Notice

Every effort was made to ensure that the information in this document was complete and accurate at the time of printing. However, information is subject to change.

Security Statement

In rare instances, unauthorized individuals make connections to the telecommunications network through the use of remote access features. In such event, applicable tariffs require that the customer pay all network charges for traffic. Lucent Technologies cannot be responsible for such charges, and will not make any allowance or give any credit for charges that result from unauthorized access.

Documentation Ordering Information

The ordering number for this document is 365-353-242. To order this document, call the Lucent Technologies Customer Information Center in Indianapolis, Indiana, on 1-888-582-3688. For more ordering information, refer to "How to Order Documentation" in the section "About this Document."

Technical Support Telephone Number

The Lucent Technologies Regional Technical Assistance Center (RTAC) provides a technical assistance telephone number which is staffed 24 hours a day. For technical assistance, simply call 1-800-225-RTAC.

Documentation Support Telephone Number

Lucent Technologies provides a telephone number for you to report errors or to ask questions about the information in this document. The support telephone numbers are:

Outside North Carolina - 1-800-334-0404
Inside North Carolina - 1-919-727-6681.

Developed by The Lucent Technologies Customer Training & Information Products Organization

How Are We Doing?

Document Title: DACS II Release 8.2.3, PDS 2.048-Mb/s Interface Command and Message Manual Volume I

Document No.: 365-353-242

Issue 1

Date: February 1999

Lucent Technologies welcomes your feedback on this document. Your comments can be of great value in helping us improve our documentation.

1. Please rate the effectiveness of this document in the following areas:

	Excellent	Good	Fair	Poor	Not Applicable
Ease of Use					////////////////
Clarity					////////////////
Completeness					////////////////
Accuracy					////////////////
Organization					////////////////
Appearance					////////////////
Examples					
Illustrations					
Overall Satisfaction					////////////////

2. Please check the ways you feel we could improve this document:

☐ Improve the overview/introduction	☐ Make it more concise/brief
☐ Improve the table of contents	☐ Add more step-by-step procedures/tutorials
☐ Improve the organization	☐ Add more troubleshooting information
☐ Include more figures	☐ Make it less technical
☐ Add more examples	☐ Add more/better quick reference aids
☐ Add more detail	☐ Improve the index

Please provide details for the suggested improvement. _____

3. What did you like most about this document?

4. Feel free to write any comments below or on an attached sheet.

If we may contact you concerning your comments, please complete the following:

Name: _____ Telephone Number: _____

Company/Organization: _____ Date: _____

Address: _____

When you have completed this form, please fold, tape, and return to address on back or Fax to: 910-727-3043.

About This Document

Purpose

The *DACS II Release 8.2.3 Command and Message Manual* describes the input commands and output messages of Release 8.2.3 of the Digital Access and Cross-Connect System II (DACS II). In addition, it provides full support for previous product releases.

NOTE:

Those customers using this manual with Releases 3 through 7.0.3 software should be aware that all features of a particular message shown for Release 8.2.3 may or may not apply to previous releases.

This manual consists of three volumes as follows:

- **Volume I** - This volume contains general information about the document, a detailed introduction that defines DACS II messages, relates how to communicate with DACS II, introduces the administrative links, and discusses in detail NPC addressing, on-line help feature, system configuration and features a listing of related documentation. Message listings in this volume include alphabetical and numerical, summary list of input commands and a list of autonomous messages. A comprehensive presentation of input commands and output messages (ABT through DGN) concludes this volume.
- **Volume II and III** - These two volumes contain input commands and output messages in the following order:
 - **Volume II** - DGRTH through RST
 - **Volume III** - SAVE through UTL and the Glossary

Reason for Issue

The *DACS II Release 8.2.3 Command and Message Manual* has been issued to include updated and new commands applicable to Release 8.2.3.

Intended Audiences

This manual is a catalog of messages intended for reference by a technician or craftperson who needs additional details about a message. It provides the user with supplemental information for the Digital Access and Cross-Connect System II (DACS II) that is programmed in the Program Documentation Standards (PDS) language. An example of a user is someone performing a task from an operation and maintenance manual who needs the definition of a specific keyword to complete the task.

How to Order Documentation

To order additional copies of this document, send or call in an order as follows:

- To order by Mail:

Lucent Technologies
Customer Information Center
Attention: Order Entry Section
2855 N. Franklin Road
P. O. Box 19901
Indianapolis, IN 46219

-
- To order by Telephone (Monday through Friday);

Within the United States of America:

1-800-LUCENT8 (582-3688) (7:30 a.m. to 6:30 p.m. EST)

From Canada:

1-800-255-1242

Worldwide:

Toll: **1-317-352-8557**

FAX: **1-317-352-8484**

For RBOC/BOC customers, process orders through your Company Documentation Coordinator.

For commercial customers, a check, money order, purchase order number, or charge card number is required with all orders. Make checks payable to Lucent Technologies.

Lucent Technologies entities should use Form IND 1-80.80 FA, available through the Customer Information Center.

One-time orders include a binder (if applicable) and the document contents for the current issue in effect at the time of order. After placing a one-time order, you can request a standing order for any document revisions *of that software release*. Documents for new software releases do *not* go to standing-order customers. You will only get those documents if you order the new software release.

How to Comment on This Document

A feedback form is located at the beginning of this publication, immediately after the title page. Please fill out the feedback form and return it (postage free) to the address on the back.

If the feedback form is missing, send comment on this publication to:

Lucent Technologies
DACS II Documentation Coordinator
Attn: Tabatha Wright
101 Crawfords Corner Road
Room 1B-320
Holmdel, NJ 07733-3030 USA

Introduction

Introduction

Foreword

This manual contains the latest message information regarding the Digital Access and Cross-Connect System II (DACS II) Release 8.2.3 software.

This manual is a catalog of messages intended for a technician or craftsperson who needs additional details about a message. This manual provides the user with supplemental information for the Digital Access and Cross-Connect System II (DACS II) which is programmed in the Program Documentation Standards (PDS) language. An example of a user is someone performing a task from an operation and maintenance manual who needs the definition of a specific keyword to complete the task.

How To Use This Manual

The user refers to a particular message via the message number or the action verb with modifiers. The messages are arranged in alphabetical order by verb; for example; add, audits, broadcast, change, etc. A numerical list, an alphabetical list, and a summary of input commands provide cross referencing of messages and should help in locating a particular message.

A *message* is a communication between a user* and a DACS II. Input messages, or *commands*, are sent from a user to a DACS II. Output messages are originated by a DACS II and sent to the user.

* A *user* can be a person operating a DACS II or an Operations System (OS), such as TIRKS[†] system, SARTS, etc.

[†] TIRKS is a registered trademark of Bell Communications Research, Inc.

How the Manual Is Organized

This manual or document consists of three volumes of messages in alphabetical verb sequence. The volumes are organized as follows:

Volume I Contents

- Introduction
 - About This Manual
 - DACS II Messages
 - Communicating With DACS II
 - DACS II Administrative Links
 - NPC Addressing
 - On-Line Help Feature
 - System Configuration
 - Documentation Support
- Alphabetical List of Messages
- Numerical List of Messages
- Summary of Input Commands
- List of Autonomous Messages
- Messages (ABT through DGN).

Volume II Contents

- Messages (DGRTN through RST).

Volume III Contents

- Messages (SW through UTL).
- Glossary

DACS II Messages

How Messages In This Manual Are Formatted

Each message is presented in actual input message format with accompanying explanations of keywords and variables providing sufficient information to fully understand the activity. Additionally, all responses to the input message such as the completion, the

denial, and any autonomous messages generated from the input or activated by the machine are shown.

Understanding Message Numbering

Messages are grouped according to verb and keywords and are indexed by a *message number*.

IMPORTANT: Message numbers are used for organization and reference in this manual, and they appear in actual output messages.

Message numbers have the following format:

I . mmmmn	Input commands
O . mmmmn	Output messages reporting successful completion (COMPLD) of the input command
O . mmmmn . pp	Output message reporting a denial (DENY) of the input command.

Input commands are prefixed by an I; output messages are prefixed by an O. All messages related to each other have the same mmmm digits. An input command may have more than one completion output message. In this case, the last digit, n, indicates the particular completion message. DNY (command denial) messages are referenced by the additional digits pp.

For example, consider the diagnose unit digital signal processor interface group of messages (mmmm = 4134). Below is the input message followed by the possible output messages or groups of messages:

```

I . 41341      DGN-EQPT:[xy]:UNIT-q:[ww]:DSPI[:CFT-X-vwxy];

O . 41341      xy yy-mm-dd hh:mm:ss <link number>
M DGN EQPT::UNIT-q:[ww]:DSPI[:CFT-X-vwxy] COMPLD
/* [0.41341] */
"{ATP|CATP-cc|STF-ppqq,d5,d4,d3,d2,d1,d0}"
;

O . 41341.01   xy yy-mm-dd hh:mm:ss <link number>
M DGN EQPT::UNIT-q:[ww]:DSPI[:CFT-X-vwxy] DENY
mmmm
/* [0.41341.01] */
/* <explanation of error condition code> */
;
```

Usage of Uppercase and Lowercase Characters

In the message format of this manual, uppercase and lowercase letters distinguish between information that is constant (uppercase) and information that is variable (lowercase). Any

character written in uppercase appears on the output device exactly as it is written. A character represented by lowercase letters will be replaced on the output driver by the value listed on the manual page for that particular message under *Explanation of Parameters*.

Representation of Lines Longer Than the Page Width

Many message lines in this document exceed the width of the page on which they are printed. Consequently, a way to present the message on more than one line while maintaining an accurate representation of the message's parameter fields and the character spacing between them has been devised. The backslash character is used in both input and output message representations to mark the point in the message text where the line has been truncated and continued onto another line. This is consistent with the present use of the backslash character on input to enter a command whose length exceeds 80 characters. The user can easily construct the single-line representation because the backslash marks the extent of any blank characters in the message.

Rather than using the backslash convention discussed above, some utility (RTRV) output messages are printed in a smaller type font because of their volume.

Delimiters

Delimiters are used to enclose a field in a message.

- [] Brackets indicate an optional field, one which may or may not be used in the input command or appear on the output message.
- { } Braces indicate a field containing alternate choices. For input messages, the user must select one of the choices. In output messages, braces indicate that only one of the fields within the braces will appear.
- < > The less than and greater than symbols enclose an abbreviation representing information too lengthy to display in the manual. These delimiters are never used in actual DACS II input commands or output messages but are used only in describing the message format in this manual.
- () Parentheses **are** part of the message text and must be entered where shown.

Message Layout and Heading Definitions

The page format for a message in this manual may contain these major headings:

- INPUT COMMAND FORMAT
- EXPLANATION OF COMMAND
- EXPLANATION OF PARAMETERS

- COMPLETION MESSAGE
- DENIAL MESSAGE (Not applicable to every message)
- AUTONOMOUS MESSAGES (Not applicable to every message).

INPUT COMMAND FORMAT shows the message exactly as it appears when entered at the terminal. Some input commands are too long to display on a single line; therefore, these commands are presented on multiple lines. Both the nonhierarchical and hierarchical NPC numbering formats are shown.

EXPLANATION OF COMMAND explains the meaning of the message in general terms.

EXPLANATION OF PARAMETERS defines the keywords present in the command and provides specific information concerning conditions that apply to a particular feature set. Keywords are generally shown in uppercase format, while variables are generally shown in lowercase format. Variables consist of data that further defines or delineates keywords.

COMPLETION MESSAGE shows a complete version of the normal response to the input command.

DENIAL MESSAGE shows a complete version of the input command denial message. The message includes an error code and a reason for the denial.

AUTONOMOUS MESSAGES are messages that report a change in the DACS II system state. The header line of the autonomous response contains the information of source identifier (SID), date, and time. The primary line contains an alarm code (ALMCDE), an autonomous message tag (ATAG) and a verb with modifiers. The verb is always REPT, indicating a report.

Communicating With DACS II

Input Command Mode

The input command requests an action to be performed; this command contains necessary information for DACS II to accomplish the requested action. The user has two basic modes for inputting commands: the command mode and the menu/prompt mode.

Command Mode

The command mode is for the experienced user or machine-machine operation. A command must be selected along with variables and entered within a single line. The user types a single-line command with the only carriage return occurring at the end. "Single-line" refers to the input *command*, not to the display of the command. *A long single-line command may extend for several lines on a display terminal.*

DACS II accepts up to 120 characters of input per command. If an input command exceeds 80 characters (the standard width of most terminal screens), the input will continue on the next line of the display beginning with the 81st character. However, the command line can be broken at a convenient place by typing a backslash (\) followed by a carriage return. The display of the input command will continue on the next line, but the command will be interpreted as a single-line command. If 120 characters is not sufficient or if the user finds entering long commands error-prone, the single-line command can be broken up into several smaller commands.

Entering a carriage return without the backslash terminates the input and causes the line to be interrupted. An exclamation point (!) also terminates the input command (that is, DACS interprets the carriage return and ! as the end of the command). If the carriage return is used, ! is echoed back to the terminal.

Menu/Prompt Mode

This optional on-line help mode assists the user in completing the input command. The menu/prompt mode aids the user by providing a list of alternative parameters or keywords.

The user starts the menu/prompt mode by entering a question mark (?) in the command line at the point in question. In response, DACS II presents a list of possible keywords. This list is presented to the user in menu or prompt form. At this point, the user may continue or return to the command line. If the user continues, s/he should refer to the detailed examples (menu form and prompt form) in the "On-Line Help Feature" section.

Aborting an Input Command or Output Message

The ABT -CMD is entered to interrupt a system response or abort an input command. If ABT -CMD is entered at LINK-I, the output from this link will be interrupted just after ABT -CMD is entered or after one or two output lines. At other links, the output messages may or may not be interrupted. When the ABT -CMD option is used, the command generating the output has been completed unless the autonomous message, CMD ERR ABT, appears.

For a nonabortable message, the output message will not be affected.

If a nonabortable message is being output but DACS II is executing an abortable command, ABT -CMD will stop the execution of the abortable command and CMD ERR ABT (Message No. O.01121) will be output on all links.

Input Command Format

General

The general format of an input command is:

VERB[-MODIFIER][-MODIFIER]:[xy]:[zz]:[ww]:[d][,e]...[,z];

Brackets [] enclose modifiers, parameters, and optional information. Parameters give the specific information required by the command verb in order to execute that command. All parameters are positional within the command line.

: [xy]: [zz]: [ww]: [d][,e]...[,z]; represent the input parameters and are separated by colons, but if they are logically connected (also called group, block, field), they are separated by commas. The colon (:) is used as a parameter field delimiter. Note: When entering a command the trailing or last colon may be omitted.

Input messages are terminated with the semicolon (;) or a carriage return. If the carriage return is used, ; is echoed back to the terminal.

Input commands must be treated on a case-by-case basis. For example:

- If a parameter field has only a single value (letter or number), it is considered a keyword defined parameter field.
- A keyword defined parameter is not positioned inside the parameter field and the comma (,) is omitted. A double comma (,,) in any keyword defined parameter field will be rejected.
- A value (letter or number) defined parameter is positional inside a parameter block.

Keywords

Commands consist of *keywords* combined with equipment and circuit identification. A *keyword* is an alphanumeric string of characters representing:

- Verb (also called command or action verb)
- Parameter addressing conventions
- Address specification
- Result of a command.

Command verbs are keywords that tell the system to do something.

Entity identification is a keyword that identifies a specific system or circuit pack within the system. For example, the keyword NPC refers to a network processing circuit pack.

Address specification is a keyword that refers to a specific address. TP 03, for example, refers to a specific test port (Test Port 03).

The "Glossary" section contains a listing of all commonly used keywords and their definitions.

Verbs

The general format of an input command is shown below with the various command keywords described in some detail:

VERB[-MODIFIER][-MODIFIER]:[TID]:[EID]:[CTAG]:DATA PARAMETER BLOCKS;
VERB is the command verb specifying what action the system is to perform: connect, audit, diagnose, etc. A *command verb* (also called an action verb) is sometimes in mnemonic form.

A verb can be followed by no *modifier*, one *-modifier*, or two *-modifiers* (each preceded by a hyphen). These modifiers represent the equipment and circuit identification and identify the physical entity within the frame or the data base entity upon which action is taken. Table 1, after the "Output Message Format" section, lists verbs, keywords, and modifiers.

Parameter Addressing Rules

Two different levels of addressing occur in messages. The first level occurs within the target identification (TID), and the second level of addressing occurs within the entity

identification (EID).

Target Identification (TID). The TID uniquely identifies the target as DACS II. An 11-character CLLI* code is the recommended value for the TID. If the CLLI code for a DACS is not unique, the CLLI code can be augmented with additional characters (letters, digits, and hyphens) for a total of 20 characters. The TID is used only in applications of indirect routing. If direct routing exists between the user and the DACS II frame, the TID is not necessary. If a TID is incorrectly entered, whether it is required or not, the entire command will be denied.

Entity Identification (EID). The EID identifies the particular entity within the DACS II frame and is composed of an equipment part and a facility part.

- Equipment

The format of the equipment part consists of PHYSICAL-{UNIT number}-{NUMBER}. The PHYSICAL description is a DISK, TAPE, UNIT, MC, PWR, FTMI, etc., and, if necessary, a hierarchic logical address may be appended to it. Therefore, the equipment part may be a combination of the physical description and the logical address. UNIT number defines where the equipment (unit) exists. There can be up to six units in a 512 primary block circuit DACS II. NUMBER is the range or count of different entities that can exist in a unit. If the range is one for NUMBER, it will be "null" in the address.

- Facility

In this manual, the double and triple ampersand (&&,&&&) define a sequence of consecutive simple parameter arguments. It is possible to indicate the arguments by writing the lower and upper simple parameter arguments separated by && or &&&.

Input Command Control Characters

In addition to input commands, DACS II responds to the following input command control characters or symbols:

CONTROL-x or CTRL-x. *Abandon message.* Depressing the CONTROL and the X keys simultaneously causes DACS II to abandon the message being entered and return the system prompt.

* COMMON LANGUAGE is a registered trademark and CLEI, CLLI, CLCI and CLFI are trademarks of Bell Communications Research, Inc.

CONTROL-h or CTRL-h, UNDERLINE, BACKSPACE. *Erase last character.*

Depressing the CONTROL and H keys simultaneously or depressing the UNDERLINE key or the BACKSPACE key causes DACS II to ignore the last character of a message and echo an underline (_). Entering *n* number of erase character symbols causes DACS II to ignore the last *n* characters of a message.

BREAK. *Interrupt output message.* The BREAK key interrupts an output message. The message continues after an allotted amount of time has passed or after the operator has finished entering an input message.

Input Command Acknowledgements

After DACS II has received the execute character of the input command, an immediate reply will appear with one of the following acknowledgements:

PF (Printout Follows)

DACS II received the input command and processed it. An output message will soon be returned. The output message will report the results of the work initiated by the command. If the system cannot complete the command, the reason will be printed.

RL (Retry Later)

DACS II cannot execute the requested command now because it does not currently have system resources available.

- The system could be temporarily overloaded.
- The command queue could be excessively long.
- The requested program may be busy, etc.

Wait, and enter the command later.

NG (No Good)

The basic format of the command is correct, but the system is in trouble. An example is when the MP is in the MCOND state.

NA (No Acknowledgement)

The command has been accepted by the parser, but processing control has been lost, thus making correct acknowledgement impossible. An example is when the communication interface (CI) has detected a local area network (LAN) failure.

If either NA or RL is sent as an input acknowledgement, a normal or error output message may not be sent. Also, if the input command itself is in error, the input acknowledgement will indicate this fact and either the normal or error message will not be sent.

Acknowledgement	Meaning
?V<cr><lf>	Command code error
?D<cr><lf>	Parameter block error
?E<cr><lf>	Error in command, cannot be identified as either ?V or ?D
?P<cr><lf>	Parity error occurred in the input
?T<cr><lf>	The time between characters exceeded timeout threshold
?X<cr><lf>	Command aborted in response to a <cancel> or <break> from user.

Output Message Format

There are three types of DACS II output messages. The normal or **completion message** indicates that the input command from the user has been executed and completed. An error response or **denial message** means that the input command has been denied and gives the reason or condition code for the denial. An autonomous output message reports a change in the operational state of the DACS II.

General Format of Output Message

An output message consists of one or more segments. Each message segment is in the following format: a *header line* followed by a *primary line* which may be followed by one or more *secondary lines*.

Header Line. The header line contains the information of target identifier (TID), date, time, and link number. The target identifier is the code for a DACS II frame and consists of up to 20 ASCII characters in length. The date is the current date presented in the format of yy-mm-dd (i.e., year-month-day), where yy is the last two digits of the year, mm is the month, and dd is the day of the month. The time is the current time of day in the format of hh:mm:ss (i.e., hour:minute:second), where hh ranges from 00 to 23, and mm and ss range from 00 to 59. The link number is the administrative link/virtual circuit number in the format of LINK-I[mm] (i.e., LINK-<administrative link number>[<virtual circuit number>]), where I ranges from 1 to 6 and mm ranges from 01 to 16. An autonomous response does not contain the link number.

Primary Line. The primary line contains the information of priority of action (PA), command code, entity identifier (EID), correlation tag (CTAG), data parameters, and termination report. The priority of action indicates the type of output message which could be either a response to an input command or an autonomous message generated by DACS II. The priority of action takes one of the following values:

Value	Meaning
*C	Immediate action, critical alarm (autonomous response)
**	Immediate action, major alarm (autonomous response)
*^	Action, minor alarm (autonomous response)
M^	Result of manual action (response to an input command)
A^	Autonomously generated message, not an alarm

Each caret (^) represents a character space.

The command code consists of the action verb and one or more possible modifiers. In a normal or error response, the correlation tag is the same as that specified in the input command. The correlation tag in an autonomous response is generated by DACS II. The data parameters further specify the action performed on the entity. The termination report indicates whether the input command is successfully completed or denied, and it takes on one of the following values:

Value	Meaning
COMPLD	Input command completed successfully
DENY	Input command denied

Secondary Lines

The secondary lines contained in the output message are of two types: free-format and fixed-format. The free-format secondary lines provide information for the user to understand the data contained in the fixed-format lines. The free-format secondary lines are enclosed by "/"* and "*/." The fixed-format secondary lines contain data generated by DACS II and are arranged in a format so as to be parsed by a machine. The fixed-format secondary lines are enclosed by double quotes ("").

Output Message Segment

The header line is the same for each message segment except for the time and possibly the date. The primary line is exactly the same for all message segments.

A multisegmented output message uses the greater-than sign (>) and the semicolon (;) to terminate the message segments. The greater-than sign is the terminating character (the last printable character) for the first and all intermediate message segments. The semicolon terminates the final message segment. A message segment should be no larger than 4096 bytes.

Normal Response

A normal response reports a successfully completed input command. The general formats of this type of output message are shown below: Each caret (^) represents a character space. The brackets [] are not part of the actual output message, except for those surrounding the output message number.

Single-Segment Normal Response Without Secondary Lines

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[^MODIFIER][^MODIFIER]::[b]:[CTAG]:[d][,e]...[z]^COMPLD
;
```

Single-Segment Normal Response With Secondary Lines

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[^MODIFIER][^MODIFIER]::[b]:[CTAG]:[d][,e]...[z]^COMPLD
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
;
```

Multisegmented Normal Response

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[^MODIFIER][^MODIFIER]::[b]:[CTAG]:[d][,e]...[z]^COMPLD
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
^^^"fixed-format secondary line "
      .....
      .....
^^^"fixed-format secondary line"
>
      .....
      .....
>
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[^MODIFIER][^MODIFIER]::[b]:[CTAG]:[d][,e]...[z]\
COMPLD
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
^^^"fixed-format secondary line"
      .....
      .....
^^^"fixed-format secondary line"
;
```

The example below shows the normal response to a cross-connect command (Message No. I.11001) for cross-connecting channel 022 of the primary block circuit terminated on unit 01, module 1, NPC 01 with channel 015 of the primary block circuit terminated on unit 03, module 2, NPC 05. The output message (Message No. O.11001) does not contain secondary lines.

```
DACS2FRAME1 88-08-01 20:27:12 LINK-2
M CONN CRS T0::01-1-01-022,03-2-05-015:CMDSEQ1:CUS::\
NORM,NORM COMPLD
;
```

Error Response

An error response reports a denial to an input command. The general error response formats are similar to the normal response. The header line is exactly the same, and the primary line only differs in the termination report (DENY). The termination report DENY indicates that the input command was not executed. The first secondary line begins with a 4-character error code (mmmm). This error code describes the reason for the denial of the input command. A free-format secondary line can give more details about the error code. A list of error codes and their meanings are given in Table 2 at the end of this section. Two error response formats are shown below:

Error Response Without Free-Format Secondary Line

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[-MODIFIER][-MODIFIER]::[b]:[CTAG]:[d][,e]...[,z]^DENY
^^^mmmm
;
```

Error Response With Free-Format Secondary Line

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[-MODIFIER][-MODIFIER]::[b]:[CTAG]:[d][,e]...[,z]^DENY
^^^mmmm
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
;
```

Autonomous Response

An autonomous response reports a change in the DACS II system state. The header line of the autonomous response contains the information of source identifier (SID), date, and time. The primary line contains an alarm code (ALMCDE), an autonomous message tag (ATAG), and a verb with modifiers. The verb is always REPT, indicating a report.

Single-Segment Autonomous Response

```
^^^SID^yy-mm-dd^hh:mm:ss
ALMCDE^ATAG^REPT[-MODIFIER][-MODIFIER]
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
;
```

Multisegmented Autonomous Response

```

^^^SID^yy-mm-dd^hh:mm:ss
ALMCDE^ATAG^REPT[-MODIFIER][-MODIFIER]
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
^^^"fixed-format secondary line"
      .....
      .....
^^^"fixed-format secondary line"
>
      .....
      .....

^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
^^^"fixed-format secondary line"
      .....
      .....
^^^"fixed-format secondary line"
;

```

The alarm code indicates an alarm for a trouble condition or a nonalarm condition for a DACS II system state change which does not trigger any alarms; it identifies the severity reported by DACS II and is shown below:

Value	Meaning
*C	Critical alarm message
**	Major alarm message
*^	Minor alarm message
A^	Autonomous nonalarm message

The ATAG is used to check for a skipped output message and for correlation of previous autonomous messages. Some similarity exists with the correlation tag (CTAG) of an input message, but DACS II generates an autonomous message tag for all autonomous output messages. The form of this parameter is xxx[.yyy] where xxx is a 3-digit number and ranges from 050 to 099 ($050 \leq xxx \leq 099$). The yyy is optional; but if used, it may be used as a correlation tag with previous autonomous messages or for association with an action verb. For example, yyy can indicate the number of times that a particular REPT message has been issued ($001 \leq yyy \leq 999$). Value 000 is not used for xxx or yyy.

The free-format secondary line may assist the user in reading the data in the fixed-format secondary line. The message number above the line is used in referring to the manual for more detailed information.

The fixed-format secondary line contains actual message information. This information is described within the individual messages.

Table 1. Verb/Keyword and/or Modifier(s)

VERB/KEYWORD	MEANING
ABT - CMD	Abort or terminate a previous input command that has not completed its execution.
ABT - PROC	Abort or terminate a currently active process or macro.
ALW - LPBK	Allow loopback or inhibit automatic switch protection.
ALW - SW	Allow switching or automatic switch protection.
CHG - LGN	Change password and/or user identification code.
CHG - RPATH - T0	Change the return path for the digroups and ranges beginning with the initial channels given in the TOX argument list.
CHG - TACC - T0	Change the modes of a test session under a specified test port.
CHG - TL - T0	Change the modes of a terminate and leave state of a circuit(s).
CONN - BDCST - T0	Connect a broadcast cross-connection (from source NPC) to a multiple number of other terminations in one direction of transmission.
CONN - CRS1 - T0	Connect a one-way cross-connect circuit or a range of one-way circuits.
CONN - CRS - T0	Connect a two-way cross-connect circuit or a range of two-way circuits.
CONN - HUB - T0	Connect a hubbing mode test access via test port kk with trunk conditioning to the T0 termination.
CONN - TACC - T0	Connect a monitor connection between a digroup (designated T0) and a test port (designated TP).

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
CPY - MEM	Copy data from one memory to another, such as disk (PRI) to tape (SEC) or RAM (WKG).
CRTE - CNFGRN	Create connectivity in the system data base.
CRTE - CRS	Create cross-connections in the cross-connect network.
CRTE - EQPT	Create equipment entities in the system data base.
CRTE - LGN	Create or add a new user to the system.
DGN - EQPT	Diagnose equipment at the user's request and report details. Equipment such as cross-connect buffer (CCB), cross-connect network interface (CCNI), communications interface (CI), disk unit (DISK), link number (LINK), main controller (MC), main processor (MP), network processing circuit (NPC), secondary storage controller (SSC), synchronizer (SYNC), tape unit (TAPE), time slot interchange (TSI), and FTU, DSPC, or DS3 unit.
DISC - BDCST - T0	Disconnect a broadcast connection (from source NPC) to a multiple number of other terminations in one direction of transmission.
DISC - CRS - T0	Disconnect a two-way cross-connect circuit or a range of two-way circuits.
DISC - CRS1 - T0	Disconnect a one-way cross-connect circuit or a range of one-way circuits.
DISC - EQPT	Disconnect (degrowth) equipment, multiple interface units, and/or multiplexers.
DISC - TACC - T0	Disconnect a test access session under a specified test port and restore the original cross-connection.
DLT - CRS	Delete a cross-connection from the system data base.
DLT - FPKG	Delete a feature package from the system data base.
DLT - LGN	Delete a password and user identification code. Only the superuser can invoke this command.
DLT - MACRO, MAP	Delete a macro or map.
DLT - PRMTR	Delete a parameter from the system data base.
ED - CNFGRN - EQPT	Edit the current connectivity and entity state of a specified equipment unit.

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
ED-CONN	Edit a connection.
ED-CRTE	Edit a create activity.
ED-DATE	Edit the system date and time clock.
ED-ADD-MAP	Enter NPCs into the map.
ED-DLT-MAP	Delete NPCs from the map.
ED-OPT-T1	Edit the programmable thresholds for the facility performance parameters of an NPC.
ED-PRMTR-EQPT	Modify the provisioning information associated with equipment.
ED-PRMTR-LINK	Modify the provisioning information associated with user interface links.
ED-PRMTR-MAP, MACRO	Modify the existing map or macro with new information.
ED-PRMTR-NE	Modify the provisioning information associated with the DACS II network element.
ED-PRMTR-T0	Modify the provisioning information associated with digroup.
ED-STATE-EQPT	Edit the maintenance state of equipment in ways other than via a remove or restore function.
ENT-EQPT	Manually provision equipment entities (those that are not automatically provisioned).
ENT-MACRO, MAP	Manually create the open session of an alternate map or a macro.
EXC-MACRO, MAP	Execute the existing map or macro.
INH-LPBK	Inhibit an automatic loopback switch protection.
INH-SW	Inhibit an automatic switch protection.
INIT-LOG	Initialize the ERR log file.
INIT-REG	Initialize the DACS II registers.
INIT-SYS	Initialize the DACS II processor system.
LGN-USER	Allow the user to identify himself/herself to the system with his/her <id>.
LGT-USER	Allow the user to logoff from the system.

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
OPR-ACO-ALL	Cut off the office audible alarm indications without changing the local alarm indications. This function does not clear other alarm indicators and does not disable future alarms from sounding audibles (so a release ACO function is not needed).
OPR-LPBK-T0	Request a loopback on a specified equipment unit or facility in the system.
RLS-LPBK-T1	Release the 1.544 Mb/s loopback.
REPT-ALM-EQPT	Report alarms associated with equipment failures.
REPT-ALMDET-EQPT	Supplement the information about the trouble generated by the REPT-ALM.
REPT-ALM-T0	Report alarms associated with DS0 facility failures.
REPT-CMPR-MEM	Report frame audit memory comparison mismatches.
REPT-DGN-EQPT	Report the results of diagnostic routines that have been initiated autonomously by the system.
REPT-EVT-EQPT	Report events which do not require alarm notifications but indicate the maintenance condition of the system.
REPT-RMV-EQPT	Report the autonomous removal of equipment from service.
REPT-RST-EQPT	Report the autonomous restoral of equipment to service.
REPT-SW-EQPT	Report the autonomous switch of an entity to protection (auto-removal) or to working (auto-restoration).
RMV-CNFGRN	Remove connectivity equipment from service.
RMV-EQPT	Remove equipment from service.
RMV-LINK	Remove a user interface link from service.
RST-CNFGRN	Restore connectivity equipment to service.
RST-EQPT	Restore equipment to service.
RST-PASSWD	Restore or recover the frame administrator password.
RST-LINK	Restore a user interface link to service.

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
RTRV-ALM-EQPT	Retrieve the current status of all automatically-reported equipment indicators (alarm or status).
RTRV-ALM-NE	Retrieve the current alarm state of the DACS II network element.
RTRV-ALM-T0	Retrieve the current status of all automatically-reported digroup indicators (alarm or status).
RTRV-BDCST-T0	Retrieve the cross-connect map for a single NPC or a range of NPCs.
RTRV-BKUP-SCHED	Retrieve the scheduled autonomous backup from a primary memory to a local nonvolatile backup memory.
RTRV-COND-EQPT	Retrieve condition types associated with equipment indicators (alarm or status).
RTRV-COND-T0	Retrieve condition types associated with NPC indicators (alarm or status).
RTRV-CNFGRN-EQPT	Retrieve the current connectivity and entity state of a specified equipment unit.
RTRV-CRS-T1	Retrieve the cross-connect map information associated with NPCs.
RTRV-HDR	Retrieve the header information associated with the DACS II network element.
RTRV-LOC-EQPT	Retrieve a physical location of a plug-in entity.
RTRV-LOG	Request to dump the contents of the log file.
RTRV-MAP-COM, EQPT	Query the map.
RTRV-MACRO-COM	Query the macro.
RTRV-OPT-T1	Retrieve the option (threshold) value for parameter.
RTRV-PRMTR-EQPT	Retrieve the provisioning information and service data associated with equipment.
RTRV-PRMTR-LINK	Retrieve provisioning information and service data associated with user interface links.
RTRV-PRMTR-MACRO, MAP	Retrieve information of the components associated with the macro or map.

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
RTRV-PRMTR-NE	Retrieve provisioning information and service data associated with the network element.
RTRV-PRMTR-T0	Retrieve the provisioning information and service data associated with NPC channels.
RTRV-PRVG-USER LINK	Retrieve privilege parameters associated with login users or link.
RTRV-RECOVY-EQPT	Retrieve information of the error source register (ESR) for a specific processor.
RTRV-REG-EQPT	Retrieve information of the error source register (ESR) for the main processor.
RTRV-STATE-COM	Retrieve the common information associated with equipment (such as TLIs and SYNCs).
RTRV-STATE-EQPT	Retrieve the state information associated with equipment.
RTRV-STATE-T0	Retrieve the state information associated with NPCs.
RTRV-TACC-T1	Retrieve information about all test access activity of the test port.
RTRV-TACC-T0	Retrieve information about all test access activity in the system.
SCHED-BKUP-MEM	Schedule an autonomous backup from a primary memory to a local nonvolatile memory.
SCHED-PMREPT-ALL	Schedule an autonomous midnight performance monitoring report.
SET-ATTR-EQPT	Set the attributes that are associated with a specified event.
SET-PRVG-USER TERM	Assign user or link privilege for input prioritization and output screening.
STA-LOCL-RST	Transfer the database from DISK to RAM or from TAPE to RAM.
SW-DX-EQPT	Request all digroup circuits to select data and clocks from cross-connect side A.

Table 2. Error Codes and Conditions

CODE	CONDITION
AETN	Not valid for access type
ENAC	Equipage, not equipped with alarm cutoff
ENDG	Equipage, not equipped with diagnostic capability
ENDS	Equipage, not equipped with duplex switching
ENEC	Equipage, not established channel
ENEQ	Equipage, not equipped
ENFE	Equipage, feature not provided
ENIE	Equipage, not identical entities
ENMB	Equipage, not a multipoint bridge
ENMD	Equipage, not equipped with memory device
ENRE	Equipage, not recognized
ERLC	Equipage, a red-lined circuit
IBEX	Input, extra block
IBNC	Input, block not consistent
ICNV	Input, command not valid
IDMS	Input, data missing
IDNV	Input, data not valid
IDRG	Input, data out of range
IAC	Input, invalid access identifier
ICM	Input, invalid command
ICT	Input, invalid correlation tag
IDT	Input, invalid data parameter
IIFM	Input, invalid data format
IITA	Input, invalid TID (target identifier)
INAC	Input, access number not correct
IORD	Input, out of range of data
IPNV	Input, parameter not valid
ISCH	Input, syntax character error
ISPC	Input, syntax punctuation error
NCON	No condition
PICC	Privilege, illegal command code
PIOC	Privilege, illegal operations channel
PIPW	Privilege, illegal password/user id code
RABY	Resource, all test ports busy
RTBY	Resource, request test port busy
RTEN	Resource, request test port does not exist
SAAL	Status, already allowed

Table 2. Error Codes and Conditions (Contd)

CODE	CONDITION
SAAS	Status, already assigned
SABT	Status, aborted
SACC	Status, already cross-connected
SADC	Status, already disconnected
SAIN	Status, already inhibited
SAIS	Status, already in-service
SAMS	Status, already in maintenance state
SAOS	Status, already out-of-service
SARL	Status, already released
SAWS	Status, already in working state
SCAT	Status, circuit already connected to another test port
SCNA	Status, command not able to be aborted
SCNS	Status, circuit not in split condition
SCOS	Status, channel out of service
SDAS	Status, diagnostic already started
SDFA	Status, duplex unit failed
SDNA	Status, duplex unit not available
SDNS	Status, diagnostic not started yet
SNAS	Status, not in pending state
SNCC	Status, not cross-connected
SNIS	Status, not in-service
SNML	Status, no monitor line established
SNOS	Status, not out-of-service
SNST	Status, execution could not be started
SNVS	Status, not in valid state
SOSF	Status, out-of-service, failed
SOST	Status, out-of-service testing
SPFA	Status, protection unit failed
SRCN	Status, request condition already exists
SROF	Status, requested operation failed
SRTN	Status, unable to release test port
SSTP	Status, execution stopped before completion
STAB	Status, test aborted
STOS	Status, test port out of service
STTI	Status, test port idle
SWFA	Status, working unit failed

DACS II Administrative Links

The DACS II can be administered (managed, operated) from a local terminal or remotely from an OS connected via an administrative link. Six physical links can be connected to the DACS II frame. Links 1–4 are asynchronous and links 5 and 6 can be asynchronous or

synchronous depending on the communications interface. Sixteen virtual circuits may be established on a synchronous link.

Variables *n* and *vv* are used within the message formats to represent the physical and virtual link numbers, respectively.

A level of message screening can be assigned to each link. A user may choose to always receive responses to his/her commands, to receive selected messages, or to receive all messages from the other links. Autonomous messages may be blocked for a particular link to prevent other output messages from being interspersed among the user's messages. Some examples of uses of an administrative link are:

- Common equipment and feature equipment provisioning and maintenance
- Equipment and channel status information
- Facility provisioning and maintenance
- Facility performance readings.

An output message is sent from the DACS II over one or more administrative links in response to one of the following occurrences:

- An input command

The output message reports that the input command was either completed successfully or denied; additionally, it may contain information requested by the input command. A *normal response* is an output message reporting a successful completion; an *error response* is an output message reporting a denial.

- An autonomous change in DACS II operation state

The output message reports the information on DACS II system operation state changes which includes alarms and other trouble indications. This output message is referred to as an *autonomous response*.

NPC Addressing

Two addressing or numbering methods for network processing circuits are available: the **nonhierarchical or extended format** and the **hierarchical**. These numbering methods are used to provide a means of locating network processing circuits.

Hierarchical Numbering

The **hierarchical method** consists of three parts: the unit number (uv), the module or group number within the unit (m), and the NPC number within the module (np) for a total of five digits (uv-m-np) with dashes separating the parts.

Nonhierarchical Numbering

The nonhierarchical or extended method uses consecutive numbering to count through the units in the frame. Each unit has a fixed starting number (for example, [0]061 for unit 2; [0]321 for unit 3; [0]481 for unit 4). The starting number is the same for the FTU or the DSPU type units.

On-Line Help Feature

Description

The DACS II provides on-line assistance to the user when constructing commands at the terminal. This assistance is in the form of a menu-driven help routine. Different menus are displayed during the routine to provide the user with information on all the command fields. The menu items include:

- Verbs (Action or command)
- Applicable keywords for a command
- Possible choices or number range for a variable field
- Definitions of keywords.

An inappropriate selection will bring an error response.

The help routine can be used to the degree needed to complete the command: either through the entire command in every field or only for a particular part of the command. Using help to construct the entire command will probably not be applicable after some experience is gained at entering commands, since all the commands are documented and the direct entry of commands is so much faster.

There are two operators or keyboard controls used to invoke the different levels of the help routine. These operators are: **SHIFT** **?** and **RETURN**. The question mark is used to initiate the routine or to go into a deeper level (more explanation), and the **RETURN** is used to see the alternative choices at a given point. The dialogue can be terminated either by entering a CTRL-x or by completing the current command line when it is displayed.

Summary: The Help Feature

By entering **SHIFT** **?** , the user may ask DACS II for help at any time before or during the construction of an input command.

In the help mode, DACS II will offer the user menus for the selection of the message keywords and/or prompt for values of variable fields. Entering **SHIFT** **?** provides a greater detail of information on the keywords or variables.

When looking at a menu of choices for a command field, you can select an item and then either continue the process or return to the current position on the command line. To continue the process, use the question mark and the next menu will appear. To return to the command line, use the **RETURN** key. When looking at a prompt to enter a value, you can enter a value, look at the next choice, or request more information. To look at the next choice or to repeat the choices, use the **RETURN** key. To obtain more information in order to enter a value, use the question mark. You can continue this process using the question mark after each entry to complete and submit the command via the dialogue. Alternatively, you can use the **RETURN** key after an entry to obtain the current command line. Then, you can directly enter the remainder of the command line just as you would any DACS command.

Constructing an Entire Command Using Help

The following demonstrates how the menus in the help routine can be used for constructing a simple RTRV (retrieve) command. Only portions of the long menus are shown, but these examples serve to demonstrate how selections are made.

- (1) To invoke the help routine at the start level, enter **SHIFT** **?** . The DACS will respond with OK and the following menu:

Select from:

1. ABT
2. ALW
3. CHG
- .
- .
- .
25. SW

Selection?

- (2) To obtain more of an explanation, enter **SHIFT** **?**. The DACS will respond with OK and the following list:

Select from:

1. ABT (perform an abort)
2. ALW (perform an allow operation)
3. CHG (perform a change)
4. CONN (perform a cross-connection)
- .
- .
- .
21. RTRV (perform a retrieve information)

Selection?

- (3) You may enter either 21 or RTRV followed by **SHIFT** **?**. The DACS responds with this menu:

Select from:

1. ALM
2. BDCST
- .
- .
- .
21. STATE
22. TACC

Selection?

- (4) Again you select the desired verb modifier by entering either 21 or STATE.

- (5) The DACS responds with:

Select from:

1. COM
2. EQPT
3. T3
4. TS

- (6) Select 2 and enter **RETURN** to see the command line developed so far.

RTRV-STATE-EQPT

- (7) Enter **SHIFT** **?** to see the next part of the command which is:
1-20 character Target Id (optional).
Since the frame target ID is optional, it can be omitted which is confirmed by entering **RETURN** . This lists the alternative go to address block (YES/NO)?
- (8) Answer Y and notice the double colons that are added to the end of the command line to close the target ID field. After this, enter a ? to obtain the next selection.
units (YES/NO)?
specify ftu unit number (YES/NO)?
specify dspc unit number (YES/NO)?
specify ds3u unit number (YES/NO)?
timeslot interchange (YES/NO)?
- (9) Select 4, bringing the resultant command line. Entering a question mark brings the response
1-10 character Correlation Tag (optional)
Again this is optional, and entering a **RETURN** requests that you go on to the next field EQPD block (YES/NO)?, which is the alternative to entering the Correlation Tag.
- (10) Answer Y and after the current command line is displayed, enter **RETURN** . At this point, the DACS returns the command line as follows:
RTRV-STATE-EQPT::TSI::EQPD;
The command line is complete.
EXECUTE (YES/NO)?
- (11) Now simply answer Y followed by **RETURN** and the command will be executed.

Obtaining Help at a Particular Point on a Command Line

DACS II's on-line help not only can be used to construct a command from scratch, it can also be used to obtain information on particular fields of a command. If the command format is not known or if the keywords or variables are not clear, the help dialogue can be initiated at any point by entering **SHIFT** **?** .

- (1) Assume the following multipoint circuit CONN-CRS command was entered and denied because one of the NPCs named in the command must be an MB-type.

```
CONN-CRS-T0::01-1-01-01,01-1-02-03::TRSP::SYM,LEG::; ?D
xy 90-10-15 13:12:10 LINK-4
M CMD ::::INERR,BAD_SYNTAX STOPPED
/* [0.01131] */
/* CONN-CRS-T0::01-1-01-01,01-1-02-03::TRSP::=SYM,LEG::; */
;
```

- (2) The equal signs around the word SYM indicate a problem because it is a multipoint bridge circuit.
- (3) Start over using the help command to obtain information. For example, enter

CONN-CRS-T0:: and ?

The DACS responds with

ds3u unit number = OK

ftu unit number =

Since you are working with a DMB which is in a DSPU, if you enter only RETURN, the next option will be displayed, which turns out to be

dspu unit number =

- (4) To get more information at this point, enter SHIFT ?. The DACS responds with:

dspu unit number = OK

/* decimal integer:, range 1 - 6 */

- (5) This is where the trouble occurred; one of the NPCs in the range must be an MB-type.

- (6) Enter "05" after the equal sign. The DACS responds with:

CONN-CRS-T0::05

dspu module number = OK

/* decimal integer:, range 1 - 8 */

- (7) Enter "1" after the question mark. The DACS responds with:

CONN-CRS-T0::05-1

dspu npc number = OK

/* decimal integer:, range 1 - 2 */

- (8) Enter "1" after the question mark. The DACS responds with:
- ```
dspu npc number = 1 OK
CONN-CRS-T0:05-1-1
dmb conference number = OK
/* decimal integer:, range 1 - 85 */
```
- (9) In response to dmb conference number =, enter the **SHIFT** **?** to get more information. The DACS responds with:
- ```
/*decimal integer, range 1 - 85 */
dmb conference number =
```
- (10) Enter your conference number (2 for example), and **SHIFT** **?**.
- (11) In response to ftu npc number =, enter a question mark to get more information. The DACS responds with:
- ```
/* 3 digit decimal integer, range 01-10-1--04-4-32 */
ftu npc number =
```
- (12) Now that the difference between the NPC numbers for the DSPU and FTU sides of the circuit is clear, terminate the dialogue by entering the required ftu npc number followed by a **RETURN**. This will cause the command line developed through the dialogue to be displayed. Enter the remaining information from the original command to complete the command.

## System Configuration

---

### Frame Configuration and Bay Growth

---

This section discusses the frame configuration for a standard DACS II Capacity Expansion Frame (CEF) and for a retrofitted CEF. In addition, it details the bay growth schemes and requirements for the CEF. The same command is used to configure a non-CEF system, however, the responses will vary since a non-CEF system can have a maximum of two interface bays.

#### Frame Configuration

A DACS II CEF supports one switch bay and up to six interface bays. The switch bay, always bay 2, controls the overall DACS II system operations and provides the switch matrix, power, timing and alarm, and administrative links connections. The interface bay terminates digital facilities and/or provides the digital signal processing function. Interface bays 1, 3, 4, and 5 support three unit positions, while interface bays 6 and 7 support two units. Therefore, a CEF can be equipped with a total of 16 units. Two interface bay types

are supported:

- Original Interface Bay

The original interface bay supports two facility terminating units (FTUs) in its two upper unit positions and one digital signal processing unit (DSPU) or DS3 unit (DS3U) in its lower unit position. The original interface bay only appears in a retrofitted CEF. An interface bay used for a CEF can be an original interface bay only if the frame is a retrofit CEF. In such a case, the original interface bay can only be in bays 1 and 3. Bay 3 can be an original interface bay only if the CEF is retrofitted from a 3-bay frame. If bay 3 of a CEF is an original interface bay, bay 1 must also be an original interface bay.

- Flexible Interface Bay

The flexible interface bay allows fully flexible unit provisioning. Each of the unit positions can be independently equipped as an IFTU, DSPU, or DS3U. The flexible interface bay can occupy any interface bay location; that is, it can occupy bay 1, 3, 4, 5, 6, or 7. The flexible interface bay is the standard interface bay type for the CEF.

## Bay Growth

The minimum bay equipage for a CEF is two bays: Bay 1 (an interface bay) and bay 2 (the switch bay). DACS II allows additional peripheral units and/or bays to be added to an in-service CEF without causing a hit to the existing service.

The bay choices and growth are provisioned by entries to the configuration file using the configuration file command:

```
[I.35021]
```

```
INIT-SYS:[xy]:FRAME:[ww];
```

After all data is entered into the configuration file and it is accepted, DACS II outputs the following response:

```
[O.35021]
```

```
xy yy-mm-dd hh:mm:ss <link number>
```

```
M INIT SYS::FRAME:[ww] COMPLD
```

```
;
```

## **Procedure For Configuring the Frame**

---

When the configuration file command is entered, DACS II leads the user to complete the entry of the file by displaying the Main Menu below:

- 1: Initialize/Reset Configuration File
- 2: Add new bay(s) and unit(s)
- 3: Add unit(s) to existing bay(s)
- 4: Change unit(s) type
- 5: Remove unit(s) OR bay(s) and unit(s)
- 6: Recall configuration data
- 7: Exit

### **Option 1, Initialize/Reset Configuration File**

If Option 1 (initializing or resetting the configuration file) is selected, DACS II leads the user through the steps detailed below.

**Note:** A default option has been assigned to each step and each time a step is entered, DACS II presents its default option unless a user has previously selected an option. In such case, the user-selected option is displayed.

Step 1. Choose the Software Serial Number.

Default = 1234567890.

Step 2. Choose the height of the bay.

The options are:

- 1: 7'0''
- 2: 11'6''

Default = 7'0''.

Step 3. Choose the Cross-Connect Network designation.

Choose ECCN for a CEF  
Choose CCN1 for a non-CEF multibay frame  
Choose CCN2 for a single-bay frame (SBF)

Step 4. Choose the allowable nonhierarchical NPC addressing scheme.

The options are:

- 1: Both 3-digit and 4-digit are allowed
- 2: Only 3-digit is allowed
- 3: Only 4-digit is allowed

Default = Option 1 (both 3-digit and 4-digit).

Selection of option 1 or 3 will be denied if the frame is non-CEF. Selection of option 3 on a CEF will be denied if there is one or more administrative link or if the user has chosen the 3-digit scheme. Similarly, the selection of option 2 on a CEF will be denied if there is one or more administrative links or users using the 4-digit scheme. The denial causes an error message to be displayed; after that, DACS II returns to the Main Menu. In this case, all the choices entered in the previous steps are discarded. Once the Main Menu is shown, the user can either exit to change the provisioning of the link (or user) or select another option from the menu.

Note that for domestic DACS II frames, the 3-digit NPC addressing scheme is the default for DACS II administrative links/users. Also, since the hierarchical NPC addressing scheme does not restrict the frame configuration, there is no selection needed here.

Step 5. Choose total number of bays.

The options are:

- 1: 1 bay
- 2: 2 bays
- 3: 3 bays
- 4: 4 bays
- 5: 5 bays
- 6: 6 bays
- 7: 7 bays

Default = 2 bays (Option 2).

Option 1 above (1 bay) is not allowed for a CEF. Options 4 through 7 must not be selected for a non-CEF. Options 4 through 7 are allowed only if the 4-digit scheme (i.e., Option 3 of Step 4) is selected. Otherwise, an error message will be generated and Step 4 will be displayed again.

## Step 6. Choose bays.

Step 6.1 If the total number of bays selected is 2, choose bays 1 and 2.

Choose bay 1 type. In the figure below, the boxes shown represent the physical relationship between the switch bay (bay 2) and the bay selected; that is, the one surrounded by asterisks (\*).

```

*****_-----
* | |
* Bay 1 | ECCN |
* | |
*****_-----

```

SELECT BAY 1 TYPE

1: Flexible Interface Bay (Units 1, 2, 5)  
2: Original Interface Bay (Units 1, 2, 5)

Default = Option 1 (Flexible Interface Bay).

Step 6.2 If the total number of bays selected is 3, choose the third bay as below.

```

*****_-----*****
* | | | *
* Bay 4 | Bay 1 | ECCN | Bay 3 *
* | | | *
*****_-----*****

```

SELECT THE NEXT BAY POSITION

1: Bay 3, Flexible Interface Bay (Units 3, 4, 6)  
2: Bay 3, Original Interface Bay (Units 3, 4, 6)  
3: Bay 4 (Units 7, 8, 11)

Default = Option 1 Bay 3, Flexible Interface Bay

Step 6.3 If the total number of bays selected is 4, select the fourth bay.

Depending on which bay is selected as the third bay, the options chosen for the fourth bay will be one of the following:

Step 6.3.1 If bay 3 is the third bay configured, the fourth bay can only be one of the following:

```
*****_-----*****
* | | | | *
* Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 *
* | | | | *
*****_-----*****
```

SELECT THE NEXT BAY POSITION

- 1: Bay 4 (Units 7, 8, 11)
- 2: Bay 5 (Units 9, 10, 12)

Default = Option 1.

Step 6.3.2 If bay 4 is the third bay configured, the fourth bay can only be one of the followings:

```
*****_-----*****
* | | | | *
* Bay 6 | Bay 4 | Bay 1 | ECCN | Bay 3 *
* | | | | *
*****_-----*****
```

SELECT THE NEXT BAY POSITION

- 1: Bay 3, Flexible Interface Bay (Units 3, 4, 5)
- 2: Bay 3, Original Interface Bay (Units 3, 4, 5)
- 3: Bay 6 (Units 13, 14)

Default = Option 1.

Bay 1 must also be an original interface bay. If this rule is violated, the type for both bays (bays 1 and 3) must be reentered.

Step 6.4 If the total number of bays is 5, choose the fifth bay.

Depending on the third and fourth bays selected, the selection for the fifth bay will be one of the following:

Step 6.4.1 If bays 3 and 4 are the third and fourth bays (in any order), the options are:

```

***** _ _ _ _ _ *****
* | | | | | *
* Bay 6 | Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 *
* | | | | | *
***** _ _ _ _ _ *****

```

SELECT THE NEXT BAY POSITION

1: Bay 5 (Units 9, 10, 12)  
2: Bay 6 (Units 13, 14)

Default = Option 1.

Step 6.4.2 If bays 3 and 5 are the third and fourth bays (in any order), the options are:

```

***** _ _ _ _ _ *****
* | | | | | *
* Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 | Bay 7 *
* | | | | | *
***** _ _ _ _ _ *****

```

SELECT THE NEXT BAY POSITION

1: Bay 4 (Units 7, 8, 11)  
2: Bay 7 (Units 15, 16)

Default = Option 1.

Step 6.4.3 If bays 4 and 6 are the third and fourth bays, the options are:

```

-----*****
Bay 6	Bay 4	Bay 1	ECCN	Bay 3
-----	-----	-----	-----	-----	*****

```

SELECT THE NEXT BAY POSITION

- 1: Bay 3, Flexible Interface Bay (Units 3, 4, 6)
- 2: Bay 3, Original Interface Bay (Units 3, 4, 6)

Default = Option 1.

**Note:** Option 2 is allowed only if bay 1 is an original interface bay. If this rule is violated, the bay type for both bays (bays 1 and 3) must be reentered.

Step 6.5 If the total number of bays is 6, choose the sixth bay.

Depending on which bays are already configured, the option displayed will be one of the following:

Step 6.5.1 If bays 3, 4, and 5 were chosen, select the next bay.

```

*****-----*****
* | | | | | | *
* Bay 6 | Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 | Bay 7 *
* | | | | | | *
*****-----*****

```

SELECT THE NEXT BAY POSITION

- 1: Bay 6 (Units 13, 14)
- 2: Bay 7 (Units 15, 16)

Default = Option 1.

Step 6.5.2 If bay 4 has not been chosen, choose bay 4 as the sixth bay configured.

```

*****-----
* | | | | | |
* Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 | Bay 7 |
* | | | | | |
*****-----

```

THE NEXT BAY IS BAY 4

Step 6.5.3 If bay 5 was not selected, choose bay 5 as the sixth bay configured.

```

-----*****
Bay 6	Bay 4	Bay 1	ECCN	Bay 3	Bay 5
-----*****

```

THE NEXT BAY IS BAY 5

Step 6.6 If the 7-bay option is selected, determine if the bay type for bays 1 and 3 has already been stored in the data base. If so, go to Step 7. Otherwise, choose these two bays.

Step 6.6.1 Choose the type for bay 1:

```

-----*****
Bay 6	Bay 4	Bay 1	ECCN	Bay 3	Bay 5	Bay 7
-----*****

```

SELECT BAY 1 TYPE

- 1: Flexible Interface Bay (Units 1, 2, 5)
- 2: Original Interface Bay (Units 1, 2, 5)

Default = Option 1.

Step 6.6.2 Choose the type for bay 3:

```

-----*****
Bay 6	Bay 4	Bay 1	ECCN	Bay 3	Bay 5	Bay 7
-----*****

```

SELECT BAY 3 TYPE

- 1: Flexible Interface Bay (Units 3, 4, 6)
- 2: Original Interface Bay (Units 3, 4, 6)

Default = Option 1.

Step 7. Choose unit types.

Step 7.1 For original interface bay 1, the unit types are:

Units 1, 2: FTU or NONE

Unit 5: DS3U, DSPU, or NONE

Default for units 1 and 2 = FTU.

Default for unit 5 = DSPU.

Step 7.2 For the flexible interface bay 1, unit types are:

Units 1, 2, 5: IFTU, DSPU, DS3U or NONE

Default = IFTU. Only one type of IFTU is available in Release 5.0. Thus, no version selection is necessary.

Step 7.3 For original interface bay 3, the unit types are:

Units 3, 4: FTU or NONE

Unit 6: DSPU, DS3U or NONE

Default for units 3 and 4 = FTU.

Default for unit 6 = DSPU.

Step 7.4 For flexible interface bay 3, the unit type can be:

Units 3, 4, 6: IFTU, DSPU, DS3U or NONE

Default = IFTU.

Step 7.5 Bay 4 is restricted to the flexible interface bay type, and the unit type can be:

Units 7, 8, 11: IFTU, DSPU, DS3U or NONE

Default = IFTU.

Step 7.6 Bay 5 is restricted to a flexible interface bay type, and the unit type can be:

Units 9, 10, 12: IFTU, DSPU, DS3U or NONE

Default = IFTU.

Step 7.7 Bay 6 is restricted to the flexible interface bay type, and the unit type can be:

Units 13, 14: IFTU, DSPU, DS3U or NONE

Default = IFTU.

Step 7.8 Bay 7 is restricted to a flexible interface bay type, and the unit type can be:

Units 15, 16: IFTU, DSPU, DS3U or NONE

Default = IFTU.

**Note:** It is acceptable for all units to be configured with the option NONE. Also, if the software used on the frame does not support the DS3 termination feature, the DS3U option will not be displayed.

Step 8. After all unit types are chosen and accepted by DACS II, the following will be displayed:

Are the Frame # and UID to be unprotected?

1: YES

2: NO

Default = unprotected.

When all required data for initializing/resetting the configuration file is entered, the user must press the carriage return to view the Main Menu. Recalling data, changing data or exiting must be implemented through the Main Menu. Note that DACS II does not back up the configuration data to DISK until the user exits.

To interrupt the data entry and exit, press the DELETE key followed by the RETURN key. Once this interrupt signal is received, DACS II denies the input command, and all newly entered data is discarded. In this case, the input message I.35021 must be reentered to

allow initialization or editing of the configuration file.

### **Option 2, Add New Bay(s) and Unit(s)**

To add new bay(s) and/or unit(s) from the Main Menu, DACS II first verifies that the action is allowed. The action of adding new bay(s) and/or unit(s) (option 2 from Main Menu) will be denied if any of the following conditions exist:

- a. The configuration file is not initialized.
- b. All bays are configured.
- c. DACS II is a single bay frame (SBF) or a 3-bay non-CEF.
- d. DACS II is a 3-bay CEF equipped with bays 1, 2 and 3, and at least one of its links/users is using the 3-digit scheme.

Once the selection is accepted, DACS II displays the allowable nonhierarchical NPC addressing scheme. If DACS II is currently a 2-bay frame, DACS II displays the same choices as displayed above, except that, instead of the default option, the currently recorded option is displayed.

If the frame is already equipped with three or more bays, DACS II displays the following:

THE NONHIERARCHICAL NPC ADDRESS SCHEME IS THE 4-DIGIT SCHEME

### **Option 3, Add Unit(s) to Existing Bay(s)**

To add unit(s) to an existing bay from the Main Menu, enter option 3. Units listed are those configured as type NONE. DACS II lists the units in ascending order, with the first unit listed being the default.

Once the unit is selected, DACS II displays the unit type as shown in Step 7 of Option 1. However, DACS II only shows up to three options (IFTU/FTU, DSPU, and DS3U) for each unit, depending on the feature package used. The NONE option will not be shown.

After the unit type is selected, if there are other units configured as NONE, DACS II asks the user if another unit is to be added. If the answer is yes, the unit list will be shown again and the same procedure must be repeated. Otherwise, DACS II will allow the user to return to the Main Menu.

The selection of option 3 from the Main Menu will be denied if either of the following two conditions exists:

- a. The configuration file is not initialized.
- b. No units are configured as NONE.

### **Option 4, Change Unit(s) Type**

To change the unit(s) type, enter option 4 from the Main Menu. Units listed are types IFTU, DSPU and DS3U. Note that an FTU cannot be changed to another unit type and vice versa. DACS II lists the units in ascending order. The first unit listed is the default.

Once the unit is selected, DACS II shows the two allowable choices of the new unit type.

If the original unit type is IFTU, the choice is:

- 1: DSPU
- 2: DS3U

If the original unit type is DSPU, the choice is:

- 1: IFTU
- 2: DS3U

If the original unit type is DS3U, the choice is:

- 1: IFTU
- 2: DSPU

**Note:** The DS3U option will not be displayed if the DS3 termination feature is not supported by the frame.

After the new type unit is selected, DACS II asks the user if another unit is to be changed to a new type. If the answer is yes, the same procedure must be repeated.

The choice of option 4 from the Main Menu will be denied if one of the following conditions exists:

- a. The configuration File is not initialized.
- b. The selected unit is grown by the GRTH command.
- c. All units are configured with type NONE or FTU.

### **Option 5, Delete Unit(s) or Bay(s) and Unit(s)**

To delete unit(s) or bay(s) and units(s) from the Main Menu choose the unit number. The units listed are those of a type other than NONE. DACS II lists the units in ascending order, and the first unit listed is the default.

Once the unit is selected, DACS II shows that the unit type is NONE and asks if another unit is to be deleted. If the answer is yes, the same procedure must be repeated. If the answer is no, DACS II then checks to verify if there is a bay with all units as type NONE. If such a bay exists and the bay is not bay 1, DACS II queries the user if the bay is to be deleted. If the response is yes, DACS II deletes the bay and its units from the configuration file. DACS II repeats the routine for each qualified bay. Note that although all three units of bay 1 can be designated as NONE, bay 1 cannot be deleted from the frame. After

verification is completed, DACS II continues completion of the configuration.

**Note:** If all units are configured as type NONE when the option is selected, DACS II immediately starts the bay deletion check.

The deletion of the unit is denied if either of the following conditions exists:

- a. The configuration file is not initialized.
- b. The selected unit is grown by the GRTH command.

### Option 6, Recall Configuration Data

If option 6 is entered from the Main Menu, DACS II presents the configuration file from the most recently completed session. If no session has previously been completed, the file stored before the current command is entered will be displayed.

A 7-bay configuration is shown below as an example:

| Bay6   | Bay4   | Bay1  | Bay2 | Bay3  | Bay5   | Bay7   |
|--------|--------|-------|------|-------|--------|--------|
| Unit14 | Unit8  | Unit2 |      | Unit4 | Unit10 | Unit16 |
| TYPE   | TYPE   | TYPE  |      | TYPE  | TYPE   | TYPE   |
| Unit13 | Unit7  | Unit1 | ECCN | Unit3 | Unit9  | Unit15 |
| TYPE   | TYPE   | TYPE  |      | TYPE  | TYPE   | TYPE   |
| -----  | Unit11 | Unit5 |      | Unit6 | Unit12 | -----  |
|        | TYPE   | TYPE  |      | TYPE  | TYPE   |        |

|                                     |                             |
|-------------------------------------|-----------------------------|
| Bay 1 Type:                         | Original Interface Bay      |
| Bay 3 Type:                         | Flexible Interface Bay      |
| Height of Bay:                      | 7'0''                       |
| Software Serial Number:             | 1234567890                  |
| Frame Number:                       | UNINITIALIZED (UNPROTECTED) |
| Unique Id:                          | UNINITIALIZED               |
| Nonhierarchical NPC Address Scheme: | 4 digits                    |

Note that the TYPE can be IFTU, DSPU, DS3U, or NONE, depending on the type provisioned. The bay type for bays 1 and 3 can be either the original interface bay or flexible interface bay. The word "UNINITIALIZED" is shown for the frame number and for the unique ID number if these numbers are not entered. Otherwise, the number and/or identification stored will be output instead of the word "UNINITIALIZED." DACS II shows whether or not the frame number is protected (in parentheses).

If a specific bay has not been selected, its space will be filled with blanks. An example of a 3-bay frame configuration follows:

|       |      |       |
|-------|------|-------|
| Bay1  | Bay2 | Bay3  |
| Unit2 |      | Unit4 |
| TYPE  |      | TYPE  |
| Unit1 | ECCN | Unit3 |
| TYPE  |      | TYPE  |
| Unit5 |      | Unit6 |
| TYPE  |      | TYPE  |

After the configuration file is recalled, DACS II instructs the user to return to the Main Menu.  
If the configuration file is not initialized, the recall option will be denied.

### Option 7, Exit

If option 7 is selected from the Main Menu, DACS II shows all data in the configuration file as if the "recall" option were chosen. In addition, DACS II displays the following:

```
Is the above data correct ? (if not, reenter the data)
 1: YES
 2: NO
IS DATA CORRECT ?
```

If the answer is yes, DACS II displays the following menu:

```
Preparing to write Configuration File to DISK
Please wait while writing to disk
Are you sure? (YES/NO)
```

If the answer is yes, DACS II begins writing the configuration file to DISK. When the configuration file backup is completed, output message O.35021 appears. DACS II backs up the configuration file to DISK before generating message O.35021.

**Note:** DACS II generates the completion message even if the content of the configuration file is unchanged.

### Configuration File Completion

This configuration file command can be executed only if the conditions listed are met:

1. The MC is in maintenance condition.
2. The command is entered from link 1.
3. The command is entered by the superuser.

The configuration file command allows the configuration information to be entered all at once or at the time that a new bay or unit is added to the frame. The entry of unit types into the unit positions in the configuration file does not equip these units; rather it limits unit equipage to be consistent with the configuration file and makes the equipment locate function available to assist the craft installation operations before the equipment has been placed in service.

## Documentation Support

The following sections provide descriptions of the following types of DACS II documents:

- Customer Reference Manual
- Operation and Maintenance Manual
- Command and Message Manual
- Quick Reference Guide
- Customer Information Releases

### Customer Reference Manual

This manual provides the overall description of the DACS II equipment and features including physical, functional, application, and capability considerations and administrative link connections.

The following table lists the Customer Reference Manual by select code, issue, and applicable software release.

| Document #    | Subject                           | Iss. | Release |   |   |   |   |   |
|---------------|-----------------------------------|------|---------|---|---|---|---|---|
|               |                                   |      | 1       | 2 | 3 | 4 | 5 | 6 |
| 365-301-002   | DACS II Customer Reference Manual | 1    | X       |   |   |   |   |   |

## **Operation and Maintenance Manuals**

---

The operation and maintenance manuals contain instructions on how to operate the DACS II and how to clear trouble messages. These manuals are intended to be the guide for daily use and for troubleshooting before requesting technical help. The operation and maintenance manuals for the basic core software and all features are available in both MML and PDS versions.

The following table lists the Operation and Maintenance Manual by select code, issue, and applicable software release.

| Operation and Maintenance Manual |                                                           |       |         |   |   |   |   |   |   |   |
|----------------------------------|-----------------------------------------------------------|-------|---------|---|---|---|---|---|---|---|
| Document #                       | Subject                                                   | Iss.  | Release |   |   |   |   |   |   |   |
|                                  |                                                           |       | 1       | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

## **Quick Reference Guides**

---

These guides contain frequently used commands organized into categories of functions, tables and illustrations of cross-connections, a summary of corrective action for frame audit messages, and for PDS, the meanings of the command denial condition codes. The guides are intended to support the experienced user and to serve as a handy reference for commands. Different guides cover two feature set: 2.048 Mb/s alone or subrate SLC<sup>®</sup> carrier, DS1, DS3, and clear-DS1. Both MML and PDS versions are available for each feature set.

The following table lists each Quick Reference Guide by select code, title, issue, and applicable software release.

| Quick Reference Guide |                               |      |         |   |   |   |   |   |   |   |

## Customer Information Releases

Customer Information Releases (CIRs) are designed both to assist sales personnel and as a vehicle to get new feature information to customers.

The following table lists CIRs by number, issue and title.

| Customer Information Releases |      |                                                                                                |
|-------------------------------|------|------------------------------------------------------------------------------------------------|
| CIR No.                       | Iss. | Title                                                                                          |

## **Summary of Input Commands**

---

### **Summary of Input Commands**

This section provides a summary of the DACS II Release 8.2.3 input commands. The commands are presented in an alphabetical and numerical order.

## **Alphabetic Command Summary**

---

[I.55711]

**ABT!**

[I.39201]

**ACT:FRM xy,SEQ ww:MAP <map name>[,CLR][,INCL]!**

### **Autonomous Messages**

This section provides a summary of the autonomous messages that can appear on the DACS II Release 8.2.3 output printer. The following are the categories of autonomous messages:

- Alarms Messages
- Audits Messages
- Error Recovery Messages
- Event Reporting Messages
- Input Denial Messages
- Scheduled PM Reporting Messages
- Startup Messages

## Alarms Messages

## **ABT — AUD**

---

### **ABT — AUD**

This section documents the commands **ABT** through **AUD**.

## **ABT**

---

### **ABORT**

#### **Explanation Of Command**

---

The abort command enables a user to stop a currently executing abortable task previously initiated by the same user from continuing execution. This command is helpful to use when a task is producing large amounts of output that the user does not wish to view, or to stop a task that is operating over a range of entities.

If no users are logged in, a command entered on one link CANNOT be aborted from another link. If the same user is logged in on two different links, commands entered from one link CAN be aborted from another link. Only USER DAX can abort commands entered on any link issued by any user.

When an abortable task is operating over a range of entities, DACS II will complete the task on the current entity, and then stop the task for the remaining entities in the specified range. Since the abort command will also delete all messages queued for output for the link or virtual circuit on which the ABT command was entered, the user should use appropriate query commands to determine which entities in the range have been operated upon before the task was stopped.

In the case where a task has already executed, or no task is executing when the abort command is entered, the abort command will not take effect. Any remaining output will not be generated, and DACS II will not generate a completion message or an ABT completion message.

The following commands may be aborted:

**31341 GRTH::NPC**  
**31352 GRTH::NPC**  
**31362 GRTH::NPC**  
**31363 GRTH::NPC**

## **ACO,ACTIVE**

### **ALARM CUTOFF ACTIVE**

#### **Explanation Of Command**

This output message automatically reports the activation (depressing) of the alarm cutoff (ACO) switch. Activation of this switch silences the audible alarms. The ACO switch will be inactivated when all alarms are retired or when a new alarm appears on the frame. For example, if there is a minor alarm on the frame before the CGA major alarm is induced, when the CGA major alarm is retired by an ACO action, the minor alarm will remain. In this case, there will be a second ACO ACTIVE message.

---

**ACO** - Alarm cutoff

**ACTIVE** - Active

## **ACT,MAP,CLR,INCL**

### **ACTIVATE ALTERNATE MAPS**

#### **Explanation Of Command**

This command requests the activation of an alternate map.

DACS II will not generate individual completion messages for each successful cross-connection; however, it will generate individual denial messages. Moreover, the individual denial messages will only be output to the link/user where the alternate map command was entered, independent of the output screening level.

When only one end of a TCON is remapped via this command, the trunk conditioning specified for a particular cross-connection when that cross-connection was first established will be applied to a disconnected channel.

#### **Command**

[I.39201]

**ACT:FRM xy,SEQ ww:MAP <map name>[,CLR][,INCL]!**

COND cc DNY

[O.55703]

M hh:mm:ss xy,ww n[vv] ACT MAP IN PROGRESS

**Note:** As the alternate map is being executed, DACS II will generate the above IN PROGRESS message every 20 seconds.

### **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**MAP** - Map

**map name**

- Map name (1 to 7 uppercase alphanumeric characters)  
Name of an already existing alternate map.

**CLR** - Clear

Clear all cross-connections on all NPCs included in the map before activating the alternate map.

**INCL** - Inclusive

When an alternate map is activated, existing circuits that are marked CUS or RDC will be overwritten only if the INCL keyword has been specified. Otherwise, a denial will be issued as is currently done for channels under test, etc.

**NPC** - Network processing circuit

**[s]abc** - The first 3- or 4-digit nonhierarchical NPC number of NPC containing a non-two-way, two-point cross-connect.

**[s]jkl, [t]ghi**

- The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - First hierarchical NPC number of NPC containing a non-two-way, two-point cross-connection.

**edhfg** - Hierarchical NPC number

**wxkqr** - Hierarchical NPC number

**uv,wx,ed**

- Unit number

**m,k,h** - Module number

**np,qr,fg**

- NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd,jjj**

- Channel number, the first channel of a range

**eee,kkk**

- Channel number, the last channel of a range

000-031      CEPT

**tc**      - Trunk conditioning

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC(abcd,efgh)**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NAM** - No A to Mu (conversion)

A- to  $\mu$ -law conversion is inhibited.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**00** No conditions

**62** File is being accessed

**64** File doesn't exist/can't be accessed

**70** Some circuits not activated,cleared or pictured

**71** The reference map does not exist

**72** The map is not valid

**cc**    *Explanation*

- 73**    Both sides of CCN are OOS
- 74**    At least one UC is OOS or At least one UC is failed
- 75**    At least one UC is not the correct type
- D5**    No user is logged in on the link/vc
- 01**    Invalid range for specified NPC type
- 02**    Invalid NPC type for AIS insertion
- 06**    Invalid range for specified FROM NPC type
- 07**    Invalid range for specified TO NPC type

## **ADD, LINK, K, T1, T3, N2, A, B**

**ADD LINK, X.25, PROTOCOL, DATA LINK, LAYER  
PARAMETERS**

### **Explanation Of Command**

This command allows the user to provision the protocol-specific parameters in the data link layer of an X.25 administrative link.

### **Command**

[I.36003]

**ADD:FRM xy,SEQ ww:LINK j[,K b][,T1 ee][,T3 ggg][,N2 aa]\  
[,FRMAD {A|B}]!**

### **Completion Message**

[O.36003]

**M hh:mm:ss xy,ww n[vv] ADD LINK j[ K b][ T1 ee][ T3 ggg]\  
[ N2 aa][ FRMAD {A|B}] COMPL**

### **Denial Message**

[O.36003.01]

**M hh:mm:ss xy,ww n[vv] ADD LINK j[ K b][ T1 ee][ T3 ggg]\  
[ N2 aa][ FRMAD {A|B}] COND cc DNY**

### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**LINK** - Link

**j** - Administrative link number (5 or 6)

**FRMAD** - Frame address used by each frame in the Data Link Layer of X.25 protocol.

**A** - Data link layer frame address A. Default is A

**B** - Data link layer frame address B

**K** - Maximum number of outstanding I frames

**b** - Number of frames (1 through 7). Default is 7.

**T1** - Acknowledgment timer

**ee** - Timer setting in seconds (2 through 20). Default is 3 seconds

**T3** - Disconnect (or Idle channel) timer

**ggg** - Timer setting in seconds (4 through 120). Default is 26 seconds

**N2** - Maximum number of frame transmissions

**aa** - Number of frame transmissions (2 through 16) (including original transmission). Default is 7.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**03** Subject entity is in service

**D0** Command is Frame administrator (DAX) only.

## **ADD, LINK, PTCOL, S, X, T, M, BAUD, ALM, BS, ENQ**

### **ADD LINK, PROTOCOL, BAUD**

#### **Explanation Of Command**

This command is used to provision (add) a Snider, X.25, or TABS administrative link.

This command can also be used to initialize or change the performance parameters of the link, including the protocol (PTCOL), link speed (BAUD), alarm class (ALM), backspace (BS), Xon/Xoff flow control (XON), and Enq/Ack flow control (ENQ) provisioning.

At least one parameter must be given.

On input, if a virtual circuit range is specified as zero (0), the corresponding group number specified is ignored by DACS II.

#### **Command**

[I.36001]

**ADD:FRM xy,SEQ ww:LINK j,PTCOL {S|X|T|M}[,BAUD bb][,ALM k]\  
[,BS e][,ENQ q][,XON x][,INIT]!**

If the protocol is Snider:

[I.36001]

**ADD:FRM xy,SEQ ww:LINK j,PTCOL S[,BAUD bb][,ALM k]\  
[,BS e][,ENQ q][,XON x][,INIT]!**

If the protocol is X.25:

[I.36001]

**ADD:FRM xy,SEQ ww:LINK j,PTCOL X[,ALM k][,INIT]!**

If the protocol is TABS:

[I.36001]

**ADD:FRM xy,SEQ ww:LINK j,PTCOL T[,BAUD bb][,ALM k][,INIT]!**

If the protocol is Modified Snider:  
[I.36001]

**ADD:FRM xy,SEQ ww:LINK j,PTCOL M[,ALM k][,INIT]!**

### **Completion Message**

---

The output message received depends upon whether "ENQ" and "XON" are specified in the input command. If "ENQ" and "XON" are not specified in the input command, the output message is the following:  
[O.36001]

**M hh:mm:ss xy,ww n[vv] ADD LINK j[ PTCOL {S|X|T|M}]\**  
**[ BAUD bb][ ALM k][ BS e][ INIT] COMPL**

If "ENQ" and "XON" are specified in the input command, the output message is the following:

**M hh:mm:ss xy,ww n[vv] ADD LINK j[ PTCOL {S|X|T|M}]\**  
**[ BAUD bb][ ALM k][ BS e][ INIT] 2 LN MSG:**  
**[ ENQ q][ XON x] COMPL**

### **Denial Message**

---

The output message received depends upon whether "ENQ" and "XON" are specified in the input command. If "ENQ" and "XON" are not specified in the input command, the output message is the following:  
[O.36001.01]

**M hh:mm:ss xy,ww n[vv] ADD LINK j[ PTCOL {S|X|T|M}]\**  
**[ BAUD bb][ ALM k][ BS e][ INIT] COND cc DNY**

If "ENQ" and "XON" are specified in the input command, the output message is the following:

**M hh:mm:ss xy,ww n[vv] ADD LINK j[ PTCOL {S|X|T|M}]\**  
**[ BAUD bb][ ALM k][ BS e][ INIT] 2 LN MSG:**  
**[ ENQ q][ XON x] COND cc DNY**

### **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**LINK** - Link

**j** - Administrative link number (1 through 6)

**PTCOL** - Protocol

**S** - SCCSAI (Snider protocol)

**X** - X.25 Synchronous protocol

**T** - TABS (Telemetry Asynchronous Block Serial protocol)

**M** - Modified Snider Protocol (requires baud rate of 1200)

**BAUD** - Baud

**bb** - Baud rate

The baud rate is not provisioned for synchronous X.25 links. Timing for X.25 links is received from the connected X.25 network or device. Provisioning the baud rate applies only to asynchronous Snider links.

| <i>bb</i> | <i>Rate</i> |
|-----------|-------------|
|-----------|-------------|

|    |      |
|----|------|
| 03 | 300  |
| 06 | 600  |
| 12 | 1200 |
| 24 | 2400 |
| 48 | 4800 |
| 96 | 9600 |

**ALM** - Alarm

**k** - Alarm class for link hardware failures

| <i>k</i> | <i>Alarm Class</i> |
|----------|--------------------|
|----------|--------------------|

|   |                 |
|---|-----------------|
| 1 | Minor (default) |
| 2 | Major           |

**BS** - Backspace

**e** - Character echoed for backspace or control-h

| <i>e</i> | <i>Character</i> |
|----------|------------------|
|----------|------------------|

|   |                               |
|---|-------------------------------|
| 0 | Backspace is echoed (default) |
| 1 | Underscore is echoed          |

**ENQ** - Enquire

**q** - ENQ/ACK Protocol Enable/Disable Control

*q*      *ENQ/ACK Protocol Provisioning*

0      Disabled

1      Enabled (default)

If the DACS II frame has been set to expect the ENQ/ACK Protocol Enable/Disable Control and the sending terminal is not set up properly to send the ACK in response to ENQ, then after several attempts to receive ACK the DACS II frame will autonomously declare a protocol OOS for ENQ/ACK, remove the link, perform diagnostics and then restore the link. At this point the ENQ/ACK protocol is set to disabled.

**XON** - XON

**x** - XON/XOFF Protocol Enable/Disable Control

*x*      *XON/XOFF Protocol Provisioning*

0      Disabled (default)

1      Enabled

The XON/XOFF Protocol Enable/Disable Control will only take effect when the DACS II frame is in output mode. The effect of XOFF lasts for 60 seconds or until an XON is received. If the frame has data to be output on the given link (that is, from a command executed on that link, or output data from another monitored link), and XOFF's are received in a manner such that at the end of an 60 second OFF interval a new 60 second OFF interval begins, thus preventing the frame from delivering output data, then the frame will declare a software error based on the assumption that a software communications error exists. The link will be autonomously removed, diagnosed, and restored. Following restoral, queued output data will be flushed. The XON protocol will still be in effect after the link is restored.

**INIT** - Initialize

Initialize the administrative link; all parameters are set to default except those specified in the command.

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 01** Subject entity is equipped
- 03** Subject entity is in service
- D0** Command is Frame administrator (DAX) only.
- DF** Command and protocol are inconsistent
- 2A** Incorrect pack type in slot
- EA** XON/XOFF flow control is supported only on Snider link
- EB** ENQ/ACK flow control is supported only on Snider link

## **ADD, LINK, W, P, T20, T22, T23, T25, T26, R20**

### **ADD X.25 LINK PARAMETERS**

#### **Explanation Of Command**

This command allows a user to provision an X.25 administrative link with packet layer parameters.

If a virtual circuit (VC) range is specified as zero (0), the corresponding group number specified in **gghh** is ignored by DACS II.

Parameters T20, R20, DBIT, and VC() are per-link parameters and the remaining parameters are per-VC parameters.

If a 3-digit link+VC number (501, 502, ..) is used and only per-VC parameters are specified, then the command is accepted and the values apply only to the specified VC.

If a 3-digit link+VC number is used and at least one per-link parameter is specified, then the command is denied.

If a 1-digit link number (5 or 6) is used and any per-link and/or per-VC parameter is specified, then the command is accepted and the values apply to all VCs in the link. To ensure proper interface between DACS II and the packet network, packet layer parameters at DACS II and network ends of the X.25 link must be identical.

#### **Command**

[I.36005]

```
ADD:FRM xy,SEQ ww:LINK j[mm][,W c][,P ddd][,T20 iii]\
[,T22 jjj][,T23 kkk][,T25 lll][,T26 mmm][,R20 nn]\
[,R22 p][,R23 qq][,R25 r][,DBIT v][,VC(ppss,gghh)]!
```

### **Completion Message**

---

[O.36005]

```
M hh:mm:ss xy,ww n[vv] ADD LINK j[mm][W c][P ddd]\
[T20 iii][T22 jjj][T23 kkk][T25 lll][T26 mmm]\
[R20 nn][R22 p][R23 qq][R25 r][DBIT v][VC(ppss,gghh)] COMPL
```

**Note:** If output message is longer than 80 characters, the following will be output.

[O.36005]

```
M hh:mm:ss xy,ww n[vv] ADD LINK j[mm][W c][P ddd]\
[T20 iii][T22 jjj] 2 LN MSG:
[T23 kkk][T25 lll][T26 mmm][R20 nn][R22 p][R23 qq]\
[R25 r][DBIT v][VC(ppss,gghh)] COMPL
```

### **Denial Message**

---

[O.36005.01]

```
M hh:mm:ss xy,ww n[vv] ADD LINK j[mm][W c][P ddd]\
[T20 iii][T22 jjj][T23 kkk] [T25 lll][T26 mmm]\
[R20 nn][R22 p][R23 qq][R25 r][DBIT v][VC(ppss,gghh)]\
COND cc DNY
```

**Note:** If output message is longer than 80 characters, the following will be output:

[O.36005.01]

```
M hh:mm:ss xy,ww n[vv] ADD LINK j[mm][W c][P ddd]\
[T20 iii][T22 jjj] 2 LN MSG:
[T23 kkk][T25 lll][T26 mmm][R20 nn][R22 p][R23 qq]\
[R25 r][DBIT v][VC(ppss,gghh)] COND cc DNY
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**LINK** - Link

**j [mm]** - Administrative link number

**j** - Physical link number (l is either 5 or 6)

**mm** - Virtual circuit number (01 through 16)

**W** - Window

**c** - Window size (1 through 7). Default window size is 2.

**P** - Packet

**ddd** - Packet size. Can be 128, 256, 512 octets. Default is 128 octets.

**T20** - Restart request response timer

**iii** - Timer setting (10 through 180 seconds). Default is 180 seconds.

T20 is valid only on a per link basis and will be denied on an individual virtual circuit.

**T22** - Reset request response timer

**jjj** - Timer setting (10 through 180 seconds). Default is 180 seconds.

**T23** - Disconnect (or idle channel) timer

**kkk** - Timer setting (10 through 180 seconds). Default is 180 seconds.

**T25** - Data packet acknowledgement timer

**lll** - Timer setting (10 through 200 seconds). Default is 200 seconds.

**T26** - Interrupt response timer.

**mmm** - Timer setting (10 through 180 seconds). Default is 180 seconds.

**R20** - Restart request retransmission counter

**nn** - Counter setting (1 through 10). Default is 1.

R20 is valid only on a per link basis and will be denied on an individual virtual circuit.

**R22** - Reset request retransmission counter.

**p** - Counter setting (1 through 3). Default is 1.

**R23** - Clear request retransmission counter.

**qq** - Counter setting (1 through 10). Default is 1.

**R25** - Data packet retransmission counter.

**r** - Counter setting (0 through 3). Default is 0.

**VC** - Virtual circuit

**ppss** - Virtual circuit number

**pp** - Range of PVCs

**ss** - Range of SVCs

The sum of the number of PVCs and SVCs must be equal to 16.

Table 1 shows the default values for these fields.

Table 1 and Table 2 show the acceptable values for these fields, allowing for an LCN numbering scheme of 00-255.

TABLE 1

| "pp" | "ss" | Number<br>of PVCs | Number<br>of SVCs | Starting LCN for first<br>PVC Channel | Starting LCN for first<br>SVC Channel |
|------|------|-------------------|-------------------|---------------------------------------|---------------------------------------|
| 00   | 16   | 00                | 16                | --                                    | 01                                    |
| 01   | 15   | 01                | 15                | 01                                    | 02                                    |
| 02   | 14   | 02                | 14                | 01                                    | 03                                    |

**gghh** - Group number

**gg** - Group number for all PVCs (00 through 15).

**hh** - Group number for all SVCs (00 through 15).

VC() is valid only on a per link basis and will be denied on an individual virtual circuit.

**DBIT** - D-bit

*v* - X.25 d-bit setting

**v**      *Explanation*

0      Off (unset) (acknowledgement done from local DTE). Default  
1      On (set) (acknowledgement done from remote DTE)

DBIT is valid only on a per link basis and will be denied on an individual virtual circuit.

**cc** - Hexadecimal condition code

**cc**    **st**    *Explanation*

**03**      Subject entity is in service  
**DF**      Command and protocol are inconsistent  
**E2**      Invalid link number specified  
**E3**    **IS**    Can't Use LCN 0/LGN 0 - designated as a supervisory channel only

## **ADD,NPC**

### **ADD NETWORK PROCESSING CIRCUIT**

#### **Explanation Of Command**

This message adds one or more network processing circuits (NPCs) of the facility terminating unit (FTU) into an alternate map while in a map session.

#### **Command**

##### **Nonhierarchical**

[I.36021]

**ADD:FRM xy,SEQ ww:NPC {[s]abc-[t]def|[s]abc[, [s]ghi]...\  
[, [t]def]]}!**

##### **Hierarchical**

[I.36021]

**ADD:FRM xy,SEQ ww:NPC {uvmnp-wxkqr|uvmnp[,edfgh]...\  
[,wxkqr]]}!**

#### **Completion Message**

If the command is accepted by DACS II, the following acknowledgement will be output.

**OK**

#### **Denial Message**

Not applicable.

### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

**NPC** - Network processing circuit

**[s]abc, [t]def, [s]ghi**  
- The 3- or 4-digit nonhierarchical NPC numbers

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

## **ADD,USER,LINK,INCL,ALL,LANG,M,P,F**

### **ADD USER/LINK LANGUAGE, NPC ADDRESSING AND PRIORITY**

#### **Explanation Of Command**

This command *is used by the DACS II frame administrator* to assign to a user or link or all users and links any of the following attributes:

- The language with which users converse with the DACS II machine
- The type of addressing used to specify a network processing circuit
- The execution priority level assigned to a given message category
- The ability to remove a link

The command can also be used to initialize these attributes, except for the language and NPC addressing type attributes, to their default values.

To change the type of addressing the frame administrator must issue this command and then logout and login again.

#### **Command**

[I.36103]

```
ADD:FRM xy,SEQ ww:{USER <user id>|LINK j[mm][,INCL]|ALL}\
[,LANG {M|P|F}][,NPCAD {E|X|H}][,LEV(a,b,c,d,e,f)]\
[, {RMON|RMOFF}][,RLK {A|I}][,{CONVON|CONVOFF}][,INIT]!
```

### **Completion Message**

---

[O.36103]

```
M hh:mm:ss xy,ww n[vv] ADD {USER <user id>|LINK j[mm][,INCL]|ALL} \
2 LN MSG:
[LANG {M|P|F}][NPCAD {E|X|H}][LEV(a,b,c,d,e,f)]\
[{RMON|RMOFF}][RLK {A|I}][{CONVON|CONVOFF}][INIT] COMPL
```

### **Denial Message**

---

[O.36103.01]

```
M hh:mm:ss xy,ww n[vv] ADD {USER <user id>|LINK j[mm][,INCL]|ALL} \
2 LN MSG:
[LANG {M|P|F}][NPCAD {E|X|H}][LEV(a,b,c,d,e,f)]\
[{RMON|RMOFF}][RLK {A|I}][INIT][{CONVON|CONVOFF}] COND cc DNY
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**USER** - User

**user id**

- User identifier

The users login identifier (two to eight alphabetic characters). The command is denied if the user identifier does not exist.

**LINK** - Link

**j[mm]** - Administrative link number

j Physical link number (1 through 6)

mm Virtual circuit number (01 through 16) for l = 5 or 6

**INCL** - Inclusive

Include virtual circuits of links 5 and 6. The INCL keyword can only be entered with X.25 links 5 and 6, and no virtual circuit number is allowed when this keyword is used. That is, "mm" and "INCL" are mutually exclusive. In addition, the INCL keyword is also mutually exclusive with the "user id" and the keyword "ALL". When INCL is entered, it means that all provisioning data specified in this command, for example, LANG, NPCAD, LEV(a,b,c,d,e,f), RMON/RMOFF and RLK, will be applied to all virtual circuits of the link (5 or 6).

**ALL** - All

All users and links (including virtual circuits). The ALL keyword can only be used together with the NPCAD option. When used, it will change the NPC addressing scheme for ALL users and links including virtual circuits. There is a single exception: the ALL keyword does not affect the NPC addressing scheme for a virtual circuit that is provisioned with the facility data link communication protocol, "F".

**LANG** - Language

The LANG keyword specifies the language used by a link communicating with the DACS II system. All languages cannot be used on all links. The protocol determines what languages are permissible. Three languages are available and they are listed below. See the table below for permissible combinations of protocol and language.

| <i>protocol</i> | <i>language</i>  |
|-----------------|------------------|
| Snider          | PDS or MML       |
| X.25            | PDS, MML, or FDL |
| TABS            | Not applicable   |
| Modified Snider | Not applicable   |

The language defaults to *MML* if LANG is not specified.

**P** - Program Documentation Standards (PDS)

**M** - HuMan-Machine Language (MML)

**NPCAD** - Network processing circuit addressing

**E** - Extended 3-digit nonhierarchical NPC addressing

If the 3-digit nonhierarchical NPC addressing scheme is allowed in the configuration file, it will be used as the default NPC addressing scheme.

**X** - Extended 4-digit nonhierarchical NPC addressing

If the 3-digit nonhierarchical NPC addressing scheme is not allowed in the configuration file, the 4-digit scheme is used as the default NPC addressing scheme.

**H** - Hierarchical NPC addressing

**NOTE:** ➡

To place a new addressing scheme into effect the frame administrator must first request the new addressing scheme with this command and then logout and login again.

**LEV** - Level

- a** - Execution priority level for circuit provisioning commands
- b** - Execution priority level for equipment provisioning commands
- c** - Execution priority level for maintenance commands
- d** - Execution priority level for test access commands
- e** - Execution priority level for monitoring commands
- f** - Execution priority level for common commands

A table giving the command verbs associated with each of the above command sets is given below.

LEV is used in combination with the command set identifiers a through f to set the execution priority level for each command set. A priority level applies to a user or link as appropriate. Priority levels range from 0 through 3. A list of these levels and their meaning is given below for a. The list for b through f is similar to the a list.

- a Explanation*
- 0 Commands in the command set assigned this execution priority level cannot be executed.
  - 1 Highest execution priority level. Commands in the command set assigned this execution priority level will be executed before commands with priority level 2 or 3.
  - 2 Middle execution priority level. Commands in the command set assigned this execution priority level will be executed before commands with priority level 3
  - 3 Lowest execution priority level. Commands in the command set assigned this execution priority level will be executed after all priority level 1 and 2 commands have been executed. Level 3 is the default priority level.
  - The execution priority level of the command set assigned this execution priority level is not to be changed.

**Note:** The commands used to login, logoff, cross-connect, stop, and abort always have the highest priority.

A single queue is used for DACS II commands. When multiple commands arrive at the same time, they will be queued for execution according to the priority assigned to their command set. Commands with the same priority will be executed in the order of arrival, that is, first come first served. A timeout feature insures that no command will wait in the queue forever. When the timeout period has expired for a given command that command will be executed regardless of its priority level.

| <b>a</b><br><b>Circuit</b><br><b>Prov.</b>                                     | <b>b</b><br><b>Equipment</b><br><b>Prov.</b> | <b>c</b><br><b>Maint.</b> | <b>d</b><br><b>Test</b><br><b>Access</b> | <b>e</b><br><b>Monitoring</b> | <b>f</b><br><b>Common</b>                    |
|--------------------------------------------------------------------------------|----------------------------------------------|---------------------------|------------------------------------------|-------------------------------|----------------------------------------------|
| BCON<br>BDIS<br><br>OCNT<br>OCON<br>ODIS<br>OPR<br>RLS<br>TCNT<br>TCON<br>TDIS | COPY<br>DGRTH<br>DLT<br>GRTH                 | CFR<br>DGN<br>RMV<br>RST  | CTST<br><br>TTST                         | AUD<br>UTL                    | ACT<br>ADD<br>ALW<br>CHG<br>ED<br>EXC<br>INH |

**RMON** - Restricted maintenance privilege ON

The RMON keyword is used to assign to a user the privilege of issuing the commands normally restricted to the Frame Administrator.

The following commands are restricted to the Frame Administrator (or superuser).

|                                   |           |
|-----------------------------------|-----------|
| RST::MC,FRC!                      | (I.34001) |
| RST::SMEM,CLR,FRC!                | (I.34211) |
| DLT::FPKG!                        | (I.37301) |
| CHG::ALMS,{ON   OFF}!             | (I.38555) |
| CHG::INTV,{ON   OFF}!             | (I.38451) |
| CHG::MSGLOG:{ON   OFF}!           | (I.38471) |
| UTL::BMTR,FROM SMEM,TO PMEM,EXCT! | (I.55701) |
| UTL::CLR,MSGLOG!                  | (I.57031) |
| UTL::UPGRD!                       | (I.57731) |
| UTL::BOOT,FRAME!                  | (I.58001) |

**RMOFF** - Restricted maintenance privilege OFF

The RMOFF keyword is used to eliminate a user's privilege to issue the commands restricted to the Frame Administrator. RMOFF is the default value.

**RLK** - Remove Link

**A** - Allowed

A is the default value.

**I** - Inhibited

RLK is used to assign to a user or link the privilege of removing a link. There is a relationship between the link privilege and the execution priority level. If c (see previous Command Sets table) in the LEV field is set to zero then the command to remove a link cannot be executed hence the remove link privilege is inhibited even if the RLK option is set to A or I.

**INIT** - Initialize

INIT is used to assign the default values to the link/user parameters LEV, RMON/RMOFF and RLK. Parameters specified in the command will take on the specified values.

**CONVON**

- Mixed Addressing Conversion ON

**CONVOFF**

- Mixed Addressing Conversion OFF

This mixed addressing conversion feature is only applicable to PDS commands in an environment that uses 4-digit sequential NPC numbers. This conversion feature is useful when a DACS II frame is converted from 3-digit sequential NPC addressing to 4-digit sequential NPC addressing for growth reasons. In that case this conversion feature allows certain Operational Support Systems to use 3-digit NPC numbers, even though the frame has been changed to normally accept only 4-digit NPC numbers.

Assuming sequential NPC number usage, DACS II normally accepts only fixed length NPC numbers in its input commands. This conversion feature transfers the fixed length requirement from NPC number to channel number on a link basis. This allows the DACS II parser to accept 3- or 4-digit NPC numbers assuming that the channel number is interpreted to be of 2-digit fixed length. If a 3-digit NPC number is entered with CONVON in effect, then DACS II will internally expand 3-digit NPC numbers to 4-digit NPC numbers.

For some feature configurations this conversion feature is not available, and the CONVOFF keyword will not appear in the output of this command.

**cc** - Hexadecimal condition code

**cc**    *Explanation*

- D0**    Command is Frame administrator (DAX) only.
- D1**    Cannot create any more users
- D2**    User has been created
- D3**    User does not exist
- D6**    Incorrect or missing password
- D8**    Cannot remove Frame administrator
- DC**    No zeros allowed for DAX privilege
- DF**    Command and protocol are inconsistent
- 25**    Invalid FPI value
- C0**    NPC addressing scheme selected is not allowed in the configuration file
- E1**    Virtual circuit is not specified for X.25 link
- E2**    Invalid link number specified
- E3**    Invalid keyword(s) combination specified
- E4**    Invalid NPC addressing scheme specified
- E5**    No user/link needs to be changed
- 3B**    Not valid for frame administrator
- 40**    Only one channel allowed to have this language
- 41**    Language "F" provisioned for this channel
- 83**    Language is not allowed

## **ADD,USER,NEW,PASSWD**

### **ADD USER**

#### **Explanation Of Command**

This message is used by the frame administrator to create a new user login identification and password or to reassign a login identification and password to a previous user of DACS II.

The **NEW** keyword indicates that a new user is being created. The frame administrator uses this command without the **NEW** keyword to reassign a password to a user who is currently on DACS II.

A user is identified to DACS II by his or her **user id** associated with the login. The administrator divulges a password to a new user for the initial log on to DACS II. Afterwards, the user can change this initial password through the **CHG PASSWD** command to a password known only to him or her.

Output from this command is sent only to the link on which the command was input.

#### **Command**

[I.36101]

**ADD:FRM xy,SEQ ww:USER <user id>[,NEW][,PASSWD <user password>]!**

If the message is entered on a Snider link:

[I.36101]

**ADD:FRM xy,SEQ ww:USER <user id>[,NEW]!**

DACS II then generates the message below and a dialog is started.

**PASSWD:** (The frame administrator enters user password.)

**REENTER PASSWD:** (The frame administrator again enters the user password.).

Note that the user password is not echoed by DACS II.

### **Completion Message**

---

[O.36101]

Not applicable.

### **Explanation Of Parameters**

---

**USER** - User

**user id**

- User identifier

User login identification (two to eight alphabetic characters).

**NEW** - New

Create a user identifier for a new user.

**Note:** The "NEW" keyword cannot be used to create a user identifier on a link that is using the X.25 protocol.

**PASSWD** - Password

**user password**

- User password

The password assigned to the user, where password is at least six alphanumeric characters.

**Note:** The "PASSWD" keyword cannot be used to create a user identifier on a link that is using the X.25 protocol.

**cc** - Hexadecimal condition code

**cc** *Explanation*

- D0** Command is Frame administrator (DAX) only.
- D1** Cannot create any more users
- D2** User has been created
- D3** User does not exist
- D6** Incorrect or missing password

## Explanation Of Parameters

### parameter

- Facility Performance Parameter

For PB and PC type NPCs:

| <i>parameter</i> | <i>explanation</i>                  |
|------------------|-------------------------------------|
| DM1H             | Degraded Minutes 1 hour             |
| DM24H            | Degraded Minutes 24 hours           |
| SERS15M          | Severely Errored Seconds 15 minutes |
| SERS24H          | Severely Errored Seconds 24 hours   |
| ERS15M           | Errored Seconds 15 minutes          |
| ERS24H           | Errored Seconds 24 hours            |
| US15M            | Unavailable Seconds 15 minutes      |
| US24H            | Unavailable Seconds 24 hours        |
| SLIPS15M         | Slip Events 15 minutes              |
| SLIPS24H         | Slip Events 24 hours                |

For PA type NPCs:

| <i>parameter</i> | <i>Explanation</i>               |
|------------------|----------------------------------|
| CRC              | CRC Block Errors                 |
| FRER             | Framing Errors                   |
| OFS              | Out of Frame Seconds             |
| ES               | Errored Seconds                  |
| SES              | Severely Errored Seconds         |
| CSS              | Controlled Slip Seconds          |
| CV               | Coding Violations                |
| UAS              | Unavailable Seconds              |
| UATC             | Unavailable Time Count           |
| MER              | Multiframe Errors                |
| FEBE             | Far End Block Errors             |
| FES              | Far End Errored Seconds          |
| FSER             | Far End Severely Errored Seconds |
| FUAS             | Far End Unavailable Seconds      |

**AI** - Accumulation Interval

**aaaaa** - The accumulation time period for the specified parameter.  
(Only for PA/TH type NPCs)

*aaaaa Explanation*

15MIN Parameter count from a 15-minute accumulator  
DAILY Parameter count from a daily accumulator

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

## **ALM,PMC,PMA,DMA,MI,CCN,OOS**

### **ALARM CROSS-CONNECT NETWORK**

#### **Explanation Of Command**

This message reports an alarm on a cross-connect network (CCN) side if the CCN duplexed entities are in an unprotected state. A alarm will be generated when a CCN side is out-of-service (OOS) and pested for two or more consecutive minutes.

#### **Command**

Not applicable.

**MI**      Maintenance Information

**COND** - Condition

**CCN** - Cross-connect network

**s** - Cross-connect Network side number (0 or 1)

**OOS** - Out-of-service

## **ALM,PMC,PMA,DMA,MI,ECCN,OOS**

### **ALARM ECCN**

#### **Explanation Of Command**

This message reports an alarm on side 0 or 1 of the expanded cross-connect network side. The reported alarm notifies the craft when the ECCN duplexed entities are in an unprotected state. An alarm is generated when an ECCN side is out-of-service and pested for two or more consecutive minutes.

**MDY** - USA format (Month, Day, Year)

**DMY** - International format (Day, Month, Year)

**yr** - Year number (four digits)

**mo** - Month number

**da** - Day of month number

**hr** - Hour of day

**mn** - Minute of hour

**sc** - Second of minute

## **ALWSW,UNIT,MMFG,TOPRTN,TOSRVC**

### **ALLOW SWITCH OF MMFG**

#### **Explanation Of Command**

This command requests removal of the inhibition of automatic protection switching from a range of service multiplexer-multiple interface unit functional group (MMFG) in a DS3 unit (DS3U) or a Hybrid DS3 unit (HDS3U) to the protection MMFG in that unit or the automatic switch back from the protection MMFG of a DS3U or a HDS3U to the service MMFG c[-d] of that unit. Only automatic protection switches due to failure will be affected by this message.

The command will always specify the number of the service MMFGs involved, even in the case of the command to allow switch back from the protection MMFG.

When the **TOSRVC** keyword is specified, a range of MMFGs is not acceptable. The command will be denied by the parser.

This command may cause an immediate protection switching/switch back if the original MMFG is out-of-service or is pested. In this case, an autonomous message that indicates the occurrence of the switch will be printed out.

#### **Command**

[I.35301]

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**MMFG** - Multiplexer-multiple interface unit functional group

**c, d** - The number of the MMFG within the unit (1 through 6)

When the TOSRVC keyword is specified, a range of MMFGs is not acceptable. The command will be denied by the parser.

**TOPRTN** - To protection pack

**TOSRVC** - To service pack

**a** - The number of the service MMFG within the range c and d

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

**11** UC is out of service

**12** UC is in service but failed

**4D** The switch is allowed (not inhibited)

## **APPEND,END**

---

### **APPEND COMPONENT COMMAND**

#### **Explanation Of Command**

---

This message is used, during a macro session, to add one or more commands to an existing macro. Commands are added following the location specified by **line number** or **END**. If neither **line number** or **END** is specified then the command(s) being added will be added on the line following the current position of the line pointer. This position may be determined by use of the LINE command.

#### **Command**

---

[I.19041]

**M hh:mm:ss xy,ww n[vv] APPEND[ {<line number>|END}] COND cc \**  
**DNY**

#### **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

### **line number**

- Line number at which to begin appending (0, 1, 2, 3, ...)

If a line number is specified, a command being added will be appended to this line. That is, the new command will be placed on the line following the line pointed to by the line number. The line pointer will then move down to point to the position of the new command. If more than one command has been entered the line pointer will move to the position of the last line entered.

### **END** - End

End is a special line number that marks the position of the last line in the macro. If END is specified, the new command will be placed on the line following the line pointed to by END. The line pointer will then move down to point to the position of the new command. END will then be the line number of the new command. If more than one command has been entered, END will be the line number of the last line entered.

### **COND** - Condition

### **cc** - Hexadecimal condition code

| <b>cc</b> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|           |                              |
|-----------|------------------------------|
| <b>60</b> | User macro/map space is full |
| <b>6B</b> | Invalid line number          |
| <b>6E</b> | No edit session active       |

## **APPL,RESET,IN,PROGRESS**

### **UTILITY QUERY, APPLICATION RESET**

#### **Explanation Of Command**

This message reports that a reset of all the DSP Application cards is complete. During the reset operation an APPL RESET IN-PROGRESS message will also be generated every 20 seconds until the reset operation is completed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**k** - Type of PBA alarm

*k*      *Explanation*

**A**      Primary AIS - AIS received in all 32 time slots.  
**B**      BER - Bit error rate detected in received signal.  
**C**      LCMA - Loss of CRC4 multiframe alignment in TS0.  
**G**      FLCMA - Far-end Loss of CRC4 multiframe alignment in TS0.  
**E**      RBER - Remote bit error rate detected in TS0 bit 4.  
**I**      RAIS - Remote AIS detected in TS0 bit 4.

**L** LMA - Loss of multiframe alignment in CAS TS16.  
**M** R16 - RAI received in TS16 bit 6 of frame 0.  
**P** PFWOOF - TS0 Pseudo Frame Word Out-Of-Frame  
**R** LOS PBF - Loss of Signal type Primary block failure.  
**F** LOF PBF - Loss of Frame type Primary block failure.  
**S** SFI - Synchronization failure indication in TS0 bit 5.  
**V** A16 - AIS received in CAS TS16  
**X** EER - EER - Excessive error rate  
**Y** RAI - Remote alarm indication received in TS0 bit 3.

## **AR01,MISC,ALM,PBA**

**AR01 MISCELLANEOUS ALARM, CGA, PBA OR  
LOS**

### **Explanation Of Command**

This autonomous message reports a DACS II Primary Block Alarm (PBA) on a facility terminated on a particular Network Processing Circuit. Once a PBA has been detected, DACS II inserts downstream trunk conditioning and performs upstream consequent actions, if they are provisioned.

### **Command**

PMA Prompt Maintenance Major Alarm (MJ)  
PMC Prompt Maintenance Critical Alarm (CR)  
DMA Deferred Maintenance Minor Alarm (MN)  
MI Maintenance Information

**PBA** - Primary block alarm

**k** - Type of PBA alarm

*k Explanation*

For PA type NPCs:

**A** Primary AIS - AIS received in all 32 time slots.  
**B** BER - Bit error rate detected in received signal.  
**C** LCMA - Loss of CRC4 multiframe alignment in TS0.  
**E** RBER - Remote bit error rate detected in TS0 bit 4.  
**F** LOF - Loss of Frame type Primary block failure.  
**G** FLCMA - Far-end Loss of CRC4 multiframe alignment in TS0.  
**I** RAIS - Remote AIS detected in TS0 bit 4.  
**L** LMA - Loss of multiframe alignment in CAS TS16.  
**M** R16 - RAI received in TS16 bit 6 of frame 0.  
**P** PFWOOF - TS0 Pseudo Frame Word Out-Of-Frame  
**R** LOS - Loss of Signal type Primary block failure.  
**S** SFI - Synchronization failure indication in TS0 bit 5.  
**V** A16 - AIS received in CAS TS16  
**X** EER - Excessive error rate  
**Y** RAI - Remote alarm indication received in TS0 bit 3.  
**Z** RPSFI- Remote Power Supply Failure Indicator

For PB and PC type NPCs:

- A** Primary AIS - AIS received in all 32 time slots.
- B** BER - Bit error rate detected in received signal.
- E** RBER - Remote bit error rate detected in TS0 bit 4.
- I** RAIS - Remote AIS detected in TS0 bit 4.
- L** LMA - Loss of multiframe alignment in CAS TS16.
- M** R16 - RAI received in TS16 bit 6 of frame 0.
- R** PBF - Primary block failure caused by LOS or LOF.
- S** SFI - Synchronization failure indication in TS0 bit 5.
- V** A16 - AIS received in CAS TS16
- X** EER - EER - Excessive error rate
- Y** RAI - Remote alarm indication received in TS0 bit 3.
- Z** RPSFI- Remote Power Supply Failure Indicator

## Explanation Of Parameters

**BER** - Bit error rate  
Minor Bit Error Rate for NPCs.

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number  
The first NPC in a module.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number  
The last NPC in a module.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number  
The first NPC in a range.

**uvmqr** - Hierarchical NPC number  
The last NPC in a range.

**uv** - Unit number

**m** - Module number

**np, qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**nnn** - Number of NPCs with BER values greater than BER minor threshold or  
number of NPCs with the parameter threshold exceeded.

**xx** - BER Alarm State

This state represents a combination of the Excessive Bit Error Rate (EER), Bit Error Rate (BER), and Remote Bit Error Rate (RBER). It is interpreted as either a Prompt Maintenance Alarm -Major(PMA), Prompt Maintenance Alarm - Critical(PMC), Deferred Maintenance Alarm (DMA), or Clear.

| <i>xx</i> | <i>EER/BER state</i>                                        | <i>RBER state</i> |
|-----------|-------------------------------------------------------------|-------------------|
| CR        | PMC                                                         |                   |
| MJ        | EER/PMA                                                     | Not applicable    |
| MN        | DMA                                                         | Inactive          |
| RN        | DMA                                                         | Active            |
| CL        | Clear*                                                      | Inactive          |
| RL        | Clear*                                                      | Active            |
| --        | NPC unequipped, out of service or with a inappropriate type |                   |

\* Clear refers to a Facility type NPC whose received error rate is less than the Minor BER threshold.

without CRC ( $10^{-5}$ )  
with CRC ( $10^{-6}$ )

Note that EER has priority over the BER/RBER states. EER does not coexist with them; however, BER and RBER coexist with each other.

Unless CHG::NPC,TS0 command is used to redefine the active value of bit 4 of CTS 0, the RBER values are:

*RBER Explanation*

|   |          |
|---|----------|
| 1 | inactive |
| 0 | Active   |

Note that if the autonomous output is the midnight report for non-PA NPCs only, the "xx" will be output as dashes ("-") for the PA NPCs within the same FTM. In this case, an FTM with PA NPCs only will be skipped. Similarly, if the autonomous output is the daily report for PA NPCs only, the "xx" for non-PA NPCs will be output as dashes ("-").

## **AUD,QRY,CFA,CGA,LOS**

### **QUERY FACILITY ALARMS**

#### **Explanation Of Command**

This message requests a listing of all Network Processing Circuits reporting a Primary Block Alarm. See message I.51011 for setting those performance parameters you would like to have measured and collected.

*The alarm report is followed by reports of the form [O.81002], [O.81003] and [O.81004] — if their respective parameters have been enabled as specified in Message I.51011.*

The end of the report is indicated by REPT EVT EQPT::NPC COMPLD.

For an autonomous message, the link field "n" is blank.

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**nnnn** - Total number of CGA/CFA reports

**SC** - Subscriber (loop) carrier

**ALM** - Alarm

**state** - Alarm status

*state Explanation*

PMA Prompt Maintenance Alarm (MJ)  
PMC Prompt Maintenance Critical Alarm (CR)  
DMA Deferred Maintenance Alarm (MN)  
MI Maintenance Information

**k** - Type of alarm

*k Explanation*

For PA type NPCs:

**A** Primary AIS - AIS received in all 32 time slots.  
**B** BER - Bit error rate detected in received signal.  
**C** LCMA - Loss of CRC4 multiframe alignment in TS0.  
**E** RBER - Remote bit error rate detected in TS0 bit 4.  
**F** LOF - Loss of Frame type Primary block failure.  
**G** FLCMA - Far-end Loss of CRC4 multiframe alignment in TS0.  
**I** RAIS - Remote AIS detected in TS0 bit 4.  
**L** LMA - Loss of multiframe alignment in CAS TS16.  
**M** R16 - RAI received in TS16 bit 6 of frame 0.  
**P** PFWOOF - TS0 Pseudo Frame Word Out-Of-Frame  
**R** LOS - Loss of Signal type Primary block failure.  
**S** SFI - Synchronization failure indication in TS0 bit 5.  
**V** A16 - AIS received in CAS TS16  
**X** EER - Excessive error rate  
**Y** RAI - Remote alarm indication received in TS0 bit 3.  
**Z** RPSFI- Remote Power Supply Failure Indicator

For PB and PC type NPCs:

**A** Primary AIS - AIS received in all 32 time slots.  
**B** BER - Bit error rate detected in received signal.  
**E** RBER - Remote bit error rate detected in TS0 bit 4.  
**I** RAIS - Remote AIS detected in TS0 bit 4.  
**L** LMA - Loss of multiframe alignment in CAS TS16.  
**M** R16 - RAI received in TS16 bit 6 of frame 0.  
**R** PBF - Primary block failure caused by LOS or LOF.  
**S** SFI - Synchronization failure indication in TS0 bit 5.  
**V** A16 - AIS received in CAS TS16  
**X** EER - EER - Excessive error rate  
**Y** RAI - Remote alarm indication received in TS0 bit 3.  
**Z** RPSFI- Remote Power Supply Failure Indicator

## **AUD,QRY,CFA,CGA,LOS**

### **AUDIT QUERY NPC PARAMETER**

#### **Explanation Of Command**

This command is used to request the value of selected facility performance parameters of all FTU or DS3U NPCs that are associated with active Carrier Group Alarms (CGAs) or Carrier Failure Alarms (CFAs). Only those parameters that were enabled by the UTL::TOD,FAC (51011) command are reported. Also see messages O.81001, O.81003, O.81004, and O.81005 for other output on performance parameters.

The output messages may be the result of executing the AUD::QRY, {CFA|CGA|LFVR|FFER} command or they may be autonomously produced.

The output messages are part of the "midnight report" parameter count section. The parameter count section appears:

- Manually: Immediately when requested by the AUD::QRY,CFA command.
- Autonomously: Daily at the time scheduled with the UTL::TOD command (default is midnight).

#### **Command**

[I.81001]

**AUD:[FRM xy,SEQ ww]:QRY,{CFA|CGA|LOS}!**

## Completion Message

### Nonhierarchical

One command response output segment is generated for each FTM.

If the FTM does not have any PA type NPCs or if the parameter is not applicable to PA type NPCs, the following output format will be generated:

[O.81002]

M hh:mm:ss xy,ww n[vv] AUD QRY <parameter> ALL FTU NPCS \  
[s]abc-[t]def TOT nnn 5 LN MSG:

```

| MER              | Multiframe Alignment Error Events (time slot 16) |

For PA type NPCs:

| <i>parameter</i> | <i>Explanation</i>               |
|------------------|----------------------------------|
| CRC              | CRC Block Errors                 |
| FRER             | Framing Errors                   |
| OFS              | Out of Frame Seconds             |
| ES               | Errored Seconds                  |
| SES              | Severely Errored Seconds         |
| CSS              | Controlled Slip Seconds          |
| CV               | Coding Violations                |
| UAS              | Unavailable Seconds              |
| UATC             | Unavailable Time Count           |
| MER              | Multiframe Errors                |
| FEBE             | Far End Block Errors             |
| FES              | Far End Errored Seconds          |
| FSES             | Far End Severely Errored Seconds |
| FUAS             | Far End Unavailable Seconds      |

**Note:** For PA type NPCs, only the daily parameters will be output by this message.

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, the first NPC in a module.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, the last NPC in a module.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

**uvmnp** - Hierarchical NPC number, the first NPC in a module.

**uvmqr** - Hierarchical NPC number, the last NPC in a module.

**uv** - Unit number

**m** - Module number

**np, qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**TOT** - Total

**nnn** - Cumulative total number of NPCs in the module

A module is either an FTM or a Multiplexer on a DS3U with the specified facility performance parameter value greater than 0.

One DS3U output module contains the information about NPCs on one Multiplexer.

**xxxxx** - Facility performance parameter value (00000 through 65536)

This value is used when there is no PA type NPC provisioned.

**h** - Thresholding Mode for PA type NPCs.

|          |                    |
|----------|--------------------|
| <i>h</i> | <i>Explanation</i> |
|----------|--------------------|

|   |           |
|---|-----------|
| I | Inhibited |
|---|-----------|

|   |         |
|---|---------|
| A | Allowed |
|---|---------|

If the count of a common parameter, that is, CRC, FRER or MER, is to be output, a dash ("-") will be output in this field for a non-PA type NPC within FTMs with mixed NPC types.

**xxxxxxxxx**

- Facility performance parameter value for PA type NPCs  
(000000000 through 345600000)

## **AUD, QRY, CFA, CGA, LOS**

### **AUDIT QUERY FACILITY PERFORMANCE PARAMETERS**

#### **Explanation Of Command**

This message indicates all equipped facility terminating network processing circuits have zero values for a specified facility performance parameter since local midnight. See message I.51011 for setting those performance parameters you would like to have measured and collected. Also see messages O.81001, O.81002, O.81003, and O.81005 for other output on performance parameters.

#### **Command**

[I.81001]

**AUD: [FRM xy, SEQ ww]: QRY, {CFA|CGA|LOS}!**

#### **Completion Message**

[O.81004]

**M hh:mm:ss xy, ww n[vv] AUD QRY <parameter> ALL NPCS TOT 000 \**  
**COMPL**

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

Not applicable.

## Explanation Of Parameters

---

**CFA** - Carrier failure alarm

**CGA** - Carrier group alarm

**ALL** - All

**NPCS** - Network processing circuits

**TOT** - Total

Total of all NPCs

### **parameter**

- Facility performance parameter

For PB and PC type NPCs:

| <i>parameter</i> | <i>Explanation</i>                               |
|------------------|--------------------------------------------------|
| DM1H             | Degraded Minutes (1 hour)                        |
| DM24H            | Degraded Minutes (24 hour)                       |
| SERS15M          | Severely Error Seconds (15 minutes)              |
| SERS24H          | Severely Error Seconds (24 hours)                |
| ERS15M           | Error Seconds (15 minutes)                       |
| ERS24H           | Error Seconds (24 hours)                         |
| US15M            | Unavailable Seconds (15 minutes)                 |
| US24H            | Unavailable Seconds (24 hours)                   |
| SLIP15M          | Slip events (15 minutes)                         |
| SLIP24H          | Slip events (24 hours)                           |
| CRC              | Cyclic Redundancy Code                           |
| FRER             | Frame Error                                      |
| LOFA             | Loss of Frame Alignment                          |
| MER              | Multiframe Alignment Error Events (time slot 16) |

For PA type NPCs:

| <i>parameter</i> | <i>Explanation</i>               |
|------------------|----------------------------------|
| CRC              | CRC Block Errors                 |
| FRER             | Framing Errors                   |
| OFS              | Out of Frame Seconds             |
| ES               | Errored Seconds                  |
| SES              | Severely Errored Seconds         |
| CSS              | Controlled Slip Seconds          |
| CV               | Coding Violations                |
| UAS              | Unavailable Seconds              |
| UATC             | Unavailable Time Count           |
| MER              | Multiframe Errors                |
| FEBE             | Far End Block Errors             |
| FES              | Far End Errored Seconds          |
| FSES             | Far End Severely Errored Seconds |
| FUAS             | Far End Unavailable Seconds      |

## **BADVERB — BX2**

---

### **BADVERB — BX2**

This section documents the commands **BADVERB** through **BX2**.

## **BADVERB,BAD,SYNTAX,STOPPED**

### **INPUT DENIAL**

#### **Explanation Of Command**

Processing of the input message is **STOPPED** because the action verb is unrecognized (**BADVERB**) or the frame or sequence number is incorrect (**FRMERR** or **SEQERR**).

Output from this command is sent only to the link on which the command was input.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01101]

M hh:mm:ss xy,ww n[vv] {BADVERB|FRMERR|SEQERR} BAD SYNTAX \  
e LN MSG:  
First 70 characters of input message.  
Remaining text of input message STOPPED

### **Explanation Of Parameters**

---

**BADVERB**

- Bad verb

The action verb was not recognized.

**FRMERR**

- Frame error

Incorrect frame number

**SEQERR**

- Sequence error

Incorrect sequence number

**BAD**

- Bad

**STOPPED**

- Stopped

**SYNTAX**

- Syntax

**e**

- Number of lines in the message

## **BADVERB,CMD,INERR,STOPPED**

### **INPUT DENIAL**

#### **Explanation Of Command**

If the message reports STOPPED it means that the input command has been stopped or has been denied processing.

If the message reports DNY it means that an attempt has been made to execute an unlicensed or inactive command.

Note that the error field, action verb, and category are optional; a reason will always be given.

Attempts to address entities (units and NPCs) dependent upon nonconfigured units will result in the following message:

**BAD ARG CONFIG ERR.**

Output from this command is sent only to the link on which the command was input.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

### **Autonomous Message**

---

[O.01131.01]

M hh:mm:ss xy,ww n[vv] [<BADVERB|FRMERR|SEQERR|CMD>|<actverb>] \\  
[<INERR>] <reason> e LN MSG:  
<First 70 characters of input message.>  
[<Text continued from input message>]  
<Remaining text of input message> {STOPPED|DNY}

### **Explanation Of Parameters**

---

#### **BADVERB**

- Bad verb

The action verb was not recognized

#### **FRMERR**

- Frame error

Incorrect frame number

#### **SEQERR**

- Sequence error

Incorrect sequence number

#### **actverb**

- Action verb

A valid action verb of the stopped or denied command

#### **CMD**

- Command

Other command error

**INERR** - Input error

#### **STOPPED**

- Stopped

#### **e**

- Number of lines in the message

**reason** - Reason for stop or denial

*reason*

*Explanation*

BAD ARG

Bad argument

BAD ARG CONFIG ERR

Bad argument and configuration error; attempted to address entities such as units and Network Processing Circuits (NPCs) dependent on non-configured units

BAD SYNTAX

Bad syntax

CMD NOT ALLOWED

Command is not allowed in a macro or alternative map

RESTRICTED

Command is restricted to frame administrator only

ERR CMD ABT

Command error and aborted

INACT

Command is for a feature package which currently is inactive

MC OOS,MCOND,INSERVICE

Main Controller is out-of-service, maintenance condition, or in-service

RANGE ERROR

Range error

## **BC,R,TO,X,ZO,NA**

### **REPORT CHANGE OF C-BIT STATUS**

#### **Explanation Of Command**

This message reports one of three states for the monitor time slot:

- idle,
- framed and c-bit, and
- network.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

#### **Nonhierarchical**

[O.65211]

I hh:mm:ss xy,ww BC R TO [s]abcd {X'abcd|ZO|NA} COMPL

## **Hierarchical**

---

[O.65211]

**I** hh:mm:ss xy,ww BC R TO uvmnpddd {X'abcd|ZO|NA} COMPL

## **Explanation Of Parameters**

---

- [s]abc** - Non-Hierarchical NPC number
- uvmnp** - Hierarchical NPC number
- ddd** - C-bit channel number, valid values are 1-30.
- abcd** - Received c-bit pattern
- ZO** - All zero (or idle) pattern
- NA** - Network Alarm

## **BCON, FROM, TO, NTR, LPD, CONV, NAM, CUS, INCL**

### **BROADCAST CROSS-CONNECTION**

#### **Explanation Of Command**

This command adds a single tributary leg to a broadcast cross-connection. It cross-connects the tributary to the indicated source.

It can be used to create a new one-way cross-connection from an existing broadcast source to the specified tributary channel. It can also be used to convert an existing two-way, two-point cross-connection to a broadcast cross-connection while adding a new tributary leg.

Data received on the broadcast tributary leg is discarded because a one-way cross-connection is created. Only data from the full tributary leg is returned to the broadcast source.

The FROM end field designates the conference backbone (source). The optional range fields indicate the conference width.

The allowable range is from 01 to 31 channels.

The FROM end will receive return data from the TO end, if and only if

- the TO end is the initial connection (first tributary), and
- the FROM end is not provisioned with the LPD or NTR keywords.

The field in the TO end designates the tributary. The width of the tributary is indicated by a range designation and must match the backbone width. If necessary, more tributaries can be added by subsequent broadcast cross-connect commands. Received data from broadcast-only TO terminations will be dead-ended as it enters DACS II.

**Note:** Broadcast cross-connections are not allowed from or to the 24th channel of a DS1 using the T1DM framing format.

For broadcast circuits (in contrast to two-point circuits) the A-law to  $\mu$ -law conversion is turned on as a default. Therefore, all broadcast connections dealing with E1 circuits need to use the NAM keyword to turn the A-law to  $\mu$ -law conversion off, if that is desired.

There is an exception. If the broadcast circuit is started as a two-way connection between E1 circuits that are later on converted to broadcast connections using the CONV keyword, then the default for E1 two-way connections governs, and there is no A-law to  $\mu$ -law conversion. In fact a broadcast circuit that is started as a two-way circuit can never be operated with A-law to  $\mu$ -law conversion on. If A-law to  $\mu$ -law conversion is desired for the broadcast connections, then the user must provision the circuit immediately as a broadcast circuit.

## Command

---

### Nonhierarchical

---

[I.13002]

```
BCON:FRM xy,SEQ ww:FROM [s]abcddd[-eee],TO [t]ghijjj[-kkk]\
[,<tc>][,<sc>][,{NTR|LPD|CONV}][,NAM][,{CUS|INCL}][,RDC]!
```

### Hierarchical

---

[I.13002]

```
BCON:FRM xy,SEQ ww:FROM uvmnpddd[-eee],TO wxkqrjjj[-kkk]\
[,<tc>][,<sc>][,{NTR|LPD|CONV}][,NAM][,{CUS|INCL}][,RDC]!
```

## Completion Message

---

Not applicable.

## Explanation Of Parameters

**FROM** - From

**TO** - To

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |
| <b>0081-0112</b> | <b>0241-0272</b> | <b>0401-0432</b> | <b>0561-0592</b> |
| <b>0121-0152</b> | <b>0281-0312</b> | <b>0441-0472</b> | <b>0601-0632</b> |
| Unit<br>5        | Unit<br>6        | Unit<br>7        | Unit<br>8        |
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0641-0672</b> | <b>0801-0832</b> | <b>0961-0992</b> | <b>1121-1152</b> |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd,**  
**jjj** - Channel numbers for beginning of channel range  
**eee,**  
**kkk** - Channel numbers for end of channel range

000-030 CEPT type NPCs grown as CAS  
000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

For CEPT type NPCs, channel associated signaling (CAS) channel 031 (TS16) is not allowed in a range of channel numbers.

**tc** - Trunk conditioning

The desired cross-connected signaling and insertion word applied when a failure occurs. The signaling and the insertion word specification are entered separately, with a comma as the delimiter.

The following signaling options are allowed:

| <i>signaling</i>      | <i>Explanation</i>                                                                                                                                                                    |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC(efghijkl,mnopqrst) | 2-way, 16-state in binary.                                                                                                                                                            |
| TC(X'ab,X'cd)         | 2-way, 16-state in hexadecimal.                                                                                                                                                       |
| TRSP                  | Transparent, no signaling (that is, channel 000 in TS16).                                                                                                                             |
| Omitted               | Defaults to TC(X'FF,X'FF) if both terminations are channel associated signaling (CAS) type. It will default to TRSP if one of the terminations is nonsignaling associated (NSA) type. |

The following insertion word options are allowed:

| <i>insertion word</i> | <i>Explanation</i>                                                                                                                       |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| Omitted               | Will default to IW X'FF.                                                                                                                 |

Additional rules apply for CEPT cross-connections. See Table 1 for allowable signaling type and signaling consequence action and Table 2 for allowable cross-connected time slot consequence action.

**Table 7-1. Allowable Signaling Type and Signaling Consequent Action**

| Primary Type<br>in X-connect | Allowable<br><tc> sig. type/<br>type/ sig.<br>consequent<br>action<br>keyword | Resulting<br>Signaling<br>consequent<br>action<br>TO | Resulting<br>sig.<br>Code<br>(when used)<br>TO | Resulting<br>Disconnect |
|------------------------------|-------------------------------------------------------------------------------|------------------------------------------------------|------------------------------------------------|-------------------------|
| CAS → CAS                    | TRSP                                                                          | None<br>(fixed at X'D)                               | Sig.<br>fixed at X'D                           | X'D                     |
|                              | TC(--, X'tu)                                                                  | CAS                                                  | X'F                                            | X'u                     |
|                              | Omitted                                                                       | CAS                                                  | X'F                                            | X'F                     |
| NSA → CAS<br>or<br>CAS → NAS | TRSP/Omitted<br>X'D in CAS<br>direction)                                      | None (fixed at<br>X'D in CAS<br>direction)           | Sig. fixed at<br>direction                     | X'D in CAS              |

**Table 7-2. Allowable Cross-Connected Time slot Consequent Action**

| Allowable <tc><br>Time slot X-connect<br>keyword | Resulting Cross-Connected<br>Time slot Consequent Action<br>TO | Resulting Disconnect<br>Code (when used)<br>TO |
|--------------------------------------------------|----------------------------------------------------------------|------------------------------------------------|
| Omitted                                          | X'FF                                                           | X'FF                                           |
| IW X'pq*                                         | X'FF                                                           | X'pq                                           |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC(abcd,efgh)**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NTR** - No Transmit

All tributaries are broadcast only. There is no return path to the source.

**LPD** - Looped.

The source loops its broadcast back to itself. All the tributaries are broadcast only. When the LPD keyword is used, the signaling conversion of the FROM side will override that of the TO side.

If neither NTR nor LPD is used, and the source (FROM abcd[ddd[-eee]]) is being established for the first time, ghij is a full tributary, capable of transmitting back to the source. If the source has been previously established, all tributaries are broadcast only.

**CONV** - Convert

CONV is given to convert a two-way, two-point circuit to a broadcast circuit.

The first termination (NPC and channel) listed in the input message is the FROM (or source) termination in the current two-point connection. The termination next following in the command is the full tributary leg to be added in the conversion to a broadcast connection.

If the range fields eee and kkk are used, the entire width of the conference tributaries must be indicated.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

E1 to E1      Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

E1 to DS1 or      Same explanation as E1 to E1.  
DS1 to E1

DS1 to DS1      Not applicable.

**CUS** - Customer

Indicates a customer controlled circuit

**RDC** - Red circuit

This keyword will cause the associated circuit to be flagged as a red circuit.

**INCL** - Inclusive

To connect a circuit or range of circuits including one or more circuits previously marked as Customer Controlled, use the INCL (inclusive) option. If this option is not used, the message will be denied if any circuits in the range are customer controlled. INCL is not needed to connect a circuit or circuits previously marked as Red Circuits.

[t]wxy

- The 3- or 4-digit nonhierarchical NPC number involved in the denial, otherwise the same as [s]abc

**opjst** - Hierarchical NPC number involved in the denial, otherwise the same as uvmp.

**zzz** - Channel number involved in the denial; otherwise, the same as ddd.

**BCAST** - Denial specific to broadcast conferences.

**COND** - Condition

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b> | <i>Explanation</i>                                                    |

## **BCON, FROM, TO, RDC, CUS, INCL, NTR, LPD, CONV**

### **BROADCAST CONNECT**

#### **Explanation Of Command**

This message connects a new broadcast circuit from a non-channelized source network processing circuit (NPC) to a single non-channelized tributary. It also adds a single non-channelized tributary to an existing conference.

This message also adds the indicated tributary and converts (CONV) a two-way, two-point circuit to a broadcast conference.

When a failure occurs or during an alarm state, the alarm-indication signal (AIS or all ones signal) is transmitted to the failed tributaries or to all tributaries if the source NPCs fail. If the failure occurs during the execution of this command, it is canceled and no broadcast circuit is set up.

## Explanation Of Parameters

**FROM** - From termination

**TO** - To termination

**[s]abc** - The 3- or 4-digit non-hierarchical non-channelized source (backbone)  
NPC number

**[t]def** - The 3- or 4-digit non-hierarchical non-channelized tributary NPC  
number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |

**uvmnp** - Hierarchical number of non-channelized source NPC  
**wxkqr** - Hierarchical number of non-channelized tributary NPC

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number

The values are listed below:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**Note:** An NPC cannot be broadcast-connected to itself. The desired effect can be achieved by specifying the LPD option.

**RDC** - Red circuit

**CUS** - Customer  
Customer-controlled circuit

**INCL** - Inclusive

The INCL keyword will remove CUS marking

**NTR** - No transmit

No transmit or return path, the tributary is broadcast only

**LPD** - Looped

One signal is looped back to source

If neither the NTR nor LPD keyword is specified and the broadcast conference is being established for the first time, the tributary is a full tributary, capable of transmitting back to the source; if the source has been previously established then the tributary is broadcast only.

**CONV** - Convert

CONV is given to convert a two-way, two-point circuit to a broadcast circuit.

The first termination (NPC and channel) listed in the input message is the FROM (or source) termination in the current two-point connection. The termination next following in the command is the full tributary leg to be added in the conversion to a broadcast connection.

**[t]ghi** - The 3- or 4-digit backbone leg (bbl) or tributary NPC number causing denial

**edfhg** - Hierarchical number of the backbone leg or tributary NPC causing denial

**st** - Status  
Status of denial

**cc** - Hexadecimal condition code

## **BCON, FROM, TOX**

---

### **BROADCAST TS0 to non-TS0 CROSS- CONNECTIONS**

#### **Explanation Of Command**

---

This command sets up a broadcast from a TS0 channel of a (FROM) NPC to up to eight non-TS0 tributary channels of (TO) receiving NPCs in the same broadcast. The FROM NPC must be grown as a PA or TH type. The broadcast connection defaults to NTR - no return leg. The broadcast connection defaults to NAM- no a-law to u-law conversion. The TS0 source defaults to NFW-non frame word mode. The broadcast connection defaults to TRSP-transparent signalling and uses a default insertion word of X'FF. This message is also used to add multiple TOs to an existing broadcast connection based on the specified FROM. Each of the TOs will be connected to the specified FROM. There will be at most eight TOs allowed in the argument list to the TO keyword.

The **FROM** field designates the source termination.

The fields following the SOURCE designation assign the tributaries to be connected to the backbone. Although a conference may have any number of tributaries (limited only by frame configuration), at most eight at a time may be added using this command.

More tributaries can be added by subsequent **BCON** commands.

If a command attempts to cross-connect a channel to the 24th channel of a DS1 provisioned with the T1DM format, the command will be denied.

#### **Command**

---

##### **Nonhierarchical**

---

[I.13051]

```
BCON:FRM xy,SEQ ww:FROM [s]abc000,\
TOX ([t]ghijjj[, [t]klmnnn, ...])!

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**FROM** - From

The FROM field is the source termination.

[s]abc - The 3- or 4-digit nonhierarchical FROM NPC number  
[t]ghi - The 3- or 4-digit nonhierarchical TO NPC number  
[u]klm - The 3- or 4-digit nonhierarchical TO NPC number

The values are as follows:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

**000** - FROM channel number is 000

**jjj** - TO channel number

000-030 CEPT type NPCs grown as CAS

000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**Table 7-3. Allowable Cross-Connected Time slot Consequence Action**

| Allowable <tc><br>Time slot X-connect<br>keyword | Resulting Cross-Connected<br>Time slot Consequence Action<br>TO | Resulting Disconnect<br>Code (when used)<br>TO |
|--------------------------------------------------|-----------------------------------------------------------------|------------------------------------------------|
| Omitted                                          | X'FF                                                            | X'FF                                           |
| IW X'pq*                                         | X'FF                                                            | X'pq                                           |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**[t]wxy** - NPC number involved in the denial; otherwise, the same as [s]abc.

**zzz** - Channel number involved in the denial; otherwise, the same as ddd.

**opjst** - Hierarchical NPC number involved in the denial, otherwise the same as uvmnp

**BCAST** - Denial specific to broadcast conferences

**cc** - Hexadecimal condition code

## **BCON, FROM, TOX, NTR, LPD, CONV, NAM, CUS**

### **BROADCAST CROSS-CONNECTIONS**

#### **Explanation Of Command**

This command sets up a broadcast from a source (FROM) NPC to up to eight tributary (TO) receiving NPCs in the same broadcast. This message is also used to add multiple TOs to an existing broadcast connection based on the specified FROM. Each of the TOs will be connected to the specified FROM. There will be at most eight TOs allowed in the argument list to the TO keyword. Note that no channel range can be specified on the TO arguments.

The channel range from 001 to 031 channels is determined by the range given for the FROM.

The **FROM** field designates the source termination. The optional range field **[-eee]** indicates the width of the conference backbone

The allowable width ranges from 001 to 031 channels and must be the same as the width of the existing conference backbone (if any).

The fields following the SOURCE designation assign the tributaries to be connected to the backbone. Although a conference may have any number of tributaries (limited only by frame configuration), at most eight at a time may be added using this command.

More tributaries can be added by subsequent **BCON** commands. Each specified tributary will have the same range width as the backbone.

If a command attempts to cross-connect a channel to the 24th channel of a DS1 provisioned with the T1DM format, the command will be denied.

For broadcast circuits (in contrast to two-point circuits) the A-law to  $\mu$ -law conversion is turned on as a default. Therefore, all broadcast connections dealing with E1 circuits need to use the NAM keyword to turn the A-law to  $\mu$ -law conversion off, if that is desired.

There is an exception. If the broadcast circuit is started as a two-way connection between E1 circuits that are later on converted to broadcast connections using the CONV keyword, then the default for E1 two-way connections governs, and there is no A-law to  $\mu$ -law conversion. In fact a broadcast circuit that is started as a two-way circuit can never be operated with A-law to  $\mu$ -law conversion on. If A-law to  $\mu$ -law conversion is desired for the broadcast connections, then the user must provision the circuit immediately as a broadcast circuit.

## Command

---

### Nonhierarchical

---

[I.13001]

```
BCON:FRM xy,SEQ ww:FROM [s]abcddd[-eee],\
TOX ([t]ghijjj[, [t]klmnnn,...])[,<tc>][,<sc>]\
[, {NTR|LPD|CONV}][, NAM][, {CUS|INCL}][, RDC]!
```

### Hierarchical

---

[I.13001]

```
BCON:FRM xy,SEQ ww:FROM uvmnpddd[-eee],\
TOX (wxqrrjjj [, edhfgnnn,...])[,<tc>][,<sc>]\
[, {NTR|LPD|CONV}][, NAM][, {CUS|INCL}][, RDC]!
```

## Completion Message

Not applicable.

## Explanation Of Parameters

**FROM** - From

The FROM field is the source termination.

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

**[u]klm** - The 3- or 4-digit nonhierarchical TO NPC number

The values are as follows:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number  
**edhfg** - Hierarchical TO NPC number within a range of NPC numbers

**uv, wx, ed**  
 - Unit number  
**m, k, h** - Module number  
**np, qr, fg**  
 - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
 Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number  
**eee** - FROM channel number denoting the end of the range  
**jjj** - TO channel number  
**nnn** - TO channel number denoting the end of the range

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

The optional range field *eee* indicates the width of the conference backbone. The range field must not be repeated on the tributary legs' specification. A termination cannot be broadcast connected to itself. The desired effect can be reached by specifying the LPD option. If this message is used to add tributary legs, the width must be the same as the width of the existing conference backbone. However, a conference can have an unlimited number of tributaries, limited only by the frame configuration. More tributaries can be added by subsequent commands.

For CEPT type NPCs, CAS channel 031 (TS16) is not allowed in a range of channel numbers.

**tc** - Trunk conditioning

**tc** represents the desired cross-connected signaling and insertion word applied when a failure occurs. The signaling and the insertion word specification are entered separately, with a comma as the delimiter, which have the following form:

<tc\_sig>,<tc\_iw>

The following signaling options are allowed:

| <i>tc_sig</i>         | <i>Explanation</i>                                                                                                                                                           |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC(ijkl,mnop)         | 2-way, 4-state signaling in binary. For ESF type framing format, software will expand 4-state to 16-state by duplicating the format on the remaining frames on a superframe. |
| TC(efghijkl,mnopqrst) | 2-way, 16-state in binary. Only valid for ESF and CEPT framing formats.                                                                                                      |
| TC(X'ab,X'cd)         | 2-way, 16-state in hexadecimal. Only valid for ESF and CEPT framing formats.                                                                                                 |
| TRSP                  | Transparent, no signaling.                                                                                                                                                   |

The following insertion word options are allowed:

| <i>tc_iw</i> | <i>Explanation</i>                                                                                                                       |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq      | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| TRB          | Standard trouble code, equal to IW X'E4, not valid for CEPT.                                                                             |
| MUX          | MUX out of sync code, equal to IW X'1A, not valid for CEPT.                                                                              |
| Omitted      | Only valid for CEPT, will default to IW-X-FF.                                                                                            |

Additional rules apply for CEPT cross-connections. See the following tables.

**Table 7-4. Allowable Signaling Type and Signaling Consequent Action**

\* For TCON and TCNT TC is X'uv,X'yz.  
For OCON, OCNT and BCON TC is --,X'yz.

**Table 7-5. Allowable Cross-Connected Time slot Consequence Action**

| Allowable <tc><br>Time slot X-connect<br>keyword | Resulting Cross-Connected<br>Time slot Consequence Action<br>TO | Resulting Disconnect<br>Code (when used)<br>TO |
|--------------------------------------------------|-----------------------------------------------------------------|------------------------------------------------|
| Omitted                                          | X'FF                                                            | X'FF                                           |
| IW X'pq*                                         | X'FF                                                            | X'pq                                           |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC(abcd,efgh)**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NTR** - No transmit

All tributaries are broadcast only. There is no return path to the source.

**LPD** - Looped

The source loops its broadcast back to itself. All the tributaries are broadcast only.

When the LPD keyword is used, the signaling conversion of the FROM side will override that of the TO side.

If neither NTR nor LPD is used, and the source (FROM abcd[...]) is being established for the first time, ghij is a full tributary, capable of transmitting back to the source. If the source has been previously established, all tributaries are broadcast only.

**CONV** - Convert

CONV is given to convert a two-way, two-point circuit to a broadcast circuit.

The first termination (NPC and channel) listed in the input message is the FROM (or source) termination in the current two-point connection. The termination next following in the command is the full tributary leg to be added in the conversion to a broadcast connection. Additional legs may be added simultaneously by specifying additional terminations.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

**E1 to E1** Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

**E1 to DS1 or DS1 to E1** Same explanation as E1 to E1.

**DS1 to DS1** Not applicable.

**CUS** - Customer

Indicates a Customer-controlled Circuit

**RDC** - Red circuit

This keyword will cause the associated circuits to be flagged as red circuits.

**INCL** - Inclusive

To connect a circuit or range of circuits including one or more circuits previously marked as customer controlled, use the INCL (inclusive) option. If this option is not used, the message will be denied if any circuits in the range are customer controlled. INCL is not needed to connect a circuit or circuits previously marked as red circuits.

**[t]wxy** - NPC number involved in the denial; otherwise, the same as [s]abc.

**zzz** - Channel number involved in the denial; otherwise, the same as ddd.

**opjst** - Hierarchical NPC number involved in the denial, otherwise the same as uvmnp

**BCAST** - Denial specific to broadcast conferences

**cc** - Hexadecimal condition code

## **BCON, FROM, TOX, RDC, CUS, INCL, NTR, LPD**

### **BROADCAST CONNECT**

#### **Explanation Of Command**

This message cross connects a new broadcast circuit from a non-channelized source network processing circuit (NPC) to up to eight non-channelized tributaries. The NPCs can belong to different units. This message can be used to add up to eight non-channelized tributaries to an existing conference.

This message is also used to add the indicated tributaries and convert (CONV) a two-way, two-point circuit to a broadcast circuit. When a failure occurs, or during an alarm state, the alarm-indication signal (AIS-all ones) is transmitted to the failed tributaries or all tributaries if the source NPCs fail. If the failure occurs during the execution of this command, the message is canceled and no broadcast circuit is set up.

#### **Command**

##### **Nonhierarchical**

[I.13011]

```
BCON:FRM xy,SEQ ww:FROM [s]abc,TOX ([t]def[, [u]ghi]\

## **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**Note:** An NPC cannot be broadcast-connected to itself. The desired effect can be achieved by specifying the LPD option.

[s]abc - The 3- or 4-digit nonhierarchical FROM NPC number  
[t]def - The 3- or 4-digit nonhierarchical TO NPC number  
[u]ghi - Same definition as [t]def  
[v]jkl - Same definition as [t]def  
[t]mno - Same definition as [t]def

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

**uvmnp** - Hierarchical number of non-channelized source NPC

**wxkqr** - Hierarchical tributary NPC number.

**edfhg** - Same definition as wxkqr

**stmno** - Same definition as wxkqr

**uv, wx, ed, st**

- Unit number

**m, k, f**

- Module number

**np, qr, hg, no**

- NPC number within the module

The values are:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**RDC** - Red circuit

**CUS** - Customer

Customer-controlled circuit

**INCL** - Inclusive

Option will remove CUS marking

**NTR** - No transmit

No transmit or return path, all tributaries are broadcast only

**LPD** - Looped

One signal is looped back to source

If neither the NTR nor the LPD keyword is specified and the broadcast conference is being established for the first time, the first tributary is a full tributary, capable of transmitting back to the source; if the source has been previously established then all tributaries are broadcast only.

**CONV** - Convert

Convert a two-way, two-point circuit to a broadcast circuit by adding the indicated tributaries

The first termination (NPC and channel) listed in the input message is the FROM (or source) termination in the current two-point connection. The termination next following in the command is the full tributary leg to be added in the conversion to a broadcast connection. Additional legs may be added simultaneously by specifying additional terminations.

**[t]qrs** - The 3- or 4-digit backbone leg (bbl) or tributary NPC involved in denial

**opqrs** - Hierarchical number of the backbone leg or tributary NPC involved in denial.

**st** - Status

Status of denial

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |

## **BDIS, FROM, TO, CONV, OOS, DCC, INCL**

### **BROADCAST DISCONNECTIONS**

#### **Explanation Of Command**

This command requests the disconnection of a broadcast circuit cross-connection. It can be used to disconnect any one-way tributary from a broadcast circuit, or the full tributary once all of the one-way tributaries have been disconnected.

#### **Command**

##### **Nonhierarchical**

[I.15201]

```
BDIS:FRM xy,SEQ ww:FROM [s]abcddd[-eee],TO [t]ghijjj[-kkk]\
[,CONV][,OOS][,DCC][,INCL]!
```

##### **Hierarchical**

[I.15201]

```
BDIS:FRM xy,SEQ ww:FROM uvmnpddd[-eee],TO wxkqrjjj[-kkk]\
[,CONV][,OOS][,DCC][,INCL]!
```

#### **Completion Message**

##### **Nonhierarchical**

[O.15201]

```

### **Autonomous Message**

---

Not applicable.

### Explanation Of Parameters

- [s]abc - The 3- or 4-digit nonhierarchical FROM NPC number  
[t]ghi - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uvmnp** - Hierarchical FROM NPC number

**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd, jjj**

- Channel number for beginning of channel range

**eee, kkk**

- Channel number for end of channel range.

Without the optional CONV keyword, ddd and jjj must be the lowest numbered channels in the range of channels that make up the broadcast circuit. If the range fields [-eee] and [-kkk] are used, the entire width of the conference tributaries must be indicated.

000-030      CEPT type NPCs grown as CAS

000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**CONV** - Convert

The CONV keyword is given to disconnect the specified one-way tributary from the broadcast circuit and convert the circuit to a two-way, two-point circuit. For a command with this option to succeed, only the broadcast source and the full tributary leg must remain on the circuit following the disconnection of the specified one-way tributary. That is, this option will be denied if the user attempts to disconnect the full tributary rather than a one-way tributary, or if any other one-way tributaries remain on the broadcast circuit following the disconnection of the one-way tributary specified in the command.

**OOS** - Out-of-service

An OOS disconnection may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnection will be denied.

**INCL** - Inclusive

Use the optional INCL keyword to disconnect a circuit or range of circuits including one or more circuits marked as a red circuit or under customer control. If this option is not used, the message will be denied if any circuits in the range are red circuits or customer controlled.

**DCC** - Disconnect code

If the DCC keyword is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field used to connect the circuit. If the DCC option is not used, the disconnect code specified in the GRTH::NPC command is used.

**[t]wxy** - The 3- or 4-digit nonhierarchical NPC number that caused the denial, with the same valid values as [s]abc.

**edhfg** - Hierarchical NPC number that caused the denial

**zzz** - Channel number that caused the denial, with the same valid value as ddd.

**BRDIS** - Broadcast disconnect

The BRDIS keyword indicates that the conference is entirely disconnected (no tributaries remain).

**CUS** - Customer

Customer-controlled circuit

CUS indicates a customer controlled circuit.

**RDC** - Red circuit

Indicates that the disconnection was performed on a red circuit.

This implies that the INCL keyword was given in the input message.

If the disconnection was given on more than one circuit, at least one of them was a red circuit or under customer control.

**BCAST** - Broadcast

**cc** - Hexadecimal condition code

**cc**    *Explanation*

- 01**    Invalid range for specified NPC type
- 03**    No RDC or CUS circuits and INCL keyword used
- 04**    No NPC's out of service and OOS keyword used
- 05**    Invalid use of CONV keyword
- 10**    NPC out of service or failed
- 11**    NPC not equipped
- 12**    Active CCN side not IS or failed or pested or hardware OOS
- 13**    UNIT not equipped, not in service, or failed
- 14**    CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS
- 15**    FTMI not equipped, not in service, or failed
- 16**    FC not eqd, not IS, or failed or inactive side FC not eqd or not IS
- 17**    TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**cc**    *Explanation*

**FF**    Termination is in process of being rolled

**E0**    ETSI not equipped, not in service, or failed

## **BDIS, FROM, TO, OOS, INCL, CONV**

### **BROADCAST DISCONNECTION**

#### **Explanation Of Command**

This message disconnects a single non-channelized tributary network processing circuit from a non-channelized digital signal broadcast circuit. It also disconnects a single tributary and converts a broadcast conference to a two-way, two-point circuit.

When the circuit is disconnected, the idle code (AIS) is transmitted.

## **BDIS, FROM, TOX, CONV, OOS, DCC, INCL**

### **BROADCAST DISCONNECTION**

#### **Explanation Of Command**

This command requests the disconnection of up to eight tributary legs from the source of a broadcast cross-connection circuit.

The **FROM** field designates the source termination. The optional range field **[-eee]** indicates the width of the conference backbone. When disconnecting a TS0 to non-TS0 broadcast the width of the conference is one. The allowable width ranges from 001 to 031 channels and must be the same as the width of the existing conference backbone (if any).

The fields in the TO end designate the tributaries to be connected to the backbone. Although a conference may have any number of tributaries (limited only by the frame configuration), at most eight at a time may be disconnected using this command. More tributaries can be disconnected by subsequent broadcast disconnect commands.

**np, qr, fg**

- NPC number within the module

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number  
**eee** - FROM channel number denoting end of width

The optional range field [-eee] or [&&-eee] indicates the width of the conference backbone. Note that a range may be specified for the source only.

**jjj** - Channel number of tributary legs  
**nnn** - Channel number of the last tributary leg of the range

Without the optional CONV keyword, ddd and jjj must be the lowest numbered channels in the range of channels that make up the broadcast circuit. If the range field [-eee] is used, the entire width of the conference tributaries must be indicated.

000-030            CEPT type NPCs grown as CAS  
000-031            CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**NOTE:** Channel 000 of a CEPT NPC(TS0) can be BCONEd to a non-TS0 of a CEPT NPC.  
**FROM** - From

The FROM field designates the source termination.

The fields following the TOX keyword (or the subsequent channel numbers in MML) designate the tributaries that are connected to the backbone.

Although a conference may have any number of tributaries (limited only by frame configuration), at most eight at a time may be disconnected using this command. More tributaries can be disconnected by subsequent commands.

**CONV** - Convert

The CONV keyword is given to disconnect the specified one-way tributaries from the broadcast circuit and convert the circuit to a two-way, two-point circuit. For a command with this option to succeed, only the broadcast source and the full tributary leg must remain on the circuit following the disconnection of the specified one-way tributaries. That is, this option will be denied if the user attempts to disconnect the full tributary rather than a one-way tributary, or if any other one-way tributaries remain on the broadcast circuit following the disconnection of the one-way tributaries specified in the command.

**OOS** - Out-of-service

An OOS disconnection may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnection will be denied.

**DCC** - Disconnect code

If the DCC keyword is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field used to connect the circuit. If the DCC option is not used, the disconnect code specified in the GRTH::NPC command is used.

**INCL** - Inclusive

To disconnect a circuit or range of circuits including one or more circuits marked as a red circuit or under customer control, use the INCL option. If this option is not used, the message will be denied if any circuits in the range are red circuits or customer controlled.

**[t]wxy** - The 3- or 4-digit nonhierarchical NPC number involved in the denial.  
(with the same valid value as [s]abc.)

**opjst** - Hierarchical NPC number involved in the denial

**zzz** - Channel number involved in the denial. Otherwise the same as ddd.

**BCAST** - Broadcast

**cc** - Hexadecimal condition code

**cc** *Explanation*

## **BDIS, FROM, TOX, OOS, INCL, CONV**

### **BROADCAST DISCONNECT**

#### **Explanation Of Command**

This message disconnects upto eight non-channelized tributaries from a non-channelized source network processing circuit (NPC). The NPCs can be in different units. This message also disconnects tributaries and can convert a broadcast conference to a two-way, two-point circuit. When the circuit is disconnected, the idle code (AIS) is transmitted.

#### **Command**

##### **Nonhierarchical**

[|.15221]

```
BDIS:FRM xy,SEQ ww:FROM [s]abc,\
TOX ([t]ghi[, [u]jkl][, [v]mno][...])[, OOS][, INCL][, CONV]!
```

##### **Hierarchical**

[|.15221]

```
BDIS:FRM xy,SEQ ww:FROM uvmnp,\
TOX (wxkqr[, edhfg][, opqrs][...])[, OOS][, INCL][, CONV]!
```

**uvmnp** - Hierarchical number of non-channelized source NPC  
**wxkqr** - Hierarchical NPC number of non-channelized tributary

**edhfg** - Hierarchical number of NPC  
**opqrs** - Hierarchical number of tributary

**uv, wx, ed, op**  
 - Unit number  
**m, x, h, q**  
 - Module number  
**np, qr, fg, rs**  
 - NPC number within the module

The values are listed below:

PA type numbers listed by unit, module, and NPC Number  
 Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**OOS** - Out-of-service keyword may be specified if one or more of the backbone or tributary NPCs is out of service

**INCL** - Inclusive keyword required for customer-controlled or Red circuits

**CONV** - Convert circuit to a two-way, two-point circuit by disconnecting the indicated tributaries; as long as more than two tributaries remain, or if no return path exists, the option is denied.

If the broadcast circuit has one full tributary, it can be disconnected only when there are no other tributaries.

**[t]qrs** - The 3- or 4-digit nonhierarchical NPC number causing denial

**uvjkl** - Hierarchical NPC number causing denial

**BRDIS** - Broadcast conference completely disconnected

**st** - Status of denial

**cc** - Hexadecimal condition code

**BOOT** - Boot.

**PMEM** - Primary memory card.

**SMEM** - Secondary memory card.

## **BOOT, FROM, PMEM, SMEM**

### **STARTUP**

#### **Explanation Of Command**

The main processor has successfully loaded the boot program from either the Primary Memory (PMEM) or the Secondary Memory (SMEM).

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01241]

**BOOT FROM {PMEM|SMEM}**

### **Explanation Of Parameters**

---

**BOOT** - Boot

**PMEM** - Primary memory.

**FROM** - From

**SMEM** - Secondary memory.

## **BX2,STF,ATP**

### **BUS EXTENDER STARTUP**

#### **Explanation Of Command**

This message indicates that the communications interface bus extender has initialized itself and has performed self-diagnostics. The results of these diagnostics are reported as some tests failed or all tests passed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01271]

**BX2 {STF|ATP}**

### **Explanation Of Parameters**

---

**BX2** - Bus extender

**STF** - Some tests failed

**ATP** - All tests passed

For ATP no action is required.

---

## **CBOFL — CTST**

---

## **CBOFL — CTST**

---

This section documents the commands **CBOFL** through **CTST**.

## **CBOFL,SIDE,EOM**

### **C-BIT BUFFER OVERFLOW**

#### **Explanation Of Command**

This message is an autonomous report of a buffer overflow condition on a c-bit processing circuit pack. Only network processing circuits reporting buffer overflow are printed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

## **Autonomous Message**

## Explanation Of Parameters

---

**abc** - Nonhierarchical NPC number

NPC number of the CB type NPC on the Digital Signal Processing Unit  
Valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

CB type NPC numbers listed by unit number, Unit Type DP (DSPU)

| Unit<br>1  | Unit<br>2  | Unit<br>3  | Unit<br>4  | Unit<br>5  | Unit<br>6  |
|------------|------------|------------|------------|------------|------------|
| <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> |
| <b>001</b> | <b>161</b> | <b>321</b> | <b>481</b> | <b>641</b> | <b>801</b> |
| <b>021</b> | <b>181</b> | <b>341</b> | <b>501</b> | <b>661</b> | <b>821</b> |
| <b>041</b> | <b>201</b> | <b>361</b> | <b>521</b> | <b>681</b> | <b>841</b> |
| <b>061</b> | <b>221</b> | <b>381</b> | <b>541</b> | <b>701</b> | <b>861</b> |
| <b>081</b> | <b>241</b> | <b>401</b> | <b>561</b> | <b>721</b> | <b>881</b> |

abcdefghijklmno

- C-bit channel activity word (hexadecimal)

This word contains 15 digits each representing two adjacent c-bit channels for a total of 30 consecutive channels. Channel numbering is 0 to 30 beginning at the left with "a". Each digit contains four bits which represent two adjacent channels at two bits per channel. The two bits have four discrete values. The meaning of each bit pair is given below:

*Bit*      *Meaning*

|    |                                                    |
|----|----------------------------------------------------|
| 00 | No activity on a c-bit channel                     |
| 01 | One change of state on a c-bit channel             |
| 10 | Two to five changes of state on a c-bit channel    |
| 11 | More than five changes of state on a c-bit channel |

Example:

X'9 = 1001      indicates two to five changes of state on the channel represented by the leftmost two bits and one change of state on a c-bit channel represented by the rightmost two bits.

---

## **CFR,FRAME**

---

### **CONFIGURE FRAME**

#### **Explanation Of Command**

---

This command is used to initialize or change the frame configuration. After this command is successfully completed, DACS II will autonomously update the location information for the packs in the frame.

**WARNING:** A manual backup from RAM to MEM must be invoked prior to entering Maintenance Condition, else the command may not complete.

Entering this message will cause DACS II to present the user with self-explanatory menus. These menus allow the user to select the total number of bays and units to be equipped and to specify the bay and unit type for each of them. With the user specified information, DACS II will then determine the physical location of each circuit pack in the frame. The completion message will be output when the user exits from the menu mode.

This command can only be entered under the following conditions:

- It is entered from link 1
- The frame is in the maintenance condition
- The user is a superuser

#### **Command**

**M hh:mm:ss xy,ww n[vv] CFR SYNC a FPLL COND cc DNY**

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**a** - Synchronizer number (0 or 1)

**FPLL** - Fast start phase-locked loop

**cc** - Hexadecimal condition code

**cc** *Explanation*

**16** SYNC TB is not equipped

**17** SYNC is out of service

**BF** Sync mode is same

**C8** Sync pack denied command

## **CFR,SYNC,MASTER,SLAVED**

### **CONFIGURE SYNCHRONIZER**

#### **Explanation Of Command**

This command requests configuration of the synchronizer to extract timing from itself (stand-alone or **MASTER** mode) or from external sources (**SLAVED** mode).

The **CFR::SYNC** command modifies the Main Controller (MC) data base for the synchronizers, thus allowing appropriate combinations of time bases, timing extractors, and timing distributors to be equipped. This command is also used by the MC to instruct the Digital Phase Locked Loops (DPLLs) to implement the specified architecture. Condition codes for completion indicate architecture states, dependent on the current equipage. Condition codes for denial indicate that the requested architecture is not consistent with the current equipage.

#### **Command**

[I.35013]

**CFR:FRM xy,SEQ ww:SYNC,{MASTER|SLAVED}!**

#### **Completion Message**

[O.35013]

**M hh:mm:ss xy,ww n[vv] CFR SYNC {MASTER|SLAVED} COND 00 \**  
**COMPL**

#### **Denial Message**

[O.35013.01]

**M hh:mm:ss xy,ww n[vv] CFR SYNC {MASTER|SLAVED} COND cc DNY**

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**MASTER** - Master

The frame will use its own sources for timing.

**SLAVED** - Slaved

Timing will be extracted from external sources.

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 16** SYNC TB is not equipped
- B6** Sync architecture is same
- B7** Some TLIs are still equipped
- B8** CRO is still equipped
- B9** Timing Extractor type TLIs are present
- BA** TLI 3 or 4 still equipped
- BC** SSP with 0 priority present
- BD** SSP with non 0 priority present
- C8** Sync pack denied command

## **CFR,SYNC,STRATUM,STR2,STR3,TOLL,LOCAL**

### **CONFIGURE SYNCHRONIZER STRATUM**

#### **Explanation Of Command**

This command requests the configuration of the synchronizer at a particular stratum level.

The command can be entered to configure the synchronizer at a lower stratum than the capability of the equipped time bases. The message can also be used to change the operating stratum level of the synchronizer to a higher level if the synchronizer is so equipped.

#### **Command**

[I.35012]

**CFR:FRM xy,SEQ ww:SYNC,STRATUM {STR2|STR3|TOLL|LOCAL}!**

#### **Completion Message**

[O.35012]

**M hh:mm:ss xy,ww n[vv] CFR SYNC STRATUM \  
{STR2|STR3|TOLL|LOCAL} COMPL**

#### **Denial Message**

[O.35012.01]

**M hh:mm:ss xy,ww n[vv] CFR SYNC STRATUM \  
{STR2|STR3|TOLL|LOCAL} COND cc DNY**

#### **Autonomous Message**

Not applicable.

## **Explanation Of Parameters**

---

**SYNC** - Synchronizer

### **STRATUM**

- Stratum

**STR2** - Stratum 2 Time Base

**STR3** - Stratum 3 Time Base

**TOLL** - CEPT Toll Time Base

**LOCAL** - CEPT Local Time Base

**COND** - Condition

**cc** - Hexadecimal condition code

**cc**    *Explanation*

**16**    SYNC TB is not equipped

**C0**    Sync stratum is same

**C1**    Stratum not allowed

**C8**    Sync pack denied command

## **CFR,XC,INCL**

### **CONFIGURE DIGROUP CIRCUITS**

#### **Explanation Of Command**

This command requests that all Network Processing Circuits (NPCs) select data and clocks from the specified cross-connect network side.

Starting with Release 8.2 this command not only applies to the cross-connect network, it also applies to the Digital Phase Locked Loop (DPLL) that provides timing to the cross-connect network. The situation where the active synch is not on the same side as the active cross-connect network will now be considered a transient state.

This change was made in Release 8.2 to avoid a single hardware problem in the active DPLL affecting both sides of the cross-connect network, which can lead to service problems.

If the frame is in the maintenance condition state then the user must be logged in as the system administrator (DAX) on link 1. In addition the INCL keyword must be specified in order for the command to be accepted. If these conditions are not met the command will be denied.

#### **Command**

[I.35001]

**CFR:FRM xy,SEQ ww:XC s[,INCL]!**

#### **Completion Message**

[O.35001]

**M hh:mm:ss xy,ww n[vv] CFR XC s[ INCL] COMPL**

### **Denial Message**

---

[O.35001.01]

### **Autonomous Message**

---

[O.35001]

**I** hh:mm:ss xy,ww n[vv] CFR XC s[ TN abcd] COMPL

### **Explanation Of Parameters**

---

**XC** - Cross-connect

**s** - Cross-connect side (0 or 1)

**INCL** - Inclusive

**a, b** - The CCN side representations used for the autonomous report, with the same definition as s.

a and b each represents a CCN side. If a is 1, b must be 0, and vice versa.

**TN** - Transaction

**abcd** - transaction number (hexadecimal)

The transaction number is shown only in the autonomous output message.

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

**1C** CCN side s is out of service

**98** Unable to verify Configuration file since MP DB not loaded

**F5** INCL keyword needed to perform this command

**64** Frame is not in MCOND

**65** Link being used is not Link 1

**66** User login-id is not DAX

## **CHG,ALMS,ON,OFF**

Turn ON or OFF the Alarm Severity Feature

### **Explanation Of Command**

This command is used to turn ON or OFF the Alarm Severity Feature which is used to change the alarm severity of the system alarms. When this feature is ON, messages I.38365 and I.38375 can be used to change the alarm severity of shelf and facility alarms. This command is restricted to those with super user privileges.

This command can only be used if the alarm severity feature has been purchased as part of the DACS II software generic.

### **Command**

**ON** - Turn feature ON

**OFF** - Turn feature OFF

**cc** - Hexadecimal condition code

**cc** *Explanation*

**F7** Alarm Severity Feature (already) OFF

**F9** Alarm Severity Feature Already ON

---

## CHG,BC,X,TO

---

### CHANGE BIT-C TO

#### Explanation Of Command

---

This message allows you to send any 15-bit pattern of 0's and 1's on the addressed c-bit circuit. The addressed c-bit circuit must be provisioned as a Director DACS (DD) for the overwrite function (Message I.38331). The pattern can be changed on a single channel or a range of channels without disconnecting and reconnecting the circuits.

abcd is the hexadecimal value of the 15-bit pattern to be sent on the address c-bit circuit(s). Bit 1 is a framing bit generated on the CPR circuit pack. The other 14 bits are specified as follows:

| HEX DIGIT | BIT POSITION       |
|-----------|--------------------|
| a         | Bits 2 and 3*      |
| b         | Bits 4 through 7   |
| c         | Bits 8 through 11  |
| d         | Bits 12 through 15 |

\*Bits 2 and 3 are the two least significant values of Hex digit a. The two most significant values of Hex digit a will always be input as 00. Hex digit a will always be a number between 0 and 3 (0000 - 0011).

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Channel number at the beginning of a range  
**eee** - Ending channel number

Valid values are listed below:

001-030      CEPT type NPCs grown as CAS

**Note:** Channel 000 of CEPT NPCs (TS0) can be connected to another channel 000 of CEPT NPCs (TS0). Also, the channel 000 of CEPT NPCs can be connected to a channel other than the channel 000 of CEPT NPCs (non-TS0).

Channel 031 of CAS NPCs (TS16) can only be cross-connected to another channel 031 of CAS (TS16) or one-way cross-connected to another channel. Also these two channels can not be part of any conference.

**cc** - Hexadecimal condition code

**cc** *Explanation*

|           |                                                   |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Starting channel number  
**eee** - Ending channel number

Valid values are listed below:

001-030      CEPT type NPCs grown as CAS

**Note:** Channel 000 of CEPT NPCs (TS0) can be connected to another channel 000 of CEPT NPCs (TS0). Also, the channel 000 of CEPT NPCs can be connected to a channel other than the channel 000 of CEPT NPCs (non-TS0).

Channel 031 of CAS NPCs (TS16) can only be cross-connected to another channel 031 of CAS (TS16) or one-way cross-connected to another channel. Also these two channels can not be part of any conference.

**cc** - Hexadecimal condition code

**cc** *Explanation*

## **CHG,DD,TO**

### **CHANGE DIRECTOR DACS TO**

#### **Explanation Of Command**

This command allows the designation or change of the c-bit signaling bit(s) for the Director DACS (DD) function of monitoring, overwriting, or both; or to stop monitoring, overwriting, or both. This change can be made on a single channel or a range of channels without disconnecting and reconnecting the circuit.

### **Explanation Of Parameters**

---

**DD** - Director DACS

**m** - Monitor function parameter for c-bits entering the C-bit Processing  
Circuit Pack

Valid values are listed below:

| <i>m</i> | <i>Explanation</i>            |
|----------|-------------------------------|
| 0        | Disable the monitor function  |
| 1        | Enable the monitor function   |
| -        | Do not change current setting |

**w** - Write function parameter for c-bits leaving the C-bit Processing Pack

Valid values are listed below:

| <i>w</i> | <i>Explanation</i>            |
|----------|-------------------------------|
| 0        | Disable the write function    |
| 1        | Enable the write function     |
| -        | Do not change current setting |

**TO** - NPC identifier keyword

**[s]abc** - The 3- or 4-digit non-hierarchical NPC number

Valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number

**m** - Module number

**np** - NPC number

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Starting channel number

Valid values are listed below:

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**eee**    - Ending channel number  
Valid values are identical to those for ddd.

**cc**      - Hexadecimal condition code

**cc**    *Explanation*

**04**    Subject entity is out of service  
**10**    Unit is not equipped  
**13**    FTMI is not equipped  
**15**    NPC is unequipped  
**24**    Unit type error  
**36**    DSPI not equipped  
**37**    DSPI out-of-service  
**3E**    DSPI failed  
**2C**    Write to CPR failed  
**50**    CPR in buffer overflow condition  
**52**    CPR is not equipped  
**53**    CPR is out of service  
**54**    Cross-connect to CPR is required  
**58**    DSPU is not equipped  
**59**    DSPU unit controller is out of service  
**5A**    DSPU unit controller is failed  
**5B**    C-bit modify function is active  
**F1**    Parameter only valid with PA, PB, or PC type NPCs  
**F2**    Invalid NPC number specified  
**FF**    Termination is in process of being rolled  
**8A**    Modify disable denied on channel connected to NPC in RPSFI condition

## **CHG,ERB,TYPE**

### **SET ERRORED BLOCK THRESHOLD RATIO**

#### **Explanation Of Command**

This command allows users to set an error threshold for PA type NPCs that will be used to determine that a severely errored second or a far-end severely errored second has occurred. The threshold is set in terms of a percentage of blocks in error (errored blocks). At system start up, this percentage is set to 81 percent. Execution of this command will change the threshold to the percentage of errored blocks requested in the command for all provisioned PA NPCs. Once the percentage is set by this command it will be applied to all PA NPCs subsequently provisioned.

### **Explanation Of Parameters**

---

**ERB** - Errored Block

**ee** - Percentage of errored blocks (1% through 91%, default is 81%)

The number of errored blocks, expressed as a percentage, used to declare a severely errored second (SES) or far-end SES (FSES).

**NPC** - Network processing circuit

**TYPE** - Type

**mn** - NPC type identifier

mn Explanation

PA CEPT NPC (75-ohm or 120-ohm)

**Note:** PA is the only value that can be entered in this field.

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

**26** NPC type error

## **CHG,FALMS,TYPE,PMACR,PMAMJ,DMAMN,MI**

### **CHANGE Facility Alarms Severity**

#### **Explanation Of Command**

This command is used to change the Alarm Severity of the system facility alarms. The Alarm Severity must be turned ON via I.38355 to use this command. If a specific type is specified the command does not verify whether the facility alarm being changed is supported by that type.

## Explanation Of Parameters

**mn** - NPC Type

PA E1 NPC (75 ohm and 120 ohm)  
PB E1 NPC (75 ohm)  
PC E1 NPC (120 ohm)

[xyz] -if the xyz is not specified all NPCs of the PA,PB, or PC will be changed  
This implies that the default value for the specified type are changed and that any changes for specific xyz of that type done prior are lost.

### PA-Type xyz fields

The provisioning values of *x*, *y*, and *z* for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (*x*, *y* or *z*) provisioning value):

**Table 8-1. Provisioning values for *x***

| <b>x<br/>value</b> | <b>CRC-4<br/>Mode</b> | <b>Automatic<br/>CRC-4</b> | <b>Far-End<br/>PM</b> | <b>NPC used as<br/>Sync Source</b> | <b>TS0 Bit 5<br/>used for SFI</b> |
|--------------------|-----------------------|----------------------------|-----------------------|------------------------------------|-----------------------------------|
| <b>0</b>           | Y                     |                            |                       |                                    |                                   |

| <b>7</b>           | Y                     |                            | Y                     | Y                                  |                                   |
| <b>8</b>           |                       | Y                          | Y                     |                                    |                                   |
| <b>9</b>           |                       | Y                          | Y                     |                                    | Y                                 |
| <b>A</b>           |                       |                            |                       |                                    | Y                                 |
| <b>B</b>           |                       |                            |                       |                                    |                                   |
| <b>C</b>           |                       | Y                          | Y                     | Y                                  |                                   |
| <b>D</b>           |                       | Y                          | Y                     | Y                                  | Y                                 |
| <b>E</b>           |                       |                            |                       | Y                                  | Y                                 |
| <b>F</b>           |                       |                            |                       | Y                                  |                                   |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled (*x* values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected (*x* values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected (*x* values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source (*x* values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected (*x* values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6. *x* value B does not enable any of the features shown in the Table; this is a valid option.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

**Table 8-2. Provisioning values for *y***

| <i>y</i><br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|-------------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0                 | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2                 | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4                 | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6                 | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8                 |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9                 |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C                 |             |             |                        |                       |                   |                  | Y               |                   |
| D                 |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2. *y* values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For *y* values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected (*y* values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected (*y* values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected (*y* value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (*y* values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For *y* values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (*y*=8) or Timeslot Channel Numbering (*y*=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (*y*=C) or as an unframed clear 2Mbit/s interface (*y*=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).

- Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 8-3. Provisioning values for *z***

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. *z* value **F** and **E** are unassigned (i.e. not valid).
2. *z* value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )
3. *z* values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For *z* values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For *z* values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if *z* = **1, 3, 5**, or **9**  
in **2496 ms**  
if *z* = **7** or **B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:<sup>\*</sup>
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when  $z = 7$  or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when  $z = 0, 1, 4, 5, 6, 7, A$  or **B**. **However**, for  $z$  values 2 and 8 the set time is 144 ms and for  $z$  values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for  $z = 4$  and 8) or 480 ms (for  $z = 5$  and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8.  $z$  values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options ( $z = 6-7$  or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms
- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

---

<sup>\*</sup> Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

**z=6 or A** hardware timing

**z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

[ix] To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 8-4. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz                              | Framed clear 2Mbit/s ( $y$ value C) is valid for all $x$ options except those invoking automatic CRC-4 interworking.<br>The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 9Cz                              |                                                                                                                                                                                                                                    |

|              |            | 101          | Enable BER calculations, BER alarm level = DMA, NFW'bit'4=disabled, RAI set in < 2 ms, for c=1 (SFDT=2496'ms, CACT=624'\$ms sup [jkl'] \$), |
|              |            | 110          | NFW'bits'3-8,in time 144ms (TRANSMIC 1G)                                                                                                    |
|              |            | 111          | Unassigned                                                                                                                                  |
|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                               |
|              |            | 1            |                                                                                                                                             |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2'ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**

if  $jkl \neq 011$  and  $jkl \neq 101$   
in 2496'ms  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl'].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a gateway **cross-connection** the insertion word always defaults to AIS.

mnxyz'bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When  $c=0$ , the AIS in signaling bits is applied within 2'ms, overriding the signaling freeze. When  $c=1$  if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option  $c=0$  is supported and both the AIS and RAI will be applied in less than 2'ms. NFW'bit'3 of TS0 in enhanced CEPT is controlled by selecting the **jkl** options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

$c=0$      **Both** remote and local alarms are declared and cleared in 144 ms.

$c=1$      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when**  $jkl=011$  or  $jkl=101$ . **For that case, see note [jkl']**.

[c''] Time T will be 144'ms when option  $c=0$  and 480 ms when option  $c=1$ .

[g] Option  $g$  has meaning only if the NPC is provisioned for CAS; that is, option  $d=1$ , otherwise it is ignored. If option  $g=0$  is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option  $g=1$  is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW'bit'5 when used as SFI, and  $h=1$ , is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW'bit'5 will default to 1 when the NPC is grown, without regard of whether option  $h$  was selected as either 0 or 1, unless it is later set to 0 by setting parameter  $e=0$  in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic'1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

EQPT (O.65011) is output on detection of change of state of NFW spare bit'5 when option h=1.

If both  $b=1$  and  $h=1$  and the NPC (used as synchronization source) receives NFW bit'5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit'3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section'2.3.2 and is the same as in Basic CEPT when option  $c$  is selected as 0; **that is, within 2'ms after detecting the failure.** If this option is not specified as 000, use of NFW bit'3 as RAI will remain unchanged except the time when NFW bit'3 is set can be changed to 144'ms as opposed to 2 ms after detecting the failure. NFW'bit'3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW'bit'4 when used as RAIS, and AIS is detected in the received signal, can only be set 144'ms after detecting this condition. Similarly, when the received NFW bit'4 is in the active state, consequent actions are taken 144'ms after detecting this condition.

NFW'bit'4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

**[jkl'] minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

LB 5 0 2 4 i 1 0

Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

RAI set in 2 ms

Signaling freeze Delay timing, consequent action clear timing:

**c=0** hardware timing

**c=1** firmware timing (SFDT=2496'ms, CACT=624'ms)

BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW'bit'4=RBER:

- DACS'II sends a remote indicator in bit'4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144'ms after detecting the minor bit error rate (BER) condition.
- “ DACS'II sets the RBER bit to its idle state, on clearing of the BER condition.
- DACS'II detects the remote setting of the received bit'4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144'ms after detecting this condition.
- “ DACS II generates an appropriate retirement message when the received bit'4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW'bit'4=disabled

NFW'bit'4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

**LE 1**

For the MBER/SFDT features, the required xyz options are **ab1d'efgh'0110** or **ab1d'efgh'1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d'efgh'0110** or **ab0d'efgh'1010**.

[ix] NFW'bit'4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic'1G the **abcdefgh=11000000**.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic'1G the **abcdefgh=00111111**.

**faIm** - Facility Alarms

**faIm** *Explanation*

For PA type NPCs, valid values are:

**RPSFI** Remote Power Supply Failure Indicator  
**LOS** Loss of Signal  
**LOF** Loss of Frame  
**AIS** Alarm Indication Signal  
**EER** Excessive Error Rate  
**BER** Bit Error Rate  
**LCMA** Loss of CRC-4 Multiframe Alignment  
**FLC** Far End Loss of CRC-4 Multiframe Alignment  
**RAI** Remote Alarm Indication  
**RBER** Remote Bit Error Rate  
**SFI** Sync failure Indication  
**POF** Psuedo Frame Word Out of Frame  
**TAI** TS-16All Ones Alarm  
**RAIS** Remote AIS  
**LMA** Loss of Multiframe  
**RABS** Remote Alarm bit 6,TS16  
**PBF** Primary Block Failure  
**ALL** ALL above identified facility alarms

For PB and PC type NPCs, valid values are:

**RPSFI** Remote Power Supply Failure Indicator  
**AIS** Alarm Indication Signal  
**EER** Excessive Error Rate  
**BER** Bit Error Rate  
**RAI** Remote Alarm Indication  
**RBER** Remote Bit Error Rate  
**SFI** Sync failure Indication  
**TAI** TS-16All Ones Alarm  
**RAIS** Remote AIS  
**LMA** Loss of Multiframe  
**RABS** Remote Alarm bit 6,TS16  
**PBF** Primary Block Failure  
**ALL** ALL above identified facility alarms

**NOTE:** The command does not check for valid facility alarm - NPC type combinations.

**PMACR** - Prompt Maintenance Action CRITICAL alarm severity

**PMAMJ** - Prompt Maintenance Action MAJOR alarm severity

**DMAMN** - Deferred Maintenance Action MINOR alarm severity

**MI** - MESSAGE INFORMATION alarm severity

**RESET** - Reset Alarm Severity to default value

**cc** - Hexadecimal condition code

**cc** *Explanation*

## **CHG, FROM, TO, NOT, TLA, TLR, F, T, B, A, INCL**

### **CHANGE CIRCUIT PARAMETERS**

#### **Explanation Of Command**

This message changes the termination state of a cross-connected non-channelized network processing circuit. This command can affect either a two-way, a one-way or a broadcast non-channelized digital signal cross-connection. This command has the ability to change the termination states of all of the legs of a broadcast circuit. However, an option is provided to exclude one of the legs from being changed. The idle code for non-channelized digital signal cross-connections is the alarm indication signal which is transmitted over a terminated connection.

#### **Command**

Not applicable.

## Explanation Of Parameters

**FROM** - From termination  
**TO** - To termination

**[s]abc** - The 3- or 4-digit nonhierarchical non-channelized  
FROM NPC number  
**[t]ghi** - The 3- or 4-digit nonhierarchical non-channelized  
TO NPC number  
**[u]rst** - The 3- or 4-digit nonhierarchical non-channelized  
NPC number that is not affected by this command.

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uvmnp** - Hierarchical number of non-channelized FROM NPC  
**wxkqr** - Hierarchical number of non-channelized TO NPC  
**edhfg** - Hierarchical number of a leg of a non-channelized digital signal broadcast circuit that is not affected by this command.

**uv, wk, ed**  
- Unit number  
**m, x, h**  
- Module number  
**np, qr, fg**  
- NPC number within the module

The values are listed below:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**INCL** - Inclusive  
Inclusive keyword, required if one or more circuits are marked Customer-controlled (CUS) or Red (RDC)

**TLA** - Terminate and leave activate  
**TLR** - Terminate and leave release

The direction in which TLA or TLR is to be applied is specified by the use of F, T, B, A, and NOT as defined below:

**F** - Towards the FROM NPC  
**T** - Towards the TO NPC  
**B** - In both directions  
**A** - All directions of a broadcast circuit  
**NOT** - In conjunction with the A options, all directions of a broadcast circuit except the one specified

**RDC** - Red circuit  
 NPC is a red circuit

**CUS** - Customer  
 NPC is a Customer-controlled Circuit

**d** - direction

|   |             |
|---|-------------|
| d | Explanation |
| F | From        |
| T | To          |
| B | Both        |
| A | All         |

**st** - Status of denial

**cc** - Hexadecimal condition code

| cc | st           | Explanation                                                           |

## CHG, FROM, TO, NOT, TLA, TLR, F, T, B, L, G, A

### CHANGE CROSS-CONNECT TERMINATION STATUS

#### Explanation Of Command

This command is used to request a change in the termination status of the specified cross-connected circuit or range of circuits which were established by a two-point or multipoint cross-connect command.

If successful, the requested change is echoed ([NOT [u]rst-vvv]{TLA|TLR}{F|T|B|L|G|A}), followed by the new termination state (**NEW STATE**) of the circuit. If the range option was given, the new states of the circuits in the range may differ, noted by the **RNG** keyword.

#### Command

##### Nonhierarchical

[I.17001]

```
CHG:[FRM xy,SEQ ww]:FROM [s]abcddd[-eee],TO [t]ghijjj[-kkk]\
[,NOT [u]rstvvv},{TLA|TLR}{F|T|B|L|G|A}[,INCL]!
```

##### Hierarchical

[I.17001]

```
CHG:[FRM xy,SEQ ww]:FROM uvmnpddd[-eee],TO wxkqrjjj[-kkk]\
[,NOT edhfgvvv},{TLA|TLR}{F|T|B|L|G|A}[,INCL]!
```

### Autonomous Message

Not applicable.

### Explanation Of Parameters

**FROM** - From

**TO** - To

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

**[u]rst** - The 3- or 4-digit nonhierarchical NPC number not affected by this message

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number  
**edfhg** - Hierarchical NPC number not affected by this message

**uv, wx, ed**  
 - Unit number  
**m, k, f**  
 - Module number  
**np, qr, hg**  
 - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
 Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
 Unit Type VI (Virtual)

| Unit      | Module   | NPC          |                                 |
|-----------|----------|--------------|---------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**ddd** - FROM channel number  
**jjj** - TO channel number  
**eee** - FROM channel number denoting the end of the range  
**kkk** - TO channel number denoting the end of range  
**vvv** - Channel number not affected by this command.

The valid channel numbers are:

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers  
 001-500 (Virtual NPC)

**TLA** - Terminate and leave activate

**s** - Direction of transmission to be terminated

If the cross-connection is between a facility terminating unit (FTU) and a virtual NPC (VI type NPC), once terminated, the FTU NPC will send out its provisioning insertion word (PIW) as the idle code.

**TLR** - Terminate and leave release

**s**      *Explanation*

**A**      Towards the facilities and the bridge (multipoint only)

**B**      Towards both terminations

**F**      Towards the FROM termination

**G**      Towards the bridge (multipoint connection only)

**L**      Towards the facilities (multipoint connection only)

**T**      Towards the TO termination

**INCL** - Inclusive

Use this keyword, to change the termination status on a channel or range of channels including one or more channels marked as a red. The command will otherwise be denied if one or more of the cross-connected circuits in the range are marked as red.

**NOT** - Not

The LEG is not affected by this command

**mmm, nnn**

- Channel number involved in the denial.

Otherwise, the same as **ddd**.

**RNG** - Range

**RDC** - Red circuit

The change in termination status was performed on a red circuit. If the command specified a range of circuits, then at least one of the circuits involved was a red circuit. This keyword will appear only if the **INCL** keyword was specified in the command.

**CUS** - Customer

The change in termination status was performed on a customer controlled circuit. If the command specified a range of circuits, then at least one of the circuits involved was a customer controlled circuit.

**d** - Direction

**d** *Direction*

**F** From

**T** To

**B** Both

**st** - Status

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>      | <i>Explanation</i>                                                      |

## **CHG, FROM, TO, TLP, NG, ES, INCL**

### **CHANGE CIRCUIT PARAMETERS**

#### **Explanation Of Command**

This message requests DACS II to change the parameters of a multipoint circuit leg. Termination [s]abcddd must be either a termination on an FTU (facility terminating unit), IFTU (integrated Facility Terminating Unit), DS3U (DS3 Unit), HDS3U (Hybrid DS3 Unit) or DSPU (Digital Signal Processing Unit) NPC. Termination [t]ghijjj must be a termination on a DSPU NPC.

## Explanation Of Parameters

**FROM** - From  
**TO** - To

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |

| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number

000-030 CEPT type NPCs grown as CAS  
000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**jjj** - TO channel number

**TLP** - Transmission level point

Specify the incoming and outgoing gain adjustments relative to the TO multipoint circuit by using the TLP (snn,smm) field. Gain adjustment snn is applied as the signal enters the bridge, while smm is applied as the signal leaves.

**snn** - Incoming gain adjust parameter

**smm** - Outgoing gain adjust parameter

**s** - Sign (+ or -)

**nn** - Incoming gain adjust value (-90 through +88)

**mm** - Outgoing gain adjust value (-90 through +88)

These are the parameters requested for the TO termination. Values are given in steps of two and the units are tenths of a db.

Certain situations require replacement of the gain adjust parameter values with "---". In general "---" is used for either snn or smm (but not both) when no change is to be made to that parameter. This feature allows changing only one of the two parameters if desired. Also, if the cross-connection was provisioned with the NTR (no transmit) option, the gain adjustment in the direction for which transmission is shut off MUST be ---. See the table below to see what situations require "---".

| <i>FROM</i> | <i>TO</i> | <i>snn</i>          | <i>smm</i> |
|-------------|-----------|---------------------|------------|
| BRD         | BBL       | ---                 | smm        |
| BBL         | BRD       | snn                 | ---        |
| LEG         | BBL       | ---                 | smm        |
| LEG         | BRD       | snn                 | ---        |
| LEG         | SYM       | snn                 | smm        |
| BBL         | LEG       | Invalid combination |            |
| BBL         | SYM       | Invalid combination |            |
| BRD         | LEG       | Invalid combination |            |
| BRD         | SYM       | Invalid combination |            |

**NG** - Noise guard

**nn** - Requested NG level setting (00, 06, 12, or 18) db

To specify the noise guard level setting, use NG nn. The following default values apply:

For Symmetrical bridges    Default: NG = -18 db

For Polling circuits        Default: NG = 0 db

**ES** - Echo suppression

**ee** - Requested ES level setting (00, 06, 12, or 18) db

To specify the echo suppression level setting, use ES ee. The following default values apply:

For Symmetrical bridges Default: ES = -18 db

For Polling circuits Default: ES = 0 db

At least one of the three parameters (TLP, NG, ES) must be specified.

Since a BBL (backbone leg) has no input to the bridge and the bridge has no output to a BRD (broadcast) leg, transmission values in these directions cannot be changed.

**INCL** - Inclusive

INCL is used to change the parameters on a circuit marked either as a red or a customer controlled circuit. If this option is not used, the command will be denied such a circuit.

**spp, sqq**

- New gain setting. Otherwise, the same as snn and smm.

**ff** - New noise guard setting. Otherwise, the same as nn.

**hh** - New echo suppression setting. Otherwise, the same as ee.

**RDC** - Red circuit

These keywords indicate the connection is marked as a red circuit.

**CUS** - Customer

The connection is a Customer-controlled Circuit.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**03** No RDC or CUS circuits and INCL keyword used

**13** UNIT not equipped, not in service, or failed

**18** DSPI not equipped, not in service, or failed

**A0** Illegal LEG LEG combination

**A1** Illegal BBL BBL combination

**A2** Illegal BRD BRD combination

**A3** Illegal SYM BRD combination

**A4** Illegal BRD SYM combination

**A5** Illegal BBL SYM combination

**A6** Illegal SYM BBL combination

**cc**    *Explanation*

- AF**    Delete or change a leg from a conference that has no leg
- B2**    Transmission parameters in command will not change existing settings
- B3**    Trying to change level out on BRD leg
- B4**    Trying to change level in on BBL leg
- B6**    TO side is not a DMB type NPC
- AE**    A substrate circuit pack is specified in the command line
- B5**    CPR circuit pack specified in the command
- D0**    FROM NPC is not provisioned as DGA
- D3**    Corresponding NPC for FROM virtual channel is not provisioned
- D6**    Invalid FROM channel number
- 43**    Trying to change in NTR direction

## **CHG,INTV,ON,OFF**

**Turn ON or OFF the Intervention Level Setting  
Feature**

### **Explanation Of Command**

This command is used to turn ON or OFF the Intervention Level Setting Feature, which is used to change the intervention level of the alarm severities for various system resources. When this feature is ON, message I.31363 can be used to change the intervention level of NPCs. This command is restricted to users with superuser privileges.

This command can only be used if the intervention level feature has been purchased as part of the DACS II software generic.

### **Command**

[I.38451]

**CHG:[FRM xy,SEQ ww]:INTV,{ON|OFF}!**

DNY**

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**SPACE** - Space

**sss** - User macro or map space allocation (000 through 100 percent)

Variable sss represents the space allocated to user macros or maps for entire DACS II system as a percentage of the system macro space.

**ttt** - Old user macro space allocation (000 through 100 percent)

Variable ttt represents the space previously allocated to user macros for the entire DACS II system as a percentage of the system macro space.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**D0** Command is Frame administrator (DAX) only.

## **CHG,MSGLOG,ON,OFF**

Turn ON or OFF the Message Logging feature

### **Explanation Of Command**

This command is used to turn ON or OFF the Message Logging feature, which is used to log the MML messages, so they can be retrieved at a later time. Turning ON the Message Logging feature resets the Message Log Number to 1. This command is restricted to those with superuser permissions.

This command can only be used if the message logging feature has been purchased as part of the DACS II software generic.

### **Command**

[I.38471]

**CHG:FRM xy,SEQ ww:MSGLOG {ON|OFF}!**

### **Explanation Of Parameters**

---

**MSGLOG** - Message Log

**ON** - Turn feature ON

**OFF** - Turn feature OFF

**cc** - Hexadecimal condition code

**cc** *Explanation*

**01** Subject entity is equipped

**02** Subject entity is not equipped

**06** Feature is (already) off

## **CHG,NPC,ALL,TLI,SYNC,CCN,LEV**

### **CHANGE INTERVENTION LEVEL**

#### **Explanation Of Command**

This command is used to change the Intervention Level Setting for the following resources:

NPC  
SYNC  
TLI

For an NPC the Intervention Level setting will affect the alarm severity level reported for all NPC alarms including the facility and performance monitoring alarms. The escalation for greater than 5 NPC alarms will not happen when Intervention Level is ON. For an SYNC and TLI, all alarms associated with these resources will be affected by Intervention Level and the escalation mechanism associated with these resources will occur. This command can be executed while the resource is in service.

#### **Command**

Not applicable.

### **Explanation Of Parameters**

---

**NPC** - Network Processing Number

abc,def - NPC number

**ALL** - ALL NPCs

**TLI** - Timing Link Interfaces(TLI 1,TLI 2,TLI 3,TLI 4)

**SYNC** - Synchronizer

**CCN** - Cross Connect Network(CCN or ECCN)

**ALL** - All equipment  
(All NPCs, TLI 1, TLI 2,TLI 3,TLI 4 SYNCs 0,1 and CCN 0,1)

#begifill

NOTE:When the intervention level setting of the TLI is changed the SSPs on that TLI if it is an extractor will inherit the same setting.

**LEV** - Intervention Level Setting

**r** - Intervention Level Setting (1-6)

Listed below is the Intervention actions for the different Intervention levels and alarm serities.

| Intv. Level<br>Setting | Alarm Severity |           |           |       |
|------------------------|----------------|-----------|-----------|-------|
|                        | PMA-Critical   | PMA-Major | DMA-Minor | Info. |
| 1                      | IMA            | IMA       | IMA       | DMA   |
| 2                      | IMA            | IMA       | DMA       | DMA   |
| 3                      | IMA            | DMA       | DMA       | NI    |
| 4                      | DMA            | DMA       | NI        | NI    |
| 5                      | DMA            | NI        | NI        | NI    |
| 6                      | NI             | NI        | NI        | NI    |

where:

**IMA** = Immediate Maintenance Action  
PMA Critical Alarm LED  
Critical Relay

**DMA** = Deferred Maintenance Action  
PMA Major Alarm LED  
Major Relay

**NI** = No Action  
No Alarm LED  
No relay

The Intervention Level setting for other resources other than the TLI,NPC,CCN,and SYNC will be set to 2 and can not be changed. These other resource are:

Power Failure (feeder or fuse)

SMEM

MC

CCI/CCNI

TSI/ETSI

FC

FTMI

DSPI

FTU UC

CCB

DSPU UC

System Date and Time

**cc** - Hexadecimal condition code

**cc** *Explanation*

**FE** Intervention Level setting not changed

## **CHG,NPC,ALMOPT,AIS,MI,PMA,PMC,DMA**

### **CHANGE NPC AIS ALARM OPTION**

#### **Explanation Of Command**

This command requests a change of the NPC alarm option to Maintenance Information (MI), Prompt Maintenance Alarm (PMA), Deferred Maintenance Alarm (DMA), or Prompt Maintenance Action Critical (PMC) for all CEPT NPC types.

#### **Command**

##### **Nonhierarchical**

[I.38281]

```
CHG:FRM xy,SEQ ww:NPC [s]abc[-[t]ghi],ALMOPT,\
AIS {MI|PMA|PMC|DMA}!
```

##### **Hierarchical**

[I.38281]

```
CHG:FRM xy,SEQ ww:NPC uvmnp[-wxkqr],ALMOPT,\
AIS {MI|PMA|PMC|DMA}!
```

**uvmnp** - Hierarchical NPC number at beginning of range  
**wxkqr** - Hierarchical NPC number at beginning of range  
**defgh** - Hierarchical NPC number between uvmnp and ijklm  
**ijklm** - Hierarchical NPC number between defgh and wxkqr

**uv,wx** - Unit number  
**m,k** - Module number in unit uv  
**np,qr** - NPC number in module m

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ALMOPT** - Alarm option

**AIS** - Alarm indication signal

Type of alarm. AIS is not detected by unframed clear (unchannelized) 2Mbit/s PAXDz or THxDz type NPCs. Therefore, specifying AIS with one of the alarm level types MI, DMA, PMA, or PMC is unnecessary. However, the command will not be denied if AIS is specified with an alarm level for unframed clear PAXDz or THxDz NPCs. AIS with its alarm level will simply never be reported for unframed clear PAXDz or THxDz NPCs.

**MI** - Maintenance information  
Maintenance information message (not an alarm). Default.

**PMC** - Prompt Maintenance Action Critical Alarm

**PMA** - Prompt Maintenance Action Major Alarm.

**DMA** - Deferred Maintenance Action Minor alarm.

**TOT nnn**  
- Total number of NPCs in the output segment.

**PLOPT** - Payload loopback option  
The NPC(s) must be out of service to use this option.

**tttt** - The old AIS alarm option/payload loopback setting for the NPC.

*tttt Explanation*

MI AIS programmed for Information message  
PMA AIS programmed for Prompt maintenance major alarm  
PMC AIS programmed for Prompt Maintenance critical alarm  
DMA AIS programmed for Deferred maintenance minor alarm

---- Not applicable (for unequipped NPCs or not valid NPC type within the specified NPC range)

**cc** - Hexadecimal condition code

*cc Explanation*

**02** Subject entity is not equipped  
**10** Unit is not equipped

- 5A** DSPU unit controller is failed
- F1** Parameter only valid with PA, PB, or PC type NPCs
- F2** Invalid NPC number specified

## **CHG,NPC,LPBK**

### **CHANGE NPC LOOPBACK**

#### **Explanation Of Command**

This command requests a loopback, or the changing of the provisioning of the loopback, for a 2048-kb/s signal received on the addressed NPC(s). It allows changing provisioning for either a single NPC or a range of NPCs.

LPBK controls loopback and provisioning. For PB/PC type NPCs, variable d is not allowed and the variable t may be set as follows:

| LPBK-t |                                                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t      | FUNCTION                                                                                                                                                          |
| A      | Starts looping the signal towards the facility and sends AIS downstream. Turns off facility performance monitoring and freezes alarm states and parameter counts. |
| T      | Transparently passes through the received signal.                                                                                                                 |
| N      | Stops looping the signal.                                                                                                                                         |

For PA type NPCs, variable d and t may be set as follows:

| LPBK-dt |   |                                                                                                                                                                                                                                                |
|---------|---|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| d       | t | FUNCTION                                                                                                                                                                                                                                       |
| F       | A | Starts looping the incoming signal back towards the facility and sends AIS downstream. Turns off facility performance monitoring and freezes alarm states and parameter counts.                                                                |
| F       | B | Starts looping the incoming signal back towards the facility and sends AIS downstream. Performance Monitoring activity and alarm processing is maintained.                                                                                     |
| F       | C | Starts looping the incoming signal back towards the facility and transparently passes through the received signal. Turns off facility performance monitoring and freezes alarm states and parameter counts.                                    |
| F       | T | Starts looping the incoming signal back towards the facility and transparently passes through the received signal. Performance Monitoring activity and alarm processing is maintained.                                                         |
| E       | A | Starts looping the outgoing signal back towards the DACS II equipment and sends AIS upstream. Turns off facility performance monitoring and freezes alarm state and parameter counts                                                           |
| E       | B | Starts looping the outgoing signal back towards the DACS II equipment and sends AIS upstream. Performance Monitoring activity and alarm processing is maintained.                                                                              |
| E       | C | Starts looping the outgoing signal back towards the DACS II equipment and transparently passes through the outgoing signal in the upstream direction. Turns off facility performance monitoring and freezes alarm states and parameter counts. |
| E       | T | Starts looping the outgoing signal back towards the DACS II equipment and transparently passes through the outgoing signal in the upstream direction. Performance Monitoring activity and alarm processing is maintained.                      |
| N       | N | Stop loopback.                                                                                                                                                                                                                                 |

When the NPC loopback is activated towards the facility, DACS II will no longer output its own clock on the line. Equipment connected to this NPC should not rely on timing from

DACS II in that case.

## Explanation Of Parameters

**NPC** - Network processing circuit

If an NPC range is specified in the input command, the following floating window rules apply:

1. Unequipped NPCs within the requested range will be skipped.
2. If a CEPT gap is within the requested range, the NPCs in the gap will be skipped.
3. If an endpoint of the requested range is in a CEPT gap, then the NPCs in the portion of the range which is in the gap will be denied.

**[s]abc** - The 3- or 4-digit beginning nonhierarchical NPC  
Valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**[t]def** - The 3- or 4-digit ending nonhierarchical NPC number  
Valid values are identical to those for [s]abc.

**uvmnp** - Beginning hierarchical NPC number

**wxkqr** - Ending hierarchical NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**LPBK** - Loopback

**d** - Loopback direction specifier; required for PA NPCs, but not allowed for PB/PC NPCs. See previous table for PA type NPCs.

**t** - Loopback signal transmission and performance monitoring specifier.  
See tables above for PB/PC type NPCs and for PA type NPCs.

For PB/PC type NPCs, only the "t" flag is allowed. If the optional "d" flag is also entered the command will be denied.

The "t" flag is allowed to be changed while a loopback is active. That is, this command can be entered to change the signal transmission and/or the PM options while a loopback is being performed.

The change of the loopback direction for PA NPCs, that is, change the "d" flag between "F" and "E", while a loopback is active is not allowed.

For PB/PC NPCs, a loopback will be stopped when this command is entered with "LPBK N". For PA NPCs, a loopback will be stopped only if this command is entered with "LPBK NN".

For PB/PC NPCs if LPBK T or LPBK N is entered from the LPBK A state, Facility Performance Monitoring is enabled and alarm and parameter counts are reset. For PA NPCs when the "t" flag is changed from "A" or "C" to another state, Facility Performance Monitoring is enabled and alarm and parameter counts are reset.

For a range command, if the "d" field is specified, the command will only be applied to PA NPCs; PB/PC NPCs will be skipped. Similarly, if the "d" field is not entered, the command will only be applied to PB/PC NPCs and will skip PA NPCs. In either cases, if no NPCs with the appropriate NPC type is in the specified range, the command will be denied.

**[v]ghi** - The 3- or 4-digit nonhierarchical NPC number  
([s]abc ≤ [v]ghi ≤ [t]def)

**edhfg** - Hierarchical NPC number (uvmnp ≤ edhfg ≤ wxkqr)

**cc** - Hexadecimal condition code

**cc**    *Explanation*

- 10**    Unit is not equipped
- 11**    UC is out of service
- 12**    UC is in service but failed
- 13**    FTMI is not equipped
- 14**    FTMI is out of service
- 15**    NPC is unequipped
- 24**    Unit type error
- 46**    NPC Failed or Out of Service
- F1**    Parameter only valid with PA, PB, or PC type NPCs
- F2**    Invalid NPC number specified
- FD**    NPC range crosses unit boundary
- A1**    The parameter specified does not match with the NPC type
- 17**    Command did not execute for any entity specified in the command
- AE**    NPC used as a timing reference

## **CHG,NPC,NFS**

---

### **CHANGE NPC NON FRAME-WORD SETTING**

#### **Explanation Of Command**

---

This command allows control of the spare national and international bits in time slot zero (TS0).

Control is exercised through variable "abcdefghi". Each letter in this variable represents one of the spare national or international bits in TS0. The bit represented by a given letter is controlled by assigning an appropriate value to the letter. Each letter may be set to one of the following: **0**, **1**, **p** or **-**. **p** indicates that the incoming bit will be passed through unchanged if cross-connected. A **0** and **1** set for any of the bits (except **c**) will override the cross-connected bits. This applies also to NPCs assigned as test NPCs. A hyphen (-) means that the bit is not affected by this command.

When a command covering a range of NPCs is denied for successive NPCs in the range for the same reason, a summary denial message shall be output, giving the range of NPCs denied and the reason. The execution of the normal completions, or of denials for a reason other than diagnostic failures, then resumes at the next NPC and continues to the end of the range.

Not applicable.

**Explanation Of Parameters**

- [s]abc** - The 3- or 4-digit nonhierarchical NPC number, start of range
- [t]def** - The 3- or 4-digit nonhierarchical NPC number, end of range, must be in the same unit as [s]abc
- [s]jkl** - The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def.
- [t]mno** - The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def.

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |

| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number, start of range

**uvkqr** - Hierarchical NPC number, end of range

**uvjkl** - Hierarchical NPC number (uvmnp through uvkqr)

**uvmno** - Hierarchical NPC number (uvmnp through uvkqr)

**uv**

- Unit number

**m, k, j**

- Module number

**np, qr, kl, no**

- NPC number within the module

The allowable values are presented below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**NFS** - Nonframe-word Setting

**abcdefghi**

- Input variables corresponding to spare bits in TS0

**abcdefghi**

- Variables of old spare bits in TS0.

- a: Bit 1 of Frame Word (FW) - International spare bit for TS0 to non-TS0 cross-connect in Mode 2, this variable can only be "-" or "b"
- b: Bit 1 of Non Frame Word (NFW) - International spare bit
- c: Bit 2 of NFW
- d: Bit 3 of NFW - Remote Alarm Indicator
- e-f: Bits 4-5 of Not Frame Word, National spare bits
- g: Bit 6 of Not Frame Word, RPSFI bit if provisioned for RPSFI otherwise a national spare bit.
- h-i: Bits 7-8 of Not Frame Word, National spare bits

| Variable<br>Input Value | Action on corresponding TS0 bit:                                 |
|-------------------------|------------------------------------------------------------------|
| "0" or "1"              | Set TS0 bit to this value                                        |
| "V"                     | Received bit is inverted and passed through                      |
| "P"                     | Received bit is passed through unchanged                         |
| "_"                     | Neither the variable nor the TS0 bit is changed by this command. |

The output parameters take on values dependent on the message language (PDS or MML) and position (OLD or NEW) as shown in the following table:

| Input | Output<br>Primary<br>Line<br>(MML) | OLD          | NEW      |
|-------|------------------------------------|--------------|----------|
| "0"   | "0"                                | previous     | "0"      |
| "1"   | "1"                                | previous     | "1"      |
| "V"   | "V"                                | previous "V" |          |
| "P"   | "P"                                | previous     | "P"      |
| "_"   | "_"                                | previous     | previous |

previous value may be one of "0", "1", "V" or "P"

For example:

11V---00P    11V---00P    0011PPPPV    11V1PP00P

If this command is not entered for a NPC, the default value for all the bits is "P".

**cc** - Hexadecimal condition code

**cc** *Explanation*

|           |                                                                       |
|-----------|-----------------------------------------------------------------------|
| <b>02</b> | Subject entity is not equipped                                        |
| <b>10</b> | Unit is not equipped                                                  |

## **CHG,NPC,OPTS,THMODE**

### **CHANGE NPC OPTIONS**

#### **Explanation Of Command**

This message changes the facility performance parameter threshold values on a specified Network Processing Circuit (NPC) without disconnecting and reconnecting provisioned circuits.

One or more alarm or information threshold values for the designated NPC may be changed to a value previously stored in the DACS II threshold data base. These previously stored values are selected through use of the indices **rr/m**.

Each facility parameter of an NPC has a default threshold and up to three user-programmable threshold values stored in the DACS II threshold data base. The **CHG SETOP NPCOP** command sets these values.

**Note:** This command will not reboot the NPC hardware. Therefore, if any NPCs are in service, use the **UTL : :BOOT,FRAME** command (Message I.58001) to avoid any possible inconsistency.

Not applicable.

## Explanation Of Parameters

---

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

The valid numbers are:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**rr** - Facility performance parameter number

Variable rr specifies the parameter whose alarm threshold is being selected.

**<m>** - Facility performance parameter threshold index (0 through X'10')

Variable <m> is used to select threshold values and threshold crossing alarm levels previously programmed for rr. The default threshold value for each parameter is shown below under the column heading "Default Threshold Value". Default threshold values are selected by setting m = 0, 1, 2 or d. Each of these m values corresponds to the default threshold but a different alarm level. The default threshold value and alarm level is given by m = 0. Threshold values selected from Set1 (m=3,4,5,e), Set2 (m=6,7,8,f), and Set3 (m=9,a,b,X'10') must exist, that is, they must have been programmed, prior to being selected.

These other thresholds can be set by using the CHG::SETOP command.

#### For PB and PC type NPCs:

| <b>rr</b> | Parameter                          | Threshold<br>Value<br>Range | Default<br>Threshold<br>Value |
|-----------|------------------------------------|-----------------------------|-------------------------------|
| <b>31</b> | Degraded Minutes, 1 hour           | 1-60                        | 60                            |

| 6   | Set 2              | MI                                     |
| 7   | Set 2              | DMA                                    |
| 8   | Set 2              | PMA Major                              |
| 9   | Set 3              | MI                                     |
| a   | Set 3              | DMA                                    |
| b   | Set 3              | PMA Major                              |
| c   | Threshold disabled | no alarm                               |
| d   | Default            | PMA Critical                           |
| e   | Set 1              | PMA Critical                           |
| f   | Set 2              | PMA Critical                           |
| 10  | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable **m** can be used to select threshold levels and alarm types other than the defaults.

**TYPE** - Type

**mnxyz** - NPC type

PAxyz - CEPT NPC (120-ohm twisted pair or 75-ohm coaxial)  
PBxyz - CEPT NPC (120-ohm twisted pair)  
PCxyz - CEPT NPC (75-ohm coaxial)

**PA-Type xyz fields**

The provisioning values of  $x$ ,  $y$ , and  $z$  for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding ( $x$ ,  $y$  or  $z$ ) provisioning value):

**Table 8-9. Provisioning values for  $x$**

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |
| B            |               |                    |               |                            |                           |
| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 8-10. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected ( $y$  value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected ( $y$  values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For  $y$  values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering ( $y=8$ ) or Timeslot Channel Numbering ( $y=9$ ) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface ( $y=C$ ) or as an unframed clear 2Mbit/s interface ( $y=D$ ). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 8-11. Provisioning values for  $z$**

| $z$<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|--------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|              | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0            | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1            |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2            | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3            |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4            | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5            |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6            | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7            |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8            | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9            |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A            | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B            |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C            | Y           |    |              |       |       |               |      |               |       |         |         |
| D            | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. **z** value **F** and **E** are unassigned (i.e. not valid).
2. **z** value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )
3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for  $z = 4$  and 8) or 480 ms (for  $z = 5$  and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8.  $z$  values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options ( $z = 6-7$  or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

$z=6$  or A hardware timing

$z=7$  or B firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for  $z=6$  or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for  $z= A$  or B**

- [vii] RBER unalarmed
- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of *xyz* for the PA type NPC.

**Table 8-12. Combinations of *x* and *y* Values**

| Invalid<br><i>xyz</i><br>Combinations | Explanation                                                                                                                                                                                                                                  |

|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the **jkl** options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when** *jkl=011* or *jkl=101*. **For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option *g* has meaning only if the NPC is provisioned for CAS; that is, option *d=1*, otherwise it is ignored. If option *g=0* is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option *g=1* is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and *h=1*, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option *h* was selected as either 0 or 1, unless it is later set to 0 by setting parameter *e=0* in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of *xyz* the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option *h=1*.

If both *b=1* and *h=1* and the NPC (used as synchronization source) receives

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

**[jkl'] minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

**c=0** hardware timing

**c=1** firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

- [vii] RBER unalarmed
- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

- [m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

**IW** - Insertion word

**pqr** - Insertion word value (hexadecimal)

**pq** - Disconnect code (DCC) or idle code

**r** - Signaling option

The value entered for pq is used as the disconnect code (DCC) or idle code. This value is inserted in the transmit direction on unassigned channels. An insertion word is not allowed for clear-2Mbit NPCs; the all ones signal is transmitted for an idle clear-2Mbit NPC. Thus, information about the disconnect code will not appear for any message involving a clear-2Mbit type NPC.

Variable r is used for circuits provisioned for channel associated signaling (CAS). A value may be entered for r for nonsignaling associated (NSA) NPCs but it has no significance.

*pq Explanation*

D5 Default idle code

*r Explanation*

D Default signaling

This sets signaling bits abcd to the binary value 1101

**For PB and PC type NPCs:**

**DM** - Degraded Minutes

**SERS** - Severely Errored Seconds

**ERS** - Errored Seconds

**US** - Unavailable Seconds

**SLIP** - Slip Events

For SHORT INTERVAL, DM is calculated hourly and SERS, ERS, US and SLIP are calculated at 15-minute intervals.

**nnnnn** - 24-hour Degraded Minutes (DM) threshold

**ppppp** - 24-hour Severely Errored Seconds (SERS) threshold

**qqqqq** - 24-hour Errored Seconds (ERS) threshold

**rrrrr** - 24-hour Unavailable Seconds (US) threshold

**sssss** - 24-hour Slip Events (SLIP) threshold

**e** - 24-hour DM threshold/alarm selection  
**f** - 24-hour SERS threshold/alarm selection  
**g** - 24-hour ERS threshold/alarm selection  
**h** - 24-hour US threshold/alarm selection  
**i** - 24-hour SLIP threshold/alarm selection

**s** - Old 24-hour DM threshold/alarm selection  
**t** - Old 24-hour SERS threshold/alarm selection  
**u** - Old 24-hour ERS threshold/alarm selection  
**v** - Old 24-hour US threshold/alarm selection  
**w** - Old 24-hour SLIP threshold/alarm selection

**nnnnn** - 1-hour DM threshold  
**ppppp** - 15-minute SERS threshold  
**qqqqq** - 15-minute ERS threshold  
**rrrrr** - 15-minute US threshold  
**sssss** - 15-minute SLIP threshold

**e** - 1-hour DM threshold/alarm selection  
**f** - 15-minute SERS threshold/alarm selection  
**g** - 15-minute ES threshold/alarm selection  
**h** - 15-minute US threshold/alarm selection  
**i** - 15-minute SLIP threshold/alarm selection

**s** - 1-hour DM threshold/alarm selection  
**t** - 15-minute SERS threshold/alarm selection  
**u** - 15-minute ES threshold/alarm selection  
**v** - 15-minute US threshold/alarm selection  
**w** - 15-minute SLIP threshold/alarm selection

**For PA type NPCs:**

**CRC** - CRC Block Errors  
**FRER** - Framing Errors  
**OFS** - Out of Frame Seconds  
**ES** - Errored Seconds  
**SES** - Severely Errored Seconds  
**CSS** - Controlled Slip Seconds  
**CV** - Coding Violations  
**UAS** - Unavailable Seconds  
**UATC** - Unavailable Time Count  
**MER** - Multiframe Errors  
**FEBE** - Far End Block Errors  
**FES** - Far End Errored Seconds  
**FSES** - Far End Severely Errored Seconds  
**FUAS** - Far End Unavailable Seconds

| <b>i</b> | - Old 15-minute unavailable time count threshold selection,          |
| <b>j</b> | - Old 15-minute multiframe alignment error threshold selection,      |
| <b>k</b> | - Old 15-minute far-end path block error selection,                  |
| <b>l</b> | - Old 15-minute far-end path second threshold selection,             |
| <b>m</b> | - Old 15-minute far-end severely errored second threshold selection, |
| <b>n</b> | - Old 15-minute far-end unavailable second threshold selection,      |

The options can be a value from "0" to "c" as specified for the "m" of the "rr/m" field.

#### For PA type NPCs:

Depending on which interface functions are enabled by the provisioning values of xyz, some parameters may not be applicable. In this case the threshold value, the parameter count (if present in the message) and the selection value will appear as dashes ("-"). In the table below "N/A" indicates that a parameter is not applicable for the given value of x or y.

Also, if the selection value m=c has been chosen for a parameter, the threshold value and the parameter count (if present in the message) will appear as dashes.

**For PA type NPCs only:****THMODE** - Thresholding mode**hhh** - Thresholding mode option

| <i>hhh</i> | <i>Explanation</i>   |
|------------|----------------------|
| INH        | Inhibit thresholding |
| ALW        | Allow thresholding   |

The INH option is used to temporarily inhibit thresholding for all parameters of a PA NPC. The ALW option is used to turn-off the INH option. The default thresholding mode is ALW.

When the INH mode is entered, all thresholds for the NPC are suspended; therefore, no threshold crossing messages will be output after the inhibition. However, the previously programmed threshold values are still stored in the database and will continue to be output for each parameter. Threshold value option changes are permitted while the NPC thresholding is inhibited.

When the ALW mode is entered, the previously programmed threshold values will be re-applied unless they were changed while in the INH mode.

**ss/n** - First improper values of "rr/m" for which message is denied.

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 02** Subject entity is not equipped
- 10** Unit is not equipped
- 11** UC is out of service
- 12** UC is in service but failed
- 13** FTMI is not equipped
- 20** Option rr/m has not been set up on 2nd database
- 21** Minor  $\geq$  major for SLIP opt
- 22** Minor  $\leq$  major for BER opt
- 23** Minor  $\geq$  major for COFA opt
- 26** NPC type error
- 29** IW is UMUX (18) but NPC not type DE4yz
- 2A** DMI combined with T1DM
- 2B** Maj|Min BER threshold is 7, but not in T1DM or Fe mode
- 4F** BER must not be less than 4 for Clear DS1
- 83** Option not programmable for this NPC type
- B5** NPC is a test port
- 93** PA NPC threshold already in inhibit mode
- 94** PA NPC threshold already in allow mode

## **CHG,NPC,TS0**

### **CHANGE NPC TIME SLOT ZERO**

#### **Explanation Of Command**

This message allows the changing of the spare national and international bits in TS0.

TS0-abcdefgh is the international and national bit in timeslot 0. Each variable may be set to one of the following: 0, 1, p or -. p indicates that the incoming bit will be passed through unchanged if cross-connected. A 0 and 1 set for any of the bits (except c) will override the cross-connected bits. This also applies to NPCs assigned as test NPCs. A hyphen (-) means that the bit is not affected by this command.

When a range NPC is denied for successive NPCs in the range for the same reason, a summary denial message shall be output, giving the range of NPCs denied and the reason. The execution of the normal completions, or of denials for a reason other than diagnostic failures, then resumes at the next NPC, up to the end of the range.

**uvmnp** - Hierarchical NPC number

**uvkqr** - Hierarchical NPC number

**uv** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**TS0** - Time slot zero (0)

**abcdefgh**

- Spare bits in TS0

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

|             |                                  |
|-------------|----------------------------------|
| Variable    | Action on corresponding TS0 bit: |
| Input Value |                                  |

|            |                                                                  |
|------------|------------------------------------------------------------------|
| "0" or "1" | Set TS0 bit to this value                                        |
| "P"        | Received bit is passed through (cross-connected) unchanged.      |
| "-"        | Neither the variable nor the TS0 bit is changed by this command. |

**[s]jkl** - The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def.

**[t]mno** - The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def.

**uvjkl** - Hierarchical NPC number (uvmnp through wxkqr)

**uvmno** - Hierarchical NPC number (uvmnp through wxkqr)

# **abcdefgh**

- Variables to corresponding TS0 bits.

The output parameters take on values dependent on the message language (PDS or MML) and position (OLD or NEW) as shown in the following table:

| Input         | Output<br>Primary<br>Line<br>(MML) | OLD      | NEW      |
|---------------|------------------------------------|----------|----------|
| "0"           | "0"                                | previous | "0"      |
| "1"           | "1"                                | previous | "1"      |
| "P"           | "P"                                | previous | "P"      |
| "V" (PA only) | "V"                                | previous | "V"      |
| "_"           | "_"                                | previous | previous |

previous value may be one of "0", "1", "P", or "V" (for PA NPCs)

For example:

|          |          |          |          |
|----------|----------|----------|----------|
| 11----00 | 11----00 | 0011PPPP | 1111PP00 |
|----------|----------|----------|----------|

## **cc** - Hexadecimal condition code

### **cc**    *Explanation*

- 02**    Subject entity is not equipped
- 10**    Unit is not equipped
- 11**    UC is out of service
- 12**    UC is in service but failed
- 13**    FTMI is not equipped
- 14**    FTMI is out of service
- 24**    Unit type error
- 26**    NPC type error
- 2B**    Bit c not settable
- 38**    Bit 6 provisioned for use as RPSFI
- 3C**    Bits 3 through 8 are provisioned for Transmic 1G
- 3D**    Alarm bits cannot be passed through or inverted
- 46**    NPC Failed or Out of Service
- B0**    Combination of bit g (b7) and h (b8) is invalid
- F1**    Parameter only valid with PA, PB, or PC type NPCs
- F2**    Invalid NPC number specified
- FF**    Termination is in process of being rolled
- 8E**    For RPSFI, TS0 bit 6 must be provisioned as 1
- 2C**    not allowed for clear 2MB
- 2E**    bit value not allowed for NPC type

## **CHG,NPC,TS0M**

### **CHANGE TIME SLOT ZERO MONITOR**

#### **Explanation Of Command**

This command is used to change the Network Processing Circuit provisioning either to monitor or to stop monitoring the National and International bits in CTS 0 without removing the NPC from service. The provisioning may be specified for one NPC or for a range of NPCs. Note that the NPC numbers which are divisible by four with remainder zero, are not a valid Hybrid DS3 Unit THxyz type NPCs. However, the range of THxyz type NPC numbers is still supported with the understanding that there may be gaps in the NPC number range.

## Explanation Of Parameters

**[s]abc** - The 3- or 4-digit beginning NPC number  
The values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>1321-1352</b> | <b>1481-1512</b> | <b>1641-1672</b> | <b>1801-1832</b> |
| <b>1361-1392</b> | <b>1521-1552</b> | <b>1681-1712</b> | <b>1841-1872</b> |
| <b>1401-1432</b> | <b>1561-1592</b> | <b>1721-1752</b> | <b>1881-1912</b> |

| Unit<br>13 | Unit<br>14 | Unit<br>15 | Unit<br>16 |
|------------|------------|------------|------------|
| NPC        | NPC        | NPC        | NPC        |
| 1921-1952  | 2081-2112  | 2241-2272  | 2401-2432  |
| 1961-1992  | 2121-2152  | 2281-2312  | 2441-2472  |
| 2001-2032  | 2161-2192  | 2321-2352  | 2481-2512  |
| 2041-2072  | 2201-2232  | 2361-2392  | 2521-2552  |

**[t]def** - The 3- or 4-digit ending NPC number  
The valid values are identical to those for [s]abc

**uvmnp** - Beginning NPC number

**wxkqr** - Ending NPC number

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

#### **abcdefgh**

- Time slot 0 monitor bits

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW  
if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

Valid values for bits **a** through **h** are described below:

| <i>Bit<br/>value</i> | <i>Explanation</i>                                                           |
|----------------------|------------------------------------------------------------------------------|
| <b>0</b>             | Do not monitor and therefore do not send a message if this bit changes state |
| <b>1</b>             | Monitor and therefore send a message if this bit changes state               |
| -                    | Leave the setting of the monitor mask for that bit unchanged                 |

**[v]ghi** - The 3- or 4-digit nonhierarchical NPC number ([s]abc through [u]jkl)

**[u]jkl** - The 3- or 4-digit nonhierarchical NPC number ([s]ghi through [t]def)

**edhfg** - Hierarchical NPC number (uvmnp through opjst)

**opjst** - Hierarchical NPC number (edhfg through wxkqr)

**OLDM** - Old value of TS0M bits

**NEWM** - New value of TS0M bits

**TS0MBOFL**  
- TS0M buffer overflow keyword

**v** - TS0M buffer overflow condition indicator

|   |                                              |
|---|----------------------------------------------|
| 0 | NPC is not in TS0M buffer overflow condition |
| 1 | NPC is in TS0M buffer overflow condition     |

**cc** - Hexadecimal condition code

| <b>cc</b> | <i>Explanation</i>                 |
|-----------|------------------------------------|
| <b>10</b> | Unit is not equipped               |
| <b>11</b> | UC is out of service               |
| <b>12</b> | UC is in service but failed        |
| <b>13</b> | FTMI is not equipped               |
| <b>14</b> | FTMI is out of service             |
| <b>15</b> | NPC is unequipped                  |
| <b>24</b> | Unit type error                    |
| <b>32</b> | Bit 3 provisioned for use as RA13  |
| <b>33</b> | Bit 4 provisioned for use as RA1S  |
| <b>38</b> | Bit 6 provisioned for use as RPSFI |
| <b>3A</b> | Bit 4 provisioned for use as RBER  |
| <b>3B</b> | Bit 5 provisioned for use as SFI   |

**cc**    *Explanation*

- 3C**    Bits 3 through 8 are provisioned for Transmic 1G
- EF**    Software does not contain Enhanced CEPT feature
- F1**    Parameter only valid with PA, PB, or PC type NPCs
- F2**    Invalid NPC number specified
- FF**    Termination is in process of being rolled

## **CHG,NPC,TYPE,IW,X**

### **CHANGE NPC TYPE**

#### **Explanation Of Command**

This command is used to change the type and, optionally, the insertion word of a specified network processing Circuit (NPC) equipped in a facility terminating unit (IFTU2/IFTU/FTU). The insertion word field is used to change the NPC's disconnect code (DCC). These changes may be made without disconnecting and reconnecting the provisioned circuits, but the NPC must be out of service when this command is executed.

For PA, PB, and PC type NPCs the y value of the type field may not be changed, because a change in the y value may change the channel numbering for cross-connections that are already provisioned.

The NPC must be out of service to change the facility provisioning. It can be taken out of service using the **RMV** command. Changes to the parameters will take effect when the NPC is restored (**RST**) to service. When the NPC facility provisioning is changed, all programmable alarm thresholds revert to their default values. These default thresholds are defined in the **GRTH: :NPC, TYPE** message. If values other than the defaults are desired, a separate **CHG: :NPC, OPTS** command must be given for each value.

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number in unit uv  
**np** - NPC number in module m

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**OLD** - Old

**TYPE** - Type

**mnxyz** - NPC type

*mnxyz* Type

PAxyz CEPT NPC (120-ohm twisted pair or 75-ohm coaxial)  
PBxyz CEPT NPC (120-ohm twisted pair)  
PCxyz CEPT NPC (75-ohm coaxial)

**ttuvw** - Previous value of mnxyz

**PA-Type xyz fields**

The provisioning values of x, y, and z for the PA type are shown in the following tables (a 'Y'

in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (x, y or z) provisioning value):

**Table 8-16. Provisioning values for x**

| x value | CRC-4 Mode | Automatic CRC-4 | Far-End PM | NPC used as Sync Source | TS0 Bit 5 used for SFI |
|---------|------------|-----------------|------------|-------------------------|------------------------|
| 0       | Y          |                 |            |                         |                        |
| 1       | Y          |                 | Y          |                         | Y                      |
| 2       | Y          |                 |            |                         | Y                      |
| 3       | Y          |                 | Y          |                         |                        |
| 4       | Y          |                 |            | Y                       |                        |
| 5       | Y          |                 | Y          | Y                       | Y                      |
| 6       | Y          |                 |            | Y                       | Y                      |
| 7       | Y          |                 | Y          | Y                       |                        |
| 8       |            | Y               | Y          |                         |                        |
| 9       |            | Y               | Y          |                         | Y                      |
| A       |            |                 |            |                         | Y                      |
| B       |            |                 |            |                         |                        |
| C       |            | Y               | Y          | Y                       |                        |
| D       |            | Y               | Y          | Y                       | Y                      |
| E       |            |                 |            | Y                       | Y                      |
| F       |            |                 |            | Y                       |                        |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled (x values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected (x values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 8-17. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected ( $y$  value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected ( $y$  values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For  $y$  values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering ( $y=8$ ) or Timeslot Channel Numbering ( $y=9$ ) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface ( $y=C$ ) or as an unframed clear 2Mbit/s interface ( $y=D$ ). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 8-18. Provisioning values for  $z$**

| $z$<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|--------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|              | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0            | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1            |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2            | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3            |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4            | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5            |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6            | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7            |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8            | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9            |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A            | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B            |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C            | Y           |    |              |       |       |               |      |               |       |         |         |
| D            | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. **z** value **F** and **E** are unassigned (i.e. not valid).
2. **z** value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )
3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for  $z = 4$  and 8) or 480 ms (for  $z = 5$  and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8.  $z$  values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options ( $z = 6-7$  or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

$z=6$  or A hardware timing

$z=7$  or B firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for  $z=6$  or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

- [vii] RBER unalarmed
- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

- [ix] To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 8-19. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations                                                               | Explanation                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz<br>9Cz<br>CCz<br>DCz                                                                       | Framed clear 2Mbit/s ( $y$ value C) is valid for all $x$ options except those invoking automatic CRC-4 interworking. The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 0Dz<br>1Dz<br>2Dz<br>3Dz<br>4Dz<br>5Dz<br>6Dz<br>7Dz<br>8Dz<br>9Dz<br>ADz<br>CDz<br>DDz<br>EDz | Unframed clear 2Mbit/s ( $y$ value D) is only valid for $x$ values B and F. These are the only $x$ options which do not require decoding of TS0 content.                                                                        |

**Table Notes:**

1. If framed clear 2Mbit/s is selected with Far-End PM enabled  $z$  values 1, 3, 5 and 7) only the receive side of the feature shall be turned on. No outgoing E-bits may be transmitted during clear signal operation.

2. If framed clear 2Mbit/s is selected with Synchronization Failure Indication (SFI) enables (x values 1, 2, 5, 6, A and E) only the receive side of the feature shall be turned on. No outgoing SFI may be transmitted in Bit 5 during clear signal operation.

**Table 8-20. Combinations of y and z Values**

| Invalid<br>xyz<br>Combinations                                                                               | Explanation                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xC1<br>xC3<br>xC5<br>xC7<br>xC8<br>xC9<br>xCB<br>xCC<br>XD1<br>xD3<br>xD5<br>xD7<br>xD8<br>xD9<br>xDB<br>xDC | Clear 2Mbit/s (y value C or D) cannot be used with Firmware controlled Consequent Action (z values 1, 3, 5, 7, 9 or B), TRANSMIC 1G (z value C) or TRANSMIC 2G (z value 8).                      |
| xD4<br>xD6                                                                                                   | Unframed clear 2Mbit/s (y value D) cannot be used with z value 4 (NFW Bit 4 used for RAIS) or with z value 6 (NFW Bit 4 used for RBER) because unframed clear signals cannot obtain TS0 framing. |
| x0C<br>x2C<br>x4C<br>x6C                                                                                     | Channel Associated Signaling (y values 0, 2, 4 and 6) is not valid for TRANSMIC 1G (z value C).                                                                                                  |

**Table Notes:**

1. If framed clear 2Mbit/s (y value C) is selected with z value 4 (NFW Bit 4 used for RAIS) only the receive side of this function will be enabled. Outgoing RAIS indicators cannot be transmitted during clear signal operation.
2. If framed clear 2Mbit/s (y value C) is selected with z= value 6 (NFW Bit 4 used for RBER) only the receive side of this function will be enabled. Outgoing RBER indicators cannot be transmitted during clear signal operation.

|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl'].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway cross-connection* the insertion word always defaults to AIS.

mxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When  $c=0$ , the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When  $c=1$  if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option  $c=0$  is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the **jkl** options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared.\*

$c=0$      **Both** remote and local alarms are declared and cleared in 144 ms.

$c=1$      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when**  $jkl=011$  or  $jkl=101$ . **For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option  $c=0$  and 480 ms when option  $c=1$ .

[g] Option *g* has meaning only if the NPC is provisioned for CAS; that is, option  $d=1$ , otherwise it is ignored. If option  $g=0$  is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option  $g=1$  is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and  $h=1$ , is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option *h* was selected as either 0 or 1, unless it is later set to 0 by setting parameter  $e=0$  in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

output. For all other combinations of *xyz* the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option *h*=1.

If both *b*=1 and *h*=1 and the NPC (used as synchronization source) receives NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] minor bit error rate and signaling freeze delay time features:

jkl=011 or jkl=101

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

c=0 hardware timing

c=1 firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

**IW** - Insertion word

**pq** - Insertion word value (hexadecimal)

Hexadecimal value of the growth insertion word (GIW). Specifies the insertion word sent in the transmit direction on unassigned channels. If this value is not specified, it remains unchanged from its previous value.

An eight-bit code, called the growth insertion word, is transmitted by this NPC on unassigned 64kb/s channels. This code is specified by the optional keyword IW and its argument pq. This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the cross-connect insertion word, which is transmitted when the disconnect message with DDC specified is used.

D5 Unassigned Channel Code (UAC). Default value.

**rs** - Previous value of pq

**r** - Transmitted signaling information

**r** is the portion of TS16 used for signaling when provisioned for CAS (four signaling bits in the associated CAS time slot 16 signaling). If **r** is not specified, it will remain unchanged.

*r Explanation*

D Unassigned channel code (UAC). Default value.

**t** - Previous value of r

**COND** - Condition

**cc** - Hexadecimal condition code

*cc Explanation*

**02** Subject entity is not equipped

**03** Subject entity is in service

**10** Unit is not equipped

**11** UC is out of service

**12** UC is in service but failed

**13** FTMI is not equipped

**14** FTMI is out of service

**1F** FTMI is in service but failed

**20** Option rr/m has not been set up on 2nd database

**21** Minor >= major for SLIP opt

**26** NPC type error

**29** IW is UMUX (18) but NPC not type DE4yz

**2A** DMI combined with T1DM

**2B** MajMin BER threshold is 7, but not in T1DM or Fe mode

**cc**    *Explanation*

- 34**    NPC type option xyz is unassigned
- 35**    NPC has active circuit
- 86**    NPC is NPCTG and chan 24 is used in a TG;Can't change to T1DM or DMI
- 19**    Test ports must be on CAS
- 3D**    Alarm bits cannot be passed through or inverted
- 42**    Change not valid
- 4E**    IW option is not allowed for new type of Clear-DS1 NPC
- 4F**    BER must not be less than 4 for Clear DS1
- 5C**    NPC providing timing to inservice SSP
- 83**    Option not programmable for this NPC type
- 8A**    x & z parameters on DSxyz are inconsistent
- 8F**    NPC not deleted
- BB**    Timeslot channel numbering not allowed with CAS
- C9**    In-service NPC change not allowed
- CD**    NPC not designated as sync timing source
- F2**    Invalid NPC number specified
- FE**    Change to non-ESF digroup with 16-state cross-connect
- FF**    Change to T1DM digroup with cross-connect that is not TRSP
- 05**    This NPC type does not allow unframed Clear-DS1
- 87**    NPC as 12th test port can not change to DMI nor T1DM
- 8D**    RPSFI condition is active
- 8E**    For RPSFI, TS0 bit 6 must be provisioned as 1
- 8F**    For RPSFI, TS0 bit 6 cannot be monitored
- AA**    NPC is NPCTG, changing to CAS/NSA is not allowed
- 36**    INCL keyword needed when restricted Insertion Word specified
- 7E**    Framed/Unframed clear 2Mbit/s NPC invalid for Automatic CRC-4
- 7F**    Unframed clear 2Mbit/s NPC invalid for TS0 processing
- 80**    Framed/Unframed clear 2Mbit/s NPC invalid for Transmic 1G, 2G
- 81**    Framed/Unframed clear 2Mbit/s NPC invalid for Firmware Timing
- 82**    Unframed clear 2Mbit/s NPC invalid for Bit 4 used as RA IS/RBER
- 85**    IW not allowed to be specified in Clear 2Mbit/s

## **CHG,NPC,TYPE,IW,X,INCL**

### **CHANGE DS3U NPC TYPE**

#### **Explanation Of Command**

For DACS II DS3 Units (DS3U) or Hybrid DS3 Units (HDS3U), this command changes a single or range of TE or TA type (DS3U Only) Network Processing Circuits (NPCs) to the newly specified type without disconnecting and reconnecting provisioned circuits. The NPCs must be out of service.

The "mn" field, as well as the "xyz" field, of the NPC type parameter ("mnxyz") can be changed by this command. This feature is used to change between the different types (TE and TA) of NPCs supported by the DS3 or Hybrid DS3 Unit line termination circuit packs.

A range is allowed for the NPCs within one DS3 or Hybrid DS3 Unit. The optional insertion word field is used to change the disconnect code (DCC).

The new parameters will take effect when the NPC is restored to service. When the NPC **TYPE** parameters are changed, all programmable alarm thresholds revert to the default values. If values other than defaults are desired, a separate **CHG** command must be given for each value. There will be one output completion message for each NPC in the range.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

Use the optional insertion word (IW X'pq) field to change the unassigned channel code.

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC Number

**[t]def** - The 3- or 4-digit nonhierarchical NPC number denoting the end of a range specification.

**uvmnp** - Hierarchical NPC number

**uvkqr** - Hierarchical NPC number denoting the end of a range specification

**uvghi** - Hierarchical NPC number within the range of uvmnp and uvkqr

**uvjyl** - Hierarchical NPC number of the first NPC of the denied range

**uvmno** - Hierarchical NPC number of the last NPC of the denied range

**uv** - Unit number

**m, k, j, m, g**

- Module number

**np, qr, yl, no, hi**

- NPC number within the module

**mnxyz** - NPC-type identifier

**TYPE** - Type

*mnxyz Explanation*

TExyz DS3U or HDS3U Enhanced NPC

TAxyz DS3U ANSI NPC

**IW** - Insertion Word

**pq** - Hexadecimal value of the growth insertion word (GIW). Specifies the insertion word in the transmit direction on unassigned channels.

An eight-bit code, called the growth insertion word, is transmitted by this NPC on unassigned DS0 channels. This code is specified by the optional keyword IW and its argument pq. This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the cross-connect insertion word, which is transmitted when the disconnect message with the DDC specified is used.

Although any 2-digit hexadecimal code may be used (see INCL below), the default GIWs are:

| <i>pq</i> | <i>Explanation</i>                                                                                                                                                                                                                    |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7F        | Unassigned Channel Code (UAC), the default value for TE/TA type NPCs provisioned with D4 or ESF framing.                                                                                                                              |
| 18        | Unassigned Multiplex Code (UMC), the default value for TE/TA type NPCs provisioned with T1DM framing. This value should only be provisioned with T1DM framing (DA4yz or TA4yz). The change command does not enforce this restriction. |

**INCL** - Inclusive

As a protection to users, this keyword must be added to provision an NPC with D4 framing and an Insertion Word with bit 2 equal to zero. NPCs grown in the D4 format (TE1yz/TA1yz) transmit a DS1 yellow alarm by setting bit 2 to zero in all 24 DS0 channels. If the Insertion Word "pq" is unknowingly provisioned in this manner, the NPC will transmit a D4 yellow alarm signal when it is restored. The D4 yellow alarm is generated by any Insertion Word with the binary value a0cdefgh, where the letters a-h define the eight bits of the binary word. The D4 yellow alarm is not generated by an Insertion Word with a binary value a1cdefgh.

For Clear-DS1 NPCs, the insertion word option is **NOT** available and the message will be denied if this option is entered. The alarm indication signal (AIS) is transmitted in the disconnect or idle state.

**[s]ghi,**

- The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def

**[s]jkl**

- The 3- or 4-digit nonhierarchical NPC number of the first NPC of a range that is being denied ( $abc \leq jkl \leq mno$ )

**[t]mno** - The 3- or 4-digit nonhierarchical NPC number of the last NPC of a range that is being denied ( $jkl \leq mno \leq def$ )

**ttuvw** - Previous value of mnxyz

**rs** - Previous value of pq

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 02** Subject entity is not equipped
- 03** Subject entity is in service
- 10** Unit is not equipped
- 11** UC is out of service
- 12** UC is in service but failed
- 24** Unit type error
- 26** NPC type error
- 29** IW is UMUX (18) but NPC not type DE4yz
- 2A** DMI combined with T1DM
- 34** NPC type option xyz is unassigned
- 35** NPC has active circuit
- 01** Invalid range for specified NPC type
- 11** NPC not equipped
- 4E** IW option is not allowed for new type of Clear-DS1 NPC
- F6** T1DM or DMI mode and channel 24 is connected
- FD** NPC range crosses unit boundary
- 05** This NPC type does not allow unframed Clear-DS1
- 87** NPC as 12th test port can not change to DMI nor T1DM
- 07** Mismatch between MXR and NPC types
- 36** INCL keyword needed when restricted Insertion Word specified

## **CHG,PASSWD,OLD,NEW**

### **CHANGE USER PASSWORD**

#### **Explanation Of Command**

This message requests a change of a previously created password by any user of DACS II.

For an X.25 link, <old pswd>:<new pswd> option must be used. DACS II will not prompt the user for old and new password.

For a SCCSAI (Snider) link, <old pswd>:<new pswd> option cannot be used.

For a Snider link, DACS II will prompt the user for the old and new password. Neither new nor old password characters will be echoed by DACS II.

Output from this command is sent only to the link on which the command was input.

### **Command**

---

[I.38301]

**CHG:FRM xy,SEQ ww:PASSWD[,OLD <old password>, \**  
**NEW <new password>]!**

If the user is on a Snider protocol administrative link, the message is entered as follows:

[I.38301]

**CHG:FRM xy,SEQ ww:PASSWD!**

Then DACS II will prompt the user for the old and new password:

**OLD PASSWD: (user enters the old password)**  
**NEW PASSWD: (user enters the new password)**  
**PASSWD: (user re-enters the new password for verification)**

**FTMI** FTMI autonomously removed  
**DSPI** DSPI autonomously removed  
**FTUC** FTU UC autonomously removed  
**CCB** CCB autonomously removed  
**DSPUC** DSP UC autonomously removed  
**SDT** System date and time not set  
**DSPC** DSP NPC autonomously removed  
**ALL** All Shelf Alarms

**PMACR** - CRITICAL alarm severity

**PMAMJ** - MAJOR alarm severity

**DMAMN** - MINOR alarm severity

**MI** - MESSAGE INFORMATION alarm severity

**RESET** - Reset Alarm Severity to default value

**cc** - Hexadecimal condition code

*cc Explanation*

**F7** Alarm Severity Feature (already) OFF  
**FA** Alarm Severity of Shelf Alarm not changed  
**FB** Shelf escalation less than source severity

## **CHG,SETOP,TYPE,ALL,NPCOP**

### **CHANGE/SET OPTIONS**

#### **Explanation Of Command**

This message initializes or changes the DACS II threshold data base, which contains the programmable set of selectable alarm thresholds for facility performance parameters accumulated by DACS II NPCs.

This command will be denied if an attempt is made to set the minor threshold greater than or equal to the major threshold of any parameter specified on *any* NPC currently in the frame.

Threshold values are entered in free format (1 to 9 digits) separated by commas. Enter a hyphen (-) for values that are *not* to be changed.

Following DACS II installation, the user-programmable (non-default) values are empty until this **CHG::SETOP** command initializes them. A user-programmable threshold value must first be initialized by this message before it can be used as an argument to the **OPTS** keyword of the **GRTH::NPC** (Message I.31352), **CHG::NPC,OPTS** (Message I.38221), and **CHG::NPC** message.

**SETOP rr** designates the parameter to be changed.

**NPCOP(set1,set2,set3)** are the user-programmable threshold values for the designated parameter.

If **ALL** is specified, the given thresholds will be written to the threshold data base for all types of NPCs for which the associated parameter is valid.

**Note:** This command will not reboot the NPC hardware. Therefore, if any NPCs are in service, use the **UTL::BOOT,FRAME** command (Message I.58001) to avoid any possible inconsistency. **Note:** This command will not reboot the NPC hardware. Therefore, if any NPCs are in service, use the **STA-LOCL-RST** command (Message I.58001) to avoid any

possible inconsistency.

## Explanation Of Parameters

**SETOP** - Set option

**OPT** - Option

**rr** - Facility performance parameter number

Variable *rr* specifies the parameter whose alarm threshold is being set or changed. The parameters and their corresponding *rr* values are given in the table below.

The Major and Minor *Slip* threshold crossing alarms can be disabled by programming a value of zero for the Slip Major and Slip Minor thresholds, respectively.

To use this feature, the Slip Major threshold must be disabled before the Slip Minor threshold. This command will be denied if an attempt is made to disable the Minor Slip threshold (by setting its value to zero) before disabling the Major Slip threshold on *any* in-service NPC on the frame.

### For PB and PC type NPCs:

| <b>rr</b> | Parameter                          | Threshold<br>Value<br>Range | Default<br>Threshold<br>Value |
|-----------|------------------------------------|-----------------------------|-------------------------------|
| <b>31</b> | Degraded Minutes, 1 hour           | 1-60                        | 60                            |
| <b>32</b> | Degraded Minutes, 24 hours         | 1-1440                      | 1440                          |
| <b>33</b> | Severely Errored Seconds, 15 mins  | 1-900                       | 900                           |
| <b>34</b> | Severely Errored Seconds, 24 hours | 1-65535                     | 65535                         |
| <b>35</b> | Errored Seconds, 15 minutes        | 1-900                       | 900                           |
| <b>36</b> | Errored Seconds, 24 hours          | 1-65535                     | 65535                         |
| <b>37</b> | Unavailable Seconds, 15 minutes    | 1-900                       | 900                           |
| <b>38</b> | Unavailable Seconds, 24 hours      | 1-65535                     | 65535                         |
| <b>39</b> | Slips, 15 minutes                  | 1-900                       | 900                           |
| <b>40</b> | Slips, 24 hours                    | 1-65535                     | 65535                         |

**Note 1:** 24-hour thresholds must be greater than their respective 15-minute or 1-hour threshold.

**For PA type NPCs:**

**Table 8-23. Parameter Register Threshold Range and Default Values**

| rr | Parameter                        | Interval | Threshold Value Range | Default Threshold Value |

**TYPE** - Type

Type of NPC for which the options are being set. Note that not all parameter threshold options apply to all NPC types.

**mn** - NPC Type prefix

| <b>mn</b> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|           |                                                        |
|-----------|--------------------------------------------------------|
| <b>PA</b> | CEPT NPC type (120-ohm twisted pair or 75-ohm coaxial) |
|-----------|--------------------------------------------------------|

|           |                                      |
|-----------|--------------------------------------|
| <b>PB</b> | CEPT NPC type (120-ohm twisted pair) |
|-----------|--------------------------------------|

|           |                                |
|-----------|--------------------------------|
| <b>PC</b> | CEPT NPC type (75-ohm coaxial) |
|-----------|--------------------------------|

|           |                     |
|-----------|---------------------|
| <b>TH</b> | HDS3U CEPT NPC type |
|-----------|---------------------|

**ALL** - All

All NPC types. If specified, the given thresholds will be written into the secondary data base for all types of NPCs for which the associated parameter is valid.

**set1** - Threshold setting 1 (m=1) for given parameter rr

**set2** - Threshold setting 2 (m=2) for given parameter rr

**set3** - Threshold setting 3 (m=3) for given parameter rr

Thresholds are entered in free format (1 to 9 digits) separated by commas. Enter a "-" (hyphen) for values that are not to be changed.

DACS II provides a set of default threshold values and alarm levels (<m>=0,1,2,d) for each NPC type. Only the default threshold value for each parameter exists in the DACS II database prior to user programming using the CHG::SETOP command. Before any non-default threshold value (m=3 to b) can be provisioned to be used by an NPC for performance monitoring, it must be entered in the DACS II database using this command. Otherwise, an error message will occur. When this command is executed, all threshold values in the DACS II frame are changed, including the ones previously set or in use. Performance monitoring thresholds are provisioned for NPCs using the "rr/<m>" argument of the GRTH::NPC or CHG::NPC command.

The default values are accessed using threshold setting 0 (<m>=0,1,2,d). Threshold settings 1 (<m>=3,4,5,e), 2 (<m>=6,7,8,f), and 3 (<m>=9,a,b,10) are user-programmable. That is, set1, set2, and set3 do not have default values; they must be programmed by the user before they can be used.

**ttttt[tttt]**

- Default threshold value for option rr

**aaaaa[aaaa]**

- Old set1 threshold value

**bbbbbb[bbbb]**

- Old set2 threshold value

**cccccc[cccc]**

- Old set3 threshold value

**pname** - Parameter name

| <i>pname</i>  | <i>Explanation</i>                           |

**xxxxx[xxxx]**  
- New set1 threshold value  
**yyyyy[yyyy]**  
- New set2 threshold value  
**zzzzz[zzzz]**  
- New set3 threshold value

**Note:** If the "TYPE mn" option is used in the input command to change the thresholds for a single NPC type and a hyphen is entered for at least one of the thresholds to preserve its value, the output response will show that the respective new threshold values are unchanged by outputting the same value for the new threshold that is output for the old threshold.

If the "ALL" types option is used in the input command to change the thresholds for all NPC types and a hyphen is entered for at least one set of thresholds to preserve their values, the output response will show that the respective threshold values are unchanged by outputting "----[----]" (a dash) for the new threshold value and the respective unchanged values in the old threshold fields for each NPC type.

**NPC** - Network processing circuit  
**[s]abc** - The 3- or 4-digit nonhierarchical NPC number of problematic NPC

If NPC numbers are expressed in three digits, the valid values are:

**uvmnp** - Hierarchical number of problematic NPC

The valid NPC numbers are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**COND** - Condition

**cc** - Hexadecimal condition code

**cc**    *Explanation*

- 21**    Minor  $\geq$  major for SLIP opt
- 22**    Minor  $\leq$  major for BER opt
- 23**    Minor  $\geq$  major for COFA opt
- 2B**    Maj|Min BER threshold is 7, but not in T1DM or Fe mode
- 14**    1 hr  $\geq$  24 hr for DM opt
- 15**    15 min  $\geq$  24 hr for SERS opt
- 16**    15 min  $\geq$  24 hr for ERS opt
- 17**    15 min  $\geq$  24 hr for US opt
- 18**    15 min  $\geq$  24 hr for SLIP opt
- 4F**    BER must not be less than 4 for Clear DS1
- 83**    Option not programmable for this NPC type
- FE**    Change to non-ESF digroup with 16-state cross-connect
- FF**    Change to T1DM digroup with cross-connect that is not TRSP
- 0A**    Minor Slip threshold disabled before Major Slip threshold
- 32**    Threshold value is out of range

## **CHG,SWCH,TOX,INCL**

### **CHANGE CIRCUIT PARAMETERS**

#### **Explanation Of Command**

This message switches return paths to the digroups and ranges beginning with the initial channels given in the TO end argument list.

This message requests a change in a broadcast multipoint circuit, switching the full tributary circuit leg (one that can both receive and transmit to the multipoint source) to another leg. Up to eight multipoint circuits can be changed with this command. Arguments [s]abcddd, [t]ghi-fff, and [u]klm-nnn etc., represent TO terminations Arguments [s]abcddd, [t]ghifff, and [u]klmnnn etc., represent TO terminations from different broadcast circuits (allowing multiple switches to be performed with a single message). That is, these arguments specify the new full tributaries in up to eight different broadcast circuits.

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number  
**jjj** - TO channel number  
**nnn** - TO channel number

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**INCL** - Inclusive

To change a circuit or range of circuits including one or more circuits previously marked as a Red Circuit or under Customer Control, use the INCL (inclusive) option. If this option is not used, the message will be denied if any circuits in the range are red circuits or customer controlled.

**SWCH** - Switch

**TOX** - TO Tributaries

**[t]wxyz**

- Nonhierarchical number of circuit leg on which problem occurred.

**opjstzzz**

- Hierarchical number of circuit leg on which problem occurred.

**BCAST** - Broadcast

Denial specific to a broadcast conference.

**CUS** - Customer

NPC is a customer-controlled circuit

**RDC** - Red circuit

NPC is a Red circuit

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 01** Invalid range for specified NPC type
- 03** No RDC or CUS circuits and INCL keyword used
- 04** No NPC's out of service and OOS keyword used
- 10** NPC out of service or failed
- 11** NPC not equipped
- 12** Active CCN side not IS or failed or pested or hardware OOS
- 13** UNIT not equipped, not in service, or failed
- 14** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS
- 15** FTMI not equipped, not in service, or failed
- 16** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS
- 17** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS
- 32** Termination is under test
- 33** Termination is a test port
- 34** Termination is under customer control (CUS)
- 35** Termination is protected (RDC)
- 53** TO side of two-way to be converted is not an FTU NPC
- 5B** TO is not a leg of this/any conference
- 5D** TO is the backbone leg of a conference
- 5F** Conference is NTR: has no switchable return leg
- 60** Conference is LPD: has no switchable return leg
- 61** TO is already the return leg
- D3** Corresponding NPC for FROM virtual channel is not provisioned
- D4** Corresponding NPC for TO virtual channel is not provisioned
- D6** Invalid FROM channel number
- D7** Invalid TO channel number
- D9** Invalid FROM channel number range
- DA** Invalid TO channel number range
- EC** Invalid channel 000 cross-connection specified
- ED** Invalid channel 031 cross-connection specified

## **CHG,SWCH,TOX,INCL**

### **CHANGE SWITCH, TOX**

#### **Explanation Of Command**

This message changes a non-channelized digital signal broadcast circuit by switching a specified tributary network processing circuit (NPC) to be the full tributary NPC. Up to eight broadcast circuits can be changed by specifying the respective full tributary NPCs, all of which are non-channelized NPCs currently part of different broadcast circuits and may belong to different Units.

## **CHG,SYNC,TLI,SSP,TYPE,NPC,SRC**

### **CHANGE PRIORITIES AND/OR TYPE, SYNCHRONIZER OR NPC**

#### **Explanation Of Command**

This command changes priorities and network processing circuit (NPC) or type parameters of timing extractor type TLIs/SSPs that have been equipped. One of the following three fields must be given: type/synchronizer sync port, the NPC/SSP, or the source for priority (SRC). Only one type may be changed at a time; the output message will show both types after the change command is completed, if both are equipped, or it will show a "-" for unequipped SSPs.

Only the type and priority data bases are affected by this command. The SSP must be out of service for the command to complete. The RST::SYNC,TLI,[SSP]! command must be given to implement the changes for both side 0 and 1.

If the SSP-type is given, you must specify the timing link Interface (TLI-n), SSP-b, and the type.

The NPC parameter (valid only with a TU-type sync) indicates that the specified TLI is receiving its synchronizing signal from the given NPC location. The system allows only one of eight NPC locations per TLI SSP.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**TLI** - Timing link interface

**m** - Timing link interface number (1 through 4)

**SSP** - Synchronizer sync port

**b** - SSP side (0 or 1)

**TYPE** - Type

**texyz** - Timing Extractor or Timing Distributor type

The output message shows the type of SSP for both SSPs on the TLI card  
If one SSP is not equipped, a "-" will appear for the unequipped SSP.

**testu** - The TLI type of the other SSP on the same TLI. If not equipped, this parameter will be output as "-----".

| <i>te</i> | <i>Explanation</i>                      |
|-----------|-----------------------------------------|
| TC        | Composite Clock Timing Extractor        |
| TE        | DS1 Timing Extractor                    |
| TP        | Primary Block Timing Extractor          |
| TR        | Basic System Reference Frequency (BSRF) |
| TU        | Unipolar Clock Timing Extractor         |
| TD        | Timing Distributor                      |

TD-type TLI xyz fields

| <b>1</b> | Composite Clock Timing Distribution      |
| <b>2</b> | Sinusoidal 2.048 MHz Timing Distribution |

**y** - Unassigned

**z** - Unassigned

TP-type TLI xyz fields

**x** - Frame format

**x**      *Explanation*

**1,5**    Common Channel Signaling

**2,6**    Channel Associated Signaling - Mode 0

**3,7**    Channel Associated Signaling - Mode 1

**4,8**    European Remote Switching Module

**0,9**    Invalid

**y** - Line format

**y**      *Explanation*

**0,2**    Alternate Mark Inversion (Bipolar)

**1,3**    High Density Bipolar (HDB3)

**4-9**    Invalid

**z** - Channel format

**z**      *Explanation*

**0-9**    Unassigned

TC, TR, and TU-type TLI xyz fields

**x** - Frame format

**y** - Line format

**z** - Channel format

Values for x, y, and z are unassigned.

**SRC** - Source

- i** - TLI slot number (1 through 4)
- a** - TLI i SSP 0 priority (1 through 8)
- b** - TLI i SSP 1 priority (1 through 8)
- j** - TLI slot number (1 through 4)
- c** - TLI j SSP 0 priority (1 through 8)
- d** - TLI j SSP 1 priority (1 through 8)
- k** - TLI slot number (1 through 4)
- e** - TLI k SSP 0 priority (1 through 8)
- f** - TLI k SSP 1 priority (1 through 8)
- l** - TLI slot number (1 through 4)
- g** - TLI l SSP 0 priority (1 through 8)
- h** - TLI l SSP 1 priority (1 through 8)

**COND** - Condition

**NPC** - Network processing circuit

**[0]abc** - The 3- or 4-digit nonhierarchical NPC number

The valid NPC numbers are:

If NPC numbers are expressed in three digits, the valid values are:

PB and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1  | Unit<br>2  |
|------------|------------|
| <b>NPC</b> | <b>NPC</b> |
| <b>030</b> | <b>190</b> |
| <b>032</b> | <b>192</b> |
| <b>070</b> | <b>230</b> |
| <b>072</b> | <b>232</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1   | Unit<br>2   |
|-------------|-------------|
| <b>NPC</b>  | <b>NPC</b>  |
| <b>0030</b> | <b>0190</b> |
| <b>0032</b> | <b>0192</b> |
| <b>0070</b> | <b>0230</b> |
| <b>0072</b> | <b>0232</b> |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid NPC numbers are:

PB and PC NPC numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit          | Module      | NPC           |
|---------------|-------------|---------------|
| <b>01, 02</b> | <b>1, 2</b> | <b>30, 32</b> |

The NPC keyword and its associated parameter are only specified in conjunction with the TLI and SSP keywords for TLI type TUxyz.

The NPC option allows the DACS II system to correlate a synchronizing source failure to either an NPC failure or an NPC input signal failure.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**02** Subject entity is not equipped  
**16** SYNC TB is not equipped  
**B3** X option is illegal  
**B4** Y option is illegal  
**C2** SSP type(options) same  
**C3** Wrong SSP type(Timing Extractor type)  
**C4** Sync architecture different  
**C5** Some priority values required  
**C6** Some priority values not required  
**C7** Priority values are same  
**C8** Sync pack denied command  
**CA** New NPC same as existing one  
**CB** NPC parameter only valid with TU type TLI  
**CC** NPC is still provisioned to provide sync timing  
**CD** NPC not designated as sync timing source  
**CE** NPC already allocated as sync timing source  
**CF** NPC already grown as non-synchronization source  
**F1** Parameter only valid with PA, PB, or PC type NPCs  
**01** Assignment of single priority to multiple SSPs  
**E4** NPC already has Equipment Loopback

## **CHG,TYPE,OPTS,THMODE**

### **CHANGE TYPE, OPTIONS**

#### **Explanation Of Command**

This command changes the threshold values for facility performance parameters on all NPCs of a particular type. The threshold values may be changed without disconnecting and reconnecting provisioned circuits.

One or more alarm or information threshold values may be set for all NPCs to a value previously stored in the DACS II threshold data base.

The values stored in the DACS II threshold data base are selected with the indices (**rr/n**).

|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the **jkl** options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when** *jkl=011* or *jkl=101*. **For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option *g* has meaning only if the NPC is provisioned for CAS; that is, option *d=1*, otherwise it is ignored. If option *g=0* is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option *g=1* is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and *h=1*, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option *h* was selected as either 0 or 1, unless it is later set to 0 by setting parameter *e=0* in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of *xyz* the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option *h=1*.

If both *b=1* and *h=1* and the NPC (used as synchronization source) receives

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] **minor bit error rate and signaling freeze delay time features:**

**jkl=011 or jkl=101**

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

**c=0** hardware timing

**c=1** firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**jkl=011**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

**PA-Type xyz fields**

The provisioning values of *x*, *y*, and *z* for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (*x*, *y* or *z*) provisioning value):

**Table 8-25. Provisioning values for  $x$** 

| <b>x<br/>value</b> | <b>CRC-4<br/>Mode</b> | <b>Automatic<br/>CRC-4</b> | <b>Far-End<br/>PM</b> | <b>NPC used as<br/>Sync Source</b> | <b>TS0 Bit 5<br/>used for SFI</b> |
|--------------------|-----------------------|----------------------------|-----------------------|------------------------------------|-----------------------------------|

| <b>A</b>           |                       |                            |                       |                                    | Y                                 |
| <b>B</b>           |                       |                            |                       |                                    |                                   |
| <b>C</b>           |                       | Y                          | Y                     | Y                                  |                                   |
| <b>D</b>           |                       | Y                          | Y                     | Y                                  | Y                                 |
| <b>E</b>           |                       |                            |                       | Y                                  | Y                                 |
| <b>F</b>           |                       |                            |                       | Y                                  |                                   |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 8-26. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 8-27. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

z=6 or A hardware timing

z=7 or B firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

- [vii] RBER unalarmed

- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

[ix] To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 8-28. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                     |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz                              | Framed clear 2Mbit/s ( $y$ value C) is valid for all $x$ options except those invoking automatic CRC-4 interworking. The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 9Cz                              |                                                                                                                                                                                                                                 |
| CCz                              |                                                                                                                                                                                                                                 |
| DCz                              |                                                                                                                                                                                                                                 |
| 0Dz                              | Unframed clear 2Mbit/s ( $y$ value D) is only valid for $x$ values B and F. These are the only $x$ options which do not require decoding of TS0 content.                                                                        |

**Table Notes:**

1. If framed clear 2Mbit/s is selected with Far-End PM enabled  $z$  values 1, 3, 5 and 7) only the receive side of the feature shall be turned on. No outgoing E-bits may be transmitted during clear signal operation.
2. If framed clear 2Mbit/s is selected with Synchronization Failure Indication (SFI) enables ( $x$  values 1, 2, 5, 6, A and E) only the receive side of the feature shall be turned on. No outgoing SFI may be transmitted in Bit 5 during clear signal operation.

**Table 8-29. Combinations of *y* and *z* Values**

| Invalid<br>xyz<br>Combinations                                                                               | Explanation                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xC1<br>xC3<br>xC5<br>xC7<br>xC8<br>xC9<br>xCB<br>xCC<br>XD1<br>xD3<br>xD5<br>xD7<br>xD8<br>xD9<br>xDB<br>xDC | Clear 2Mbit/s ( <i>y</i> value C or D) cannot be used with Firmware controlled Consequent Action ( <i>z</i> values 1, 3, 5, 7, 9 or B), TRANSMIC 1G ( <i>z</i> value C) or TRANSMIC 2G ( <i>z</i> value 8).            |
| xD4<br>xD6                                                                                                   | Unframed clear 2Mbit/s ( <i>y</i> value D) cannot be used with <i>z</i> value 4 (NFW Bit 4 used for RAIS) or with <i>z</i> value 6 (NFW Bit 4 used for RBER) because unframed clear signals cannot obtain TS0 framing. |
| x0C<br>x2C<br>x4C<br>x6C                                                                                     | Channel Associated Signaling ( <i>y</i> values 0, 2, 4 and 6) is not valid for TRANSMIC 1G ( <i>z</i> value C).                                                                                                        |

**Table Notes:**

1. If framed clear 2Mbit/s (*y* value C) is selected with *z* value 4 (NFW Bit 4 used for RAIS) only the receive side of this function will be enabled. Outgoing RAIS indicators cannot be transmitted during clear signal operation.
2. If framed clear 2Mbit/s (*y* value C) is selected with *z*= value 6 (NFW Bit 4 used for RBER) only the receive side of this function will be enabled. Outgoing RBER indicators cannot be transmitted during clear signal operation.

**Table 8-30. Combinations of *x* and *z* Values**

| Invalid<br>xyz<br>Combinations                       | Explanation                                                                                                                                                                                                                                                       |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4yC<br>5yC<br>6yC<br>7yC<br>CyC<br>DyC<br>EyC<br>FyC | Use of NPC as Sync Source ( <i>x</i> 4, 5, 6, 7, C, D, E and F) is not valid for TRANSMIC 1G ( <i>z</i> value C). This is because the TSO Monitoring scheme used in TRANSMIC 1G prevents incoming SFI indicators from cutting off the signal to the Synchronizer. |

**OPTS** - Options

Clear DS1 DE type FTU NPCs have a limited number of parameters for performance monitoring, 01 through 04 only. Clear DS1 TE type DS3U or HDS3U NPCs have only parameters 01 and 02.

**rr** - Facility performance parameter number

Variable *rr* specifies the parameter whose alarm threshold is being selected

**<m>** - Facility performance parameter threshold index (0 through 10 hex)

Variable *<m>* is used to select threshold values previously programmed for *rr*. The default threshold value, the value selected by *m*=0, for each parameter is shown below for each NPC type under the column heading "Default Threshold Value". Threshold values selected by values of *m* other than 0 must exist, that is, must have been programmed, prior to being selected. These other thresholds can be set by using the CHG::SETOP (38201) command.

**For PB and PC type NPCs:**

| rr | Parameter                          | Threshold      | Default            |
|----|------------------------------------|----------------|--------------------|
|    |                                    | Value<br>Range | Threshold<br>Value |
| 31 | Degraded Minutes, 1 hour           | 1-60           | 60                 |
| 32 | Degraded Minutes, 24 hours         | 1-1440         | 1440               |
| 33 | Severely Errored Seconds, 15 mins  | 1-900          | 900                |
| 34 | Severely Errored Seconds, 24 hours | 1-65535        | 65535              |
| 35 | Errored Seconds, 15 minutes        | 1-900          | 900                |
| 36 | Errored Seconds, 24 hours          | 1-65535        | 65535              |
| 37 | Unavailable Seconds, 15 minutes    | 1-900          | 900                |

| c   | Threshold disabled | no alarm                               |
| d   | Default            | PMA Critical                           |
| e   | Set 1              | PMA Critical                           |
| f   | Set 2              | PMA Critical                           |
| 10  | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable **m** can be used to select threshold levels and alarm types other than the defaults.

|             |                             |
|-------------|-----------------------------|
| <b>SLIP</b> | - Timing slip               |
| <b>BER</b>  | - Bit error rate            |
| <b>ERS</b>  | - Errored seconds           |
| <b>SERS</b> | - Severely errored seconds  |
| <b>COFA</b> | - Change of frame alignment |
| <b>SANE</b> | - Shelf Alarm Near End      |
| <b>SAFE</b> | - Shelf Alarm Far End       |

SLIP

- mmm** - Slip major alarm threshold (0 through 255)
- nnn** - Slip minor alarm threshold (0 through 255)
- e** - Slip major alarm option selection (0 through 3)
- f** - Slip minor alarm option selection (0 through 3)

BER (Bit Error Rate)

- p** - BER major alarm threshold, (1E-p, 3\* through 6†)
- q** - BER minor alarm threshold, (1E-q, 3\* through 6†)
  - \* 4 for clear-DS1 FTU NPC or DS type NPC
  - † 7 on T1DM and Fe framing
- g** - BER major alarm option selection (0 through 3)
- h** - BER minor alarm option selection (0 through 3)

ERS (Errored Seconds)

- rrrrr** - ERS threshold (1 through 65535)
- i** - ERS option selection (0 through 3)

SERS (Severely Errored Seconds)

- sss** - SERS threshold (1 through 255)
- j** - SERS option selection (0 through 3)

COFA (Change of Frame Alignment)

- ttt** - COFA major alarm threshold (1 through 511)
- uuu** - COFA minor alarm threshold (1 through 255)
- k** - COFA major alarm option selection (0 through 3)
- l** - COFA minor alarm option selection (0 through 3)

SANE (Shelf Alarm Near End)

- xxxxx** - SANE alarm threshold (00000 through 65535)
- m** - SANE alarm option selection (0 through 3)

SAFE (Shelf Alarm Far End)

- zzzzz** - SAFE alarm threshold (00000 through 65535)
- n** - SAFE alarm option selection (0 through 3)

For PB and PC type NPCs:

**DM** - Degraded Minutes  
**SERS** - Severely Errored Seconds  
**ERS** - Errored Seconds  
**US** - Unavailable Seconds  
**SLIP** - Slip Events

For SHORT INTERVAL, DM is calculated hourly and SERS, ERS, US and SLIP are calculated at 15-minute intervals.

**nnnnn** - 24-hour Degraded Minutes (DM) threshold  
**ppppp** - 24-hour Severely Errored Seconds (SERS) threshold  
**qqqqq** - 24-hour Errored Seconds (ERS) threshold  
**rrrrr** - 24-hour Unavailable Seconds (US) threshold  
**sssss** - 24-hour Slip Events (SLIP) threshold

**e** - 24-hour DM threshold/alarm selection  
**f** - 24-hour SERS threshold/alarm selection  
**g** - 24-hour ERS threshold/alarm selection  
**h** - 24-hour US threshold/alarm selection  
**i** - 24-hour SLIP threshold/alarm selection

**nnnnn** - 1-hour DM threshold  
**ppppp** - 15-minute SERS threshold  
**qqqqq** - 15-minute ERS threshold  
**rrrrr** - 15-minute US threshold  
**sssss** - 15-minute SLIP threshold

**e** - 1-hour DM threshold/alarm selection  
**f** - 15-minute SERS threshold/alarm selection  
**g** - 15-minute ES threshold/alarm selection  
**h** - 15-minute US threshold/alarm selection  
**i** - 15-minute SLIP threshold/alarm selection

For PA type NPCs:

**CRC** - CRC Block Errors  
**FRER** - Framing Errors  
**OFS** - Out of Frame Seconds  
**ES** - Errored Seconds  
**SES** - Severely Errored Seconds  
**CSS** - Controlled Slip Seconds  
**CV** - Coding Violations  
**UAS** - Unavailable Seconds  
**UATC** - Unavailable Time Count  
**MER** - Multiframe Errors  
**FEBE** - Far End Block Errors  
**FES** - Far End Errored Seconds  
**FSES** - Far End Severely Errored Seconds  
**FUAS** - Far End Unavailable Seconds

**aaaaaaaa**

- Daily CRC block error threshold value.

**bbbbbbbb**

- Daily framing error threshold value.

**cccc**

- Daily out of frame seconds threshold value.

**dddd**

- Daily errored second threshold value.

**eeee**

- Daily severely errored second threshold value.

**ffff**

- Daily controlled slip second threshold value.

**gggggggg**

- Daily coding violation threshold value.

**hhhh**

- Daily unavailable second threshold value.

**iiii**

- Daily unavailable time count threshold value.

**jjjj**

- Daily multiframe alignment error threshold value.

**kkkkkkkk**

- Daily far-end block error threshold value.

**llll**

- Daily far-end errored second threshold value.

**mmmm**

- Daily far-end severely errored second threshold value.

**nnnn**

- Daily far-end unavailable second threshold value.

- a** - Daily CRC block error threshold selection,
- b** - Daily framing error threshold selection,
- c** - Daily out of frame seconds threshold selection,
- d** - Daily errored second threshold selection,
- e** - Daily severely errored second threshold selection,
- f** - Daily controlled slip second threshold selection,
- g** - Daily coding violation threshold selection,
- h** - Daily unavailable second threshold selection,
- i** - Daily unavailable time count threshold selection,
- j** - Daily multiframe alignment error threshold selection,
- k** - Daily far-end path block error selection,
- l** - Daily far-end path second threshold selection,
- m** - Daily far-end severely errored second threshold selection,
- n** - Daily far-end unavailable second threshold selection,

The options can be from "0" to "c" as specified for the "m" of the "rr/<m>" field.

**aaaaaa** - 15-minute CRC block error threshold value.

**bbbbbb**

- 15-minute framing error threshold value.

**ccc** - 15-minute out of frame seconds threshold value.

**ddd** - 15-minute errored second threshold value.

**eee** - 15-minute severely errored second threshold value.

**fff** - 15-minute controlled slip second threshold value.

**ggggggg**

- 15-minute coding violation threshold value.

**hhh** - 15-minute unavailable second threshold value.

**ii** - 15-minute unavailable time count threshold value.

**jjj** - 15-minute multiframe alignment error threshold value.

**kkkkkk** - 15-minute far-end block error threshold value.

**lll** - 15-minute far-end errored second threshold value.

**mmm** - 15-minute far-end severely errored second threshold value.

**nnn** - 15-minute far-end unavailable second threshold value.

- a** - 15-minute CRC block error threshold selection,
- b** - 15-minute framing error threshold selection,
- c** - 15-minute out of frame seconds threshold selection,
- d** - 15-minute errored second threshold selection,
- e** - 15-minute severely errored second threshold selection,
- f** - 15-minute controlled slip second threshold selection,
- g** - 15-minute coding violation threshold selection,
- h** - 15-minute unavailable second threshold selection,
- i** - 15-minute unavailable time count threshold selection,
- j** - 15-minute multiframe alignment error threshold selection,
- k** - 15-minute far-end path block error selection,
- l** - 15-minute far-end path second threshold selection,
- m** - 15-minute far-end severely errored second threshold selection,
- n** - 15-minute far-end unavailable second threshold selection,

The options can be from "0" to "c" as specified for the "m" of the "rr/<m>" field.

**For PA type NPCs:**

Depending on which interface functions are enabled by the provisioning values of xyz, some parameters may not be applicable. In this case the threshold value, the parameter count (if present in the message) and the selection value will appear as dashes ("-"). In the table below "N/A" indicates that a parameter is not applicable for the given value of x or y.

Also, if the selection value m=c has been chosen for a parameter, the threshold value and the parameter count (if present in the message) will appear as dashes.

| For PA Type NPCs |                                    |                                            |                             |                                 |

**THMODE** - Thresholding mode (for PA NPCs only)

**hhh** - Thresholding mode option

*hhh*                      *Explanation*

INH                      Inhibit thresholding

ALW                      Allow thresholding

The INH option is used to temporarily inhibit thresholding for all parameters of all NPCs provisioned with TYPE mnxyz whether the thresholding for a specific NPC is already inhibited or not. When it is entered, all thresholds for those NPCs are suspended; therefore, no new threshold crossing messages will be output after the inhibition.

The ALW option is the default option and can be used to turn-off the thresholding inhibition. Note that, this command with the "ALW" option can be used for TYPE mnxyz NPCs whose thresholding capability is inhibited due to the entry of command I.38221

When the "ALW" is entered, the thresholds applied before the inhibition will be re-applied unless the thresholds were changed during the inhibition. Option change requests are permitted while the NPC thresholding is inhibited.

**vv/k** - Parameter/option involved in denial

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 02** Subject entity is not equipped
- 10** Unit is not equipped
- 11** UC is out of service
- 12** UC is in service but failed
- 13** FTMI is not equipped
- 20** Option rr/m has not been set up on 2nd database
- 21** Minor  $\geq$  major for SLIP opt
- 22** Minor  $\leq$  major for BER opt
- 23** Minor  $\geq$  major for COFA opt
- 2A** DMI combined with T1DM
- 2B** Maj|Min BER threshold is 7, but not in T1DM or Fe mode
- 4F** BER must not be less than 4 for Clear DS1
- 83** Option not programmable for this NPC type

## **CHG,TYPE,THMODE**

### **CHANGE TYPE AND THRESHOLD MODE**

#### **Explanation Of Command**

This command inhibits or allows the threshold-crossing messages for all unequipped NPCs that will be provisioned as the specified NPC type. After the execution of this command, any NPCs that are subsequently provisioned as the specified NPC type will have their threshold-crossing messages inhibited or allowed.

The only NPC type that can be specified in this command is the PA type and no xyz options shall be specified in this command.

When this command is entered for inhibiting threshold-crossing messages, it shall not be denied even if the threshold-crossing messages are already inhibited; when this command is entered for allowing threshold-crossing messages, it shall not be denied even if the threshold-crossing messages are already allowed. In addition, if this command is never entered for a given NPC type, the threshold-crossing messages will be allowed for all NPCs that will be provisioned as that NPC type.

The execution of this command does not require any Unit or CCN/ECCN hardware entities to be in service, except for the Main Controller.

In contrast, the CHG,TYPE,OPTS,THMODE command (I.38231) can be used to inhibit or allow the threshold-crossing messages for all equipped NPCs that have been provisioned as PA type with the specified xyz option; the CHG,NPC,OPTS,THMODE command (I.38221) can be used to inhibit or allow the threshold-crossing messages for the specified NPC that has been provisioned as PA type.

### Explanation Of Parameters

**TYPE** - Type

**mn** - NPC type

| <i>mn</i> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|    |                                                   |
|----|---------------------------------------------------|
| PA | CEPT NPC (120-ohm twisted pair or 75-ohm coaxial) |
|----|---------------------------------------------------|

**THMODE** - Thresholding mode

**hhh** - Threshold-crossing message mode

| <i>hhh</i> | <i>Explanation</i> |
|------------|--------------------|
|------------|--------------------|

|     |                                     |
|-----|-------------------------------------|
| INH | Inhibit threshold-crossing messages |
|-----|-------------------------------------|

|     |                                   |
|-----|-----------------------------------|
| ALW | Allow threshold-crossing messages |
|-----|-----------------------------------|

The INH option is used to inhibit (turn off) the threshold-crossing messages for all NPCs that will be provisioned as the specified NPC type. After this option is selected, no threshold-crossing messages will be output for all NPCs that will be provisioned as the specified NPC type.

The ALW option can be used to allow (turn on) the threshold-crossing messages for all NPCs that will be provisioned as the specified NPC type. After this option is selected, threshold-crossing messages will be output for all NPCs that will be provisioned as the specified NPC type.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**26** NPC type error

## **CHG,UNIT,CONN**

### **CHANGE CONNECTIVITY**

#### **Explanation Of Command**

This command requests a change of a unit's connectivity. Timeslot interchange (TSI) circuit packs will be automatically grown and/ or degrown (deprovisioned) as needed.

New or degrown TSIs are listed at the end of the output message. They are listed pairwise with up to six pairs listed per message line. At most there will be 10 of these pairs when the connectivity of a unit is changed.

---

## **CHG,USER,LINK,INCL,SCR,GR,MCON,MCOFF**

### **CHANGE USER/LINK SCREENING**

#### **Explanation Of Command**

This command assigns the output message screening for a user or administrative link, including all virtual circuits in a X.25 link, on the DACS II system.

The command can also assign default values to the link options.

The function is denied if the user identification does not exist.

Output from this command is sent only to the link on which the command was input.

With the Message Logging feature, a request to retrieve logged messages will be sent to the link on which the retrieval command was input and the links with screening option 5 that are running MML.

#### **Command**

[I.38401]

```
CHG:FRM xy,SEQ ww:{USER <user id>|LINK j[mm][,INCL]}\
[,SCR n[,GR(a,b,c,d,e,f)]][, {MCON|MCOFF}][,INIT]!
```

#### **Completion Message**

[O.38401]

```
M hh:mm:ss xy,ww n[vv] CHG {USER <user id>|LINK j[mm][,INCL]}\
[SCR n[GR(a,b,c,d,e,f)]] [{MCON|MCOFF}][INIT] COMPL
```

## **Denial Message**

---

[O.38401.01]

M hh:mm:ss xy,ww n[vv] CHG {USER <user id>|LINK j[mm][,INCL]} \  
[ SCR n[ GR(a,b,c,d,e,f)]] [ {MCON|MCOFF}][ INIT] COND cc DNY

## **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

**USER** - User

**user id**

- User identifier (two to eight alphabetic characters)

User login identification

**LINK** - Link

**j [mm]** - Administrative link number

**j** - Physical link number (1 through 6)

**mm** - Virtual circuit number (01 through 16, for l = 5 or 6)

If mm is specified, pp must be specified as 01.

**INCL** - Include

Include virtual circuits of links 5 and 6. The INCL keyword can only be entered with X.25 links 5 and 6, and no virtual circuit number is allowed when this keyword is used. That is, "mm" and "INCL" are mutually exclusive. In addition, the INCL keyword is also mutually exclusive with the "<user id>". When the INCL keyword is entered, it means that all provisioning data specified in this command, for example, SCR n, GR(a,b,c,d,e,f), and MCON/MCOFF, will be applied to all virtual circuits of the link (5 or 6).

**SCR** - Screening

**n** - Screening option number (1 through 5)

The screening option is used to limit responses on a given administrative link to one of the sets given in the table below. The set to be received is selected by the use of variable "n".

| <i>n</i> | <i>Explanation</i>                                                                                                  |
|----------|---------------------------------------------------------------------------------------------------------------------|
| 1        | Responses to input at the same link.                                                                                |
| 2        | Responses to input at the same link and autonomous messages.<br>This is the default value.                          |
| 3        | Responses to messages input at the same link and some specified sets of action verbs.                               |
| 4        | Responses to messages input at the same link and some specified sets of action verbs including autonomous messages. |
| 5        | Responses to input messages on all links and autonomous messages                                                    |

**GR** - Group

**a, b, c, d, e, f**

- Screening groups a through f (0 or 1)

The entry of the screening group option is allowed only if n = 3 or 4 was entered for the screening option number. The screening group option will not apply for n = 2; the default screening option. The restricted commands are not categorized by group and are always assigned the screening group value "1".

| <i>a*</i> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

- |   |                                                                                                                          |
|---|--------------------------------------------------------------------------------------------------------------------------|
| 0 | Messages in the message group represented by variable a will not be sent to the link or user specified in this command.  |
| 1 | Messages in the message group represented by variable a will also be sent to the link or user specified in this command. |
| - | Do not change the screening group option for variable a.                                                                 |

\* This table applies also to variables b through f.

DACS II has six groups of action verbs represented in this message by variables a, b, c, d, e, and f. The following table defines the variables assigned to each action verb.

| a<br>Circuit<br>Prov. | b<br>Equipment<br>Prov. | c<br>Maintenance | d<br>Test<br>Access | e<br>Monitoring | f<br>Common |
|-----------------------|-------------------------|------------------|---------------------|-----------------|-------------|
| TCON                  | GRTH                    | RMV              | TTST                | AUD             | CHG         |
| TDIS                  | DGRTH                   | RST              | STST                | UTL             | ED          |
| TCNT                  | ADD                     | DGN              |                     |                 | EXC         |
| BCON                  | DLT                     | CFR              |                     |                 | ACT         |
| BDIS                  |                         |                  |                     |                 | ADD         |
| OCON                  |                         |                  |                     |                 | DELETE      |
| ODIS                  |                         |                  |                     |                 | LIST        |
| OCNT                  |                         |                  |                     |                 | TOTAL       |
| SW                    |                         |                  |                     |                 |             |
| CONF                  |                         |                  |                     |                 |             |
| SECH                  |                         |                  |                     |                 |             |

| SCON                  |                         |                  |                     |                 |             |
| SCNT                  |                         |                  |                     |                 |             |
| SDIS                  |                         |                  |                     |                 |             |

**MCON** - Macro on

Macro completion message screening ON. MCON is the default value.

**MCOFF** - Macro off

Macro completion message screening OFF

The MCON/MCOFF options are used to turn on or off the completion messages of the component commands inside a macro during its execution.

**INIT** - Initialize

Initialize the link or user options; all parameters are set to their default values except those specified in the command.

**cc** - Hexadecimal condition code

**cc** *Explanation*

- D3** User does not exist
- D7** Cannot execute privileged command
- DF** Command and protocol are inconsistent
- E1** Virtual circuit is not specified for X.25 link
- E2** Invalid link number specified
- E3** Invalid keyword(s) combination specified
- 41** Language "F" provisioned for this channel
- 83** Language is not allowed

## **CI,ECI,RESET**

### **STARTUP**

#### **Explanation Of Command**

DACS II outputs this message immediately after a hardware reset. The message notifies remote systems by the major alarm state (indicated by \*\*) that the frame has reset.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01201]

**\*\*{CI|ECI} RESET**

### **Explanation Of Parameters**

---

**CI** - Communications interface

**ECI** - Enhanced communications interface

**RESET** - Reset

Indicates a hardware reset of the frame

## **CI,ECI,STARTUP,STF,ATP**

### **STARTUP**

#### **Explanation Of Command**

The communications interface or enhanced communications interface has initialized itself and has performed self-diagnostics. The results of these diagnostics are reported as some tests failed or all tests passed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01211]

{CI|ECI} STARTUP {STF|ATP}

### **Explanation Of Parameters**

---

**CI** - Communications interface

**ECI** - Enhanced communications interface

**STARTUP**

- Startup

Indicates initialization

**STF** - Some tests failed

**ATP** - All tests passed

## **CMD,MC,OOS,MCOND,INSERVICE,MPDBASE**

### **INPUT DENIAL**

#### **Explanation Of Command**

This autonomous message indicates that processing of the input message is **STOPPED** because the main controller is either out of service, in maintenance condition, in service, or the main processor data base is not loaded.

Output from this command is sent only to the link on which the command was input.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01111]

M hh:mm:ss xy,ww n[vv] CMD MC {OOS|MCOND|INSERVICE|MPDBASE} \

e LN MSG:

<First 70 characters of input message.>

<Remaining text of input message> STOPPED

### **Explanation Of Parameters**

---

**e** - Number of lines in message

**OOS** - Out-of-service

**MCOND** - Maintenance condition

**INSERVICE**

- In-service

**MPDBASE**

- MP data base

The main processor data base is not loaded

**STOPPED**

- Stopped

## **COPY,NPC,TO**

### **COPY NPC**

#### **Explanation Of Command**

This command is used to copy provisioning information from a previously provisioned network processing circuit (NPC) to an NPC to be provisioned (the destination NPC). It is used for international NPC types PA, PB, PC and TH. Intervention Level data for the NPC is also copied. Copying is limited to the combinations given below:

- PA to PA
- PB to PB
- PC to PC
- PB to PC
- PC to PB
- TH to TH

One output message is printed for each NPC successfully copied and provisioned.

When a range address crosses a Unit boundary, the command will be denied. The NPC numbers which are divisible by four with a remainder of zero are not a valid Hybrid DS3 Unit THxyz type NPC. However, the range of THxyz type NPC numbers is still supported with the understanding that there may be gaps in the NPC number range.

When an NPC range specified within a Unit crosses a Facility Terminating Module (FTM) boundary and the FTM type differs from that specified in this command then that FTM will be skipped and a summary denial message will be output. This message will give the range of NPCs for which the denial is effective and the reason for the denial. The NPC range covers successive NPCs in the range that are denied for the same reason.

Execution of the command then resumes at the NPC following the last one in the summary denial message and continues to the end of the specified range.

This command is very similar to the GRTH command. The input parameters that can be specified on the GRTH command will be copied from the source NPC to the destination NPC. The performance monitoring threshold parameters are also copied. Others that are defaulted by the GRTH command will be defaulted.

### **Command**

---

#### **Nonhierarchical**

---

## Explanation Of Parameters

**NPC** - Network processing circuit

**TO** - to

**TYPE** - type

**mnxyz** - NPC type identifier

| <i>mn</i> | <i>Explanation</i>              |
|-----------|---------------------------------|
| PA        | CEPT NPC (75- or 120-ohm)       |
| PB        | CEPT NPC (120-ohm twisted pair) |
| PC        | CEPT NPC (75-ohm coaxial)       |

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, denoting the source of the provisioning information.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, denoting the start of a range.

**[u]ghi** - The 3- or 4-digit nonhierarchical NPC number, denoting the end of a range.

**[s]jkl** - The 3- or 4-digit nonhierarchical NPC number of the NPC that was successfully equipped.

**[t]mno** - The 3- or 4-digit nonhierarchical NPC number of the first NPC in a range to be denied.

**[u]vwx** - The 3- or 4-digit nonhierarchical NPC number of the last NPC in a range to be denied.

**bcdfe** - Hierarchical NPC number of the first NPC in a range to be denied.

**efhed** - Hierarchical NPC number of the last NPC in a range to be denied.

**ghikl** - Hierarchical NPC number of the last NPC in a range to be equipped.

**uvjkl** - Hierarchical NPC number of the NPC that was successfully equipped.

**uvmnp** - Hierarchical NPC number denoting the source of the provisioning information to be copied.

**wxkqr** - Hierarchical NPC number of the NPC to be equipped or the first NPC in a range to be equipped.

**bc, ef, gh, uv, wx**  
- Unit number  
**d, h, i, j, k, m**  
- Module number  
**fe, ed, kl, np, qr**  
- NPC number within the module

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

If NPC numbers are expressed in hierarchical form, the valid values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**IW** - Insertion word

**pq** - Hexadecimal value of the insertion word.

An eight-bit code, called the growth insertion word, is transmitted by this NPC on unassigned DS0 channels. This code is specified by the optional keyword IW and its argument pq. This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the cross-connect insertion word, which is transmitted when the disconnect message with the DDC specified is used.

Although any 2-digit hexadecimal code may be used, the default values are:

*pq Explanation*

7F Unassigned Channel Code (UAC), the default value for DE/TE type, DA/TA type, and DS type NPCs provisioned with D4 or ESF framing.

18 Unassigned Multiplex Code (UMC), the default value for DA/TA type NPCs provisioned with T1DM framing. This value should only be provisioned with T1DM framing (DE4yz/TE4yz, DA4yz/TA4yz), so the growth command enforces this restriction.

FF This is recommended for unconnected channels in the SLC® interface and CPI applications.

For Clear-DS1 NPCs, the insertion word option is **NOT** available and the message will be denied if this option is entered. The alarm indication signal (AIS) is transmitted in the disconnect or idle state.

**AIS** - Alarm indication signal

**INFO** - Information

Information message (not an alarm).

**MJ** - Major (alarm)

**MN** - Minor (alarm)

**BER** - Bit Error Rate

**ERS** - Errored seconds

**SERS** - Severe errored seconds

**COFA** - Change of frame alignment

**mmm** - SLIP major alarm threshold (0 through 255)  
**nnn** - SLIP minor alarm threshold (0 through 255)  
**e** - SLIP major option selection (0 through 3)  
**f** - SLIP minor option selection (0 through 3)

**p** - BER major alarm threshold (4 through 6)  
**q** - BER minor alarm threshold (4 through 6)  
**g** - BER major option selection (0 through 3)  
**h** - BER minor option selection (0 through 3)

**rrrrr** - ERS threshold (1 through 65535)  
**i** - ERS option selection (0 through 3)

**sss** - SERS threshold (1 through 255)  
**j** - SERS option selection (0 through 3)

**ttt** - COFA major alarm threshold (1 through 511)  
**uuu** - COFA minor alarm threshold (1 through 255)  
**k** - COFA major option selection (0 through 3)  
**l** - COFA minor option selection (0 through 3)

**xxxxx** - SANE threshold (0 through 65535)  
**v** - SANE option selection (0 through 3)

**zzzzz** - SAFE threshold (0 through 65535)  
**w** - SAFE option selection (0 through 3)

**Note:** For clear-DS1 FTU NPC only SLIP and BER parameters are listed.  
For clear-DS1 DS3U NPC only SLIP parameters are listed.

The SANE and SAFE parameters are not applicable to DS1yz and DS7yz type NPCs.

Except for BER, major thresholds may not be equal to or less than the minor thresholds. The BER major threshold can be equal to the BER minor threshold.

**PL** - Payload loopback

**ENA** - Enabled

Payload loopback commands received from far-end equipment on the ESF data link are recognized and performed by the ANSI NPC. This is the default option.

**DSA** - Disabled

Payload loopback commands received from far-end equipment on the ESF data link are ignored by the ANSI NPC. This prevents customer equipment from controlling network configurations.

**CVP** - Path Coding Violations

**ESP** - Path Errored Seconds

**SESP** - Path Severely Errored Seconds

**SEFS** - Severely Errored Framing Seconds

**CSSP** - Path Controlled Slip Seconds

**UASP** - Path Unavailable Seconds

**CVL** - Line Coding Violations

**ESL** - Line Errored Seconds

**SESL** - Line Severely Errored Seconds

**l** - 15-Minute far-end path severely errored second threshold selection,  
(0 through 3)

**mmm** - 15-Minute far-end severely errored framing second threshold,  
(000 through 900, or --- if not applicable)

**m** - 15-Minute far-end severely errored framing second threshold selection,  
(0 through 3)

- nnn** - 15-Minute far-end controlled slip second threshold,  
(000 through 900, or --- if not applicable)
- n** - 15-Minute far-end controlled slip second threshold selection,  
(0 through 3)
- ooo** - 15-Minute far-end unavailable second threshold,  
(000 through 900)
- o** - 15-Minute far-end unavailable second threshold selection,  
(0 through 3)
- ppp** - 15-Minute far-end line errored second threshold,  
(000 through 900, or --- if not applicable)
- p** - 15-Minute far-end line errored second threshold selection,  
(0 through 3)

**Note:** A threshold of zero for any parameter inhibits threshold crossing monitoring for that parameter.

**For PB/PC type:**

Note that:

- If the NPC is not located in a sync NPC location, bit "b" set to "1" will be denied.
- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.
- For NSA NPCs (bit d = 0), bits "f" and "g" are don't cares: any values are accepted.
- If bit "d" is set to "1" (that is, a CAS NPC) and "jkl" is "110" (that is, Transmic 1G), the command will be denied.
- If bit "d" is set to "1" (that is, a CAS NPC) and bit "e" is "1" for time slot channel numbering, the command will be denied.

- m** - Facility performance parameter threshold index (0 through 10 hexadecimal)

Variable m is used to select threshold values previously programmed for rr. The default threshold value for each parameter is shown in the table below under the column heading "Default Threshold Value". This is the value selected by m = 0, 1, or 2 in the table of m values following the parameter table. A given value of m selects both the performance monitoring threshold level and the alarm type associated with it as shown in that table. Threshold values selected by values of m greater than 2 must exist, that is, must have been programmed, prior to being selected. These other thresholds can be set by using the CHG,SETOP, TYPE,ALL,NPCOP command. Thresholds of all unspecified parameters will be set to the default value associated with m=0. Although the NPC type field is optional for PB and PC types, the options field must not be given without the NPC type field.

**For PB and PC type NPCs:**

| rr | Parameter                          | Threshold Value Range | Default Threshold Value |
|----|------------------------------------|-----------------------|-------------------------|
| 31 | Degraded Minutes, 1 hour           | 1-60                  | 60                      |
| 32 | Degraded Minutes, 24 hours         | 1-1440                | 1440                    |
| 33 | Severely Errored Seconds, 15 mins  | 1-900                 | 900                     |
| 34 | Severely Errored Seconds, 24 hours | 1-65535               | 65535                   |
| 35 | Errored Seconds, 15 minutes        | 1-900                 | 900                     |
| 36 | Errored Seconds, 24 hours          | 1-65535               | 65535                   |
| 37 | Unavailable Seconds, 15 minutes    | 1-900                 | 900                     |
| 38 | Unavailable Seconds, 24 hours      | 1-65535               | 65535                   |
| 39 | Slips, 15 minutes                  | 1-900                 | 900                     |
| 40 | Slips, 24 hours                    | 1-65535               | 65535                   |

**Note 1:** 24-hour thresholds must be greater than their respective 15-minute or 1-hour threshold.

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m>       | Threshold Value    | Alarm Type                             |
|-----------|--------------------|----------------------------------------|
| <b>0</b>  | Default            | MI (Maintenance Information)           |
| <b>1</b>  | Default            | DMA (Deferred Maintenance Minor Alarm) |
| <b>2</b>  | Default            | PMA (Prompt Maintenance Major Alarm)   |
| <b>3</b>  | Set 1              | MI                                     |
| <b>4</b>  | Set 1              | DMA                                    |
| <b>5</b>  | Set 1              | PMA Major                              |
| <b>6</b>  | Set 2              | MI                                     |
| <b>7</b>  | Set 2              | DMA                                    |
| <b>8</b>  | Set 2              | PMA Major                              |
| <b>9</b>  | Set 3              | MI                                     |
| <b>a</b>  | Set 3              | DMA                                    |
| <b>b</b>  | Set 3              | PMA Major                              |
| <b>c</b>  | Threshold disabled | no alarm                               |
| <b>d</b>  | Default            | PMA Critical                           |
| <b>e</b>  | Set 1              | PMA Critical                           |
| <b>f</b>  | Set 2              | PMA Critical                           |
| <b>10</b> | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable m can be used to select threshold levels and alarm types other than the defaults.

**Note:** If the queried NPC can not be accessed for some reason, for example because the Facility Terminating Module is not equipped or the FTMI or Unit Controller is out of service, then the NPC's parameter count fields are printed as a string of dashes to indicate that the counts are not available. The parameter thresholds and options will still be correctly output.

In addition, certain parameters do not apply. In the cases where specific parameters do not apply to the queried NPC, the respective parameter count fields, threshold values and threshold options are all displayed as a string of dashes.

IW - Insertion Word

pq[r] - Hexadecimal value of the Growth Insertion Word (GIW)

Used in the transmit direction on unassigned channels for CEPT NPCs.

pq transmitted data information  
r transmitted signaling information

A special code, called the Growth Insertion Word (GIW), is transmitted by this NPC on unassigned channels. This code is specified by the optional keyword **IW** and its argument **pq**.

*This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the TCON Insertion Word, which is transmitted when the "TDIS: :FROM, TO, . . . , DCC" command is used.*

**IW** - Insertion word

**pqr** - Hexadecimal value of the insertion word.

For PB and PC type NPCs, the IW argument is X'pq[r], and the default GIW code is X'D5D (Binary: 11010101 1101). Hexadecimal digits "pq" represent the CEPT insertion word for cross-connected time slots and hexadecimal digit "r" represents the CEPT signaling option. The "r" digit is needed to accommodate the cross-connected CEPT time slot and its associated portion of TS16 used for signaling when provisioned for channel associated signaling (CAS).

Although the "r" digit is accepted on input, for NSA NPCs, it has no significance.

**AIS** - Alarm indication signal

AIS is not detected by unframed clear (unchannelized) 2Mbit/s PAXDz type NPCs. Therefore, specifying AIS with one of the alarm level types MI, DMA, or PMA, is unnecessary. However, the command will not be denied if AIS is specified with an alarm level for unframed clear PAXDz NPCs. AIS with its alarm level will simply never be reported for unframed clear PAXDz NPCs.

**MI** - Maintenance information

This is the default option.

**PMA** - Prompt Maintenance Action Major Alarm

**PMC** - Prompt Maintenance Action Critical Alarm

**DMA** - Deferred Maintenance Action Minor Alarm

For each NPC listed, this message prints out values of the states, counts, thresholds and options of the following facility performance parameters and the spare international and national bits in time slot 0 for CEPT NPCs.

For PB and PC type NPCs:

**DM** - Degraded Minutes

**nnnnn** - 24-hour Degraded Minutes threshold

**nnnnn** - 1-hour DM threshold

**e** - 24-hour Degraded Minutes threshold/alarm selection

**e** - 1-hour DM threshold/alarm selection

**SERS** - Severely Errored Seconds

**ppppp** - 24-hour Severely Errored Seconds threshold

**ppppp** - 15-minute SERS threshold

**f** - 24-hour Severely Errored Seconds threshold/alarm selection

**f** - 15-minute SERS threshold/alarm selection

**ERS** - Errored Seconds

**qqqqq** - 24-hour Errored Seconds threshold

**qqqqq** - 15-minute ERS threshold

**g** - 24-hour Errored Seconds threshold/alarm selection

**g** - 15-minute ES threshold/alarm selection

**US** - Unavailable Seconds

**rrrrr** - 24-hour Unavailable Seconds threshold

**rrrrr** - 15-minute US threshold

**h** - 24-hour Unavailable Seconds threshold/alarm selection

**h** - 15-minute US threshold/alarm selection

**SLIP** - Slip Events

**sssss** - 24-hour Slip Events threshold

**sssss** - 15-minute SLIP threshold

**i** - 24-hour Slip threshold/alarm selection

**i** - 15-minute SLIP threshold/alarm selection

For SHORT INTERVAL, DM is calculated hourly and SERS, ERS, US, and SLIP are calculated at 15 minute intervals.

The **TS0 abcdefgh** variables represent international and national bits in time slot'0, as defined by:

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

These variables are set to their default values "11011111" by this command, except for the Transmic'1G option, where the default is "11000000."

The variables may later be changed by setting the abcdefgh parameters in the TS0 field of the CHG::NPC command.

Each of the variables may then be set to "0", "1", or "P." "P" indicates that the incoming bit will be cross-connected unchanged.

When TS0 is cross-connected, the TS0 bits will be either passed, or set to "0" or "1" as indicated by the "abcdefgh" variable values. Note that bits which are used for alarms (bit 3 always; bits 4 and 5 if provisioned by the **mnxyz** values) may not be set to "P."

This is also true for NPCs assigned as test port NPCs.

The **TS0M abcdefgh** field allows monitoring of state changes in the received spare international bits, where the "abcdefgh" variables refer to the same TS0 bits as defined above for the TS0 "abcdefgh" variables.

The TS0M variables are specified for monitoring in the command as:

The default values for TS0M variables are **abcdefgh=00000000**, unless the **xyz** parameters set them differently, that is, for Transmic'1G the abcdefgh=00111111. The TS0M variables may later be provisioned by the CHG::TS0M'abcdefgh or the ED-PRMTR-EQPT TS0M-abcdefgh (38323) command.

**For PA type:**

Note that:

- If the NPC is not located in a sync NPC location, the value of "x" must be in the range 0 - 3 or 8 - B. Otherwise the command will be denied.
- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.
- If the value of "y" is 0, 2, 4 or 6 (i.e., a CAS NPC) and the value of "z" is C (i.e. Transmic 1G), the command will be denied.

**For TH type:**

Note that:

- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.

<m> - Facility performance parameter threshold index (0 through 10 hexadecimal)

Variable <m> is used to select the threshold value and alarm type previously programmed for parameter rr. There are four possible alarm thresholds and 4 different alarm levels. A given value of <m> selects one combination of threshold value and alarm level. The combinations of these two result in 16 possible values of m. There is a 17th <m> value which is used to disable the alarm threshold and the alarm. The values of <m> that produce the default values of the thresholds and alarms are shown in the table below under the column heading "Threshold Value". Threshold and alarm combinations selected by m = 3 through b and d-10 must exist, that is, must have been programmed, prior to being selected. The thresholds are programmed by using the ED-OPT-T1 command. Thresholds of all unspecified parameters will be set to the default value associated with m=0. Setting <m> = c disables thresholding for a given parameter.

For PA type NPCs:

**Table 8-32. Parameter Register Threshold Range and Default Values**

| rr | Parameter                        | Interval | Threshold Value Range | Default Threshold Value |
|----|----------------------------------|----------|-----------------------|-------------------------|
| 11 | CRC Block Errors                 | DAILY    | 1 - 79056000          | 176947                  |
| 12 | Framing Errors                   | DAILY    | 1 - 345600000         | 176947                  |
| 13 | Out of Frame Seconds             | DAILY    | 1 - 86400             | 4                       |
| 14 | Errored Seconds                  | DAILY    | 1 - 86400             | 4320                    |
| 15 | Severely Errored Seconds         | DAILY    | 1 - 86400             | 90                      |
| 16 | Controlled Slip Seconds          | DAILY    | 1 - 86400             | 4                       |
| 17 | Coding Violations                | DAILY    | 1 - 176947200         | 176947                  |
| 18 | Unavailable Seconds              | DAILY    | 1 - 86400             | 90                      |
| 19 | Unavailable Time Count           | DAILY    | 1 - 4320              | 9                       |
| 20 | Multiframe Errors                | DAILY    | 1 - 86400             | 4095                    |
| 21 | Far End Block Errors             | DAILY    | 1 - 79056000          | 176947                  |
| 22 | Far End Errored Seconds          | DAILY    | 1 - 86400             | 4320                    |
| 23 | Far End Severely Errored Seconds | DAILY    | 1 - 86400             | 90                      |
| 24 | Far End Unavailable Seconds      | DAILY    | 1 - 86400             | 90                      |
| 81 | CRC Block Errors                 | 15MIN    | 1 - 823500            | 18432                   |
| 82 | Framing Errors                   | 15MIN    | 1 - 3600000           | 18432                   |
| 83 | Out of Frame Seconds             | 15MIN    | 1 - 900               | 4                       |
| 84 | Errored Seconds                  | 15MIN    | 1 - 900               | 300                     |
| 85 | Severely Errored Seconds         | 15MIN    | 1 - 900               | 30                      |
| 86 | Controlled Slip Seconds          | 15MIN    | 1 - 900               | 1                       |
| 87 | Coding Violations                | 15MIN    | 1 - 1843200           | 18432                   |
| 88 | Unavailable Seconds              | 15MIN    | 1 - 900               | 30                      |
| 89 | Unavailable Time Count           | 15MIN    | 1 - 45                | 3                       |
| 90 | Multiframe Errors                | 15MIN    | 1 - 900               | 255                     |
| 91 | Far End Block Errors             | 15MIN    | 1 - 823500            | 18432                   |
| 92 | Far End Errored Seconds          | 15MIN    | 1 - 900               | 300                     |
| 93 | Far End Severely Errored Seconds | 15MIN    | 1 - 900               | 30                      |
| 94 | Far End Unavailable Seconds      | 15MIN    | 1 - 900               | 30                      |

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m>       | Threshold Value    | Alarm Type                             |
|-----------|--------------------|----------------------------------------|
| <b>0</b>  | Default            | MI (Maintenance Information)           |
| <b>1</b>  | Default            | DMA (Deferred Maintenance Minor Alarm) |
| <b>2</b>  | Default            | PMA (Prompt Maintenance Major Alarm)   |
| <b>3</b>  | Set 1              | MI                                     |
| <b>4</b>  | Set 1              | DMA                                    |
| <b>5</b>  | Set 1              | PMA Major                              |
| <b>6</b>  | Set 2              | MI                                     |
| <b>7</b>  | Set 2              | DMA                                    |
| <b>8</b>  | Set 2              | PMA Major                              |
| <b>9</b>  | Set 3              | MI                                     |
| <b>a</b>  | Set 3              | DMA                                    |
| <b>b</b>  | Set 3              | PMA Major                              |
| <b>c</b>  | Threshold disabled | no alarm                               |
| <b>d</b>  | Default            | PMA Critical                           |
| <b>e</b>  | Set 1              | PMA Critical                           |
| <b>f</b>  | Set 2              | PMA Critical                           |
| <b>10</b> | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable m can be used to select threshold levels and alarm types other than the defaults.

IW - Insertion Word

pq[r] - Hexadecimal value of the Growth Insertion Word (GIW)

Used in the transmit direction on unassigned channels for CEPT NPCs.

pq transmitted data information  
r transmitted signaling information

A special code, called the Growth Insertion Word (GIW), is transmitted by this NPC on unassigned channels. This code is specified by the optional keyword **IW** and its argument **pq**.

*This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the TCON Insertion Word, which is transmitted when the "TDIS: :FROM, TO, . . . , DCC" command is used.*

**IW** - Insertion word

**pqr** - Hexadecimal value of the insertion word.

For PA type NPCs, the IW argument is X'pq[r]', and the default GIW code is X'D5D (Binary: 11010101 1101). The "pq" hex digits represent the CEPT insertion word for cross-connected time slots and the "r" hex digit represents the CEPT signaling options. The "r" digit is needed to accommodate the cross-connected CEPT time slot and its associated portion of TS16 used for signaling when provisioned for CAS.

Although the "r" digit is accepted on input, for NSA NPCs, it has no significance.

For each NPC listed, this message prints out values of the states, counts, thresholds and options of the following facility performance parameters and the spare international and national bits in time slot 0 for CEPT DPCs.

| parameter | explanation                      |
|-----------|----------------------------------|
| CRC       | CRC Block Errors                 |
| FRER      | Framing Errors                   |
| OFS       | Out of Frame Seconds             |
| ES        | Errored Seconds                  |
| SES       | Severely Errored Seconds         |
| CSS       | Controlled Slip Seconds          |
| CV        | Coding Violations                |
| UAS       | Unavailable Seconds              |
| UATC      | Unavailable Time Count           |
| MER       | Multiframe Errors                |
| FEBE      | Far End Block Errors             |
| FES       | Far End Errored Seconds          |
| FSES      | Far End Severely Errored Seconds |
| FUAS      | Far End Unavailable Seconds      |

Two sets of thresholds are kept for each parameter: One for DAILY intervals and one for 15 MINUTE intervals.

**For PA type NPCs:**

Depending on which interface functions are enabled by the provisioning values of xyz, some parameters may not be applicable. In this case the threshold value, the parameter count (if present in the message) and the selection value will appear as dashes ("-"). In the table below "N/A" indicates that a parameter is not applicable for the given value of x or y.

Also, if the selection value m=c has been chosen for a parameter, the threshold value and the parameter count (if present in the message) will appear as dashes.

| For PA Type NPCs |                                    |                                            |                             |                                 |
|------------------|------------------------------------|--------------------------------------------|-----------------------------|---------------------------------|
| Parameter        | CRC-4 Mode Disabled<br>(x=A,B,E,F) | Far-End PM Disabled<br>(x=0,2,4,6,A,B,E,F) | CAS Disabled<br>(y=8,9,C,D) | Unframed Clear 2Mbit/s<br>(y=D) |
| CRC              | N/A                                |                                            |                             | N/A                             |
| FRER             |                                    |                                            |                             | N/A                             |
| OFS              |                                    |                                            |                             | N/A                             |
| ES               |                                    |                                            |                             | N/A                             |
| SES              |                                    |                                            |                             | N/A                             |
| CSS              |                                    |                                            |                             |                                 |
| CV               |                                    |                                            |                             |                                 |
| UAS              |                                    |                                            |                             | N/A                             |
| UATC             |                                    |                                            |                             | N/A                             |
| MER              |                                    |                                            | N/A                         | N/A                             |

aaaaaaa

- Daily CRC block error threshold value.

**a**

- Daily CRC block error threshold selection, (0 through 3)

bbbbbbbb

- Daily framing error threshold value.

**b**

- Daily framing error threshold selection, (0 through 3)

cccc

- Daily out of frame seconds threshold value.

**c**

- Daily out of frame seconds threshold selection, (0 through 3)

**dddd** - Daily errored second threshold value.  
**d** - Daily errored second threshold selection, (0 through 3)  
  
**eeee** - Daily severely errored second threshold value.  
**e** - Daily severely errored second threshold selection, (0 through 3)  
  
**ffff** - Daily controlled slip second threshold value.  
**f** - Daily controlled slip second threshold selection, (0 through 3)  
  
**ggggggggg** - Daily coding violation threshold value.  
**g** - Daily coding violation threshold selection, (0 through 3)  
  
**hhhh** - Daily unavailable second threshold value.  
**h** - Daily unavailable second threshold selection, (0 through 3)  
  
**iiii** - Daily unavailable time count threshold value.  
**i** - Daily unavailable time count threshold selection, (0 through 3)  
  
**jjjj** - Daily multiframe alignment error threshold value.  
**j** - Daily multiframe alignment error threshold selection, (0 through 3)  
  
**kkkkkkkk** - Daily far-end block error threshold value.  
**k** - Daily far-end path block error selection, (0 through 3)  
  
**lllll** - Daily far-end errored second threshold value.  
**l** - Daily far-end path second threshold selection, (0 through 3)  
  
**mmmm** - Daily far-end severely errored second threshold value.  
**m** - Daily far-end severely errored second threshold selection,  
(0 through 3)  
  
**nnnn** - Daily far-end unavailable second threshold value.  
**n** - Daily far-end unavailable second threshold selection, (0 through 3)  
  
**a a a a a** - 15-Minute CRC block error threshold value.  
**a** - 15-Minute CRC block error threshold selection, (0 through 3)

- nnn** - 15-Minute far-end unavailable second threshold value.
- n** - 15-Minute far-end unavailable second threshold selection,  
(0 through 3)

The options {a,b,c,d,e,f,g,h,i,j,k,l,m,n} and {a,b,c,d,e,f,g,h,i,j,k,l,m,n} are **m values** as previously shown and specify the threshold sets of the performance parameters listed.

The **TS0 abcdefgh** variables represent international and national bits in time slot'0, as defined by:

- ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

- c** - Remote Alarm Indication
- de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.
- f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW  
if provisioned for RPSFI otherwise spare national bit.
- gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

These variables are set to their default values "11011111" by this command, except for the Transmic'1G option, where the default is "11000000."

The variables may later be changed by setting the abcdefgh parameters in the TS0 field of the ED-PRMTR-EQPT::NPC or CHG::NPC (38321) command. Each of the variables may then be set to "0", "1", "P" or "V." "P" indicates that the incoming bit will be cross-connected unchanged; "V" indicates that the bit received will be inverted.

When TS0 is cross-connected, the TS0 bits will be either passed, inverted or set to "0" or "1" as indicated by the "abcdefgh" variable values. Note that bits which are used for alarms (bit 3 always; bits 4 and 5 if provisioned by the **mnxyz** values) may not be set to "P."

This is also true for NPCs assigned as test port NPCs.

The **TS0M abcdefgh** field allows monitoring of state changes in the received spare international bits, where the "abcdefgh" variables refer to the same TS0 bits as defined above for the TS0 "abcdefgh" variables.

The TSOM variables are specified for monitoring in the command as:

The default values for TSOM variables are **abcdefgh=00000000**, unless the **xyz** parameters set them differently, i.e., for Transmic'1G the abcdefgh=00111111. The TSOM variables may later be provisioned by the CHG::TSOM'abcdefgh or the ED-PRMTR-EQPT TSOM-abcdefgh (38323) command.

## **CTST,FAD,AIS,INCL**

### **NON-CANNELIZED TEST, MONITOR,SPLIT,LOOP**

#### **Explanation Of Command**

For a one-way circuit under test, the test mode can only be MONE or SPLTA. The FROM and TO NPCs must be entered as the E- and F-end NPCs, respectively.

The AIS keyword is required for test modes SPLTE, SPLTF, SPLTEF, LOOPE and LOOPF, to indicate the idle signal for any idle output port that resulted from the interruption.

The INCL keyword is required if one or more of the NPC(s) under test is marked Red or Customer-controlled, except when changing to a monitor mode.

Once a test connection is set up, this command can be entered with either one or both FADs, in any order. The original order of FAD assignment will be used until test access is released.

The E- and F-end NPCs for non-channelized test access correspond to the FROM and TO NPCs of a cross-connection, respectively. The test session is the circuit connection under test.

During a test session, if a hard-reset or link failure occurs, the test session is released automatically. However, if the failure is such that it prevents release at the time of logoff or if the FAD fails, the test session is NOT automatically released and can be released by manual disconnection.

## **Autonomous Message**

Not applicable.

## **Explanation Of Parameters**

**FAD** - Facility access digroup  
The test NPC

**tmode** - Test mode

*tmode* *Explanation*

**MONE** Monitor signal from equipment end (E-end) NPC to facility end (F-end) NPC of unmapped or one-/two-way mapped test session

**MONF** Monitor signal from F-end NPC to E-end NPC of a two-way mapped test session

**MONEF** Monitor a two-way mapped connection in both directions; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs

**SPLTA** Split the A signal from the equipment E-end NPC to the facility F-end NPC of one-/two-way mapped test session

**SPLTB** Split the B signal from the F-end NPC to the E-end NPC of a mapped two-way test session

**SPLTAB** Split both A and B signals of a two-way test session; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs

**SPLTE** Split the input and output ports of E-end NPC of an unmapped or two-way mapped test session

**SPLTF** Split the input and output ports of F-end NPC of a two-way mapped test session

**SPLTEF** Split a two-way mapped test session in both directions; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs

**LOOPE**                      Loop the E-end input port to the output port, and connect the looped signal to the FAD; the test session may include an unmapped or two-way mapped connection

**LOOPF**                      Loop the F-end input port to the output port, and connect the looped signal to the FAD; only for a two-way mapped test session; not allowed for one-way broadcast tributaries

**[s]abc**    - The 3- or 4-digit nonhierarchical number of test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this is one of two test NPCs; the message is denied if this NPC is currently not a FAD

**[t]def**    - Nonhierarchical number of second test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this number can be entered or omitted; either and/or both of [s]abc and [t]def can be entered, in any order, the original order of FAD assignment will be used; the message is denied if this NPC is currently not a FAD

**[u]ghi**    - Nonhierarchical number of E-end NPC, this is the reference NPC for the test session; it is a mapped or unmapped NPC, or the backbone of a broadcast circuit, depending on the test session specified

**[v]jkl**    - Nonhierarchical number of current F-end NPC of the test session. It is defined only if it is mapped to the E-end NPC; if it is omitted, the NPC mapped to the E-end NPC becomes the F-end NPC, or if the test session involves a broadcast circuit, the full tributary becomes the F-end NPC, if one does not exist, the parameter must be given to specify the tributary being tested; it must be omitted if the E-end NPC is unmapped.

**[t]klm**    - Nonhierarchical number of problematic NPC.

The valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

**uvmnp** - Hierarchical NPC number for FAD  
**wxkqr** - Hierarchical NPC number of second FAD  
**eghij** - Hierarchical E-end NPC number of test session  
**jklmn** - Hierarchical F-end NPC number of a mapped test session  
**ghklm** - Hierarchical number of problematic NPC

**uv,wx, eg, jk, gh**  
- Unit number  
**m,k,h,l** - Module number  
**np, qr, ij, mn, lm**  
- NPC number

The valid values are listed below:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**AIS** - Alarm indication signal.

May be specified to be idle signal. Quasi-random signal source (QRSS) is the default idle signal. If QRSS is not provisioned or in service, AIS must be entered for all test modes resulting in idle output port(s): SPLTE, SPLTF, SPLTEF, LOOPE, and LOOPF. AIS input shall be denied for test access of an unmapped NPC, and all other test modes.

**INCL** - Inclusive

Required for test session with red or customer-controlled NPC(s), except for MONE, MONF and MONEF modes.

**RDC** - Red circuit

Test session has red NPC(s)

**CUS** - Customer

Customer-controlled circuit  
Test session has Customer-controlled NPC(s)

**ONEWAY** - One way cross-connection  
Test session has one-way cross-connection

**UMPD** - Unmapped  
Test session has unmapped NPC

**EMODE** - E-end termination status

**FMODE** - F-end termination status

*emode*

*fmode Explanation*

**NORM** - The circuit under test is not terminated in this direction

**TERM** - The circuit under test terminated in this direction

The emode output is omitted for one-way circuits

Both emode and fmode are omitted for unmapped circuits

**COND** - Condition

**cc** - Condition code

**st** - Status of denial

**cc** - Hexadecimal condition code

**cc** *Explanation*

**02** Subject entity is not equipped

**04** Subject entity is out of service

**1E** Customer control or red circuit exists

**10** NPC out of service or failed

**12** Active CCN side not IS or failed or pested or hardware OOS

**13** UNIT not equipped, not in service, or failed

**14** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS

**15** FTMI not equipped, not in service, or failed

**16** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**17** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**34** Termination is under customer control (CUS)

**35** Termination is protected (RDC)

**46** NPC Failed or Out of Service

**70** NPC invalid type

**72** Invalid test mode for an unmapped test session

**73** Invalid test mode for a one-way test session

**75** Test session already exists

**76** AIS not entered for SPLTE/SPLTF/SPLTEF/LOOPE/LOOPF

**79** NPC is not a Facility Access Digroup

**7A** NPC is not an E-end

**7B** Invalid change from previous mode

**cc**    *Explanation*

**7C**    NPC is not a F-end

**FF**    Termination is in process of being rolled

**FE**    AIS entered for MONE/MONF/MONEF/SPLTA/SPLTB/SPLTAB

**8C**    The two FADS entered are not associated with one another.

## **CTST,FAD,EMODE,FMODE,INCL**

### **NON-CANNELIZED TEST FAD, EMODE, FMODE**

#### **Explanation Of Command**

This message changes the output mode (also known as termination status) of a non-channelized circuit under test. The status can be normal data transmission (NORM), or terminate (TERM) and send idle signal(s) to output port(s). The change can be selectively specified for the circuit's E-end and/or F-end NPCs. At least one of the two <e/fmode> fields must be entered, or the message is denied.

If the cross-connected circuit is terminated before a test session is set up, this command can be used to change the state from TERM to NORM. When the test session is released, the most recent state remains until a change (CHG) termination command is entered.

During a test session, if a hard-reset or link failure occurs, the test session is released automatically. However, if the failure is such that it prevents release at the time of logout or if the FAD fails, the test session is NOT automatically released and can be released by manual disconnection.

The E- and F-end NPCs for non-channelized test access correspond to the FROM and TO NPCs of a cross connection, respectively. A test session is the circuit connection under test.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**FAD** - Facility access digroup

**[s]abc** - The 3- or 4-digit nonhierarchical number of test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this is one of two test NPCs;  
the message is denied if this NPC is currently not a FAD

**[t]def** - Nonhierarchical number of second test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this number can be entered or  
omitted; either and/or both of [s]abc and [t]def can be entered,  
in any order, the original order of FAD assignment will be used;  
the message is denied if this NPC is currently not a FAD

**[u]ghi** - Nonhierarchical number of E-end NPC of circuit under test

**[v]jkl** - Nonhierarchical number of current F-end NPC

**[t]klm** - Nonhierarchical number of problematic NPC

The valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**uvmnp** - Hierarchical NPC number for FAD  
**wxkqr** - Hierarchical NPC number of second FAD  
**eghij** - Hierarchical E-end NPC number of test session  
**jklmn** - Hierarchical F-end NPC number of a mapped test session  
**ghklm** - Hierarchical number of problematic NPC

**uv,wx, eg, jk, gh**

- Unit number

**m,k,h,l** - Module number

**np,qr, ij, mn, lm**

- NPC number

The valid values are listed below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**EMODE** - Equipment-end mode

**emode** - Equipment-end termination status

**FMODE** - Facility-end mode

**fmode** - Facility-end termination status

*emode*

*fmode Explanation*

**NORM** The circuit under test is not terminated in this direction

**TERM** The circuit under test terminated in this direction

The emode cannot be changed and is omitted for one-way circuits

The fmode cannot be changed for modes SPLTE, SPLTEF and LOOPE

For an unmapped circuit neither the EMODE or FMODE can be changed.

If emode or fmode is omitted, the parameter retains its current value.

If either the E- or F-end NPC is out of service or failed, then is subsequently restored to service, the output modes remain as they were before the failure.

**RDC** - Red circuit

Test session has NPC(s) designated as red circuits

**CUS** - Customer

Test session has Customer-controlled NPC(s)

**INCL** - Inclusive

Required for circuits with customer-controlled or red NPC(s)

**ONEWAY** - One-way

Test session has a one-way cross-connection

**COND** - Condition

**st** - Status of denial

**cc** - Hexadecimal condition code

## **CTST,FAD,FROM,TO,AIS,INCL**

### **NON-CANNELIZED TEST ACCESS (MONITOR, SPLIT, OR LOOP)**

#### **Explanation Of Command**

This message sets up non-channelized test access in the monitor modes MONE, MONF, MONEF; the split modes SPLTA, SPLTB, SPLTAB, SPLTE, SPLTF, SPLTEF; and the loop modes LOOPE or LOOPF. The circuit under test can be one unmapped Network Processing Circuit (NPC), or a pair of mapped NPCs. The mapped circuit may be a one-way, two-way or broadcast circuit. A one-way circuit can only be tested in modes MONE and SPLTA. Only one test connection can exist at a time for any circuit.

For test modes MONEF, SPLTAB and SPLTEF two Facility Access Digroups (FADs), or test NPCs, are connected. The first FAD number is required; the second FAD can be user specified, or assigned by default to be NPC numbered n+1, where n is the NPC number of the first FAD. If n is the highest NPC number on the DACS II frame, the first NPC on the frame will be used as default for the second FAD. Whether a FAD is user specified or assigned by DACS II, the command will be denied if the FAD is assigned or has invalid type. One FAD is connected for all other modes.

During a test session, if a hard-reset or link failure occurs, the test session is released automatically. However, if the failure is such that it prevents release at the time of logoff, or if the FAD fails, the test session is NOT automatically released and can be released by manual disconnection.

The E- and F-end NPCs for non-channelized test access correspond to the FROM and TO NPCs of a cross-connection, respectively. For a broadcast circuit the full tributary is considered to be a two-way connection, and all other tributaries are one-way connections. Only one test session can exist for a circuit at a time. The FAD or test NPC corresponds to test ports for DS0 test access.

For modes SPLTE and LOOPE, the idle output port of the F-end NPC, and any other output ports the E-end is transmitting to, must be set to AIS.

For modes SPLTF and LOOPF, the idle output port of the E-end NPC, and any other output ports the F-end is transmitting to, must be set to AIS.

The output signal on all idle output ports related to a test session are restored to their previous values when the test modes are changed or test access is released. The OUTPUT modes can be overwritten when the NPC is test accessed.

### **Explanation Of Parameters**

---

**FAD** - Facility access digroup

**FROM** - FROM termination

**TO** - TO termination

**tmode** - Test mode

| <i>tmode</i> | <i>Explanation</i>                                                                                                                                                            |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MONE         | Monitor signal from equipment E-end NPC to facility F-end NPC of unmapped or one-/two-way mapped test session                                                                 |
| MONF         | Monitor signal from F-end NPC to E-end NPC of a two-way mapped test session                                                                                                   |
| MONEF        | Monitor a two-way mapped connection in both directions; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs         |
| SPLTA        | Split the A signal from the equipment E-end NPC to the facility F-end NPC of one-/two-way mapped test session                                                                 |
| SPLTB        | Split the B signal from the F-end NPC to the E-end NPC of a mapped two-way test session                                                                                       |
| SPLTAB       | Split both A and B signals of a two-way test session; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs           |
| SPLTE        | Split the input and output ports of E-end NPC of an unmapped or two-way mapped test session                                                                                   |
| SPLTF        | Split the input and output ports of F-end NPC of a two-way mapped test session                                                                                                |
| SPLTEF       | Split a two-way mapped test session in both directions; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs         |
| LOOPE        | Loop the E-end input port to the output port, and connect the looped signal to the FAD; the test session may include an unmapped or two-way mapped connection                 |
| LOOPF        | Loop the F-end input port to the output port, and connect the looped signal to the FAD; only for a two-way mapped test session; not allowed for one-way broadcast tributaries |

- [s]abc** - The 3- or 4-digit nonhierarchical number of test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this is the first of two test NPCs; the message is denied if this NPC is assigned
- [t]def** - The 3- or 4-digit nonhierarchical number of second test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this number can be user specified, if none is entered the next higher NPC number to [s]abc is used; the message is denied if it is assigned
- [u]ghi** - Nonhierarchical number of E-end NPC.  
This is the reference NPC for the test session; it is a mapped or unmapped NPC, or the backbone of a clear-DS1 broadcast circuit, depending on the test session specified
- [v]jkl** - Nonhierarchical number of current F-end NPC of the test session.  
This NPC is defined only if it is mapped to the E-end NPC. If this NPC is omitted from the input command, the NPC mapped to the E-end NPC becomes the F-end NPC or if the test session involves a broadcast circuit, the full tributary becomes the F-end NPC. If a full tributary does not exist, the NPC must be given to specify the tributary being tested. Omit this NPC if the E-end NPC is unmapped.
- [t]klm** - The 3- or 4-digit nonhierarchical number of problematic NPC

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**uvmnp** - Hierarchical number of test NPC or FAD  
**wxkqr** - Hierarchical number of second FAD  
**eghij** - Hierarchical number of E-end NPC  
**jklmn** - Hierarchical number of F-end NPC of the test session  
**ghklm** - Hierarchical number of problematic NPC

**uv,wx, eg, jk, gh**

- Unit number

**m,k,h,l** - Module number

**np,qr, ij, mn, lm**

- NPC number

The valid values are listed below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**AIS** - Alarm indication signal.

May be specified to be idle signal. AIS must be entered for all test modes resulting in idle output port(s): SPLTE, SPLTF, SPLTEF, LOOPE, and LOOPF. AIS input will be denied for test access of an unmapped NPC, and all other test modes.

**INCL** - Inclusive

Required for test session with red or customer-controlled NPC(s), except for MONE, MONF and MONEF modes. INCL will be ignored if the circuit is NOT RDC or CUS.

**RDC** - Red circuit

Test session has red NPC(s)

**CUS** - Customer

Customer-controlled circuit. Test session has Customer-controlled NPC(s)

**ONEWAY** - One way cross-connection

Test session has one-way cross-connection

**UMPD** - Unmapped

Test session has unmapped NPC

**EMODE** - E-end termination status

**FMODE** - F-end termination status

*emode**fmode Explanation***NORM** - The circuit under test is not terminated in this direction**TERM** - The circuit under test is terminated in this direction

The emode output is omitted for one-way circuits

Both emode and fmode are omitted for unmapped circuits

**COND** - Condition**cc** - Condition code**st** - Status of denial**cc** - Hexadecimal condition code

## **CTST,HUB,FAD,TO,INCL**

### **NON-CHANNELIZED TEST HUB**

#### **Explanation Of Command**

This message sets up a non-channelized hub connection between a facility access digroup (FAD), or test network processing circuit (NPC) and a remote FAD. The FAD is connected to an NPC which is connected to a remote test NPC. The NPCs cannot be part of an existing mapped circuit or test connection.

During a hub test session if a hard-reset or link failure occurs the hub test session is released automatically. However, if the failure is such that it prevents release at the time of logout, or if the FAD fails, the hub test session is NOT automatically released and can be released by manual disconnection.

Not applicable.

## Explanation Of Parameters

**HUB** - HUB connection

**FAD** - Facility access digroup

**[s]abc** - The 3- or 4-digit nonhierarchical number of test NPC or Facility Access Digroup (FAD).

**[t]jkl** - The 3- or 4-digit nonhierarchical number of TO NPC connected to the remote FAD

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

## **CTST,LPBKT,FAD,INCL**

### **NON-CANNELIZED LOOP TEST ACCESS FACILITY**

#### **Explanation Of Command**

This message terminally loops back a non-channelized Facility Access Digroup (FAD) or test network processing circuit (NPC).

Terminal looping is defined as looping of a terminated signal; it is done in the cross-connect network.

### Explanation Of Parameters

**FAD** - Facility access digroup

**[s]abc** - The 3- or 4-digit nonhierarchical FAD NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

## **CTST,TNR,ALL,OOS**

### **NON-CANNELIZED TEST NPC RELEASE**

#### **Explanation Of Command**

This message releases ALL non-channelized facility access digroups (FADs), or test network processing circuits (NPCs) activated by the user, and restores the test session to its original mapped or unmapped state.

It is preceded by individual CTST,TNR,FAD,OOS messages printed for each test session which is in progress.

If the circuit under test was a mapped circuit before the test session started, upon release of the FAD, the original cross-connection is restored. If the circuit was unmapped, it is restored to the unmapped or idle state that existed prior to testing.

#### **Command**

CTST:FRM xy,SEQ ww:TNR,ALL[,OOS]!

#### **Completion Message**

[O.20202]

M hh:mm:ss xy,ww n[vv] CTST TNR ALL COND cc COMPL

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**TNR** - Test NPC release

**ALL** - All  
Release all test NPCs

**OOS** - Out-of-service  
The OOS keyword must be entered to release one or more NPC(s) that are OOS. Mapped NPC(s) that are OOS will not be restored to original cross-connection until NPC(s) are returned to service.

**COND** - Condition code

**cc** - Hexadecimal condition code

**cc** *Explanation*

**00** No conditions

**01** No FADs were activated by link n

**02** One or more FADs could not be released

## **CTST,TNR,FAD,OOS**

### **NON-CANNELIZED TEST NPC RELEASE**

#### **Explanation Of Command**

This message releases a non-channelized facility access digroup (FAD) or test Network Processing Circuit (NPC) and restores the test session to its original mapped or unmapped state and releases ALL test NPCs activated by the user from the current link.

For test modes using two FADs, if one of the two FADs is entered, both FADs will be released from testing. If both FADs are entered, they must be associated with one another in the same test connection. Both FADs can be entered in any order and will still be released.

If the circuit under test was a mapped circuit before the test session start, upon release of FAD(s), the circuit is restored to cross-connection. If the circuit was unmapped, it is restored to the unmapped or idle state that existed prior to testing.

If the OOS keyword is input, NPC(s) that are out-of-service (OOS) should not be a reason for denial; 'NPC unequipped, failed, or not a test NPC' is a denial condition only for the case of one NPC.

#### **Command**

## Explanation Of Parameters

**TNR** - Test NPC release

**FAD** - Facility access digroup

**[s]abc** - The 3- or 4-digit nonhierarchical test NPC or Facility Access Digroup (FAD) number

**[t]def** - The second 3- or 4-digit nonhierarchical FAD number, if applicable

**[u]ghi** - The 3- or 4-digit nonhierarchical E-end NPC number of test session. Not applicable to loopback FAD

**[v]jkl** - The 3- or 4-digit nonhierarchical F-end NPC number of a mapped test session. Not applicable to loopback FAD

The values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

Test session has unmapped NPC

**EMODE** - E-end termination status

**FMODE** - F-end termination status

*emode*

*fmode Explanation*

**NORM** - The circuit under test is not terminated in this direction

**TERM** - The circuit under test terminated in this direction

The emode output is omitted for one-way circuits

Both emode and fmode are omitted for unmapped circuits

**OOS** - Out-of-service

The OOS keyword must be entered to release one or more NPC(s) that are OOS. Mapped NPC(s) that are OOS will not be restored to original cross-connection until NPC(s) are returned to service.

If the OOS keyword is entered in the input command it will appear in the first line of the output message. A second OOS keyword will appear in the last line of the output message if at least one NPC is out-of-service at the time the command is issued.

**RDC** - Red circuit

Test session has red circuit

**CUS** - Customer

Test session has customer-controlled Circuit

**COND** - Condition

**cc** - Condition code

**st** - Status of denial

**cc** - Hexadecimal condition code

**cc st Explanation**

**00** No conditions

**02** Subject entity is not equipped

**04** Subject entity is out of service

**10** NPC out of service or failed

**12 MCOND** Active CCN side not IS or failed or pested or hardware OOS

**13 MCOND** UNIT not equipped, not in service, or failed

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |

## **DDIS — DGN**

---

## **DDIS — DGN**

---

This section documents the commands **DDIS** through **DGN**.

## **DDIS,FROM,TO**

### **DISCONNECTION OF CIRCUITS FROM/TO DSP APPLICATION CARD**

#### **Explanation Of Command**

This command is used to disconnect a circuit (or a range of circuits) between an NPC that is not a DSP application and an NPC that **is** a DSP application NPC. The circuit may be a two-way or a one-way circuit. This command is also used to disconnect a circuit between two application cards.

**This command should only be used for clean-up purposes if the cross-connect cannot be disconnected by commands to the application itself.** Before issuing the command the user should perhaps try to remove and restore the application and try to issue the disconnect command through the application; keeping in mind, however, that a remove and subsequent restore will result in a momentary service loss.

This command is restricted to only the users who have the RMON (Restricted Maintenance privilege ON) privilege. Also, this command is not available via the on-line help feature.

This command will work if the facility terminating NPC and/or the application NPC are/is out-of-service. This command will also work for Red circuits.

This command should also be used if a test port connection to an application has been released using the FRC keyword in the TTST::TPR,TP,FRC command (I.27001), but the cross-connection that was used for the test port connection, which is a cross-connection between two of the application channels, still needs to be disconnected. The user should use the command UTL::QRY,CMAP (I.52011) to find the channel pair used by the application for the test port before executing this command.

### **Command**

---

#### **Nonhierarchical**

---

[I.15061]

DDIS:[FRM xy,SEQ ww]:FROM [s]abcddd[-eee],TO [v]ghijjj[-kkk]!

## Autonomous Message

Not applicable.

## Explanation Of Parameters

[s]abc - The From termination NPC number (3- or 4-digit)

uvmnp - The From termination NPC number (hierarchical)

[v]ghi - The To termination NPC number (3- or 4-digit)

wxkqr - The To termination NPC number (hierarchical)

ddd, jjj

- Channel numbers

eee, kkk

- Channel numbers, denoting the end of a range.

**Range**

*Type*

**001-024** DE, DA, TE and TA type NPCs

**000-031** PA, PB, PC and TH type NPCs

**001-064** SDxyz type application, see your application manual for details

**OOS** - At least one of the NPCs was out-of-service.

**RDC** - The disconnected circuit was a Red circuit

**mmm, nnn**

- Channel number involved in the denial. Otherwise the same as ddd.

**d** - Direction

**d** *Explanation*

**F** From

**T** To

**B** Both

**st** - Status of denial

**cc** - Hexadecimal condition code

## **DELETE,END**

### **DELETE LINES FROM MACRO**

#### **Explanation Of Command**

This command is used to delete one or more commands from an existing macro while in a macro session. If neither a range of line numbers nor END is specified then the line pointed to by the line pointer (the current line) is deleted.

#### **Command**

[I.19051]

```
DELETE[:FRM xy,SEQ ww:{<starting line>|END}[-{<ending line>\
|END}]]!
```

#### **Completion Message**

[O.19051]

```
M hh:mm:ss xy,ww n[vv] DELETE[{<starting line>\
|END}[-{<ending line>|END}]] COMPL
```

#### **Denial Message**

[O.19051.01]

```
M hh:mm:ss xy,ww n[vv] DELETE[{<starting line>|\
END}[-{<ending line>|END}]] COND cc DNY
```

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

{<starting line>|END}{-<ending line>\ {<starting line>|END}{-<ending line>|END}:\

#### **starting line**

- Beginning line number of a line range (1, 2, ..., n)

Starting line indicates the line number of the first line of a range of lines to be deleted from a macro.

#### **ending line**

- Ending line number of a line range (2, 3, ..., n+1)

Ending line indicates the line number of the last line of a range of lines to be deleted from a macro.

#### **END**

- End

Line number of the line at the end of the macro.

#### **COND**

- Condition

#### **cc**

- Hexadecimal condition code

**cc**    *Explanation*

**6B**    Invalid line number

**6E**    No edit session active

## Explanation Of Parameters

**CCB** - Cross-connect buffer

**s** - Cross-Connect Buffer side number (0 or 1)

**f** - Cross-Connect Buffer number (1 through 6)

**CFT** - Craft

The optional craft diagnostic test code field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run.

All tests can be run while out of service. Test 0004 will not run if any TSI on this Cross-connect Buffer (that is, TSI1 through TSI6) is in service.

**vwxy** - Diagnostic test number

| Test                        | vwxy |
|-----------------------------|------|
| Sync energy detector test   | 0001 |
| Port alarm test             | 0002 |
| Port alarm test             | 0004 |
| Clock energy detector test. | 0008 |

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**cc** - Condition code for CATP

| <i>cc</i> | <i>Explanation</i>                                             |
|-----------|----------------------------------------------------------------|
| 03        | CCB in service                                                 |
| 39        | Not all buses have mapped time slot, or some TSI is in service |
| 3A        | No unmapped time slots on one of the buses                     |
| 44        | DMB type NPCs on unit f on side s is in service.               |

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

pp - Failing diagnostic number in hexadecimal form  
qq - Test number in hexadecimal form.

| <i>ppqq</i> | <i>Explanation</i>                                             |

038N Port Alarm in-service test. Circuit pack identification wrong in ESR N.  
034N Port alarm in-service test. Overall error bit not set when test bus B. B=0-3.

**Note:** Involves CCNI register; could be a CCNI problem.

03aN Port alarm in-service test. Error bit not cleared in ESR N.  
032N Port alarm in-service test. Error returns after clear in ESR N.  
03b0 Port alarm in-service test. Summary returns after clear.

**Note:** Involves CCNI register; could be a CCNI problem.

03f0 Port alarm in-service test. Software error.  
0b00 Could not initialize pack.

**d5 - d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

**d5** - CCNI Error Source Register 5

Each data field contains sixteen bits. The significance of each data field and its individual bits is as follows:

| <i>Bit</i> | <i>Explanation</i>                        |
|------------|-------------------------------------------|
| 15-8       | Don't care                                |
| 7          | Error on autonomous switch enable circuit |
| 6          | Error on BSR parity                       |
| 5          | Parity error on high byte of data         |
| 4          | Parity error on low byte of data          |
| 3          | Address bus parity error                  |
| 2          | Synchronizer error                        |
| 1          | Error on CCB 6                            |
| 0          | Error on CCB 5                            |

**d4** - CCNI Error Source Register 4.

Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i>     |
|------------|------------------------|
| 15         | Error on CCB 4         |
| 14         | Error on CCB 3         |
| 13         | Error on CCB 2         |
| 12         | Error on CCB 1         |
| 11         | Error on FTM 4, Unit 6 |
| 10         | Error on FTM 3, Unit 6 |
| 09         | Error on FTM 2, Unit 6 |
| 08         | Error on FTM 1, Unit 6 |
| 07         | Error on FTM 4, Unit 5 |
| 06         | Error on FTM 3, Unit 5 |
| 05         | Error on FTM 2, Unit 5 |
| 04         | Error on FTM 1, Unit 5 |
| 03         | Error on FTM 4, Unit 4 |
| 02         | Error on FTM 3, Unit 4 |
| 01         | Error on FTM 2, Unit 4 |
| 00         | Error on FTM 1, Unit 4 |

**d3** - CCNI Error Source Register 3.

Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i>     |
|------------|------------------------|
| 15         | Error on FTM 4, Unit 3 |
| 14         | Error on FTM 3, Unit 3 |
| 13         | Error on FTM 2, Unit 3 |
| 12         | Error on FTM 1, Unit 3 |
| 11         | Error on FTM 4, Unit 2 |
| 10         | Error on FTM 3, Unit 2 |
| 09         | Error on FTM 2, Unit 2 |
| 08         | Error on FTM 1, Unit 2 |
| 07         | Error on FTM 4, Unit 1 |
| 06         | Error on FTM 3, Unit 1 |
| 05         | Error on FTM 2, Unit 1 |
| 04         | Error on FTM 1, Unit 1 |
| 03         | Error on TSI 66        |
| 02         | Error on TSI 56        |
| 01         | Error on TSI 46        |
| 00         | Error on TSI 36        |

**d2** - CCNI Error Source Register 2.

Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i> |
|------------|--------------------|
| 15         | Error on TSI 26    |
| 14         | Error on TSI 16    |
| 13         | Error on TSI 65    |
| 12         | Error on TSI 55    |
| 11         | Error on TSI 45    |
| 10         | Error on TSI 35    |
| 09         | Error on TSI 25    |
| 08         | Error on TSI 15    |
| 07         | Error on TSI 64    |
| 06         | Error on TSI 54    |
| 05         | Error on TSI 44    |
| 04         | Error on TSI 34    |
| 03         | Error on TSI 24    |
| 02         | Error on TSI 14    |
| 01         | Error on TSI 63    |
| 00         | Error on TSI 53    |

**d1** - CCNI Error Source Register 1.

Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i> |
|------------|--------------------|
| 15         | Error on TSI 43    |
| 14         | Error on TSI 33    |
| 13         | Error on TSI 23    |
| 12         | Error on TSI 13    |

\* Can be run only when the Expanded Cross-Connect Network (ECCN) side is out-of-service

The optional craft diagnostic code field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run.

**BT** - Bus termination

**sf** - BT identifier

**s** - Cross-connect side number (0 or 1)

**f** - Failed BT indicator

*f* *Explanation*

1 BT 1

2 BT 2

B Both BTs

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**cc** - Completion condition code (hexadecimal) (see cc for explanation)

**STF** - Some tests failed

**ppqq** - Trouble number for the craft (hexadecimal)

pp - Failing diagnostic number

qq - Test number

*ppqq* *Explanation*

0001 Address and Data Parity Exercise failed

0002 CCI Sync and Clock Exercise failed

0004 ETSI alarm exercise failed

0008 Sync summary alarm exercise failed

0010 Unit Summary Alarm Exercise failed

0020\* CCI Power Alarm Exercise failed

0040 Bus Status Register Parity Test failed

0080 Logic Cell Arrays (LCA) readback Test failed

0100 Bus Terminator (BT) Pack Alarm Exercise failed

0200\* Out-of-service Bus Status Register Diagnostics failed

0400\* CCI reset register check failed

0800\* ETSI reset register check failed

8000 CCI failed hardware initialization

\* ECCN out-of-service test

wd21, ..., wd00

- Raw data words

These words are related to the diagnostic failure. Each word contains two bytes, and each byte is shown as a 2-digit hexadecimal number.

**cc** - Hexadecimal condition code

**cc Explanation**

**02 Subject entity is not equipped**  
**03 Subject entity is in service**  
**55 Invalid CFT code**  
**56 Unrunnable CFT code**

**Explanation Of Parameters**

---

**CCNI** - Cross-connect network interface**s** - Cross-connect side number (0 or 1)**CFT** - Craft

The optional craft diagnostic code field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run. All diagnostic tests can be run in or out of service.

**vwxy** - Diagnostic test number

| <i>Test</i>                  | <i>vwxy</i> |
|------------------------------|-------------|
| Unmask test                  | 0001        |
| Lowbyte/highbyte parity test | 0002        |
| ESR/EMR test                 | 0004        |
| Bus status register test     | 0008        |
| Autonomous switch test       | 0010        |
| Address bus parity test      | 0020        |

**ATP** - All tests passed**STF** - Some tests failed

**ppqq** - Trouble number for the craft

pp - Failing diagnostic number in hexadecimal form

qq - Test number in hexadecimal form

| <i>ppqq</i> | <i>Explanation</i>                                                                                                                                          |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0110        | Autonomous switch enable test: error bit not set                                                                                                            |
| 0120        | Error bit returns after clear                                                                                                                               |

| 0b00        | Could not initialize pack                                                                                                                                   |

**CATP** - Conditional all tests passed

**cc** - Hexadecimal condition code

**d5-d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

**d5** - CCNI Error Source Register 5

Each data field contains sixteen bits. The significance of each data field and its individual bits is as follows:

| <i>Bit</i> | <i>Explanation</i>                        |
|------------|-------------------------------------------|
| 15-8       | Don't care                                |
| 7          | Error on autonomous switch enable circuit |
| 6          | Error on BSR parity                       |
| 5          | Parity error on high byte of data         |
| 4          | Parity error on low byte of data          |
| 3          | Address bus parity error                  |
| 2          | Synchronizer error                        |
| 1          | Error on CCB 6                            |
| 0          | Error on CCB 5                            |

**d4** - CCNI Error Source Register 4. Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i>     |
|------------|------------------------|
| 15         | Error on CCB 4         |
| 14         | Error on CCB 3         |
| 13         | Error on CCB 2         |
| 12         | Error on CCB 1         |
| 11         | Error on FTM 4, Unit 6 |
| 10         | Error on FTM 3, Unit 6 |
| 09         | Error on FTM 2, Unit 6 |
| 08         | Error on FTM 1, Unit 6 |
| 07         | Error on FTM 4, Unit 5 |
| 06         | Error on FTM 3, Unit 5 |
| 05         | Error on FTM 2, Unit 5 |
| 04         | Error on FTM 1, Unit 5 |
| 03         | Error on FTM 4, Unit 4 |
| 02         | Error on FTM 3, Unit 4 |
| 01         | Error on FTM 2, Unit 4 |
| 00         | Error on FTM 1, Unit 4 |

**d3** - CCNI Error Source Register 3. Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i>     |
|------------|------------------------|
| 15         | Error on FTM 4, Unit 3 |
| 14         | Error on FTM 3, Unit 3 |
| 13         | Error on FTM 2, Unit 3 |
| 12         | Error on FTM 1, Unit 3 |
| 11         | Error on FTM 4, Unit 2 |
| 10         | Error on FTM 3, Unit 2 |
| 09         | Error on FTM 2, Unit 2 |
| 08         | Error on FTM 1, Unit 2 |
| 07         | Error on FTM 4, Unit 1 |
| 06         | Error on FTM 3, Unit 1 |
| 05         | Error on FTM 2, Unit 1 |
| 04         | Error on FTM 1, Unit 1 |
| 03         | Error on TSI 66        |
| 02         | Error on TSI 56        |
| 01         | Error on TSI 46        |
| 00         | Error on TSI 36        |

**d2** - CCNI Error Source Register 2. Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i> |
|------------|--------------------|
| 15         | Error on TSI 26    |
| 14         | Error on TSI 16    |
| 13         | Error on TSI 65    |
| 12         | Error on TSI 55    |
| 11         | Error on TSI 45    |
| 10         | Error on TSI 35    |
| 09         | Error on TSI 25    |
| 08         | Error on TSI 15    |
| 07         | Error on TSI 64    |
| 06         | Error on TSI 54    |
| 05         | Error on TSI 44    |
| 04         | Error on TSI 34    |
| 03         | Error on TSI 24    |
| 02         | Error on TSI 14    |
| 01         | Error on TSI 63    |
| 00         | Error on TSI 53    |

**d1** - CCNI Error Source Register 1. Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i> |
|------------|--------------------|
| 15         | Error on TSI 43    |
| 14         | Error on TSI 33    |
| 13         | Error on TSI 23    |

### **DIAGNOSE COMMUNICATIONS INTERFACE**

#### **Explanation Of Command**

---

This message requests diagnostics to be run on the communications interface (CI). The optional craft (CFT) field specifies which test(s) vwxy is to be run on the CI. The remainder of the CI diagnostics will then not be run.

An in progress message (O.41004) is output every 20 seconds while CI is being diagnosed until the command response or the autonomous report is output.

### Explanation Of Parameters

**CI** - Communications Interface

**CFT** - Craft

**vwxy** - Diagnostic test number (hexadecimal)

| Test                             | vwxy  |
|----------------------------------|-------|
| CI RAM Test                      | 0001* |
| CI ROM Test                      | 0002  |
| CI DMA Controller Test           | 0004* |
| CI LAN Controller Test           | 0008* |
| CI Acknowledge Test              | 0010  |
| CI Timer Test.                   | 0020  |
| CI Debug Port Test               | 0040* |
| CI Additional Memory Enable Test | 0080* |

\*Out-of-service test.

**ATP** - All Tests Passed

**CATP** - Conditional All Tests Passed

**cc** - Hexadecimal completion condition code  
*To interpret values of cc see the cc table below.*

**STF** - Some Tests Failed

**ppqq** - Trouble number for the craft (hexadecimal)  
pp - Failing diagnostic number  
qq - Test number

| <i>ppqq</i> | <i>Explanation</i>                                 |
|-------------|----------------------------------------------------|
| 0101        | RAM Data Fail                                      |
| 0102        | RAM Address Fail                                   |
| 0103        | RAM Access Fault                                   |
| 0104        | RAM Refresh Fail                                   |
| 0105        | RAM Parity Fail                                    |
| 0200        | ROM Fail                                           |
| 0400        | Timer Fail                                         |
| 0500        | Input Port Fail                                    |
| 0600        | DMA Controller Fail                                |
| 0700        | LAN Controller Fail                                |
| 0900        | Acknowledge Fail                                   |
| 0831        | The input port is unstable                         |
| 0832        | The timer failed to generate an interrupt in time  |
| 0840        | Timeout occurred during loopback                   |
| 0841        | Character overrun occurred during loopback         |
| 0842        | Framing error occurred during loopback             |
| 0843        | Looped character had a parity error                |
| 0844        | Received break during loopback test                |
| 0845        | Transmit and Receive buffers don't match           |
| 0846        | Too many characters looped back                    |
| 0847        | An unknown condition occurred                      |
| 0301        | Additional memory IS enabled when it should not be |
| 0302        | Additional memory IS NOT enabled when it should be |

**d5 - d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

| <i>Data Byte</i> | <i>Value</i> |

## **Explanation Of Parameters**

---

**ET SIS** - Expanded time slot interchangers

**ECCN** - Expanded cross-connect network

**s** - Side number (0 or 1)

**pa** - Priority of action

*pa*            *Explanation*

M^            Manual response

I^            Information from an autonomous activity

**r** - Diagnostic status for an individual ETSI

*r*            *Explanation*

A            All tests passed (ATP)

C            Conditional all tests passed (CATP)

S            Some tests failed (STF)

-            unequipped ETSI

**nn** - Condition code (hexadecimal) for an individual ETSI

**nn**            *Explanation*

--            Unequipped ETSI

To interpret other values of nn see cc below.

**tt** - Total number of ETSIs equipped in the ECCN side (01 through 16)

**kk** - Completion condition code (hexadecimal) for the whole message

To interpret values of kk see cc below.

**cc** - Condition code (hexadecimal)

**cc** - Hexadecimal condition code

**cc Explanation**

|    |                                |
|----|--------------------------------|
| 02 | Subject entity is not equipped |
| 03 | Subject entity is in service   |
| 16 | SYNC TB is not equipped        |
| 17 | SYNC is out of service         |
| 55 | Invalid CFT code               |
| 56 | Unrunnable CFT code            |
| A9 | No unmapped time slot          |
| CE | CCI is out of service          |
| CF | SYNC is inservice but failed   |
| D1 | CCI is not present             |
| D4 | CCI is inservice but failed    |

## **DGN,IN,PROGRESS**

### **DIAGNOSTIC IN PROGRESS**

#### **Explanation Of Command**

This message indicates that the diagnosis of the specified entity is in progress. This message will be output every 20 seconds while waiting for the response to the diagnostic command or the autonomous diagnostic report to be output.

### Explanation Of Parameters

**CFT** - Craft

**vwxy** - Diagnostic test number

|                         |             |
|-------------------------|-------------|
| <i>test</i>             | <i>vwxy</i> |
| Link Loopback Test      | 0001        |
| Input Port & Timer Test | 0002        |

**LINK** - Link

**a** - Administrative link number (1 through 6)

**ATP** - All tests passed

**STF** - Some tests failed

**ppqq** - Diagnostic trouble number

| <i>ppqq</i> | <i>Explanation</i>          |
|-------------|-----------------------------|
| 0100        | Link fail                   |
| 0300        | DUART test fail             |
| 0400        | Timer test fail             |
| 0500        | Input/output port test fail |

**pp** - Failing diagnostic number (hexadecimal)

**qq** - Test number (hexadecimal)

**d5,**

**d4,**

**...,**

**d0**

- Hexadecimal raw data bytes relating to the failed diagnostic detected

These data bytes can only be interpreted by a Lucent Technologies design engineer.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**03** Subject entity is in service

**BE** Hardware mismatch or not present

**F0** Clock absent for XPC to loop back

### **DIAGNOSE MAIN CONTROLLER**

#### **Explanation Of Command**

---

This message requests diagnostics to be run on the main controller (MC). The optional CFT field specifies which test(s) is to be run on the MC.

The DGN <entity> IN PROGRESS message (O.41004) is output every 20 seconds while the MC is being diagnosed until the command response or the autonomous report is output.

## **DGN,MP,CFT,X**

---

### **DIAGNOSE MAIN PROCESSOR**

#### **Explanation Of Command**

---

This message requests diagnostics to be run on the main processor (MP). If the craft (CFT) option is used, the value supplied for *vwxy* will determine the diagnostic run. The remainder of the diagnostics will then not be run. If the CFT option is not used, all the diagnostics listed under *vwxy* will be run.

An in-progress message (O.41004) is output every 20 seconds while the MP is being diagnosed until the command response or the autonomous report is output.

**06xx** DMA Controller Fail

**07xx** LAN Controller Fail

**0900** Acknowledge Fail

xx indicates a low level test failure point which can only be interpreted by a Lucent Technologies design engineer.

**d5-d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

These data bytes can only be interpreted by a Lucent Technologies design engineer.

An in-progress message (O.41004) is output every 20 seconds while the MP is being diagnosed until the command response or the autonomous report is output.

**cc** - Hexadecimal condition code

**cc Explanation**

**03 Subject entity is in service**

**55 Invalid CFT code**

**56 Unrunnable CFT code**

## **DGN,NPC**

---

### **DIAGNOSE NETWORK PROCESSING CIRCUITS**

#### **Explanation Of Command**

---

This command requests the diagnosis of a range of network processing circuits (NPCs) in a Facility Terminating Unit (FTU). It cannot be used to request the diagnosis of NPCs in a digital signal processing unit.

This command will be denied if the requested NPC range crosses a unit boundary. This command cannot be used to request the diagnosis of NPCs in a DS3 unit (DS3U) or a Hybrid DS3 unit (HDS3U). If this command is specified for a range of NPCs and the first or last NPC in the range request in is a CEPT GAP the entire command will be denied. If the CEPT GAP is contained within the range requested the gap NPCs are ignored and all equipped NPCs are diagnosed.

## Explanation Of Parameters

---

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, denoting the beginning of a range.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, denoting the end of a range.

[s]abc and [t]def must be in the same unit.

**[s]ghi** - Lowest NPC number in the FTM being reported ([s]abc through [s]def)

**[t]jkl** - Highest NPC number in the FTM being reported ([s]abc through [s]def)

The command may specify an NPC range that spans more than one facility terminating module (FTM) in the facility terminating unit or it may specify all or a subset of the NPCs in a given FTM. Hence the NPC numbers reported in a message segment for a given FTM will, in general, be numbers within the range given in the input command and may include the end points of the specified range.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |

| <b>1281-1312</b> | <b>1441-1472</b> | <b>1601-1632</b> | <b>1761-1792</b> |
| <b>1321-1352</b> | <b>1481-1512</b> | <b>1641-1672</b> | <b>1801-1832</b> |
| <b>1361-1392</b> | <b>1521-1552</b> | <b>1681-1712</b> | <b>1841-1872</b> |
| <b>1401-1432</b> | <b>1561-1592</b> | <b>1721-1752</b> | <b>1881-1912</b> |

| Unit<br>13 | Unit<br>14 | Unit<br>15 | Unit<br>16 |
|------------|------------|------------|------------|
| NPC        | NPC        | NPC        | NPC        |
| 1921-1952  | 2081-2112  | 2241-2272  | 2401-2432  |
| 1961-1992  | 2121-2152  | 2281-2312  | 2441-2472  |
| 2001-2032  | 2161-2192  | 2321-2352  | 2481-2512  |
| 2041-2072  | 2201-2232  | 2361-2392  | 2521-2552  |

**uvmnp** - Hierarchical NPC number, denoting the beginning of a range.

**uvkqr** - Hierarchical NPC number, denoting the end of a range.

**abcde** - Lowest NPC number in the FTM being reported (**uvmnp** through **uvkqr**)

**abcfg** - Highest NPC number in the FTM being reported (**uvmnp** through **uvkqr**)

**uv, ab**

- Unit number

**m, k, c**

- Module number

**np, qr, de, fg**

- NPC number within the module

The command may specify an NPC range that spans more than one facility terminating module (FTM) in the facility terminating unit or it may specify all or a subset of the NPCs in a given FTM. Hence the NPC numbers reported in a message segment for a given FTM will, in general, be numbers within the range given in the input command and may include the end points of the specified range.

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

**TOT** - Total

**ttt** - Total number of equipped NPCs in a CEPT FTM (**001** through **032**).

**pa** - Priority of action

**pa**      *Explanation*

**\*\***      Major

**M**      Manual

**r** - Result of diagnostics

| <b>r</b> | <i>Explanation</i>           |
|----------|------------------------------|
| <b>A</b> | All tests passed             |
| <b>C</b> | Conditional all tests passed |
| <b>S</b> | Some tests failed            |
| <b>D</b> | Diagnostics denied           |
| <b>N</b> | NPC is not in the range      |
| <b>-</b> | NPC is not equipped          |

If the diagnostic result is Some Test Failed, one output message will be generated for each NPC.

**kk** - Completion condition code for each NPC diagnostic (hexadecimal)

To interpret values of kk see cc in the condition code table. One special value is given below.

| <b>kk</b> | <i>Explanation</i> |
|-----------|--------------------|
| <b>--</b> | Not applicable     |

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>Explanation</b>               |
|-----------|----------------------------------|
| <b>00</b> | No conditions                    |
| <b>02</b> | Subject entity is not equipped   |
| <b>03</b> | Subject entity is in service     |
| <b>04</b> | Subject entity is out of service |
| <b>10</b> | Unit is not equipped             |
| <b>11</b> | UC is out of service             |
| <b>13</b> | FTMI is not equipped             |
| <b>14</b> | FTMI is out of service           |
| <b>15</b> | NPC is unequipped                |
| <b>36</b> | DSPI not equipped                |
| <b>37</b> | DSPI out-of-service              |
| <b>40</b> | FC out of service                |
| <b>43</b> | (NPC) Hardware mismatch          |
| <b>0B</b> | Invalid CEPT NPC                 |

## **DGN,NPC,SIDE,CFT,X**

### **DIAGNOSE NPC**

#### **Explanation Of Command**

This command requests diagnostics to be run on a single network processing circuit (NPC) in a facility terminating unit (FTU) or a digital signal processing unit (DSPU). For a Capacity Expansion Frame (CEF), if the NPC is in a DSPU (that is, NPC types MB, SR, or MJ), this message also initiates the continuity test for the cable between the NPC and its corresponding expanded time slot interchanger (ETSI). However, the continuity test will not be run if the optional craft code is entered.

This command is not valid for NPCs in a DS3 unit (DS3U) or Hybrid DS3 unit (HDS3U).

### Explanation Of Parameters

[s]abc - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 |
|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       |
| 0001-0032 | 0161-0192 | 0321-0352 | 0481-0512 |
| 0041-0072 | 0201-0232 | 0361-0392 | 0521-0552 |
| 0081-0112 | 0241-0272 | 0401-0432 | 0561-0592 |
| 0121-0152 | 0281-0312 | 0441-0472 | 0601-0632 |

If NPC numbers are expressed in four digits, the valid values are:

SD type NPC numbers listed by unit number, within a **North American module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

CB type NPC numbers listed by unit, module, and NPC Number  
Unit Type DP (DSPU)

|              |            |           |
|--------------|------------|-----------|
| Unit         | Module     | NPC       |
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**SIDE** - Side

**s** - Side number (s = 0 or 1)

Side of the duplicated NPC circuit pack in a DSPU that is to be diagnosed.

**CFT** - Craft

**vwxy** - Diagnostic test number

The optional craft code field indicates the diagnostic test(s) to be run. If this field is omitted, all tests of this diagnostic will be run. If the NPC is in-service, only in-service diagnostics are run.

**Craft codes for the CB type NPC are listed below:**

| <i>Test</i>                              | <i>vwx</i> y |
|------------------------------------------|--------------|
| Out of service LCA device initialization | 0001*        |
| Interrupt and mask register test         | 0002*        |
| Out of service RAM test                  | 0004         |
| Status and mask register test            | 0008         |
| Parity checker test                      | 0010         |
| State machine exercise                   | 0020         |
| Receive CCN exercise                     | 0040         |
| Loss of clock exercise                   | 0080         |
| C-bit interface test                     | 0100         |
| In-service RAM test                      | 0200         |

\* Out-of-service only test

**Craft codes for the MB type NPC are listed below:**

| <i>Test</i>                      | <i>vwx</i> y |
|----------------------------------|--------------|
| RAM test                         | 0001*        |
| Interrupt and mask register test | 0002         |
| Data processing error test       | 0004         |
| Clock error test                 | 0008         |
| Serial interface error test      | 0010         |
| Control memory 0 test            | 0020         |
| Control memory 1 test            | 0040         |
| Conference 0 test                | 0080         |
| Conference 1 test                | 0100         |

\* Out-of-service only test

**Craft codes for the PA type NPC are listed below:**

| <i>Test</i>                            | <i>vwx</i> |
|----------------------------------------|------------|
| CI stuck bit test                      | 0001       |
| CI sanity test                         | 0002       |
| CI serial link test                    | 0004       |
| TG192 RAM test                         | 0008       |
| Channel controller tests               | 0010*      |
| Transceiver tests                      | 0020       |
| Miscellaneous register tests           | 0040       |
| Real-time clock test                   | 0080       |
| CC to format converter continuity test | 0100       |

\* In-service test

**Craft codes for the PB and PC type NPCs are listed below:**

| <i>Test</i>                                                                                                                                                 | <i>vwx</i> |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| CI stuck bit and device alarm tests                                                                                                                         | 0001       |
| CI sanity timer test                                                                                                                                        | 0002       |
| CI serial link test                                                                                                                                         | 0004       |
| CC stuck bit test on read and write registers                                                                                                               | 0008       |
| CC Instruction RAM stuck bit test                                                                                                                           | 0010       |
| CC receive data parity alarm test                                                                                                                           | 0020       |
| Memory test                                                                                                                                                 | 0040       |
| DSI LFV exercise and transceiver LFV counter test                                                                                                           | 0080*      |
| Data path, CC monitor, and DSI loopback tests AND CC PCM conversion and signaling mode test AND CC conditional substitution and transceiver EFG source test | 0100       |

|                                                                                                         |       |
|---------------------------------------------------------------------------------------------------------|-------|
| SLIP/SKIP tests                                                                                         | 0200* |
| Line coding format test                                                                                 | 0400* |
| Diframe framing, NSA signaling<br>mode tests AND CRC framing mode<br>tests AND CAS signaling mode tests | 0800* |
| CC device alarm exercises                                                                               | 1000  |
| Transceiver r/w reg. stuck bit test and<br>device alarm exercises                                       | 2000* |
| Miscellaneous register stuck bit test                                                                   | 4000  |
| Time slot 0/16 source test                                                                              | 8000* |

Notes:

1. Only tests 0001 and 1000 can be run when the NPC is in service.
2. If the requested NPC is Out-of-Service and its mate is In Service, only the tests marked with "\*" can be run:
3. If both the requested NPC and its mate are Out-of-Service, any test may be run.

**Craft codes for the SD type NPCs are listed below:**

|                                 |            |
|---------------------------------|------------|
| <i>Test</i>                     | <i>vwx</i> |
| CI stuck bit test               | 0001       |
| CI sanity test                  | 0002       |
| CI serial link test             | 0004       |
| TG193 CC Config. Reg. test      | 0008       |
| TG193 CC IRAM etc. tests        | 0010       |
| TG193 clock & synch error tests | 0020*      |
| TG193 RAM tests                 | 0040       |
| Miscellaneous register test     | 0080       |

**Note:** \* denotes that the test can be run while the NPC is In Service

**[t]def** - The 3- or 4-digit nonhierarchical MB type NPC number  
([t]def= [s]abc + 1)

**uvmnp** - Hierarchical MB type NPC number

**uvmqr** - Hierarchical MB type NPC number

**qr** - MB type NPC number within module "m" (qr = np +1).

**TYPE** - Type

**mnxyz** - NPC type identifier

*mnxyz NPC type*

**CB10z** C-bit processor

**MB100** Digital Multipoint Bridge

**PAxyz** CEPT Type NPC (120-ohm twisted pair or 75-ohm coaxial)

**PBxyz** CEPT Type NPC

**PCxyz** CEPT Type NPC

**SDxyz** DSP Platform Applications

**e** - Number of lines in the message (2 or 3)

**qq** - Unit number (01 through 16)

**UPN** - Unit plug number

**upn** - The value of the UPN.

**XPN** - ECCN plug number

**xpn** - The value of the XPN

**BIT** - Bit number of the data bus

**TD** - Transmit data

**RD** - Receive data

**bb** - Bit number (00 through 15)

The optional line which contains the unit, port, and pin information will only be output if the NPC is in a DSPU and if the continuity check between the NPC and the ECCN is failed. In addition, the completion condition must always be STF. The valid values and the associated information of the UPN and XPN are shown below. Note that the numbers shown in the output are exactly the same as the numbers on the backplane.

| Unit Plug No. | ECCN Plug No. | Side | Direction | Associated DSP Packs  |
|---------------|---------------|------|-----------|-----------------------|
| P1            | PqqA*         | 0    | Receive   | 1st and 2nd DSP Packs |
| P2            | PqqE          | 0    | Transmit  | 1st and 2nd DSP Packs |
| P3            | PqqB          | 0    | Receive   | 3rd and 4th DSP Packs |
| P4            | PqqF          | 0    | Transmit  | 3rd and 4th DSP Packs |
| P5            | PqqC          | 0    | Receive   | 5th and 6th DSP Packs |
| P6            | PqqG          | 0    | Transmit  | 5th and 6th DSP Packs |
| P7            | PqqD          | 0    | Receive   | 7th and 8th DSP Packs |
| P8            | PqqH          | 0    | Transmit  | 7th and 8th DSP Packs |
| P10           | PqqA          | 1    | Receive   | 1st and 2nd DSP Packs |
| P11           | PqqE          | 1    | Transmit  | 1st and 2nd DSP Packs |
| P12           | PqqB          | 1    | Receive   | 3rd and 4th DSP Packs |
| P13           | PqqF          | 1    | Transmit  | 3rd and 4th DSP Packs |
| P14           | PqqC          | 1    | Receive   | 5th and 6th DSP Packs |
| P15           | PqqG          | 1    | Transmit  | 5th and 6th DSP Packs |
| P16           | PqqD          | 1    | Receive   | 7th and 2nd DSP Packs |
| P17           | PqqH          | 1    | Transmit  | 7th and 8th DSP Packs |

\* qq is the unit number

The bit number (that is, BIT = TDRD bb) will be shown if the software identifies the bit of the data bus as the failed one.

**ATP** - All tests passed

All tests passed on the diagnostic of NPC

**CATP** - Conditional all tests passed

The reason for the conditional completion is indicated by cc.

**STF** - Some tests failed

Some tests failed on the diagnostic of NPC.

**ppqq** - Trouble number for the craft

pp Failing diagnostic number (hexadecimal)

qq Test number (hexadecimal)

#### **Trouble numbers for the PA type NPC are listed below:**

The TG192 circuit pack can be grown as either a PA or PB/PC type. As a consequence the trouble numbers for the PB type apply in addition to those shown below.

*ppqq Cause of failure*

|             |                                                     |
|-------------|-----------------------------------------------------|
| <b>0001</b> | TG192 Initialization - Phase 1                      |
| <b>0002</b> | TG192 Initialization - Phase 2                      |
| <b>0003</b> | digroup physical type verification                  |
| <b>0004</b> | devices/registers on the FC could not be accessed   |
| <b>0005</b> | devices/registers on the FTMI could not be accessed |

**Note:** "--" indicates a two-digit hexadecimal value indicating a decision point within the source program. This value can only be interpreted by a programmer with access to the source program.

**Trouble numbers for PB and PC type NPCs are listed below:**

The TG192 circuit pack can be grown as either a PA or PB/PC type. As a consequence the trouble numbers for the PA type apply in addition to those shown below.

*ppqq Cause of failure*

**0B01** DPC NSA Signaling Mode failure  
**0B02** DPC CRC Signaling Mode failure  
**0B03** DPC CAS Signaling Mode failure  
**1100** DPC Channel Controller/PCM Conversion failure  
**1200** DPC CC Conditional Substitution failure  
**1300** DPC Channel Controller Alarm failure  
**1700** DPC Line Format Violation failure  
**1A00** DPC Line Coding Format(AMI/HDB3) failure  
**1C00** DPC Misc. Register Stuck Bit failure  
**1D00** DPC Timeslot 0/16 Spare Bit failure  
**1E00** DPC CI Device Alarm failure  
**1F00** DPC Channel Controller Data Path failure

**Trouble numbers for MB and CB type NPCs are listed below:**

*ppqq Cause of failure*

**0F00** Error Summary Failure  
**0F01** Hardware Fail on ECCI pack  
**0F02** Hardware Fail on ETSI pack  
**0F03** RCV Network Data Bus Failure  
badbit, baddirection & badport  
**0F04** RCV Network Data Bus Failure  
baddirection & badport  
**0F05** XMIT Network Data Bus Failure  
badbit, baddirection & badport  
**0F06** XMIT Network Data Bus Failure  
baddirection & badport  
**0F07** Pack hardware failure  
**0F0A** Parent pack failed, for DSP packs  
**0F0C** Network Parity or Frame Sync. or  
Network Data Bus error

**Trouble numbers for only the MB type NPCs are listed below:**

*ppqq Cause of failure*

- 0F08** Pack Failed to Initialize for CT
- 0F0B** DMB clock problem during initialization

**Trouble numbers for the SD type NPCs are listed below:**

*ppqq Cause of failure*

- C8** RCV continuity test won't be run: at least one timeslot in use
- CB** Skip error summary since adjacent pack not in service or pested
- CE** CCI is out of service
- E0** ETSI not equipped, not in service, or failed

## **DGN,PMEM,SMEM,CFT,X,EXCT,DBASE,VERIFY**

### **RUN DIAGNOSTICS ON NON-VOLATILE MEMORY CARD**

#### **Explanation Of Command**

This command requests diagnostics to be run on the specified non-volatile memory card; either the primary memory card (PMEM) or the secondary memory card (SMEM). The diagnostics test the operation of the underlying hardware of the specified memory card. By default, the entire set of in-service or out-of-service diagnostics are run except for the database and executable tests. If the craft option is used, the value supplied for *vwxy* will determine the diagnostics run and can include database and executable tests.

Using the optional keywords EXCT or DBASE, allows the user to test the system's ability to correctly read either the executable program or the database stored on a memory card. When a single or multiple diagnostic test is specified via the CFT parameter, only those tests specified by the CFT parameter are run, all other possible tests are not run. The **DGN IN PROGRESS** message is output every 20 seconds while the diagnostics are being executed until the command response or the autonomous report is output.

### **Explanation Of Parameters**

---

**PMEM** - Primary memory card.

**SMEM** - Secondary memory card.

**CFT** - Craft

**X** - Hexidecimal

**vwxy** - Diagnostic test number

The optional craft code field specifies which test is to be run on the PMEM/SMEM. The card status test is always performed. The remainder of the PMEM/SMEM diagnostics will not be run.

**vwyx** *Test*

**0001** Card Status Test

**0002** Wear Level Test

**0004\*** Card Diagnostic Test

0010\*+ Validate Data Base Test

0020\*% Validate Boot Block Test

0040\*% Validate Executable Header Test

0080\*% Validate Executable Test

**0100\*** Read/Write DGN Volume Test

**0200\*** Mount/Unmount All Volumes Test

\* out-of-service tests (not performed if PMEM/SMEM card is in the in-service state and the main controller is also in the in-service state).

+ Database tests (performed when DBASE keyword is specified).

% Executable tests (performed when EXCT keyword is specified).

**DBASE** - Database

This keyword is used to test the ability to correctly read the data base files stored on the PMEM/SMEM. This diagnostic will be run only if the DBASE keyword is entered or if the specific test CFT field is specified.

PMEM/SMEM must be out-of-service (OOS) or the main controller must be in maintenance condition (MCOND) when using this keyword.

**EXCT** - Executables

This keyword is used to test the ability to correctly read the executables stored on the PMEM/SMEM. This diagnostic will be run only if the EXCT keyword is entered or if the specific test CFT field is specified.

PMEM/SMEM must be out-of-service (OOS) or the main controller must be in maintenance condition (MCOND) when using this keyword.

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

**pp** - Failing Diagnostic Number (hexadecimal)

**qq** - Test number (hexadecimal)

| <b>ppqq</b>       | <i>Explanation</i>                                                                               |

**d5-d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

These data bytes can only be interpreted by a Lucent engineer.

An in-progress message (O.41004) is output every 20 seconds while the device is being diagnosed until the command response or autonomous report is output.

**VERIFY** - Verify

This option causes block checking to be performed.

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 03** Subject entity is in service
- 04** Subject entity is out of service
- 55** Invalid CFT code
- 56** Unrunnable CFT code
- 84** Problem occurred while accessing SMEM or unformatted SMEM
- 85** Problem occurred while accessing PMEM

## **DGN,SYNC,TLI,SSP**

---

### **DIAGNOSE SYNCHRONIZER TIMING LINK INTERFACE**

#### **Explanation Of Command**

---

This command requests the diagnosis of a timing link interface on the synchronizer side. If the optional synchronizer sync port parameter is specified, only that single SSP is diagnosed. For autonomous diagnostics of a TD-type TLI circuit pack, the SSP field does not appear in the output message. Both arguments appear for autonomous removal of a timing extractor type TLI.

#### **Command**

---

[I.41121]

**DGN:FRM xy,SEQ ww:SYNC a,TLI m[,SSP b]!**

#### **Completion Message**

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**a** - Synchronizer side number (0 or 1)

**TLI** - Timing link interface

**m** - Timing link interface number (1 through 4)

**SSP** - Synchronizer synchronization port

**b** - Synchronizer Synchronization Port number (0 or 1)

**Note 1:** SSP must be specified if the TLI is a timing extractor type NPC.

**Note 2:** If the SSP parameter is supplied, only that SSP is diagnosed. Otherwise both SSPs are diagnosed.

**ATP** - All tests passed

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

Valid values are listed below:

| <i>ppqq</i> | <i>Explanation</i> |
|-------------|--------------------|
|-------------|--------------------|

|      |                               |
|------|-------------------------------|
| 0300 | TLI status query showed error |
|------|-------------------------------|

|      |                               |
|------|-------------------------------|
| 0400 | TLI status query showed error |
|------|-------------------------------|

**d5 - d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

These data bytes can only be interpreted by a Lucent Technologies design engineer.

**cc** - Hexadecimal condition code

| <b>cc</b> | <i>Explanation</i> |
|-----------|--------------------|

|-----------|---------------|
| <b>AB</b> | Bad sync mode |
|-----------|---------------|

## **DGN,TSI,CFT,X**

### **DIAGNOSE TIME SLOT INTERCHANGE**

#### **Explanation Of Command**

This command requests diagnostics to be run on a specific time slot interchange.

The optional **CFT** field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run.

If there are no mapped TSI slots, DACS II will respond with some tests failed (STF).

#### **Command**

### **Explanation Of Parameters**

---

**TSI** - Time slot interchange  
**s** - Cross-connect network side number (0 or 1)  
**f** - FROM unit number (1 through 6)  
**t** - TO unit number (1 through 6)

**CFT** - Craft

**vwxy** - Diagnostic test number

| <i>Test</i>                     | <b>vwxy</b> |
|---------------------------------|-------------|
| Output data checker exercise    | 0001        |
| Memory test                     | 0002        |
| Memory diagnostic               | 0004        |
| Address bus parity test         | 0008        |
| Loss of clock exercise 2        | 0010        |
| Loss of clock exercise 1        | 0020        |
| Memory diagnostic exercise      | 0040        |
| Control RAM checker exercise    | 0080        |
| Communication test              | 0100        |
| Memory and Alarms diagnostic(s) | 0200        |

**Note:**

1. If the CFT field is omitted, all tests of this diagnostic will be run.
2. Tests 0200, 0040, 0020, 0010, 0004, and 0002 can only be run when the TSI is out-of-service. All other tests can be run when the TSI is in service.

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

pp - Failing diagnostic number in hexadecimal form

qq - Test number in hexadecimal form.

| <b>ppqq</b> | <i>Explanation</i>                                                                                               |

### Explanation Of Parameters

**TSIS** - Time slot interchangers

**CCN** - Cross-connect network

**s** - Cross-Connect Network side number (0 or 1)

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**CONN** - Unit connection

**a, b, c, d, e, f**

- Connected unit number

If the connected unit field is omitted, then all TSIs connected to the specified unit will be diagnosed.

**sft** - TSI identifier

**s** - See s under CCN above

**f** - FROM Unit

**t** - TO Unit

**e** - Number of lines in the message

**r** - Diagnostic status for an individual TSI

*r Explanation*

A ATP COMPL (All Tests Passed)

C CATP COMPL (Conditional All Tests Passed)

S STF COMPL (Some Tests Failed)

D DNY (Deny)

- unequipped TSIs

**nn** - Condition code for each TSI addressed (-- for unequipped TSIs)

See cc below to interpret values of nn.

**cc** - Hexadecimal condition code

**cc Explanation**

**02 Subject entity is not equipped**

**45 A DMB on the UNIT is 00S**

### Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**DSPI** - Digital signal processing interface

**CFT** - Craft

**vwxy** - Diagnostic test number

| Test                                                   | vwxy |
|--------------------------------------------------------|------|
| Processor bus parity checker test<br>(in-service test) | 0001 |
| Interrupt and mask register test<br>(in-service test)  | 0002 |
| Serial interface (in-service test)                     | 0004 |
| Serial interface (out-of-service test)                 | 0008 |

The optional CFT field is used to indicate which diagnostic test(s) is to be run. If this field is omitted, all DSPI diagnostic tests will be run.

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**cc** - Hexadecimal completion condition code for CATP

| <i>cc</i> | <i>Explanation</i>                                                                 |
|-----------|------------------------------------------------------------------------------------|
| 03        | Subject entity is in-service                                                       |
| 37        | DSPI out-of-service                                                                |
| 44        | DSPI is out-of-service; Digital Signaling Processing Circuit (DSPC) is in-service. |

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

|    |                                               |
|----|-----------------------------------------------|
| pp | Failing diagnostic number in hexadecimal form |
| qq | Test number in hexadecimal form.              |

| <i>ppqq</i> | <i>Explanation</i>      |
|-------------|-------------------------|
| 0100        | MP Fail                 |
| 0600        | EMTC/MTC Interrupt Fail |
| 0A01        | EBX/BX RAM Data Fail    |
| 0B00        | EBX/BX Interrupt Fail   |
| 0C00        | EBX/BX Acknowledge Fail |

**d5 - d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

| <i>Data Byte</i> | <i>Description</i>                       |
|------------------|------------------------------------------|
| d5               | Upper byte of interrupt register 0       |
| d4               | Lower byte of interrupt register 0       |
| d3               | Interrupt register 1                     |
| d2               | Upper byte of side 0 service register 0  |
| d1               | Lower byte of side 0- service register 0 |
| d0               | Unused                                   |

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>Explanation</b>   |
|-----------|----------------------|
| 10        | Unit is not equipped |
| 11        | UC is out of service |
| 36        | DSPI not equipped    |
| 4D        | DSPI is in service   |
| 55        | Invalid CFT code     |
| 56        | Unrunnable CFT code  |

### Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FC** - Format converter

**s** - Side number (0 or 1)

**b** - FC number (1 through 4)

**CFT** - Craft

**vwxy** - Diagnostic test number

|                  |             |
|------------------|-------------|
| <i>Test</i>      | <i>vwxy</i> |
| CI device test   | 0001        |
| Receiver test    | 0002        |
| Transmitter test | 0004        |

The optional craft diagnostic test number indicates which test(s) of the diagnostic is to be run under craft control. If this number is omitted, all tests including the continuity check will be run.

**ATP** - All tests passed

**STF** - Some tests failed

**e** - Number of lines in the segment (2 or 3)

**UPN** - Unit plug number

**upn** - The value of UPN.

**XPN** - ECCN plug number

**xpn** - The value of XPN

**BIT** - Bit number of the data bus

**TD** - Transmit data

**RD** - Receive data

**bb** - Bit number (00 through 15)

The optional line which contains the unit, plug, and bit information will only be output if continuity checks between the NPC and the ECCN failed. The bit number (i.e., BIT={TD|RD}bb) will be shown if software identifies the bit of the data bus as the failed one. The optional line will always be output with the STF keyword. Valid values of the UPN and XPN are shown below. Note that the numbers shown in the output are exactly the same as the numbers on the backplane.

| Unit Plug<br>Number(FIB†) | Unit Plug<br>Number(OIB‡) | ECCN Plug<br>Number | Direction | Corresponding<br>FC |
|---------------------------|---------------------------|---------------------|-----------|---------------------|
| P01                       | P02                       | PqqA*               | Receive   | FC 01               |
| P02                       | P01                       | PqqE                | Transmit  | FC 01               |
| P03                       | P07                       | PqqB                | Receive   | FC 02               |

[O.41321.01]

**I** hh:mm:ss xy,ww DGN UNIT [q]q FTMI d COND cc DNY

### Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FTMI** - Facility Terminating Module Interface

**d** - FTMI number (1 through 4)

**CFT** - Craft

**vwxy** - Diagnostic test number

| <i>Test</i>           | <i>vwxy</i> |
|-----------------------|-------------|
| Register test         | 0001        |
| Address parity test   | 0002        |
| High data parity test | 0004        |
| Low data parity test  | 0008        |
| CI A data strobe test | 0010        |
| CI A pack id test     | 0020        |
| CI B data strobe test | 0040        |
| CI B pack id test     | 0080        |
| CI C data strobe test | 0100        |
| CI C pack id test.    | 0200        |

All tests listed above can be run in-service.

**Note:** The optional **CFT** field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run.

**ATP** - All tests passed

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

pp Failing diagnostic number in hexadecimal form

qq Test number in hexadecimal form.

*ppqq Explanation*

0100 Register Test Fail

0200 Address Parity Test Fail

0300 High Data Parity Test Fail

0400 Low Data Parity Test Fail

0500 Data Strobe A Test Fail

0600 Pack ID A Test Fail

0700 Data Strobe B Test Fail

0800 Pack ID B Test Fail

0900 Data Strobe C Test Fail

0A00 Pack ID C Test Fail

**d5-d0** - Raw data

Hexadecimal raw data bytes relating to the failed diagnostic detected.

These data bytes are only used for system development.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

**11** UC is out of service

**13** FTMI is not equipped

**55** Invalid CFT code

**56** Unrunnable CFT code

## **DGN,UNIT,UC,CFT,X**

### **DIAGNOSE UNIT CONTROLLER**

#### **Explanation Of Command**

This command requests diagnostics to be run on the specified unit controller.

#### **Command**

[O.41311.01]

I hh:mm:ss xy,ww DGN UNIT [q]q UC COND cc DNY

### Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**UC** - Unit controller

**CFT** - Craft diagnostic test code

**vwxy** - Diagnostic test number (hexadecimal)

| <i>Test</i>                             | <i>vwxy</i> |
|-----------------------------------------|-------------|
| UC RAM test (out-of-service test)       | 0001        |
| UC ROM test (in-service test)           | 0002        |
| UC timer test (in-service test)         | 0004        |
| UC DMA test (out-of-service test)       | 0008        |
| UC LAN test (out-of-service test)       | 0010        |
| UC bus error test (in-service test)     | 0020        |
| UBX register test (out-of-service test) | 0040        |
| UBX sanity test (out-of-service test)   | 0080        |

### Notes:

1. The optional **CFT** field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run.
2. Out-of-service diagnostics on the UC will run successfully only if the UC circuit pack is present in the frame and the diagnostic program can communicate with the unit. Otherwise, this message will be denied.
3. The UC DMA test cannot be run on the KER6 Unit Controller which is used on Hybrid DS3Us and DS3Us that are shipped with Release 8.0 and later

Releases.

4. The UBX tests are only valid on FTUs and IFTUs.

**ATP** - All tests passed

**CATP** - Conditional all tests passed  
The reason for the conditional completion is indicated by cc.

**STF** - Some tests failed

**ppqq** - Trouble number for the craft (hexadecimal)

pp Failing diagnostic number  
qq Test number

*ppqq Explanation*

|      |                                      |
|------|--------------------------------------|
| 0101 | RAM Test Failed - Data Error         |
| 0102 | RAM Test Failed - Address Error      |
| 0103 | RAM Test Failed - Access Error       |
| 0104 | RAM Test Failed - Refresh Error      |
| 0105 | RAM Test Failed - Parity Error       |
| 0200 | ROM Test Failed                      |
| 0400 | Timer Test Failed - Timer Error      |
| 0500 | Timer Test Failed - Input Port Error |
| 0600 | DMA Test Failed                      |
| 0700 | LAN Test Failed                      |
| 0900 | Bus Error Test Failed                |
| 0A00 | UBX Register Test Failed             |
| 0B00 | UBX Sanity Test Failed               |

**d5 - d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

*Data Byte Value*

|    |        |
|----|--------|
| d5 | Unused |
| d4 | Unused |
| d3 | Unused |
| d2 | Unused |
| d1 | Unused |
| d0 | Unused |

For in-service UC:

- In-service tests will return ATP (All Tests Passed)
- Out-of-service tests will return CATP (Conditional All Tests Passed)

For out-of-service UC:

- In-service tests will return ATP
- Out-of-service tests will return ATP

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>Explanation</b>                      |

### **Notice**

Every effort was made to ensure that the information in this document was complete and accurate at the time of printing. However, information is subject to change.

### **Security Statement**

In rare instances, unauthorized individuals make connections to the telecommunications network through the use of remote access features. In such event, applicable tariffs require that the customer pay all network charges for traffic. Lucent Technologies cannot be responsible for such charges, and will not make any allowance or give any credit for charges that result from unauthorized access.

### **Documentation Ordering Information**

The ordering number for this document is 365-353-242. To order this document, call the Lucent Technologies Customer Information Center in Indianapolis, Indiana, on 1-888-582-3688. For more ordering information, refer to "How to Order Documentation" in the section "About this Document."

### **Technical Support Telephone Number**

The Lucent Technologies Regional Technical Assistance Center (RTAC) provides a technical assistance telephone number which is staffed 24 hours a day. For technical assistance, simply call 1-800-225-RTAC.

### **Documentation Support Telephone Number**

Lucent Technologies provides a telephone number for you to report errors or to ask questions about the information in this document. The support telephone numbers are:

Outside North Carolina - 1-800-334-0404  
Inside North Carolina - 1-919-727-6681.

## How Are We Doing?

Document Title: DACS II Release 8.2.3, PDS 2.048-Mb/s Interface Command and Message Manual Volume II

Document No.: 365-353-242

Issue 1

Date: February 1999

Lucent Technologies welcomes your feedback on this document. Your comments can be of great value in helping us improve our documentation.

1. Please rate the effectiveness of this document in the following areas:

|                      | Excellent | Good | Fair | Poor | Not Applicable       |
|----------------------|-----------|------|------|------|----------------------|
| Ease of Use          |           |      |      |      | //////////////////// |
| Clarity              |           |      |      |      | //////////////////// |
| Completeness         |           |      |      |      | //////////////////// |
| Accuracy             |           |      |      |      | //////////////////// |
| Organization         |           |      |      |      | //////////////////// |
| Appearance           |           |      |      |      | //////////////////// |
| Examples             |           |      |      |      |                      |
| Illustrations        |           |      |      |      |                      |
| Overall Satisfaction |           |      |      |      | //////////////////// |

2. Please check the ways you feel we could improve this document:

- |                                                            |                                                                     |
|------------------------------------------------------------|---------------------------------------------------------------------|
| <input type="checkbox"/> Improve the overview/introduction | <input type="checkbox"/> Make it more concise/brief                 |
| <input type="checkbox"/> Improve the table of contents     | <input type="checkbox"/> Add more step-by-step procedures/tutorials |
| <input type="checkbox"/> Improve the organization          | <input type="checkbox"/> Add more troubleshooting information       |
| <input type="checkbox"/> Include more figures              | <input type="checkbox"/> Make it less technical                     |
| <input type="checkbox"/> Add more examples                 | <input type="checkbox"/> Add more/better quick reference aids       |
| <input type="checkbox"/> Add more detail                   | <input type="checkbox"/> Improve the index                          |

Please provide details for the suggested improvement. \_\_\_\_\_

## About This Document

---

### Purpose

---

The *DACS II Release 8.2.3 Command and Message Manual* describes the input commands and output messages of Release 8.2.3 of the Digital Access and Cross-Connect System II (DACS II). In addition, it provides full support for previous product releases.

**⇒ NOTE:**

Those customers using this manual with Releases 3 through 7.0.3 software should be aware that all features of a particular message shown for Release 8.2.3 may or may not apply to previous releases.

This manual consists of three volumes as follows:

- **Volume I** - This volume contains general information about the document, a detailed introduction that defines DACS II messages, relates how to communicate with DACS II, introduces the administrative links, and discusses in detail NPC addressing, on-line help feature, system configuration and features a listing of related documentation. Message listings in this volume include alphabetical and numerical, summary list of input commands and a list of autonomous messages. A comprehensive presentation of input commands and output messages (ABT through DGN) concludes this volume.
- **Volume II and III** - These two volumes contain input commands and output messages in the following order:
  - **Volume II** - DGRTH through RST
  - **Volume III** - SAVE through UTL and the Glossary

---

## **Reason for Issue**

---

The *DACS II Release 8.2.3 Command and Message Manual* has been issued to include updated and new commands applicable to Release 8.2.3.

## **Intended Audiences**

---

This manual is a catalog of messages intended for reference by a technician or craftperson who needs additional details about a message. It provides the user with supplemental information for the Digital Access and Cross-Connect System II (DACS II) that is programmed in the Program Documentation Standards (PDS) language. An example of a user is someone performing a task from an operation and maintenance manual who needs the definition of a specific keyword to complete the task.

## **How to Order Documentation**

---

To order additional copies of this document, send or call in an order as follows:

- To order by Mail:

Lucent Technologies  
Customer Information Center  
Attention: Order Entry Section  
2855 N. Franklin Road  
P. O. Box 19901  
Indianapolis, IN 46219

- 
- To order by Telephone (Monday through Friday);

Within the United States of America:

**1-800-LUCENT8 (582-3688)** (7:30 a.m. to 6:30 p.m. EST)

From Canada:

**1-800-255-1242**

Worldwide:

Toll: **1-317-352-8557**

FAX: **1-317-352-8484**

For RBOC/BOC customers, process orders through your Company Documentation Coordinator.

For commercial customers, a check, money order, purchase order number, or charge card number is required with all orders. Make checks payable to Lucent Technologies.

Lucent Technologies entities should use Form IND 1-80.80 FA, available through the Customer Information Center.

One-time orders include a binder (if applicable) and the document contents for the current issue in effect at the time of order. After placing a one-time order, you can request a standing order for any document revisions *of that software release*. Documents for new software releases do *not* go to standing-order customers. You will only get those documents if you order the new software release.

## **How to Comment on This Document**

A feedback form is located at the beginning of this publication, immediately after the title page. Please fill out the feedback form and return it (postage free) to the address on the back.

If the feedback form is missing, send comment on this publication to:

## **DGRTH — DSPC**

---

## **DGRTH — DSPC**

---

This section documents the commands **DGRTH** through **DSPC**.

## **DGRTH,NPC**

### **DEGROWTH NPC**

#### **Explanation Of Command**

This command unequips network processing circuits (NPCs) in DACS II Facility Terminating Units (FTU/IFTU/IFTU2), DS3 Units (DS3U), Hybrid DS3 Units (HDS3U) and Digital Signal Processing Units (DSPU).

It may be used to unequip a single NPC or a range of NPCs in an FTU (IFTU or IFTU2), a DS3U or an HDS3U. The HDS3U supports type TExyz and THxyz NPCs. The NPC numbers which are divisible by four with remainder zero, are not valid THxyz NPCs. However, the range of THxyz type NPC numbers is still supported with the understanding that there may be gaps in the NPC number range.

C-bit processing DSPU circuit packs (**CB**-type NPCs) as well as other DSPU circuit packs must be individually unequipped.

When ranges of NPCs are addressed, the **DGRTH** command will show a completion indication after the last NPC in the range that has been unequipped or the highest numbered NPC that has been successfully unequipped. **Before** the completion indication is output, individual denial messages will be output for each **NPC that is denied unequipage**.

One output message is printed for each NPC that is successfully unequipped.

Degrowth commands where the range address crosses a unit boundary will be completely denied.

Within an NPC range the degrowth command will be denied for specific NPCs or sets of NPCs for any one of the following reasons:

1. A Facility Terminating Module (FTM) within the range is unequipped.
2. The NPC is unequipped.
3. The NPC is in-service.
4. The NPC is a testport or testgroup NPC.

5. The NPC has active terminations or circuits under test.

The denial for two or more successive NPCs that need to be denied for the same reason will be formatted in a summary message using the **Floating Window Denial Message** format. In that format a summary denial message will be output, giving the range of NPCs denied, and the reason. The execution of normal completions or of denials for other reasons then resumes at the next NPC, up to the end of the range.

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, denoting the beginning of the range.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, denoting the end of the range.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

# **uvmnp, uvkqr**

- Hierarchical NPC numbers

**uv** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

CB type NPC numbers listed by unit, module, and NPC Number

Unit Type DP (DSPU)

|              |            |           |
|--------------|------------|-----------|
| Unit         | Module     | NPC       |
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**Note:** Range is not allowed for DSPU NPC degrowth.

With exceptions, an NPC must first be removed from service with the RMV,NPC,SIDE,INCL command before it can be degrown.

The exceptions are DSPU NPCs. However, if a cross-connected channel or a channel under test is present on the NPC, the command will be denied.

Degrowth of DMB NPCs results in degrowth of both duplicated NPCs in the DMB circuit packs in the DSPU. For other DSPU NPCs, there is only one NPC per circuit pack. One of the duplicated NPCs may first be removed from service with the RMV,NPC,SIDE,INCL

message.

If both NPCs are in service, both will be automatically removed during the degrowth of NPC operation. If a cross-connected channel is present on the NPC, the message will be denied.

SLC carrier terminated digroups must be deleted from the SLC carrier bank by executing the DLT,RT,DL,DGA,DGB,DGC,DGD,DGP command.

**[s]ghi** - The 3- or 4-digit nonhierarchical NPC number ([s]abc through [t]def)  
**[s]jkl** - The 3- or 4-digit nonhierarchical NPC number ([s]abc through [t]mno)  
**[t]mno** - The 3- or 4-digit nonhierarchical NPC number ([s]ghi through [t]def)

**uvghi** - Hierarchical NPC number within the range of uvmnp and uvkqr  
**uvjkl** - Hierarchical NPC number within the range of uvmnp and uvmno  
**uvmno** - Hierarchical NPC number within the range of uvjkl and uvkqr

**TYPE** - Type

**mnxyz** - NPC-type identifier

| mn | Explanation                                        |
|----|----------------------------------------------------|
| CB | C-bit processor (CPR) NPC                          |
| PA | CEPT NPC (75- or 120-ohm)                          |
| PB | CEPT NPC (120-ohm twisted pair)                    |
| PC | CEPT NPC (75-ohm coaxial)                          |
| SD | Digital Signal Processing Application Circuit Pack |

**UEQD** - Unequipped  
The specified NPC is already unequipped

**IS** - In-service  
The specified NPC is in service

**NPCTP** - NPC (for) test port  
The specified NPC is designated for DS0 test ports

**NPCTG** - NPC (for) test group  
The specified NPC is designated for Nx64Kbit/s test groups

**TERM** - Termination

**ASGN** - Assigned

The specified NPC has active or under-test assigned termination

**COND** - Condition

The specified NPC is denied due to condition given by cc

**cc** - Hexadecimal condition code

**cc**    *Explanation*

| <b>6A</b> | Pseudochannels exist which reference this NPC |

## **DGRTH,NPC,NPCTG,TGR**

### **DEGROWTH TEST-ACCESS GROUP NPC**

#### **Explanation Of Command**

This command is used to request the removal of the test-access group (TG) designation from a network processing circuit for test-access groups. All TGs associated with this NPCTG must be released before the NPCTG can be deprovisioned. If "TGR" is specified in the command all active TGs will be released and deprovisioned before the NPCTG is deprovisioned. Any out-of-serve (OOS) condition will be bypassed.

A TG may be supported by one or two NPCTGs. Deprovisioning of an NPCTG that supports half (one bundle) of an active TG, will result in the release and deprovisioning of the entire TG; provided "TGR" was specified.

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**NPCTP** - NPC test port  
**n** - NPCTP number (1 through 8)

**TPR** - Test port release

This keyword causes any active test ports to be released from service before the test port NPC is degrown. Without the TPR keyword, the test ports must all be idle or the command is denied.

**TPS** - Test ports

**kk** - Beginning test port number

**nn** - Ending test port number

kk and nn indicate the range of test port numbers which the named NPC included

| <i>n</i> | <i>kk</i> | <i>nn</i> |
|----------|-----------|-----------|
| 1        | 01        | 12        |
| 2        | 13        | 24        |
| 3        | 25        | 36        |

#### **Denial Message**

[O.32101.01]

**M hh:mm:ss xy,ww n[vv] DGRTH SYNC TB TYPE TBpqr COND cc DNY**

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**TYPE** - Type

**TB** - Time base

**p** - Time base identifier

**qr** - Unassigned

q and r can take any value from 0 through 9

**p**      *Time base*

**0**      Stratum 3

**1**      CEPT Local

**2**      CEPT Toll

**3**      Stratum 2

**Note:** pqr will be shown as "---" if the synchronizer is not equipped.

**cc** - Hexadecimal condition code

**cc**      *Explanation*

**16**      SYNC TB is not equipped

**A4**      Both syncs are in-service

## **DGRTH,SYNC,TLI,SSP**

### **DEPROVISION SYNCHRONIZER TIMING LINK INTERFACE**

#### **Explanation Of Command**

This message requests the deprovisioning of the synchronizer's timing link interface.

If the timing link interface was configured as a timing extractor (**TYPE - txyz**), the synchronizer sync port must be specified as well.

On output, note that the NPC option can be a source of synchronization for a timing link interface. When a TU type TLI receiving its input from an NPC is degrown, the NPC must be marked as no longer being a synchronizer source.

{SSP a SRC p TYPE tepgr[ NPC uvmnp]|TYPE TDpqr|TBpqr} \  
COND cc DNY

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**TLI** - Timing link interface

**m** - TLI number (1 through 4)

**SSP** - Synchronizer synchronization port

**a** - SSP number (0 or 1)

**SRC** - Source

**p** - Synchronization port priority (1 through 8)

*p*      *Explanation*

1      HIGHEST priority

8      LOWEST priority

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, PB/PC type

The valid values are:

NPC type      NPC number

PB,PC      [0]030, [0]032, [0]070, [0]072, [0]190, [0]192, [0]230, [0]232

**uvmnp** - Hierarchical NPC number, PB/PC type

NPC type      Unit No.      Module No.      NPC No.

PB,PC      01      1,2      30,32

02      1,2      30,32

Option NPC ([s]abc or uvmnp) is only used with the SSP variable and TLI type TUxyz.

**TYPE** - Type

**texyz** - Timing extractor type

*texyz*      *Explanation*

TCxyz      Composite Clock Timing Extractor

TExyz      DS1 Timing extractor

TPxyz      Primary Block Timing Extractor (xyz values are listed below)

TRxyz      Basic System Reference Frequency

TUxyz      Unipolar Clock Timing Extractor

-----      Not Equipped

TP-type TLI xyz fields

|             |                                       |

| <b>qr</b> | Unassigned                                                               |

**TB** - Time base

**p** - Time base identifier

**qr** - Unassigned

q and r can take any value from 0 through 9

**p** *Time base*

**0** Stratum 3

**1** CEPT Local

**2** CEPT Toll

**3** Stratum 2

**Note:** pqr will be shown as "---" if the synchronizer is not equipped.

**cc** - Hexadecimal condition code

**cc** **Explanation**

**02** Subject entity is not equipped

**03** Subject entity is in service

**A1** CRO type TLI (SSP portion not required)

**A2** SSP number is illegal

**A3** SSP number required

**B8** CRO is still equipped

**BE** Hardware mismatch or not present

**CC** NPC is still provisioned to provide  
sync timing

## **DGRTH,TP**

### **DEGROWTH**

#### **Explanation Of Command**

This message requests the unequipage of a specified test port. Any subsequent test access requests for this test port will be denied. Also, if the specified test port is in use, the command will be denied.

When degrowth of the specified test port is completed, the channel units associated with this test port are no longer assumed in place, and no test ports with numbers greater than the one specified remain equipped.

#### **Command**

[I.32411]

**DGRTH:FRM xy,SEQ ww:TP kk!**

#### **Completion Message**

[O.32411.02]

**M hh:mm:ss xy,ww n[vv] DGRTH TP kk NOT IDLE DNY**

[O.32411.03]

M hh:mm:ss xy,ww n[vv] DGRTH TP kk TPMAX nn TP NSO DNY

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**TP** - Test port

**kk** - Test port number (01 through 96)

**NPCTP** - NPC for test ports

**UEQD** - Unequipped

**TPMAX** - Test port maximum

**nn** - Test port number (01 through 96)

**NSO** - Not in sequence order

Degrowth of test port kk can be denied under the following conditions:

- The NPCTP (network processing circuit for test ports) has not been designated or UEQD.
- The requested test port is not idle. The test port is currently assigned to a cross-connected channel for test access (NOT-IDLE).
- The requested test port is NSO (not in sequence order) (TPMAX=nn, TP, NSO). That is, kk is not equal to the highest existing test port number nn in the NPCTP.

## **DGRTH,UNIT**

### **DEGROW UNIT**

#### **Explanation Of Command**

When this request is completed, the two ETSI circuit packs required by the subject unit to cross-connect to other grown units are unequipped.

This message requests the degrowth of a DACS II unit.

When this request is completed, all cross-connect buffer and time slot interchange circuit packs required by the subject unit to cross-connect to other grown units are degrown.

When this request is completed, the two ETSI circuit packs required by the subject unit to cross-connect to other grown units are degrown.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**TOTAL** - Total

**TSIS** - Time slot interchangers

**tt** - Total number of provisioned TSIs in frame after unit is degrown  
(00 through 70)

**dd** - Number of TSIs deprovisioned by command (00 through 22)

**sft** - TSI equipped status

**s** - Service side number (0 or 1)

**f**  
- FROM unit number

*f* *Explanation*

*n* Unit number *n* (equals 1 through 6) is equipped  
- Not equipped

**t**  
- TO unit number

*t* *Explanation*

*n* Unit number *n* (equals 1 through 6) is equipped  
- Not equipped

**e** - Number of lines in the output message segment (2 through 4)

### DEGROWN

- Degrown

Degrowth of UNIT *q* (1 through 6) can be denied because:

**kk** - Total number of equipped ETSIs in the frame after the unit is degrown  
(00 through 30)

**ETSIS** - Expanded time slot interchangers

**ETSI** - Expanded time slot interchanger

**0qq** - ETSI number side 0

**1qq** - ETSI number side 1

0qq and 1qq identify the ETSI packs deprovisioned by this command.  
qq is the unit number (see UNIT above).

Three dashes "---" are shown if an ETSI pack is not provisioned.

**0rr** - ETSI number side 0

**1rr** - ETSI number side 1

0rr and 1rr give the ETSIs equipage status. rr is the unit number  
(see UNIT above)

Three dashes "---" are shown if an ETSI pack is not provisioned.

- The unit is already degrown (UEQD), or
- The FTU is still equipped with m FTMIs (facility terminating module interfaces), or
- The DSPU is supporting l NPCs, or
- The unit controller (UC) is in service (IS)
- The DS3U is still equipped with k multiplexers (MXRs) or Hybrid multiplexers (HMXR) and/or the protection multiple interface unit (MIU P), or
- The DS3U or Hybrid DS3U is supporting at least one in-service facility line interface (FLI),

Note that Hybrid DS3U does not support MIU.

**FLI** - Facility line interface

**S** - Service

**P** - Protection

**FMT** - Formatter or Hybrid Formatter

**0** - Side number 0

**1** - Side number 1

**MIU** - Multiple interface unit

**MXR** - Multiplexer or Hybrid Multiplexer

**P** - Protection

**FTMI** - Facility terminating module interface

**m** - Number of FTMIs (1 through 4). Will appear if the unit is equipped as an FTU.

**NPC** - Network processing circuit

**l** - Number of NPCs in DSP unit (1 through 8). Will appear if the unit is equipped as a DSPU.

**k** - Number of MXRs or HMXRs (1 through 6). Will appear if the unit is equipped as a DS3U or a HDS3U.

**c** - Number of FLIs that are in service (1 or 2). Will appear if the unit is equipped as a DS3U or a HDS3U.

**EQD** - Equipped

**cc** - Hexadecimal condition code

**cc** *Explanation*

**00** No conditions

**03** Subject entity is in service

**4D** DSPI is in service

## **DGRTH,UNIT,FTMI**

## Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**MXR** - Multiplexer

**c, d** - The number of the MXR within the unit ( $1 \leq c, d \leq 6$ )

**Note:** The Protection MXR is degrown along with the UNIT.

**a** - MXR number within the range of c and d

**TYPE** - The requested DS3 format that will be processed by the MXR.

**mnxyz** - The DS3 format processed by the MXR:

**mn** - the type of DS3 facility

MX : the original R4.0 DS3 facility type supported by the Multiplexer (MXR) circuit pack (KCR-1).

EX : the enhanced R6.0 DS3 facility type supported by the Enhanced Multiplexer (EMXR) circuit pack (KCR-5).

HX : The hybrid facility type supported by the Hybrid Multiplexer (HMXR) circuit pack (KCR-8).

If the unit is a regular DS3U of unit type DT100, then the Default is the MX type for backward compatibility.

If the unit is a Hybrid DS3U of unit type HT100, then the default is HX.

**x** - the DS3 framing format

1 - M13 format.(default)

2 - C-bit parity format, not supported by HMXR

**y** - not assigned (the only valid value is 0)

**z** - not assigned (the only valid value is 0)

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

**11** UC is out of service

**12** UC is in service but failed

**55** Some associated NPCs are equipped

## **DLT,FPKG**

### **DELETE FEATURE PACKAGE IDENTIFICATION**

#### **Explanation Of Command**

The frame administrator enters this command to change the feature package identification code. This command is used to reduce the feature package set by a single feature at a time.

**Note:** The execution of this command requires DACS II superuser privileges. The frame must be in the **MCOND** (maintenance condition) state at execution.

**WARNING:** A manual backup from RAM to MEM (PMEM & SMEM together) must be invoked prior to entering Maintenance Condition, else the command may not complete.

Because of the impact of this command on the available features, the following dialogue will be displayed by DACS II.

ARE YOU SURE?

The user must respond with an affirmative Y for the command to be executed.

In general a feature package identification code is a combination of several individual feature package numbers. To determine the individual features that make up a feature package it is necessary to decode the feature package identification code. This code is an eight digit hexadecimal number. Each hexadecimal number represents a four-bit binary number. Within this binary number each feature is associated with one particular bit. Consequently to determine the feature list from a feature package identification code it is necessary to convert each hexadecimal digit to its binary equivalent and look up the features in the list above. For example the feature package identification code 0000000F can be converted to the following binary number working from left to right one hex digit at a time.

0000 0000 0000 0000 0000 0000 0000 1111

This number contains eight binary numbers each representing one of the hexadecimal numbers in the feature package identification code 0000000F. The rightmost number of the code contains four features since there are four bits set to one. This would be decoded as follows using the table of features above.

|       | binary | hex | Feature                      |
|-------|--------|-----|------------------------------|
|       | 0001   | 1   | DS1                          |
|       | 0010   | 2   | CEPT                         |
|       | 0100   | 4   | Subrate                      |
|       | 1000   | 8   | Direct SLC                   |
| Total | 1111   | F   | (DS1 + CEPT + Subrate + SLC) |

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 96** Unit(s) OOS, and additional backup required
- 25** Invalid FPI value
- 26** Feature deactivation would leave system with core software
- 27** Disable not allowed - supports another feature
- 28** Feature is active
- 29** Feature not enabled
- 2A** Database not loaded
- 2B** Reading Feature Package Id from PMEM failed
- 2C** Writing Feature Package Id to PMEM failed
- 01** Backup required before executing this command

## **DLT,MACRO,MAP,USER**

### **DELETE MACRO**

#### **Explanation Of Command**

This command requests the deletion of a macro or alternate map from the DACS II system.

**Note:** Only the DACS II frame administrator can remove a public macro or another user's macros and maps. The names of public macros begin with the letter P.

#### **Command**

[I.37201]

DLT:FRM xy,SEQ ww:{MACRO <macro name>|MAP <map name>}\  
[,USER <user id>]!

#### **Completion Message**

[O.37201]

M hh:mm:ss xy,ww n[vv] DLT {MACRO <macro name>|MAP <map name>}\  
[ USER <user id>] COMPL

#### **Denial Message**

[O.37201.01]

M hh:mm:ss xy,ww n[vv] DLT {MACRO <macro name>|MAP <map name>}\  
[ USER <user id>] COND cc DNY

#### **Autonomous Message**

Not applicable.

## **Explanation Of Parameters**

---

### **macro name**

- Macro name (seven characters maximum length)

The name of a collection of DACS II commands executed as a group.

A macro name is a string of capitalized alphanumeric characters. There are two type of macros; public and private. A private macros is created by a user in space allocated to the user by the system administrator. Only the user that created it can execute or read (LIST) a private macro. A public macro is created by the system administrator and is executable and readable by all users. A public macro name must start with the letter "P". A private macro name must not start with the letter "P".

### **map name**

- Map name (seven characters maximum length)

The name of a collection of DACS II cross-connect commands that can be activated as a group to produce a new set of cross-connections (a new cross-connect map).

A map name is a string of capitalized alphanumeric characters.

### **user id**

- User identifier (two to eight alphabetic characters)

The user field is the user's login identifier. It is used only by the frame administrator to delete a private macro or map owned by the user specified. A user does not need to specify this information in order to delete a personally owned (private) macro or map.

- cc** - Hexadecimal condition code

| <b>D5</b> | No user is logged in on the link/vc        |

## **DLT,NPC**

---

### **EDIT DELETE MAP**

#### **Explanation Of Command**

---

This command is only used in the open and create session of the alternate map feature. It is not intended to be used as a regular command under any circumstances.

This message is used to *delete* a single NPC, a range of NPCs, or a list of NPCs, from an alternate map.

To delete circuits from an alternate map, enter the **TCON : : FRM, TO** command (I.11001) with the DLT keyword at the end.

The only system response to this command is:

OK

Denials in response to this command are sent only to the link on which the command was input.

#### **Command**

---

#### **Nonhierarchical**

---

[I.37001]

**DLT:FRM xy,SEQ ww:NPC {[s]abc-[t]def|[s]abc[, [s]ghi]...\  
[, [t]def]]}!**

### **Hierarchical**

[I.37001]

**DLT:FRM xy,SEQ ww:NPC {uvmnp-wxkqr|uvmnp[,abcde]...[,wxkqr]}!**

### **Completion Message**

If the command is accepted by DACS II, the following input acknowledgement is output.

**OK**

### **Denial Message**

Not applicable.

### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

**[s]abc, [t]def, [s]ghi**

- The 3- or 4-digit non-hierarchical NPC numbers

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number

Unit Type FT (IFTU2/IFTU/FTU)

#### **Explanation Of Command**

---

This command explains the command syntax from the DACS II point of view for all applications that run on the Digital Signal Processing Platform (DSPP) circuit pack (TG193). All applications use a prefix system for both input commands and output messages of all types for communication between the user and the application. This prefix system is defined in the subsequent commands and messages. The prefix system permits DACS II to send a command to an application without parsing and/or examining that command. Any return message from the application uses a prefix also, which is simply prepended to the return message from the application by DACS II. Similarly, an autonomous message from an application is prepended with a prefix that identifies the NPC number of the particular DSPP circuit pack on which the message was issued.

The commands for a particular application are given in detailed form in the documentation package for that application. In that documentation the prefix notation that is explained here is also given, so that the user sees a complete command structure. Depending on the individual command that command may be sent to an individual DSPP circuit pack running that application, a range of circuit packs running that application, or all circuit packs running that application restored in the frame.

#### **Command**

---

#### **Nonhierarchical**

---

[I.14901]

**DSPC:** [FRM xy,SEQ ww]:{[s]aaa|[s]aaa-[v]bbb|SDxyz}:<pds\_application command>

---

## Hierarchical

[I.14901]

DSPC:[FRM xy,SEQ ww]:{uvnmp|uvnmp-wxkqr|SDxyz}:<pds\_application command>

---

## Completion Message

---

### Nonhierarchical

Command using single NPC

[O.14901]

M hh:mm:ss xy,ww n[vv] DSPC [s]aaa <pds\_application\_response for NPC [s]aaa>

Command using range of NPCs

[O.14901]

M hh:mm:ss xy,ww n[vv] DSPC [s]aaa <pds\_application\_response for NPC [s]aaa>

.  
.  
.

M hh:mm:ss xy,ww n[vv] DSPC [v]bbb <pds\_application\_response for NPC [v]bbb>

M hh:mm:ss xy,ww n[vv] DSPC [s]aaa-[v]bbb <pds\_input\_command - truncated>....COMPL

Command using NPC type

[O.14901]

M hh:mm:ss xy,ww n[vv] DSPC [s]aaa <pds\_application\_response for NPC [s]aaa>

.  
.  
.

M hh:mm:ss xy,ww n[vv] DSPC [v]bbb <pds\_application\_response for NPC [v]bbb>

M hh:mm:ss xy,ww n[vv] DSPC SDxyz <pds\_input\_command - truncated>....COMPL

---

## Hierarchical

Command using single NPC

[O.14901]

M hh:mm:ss xy,ww n[vv] DSPC uvnmp <pds\_application\_response for NPC uvnmp>

Command using range of NPCs  
[O.14901]

```
M hh:mm:ss xy,ww n[vv] DSPC uvnmp <pds_application_response for NPC uvnmp>
.
.
.
M hh:mm:ss xy,ww n[vv] DSPC wxkqr <pds_application_response for NPC wxkqr>
M hh:mm:ss xy,ww n[vv] DSPC uvnmp-wxkqr <pds_input_command - truncated>...COMPL
```

Command using NPC type  
[O.14901]

```
M hh:mm:ss xy,ww n[vv] DSPC uvnmp <pds_application_response for NPC uvnmp>
.
.
.
M hh:mm:ss xy,ww n[vv] DSPC wxkqr <pds_application_response for NPC wxkqr>
M hh:mm:ss xy,ww n[vv] DSPC SDxyz <pds_input_command - truncated>...COMPL
```

## Denial Message

---

### Nonhierarchical

---

Command using single NPC  
[O.14901.01]

```
M hh:mm:ss xy,ww n[vv] DSPC [s]aaa <pds_application_error_response for NPC [s]aaa>
```

Command using range of NPCs  
[O.14901.01]

```

<pds_input_command - truncated>.... COND cc DNY
```

## **Autonomous Message**

---

### **Nonhierarchical**

---

[O.14901]

**I** hh:mm:ss xy,ww ALM DSPC [s]aaa <pds\_application\_autonomous\_message>

### **Hierarchical**

---

[O.14901]

**I** hh:mm:ss xy,ww ALM DSPC uvnmp <pds\_application\_autonomous\_message>

## **Explanation Of Parameters**

---

**DSPC** - Execute <pds\_application\_command> on  
Digital Signal Processing Platform (DSPP)

**[s]aaa** - NPC number of DSPP Platform running application that will  
receive command or NPC number at beginning of range  
(3- or 4-digit)

**uvnmp** - NPC number of DSPP Platform running application that will  
receive command or NPC number at beginning of range  
(hierarchical)

**[v]bbb** - NPC number for end of range specified or last NPC number  
in frame of type SDxyz (3- or 4-digit)

**wxkqr** - NPC number for end of range specified or last NPC number  
in frame of type SDxyz (hierarchical)

**SDxyz** - Type designation for DSPP Platform running application "x".

This addresses all DSPP circuit packs that run application "x". Where "x" is a hexadecimal number that identifies the application. Values "y" and "z" are ignored, because they are possibly used internally by the application at the time the application is restored. Please note that "SDxyz" is also used at the time a DSPP circuit pack is grown to run a particular application.

- <pds\_application\_command> - This is a PDS command string that is sent to the application.
- <pds\_application\_response for NPC hhh> - This is an application command response in PDS for the particular NPC designated by the number hhh
- <pds\_application\_error\_response for NPC hhh> - This is a PDS error message generated when the application running on NPC hhh found an error in a command
- <pds\_application\_autonomous\_message> - This is an application autonomous message in PDS

Beyond the prefix notation that is explained here no specific conventions for an application are documented here. Instead, the exact command structure for commands that are handled by an application is given by the documentation for that application. This includes such items as terminating "!" for PDS strings and terminating ";" for MML strings. All error messages and condition codes generated by the application are given in the application documentation.

**cc** - Hexadecimal condition code

**cc**    *Explanation*

- 02**    Subject entity is not equipped  
**04**    Subject entity is out of service  
**26**    NPC type error  
**07**    Application circuit pack is out of service  
**F2**    Invalid NPC number specified  
**E9**    Platform Communication Error  
**EA**    The (last) destination NPC denies the DSPC command  
**EB**    The (last) destination NPC failed, and was rebooted  
**B3**    Initialization of application in progress, retry command later

---

## **EBX — EXC**

---

## **EBX — EXC**

---

This section documents the commands **EBX** through **EXC**.

## **EBX,STARTUP,STF,ATP**

### **EXPANDED BUS EXTENDER STARTUP**

#### **Explanation Of Command**

This message reports that the expanded bus extender has initialized itself and has performed self-diagnostics. The results of these diagnostics are reported. For all tests passed, no action is required.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01272]

**EBX STARTUP {STF|ATP}**

### **Explanation Of Parameters**

---

**EBX** - Expanded bus extender

**STARTUP**

- Startup

Indicates initialization

**STF** - Some tests failed

**ATP** - All tests passed

## **ED,CRET,MAP,PIC**

### **CREATE PICTURE ALTERNATE MAP**

#### **Explanation Of Command**

This command takes a **PIC** (picture) of currently-implemented cross-connections and stores them in the **new map name**. **reference map name** is the name of the map that contains the desired list of cross-connections.

**one to seven characters long.**

Output from this command is sent only to the link on which the command was input.

#### **Command**

[I.19031]

**ED:FRM xy,SEQ ww:CRET,MAP <new map name>\  
,PIC <reference map name>!**

#### **Completion Message**

#### **Nonhierarchical**

[O.19031]

**M hh:mm:ss xy,ww n[vv] ED CRET MAP <new map name> \  
PIC <reference map name>  
[ NPC [s]abc] COND kk COMPL**

## **Hierarchical**

---

[O.19031]

**M** hh:mm:ss xy,ww n[vv] **ED** **CRET** **MAP** <new map name> \

## **Denial Message**

---

[O.19031.01]

**M** hh:mm:ss xy,ww n[vv] **ED** **CRET** **MAP** <new map name> \  
**PIC** <reference map name> **COND** cc **DNY**

## **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

**CRET** - Create

**MAP** - Map

new map name

- The new alternate map to be created by this message

"new map name" is a string of capitalized alphanumeric characters.  
The first character must be an alphabetic character. The maximum  
length of a map name is seven characters.

**PIC** - Picture

reference map name

- The existing alternate map

"reference map name" is a string of capitalized alphanumeric characters.  
The first character must be an alphabetic character. The maximum  
length of a map name is seven characters.

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

This number identifies the first NPC that contains either a  
non-two-way, two-point cross-connection, or a cross-connection with a  
termination on an NPC not found in the reference alternate map.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |

| <b>1401-1432</b> | <b>1561-1592</b> | <b>1721-1752</b> | <b>1881-1912</b> |

| Unit<br>13 | Unit<br>14 | Unit<br>15 | Unit<br>16 |
|------------|------------|------------|------------|
| NPC        | NPC        | NPC        | NPC        |
| 1921-1952  | 2081-2112  | 2241-2272  | 2401-2432  |
| 1961-1992  | 2121-2152  | 2281-2312  | 2441-2472  |
| 2001-2032  | 2161-2192  | 2321-2352  | 2481-2512  |
| 2041-2072  | 2201-2232  | 2361-2392  | 2521-2552  |

**uvmnp** - Hierarchical NPC number

This number identifies the first NPC that contains either a non-two-way, two-point cross-connection, or a cross-connection with a termination on an NPC not found in reference alternate map.

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

**cc** - Hexadecimal condition code

**cc**    *Explanation*

|    |                                                 |
|----|-------------------------------------------------|
| 00 | No conditions                                   |
| 60 | User macro/map space is full                    |
| 61 | System macro/map space is full                  |
| 62 | File is being accessed                          |
| 63 | File already exists                             |
| 70 | Some circuits not activated,cleared or pictured |
| 71 | The reference map does not exist                |
| D5 | No user is logged in on the link/vc             |

## **ED,MACRO,MAP**

### **CREATE OR EDIT A MACRO OR MAP**

#### **Explanation Of Command**

This command is dual purpose. It can be used to create a new macro or alternate map or to edit an existing macro or map. A macro is a collection of DACS II commands that can be executed as a group by a single command. A map is a collection of DACS II cross-connect commands that can be activated as a group by a single command to create a new cross-connect map.

Once a macro has been created, and is free of errors, it can be executed repeatedly. For commonly used command sequences this saves a lot of typing, speeds execution, and assures the user of repeatability. Similarly a map, once created, can be repeatedly activated. However, prior to each activation of a map the information specified in the map must be edited to create a new map. On the other hand the information in a macro can be changed, without editing, when the command is executed. The new information is inserted into the command line and replaces information within the macro at execution time.

The commands used in the macro, the macro commands, will always be executed in the order they are listed in the macro. However, because the commands can use variables as well as constants, the information within the macro can vary with each execution. A command within the macro that addresses a given NPC can be made to address a different NPC the next time the macro is executed. This is done by replacing the constant, representing the NPC number, listed in the macro command with a variable. Many other command parameters can be changed from execution to execution by the use of variables in the macro commands.

Consider the private macro named "DEMO" below. Some elements of these macro commands have been omitted in order to focus on the use of variables.

```
TDIS::FROM 00101,TO 00301,STOP!OK
TCON::FROM 00101,TO 00501!OK
TCON::FROM 00102,TO 00502!OK
TCON::FROM 00103,TO 00503!OK
UTL::QRY,CMAP 001!OK
```

This macro will always disconnect, connect, and query the same NPCs. If DEMO were written as follows, using variables, the NPCs affected could be specified each time the macro was executed without having to reenter the macro. A macro written in this manner is referred to as a universal macro. This particular macro would be even more universal if the channel numbers were represented by variables.

```
TDIS::FROM #0101,TO 00301,STOP!OK
TCON::FROM #0101,TO #0201!OK
TCON::FROM #0102,TO #0202!OK
TCON::FROM #0103,TO #0203!OK
UTL::QRY,CMAP #01!OK
```

Variables have replaced some of the constants in macro DEMO. NPC number 001 has been replaced with variable #01 and NPC number 005 has been replaced with variable #02. The numbers in these variable names refer to the position of the replacement in the command used to execute the macro. To execute this macro replacing #01 with 020 and #02 with 040 we would enter the following command.

```
EXC::MACRO DEMO,(020,040)!
```

The variables used in the macro commands of macro DEMO are replaced, upon execution of this command, by parameters included in the command. The first parameter replaces variable #01 and the second parameter replaces #02. After variable replacement macro DEMO would look as follows.

```
TDIS::FROM 02001,TO 00301,STOP!OK
TCON::FROM 02001,TO 04001!OK
TCON::FROM 02002,TO 04002!OK
TCON::FROM 02003,TO 04003!OK
UTL::QRY,CMAP 020!OK
```

Variables may be used for any macro command parameter except action verbs and punctuation. The number of variables used in a macro is limited to 10. A variable may be used wherever its value is needed, that is, it is not restricted to an NPC number just because it was used for that purpose at some other point in the macro. If the user wished to address NPC number 003 and channel 003 the variable #01 with value 003 could be used for both the NPC number and the channel number. The macro command would look as follows.

TCON::FROM #01#01,...!

At execution time this would translate to the following.

TCON::FROM 003003,...!

 **NOTE:**

To represent hierarchical NPC numbers a variable must be used for each part (unit, module, NPC) of the NPC number. A macro expecting a hierarchical format parameter should not be executed with a nonhierarchical format parameter.

NPC 01101 would be represented in a macro command with variables #01, #02, and #03 as follows.

UTL::QRY,CMAP #01#02#03!

**WARNING:**

*Any command prompting "Are You Sure?" which is accepted as a macro command will always have the "No" answer to the question.*

The system responds with "OK" when the ED::MAP command is entered.

The system responds with LINE and SAVE messages, as shown below, when the ED-MACRO command is entered.

[O.19071]  
... **LINE** <line pointer> **TOTAL** <line total> **COMPL**

[O.19081]

... SAVE <macro name> SPACE sss USED uuu COMPL

A macro session is the period between entering the command to create a macro and entering the command to exit the macro. A line pointer is maintained by the system during the session to mark the position of the current line within the macro. As a line is added to the macro the line pointer moves down a line; tracking the position of the current line. The LINE command is used to determine the current line pointer value and the total number of lines currently in the macro.

The SAVE command is used during a macro session to save the current set of macro commands in the macro represented in the message by "macro name." The macro name is chosen by the user.

The completion messages correspond to the frame response when END or QTEND is entered after completion of editing or creating a macro. The END command saves all the changes before ending (exiting) a macro session. The QTEND command ends the macro session without saving the changes.

Output from this command is sent only to the link on which the command was input.

## **Explanation Of Parameters**

---

**MACRO** - Macro

### **macro name**

- Macro name (seven characters maximum length)

The name of a collection of DACS II commands executed as a group.

A macro name is a string of capitalized alphanumeric characters. There are two type of macros; public and private. A private macros is created by a user in space allocated to the user by the system administrator. Only the user that created it can execute or read (LIST) a private macro. A public macro is created by the system administrator and is executable and readable by all users. A public macro name must start with the letter "P". A private macro name must not start with the letter "P".

**MAP** - Map

### **map name**

- Map name (seven characters maximum length)

The name of a collection of DACS II cross-connect commands that can be activated as a group to produce a new set of cross-connections (a new cross-connect map).

A map name is a string of capitalized alphanumeric characters.

**QTEND** - Quit end

Quit to end a macro or map session without saving any changes to the macro or map.

**COND** - Condition

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>Explanation</b>                                         |
|-----------|------------------------------------------------------------|
| 00        | No conditions                                              |
| 00        | No conditions                                              |
| 60        | User macro/map space is full                               |
| 60        | User macro/map space is full                               |
| 61        | System macro/map space is full                             |
| 62        | File is being accessed                                     |

## **EMTC,STARTUP,STF,ATP**

### **EXPANDED MAINTENANCE STARTUP**

#### **Explanation Of Command**

This message reports that the expanded maintenance circuit has initialized itself and has performed self-diagnostics. The results of these diagnostics are reported. For all tests passed, no action is required.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01282]

**EMTC STARTUP {STF|ATP}**

### **Explanation Of Parameters**

---

**EMTC** - Expanded maintenance circuit

**STF** - Some tests failed

**ATP** - All tests passed

## **ERR,CMD,ABT,TN,STOPPED**

### **INPUT DENIAL**

#### **Explanation Of Command**

This message is output by DACS II when a task indicated by the transaction number has been autonomously aborted.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01121]

A hh:mm:ss xy,ww    ERR CMD ABT [TN abcd]    e LN MSG:  
First 70 characters of input message.  
Remaining text of input message STOPPED

### **Explanation Of Parameters**

---

**ERR**    - Error recovery

**CMD**    - Command

**ABT**    - Abort

**TN**     - Transaction

**abcd**   - Transaction number

**e**      - Number of lines in the message

## **ERR,ESR,ANALYSIS,REPORT,EVENT**

### **ERROR RECOVERY ESR ANALYSIS REPORT**

#### **Explanation Of Command**

This message outputs a list of circuit packs associated with a series of alarm messages identified by the EVENT number. One of the circuit packs listed may be at fault. The most likely faulty pack is at the top of the list. Only the first circuit pack on the list will be removed. This message will not be output if a single circuit pack is implicated.

## **ERR,ESR,CCB,TN,EVENT,COND**

### **ERROR RECOVERY**

#### **Explanation Of Command**

This message indicates that error recovery was called to handle an error occurring in the cross-connect buffer.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01351]

```
I hh:mm:ss xy,ww ERR [ESR] CCB sf TN dddd EVENT eeee \
2 LN MSG:
<error analysis data bytes> COND cc COMPL
```

## Explanation Of Parameters

---

- ERR** - Error recovery
- ESR** - Error Source Register  
The ESR keyword is not output if the register contents cannot be read.
- CCB** - Cross-connect Buffer
- s** - Cross-connect side (0 or 1)
- f** - Unit (1 through 6)
- TN** - Transaction
- dddd** - Transaction number
- EVENT** - Event
- eeee** - Event number

## error analysis data bytes

- Data used to analyze the cause of an error.  
Eight bytes are output. These bytes are labeled "byte 0", "byte 1",  
etc, below.

- byte 0** - ESR0 (Error Source Register 0) in the CCB  
**byte 1** - ESR1 (Error Source Register 1) in the CCB  
**byte 2** - ESR2 (Error Source Register 2) in the CCB  
**byte 3** - CCNI ESR0  
**byte 4** - CCNI ESR1  
**byte 5** - CCNI ESR2  
**byte 6** - CCNI ESR3  
**byte 7** - CCNI ESR4

- cc** - Hexadecimal condition code

### **cc**    *Explanation*

- A0**    CCB packid error, wrong pack, can't read pack  
**A1**    CCB sync pulse error  
**A2**    CCB clock error  
**A3**    CCB input port alarm error  
**A4**    CCB zero bit is stuck at 1  
**A5**    Corresponding CCNI bit is stuck

## **ERR,ESR,CCI,TN,EVENT,COND**

### **ERROR RECOVERY CCI**

#### **Explanation Of Command**

This message indicates that DACS II detected an alarm occurring in the clock and control interface.

### **Explanation Of Parameters**

---

**I** Information

**ERR** - Error recovery

**ESR** - Error source register

The ESR keyword is not output if the register contents cannot be read.

**CCI** - Clock control interface

**s** - Cross-connect side number (0 or 1)

**TN** - Transaction

**dddd** - Transaction number

The TN number can be specified in UTL::QRY,ERR to retrieve the content of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

**EVENT** - Event

**eeee** - Event number

The event number can be specified in UTL::QRY, ERR to retrieve the content of the DACS II error recovery log file which contains the data of this error recovery event.

**wd01,**  
**wd02,**

...,

**wd12** - Word 1 through 12

0 to 12 words of hexadecimal raw error data for internal use. Each word is four hexadecimal digits.

```

## Explanation Of Parameters

I Information

**ERR** - Error recovery

**ESR** - Error Status Register.

The ESR keyword is not output if the register contents cannot be read.

**CCNI** - Cross-connect network interface

**s** - Cross-connect side (0 or 1)

**TN** - Transaction

**dddd** - Transaction number

**EVENT** - Event

**eeee** - Event number

**regn** - Device register n (n = 0 through 4)

A bit set to "1" in these registers indicates the alarming circuit pack or a parity error.

### CCNI s Error Source Register Bit Definitions

**reg0** - Error Source Register 0

| Bit | Condition                                  |
|-----|--------------------------------------------|
| 15  | Time Slot Interchange (TSI) 43 is alarming |
| 14  | TSI 33 is alarming                         |

## **ERR,ESR,ETSI,TN,EVENT,COND**

### **ERROR RECOVERY ETSI**

#### **Explanation Of Command**

This message reports an alarm on a extended time slot interchanger.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01355]

```
I hh:mm:ss xy,ww ERR[ESR] ETSI sqq \
TN dddd EVENT eeee 2 LN MSG:
wd01 wd02 wd03 wd04 wd05 wd06 wd07 wd08 wd09 wd10 wd11 \
wd12 COND cc COMPL
```

## Explanation Of Parameters

**I** Information

**ERR** - Error recovery

**ESR** - Error source register

The ESR keyword is not output if the register contents cannot be read.

**ETSI** - Expanded time slot interchanger (ETSI)

**sqq** - ETSI identification

**s** - Cross-connect side (0 or 1)

**qq** - Unit number (01 through 16)

**TN** - Transaction

**dddd** - Transaction number

The TN number can be specified in UTL::QRY,ERR to retrieve the contents of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

**EVENT** - Event

**eeee** - Event number

The event number can be specified in UTL::QRY, ERR to retrieve the contents of the DACS II error recovery log file which contains the data for this error recovery event.

**wd01,**

**wd02,**

...,

**wd12** - Word 1 through 12

0 to 12 words of four-digit hexadecimal raw error data for internal use.

**wd01** - Circuit Pack Summary Register

**wd02** - Receive MDX Status Register

**wd03** - Transmit MDX Status Register

**wd04** - Control RAM Status Register

**wd05** - Control RAM Port Alarm Register

**wd06** - Control RAM Data RAM Alarm Register

**wd07** - Receive MDX Mask Register

**wd08** - Transmit MDX Mask Register

**wd09** - CCI ETSI Error Source Register 0

**wd10** - CCI ETSI Error Source Register 1

**wd11** - CCI ETSI Error Source Register 2

**wd12** - CCI ETSI Error Source Register 3

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 20** ETSI pack is not present
- 21** Can't communicate to ETSI pack (incorrect version number)
- 22** ETSI pack's summary is set on CCI but has no errors
- 23** ETSI loss of 32.768 MHz clock
- 24** ETSI loss of 240 frame sync
- 25** ETSI Rcv MDX summary stuck bit
- 26** ETSI control RAM summary stuck bit
- 27** ETSI TX MDX summary stuck bit
- 28** ETSI loss of Vdd (3.3v) power
- 29** Peripheral unit port alarm (RCV MDX)
- 2A** Receive MDX data source time slot parity error
- 2B** Receive MDX sync error
- 2C** Receive MDX address parity error
- 2D** Receive MDX write data parity error
- 2F** Receive MDX can't be accessed (incorrect chip Id)
- 30** Transmit MDX data parity error
- 31** Transmit MDX data source time slot parity error
- 32** Transmit MDX sync error
- 33** Transmit MDX address parity error
- 34** Transmit MDX write data parity error
- 35** Transmit MDX can't be accessed (incorrect chip Id)
- 37** Control RAM parity error
- 38** Control RAM sync alarm
- 39** Control RAM port alarm
- 3A** Control RAM BIST flag is set
- 3B** Data RAM BIST flag is set
- 3C** Control RAM address parity error
- 3D** Control RAM write data parity error
- 3E** Control RAM device can't be accessed (incorrect chip Id)
- 3F** Control RAM circuit pack parity
- 40** Control RAM device is in reset state
- 41** Control RAM port alarm summary is stuck
- 42** ETSI TRD3ST exercise bit is set
- 43** ETSI ready high error on CCI
- 44** ETSI ready time-out error on CCI(ETSI can't be accessed)
- 45** Control RAM stuck bit error

## **ERR,ESR,MC,MP,CI,TN**

### **ERROR RECOVERY ERROR SOURCE REGISTER MAIN CONTROLLER**

### Explanation Of Parameters

**MC** - Main controller

**MP** - Main processor

**CI** - Communications interface

**BX** - Bus extender pack for MP

**MTC** - Maintenance pack

**EBX** - Expanded bus extender pack for MP

**EMTC** - Expanded maintenance pack

**ESR** - Error source register

This keyword is not output if the register content cannot be read.

**ERR** - Error recovery

**TN** - Transaction

**dddd** - Transaction number

The TN number can be specified in UTL::QRY,ERR to retrieve the contents of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

**EVENT** - Event

**eeee** - Event number

The event number can be specified in UTL::QRY, ERR to retrieve the contents of the DACS II error recovery log file which contains the data for this error recovery event.

**abab, bbbb, ..., jjjj**

- Raw data

0 to 10 words of hexadecimal raw error data for internal use. The number of words output is dependent upon the error event. Each word consists of four hexadecimal digits.

**ERR ESR MC MP data words:**

abab bbbb cccc dddd eeee ffff

|             |                                           |
|-------------|-------------------------------------------|
| <b>abab</b> | - CPU Interrupt Holding Register contents |
| <b>bbbb</b> | - CPU Interrupt Mask Register contents    |

**I** hh:mm:ss xy,ww **ERR**[ **ESR**] **NPC** uvmnp[-uvmqr] **SIDE** s \  
**TN** dddd **EVENT** eeee **2 LN MSG:**  
<error analysis data bytes>[ **COND** cc] **COMPL**

## Explanation Of Parameters

**I** Information

**ERR** - Error recovery

**ESR** - Error source register

The ESR keyword is not output if the register content can not be read.

**NPC** - Network Processing Circuit

[**s**]abc - The 3- or 4-digit nonhierarchical odd DSPU NPC number

[**t**]def - The 3- or 4-digit nonhierarchical even DMB NPC number ([t]def =  
[s]abc + 1)

If NPC numbers are expressed in three digits, the valid values are:

CB type NPC numbers listed by unit number, Unit Type DP (DSPU)

| Unit<br>1  | Unit<br>2  | Unit<br>3  | Unit<br>4  | Unit<br>5  | Unit<br>6  |
|------------|------------|------------|------------|------------|------------|
| <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> | <b>NPC</b> |
| <b>001</b> | <b>161</b> | <b>321</b> | <b>481</b> | <b>641</b> | <b>801</b> |
| <b>021</b> | <b>181</b> | <b>341</b> | <b>501</b> | <b>661</b> | <b>821</b> |
| <b>041</b> | <b>201</b> | <b>361</b> | <b>521</b> | <b>681</b> | <b>841</b> |
| <b>061</b> | <b>221</b> | <b>381</b> | <b>541</b> | <b>701</b> | <b>861</b> |
| <b>081</b> | <b>241</b> | <b>401</b> | <b>561</b> | <b>721</b> | <b>881</b> |
| <b>101</b> | <b>261</b> | <b>421</b> | <b>581</b> | <b>741</b> | <b>901</b> |
| <b>121</b> | <b>281</b> | <b>441</b> | <b>601</b> | <b>761</b> | <b>921</b> |
| <b>141</b> | <b>301</b> | <b>461</b> | <b>621</b> | <b>781</b> | <b>941</b> |

If NPC numbers are expressed in four digits, the valid values are:

CB type NPC numbers listed by unit number, Unit Type DP (DSPU)

**uvmnp** - Hierarchical odd DSPU NPC numbers

**uvmqr** - Hierarchical even DMB NPC numbers

**uv** - Unit number

**m** - Module number

**np, qr** - NPC number within the module  
(qr = np + 1)

The values are listed below:

CB type NPC numbers listed by unit, module, and NPC Number  
Unit Type DP (DSPU)

| Unit         | Module     | NPC       |
|--------------|------------|-----------|
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

**SIDE** - Side

**s** - Side number (0 or 1)

**TN** - Transaction

**dddd** - Transaction number

The transaction number can be specified in the UTL::QRY,ERR message (I.55011) to retrieve the contents of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

**EVENT** - Event

**eeee** - Event number

**error analysis data bytes**

- Troubleshooting data (four-digit hexadecimal)

There can be from 0 through 10 data bytes output depending upon the circuit pack and error condition. The fields are labeled aaaa, bbbb, cccc, dddd, eeee, ffff, gggg, hhhh, iiii, and jjjj below for explanation purposes.

For the Digital Multipoint Bridge (DMB),  
C-Bit Processor (CPR),  
Multipoint Junction Unit (MJU), and  
Subrate Multiplexer (SRM)

aaaa DMB Interrupt Register content  
bbbb DMB Interrupt Mask Register content

For the DMB only

cccc cme 0 reply - word 2  
dddd cme 0 reply - word 1  
eeee cme 1 reply - word 2  
ffff cme 1 reply - word 1  
gggg conf 0 reply - word 2  
hhhh conf 0 reply - word 1  
iiii conf 1 reply - word 2  
jjjj conf 1 reply - word 1

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

**70** DMB access error (e.g. pack not there )  
**71** DMB serial access error (pack not there)  
**72** DMB parallel access error  
**73** DMB bits stuck in exercise register  
**74** DMB data processing error  
**75** Multiple data parity error, CCB problem  
**76** DMB clock error  
**77** Multiple clock errors, CCB/SYNC problem  
**78** DMB FIFO error  
**79** Possible power failure on side  
**7A** DMB control memory error 0 (used for trans)  
**7B** DMB control memory error 1 (used for trans)  
**7C** Control Memory 0 control ram parity error  
**7D** Control Memory 1 control ram parity error  
**7E** Control Memory 0 control interface error  
**7F** Control Memory 1 control interface error  
**80** Control Memory 0 loss of sync error

**cc**    *Explanation*

- 81**    Control Memory 1 loss of sync error
- 82**    Control Memory 0 DMB input data parity error
- 83**    Control Memory 1 DMB input data parity error
- 84**    DMB conference error 0 ( used for trans)
- 85**    DMB conference error 1 ( used for trans)
- 86**    Conference 0 control interface error
- 87**    Conference 1 control interface error
- 88**    Conference 0 control ram parity error
- 89**    Conference 1 control ram parity error
- 8A**    Conference 0 DMB input data parity error
- 8B**    Conference 1 DMB input data parity error
- 8C**    Conference 0 DMB device (chip) error
- 8D**    Conference 1 DMB device (chip) error
- 8E**    Bad Ram Data in DMB device (bits alarms)
- 8F**    Bad Ram Data in DMB device (bits alarms)
- 98**    CPR serial access error
- 99**    CPR clock error
- 9A**    CPR processor interface failure
- 9B**    CPR input data interface error
- 9C**    CPR D-Bit interface parity error
- 9D**    CPR control memory failure
- 9E**    CPR control memory or state machine failure
- 9F**    CPR FIFO FRDY/FFULL stuck bit
- D5**    Illegal/unknown condition code
- 6D**    Invalid FPA state

---

## **ERR,ESR,NPC,TN,EVENT,COND**

### **ERROR RECOVERY FTU NPC**

#### **Explanation Of Command**

This message indicates that an alarm was detected in a facility terminating unit Network Processing Circuit. The specific alarm type is identified by the error condition code.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

#### **Nonhierarchical**

## Explanation Of Parameters

**ERR** - Error recovery

**ESR** - Error source register

The ESR keyword is not output if the register content cannot be read.

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number denoting beginning of range specification

**[t]def** - The 3- or 4-digit nonhierarchical NPC number denoting end of range specification

If NPC numbers are expressed in three digits, the valid values are:

PB and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

- 69**    Transceiver B Error
- 6A**    Circuit ID Error
- 6B**    Facility errors
- 6C**    NPC address parity error
- D5**    Illegal/unknown condition code

## **ERR,ESR,SYNC,TLI,SSP,TN,EVENT,NPC,COND**

### **ERROR RECOVERY SYNC TLI SSP**

#### **Explanation Of Command**

This message indicates that error recovery was called to handle an error that occurred in the synchronizer timing link interface sync port. The message also indicates the nature of the error.

If the port on which the error has occurred receives clock information from a dual primary card, then a network processing circuit has been added.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

#### **Nonhierarchical**

## **Explanation Of Parameters**

---

I            Information

**ERR**    - Error recovery

**ESR**    - Error source register

The ESR keyword is not output if the register contents cannot be read.

**SYNC**   - Synchronizer

**a**       - SYNC number (0 or 1)

**TLI**    - Timing link interface

**m**       - TLI number (1 through 4)

**SSP**    - Synchronizer sync port

**b**       - SSP number (0 or 1)

**NPC**    - Network processing circuit

[s]abc       - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

**PB and PC type NPC numbers listed by unit number**

**Unit Type FT (FTU)**

**Units**

| <b>1</b>   | <b>2</b>   |
|------------|------------|
| <b>NPC</b> | <b>NPC</b> |
| <b>030</b> | <b>190</b> |
| <b>032</b> | <b>192</b> |
| <b>070</b> | <b>230</b> |
| <b>072</b> | <b>232</b> |

If NPC numbers are expressed in four digits, the valid values are:

**Units**

| <b>1</b>    | <b>2</b>    |
|-------------|-------------|
| <b>0030</b> | <b>0190</b> |
| <b>0032</b> | <b>0192</b> |
| <b>0070</b> | <b>0230</b> |
| <b>0072</b> | <b>0232</b> |

**uvmnp** - Hierarchical NPC number

**PB and PC type numbers listed by unit, module,  
and NPC No.**

**Unit Type FT (FTU)**

| <b>Unit</b>  | <b>Module</b> | <b>NPC No. (np)</b> |
|--------------|---------------|---------------------|
| <b>01-02</b> | <b>1-2</b>    | <b>30, 32</b>       |

**TN** - Transaction

**dddd** - Transaction number

The TN number can be specified in UTL::QRY,ERR to retrieve the contents of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

**EVENT** - Event

**eeee** - Event number

The EVENT number can be specified in UTL::QRY, ERR to retrieve the contents of the DACS II error recovery log file which contains the data of this error recovery event.

### **synchronizer status data bytes**

- Synchronizer status data in binary form

From 0 to 5 bytes may be output, depending upon the synchronizer error condition. In the explanations below the bytes are named "byte 1", "byte 2, and so on. The eight bits of each byte are labeled abcdefgh and are explained below. These bytes appear in the message in numeric order from left to right with "byte 1" first.

Note that if communications between the MP and the SYNC have failed, Error Recovery may not get the correct status data from the SYNC. All bits in "synchronizer status data bytes" will then be set to 1 by default.

#### **byte 1 - Timing link status**

| <i>bit</i> | <i>Explanation</i>                      |
|------------|-----------------------------------------|
| a          | Timing link equipped by MC              |
| b          | Timing link declared out-of-service     |
| c          | Timing link out-of-service due to error |
| d          | Associated Timing Extractor TLI error   |
| efgh       | Not used                                |

#### **byte 2 - Priority weighting of link, a number from 1 to 8**

#### **byte 3 - Framing format, line format, and frequency**

| <i>bits</i> | <i>Explanation</i>                                |
|-------------|---------------------------------------------------|
| abc         | Framing format (valid only for TXB1 or TXB2 TLIs) |
| TXB1        |                                                   |
| 000         | D4                                                |
| 001         | ESF                                               |
| 010         | DDS                                               |
| TXB2        |                                                   |
| 000         | CCS                                               |
| 001         | ERSM                                              |
| 010         | CAS0                                              |
| 011         | CAS1                                              |

de Line format (valid only for TXB1 or TXB2 TLIs)

TXB1

00 Bipolar  
01 B8ZS

TXB2

10 AMI  
11 HDB3

fgh Frequency (TXUC TLI)

000 512 kHz  
001 1.000 MHz  
010 1.544 MHz  
011 2.048 MHz  
100 5.000 MHz

**byte 4 - Mixed status**

*bit Explanation*

a Carrier failure alarm/loss of signal (TXB1, TXB2, and TXCC)  
b Timing signal loss of energy  
c Autobaud failure  
d Frequency offset flag  
e Excessive jitter  
f Phase step  
gh Not used

**byte 5 - Framing status**

*bit Explanation*

a Out of frame  
b Major framing error rate  
c Minor framing error rate  
defgh Not used

**COND** - Condition

**cccc** - Error recovery condition code

**cccc** - Hexadecimal condition code

**cccc**    *Explanation*

**E600**    TL error reported, unknown  
**E602**    Timing Extractor type TLI has hardware problem  
**E603**    Timing Extractor type TLI has autobaud failure  
**E806**    TLI error cleared

## **ERR,ESR,SYNC,TLI,TN,EVENT,COND**

### **ERROR RECOVERY**

#### **Explanation Of Command**

This message indicates that error recovery was called to handle an error that occurred in a synchronizer timing link interface, and also the nature of the error.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01342]

I hh:mm:ss xy,ww ERR [ESR] SYNC a TLI m \  
TN dddd EVENT eeee 2 LN MSG:  
<synchronizer status data bytes> COND cccc COMPL

## **Explanation Of Parameters**

---

**I** Information

**ERR** - Error recovery

**ESR** - Error source register

The ESR keyword is not output if the register contents cannot be read.

**SYNC** - Synchronizer

**a** - Synchronizer number (0 or 1)

**TLI** - Timing link interface

**m** - TLI number (1 through 4)

**TN** - Transaction

**dddd** - Transaction number

**EVENT** - Event

**eeee** - Event number

synchronizer status data bytes

- Synchronizer status data in binary form

Three bytes of synchronizer status data are output. These bytes are named "byte1", "byte2", and "byte3" in the explanations below. They would appear on output as "byte1 byte2 byte3" in place of "synchronizer status data bytes". The eight bits in each byte are labeled abcdefgh in left to right order. These bits are set to "1" for the listed conditions:

**byte1** - Overall status and configuration

|             |                                                           |

<byte1> <byte2> <byte3> <byte4> <byte5> COND cccc COMPL

## Explanation Of Parameters

**I** Information

**ERR** - Error recovery

**ESR** - Error source register

The ESR keyword is not output if the register contents cannot be read.

**SYNC** - Synchronizer

**a** - Synchronizer number (0 or 1)

**TN** - Transaction

**dddd** - Transaction number

**EVENT** - Event

**eeee** - Event number

**byte1,**  
**byte2,**

...,

**byte5** - Synchronizer status data bytes

Synchronizer status data in binary form. The number of data bytes ranges from 1 to 5, depending upon the synchronizer error type. Each byte has eight bits labeled abcdefgh in left to right order.

If main processor to synchronizer communication has failed, Error Recovery may not get the correct status data from the Synchronizer. All bits in "synchronizer status data bytes" will then be set to 1 by default.

**byte1** - Synchronizer status data

| bit  | Explanation                  |
|------|------------------------------|
| a    | MC is down flag              |
| b    | SYNC is down flag            |
| c    | Mate SYNC is OOS             |
| d    | Time Base is down            |
| efgh | Timing link inservice status |

**byte2** - Timing link (SSP) inservice status

**byte3** - Synchronizer status data

### error analysis data

- The error analysis data consists of from 2 to 10 four-digit hexadecimal fields labeled regn below. The number of fields reported depends upon the error condition. The data is used for internal troubleshooting purposes only.

For pack id errors and TSI stuck bit errors the data include the pack id and the TSI number.

**regn** - Device register n (n ranges from 2 through 10)

For the TSI identified by sft:

There are 16 TSI devices in a TSI circuit pack.

Each bit set in the summary status register indicates an alarming device on TSI sft.

For each alarming TSI device, the device status register is dumped in device fields <reg1> through <reg2>, one device per register. Up to four devices can dump their status register, per message. If less than four devices are alarming, the fields will have a 0000 value.

# Register Bit Definitions

**reg1** - TSI summary status register

| bit | Definition                 |
|-----|----------------------------|
| 15  | Error on TSI sft device 15 |
| 14  | Error on TSI sft device 14 |
| 13  | Error on TSI sft device 13 |
| 12  | Error on TSI sft device 12 |
| 11  | Error on TSI sft device 11 |
| 10  | Error on TSI sft device 10 |
| 09  | Error on TSI sft device 09 |
| 08  | Error on TSI sft device 08 |
| 07  | Error on TSI sft device 07 |
| 06  | Error on TSI sft device 06 |
| 05  | Error on TSI sft device 05 |
| 04  | Error on TSI sft device 04 |
| 03  | Error on TSI sft device 03 |
| 02  | Error on TSI sft device 02 |
| 01  | Error on TSI sft device 01 |
| 00  | Error on TSI sft device 00 |

reg2,  
reg3,  
reg4,

**reg5** - TSI device summary status registers 2 through 5

For up to four TSI devices indicated by reg2 through reg5,  
each device will be represented by a summary status register  
indicating the following information:

| bit(s) | Definition                              |
|--------|-----------------------------------------|
| 15     | Not used                                |
| 14     | Not used                                |
| 13     | Odd parity over data bits 12 through 00 |
| 12     | TSI memory diagnostic in progress       |
| 11-08  | 4-bit TSI ID                            |
| 07     | Exercise in progress                    |
| 06     | Not used                                |
| 05     | Memory error overflow                   |
| 04     | Failure of memory diagnostic            |
| 03     | Loss of 8 MHz clock                     |
| 02     | Output data error                       |
| 01     | Control RAM parity error                |
| 00     | Microprocessor bus error                |

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

- B0** Pack id error, can't read pack
- B1** TSI stuck bit, summary bit set, no devices alarming
- B2** TSI device error
- B3** TSI device id error, cannot read device
- B4** Illegal exercise bits set
- B5** Bus address error
- B6** Device clock error
- B7** Device control ram parity error
- B8** Output data parity error (from an FTM)
- B9** Corresponding CCNI bit is stuck

## **ERR,ESR,UNIT,DSPI,TN,EVENT,COND**

### **ERROR RECOVERY UNIT DSPI**

#### **Explanation Of Command**

This autonomous message reports that DACS II detected an alarm on the specified unit's digital signal processing interface.

#### **Command**

Not applicable.

#### **Completion Message**

[O.01365]

I hh:mm:ss xy,ww ERR[ ESR] UNIT [q]q DSPI TN dddd \  
EVENT eeee 2 LN MSG:  
<error analysis data> COND cc COMPL

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

Not applicable.

## Explanation Of Parameters

**I** Information

**ERR** - Error recovery

**ESR** - Error source register

The ESR keyword is not output if the register content cannot be read.

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**DSPI** - Digital signal processing interface

**TN** - Transaction

**dddd** - Transaction number

The TN number can be specified in UTL::QRY,ERR to retrieve the contents of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

**EVENT** - Event

**eeee** - Event number

The event number can be specified in UTL::QRY, ERR to retrieve the contents of the DACS II error recovery log file which contains the data for this error recovery event.

## error analysis data

- Troubleshooting data (four-digit hexadecimal)

Six words of troubleshooting data. For purposes of explanation they are here labeled and appear in the the following manner:

aaaa bbbb cccc dddd eeee ffff

| Name | Explanation                                  |
|------|----------------------------------------------|
| aaaa | CPU Interrupt Holding Register contents      |
| bbbb | CPU Interrupt Mask Register contents         |
| cccc | DSPI Interrupt Capturing Register 0 contents |
| dddd | DSPI Interrupt Capturing Register 0 contents |
| eeee | DSPI Interrupt Capturing Register 1 contents |
| ffff | DSPI Interrupt Capturing Register 1 contents |

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

**6D** DSPI access error (e.g. pack not there)  
**6E** DSPI bus data parity error  
**6F** DSPI bus address parity error  
**D1** Source of error is unknown  
**D2** Source of error was not found  
**D3** Stuck bit in register  
**D5** Illegal/unknown condition code

## **ERR,ESR,UNIT,FC,TN,EVENT,COND**

### **ERROR RECOVERY UNIT FC**

#### **Explanation Of Command**

This autonomous message reports that DACS II has detected an alarm on a given facility terminating unit's format converter.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01364]

I hh:mm:ss xy,ww ERR[ ESR] UNIT [q]q FC sb \  
TN dddd EVENT eeee 2 LN MSG:  
<error analysis data> COND cc COMPL

### Explanation Of Parameters

---

**I** Information

**ERR** - Error recovery

**ESR** - Error source register

The ESR keyword is not output if the register contents cannot be read.

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FC** - Format converter

**sb** - FC identifier

**s** - FC side (0 or 1)

**b** - FC No. (1 through 4)

**TN** - Transaction

**dddd** - Transaction number

The TN number can be specified in UTL::QRY,ERR to retrieve the contents of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

**EVENT** - Event

**eeee** - Event number

The event number can be specified in UTL::QRY, ERR to retrieve the contents of the DACS II error recovery log file which contains the data for this error recovery event.

## error analysis data

- troubleshooting data (four-digit hexadecimal)

Six words of troubleshooting data. For purposes of explanation they are here labeled and appear in the the following manner:

aaaa bbbb cccc dddd eeee ffff

| <i>Name</i> | <i>Explanation</i>                            |
|-------------|-----------------------------------------------|
| aaaa        | Board Level ESR0 & ESR1 content               |
| bbbb        | Board Level EMR0 & EMR1 content               |
| cccc        | RF Device ESR0 & EMR0 content                 |

| <b>eeee</b>  | - Event number<br>The event number can be specified in UTL::QRY, ERR to retrieve the contents of the DACS II error recovery log file which contains the data for this error recovery event.                                        |

## error analysis data

- 2 to 8 words, depending on the unit type, of four hexadecimal digits each containing troubleshooting data.

For a DS3U the words are labeled as follows:

ire0, ire1, ire2, cies, irm0, irm1, irm2, cima

|             |                                                  |
|-------------|--------------------------------------------------|
| <b>ire0</b> | - Error source register 0                        |
| <b>ire1</b> | - Error source register 1                        |
| <b>ire2</b> | - Error source register 2                        |
| <b>cies</b> | - Communications interface error source register |
| <b>irm0</b> | - MASK register 0                                |
| <b>irm1</b> | - MASK register 1                                |
| <b>irm2</b> | - MASK register 2                                |
| <b>cima</b> | - Communications interface MASK register         |

For an FTU the words are labeled as follows:

aabb eeff

|           |                                           |
|-----------|-------------------------------------------|
| <b>aa</b> | - CPU interrupt mask register contents    |
| <b>bb</b> | - CPU interrupt holding register contents |
| <b>ee</b> | - UBX interrupt mask register contents    |
| <b>ff</b> | - UBX interrupt holding register contents |

For a DSPU the words are labeled as follows:

aaaa bbbb cccc dddd eeee ffff

|             |                                                |
|-------------|------------------------------------------------|
| <b>aaaa</b> | - CPU interrupt holding register contents      |
| <b>bbbb</b> | - CPU interrupt mask register contents         |
| <b>cccc</b> | - DSPI interrupt capturing register 0 contents |
| <b>dddd</b> | - DSPI interrupt mask register 0 contents      |
| <b>eeee</b> | - DSPI interrupt capturing register 1 contents |
| <b>ffff</b> | - DSPI interrupt mask register 1 contents      |

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

|           |                                |
|-----------|--------------------------------|
| <b>00</b> | No conditions                  |
| <b>0F</b> | CPU internal bus error         |
| <b>10</b> | CPU parallel bus parity error  |
| <b>11</b> | CPU serial bus parity error    |
| <b>31</b> | Sanity Time-out                |
| <b>D0</b> | CPU RAM Parity error           |
| <b>D1</b> | Source of error is unknown     |
| <b>D2</b> | Source of error was not found  |
| <b>D3</b> | Stuck bit in register          |
| <b>D4</b> | Bad UBX pack                   |
| <b>D5</b> | Illegal/unknown condition code |

## **ERR,HARDWARE,TN,COND,EVENT,ACTION**

### **ERROR RECOVERY HARDWARE**

#### **Explanation Of Command**

This message is printed out when applications software attempted some operation on a circuit, but that operation failed. The type of failure is indicated in the condition code. The applications software may have requested some autonomous action on the circuit and that action will be reflected with an autonomous request for removal and/or diagnostics. Additional information can be gathered by querying the error recovery log file, but this will require technical assistance for interpretation.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01392]

```
I hh:mm:ss xy,ww ERR HARDWARE <entity> 4 LN MSG:
 TN=dddd COND=cc EVENT=xxxx ACTION=<action>
 SOURCE=<source> DP=<dp> PROC=<proc> <load>
 TSARGS=cn [<tsargs>] COMPL
```

## **Explanation Of Parameters**

---

**ERR** - Error recovery

**HARDWARE**

- Hardware

**TN** - Transaction

**dddd** - Transaction number (hexadecimal)

The TN number can be specified in UTL::QRY,ERR to retrieve the contents of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

**COND** - Condition

**EVENT** - Event

**xxxx** - Event number

**SOURCE** - Source

**source** - Source filename

DACS II internal software filename (up to 12 characters)

**DP** - Decision point

**dp** - Decision point value

Number associated with a particular location in the software file specified in the "source" field. Value is 0- to 8-digit positive decimal number.

**ACTION** - Action

**action** - Action to be taken

| <i>(CBaction</i> | <i>Explanation</i>            |
|------------------|-------------------------------|
| REPORT           | Report only, no action        |
| REMOVE           | Remove processor from service |

**PROC** - Process

**proc** - Process value

**TSARGS** - Trouble shooting arguments

**cn** - The number of trouble shooting arguments that follow (00 through 10)

**tsargs** - List of "count" trouble shooting arguments

**load** - Load number

The load number is a ten digit number of the following form:

abcdefghij

|    |                             |
|----|-----------------------------|
| ab | software generic number     |
| cd | software point issue number |
| ef | software release number     |
| gh | year                        |
| ij | load number                 |

**entity** - DACS II entity involved

**entity**

BTS s  
CCB sf  
CCI s  
CCNI s s  
ETSI sqq  
LINK n  
NPC [s]abc[-[t]def][SIDE s]  
NPC uvmp[-wxkqr][SIDE s]  
SYNC s  
SYNC s TLI m  
TSI sft  
UC [q]q  
UNIT [q]q DSPI  
UNIT [q]q FC sb  
UNIT [q]q FTMI b  
UNIT [q]q MXR n DEV devc  
UNIT [q]q UBX  
UNIT [q]q MIU I  
UNIT [q]q FLI d  
UNIT [q]q FMT k  
UNIT [q]q MMFG y

**cc** - Hexadecimal condition code

**cc**    *Explanation*

|           |                                           |
|-----------|-------------------------------------------|
| <b>E0</b> | Hardware database mismatch                |
| <b>E1</b> | Hardware Failure                          |
| <b>E2</b> | Hardware Boot Failed                      |
| <b>E3</b> | Can't access link                         |
| <b>E4</b> | Transmit Time-out                         |
| <b>E5</b> | Receiver Time-out                         |
| <b>E6</b> | softerr failure which forces link removal |
| <b>E7</b> | Unit could not be reset                   |

**cc**    *Explanation*

- E8**    Unit failed sanity check
- E9**    failure to insert TCC
- EA**    failure to remove TCC
- EB**    failed to switch CCN sides
- EC**    NPC's facility queue overflow condition
- ED**    Duplex entity failed diagnostics
- EE**    Lost Clear-To-Send signal on X.25 links
- EF**    Frame Audit reboot DDC failure
- F5**    Packet layer parameters are mismatched between DACS II and the network
- F6**    Failed to write XPC register
- F7**    Transmit time-out because Clear To Send lost
- F8**    R20 counter reaches limit
- F9**    T3 timer expires
- FA**    Too many interrupts or illegal interrupt from XPC

## **ERR, LINK, TN, STATUS**

### **ERROR RECOVERY**

#### **Explanation Of Command**

This message reports that error recovery was called to handle an error occurring in an administrative link.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01321]

I hh:mm:ss xy,ww    ERR LINK a TN dddd STATUS a0 a1 a2 COMPL

## Explanation Of Parameters

**ERR** - Error recovery

**LINK** - Link

**a** - Link number (1 through 6)

**TN** - Transaction

**dddd** - Transaction number

**STATUS** - Status

**a0,**

**a1,**

**a2** - Status data

The following status data is for asynchronous links.

**a0** - Message code

| <i>a0</i> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|    |                                   |
|----|-----------------------------------|
| 00 | Link has gone protocol in-service |
|----|-----------------------------------|

|    |                                       |
|----|---------------------------------------|
| 01 | Link has gone protocol out-of-service |
|----|---------------------------------------|

**a1** - Link mode status

| <i>a1</i> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|    |      |
|----|------|
| 00 | Idle |
|----|------|

|    |                           |
|----|---------------------------|
| 01 | Input message in progress |
|----|---------------------------|

|    |                            |
|----|----------------------------|
| 02 | Output message in progress |
|----|----------------------------|

**a2** - Link interrupt register (hexadecimal)

Bit numbering 76543210

| <i>Bit</i> | <i>Explanation</i> |
|------------|--------------------|
|------------|--------------------|

|   |                |
|---|----------------|
| 7 | Received break |
|---|----------------|

|   |              |
|---|--------------|
| 6 | Parity error |
|---|--------------|

|   |               |
|---|---------------|
| 5 | Framing error |
|---|---------------|

|   |               |
|---|---------------|
| 4 | Overrun error |
|---|---------------|

|   |                   |
|---|-------------------|
| 3 | Transmitter empty |
|---|-------------------|

|   |                   |
|---|-------------------|
| 2 | Transmitter ready |
|---|-------------------|

|   |               |
|---|---------------|
| 1 | Receiver full |
|---|---------------|

|   |                |
|---|----------------|
| 0 | Receiver Ready |
|---|----------------|

If bits 4, 5, and 6 are all set (equal to 1) simultaneously it indicates a transmission error.

The following status data is for synchronous links.

| <i>a0</i> | <i>Explanation</i>                     |
|-----------|----------------------------------------|
| 00        | Session established on virtual circuit |
| 01        | Session closed on virtual circuit      |

| <i>a1</i> | <i>Explanation</i> |
|-----------|--------------------|
| 00        | always set to 00   |

**a2** - Virtual circuit number (hexadecimal)

| <i>a2</i> | <i>Virtual circuit number</i> |
|-----------|-------------------------------|
| 01        | 1                             |
| 02        | 2                             |
| 03        | 3                             |
| 04        | 4                             |
| 05        | 5                             |
| 06        | 6                             |

## **ERR,MSG,TO,LOG,DISCARDED**

### **ERROR RECOVERY**

#### **Explanation Of Command**

This autonomous message reports that due to large numbers of error reports being passed through the system, not all transient error events were transferred to the disk. Logging will resume automatically when activity decreases to a manageable level.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01337]

I hh:mm:ss xy,ww ERR MSGS TO LOG DISCARDED COMPL

### **Explanation Of Parameters**

---

**ERR** - Error recovery

**MSGs** - Messages

**TO** - To

**LOG** - Log

**DISCARDED**  
- Discarded

## **ERR,PMEM,SMEM,TN,EVENT,COND**

### **REPORT MEMORY CARD ERROR**

#### **Explanation Of Command**

This autonomous message reports that a hardware error has been detected on the Primary Memory Card (PMEM) or the Secondary Memory Card (SMEM). The message identifies the source of the error by displaying error and status registers. Each bit in a register corresponds to a particular type of error. A specific error exists when its corresponding bit is set to one.

#### **Command**

Not applicable.

#### **Completion Message**

#### **Autonomous Message**

[O.01315]

I hh:mm:ss xy,ww ERR {PMEM|SMEM} TN dddd EVENT eeee COND cc COMPL

### **Explanation Of Parameters**

---

**ERR** - Error

**PMEM** - Primary memory card.

**SMEM** - Secondary memory card.

**TN** - Transaction Number

**dddd** - Four digit (hexadecimal) transaction number

The transaction number is a unique tag used to identify a specific event that is recorded in the error recovery log. Specific events may be retrieved from the error log using message I.55011 if the user knows their transaction numbers.

**EVENT** - Event

**eeee** - Four digit (hexadecimal) event number

The event number is a unique tag used to identify a specific event that is recorded in the error recovery log. Specific events may be retrieved from the error log using message I.55011 if the user knows their event numbers.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**80** Memory card cannot be accessed

## **ERR,PWR,PMC,PMA,DMA,MI,TN**

### **ERROR RECOVERY POWER**

#### **Explanation Of Command**

This message indicates that error recovery was called by DACS II because of a power failure on the frame.

This message also indicates which power supply failed. The 4-digit hexadecimal "fields" of the error status register indicate the failed power source(s). These hexadecimal values must be decoded into their individual bits. A bit set to 1 indicates an errored power source.

[O.01301]

pa <il> hh:mm:ss xy,ww ERR PWR {PMC|PMA|DMA|MI}  
aaaa bbbb cccc dddd TN dddd COMPL

## Explanation Of Parameters

**pa** - Priority of action field.

*pa Explanation*

|           |                |
|-----------|----------------|
| <b>I</b>  | Information    |
| <b>*</b>  | Minor alarm    |
| <b>**</b> | Major alarm    |
| <b>*C</b> | Critical alarm |

**il** - Intervention level.

|            |                              |
|------------|------------------------------|
| <b>il</b>  | Explanation                  |
| <b>AMI</b> | Immediate maintenance action |
| <b>AMD</b> | Deferred maintenance action  |
| <b>SI</b>  | No intervention              |

|            |                                    |
|------------|------------------------------------|
| <b>PMC</b> | Prompt Maintenance Action Critical |
| <b>PMA</b> | Prompt Maintenance Action Major    |
| <b>DMA</b> | Deferred Maintenance Action Minor  |
| <b>MI</b>  | Maintenance Information            |

**PWR** - Power

**ERR** - Error recovery

**aaaa** - EMTC ESR0

aaaa is a four-digit hexadecimal number representing the sixteen bits of ESR0. Each bit of this register contains the status of an individual power source. A power source has failed if the bit corresponding to it is set to 1.

*bit # Explanation*

|              |                                              |
|--------------|----------------------------------------------|
| <b>15-12</b> | Unused                                       |
| <b>11</b>    | CCN/ECCN 1 PWR failure                       |
| <b>10</b>    | CCN/ECCN 0 PWR failure                       |
| <b>9</b>     | SYNC 1 PWR failure                           |
| <b>8</b>     | SYNC 0 PWR failure                           |
| <b>7</b>     | Unit 7 PWR failure                           |
|              | Unused if non-Capacity Expansion Frame (CEF) |
| <b>6</b>     | Unused                                       |
| <b>5</b>     | Unit 6 PWR failure                           |
| <b>4</b>     | Unit 5 PWR failure                           |
| <b>3</b>     | Unit 4 PWR failure                           |
| <b>2</b>     | Unit 3 PWR failure                           |
| <b>1</b>     | Unit 2 PWR failure                           |
| <b>0</b>     | Unit 1 PWR failure                           |

**bbbb** - EMTC ESR1

bbbb is similar to aaaa above but represents the sixteen bits of ESR1.

| bit # | Explanation                                                                                               |
|-------|-----------------------------------------------------------------------------------------------------------|
| 15-14 | Unused                                                                                                    |
| 13    | The +12 V disk and tape power unit has failed<br>(484GA, 484GB, or 484GC)                                 |
| 12    | The +5 V main controller power unit has failed<br>(411AA, 411AB, or 411AC)                                |
|       | OR                                                                                                        |
|       | the +/-12 V main controller power unit for communication<br>links has failed<br>(SM565, SM624, or SM565B) |
| 11-00 | Unused                                                                                                    |

**cccc** - EMTC ESR2 (Reserved for future use)

**dddd** - EMTC ESR3 (Unused if non-CEF)

dddd is similar to aaaa above but represents the sixteen bits of ESR3.

| <i>bit #</i> | <i>Explanation</i>  |
|--------------|---------------------|
| <b>15-9</b>  | Unused              |
| <b>8</b>     | Unit 16 PWR failure |
| <b>7</b>     | Unit 15 PWR failure |
| <b>6</b>     | Unit 14 PWR failure |
| <b>5</b>     | Unit 13 PWR failure |
| <b>4</b>     | Unit 12 PWR failure |
| <b>3</b>     | Unit 11 PWR failure |
| <b>2</b>     | Unit 10 PWR failure |
| <b>1</b>     | Unit 9 PWR failure  |
| <b>0</b>     | Unit 8 PWR failure  |

**TN** - Transaction

**dddd** - Transaction number

The TN number can be specified by the UTL::QRY,ERR message to retrieve the contents of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

## **ERR,SOFTWARE,MC,ERROR,MID,TN,RC,ACTION**

### **ERROR RECOVERY SOFTWARE**

#### **Explanation Of Command**

This output message reports that an error was detected by the software in the indicated processor. The report also gives the error type, the source of the error, and the action taken.

The action taken should be sufficient to recover from the problem, in which case no craft action is necessary. Or the action taken was to isolate the problem and prevent system inconsistencies. In this case, manual action will be required to restore the appropriate entities.

#### **⇒ NOTE:**

All new or unknown occurrences of this error should be reported to the development organizations immediately.

The word "SOFTWARE", in the message text, is replaced by "MC" when the error type is "DISK" or "TAPE".

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

[O.01362]

```

## Explanation Of Parameters

[illegible]

## SOFTWARE

- Software

**MC** - Main controller

**TN** - Transaction

**dddd** - Transaction number

The TN number can be specified in UTL::QRY,ERR to retrieve the content of the DACS II error recovery log file which contains the past history of all error recovery events related to this output report.

**error type**

- Type of error

| <i>error type</i> | <i>Explanation</i>                                                   |
|-------------------|----------------------------------------------------------------------|
| CHECKSUM          | Text or data checksum error                                          |
| COMMUNICATION     | Difficulty talking to remove<br>processes of processors              |
| CPUDGN            | CPU diagnostic failed                                                |
| DATA BASE         | Error in data base access                                            |
| DBCHECKSUM        | Data base checksum error                                             |
| DISK              | Trouble accessing disk                                               |
| EXCESSIVE INT     | Too many error recovery calls                                        |
| HARDWARE          | External hardware failure                                            |
| JOURNAL           | Trouble sending journal to disk                                      |
| PROGRAM           | Program error, bad internal data passed                              |
| RAMTEST           | Internal RAM test failed                                             |
| RECOVERY          | Internal recovery error                                              |
| REMOTE PROGRAM    | Program error encountered on other<br>processor local process report |
| TAPE              | Trouble accessing tape                                               |
| VMACHINE          | Operating system or interface problem                                |

**ERROR** - Error

**SOURCE** - Source

**source** - Internal DACS II software filename (12 characters)

**DP** - Decision point

**dp** - Decision point value (0- to 8-digit positive decimal number)  
Number associated with a specific point in the file specified in  
the source field.

**RC** - Return code

**rc** - Return code value (0- to 8-digit positive or negative number)  
Number returned by an internal function.

**ACTION** - Action

**action** - Action to be taken

| <i>action</i> | <i>Explanation</i>                                        |
|---------------|-----------------------------------------------------------|
| RSCOLDBT      | Super Cold Boot                                           |
| REPORT        | Report only, no action                                    |
| HWBOOT        | Hardware boot (boot of processor with existing data base) |
| WMBOOT        | Warm boot (boot of processor with disk data base)         |
| CDBOOT        | Cold boot (boot of processor programs and data base)      |
| REMOVE        | Remove processor from service                             |
| MCOND         | Put frame into MCOND                                      |
| PARK          | Stop processor immediately                                |

**ENTITY** - Entity

**entity** - Entity identifier

| <i>entity</i> | <i>Explanation</i>                     |
|---------------|----------------------------------------|
| MP            | Action on Main Processor               |
| CI            | Action on Communication Interface      |
| MC            | Action on MC                           |
| UNIT [q]q     | Action on specific unit (1 through 16) |
| FRAME         | Frame wide action                      |

**MID** - Mailbox identifier

**mid** - Identifier

**PROC** - Process

**proc** - Process value

**TSARGS** - Trouble shooting arguments

**tsargs** - Trouble shooting arguments value

## **ERR,SYNC,MODE,FAST,HOLDOVER,NORMAL**

### **ERROR RECOVERY**

#### **Explanation Of Command**

This message reports that the active sync has switched to a new operating mode. Additional autonomous actions may be reported (that is, side switch) based on the state of the mate synchronizer.

| <b>cccc</b>     | - Error recovery condition code                                                                                             |

### **synchronizer status data bytes**

- Synchronizer status information (hexadecimal)

Up to five bytes of synchronizer status data. The actual number of bytes output depends upon cccc. The bits of each byte are labeled abcdefgh in that order. The output will appear in the following order:

byte 1, byte 2, byte 3, byte 4, and byte 5.

#### **byte 1**

| <i>bit</i> | <i>Explanation</i>          |
|------------|-----------------------------|
| a          | MC is down flag             |
| b          | SYNC is down flag           |
| c          | Mate SYNC is out-of-service |
| d          | Time Base is down           |

Timing link service status. A bit set to 1 indicates in-service.

| <i>bit</i> | <i>Explanation</i> |
|------------|--------------------|
| e          | TLI1               |
| f          | TLI2               |
| g          | TLI3               |
| h          | TLI4               |

byte 2 - Timing link (SSP) in-service status

A bit set to 1 indicates the indicated entity is in-service

| <i>bit</i> | <i>Explanation</i> |
|------------|--------------------|
| a          | SSP 0 on TLI 1     |
| b          | SSP 1 on TLI 1     |
| c          | SSP 0 on TLI 2     |
| d          | SSP 1 on TLI 2     |
| e          | SSP 0 on TLI 3     |
| f          | SSP 1 on TLI 3     |
| g          | SSP 0 on TLI 4     |
| h          | SSP 1 on TLI 4     |

### byte 3

| <i>bit</i> | <i>Explanation</i>                                 |
|------------|----------------------------------------------------|
| a          | SYNC restart flag                                  |
| b          | Hardware summary, error on DPLL                    |
| c          | PLL summary, any major cross-couple error          |
| d          | Cross-couple summary, any major cross-couple error |
| e          | CRO summary error, any major CRO error             |
| fgh        | Not used                                           |

### byte 4

| <i>bit</i> | <i>Explanation</i>                   |
|------------|--------------------------------------|
| ab         | Synchronizer architecture            |

111      TLI 4, SSP 1

fgh      Not used

**COND**   - Condition

**cccc**   - Hexadecimal condition code

**cccc**   *Explanation*

**EF00**   Unknown what sync switched to

**EF01**   SYNC switched to NORMAL mode

**EF02**   SYNC switched to HOLDOVER

**EF03**   SYNC switched to FAST mode

**EF04**   SYNC switched TLIs/SSPs

**EF05**   SYNC switched to cross couple

## **ERR,SYNC,TLI,SSP,NPC,TN,ALM,LOS,LEN**

### **ERROR RECOVERY**

#### **Explanation Of Command**

This message reports the results of the error recovery process on the synchronizer with the alarms set.

The errors can be of the following types:

- Loss of signal
- Loss of energy
- Excessive jitter
- Phase step
- Out of frame
- Major framing error rate
- Minor framing error rate

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

## **Explanation Of Parameters**

---

**ERR**    - Error recovery

**SYNC**   - Synchronizer

**a**        - SYNC number (0 or 1)

**TLI**     - Timing link interface

**m**        - TLI number (1 through 4)

**SSP**     - Synchronizer sync port

**b**        - SSP number (0 or 1)

**NPC**     - Network processing circuit

**abc**     - Nonhierarchical NPC number

**uvmp**   - Hierarchical NPC number

**uv**     - Unit number

**m**       - Module number

**np**     - NPC number within the module

**TN**       - Transaction

**dddd**   - Transaction number

**ALM**     - Alarm

**LOS**     - Loss of signal

**LEN**     - Loss of energy

**EXJ**     - Excessive jitter

**PHS**     - Phase step

**00F** - Out of frame

**MAJ** - Major framing error rate

**MIN** - Minor framing error rate

**CLR** - Clear

**byte 1,**

**byte 2,**

...,

**byte 5** - Synchronizer status bytes

Synchronizer status data in binary form. The number of data bytes ranges from 1 to 5, depending upon the synchronizer error type. These bytes are a coded form of the information shown in "explanation of error condition code". Each byte has eight bits labeled abcdefgh.

If Main Processor to Synchronizer communication has failed, Error Recovery may not get the correct status data from the Synchronizer. All bits in "synchronizer status data bytes" will then be set to 1 by default.

byte 1

| bit  | Explanation                             |
|------|-----------------------------------------|
| a    | Timing link equipped by MC              |
| b    | Timing link declared out-of-service     |
| c    | Timing link out-of-service due to error |
| d    | Associated Timing Extractor TLI error   |
| efgh | Not used                                |

**byte 2** - Priority weighting of link, a number from 1 through 8

**byte 3** - Framing format, line format, and frequency

bit Explanation

abc Framing format (valid only for TXB1 or TXB2 TLIs)

TXB1

000 D4

001 ESF

010 DDS

TXB2

000 CCS

001 ERSM

gh Not used

**byte 5** - Framing status

bit Explanation

a Out of frame

b Major framing error rate

c Major framing error rate

defgh Not used

**COND** - Condition

**cccc** - Error recovery condition code

**cccc** - Hexadecimal condition code

**cccc** *Explanation*

**E805** TL error cleared

---

## **EXC,MACRO**

---

### **EXECUTE MACRO**

#### **Explanation Of Command**

---

This message requests the execution of macro **<name>**. The optional fields **p1**, **p2**, etc., specify parameters used in the macro.

To list the contents of a macro, use the **UTL QRY,LIST,MACRO** command, Message I.54131.

The **NULL** keyword may be used as a parameter.

#### **Command**

---

[I.39301]

**EXC:FRM xy,SEQ ww:MACRO <macro name>[,(<p1>[,<p2>[,<p3>\**  
**[, ...[,<p10>]]]])]!**

#### **Completion Message**

## **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

**p1,**  
**p2,**  
**p3,**

...,

**p10** - Macro parameter values (1 to 7 uppercase alphanumeric characters)

Within a macro a parameter is referred to by #nn. The # sign indicates a parameter reference follows and the nn indicates the position in the command line from which the parameter value will be taken. That is, if the parameter reference #03 is contained in a line within a macro then the third parameter on the EXC::MACRO command line will be substituted for each appearance of the parameter reference #03.

A maximum of 10 parameters can be specified.

**MACRO** - Macro

**macro name**

- Macro name (seven characters maximum length)

The name of a collection of DACS II commands executed as a group.

A macro name is a string of capitalized alphanumeric characters. There are two type of macros; public and private. A private macros is created by a user in space allocated to the user by the system administrator. Only the user that created it can execute or read (LIST) a private macro. A public macro is created by the system administrator and is executable and readable by all users. A public macro name must start with the letter "P". A private macro name must not start with the letter "P".

**STOP** - Indicates that macro execution is stopped

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 62** File is being accessed
- 64** File doesn't exist/can't be accessed
- 68** Incorrect language/addressing mode
- 69** Incorrect number of parameters
- D5** No user is logged in on the link/vc

## **FRADTS — LOGOFF**

---

## **FRADTS — LOGOFF**

---

This section documents the commands **FRADTS** through **LOGOFF**.

## **FRADTS,BMCMP**

### **FRAME AUDITS**

#### **Explanation Of Command**

This completed, autonomously-generated action message from frame audits indicates that the data in Main Controller (MC) Random Access Memory (RAM) did not match the data on the PMEM PCMCIA card. A similar message may be used for mismatches between the Main Controller and individual Unit Controllers (UC) or between Main Controller and the Communications Interface (CI).

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.82003]

**I hh:mm:ss xy,ww FRADTS BMCMP <ttt> d8 d7 d6 d5 d4 d3 d2 d1 COMPL**

### **Explanation Of Parameters**

---

**ttt** - Entity name

*ttt*      *Explanation*

MP      Main processor

CI      Communications interface

U1-U16 Unit controller (1 through 16)

**d8** - Data base file number on PMEM card

**d7** - Invalid page number divided by 100 ( $d7 / 100$ )

**d6** - Invalid page number modulo by 100 ( $d6 \% 100$ )

If RAM page checksum is invalid,  $d5 = d4 = d3 = d2 = d1 = FF$ .

If DACS II cannot get the data base file on the PMEM card,  $d7 = d5 = FF$ .

## **FRADTS,DGN**

---

### **FRAME AUDITS DIAGNOSTICS**

#### **Explanation Of Command**

---

This autonomously-generated action message from frame audits indicates that an in-service diagnostic was run on the entity **ttt** for the element **eee** and the diagnostic test is complete.

#### **Command**

---

Not applicable.

#### **Completion Message**

---

Not applicable.

#### **Denial Message**

---

Not applicable.

#### **Autonomous Message**

---

## Explanation Of Parameters

---

**ttt** - Test Number

**d9 - d0** - Hexadecimal values of errored data bytes  
Data bytes d9 through d6 are used by some but not all tests.

*ttt Explanation*

002 FTU FTMI status flags are inconsistent

The FTMI equipage flag in the MP data base does not match the equipage flag in the UC data base.

d0 FTMI flag from MP data base  
d1 FTMI flag from UC data base  
d2 Not used  
d3 Not used  
d4 FTMI number  
d5 UNIT number

003 FTU FC status flags are inconsistent

The FC equipage flag in the MP data base does not match the equipage flag in the UC data base.

d0 FC flag from MP data base  
d1 FC flag from UC data base  
d2 Not used  
d3 FC side  
d4 FTMI number  
d5 UNIT number

004 FTU FTMI left side equalization values are inconsistent

The FTMI left side equalization values in the MP data base do not match those in the UC data base.

d0 Second byte of the equalization value from MP data base  
d1 First byte of the equalization value from MP data base  
d2 Second byte of the equalization value from UC data base  
d3 First byte of the equalization value from UC data base  
d4 FTMI number  
d5 UNIT number

005 FTU FTMI right side equalization values are inconsistent

The FTMI right side equalization values in the MP data base do not match those in the UC data base.

- d0 Second byte of the equalization value from MP data base
- d1 First byte of the equalization value from MP data base
- d2 Second byte of the equalization value from UC data base
- d3 First byte of the equalization value from UC data base
- d4 FTMI number
- d5 UNIT number

006 FTU FTMI mode flags are inconsistent

The mode of the FTMI in the MP data base does not match the mode of the FTMI in the UC data base.

- d0 FTMI mode from MP data base
- d1 FTMI mode from UC data base
- d2 Not used
- d3 Not used
- d4 FTMI number
- d5 UNIT number

007 Unit flags are inconsistent

The UNIT equipage flag in the MP data base does not match the UNIT equipage flag in the unit data base.

- d0 UNIT flag from MP data base
- d1 UNIT flag from UC data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 UNIT number

008 Unit Cross-Connect side status flag is inconsistent

The Cross-Connect side status flag in the MP data base does not match the CCN/ECCN side status flag in the unit data base.

- d0 Cross-Connect side flag from MP data base
- d1 Cross-Connect side flag from UNIT data base
- d2 Not used
- d3 Not used
- d4 Cross-Connect side
- d5 UNIT number

009 DS3 FMT/HFMT equipage inconsistent

FMT/HFMT equipage in the MP data base is not consistent with that of the unit data base

d0 MP equipage flag  
d1 UA equipage flag  
d2 Not used  
d3 Not used  
d4 FMT/HFMT Number  
d5 Unit Number

00A DS3 MXR/HMXR equipage inconsistent

MXR/HMXR equipage in the MP data base is not consistent with that of the unit data base

d0 MP data base equipage flag  
d1 UA data base equipage flag  
d2 Not used  
d3 Not used  
d4 MXR/HMXR Number  
d5 Unit Number

00B DS3 MIU equipage inconsistent

MIU equipage in the MP data base is not consistent with that of the Unit data base

d0 MP data base equipage flag  
d1 UA data base equipage flag  
d2 Not used  
d3 Not used  
d4 MIU Number  
d5 Unit Number

00C DS3 FLI equipage inconsistent

FLI equipage in the MP data base is not consistent with that of the Unit data base

d0 MP equipage flag  
d1 UA equipage flag  
d2 Not used  
d3 Not used  
d4 FLI Number  
d5 Unit Number

00D NPC Transmit Pseudo Framing Word is out of range

The Transmit Pseudo Framing Word is out of range in the MP data base

d0 The Transmit Pseudo Framing Word of NPC from MP data base  
d1 Not used  
d2 Not used  
d3 Not used  
d4 NPC number  
d5 UNIT number

00E NPC Receive Pseudo Framing Word is out of range

The Receive Pseudo Framing Word is out of range in the MP data base

d0 The Receive Pseudo Framing Word of NPC from MP data base  
d1 Not used  
d2 Not used  
d3 Not used  
d4 NPC number  
d5 UNIT number

00F NPC AIS Alarm data are inconsistent

The AIS Alarm data of the NPC in the MP data base does not match that in the unit data base

d0 The AIS Alarm data of NPC from MP data base  
d1 The AIS Alarm data of NPC from unit data base  
d2 Not used  
d3 Not used  
d4 NPC number  
d5 UNIT number

011 FTU NPC flags are inconsistent

The FTU (or DSPU) NPC equipage flag in the MP data base does not match the FTU (or DSPU) NPC equipage flag in the Unit data base.

d0 NPC flag from MP data base  
d1 NPC flag from UC data base  
d2 Not used  
d3 Not used  
d4 NPC number  
d5 UNIT number

012 FTU NPC insertion words are inconsistent

The FTU NPC insertion word in the MP data base does not match the FTU NPC insertion word in the UC data base.

- d0 NPC insertion word from MP data base
- d1 NPC insertion word from UC data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

013 FTU NPC types are inconsistent

The type of the FTU NPC in the MP data base does not match the type of the FTU NPC in the UC data base.

- d0 NPC type from MP data base
- d1 NPC type from UC data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

014 FTU NPC X option values are inconsistent

The X option of the FTU NPC in the MP data base does not match that in the UC data base.

- d0 Second byte of the X option of NPC from MP data base
- d1 First byte of the X option of NPC from MP data base
- d2 Second byte of the X option of NPC from UC data base
- d3 First byte of the X option of NPC from UC data base
- d4 NPC number
- d5 UNIT number

015 FTU NPC Y option values are inconsistent

The Y option of the FTU NPC in the MP data base does not match that in the UC data base.

- d0 Second byte of the Y option of NPC from MP data base
- d1 First byte of the Y option of NPC from MP data base
- d2 Second byte of the Y option of NPC from UC data base
- d3 First byte of the Y option of NPC from UC data base
- d4 NPC number
- d5 UNIT number

016 FTU NPC Z option values are inconsistent

The Z option of the FTU NPC in the MP data base does not match that in the UC data base.

- d0 Second byte of the Z option of NPC from MP data base
- d1 First byte of the Z option of NPC from MP data base
- d2 Second byte of the Z option of NPC from UC data base
- d3 First byte of the Z option of NPC from UC data base
- d4 NPC number
- d5 UNIT number

017 FTU NPC threshold values are inconsistent

The threshold value of the FTU NPC in the MP data base does not match that in the UC data base.

- d0 Second byte of the threshold value of NPC from MP data base
- d1 First byte of the threshold value of NPC from MP data base
- d2 Second byte of the threshold value of NPC from UC data base
- d3 First byte of the threshold value of NPC from UC data base
- d4 NPC number
- d5 UNIT number

018 FTU NPC Signaling field is inconsistent

The FTU NPC SIG field in the MP data base does not match the FTU NPC SIG field in the UC data base.

- d0 NPC SIG field from MP data base
- d1 NPC SIG field from UC data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

019 FTU NPC TS0 bit value is inconsistent

The FTU NPC TS0 bits in the MP data base do not match the FTU NPC TS0 bits in the UC data base.

- d0 NPC TS0 bits from MP data base
- d1 NPC TS0 bits from UC data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

01A FTU NPC loopback field is inconsistent

The FTU NPC LPBK field in the MP data base does not match the FTU NPC LPBK field in the UC data base.

- d0 NPC LPBK field from MP data base
- d1 NPC LPBK field from UC data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

01B FTU NPC TS0M bit value is inconsistent

The FTU NPC TS0M bits in the MP data base do not match the FTU NPC TS0M bits in the UC data base.

- d0 NPC TS0M bits from MP data base
- d1 NPC TS0M bits from UC data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

01C FTU syncmode value is inconsistent

The FTU syncmode in the MP data base does not match the FTU syncmode in the UC data base.

- d0 syncmode from MP data base
- d1 syncmode from UC data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 UNIT number

01D CPR channel modify activated information is inconsistent

The CPR channel modify activated information stored in UC data base does not match that stored in the MP data base.

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Not used
- d4 FTU NPC number
- d5 UNIT number

01E NPC Insertion AIS values are inconsistent

The Insertion AIS of the NPC in the MP data base does not match that in the unit data base

- d0 The AIS Insertion of NPC from MP data base
- d1 The AIS Insertion of NPC from MP data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

01F NPC alarm disable flag values are inconsistent

The alarm disable flag of the NPC in the MP data base does not match that in the unit data base

- d0 Second byte of the alarm disable flag of NPC from MP data base
- d1 First byte of the alarm disable flag of NPC from MP data base
- d2 Second byte of the alarm disable flag of NPC from unit data base
- d3 First byte of the alarm disable flag of NPC from unit data base
- d4 NPC number
- d5 UNIT number

021 CCN side entity flags are inconsistent

The equipage flag of the CCN side entity in the MP data base does not match that in the CCN data base.

- d0 CCN side flag from MP data base
- d1 CCN side flag from CCN data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 CCN side

022 CCN CCNI entity flags are inconsistent

The equipage flag of the CCN CCNI entity in the MP data base does not match that in the CCN data base.

- d0 CCNI flag from MP data base
- d1 CCNI flag from CCN data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 CCN side

023     CCN CCB entity flags are inconsistent

The equipage flag of the CCN CCB entity in the MP data base does not match that in the CCN data base.

- d0     CCB flag from MP data base
- d1     CCB flag from CCN data base
- d2     Not used
- d3     Not used
- d4     CCB number
- d5     CCN side

024     CCN TSI entity flags are inconsistent

The equipage flag of the CCN TSI entity in the MP data base does not match that in the CCN data base.

- d0     CCN TSI flag from MP data base
- d1     CCN TSI flag from CCN data base
- d2     Not used
- d3     CCB number - TO side
- d4     CCB number - FROM side
- d5     CCN side

025     CCN active side flags are inconsistent

The CCN active side reported by the MP data base does not match the CCN active side reported by the CCN data base.

- d0     CCN active side flag MP data base
- d1     CCN active side from CCN data base
- d2     Not used
- d3     Not used
- d4     Not used
- d5     Not used

026     ECCN side entity flags are inconsistent

The equipage flag of the ECCN side entity in the MP data base does not match that in the ECCN data base.

- d0     ECCN side flag from MP data base
- d1     ECCN side flag from ECCN data base
- d2     Not used
- d3     Not used
- d4     Not used
- d5     ECCN side

027 ECCN CCI entity flags are inconsistent

The equipage flag of the ECCN CCI entity in the MP data base does not match that in the ECCN data base.

- d0 CCI flag from MP data base
- d1 CCI flag from ECCN data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 ECCN side

028 ECCN ETSI entity flags are inconsistent

The equipage flag of the ECCN ETSI entity in the MP data base does not match that in the ECCN data base.

- d0 ECCN ETSI flag from MP data base
- d1 ECCN ETSI flag from ECCN data base
- d2 Not used
- d3 Not used
- d4 ETSI number
- d5 ECCN side

029 ECCN active side flags are inconsistent

The ECCN active side reported by the MP data base does not match the ECCN active side reported by the ECCN data base.

- d0 ECCN active side flag MP data base
- d1 ECCN active side from ECCN data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Not used

02A NPC Transmit Pseudo Framing Words are inconsistent

The Transmit Pseudo Framing Word of the NPC in the MP data base does not match that in the unit data base

- d0 The Transmit Pseudo Framing word of NPC from MP data base
- d1 The Transmit Pseudo Framing word of NPC from unit data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

02B NPC Receive Pseudo Framing Word values are inconsistent

The Receive Pseudo Framing Word of the NPC in the MP data base does not match that in the unit data base

- d0 The Receive Pseudo Framing Word of NPC from MP data base
- d1 The Receive Pseudo Framing Word of NPC from unit data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

02C NPC Non Frame Word Setting values are inconsistent

The Non Frame Word Setting of the NPC in the MP data base does not match that in the unit data base

- d0 Fourth byte of the Non Frame Word Setting of NPC from MP data base
- d1 Third byte of the Non Frame Word Setting of NPC from MP data base
- d2 Fourth byte of the Non Frame Word Setting of NPC from unit data base
- d3 Third byte of the Non Frame Word Setting of NPC from unit data base
- d4 NPC number
- d5 UNIT number

02D NPC Transmit and Receive Pseudo Framing word values are inconsistent

The Transmit Pseudo Framing Word of a NPC does not match the Receive Pseudo Framing Word in the MP data base when one of them is set to the Non-Framing Word

- d0 The Transmit Pseudo Framing Word of NPC from MP data base
- d1 The Receive Pseudo Framing Word of NPC from MP data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

02E CCN and Sync are running on opposite sides

The CCN active side reported by the MP data base does not match the Sync active side reported by the frame data base.

- d0 CCN active side from MP data base
- d1 Sync active side from frame data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Not used

02F ECCN and Sync are running on opposite sides

The ECCN active side reported by the MP data base does not match the Sync active side reported by the frame data base.

- d0 ECCN active side from MP data base
- d1 Sync active side from frame data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Not used

032 DSPI entity flags are inconsistent

The equipage flag of the DSPI entity in the MP data base does not match that in the DSPU data base.

- d0 DSPI flag from MP data base
- d1 DSPI flag from UD data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Unit number

033 HUB-ID value in data bases is inconsistent

The HUB-ID is inconsistent between the MP data base and the UD data base.

- d0 HUB-ID value from MP data base
- d1 HUB-ID value from UD data base
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Unit number

034 NPC connected to a time slot is inconsistent

The NPC connected to a time slot in the MP data base does not match with the UD data base.

- d0 The connected NPC number from MP data base
- d1 The connected NPC number from UD data base
- d2 Not used
- d3 The time slot number
- d4 The NPC number
- d5 Unit number

035 Function block for a time slot is inconsistent

The function block connected to a time slot in the MP data base does not match with the UD data base.

- d0 The connected function block number from MP data base
- d1 The connected function block number from UD data base
- d2 Not used
- d3 The time slot number
- d4 The NPC number
- d5 Unit number

036 SRM customer number or MJU branch number is inconsistent

The SRM customer number or MJU branch number in the MP data base does not match with the UD data base.

- d0 The SRM customer number or MJU branch number from MP data base
- d1 The SRM customer number or MJU branch number from UD data base
- d2 Not used
- d3 The SRM number or the MJU number
- d4 The NPC number
- d5 Unit number

037 Time slot rate is inconsistent

The time slot rate in the MP data base does not match with that of the UD data base.

- d0 The time slot rate from MP data base
- d1 The time slot rate from UD data base
- d2 Not used
- d3 The time slot number
- d4 The NPC number
- d5 Unit number

038 Time slot functional usage is inconsistent

The functional usage in the MP data base does not match with that of the UD data base.

- d0 the functional usage from MP data base
- d1 the functional usage from UD data base
- d2 Not used
- d3 The time slot number
- d4 The NPC number
- d5 Unit number

039 SRDC unexpected errors

An unexpected error was encountered during Subrate Circuit audits.

- d0 The Unit where the error is found
- d1 Not used
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Not used

03B DS3 FLI LBO data base inconsistent

FLI/Line Build Out in the MP data base is not consistent with that of the Unit data base

- d0 MP lbo
- d1 UA lbo
- d2 Not used
- d3 Not used
- d4 MXR/HMXR Number
- d5 Unit Number

03C DS3 MXR/HMXR data base flag inconsistent

MXR/HMXR data base flag in the MP data base is not consistent with that of the Unit data base

- d0 MP data base flag
- d1 UA data base flag
- d2 Not used
- d3 Not used
- d4 MXR/HMXR Number
- d5 Unit Number

03D DS3 MXR/HMXR data base type inconsistent

MXR/HMXR type in the MP data base is not consistent with that of the Unit data base

- d0 MP data base type
- d1 UA data base type
- d2 Not used
- d3 Not used
- d4 MXR/HMXR Number
- d5 Unit Number

03E DS3 MXR/HMXR data base xoption inconsistent

MXR/HMXR 'x' option in the MP data base is not consistent with that of the Unit data base

d0 MP data base xoption  
d1 UA data base xoption  
d2 Not used  
d3 Not used  
d4 MXR/HMXR Number  
d5 Unit Number

03F DS3 MXR/HMXR data base yoption inconsistent

MXR/HMXR 'y' option in the MP data base is not consistent with that of the Unit data base

d0 MP data base yoption  
d1 UA data base yoption  
d2 Not used  
d3 Not used  
d4 MXR/HMXR Number  
d5 Unit Number

040 DS3 MXR/HMXR data base zoption inconsistent

MXR/HMXR 'z' option in the MP data base is not consistent with that of the Unit data base

d0 MP data base zoption  
d1 UA data base zoption  
d2 Not used  
d3 Not used  
d4 MXR/HMXR Number  
d5 Unit Number

041 DS3 MXR/HMXR data base BER threshold inconsistent

MXR/HMXR 'BER' threshold in the MP data base is not consistent with that of the Unit data base

d0 MP data base ber threshold  
d1 UA data base ber threshold  
d2 Not used  
d3 Not used  
d4 Unit Number  
d5 MXR/HMXR Number

042 DS3 MXR/HMXR data base BER type inconsistent

MXR/HMXR 'BER' type in the MP data base is not consistent with that of the Unit data base

- d0 MP data base ber type
- d1 UA data base ber type
- d2 Not used
- d3 Not used
- d4 Unit Number
- d5 MXR/HMXR Number

043 DS3 MIU data base flag inconsistent

MIU data base flag in the MP data base is not consistent with that of the Unit data base

- d0 MP data base flag
- d1 UA data base flag
- d2 Not used
- d3 Not used
- d4 MIU Number
- d5 Unit Number

044 DS3 MIU data base type inconsistent

MIU data base type in the MP data base is not consistent with that of the Unit data base

- d0 MP data base type
- d1 UA data base type
- d2 Not used
- d3 Not used
- d4 MIU Number
- d5 Unit Number

045 DS3 MIU data base xoption inconsistent

MIU 'x' option in the MP data base is not consistent with that of the Unit data base

- d0 MP data base xoption
- d1 UA data base xoption
- d2 Not used
- d3 Not used
- d4 MIU Number
- d5 Unit Number

046 DS3 MIU data base yoption inconsistent

MIU 'y' option in the MP data base is not consistent with that of the Unit data base

- d0 MP data base yoption
- d1 UA data base yoption
- d2 Not used
- d3 Not used
- d4 MIU Number
- d5 Unit Number

047 DS3 MIU data base zoption inconsistent

MIU 'z' option in the MP data base is not consistent with that of the Unit data base

- d0 MP data base zoption
- d1 UA data base zoption
- d2 Not used
- d3 Not used
- d4 MIU Number
- d5 Unit Number

048 MMFG data base inhibit flag inconsistent

MMFG inhibit status in the MP data base is not consistent with that of the Unit data base

- d0 Protection switch data base flag
- d1 UA data base flag
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Unit Number

049 MMFG data base protection status inconsistent

MMFG protected status in the MP data base is not consistent with that of the Unit data base

- d0 Protection switch data base status
- d1 UA data base status
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Unit Number

04A MMFG data base protection index inconsistent

MMFG protected index in the MP data base is not consistent with that of the Unit data base

- d0 Protection switch data base index
- d1 UA data base index
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Unit Number

04B MMFG data base protection mode inconsistent

MMFG protected mode in the MP data base is not consistent with that of the Unit data base

- d0 Protection switch data base mode
- d1 UA data base mode
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Unit Number

04C MMFG data base service status of MXR P/HMXR P inconsistent

MXR-P/HMXR-P service status in the MP data base is not consistent with that of the Unit data base

- d0 Protection switch data base status
- d1 UA data base status
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Unit Number

04D MMFG data base service status of MIU P inconsistent

MIU-P service status in the MP data base is not consistent with that of the Unit data base

- d0 Protection switch data base status
- d1 UA data base status
- d2 Not used
- d3 Not used
- d4 Not used
- d5 Unit Number

050 Time slot partner is inconsistent

The time slot's partner time slot in the MP data base does not match with that of the UC data base.

- d0 The partner time slot from MP data base
- d1 The partner time slot from UC data base
- d2 Not used
- d3 The time slot number
- d4 The NPC number
- d5 Unit number

052 Time slot TLA state is inconsistent

The time slot's TLA state in the MP data base does not match with that of the UC data base.

- d0 The TLA state from MP data base
- d1 The TLA state from UC data base
- d2 Not used
- d3 The time slot number
- d4 The NPC number
- d5 Unit number

055 RTs external number is inconsistent

An RTs external number in the MP data base does not match with that of the UC data base.

- d0 Left byte of the RT external number in MP data base
- d1 Right byte of the RT external number in MP data base
- d2 Left byte of the RT external number in UC data base
- d3 Right byte of the RT external number in UC data base
- d4 Not used
- d5 The Unit of the RT

056 RTs digroup NPC number is inconsistent

An RTs digroup NPC number in the MP data base does not match with that of the UC data base (d3=2); An RTs digroup NPC number does not match with the associated DCLUs both in the MP data base (d3=1)

- d0 The RT digroup NPC number in MP data base
- d1 The RT digroup NPC number in UC data base
- d2 Index of the digroup (1,2,3,4,5 for DGA,DGB,DGC,DGD,DGP respectively)
- d3 Not used
- d4 The RT internal number
- d5 The Unit of the RT

057 RTs index of protected digroup is inconsistent

An RTs index of protected digroup in the MP data base does not match with that of the UC data base

- d0 The RT index of protected digroup in MP data base
- d1 The RT index of protected digroup in UC data base
- d2 Not used
- d3 Not used
- d4 The RT internal number
- d5 The Unit of the RT

058 RTs Zoption is inconsistent

An RTs Zoption in the MP data base does not match with that of the UC data base

- d0 The RT Zoption in MP data base
- d1 The RT Zoption in UC data base
- d2 Not used
- d3 Not used
- d4 The RT internal number
- d5 The Unit of the RT

059 RTs inhibit state is inconsistent

An RTs inhibit state in the MP data base does not match with that of the UC data base

- d0 The RT inhibit state in MP data base
- d1 The RT inhibit state in UC data base
- d2 Index of the digroup
- d3 Not used
- d4 The RT internal number
- d5 The Unit of the RT

05A SLC® carrier unexpected errors

An unexpected error is encountered during SLC carrier RT audits.

- d0 The Unit where the error is found

069 Invalid internal MJU number or internal NPC number

An NPC indicates there is an MJU allocated to it, after the MJU query returns a different internal MJU number or that MJU is marked to allocate to another NPC.

d0 the MJU number  
d1 The NPC number  
d2 the UNIT number  
d3 the MJU internal number from the query  
d4 the internal NPC number from the query  
d5 Not used

070 Inconsistent mapping between a facility channel and a time slot.

A channel is connected to a time slot but the time slot does not connect the channel in the MP data base.

d0 the channel number  
d1 The NPC number  
d2 the UNIT number  
d3 The time slot  
d4 The time slot NPC  
d5 The time slot Unit

071 Inconsistent time slot mapping between a facility channel and a MVEC.

An MVEC is expected to connect to a facility channel but the MP data base shows the channel does not connect to the MVEC.

d0 the channel number  
d1 The NPC number  
d2 the UNIT number  
d3 the MVEC time slot  
d4 the MVEC NPC  
d5 MVEC Unit

072 Inconsistent time slot mapping a channel to a PCHEC.

A PCHEC is expected to connect to a facility channel but the MP data base shows the channel does not connect to the PCHEC.

d0 the channel number  
d1 The NPC number  
d2 the UNIT number  
d3 the PCHEC time slot  
d4 the PCHEC NPC  
d5 the PCHEC Unit

073 Inconsistent time slot mapping a channel to a PCHECs parity leg.

A PCHEC parity leg is expected to connect to a facility channel but the MP data base shows the channel does not connect to the leg.

d0 the channel number  
d1 The NPC number  
d2 the UNIT number  
d3 the PCHEC time slot  
d4 the PCHEC NPC  
d5 the PCHEC Unit

074 Inconsistent time slot mapping a channel to a PCHECs data leg

A PCHEC data leg is expected to connect to a facility channel but the MP data base shows the channel does not connect to the leg.

d0 the channel number  
d1 The NPC number  
d2 the UNIT number  
d3 the PCHEC time slot  
d4 the PCHEC NPC  
d5 the PCHEC Unit

076 Invalid time slot assignment to an MJU's master leg.

An MJU's master leg is expected to connect a time slot but the MP data base shows that the time slot does not connect to the master leg.

d0 the MJU number  
d1 The NPC number  
d2 the UNIT number  
d3 the MJU master leg index  
d4 Not used  
d5 Not used

077 Invalid time slot assignment to an MJU's branch leg.

An MJU's branch leg is expected to connect a time slot but the MP data base shows that the time slot does not connect to the branch leg.

d0 the MJU number  
d1 The NPC number  
d2 the UNIT number  
d3 the MJU branch leg  
d4 Not used  
d5 Not used

078 Inconsistent time slot mapping a channel to a PCHECs customer leg.

A PCHEC customer leg is expected to connect to a facility channel but the MP data base shows the channel does not connect to the leg.

d0 the channel number  
d1 The NPC number  
d2 the UNIT number  
d3 the PCHEC time slot  
d4 the PCHEC NPC  
d5 the PCHEC Unit

079 Cascaded MJUs do not have same rate.

An MJU is cascaded with MJU b, their rate must be the same.

d0 the MJU b number  
d1 The NPC number of MJU b  
d2 the UNIT number of MJU b  
d3 the MJU a number  
d4 The NPC number of MJU a  
d5 the UNIT number of MJU a

080 SRM rate is invalid

An SRM rate is invalid.

d0 The SRM number  
d1 The NPC number of SRM  
d2 the UNIT number of SRM  
d3 Not used  
d4 Not used  
d5 Not used

081 Invalid time slot assignment to an SRMs leg.

An SRMs branch leg is expected to connect a time slot but the MP data base shows that the time slot does not connect to the branch leg.

- d0 The SRM number
- d1 The NPC number
- d2 the UNIT number
- d3 Index of SRM leg
- d4 Not used
- d5 Not used

084 A DS0A channel does not connect to an EC.

A DS0A channel is expected to connect to an error corrector through a time slot but the MP data base shows that the time slot does not connect to an error corrector.

- d0 the DS0A channel number
- d1 The NPC number of the channel
- d2 the UNIT number of the channel
- d3 The ECs time slot
- d4 The ECs NPC number
- d5 The ECs Unit number

086 RTs external number is inconsistent with DCLU

An RTs external number in the MP data base does not match with that of the DCLU in the MP data base.

- d0 Left byte of the RT external number in MP data base
- d1 Right byte of the RT external number in MP data base
- d2 Left byte of the DCLU external number in MP data base
- d3 Right byte of the DCLU external number in MP data base
- d4 Not used
- d5 The Unit of the RT

089 RTs Zoption is inconsistent with DCLU Zoption

An RTs Zoption in the MP data base does not match with that of the DCLU in the MP data base

- d0 The RT Zoption in MP data base
- d1 The DCLU Zoption in MP data base
- d2 Not used
- d3 Not used
- d4 The RT internal number
- d5 The Unit of the RT

090 RTs inhibit state is inconsistent with DCLU

An RTs inhibit state in the MP data base does not match with that of the DCLU in the MP data base

- d0 The RT inhibit state in MP data base
- d1 The DCLU inhibit state in MP data base
- d2 Index of the digroup
- d3 Not used
- d4 The RT internal number
- d5 The Unit of the RT

091 RTs loopback state is inconsistent with DCLU

An RTs loopback state in the MP data base does not match with that of the DCLU in the MP data base

- d0 The RT loopback state in MP data base
- d1 The DCLU loopback state in MP data base
- d2 Index of the digroup
- d3 Not used
- d4 The RT internal number
- d5 The Unit of the RT

093 RTs data link status is inconsistent with DCLU

An RTs data link status in the MP data base does not match with that of the DCLU in the MP data base

- d0 The RT data link in MP data base
- d1 The DCLU data link in MP data base
- d2 Not used
- d3 Not used

- d5 The Unit of the RT

095 RTs SLC carrier mode is inconsistent with DCLU

An RTs SLC carrier mode in the MP data base does not match with that of the DCLU in the MP data base

- d0 The RT SLC carrier mode in MP data base
- d1 The DCLU SLC carrier mode in MP data base
- d2 Not used
- d3 Not used
- d4 The RT internal number
- d5 The Unit of the RT

102 MP two-way two-point connection types are inconsistent

The two-way two-point connection types in the MP data base do not match between two sides.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

103 MP two-way two-point connection data are inconsistent

The two-way two-point connection data in the MP data base do not match between two sides.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

104 UC two-way two-point connection data are inconsistent

The two-way two-point connection channel data in the UC data base do not match that from MP data base.

- d0 TCC audit result - equal 1 if inconsistency detected
- d1 Flag audit result - equal 1 if inconsistency detected
- d2 Connected NPC audit result - equal 1 if inconsistency detected
- d3 Channel number
- d4 NPC number
- d5 UNIT number

105 CCN two-way two-point connection map error detected

The two-way two-point connection TSI map in the CCN does not match between two sides.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

106 ECCN two-way two-point connection map error detected

The two-way two-point connection ETSI map in the ECCN does not match between two sides.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

112 MP one-way two-point connection types are inconsistent

The one-way two-point connection types in the MP data base do not match between two sides.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

113 MP one-way two-point connection data are inconsistent

The one-way two-point connection data in the MP data base does not match between two sides.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

114 UC one-way two-point connection data are inconsistent

The one-way two-point connection channel data in the UC data base do not match that MP data base.

- d0 TCC audit result - equal 1 if inconsistency detected
- d1 Flag audit result - equal 1 if inconsistency detected
- d2 Connected NPC audit result - equal 1 if inconsistency detected
- d3 Channel number
- d4 NPC number
- d5 UNIT number

115 CCN one-way two-point connection map error detected

The one-way two-point connection TSI map in the CCN does not match between two sides.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

116 CCN unmapped connection error detected

The TSI map shows that there is a connection map to an NPC and channel in CCN data base while the NPC and channel are marked as unmapped in MP data base.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 Unit number of the TO side
- d3 Not used
- d4 Not used
- d5 Not used

121 UC virtual conference leg channel alternate message store (AMS) value is inconsistent

The virtual conference leg channel AMS data in the UC data base does not match the TCC value in the MP data base.

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Channel number
- d4 NPC number
- d5 UNIT number

122 UC virtual conference leg channel connected NPC is inconsistent

The connected NPC of the virtual conference leg channel in the UC data base does not match the BBL NPC number from the MP data base.

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Channel number
- d4 NPC number
- d5 UNIT number

123 UC virtual conference leg channel flag is inconsistent

The virtual conference leg channel flag in the UC data base does not match the flag from the MP data base.

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Channel number
- d4 NPC number
- d5 UNIT number

125 CCN virtual conference leg channel connection map error detected

The two-point connection TSI map in the CCN does not match between the BBL channel and the leg channel.

- d0 Channel number of the BRD leg
- d1 NPC number of the BRD leg
- d2 UNIT number of the BRD leg
- d3 Channel number of the BBL leg
- d4 NPC number of the BBL leg
- d5 UNIT number of the BBL leg

126 ECCN virtual conference leg channel connection map error detected

The two-point connection ETSI map in the ECCN does not match between the BBL channel and the leg channel.

- d0 Channel number of the BRD leg
- d1 NPC number of the BRD leg
- d2 UNIT number of the BRD leg
- d3 Channel number of the BBL leg
- d4 NPC number of the BBL leg
- d5 UNIT number of the BBL leg

127 ECCN one-way two-point connection map error detected

The one-way two-point connection ETSI map in the ECCN does not match between two sides.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

128 ECCN unmapped connection error detected

The ETSI map shows that there is a connection map to an NPC and channel in ECCN data base while they are marked as unmapped in MP data base.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 Unit number of the TO side
- d3 Not used
- d4 Not used
- d5 Not used

131 UC BCON leg channel alternate message store (AMS) value is inconsistent

The BCON leg channel AMS data in the UC data base does not match the TCC value from the MP data base.

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Channel number
- d4 NPC number
- d5 UNIT number

132 UC BCON leg channel connected NPC is inconsistent

The connected NPC of the BCON leg channel in the UC data base does not match the BBL NPC number from the MP data base.

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Channel number
- d4 NPC number

135 CCN BCON leg channel connection map error detected

The two-point connection TSI map in the CCN does not match between the BBL channel and the leg channel.

- d0 Channel number of the BRD leg
- d1 NPC number of the BRD leg
- d2 UNIT number of the BRD leg
- d3 Channel number of the BBL leg
- d4 NPC number of the BBL leg
- d5 UNIT number of the BBL leg

136 ECCN BCON leg channel connection map error detected

The two-point connection ETSI map in the ECCN does not match between the BBL channel and the leg channel.

- d0 Channel number of the BRD leg
- d1 NPC number of the BRD leg
- d2 UNIT number of the BRD leg
- d3 Channel number of the BBL leg
- d4 NPC number of the BBL leg
- d5 UNIT number of the BBL leg

150 UC DMB conference leg channel connected NPC is inconsistent

The connected NPC of the DMB conference leg channel in the UC data base does not match that from MP data base.

- d0 Channel flag in the UC data base
- d1 Connected NPC number
- d2 Connected Unit number
- d3 Channel number
- d4 NPC number
- d5 UNIT number

151 UC DMB conference leg channel alternate message store (AMS) value is inconsistent

The DMB conference leg channel AMS data in the UC data base does not match the TCC value from the MP data base.

- d0 Channel flag in the UC data base
- d1 Connected NPC number
- d2 Connected Unit number
- d3 Channel number
- d4 NPC number
- d5 UNIT number

152 UC DMB conference leg channel flag is inconsistent

The DMB conference leg channel flag in the UC data base does not match the flag from the MP data base.

- d0 Channel flag in the UC data base
- d1 Connected NPC number
- d2 Connected Unit number
- d3 Channel number
- d4 NPC number
- d5 UNIT number

154 CCN one-way DMB conference connection map error detected

The one-way DMB conference connection TSI map in the CCN does not match between two legs.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

155 CCN two-way DMB conference connection map error detected

The two-way DMB conference connection TSI map in the CCN does not match between two legs.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

156 ECCN one-way DMB conference connection map error detected

The one-way DMB conference connection ETSI map in the ECCN does not match between two legs.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

157 ECCN two-way DMB conference connection map error detected

The two-way DMB conference connection ETSI map in the ECCN does not match between two legs.

- d0 Channel number of the TO side
- d1 NPC number of the TO side
- d2 UNIT number of the TO side
- d3 Channel number of the FROM side
- d4 NPC number of the FROM side
- d5 UNIT number of the FROM side

160 UD DMB conference leg is inconsistent

The DMB conference number of the leg channel in the UD data base does not match the number from the MP data base.

- d0 Connected NPC number of the leg
- d1 Connected UC Unit number of the leg
- d2 Conference number of the leg stored in the UD data base
- d3 Channel number of the leg
- d4 DMB NPC number of the leg
- d5 UNIT number

161 UD DMB conference leg channel connected NPC is inconsistent

The connected NPC of the DMB conference leg channel in the UD data base does not match the NPC number from the MP data base.

- d0 Connected NPC number of the leg
- d1 Connected UC Unit number of the leg
- d2 Conference number of the leg
- d3 Channel number of the leg
- d4 DMB NPC number of the leg
- d5 UNIT number

162 UD DMB conference leg connected conference is inconsistent

The connected conference number of the DMB conference leg channel in the UD data base does not match the number from the MP data base.

- d0 Connected NPC number of the leg from UD data base
- d1 Connected UC Unit number of the leg
- d2 Conference number of the leg
- d3 Channel number of the leg
- d4 DMB NPC number of the leg
- d5 UNIT number

163 UD DMB conference leg type is inconsistent

The type of the DMB conference leg channel in the UD data base does not match the type from the MP data base.

- d0 Connected NPC number of the leg
- d1 Connected UC Unit number of the leg
- d2 Conference number of the leg
- d3 Channel number of the leg
- d4 DMB NPC number of the leg
- d5 UNIT number

164 UD DMB channel tlpin value is inconsistent

The value of transmit level into bridge of the DMB conference leg channel from UD data base does not match that from the MP data base.

- d0 Connected NPC number of the leg
- d1 Connected UC Unit number of the leg
- d2 Conference number of the leg
- d3 Channel number of the leg
- d4 DMB NPC number of the leg
- d5 UNIT number

165 UD DMB channel tlpout value is inconsistent

The value of transmit level out of bridge of the DMB conference leg channel from UD data base does not match that from the MP data base.

- d0 Connected NPC number of the leg
- d1 Connected UC Unit number of the leg
- d2 Conference number of the leg
- d3 Channel number of the leg
- d4 DMB NPC number of the leg
- d5 UNIT number

166 UD DMB channel noise guard value is inconsistent

The value of noise guard of the DMB conference leg channel from UD data base does not match that from the MP data base.

- d0 Connected NPC number of the leg
- d1 Connected UC Unit number of the leg
- d2 Conference number of the leg
- d3 Channel number of the leg
- d4 DMB NPC number of the leg
- d5 UNIT number

167 UD DMB channel echo suppression value is inconsistent

The value of echo suppression of the DMB conference leg channel from UD data base does not match that from the MP data base.

- d0 Connected NPC number of the leg
- d1 Connected UC Unit number of the leg
- d2 Conference number of the leg
- d3 Channel number of the leg
- d4 DMB NPC number of the leg
- d5 UNIT number

168 UD DMB channel NTR state is inconsistent

The current NTR state of the DMB conference leg from UD data base does not match that from the MP data base.

- d0 Connected NPC number of the leg
- d1 Connected UC Unit number of the leg
- d2 Conference number of the leg
- d3 Channel number of the leg
- d4 DMB NPC number of the leg
- d5 UNIT number

171 DSPU CPR channel modify activated/monitor enabled information is inconsistent

The CPR channel modify activated/monitor enabled information stored in UD data base does not match that stored in the MP data base.

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Channel number
- d4 CPR NPC number
- d5 UNIT number

172 DSPU CPR channel modify activated/monitor enabled information is inconsistent

The CPR channel modify activated/monitor enabled information stored in UD data base does not match that stored in the CPR hardware.

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Channel number
- d4 CPR NPC number
- d5 UNIT number

173 DSPU CPR liaison C-Bit modify pattern information is inconsistent

The CPR liaison C-Bit modify pattern information stored in UD data base does not match that stored in the CPR hardware.

| d2 | Not used       |
| d3 | Channel number |
| d4 | CPR NPC number |
| d5 | UNIT number    |

174 DSPU CPR pack type is inconsistent

The CPR pack type stored in UD data base does not match with the CPR pack.

|    |                |
|----|----------------|
| d0 | Type on Uddb   |
| d1 | CPR pack type  |
| d2 | Not used       |
| d3 | Channel number |
| d4 | CPR NPC number |
| d5 | UNIT number    |

205 FTU FTMI hardware not in service

The FTU FTMI hardware status is not in service but the equipage flag in the UC data base is in service.

|    |             |
|----|-------------|
| d0 | Not used    |
| d1 | Not used    |
| d2 | Not used    |
| d3 | Not used    |
| d4 | FTMI number |
| d5 | UNIT number |

207 FTU FC hardware not in service

The FTU FC hardware status is not in service but the equipage flag in the UC data base is in service.

|    |             |
|----|-------------|
| d0 | Not used    |
| d1 | Not used    |
| d2 | Not used    |
| d3 | FC side     |
| d4 | FTMI number |
| d5 | UNIT number |

208 NPC hardware not in service

The Unit NPC hardware status is not in service but the equipage flag in the UC data base is in service.

d0 Not used  
d1 Not used  
d2 Not used  
d3 Not used  
d4 NPC number  
d5 UNIT number

209 UC NPC type not match with hardware

The Unit NPC type in the UC data base does not match with that indicated in the hardware.

d0 NPC type in hardware  
d1 NPC type in data base  
d2 Not used  
d3 Not used  
d4 NPC number  
d5 UNIT number

210 FTU FC hardware mode is inconsistent

The FTU FC hardware mode status does not match the FC mode stored in the UC data base.

d0 Not used  
d1 FC hardware mode  
d2 FC mode in the UC data base  
d3 FC side  
d4 FTMI number  
d5 UNIT number

211 FTU or DS3U/HDS3U NPC channel alternate message store (AMS) value is inconsistent

The FTU or DS3U/HDS3U NPC channel AMS value stored in the unit data base does not match the AMS value from the DDC hardware.

d0 Not used  
d1 Not used  
d2 Side  
d3 Channel number  
d4 NPC number  
d5 UNIT number

215 DPC NPC TS0M value is inconsistent

The TS0M value stored in UC data base does not match that stored in the DPC hardware.

- d0 NPC TS0M bits from DPC hardware
- d1 NPC TS0M bits from UC data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

216 DPC NPC loopback value is inconsistent

The LPBK value stored in UC data base does not match that stored in the DPC hardware.

- d0 NPC LPBK bits from DPC hardware
- d1 NPC LPBK bits from UC data base
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 UNIT number

217 FTU and DS3U/HDS3U NPC pgfbits in the channel are inconsistent

The pgfbits in the data base do not match the pgfbits stored in the transceiver loopback parity channel hardware. The F and G bits determine the signaling type (16-state, 4-state or transparent). This comparison is only done on domestic NPCs on the RECEIVE side.

- d0 Data base F and G bits
- d1 Transceiver Hardware F and G bits
- d2 CHANNEL side : (Receive side)
- d3 CHANNEL number
- d4 NPC number
- d5 UNIT number

218 FTU NPC Channel AIS flag is inconsistent.

The AIS flag set in the DDC Digital Signal Interface (DSI) hardware register does not match with the associated flag saved in the UC data base.

- d0 AIS flag in the DSI register
- d1 AIS flag in the UC data base
- d2 Not used
- d3 Channel side
- d4 NPC number
- d5 Unit number

220 FTU and DS3U/HDS3U NPC COFAMAJ threshold value is inconsistent

The Change Of Frame Alignment Major value of the FTU NPC threshold value stored in the FTU Unit data base does not match that stored in the DDC hardware.

- d0 Second byte of the cofamaj value from DDC hardware
- d1 First byte of the cofamaj value from DDC hardware
- d2 Second byte of the cofamaj value from UC data base
- d3 First byte of the cofamaj value from UC data base
- d4 NPC number
- d5 UNIT number

221 FTU and DS3U/HDS3U NPC COFAMIN threshold value is inconsistent

The Change Of Frame Alignment Minor value of the FTU NPC NPC threshold value stored in the FTU data base does not match that stored in the DDC hardware.

- d0 Second byte of the cofamin value from DDC hardware
- d1 First byte of the cofamin value from DDC hardware
- d2 Second byte of the cofamin value from UC data base
- d3 First byte of the cofamin value from UC data base
- d4 NPC number
- d5 UNIT number

222 FTU NPC SLIPMAJ threshold value is inconsistent

The Slip Major value stored in the UC data base does not match that stored in the DDC hardware

- d0 Second byte of the slipmaj value from DDC hardware
- d1 First byte of the slipmaj value from DDC hardware
- d2 Second byte of the slipmaj value from UC data base
- d3 First byte of the slipmaj value from UC data base
- d4 NPC number
- d5 UNIT number

223 FTU and DS3U/HDS3U NPC SLIPMIN threshold value is inconsistent

The Slip Minor threshold value stored in the UC data base does not match that stored in the DDC hardware

- d0 Second byte of the slipmin value from DDC hardware
- d1 First byte of the slipmin value from DDC hardware
- d2 Second byte of the slipmin value from UC data base
- d3 First byte of the slipmin value from UC data base
- d4 NPC number
- d5 UNIT number

224 FTU and DS3U/HDS3U NPC SES threshold value is inconsistent

The Severe Errored Seconds value stored in the UC data base does not match that stored in the DDC hardware.

- d0 Second byte of the ses value from DDC hardware
- d1 First byte of the ses value from DDC hardware
- d2 Second byte of the ses value from UC data base
- d3 First byte of the ses value from UC data base
- d4 NPC number
- d5 UNIT number

225 FTU and DS3U/HDS3U NPC ES threshold value is inconsistent

The Errored Seconds value stored in the UC data base does not match that stored in the DDC hardware.

- d0 Second byte of the es value from DDC hardware
- d1 First byte of the es value from DDC hardware
- d2 Second byte of the es value from UC data base
- d3 First byte of the es value from UC data base
- d4 NPC number
- d5 UNIT number

226 FTU and DS3U/HDS3U NPC BERMAJ threshold value is inconsistent

The Bit Error Rate Major value stored in the UC data base does not match that stored in the DDC hardware.

- d0 Second byte of the bermaj value from DDC hardware
- d1 First byte of the bermaj value from DDC hardware
- d2 Second byte of the bermaj value from UC data base
- d3 First byte of the bermaj value from UC data base
- d4 NPC number
- d5 UNIT number

227 FTU and DS3U/HDS3U NPC BERMIN threshold value is inconsistent

The Bit Error Rate Minor value stored in the UC data base does not match that stored in the DDC hardware.

- d0 Second byte of the bermin value from DDC hardware
- d1 First byte of the bermin value from DDC hardware
- d2 Second byte of the bermin value from UC data base
- d3 First byte of the bermin value from UC data base
- d4 NPC number
- d5 UNIT number

228 NPC (DIU/DPC) Error Seconds 15 min. threshold value is inconsistent

The Error Seconds 15 min. (ERS15) threshold value stored in UC data base does not match that stored in the NPC hardware.

- d0 Second byte of the ERS15 value of the NPC from hardware
- d1 First byte of the ERS15 value of the NPC from hardware
- d2 Second byte of the ERS15 value of the NPC from UC data base
- d3 First byte of the ERS15 value of the NPC from UC data base
- d4 NPC number
- d5 Unit number

229 DIU NPC Bursty Error Seconds 15 Min threshold value is inconsistent

The Bursty Error Seconds 15 min. threshold value of a DIU NPC stored in the UC data base does not match with that in the hardware.

- d0 Second byte of the BERS15 value of the NPC from hardware
- d1 First byte of the BERS15 value of the NPC from hardware
- d2 Second byte of the BERS15 value of the NPC from UC data base
- d3 First byte of the BERS15 value of the NPC from UC data base
- d4 DIU NPC number
- d5 Unit number

230 NPC (DIU/DPC) Severely Error Seconds 15 min. threshold value is inconsistent

The Severely Error Seconds 15 min. (SERS15) threshold value stored in the UC data base does not match with that in the hardware.

- d0 Second byte of the SERS15 value of the NPC from hardware
- d1 First byte of the SERS15 value of the NPC from hardware
- d2 Second byte of the SERS15 value of the NPC from UC data base
- d3 First byte of the SERS15 value of the NPC from UC data base
- d4 NPC number
- d5 Unit number

231 NPC (DIU/DPC) Unavailable Seconds 15 min. threshold value is inconsistent

The Unavailable Seconds 15 min. (US15) threshold value of an NPC stored in the UC data base does not match with that in the hardware.

- d0 Second byte of the US15 value of the NPC from hardware
- d1 First byte of the US15 value of the NPC from hardware
- d2 Second byte of the US15 value of the NPC from UC data base
- d3 First byte of the US15 value of the NPC from UC data base
- d4 NPC number
- d5 Unit number

232 NPC (DIU/DPC) Slips 15 min. threshold value is inconsistent

The Slips Error Seconds 15 min. (SLP15) threshold value stored in the UC data base does not match with that in the hardware.

- d0 Second byte of the SLP15 value of the NPC from hardware
- d1 First byte of the SLP15 value of the NPC from hardware
- d2 Second byte of the SLP15 value of the NPC from UC data base
- d3 First byte of the SLP15 value of the NPC from UC data base
- d4 NPC number
- d5 Unit number

233 NPC (DIU/DPC) Error Seconds 24 hr. threshold value is inconsistent

The Error Seconds 24 hr. (ESR24) threshold value stored in UC data base does not match that stored in the hardware.

- d0 Second byte of the ESR24 value of the NPC from hardware
- d1 First byte of the ESR24 value of the NPC from hardware
- d2 Second byte of the ESR24 value of the NPC from UC data base
- d3 First byte of the ESR24 value of the NPC from UC data base
- d4 NPC number
- d5 Unit number

234 DIU NPC Bursty Error Seconds 24 Min threshold value is inconsistent

The Bursty Error Seconds 24 min. threshold value of a DIU NPC stored in the UC data base does not match with that in the hardware.

- d0 Second byte of the BERS24 value of the NPC from hardware
- d1 First byte of the BERS24 value of the NPC from hardware
- d2 Second byte of the BERS24 value of the NPC from UC data base
- d3 First byte of the BERS24 value of the NPC from UC data base
- d4 DIU NPC number
- d5 Unit number

235 NPC (DIU/DPC) Severely Error Seconds 24 hr. threshold value is inconsistent

The Severely Error Seconds 24 hr. (SERS24) threshold value stored in the UC data base does not match with that in the hardware.

- d0 Second byte of the SERS24 value of the NPC from hardware
- d1 First byte of the SERS24 value of the NPC from hardware
- d2 Second byte of the SERS24 value of the NPC from UC data base
- d3 First byte of the SERS24 value of the NPC from UC data base
- d4 NPC number
- d5 Unit number

- 236 NPC (DIU/DPC) Unavailable Seconds 24 hr. threshold value is inconsistent

The Unavailable Seconds 24 hr. (US24) threshold value stored in the UC data base does not match with that in the hardware.

- d0 Second byte of the US24 value of the NPC from hardware
- d1 First byte of the US24 value of the NPC from hardware
- d2 Second byte of the US24 value of the NPC from UC data base
- d3 First byte of the US24 value of the NPC from UC data base
- d4 NPC number
- d5 Unit number

- 237 NPC (DIU/DPC) Slips Error Seconds 24 hr. threshold value is inconsistent

The Slips Error Seconds 24 hr. (SLP24) threshold value stored in the UC data base does not match with that in the hardware.

- d0 Second byte of the SLP24 value of the NPC from hardware
- d1 First byte of the SLP24 value of the NPC from hardware
- d2 Second byte of the SLP24 value of the NPC from UC data base
- d3 First byte of the SLP24 value of the NPC from UC data base
- d4 NPC number
- d5 Unit number

- 238 DPC NPC Degraded Minute 1 hr (DM) threshold value is inconsistent

The Degraded Minute 1 hr. threshold value stored in UC data base does not match that stored in the DPC hardware.

- d0 Second byte of the DM value from DPC hardware
- d1 First byte of the DM value from DPC hardware
- d2 Second byte of the DM value from UC data base
- d3 First byte of the DM value from UC data base
- d4 NPC number
- d5 UNIT number

- 239 DPC NPC Degraded Minute 24 hr (DM24) threshold value is inconsistent

The Degraded Minute 24 hr. threshold value stored in UC data base does not match that stored in the DPC hardware.

- d0 Second byte of the DM24 value from DPC hardware
- d1 First byte of the DM24 value from DPC hardware
- d2 Second byte of the DM24 value from UC data base
- d3 First byte of the DM24 value from UC data base
- d4 NPC number
- d5 UNIT number

240 SLC carrier NPC SANE threshold value is inconsistent

The SLC carrier NPC SANE threshold value stored in the UC data base does not match with that stored in the DDC hardware

- d0 Second byte of the sane threshold value from DDC hardware
- d1 First byte of the sane threshold value from DDC hardware
- d2 Second byte of the sane threshold value from UC data base
- d3 First byte of the sane threshold value from UC data base
- d4 NPC number
- d5 UNIT number

241 SLC carrier NPC SAFE threshold value is inconsistent

The SLC carrier NPC SAFE threshold value stored in the UC data base does not match with that stored in the DDC hardware

- d0 Second byte of the SAFE threshold value from DDC hardware
- d1 First byte of the SAFE threshold value from DDC hardware
- d2 Second byte of the SAFE threshold value from UC data base
- d3 First byte of the SAFE threshold value from UC data base
- d4 NPC number
- d5 UNIT number

242 SLC carrier NPC SELF alarm threshold value is inconsistent

The SLC carrier NPC SELF alarm threshold value stored in the UC data base does not match with that stored in the DDC hardware

- d0 Second byte of the SELF alarm threshold value from DDC hardware
- d1 First byte of the SELF alarm threshold value from DDC hardware
- d2 Second byte of the SELF alarm threshold value from UC data base
- d3 First byte of the SELF alarm threshold value from UC data base
- d4 NPC number
- d5 UNIT number

250 HUB-ID value in hardware is inconsistent

The HUB-ID is inconsistent between the MP data base and the hardware.

- d0 HUB-ID value from MP data base
- d1 HUB-ID value from the hardware
- d2 Not used
- d3 Not used
- d4 NPC number
- d5 Unit number

251 The time slot hardware image or control memory is inconsistent

The EC Hardware Image/Control Memory is inconsistent between MP data base and the hardware.

d0 The EC image value from MP data base  
d1 The EC image value from the hardware  
d2 SRM hardware data  
d3 The time slot number  
d4 The NPC number of the time slot  
d5 The Unit number of the time slot

252 E1/T1 hardware selection flag inconsistent

d0 UH hardware flag  
d1 UH database flag  
d2 Not used  
d3 DS2 Number (1 through 7)  
d4 HMXR Number  
d5 Unit Number

253 DS3 FLI LOG hardware inconsistent

d0 UA hardware  
d1 UA lbo  
d2 Not used  
d3 Not used  
d4 MXR/HMXR Number  
d5 Unit Number

254 DS3 MXR/HMXR hardware flag inconsistent

d0 UA hardware flag  
d1 UA data base flag  
d2 Not used  
d3 Not used  
d4 MXR/HMXR Number  
d5 Unit Number

255 DS3 MXR/HMXR hardware type inconsistent

d0 UA hardware type  
d1 UA data base type  
d2 Not used  
d3 Not used  
d4 MXR/HMXR Number  
d5 Unit Number

- 256 DS3 MXR/HMXR hardware xoption inconsistent
- d0 UA hardware xoption
  - d1 UA data base xoption
  - d2 Not used
  - d3 Not used
  - d4 MXR/HMXR Number
  - d5 Unit Number
- 257 DS3 MXR/HMXR hardware yoption inconsistent
- d0 UA hardware yoption
  - d1 UA data base yoption
  - d2 Not used
  - d3 Not used
  - d4 MXR/HMXR Number
  - d5 Unit Number
- 258 DS3 MXR/HMXR hardware zoption inconsistent
- d0 UA hardware zoption
  - d1 UA data base zoption
  - d2 Not used
  - d3 Not used
  - d4 MXR/HMXR Number
  - d5 Unit Number
- 259 DS3 MXR/HMXR hardware BER threshold inconsistent
- d0 UA hardware BER threshold
  - d1 UA data base BER threshold
  - d2 Not used
  - d3 Not used
  - d4 MXR/HMXR Number
  - d5 Unit Number
- 25A DS3 MXR/HMXR hardware BER type inconsistent
- d0 UA hardware BER type
  - d1 UA data base BER type
  - d2 Not used
  - d3 Not used
  - d4 MXR/HMXR Number
  - d5 Unit Number

d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

273     NPC Daily Near-end Severely Errored Framing Seconds threshold values are inconsistent

The Daily Near-end Severely Errored Framing Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0     Long ANSI threshold value in the hardware  
d1     Long ANSI threshold value in the hardware  
d2     Long ANSI threshold value in the hardware  
d3     Long ANSI threshold value in the hardware  
d4     Long ANSI threshold value in the data base  
d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

- 274     NPC Daily Near-end Controlled Slip Seconds threshold values are inconsistent

The Daily Near-end Controlled Slip Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0     Long ANSI threshold value in the hardware
- d1     Long ANSI threshold value in the hardware
- d2     Long ANSI threshold value in the hardware
- d3     Long ANSI threshold value in the hardware
- d4     Long ANSI threshold value in the data base
- d5     Long ANSI threshold value in the data base
- d6     Long ANSI threshold value in the data base
- d7     Long ANSI threshold value in the data base
- d8     NPC number
- d9     UNIT number

- 275     NPC Daily Near-end Unavailable Seconds threshold values are inconsistent

The Daily Near-end Unavailable Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0     Long ANSI threshold value in the hardware
- d1     Long ANSI threshold value in the hardware
- d2     Long ANSI threshold value in the hardware
- d3     Long ANSI threshold value in the hardware
- d4     Long ANSI threshold value in the data base
- d5     Long ANSI threshold value in the data base
- d6     Long ANSI threshold value in the data base
- d7     Long ANSI threshold value in the data base
- d8     NPC number
- d9     UNIT number

- 276      NPC Daily Near-end Line Coding Violations threshold values are inconsistent

The Daily Near-end Line Coding Violations of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0      Long ANSI threshold value in the hardware
- d1      Long ANSI threshold value in the hardware
- d2      Long ANSI threshold value in the hardware
- d3      Long ANSI threshold value in the hardware
- d4      Long ANSI threshold value in the data base
- d5      Long ANSI threshold value in the data base
- d6      Long ANSI threshold value in the data base
- d7      Long ANSI threshold value in the data base
- d8      NPC number
- d9      UNIT number

- 277      NPC Daily Near-end Line Errored Seconds threshold values are inconsistent

The Daily Near-end Line Errored Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0      Long ANSI threshold value in the hardware
- d1      Long ANSI threshold value in the hardware
- d2      Long ANSI threshold value in the hardware
- d3      Long ANSI threshold value in the hardware
- d4      Long ANSI threshold value in the data base
- d5      Long ANSI threshold value in the data base
- d6      Long ANSI threshold value in the data base
- d7      Long ANSI threshold value in the data base
- d8      NPC number
- d9      UNIT number

- 278     NPC Daily Near-end Line Severely Errored Seconds threshold  
         are inconsistent

The Daily Near-end Line Severely Errored Seconds of the ANSI NPC  
threshold value stored in the unit data base does not match that  
stored in the hardware

- d0     Long ANSI threshold value in the hardware
- d1     Long ANSI threshold value in the hardware
- d2     Long ANSI threshold value in the hardware
- d3     Long ANSI threshold value in the hardware
- d4     Long ANSI threshold value in the data base
- d5     Long ANSI threshold value in the data base
- d6     Long ANSI threshold value in the data base
- d7     Long ANSI threshold value in the data base
- d8     NPC number
- d9     UNIT number

- 279     NPC Daily Far-end Path Coding Violations threshold values are  
         inconsistent

The Daily Far-end Path Coding Violations of the ANSI NPC threshold  
value stored in the unit data base does not match that stored in the  
hardware

- d0     Long ANSI threshold value in the hardware
- d1     Long ANSI threshold value in the hardware
- d2     Long ANSI threshold value in the hardware
- d3     Long ANSI threshold value in the hardware
- d4     Long ANSI threshold value in the data base
- d5     Long ANSI threshold value in the data base
- d6     Long ANSI threshold value in the data base
- d7     Long ANSI threshold value in the data base
- d8     NPC number
- d9     UNIT number

27A NPC Daily Far-end Path Errored Seconds threshold values are inconsistent

The Daily Far-end Path Errored Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

|    |                                            |
|----|--------------------------------------------|
| d0 | Long ANSI threshold value in the hardware  |
| d1 | Long ANSI threshold value in the hardware  |
| d2 | Long ANSI threshold value in the hardware  |
| d3 | Long ANSI threshold value in the hardware  |
| d4 | Long ANSI threshold value in the data base |
| d5 | Long ANSI threshold value in the data base |
| d6 | Long ANSI threshold value in the data base |
| d7 | Long ANSI threshold value in the data base |
| d8 | NPC number                                 |
| d9 | UNIT number                                |

27B NPC Daily Far-end Path Severely Errored Seconds threshold values are inconsistent

The Daily Far-end Path Severely Errored Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

|    |                                            |
|----|--------------------------------------------|
| d0 | Long ANSI threshold value in the hardware  |

| d7 | Long ANSI threshold value in the data base |
| d8 | NPC number                                 |
| d9 | UNIT number                                |

27C    NPC Daily Far-end Severely Errored Framing Seconds threshold values are inconsistent

The Daily Far-end Severely Errored Framing Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0    Long ANSI threshold value in the hardware  
d1    Long ANSI threshold value in the hardware  
d2    Long ANSI threshold value in the hardware  
d3    Long ANSI threshold value in the hardware  
d4    Long ANSI threshold value in the data base  
d5    Long ANSI threshold value in the data base  
d6    Long ANSI threshold value in the data base  
d7    Long ANSI threshold value in the data base  
d8    NPC number  
d9    UNIT number

27D    NPC Daily Far-end Controlled Slip Seconds threshold values are inconsistent

The Daily Far-end Controlled Slip Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0    Long ANSI threshold value in the hardware  
d1    Long ANSI threshold value in the hardware  
d2    Long ANSI threshold value in the hardware  
d3    Long ANSI threshold value in the hardware  
d4    Long ANSI threshold value in the data base  
d5    Long ANSI threshold value in the data base  
d6    Long ANSI threshold value in the data base  
d7    Long ANSI threshold value in the data base  
d8    NPC number  
d9    UNIT number

27E NPC Daily Far-end Unavailable Seconds threshold values are inconsistent

The Daily Far-end Unavailable Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long ANSI threshold value in the hardware  
d1 Long ANSI threshold value in the hardware  
d2 Long ANSI threshold value in the hardware  
d3 Long ANSI threshold value in the hardware  
d4 Long ANSI threshold value in the data base  
d5 Long ANSI threshold value in the data base  
d6 Long ANSI threshold value in the data base  
d7 Long ANSI threshold value in the data base  
d8 NPC number  
d9 UNIT number

27F NPC Daily Far-end Line Errored Seconds threshold values are inconsistent

The Daily Far-end Line Errored Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long ANSI threshold value in the hardware  
d1 Long ANSI threshold value in the hardware  
d2 Long ANSI threshold value in the hardware  
d3 Long ANSI threshold value in the hardware  
d4 Long ANSI threshold value in the data base  
d5 Long ANSI threshold value in the data base  
d6 Long ANSI threshold value in the data base  
d7 Long ANSI threshold value in the data base  
d8 NPC number  
d9 UNIT number

280     NPC 15-Minute Near-end Path Coding Violations threshold values  
         are inconsistent

The 15-Minute Near-end Path Coding Violations of the ANSI NPC  
threshold value stored in the unit data base does not match that  
stored in the hardware

d0     Long ANSI threshold value in the hardware  
d1     Long ANSI threshold value in the hardware  
d2     Long ANSI threshold value in the hardware  
d3     Long ANSI threshold value in the hardware  
d4     Long ANSI threshold value in the data base  
d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

281     NPC 15-Minute Near-end Path Errored Seconds threshold values  
         are inconsistent

The 15-Minute Near-end Path Errored Seconds of the ANSI NPC threshold  
value stored in the unit data base does not match that stored in the  
hardware

d0     Long ANSI threshold value in the hardware  
d1     Long ANSI threshold value in the hardware  
d2     Long ANSI threshold value in the hardware  
d3     Long ANSI threshold value in the hardware  
d4     Long ANSI threshold value in the data base  
d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

282      NPC 15-Minute Near-end Path Severely Errored Seconds threshold values are inconsistent

The 15-Minute Near-end Path Severely Errored Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

|    |                                            |
|----|--------------------------------------------|
| d0 | Long ANSI threshold value in the hardware  |
| d1 | Long ANSI threshold value in the hardware  |
| d2 | Long ANSI threshold value in the hardware  |
| d3 | Long ANSI threshold value in the hardware  |
| d4 | Long ANSI threshold value in the data base |
| d5 | Long ANSI threshold value in the data base |
| d6 | Long ANSI threshold value in the data base |
| d7 | Long ANSI threshold value in the data base |
| d8 | NPC number                                 |
| d9 | UNIT number                                |

283      NPC 15-Minute Near-end Severely Errored Framing Seconds threshold values are inconsistent

The 15-Minute Near-end Severely Errored Framing Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

|    |                                            |
|----|--------------------------------------------|
| d0 | Long ANSI threshold value in the hardware  |
| d1 | Long ANSI threshold value in the hardware  |
| d2 | Long ANSI threshold value in the hardware  |
| d3 | Long ANSI threshold value in the hardware  |
| d4 | Long ANSI threshold value in the data base |
| d5 | Long ANSI threshold value in the data base |
| d6 | Long ANSI threshold value in the data base |
| d7 | Long ANSI threshold value in the data base |
| d8 | NPC number                                 |
| d9 | UNIT number                                |

284     NPC 15-Minute Near-end Controlled Slip Seconds threshold values  
         are inconsistent

The 15-Minute Near-end Controlled Slip Seconds of the ANSI NPC  
threshold value stored in the unit data base does not match that  
stored in the hardware

d0     Long ANSI threshold value in the hardware  
d1     Long ANSI threshold value in the hardware  
d2     Long ANSI threshold value in the hardware  
d3     Long ANSI threshold value in the hardware  
d4     Long ANSI threshold value in the data base  
d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

285     NPC 15-Minute Near-end Unavailable Seconds threshold values are  
         inconsistent

The 15-Minute Near-end Unavailable Seconds of the ANSI NPC threshold  
value stored in the unit data base does not match that stored in the  
hardware

d0     Long ANSI threshold value in the hardware  
d1     Long ANSI threshold value in the hardware  
d2     Long ANSI threshold value in the hardware  
d3     Long ANSI threshold value in the hardware  
d4     Long ANSI threshold value in the data base  
d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

286      NPC 15-Minute Near-end Line Coding Violations threshold values  
         are inconsistent

The 15-Minute Near-end Line Coding Violations of the ANSI NPC  
threshold value stored in the unit data base does not match that  
stored in the hardware

d0      Long ANSI threshold value in the hardware  
d1      Long ANSI threshold value in the hardware  
d2      Long ANSI threshold value in the hardware  
d3      Long ANSI threshold value in the hardware  
d4      Long ANSI threshold value in the data base  
d5      Long ANSI threshold value in the data base  
d6      Long ANSI threshold value in the data base  
d7      Long ANSI threshold value in the data base  
d8      NPC number  
d9      UNIT number

287      NPC 15-Minute Near-end Line Errored Seconds threshold values  
         are inconsistent

The 15-Minute Near-end Line Errored Seconds of the ANSI NPC threshold  
value stored in the unit data base does not match that stored in the  
hardware

d0      Long ANSI threshold value in the hardware  
d1      Long ANSI threshold value in the hardware  
d2      Long ANSI threshold value in the hardware  
d3      Long ANSI threshold value in the hardware  
d4      Long ANSI threshold value in the data base  
d5      Long ANSI threshold value in the data base  
d6      Long ANSI threshold value in the data base  
d7      Long ANSI threshold value in the data base  
d8      NPC number  
d9      UNIT number

288     NPC 15-Minute Near-end Line Severely Errored Seconds threshold values are inconsistent

The 15-Minute Near-end Line Severely Errored Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0     Long ANSI threshold value in the hardware  
d1     Long ANSI threshold value in the hardware  
d2     Long ANSI threshold value in the hardware  
d3     Long ANSI threshold value in the hardware  
d4     Long ANSI threshold value in the data base  
d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

289     NPC 15-Minute Far-end Path Coding Violations threshold values are inconsistent

The 15-Minute Far-end Path Coding Violations of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0     Long ANSI threshold value in the hardware  
d1     Long ANSI threshold value in the hardware  
d2     Long ANSI threshold value in the hardware  
d3     Long ANSI threshold value in the hardware  
d4     Long ANSI threshold value in the data base  
d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

28A NPC 15-Minute Far-end Path Errored Seconds threshold values are inconsistent

The 15-Minute Far-end Path Errored Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long ANSI threshold value in the hardware  
d1 Long ANSI threshold value in the hardware  
d2 Long ANSI threshold value in the hardware  
d3 Long ANSI threshold value in the hardware  
d4 Long ANSI threshold value in the data base  
d5 Long ANSI threshold value in the data base  
d6 Long ANSI threshold value in the data base  
d7 Long ANSI threshold value in the data base  
d8 NPC number  
d9 UNIT number

28B NPC 15-Minute Far-end Path Severely Errored Seconds threshold values are inconsistent

The 15-Minute Far-end Path Severely Errored Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long ANSI threshold value in the hardware  
d1 Long ANSI threshold value in the hardware  
d2 Long ANSI threshold value in the hardware  
d3 Long ANSI threshold value in the hardware  
d4 Long ANSI threshold value in the data base  
d5 Long ANSI threshold value in the data base  
d6 Long ANSI threshold value in the data base  
d7 Long ANSI threshold value in the data base  
d8 NPC number  
d9 UNIT number

28C     NPC 15-Minute Far-end Severely Errored Framing Seconds threshold values are inconsistent

The 15-Minute Far-end Severely Errored Framing Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0     Long ANSI threshold value in the hardware  
d1     Long ANSI threshold value in the hardware  
d2     Long ANSI threshold value in the hardware  
d3     Long ANSI threshold value in the hardware  
d4     Long ANSI threshold value in the data base  
d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

28D     NPC 15-Minute Far-end Controlled Slip Seconds threshold values are inconsistent

The 15-Minute Far-end Controlled Slip Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

d0     Long ANSI threshold value in the hardware  
d1     Long ANSI threshold value in the hardware  
d2     Long ANSI threshold value in the hardware  
d3     Long ANSI threshold value in the hardware  
d4     Long ANSI threshold value in the data base  
d5     Long ANSI threshold value in the data base  
d6     Long ANSI threshold value in the data base  
d7     Long ANSI threshold value in the data base  
d8     NPC number  
d9     UNIT number

28E NPC 15-Minute Far-end Unavailable Seconds threshold values are inconsistent

The 15-Minute Far-end Unavailable Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

|    |                                            |
|----|--------------------------------------------|
| d0 | Long ANSI threshold value in the hardware  |
| d1 | Long ANSI threshold value in the hardware  |
| d2 | Long ANSI threshold value in the hardware  |
| d3 | Long ANSI threshold value in the hardware  |
| d4 | Long ANSI threshold value in the data base |
| d5 | Long ANSI threshold value in the data base |
| d6 | Long ANSI threshold value in the data base |
| d7 | Long ANSI threshold value in the data base |
| d8 | NPC number                                 |
| d9 | UNIT number                                |

28F NPC 15-Minute Far-end Line Errored Seconds threshold values are inconsistent

The 15-Minute Far-end Line Errored Seconds of the ANSI NPC threshold value stored in the unit data base does not match that stored in the hardware

|    |                                            |
|----|--------------------------------------------|
| d0 | Long ANSI threshold value in the hardware  |
| d1 | Long ANSI threshold value in the hardware  |
| d2 | Long ANSI threshold value in the hardware  |
| d3 | Long ANSI threshold value in the hardware  |
| d4 | Long ANSI threshold value in the data base |
| d5 | Long ANSI threshold value in the data base |
| d6 | Long ANSI threshold value in the data base |
| d7 | Long ANSI threshold value in the data base |
| d8 | NPC number                                 |
| d9 | UNIT number                                |

290     NPC Daily CRC Block Error Count threshold values are  
         inconsistent

The Daily CRC Block Error Count of the enhanced-30-channel NPC  
threshold value stored in the unit data base does not match that  
stored in the hardware

d0     Long enhanced-30-channel threshold value in the hardware  
d1     Long enhanced-30-channel threshold value in the hardware  
d2     Long enhanced-30-channel threshold value in the hardware  
d3     Long enhanced-30-channel threshold value in the hardware  
d4     Long enhanced-30-channel threshold value in the data base  
d5     Long enhanced-30-channel threshold value in the data base  
d6     Long enhanced-30-channel threshold value in the data base  
d7     Long enhanced-30-channel threshold value in the data base  
d8     NPC number  
d9     UNIT number

291     NPC Daily Framing Error Count threshold values are inconsistent

The Daily Framing Error Count of the enhanced-30-channel NPC threshold  
value stored in the unit data base does not match that stored in the  
hardware

d0     Long enhanced-30-channel threshold value in the hardware  
d1     Long enhanced-30-channel threshold value in the hardware  
d2     Long enhanced-30-channel threshold value in the hardware  
d3     Long enhanced-30-channel threshold value in the hardware  
d4     Long enhanced-30-channel threshold value in the data base  
d5     Long enhanced-30-channel threshold value in the data base  
d6     Long enhanced-30-channel threshold value in the data base  
d7     Long enhanced-30-channel threshold value in the data base  
d8     NPC number  
d9     UNIT number

292 NPC Daily Out of Frame Seconds threshold values are inconsistent

The Daily Out of Frame Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0 Long enhanced-30-channel threshold value in the hardware
- d1 Long enhanced-30-channel threshold value in the hardware
- d2 Long enhanced-30-channel threshold value in the hardware
- d3 Long enhanced-30-channel threshold value in the hardware
- d4 Long enhanced-30-channel threshold value in the data base
- d5 Long enhanced-30-channel threshold value in the data base
- d6 Long enhanced-30-channel threshold value in the data base
- d7 Long enhanced-30-channel threshold value in the data base
- d8 NPC number
- d9 UNIT number

293 NPC Errored Seconds threshold values are inconsistent

The Errored Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0 Long enhanced-30-channel threshold value in the hardware
- d1 Long enhanced-30-channel threshold value in the hardware
- d2 Long enhanced-30-channel threshold value in the hardware
- d3 Long enhanced-30-channel threshold value in the hardware
- d4 Long enhanced-30-channel threshold value in the data base
- d5 Long enhanced-30-channel threshold value in the data base
- d6 Long enhanced-30-channel threshold value in the data base
- d7 Long enhanced-30-channel threshold value in the data base
- d8 NPC number
- d9 UNIT number

- 294     NPC Daily Severely Errored Seconds threshold values are inconsistent

The Daily Severely Errored Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0     Long enhanced-30-channel threshold value in the hardware
- d1     Long enhanced-30-channel threshold value in the hardware
- d2     Long enhanced-30-channel threshold value in the hardware
- d3     Long enhanced-30-channel threshold value in the hardware
- d4     Long enhanced-30-channel threshold value in the data base
- d5     Long enhanced-30-channel threshold value in the data base
- d6     Long enhanced-30-channel threshold value in the data base
- d7     Long enhanced-30-channel threshold value in the data base
- d8     NPC number
- d9     UNIT number

- 295     NPC Daily Controlled Slip Seconds threshold values are inconsistent

The Daily Controlled Slip Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0     Long enhanced-30-channel threshold value in the hardware
- d1     Long enhanced-30-channel threshold value in the hardware
- d2     Long enhanced-30-channel threshold value in the hardware
- d3     Long enhanced-30-channel threshold value in the hardware
- d4     Long enhanced-30-channel threshold value in the data base
- d5     Long enhanced-30-channel threshold value in the data base
- d6     Long enhanced-30-channel threshold value in the data base
- d7     Long enhanced-30-channel threshold value in the data base
- d8     NPC number
- d9     UNIT number

296 NPC Daily Code Violation Count threshold values are inconsistent

The Daily Code Violation Count of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0 Long enhanced-30-channel threshold value in the hardware
- d1 Long enhanced-30-channel threshold value in the hardware
- d2 Long enhanced-30-channel threshold value in the hardware
- d3 Long enhanced-30-channel threshold value in the hardware
- d4 Long enhanced-30-channel threshold value in the data base
- d5 Long enhanced-30-channel threshold value in the data base
- d6 Long enhanced-30-channel threshold value in the data base
- d7 Long enhanced-30-channel threshold value in the data base
- d8 NPC number
- d9 UNIT number

297 NPC Daily Unavailable Seconds threshold values are inconsistent

The Daily Unavailable Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0 Long enhanced-30-channel threshold value in the hardware
- d1 Long enhanced-30-channel threshold value in the hardware
- d2 Long enhanced-30-channel threshold value in the hardware
- d3 Long enhanced-30-channel threshold value in the hardware
- d4 Long enhanced-30-channel threshold value in the data base
- d5 Long enhanced-30-channel threshold value in the data base
- d6 Long enhanced-30-channel threshold value in the data base
- d7 Long enhanced-30-channel threshold value in the data base
- d8 NPC number
- d9 UNIT number

- 298     NPC Daily Unavailable Time Count threshold values are inconsistent

The Daily Unavailable Time Count of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0     Long enhanced-30-channel threshold value in the hardware
- d1     Long enhanced-30-channel threshold value in the hardware
- d2     Long enhanced-30-channel threshold value in the hardware
- d3     Long enhanced-30-channel threshold value in the hardware
- d4     Long enhanced-30-channel threshold value in the data base
- d5     Long enhanced-30-channel threshold value in the data base
- d6     Long enhanced-30-channel threshold value in the data base
- d7     Long enhanced-30-channel threshold value in the data base
- d8     NPC number
- d9     UNIT number

- 299     NPC Daily Multiframe Alignment Error Count threshold values are inconsistent

The Daily Multiframe Alignment Error Count of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0     Long enhanced-30-channel threshold value in the hardware
- d1     Long enhanced-30-channel threshold value in the hardware
- d2     Long enhanced-30-channel threshold value in the hardware
- d3     Long enhanced-30-channel threshold value in the hardware
- d4     Long enhanced-30-channel threshold value in the data base
- d5     Long enhanced-30-channel threshold value in the data base
- d6     Long enhanced-30-channel threshold value in the data base
- d7     Long enhanced-30-channel threshold value in the data base
- d8     NPC number
- d9     UNIT number

29A NPC Daily Far End Block Error Count threshold values are inconsistent

The Daily Far End Block Error Count of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long enhanced-30-channel threshold value in the hardware  
d1 Long enhanced-30-channel threshold value in the hardware  
d2 Long enhanced-30-channel threshold value in the hardware  
d3 Long enhanced-30-channel threshold value in the hardware  
d4 Long enhanced-30-channel threshold value in the data base  
d5 Long enhanced-30-channel threshold value in the data base  
d6 Long enhanced-30-channel threshold value in the data base  
d7 Long enhanced-30-channel threshold value in the data base  
d8 NPC number  
d9 UNIT number

29B NPC Daily Far End Errored Seconds threshold values are inconsistent

The Daily Far End Errored Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long enhanced-30-channel threshold value in the hardware  
d1 Long enhanced-30-channel threshold value in the hardware  
d2 Long enhanced-30-channel threshold value in the hardware  
d3 Long enhanced-30-channel threshold value in the hardware  
d4 Long enhanced-30-channel threshold value in the data base  
d5 Long enhanced-30-channel threshold value in the data base  
d6 Long enhanced-30-channel threshold value in the data base  
d7 Long enhanced-30-channel threshold value in the data base  
d8 NPC number  
d9 UNIT number

29C    NPC Daily Far End Severely Errored Seconds threshold values are inconsistent

The Daily Far End Severely Errored Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0    Long enhanced-30-channel threshold value in the hardware
- d1    Long enhanced-30-channel threshold value in the hardware
- d2    Long enhanced-30-channel threshold value in the hardware
- d3    Long enhanced-30-channel threshold value in the hardware
- d4    Long enhanced-30-channel threshold value in the data base
- d5    Long enhanced-30-channel threshold value in the data base
- d6    Long enhanced-30-channel threshold value in the data base
- d7    Long enhanced-30-channel threshold value in the data base
- d8    NPC number
- d9    UNIT number

29D    NPC Daily Far End Unavailable Seconds threshold values are inconsistent

The Daily Far End Unavailable Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0    Long enhanced-30-channel threshold value in the hardware
- d1    Long enhanced-30-channel threshold value in the hardware
- d2    Long enhanced-30-channel threshold value in the hardware
- d3    Long enhanced-30-channel threshold value in the hardware
- d4    Long enhanced-30-channel threshold value in the data base
- d5    Long enhanced-30-channel threshold value in the data base
- d6    Long enhanced-30-channel threshold value in the data base
- d7    Long enhanced-30-channel threshold value in the data base
- d8    NPC number
- d9    UNIT number

29E NPC 15-Minute CRC Block Error Count threshold values are inconsistent

The 15-Minute CRC Block Error Count of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long enhanced-30-channel threshold value in the hardware  
d1 Long enhanced-30-channel threshold value in the hardware  
d2 Long enhanced-30-channel threshold value in the hardware  
d3 Long enhanced-30-channel threshold value in the hardware  
d4 Long enhanced-30-channel threshold value in the data base  
d5 Long enhanced-30-channel threshold value in the data base  
d6 Long enhanced-30-channel threshold value in the data base  
d7 Long enhanced-30-channel threshold value in the data base  
d8 NPC number  
d9 UNIT number

29F NPC 15-Minute Framing Error Count threshold values are inconsistent

The 15-Minute Framing Error Count of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long enhanced-30-channel threshold value in the hardware  
d1 Long enhanced-30-channel threshold value in the hardware  
d2 Long enhanced-30-channel threshold value in the hardware  
d3 Long enhanced-30-channel threshold value in the hardware  
d4 Long enhanced-30-channel threshold value in the data base  
d5 Long enhanced-30-channel threshold value in the data base  
d6 Long enhanced-30-channel threshold value in the data base  
d7 Long enhanced-30-channel threshold value in the data base  
d8 NPC number  
d9 UNIT number

2A0     NPC 15-Minute Out of Frame Seconds threshold values are inconsistent

The 15-Minute Out of Frame Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0     Long enhanced-30-channel threshold value in the hardware  
d1     Long enhanced-30-channel threshold value in the hardware  
d2     Long enhanced-30-channel threshold value in the hardware  
d3     Long enhanced-30-channel threshold value in the hardware  
d4     Long enhanced-30-channel threshold value in the data base  
d5     Long enhanced-30-channel threshold value in the data base  
d6     Long enhanced-30-channel threshold value in the data base  
d7     Long enhanced-30-channel threshold value in the data base  
d8     NPC number  
d9     UNIT number

2A1     NPC 15-Minute Errored Seconds threshold values are inconsistent

The 15-Minute Errored Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0     Long enhanced-30-channel threshold value in the hardware  
d1     Long enhanced-30-channel threshold value in the hardware  
d2     Long enhanced-30-channel threshold value in the hardware  
d3     Long enhanced-30-channel threshold value in the hardware  
d4     Long enhanced-30-channel threshold value in the data base  
d5     Long enhanced-30-channel threshold value in the data base  
d6     Long enhanced-30-channel threshold value in the data base  
d7     Long enhanced-30-channel threshold value in the data base  
d8     NPC number  
d9     UNIT number

2A2 NPC 15-Minute Severely Errored Seconds threshold values are inconsistent

The 15-Minute Severely Errored Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0 Long enhanced-30-channel threshold value in the hardware
- d1 Long enhanced-30-channel threshold value in the hardware
- d2 Long enhanced-30-channel threshold value in the hardware
- d3 Long enhanced-30-channel threshold value in the hardware
- d4 Long enhanced-30-channel threshold value in the data base
- d5 Long enhanced-30-channel threshold value in the data base
- d6 Long enhanced-30-channel threshold value in the data base
- d7 Long enhanced-30-channel threshold value in the data base
- d8 NPC number
- d9 UNIT number

2A3 NPC 15-Minute Controlled Slip Seconds threshold values are inconsistent

The 15-Minute Controlled Slip Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0 Long enhanced-30-channel threshold value in the hardware
- d1 Long enhanced-30-channel threshold value in the hardware
- d2 Long enhanced-30-channel threshold value in the hardware
- d3 Long enhanced-30-channel threshold value in the hardware
- d4 Long enhanced-30-channel threshold value in the data base
- d5 Long enhanced-30-channel threshold value in the data base
- d6 Long enhanced-30-channel threshold value in the data base
- d7 Long enhanced-30-channel threshold value in the data base
- d8 NPC number
- d9 UNIT number

2A4     NPC 15-Minute Code Violation Count threshold values are  
         inconsistent

The 15-Minute Code Violation Count of the enhanced-30-channel NPC  
threshold value stored in the unit data base does not match that  
stored in the hardware

d0     Long enhanced-30-channel threshold value in the hardware  
d1     Long enhanced-30-channel threshold value in the hardware  
d2     Long enhanced-30-channel threshold value in the hardware  
d3     Long enhanced-30-channel threshold value in the hardware  
d4     Long enhanced-30-channel threshold value in the data base  
d5     Long enhanced-30-channel threshold value in the data base  
d6     Long enhanced-30-channel threshold value in the data base  
d7     Long enhanced-30-channel threshold value in the data base  
d8     NPC number  
d9     UNIT number

2A5     NPC 15-Minute Unavailable Seconds threshold values are  
         inconsistent

The 15-Minute Unavailable Seconds of the enhanced-30-channel NPC  
threshold value stored in the unit data base does not match that  
stored in the hardware

d0     Long enhanced-30-channel threshold value in the hardware  
d1     Long enhanced-30-channel threshold value in the hardware  
d2     Long enhanced-30-channel threshold value in the hardware  
d3     Long enhanced-30-channel threshold value in the hardware  
d4     Long enhanced-30-channel threshold value in the data base  
d5     Long enhanced-30-channel threshold value in the data base  
d6     Long enhanced-30-channel threshold value in the data base  
d7     Long enhanced-30-channel threshold value in the data base  
d8     NPC number  
d9     UNIT number

2A6 NPC 15-Minute Unavailable Time Count threshold values are inconsistent

The 15-Minute Unavailable Time Count of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long enhanced-30-channel threshold value in the hardware  
d1 Long enhanced-30-channel threshold value in the hardware  
d2 Long enhanced-30-channel threshold value in the hardware  
d3 Long enhanced-30-channel threshold value in the hardware  
d4 Long enhanced-30-channel threshold value in the data base  
d5 Long enhanced-30-channel threshold value in the data base  
d6 Long enhanced-30-channel threshold value in the data base  
d7 Long enhanced-30-channel threshold value in the data base  
d8 NPC number  
d9 UNIT number

2A7 NPC 15-Minute Multiframe Alignment Error Count threshold values are inconsistent

The 15-Minute Multiframe Alignment Error Count of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long enhanced-30-channel threshold value in the hardware  
d1 Long enhanced-30-channel threshold value in the hardware  
d2 Long enhanced-30-channel threshold value in the hardware  
d3 Long enhanced-30-channel threshold value in the hardware  
d4 Long enhanced-30-channel threshold value in the data base  
d5 Long enhanced-30-channel threshold value in the data base  
d6 Long enhanced-30-channel threshold value in the data base  
d7 Long enhanced-30-channel threshold value in the data base  
d8 NPC number  
d9 UNIT number

2A8 NPC 15-Minute Far End Block Error Count threshold values are inconsistent

The 15-Minute Far End Block Error Count of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long enhanced-30-channel threshold value in the hardware  
d1 Long enhanced-30-channel threshold value in the hardware  
d2 Long enhanced-30-channel threshold value in the hardware  
d3 Long enhanced-30-channel threshold value in the hardware  
d4 Long enhanced-30-channel threshold value in the data base  
d5 Long enhanced-30-channel threshold value in the data base  
d6 Long enhanced-30-channel threshold value in the data base  
d7 Long enhanced-30-channel threshold value in the data base  
d8 NPC number  
d9 UNIT number

2A9 NPC 15-Minute Far End Errored Seconds threshold values are inconsistent

The 15-Minute Far End Errored Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

d0 Long enhanced-30-channel threshold value in the hardware  
d1 Long enhanced-30-channel threshold value in the hardware  
d2 Long enhanced-30-channel threshold value in the hardware  
d3 Long enhanced-30-channel threshold value in the hardware  
d4 Long enhanced-30-channel threshold value in the data base  
d5 Long enhanced-30-channel threshold value in the data base  
d6 Long enhanced-30-channel threshold value in the data base  
d7 Long enhanced-30-channel threshold value in the data base  
d8 NPC number  
d9 UNIT number

2AA NPC 15-Minute Far End Severely Errored Seconds threshold values are inconsistent

The 15-Minute Far End Severely Errored Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0 Long enhanced-30-channel threshold value in the hardware
- d1 Long enhanced-30-channel threshold value in the hardware
- d2 Long enhanced-30-channel threshold value in the hardware
- d3 Long enhanced-30-channel threshold value in the hardware
- d4 Long enhanced-30-channel threshold value in the data base
- d5 Long enhanced-30-channel threshold value in the data base
- d6 Long enhanced-30-channel threshold value in the data base
- d7 Long enhanced-30-channel threshold value in the data base
- d8 NPC number
- d9 UNIT number

2AB NPC 15-Minute Far End Unavailable Seconds threshold values are inconsistent

The 15-Minute Far End Unavailable Seconds of the enhanced-30-channel NPC threshold value stored in the unit data base does not match that stored in the hardware

- d0 Long enhanced-30-channel threshold value in the hardware
- d1 Long enhanced-30-channel threshold value in the hardware
- d2 Long enhanced-30-channel threshold value in the hardware
- d3 Long enhanced-30-channel threshold value in the hardware
- d4 Long enhanced-30-channel threshold value in the data base
- d5 Long enhanced-30-channel threshold value in the data base
- d6 Long enhanced-30-channel threshold value in the data base
- d7 Long enhanced-30-channel threshold value in the data base
- d8 NPC number
- d9 UNIT number

2B1 NPC Transmit or Receive Pseudo Framing Word values are inconsistent

The Transmit or Receive Pseudo Framing Word of the NPC mismatch between unit data base and the hardware

- d0 The Receive Pseudo Framing Word of NPC from hardware
- d1 The Receive Pseudo Framing Word of NPC from unit data base
- d2 The Transmit Pseudo Framing Word of NPC from hardware
- d3 The Transmit Pseudo Framing Word of NPC from unit data base
- d4 NPC number
- d5 UNIT number

2B2 NPC Non Framing Setting values are inconsistent

The Non Framing Setting value the NPC mismatch between unit data base and the hardware

- d0 Fourth byte the Non Framing Setting of NPC from hardware
- d1 Third byte of the Non Framing Setting of NPC from hardware
- d2 Fourth byte of the Non Framing Setting of NPC from unit data base
- d3 Third byte of the Non Framing Setting of NPC from unit data base
- d4 NPC number
- d5 UNIT number

300 E1/T1 Select Registers are inconsistent

The various select registers are not consistently provisioned for either E1 or T1 within a DS2

- d0 NPC type
- d1 Not used
- d2 Not used
- d3 DS2 number
- d4 HMXR number
- d5 UNIT number

301 CCN sides is unpested (INS) in DB but pested in hardware (BXREG).

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Not used
- d4 Not used
- d5 CCN side

302 TSI entity is unpested (INS) in DB but pested in hardware (CCNI EMR).

- d0 Not used
- d1 Not used
- d2 Not used
- d3 To UNIT
- d4 From UNIT
- d5 CCNI side

303 CCB entity is unpested (INS) in DB but pested in hardware (CCNI EMR).

- d0 Not used
- d1 Not used
- d2 Not used
- d3 Not used
- d4 CCB number
- d5 CCN side

- 305 SYNC entity is in-service in DB but cannot communicate with MP.
- d0 Not used
  - d1 Not used
  - d2 Not used
  - d3 Not used
  - d4 Not used
  - d5 SYNC side
- 306 TLI entity is in-service in DB but out-of-service in SYNC data.
- d0 Syncdata.arch
  - d1 TLI data base flags
  - d2 TLI hardware status
  - d3 Number of times data mismatch verified
  - d4 TLI number
  - d5 SYNC side
- 307 TLR entity is in-service in DB but out-of-service in SYNC data.
- d0 Not used
  - d1 Not used
  - d2 Not used
  - d3 TLR number
  - d4 TLI number
  - d5 SYNC side
- 308 CI links is in-service in DB but out of service in CI hardware data
- d0 Not used
  - d1 Not used
  - d2 Not used
  - d3 Not used
  - d4 Not used
  - d5 link number
- 310 TLR entity priority is different b/t DB and SYNC data (TE and TP)
- d0 Not used
  - d1 SYNC hardware TLR priority
  - d2 Data base priority
  - d3 TLR number
  - d4 TLI number
  - d5 SYNC side

- 311 TLR entity x and y value is different b/t DB and SYNC data
- d0 SYNC hardware y value
  - d1 Data base y value
  - d2 SYNC hardware x value
  - d3 Data base x value
  - d4 [AB] A = TLI number; B = TLR number;
  - d5 SYNC side
- 312 SYNC entity architect or stratum value is different b/t DB and SYNC.
- d0 SYNC hardware stratum value
    - 0 - domestic stratum 3
    - 1 - CEPT local exchange
    - 2 - CEPT toll exchange
    - 3 - domestic stratum 2
  - d1 Data base stratum value
    - 0 - no type defined
    - 1 - stratum 2 sync
    - 2 - stratum 3 sync
    - 3 - CEPT local
    - 4 - CEPT toll
  - d2 SYNC hardware architect value
    - 0 - slaved in master-slave system
    - 1 - master in master-slave system
    - 2 - mutual synchronization system
  - d3 Data base architect value
    - 0 - no type defined
    - 1 - master in master-slave system
    - 2 - slaved in master-slave system
    - 3 - mutual synchronization system
  - d4 Not used

- d7 Channel number in pseudo-channel entry
- d8 NPC number in pseudo-channel entry Low Byte
- d9 NPC number in pseudo-channel entry High Byte

### 3B3 The DSP Platform software version is inconsistent.

The DSP Platform software version stored in the main controller does not match that stored in the hardware.

- d0 Not used
- d1 Data stored in the database
- d2 Data stored in the hardware
- d3 Index - the reason of failure
  - 1 - DSPP software generic is inconsistent
  - 2 - DSPP software issue is inconsistent
  - 3 - DSPP software release is inconsistent
  - 4 - DSPP software year load is inconsistent
  - 5 - CP code version is inconsistent
  - 6 - DSP code version is inconsistent
- d4 NPC number
- d5 UNIT number

### 3B4 The DSP Platform application database does not match that stored in hardware

- d0 Not used
- d2 Not used
- d3 Not used
- d4 NPC number of circuit pack that is running the application
- d5 UNIT number

## **FRADTS,MC,DGN**

### **FRAME AUDITS MAIN CONTROLLER**

#### **Explanation Of Command**

This autonomous output message from frame audits indicates that a diagnostic test was run on the main controller (MC) but failed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.82004]

I hh:mm:ss xy,ww FRADTS MC DGN <tt> COMPL

### **Explanation Of Parameters**

---

**MC** - Main controller

**DGN** - Diagnose

**tt** - Entity identifier

**tt** *Explanation*

**BX** Bus Extender RAM

**CI** Communications Interface

**EBX** Expanded Bus Extender RAM

**EMTC** Expanded Maintenance Circuit

**MP** Main Processor

**MTC** Maintenance Circuit

**PMEM** Primary Memory Device

**SMEM** Secondary Memory Device

## **GRTH,FRAME,CHAR,UID**

### **GROWTH FRAME**

#### **Explanation Of Command**

This command allows the optional frame identifier and unique frame identifier to be set.

Until this command is used, the frame identifier defaults to 00.

#### **⇒ NOTE:**

**Note:** If the frame identifier is protected (hard wired), it cannot be changed by this command.

The **CHAR** field determines the number of characters in the frame identifier (2 is the default).

For DACS II Capacity Expansion Frames (CEF), this command also results in the provisioning of virtual NPCs [9]961, [9]962, [9]963, [9]964, [9]965, and [9]966 (99101, 99102, 99103, 99104, 99105, and 99106 in the hierarchical NPC numbering format), default type VI100.

For Non-CEF frames, this command also results in the provisioning of virtual NPCs 961 and 962 (99101 and 99102 in the hierarchical NPC numbering format), default type VI100. This NPC type may be changed if necessary by the **CHG: :NPC, TYPE** command (Message 38211).

#### **Command**

[I.30101]

**GRTH:FRM xy,SEQ ww:FRAME fg[,CHAR m][,UID <uid>]!**

### **Completion Message**

[O.30101.01]

M hh:mm:ss xy,ww n[vv] GRTH FRAME fg CHAR m UID [<uid>] \  
COND cc DNY

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**FRAME** - Frame

**fg** - Frame identifier. (alphanumeric, 01 through ZZ).

The frame identifier is required. If the disk-stored frame identifier is 00, then this command sets the frame identifier to fg. Until the GRTH::FRAME command is used, the frame number defaults to 00.

The frame identifier is used in input and output messages.

**CHAR** - Character

**m** - The number of characters in the frame identifier. (2 or 3).

**UID** - Unique identifier

**uid** - Unique frame identifier. (1 to 20 alphanumeric characters)

If the UID field is entered, the unique frame identifier will be assigned the value of uid.

**cc** - Hexadecimal condition code

**cc** *Explanation*

**81** Frame ID is protected

## **GRTH,NPC,NPCTG**

### **GROWTH TEST-ACCESS GROUP NPC**

#### **Explanation Of Command**

This command is used to designate a network processing circuit (NPC) as a test-access group NPC (NPCTG).

To provision an individual test-access group (TG) use the GRTH::TG,NPCTG command

#### **Command**

##### **Nonhierarchical**

[I.31401]

### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |

## **GRTH,NPC,TYPE**

### **PROVISION DIGITAL SIGNAL PROCESSING PLATFORM NPC**

#### **Explanation Of Command**

This command is used to request the provisioning of a Digital Signal Processing Platform (DSPP) circuit pack. A DSPP circuit pack is used to run one of the following applications:

1. The X.50/X.57 International Subrate application, which has the type field SD111.
2. The Digital Multipoint Bridge (DMB) application, which has the type field SD311 (this application is similar to the DMB feature that may be provisioned in the DSPU).
3. The DDS Subrate and Multipoint Junction Unit application, which has the type field SD411 (this application is similar to the SRM and MJU features that may be provisioned in the DSPU). This application supports 19.2 MJU circuits, which the DSPU MJU does not support.
4. Any future application, which has a type field of the form SDxyz.

The DSPP circuit pack may be provisioned in an FTU, IFTU, or IFTU2. In those units it may be provisioned in a North American module or in an International module. When being provisioned in an International module a full complement of 64 channels are usable, unless the application itself restricts the number of channels. A total number of 16 DSPP circuit packs may be provisioned in an International module. When being provisioned in a North American module a maximum number of 50 channels are available to the application running on the circuit pack. A total of 20 DSPP circuit packs may be provisioned in a North American module. Customers running a North American DACS II installation may want to set one or more FTU (IFTU or IFTU2) modules aside and provision them as International modules for running the DSPP circuit packs with a maximum of 64 channels.

Only odd numbered DSPP NPCs may be provisioned. The next higher even numbered NPC is not available for other NPC types and must be unequipped when an SDxyz NPC is provisioned. When specifying a range of NPCs to be provisioned the beginning and end of the range should be specified as odd numbers.

DSPP applications are separately orderable products and are shipped with their own documentation. See command I.55721 INSTALL on how to install an application.

### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

**NPC** - Network Processing Circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

**[t]def** - The 3- or 4-digit nonhierarchical NPC number designating the end of a range specification

If NPC numbers are expressed in three digits, the valid values are:

SD type NPC numbers listed by unit number, within an **International module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

### **PROVISION DIGITAL SIGNAL PROCESSING UNIT NPC**

#### **Explanation Of Command**

This command requests the provisioning of a digital signal processing unit type (non-FTU) network processing circuit (NPC). This DSPU type NPC can be either type MB (digital multipoint bridge) or type CB (c-bit processor).

The growth command results in the provisioning of all NPCs in the circuit pack on both duplicated sides. For CEPT circuit packs, there is only one NPC per circuit pack.

## **GRTH,NPC,TYPE,OPTS,IW,X,AIS,MI,PMA,DMA**

### **GROWTH NPC for PA and TH TYPES**

#### **Explanation Of Command**

This command is used to request the provisioning of one or more PA type or TH type network processing circuits (NPCs). (See command I.31362 for PB and PC type NPCs.) PA type NPCs are provisioned in a facility terminating unit (FTU, IFTU, or IFTU2). TH type NPCs are provisioned in a Hybrid DS3 Unit (HDS3U). It is also used to enable the minor bit error rate (MBER) and Signaling Freeze Delay Time Features. For the MBER feature, CTS0 NFW bit 4 is used as RBER. CTS0 NFW bit 4 use as REER is not supported.

One output message is printed for each NPC requested and successfully provisioned.

Provisioning commands where the specified NPC range crosses a Unit boundary will be denied.

For TH type NPCs, the NPC numbers which are divisible by four with a remainder of zero are not valid NPCs. However, the range of THxyz type NPC numbers is still supported with the understanding that there may be gaps in the NPC number range.

When a provisioning command addressing a range of NPCs is denied for successive NPCs in the range for the same reason, a summary denial message will be output, giving the range of NPC numbers denied and the reason for the denial.

If the type field is inconsistent with the first FTM specified or the first FTM specified is unequipped, the entire command is denied. Otherwise, the specified type field is applied to the entire NPC range.

When a provisioning command addressing a range of NPCs within a unit crosses a facility terminating module (FTM) boundary, and if that subsequent FTM is unequipped or provisioned inconsistently with respect to the first FTM, then that FTM will be skipped as a whole, with a summary denial message.

The execution of normal completions, or of denials for reasons other than diagnostic failures, then resumes at the next NPC and continues until the end of the range.

**uvmnp** - Hierarchical NPC number, the first NPC of a range specification.

**uvkqr** - Hierarchical NPC number, the last NPC of a range specification.

**uv** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The allowable values are:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**TYPE** - Type

**mnxyz** - NPC-type identifier

**mn** - NPC Type

|           |                    |
|-----------|--------------------|
| <i>mn</i> | <i>Explanation</i> |
|-----------|--------------------|

|    |                       |
|----|-----------------------|
| PA | 2Mbit/s Interface NPC |
|----|-----------------------|

|    |                   |
|----|-------------------|
| TH | 2Mbit/s HDS3U NPC |
|----|-------------------|

For PA type NPCs the impedance will automatically be set according to the configuration of the FTMI. If the NPC type field is omitted, the NPC type will default to PB100 or PC100 depending on how the FTMI is grown (75- or 120-ohm NPCs) (see command 31362).

The argument xyz is to be interpreted as a 3-digit hexadecimal number. The 3 digits in xyz indicate the selection of provisioning options for the NPC. A detailed discussion of these provisioning options for both the PA and TH type NPCs is given below.

**PA-Type xyz fields**

The provisioning values of  $x$ ,  $y$ , and  $z$  for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding ( $x$ ,  $y$  or  $z$ ) provisioning value):

**Table 12-1. Provisioning values for  $x$** 

| <b>x value</b> | <b>CRC-4 Mode</b> | <b>Automatic CRC-4</b> | <b>Far-End PM</b> | <b>NPC used as Sync Source</b> | <b>TS0 Bit 5 used for SFI</b> |
|----------------|-------------------|------------------------|-------------------|--------------------------------|-------------------------------|
| <b>0</b>       | Y                 |                        |                   |                                |                               |
| <b>1</b>       | Y                 |                        | Y                 |                                | Y                             |
| <b>2</b>       | Y                 |                        |                   |                                | Y                             |
| <b>3</b>       | Y                 |                        | Y                 |                                |                               |
| <b>4</b>       | Y                 |                        |                   | Y                              |                               |
| <b>5</b>       | Y                 |                        | Y                 | Y                              | Y                             |
| <b>6</b>       | Y                 |                        |                   | Y                              | Y                             |
| <b>7</b>       | Y                 |                        | Y                 | Y                              |                               |
| <b>8</b>       |                   | Y                      | Y                 |                                |                               |
| <b>9</b>       |                   | Y                      | Y                 |                                | Y                             |
| <b>A</b>       |                   |                        |                   |                                | Y                             |
| <b>B</b>       |                   |                        |                   |                                |                               |
| <b>C</b>       |                   | Y                      | Y                 | Y                              |                               |
| <b>D</b>       |                   | Y                      | Y                 | Y                              | Y                             |
| <b>E</b>       |                   |                        |                   | Y                              | Y                             |
| <b>F</b>       |                   |                        |                   | Y                              |                               |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent CHG::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 12-2. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.

2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected ( $y$  value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected ( $y$  values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For  $y$  values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering ( $y=8$ ) or Timeslot Channel Numbering ( $y=9$ ) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface ( $y=C$ ) or as an unframed clear 2Mbit/s interface ( $y=D$ ). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 12-3. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )
3. z values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For z values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For z values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS

in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B.**
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when z = 0, 1, 4, 5, 6, 7, A or B. **However,** for z values 2 and 8 the set time is 144 ms and for z values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for z = 4 and 8) or 480 ms (for z = 5 and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the CHG::NPC,TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms
- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:
  - z=6 or A** hardware timing
  - z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)
- [iv] BER alarm level = DMA

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

**Specific Options for z= 6 or 7**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

[ix] To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of xyz for the PA type NPC.

**Table 12-4. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |

| xC1<br>xC3<br>xC5<br>xC7<br>xC8<br>xC9<br>xCB<br>xCC<br>XD1<br>xD3<br>xD5<br>xD7<br>xD8<br>xD9<br>xDB<br>xDC | Clear 2Mbit/s ( <i>y</i> value C or D) cannot be used with Firmware controlled Consequent Action ( <i>z</i> values 1, 3, 5, 7, 9 or B), TRANSMIC 1G ( <i>z</i> value C) or TRANSMIC 2G ( <i>z</i> value 8).            |
| xD4<br>xD6                                                                                                   | Unframed clear 2Mbit/s ( <i>y</i> value D) cannot be used with <i>z</i> value 4 (NFW Bit 4 used for RAIS) or with <i>z</i> value 6 (NFW Bit 4 used for RBER) because unframed clear signals cannot obtain TSO framing. |
| x0C<br>x2C<br>x4C<br>x6C                                                                                     | Channel Associated Signaling ( <i>y</i> values 0, 2, 4 and 6) is not valid for TRANSMIC 1G ( <i>z</i> value C).                                                                                                        |

**Table Notes:**

1. If framed clear 2Mbit/s (*y* value C) is selected with *z* value 4 (NFW Bit 4 used for RAIS) only the receive side of this function will be enabled. Outgoing RAIS indicators cannot be transmitted during clear signal operation.
2. If framed clear 2Mbit/s (*y* value C) is selected with *z*= value 6 (NFW Bit 4 used for RBER) only the receive side of this function will be enabled. Outgoing RBER indicators cannot be transmitted during clear signal operation.

**Table 12-6. Combinations of  $x$  and  $z$  Values**

| Invalid<br>xyz<br>Combinations                       | Explanation                                                                                                                                                                                                                                             |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4yC<br>5yC<br>6yC<br>7yC<br>CyC<br>DyC<br>EyC<br>FyC | Use of NPC as Sync Source ( $x$ 4, 5, 6, 7, C, D, E and F) is not valid for TRANSMIC 1G ( $z$ value C). This is because the TSO Monitoring scheme used in TRANSMIC 1G prevents incoming SFI indicators from cutting off the signal to the Synchronizer. |

Additionally:

- If the NPC is not located in a sync NPC location, the value of "x" must be in the range 0 - 3 or 8 - B. Otherwise the command will be denied.
- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.
- If the value of "y" is 0, 2, 4 or 6 (i.e., a CAS NPC) and the value of "z" is C (i.e. Transmic 1G), the command will be denied.

**OPTS** - Options

**rr** - Facility performance parameter number

Variable rr specifies the parameter whose alarm threshold is being selected.

<m> - Facility performance parameter threshold index (0 through X'10' )

Variable <m> is used to select the threshold value and alarm type previously programmed for parameter rr. There are four possible alarm thresholds and 4 different alarm levels. A given value of <m> selects one combination of threshold value and alarm level. The combinations of these two result in 16 possible values of <m>. There is a 17th <m> value which is used to disable the alarm threshold and the alarm. The values of <m> that produce the default values of the thresholds and alarms are shown in the table below under the column heading "Threshold Value". Threshold and alarm combinations selected by m = 3 through b or d-X'10 must exist, that is, must have been programmed, prior to being selected. The thresholds are programmed by using the ED-OPT-T1 command. Thresholds of all unspecified parameters will be set to the default value associated with m=0. Setting m = c disables thresholding for a given parameter.

For PA type NPCs:

**Table 12-7. Parameter Register Threshold Range and Default Values**

| rr | Parameter                        | Interval | Threshold Value Range | Default Threshold Value |
|----|----------------------------------|----------|-----------------------|-------------------------|
| 11 | CRC Block Errors                 | DAILY    | 1 - 79056000          | 176947                  |
| 12 | Framing Errors                   | DAILY    | 1 - 345600000         | 176947                  |

| 20 | Multiframe Errors                | DAILY    | 1 - 86400             | 4095                    |
| 21 | Far End Block Errors             | DAILY    | 1 - 79056000          | 176947                  |
| 22 | Far End Errored Seconds          | DAILY    | 1 - 86400             | 4320                    |
| 23 | Far End Severely Errored Seconds | DAILY    | 1 - 86400             | 90                      |
| 24 | Far End Unavailable Seconds      | DAILY    | 1 - 86400             | 90                      |
| 81 | CRC Block Errors                 | 15MIN    | 1 - 823500            | 18432                   |
| 82 | Framing Errors                   | 15MIN    | 1 - 3600000           | 18432                   |
| 83 | Out of Frame Seconds             | 15MIN    | 1 - 900               | 4                       |
| 84 | Errored Seconds                  | 15MIN    | 1 - 900               | 300                     |
| 85 | Severely Errored Seconds         | 15MIN    | 1 - 900               | 30                      |
| 86 | Controlled Slip Seconds          | 15MIN    | 1 - 900               | 1                       |
| 87 | Coding Violations                | 15MIN    | 1 - 1843200           | 18432                   |
| 88 | Unavailable Seconds              | 15MIN    | 1 - 900               | 30                      |
| 89 | Unavailable Time Count           | 15MIN    | 1 - 45                | 3                       |
| 90 | Multiframe Errors                | 15MIN    | 1 - 900               | 255                     |
| 91 | Far End Block Errors             | 15MIN    | 1 - 823500            | 18432                   |
| 92 | Far End Errored Seconds          | 15MIN    | 1 - 900               | 300                     |
| 93 | Far End Severely Errored Seconds | 15MIN    | 1 - 900               | 30                      |
| 94 | Far End Unavailable Seconds      | 15MIN    | 1 - 900               | 30                      |

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m>       | Threshold Value    | Alarm Type                             |
|-----------|--------------------|----------------------------------------|
| <b>0</b>  | Default            | MI (Maintenance Information)           |
| <b>1</b>  | Default            | DMA (Deferred Maintenance Minor Alarm) |
| <b>2</b>  | Default            | PMA (Prompt Maintenance Major Alarm)   |
| <b>3</b>  | Set 1              | MI                                     |
| <b>4</b>  | Set 1              | DMA                                    |
| <b>5</b>  | Set 1              | PMA Major                              |
| <b>6</b>  | Set 2              | MI                                     |
| <b>7</b>  | Set 2              | DMA                                    |
| <b>8</b>  | Set 2              | PMA Major                              |
| <b>9</b>  | Set 3              | MI                                     |
| <b>a</b>  | Set 3              | DMA                                    |
| <b>b</b>  | Set 3              | PMA Major                              |
| <b>c</b>  | Threshold disabled | no alarm                               |
| <b>d</b>  | Default            | PMA Critical                           |
| <b>e</b>  | Set 1              | PMA Critical                           |
| <b>f</b>  | Set 2              | PMA Critical                           |
| <b>10</b> | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable m can be used to select threshold levels and alarm types other than the defaults.

IW - Insertion Word

pq[r] - Hexadecimal value of the Growth Insertion Word (GIW)

Used in the transmit direction on unassigned channels for CEPT NPCs.

pq transmitted data information  
r transmitted signaling information

A special code, called the Growth Insertion Word (GIW), is transmitted by this NPC on unassigned channels. This code is specified by the optional keyword **IW** and its argument **pq**.

*This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the TCON Insertion Word, which is transmitted when the "TDIS: :FROM, TO, . . . , DCC" command is used.*

For PA type NPCs, the IW argument is X'pq[r], and the default GIW code is X'D5D (Binary: 11010101 1101). The "pq" hex digits represent the CEPT insertion word for cross-connected time slots and the "r" hex digit represents the CEPT signaling options. The "r" digit is needed to accommodate the cross-connected CEPT time slot and its associated portion of TS16 used for signaling when provisioned for CAS.

Although the "r" digit is accepted on input, for NSA NPCs, it has no significance.

For clear E1 NPCs (y value "C" or "D") the insertion word option is **not** available and the message will be denied if this option is entered. The alarm indication signal (AIS) is transmitted in the disconnected or idle state for clear E1 NPCs.

**AIS** - Alarm indication signal

AIS is not detected by unframed clear (unchannelized) 2Mbit/s PAXDz type NPCs. Therefore, specifying AIS with one of the alarm level types MI, DMA, or PMA, is unnecessary. However, the command will not be denied if AIS is specified with an alarm level for unframed clear PAXDz NPCs. AIS with its alarm level will simply never be reported for unframed clear PAXDz NPCs.

**MI** - Maintenance information

This is the default option.

**PMA** - Prompt maintenance major alarm

**PMC** - Prompt maintenance critical alarm

**DMA** - Deferred maintenance minor alarm

**LEV** -Intervention Level

**g** - Intervention Level Setting (1-6)

Intervention Level is a feature that changes the Alarm Severity of an alarm based on the alarm severity and the Intervention Level setting.

**[s]jkl** - Nonhierarchical NPC number ([s]abc ≤ [s]jkl ≤ [t]def)

**[t]mno** - Nonhierarchical NPC number ([s]jkl ≤ [t]mno ≤ [t]def)

**uvjkl** - Hierarchical NPC number ( $uvmnp \leq uvjkl \leq uvkqr$ )  
**uvmno** - Hierarchical NPC number ( $uvjkl \leq uvmno \leq uvkqr$ )

**Note:** uvjkl and uvkqr are in the **same** unit.

**ss/n** - First improper value of "rr/<m>" for which the message is denied.

For each NPC listed, this message prints out values of the states, counts, thresholds and options of the following facility performance parameters and the spare international and national bits in time slot 0 for CEPT DPCs.

| parameter | explanation                      |
|-----------|----------------------------------|
| CRC       | CRC Block Errors                 |
| FRER      | Framing Errors                   |
| OFS       | Out of Frame Seconds             |
| ES        | Errored Seconds                  |
| SES       | Severely Errored Seconds         |
| CSS       | Controlled Slip Seconds          |
| CV        | Coding Violations                |
| UAS       | Unavailable Seconds              |
| UATC      | Unavailable Time Count           |
| MER       | Multiframe Errors                |
| FEBE      | Far End Block Errors             |
| FES       | Far End Errored Seconds          |
| FSES      | Far End Severely Errored Seconds |
| FUAS      | Far End Unavailable Seconds      |

**Note** that parameters CV, FEBE, FES, FSES and FUAS do not apply to TH type NPCs.

Two sets of thresholds are kept for each parameter: One for DAILY intervals and one for 15 MINUTE intervals.

#### For PA type NPCs:

Depending on which interface functions are enabled by the provisioning values of xyz, some parameters may not be applicable. In this case the threshold value, the parameter count (if present in the message) and the selection value will appear as dashes ("-"). In the table below "N/A" indicates that a parameter is not applicable for the given value of x or y.

Also, if the selection value m=c has been chosen for a parameter, the threshold value and the parameter count (if present in the message) will appear as dashes.

| For PA Type NPCs |                                    |                                            |                             |                                 |
|------------------|------------------------------------|--------------------------------------------|-----------------------------|---------------------------------|
| Parameter        | CRC-4 Mode Disabled<br>(x=A,B,E,F) | Far-End PM Disabled<br>(x=0,2,4,6,A,B,E,F) | CAS Disabled<br>(y=8,9,C,D) | Unframed Clear 2Mbit/s<br>(y=D) |
| CRC              | N/A                                |                                            |                             | N/A                             |
| FRER             |                                    |                                            |                             | N/A                             |
| OFS              |                                    |                                            |                             | N/A                             |
| ES               |                                    |                                            |                             | N/A                             |
| SES              |                                    |                                            |                             | N/A                             |
| CSS              |                                    |                                            |                             |                                 |
| CV               |                                    |                                            |                             |                                 |

| <b>n</b>                    | - 15-Minute far-end unavailable second threshold selection,<br>(0 through 3)      |

The options {a,b,c,d,e,f,g,h,i,j,k,l,m,n} and {a,b,c,d,e,f,g,h,i,j,k,l,m,n} are **m values** as previously shown and specify the threshold sets of the performance parameters listed.

The **TS0 abcdefgh** variables represent international and national bits in time slot'0, as defined by:

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

These variables are set to their default values "11011111" by this command, except for the Transmic'1G option, where the default is "11000000."

The variables may later be changed by setting the abcdefgh parameters in the TS0 field of the ED-PRMTR-EQPT::NPC or CHG::NPC (38321) command. Each of the variables may then be set to "0", "1", "P" or "V." "P" indicates that the incoming bit will be cross-connected unchanged; "V" indicates that the bit received will be inverted.

When TS0 is cross-connected, the TS0 bits will be either passed, inverted or set to "0" or "1" as indicated by the "abcdefgh" variable values. Note that bits which are used for alarms (bit 3 always; bits 4 and 5 if provisioned by the **mnxyz** values) may not be set to "P."

This is also true for NPCs assigned as test port NPCs.

The **TS0M abcdefgh** field allows monitoring of state changes in the received spare international bits, where the "abcdefgh" variables refer to the same TS0 bits as defined above for the TS0 "abcdefgh" variables.

The TS0M variables are specified for monitoring in the command as:

The default values for TS0M variables are **abcdefgh=00000000**, unless the **xyz** parameters set them differently, i.e., for Transmic'1G the abcdefgh=00111111. The TS0M variables may later be provisioned by the CHG::TS0M'abcdefgh (I.38323) command.

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 00** No conditions
- 10** Unit is not equipped
- 11** UC is out of service
- 12** UC is in service but failed
- 13** FTMI is not equipped
- 20** Option rr/m has not been set up on 2nd database
- 24** Unit type error
- 26** NPC type error
- 34** NPC type option xyz is unassigned or invalid for feature package
- 83** NPC type is inconsistent with FTMI type
- 84** Incompatible types of NPCs in a DDC
- 31** NPC not provisioned for NSA
- 32** Bit 3 provisioned for use as RAI3
- 33** Bit 4 provisioned for use as RAIS
- 39** NPC provisioned as a SYNC source cannot be provisioned for RPSFI
- 3A** Bit 4 provisioned for use as RBER
- 3B** Bit 5 provisioned for use as SFI
- 3C** Bits 3 through 8 are provisioned for Transmic 1G
- 3D** Alarm bits cannot be passed through or inverted
- B0** Combination of bit g (b7) and h (b8) is invalid
- BB** Timeslot channel numbering not allowed with CAS
- CD** NPC not designated as sync timing source
- F1** Parameter only valid with PA, PB, or PC type NPCs
- F2** Invalid NPC number specified
- FD** NPC range crosses unit boundary
- 8B** Must provision for SFI if also provisioning for RPSFI
- 8C** Must provision for CAS if also provisioning for RPSFI
- A3** Transmic 1G NPC designated as SYNC source invalid
- A4** Firmware timing invalid for Transmic 1G NPC
- A5** AIS keyword incompatible with NPC type
- AB** LEV keyword incompatible with NPC type
- AC** LEV keyword not allowed with Intervention Level Feature OFF
- 04** This NPC type does not allow Payload
- 7E** Framed/Unframed clear 2Mbit/s NPC invalid for Automatic CRC-4
- 7F** Unframed clear 2Mbit/s NPC invalid for TS0 processing
- 80** Framed/Unframed clear 2Mbit/s NPC invalid for Transmic 1G, 2G
- 81** Framed/Unframed clear 2Mbit/s NPC invalid for Firmware Timing
- 82** Unframed clear 2Mbit/s NPC invalid for Bit 4 used as RA IS/RBER
- 85** IW not allowed to be specified in Clear 2Mbit/s
- 91** Option not programmable for this NPC type

## **GRTH,NPC,TYPE,OPTS,IW,X,AIS,MI,PMA,PMC**

### **GROWTH NPC for PB and PC TYPES**

#### **Explanation Of Command**

This message requests the equipage of one or more primary block or primary block coaxial network processing circuits in a facility terminating unit within a CEPT or Gateway frame. The system uses type PB with 120-ohm and type PC with 75-ohm facility terminating module interfaces.

This message is also used to enable the minor bit error rate (MBER) and signaling freeze delay time features.

When a range of NPCs is being equipped, the execution of this command may be aborted by entering the ABT command.

Although the NPC type field is optional for PB and PC types, it is required if the options field is specified.

One output message is printed for each NPC requested and successfully provisioned.

Provisioning commands where the specified NPC range crosses a Unit boundary will be denied.

When a provisioning command addressing a range of NPCs is denied for successive NPCs in the range for the same reason, a summary denial message will be output, giving the range of NPC numbers denied and the reason for the denial.

When a provisioning command addressing a range of NPCs within a unit crosses a facility terminating module (FTM) boundary, if the FTM is unequipped or provisioned as a CEPT module, then the FTM will be skipped as a whole, with a summary denial message, as noted below.

- If the type field is specified, and it is inconsistent with the first FTM specified or the first FTM specified is unequipped, the entire command is denied. Otherwise, the specified type field is applied to the entire NPC range.
- If the type field is omitted, the NPC type will default to the type of the first FTM, either domestic or CEPT.

Whether or not the type field is specified, if an FTM, beyond the first one addressed, is of a different type, that entire FTM will be denied.

The execution of the normal completions, or of denials for a reason other than diagnostic failures, then resumes at the next NPC and continues until the end of the range.

A summary denial message will not be issued for denial of range NPC RESTORE commands if the reason is an NPC diagnostic failure. In this case, there is one output message for each NPC in the range.

### **Command**

If the output message requires more than 80 characters:

M hh:mm:ss xy,ww n GRTH NPC uvjkl[-uvmno] TYPE mnxyz 2 LN MSG:  
[ ss/n][ IW pq[r]][ AIS {MI|PMA|PMC|DMA}][ LEV g] COND cc DNY

[O.31362.02]

M hh:mm:ss xy,ww n GRTH NPC uvjkl[-uvmno] TYPE mnxyz EQD DNY

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, the first NPC of a range specification.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, the last NPC of a range specification.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uvmnp** - Hierarchical NPC number, the first NPC of a range specification.

**uvkqr** - Hierarchical NPC number, the last NPC of a range specification.

**uv** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The allowable values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**TYPE** - Type

**mnxyz** - NPC-type identifier

**mn** - NPC Type

*mn* Explanation

PB CEPT NPC (120-Ohm twisted pair)

PC CEPT NPC (75-Ohm coaxial)

If the NPC TYPE field is omitted, the NPC type will default to PB100 or PC100 depending on how the FTMI is provisioned (75- or 120-ohm NPCs).

The argument xyz is to be interpreted as a 3-digit hexadecimal number. The 12 bits in xyz, represented as abcd efgh jklm, indicate the selection of provisioning options for the NPC.

**PB- and PC-type xyz fields**

**Table 12-8. NPC Provisioning Options**

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                         |
|--------------|------------|--------------|------------------------------------------------------------------------|
| x            | a          | 0            | CRC multiframe in TS0                                                  |
|              |            | 1            | Non-CRC framing in TS0                                                 |
|              | b          | 0            | NPC is not used as a synchronization source                            |
|              |            | 1            | NPC is used as a synchronization source                                |
|              | c          | 0            | CCITT G.732 (hardware controlled) Consequent Actions, AIS in signaling |
|              |            | 1            | Firmware controlled Consequent Actions <sup>[c]</sup>                  |
|              | d          | 0            | Non-signaling associated (NSA)                                         |
|              |            | 1            | 16-state channel associated signaling (CAS)                            |

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                                              |
|--------------|------------|--------------|---------------------------------------------------------------------------------------------|
| y            | e          | 0            | Telephone channel numbering                                                                 |
|              |            | 1            | Channel timeslot numbering                                                                  |
|              | f          | 0            | Convert the <i>abcd</i> bits of TS16 to 1111 if 0000                                        |
|              |            | 1            | Transmit the 0000 in the <i>abcd</i> bits transparently                                     |
|              | g          | 0            | AIS applied to received TS16 on detection of RAI, RAIS, or R16                              |
|              |            | 1            | AIS not applied to received TS16 on detection of RAI, RAIS, or R16                          |
|              | h          | 0            | NFW bit 5=Synchronization Failure Indication (SFI) unaffected by Synchronizer Holdover (SH) |
|              |            | 1            | NFW bit 5=SFI inverted on SH on output and detected on input                                |

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                                                                                         |
|--------------|------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| z            | jkl        | 000          | NFW bit 3=RAI set in < 2 ms,                                                                                                           |
|              |            | 001          | NFW bit 3=RAI set in time $T^{[c']}$                                                                                                   |
|              |            | 010          | NFW bit 4=RAIS in time $T^{[c']}$ and RAI in < 2 ms                                                                                    |
|              |            | 011          | Enable BER calculations, BER alarm level = DMA, NFW bit 4=RBER, RAI set in < 2 ms, for c=1 (SFDT=2496 ms, CACT=624 $ms^{[jkl]}$ ),     |
|              |            | 100          | NFW bit 4=RAIS and RAI in time $T^{[c']}$ (TRANSMIC 2G)                                                                                |
|              |            | 101          | Enable BER calculations, BER alarm level = DMA, NFW bit 4=disabled, RAI set in < 2 ms, for c=1 (SFDT=2496 ms, CACT=624 $ms^{[jkl]}$ ), |
|              |            | 110          | NFW bits 3-8,in time 144ms (TRANSMIC 1G)                                                                                               |
|              |            | 111          | Unassigned                                                                                                                             |
|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                          |
|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
 if  $jkl \neq 011$  and  $jkl \neq 101$   
 in **2496 ms**  
 if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared.\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the CHG::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option h=1.

If both b=1 and h=1 and the NPC (used as synchronization source) receives

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option *c* is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] minor bit error rate and signaling freeze delay time features:

jkl=011 or jkl=101

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

*c*=0 hardware timing

*c*=1 firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

jkl=011

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the CHG::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

Additionally:

- If the NPC is not located in a sync NPC location, bit "b" set to "1" will be denied.
- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.
- For NSA NPCs (bit d = 0), bits "f" and "g" are don't cares: any values are accepted.
- If bit "d" is set to "1" (that is, a CAS NPC) and "jkl" is "110" (that is, Transmic 1G), the command will be denied.
- If bit "d" is set to "1" (that is, a CAS NPC) and bit "e" is "1" for time slot channel numbering, the command will be denied.

**OPTS** - Options

**rr** - Facility performance parameter number

Variable rr specifies the parameter whose alarm threshold is being selected.

**<m>** - Facility performance parameter threshold index  
(0 through X'10')

Variable <m> is used to select threshold values previously programmed for rr. The default threshold value for each parameter is shown in the table below under the column heading "Default Threshold Value". This is the value selected by m = 0, 1, 2 or d in the table of <m> values following the parameter table. A given value of m selects both the performance monitoring threshold level and the alarm type associated with it as shown in that table. Threshold values selected by values of m other than the default must exist, that is, must have been programmed, prior to being selected. These other thresholds can be set by using the CHG,SETOP, TYPE,ALL,NPCOP command. Thresholds of all unspecified parameters will be set to the default value associated with m=0. Although the NPC type field is optional for PB and PC types, the options field must not be given without the NPC type field.

**For PB and PC type NPCs:**

| rr | Parameter                          | Threshold<br>Value<br>Range | Default<br>Threshold<br>Value |
|----|------------------------------------|-----------------------------|-------------------------------|
| 31 | Degraded Minutes, 1 hour           | 1-60                        | 60                            |
| 32 | Degraded Minutes, 24 hours         | 1-1440                      | 1440                          |
| 33 | Severely Errored Seconds, 15 mins  | 1-900                       | 900                           |
| 34 | Severely Errored Seconds, 24 hours | 1-65535                     | 65535                         |
| 35 | Errored Seconds, 15 minutes        | 1-900                       | 900                           |
| 36 | Errored Seconds, 24 hours          | 1-65535                     | 65535                         |
| 37 | Unavailable Seconds, 15 minutes    | 1-900                       | 900                           |
| 38 | Unavailable Seconds, 24 hours      | 1-65535                     | 65535                         |
| 39 | Slips, 15 minutes                  | 1-900                       | 900                           |
| 40 | Slips, 24 hours                    | 1-65535                     | 65535                         |

**Note 1:** 24-hour thresholds must be greater than their respective 15-minute or 1-hour threshold.

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m> | Threshold Value    | Alarm Type                             |
|-----|--------------------|----------------------------------------|
| 0   | Default            | MI (Maintenance Information)           |
| 1   | Default            | DMA (Deferred Maintenance Minor Alarm) |
| 2   | Default            | PMA (Prompt Maintenance Major Alarm)   |
| 3   | Set 1              | MI                                     |
| 4   | Set 1              | DMA                                    |
| 5   | Set 1              | PMA Major                              |
| 6   | Set 2              | MI                                     |
| 7   | Set 2              | DMA                                    |
| 8   | Set 2              | PMA Major                              |
| 9   | Set 3              | MI                                     |
| a   | Set 3              | DMA                                    |
| b   | Set 3              | PMA Major                              |
| c   | Threshold disabled | no alarm                               |
| d   | Default            | PMA Critical                           |
| e   | Set 1              | PMA Critical                           |
| f   | Set 2              | PMA Critical                           |
| 10  | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable m can be used to select threshold levels and alarm types other than the defaults.

**Note:** If the queried NPC can not be accessed for some reason, for example because the Facility Terminating Module is not equipped or the FTMI or Unit Controller is out of service, then the NPC's parameter count fields are printed as a string of dashes to indicate that the counts are not available. The parameter thresholds and options will still be correctly output.

In addition, certain parameters do not apply. In the cases where specific parameters do not apply to the queried NPC, the respective parameter count fields, threshold values and threshold options are all displayed as a string of dashes.

IW - Insertion Word

pq[r] - Hexadecimal value of the Growth Insertion Word (GIW)

Used in the transmit direction on unassigned channels for CEPT NPCs.

pq transmitted data information  
r transmitted signaling information

A special code, called the Growth Insertion Word (GIW), is transmitted by this NPC on unassigned channels. This code is specified by the optional keyword **IW** and its argument **pq**.

*This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the TCON Insertion Word, which is transmitted when the "TDIS: :FROM, TO, . . . , DCC" command is used.*

For PB and PC type NPCs, the IW argument is X'pq[r]', and the default GIW code is X'D5D (Binary: 11010101 1101). Hexadecimal digits "pq" represent the CEPT insertion word for cross-connected time slots and hexadecimal digit "r" represents the CEPT signaling option. The "r" digit is needed to accommodate the cross-connected CEPT time slot and its associated portion of TS16 used for signaling when provisioned for channel associated signaling (CAS).

Although the "r" digit is accepted on input, for NSA NPCs, it has no significance.

**AIS** - Alarm indication signal

**LEV** - Intervention Level  
g Intervention Level Setting(1-6)

Intervention Level is a feature that changes the Alarm Severity of an alarm based on the alarm severity and the Intervention Level setting.

**MI** - Maintenance information  
This is the default option.

**PMA** - Prompt maintenance major alarm

**DMA** - Deferred maintenance minor alarm

**PMC** -Prompt Maintenance Critical Alarm

**[s]jkl** - Nonhierarchical NPC number ( $[s]abc \leq [s]jkl \leq [t]def$ )  
**[t]mno** - Nonhierarchical NPC number ( $[s]jkl \leq [t]mno \leq [t]def$ )

**uvjkl** - Hierarchical NPC number ( $uvmnp \leq uvjkl \leq uvkqr$ )

**uvmno** - Hierarchical NPC number ( $uvjkl \leq uvmno \leq uvkqr$ )

**Note:** uvjkl and uvkqr are in the **same** unit.

**ss/n** - First improper value of "rr/<m>" for which the message is denied.

For each NPC listed, this message prints out values of the states, counts, thresholds and options of the following facility performance parameters and the spare international and national bits in time slot 0 for CEPT NPCs.

For PB and PC type NPCs:

**DM** - Degraded Minutes

**nnnnn** - 24-hour Degraded Minutes threshold

**nnnnn** - 1-hour DM threshold

**e** - 24-hour Degraded Minutes threshold/alarm selection

**e** - 1-hour DM threshold/alarm selection

**SERS** - Severely Errored Seconds

**ppppp** - 24-hour Severely Errored Seconds threshold

**ppppp** - 15-minute SERS threshold

**f** - 24-hour Severely Errored Seconds threshold/alarm selection

**f** - 15-minute SERS threshold/alarm selection

**ERS** - Errored Seconds

**qqqqq** - 24-hour Errored Seconds threshold

**qqqqq** - 15-minute ERS threshold

**g** - 24-hour Errored Seconds threshold/alarm selection

**g** - 15-minute ES threshold/alarm selection

**US** - Unavailable Seconds

**rrrrr** - 24-hour Unavailable Seconds threshold

**rrrrr** - 15-minute US threshold

**h** - 24-hour Unavailable Seconds threshold/alarm selection

**h** - 15-minute US threshold/alarm selection

**SLIP** - Slip Events

**sssss** - 24-hour Slip Events threshold

**sssss** - 15-minute SLIP threshold

**i** - 24-hour Slip threshold/alarm selection

**i** - 15-minute SLIP threshold/alarm selection

For SHORT INTERVAL, DM is calculated hourly and SERS, ERS, US, and SLIP are calculated at 15 minute intervals.

The **TS0 abcdefgh** variables represent international and national bits in time slot 0, as defined by:

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

These variables are set to their default values "11011111" by this command, except for the Transmic 1G option, where the default is "11000000."

The variables may later be changed by setting the abcdefgh parameters in the TS0 field of the CHG::NPC command.

Each of the variables may then be set to "0", "1", or "P." "P" indicates that the incoming bit will be cross-connected unchanged.

When TS0 is cross-connected, the TS0 bits will be either passed, or set to "0" or "1" as indicated by the "abcdefgh" variable values. Note that bits which are used for alarms (bit 3 always; bits 4 and 5 if provisioned by the **mnxyz** values) may not be set to "P."

This is also true for NPCs assigned as test port NPCs.

The **TS0M abcdefgh** field allows monitoring of state changes in the received spare international bits, where the "abcdefgh" variables refer to the same TS0 bits as defined above for the TS0 "abcdefgh" variables.

The TS0M variables are specified for monitoring in the command as:

The default values for TS0M variables are **abcdefgh=00000000**, unless the **xyz** parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111. The TS0M variables may later be provisioned by the CHG::TS0M abcdefgh or the ED-PRMTR-EQPT TS0M-abcdefgh (38323) command.

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 00** No conditions
- 10** Unit is not equipped
- 11** UC is out of service
- 12** UC is in service but failed
- 13** FTMI is not equipped
- 20** Option rr/<m> has not been set up on 2nd database
- 24** Unit type error
- 26** NPC type error
- 34** NPC type option xyz is unassigned
- 83** NPC type is inconsistent with FTMI type
- 84** Incompatible types of NPCs in a DDC
- 14** 1 hr >= 24 hr for DM opt
- 15** 15 min >= 24 hr for SERS opt
- 16** 15 min >= 24 hr for ERS opt
- 17** 15 min >= 24 hr for US opt
- 18** 15 min >= 24 hr for SLIP opt
- 31** NPC not provisioned for NSA
- 32** Bit 3 provisioned for use as RAI3
- 33** Bit 4 provisioned for use as RAIS
- 3A** Bit 4 provisioned for use as RBER
- 3B** Bit 5 provisioned for use as SFI
- 3C** Bits 3 through 8 are provisioned for Transmic 1G
- 3D** Alarm bits cannot be passed through or inverted
- B0** Combination of bit g (b7) and h (b8) is invalid
- BB** Timeslot channel numbering not allowed with CAS
- CD** NPC not designated as sync timing source
- F1** Parameter only valid with PA, PB, or PC type NPCs
- F2** Invalid NPC number specified
- FD** NPC range crosses unit boundary
- 1A** The facility parameter not programmable for specified x or z parameter

**cc**    *Explanation*

- A3**    Transmic 1G NPC designated as SYNC source invalid
- A4**    Firmware timing invalid for Transmic 1G NPC
- A5**    AIS keyword incompatible with NPC type
- AB**    LEV keyword incompatible with NPC type
- AC**    LEV keyword not allowed with Intervention Level Feature OFF
- 04**    This NPC type does not allow Payload
- 91**    Option not programmable for this NPC type

## **GRTH,SYNC,TLI,TYPE,SSP,SRC,NPC**

### **PROVISION SYNCHRONIZER TIMING LINK INTERFACE**

#### **Explanation Of Command**

This message requests provisioning of the synchronizer's timing link interface. The TLI can be configured as a timing extractor or as a timing distributor.

If the timing extractor is selected, you must also select synchronizer sync port (SSP) 0 or 1 and its source for priority.

Timing extractor types must be compatible for both **SSP 0** and **SSP 1**.

#### **Command**

## Explanation Of Parameters

**SYNC** - Synchronizer

**TLI** - Timing link interface

**m** - TLI number (1 through 4)

**TYPE** - Type

**texyz** - Timing Extractor type

| <i>te</i> | <i>Explanation</i>                      |
|-----------|-----------------------------------------|
| TC        | Composite Clock Timing Extractor        |
| TE        | DS1 Timing Extractor                    |
| TP        | Primary Block Timing Extractor          |
| TR        | Basic System Reference Frequency (BSRF) |
| TU        | Unipolar Clock Timing Extractor         |

**Note:** For the TC, TU and TR timing extractors the x, y and z parameters can be any value from 0 to 9.

Valid x, y, and z values for the other timing extractors are:

TP-type TLI xyz fields

**x** - Frame format

| <b>x</b>    | <i>Explanation</i>                    |
|-------------|---------------------------------------|
| <b>1, 5</b> | Common Channel Signaling              |
| <b>2, 6</b> | Channel Associated Signaling - Mode 0 |
| <b>3, 7</b> | Channel Associated Signaling - Mode 1 |
| <b>4, 8</b> | European Remote Switching Module      |
| <b>0, 9</b> | Invalid                               |

**y** - Line format

| <b>y</b>    | <i>Explanation</i>                 |
|-------------|------------------------------------|
| <b>0, 2</b> | Alternate Mark Inversion (Bipolar) |
| <b>1, 3</b> | High Density Bipolar (HDB3)        |
| <b>4-9</b>  | Invalid                            |

**z** - Channel format

| <b>z</b>   | <i>Explanation</i> |
|------------|--------------------|
| <b>0-9</b> | Unassigned         |

**SSP** - Synchronizer synchronization port

**a** - SSP number (0 or 1)

Required when texyz is specified.

**Note:** Timing Extractors must have the same "te" type for both SSP 0 and SSP 1.

**SRC** - Source

**p** - Priority (1 through 8)

Required when texyz is specified. 1 = HIGHEST priority, 8 = LOWEST priority

**TDxyz** - Timing Distributor type

The valid values for x, y, and z are:

TD-type TLI xyz fields

**x** - Timing distributor identification

**x**      *Explanation*

**1**      Composite Clock Timing Distribution

**2**      Sinusoidal 2.048 MHz Timing Distribution

**y** - Unassigned

**z** - Unassigned

**NPC** - Network Processing Circuit

The NPC keyword and its associated parameter are only specified in conjunction with the SSP and SRC keywords for TLI type TUxyz.

This keyword indicates that the synchronization signal is terminated in one of the facility terminating locations. Use of this keyword allows the DACS II system to correlate a synchronizing source failure to either an NPC failure or an NPC input signal failure.

**[0]abc** - The 3- or 4-digit nonhierarchical NPC number

Timing source NPC number

The valid NPC numbers are:

If NPC numbers are expressed in three digits, the valid values are:

PB and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit       | Unit       |
|------------|------------|
| 1          | 2          |
| <b>NPC</b> | <b>NPC</b> |
| <b>030</b> | <b>190</b> |
| <b>032</b> | <b>192</b> |
| <b>070</b> | <b>230</b> |
| <b>072</b> | <b>232</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit        | Unit        |
|-------------|-------------|
| 1           | 2           |
| <b>NPC</b>  | <b>NPC</b>  |
| <b>0030</b> | <b>0190</b> |
| <b>0032</b> | <b>0192</b> |
| <b>0070</b> | <b>0230</b> |
| <b>0072</b> | <b>0232</b> |

**uvmnp** - Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid NPC numbers are:

PB and PC NPC numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit          | Module      | NPC           |
|---------------|-------------|---------------|
| <b>01, 02</b> | <b>1, 2</b> | <b>30, 32</b> |

**cc** - Hexadecimal condition code

**cc** *Explanation*

**01** Subject entity is equipped  
**16** SYNC TB is not equipped  
**A7** Sync 0 is not in-service  
**A8** Sync 1 is not in-service  
**A9** Both syncs are out-of-service  
**AC** Timing Extractor type TLI (need SSP info)  
**AD** Not Timing Extractor type TLI (not SSP)

**cc**    *Explanation*

- AE**    Wrong TLI type (need CRO grow command)
- AF**    3 Timing Distributor type TLIs are equipped
- B1**    Illegal priority value
- B2**    Illegal SSP type (not same as other SSPs)
- B3**    X option is illegal
- B4**    Y option is illegal
- B5**    Z option is illegal
- BE**    Hardware mismatch or not present
- CB**    NPC parameter only valid with TU type TLI
- CC**    NPC is still provisioned to provide sync timing
- CD**    NPC not designated as sync timing source
- CE**    NPC already allocated as sync timing source
- CF**    NPC already grown as non-synchronization source
- F1**    Parameter only valid with PA, PB, or PC type NPCs
- E4**    NPC already has Equipment Loopback

## **GRTH,TG,NPCTG**

### **GROWTH TEST-ACCESS GROUP**

#### **Explanation Of Command**

This command is used to provision a test-access group (TG) as a network processing circuit for test groups (NPCTG) covering a specific channel range.

The TG consists of two bundles of n consecutive DS0 channels each. The TG's width is determined by the number of channels within the range specified in the command. The east bundle of the TG is located on the first NPCTG and spans the given channel range; the west bundle is located on the second NPCTG and spans the second channel range. Both bundles may be assigned to the same NPCTG, provided the necessary bandwidth is available.

### **GROW TEST PORT**

#### **Explanation Of Command**

---

This message requests the provisioning of a test port.

If trunk conditioning is omitted from the input command the test port is provisioned as a *dynamic* test port. A dynamic test port's trunk conditioning is set to match the trunk conditioning of the circuit under test at the time the circuit is accessed.

If trunk conditioning is given in the input command the test port is provisioned as a *static* test port. A static test port's trunk conditioning is set at the time the port is provisioned. Its trunk conditioning does not change when a circuit is accessed for testing.

The *static* or *dynamic* designations have meaning only for access to unmapped terminations.

For access to a mapped termination, trunk conditioning is always adopted from the circuit under test.

| 09,21,33,45,57,69,81,93 | 22      | 23 |
| 10,22,34,46,58,70,82,94 | 24      | 25 |
| 11,23,35,47,59,71,83,95 | 26      | 27 |
| 12,24,36,48,60,72,84,96 | 28      | 29 |

**tc** - Trunk conditioning

Represents the desired signaling and insertion word to be applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. For example, TRSP,IW X'pq (input form).

| <i>signaling</i>      | <i>Explanation</i>                                                                                                                                                                             |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC(ijkl,mnop)         | 2-way, 4-state signaling in binary. For CEPT and ESF type framing format, software will expand 4-state to 16-state by duplicating the bits.                                                    |
| TC(efghijkl,mnopqrst) | 2-way, 16-state in binary.                                                                                                                                                                     |
| TC(X'ab,X'cd)         | 2-way, 16-state in hexadecimal.                                                                                                                                                                |
| TRSP                  | Transparent, no signaling.                                                                                                                                                                     |
| Omitted               | Cross-connections. Default is TC X'FF,X'FF if both terminations are channel associated signaling types. Default will be TRSP if one of the terminations is nonsignaling associated (NSA) type. |

| <i>insertion word</i> | <i>Explanation</i>                                                                                                                       |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| Omitted               | Will default to IW X'FF.                                                                                                                 |

For 4-state signaling, the A/B signaling bits of both test port channels are specified by ijkl for the receive time slot interchange (RTSI), and by mnop for the transmit time slot interchange (TTSI).

For 16-state signaling, the A/B/C/D signaling bits of both test port channels are specified by efghijkl (or hexadecimal digits ab) for the RTSI, and by mnopqrst (or hexadecimal digits cd) for the TTSI.

**NPCTP** - NPC for test ports

## **GRTH,UNIT,MXR,TYPE,BERM,BERT,LBO**

### **GROWTH MULTIPLEXER**

#### **Explanation Of Command**

This message equips one or more regular Multiplexer (MXR) circuit packs and their associated DS3 facility's in the service slots of a DACS II DS3 Unit. It is also used to equip the Hybrid Multiplexer (HMXR) circuit packs and their associated DS3 facility's in the service slots of a DACS II Hybrid DS3 (HDS3) Unit.

The protection MXR or HMXR circuit pack is not grown because no specific DS3 facility is associated with it. The protection MXR or HMXR is provisioned when DS3 or HDS3 unit is grown.

Up to six MXRs or HMXRs and their DS3 facilities can be grown with one command.

There will be one output message (either completion or denial) for each MXR or HMXR that is grown.

### Explanation Of Parameters

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**MXR** - Multiplexer

**c** - MXR number within the unit (1 through 6)

**d** - MXR number within the unit (1 through 6)

Variable d is used to specify a range of MXRs

**a** - MXR number within the range of MXR c and MXR d

**TYPE** - Type

**mnxyz** - The DS3 format processed by the MXR:

**mn** - DS3 type

| mn | Explanation |
|----|-------------|
|----|-------------|

|           |                                                                                              |
|-----------|----------------------------------------------------------------------------------------------|
| <b>MX</b> | The original R4.0 DS3 facility type supported by the Multiplexer (MXR) circuit pack (KCR-1). |
|-----------|----------------------------------------------------------------------------------------------|

|           |                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------|
| <b>EX</b> | The enhanced R6.0 DS3 facility type supported by the Enhanced Multiplexer (EMXR) circuit pack (KCR-5). |
|-----------|--------------------------------------------------------------------------------------------------------|

|           |                                                                                           |
|-----------|-------------------------------------------------------------------------------------------|
| <b>HX</b> | The hybrid facility type supported by the Hybrid Multiplexer (HMXR) circuit pack (KCR-8). |
|-----------|-------------------------------------------------------------------------------------------|

If the unit is a regular DS3U of unit type DT100, then the Default is the MX type for backward compatibility.

If the unit is a Hybrid DS3U of unit type HT100, then the default is HX.

The optional settings available for each MXR are:

**BERM** - Bit error rate calculation method

**s** - The requested BER calculation method

*s* *BER calculation method*

B Bipolar violations (BPV - default)

P DS3 Parity Errors

C Both Bipolar violations (BPV) and DS3 Parity Errors, support by HMXR only

**BERT** - Bit error rate threshold for declaring High BER condition

**t** - Requested BER threshold

*t* *BER threshold*

3 Corresponds to threshold of  $10^{-3}$  (default)

6 Corresponds to threshold of  $10^{-6}$

**LBO** - Line buildout

**b** - LBO specification

*b* *Explanation*

ON Line build out is turned on

OFF Line build out is turned off (default)

LBO is required as shown in the following table.

734A Cabling to DSX-3 KS-19224,L2 Cabling to DSX-3 LBO

|               |              |    |
|---------------|--------------|----|
| 0 to 225 feet | 0 to 75 feet | ON |
|---------------|--------------|----|

|                 |                |     |
|-----------------|----------------|-----|
| 225 to 450 feet | 75 to 150 feet | OFF |
|-----------------|----------------|-----|

**Note:** LBO <b> may be used to change the LBO setting of an in-service, traffic- carrying Multiplexer-Multiplexer Interface Unit (MMFG).

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

**11** UC is out of service

**12** UC is in service but failed

## **GRTH,UNIT,TYPE,CONN**

### **PROVISION A UNIT**

#### **Explanation Of Command**

This command requests the provisioning of a DACS II unit.

For a NonCEF frame this will result in the provisioning of all cross-connect and time slot interchange circuit packs. For a CEF frame this will result in the provisioning of the expanded time slot interchanger. When this request has completed, all circuit packs required by the subject unit to cross-connect to other equipped units have been provisioned.

The unit type is optionally specified in the **TYPE** field.

The unit type can be a facility terminating unit, a DS3 terminating unit, a Hybrid DS3 terminating unit, or a digital signal processing unit.

If the unit is a digital signal processing unit, its associated digital signal processing interface is also provisioned. If the unit is a DS3 or a Hybrid DS3 facility terminating unit, both of its associated service and protection facility line interface packs, both sides of its formatter or hybrid formatter packs (side 0 and 1), and its protection multiplexer or hybrid multiplexer are also provisioned. Only facility line interface packs, Hybrid Formatter packs (HFMT), and Hybrid Multiplexer packs (HMXR) can be equipped in the Hybrid DS3 facility terminating unit. Therefore, FMT and MXR as shown in the command output messages should be interpreted as HFMT and HMXR when the Hybrid DS3 Unit type HT100 is provisioned.

**Note:** DMB, TSI, and FMT/HFMT circuit packs must be inserted into the inactive side of

DACS II. Inserting circuit packs into the active side may result in transmission "hits."

## Command

---

For DACS II Non-CEF frames:

[I.31211]

```
GRTH:FRM xy,SEQ ww:UNIT q[,TYPE utxyz]\

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**utxyz** - Unit type as submitted in the input message

**uexyz** - Type of unit already equipped as

*uexyz Explanation*

FT100 FT = Facility Terminating Unit

DP100 DP = Digital Signal Processing Unit

HT100 HT = Hybrid DS3 Facility Terminating Unit

The unit type is optionally specified in the TYPE utxyz field. The unit type can be an FTxyz (Facility Terminating Unit), , a HTxyz (Hybrid DS3 Terminating Unit) or a DPxyz (Digital Signal Processing Unit) type.

Currently, only FT100, HT100, and DP100 types are supported by DACS II.

The unit type entered must be consistent with the unit type entered for the configuration file.

If the unit is a DPxyz type, its associated DSPI (Digital Signal Processing Interface) is also provisioned.

If the unit is a DTxyz or HTxyz type, both of its associated Service and Protection Facility Line Interface (FLI) packs, both sides of its Formatter (FMT) or Hybrid Formatter (HFMT) packs (side 0 and 1), and its Protection Multiplexer(MXR) or Hybrid Multiplexer (HMXR) pack are also provisioned.

For both Non-CEF and CEF frames, if the unit type is not entered, the unit type will default to FT100.

For Non-CEF frames, the optional CONN field is used if only a partial complement of the unit's TSI circuit packs is to be provisioned. If this field is not used, all TSI circuit packs are provisioned and the unit has full connectivity with other provisioned units.

**CONN** - Connectivity

**a, b, c, d, e, f**

- Time slot interchange numbers

A partial complement of the unit's TSIs have been provisioned. (If this field is absent, all of the unit's TSIs were provisioned.)

**CCB** - Cross-connect buffer

**0q** - CCB number side 0

**1q** - CCB number side 1

0q and 1q identify the cross-connect buffer(s) provisioned. q is the unit number (see UNIT above).

**tt** - Total number of provisioned TSIs in frame (02 through 72)

**NEW** - New

**TSIS** - Time slot interchangers

**nn** - Number of TSIs provisioned by command (02 through 22)

- sft** - TSI equipped status
- s** - Service side number (0 or 1)
- f** - Equipped FROM unit number (1 through 6) if equipped  
- Not equipped
- t** - Equipped TO unit number (1 through 6) if equipped  
- Not equipped
- e** - Number of lines in message
- Equals either 4 or 5 depending on the type of the unit provisioned.
- ETSI** - Expanded time slot interchanger
- 0qq** - ETSI number side 0
- 1qq** - ETSI number side 1
- 0qq and 1qq identify the ETSI packs provisioned by this command.  
qq is the unit number (see UNIT above).
- Three dashes "---" are shown if an ETSI pack is not provisioned.
- kk** - Total number of provisioned ETSIs in frame (02 through 32)
- rr** - Unit number with the same definition as qq.
- MXR** - Multiplexer (MXR) or Hybrid Multiplexer (HMXR)
- P** - Protection multiplexer (MXR) or Hybrid Multiplexer (HMXR)  
(automatically provisioned MXR with DT100 or HMXR with HT100 units)
- EQD** - Equipped
- NSUP** - Not supported
- cc** - Hexadecimal condition code
- cc** *Explanation*
- 27** Illegal connectivity specified
- 28** Connectivity contains unequipped units
- 97** Entity can't be addressed in this configuration
- 99** Unit type (xyz) not supported
- CA** Connectivity can not be specified for CEF unit

## **IN,PROGRESS**

Not applicable.

## **INH SW,UNIT,MMFG, TOPRTN,TOSRVC**

### **INHIBIT SWITCH MMFG**

#### **Explanation Of Command**

This message requests the inhibition of automatic protection switching from multiplexer-multiple interface unit functional group (MMFG) c on a DS3 unit (DS3U) or a Hybrid DS3 unit (HDS3U) to MMFG P or the automatic switchback from MMFG P to service MMFG c (when MMFG c becomes in-service). Only automatic switches due to failure will be affected by this message.

If **TOPRTN** is specified and MMFG P is already protecting the MMFG c's facility, the command will be denied.

If **TOSRVC** is specified and MMFG c is not under protection, the command will be denied.

This inhibition will be removed if a switch occurs from the "selected" MMFG.

#### **Command**

[I.35311]

**INH SW:FRM xy,SEQ ww:UNIT [q]q,MMFG c[-d],{TOPRTN|TOSRVC}!**

**COMPL**

### **Denial Message**

---

[O.35311.01]

M hh:mm:ss xy,ww n[vv] INHSW UNIT [q]q MMFG a {TOPRTN|TOSRVC} \  
COND cc DNY

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**MMFG** - Multiplexer-multiplexer interface unit functional group

**c, d** - The number of the MMFG within the unit (1 - 6)

**TOPRTN** - To protection

**TOSRVC** - To service

When TOSRVC is specified, a range of MMFGs is not acceptable. In this case the command will be denied.

**a** - The number of the service MMFG within the range c and d

**cc** - Hexadecimal condition code

**cc** *Explanation*

**10** Unit is not equipped

**11** UC is out of service

**12** UC is in service but failed

**4E** The switch is already inhibited

## **INSTALL**

---

### **UTILITY FOR APPLICATION SOFTWARE RELEASE INSTALLATION, REMOVAL, AND UPGRADE**

#### **Explanation Of Command**

---

Software that runs on the Digital Signal Processing Platform (DSPP) circuit pack is called application software because it is treated by DACS II as a separate and distinct application that interacts with the DACS II generic software through an operating system like interface. Applications for the DSPP circuit pack are packaged and shipped as separately orderable software releases on PCMCIA cards. Documentation for an individual application is also separate from regular DACS II documentation and is shipped together with the PCMCIA card containing that application.

This command (**INSTALL**) performs installation services for application releases. These services consist of:

1. Listing application releases currently installed.
2. Installation of a new application release.
3. Upgrading an older release of an application with a newer release of that application.
4. Removal of an application release.

Usage of this command is limited to the Frame Administrator and users with Restricted Maintenance privileges. The following configuration must be present for a successful application installation, removal, or upgrade.

1. The Main Controller (MC) must be in Maintenance Condition (MCOND).
2. The SMEM slot of the MC must contain the following depending on the task:
  - For installing or upgrading an application the SMEM slot must have inserted into it a PCMCIA card purchased from Lucent Technologies that contains the application to be installed or upgraded.
  - For removing an application the SMEM slot should contain the normal DACS II card with the current executables and system database.

This command allows the listing of application version information, but DACS II must be in MCOND for this to work. Command I.51001 UTL::QRY, MEMSTAT should be used for listing application version information while DACS II is in-service.

The customer must perform the following steps to install an application:

1. The Main Controller must be placed in Maintenance Condition (MCOND).
2. The regular memory card in the SMEM slot must be removed logically and physically.
3. The memory card with the application must be inserted into slot SMEM and then must be restored.
4. The customer must invoke the INSTALL command as shown in the input command format section.
5. The INSTALL command appears as shown in Menu Display 1 below. The user is asked to respond with a number between "1" and "3" or with a "Q" to quit. A response of "1" initially generates a response as shown in Menu Display 1, which shows that in the PMEM slot there is a regular DACS II memory card. This card does not have an application program, thus no application line is shown. The memory card in the SMEM slot is identified as an application distribution card (called DSP DISTRIBUTION CARD), and it **does** have an application on it. Note that the type, the version, and the date stamp of when the application was built is given; this is the identity of the application.
6. The actual install happens when the user responds with a "2" to the INSTALL menu. This is shown in Menu Display 4.
7. Then the user can quit out of the install menu as shown in Menu Display 9. After quitting the install menu the user should remove the application card from the SMEM slot both logically and physically and then restore the regular DACS II memory card in the SMEM slot that had previously been removed.
8. Next the user must copy the executables from the regular PMEM card to the regular SMEM card by executing the command:

**UTL : : BMTR, FROM PMEM, TO SMEM, EXCT !**

This copying step is mandatory in order to ensure that the application does also reside on SMEM.

9. The user can now verify that the application resides on both memory cards by invoking the INSTALL menu one more time. A listing of the application will be like the one shown in Menu Display 2.
10. The user is now ready to put the Main Controller (MC) back into service.

Upgrading an application from one version to another is a very similar procedure as given above. The memory card carrying the new version of the application must be in the SMEM slot. Menu Display 3 shows what a listing of the applications looks like. Notice that the

regular DACS II card in PMEM has the application version that is to be replaced, while the application card in the SMEM slot has the application version that is to replace the current version. Menu Display 5 shows how the actual upgrade takes place if no NPCs are actually running the application. Menu Display 6 shows how the actual upgrade takes place if at least one NPC is running the application. The user gets a chance to reconsider the upgrade, which must be responded to with a "Y", before the actual upgrade takes place. Please note that as part of the upgrade the application is downloaded into the appropriate DSPP Circuit Pack(s) if they are in service and each affected DSPP Circuit Pack is then rebooted after the download is complete. This last step happens at the time the MC is placed back into service.

Menu Display 7 shows how to remove an application from the regular DACS II memory card. Again, the user is required to respond to "ARE YOU REALLY SURE" questions to ensure that no inadvertent mistakes are made. Menu Display 8 shows what happens when an attempt is being made to remove an application when at least one NPC is still running that application. The removal attempt is denied.

As previously stated, the execution of the **INSTALL** command generates a menu for the user. These menus are shown in nine displays next:

Menu Display 1:

Listing application releases (No application installed, but application card in SMEM slot):

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:1

DSP LOADS ON MEMORY CARDS:

```

NEW (SMEM): SDxxx g.ii.rr yy/mm/dd hh:mm:ss

x NPCs may be affected

Do you wish to continue overwrite of this file? [y/N]:Y

Installing DSP load file: x.xx/SDxload, bbbbbb bytes from SMEM to PMEM

Installation Complete, Number of files installed from SMEM to PMEM: 1.

Menu Display 7:

Removing an application release:

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:3

WARNING: This function will REMOVE a DSP PLATFORM load  
from the ISX flash card you specify.

Are you REALLY SURE you wish to proceed? [y/N]: Y

Enter Device [A=PMEM, B=SMEM]: A

----- REMOVE FILES: PMEM DEVICE -----

1. Remove SDxload ( bbbbbb bytes)
- Q. QUIT

Enter File number to remove, or "Q" to QUIT: 1

WARNING: This will remove SDxload on PMEM.

Are you REALLY sure? [y/N]: Y

File SDxload removed from PMEM.

Menu Display 8:

Attempting to remove an application release when NPCs are running that application:

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:3

WARNING: This function will REMOVE a DSP PLATFORM load  
from the ISX flash card you specify.

Are you REALLY SURE you wish to proceed? [y/N]: Y

Enter Device [A=PMEM, B=SMEM]: A

----- REMOVE FILES: PMEM DEVICE -----

1. Remove SDxload ( bbbbbbb bytes) 1 NPCs using load!
- Q. QUIT

Enter File number to remove, or "Q" to QUIT: 1

Can't remove file SDxload, there are 1 NPCs using this load

Menu Display 9:

Quitting the INSTALL menu:

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:Q

## **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

### **starting line**

- Beginning line number of a line range (1, 2, ..., n)

Starting line indicates the line number of the first line of a range of lines within a macro that are to be listed.

### **ending line**

- Ending line number of a line range (2, 3, ..., n+1)

Ending line indicates the line number of the last line of a range of lines within a macro that are to be deleted.

**END** - End

Line number of the line at the end of the macro.

**00001,**

**mmmmm,**

**nnnnn,**

**ppppp,**

**qqqqq,**

**zzzzz** - Component command line numbers (00001 through 99999)

**cc** - Hexadecimal condition code

**cc** *Explanation*

**6B** Invalid line number

**6E** No edit session active

## **LOGIN,USER,PASSWD**

### **LOG ON TO DACS II**

#### **Explanation Of Command**

**Note:** Before logging on to DACS II for the first time, it is suggested that the user thoroughly read the documentation for this message.

This command allows a user or frame administrator to identify himself/herself to DACS II by an identification code, the **user id**, on any link.

DACS II checks the user id and password against entries previously stored in the data base. If the user is not authorized, DACS II will deny the input command.

A user can log on to DACS II from more than one link.

*If on a Snider administrative link, the command must be entered as follows:*

**LOGIN:FRM xy,SEQ ww:USER <user id>!**

The DACS II system will respond with the following dialogue:

PASSWD: The user enters a password. Note that the password is not echoed by DACS II.

*If on an X.25 administrative link, the command must be entered as follows:*

**LOGIN:FRM xy,SEQ ww:USER <user id>,PASSWD <user password>!**

Output from this command is sent only to the link on which the command was input.

### **Command**

---

[I.39001]

**LOGIN:FRM xy,SEQ ww:USER <user id>[,PASSWD <user password>]!**

If the user is on a Snider protocol administrative link, the message is entered as follows:

[I.39001]

**LOGIN:FRM xy,SEQ ww:USER <user id>!**

Then DACS II will prompt the following:

**PASSWD: <user enters the user password>**

### **Completion Message**

---

[O.39001]

**M hh:mm:ss xy,ww n[vv] LOGIN USER <user id> COMPL**

#### **WARNING MESSAGE**

**THIS SYSTEM IS RESTRICTED TO [Lucent Technologies ]AUTHORIZED USERS FOR BUSINESS PURPOSES. UNAUTHORIZED ACCESS IS A VIOLATION OF THE LAW. THIS SERVICE MAY BE MONITORED FOR ADMINISTRATIVE AND SECURITY REASONS. BY PROCEEDING, YOU CONSENT TO THIS MONITORING.**

### **Denial Message**

---

[O.39001.01]

**M hh:mm:ss xy,ww n[vv] LOGIN USER <user id> COND cc DNY**

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**USER** - User

**user id**

- User identifier

The user login identification (two to eight alphabetic characters)

**PASSWD** - Password

**user password**

- User password (at least six alphanumeric characters)

**cc** - Hexadecimal condition code

**cc** *Explanation*

**D3** User does not exist

**D4** A user is already logged in on the link/vc

**D6** Incorrect or missing password

## **LOGOFF,USER,LINK,INCL**

### **LOG OFF USER OR LINK**

#### **Explanation Of Command**

This command requests DACS II to log off a user or a link. A user is specified by his or her **<user id>**; a link, by its physical link number. The virtual circuit number is optional. The INCL keyword is also optional. The virtual circuit number and INCL are mutually exclusive. The INCL keyword must be specified to log off all virtual circuits of an X.25 link (5 or 6).

The DACS II frame administrator can use the **<user id>** option from any link to log off any user on another link. If the user is logged in on more than one link and is not the frame administrator, DACS II will log the user off every link. An autonomous message will appear on the user's link if the frame administrator logs a user out.

Output from this command is sent only to the link on which the command was input.

#### **Command**

[I.39101]

**LOGOFF:FRM xy,SEQ ww:{USER <user id>|LINK j[mm][,INCL]}!**

#### **Completion Message**

[O.39101]

**M hh:mm:ss xy,ww n[vv] LOGOFF {USER <user id>|LINK j[mm][,INCL]} \**  
**COMPL**

### **Denial Message**

---

[O.39101.01]

**M** hh:mm:ss xy,ww n[vv] LOGOFF {USER <user id>|LINK j[mm][,INCL]} \\  
**COND** cc DNY

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**USER** - User

**user id**

- User identifier (two to eight alphabetic characters)

User login identification

**TERM** - Terminal (link)

**LINK** - Link

**j [mm]** - Administrative link number

**j** - Physical link number (1 through 6)

**mm** - Virtual circuit number (01 through 16)

The virtual circuit number must be entered when logging off a single virtual circuit of an X.25 link.

**INCL** - Inclusive

Include virtual circuits of links 5 and 6. The INCL keyword can only be entered with X.25 links 5 and 6, and no virtual circuit number is allowed when this keyword is used. That is, "mm" and "INCL" are mutually exclusive. In addition, the INCL keyword is also mutually exclusive with the "<user id>". When the INCL keyword is entered, it means that the logoff applies to all the virtual circuits of X.25 link (5 or 6).

**COND** - Condition

**cc** - Hexadecimal condition code

**cc** *Explanation*

- D3** User does not exist
- D5** No user is logged in on the link/vc
- D7** Cannot execute privileged command
- DA** User is not logged in
- E1** Virtual circuit is not specified for X.25 link
- E2** Invalid link number specified
- E3** Invalid keyword(s) combination specified

In general a feature package identification code is a combination of several individual feature package numbers. To determine the individual features that make up a feature package it is necessary to decode the feature package identification code. This code is an eight digit hexadecimal number. Each hexadecimal number represents a four-bit binary number. Within this binary number each feature is associated with one particular bit. Consequently to determine the feature list from a feature package identification code it is necessary to convert each hexadecimal digit to its binary equivalent and look up the features in the list above. For example the feature package identification code 0000000F can be converted to the following binary number working from left to right one hex digit at a time.

0000 0000 0000 0000 0000 0000 0000 1111

This number contains eight binary numbers each representing one of the hexadecimal numbers in the feature package identification code 0000000F. The rightmost number of the code contains four features since there are four bits set to one. This would be decoded as follows using the table of features above.

|       | binary | hex | Feature                      |
|-------|--------|-----|------------------------------|
|       | 0001   | 1   | DS1                          |
|       | 0010   | 2   | CEPT                         |
|       | 0100   | 4   | Subrate                      |
|       | 1000   | 8   | Direct SLC                   |
| Total | 1111   | F   | (DS1 + CEPT + Subrate + SLC) |

**COND** - Condition

**DACSII** - Digital access and crossconnect system II

**cc** - Hexadecimal condition code

**cc** *Explanation*

- 46** Failed to boot CONF file
- 47** Failed to boot DB
- 48** Failed to boot journal--recurrence indicates database corruption
- 49** Failed to boot unit
- 4A** SMEM error, boot from PMEM
- 4B** PMEM error, boot from SMEM
- 4C** Failed to boot CI
- 51** General boot failure (vanilla flavor)
- 18** DSPI not equipped, not in service, or failed
- 20** Software Identification Block is not readable
- 21** Software Identification Block failed comparison
- 22** Release number mismatch
- 23** Point number mismatch

**cc**    *Explanation*

- 24**    PDI Version number mismatch
- 4D**    MP database not consistent with Configuration file
- 52**    Database is empty
- 3F**    G4 to G4.1 retrofit failed
- 91**    Can't mount or unmount SMEM
- 92**    Can't mount or unmount PMEM

## **MOVE, FROM, END, TO**

### **MOVE MACRO LINES**

#### **Explanation Of Command**

This command is used to move one or more lines and place them after a specified line in the macro while in a macro session.

If only one line is specified, the **starting line** or **END**, then only that line is moved to **destination line**.

#### **Command**

[I.19091]

```
MOVE:FRM xy,SEQ ww:FROM {<starting line>|END}\
[-{<ending line>|END}],TO {<destination line>|END}!
```

#### **Completion Message**

[O.19091]

```
M hh:mm:ss xy,ww n[vv] MOVE FROM {<starting line>|END}\
[-{<ending line>|END}] TO {<destination line>|END} COMPL
```

#### **Denial Message**

[O.19091.01]

```
M hh:mm:ss xy,ww n[vv] MOVE FROM {<starting line>|END}\
[-{<ending line>|END}] TO {<destination line>|END} COND cc \
DNY
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**FROM** - From

#### **starting line**

- Beginning line number of a line number range (1, 2, ..., n)

Starting line indicates the first line of the group of lines to be moved.

#### **ending line**

- Ending line number of a line number range (2, 3, ..., n+1)

Ending line indicates the end line of the group of lines to be moved.

**END** - End

END is a special line number that marks the position of the last line in the macro. If END is specified in place of ending line then the lines from starting line through END will be moved to destination line.

If END is specified as destination line then the line range specified in the command will be moved, as a unit, to the line following END.

The line number associated with END will change to the new line number of the last line moved.

**TO** - To

#### **destination line**

- Destination line number for the move (0, 1, 2, ..., n)

The first line of the lines to be moved will be placed on the line following destination line.

**COND** - Condition

**cc** - Hexadecimal condition code

**cc**    *Explanation*

**6B**    Invalid line number

## **MP,STARTUP,STF,ATP**

### **STARTUP**

#### **Explanation Of Command**

This message indicates that The main processor has initialized itself, established local area network communications between itself and the communications interface or the enhanced communications interface and has performed self-diagnostics. The results of these diagnostics are reported as some tests failed or all tests passed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01221]

**MP STARTUP {STF|ATP}**

### **Explanation Of Parameters**

---

**MP** - Main processor

**STARTUP**

- Startup

Indicates initialization

**STF** - Some tests failed

**ATP** - All tests passed

## **MTC,STF,ATP**

### **MAINTENANCE**

#### **Explanation Of Command**

This message indicates that the maintenance controller has initialized itself and has performed self-diagnostics. The results of these diagnostics are reported as some tests failed or as all tests passed passed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01281]

**MTC {STF|ATP}**

**Explanation Of Parameters**

---

**MTC** - Maintenance circuit

**STF** - Some tests failed

**ATP** - All tests passed

---

## **OCNT — OVERLOAD**

---

### **OCNT — OVERLOAD**

This section documents the commands **OCNT** through **OVERLOAD**.

## **OCNT, FROM, TO, MPM, NAM, CUS, INCL, RDC**

### **ONE-WAY CROSS-CONNECT TERMINATED MULTIPOINT CIRCUIT**

#### **Explanation Of Command**

This message requests a leg to be one-way terminated and cross-connected to a multipoint circuit. The terminated cross-connection means that the circuit will be set up in the terminated state with the disconnect channel code inserted in both directions of transmission.

The backbone and broadcast terminations are on the virtual NPCs.

For both NSA and CAS primaries, the channel numbering range, ddd and eee, is 001 to 030 and jjj is from 001 to 999. Only TRSP channels are allowed for CAS primaries. For CAS primaries, the spare bits of the signaling channel (timeslot 16) are cross-connected by using the value of 031 for both directions.

#### **Command**

### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

**FROM** - From

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**TO** - To

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical FROM NPC number

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

|           |          |                                       |
|-----------|----------|---------------------------------------|
| Unit      | Module   | NPC                                   |
| <b>99</b> | <b>1</b> | <b>01-02 (DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06 (DACS II CEF frames)</b>     |

**ddd,**  
**jjj** - FROM channel numbers  
**eee,**  
**kkk** - TO channel numbers denoting end of range specification

Channel numbers

000-030 CEPT type NPCs grown as CAS  
000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

001-500 (Virtual NPC)

**MPM** - Multipoint mode

**fmd** - FROM mode

**tmd** - TO mode

Modes fmd and tmd set the modes of the FROM and TO ends of the circuit. There are three possible values of fmd and tmd:

**fmd**

**tmd** *Explanation*

|     |                                                                                         |
|-----|-----------------------------------------------------------------------------------------|
| LEG | Nonvirtual circuit end of the cross-connections. Must be an FTU, DS3U or HDS3U channel. |
| BRD | Nonbackbone leg of a virtual conference. Must be a virtual NPC channel.                 |
| BBL | Backbone leg of a virtual conference. Must be a virtual NPC channel.                    |

For OCNT multipoint circuits, there are two valid combinations for fmd and tmd:

**fmd, tmd**

(LEG,BBL) - for the backbone leg of a broadcast multipoint circuit  
(BRD,LEG) - for the broadcast legs of the multipoint circuit.

**Note:** Default values for noise guard (NG) and echo suppression (ES) are applied to symmetrical bridges (multipoint mode SYM) and polling circuits (multipoint mode BBL,BRD). These default values are:

|                     |             |             |
|---------------------|-------------|-------------|
| Symmetrical bridges | NG = -18 db | ES = -18 db |
| Polling circuits    | NG = 0 db   | ES = 0 db   |

**NOBBL** - No Backbone Leg

**F** - From

**T** - To

**tc** - Trunk conditioning

Represents the desired cross-connected signaling and insertion word applied when a failure occurs. The tc options allowed are as follows:

| <i>tc</i>    | <i>Explanation</i>                         |
|--------------|--------------------------------------------|
| TRSP,IW X'pq | no signaling, insertion word pattern of pq |
| TRSP         | no signaling                               |

All leg connections to multipoint circuits using a virtual NPC must use TRSP signaling (no signaling). The insertion word (IW) portion is user specified and may be varied from leg to leg.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

**E1 to E1** Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

**E1 to DS1 or DS1 to E1** Same explanation as E1 to E1.

**DS1 to DS1** Not applicable.

**CUS** - Customer

The optional CUS keyword indicates a Customer Controlled Circuit. All legs on a multipoint Customer-Controlled circuit must be designated as CUS.

A disconnected termination previously marked CUS remains as a Customer Controlled termination.

**INCL** - Inclusive

The INCL keyword must be used to reconnect this termination to other terminations. However, if they are reconnected without the CUS keyword, they lose their Customer Controlled status.

**RDC** - Red circuit

If the optional RDC field is present, the circuit will be flagged as a Red Circuit. All legs on a multipoint Red Circuit must be designated RDC.

**mmm** - FROM channel number involved in the denial (ddd through eee)

**nnn** - TO channel number involved in the denial (jjj through kkk)

**d** - Direction

|   |             |
|---|-------------|
| d | Explanation |
| F | FROM        |
| T | TO          |
| B | Both        |

**st** - Status

**cc** - Hexadecimal condition code

| cc | st      | Explanation                                                           |
|----|---------|-----------------------------------------------------------------------|
| 06 | INERR   | Invalid range for specified FROM NPC type                             |
| 07 | INERR   | Invalid range for specified TO NPC type                               |
| 08 | INERR   | Invalid FROM NPC type for AIS insertion                               |
| 09 | INERR   | Invalid TO NPC type for AIS insertion                                 |
| 12 | MCOND   | Active CCN side not IS or failed or pested or hardware OOS            |

## **OCNT, FROM, TO, NAM, RDC, CUS, INCL, PRIOUT**

### **ONE-WAY CROSS-CONNECTION TERMINATE**

#### **Explanation Of Command**

For a CAS primary, the channel numbering range, ddd, eee, jjj and kkk is 000 to 030 and for NSA primaries, the channel numbering range is 000 to 031. If the 000 (timeslot 0) value is used, it must be used in both the FROM and TO sides of the cross-connect and only the bits reserved for national and international use will be cross-connected. If 031 is used in the TO side of the CAS primary, the FROM side must also be a CAS primary and only the spare bits will be cross-connected. If 031 is used in the TO side of an NSA, then any value except 000 can be used in the FROM side and all bits will be cross-connected.

#### **Command**

##### **Nonhierarchical**

Not applicable.

## Explanation Of Parameters

**FROM** - From

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**TO** -To

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number

**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

ddd,  
jjj  
eee,  
kkk

- Channel numbers, denoting the beginning of a range  
- Channel numbers, denoting the end of a range

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Channel 000 is not allowed in a range of channels and CAS channel 031 (that is, TS16 of a CEPT type NPC) is also not allowed in a range of channel numbers.

**tc** - Trunk conditioning specification

This specifies the signaling and insertion word to be applied to the cross-connection when a failure occurs. In the input command the signaling and insertion word specifications are entered separately, with a comma as the delimiter. An example of tc is "TC(----,mnop),TRB". The following signaling options are allowed:

| signaling          | Explanation                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC(----,mnop)      | One-way, 4-state signaling in binary. For CEPT type framing format, software will expand 4-state to 16-state by duplicating the format on the remaining frames on a superframe.       |
| TC(-----,mnopqrst) | One-way, 16-state signaling in binary. Only valid for CEPT framing formats.                                                                                                           |
| TC(X'--,X'cd)      | One-way, 16-state signaling in hexadecimal                                                                                                                                            |
| TRSP               | Transparent, no signaling                                                                                                                                                             |
| Omitted            | Defaults to TC(X'--,X'FF) if both terminations are channel associated signaling (CAS) type. It will default to TRSP if one of the terminations is nonsignaling associated (NSA) type. |

The following insertion word options are allowed:

| <i>insertion word</i> | <i>Explanation</i>                                                                                                                      |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line |
| Omitted               | Will default to IW X'FF.                                                                                                                |

Additional rules apply for CEPT cross-connection. (See Tables A and B.)

#### **TC** - Trunk conditioning

When the DCC option is provided in GRTH::NPC, a 4-bit pattern is inserted into the associated portion of time slot 16 for CAS circuits when the circuit is disconnected.

#### **CAS** - Channel associated signaling in time slot 16

#### **TRSP** - No signaling sent out in the associated portion of time slot 16 for CAS primaries. TRSP is the only option for NSA primaries.

**Table 14-1. Allowable Signaling Type and Signaling Consequent Action**

| Primary Type in Cross-connect | Allowable <tc> Signaling Specification | Resulting Signaling Code<br><br>FROM, TO    | Resulting Signaling Consequent Action (Hardware)<br>FROM, TO | Resulting Signaling Consequent Action (Firmware)<br>FROM, TO | Resulting Disconnect (When DCC used in disconnect command) |
|-------------------------------|----------------------------------------|---------------------------------------------|--------------------------------------------------------------|--------------------------------------------------------------|------------------------------------------------------------|
| CAS ↔ CAS                     | <b>TRSP</b>                            | Fixed at <b>X'D</b>                         | Fixed at <b>X'D</b>                                          | Fixed at <b>X'D</b>                                          | <b>X'D</b>                                                 |

| Allowable <tc> Time slot X-connect keyword | Resulting Cross-Connected Time slot Consequent Action TO | Resulting Disconnect Code (when DCC used in disconnect command) |
|--------------------------------------------|----------------------------------------------------------|-----------------------------------------------------------------|
| Omitted                                    | X'FF                                                     | X'FF                                                            |
| IW X'pq*                                   | X'FF                                                     | X'pq                                                            |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result

of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

The variable **sc** represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC(----,efgh)**

efgh - To direction

Where **efgh** represents the four time slot 16 signaling bits to be controlled. All 4 bits can be controlled independently. Control is applied by replacing each character in the variable **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

|          |                        |
|----------|------------------------|
| <b>P</b> | Pass through unchanged |
| <b>V</b> | Pass through inverted  |
| <b>0</b> | Set output to 0        |
| <b>1</b> | Set output to 1        |

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To directions. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Two-Point:*

E1 to DS1 Gateway cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law conversion set as a default. The **NAM** keyword is used to disable the conversions.

E1 to E1 Default, the **NAM** keyword may be used but there is no need to specify **NAM** explicitly since A-law to  $\mu$ -law and  $\mu$ -law to A-law conversion is not needed, and therefore not performed, for a pure E1 cross-connect.

DS1 to DS1 Not applicable.

**CUS** - Customer

The circuit will be flagged as a customer controlled circuit.

**RDC** - Red circuit

**INCL** - Inclusive

A termination designated as CUS or RDC cannot be disconnected or modified without using the INCL keyword in the message. Also, an NPC which supports these circuits cannot be manually removed unless the INCL keyword is given in the remove message.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**mmm** - FROM channel number involved in the denial (ddd through eee)

**nnn** - TO channel number involved in the denial (jjj through kkk)

**d** - Direction

d Explanation

F From

T To

B Both

**st** - Status

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |

## **OCNT, FROM, TO, RDC, CUS, INCL, PRIOUT**

### **TERMINATED ONE-WAY CROSS CONNECT**

#### **Explanation Of Command**

This message terminates one-way cross-connections of non-channelized network processing circuits (NPCs). The alarm-indication signal (AIS) is the idle code and does not need to be entered. Trunk condition options for 64 kbit/s cross-connections are not allowed for non-channelized connections. When a failure occurs or during an alarm state, the AIS is transmitted toward the TO NPC.

## **OCON, FROM, TO, MPM, CUS, INCL, RDC, NAM**

### **ONE WAY CROSS-CONNECTIONS**

#### **Explanation Of Command**

This command requests a one-way cross-connection from the specified FROM termination(s) and to the TO termination. It is used to construct a one-way multipoint circuit. The backbone and broadcast terminations are on the virtual NPCs.

If the user wants to cross-connect Nx64 kbits/s circuits, then the range feature of this command should be used.

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC                                   |
|-----------|----------|---------------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02 (DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06 (DACS II CEF frames)</b>     |

**ddd,**  
**jjj** - Channel numbers  
**eee,**  
**kkk** - Channel numbers denoting the end of a range specification

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

001-500      (Virtual NPC)

**Note:** Range values -eee, -kkk apply only to the FTU/DS3U/HDS3U end of an FTU/DS3U/HDS3U Virtual NPC circuit, that is, they cannot apply to the Virtual NPC end of the circuit.

**MPM**      - Multipoint mode

**fmd**      - FROM mode

**tmd**      - TO mode

Multipoint modes of the FROM and TO ends of the circuit

*fmd*

tmd      Explanation

LEG      Non-VI circuit end of the cross connections. Must be an FTU/DS3U/HDS3U channel.

BRD      Nonbackbone leg of a virtual conference. Must be a virtual NPC channel.

BBL      Backbone leg of a virtual conference. Must be a Virtual NPC channel.

For OCN multipoint circuits, there are two valid combinations for fmd and tmd:

|         |                                                        |
|---------|--------------------------------------------------------|
| fmd,tmd | Explanation                                            |
| LEG,BBL | For the backbone leg of a broadcast multipoint circuit |
| BRD,LEG | For the broadcast legs of the multipoint circuit.      |

**Note:** Default values for noise guard (NG) and echo suppression (ES) are applied to symmetrical bridges (multipoint mode SYM) and polling circuits (multipoint mode BBL,BRD). These default values are:

|                     |            |            |
|---------------------|------------|------------|
| Symmetrical bridges | NG = -18db | ES = -18db |
| Polling circuits    | NG = 0db   | ES = 0db   |

**tc** - Trunk conditioning, which has the input form

**TRSP, {IW X'pq|TRB|MUX}**

Represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. The TRSP (transparent) signaling specification is the only one allowed.

The following signaling option is allowed:

| <i>tc</i> | <i>Explanation</i>         |
|-----------|----------------------------|
| TRSP      | Transparent, no signaling. |

The following insertion word options are allowed:

| <i>IW</i> | <i>Explanation</i>                                                                                                                       |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq   | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| TRB       | Standard trouble code, equal to IW X'E4, not valid for CEPT.                                                                             |
| MUX       | MUX out of sync code, equal to IW X'1A, not valid for CEPT.                                                                              |
| Omitted   | Only valid for CEPT, will default to IW-X-FF.                                                                                            |

**NOBBL** - No backbone leg

**F** - From

**T** - To

In addition, for CEPT and gateway connections, the terms CAS, TRSP, and IW defined below are used in Tables A and B. Hex notation is shown for brevity, but binary is allowed.

**CAS** - Channel associated signaling

Indicates that channel associated signaling has been applied in time slot 16.

**TRSP** - Transparent

No signaling sent out in the associated portion of time slot 16 for CAS primaries.

**IW** - Insertion word

The insertion word is provided with the DCC option, an 8-bit pattern that is inserted in the specified time slot when the circuit is disconnected.

During the alarm state, AIS (all ones) is sent out in the specified time slot.

All leg connections to multipoint circuits using a Virtual NPC must use TRSP signaling (no signaling). The insertion word portion is user specified as noted above and may be varied from leg to leg.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

**E1 to E1** Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

**E1 to DS1 or DS1 to E1** Same explanation as E1 to E1.

**DS1 to DS1** Not applicable.

**CUS** - Customer

Customer-controlled circuit

The optional CUS field indicates a customer controlled circuit. All legs on a multipoint customer-controlled circuit must be designated CUS.

**INCL** - Inclusive

A disconnected termination previously marked CUS remains as a customer controlled termination. The INCL keyword must be used to reconnect this termination to other terminations. However, if they are reconnected without the CUS keyword, they lose their customer controlled status.

**RDC** - Red circuit

All legs on a multipoint red circuit must be designated RDC.

ddd,jjj -Channel numbers

mmm - FROM channel number involved in the denial ( $ddd \leq mmm \leq eee$ )

st - Status

d - Direction (F = From, T = To, B = Both)

cc - Hexadecimal condition code

| cc | st      | Explanation                                                           |
|----|---------|-----------------------------------------------------------------------|
| 06 | INERR   | Invalid range for specified FROM NPC type                             |

## **OCON, FROM, TO, NAM, RDC, CUS, INCL, PRIOUT**

### **ONE WAY CROSS-CONNECTIONS**

#### **Explanation Of Command**

This message requests the connection of a one-way cross-connect circuit or a range of one-way circuits.

If the user wants to cross-connect Nx64 kbits/s circuits, then the range feature of this command should be used.

#### **Command**

##### **Nonhierarchical**

[|.11101]

```
OCON:FRM xy,SEQ ww:FROM [s]abcddd[-eee],TO [t]ghijjj[-kkk]\

### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |

| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd,**

**jjj** - Channel numbers

**eee,**

**kkk** - Channel numbers denoting the end of a range

000-030 CEPT type NPCs grown as CAS

000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Channel 000 and CAS channel 31 (that is, TS16 of a CEPT-type NPC) are not allowed in a range of channel numbers.

**tc** - Trunk conditioning

tc represents the desired cross-connected signaling and insertion word applied when a failure occurs. The signaling and the insertion word specification are entered separately, with a comma as the delimiter, which have the following form:

<tc\_sig>,<tc\_iw>

The following signaling options are allowed:

| <i>tc_sig</i>      | <i>Explanation</i>                                                                                                                                                                                                       |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC(----,mnop)      | 1-way, 4-state signaling in binary. For CEPT type framing format, software will expand 4-state to 16-state by duplicating the format on the remaining frames on a superframe.                                            |
| TC(-----,mnopqrst) | 1-way, 16-state in binary. Only valid for CEPT framing formats.                                                                                                                                                          |
| TC(X'--,X'cd)      | 1-way, 16-state in hexadecimal.                                                                                                                                                                                          |
| TRSP               | Transparent, no signaling.                                                                                                                                                                                               |
| Omitted            | Only valid for CEPT cross-connections, defaults to TC(X'--,X'FF) if both terminations are channel associated signaling type. It will default to TRSP if one of the terminations is a nonsignaling associated (NSA) type. |

The following insertion word options are allowed:

| <i>tc_iw</i> | <i>Explanation</i>                                                                                                                    |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------|
| IW X'pq      | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted to the downstream direction of a failure on the line. |
| Omitted      | Only valid for CEPT, will default to IW X'FF.                                                                                         |

Besides that, additional rules apply for CEPT cross-connections.

Allowable signaling types and signaling consequent actions are given in Table 1 and allowable cross-connected time slot consequent actions are given in Table 2.

**TC** - Trunk conditioning

When the DCC option is provided in the disconnect command, a 4-bit pattern is inserted into the associated portion of time slot 16 for CAS circuits when the circuit is disconnected.

**CAS** - Channel associated signaling

Channel associated signaling in time slot 16

**TRSP** - Transparent

No signaling sent out in the associated portion of time slot 16 for CAS primaries. TRSP is the only option for NSA primaries.

**Table 14-3. Allowable Signaling Type and Signaling Consequent Action**

| Primary Type<br>in<br>Cross-connect | Allowable<br><tc><br>Signaling<br>Specification | Resulting<br>Signaling<br>Code<br><br>FROM, TO    | Resulting<br>Signaling<br>Consequent<br>Action<br>(Hardware)<br>FROM, TO | Resulting<br>Signaling<br>Consequent<br>Action<br>(Firmware)<br>FROM, TO | Resulting<br>Disconnect<br>(When DCC used<br>in disconnect<br>command) |
|-------------------------------------|-------------------------------------------------|---------------------------------------------------|--------------------------------------------------------------------------|--------------------------------------------------------------------------|------------------------------------------------------------------------|

|                                     | <b>TC-X'uv,X'yz*</b>                            | CAS<br>(Passed Through)                           | <b>X'F</b>                                                               | <b>X'uv,X'yz</b>                                                         | <b>X'v,X'z</b>                                                         |
|                                     | Omitted                                         | CAS<br>(Passed Through)                           | <b>X'F</b>                                                               | <b>X'F</b>                                                               | <b>X'F</b>                                                             |
| NSA ↔ CAS                           | <b>TRSP/Omitted</b>                             | None (Fixed at<br><b>X'D</b> in CAS<br>direction) | Fixed at<br><b>X'D</b> in CAS<br>direction                               | Fixed at<br><b>X'D</b> in CAS<br>direction                               | <b>X'D</b> in CAS<br>direction                                         |
| NSA ↔ NSA                           | <b>TRSP/Omitted</b>                             | Not appl.                                         | Not appl.                                                                | Not appl.                                                                | Not appl.                                                              |

\* For TCON and TCNT TC is X'uv,X'yz.  
For OCON, OCNT and BCON TC is --,X'yz.

**Table 14-4. Allowable Cross-Connected Time slot Consequent Action**

| Allowable <tc><br>Time slot X-connect<br>keyword | Resulting Cross-Connected<br>Time slot Consequent Action<br>TO | Resulting Disconnect<br>Code (when DCC used<br>in disconnect command) |
|--------------------------------------------------|----------------------------------------------------------------|-----------------------------------------------------------------------|
| Omitted                                          | X'FF                                                           | X'FF                                                                  |
| IW X'pq*                                         | X'FF                                                           | X'pq                                                                  |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

The variable sc represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC(----,efgh)**

efgh - To direction

Where **efgh** represents the four time slot 16 signaling bits to be controlled. All 4 bits can be controlled independently. Control is applied by replacing each character in the variable **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

|          |                        |
|----------|------------------------|
| <b>P</b> | Pass through unchanged |
| <b>V</b> | Pass through inverted  |
| <b>0</b> | Set output to 0        |
| <b>1</b> | Set output to 1        |

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To directions. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Two-Point:*

|            |                                                                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E1 to DS1  | Gateway cross-connects have A-law to $\mu$ -law and $\mu$ -law to A-law conversion set as a default. The <b>NAM</b> keyword is used to disable the conversions.                                                                         |
| E1 to E1   | Default, the <b>NAM</b> keyword may be used but there is no need to specify <b>NAM</b> explicitly since A-law to $\mu$ -law and $\mu$ -law to A-law conversion is not needed, and therefore not performed, for a pure E1 cross-connect. |
| DS1 to DS1 | Not applicable.                                                                                                                                                                                                                         |

**CUS** - Customer

Used to indicate a customer-controlled circuit

**RDC** - Red circuit

**INCL** - Inclusive

A termination designated as customer controlled or a red circuit cannot be disconnected or modified without using the INCL keyword in the message. Also, an NPC which supports these circuits cannot be manually removed unless the inclusive keyword is given in the remove message.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**mmm** - FROM channel number involved in the denial (ddd through eee)

**nnn** - TO channel number involved in the denial (jjj through kkk)

**st** - Status of denial

**d** - Direction

*d Explanation*

F From

T To

B Both

**cc** - Hexadecimal condition code

*cc st Explanation*

**06 INERR** Invalid range for specified FROM NPC type

**07 INERR** Invalid range for specified TO NPC type

## **OCON, FROM, TO, RDC, CUS, INCL, PRIOUT**

### **ONE-WAY NON-CANNELIZED DIGITAL SIGNAL CROSS CONNECT**

#### **Explanation Of Command**

This message requests a one-way cross-connection between two non-channelized network processing circuits.

The idle code is the alarm-indication signal (AIS-all ones), and does not need to be specified. The disconnect code for 64 kbit/s disconnection cannot be used for non-channelized network processing circuits.

When a failure occurs or during an alarm state, the AIS is transmitted toward the TO network processing circuits.

### Explanation Of Parameters

**[s]abc** - The 3- or 4-digit non-hierarchical non-channelized FROM NPC

**[t]ghi** - The 3- or 4-digit non-hierarchical non-channelized TO NPC

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |
| <b>0081-0112</b> | <b>0241-0272</b> | <b>0401-0432</b> | <b>0561-0592</b> |
| <b>0121-0152</b> | <b>0281-0312</b> | <b>0441-0472</b> | <b>0601-0632</b> |
| Unit<br>5        | Unit<br>6        | Unit<br>7        | Unit<br>8        |
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0641-0672</b> | <b>0801-0832</b> | <b>0961-0992</b> | <b>1121-1152</b> |
| <b>0681-0712</b> | <b>0841-0872</b> | <b>1001-1032</b> | <b>1161-1192</b> |
| <b>0721-0752</b> | <b>0881-0912</b> | <b>1041-1072</b> | <b>1201-1232</b> |
| <b>0761-0792</b> | <b>0921-0952</b> | <b>1081-1112</b> | <b>1241-1272</b> |

| Unit<br>9        | Unit<br>10       | Unit<br>11       | Unit<br>12       |

| <b>1361-1392</b> | <b>1521-1552</b> | <b>1681-1712</b> | <b>1841-1872</b> |
| <b>1401-1432</b> | <b>1561-1592</b> | <b>1721-1752</b> | <b>1881-1912</b> |

| Unit<br>13       | Unit<br>14       | Unit<br>15       | Unit<br>16       |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uvmnp** - Hierarchical FROM NPC number

**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**RDC** - Red circuit

**CUS** - Customer-controller circuit

**INCL** - Inclusive option will remove CUS marking

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**st** - Status

**d** - Direction

**cc** - Hexadecimal condition code

| <b>cc</b> | <b>st</b>    | <i>Explanation</i>                                                    |

## **ODIS, FROM, TO, INCL, OOS, DCC**

### **ONE-WAY MULTIPOINT DISCONNECTIONS**

#### **Explanation Of Command**

This message requests a one-way disconnection from the specified FROM end termination(s) and to the TO end termination. It is used to disconnect a one-way multipoint circuit.

#### **Command**

##### **Nonhierarchical**

[I.15102]

ODIS:FRM xy,SEQ ww:FROM [s]abcddd[-eee],TO [t]ghijjj[-kkk]\

Not applicable.

## Explanation Of Parameters

**FROM** - From terminations  
**TO** - To terminations

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

**uvmnp** - Hierarchical FROM NPC number  
**wxkqr** - Hierarchical TO NPC number

**uv, wx** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC                                   |
|-----------|----------|---------------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02 (DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06 (DACS II CEF frames)</b>     |

**ddd, jjj**  
- Channel number  
**eee, kkk**  
- Channel number denoting the end of range.

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

The backbone termination is on the Virtual NPC (001 through 500).

**INCL** - Inclusive

To disconnect a channel or range of channels including one or more channels marked as a Red Circuit, use the INCL option.

The message will be denied if any circuits in the range are Red Circuits and the INCL option is not used.

**OOS** - Out of service

At least one end of the circuit must be out-of-service or the OOS disconnect will be denied.

**DCC** - Disconnect code

DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field of the TCON command that initially connected the channels.

If the DCC option is not used, the disconnect code specified in the grow NPC command will be used.

**NOBBL** - No backbone leg

The optional NOBBL will appear if the multipoint circuit FROM or TO was in the broadcast mode but has no backbone leg.

**MPDIS** - Multipoint disconnect

**F** - From

**T** - To

Full disconnection of the multipoint circuits is indicated by MPDIS for FROM or TO.

**CUS** - Customer  
Customer-control circuit

**RDC** - Red circuit  
Disconnection was performed on a red circuit.  
If the disconnection was given on more than one circuit, then at least one of them was a red circuit.

**mmm, nnn**  
- Channel number involved in denial.

**st** - Status of denial

**d** - Direction

|          |                    |
|----------|--------------------|
| <b>d</b> | <i>Explanation</i> |
| F        | From               |
| T        | To                 |
| B        | Both               |

**cc** - Hexadecimal condition code

|           |                |                                                                         |
|-----------|----------------|-------------------------------------------------------------------------|
