

**23** No PM data available

**24** Monitored Time field is not allowed

**89** Interval is not valid/not available

**9E** MONDAT set to ALL is not allowed

**9F** MONTIM set to ALL is not allowed

---

## **UTL, QRY, NPC, CBTIMER**

---

### **Explanation Of Command**

---

This message retrieves the current setting of the C-bit message timer for an NPC or range of NPCs. NPCs with type CB10z or cept NPCs cross-connected to NPCs with CB10z type can be specified. The timeout value return for an NPC value applies to all the timeslots served by the NPC. Valid settings for the timer 0,1,2,3,4,5,6,7,8,9 and 10 seconds

### **Command**

## Explanation Of Parameters

**NPC** - Network processing circuit

**MAP** - Alternate Map

**name** - The alternate map name which is a string of uppercase alphanumeric characters from one to seven characters long. The first character must be an alphabetic character.

**USER** - User

**user id**

- User login identification is two to eight alphabetic characters.

A user can query his or her own maps but only the frame administrator can use the command to query maps owned by other users. To do so, the optional USER field must be entered.

**[x]xxx** - The 3- or 4-digit nonhierarchical NPC Number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

- D5** No user is logged in on the link/vc

## **UTL, QRY, NPCTG**

### **UTILITY QUERY TEST-ACCESS GROUP NPC**

#### **Explanation Of Command**

This command is used to request information regarding one or more network processing circuits used for test-access groups (NPCTGs). the following information will be provided for each designated NPCTG:

1. All test-access groups (TGs)
2. TG width
3. The bundle being supported (east or west)
4. the channel assignment on the NPCTG

The TGs are listed in the order of bandwidth assignment.

### Explanation Of Parameters

**TG** - Test (access) group

**mmm** - TG number (001 through 400)

**NPCTG** - NPC (for) test group

**rrr** - TG number (001 through 400)

**sss** - TG number (001 through 400, must be greater than rrr)

Variable sss is used to specify the end of an NPCTG range

**[s]abc** - 3- or 4-digit non-hierarchical NPC number designated as NPCTG rrr

**[t]def** - 3- or 4-digit non-hierarchical NPC number designated as NPCTG sss

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

## **UTL, QRY, OPT, TYPE, ALL, NPCS**

### **UTILITY QUERY OPTIONS NPCS**

#### **Explanation Of Command**

This message requests a printout of the parameter threshold values for NPC types stored in the DACS II threshold data base.

If an NPC type is specified, the output message shows the threshold values for all parameters associated with the designated NPC type. If the ALL keyword is entered, the output message shows the threshold values for the parameters and all NPC types.

#### **Command**

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**OPT** - Option

In the output messages the first value shown following the keyword OPT is the option number. The value immediately following the option number is the default alarm threshold value. The next three fields show user-programmed values. Any user-programmed values that have not been initialized in the DACS II data base will be shown as "-----[----]". Until they are initialized, user-programmable values cannot be used as valid alarm thresholds.

**TYPE** - Type

**mn** - NPC type

| <i>mn</i> | <i>Explanation</i> |
|-----------|--------------------|

### **Denial Message**

---

Not applicable.

### **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**PEST** - Pested

**FAIL** - Failed

**OOS** - Out of service

For the PEST, FAIL and OOS indications, each entity in the DACS II frame is represented by a single character variable. This variable can have the value of 1, 0 or "-" indicating the following status:

| <i>Value</i> | <i>OOS</i>     | <i>FAIL</i>    | <i>PEST</i>    |
|--------------|----------------|----------------|----------------|
| 1            | out of service | failed         | pested         |
| 0            | in service     | not failed     | unpested       |
| -            | not applicable | not applicable | not applicable |

A hyphen (-) indicates the parameter is not applicable to the particular entity. For example, an unequipped circuit displays a "-" for its OOS, FAIL and PEST indicators.

The DACS II entities and their status fields are as follows:

- g** - Link 1
- h** - Link 2
- i** - Link 3
- j** - Link 4
- k** - Link 5
- l** - Link 6
- m** - XC0 (cross-connect 0)
- n** - XC1 (cross-connect 1)
- o** - CCNI/CCI 0 (cross-connect network interface 0 for non-CEF frame)  
(clock and control interface 0 for CEF frame)
- p** - CCNI/CCI 1 (cross-connect network interface 1 for non-CEF frame)  
(clock and control interface 1 for CEF frame)

**SYNC** - Synchronizer

**CRO** - Clock reference oscillator

**TLI** - Timing link interface

**x** - TLI status, side 0

**x** - TLI status, side 1

TLI information is listed in the message from left to right, starting with status information for TLI 1, SSP 0, Side 0 in the first position and ending with status information for TLI 4, SSP1, Side 1 in the last position. The entities for which status is reported are listed below in the order they appear in the output message.

The status is represented by the variable x or x. The value of the variable is interpreted as follows.

*x* Explanation (PEST, FAIL, or OOS will be indicated in message)

0 Unpested, in-service, or not failed

1 Pested, out-of-service, or failed

Side 0

**TLI 1, SSP 0**

**TLI 1, SSP 1**

**TLI 2, SSP 0**

**TLI 2, SSP 1**

**TLI 3, SSP 0**

**TLI 3, SSP 1**

**TLI 4, SSP 0**

**TLI 4, SSP 1**

Side 1

**TLI 1, SSP 0**

**TLI 1, SSP 1**

**TLI 2, SSP 0**

**TLI 2, SSP 1**

**TLI 3, SSP 0**

**TLI 3, SSP 1**

**TLI 4, SSP 0**

**TLI 4, SSP 1**

**TSI** - Time slot interchange

**f** - FROM unit (1 through 6)

**t** - TO Unit (1 through 6)

**ETSI** - Expanded time slot interchanger

- x** - Status indication for the entity or for the side 0 entity if duplicated.
- x** - Status indication for side 1 entity.
- tt** - Total number of equipped TSIs/ETSIs.
- nn** - Total number of equipped TSIs/ETSIs having the requested status.

## **UTL, QRY, PEST, FAIL, OOS, UNIT**

### **UTILITY QUERY STATUS OF ENTITIES/EQUIPMENT**

#### **Explanation Of Command**

This message requests reports on any one of the following parameters:

|      |                           |
|------|---------------------------|
| PEST | Pested components         |
| FAIL | Failed components         |
| OOS  | Out-of-service components |

These reports may be generated for the entire DACS II frame or for a particular unit. The UNIT parameter must be specified in the command to query for a particular unit. The UNIT parameter must be omitted to generate a report for the entire frame.

#### **Command**

[I.53103]

**UTL:FRM xy,SEQ ww:QRY,{PEST|FAIL|OOS}[ ,UNIT [q]q]!**

## **Completion Message**

### **Nonhierarchical**

If the optional unit number is not entered, the following output segments will be generated:

The output starts out with:

[O.53103]

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} \  
g h i j k l m n o p EOM

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} 3 LN MSG:  
SYNC x x CRO x  
TLI x x x x x x x x y y y y y y y y EOM

For DACS II Non-CEF frames, the next segment describes the CCN hardware:

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} TOTAL \  
TSIS tt nn 5 LN MSG:  
11 x y 12 x y 13 x y 14 x y 15 x y 16 x y  
21 x y 22 x y 23 x y 24 x y 25 x y 26 x y  
31 x y 32 x y 33 x y 34 x y 35 x y 36 x y  
41 x y 42 x y 43 x y 44 x y 45 x y 46 x y EOM

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} TOTAL \  
TSIS tt nn 3 LN MSG:  
51 x y 52 x y 53 x y 54 x y 55 x y 56 x y  
61 x y 62 x y 63 x y 64 x y 65 x y 66 x y EOM

For DACS II CEF frames, the segment describes the ECCN hardware:

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} TOTAL \  
ETSIS tt nn 3 LN MSG:  
01 x y 02 x y 03 x y 04 x y 05 x y 06 x y 07 x y 08 x y  
09 x y 10 x y 11 x y 12 x y 13 x y 14 x y 15 x y 16 x y EOM

The output then continues with information about the common equipment in the units. The data line will only appear for units that are equipped. If more than four units are equipped, the output for the equipage of the units will be divided into multiple segments.

[O.53103]

```
[M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} UNITS e LN MSG:]
[<data line for the common equipment in the first equipped unit>]

[<data line for the common equipment in the seventh equipped unit>]
[<data line for the common equipment in the eighth equipped unit> EOM]
```

```
[M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} UNITS e LN MSG:]
[<data line for the common equipment in the ninth equipped unit>]
[<data line for the common equipment in the tenth equipped unit>]
[<data line for the common equipment in the eleventh equipped unit>]
[<data line for the common equipment in the twelfth equipped unit> EOM]
```

```
[M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} UNITS e LN MSG:]
[<data line for the common equipment in the thirteenth equipped unit>]
[<data line for the common equipment in the fourteenth equipped unit>]
[<data line for the common equipment in the fifteenth equipped unit>]
[<data line for the common equipment in the sixteenth equipped unit> EOM]
```

Data line for a unit equipped as an FTU:

```
UNIT [q]q UC a FTMI b c d e FC f g h j k m p q[CCB r s]
```

Data line for a unit equipped as a DSPU:

```
UNIT [q]q UC a DSPI b[CCB r s]
```

Then the output message continues with information about individual NPCs. For each FTM or DSPU, one output message will be printed.

Output message for PEST, FAIL, or OOS status of NPCs on an equipped CEPT FTM:

Please note, if any of the odd NPCs has been provisioned with a Digital Signal Processing Platform (DSPP) application (TG193), then the even NPC following it does not exist and a dash will be shown in its place:

[O.53103]

```
M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} FTU \
NPCS [a]aaa-[b]bbb tt 5 LN MSG:
x x x x x x x x {PEST|FAIL|OOS} nn
x x x x x x x x
x x x x x x x x
x x x x x x x x EOM
```

Output message for PEST, FAIL, or OOS status of NPCs on an equipped DSP Unit:

[O.53103]

```
M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} DSPU \
NPCS [a]aaa-[b]bbb tt 3 LN MSG:
[z]zzz x y [z]zzz x y [z]zzz x y [z]zzz x y
[z]zzz x y [z]zzz x y [z]zzz x y [z]zzz x y \
{PEST|FAIL|OOS} nn EOM
```

Output message for NPCs on an equipped FTM/DSPU with no NPC in PEST, FAIL, or OOS state:

[O.53103]

```
M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} {FTU|DSPU} \
NPCS [a]aaa-[b]bbb tt 2 LN MSG:

[<data line for the common equipment in the thirteenth equipped unit>]
[<data line for the common equipment in the fourteenth equipped unit>]
[<data line for the common equipment in the fifteenth equipped unit>]
[<data line for the common equipment in the sixteenth equipped unit> EOM]
```

Data line for a unit equipped as an FTU:

```
UNIT [q]q UC a FTMI b c d e FC f g h j k m p q[CCB r s]
```

Data line for a unit equipped as a DSPU:

```
UNIT [q]q UC a DSPI b[CCB r s]
```

Then the output message continues with information about individual NPCs. For each FTM or DSPU, one output message will be printed.

For PEST, FAIL, or OOS status of NPCs on an equipped CEPT FTM:

Please note, if any of the odd NPCs has been provisioned with a Digital Signal Processing Platform (DSPP) application (TG193), then the even NPC following it does not exist and a dash will be shown in its place:

[O.53103]

```
M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} FTU \
NPCS uvmnp-uxkqr tt 5 LN MSG:
x x x x x x x x {PEST|FAIL|OOS} nn
x x x x x x x x
x x x x x x x x
x x x x x x x x EOM
```

For PEST, FAIL, or OOS status of NPCs on an equipped DSP unit:

[O.53103]

```
M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} DSPU \
NPCS uvmnp-uxkqr tt 3 LN MSG:
uvmnp x y uvmnp x y uvmnp x y uvmnp x y
uvmnp x y uvmnp x y uvmnp x y uvmnp x y {PEST|FAIL|OOS} nn EOM
```

Output message for an equipped FTM/DSPU with no NPC having the PEST, FAIL, or OOS status:

[O.53103]

```
M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} {FTU|DS3U|DSPU} \
NPCS uvmnp-uxkqr tt 2 LN MSG:
{PEST|FAIL|OOS} 00 EOM
```

After the above information is output, the following message will be generated to complete the response:

[O.53103]

```
M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} COMPL
```

If the unit number is specified, the following output segments will be generated:

For entities in an FTU:

[O.53103]

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} 2 LN MSG:  
UNIT [q]q UC a FTMI b c d e FC f g h j k m p q[ CCB r s] EOM

The output then continues with up to four of the following segment for NPCs in an FTM. If an FTM is not equipped, the segment for this FTM will not be output:

Please note, if any of the odd NPCs has been provisioned with a Digital Signal Processing Platform (DSPP) application (TG193), then the even NPC following it does not exist and a dash will be shown in its place:

[O.53103]

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} UNIT [q]q \  
FTU NPCS uvmnp-uxkqr tt 5 LN MSG:  
x x x x x x x x {PEST|FAIL|OOS} nn  
x x x x x x x x  
x x x x x x x x  
x x x x x x x x EOM

For entities in a DSPU:

[O.53103]

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} UNIT [q]q UC a \  
DSPI b[ CCB r s] EOM

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} UNIT [q]q DSPU \  
NPCS uvmnp-uxkqr tt 3 LN MSG:  
uvmnp x y uvmnp x y uvmnp x y uvmnp x y  
uvmnp x y uvmnp x y uvmnp x y uvmnp x y {PEST|FAIL|OOS} nn EOM

Output message for an equipped FTM/DSPU with no NPC having the PEST, FAIL, or OOS status:

[O.53103]

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} {FTU|DS3U|DSPU} \  
NPCS uvmnp-uxkqr tt 2 LN MSG:  
{PEST|FAIL|OOS} 00 EOM

After the above information is output, the following message will be generated to complete the response:

[O.53103]

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} UNIT [q]q COMPL

### Denial Message

---

[O.53103.01]

M hh:mm:ss xy,ww n[vv] UTL QRY {PEST|FAIL|OOS} UNIT [q]q COND cc DNY

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

The UNIT option must be specified to query a particular unit. The UNIT option must be omitted to query the entire frame. If the UNIT option is specified, only the information related to the equipment in that unit will be generated.

**OOS** - Out of service

Out of Service Components

**FAIL** - Failed

Failed Components

**PEST** - Pested

Pest States

For the OOS, FAIL and PEST indications, each entity in the DACS II frame is represented by a single character variable. This variable can have the value of 1, 0 or "-" indicating the following status:

| <i>Value</i> | <i>OOS</i>     | <i>FAIL</i>    | <i>PEST</i>    |
|--------------|----------------|----------------|----------------|
| 1            | out of service | failed         | pested         |
| 0            | in service     | not failed     | unpested       |
| -            | not applicable | not applicable | not applicable |

A hyphen (-) indicates the parameter is not applicable to the particular entity. For example, an unequipped circuit displays a "-" for its OOS, FAIL and PEST indicators.

The DACS II entities and their status fields are as follows:

- g** - Link 1
- h** - Link 2
- i** - Link 3
- j** - Link 4
- k** - Link 5
- l** - Link 6
- m** - XC0 (cross-connect 0)
- n** - XC1 (cross-connect 1)
- o** - CCNI/CCI 0 (cross-connect network interface 0 for non-CEF frame)  
(clock and control interface 0 for CEF frame)
- p** - CCNI/CCI 1 (cross-connect network interface 1 for non-CEF frame)  
(clock and control interface 1 for CEF frame)

**SYNC** - Synchronizer

**CRO** - Clock reference oscillator

**TLI** - Timing link interface

The order of the TLI presented in the output is shown below:

TLI 1, SSP 0, Side 0  
TLI 1, SSP 1, Side 0  
TLI 2, SSP 0, Side 0  
TLI 2, SSP 1, Side 0  
TLI 3, SSP 0, Side 0  
TLI 3, SSP 1, Side 0  
TLI 4, SSP 0, Side 0  
TLI 4, SSP 1, Side 0

TLI 1, SSP 0, Side 1  
TLI 1, SSP 1, Side 1  
TLI 2, SSP 0, Side 1  
TLI 2, SSP 1, Side 1  
TLI 3, SSP 0, Side 1  
TLI 3, SSP 1, Side 1  
TLI 4, SSP 0, Side 1  
TLI 4, SSP 1, Side 1

**TSIS** - Time slot interchanges NonCEF

**f** - FROM unit (1 through 6) NonCEF  
**t** - TO Unit (1 through 6) NonCEF

**ETSIS** - Expanded time slot interchangers

**x** - Status of the entity or the side 0 entity if the entity is duplicated

**y** - Status of the side 1 entity

**tt** - Total number of equipped entities

**nn** - Total number of entities having the requested status

**UC** - Unit controller

**FTMI** - Facility terminating module interface

**FC** - Format converter

**CCB** - Cross-connect buffer

For an FTU equipment output, the definition of each character is given below:

- a - status of UC
- b - status of FTMI 1
- c - status of FTMI 2
- d - status of FTMI 3
- e - status of FTMI 4
- f - status of FC 01
- g - status of FC 11
- h - status of FC 02
- j - status of FC 12
- k - status of FC 03
- m - status of FC 13
- p - status of FC 04
- q - status of FC 14
- r - status of side 0 CCB
- s - status of side 1 CCB

**FMT** - Formatter or Hybrid Formatter

**DSPI** - Digital signal processing interface

For a DSPU equipment output, the definition of each character is as below:

- a - status of UC
- b - status of DSPI
- r - status of side 0 CCB
- s - status of side 1 CCB

**[a]aaa** - The first 3- or 4-digit nonhierarchical NPC number of an FTM/DSPU.

**[b]bbb** - The last 3- or 4-digit nonhierarchical NPC number of an FTM/DSPU.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

## **UTL, QRY, ROLL, DS0, NPC, ALL, UNIT**

### **UTILITY QUERY ROLL DS0**

#### **Explanation Of Command**

This command is used to request a report on the roll status of all of the channels in a network processing circuit (NPC). The roll status request may be for a single NPC, a range of NPCs, all NPCs in a unit, or all NPCs in the DACS II frame.

The output message shows the correspondence between the bridge and service legs of the Roll procedure. Original Service and Original Bridged leg refer to the service and bridged leg designations created by the Bridge step of the Roll procedure. New Service and New Bridged leg refer to the service and bridged leg designations created by the Roll step of the Roll procedure.

The output message displays the roll status of each of the 32 channels of an NPC.

The top left position corresponds to telephone channel 0 of the NPC and the last item corresponds to telephone channel 31 of the NPC. Note that telephone channel 0 (Channel Timeslot 0) and telephone channel 31 (Channel Timeslot 16) in the Channel Associated Signaling mode cannot be rolled.

All dashes are displayed if there is neither a Service leg nor a Bridged leg associated with a channel. Telephone channel 0 and telephone channel 31 in the Channel Associated Signaling mode will have all dashes.

The display is repeated for each NPC in the range.  
If there are no rolled channels on an NPC within a range, then no roll status output will be generated for that NPC.

**Note:** The processing time to query the roll status of a fully equipped frame could exceed 9 minutes.

The specified NPC range can cross a unit boundary.

### **Command**

---

#### **Nonhierarchical**

---

[I.52081]

UTL:FRM xy,SEQ ww:QRY,ROLL,DS0,{NPC [s]abc[-[t]def]|ALL[,UNIT [q]q]}!

#### **Hierarchical**

---

[I.52081]

UTL:FRM xy,SEQ ww:QRY,ROLL,DS0,{NPC uvmnp[-wxkqr]|ALL[,UNIT [q]q]}!

### **Completion Message**

---

#### **Nonhierarchical**

---

The output message in nonhierarchical PDS form will span one output segment per NPC.

If the 3- or 4-digit nonhierarchical NPC number is used, the output will be six channels per line (except for the last line) as shown below:

[O.52081]

```

### **Denial Message**

---

Not applicable.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**[s]abc** - 3- or 4-digit nonhierarchical NPC number, the first number of a range or a single NPC number.

**[t]def** - 3- or 4-digit nonhierarchical NPC number, the last number of a range.

**ALL** - All  
Keyword indicating that all NPCs in the frame are being queried for Roll status.

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

Keyword used to limit query to all NPCs in a Unit.

**[u]ghi** - The 3- or 4-digit nonhierarchical NPC number of the Service or Bridged channel associated with the queried NPC.

**ghikl** - Hierarchical NPC number of the Service or Bridged leg associated with the queried NPC

**jjj** - Channel number of the Service or Bridged leg associated with the queried NPC

**rr** - The Roll status of a channel interpreted as follows:

*rr*      *Type of Leg*

OS      Indicates that channel [u]ghijjj or ghikljjj is the Original Service leg and the corresponding channel is the Original Bridged leg.

NS      Indicates that channel [u]ghijjj or ghikljjj is the New Service leg and the corresponding channel is the New Bridged leg.

OB      Indicates that channel [u]ghijjj or ghikljjj is the Original Bridged leg and the corresponding channel is the Original Service leg.

NB      Indicates that channel [u]ghijjj or ghikljjj is the New Bridged leg and the corresponding channel is the New Service leg.

--      Indicates that the channel is not a Service or Bridged leg

**uvmnp** - Hierarchical NPC number, the first number of a range or a single NPC number

**wxkqr** - Hierarchical NPC number, the last number of a range

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

**Note:** Valid NPC types for 64kbps Roll are PAxyz, PBxyz and PCxyz, except for the following conditions:

- Either NPC is of type PAxyz where y=C or y=D
- The old NPC supports Channel Associated Signaling (CAS) and the new NPC does not.
- The old NPC supports Non-Signaling Associated, the new NPC supports CAS, and CTS16 is being rolled to CTS16.

Because CTS0 and CTS16 (when Channel Associated Signaling is used) are not rolled at the 64kbps level, the status for these channels will be displayed with "-". If NSA (Non-Signaling Associated) mode is used, CTS16 can be rolled. The appropriate roll status will be displayed for this channel.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

## **UTL, QRY, ROLL, DS1, NPC, ALL, UNIT**

### **UTILITY QUERY ROLL DS1**

#### **Explanation Of Command**

This command is used to request a report on the roll status of 2Mbit/s facilities.

The roll status request may be for a single network processing circuit (NPC), a range of NPCs, all NPCs in a unit, or all NPCs in the DACS II frame. The output message shows the correspondence between the bridge and service facilities of the Roll procedure.

Original Service and Original Bridged facility refer to the service and bridged facility designations created by the Bridge step of the Roll procedure.

New Service and New Bridged facility refer to the service and bridged facility designations created by the Roll step of the Roll procedure.

The output message displays the roll status of each of the NPCs in a Facility Terminating Module (FTM).

The top left position corresponds to the first NPC in the FTM and the bottom right position corresponds to the last NPC in that FTM. All dashes are displayed if there is neither a Service facility nor a Bridged facility associated with an NPC.

The display is repeated for each FTM in the range.

If the range queried in the input message is a subset of a FTM, all NPCs of that FTM will still be displayed.

If there are no rolled channels in a FTM, then no roll status output will be generated for that FTM.

The specified NPC range can cross a unit boundary and is applicable to facility terminating unit (FTU) types.

If only one NPC is queried, then the output display will be one line with the roll status information for the requested NPC.

## Command

---

### Nonhierarchical

---

[I.52091]

UTL:FRM xy, SEQ ww:QRY, ROLL, DS1, {NPC [s]abc[-[t]def]|ALL[, UNIT [q]q]}!

### Hierarchical

---

[I.52091]

UTL:FRM xy, SEQ ww:QRY, ROLL, DS1, {NPC uvmnp[-wxkqr]|ALL[, UNIT [q]q]}!

## Completion Message

---

### Nonhierarchical

---

The output message in nonhierarchical PDS form will span one output segment per FTM for FTU NPC ranges, and one line for a single FTU NPC.

If the 3- or 4-digit nonhierarchical NPC number in an FTU range is used, the output will be eight NPCs per line as shown below:

[O.52091]

```
M hh:mm:ss xy,ww n[vv] UTL QRY ROLL DS1 FTU NPC [a]aaa-[b]bbb 5 LN MSG:
rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi
rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi
rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi
rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi rr[u]ghi \
EOM
```

```

 .
 .
 .

```

M hh:mm:ss xy,ww n[vv] UTL QRY ROLL DS1 {NPC [s]abc-[t]def|\  
ALL[ UNIT [q]q]} COMPL

If a single 3- or 4-digit nonhierarchical NPC number in a FTU used,  
the output will be one line as shown below:

[O.52091]

M hh:mm:ss xy,ww n[vv] UTL QRY ROLL DS1 NPC [s]abc rr[u]ghi COMPL

### **Hierarchical**

The output message in hierarchical PDS form will span  
two output segments per FTM for FTU NPC ranges, and one  
line for a single FTU NPC.

If the hierarchical NPC number in a FTU range is used, each output  
segment will display four NPCs per line as shown below:

[O.52091]

M hh:mm:ss xy,ww n[vv] UTL QRY ROLL DS1 FTU NPC bcdef-edhfg 5 LN MSG:  
rrghikl rrghikl rrghikl rrghikl  
rrghikl rrghikl rrghikl rrghikl  
rrghikl rrghikl rrghikl rrghikl

```

 .
 .
 .

```

M hh:mm:ss xy,ww n[vv] UTL QRY ROLL DS1 {NPC uvmnp-wxkqr|\  
ALL[ UNIT [q]q]} COMPL

If a single 3- or 4-digit hierarchical NPC number in a FTU is used, the output will be one line as shown below:

[O.52091]

M hh:mm:ss xy,ww n[vv] UTL QRY ROLL DS1 NPC uvmpn rrgghikl COMPL

### **Denial Message**

---

Not applicable.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**[s]abc** - 3- or 4-digit nonhierarchical NPC number, the first number of a range or a single NPC number.

**[t]def** - 3- or 4-digit nonhierarchical NPC number, the last number of a range.

**ALL** - All

Keyword indicating that all NPCs in the frame are being queried for Roll status.

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

Keyword used to limit query to all NPCs in a Unit.

**[q]q** - The 1- or 2-digit Unit number

**[a]aaa** - 3- or 4-digit nonhierarchical NPC number, the first NPC number of a FTM.

**[b]bbb** - 3- or 4-digit nonhierarchical NPC number, the last NPC number of a FTM.

**[u]ghi** - The 3- or 4-digit nonhierarchical NPC number of the Service or Bridged facility associated with the queried NPC.

**ghikl** - Hierarchical NPC number of the Service or Bridged facility associated with the queried NPC.

**rr** - NPC Roll status interpreted as follows:

*rr*      *Type of Facility*

**OS**      Indicates that NPC [u]ghi or ghikl is the Original Service facility and the corresponding NPC is the Original Bridged facility.

**NS**      Indicates that NPC [u]ghi or ghikl is the New Service facility and the corresponding NPC is the New Bridged facility.

**OB**      Indicates that NPC [u]ghi or ghikl is the Original Bridged facility and the corresponding NPC is the Original Service facility.

**NB**      Indicates that NPC [u]ghi or ghikl is the New Bridged facility and the corresponding NPC is the New Service facility.

**--**      Indicates that the NPC is not a Service or Bridged facility.

**bcdef** - Hierarchical NPC number, the first NPC number of a FTM.

**edhfg** - Hierarchical NPC number, the last NPC number of an FTM output segment.

**fhjrk** - Hierarchical NPC number, the first NPC number of an FTM output segment.

**stxyz** - Hierarchical NPC number, the last NPC number of a FTM.

**uvmnp** - Hierarchical NPC number, the first NPC number of a range or a single NPC number.

**wxkqr** - Hierarchical NPC number, the last NPC number of a range.

**uv,wx,bc,st,fh,ed**

- Unit number

**m,k,d,x,j,h**

- Module number

**np,qr,ef,yz,rk,fg**

- NPC number within the module

**Note:** Valid NPC types for 2Mbit/s Roll are PAXyz, PBxyz,PCxyz. However, Roll is denied when rolling from a PAXyz type FTU NPC to a PBxyz/PCxyz type FTU NPC. Also, the xyz values between the old and the new NPCs have to be the same or equivalent (in the case of rolling from PBxyz/PCxyz to PAXyz).

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

## UTL, QRY, SCR, LINK, USER, LINKS, USERS

### QUERY USER|LINK SCREENING OPTION

#### Explanation Of Command

This command is used to query the user/administrative link for screening options, command category, and the restricted maintenance privilege. These items are set when the user accesses the link.

The frame administrator may query any one or all users and may query the screening options for any one or all administrative links.

The RMON/RMOFF option indicates that the user/administrative link is assigned the privilege or not assigned the privilege of issuing the commands restricted to the frame administrator. Default is RMOFF.

The restricted commands are:

```
I.37301 DLT::FPKG
I.34001 RST::MC:CLR[,ALL];
I.34001 RST::MC:TAPE;
I.34211 RST::DISK[,CLR];
I.34211 RST::[,CLR]|TAPE;
I.58001 UTL::BOOT,FRAME[, {TAPE|CLR}];
I.55701 UTL::BMTR, FROM {RAM|DISK|TAPE}[, {EXCT|INCL}];
I.51051 UTL::CLR, BMTR;
I.38471 CHG::MSGLOG {ON|OFF}
I.57031 UTL::CLR, MSGLOG[, RSTNUM]
I.38355 CHG::ALMS, {ON|OFF}
I.38451 CHG::INTV, {ON|OFF}
```

Output from this command is sent only to the link on which the command was input.

Also, for the Message Logging feature, the logged messages will be sent to the link on which the command was input and the links with screening option 5.

| 5        | Responses to input messages on all links and autonomous messages and message log replay if link is in MML and log retrieval is requested |

#### **LINK** - Link

**j[mm]** - Administrative link number

**j** - Physical link number (1 through 6)  
**mm** - Virtual circuit number (01 through 16) for j = 5 or 6

Variable j[mm] when used in combination with p[nn] denotes a range of administrative link numbers beginning with j[mm] and ending with p[nn]. In the general case j is the same value as p; that is, there is no link range. A range of links may only be specified by the Frame Administrator and may only be used for synchronous links, not the asynchronous links 1 through 4.

**o[uu]** - Next administrative link number in command range  
**g[vv]** - Next administrative link number in command range  
**h[ii]** - Next administrative link number in command range  
**j[kk]** - Next administrative link number in command range  
**r[tt]** - Next administrative link number in command range  
**s[yy]** - Next administrative link number in command range  
**p[nn]** - Administrative link number at end of command range

o,g,h,j,r,s,p                      Physical link numbers (1 through 6)  
uu,vv,ii,kk,tt,yy,nn              Virtual circuit numbers (01 through 16)  
for o, g, h, j, r, s, or p = 5 or 6

#### **USER** - User

**user id**

- User identifier

The user's login identifier (two to eight alphabetic characters). The frame administrator may use specify any user\_id but an individual user is restricted to their own user\_id.

#### **LINKS** - Links

All administrative links (frame administrator only)

**USERS** - Users

All users (frame administrator only)

**LANG** - Language

**P** - Program Documentation Standards (PDS)

**M** - HuMan-Machine Language (MML)

**NPCAD** - NPC Addressing scheme

**E** - Extended 3-digit nonhierarchical NPC addressing

**X** - Extended 4-digit nonhierarchical NPC addressing

**H** - Hierarchical NPC addressing

**LEV** - Level

- a** - Execution priority level for circuit provisioning commands
- b** - Execution priority level for equipment provisioning commands
- c** - Execution priority level for maintenance commands
- d** - Execution priority level for test access commands
- e** - Execution priority level for monitoring commands
- f** - Execution priority level for common commands

A table giving the command verbs associated with each of the above command sets is given below.

LEV is used in combination with the command set identifiers a through f to set the execution priority level for each command set. A priority level applies to a user or link as appropriate. Priority levels range from 0 through 3. A list of these levels and their meaning is given below for a. The list for b through f is similar to the a list.

- a Explanation*
- 0 Commands in the command set assigned this execution priority level cannot be executed.
  - 1 Highest execution priority level. Commands in the command set assigned this execution priority level will be executed before commands with priority level 2 or 3.
  - 2 Middle execution priority level. Commands in the command set assigned this execution priority level will be executed before commands with priority level 3
  - 3 Lowest execution priority level. Commands in the command set assigned this execution priority level will be executed after all priority level 1 and 2 commands have been executed. Level 3 is the default priority level.
  - The execution priority level of the command set assigned this execution priority level is not to be changed.

**Note:** The commands used to login, logoff, cross-connect, stop, and abort always have the highest priority.

A single queue is used for DACS II commands. When multiple commands arrive at the same time, they will be queued for execution according to the priority assigned to their command set. Commands with the same priority will be executed in the order of arrival, that is, first come first served. A timeout feature insures that no command will wait in the queue forever. When the timeout period has expired for a given command that command will be executed regardless of its priority level.

| <b>a</b><br><b>Circuit</b><br><b>Prov.</b> | <b>b</b><br><b>Equipment</b><br><b>Prov.</b> | <b>c</b><br><b>Maint.</b> | <b>d</b><br><b>Test</b><br><b>Access</b> | <b>e</b><br><b>Monitoring</b> | <b>f</b><br><b>Common</b> |

| TCON                                       |                                              |                           |                                          |                               |                           |
| TDIS                                       |                                              |                           |                                          |                               |                           |

**RMON** - Restricted maintenance privilege on  
**RMOFF** - Restricted maintenance privilege off (default)

**GR** - Group

- a** - Screening level for circuit provisioning commands
- b** - Screening level for equipment provisioning commands
- c** - Screening level for maintenance commands
- d** - Screening level for test access commands
- e** - Screening level for monitoring commands
- f** - Screening level for common commands

A table giving the command verbs associated with each of the above command sets is given in the Explanation of Message section.

The command set identifiers a through f are used to set the group screening level for each command set. Screening levels range from 0 through 1. A list of these levels and their meaning is given below for a. The list for b through f is similar to the a list.

| a | Explanation                                                                                                                                             |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Output messages from other links are allowed,                                                                                                           |
| 0 | Output messages from other links are not allowed (the screening option for commands LOGIN, LOGOFF, STOP and ABT is not changeable, and it is set to 1). |

Note: Group information applies only to screening options 3 or 4; it does not appear for options 1, 2, and 5.

**MCON** - Macro component completion messages screening on  
**MCOFF** - Macro component completion messages screening off

**RLK** - Remove link

**A** - Allowed

**I** - Inhibited

A and I are used to assign to a user or link the privilege of removing a link. There is a relationship between the link privilege and the execution priority level. If c (see previous Command Sets table) in the LEV field is set to zero then the command to remove a link cannot be executed hence the remove link privilege is inhibited even if the RLK option is set to A or I.

**CONVON**

- Mixed Addressing Conversion ON

**CONVOFF**

- Mixed Addressing Conversion OFF

This mixed addressing conversion feature is only applicable to PDS commands in an environment that uses 4-digit sequential NPC numbers. This conversion feature is useful when a DACS II frame is converted from 3-digit sequential NPC addressing to 4-digit sequential NPC addressing for growth reasons. In that case this conversion feature allows certain Operational Support Systems to use 3-digit NPC numbers, even though the frame has been changed to normally accept only 4-digit NPC numbers.

Assuming sequential NPC number usage, DACS II normally accepts only fixed length NPC numbers in its input commands. This conversion feature transfers the fixed length requirement from NPC number to channel number on a link basis. This allows the DACS II parser to accept 3- or 4-digit NPC numbers assuming that the channel number is interpreted to be of 2-digit fixed length. If a 3-digit NPC number is entered with CONVON in effect, then DACS II will internally expand 3-digit NPC numbers to 4-digit NPC numbers.

For some feature configurations this conversion feature is not available, and the CONVOFF keyword will not appear in the output of this command.

- cc**     - Hexadecimal condition code

**cc**     *Explanation*

- D0**    Command is Frame administrator (DAX) only.
- D3**    User does not exist
- D7**    Cannot execute privileged command
- DF**    Command and protocol are inconsistent
- E1**    Virtual circuit is not specified for X.25 link
- E2**    Invalid link number specified

### **QUERY TRUNK SIGNALING CONVERSION STATE**

#### **Explanation Of Command**

---

This command is used to query the signaling state of a trunk which is using the E1/T1 signaling conversion feature. This feature is implemented on the Digital Signal Processing Platform (DSPP) circuit pack.

The signaling state on any given trunk will change rapidly with respect to time. This command will only take a snapshot of the state of the specified trunk. This snapshot will only be useful if the circuit is stuck in one given state. Thus it will give field personnel a way of tracking down the real problem.

## Explanation Of Parameters

**SIGST** - Signaling state

**abcd** - E1/T1 trunk termination  
**abc** - NPC number  
**ddd** - Channel number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

#### uvmnpddd

- E1/T1 trunk termination

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module  
**ddd** - Channel number

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

Valid values are listed below:

| <b>ddd</b>     | <i>Explanation</i>   |
|----------------|----------------------|
| <b>001-024</b> | T1 NPC channel range |
| <b>001-030</b> | E1 NPC channel range |

**TYPE** - Type

**mnxyz** - NPC Type and provisioning options

**tdir** - Trunk direction

The direction of the trunk as viewed from this channel. A trunk will have a direction specified in the circuit provisioning command which established the cross-connection. That direction will be either "from T1 to E1" or "from E1 to T1". This represents the direction in which a call is being established on the trunk between two switches. Valid values are listed below:

| <b>tdir</b> | <i>Explanation</i>                                             |
|-------------|----------------------------------------------------------------|
| <b>T1IC</b> | T1 Incoming, Channel belongs to a T1 NPC receiving the call    |
| <b>T1OG</b> | T1 Outgoing, Channel belongs to a T1 NPC originating the call  |
| <b>E1IC</b> | E1 Incoming, Channel belongs to an E1 NPC receiving the call   |
| <b>E1OG</b> | E1 Outgoing, Channel belongs to an E1 NPC originating the call |

**ab** - E1 Transmitting AB signaling bits associated with this channel

**cd** - E1 Receiving AB signaling bits associated with this channel

**e** - T1 Transmitting A signaling bit associated with this channel

**g** - T1 Receiving A signaling bit associated with this channel

Valid values for each bit are zero or one.

**sigst** - Signaling state value

| <b>sigst</b> | <i>Explanation</i>    |
|--------------|-----------------------|
| <b>ANS</b>   | Answer                |
| <b>BLK</b>   | Blocking              |
| <b>CLB</b>   | Clear Backward        |
| <b>CLF1</b>  | Clear Forward 1       |
| <b>CLF2</b>  | Clear Forward 2       |
| <b>DIL0</b>  | Dial 0                |
| <b>DIL1</b>  | Dial 1                |
| <b>IDL</b>   | Idle                  |
| <b>SEI</b>   | Seizure               |
| <b>SEA</b>   | Seize Acknowledgement |

**Note:** An asterisk (\*) may be appended to any of the above states. This means that the current received signaling bit value(s) do not correspond to the current signaling state.

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

|           |                                                       |
|-----------|-------------------------------------------------------|
| <b>04</b> | Subject entity is out of service                      |

## **UTL, QRY, SQN**

---

### **UTILITY QUERY SEQUENCE**

#### **Explanation Of Command**

---

This command is used to retrieve the sequence number of the last autonomous message issued by DACS II.

#### **Command**

---

[I.51131]

UTL:FRM xy,SEQ ww:QRY,SQN!

#### **Completion Message**

---

[O.51131]

M hh:mm:ss xy,ww n[vv] UTL QRY SQN nn COMPL

#### **Denial Message**

---

Not applicable.

#### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**SQN** - Sequence Number

**nn** - two digit sequence number of the last autonomous message

## **UTL, QRY, STATE, ACO**

### **UTILITY QUERY STATE ALARM CUT OFF**

#### **Explanation Of Command**

This message queries for the active or inactive status of the alarm cutoff.

#### **Command**

[I.54340]

UTL:FRM xy,SEQ ww:QRY,STATE,ACO!

#### **Completion Message**

[O.54340]

M hh:mm:ss xy ww n[vv] UTL QRY STATE ACO <mode> COMPL

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**STATE** - State

**ACO** - Alarm cut off

**mode** - Alarm mode

Current state of alarm cut off

| <i>mode</i> | <i>Explanation</i>       |
|-------------|--------------------------|
| ACTIVE      | Alarm cutoff is active   |
| INACT       | Alarm cutoff is inactive |

## **UTL, QRY, STATE, NPC**

### **UTILITY QUERY STATE**

#### **Explanation Of Command**

This command requests the provisioning and status information of a single Network Processing Circuit (NPC) or range of NPCs for one or more Facility Terminating Units (FTU) or DS3 Units (DS3U) or Hybrid DS3 units (HDS3U) or for a single Digital Signal Processing Unit (DSPU).

In the output message, the "PREVIOUS SHORT INTERVAL" data should be ignored for the first 15 minutes following the execution of the CHG::SETOP (Message I.38201) or CHG::NPC,OPTS (Message I.38221) command. These CHG commands clear the stored data, which results in a value of zero being printed for the interval count.

**Note:** If the accumulated count of a parameter reaches or exceeds its programmed threshold, an autonomous alarm message is generated.

If an NPC range is specified in the input command, the following floating window rules apply:

- Unequipped NPCs within the requested range will be skipped.
- If a CEPT gap is within the requested range, the NPCs in the gap will be skipped.
- If an endpoint of the requested range is in a CEPT gap, then the NPCs in the portion of the range which is in the gap will be denied.

### **Command**

---

### **Nonhierarchical**

---

[I.56311]

UTL:[FRM xy,SEQ ww]:QRY,STATE,NPC [s]abc[-[t]def]!

### **Hierarchical**

---

[I.56311]

UTL:[FRM xy,SEQ ww]:QRY,STATE,NPC uvmnp[-wxkqr]!

## Completion Message

### Nonhierarchical

**Note:** The following message segments will be output for each PB and PC NPC.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit starting nonhierarchical NPC number

**[t]def** - The 3- or 4-digit ending nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                                |
|              |            | 1            |                                                                                                                                              |

#### Table Notes:

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway cross-connection* the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option  $c=0$  is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the **jkl** options. Also see note [jkl].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when** *jkl=011* or *jkl=101*. **For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option *g* has meaning only if the NPC is provisioned for CAS; that is, option *d=1*, otherwise it is ignored. If option *g=0* is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option *g=1* is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and *h=1*, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option *h* was selected as either 0 or 1, unless it is later set to 0 by setting parameter *e=0* in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of *xyz* the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option *h=1*.

If both *b=1* and *h=1* and the NPC (used as synchronization source) receives NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure**. If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

**[jkl'] minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

c=0 hardware timing

c=1 firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

#### **PA-Type xyz fields**

The provisioning values of x, y, and z for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (x, y or z) provisioning value):

**Table 19-30. Provisioning values for  $x$** 

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |
| B            |               |                    |               |                            |                           |
| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 19-31. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 19-32. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8. *z* values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (*z* = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

***z*=6 or A** hardware timing

***z*=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for *z*= 6 or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for *z*= A or B**

- [vii] RBER unalarmed

- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of *xyz* for the PA type NPC.

**Table 19-33. Combinations of *x* and *y* Values**

| Invalid<br><i>xyz</i><br>Combinations | Explanation                                                                                                                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz                                   | Framed clear 2Mbit/s ( <i>y</i> value C) is valid for all <i>x</i> options except those invoking automatic CRC-4 interworking.<br>The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 9Cz                                   |                                                                                                                                                                                                                                              |
| CCz                                   |                                                                                                                                                                                                                                              |

| xD4<br>xD6                                                                                                   | Unframed clear 2Mbit/s ( <i>y</i> value D) cannot be used with <i>z</i> value 4 (NFW Bit 4 used for RAIS) or with <i>z</i> value 6 (NFW Bit 4 used for RBER) because unframed clear signals cannot obtain TS0 framing. |
| x0C<br>x2C<br>x4C<br>x6C                                                                                     | Channel Associated Signaling ( <i>y</i> values 0, 2, 4 and 6) is not valid for TRANSMIC 1G ( <i>z</i> value C).                                                                                                        |

**Table Notes:**

1. If framed clear 2Mbit/s (*y* value C) is selected with *z* value 4 (NFW Bit 4 used for RAIS) only the receive side of this function will be enabled. Outgoing RAIS indicators cannot be transmitted during clear signal operation.
2. If framed clear 2Mbit/s (*y* value C) is selected with *z* = value 6 (NFW Bit 4 used for RBER) only the receive side of this function will be enabled. Outgoing RBER indicators cannot be transmitted during clear signal operation.

**Table 19-35. Combinations of *x* and *z* Values**

| Invalid<br>xyz<br>Combinations                       | Explanation                                                                                                                                                                                                                                                       |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4yC<br>5yC<br>6yC<br>7yC<br>CyC<br>DyC<br>EyC<br>FyC | Use of NPC as Sync Source ( <i>x</i> 4, 5, 6, 7, C, D, E and F) is not valid for TRANSMIC 1G ( <i>z</i> value C). This is because the TSO Monitoring scheme used in TRANSMIC 1G prevents incoming SFI indicators from cutting off the signal to the Synchronizer. |

**CB-type xyz fields**

- x** - Fixed at 1
- y** - Fixed at 0
- z** - Network timer value
- z**      *Value in milliseconds*
- 0**      600 to 750
- 1**      1500 to 1650
- 2**      2400 to 2550
- 3**      4650 to 4800

- IW** - Insertion word
- pq** - Insertion word value (Hexadecimal)

Also referred to as the Disconnect Code (DCC) or idle code. This value is inserted in the transmit direction on unassigned channels. DCC is not applicable to clear-DS1 NPCs, and is not printed. Some common disconnect codes are:

- pq**      *Explanation*
- D5**      Unassigned Channel code (UAC), the default value

**r** - Transmitted signaling information

**r** *Explanation*

**D** Unassigned Channel code (UAC), the default value for CEPT

**00S** - Out-of-Service

**a** - Out of Service flag, applies to FTU NPCs and DSP NPCs on Side 0

**a** - Out of Service flag, applies to DSP NPCs on Side 1

**a, a** *Explanation*

**1** Out-of-service

**0** Not Out-of-service

**FAIL** - Fail

**b** - Failed flag, applies to FTU NPCs and DSP NPCs on Side 0

**b** - Failed flag, applies to DSP NPCs on Side 1

**b, b** *Explanation*

**1** Failed

**0** Not failed

**PEST** - Pest

**c** - Pested flag, applies to FTU NPCs and DSP NPCs on Side 0

**c** - Pested flag, applies to DSP NPCs on Side 1

**c, c** *Explanation*

**1** Pested

**0** Not pested

**PBA** - Primary block alarm

**d** - PBA flag

d      *Explanation*

**1**      PBA

**0**      No PBA

**Note:** The PBA flag indicates the presence of one or more of the following conditions:

|             |                                                          |
|-------------|----------------------------------------------------------|
| <b>A16</b>  | AIS received in CAS time slot 16.                        |
| <b>AIS</b>  | Alarm Indication Signal received in all 32 time slots.   |
| <b>BER</b>  | Bit Error Rate detected in received signal.              |
| <b>EER</b>  | Excessive Error Rate                                     |
| <b>LMA</b>  | Loss of Multiframe Alignment in CAS time slot 16.        |
| <b>LOFA</b> | Loss of Frame Alignment                                  |
| <b>LOS</b>  | Loss of Signal                                           |
| <b>R16</b>  | RAI received in bit 6 of frame 0 of TS16.                |
| <b>RAI</b>  | Remote Alarm Indication received in bit 3 of NFW of TS0. |
| <b>RAIS</b> | Remote AIS detected in bit 4 of TS0.                     |
| <b>RBER</b> | Remote Bit Error Rate detected in bit 4 of TS0.          |
| <b>SFI</b>  | Synchronization Failure Indication in bit 5 of TS0.      |

**Note:** The facility monitoring parameters accumulated by the NPC are described below. If the queried NPC cannot be accessed for some reason, for example because the Facility Terminating Module is not equipped or the FTMI or Unit Controller is out of service, then the NPC's parameter count fields are printed as a string of dashes to indicate that the counts are not available. The parameter thresholds and options are still correctly output in this case.

In addition, some parameters are not applicable to all NPCs. Certain parameters may or may not be collected based on NPC type and whether the NPC carries a Clear or Channelized facility. In the cases where specific parameters do not apply to the queried NPC, the respective parameter count fields, threshold values and threshold options are all displayed as a string of dashes.

**DM** - Degraded minutes

Degraded minutes are accumulated on an hourly interval and not a 15-minute interval as with SERS, ERS, US, and SLIP.

**aaaaa** - DM long interval count

**laaaa** - DM long interval threshold (1 through 1440)

**f** - DM long interval option selection (0 through C)

**jjjjj** - DM previous short interval count

**saaaa** - DM short interval threshold (1 through 60)

**k** - DM short interval option selection (0 through C)

**ooooo** - DM current short interval count

**SERS** - Severely errored seconds

**bbbbbb** - SERS long interval count (CEPT)

**lbbbb** - SERS long interval threshold (1 through 65535)

**g** - SERS long interval option selection (0 through C)

**kkkkk** - SERS previous short interval count

**sbbbb** - SERS short interval threshold (1 through 900)

**ppppp** - SERS current short interval count

**l** - SERS short interval option selection (0 through C)

**ERS** - Errored seconds

**ccccc** - ERS long interval count (CEPT)

**lcccc** - ERS long interval threshold (1 through 65535)  
**h** - ERS long interval option selection (0 through C)  
**l1111** - ERS previous short interval count  
**scccc** - ERS short interval threshold (1 through 900)  
**n** - ERS short interval option selection (0 through C)  
**qqqqq** - ERS current short interval count  
**US** - Unavailable seconds  
**ddddd** - US long interval count  
**ldddd** - US long interval threshold (1 through 65535)  
**i** - US long interval option selection (0 through C)  
**mmmm** - US previous short interval count  
**sdddd** - US short interval threshold (1 through 900)  
**p** - US short interval option selection (0 through C)  
**rrrrr** - US current short interval count  
**SLIP** - Slip  
**eeee** - Slip long interval count  
**leeee** - Slip long interval threshold (1 through 65535)  
**j** - Slip long interval option selection (0 through C)  
**nnnn** - Slip previous short interval count  
**seeee** - Slip short interval threshold (1 through 900)  
**q** - Slip short interval option selection (0 through C)  
**sssss** - Slip current short interval count

- CRC** - Cyclic redundancy code
- fffff** - CRC-4 check block error count
- FRER** - Framing error
- ggggg** - FRER count
- LOFA** - Loss of frame alignment
- hhhhh** - LOFA count
- MER** - Multiframe alignment error (time slot 16)
- iiiii** - MER count
- TS0** - Time slot 0 bits transmitted by the NPC

**abcdefgh**  
- Spare bits in TS0

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

Valid values for a through h are described below:

| <i>Bit value</i> | <i>Explanation</i>                                                |
|------------------|-------------------------------------------------------------------|
| <b>0</b>         | Transmitted bit set to binary "0"                                 |
| <b>1</b>         | Transmitted bit set to binary "1"                                 |
| <b>P</b>         | Pass-through: the received bit will be cross-connected unchanged. |

**Note:** A bit provisioned for pass-through may be cross-connected to a bit from another TS0.

The values displayed for 'abcdefgh' are those that the NPC is provisioned to transmit. The actually transmitted values may be different, depending on alarm states (see Message 56321).

**TS0M** - Time slot 0 bits monitored by NPC

**abcdefgh**

- Spare bits in TS0M

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

Valid values for bits **a** through **h** are described below:

| <i>Bit value</i> | <i>Explanation</i>                                                           |
|------------------|------------------------------------------------------------------------------|
| <b>0</b>         | Do not monitor and therefore do not send a message if this bit changes state |
| <b>1</b>         | Monitor and therefore send a message if this bit changes state               |

**TS0MBOFL**

- TS0M buffer overflow keyword

**v** - TS0M buffer overflow condition indicator

|   |                                              |
|---|----------------------------------------------|
| 0 | NPC is not in TS0M buffer overflow condition |
| 1 | NPC is in TS0M buffer overflow condition     |

**BOFL** - Buffer overflow

CB type NPC buffer overflow keyword

**o** - State of the buffer

**o** *State*

**1** C-bit buffer overflow

**0** No C-bit overflow

**cc** - Hexadecimal condition code

**cc** *Explanation*

**00** No conditions

**04** Subject entity is out of service

**11** UC is out of service

**12** UC is in service but failed

**14** FTMI is out of service

**1F** FTMI is in service but failed

**0B** Invalid CEPT NPC

**46** NPC Failed or Out of Service

## **UTL,QRY,STATE,NPC**

### **UTILITY QUERY NPC STATE**

#### **Explanation Of Command**

This command requests the provisioning and status information of a single Network Processing Circuit (NPC) or a range of NPCs. The output format shown in this message applies to PA type NPCs in one or more Facility Terminating Unit(s) (FTUs).

**NOTE:** Similar information for other NPC types are given by message 56311.

Not applicable.

## Explanation Of Parameters

**NPC** - Network Processing Circuit

If an NPC range is specified in the input command, unequipped NPCs within the requested range will be skipped.

**[s]abc** - The first 3- or 4-digit nonhierarchical NPC Number of a range.

**[t]def** - The last 3- or 4-digit nonhierarchical NPC Number of a range.

**[t]ghi** - A 3- or 4-digit nonhierarchical NPC number, where  
 $([s]abc \leq [t]ghi \leq [t]def)$

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |

**uvmnp** - The first hierarchical NPC number of a range.  
**wxkqr** - The last hierarchical NPC number of a range.  
**edhfg** - A 3- or 4-digit hierarchical NPC number, where  
 $(uvmnp \leq edhfg \leq wxkqr)$

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**mnxyz** - NPC type

**PAxyz** - Enhanced 2Mbit/s Interface NPC type (120-ohm or 75-ohm)

#### PA-Type xyz fields

The provisioning values of *x*, *y*, and *z* for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (*x*, *y* or *z*) provisioning value):

**Table 19-36. Provisioning values for  $x$** 

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |

| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 19-37. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|

| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 19-38. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.
- [ii] RAI set in 2 ms
- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:
  - z=6 or A** hardware timing
  - z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)
- [iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

- [v] RBER alarm level = MI
- [vi] NFW bit 4=RBER:
  - DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.
  - DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

- [vii] RBER unalarmed
- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

[ix] To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 19-39. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz                              | Framed clear 2Mbit/s ( $y$ value C) is valid for all $x$ options except those invoking automatic CRC-4 interworking.<br>The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 9Cz                              |                                                                                                                                                                                                                                    |
| CCz                              |                                                                                                                                                                                                                                    |

**IW** - Insertion Word

**pq** - Hexadecimal value of the DCC (disconnect code).

This value is inserted in the transmit direction on unassigned channels. DCC is not applicable to Clear-2Mbit NPCs, and is not printed. Although any 2-digit hexadecimal code may be specified, the following are the default codes:

*pq*      *Explanation*

D5      Unassigned Channel code (UAC), the default value for CEPT

**r** - Transmitted signaling information

*r*      *Explanation*

D      Unassigned Channel code (UAC), the default value for CEPT

**OOS** - Out-of-Service

**q** - Out-of-service indicator

*q*      *Explanation*

1      NPC is out-of-service

0      NPC is not out-of-service

**FAIL** - Failed

**r** - Failed indicator

*r*      *Explanation*

1      NPC is failed

0      NPC is not failed

**PEST** - Pested  
**s** - Pested indicator

*s*      *Explanation*

1      NPC is pested

0      NPC is not pested

**CRCST** - CRC Multiframe Status for NPCs with the automatic CRC mode  
**u** - CRC Multiframe status flag

*u*      *Explanation*

1      CRC Multiframe active

0      CRC Multiframe inactive

-      Not applicable, i.e., automatic CRC mode not provisioned

**FEPM** - Far End Performance Monitoring  
**v** - Far End Performance Monitoring provisioning flag

*v*      *Explanation*

1      FEPM provisioned

0      FEPM not provisioned

**SYNSRC** - Synchronization source  
**w** - SYNC source provisioning flag

*w*      *Explanation*

1      NPC used as SYNC source

0      NPC not used as SYNC source

-      Not applicable, i.e., the NPC cannot be SYNC source

**CAS** - Channel Associated Signaling  
**x** - CAS provisioning flag

*x*      *Explanation*

1      NPC with CAS

0      NPC with NSA

-      Not applicable, i.e., NPC is non-channelized

**LPBK** - Loopback status

**d** - Loopback direction flag

**t** - Loopback NPC state flag

*d Explanation*

F Facility loopback

E Equipment loopback

- Not applicable, i.e., no loopback

*t Explanation*

A AIS downstream/upstream with performance monitoring off

B AIS downstream/upstream with performance monitoring on

C Pass-through with performance monitoring off

T Pass-through with performance monitoring on

- Not applicable, i.e., no loopback

**THMOD** - Thresholding Mode

**z** - Thresholding mode flag

*z Explanation*

1 Thresholding is inhibited

0 Thresholding is allowed

**AISPROV**

- AIS provisioning

**ttt** - Provisioned AIS alarm level

The AIS PBA alarm is not provisioned for unframed clear (unchannelized) 2.048Mbit/s PAXDz type NPCs. Therefore, disregard the value of "ttt" for these NPCs, since the AIS alarm with the "ttt" alarm level will not be detected.

*ttt Explanation*

PMC Prompt maintenance alarm - critical

PMA Prompt maintenance alarm - major

DMA Deferred maintenance alarm - minor

MI Maintenance information

**ERB** - Errored block

**ee** - Percentage of errored blocks (1% through 91%, default is 81%)

The number of errored blocks, expressed as a percentage, used to declare a severely errored second (SES) or far-end SES (FSES).

**PBA** - Primary block alarm

**p** - PBA flag

| <i>p</i> | <i>Explanation</i> |
|----------|--------------------|
| 1        | PBA                |
| 0        | No PBA             |

The PBA flag indicates the presence of one or more of the failure conditions output in the same data line.

**LOS** - Loss of Signal

**LOF** - Loss of Frame

**AIS** - Alarm Indication Signal received in all 32 time slots.

**EER** - Excessive Error Rate

**RAI** - Remote Alarm Indication received in bit 3 of NFW of TS0.

**LMA** - Loss of Multiframe Alignment in CAS time slot 16.

**LCMA** - Loss of CRC4 Multiframe Alignment

**BER** - Bit Error Rate detected in received signal.

**A16** - AIS received in CAS time slot 16.

**RAIS** - Remote AIS detected in bit 4 of NFW of TS0.

**RBER** - Remote Bit Error Rate detected in bit 4 of NFW of TS0.

**RMA** - Remote Multiframe Alarm received in bit 6 of frame 0 of TS16.

**SFI** - Synchronization Failure Indication in bit 5 of NFW of TS0.

**PFW00F** - Pseudo Frame Word Out-Of-Frame for TS0 to non-TS0 cross-connect.

**FLCMA** - Far-end loss of CRC-4 Multiframe Alignment.

**RPSFI** - Remote Power Supply Failure Indicator

**y** - failure flag

*y*      *Explanation*

1      The failure condition exists

0      The failure condition does not exist

-      The detection of the failure condition is not provisioned

**Note:** The facility monitoring parameters accumulated by the NPC are described below. If the queried NPC cannot be accessed for some reason, for example because the Unit Controller is out of service, then the NPC's parameter count fields are printed as a string of dashes to indicate that the counts are not available. The parameter thresholds and options are still correctly output in this case.

In addition, some parameters are not applicable to all NPCs. Certain parameters may or may not be collected based on NPC type and whether the NPC carries a Clear or Channelized facility. In the cases where specific parameters do not apply to the queried NPC, the respective parameter count fields, threshold values and threshold options are all displayed as a string of dashes.

PA NPC performance monitoring parameters:

**CRC** - CRC Block Errors

**FRER** - Framing Errors

**OFS** - Out of Frame Seconds

**ES** - Errored Seconds

**SES** - Severely Errored Seconds

**CSS** - Controlled Slip Seconds

**CV** - Coding Violations

**UAS** - Unavailable Seconds

**UATC** - Unavailable Time Count

**MER** - Multiframe Errors

**FEBE** - Far End Block Errors

**FES** - Far End Errored Seconds

**FSES** - Far End Severely Errored Seconds

**FUAS** - Far End Unavailable Seconds

**Note that parameters FEBE, FES, FSES and FUAS are not applicable for the TH type NPCs.**

**aaaaaaaa**

- Daily CRC block error current counts.

**bbbbbbbb**

- Daily framing error current counts.

**cccc** - Daily out of frame seconds current counts.

**dddd** - Daily errored second current counts.

**eeee** - Daily severely errored second current counts.

**ffff** - Daily controlled slip second current counts.

**gggggggg**

- Daily coding violation current counts.

**hhhh** - Daily unavailable second current counts.

**iiii** - Daily unavailable time count current counts.

**jjjj** - Daily multiframe alignment error current counts.

**kkkkkk**

- Daily far-end block error current counts.

**llll** - Daily far-end errored second current counts.

**mmmm** - Daily far-end severely errored second threshold value.

**nnnn** - Daily far-end unavailable second current counts.

**aaaaaaaa**

- Daily CRC block error threshold value.

**bbbbbbbb**

- Daily framing error threshold value.

**cccc** - Daily out of frame seconds threshold value.

**dddd** - Daily errored second threshold value.

**eeee** - Daily severely errored second threshold value.

**ffff** - Daily controlled slip second threshold value.

#### For PA type NPCs:

Depending on which interface functions are enabled by the provisioning values of xyz, some parameters may not be applicable. In this case the threshold value, the parameter count (if present in the message) and the selection value will appear as dashes ("-"). In the table below "N/A" indicates that a parameter is not applicable for the given value of x or y.

Also, if the selection value m=c has been chosen for a parameter, the threshold value and the parameter count (if present in the message) will appear as dashes.

| For PA Type NPCs |                                    |                                            |                             |                                 |
|------------------|------------------------------------|--------------------------------------------|-----------------------------|---------------------------------|
| Parameter        | CRC-4 Mode Disabled<br>(x=A,B,E,F) | Far-End PM Disabled<br>(x=0,2,4,6,A,B,E,F) | CAS Disabled<br>(y=8,9,C,D) | Unframed Clear 2Mbit/s<br>(y=D) |
| CRC              | N/A                                |                                            |                             | N/A                             |

| FES              |                                    | N/A                                        |                             | N/A                             |
| FSES             |                                    | N/A                                        |                             | N/A                             |
| FUAS             |                                    | N/A                                        |                             | N/A                             |

**TS0** - Time Slot 0

Note that the TS0 output data field will be populated with dashes ("-") if the NPC is provisioned as a non-channelized NPC, that is, clear 2Mbit/s NPC.

**abcdefgh**

- Spare bits in TS0

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW  
if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

Valid values for a through h are described below:

| <i>Bit<br/>value</i> | <i>Explanation</i>                                                |
|----------------------|-------------------------------------------------------------------|
| <b>0</b>             | Transmitted bit set to binary "0"                                 |
| <b>1</b>             | Transmitted bit set to binary "1"                                 |
| <b>P</b>             | Pass-through: the received bit will be cross-connected unchanged. |

**Note:** A bit provisioned for pass-through may be cross-connected to a bit from another TS0.

The values displayed for 'abcdefgh' are those that the NPC is provisioned to transmit. The actually transmitted values may be different, depending on alarm states (see UTL::QRY,TS0,NPC).

**TS0M** - Time slot 0 bits monitored by NPC

The TS0 output data field will be populated with dashes ("-") if the NPC is provisioned as a non-channelized NPC, i.e., clear 2Mbit/s NPC.

**abcdefgh**

- Spare bits in TS0M

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

Valid values for bits **a** through **h** are described below:

| <i>Bit<br/>value</i> | <i>Explanation</i>                                                           |
|----------------------|------------------------------------------------------------------------------|
| <b>0</b>             | Do not monitor and therefore do not send a message if this bit changes state |
| <b>1</b>             | Monitor and therefore send a message if this bit changes state               |

**TS0MBOFL**

- TS0M buffer overflow

**v** - TS0M buffer overflow condition indicator

| <i>v</i> | <i>Explanation</i>                           |
|----------|----------------------------------------------|
| <b>0</b> | NPC is not in TS0M buffer overflow condition |
| <b>1</b> | NPC is in TS0M buffer overflow condition     |

**COND** - Condition

**kk** - Hexadecimal completion condition code

**cc** - Hexadecimal denial condition code

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>Explanation</b>                      |
|-----------|-----------------------------------------|
| <b>00</b> | <b>No conditions</b>                    |
| <b>04</b> | <b>Subject entity is out of service</b> |
| <b>11</b> | <b>UC is out of service</b>             |
| <b>12</b> | <b>UC is in service but failed</b>      |
| <b>14</b> | <b>FTMI is out of service</b>           |
| <b>0B</b> | <b>Invalid CEPT NPC</b>                 |
| <b>46</b> | <b>NPC Failed or Out of Service</b>     |

| <b>c</b>       |                                            |
| <b>d</b>       | <i>Explanation</i>                         |
| 0              | Out of service                             |
| 1              | In service                                 |

**SOURCE** - Timing source

**e** - Timing Source status, side 0

**f** - Timing Source status, side 1

**e**

**f** *Explanation*

0 No SSP on side 1 is in service

1 At least one SSP on side 1 is in service

**gh,**

**ij** - Active SSP number

These variables will be output as "--" if no active SSP is present for SYNC 0 and SYNC 1, respectively

**g, i** - Timing link interface number of active SSP

**h, j** - Synchronizer synchronization port (SSP) number

**PLL** - Phase locked loop

**k** - Phase-locked loop timing error, side 0

**l** - Phase-locked loop timing error, side 1

**k**

**l** *Explanation*

0 No errors

1 PLL error exists

**cc** - Hexadecimal condition code

**cc** *Explanation*

**16** SYNC TB is not equipped

| <b>m</b> | - Mode                                          |
| <b>m</b> | <i>Status</i>                                   |
| 0        | Idle                                            |
| 1        | Input message in progress                       |
| 2        | Output message in progress                      |
| <b>s</b> | - Status                                        |
|          | This status applies to the following protocols: |
|          | Snider                                          |
|          | Modified Snider                                 |
|          | X.25 (Single or Range of Virtual Circuits)      |
|          | TABS                                            |
| <b>s</b> | <i>Explanation</i>                              |
| 0        | In service                                      |
| 1        | Out-of-service (OOS)                            |

**xxxx** - Virtual circuit (VC) status (hexadecimal). Range 0000 through FFFF.

This status applies to the X.25 protocol. A four-digit hexadecimal number will be output in the protocol field whenever a specific VC number is not entered. Each digit represents four bits and each bit is associated with a particular VC. The four hexadecimal digits therefore represent 16 VCs. The bits are assigned to VCs from right to left in increasing order of VC number. That is, bit 1 represents VC 1 and bit 16 represents virtual circuit 16. See below where VC16 marks the position of the bit representing virtual circuit 16 and VC01 similarly marks the position of the bit representing VC 1.

|             |                               |
|-------------|-------------------------------|
| <b>hex</b>  | <b>binary</b>                 |
| <b>xxxx</b> | <b>bbbbbbbbbbbbbbbb</b>       |
|             | ^ ^                           |
|             | <b>VC16</b> <b>&lt;--VC01</b> |

The interpretation of the value of a particular bit is given in the explanation of variable s above. Some specific examples of the output are interpreted below.

| xxxx | binary expansion | Explanation                             |
|------|------------------|-----------------------------------------|
| 0000 | 0000000000000000 | All 16 VCs in service                   |
| 0001 | 0000000000000001 | VC 1 OOS, all others in service         |
| 0002 | 0000000000000010 | VC 2 OOS, all others in service         |
| 8004 | 1000000000000100 | VCs 16 and 3 OOS, all others in service |
| FFFF | 1111111111111111 | All VCs are OOS                         |

**hh** - Hardware status

| <b>hh</b> | <i>Explanation</i>                           |
|-----------|----------------------------------------------|
| 03        | Link hardware in service                     |
| 04        | Link hardware out of service                 |
| 05        | Link hardware pested for autonomous restoral |

|             |                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------|
| <b>LNKL</b> | - Link Layer                                                                                           |
| <b>b</b>    | - Maximum number of outstanding I frames (1 through 7). Default is 7                                   |
| <b>eee</b>  | - Acknowledgment timer (2 through 20 seconds). Default is 3 seconds                                    |
| <b>ggg</b>  | - Disconnect (or Idle channel) timer (4 through 120 seconds). Default is 26 seconds                    |
| <b>aa</b>   | - Maximum number of frame transmissions (2 through 16) (including original transmission). Default is 7 |
| <b>A</b>    | - Data link layer frame address A                                                                      |
| <b>B</b>    | - Data link layer frame address B                                                                      |
| <b>PKTL</b> | - Packet layer                                                                                         |
| <b>c</b>    | - Window size (1 through 7). Default is 2                                                              |
| <b>ddd</b>  | - Packet size P (ddd) can be 128, 256, or 512 octets. Default is 128 octets                            |
| <b>iii</b>  | - Restart request response timer (10 through 180 seconds). Default is 180 seconds                      |
| <b>jjj</b>  | - Reset request response timer (10 through 180 seconds). Default is 180 seconds                        |
| <b>kkk</b>  | - Disconnect (or Idle channel) timer (10 through 180 seconds). Default is 180 seconds                  |
| <b>lll</b>  | - Data packet acknowledgement timer (10 through 200 seconds). Default is 200 seconds                   |
| <b>mmm</b>  | - Interrupt response timer (10 through 180 seconds). Default is 180 seconds                            |
| <b>nn</b>   | - Restart request retransmission counter (1 through 10). Default is 1                                  |
| <b>p</b>    | - Reset request retransmission counter (1 through 3). Default is 1                                     |
| <b>q</b>    | - Clear request retransmission counter (1 through 10). Default is 1                                    |
| <b>r</b>    | - Data packet retransmission counter (0 through 3). Default is 0                                       |

**ppss** - Virtual circuit range

**pp** - Range of permanent virtual circuits (PVCs).

**ss** - Range of switched virtual circuits (SVCs).

The sum of the number of PVCs and SVCs must be equal to 16.

Table 1 shows the default values for these fields.

Table 1 and Table 2 show the acceptable values for these fields, allowing for an LCN numbering scheme of 00-255.

TABLE 1

| "pp" | "ss" | Number<br>of PVCs | Number<br>of SVCs | Starting LCN for first<br>PVC Channel | Starting LCN for first<br>SVC Channel |
|------|------|-------------------|-------------------|---------------------------------------|---------------------------------------|
| 00   | 16   | 00                | 16                | --                                    | 01                                    |

**gghh** - Virtual circuit group number

**gg** - Group number of all PVCs

**hh** - Group number for all SVCs (00 through 15)

**APPL** - Application layer

**ASCS** - Alarm surveillance and control, summary

**ASCD** - Alarm surveillance and control, detailed

**PM** - Performance monitoring

**aa** - Layer 2 address

**ttt** - Polling time

**DBIT** - D-bit

**v** - X.25 d-bit setting

**v**      *Explanation*

0      Off (unset) (acknowledgement done from local DTE). Default

1      On (set) (acknowledgement done from remote DTE)

DBIT is valid only on a per link basis and will be denied on an individual virtual circuit.

**COND** - Condition

**cc** - Hexadecimal condition code

**cc**      *Explanation*

**E1**      Virtual circuit is not specified for X.25 link

**E2**      Invalid link number specified

## **Explanation Of Parameters**

---

**STR** - Status register

**SYNC** - Synchronizer

**a** - Synchronizer number (0 or 1)

**byte01,**

...,

**byte12** - Status register data bytes

Each data byte contains eight bits. These bits are labeled, in the order they appear in the output, as abcdefgh. These bits are set for the following conditions:

byte01

- a** - Unused by craft
- b** - Sync core hardware fault
- c** - Mate sync is bad or declared out of service
- d** - Time base is bad or missing
- e** - TLI 1 in service without errors
- f** - TLI 2 in service without errors
- g** - TLI 3 in service without errors
- h** - TLI 4 in service without errors

byte02

- a** - Timing Extractor Timing link 1 is in service and good
- b** - Timing Extractor Timing link 2 is in service and good
- c** - Timing Extractor Timing link 3 is in service and good
- d** - Timing Extractor Timing link 4 is in service and good
- e** - Timing Extractor Timing link 5 is in service and good
- f** - Timing Extractor Timing link 6 is in service and good
- g** - Timing Extractor Timing link 7 is in service and good
- h** - Timing Extractor Timing link 8 is in service and good

byte03

- a** - Sync has been reset and awaits configuration
- b** - Hardware error on DPLL pack. See byte06 and byte07
- c** - Time base has an error, see byte09
- d** - PLL symmetry error, see byte08
- e** - Problem with cross-couple timing. See byte10 and byte11
- f** - Problem with CRO timing. See byte12
- g** - Unused bit
- h** - Unused bit

**byte04** - Sync configuration data

**ab** - Sync architecture:

| <i>ab</i> | <i>Explanation</i>                    |
|-----------|---------------------------------------|
| 00        | Sync is slave in master-slave system  |
| 01        | Sync is master in master-slave system |

**cde** - Operational stratum

| <i>cde</i> | <i>Explanation</i>  |
|------------|---------------------|
| 000        | Domestic stratum 3  |
| 001        | CEPT local exchange |
| 010        | CEPT toll exchange  |
| 011        | Domestic stratum 2  |

**fg** - PLL locking mode

| <i>fg</i> | <i>Explanation</i> |
|-----------|--------------------|
| 00        | Normal             |
| 01        | Fast               |
| 10        | Holdover           |

**h** - Unused by craft

- byte05** - Sync configuration data
- ab** - Source of timing to which Sync is presently locking
- | <i>ab</i> | <i>Explanation</i>               |
|-----------|----------------------------------|
| 00        | Holdover (Not locking)           |
| 01        | Timing link(s)                   |
| 10        | Cross couple                     |
| 11        | CRO (Clock Reference Oscillator) |
- cde** - Active Link: Which timing link the Sync is locking to (This field is meaningful only if byte04 ab = 00 and byte05 ab = 01)
- | <i>cde</i> | <i>Explanation</i> |
|------------|--------------------|
| 000        | TLI 1, Link 0      |
| 001        | TLI 1, Link 1      |
| 010        | TLI 2, Link 0      |
| 011        | TLI 2, Link 1      |
| 100        | TLI 3, Link 0      |
| 101        | TLI 3, Link 1      |
| 110        | TLI 4, Link 0      |
| 111        | TLI 4, Link 1      |
- f** - Unused by craft
- g** - Unused by craft
- h** - Unused by craft
- byte06** - DPLL Hardware status. If any bit equals 1, a DPLL hardware failure is indicated
- a** - ROM error
- b** - RAM error
- c** - Phase/Frequency latch error
- d** - Loss of energy on 2.048 MHz output of frequency synthesizer
- e** - Loss of energy on 2.048 MHz output of phase shifter
- f** - Loss of energy on generated sync pulse
- g** - Loss of energy on time base strobe signal
- h** - Unused by craft
- byte07** - DPLL Hardware status. If any bit equals 1, a DPLL hardware failure is indicated
- a** - Interrupt controller error
- b** - Interrupt holding register error
- c** - UART error
- d** - Control data readable output latch error
- e-h** - Unused bits

- byte08** - PLL status
- a** - PLL end of range indicator
  - b** - PLL excessive range error
  - c** - PLL real time violation
  - d** - Fast start timeout
  - e-h** - Unused bits
- byte09** - Time base status
- a** - Loss of energy for time base signal
  - b** - Time base I/O error
  - c** - Time base oscillator has drifted beyond its specified accuracy limit. (This condition is monitored only when the sync is the master timing source)
  - d** - Time base oven is cold. It must warm up for accurate holdover
  - e** - Unused bit
  - fgh** - Stratum of oscillator:
- | <i>fgh</i> | <i>Explanation</i>        |
|------------|---------------------------|
| 000        | TBS3, Domestic stratum 3  |
| 001        | TBCL, CEPT local exchange |
| 010        | TBCT, CEPT toll exchange  |
| 011        | TBS2, Domestic stratum 2  |
- byte10** - Cross Couple Status
- a** - Mate sync declared out-of-service by MC
  - b** - Mate sync hardware error
  - c** - Loss of energy on the 1 ms cross couple interrupt flag
  - d** - Loss of energy on the 30 ms cross couple interrupt flag
  - e** - Cross couple fast lock not working
  - f** - Sync's time base drifting with respect to CRO in master mode
  - g** - Cross couple timing problem
  - h** - Cross couple timing problem - mate sync's timing suspected
- byte11** - Cross couple status
- a** - Sync clocks not aligned, cross couple network may alarm
  - b-h** - Unused bits

**byte12** - CRO status

The following bits are important only when the sync is a master timing source:

- a** - Timing from CRO bad or declared out of service by MC
- b** - CRO declared out of service by the MC
- c** - Loss of energy on the CRO input signal flag
- d** - In master mode, CRO drifting with respect to sync time bases
- e-h** - Unused bits

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 02** Subject entity is not equipped
- 04** Subject entity is out of service
- 05** Subject entity is pested
- 16** SYNC TB is not equipped
- 17** SYNC is out of service
- C8** Sync pack denied command

## **UTL,QRY,STR,SYNC,TLI**

### **UTILITY QUERY, TIMING LINK INTERFACE**

#### **Explanation Of Command**

This message requests a printout of the 3-byte status register of a timing link interface (TLI) for a specific synchronizer.

#### **Command**

[I.55311]

UTL:FRM xy,SEQ ww:QRY,STR,SYNC a,TLI m!

#### **Completion Message**

[O.55311]

M hh:mm:ss xy,ww n[vv] UTL QRY STR SYNC a TLI m <byte01> \  
<byte02> <byte03> COMPL

#### **Denial Message**

[O.55311.01]

M hh:mm:ss xy,ww n[vv] UTL QRY STR SYNC a TLI m COND cc DNY

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**STR** - Status register

**SYNC** - Synchronizer

**a** - Synchronizer number (0 or 1)

**TLI** - Timing link interface

**m** - Timing link interface number (1 through 4)

**byte01,**

...,

**byte03** - Status register data bytes

Each data byte contains eight bits: abcdefgh. These bits are set for the following conditions:

**byte01** - Overall TLI type and configuration

abcd TLI type

0000 TXB1, 1.544 Mb/s DS1 Extractor

0001 TXB2, 2.048 Mb/s Primary Block (120 OHM) Extractor

0010 TXCC, Composite Clock Extractor

0011 TXUC, High Level Unipolar Clock Extractor

0100 TXRF, Basic System Reference Frequency and  
CEPT 2.048 MHz Sine (75 OHM) Extractor

0101 TDCC, 64 kb/s Composite Clock Distributor

0110 TDS2, 2.048 MHz Sine Distributor

0111 TXCP, CEPT 2.048 MHz Sine (120 Ohm) Extractor

**e** - TLI is grown

**f** - TLI out-of-service

**g** - TLI hardware error

**h** - Unused bit

**byte02** - TLI phase detector and timing monitor circuitry status

- a** - Hardware energy detector on the time base strobe signal has failed
- b** - Loss of timebase strobe signal coming from the DPLL
- c** - Hardware energy detector on the CRO signal has failed
- d** - Loss of reference clock signal coming from the CRO

**Note:** Bits c and d have meaning only for TDCC and TDS2 TLIs and when the SYNC is a master timing source.

For TXB1 or TXB2 TLIs:

- e** - Framer chip on side 0 has failed
- f** - Framer chip on side 1 has failed

For TXCC TLIs:

- e** - Out-of-lock detector on side 0 has failed
- f** - Out-of-lock detector on side 1 has failed

**Note:** Bits e and f have meaning only for TE TLIs

**byte03** - Hardware status and diagnostic results for Timing Distributor (TD) type TLI only

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 05** Subject entity is pested
- 16** SYNC TB is not equipped
- 17** SYNC is out of service
- A5** (Timing Distributor) TLI is not equipped
- C8** Sync pack denied command

## **UTL,QRY,STR,SYNC,TLI,SSP**

### **UTILITY QUERY SSP**

#### **Explanation Of Command**

This message requests a printout of the 5-byte status register for a select synchronizer port (SSP). The port is located on a timing link interface (TLI) circuit pack of a synchronizer.

### Explanation Of Parameters

**STR** - Status register

**SYNC** - Synchronizer

**a** - Synchronizer number (0 or 1)

**TLI** - Timing link interface

**m** - Timing link interface number (1 through 4)

**SSP** - Synchronization Sync Port

**b** - Synchronization Sync Port number (0 or 1)

**NPC** - Network processing circuit

**abc** - Nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PB and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1  | Unit<br>2  |
|------------|------------|
| <b>NPC</b> | <b>NPC</b> |
| <b>030</b> | <b>190</b> |
| <b>032</b> | <b>192</b> |
| <b>070</b> | <b>230</b> |
| <b>072</b> | <b>232</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 |
|-----------|-----------|
| NPC       | NPC       |
| 0030      | 0190      |
| 0032      | 0192      |
| 0070      | 0230      |
| 0072      | 0232      |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

PB and PC NPC numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit   | Module | NPC    |
|--------|--------|--------|
| 01, 02 | 1, 2   | 30, 32 |

**byte1, ... byte5**  
- Status register data bytes

Each data byte contains eight bits: abcdefgh. These bits are set for the following conditions:

**byte1** - Overall status and configuration

- a** - Timing link is grown
- b** - Timing link out-of-service
- c** - Timing link out-of-service; Timing signal from the link has serious enough errors that it will not be accepted as a source of reference clock
- d** - TE TLI hardware problem; link will not be accepted as a source of reference clock
- e-h** - Undefined

**byte2** - Timing link priority field. This field ranges from a value of 1 (highest) to 8 (lowest) for master/slave synchronization networks and affects the choice of a link as the active timing source.

- byte3** - Characteristics of the timing source
- abc** - Framing format (TXB1 or TXB2 TE TLIs only)
    - For TXB1 TE TLIs:
      - 000 D4
      - 001 ESF
      - 010 DDS
    - For TXB2 TE TLIs:
      - 000 CCS
      - 001 ERSM
      - 010 CAS0
      - 011 CAS1
  - de** - Line format (TXB1 or TXB2 TE TLIs only)
    - For TXB1 TE TLIs:
      - 00 Bipolar
      - 01 B8ZS
    - For TXB2 TE TLIs:
      - 00 AMI
      - 01 HDB3
  - fgh** - Frequency (TXUC TLIs only)
    - 000 512 kHz
    - 001 1.000 MHz
    - 010 1.544 MHz

## Explanation Of Parameters

**SYNC** - Synchronizer

**TYPE** - Type  
Request for provisioning information

**TB** - Time base

**mnxyz** - SYNC time base type

| <i>mnxyz</i> | <i>Explanation</i> |
|--------------|--------------------|
| -----        | Not equipped       |
| TB1yz        | CEPT Local         |
| TB2yz        | CEPT Toll          |

**TLI** - Timing link interface

**pqxyz** - TLI type provisioned on synchronizer synchronization port (SSP) 0  
**rsxyz** - TLI type provisioned on SSP 1

| <i>pqxyz</i><br><i>rsxyz</i> | <i>Explanation</i>                                                                        |
|------------------------------|-------------------------------------------------------------------------------------------|
| -----                        | Not equipped                                                                              |
| TCxyz                        | 64 kb/s composite clock timing extractor                                                  |
| TD1yz                        | 64 kb/s composite clock timing distributor                                                |
| TD2yz                        | Sinusoidal 2.048 MHz timing distributor                                                   |
| TPxyz                        | 2.048 Mb/s primary block timing extractor<br>(xyz should be same as for PBxyz/PCxyz NPCs) |
| TUxyz                        | Unipolar clock timing extractor                                                           |
| TRxyz                        | Basic system reference frequency timing extractor                                         |

For CRO applications in MASTER mode, TLI 3 is equipped with a Time Base circuit pack. In this case, "pqxyz" = "mnxyz", showing the Time Base type in the TLI 3 and TLI 4 positions.

**SRC** - Source

**p** - Source for priority for the given TLI/SSP

| <i>p</i> | <i>Explanation</i>                                  |
|----------|-----------------------------------------------------|
| -        | Not equipped.                                       |
| 1-8      | 1 is the HIGHEST priority, 8 is the LOWEST priority |

**VALUE** - Value

**SOURCE** - Source

**NPC** - Network processing circuit

**cc** - Hexadecimal condition code

**cc** *Explanation*

**00** No conditions

| SPLNOY | Split with yellow alarm transmission disabled |

**UEQD** - Unequipped

**NN** - TG width (01 through 31)

**cc** - Hexadecimal condition code

**cc** *Explanation*

**63** None of the designated TG(s) are equipped

## **UTL, QRY, TO**

---

### **QUERY DESTINATION CROSS-CONNECT**

#### **Explanation Of Command**

---

This command requests circuit provisioning information associated with the specified To-direction termination(s). The output messages generated depend upon:

- Whether or not the termination is assigned,
- Whether or not the termination is a test port termination,
- The type of network processing circuit for this termination,
- The far-end to which the termination is mapped (if any).

For this utility command, DACS II terminations can be divided into two categories:

- Multipoint termination, which is a multipoint circuit on a real digital multipoint bridge (DMB) in the digital signaling processing unit (DSPU), or in virtual network processing circuits.
- All other terminations.

If the network processing circuit (NPC) number specified in the command is the number of a remote terminal (DL) digroup currently under protection by the protection digroup (DGP), the execution of the command will be completed and DGP with its associated NPC number appears on the output message.

For a SLC® carrier denial message, the following appears on output: the bank identification number, operation mode, and digroup A NPC number for that remote terminal.

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**ddd** - Beginning range channel or conference number  
**eee** - End range channel or conference number  
**kkk** - Mid-range channel or conference number  
**lll** - Mid-range channel or conference number  
**hhh** - Typical midrange channel or conference number

Valid values are given below

Channel numbers

000-031          CEPT

000-127          (C-bit processing)

Conference numbers

001-500          (Virtual NPC)

001-085          (MB NPC)

**UASGN** - Unassigned

**DCC** - Disconnect code

**tc** - Trunk conditioning

Represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word (IW) specification.

Valid values are listed below:

*tc*

**TC(ijkl,mnop) IW pq**

**TC(----,mnop) IW pq**

**TC(ab,cd) IW pq**

**TC(--,cd) IW pq**

**TRSP IW pq**

**TRSP**

*signaling modes*

**2-way 4-state**

**1-way 4-state**

**2-way 16-state**

**1-way 16-state**

**(DMB to DMB)**

**Note:** For CEPT to CEPT connections, the insertion word may be specified by the USER if the NPC is provisioned for firmware control. Otherwise, the insertion word defaults to X'FF.

**Note:** For connection of Channel Time Slot 16 (CTS 16) to the CPR pack, the tc field is not output. Also the only optional keywords that can be output are [ **CUS**][ **RDC**].

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC(abcd,efgh)**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**MD** - Mode

**g[g]** - Mode of operation of the RT or DCLU

*g[g] Explanation*

**1** SLC 96 Carrier Mode 1

**3** SLC 96 Carrier Mode 3

**C** SLC Series 5 Carrier Feature Package C (FPC)

**NAM** - No A to Mu (conversion)

In all cases where the NAM keyword is output, the A law to  $\mu$  law and  $\mu$  law to A law code translators on the PA, PB and PC type NPCs are disabled.

Presence of the NAM keyword in the output reports on the conversion mode of the circuit, not necessarily on the input keyword used to create it, since NAM is the default case for CEPT to CEPT two — point connections.

For multipoint connections the conference mode is established as NAM or A law to  $\mu$  law when the first CEPT leg is connected.

The NAM keyword is output only in the following cases:

*two—point:*

- CEPT to CEPT
- CEPT to North American

*multi—point:*

- CEPT only or GATEWAY conference:  
NAM keyword is output **ONLY** if conference mode is NAM  
  
This applies to both the CEPT and North American legs of a GATEWAY conference.

The NAM keyword is *NOT* output in the following cases:

*two—point:*

- North American to North American

*multi—point:*

- CEPT only or GATEWAY conference:  
NAM keyword is **NOT** output if conference mode is A law to  $\mu$  law.
- North American only conference:  
Here the conference mode is NAM.

**Note:** For purposes of this utility, a CEPT only multipoint conference created without the NAM keyword is considered a conversion type conference, *even though all data is externally transmitted in A law*, because canceling A law to  $\mu$  law and  $\mu$  law to A law conversions are done. This type of conference has more quantization noise than a true NAM connection such as a CEPT to CEPT two — point.

**[t]defiii**

- Nonhierarchical FROM termination

**[t]def** - The 3- or 4-digit nonhierarchical NPC number

Valid values are identical to those for [s]abc

**iii** - Channel number

Valid values are identical to those for ddd

**ppqqq** - NPC type of the FROM termination

To interpret values of ppqqq see the table following mnxyz below.

**Note:** If ppqqq = MB100 or VI100,  
then FROM is a multipoint termination and TO is not.

If ppqqq = PAxyz, PBxyz, or PCxyz, then TO is a multipoint termination,  
FROM is not.

**TYPE** - Type

**mnxyz** - NPC Type

| <b>mn</b> | <i>Explanation</i>                                      |
|-----------|---------------------------------------------------------|
| CB        | C-Bit processing NPC                                    |
| MB        | Digital multipoint bridge NPC                           |
| PA        | Primary block NPC (120- or 75-Ohm)                      |
| PB        | Primary block NPC (120-Ohm twisted pair)                |
| PC        | Primary block NPC (75-Ohm coaxial)                      |
| SD        | Digital Signal Processing Application NPC on TG193 pack |
| VI        | Virtual NPC                                             |

**xyz** - Multiframe, line and signaling, and channel numbering formats

**CB-type xyz fields**

**x** - Fixed at 1

**y** - Fixed at 0

**z** - Network timer value

| <b>z</b> | <i>Value in milliseconds</i> |
|----------|------------------------------|
| <b>0</b> | 600 to 750                   |
| <b>1</b> | 1500 to 1650                 |
| <b>2</b> | 2400 to 2550                 |
| <b>3</b> | 4650 to 4800                 |

**PA-Type xyz fields**

The provisioning values of *x*, *y*, and *z* for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (*x*, *y* or *z*) provisioning value):

**Table 19-42. Provisioning values for *x***

| <b>x<br/>value</b> | <b>CRC-4<br/>Mode</b> | <b>Automatic<br/>CRC-4</b> | <b>Far-End<br/>PM</b> | <b>NPC used as<br/>Sync Source</b> | <b>TS0 Bit 5<br/>used for SFI</b> |
|--------------------|-----------------------|----------------------------|-----------------------|------------------------------------|-----------------------------------|
| <b>0</b>           | Y                     |                            |                       |                                    |                                   |
| <b>1</b>           | Y                     |                            | Y                     |                                    | Y                                 |
| <b>2</b>           | Y                     |                            |                       |                                    | Y                                 |
| <b>3</b>           | Y                     |                            | Y                     |                                    |                                   |
| <b>4</b>           | Y                     |                            |                       | Y                                  |                                   |
| <b>5</b>           | Y                     |                            | Y                     | Y                                  | Y                                 |
| <b>6</b>           | Y                     |                            |                       | Y                                  | Y                                 |
| <b>7</b>           | Y                     |                            | Y                     | Y                                  |                                   |
| <b>8</b>           |                       | Y                          | Y                     |                                    |                                   |
| <b>9</b>           |                       | Y                          | Y                     |                                    | Y                                 |
| <b>A</b>           |                       |                            |                       |                                    | Y                                 |
| <b>B</b>           |                       |                            |                       |                                    |                                   |
| <b>C</b>           |                       | Y                          | Y                     | Y                                  |                                   |
| <b>D</b>           |                       | Y                          | Y                     | Y                                  | Y                                 |
| <b>E</b>           |                       |                            |                       | Y                                  | Y                                 |
| <b>F</b>           |                       |                            |                       | Y                                  |                                   |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled (*x* values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 19-43. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.

2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected ( $y$  value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected ( $y$  values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For  $y$  values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering ( $y=8$ ) or Timeslot Channel Numbering ( $y=9$ ) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface ( $y=C$ ) or as an unframed clear 2Mbit/s interface ( $y=D$ ). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 19-44. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )
3. z values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For z values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For z values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS

in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when z = 0, 1, 4, 5, 6, 7, A or B. **However**, for z values 2 and 8 the set time is 144 ms and for z values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for z = 4 and 8) or 480 ms (for z = 5 and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:
  - DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.
  - When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.
- [ii] RAI set in 2 ms
- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:
  - z=6 or A** hardware timing
  - z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

[iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 19-45. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Table 19-48. NPC Provisioning Options**

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                         |
|--------------|------------|--------------|------------------------------------------------------------------------|
| x            | a          | 0            | CRC multiframe in TS0                                                  |
|              |            | 1            | Non-CRC framing in TS0                                                 |
|              | b          | 0            | NPC is not used as a synchronization source                            |
|              |            | 1            | NPC is used as a synchronization source                                |
|              | c          | 0            | CCITT G.732 (hardware controlled) Consequent Actions, AIS in signaling |
|              |            | 1            | Firmware controlled Consequent <i>Actions</i> <sup>[c]</sup>           |
|              | d          | 0            | Non-signaling associated (NSA)                                         |
|              |            | 1            | 16-state channel associated signaling (CAS)                            |

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                                              |
|--------------|------------|--------------|---------------------------------------------------------------------------------------------|
| y            | e          | 0            | Telephone channel numbering                                                                 |
|              |            | 1            | Channel timeslot numbering                                                                  |
|              | f          | 0            | Convert the <i>abcd</i> bits of TS16 to 1111 if 0000                                        |
|              |            | 1            | Transmit the 0000 in the <i>abcd</i> bits transparently                                     |
|              | g          | 0            | AIS applied to received TS16 on detection of RAI, RAIS, or R16                              |
|              |            | 1            | AIS not applied to received TS16 on detection of RAI, RAIS, or R16                          |
|              | h          | 0            | NFW bit 5=Synchronization Failure Indication (SFI) unaffected by Synchronizer Holdover (SH) |
|              |            | 1            | NFW bit 5=SFI inverted on SH on output and detected on input                                |

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                                                                                         |
|--------------|------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| z            | jkl        | 000          | NFW bit 3=RAI set in < 2 ms,                                                                                                           |
|              |            | 001          | NFW bit 3=RAI set in time $T^{[c']}$                                                                                                   |
|              |            | 010          | NFW bit 4=RAIS in time $T^{[c']}$ and RAI in < 2 ms                                                                                    |
|              |            | 011          | Enable BER calculations, BER alarm level = DMA, NFW bit 4=RBER, RAI set in < 2 ms, for c=1 (SFDT=2496 ms, CACT=624 $ms^{[jkl]}$ ),     |
|              |            | 100          | NFW bit 4=RAIS and RAI in time $T^{[c']}$ (TRANSMIC 2G)                                                                                |
|              |            | 101          | Enable BER calculations, BER alarm level = DMA, NFW bit 4=disabled, RAI set in < 2 ms, for c=1 (SFDT=2496 ms, CACT=624 $ms^{[jkl]}$ ), |
|              |            | 110          | NFW bits 3-8, in time 144ms (TRANSMIC 1G)                                                                                              |
|              |            | 111          | Unassigned                                                                                                                             |
|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                          |
|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:
- in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway cross-connection* the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option h=1.

If both b=1 and h=1 and the NPC (used as synchronization source) receives

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] **minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

**c=0** hardware timing

**c=1** firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

**VI-type xyz fields**

**x** - Fixed at 1  
**y** - Fixed at 0  
**z** - Fixed at 0

**SD-type xyz fields (Digital Signal Processing Platform (DSPP) Applications)**

**SD111** X.50/X.57 International subrate application  
**SD311** Digital Multipoint Bridge application  
**SD411** North American DDS Subrate and MJU application  
**SDxyz** Possible future applications with specific values for xyz

**e** - Number of lines in the message segment

**SECH** - Subrate establish channel

**CUS** - Customer  
The circuit is a customer controlled circuit

**RDC** - Red circuit  
The circuit is a red circuit

**UTST** - Under test  
The circuit is under test

**ONEWAY** - One-way  
The circuit is a one-way connection

**BCAST** - Broadcast  
The circuit is a broadcast-type connection

**ROLL** - Roll  
Bridged leg from Roll procedure

**TLA** - Terminate and leave active

**s** - Terminate and leave state

**s** *state*

**F** FROM terminated

**T** TO terminated

**B** BOTH terminated

**fmd** - FROM multipoint circuit mode of the connection

**tmd** - TO multipoint circuit mode of the connection

For DMB circuits, there are four possible values for fmd and tmd:

**fmd,**

**tmd** *Explanation*

**SYM** For legs of a symmetrical multipoint circuit (must be a DMB channel)

**BRD** For nonbackbone (tributary) legs of a broadcast multipoint circuit (must be a DMB channel)

**BBL** For the backbone leg of a broadcast multipoint circuit (must be a DMB channel)

**LEG** For the end that does not terminate on the multipoint circuit (must be an FTU/DS3U channel)

For virtual NPC circuits, there are three possible values for fmd and tmd:

**fmd,**

**tmd** *Explanation*

**BRD** For nonbackbone legs of a broadcast multipoint circuit (must be a virtual NPC channel)

**BBL** For the backbone leg of a broadcast multipoint circuit (must be a virtual NPC channel)

**LEG** For the end that does not terminate on the multipoint circuit (must be FTU/DS3U channels)

**snn** - Incoming gain adjust parameters for the DMB NPC  
**smm** - Outgoing gain adjust parameters for the DMB NPC

**s** - Sign (+ or -)  
**nn** - Incoming gain adjust value (-90 through +88)  
**mm** - Outgoing gain adjust value (-90 through +88)

These are the parameters requested for the TO termination. Values are given in steps of two and the units are tenths of a db.

For type VI100 NPCs snn and smm will be output as "---"

The special value --- (three dashes) can be used for either snn or smm (but not both) when no change is to be made to that parameter. This feature allows changing only one of the two parameters if desired. Also, if the cross-connection was provisioned with the NTR (no transmit) option, the gain adjustment in the direction for which transmission is shut off MUST be ---.

**nn** - Noise guard setting (in dB) for the FROM/TO NPC

The following default values apply:

For Symmetrical bridges Default: nn = -18 db  
For Polling circuits Default: nn = 0 db

Valid values are listed below:

**nn**  
00 db  
06 db  
12 db  
18 db  
-- (For VI100 NPCs)

**ee** - Echo suppression setting (in dB) for the FROM/TO NPC

The following default values apply:

For Symmetrical bridges Default: ee = -18 db  
For Polling circuits Default: ee = 0 db

Valid values are listed below:

**ee**  
00 db  
06 db  
12 db  
18 db  
-- (For VI100 NPCs)

**spp** - Incoming gain adjust parameters for the TO DMB NPC  
**sqq** - Outgoing gain adjust parameters for the FROM DMB NPC

See **snn** and **smm** above for explanation and values.

**vv** - Noise guard setting (in dB) for the FROM DMB NPC  
**tt** - Noise guard setting (in dB) for the TO DMB NPC

See **nn** above for default values.

**vv, tt**

00 db  
06 db  
12 db  
18 db

**ww** - Echo suppression setting (in dB) for the FROM DMB NPC  
**uu** - Echo suppression setting (in dB) for the TO DMB NPC

See **ee** above for default values.

**ww, uu**

00 db  
06 db  
12 db  
18 db

**NTR** - No transmit

**r** - Direction which has no transmission

*r*      *Explanation*

**F**      FROM

**T**      TO

**TP** - Test port

**kk** - Test port number (01 through 96)

**TG** - Test (access) group

**mmm** - Test group number (001 through 400)

**t sm** - Test mode

Values are listed below:

| <i>t sm</i>   | <i>Mode</i>                                   |
|---------------|-----------------------------------------------|
| <b>HUB</b>    | Hubbed                                        |
| <b>LPD</b>    | Looped                                        |
| <b>MON</b>    | Monitor                                       |
| <b>SPL</b>    | Split                                         |
| <b>TPR</b>    | Test Port Released                            |
| <b>TGR</b>    | Test Group Released                           |
| <b>SPLNOY</b> | Split with yellow alarm transmission disabled |

**l** - Link used to access this test port (0 if mode is released)

**vv** - Virtual circuit number of an X.25 link used to access this test port  
(01 through 16)

**p** - Channel assignment

Valid values are listed below:

| <i>p</i> | <i>Explanation</i>                                        |
|----------|-----------------------------------------------------------|
| <b>F</b> | FROM side of circuit under test                           |
| <b>H</b> | HIGH channel of hubbed test port (only for HUB test mode) |

**q** - Channel assignment

Valid values are listed below:

| <i>q</i> | <i>Explanation</i>                                       |
|----------|----------------------------------------------------------|
| <b>T</b> | TO side of circuit under test                            |
| <b>L</b> | LOW channel of hubbed Test Port (only for HUB test mode) |

**[s]ghijj**

- Nonhierarchical FROM, HIGH, or DSPP NPC number

If test access is made to a digital signal processing platform (used for signaling conversion between an E1 and a T1 NPC) then [s]ghijj is the SP100 NPC.

**[t]jklenn**

- Nonhierarchical TO, LOW, E1, or T1 NPC number

If test access is made to a digital signal processing platform (used for signaling conversion between an E1 and a T1 NPC) then [t]jklenn is the E1 or T1 NPC.

**edhfg** - Hierarchical FROM/HIGH

**opjst** - Hierarchical TO/LOW

**ed, op** - Unit number

**h, j** - Module number

**fg, st** - NPC number within module

Valid values are identical to those for uvmnp

**[s]ghi, [t]jhk**

- The 3- or 4-digit nonhierarchical NPC number

Valid values are identical to those for [s]abc.

**jjj, nnn**

- Channel or time slot number

Valid values are identical to those for ddd above.

**PFW** - Pseudo frame word

**abcdefg**

- Pseudo frame word value (TO to FROM direction)

**ijklmno**

- Pseudo frame word value (FROM to TO direction)

The PFW keyword is used to select Mode 1 of TS0 Cross-Connect. In both directions of transmission the Frame Word is replaced by a Pseudo Frame Word. The pseudo frame word value replaces the Frame Alignment Signal (Bits 2 - 8) of the transmitted Frame Word. The bit assignments for abcdefg and ijklmno are shown below:

|         |               |
|---------|---------------|
| 2345678 | - bit numbers |
| abcdefg |               |
| ijklmno |               |

Variables a through g and i through o may each be set to 0 or 1.

0 - Sets the corresponding bit to 0

1 - Sets the corresponding bit to 1

**NFW** - Non frame word

The NFW keyword is used to select Mode 2 of TS0 Cross-Connect. In both directions of transmission the Frame Word is replaced by the Non Frame Word, thus repeating the content of the Non Frame Word in consecutive frames.

**UEQD** - Unequipped

**RNGIE** - Range input error

**COND** - Condition

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>Explanation</b> |
|-----------|--------------------|
|-----------|--------------------|

|           |                          |
|-----------|--------------------------|
| <b>15</b> | <b>NPC is unequipped</b> |
|-----------|--------------------------|

|           |                                                 |
|-----------|-------------------------------------------------|
| <b>E3</b> | <b>One way unassigned channel/NPC in QRY,TO</b> |
|-----------|-------------------------------------------------|

|           |                               |
|-----------|-------------------------------|
| <b>62</b> | <b>Invalid channel number</b> |
|-----------|-------------------------------|

|           |                         |

## Explanation Of Parameters

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number of TO non-channelized NPC

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**[t]ghi** - The 3- or 4-digit nonhierarchical number of FROM NPC mapped to TO NPC, or FROM NPC in the test access connection (--- for unassigned NPC)

**[u]klm** - The 3- or 4-digit nonhierarchical number of TO NPC in the test access connection

----- or ----- for unassigned NPC

**wxkqr** - Hierarchical number of FROM NPC mapped to TO NPC

**ghijk** - FROM NPC in the test access connection.

**mnxyz** - NPC type of TO or FROM NPCs

| <b>mn</b> | <b>Explanation</b>              |
|-----------|---------------------------------|
| PA        | CEPT NPC (75- or 120-ohm)       |
| PB        | CEPT NPC (120-ohm twisted pair) |
| PC        | CEPT NPC (75-ohm coaxial)       |
| --        | - Unequipped or unassigned NPC  |

#### PA-Type xyz fields

The provisioning values of x, y, and z for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (x, y or z) provisioning value):

**Table 19-49. Provisioning values for  $x$** 

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |
| B            |               |                    |               |                            |                           |
| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 19-50. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |

| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 19-51. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

z=6 or A hardware timing

z=7 or B firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

- [vii] RBER unalarmed

- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of *xyz* for the PA type NPC.

**Table 19-52. Combinations of *x* and *y* Values**

| Invalid<br><i>xyz</i><br>Combinations | Explanation                                                                                                                                                                                                                                  |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway cross-connection* the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared.\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option h=1.

If both b=1 and h=1 and the NPC (used as synchronization source) receives

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] minor bit error rate and signaling freeze delay time features:

jkl=011 or jkl=101

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

*c*=0 hardware timing

*c*=1 firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

jkl=011

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

**Note:** xyz values for non-channelized NPC are xCz and xDz only.

**AIS** - Alarm indication signal

The idle code for non-channelized cross-connection

**CUS** - Customer-controlled circuit

**RDC** - Red circuit

**UTST** - Circuit is under test

**jj** - is the FAD NPC number.

If MONEF is in use and there are two FADS, then  
jj reports the lower FAD NPC number.

**tmode** - Test access mode

**FAD** - Facility access digroup

**TERM** - Termination

**F** - From termination

**T** - To termination

**B** - Both terminations

**ONEWAY** - One-way connection

**BCAST** - Circuit is part of a broadcast connection

**UASGN** - Unassigned

**TLA s** - Connection is terminated in direction s (F-From, T-To, B-Both)

**ROLL** - Bridged facility from Roll procedure

**kk** - Hexadecimal completion condition code

*kk Explanation*

**E3** One way circuit. This means that although the receive side of the NPC is unassigned, the transmit side of the NPC is one-way connected. Thus, this NPC cannot be subsequently two-way connected.

**E4** Broadcast circuit. This means that although the receive side of the NPC is unassigned, the NPC is the backbone leg of a NTR type broadcast circuit. Thus, this NPC cannot be subsequently cross-connected, either one-way or two-way.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**15** NPC is unequipped

**B4** NPC is channelized type

**E4** Broadcast unassigned channel/NPC in QRY,TO

## **UTL, QRY, TOD, CFA, MONDAT**

### **RETRIEVE PERFORMANCE MONITORING REPORT SCHEDULE**

#### **Explanation Of Command**

This command is used to query the scheduled time for the daily report of facility performance parameter threshold alarms (FAC) and carrier failure alarms (CFA). This command is used to query the scheduled time for the daily report of primary rate performance parameter threshold alarms (PRIM) and carrier failure alarms (CFA). On a frame with the GATEWAY feature enabled, the normal output response message format includes both the North American and International parameters.

## Explanation Of Parameters

**TOD** - Time of day

**CFA** - Carrier Failure Alarm

Used to request the time of day for the daily CFA and FAC/PRIM report for non-PA and non-ANSI type NPCs.

**MONDAT** - Daily monitor interval starting time

Used to request the time of day for the daily report for PA NPCs.

**FAC** - Facility

Facility performance alarm report keyword.

**PRIM** - Primary Alarm/Parameter - count report keyword

Request that reporting of alarms specified by efgh be enabled. This will cause only a subset of the daily facility report to be output.

**ghij** - Primary Alarm/Parameter-count reports enable.

This field is a 4-digit, hexadecimal number. To enable alarm/parameter-count reports for a particular facility parameter, set the appropriate bit of efgh to 1. A bit set to 0 will disable the alarm report.

| <i>hex<br/>digit</i> | <i>bit</i> | <i>PB/PC NPC parameters</i>                            |

|                      | 1          | OFS (Out-of-Frame Seconds)                           |
|                      | 2          | CSS (Controlled Slip Seconds)                        |
|                      | 3          | UAS (Unavailable Seconds)                            |
| i                    | 4          | ES (Errored Seconds)                                 |
|                      | 5          | SES (Severely Errored Seconds)                       |
|                      | 6          | CV (Code Violations)                                 |
|                      | 7          | CRC (CRC4 Block Errors)                              |
| h                    | 8          | MER (Multiframe Errors)                              |
|                      | 9          | FRER (Framing Errors)                                |
|                      | 10         | BER (Minor Bit Error Rate; for NPCs w/ MBER feature) |
|                      | 11         | UATC (Unavailable Time Count)                        |
| g                    | 12         | FUAS (Far End Unavailable Seconds)                   |
|                      | 13         | FSES (Far End Severely Errored Seconds)              |
|                      | 14         | FES (Far End Errored Seconds)                        |
|                      | 15         | FEBE (Far End Block Error)                           |

If CFA is specified, the PBA and ERS/ES bits are enabled.

**MDNT** - Midnight

The MDNT will be shown in the output when the CFA option is entered.

**hrmns** - Time of the scheduled performance parameter report

## **UTL,QRY,TPS**

### **UTILITY QUERY, TEST PORTS**

#### **Explanation Of Command**

This command reports the network processing circuits (NPCs) designated for test ports, their designation **n**, and the test modes of each equipped test port. There cannot be any unequipped test ports with numbers less than that of the highest equipped test port **within** an NPCTP since in each NPC they must be grown in numerical order starting with the lowest numbered test port within each NPCTP (01, 13, 25, etc.).

All non-channelized test NPCs or Facility Access Digroups (FADs) will be listed together in one or more segments. Each FAD number is the same as the NPC number, and is given with its test mode.

Even though test ports that are established to a Digital Signal Processing Platform (DSPP) application (such as the DDS Substrate and MJU application, the X.50 International substrate application, or the DMB application) are put into monitor or split mode within the application, this command will always display a Test Port as a split connection as long as it is connected to an application.

**uvmnp** - Hierarchical NPC number of test NPC

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**NPCTP** - NPC for test ports

**FAD** - Facility access digroup  
Non-channelized test NPC

**n** - 64Kbit/s NPCTP number (1 through 8)

**md01-md96**

- Mode of 64Kbit/s Test Port number nn (01 through 96)

*mdnn Definition*

|     |                    |
|-----|--------------------|
| TPR | Test Port Released |
| MON | Monitor            |
| SPL | Split              |
| HUB | Hubbed             |
| LPD | Looped             |
| --- | Not equipped       |

**tmode** - Test mode of non-channelized test NPC

*tmode Definition*

|       |                  |
|-------|------------------|
| MONE  | Monitor E (FROM) |
| MONF  | Monitor F (TO)   |
| MONEF | Monitor E and F  |

|        |               |
|--------|---------------|
| SPLTA  | Split A       |
| SPLTB  | Split B       |
| SPLTAB | Split A and B |
| SPLTE  | Split E       |
| SPLTF  | Split F       |
| SPLTEF | Split E and F |

|       |               |
|-------|---------------|
| LOOPE | Loop E        |
| LOOPF | Loop F        |
| LPBKT | Loopback Test |
| HUB   | Hub           |

**e** - Number of lines in message (2 through 5)

## **UTL, QRY, TS0, NPC**

### **QUERY NPC TIME SLOT ZERO**

#### **Explanation Of Command**

This message prints out the status of the provisioned transmit or of the actual received spare International, National, and Remote Alarm Indication (A) Bits in time slot 0 of a specified network processing circuit (NPC) or range of NPCs. If an NPC range was specified in the input command, the following floating window rules apply:

- Unequipped NPCs within the requested range will be skipped.
- If a CEPT gap is within the requested range, the NPCs in the gap will be skipped.
- If an endpoint of the requested range is in a CEPT gap, then the NPCs in the portion of the range which is in the gap will be denied.

**[t]def** - Nonhierarchical NPC number

Values are identical to those for [s]abc.

**uvmnp** - Hierarchical NPC number

**wxkqr** - Hierarchical NPC number

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number

**TS0** - Time slot 0

**s** - Direction of transmission for time slot 0 bits

*s* Explanation

T Provisioned time slot 0 values

R Received time slot 0 values

**[t]ghi** - The 3- or 4-digit nonhierarchical NPC number (abc through def)

**[t]jkl** - The 3- or 4-digit nonhierarchical NPC number (abc through def)

**edhfg** - Hierarchical NPC number (uvmnp through wxkqr)

**opjst** - Hierarchical NPC number (uvmnp through wxkqr)

**ed, op** - Unit number (uv through wx)  
**h, j** - Module number (m through k)  
**fg, st** - NPC number (np through qr)

**abcdefgh**

- Eight individual variables.

These represent the provisioned or received state of the time slot 0 bits.

For Clear-2Mbit/s NPCs, dashes ("-----") will be shown in place of TS0 bits.

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW  
if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

**cc** - Hexadecimal condition code

**cc** *Explanation*

|           |                                  |

| <b>46</b> | NPC Failed or Out of Service     |

## **UTL, QRY, TS0M, NPC**

### **QUERY TIME SLOT ZERO MONITOR**

#### **Explanation Of Command**

This message checks whether the received spare national and international bits in time slot 0 are provisioned for monitoring. This information may be requested for a single network processing circuit (NPC) or a range of circuits. If an NPC range was specified in the input command, the following floating window rules apply:

- Unequipped NPCs within the requested range will be skipped.
- If a CEPT gap is within the requested range, the NPCs in the gap will be skipped.
- If an endpoint of the requested range is in a CEPT gap, then the NPCs in the portion of the range which is in the gap will be denied.

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical starting NPC number  
**wxkqr** - Hierarchical ending NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**[v]ghi** - The 3- or 4-digit nonhierarchical NPC number ([s]abc through [u]jkl)

**[u]jkl** - The 3- or 4-digit nonhierarchical NPC number ([v]ghi through [t]def)

**edhfg** - Hierarchical NPC number (uvmnp through opjst)

**opjst** - Hierarchical NPC number (edhfg through wxkqr)

**ed,op** - Unit number (uv through wx)

**h,j** - Module number

**fg,st** - NPC number

**TS0M** - Time slot 0 monitor

**abcdefgh**

- Time slot 0 monitor bits

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

Valid values for bits **a** through **h** are described below:

| <i>Bit value</i> | <i>Explanation</i>                                                           |
|------------------|------------------------------------------------------------------------------|
| <b>0</b>         | Do not monitor and therefore do not send a message if this bit changes state |
| <b>1</b>         | Monitor and therefore send a message if this bit changes state               |

#### **TS0MBOFL**

- Time slot 0 monitor buffer overflow keyword

**v** - TS0M condition indicator

|   |                                              |
|---|----------------------------------------------|
| 0 | NPC is not in TS0M buffer overflow condition |
| 1 | NPC is in TS0M buffer overflow condition     |

**cc** - Hexadecimal condition code

| <b>cc</b> | <i>Explanation</i>                                |
|-----------|---------------------------------------------------|
| <b>10</b> | Unit is not equipped                              |
| <b>15</b> | NPC is unequipped                                 |
| <b>0B</b> | Invalid CEPT NPC                                  |
| <b>F1</b> | Parameter only valid with PA, PB, or PC type NPCs |

## Explanation Of Parameters

**WHO** - Who

With reference to the frame "Who are you?"

**uid** - Unique (frame) identifier (1 to 20 alphanumeric characters)

The uid is initialized by GRTH::FRAME.

If the uid is not initialized, no characters will appear.

**VERSN** - Version

**DACSII** - DACS II

**gg** - DACS II software release number

**pp** - DACS II software release point number

**r** - Version number of the release point

**FPKG** - Feature package

**kkt tuuvv**

- Feature package identifier

| 00020000 | DS3 Hybrid                                    |

In general a feature package identification code is a combination of several individual feature package numbers. To determine the individual features that make up a feature package it is necessary to decode the feature package identification code. This code is an eight digit hexadecimal number. Each hexadecimal number represents a four-bit binary number. Within this binary number each feature is associated with one particular bit. Consequently to determine the feature list from a feature package identification code it is necessary to convert each hexadecimal digit to its binary equivalent and look up the features in the list above. For example the feature package identification code 0000000F can be converted to the following binary number working from left to right one hex digit at a time.

0000 0000 0000 0000 0000 0000 0000 1111

This number contains eight binary numbers each representing one of the hexadecimal numbers in the feature package identification code 0000000F. The rightmost number of the code contains four features since there are four bits set to one. This would be decoded as follows using the table of features above.

|       | binary | hex | Feature                      |
|-------|--------|-----|------------------------------|
|       | 0001   | 1   | DS1                          |
|       | 0010   | 2   | CEPT                         |
|       | 0100   | 4   | Subrate                      |
|       | 1000   | 8   | Direct SLC                   |
| Total | 1111   | F   | (DS1 + CEPT + Subrate + SLC) |

## UTL, QRY, XCSB, UNIT

### QUERY CROSS-CONNECT STATUS BUS

#### Explanation Of Command

This command requests a check of the side switch consistency between the hardware entities and the data base. Depending on the result of the cross-connect consistency check, DACS II will respond with different outputs as specified in the following sections.

If the entities of a unit are either all consistent or all inconsistent with the data base, a single line output will be generated. The field "DB s", which indicates the active side recorded in the data base (DB), will always be shown, while the keyword "UM" (Unmatch) will be shown only if all entities of the unit are inconsistent with the data base.

**Note:** For an FTU, if some but not all of its DDCs are consistent with the data base, four output message segments will be generated. Each segment will report the side status for NPCs in one Facility Terminating Module (FTM). If all NPCs in an FTM have the same status, the segment for the FTM will have only one line; otherwise, it will be a five-line segment.

When this command is entered, the side selection configuration register on each dual digroup circuit of the facility terminating units and each multiplexer or hybrid multiplexer of the DS3 units or Hybrid DS3 units is compared with the information stored in the data base. In addition, the configuration register on each cross-connect network interface or clock and control interface (CCNI/CCI) is also checked against the status of the data base.

This command can be entered to request the status of the whole frame or of a particular unit. If the status of the whole frame is requested, DACS II will output the result for each unit in ascending order from units 01 through 16. Unequipped units or digital signal processing units will not be checked and reported. If the unit number is specified on input, it must be an FTU or DS3U or HDS3U ; otherwise, the command will be denied.

After the unit-related results are reported, DACS II will output the result for the CCNI/CCI.

If all DDCs/MXR/HMXRs of an FTU/DS3U/HDS3U are marked pass, DACS II will generate the completion output (O.55181) showing the active side indicated in the data base, that is, showing "DB s". If all of them are marked fail, the "UM" keyword will also be shown to indicate that the side selected by the entities does not match the side recorded in the data base.

For a DS3U/HDS3U, if all its MXRs/HMXRs do not have the same marking, output message O.55182 will be generated. This message will give the MXR/HMXR number of the MXR(s)/HMXR(s) marked fail. MXR(s)/HMXR(s) that is (are) pested, out-of-service, or marked pass will show a dash (-) in place of the MXR/HMXR number.

For an FTU, if all its DDCs do not have the same marking, output message O.55183 will be generated. This message will give the NPC number of the NPC(s) marked fail. NPCs that are pested, out-of-service, or marked pass will show dashes (---) in place of the NPC number. Since the two NPCs of a DDC will always have the same status, the two NPC numbers will either both be shown or both be represented by dashes. For the CCNIs/CCIs, if the side status for one or both packs does not agree with the data base, the key word "UM" will be output in the output message O.55184. A pack that has failed is identified by its side number whereas a pack that has passed is identified by a dash "-".

The execution of this command and the output of messages in response to its execution can be aborted by use of the ABT command.

| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FTU NPC number of the first NPC in an FTM  
**uvmqr** - Hierarchical FTU NPC number of the last NPC in an FTM  
**uvmhi** - Hierarchical odd FTU NPC number (uvmnp through uvmkl)  
**uvmkl** - Hierarchical even FTU NPC number (uvmkl = uvmhi + 1)

**uv** - Unit number  
**m** - Module number  
**np, qr, hi, kl**  
- NPC number

The valid values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**UM** - Unmatched

This keyword indicates there are entities selecting a side different from the side recorded in the database.

**DB** - Database

**s** - Cross-connect side (0 or 1)

**MXR** - Multiplexer or Hybrid Multiplexer

**a,**

**...,**

**g** - Multiplexer/Hybrid Multiplexer status

The assignment of MXRs/HMXRs to variables a through g is shown below.

| a | b | c | d | e | f | g | Variable                |
|---|---|---|---|---|---|---|-------------------------|
| P | 1 | 2 | 3 | 4 | 5 | 6 | MXR/HMXR identification |

The MXR/HMXR identification appears if the MXR/HMXR has failed.  
The appearance of a dash (-) in place of a MXR/HMXR identification indicates that the particular MXR/HMXR passed.

**CCNI** - Cross-connect network interface (NonCEF)

**CCI** - Clock and control interface (CEF)

**h** - CCNI/CCI 0 status

**j** - CCNI/CCI 1 status

The assignment of CCNIs/CCIs to variables h and j is shown below.

| h | j | Variable                |
|---|---|-------------------------|
| 0 | 1 | CCNI/CCI identification |

The CCNI/CCI identification appears if the CCI has failed. The appearance of a dash in place of a CCNI/CCI identification indicates that the particular CCNI/CCI passed.

**kk** - Completion condition code (hexadecimal)

To interpret values of kk use the table of cc values below.

**cc** - Hexadecimal condition code

**cc**    *Explanation*

|           |                               |
|-----------|-------------------------------|
| <b>00</b> | No conditions                 |
| <b>05</b> | Subject entity is pested      |

## **Explanation Of Parameters**

---

**RCY** - Internal recovery error

**entity** - DACS II entity involved

| <i>entity</i> | <i>Explanation</i>                     |
|---------------|----------------------------------------|
| MC            | Action on Main Controller              |
| MP            | Action on Main Processor               |
| CI            | Action on Communication Interface      |
| DISK          | Action on DISK unit                    |
| TAPE          | Action on TAPE unit                    |
| UNIT [q]q     | Action on specific unit (1 through 16) |
| FRAME         | Frame wide action                      |

**action** - Action that the error recovery takes to the entity

| <i>action</i> | <i>Explanation</i>                                        |
|---------------|-----------------------------------------------------------|
| REMOVE        | Remove processor from service                             |
| HWBOOT        | Hardware boot (boot of processor with existing data base) |
| WMBOOT        | Warm boot (boot of processor with disk data base)         |
| CDBOOT        | Cold boot (boot of processor programs and data base)      |
| MCOND         | Put frame into maintenance condition                      |

**cc** - Hexadecimal condition code

### **cc Explanation**

|           |                                                                         |
|-----------|-------------------------------------------------------------------------|
| <b>00</b> | <b>No conditions</b>                                                    |

**FA SSC software out of date**  
**2B Database corrupt**

## **UTL,RCY,PASSWD**

### **UTILITY, RECOVERY,PASSWORD**

#### **Explanation Of Command**

This command is used to recover the frame administrator password with the password recovery card. Upon successful completion of this command, DACS II will have copied the original frame administrator's password from the password recovery card to the data base in the RAM. To ensure proper security, the administrator should immediately change his or her password using message I.38301. See Operations and Maintenance manual for procedures.

### **Explanation Of Parameters**

---

**RCY** - Recovery

**PASSWD** - Password

**cc** - Hexadecimal condition code

**cc** *Explanation*

**64** File doesn't exist/can't be accessed

**8D** DB PMEM error OP-CL-RD-WR-SK

**DD** Password recovery card is not READ-only

**91** Can't mount or unmount password recovery card

## **UTL,TOD,CFA,PRIM,X,MONDAT**

### **SET DAILY FACILITY ALARM REPORTING TIME**

#### **Explanation Of Command**

This command is used for the following purposes:

- To set the DACS II System clock
- To set the time for the daily facility alarms report.
- To set the parameters to be reported in the daily facility alarms report.

### **SETTING THE DACS II SYSTEM CLOCK**

To set the DACS II System clock specify only the time to which the clock is to be set (TOD).

### **SETTING THE TIME FOR THE DAILY FACILITY ALARMS REPORT**

The facility alarms report is output daily at the default time of midnight. To output the report at a different time the user must redefine midnight. This redefined midnight is sometimes referred to as "local midnight". The "local midnight" is set by jointly specifying the time of day and the parameters to be reported. Once a "local midnight" has been set the facility alarms report will be output daily at the new "midnight".

### **SETTING THE PARAMETERS TO BE REPORTED**

The parameters are set by use of the PRIM keyword using the appropriate value of ghij from the tables below.

**Note:** There are two sets of ghij values; one for NPCs provisioned as PA/TH type NPCs and the other for NPCs provisioned as PB or PC type NPCs.

To disable all reports specify zeros for each digit in the variable abcdef.

To disable all reports specify zeros for each digit in the variable ghij.

The CGA alarms report defaults to midnight if this command is not used to alter the report time or parameters.

The PBA alarms report defaults to midnight if this command is not used to alter the report time or parameters.

### **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

**TOD** - Time of day

**hrmns** - Time specification

**hr** - hours (00 through 23)

**mn** - minutes (00 through 59)

**sc** - seconds (00 through 59)

When the time of day is used with the MONDAT keyword mn and sc are restricted to certain values listed in the explanation of MONDAT.

**MONDAT** - Daily Monitor Starting Time

When the MONDAT keyword is entered, "hrmns" is used to specify the starting time for the daily accumulation interval for PA/TH type NPCs. In this case, "mn" is limited to 00, 15, 30 or 45, and "sc" is limited to 00. The default daily monitor starting time is midnight. At the daily monitor starting time DACS II will report the facility alarms and the counts for all selected daily parameters for the daily interval just ended and clear all current counts and threshold crossing alarms to start a new daily interval. The report time specified with the MONDAT keyword is not applicable to other NPC types. Likewise, the midnight report time entered without the MONDAT keyword is not applicable to PA/TH type NPCs.

**MDNT** - Midnight

This keyword is output to indicate that midnight, the default time to output facility alarm reports, has been reset to be the time indicated by TOD hrmns.

**Note:** If the MONDAT keyword is entered, the MDNT keyword will not be output.

**CFA** - Carrier failure alarm

This keyword, when specified with the time of day field, indicates that the daily facility report time rather than the system time of day is being reprogrammed. The daily facility report will be output at the specified time, which defaults to midnight. See below the complete description of facility monitoring alarms that may be included in the daily facility report.

**FAC** - Facility

Request that the reporting of alarms specified by abcdef be enabled. This will cause only a subset of the daily facility report to be output.

**abcdef** - Facility performance alarm reports enable (hexadecimal)

This variable represents a six-digit hexadecimal number. Each hexadecimal digit represents 4 bits and each bit corresponds to a particular facility parameter. To enable alarm reports for a facility parameter the bit corresponding to that parameter is set to 1 using the tables below. To disable the alarm report the bit is set to 0.

The following tables should be used to set or interpret the hexadecimal values of digit identifiers a through f.

**a** - Digit identifier (Unassigned)

**b** - Digit identifier

**b** *Facility parameter alarm report enabled*

|          |                                            |
|----------|--------------------------------------------|
| <b>F</b> | DS3 ALM, SAFE, SANE                        |
| <b>E</b> | DS3 ALM, SAFE                              |
| <b>D</b> | DS3 ALM, SANE                              |
| <b>C</b> | DS3 ALM                                    |
| <b>B</b> | SAFE, SANE                                 |
| <b>A</b> | SAFE                                       |
| <b>9</b> | SANE                                       |
| <b>8</b> | Not assigned                               |
| <b>7</b> | DS3 ALM, SAFE, SANE                        |
| <b>6</b> | DS3 ALM, SAFE                              |
| <b>5</b> | DS3 ALM, SANE                              |
| <b>4</b> | DS3 ALM                                    |
| <b>3</b> | SAFE, SANE                                 |
| <b>2</b> | SAFE                                       |
| <b>1</b> | SANE                                       |
| <b>0</b> | DS3 ALM, SAFE, SANE alarm reports disabled |

DS3 ALM - DS3 or Hybrid DS3 alarm

SAFE - Shelf alarm far end

SANE - Shelf alarm near end

**c** - Digit identifier (Unassigned)

**d** - Digit identifier

**d** *Facility parameter alarm report enabled*

**F** FRER, BPV

**E** FRER

**D** BPV

**C** Not assigned

**B** FRER, BPV

**A** FRER

**9** BPV

**8** Not assigned

**7** FRER, BPV

**6** FRER

**5** BPV

**4** Not assigned

**3** FRER, BPV

**2** FRER

**1** BPV

**0** FRER, BPV alarm reports disabled

FRER - Frame errors

BPV - Bipolar violations

**e** - Digit identifier

**e** *Facility parameter alarm report enabled*

**F** CRC, COFA, SERS, ERS

**E** CRC, COFA, SERS

**D** CRC, COFA, ERS

**C** CRC, COFA

**B** CRC, SERS, ERS

**A** CRC, SERS

**9** CRC, ERS

**8** CRC

**7** COFA, SERS, ERS

**6** COFA, SERS

**5** COFA, ERS

**4** COFA

**3** SERS, ERS

**2** SERS

**1** ERS

**0** CRC, COFA, SERS, ERS alarm reports disabled

CRC - Cyclic redundancy code

COFA - Change of frame alignment

SERS - Severely errored seconds

ERS - Errored seconds

**f** - Digit identifier

**f** *Facility parameter alarm report enabled*

**F** BER, SLIP, OOF, CGA, LOS

**E** BER, SLIP, OOF

**D** BER, SLIP, CGA, LOS

**C** BER, SLIP

**B** BER, OOF, CGA, LOS

**A** BER, OOF

**9** BER, CGA, LOS

**8** BER

**7** SLIP, OOF, CGA, LOS

**6** SLIP, OOF

**5** SLIP, CGA, LOS

**4** SLIP

**3** OOF, CGA, LOS

**2** OOF

**1** CGA, LOS

**0** BER, SLIP, OOF, CGA, LOS alarm reports disabled

BER - Bit error rate

SLIP - Slip

OOF - Out of frame

CGA - Carrier group alarm

LOS - Loss of signal

Some examples of the available choices for X'abcdef are shown below:

X'00000A BER and OOF alarm reporting enabled

X'000000 alarm reports disabled for all parameters

X'000001 CGA and LOS alarm reporting enabled

X'0C0511 DS3, BPV, ERS, CGA, and LOS alarm reporting enabled

## PA/TH NPC parameters

The following tables should be used to set or interpret the hexadecimal values of digit identifiers g through j.

**g** - Digit identifier

**g** *Facility parameter alarm report enabled*

**F** FEBE, FES, FSES, FUAS

**E** FEBE, FES, FSES

**D** FEBE, FES, FUAS

**C** FEBE, FES

**B** FEBE, FSES, FUAS

**A** FEBE, FSES

**9** FEBE, FUAS

**8** FEBE

**7** FES, FSES, FUAS

**6** FES, FSES

**5** FES, FUAS

**4** FES

**3** FSES, FUAS

**2** FSES

**1** FUAS

**0** FEBE, FES, FSES, FUAS alarm reports disabled

FEBE - Far end block error

FES - Far end errored seconds

FSES - Far end severley errored seconds

FUAS - Far end unavailable seconds

**Note that parameters FEBE, FES, FSES and FUAS are not applicable for the TH type NPCs.**

**h** - Digit identifier

**h** *Facility parameter alarm report enabled*

**F** UATC, BER, FRER, MER

**E** UATC, BER, FRER

**D** UATC, BER, MER

**C** UATC, BER

**B** UATC, FRER, MER

**A** UATC, FRER

**9** UATC, MER

**8** UATC

**7** BER, FRER, MER

**6** BER, FRER

**5** BER, MER

**4** BER

**3** FRER, MER

**2** FRER

**1** MER

**0** UATC, BER, FRER, MER alarm reports disabled

UATC - Unavailable time count

BER - Minor bit error rate; for NPCs with MBER feature

FRER - Framing errors

MER - Multiframe errors

**i** - Digit identifier

**i** *Facility parameter alarm report enabled*

**F** CRC, CV, SES, ES

**E** CRC, CV, SES

**D** CRC, CV, ES

**C** CRC, CV

**B** CRC, SES, ES

**A** CRC, SES

**9** CRC, ES

**8** CRC

**7** CV, SES, ES

**6** CV, SES

**5** CV, ES

**4** CV

**3** SES, ES

**2** SES

**1** ES

**0** CV, SES, ES alarm reports disabled

CRC - CRC4 check block errors

CV - Degraded minutes

SES - Severely errored seconds

ES - Errored seconds

# Glossary

---

## Glossary

---

### A

**AAC**

ACCULINK Access Controller

**ABT**

Abort

**ACO**

Alarm Cutoff

**Active**

For duplicated entities, the entity is providing service rather than operating in hot standby.

**AI**

Alarm Interface

**AIS**

Alarm Indication Signal (also known as all 1s signal)

**Alarm Delay**

The alarm delay (in seconds) for software-detected alarm conditions. Initial value is 20 seconds.

**Alarm Indication Signal (AIS)**

A signal transmitted downstream to indicate that network transmission line failures were detected upstream.

**All Ones Signal**

Another name for DS1 Alarm Indication Signal (AIS). It is defined to contain all ones in the terminal-to-terminal mode.

**ALM**

Alarm

**Alphanumeric Characters**

Letters and digits.

**Alternate Mark Inversion (AMI)**

A DS1 line code in which alternate one bits are positive and negative, but zero substitution is not used.

---

**AMI**

Alternate Mark Inversion

**ANSI**

American National Standards Institute

**AS&C**

Alarm Surveillance and Control

**ASCII Character**

Letters, digits, and symbols used in the American Standard Code for Information Interchange.

**ATAG**

Autonomous Message Tag

**ATP**

All Tests Passed

**Attribute**

Alarm indication level: major, minor, or no alarm.

**AUD**

Audit

**Autolock**

When the system autolocks and entity, it switches to protection and forbids return to the working entity even if the trouble clears. This is usually caused by multiple protection switches on that entity in a short time period.

**Autolock Number of Switches**

This parameter is the number of times that the system restores an entity to service (after intermittent failures) in a given autolock switching interval before the entity is autolocked.

**Autolock Release Time**

The number of hours between times when the system automatically releases autolock.

**Autolock Switching Interval**

An interval in minutes (see Autolock Number of Switches).

**Autonomous**

Done automatically by the system without any manual intervention from the user.

**Autoprovisioned**

Put in the provisioned state automatically by the system.

---

## **B**

### **B3Zs**

Bipolar with 3-zero substitution, a DS3 line code.

### **B8ZS**

Bipolar Eight Zero Substitution

### **Baud Rate**

Transmission data rate (bits per second) on an administrative link.

### **BBL**

Backbone Leg

### **BC**

Bus Controller

### **BCON**

Broadcast Cross-Connect

### **BDIS**

Broadcast Disconnect

### **BER**

Bit Error Rate

### **BER Metric**

Specifies the metric for calculating bit error rate at a DS3 interface port. Options are bipolar variations (BPV) or parity (PTY). (Initial value is BPV).

### **Bipolar Violation**

A violation of the alternating +1, -1 pattern in a 3-level code.

### **Bit Error Rate Threshold**

3 stands for 0.001, 6 stands for 0.000001.

### **Blue Code**

Same as AIS

### **BMTR**

Back-up Memory Transfer

### **Boot**

To transfer contents of a Memory Card into the system's working memory and system hardware. The contents of a Memory Card can include both system software and database.

### **BOS**

Bit Oriented Signaling

### **BPV**

Bipolar Violation

---

**BRD**

Broadcast Leg

**Broadcast**

Form a bridge connection.

**BSRF**

Basic Synchronization Reference Facility

**BT**

Bus Terminator

**BX**

Bus Extender

**Byte**

Usually refers to a group of eight consecutive binary digits, but sometimes used for bit groups of other sizes.

---

**C**

**CAS**

Channel Associated Signaling

**CATP**

Conditional All Tests Passed

**CBIT**

A DS3 line code in which parity checks on blocks of data are used to detect bits in error.

**CCB**

Cross-Connect Buffer

**CCI**

Clock and Control Interface

**CCIS**

Common Channel Interoffice Signaling

**CCITT**

International Telephone and Telegraph Consultative Committee

**CCN**

Cross-Connect Network

**CCNI**

Cross-Connect Network Interface

**CEF**

Capacity Expansion Frame

---

**CFA**  
Carrier Failure Alarm

**CFR**  
Synchronizer Configuration

**CGA**  
Carrier Group Alarm

**CHG**  
Change

**CI**  
Communications Interface

**CIU**  
Craft Interface Unit

**Clear (CL)**  
An alarm condition no longer exists.

**CLF**  
Carrier Line Failure

**CMAP**  
Channel Map

**COFA**  
Change-Of-Frame-Alignment

**Condition**  
The type of alarm indication.

**CP**  
Circuit Pack

**CPR**  
C-Bit Processor

**CPU**  
Central Processing Unit

**CRC**  
Cyclic Redundancy Checking

**CRO**  
Clock Reference Oscillator

**Cross-Connect**  
A piece of hardware used to interconnect line-terminating equipment, multiplexers, and other equipment.

**Cross-Connection**  
An interconnection between two specified NPC channels.

**Crosstalk**  
A signal induced into one transmission line from another transmission line.

---

**CRT**

Cathode Ray Tube

**CSS**

Controlled Slip Seconds

**CTAG**

Correlation Tag

**Current Value**

In the dialog mode, it indicates that the current value of a parameter is used by the system unless you direct otherwise.

**CV**

Coding Violations

---

**D****DACS**

Digital Access and Cross-Connect System

**Database**

A record of the system configuration and status. It contains cross-connections, status of entities and transmission lines, performance monitoring threshold values and collected data.

**DATS**

Digital Access Test Set

**DC**

Digroup Circuit or Direct Current

**DCC**

Disconnect Code

**DCLU**

Digital Carrier Line Unit

**DDC**

Dual Digroup Circuit

**DDS**

Digital Data System

**Default**

A value the system automatically uses for a parameter if you do not specify a value.

**Delimiter**

A colon, comma, or space used to separate two parameters in a command or message.

**Demultiplexer**

A device used with a multiplexed signal for recovering signals contained within it and restoring the distinct individual channels of these signals.

---

**DFB**

Dual Fuse Board

**Diagnose**

Test an entity.

**DIF**

DACS Interface Module

**DL**

Data Link

**DLC**

Digital Loop Carrier

**DM**

Dual Multiplexer

**DMA**

Deferred Maintenance Alarm

**DMAP**

Digroup Map

**DMB**

Digital Multipoint Bridge

**DMI**

Digital Multiplex Interface

**DMM**

Digital Multimeter

**DOTS**

Digital Office Timing Supply

**DPC**

Dual Primary Circuit

**DPLL**

Digital-Phase Locked Loop

**Driven**

A driven port is being monitored, and a good signal is expected.

**DS0**

Digital Signal Level 0 (64-kb/s)

**DS1**

Digital Signal Level 1 (1.544-Mb/s)

**DS1 Data Rate**

The DS1 Data Rate is calculated as follows:

$DS1 = (24 \text{ Channels} \times 8 \text{ bit/sample} + 1 \text{ frame bit}) \times 8000 \text{ samples/sec}$

$DS1 = 193 \times 8000 = 1.544 \text{ Mb/s}$

---

**DS1 Port**

A DS1 port in either a DS1 interface module or a DS3 interface module.

**DS3**

Digital Signal Level 3

**DS3U**

DS3 Unit

**DSP**

Digital Signal Processor

**DSPC**

Digital Signal Processor Circuit

**DSPI**

Digital Signal Processor Interface

**DSPU**

Digital Signal Processor Unit

**DSU**

Data Service Unit

**DSX**

Digital Signal Cross-Connect

**DTAC**

Digital Test Access Connector

**Duplex Entity**

A pair of entities in which one is active and the other is in hot standby (clock generators).

**Duplicated Entity**

A pair of entities in which one is active and the other is in hot standby (for example, the Synchronizer Cross-Connect (SXC) circuit packs).

---

**E****E1 Data Rate**

The E1 Data Rate is calculated as follows:

$$E1 = (32 \text{ Channels} \times 8 \text{ bit/sample}) \times 8000 \text{ samples/sec}$$

$$E1 = 256 \times 8000 = 2.048 \text{ Mb/s}$$

**NOTE:**

With this data rate, 30 channels carry traffic and two channels are reserved; one channel contains framing information and the other channel contains signaling information.

---

**E2A**

Type of Alarm Telemetry

**EBX**

Expanded Bus Extender

**ECCN**

Expanded Cross-Connect Network

**Echo**

Display of keystrokes entered from a terminal (passwords are not echoed).

**ECI**

Enhanced Communications Interface

**EDDC**

Enhanced Dual Digroup Circuit

**EDPC**

Enhanced Dual Primary Circuit

**EER**

Excessive Error Rate

**EFC**

Extended Frame Controller

**EIA**

Electronic Industries Association

**EID**

Entity Identification

**EMC**

Electromagnetic Compatibility

**EMIU**

Expanded Multiple Interface Unit

**EMTC**

Expanded Maintenance Circuit

**Enter**

Provision an entity by a command, not automatically by the system.

**Entity**

A specific piece of hardware (such as the Main Controller (MC) or Network Processing Circuit (NPC)) that has been assigned a name and is recognized by the system.

**Entity Identifier**

The name used by the system to refer to an entity.

**Equalizer**

A circuit adjustment used to maintain signal strength between desired limits.

**Equipped**

The entity is entered in the system database via a user provisioning command.

---

**ER**  
Error Rate

**ERS**  
Errored Seconds

**ES**  
Errored Seconds

**ESD**  
Electrostatic Discharge

**ESF**  
Extended Superframe

**ESR**  
Error Source Register

**ESR1**  
Error Source Register 1

**ESR2**  
Error Source Register 2

**ETSI**  
European Telecommunication Standardization Institute

---

## **F**

**FAL**  
Fuse Alarm Lamp

**FAS**  
Frame Alignment Signal

**FC**  
Format Converter

**FDL**  
Facility Data Link

**Fe**  
Extended Superframe Format

**FEBE**  
Far-End Block Error

**FELP**  
Far End Loopback

**FES**  
Far-End Errored Seconds

---

**FLI**

Facility-Line Interface

**FMAC**

Facility Maintenance and Administration Center

**FMT**

Formatter

**Forced**

A traffic-carrying entity (either service or protection) has been deliberately locked into a service providing state by manual command despite being bad.

**FPA**

Feature Package A

**FPB**

Feature Package B

**FPC**

Feature Package C

**FRADT**

Frame Audit

**FRER**

Framing Bit Error

**Fs**

Fx Framing Format

**FSES**

Far-End Severely Errored Seconds

**FTM**

Facility Terminating Module

**FTU**

Facility Terminating Unit

**FUAS**

Far-End Unavailable Seconds"

**FW**

Framing Word

---

**G****Grooming**

Rearrangement of DS1 signals in DS3 signals.

---

## **H**

### **HDB3**

High Density Bipolar 3 Zero Substitution

### **Header**

The first line of a message.

### **Header Date**

Specifies the current date as YYMMDD, where YY is the last two digits of the year, MM is the month, and DD is the day of the month.

### **Header Time**

Specifies the current time of day as HHMMSS, where HH is the hour (00 to 23), MM is the minutes, and SS is the seconds.

### **HECI**

High-Speed Enhanced Communications Interface

### **Hierarchy**

An orderly ranking or sequence of elements, such as that of menus presented at a terminal.

### **Hit**

A disruption of service that lasts for less than 1 second. See Outage.

### **Hot Standby**

An entity ready for fast, automatic placement into operation to replace an active entity.

### **HUBID**

Hub Identifier

---

## **I**

### **ICLD**

Idled

### **Idle**

An output port is idle if it is not cross-connected to an input port.

### **Idle Channel**

A channel on an NPC that has not been cross-connected.

### **IFTU**

Integrated Facility Terminating Unit

### **In Service**

The entity is performing normal service functions, either active or standby.

---

**ISX**

Integral Shelf Cross-Connect

**ITU-TSS**

International Telecommunication Union-Telecommunication Standardization Sector

---

**J****Jitter**

Short term variations in the phase of a digital signal.

---

**K****kb/s**

Kilobit Per Second

**kHz**

Kilohertz

---

**L****LAN**

Local Area Network

**LBO**

Line Build-Out

**LED**

Light-Emitting Diode

**LFA**

Loss of Frame Alignment

**LILB**

Line Interface Loopback

**Link ID**

The location and type of a user interface link.

**LLB**

Line Loopback

---

**LMA**

Loss of Multiframe Alignment

**Location**

The specific entity involved.

**Loopback**

A circuit arrangement that causes a received signal to be returned to its source.

**LOS**

Loss of Signal

---

**M****M13**

A standard format used for DS3 signals

**Maintenance**

The entity has been locked into a non-service providing state by a manual command.

**Maintenance Condition (MCOND)**

MCOND is a condition in which the Main Controller (MC) is isolated from system hardware in order for the user to perform memory transfer operations. Placing the MC in MCOND is non-service affecting. When the MC is in the MCOND service state, the system software and database are not transferred to the Memory Cards. The Maintenance Condition enables the user to transfer database and/or system software among the Memory Cards and the MC's Random Access Memory (RAM) in a controlled manner via user commands. The MCOND service state is also used to perform system software upgrades.

**Mapped**

Cross-Connected

**Mapped**

Cross-connected.

**Mb**

Megabit

**Mb/s**

Megabit Per Second

**MBER**

Minor Bit Error Rate

**MC**

Main Controller

**MCOND**

Maintenance Condition

---

**MCP**

Main Controller Peripheral

**MEMA**

Memory Card Slot A

**MEMB**

Memory Card Slot B

**Memory Location**

Specifies the equipment, DS1 interface port, or DS3 MUX port location associated with a memory type.

**MER**

Multiframe Error

**MI**

Maintenance Information

**MIU**

Multipoint Interface Unit

**MJU**

Multipoint Junction Unit

**MMFG**

Multiplexer-MIU Function Group

**MML**

HuMan-Machine Language

**MP**

Main Processor

**MPDIS**

Multipoint Disconnect

**MPM**

Multipoint Mode

**MTC**

Maintenance Circuit

**MXR**

Multiplexer

---

**N**

**NA**

No Acknowledgement

---

**NDL**

No Data Link

**NEBS**

Network Equipment Building Systems

**Network Element**

A DACS II ISX system is a network element.

**Network Element**

A DACS II frame is a network element.

**NFW**

Not Framing Word

**NG**

No Good

**NOBBL**

No Backbone Leg

**Notification Code**

The notification code for alarm and status conditions, which include: MJ - major alarm; MN - minor alarm.

**Notification Code**

The notification code for alarm and status condition which include: MJ - major alarm; MN - minor alarm; NA - no alarm (status only); or CL - cleared alarm.

**NPC**

Network Processing Circuit

**NPCTG**

Network Processing Circuit Test Group

**NPCTP**

Network Processing Circuit Test Port

**NSA**

Nonsignaling Associated

**NZCS**

No Zero Code Suppression

---

**O**

**OA&M**

Operation, Administration and Maintenance

**OCNT**

One-Way Cross-Connect, Terminated

---

**ODIS**

One-Way Disconnect

**OFS**

Out-Of-Frame Seconds

**One-Way Cross-Connect****OOS**

Out-of-service

**OS**

Operations System

**Out Of Service (OOS)**

The entity is not providing its normal service function (removed from service) either because of a system problem or because it has been removed from service manually.

**Out-of-Service (OOS)**

The entity is not providing its normal service function (removed from service or protected) either because of a system problem or because it has been removed from service manually.

**Outage**

A disruption of service that lasts for more than one second. See Hit.

---

**P****Parity Check**

To determine whether a block of digital data has been corrupted in transmission, you can use an even-parity format in which an extra bit is added to the block at the transmitter if necessary so that the block always contains an even number of one bits. A parity-checking circuit at the receiving end can determine whether an error has occurred in transmission. An odd-parity format can also be used for the same purpose.

**Parity Check**

To determine whether a block of digital data has been corrupted in transmission, you can use an even- or odd-parity format in which an extra bit is added to the block at the transmitter if necessary so that the block always contains an even number of one bits. A parity-checking circuit at the receiving end can determine whether an error has occurred in transmission.

**PBA**

Primary Block Alarm

**PBC**

Primary Block Circuit

**PBF**

Primary Block Failure

---

**PBX**

Private Branch Exchange

**PCM**

Pulse Code Modulation

**PCMCIA**

Personal Computer Memory Card International Association

**PDS**

Program Documentation Standards (Language)

**PF**

Printout Follows

**PFW**

Pseudo-Frame Word

**PLL**

Phase-Locked Loop

**PMA**

Prompt Maintenance Alarm

**PNI**

Packet Network Interface

**POTS**

Plain Old Telephone Service

**Primary Line**

The second line in an output message.

**Program**

The software that directs the operation of the main controller and other frame elements.

**Protocol**

Detailed format and procedure used for transmitting data.

**Protocol**

Detailed format and procedures used for transmitting digital data.

**Protocol Type**

Indicates the protocol supported on the interface link.

**Provisioned**

The entity has been configured by the user and entered into the system database and is ready to be restored to service.

**Provisioned**

The entity is ready to perform its intended function"

**PU**

Power Unit

**Pulse Code Modulation (PCM)**

The process by which analog signals are sampled, quantized, and coded into a digital bit stream.

---

**Pulse Code Modulation (PCM)**

The process by which analog signals are sampled, quantized, and coded into a digital bit stream.

**PVC**

Permanent Virtual Circuit

---

**R**

**R16**

Remote Alarm Indication in TS16

**RAI**

Remote Alarm Indication

**RAIS**

Remote Alarm Indication Signal

**RAM**

Random Access Memory

**RBER**

Remote Bit Error Rate

**RDC**

Red Circuit

**REER**

Remote Bit Error

**Released**

If an input port, it is not under test access; if an output port, it is not cross-connected to an input port under test access.

**Released**

If an input port, not under test access; if an output port, not cross-connected to an input port under test access.

**RL**

Retry later

**RMS-D**

Remote Measurement System - Digital

**RMS-I**

Remote Measurement System - International

**Rollover**

Operation used when the transmission facility between the system and an upstream system is to be replaced.

---

**RT**

Remote Terminal

**RTS**

Remote Test System

**RTS-5A**

Remote Test System 5a

---

**S****SAP**

Status and Alarm Panel

**SARTS**

Switched Access Remote Test System

**SCC**

Subrate Cross-Connect

**SCCSAI Switching Control Center System Asynchronous Interface****SECH**

Subrate Establish Command

**SERS**

Severely Errored Seconds

**SID**

Source Identifier

**SNIDER**

Protocol (message format) used on administrative links.

**SNIDER**

Protocol (message format) used on asynchronous administrative links.

**Software ID**

Gives the software version information for a system: g - is a one-digit number giving the software release; i - is a two-digit number giving the issue; r - is a one-digit number giving the point release.

**Software ID**

The software version information for the system.

**SPU**

Synchronizer Power Unit

**SRM**

Subrate Multiplexer

---

**SSC**

Secondary Storage Controller

**SSP**

Select Synchronization Port

**Standby**

Entity is one of a duplicated pair, but not providing service. It is ready to be used to replace a similar entity either by protection or by duplex switching.

**Standby**

The entity is in service, but is not providing service functions. It is ready to be used to replace a similar entity either by protection or by duplex switching.

---
