Notice

Every effort was made to ensure that the information in this document was complete and accurate at the time of printing. However, information is subject to change.

Security Statement

In rare instances, unauthorized individuals make connections to the telecommunications network through the use of remote access features. In such event, applicable tariffs require that the customer pay all network charges for traffic. Lucent Technologies cannot be responsible for such charges, and will not make any allowance or give any credit for charges that result from unauthorized access.

Documentation Ordering Information

The ordering number for this document is 365-353-192. To order this document, call the Lucent Technologies Customer Information Center in Indianapolis, Indiana, on 1-888-582-3688. For more ordering information, refer to "How to Order Documentation" in the section "About this Document."

Technical Support Telephone Number

The Lucent Technologies Regional Technical Assistance Center (RTAC) provides a technical assistance telephone number which is staffed 24 hours a day. For technical assistance, simply call 1-800-225-RTAC.

Documentation Support Telephone Number

Lucent Technologies provides a telephone number for you to report errors or to ask questions about the information in this document. The support telephone numbers are:

Outside North Carolina - 1-800-334-0404
Inside North Carolina - 1-919-727-6681.

Developed by The Lucent Technologies Customer Training & Information Products Organization

How Are We Doing?

Document Title: DACS II Release 8.2.3, MML 2.048-Mb/s Interface Command and Message Manual Volume I

Document No.: 365-353-252

Issue 1

Date: February 1999

Lucent Technologies welcomes your feedback on this document. Your comments can be of great value in helping us improve our documentation.

1. Please rate the effectiveness of this document in the following areas:

	Excellent	Good	Fair	Poor	Not Applicable
Ease of Use					////////////////////
Clarity					////////////////////
Completeness					////////////////////
Accuracy					////////////////////
Organization					////////////////////
Appearance					////////////////////
Examples					
Illustrations					
Overall Satisfaction					////////////////////

2. Please check the ways you feel we could improve this document:

☐ Improve the overview/introduction	☐ Make it more concise/brief
☐ Improve the table of contents	☐ Add more step-by-step procedures/tutorials
☐ Improve the organization	☐ Add more troubleshooting information
☐ Include more figures	☐ Make it less technical
☐ Add more examples	☐ Add more/better quick reference aids
☐ Add more detail	☐ Improve the index

Please provide details for the suggested improvement. _____

3. What did you like most about this document?

4. Feel free to write any comments below or on an attached sheet.

If we may contact you concerning your comments, please complete the following:

Name: _____ Telephone Number: _____

Company/Organization: _____ Date: _____

Address: _____

When you have completed this form, please fold, tape, and return to address on back or Fax to: 910-727-3043.

About This Document

Purpose

The *DACS II Release 8.2.3 Command and Message Manual* describes the input commands and output messages of Release 8.2.3 of the Digital Access and Cross-Connect System II (DACS II). In addition, it provides full support for previous product releases.

⇒ NOTE:

Those customers using this manual with Releases 3 through 7.0.3 software should be aware that all features of a particular message shown for Release 8.2.3 may or may not apply to previous releases.

This manual consists of three volumes as follows:

- **Volume I** - This volume contains general information about the document, a detailed introduction that defines DACS II messages, relates how to communicate with DACS II, introduces the administrative links, and discusses in detail NPC addressing, on-line help feature, system configuration and features a listing of related documentation. Message listings in this volume include alphabetical and numerical, summary list of input commands and a list of autonomous messages. A comprehensive presentation of input commands and output messages (ABT through DLT) concludes this volume.
- **Volume II and III** - These two volumes contain input commands and output messages in the following order:
 - **Volume II** - EBX through RMV
 - **Volume III** - RST through SW and the Glossary

Reason for Issue

The *DACS II Release 8.2.3 Command and Message Manual* has been issued to include updated and new commands applicable to Release 8.2.3.

Intended Audiences

This manual is a catalog of messages intended for reference by a technician or craftperson who needs additional details about a message. It provides the user with supplemental information for the Digital Access and Cross-Connect System II (DACS II) that is programmed in the HuMan-Machine Language (MML) language. An example of a user is someone performing a task from an operation and maintenance manual who needs the definition of a specific keyword to complete the task.

How to Order Documentation

To order additional copies of this document, send or call in an order as follows:

- To order by Mail:

Lucent Technologies
Customer Information Center
Attention: Order Entry Section
2855 N. Franklin Road
P. O. Box 19901
Indianapolis, IN 46219

-
- To order by Telephone (Monday through Friday);

Within the United States of America:

1-800-LUCENT8 (582-3688) (7:30 a.m. to 6:30 p.m. EST)

From Canada:

1-800-255-1242

Worldwide:

Toll: **1-317-352-8557**

FAX: **1-317-352-8484**

For RBOC/BOC customers, process orders through your Company Documentation Coordinator.

For commercial customers, a check, money order, purchase order number, or charge card number is required with all orders. Make checks payable to Lucent Technologies.

Lucent Technologies entities should use Form IND 1-80.80 FA, available through the Customer Information Center.

One-time orders include a binder (if applicable) and the document contents for the current issue in effect at the time of order. After placing a one-time order, you can request a standing order for any document revisions *of that software release*. Documents for new software releases do *not* go to standing-order customers. You will only get those documents if you order the new software release.

How to Comment on This Document

A feedback form is located at the beginning of this publication, immediately after the title page. Please fill out the feedback form and return it (postage free) to the address on the back.

If the feedback form is missing, send comment on this publication to:

Lucent Technologies
DACS II Documentation Coordinator
Attn: Tabatha Wright
101 Crawfords Corner Road
Room 1B-320
Holmdel, NJ 07733-3030 USA

Introduction

Introduction

Foreword

This manual contains the latest message information regarding the Digital Access and Cross-Connect System II (DACS II) Release 8.2.3 software.

This manual is a catalog of messages intended for a technician or craftsperson who needs additional details about a message. This manual provides the user with supplemental information for the Digital Access and Cross-Connect System II (DACS II) which is programmed in the HuMan-Machine Language (MML). An example of a user is someone performing a task from an operation and maintenance manual who needs the definition of a specific keyword to complete the task.

How To Use This Manual

The user refers to a particular message via the message number or the action verb with modifiers. The messages are arranged in alphabetical order by verb; for example; add, audits, broadcast, change, etc. A numerical list, an alphabetical list, and a summary of input commands provide cross referencing of messages and should help in locating a particular message.

A *message* is a communication between a user* and a DACS II. Input messages, or *commands*, are sent from a user to a DACS II. Output messages are originated by a DACS II and sent to the user.

* A *user* can be a person operating a DACS II or an Operations System (OS), such as TIRKS[†] system, SARTS, etc.

[†] TIRKS is a registered trademark of Bell Communications Research, Inc.

How the Manual Is Organized

This manual or document consists of three volumes of messages in alphabetical verb sequence. The volumes are organized as follows:

Volume I Contents

- Introduction
 - About This Manual
 - DACS II Messages
 - Communicating With DACS II
 - DACS II Administrative Links
 - NPC Addressing
 - On-Line Help Feature
 - System Configuration
 - Documentation Support
- Alphabetical List of Messages
- Numerical List of Messages
- Summary of Input Commands
- List of Autonomous Messages
- Messages (ABT through DLT)

Volume II Contents

- Messages (EBX through RMV).

Volume III Contents

- Messages (RST through SW)
- Glossary

DACS II Messages

How Messages In This Manual Are Formatted

Each message is presented in actual input message format with accompanying explanations of keywords and variables providing sufficient information to fully understand the activity. Additionally, all responses to the input message such as the completion, the

denial, and any autonomous messages generated from the input or activated by the machine are shown.

Understanding Message Numbering

Messages are grouped according to verb and keywords and are indexed by a *message number*.

IMPORTANT: Message numbers are used for organization and reference in this manual, and they appear in actual output messages.

Message numbers have the following format:

I . mmmmn	Input commands
O . mmmmn	Output messages reporting successful completion (COMPLD) of the input command
O . mmmmn . pp	Output message reporting a denial (DENY) of the input command.

Input commands are prefixed by an I; output messages are prefixed by an O. All messages related to each other have the same mmmm digits. An input command may have more than one completion output message. In this case, the last digit, n, indicates the particular completion message. DNY (command denial) messages are referenced by the additional digits pp.

For example, consider the diagnose unit digital signal processor interface group of messages (mmmm = 4134). Below is the input message followed by the possible output messages or groups of messages:

```

I . 41341      DGN-EQPT:[xy]:UNIT-q:[ww]:DSPI[:CFT-X-vwxy];

O . 41341      xy yy-mm-dd hh:mm:ss <link number>
M DGN EQPT::UNIT-q:[ww]:DSPI[:CFT-X-vwxy] COMPLD
/* [0.41341] */
"{ATP|CATP-cc|STF-ppqq,d5,d4,d3,d2,d1,d0}"
;

O . 41341.01   xy yy-mm-dd hh:mm:ss <link number>
M DGN EQPT::UNIT-q:[ww]:DSPI[:CFT-X-vwxy] DENY
mmmm
/* [0.41341.01] */
/* <explanation of error condition code> */
;
```

Usage of Uppercase and Lowercase Characters

In the message format of this manual, uppercase and lowercase letters distinguish between information that is constant (uppercase) and information that is variable (lowercase). Any

character written in uppercase appears on the output device exactly as it is written. A character represented by lowercase letters will be replaced on the output driver by the value listed on the manual page for that particular message under *Explanation of Parameters*.

Representation of Lines Longer Than the Page Width

Many message lines in this document exceed the width of the page on which they are printed. Consequently, a way to present the message on more than one line while maintaining an accurate representation of the message's parameter fields and the character spacing between them has been devised. The backslash character is used in both input and output message representations to mark the point in the message text where the line has been truncated and continued onto another line. This is consistent with the present use of the backslash character on input to enter a command whose length exceeds 80 characters. The user can easily construct the single-line representation because the backslash marks the extent of any blank characters in the message.

Rather than using the backslash convention discussed above, some utility (RTRV) output messages are printed in a smaller type font because of their volume.

Delimiters

Delimiters are used to enclose a field in a message.

- [] Brackets indicate an optional field, one which may or may not be used in the input command or appear on the output message.
- { } Braces indicate a field containing alternate choices. For input messages, the user must select one of the choices. In output messages, braces indicate that only one of the fields within the braces will appear.
- < > The less than and greater than symbols enclose an abbreviation representing information too lengthy to display in the manual. These delimiters are never used in actual DACS II input commands or output messages but are used only in describing the message format in this manual.
- () Parentheses **are** part of the message text and must be entered where shown.

Message Layout and Heading Definitions

The page format for a message in this manual may contain these major headings:

- INPUT COMMAND FORMAT
- EXPLANATION OF COMMAND
- EXPLANATION OF PARAMETERS

- COMPLETION MESSAGE
- DENIAL MESSAGE (Not applicable to every message)
- AUTONOMOUS MESSAGES (Not applicable to every message).

INPUT COMMAND FORMAT shows the message exactly as it appears when entered at the terminal. Some input commands are too long to display on a single line; therefore, these commands are presented on multiple lines. Both the nonhierarchical and hierarchical NPC numbering formats are shown.

EXPLANATION OF COMMAND explains the meaning of the message in general terms.

EXPLANATION OF PARAMETERS defines the keywords present in the command and provides specific information concerning conditions that apply to a particular feature set. Keywords are generally shown in uppercase format, while variables are generally shown in lowercase format. Variables consist of data that further defines or delineates keywords.

COMPLETION MESSAGE shows a complete version of the normal response to the input command.

DENIAL MESSAGE shows a complete version of the input command denial message. The message includes an error code and a reason for the denial.

AUTONOMOUS MESSAGES are messages that report a change in the DACS II system state. The header line of the autonomous response contains the information of source identifier (SID), date, and time. The primary line contains an alarm code (ALMCDE), an autonomous message tag (ATAG) and a verb with modifiers. The verb is always REPT, indicating a report.

Communicating With DACS II

Input Command Mode

The input command requests an action to be performed; this command contains necessary information for DACS II to accomplish the requested action. The user has two basic modes for inputting commands: the command mode and the menu/prompt mode.

Command Mode

The command mode is for the experienced user or machine-machine operation. A command must be selected along with variables and entered within a single line. The user types a single-line command with the only carriage return occurring at the end. "Single-line" refers to the input *command*, not to the display of the command. *A long single-line command may extend for several lines on a display terminal.*

DACS II accepts up to 120 characters of input per command. If an input command exceeds 80 characters (the standard width of most terminal screens), the input will continue on the next line of the display beginning with the 81st character. However, the command line can be broken at a convenient place by typing a backslash (\) followed by a carriage return. The display of the input command will continue on the next line, but the command will be interpreted as a single-line command. If 120 characters is not sufficient or if the user finds entering long commands error-prone, the single-line command can be broken up into several smaller commands.

Entering a carriage return without the backslash terminates the input and causes the line to be interrupted. An exclamation point (!) also terminates the input command (that is, DACS interprets the carriage return and ! as the end of the command). If the carriage return is used, ! is echoed back to the terminal.

Menu/Prompt Mode

This optional on-line help mode assists the user in completing the input command. The menu/prompt mode aids the user by providing a list of alternative parameters or keywords.

The user starts the menu/prompt mode by entering a question mark (?) in the command line at the point in question. In response, DACS II presents a list of possible keywords. This list is presented to the user in menu or prompt form. At this point, the user may continue or return to the command line. If the user continues, s/he should refer to the detailed examples (menu form and prompt form) in the "On-Line Help Feature" section.

Aborting an Input Command or Output Message

The ABT -CMD is entered to interrupt a system response or abort an input command. If ABT -CMD is entered at LINK-I, the output from this link will be interrupted just after ABT -CMD is entered or after one or two output lines. At other links, the output messages may or may not be interrupted. When the ABT -CMD option is used, the command generating the output has been completed unless the autonomous message, CMD ERR ABT, appears.

For a nonabortable message, the output message will not be affected.

If a nonabortable message is being output but DACS II is executing an abortable command, ABT -CMD will stop the execution of the abortable command and CMD ERR ABT (Message No. O.01121) will be output on all links.

Input Command Format

General

The general format of an input command is:

VERB[-MODIFIER][-MODIFIER]:[xy]:[zz]:[ww]:[d][,e]...[,z];

Brackets [] enclose modifiers, parameters, and optional information. Parameters give the specific information required by the command verb in order to execute that command. All parameters are positional within the command line.

: [xy]: [zz]: [ww]: [d][,e]...[,z]; represent the input parameters and are separated by colons, but if they are logically connected (also called group, block, field), they are separated by commas. The colon (:) is used as a parameter field delimiter. Note: When entering a command the trailing or last colon may be omitted.

Input messages are terminated with the semicolon (;) or a carriage return. If the carriage return is used, ; is echoed back to the terminal.

Input commands must be treated on a case-by-case basis. For example:

- If a parameter field has only a single value (letter or number), it is considered a keyword defined parameter field.
- A keyword defined parameter is not positioned inside the parameter field and the comma (,) is omitted. A double comma (,,) in any keyword defined parameter field will be rejected.
- A value (letter or number) defined parameter is positional inside a parameter block.

Keywords

Commands consist of *keywords* combined with equipment and circuit identification. A *keyword* is an alphanumeric string of characters representing:

- Verb (also called command or action verb)
- Parameter addressing conventions
- Address specification
- Result of a command.

Command verbs are keywords that tell the system to do something.

Entity identification is a keyword that identifies a specific system or circuit pack within the system. For example, the keyword NPC refers to a network processing circuit pack.

Address specification is a keyword that refers to a specific address. TP 03, for example, refers to a specific test port (Test Port 03).

The "Glossary" section contains a listing of all commonly used keywords and their definitions.

Verbs

The general format of an input command is shown below with the various command keywords described in some detail:

VERB[-MODIFIER][-MODIFIER]:[TID]:[EID]:[CTAG]:DATA PARAMETER BLOCKS;
VERB is the command verb specifying what action the system is to perform: connect, audit, diagnose, etc. A *command verb* (also called an action verb) is sometimes in mnemonic form.

A verb can be followed by no modifier, one -modifier, or two -modifiers (each preceded by a hyphen). These modifiers represent the equipment and circuit identification and identify the physical entity within the frame or the data base entity upon which action is taken. Table 1, after the "Output Message Format" section, lists verbs, keywords, and modifiers.

Parameter Addressing Rules

Two different levels of addressing occur in messages. The first level occurs within the target identification (TID), and the second level of addressing occurs within the entity

identification (EID).

Target Identification (TID). The TID uniquely identifies the target as DACS II. An 11-character CLLI* code is the recommended value for the TID. If the CLLI code for a DACS is not unique, the CLLI code can be augmented with additional characters (letters, digits, and hyphens) for a total of 20 characters. The TID is used only in applications of indirect routing. If direct routing exists between the user and the DACS II frame, the TID is not necessary. If a TID is incorrectly entered, whether it is required or not, the entire command will be denied.

Entity Identification (EID). The EID identifies the particular entity within the DACS II frame and is composed of an equipment part and a facility part.

- Equipment

The format of the equipment part consists of PHYSICAL-{UNIT number}-{NUMBER}. The PHYSICAL description is a DISK, TAPE, UNIT, MC, PWR, FTMI, etc., and, if necessary, a hierarchic logical address may be appended to it. Therefore, the equipment part may be a combination of the physical description and the logical address. UNIT number defines where the equipment (unit) exists. There can be up to six units in a 512 primary block circuit DACS II. NUMBER is the range or count of different entities that can exist in a unit. If the range is one for NUMBER, it will be "null" in the address.

- Facility

In this manual, the double and triple ampersand (&&,&&&) define a sequence of consecutive simple parameter arguments. It is possible to indicate the arguments by writing the lower and upper simple parameter arguments separated by && or &&&.

Input Command Control Characters

In addition to input commands, DACS II responds to the following input command control characters or symbols:

CONTROL-x or CTRL-x. *Abandon message.* Depressing the CONTROL and the X keys simultaneously causes DACS II to abandon the message being entered and return the system prompt.

* COMMON LANGUAGE is a registered trademark and CLEI, CLLI, CLCI and CLFI are trademarks of Bell Communications Research, Inc.

CONTROL-h or CTRL-h, UNDERLINE, BACKSPACE. *Erase last character.*

Depressing the CONTROL and H keys simultaneously or depressing the UNDERLINE key or the BACKSPACE key causes DACS II to ignore the last character of a message and echo an underline (_). Entering *n* number of erase character symbols causes DACS II to ignore the last *n* characters of a message.

BREAK. *Interrupt output message.* The BREAK key interrupts an output message. The message continues after an allotted amount of time has passed or after the operator has finished entering an input message.

Input Command Acknowledgements

After DACS II has received the execute character of the input command, an immediate reply will appear with one of the following acknowledgements:

PF (Printout Follows)

DACS II received the input command and processed it. An output message will soon be returned. The output message will report the results of the work initiated by the command. If the system cannot complete the command, the reason will be printed.

RL (Retry Later)

DACS II cannot execute the requested command now because it does not currently have system resources available.

- The system could be temporarily overloaded.
- The command queue could be excessively long.
- The requested program may be busy, etc.

Wait, and enter the command later.

NG (No Good)

The basic format of the command is correct, but the system is in trouble. An example is when the MP is in the MCOND state.

NA (No Acknowledgement)

The command has been accepted by the parser, but processing control has been lost, thus making correct acknowledgement impossible. An example is when the communication interface (CI) has detected a local area network (LAN) failure.

If either NA or RL is sent as an input acknowledgement, a normal or error output message may not be sent. Also, if the input command itself is in error, the input acknowledgement will indicate this fact and either the normal or error message will not be sent.

Acknowledgement	Meaning
?V<cr><lf>	Command code error
?D<cr><lf>	Parameter block error
?E<cr><lf>	Error in command, cannot be identified as either ?V or ?D
?P<cr><lf>	Parity error occurred in the input
?T<cr><lf>	The time between characters exceeded timeout threshold
?X<cr><lf>	Command aborted in response to a <cancel> or <break> from user.

Output Message Format

There are three types of DACS II output messages. The normal or **completion message** indicates that the input command from the user has been executed and completed. An error response or **denial message** means that the input command has been denied and gives the reason or condition code for the denial. An autonomous output message reports a change in the operational state of the DACS II.

General Format of Output Message

An output message consists of one or more segments. Each message segment is in the following format: a *header line* followed by a *primary line* which may be followed by one or more *secondary lines*.

Header Line. The header line contains the information of target identifier (TID), date, time, and link number. The target identifier is the code for a DACS II frame and consists of up to 20 ASCII characters in length. The date is the current date presented in the format of yy-mm-dd (i.e., year-month-day), where yy is the last two digits of the year, mm is the month, and dd is the day of the month. The time is the current time of day in the format of hh:mm:ss (i.e., hour:minute:second), where hh ranges from 00 to 23, and mm and ss range from 00 to 59. The link number is the administrative link/virtual circuit number in the format of LINK-I[mm] (i.e., LINK-<administrative link number>[<virtual circuit number>]), where I ranges from 1 to 6 and mm ranges from 01 to 16. An autonomous response does not contain the link number.

Primary Line. The primary line contains the information of priority of action (PA), command code, entity identifier (EID), correlation tag (CTAG), data parameters, and termination report. The priority of action indicates the type of output message which could be either a response to an input command or an autonomous message generated by DACS II. The priority of action takes one of the following values:

Value	Meaning
*C	Immediate action, critical alarm (autonomous response)
**	Immediate action, major alarm (autonomous response)
*^	Action, minor alarm (autonomous response)
M^	Result of manual action (response to an input command)
A^	Autonomously generated message, not an alarm

Each caret (^) represents a character space.

The command code consists of the action verb and one or more possible modifiers. In a normal or error response, the correlation tag is the same as that specified in the input command. The correlation tag in an autonomous response is generated by DACS II. The data parameters further specify the action performed on the entity. The termination report indicates whether the input command is successfully completed or denied, and it takes on one of the following values:

Value	Meaning
COMPLD	Input command completed successfully
DENY	Input command denied

Secondary Lines

The secondary lines contained in the output message are of two types: free-format and fixed-format. The free-format secondary lines provide information for the user to understand the data contained in the fixed-format lines. The free-format secondary lines are enclosed by "/"* and "*/." The fixed-format secondary lines contain data generated by DACS II and are arranged in a format so as to be parsed by a machine. The fixed-format secondary lines are enclosed by double quotes ("").

Output Message Segment

The header line is the same for each message segment except for the time and possibly the date. The primary line is exactly the same for all message segments.

A multisegmented output message uses the greater-than sign (>) and the semicolon (;) to terminate the message segments. The greater-than sign is the terminating character (the last printable character) for the first and all intermediate message segments. The semicolon terminates the final message segment. A message segment should be no larger than 4096 bytes.

Normal Response

A normal response reports a successfully completed input command. The general formats of this type of output message are shown below: Each caret (^) represents a character space. The brackets [] are not part of the actual output message, except for those surrounding the output message number.

Single-Segment Normal Response Without Secondary Lines

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[^MODIFIER][^MODIFIER]::[b]:[CTAG]:[d][,e]...[z]^COMPLD
;
```

Single-Segment Normal Response With Secondary Lines

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[^MODIFIER][^MODIFIER]::[b]:[CTAG]:[d][,e]...[z]^COMPLD
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
;
```

Multisegmented Normal Response

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[^MODIFIER][^MODIFIER]::[b]:[CTAG]:[d][,e]...[z]^COMPLD
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
^^^"fixed-format secondary line "
.....
.....
^^^"fixed-format secondary line"
>
.....
.....
>
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[^MODIFIER][^MODIFIER]::[b]:[CTAG]:[d][,e]...[z]\
COMPLD
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
^^^"fixed-format secondary line"
.....
.....
^^^"fixed-format secondary line"
;
```

The example below shows the normal response to a cross-connect command (Message No. I.11001) for cross-connecting channel 022 of the primary block circuit terminated on unit 01, module 1, NPC 01 with channel 015 of the primary block circuit terminated on unit 03, module 2, NPC 05. The output message (Message No. O.11001) does not contain secondary lines.

```
DACS2FRAME1 88-08-01 20:27:12 LINK-2
M CONN CRS T0::01-1-01-022,03-2-05-015:CMDSEQ1:CUS::\
NORM,NORM COMPLD
;
```

Error Response

An error response reports a denial to an input command. The general error response formats are similar to the normal response. The header line is exactly the same, and the primary line only differs in the termination report (DENY). The termination report DENY indicates that the input command was not executed. The first secondary line begins with a 4-character error code (mmmm). This error code describes the reason for the denial of the input command. A free-format secondary line can give more details about the error code. A list of error codes and their meanings are given in Table 2 at the end of this section. Two error response formats are shown below:

Error Response Without Free-Format Secondary Line

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[-MODIFIER][-MODIFIER]::[b]:[CTAG]:[d][,e]...[,z]^DENY
^^^mmmm
;
```

Error Response With Free-Format Secondary Line

```
^^^TID^yy-mm-dd^hh:mm:ss^LINK-l[mm]
M^^VERB[-MODIFIER][-MODIFIER]::[b]:[CTAG]:[d][,e]...[,z]^DENY
^^^mmmm
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
;
```

Autonomous Response

An autonomous response reports a change in the DACS II system state. The header line of the autonomous response contains the information of source identifier (SID), date, and time. The primary line contains an alarm code (ALMCDE), an autonomous message tag (ATAG), and a verb with modifiers. The verb is always REPT, indicating a report.

Single-Segment Autonomous Response

```
^^^SID^yy-mm-dd^hh:mm:ss
ALMCDE^ATAG^REPT[-MODIFIER][-MODIFIER]
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
;
```

Multisegmented Autonomous Response

```

^^^SID^yy-mm-dd^hh:mm:ss
ALMCDE^ATAG^REPT[-MODIFIER][-MODIFIER]
^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
^^^"fixed-format secondary line"
      .....
      .....
^^^"fixed-format secondary line"
>
      .....
      .....
>
^^^SID^yy-mm-dd^hh:mm:ss

^^^/*^[output message number]^*/
^^^/*^free-format secondary line^*/
^^^"fixed-format secondary line"
^^^"fixed-format secondary line"
      .....
      .....
^^^"fixed-format secondary line"
;

```

The alarm code indicates an alarm for a trouble condition or a nonalarm condition for a DACS II system state change which does not trigger any alarms; it identifies the severity reported by DACS II and is shown below:

Value	Meaning
*C	Critical alarm message
**	Major alarm message
*^	Minor alarm message
A^	Autonomous nonalarm message

The ATAG is used to check for a skipped output message and for correlation of previous autonomous messages. Some similarity exists with the correlation tag (CTAG) of an input message, but DACS II generates an autonomous message tag for all autonomous output messages. The form of this parameter is xxx[.yyy] where xxx is a 3-digit number and ranges from 050 to 099 ($050 \leq xxx \leq 099$). The yyy is optional; but if used, it may be used as a correlation tag with previous autonomous messages or for association with an action verb. For example, yyy can indicate the number of times that a particular REPT message has been issued ($001 \leq yyy \leq 999$). Value 000 is not used for xxx or yyy.

The free-format secondary line may assist the user in reading the data in the fixed-format secondary line. The message number above the line is used in referring to the manual for more detailed information.

The fixed-format secondary line contains actual message information. This information is described within the individual messages.

Table 1. Verb/Keyword and/or Modifier(s)

VERB/KEYWORD	MEANING
ABT - CMD	Abort or terminate a previous input command that has not completed its execution.
ABT - PROC	Abort or terminate a currently active process or macro.
ALW - LPBK	Allow loopback or inhibit automatic switch protection.
ALW - SW	Allow switching or automatic switch protection.
CHG - LGN	Change password and/or user identification code.
CHG - RPATH - T0	Change the return path for the digroups and ranges beginning with the initial channels given in the TOX argument list.
CHG - TACC - T0	Change the modes of a test session under a specified test port.
CHG - TL - T0	Change the modes of a terminate and leave state of a circuit(s).
CONN - BDCST - T0	Connect a broadcast cross-connection (from source NPC) to a multiple number of other terminations in one direction of transmission.
CONN - CRS1 - T0	Connect a one-way cross-connect circuit or a range of one-way circuits.
CONN - CRS - T0	Connect a two-way cross-connect circuit or a range of two-way circuits.
CONN - HUB - T0	Connect a hubbing mode test access via test port kk with trunk conditioning to the T0 termination.
CONN - TACC - T0	Connect a monitor connection between a digroup (designated T0) and a test port (designated TP).

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
CPY - MEM	Copy data from one memory to another, such as disk (PRI) to tape (SEC) or RAM (WKG).
CRTE - CNFGRN	Create connectivity in the system data base.
CRTE - CRS	Create cross-connections in the cross-connect network.
CRTE - EQPT	Create equipment entities in the system data base.
CRTE - LGN	Create or add a new user to the system.
DGN - EQPT	Diagnose equipment at the user's request and report details. Equipment such as cross-connect buffer (CCB), cross-connect network interface (CCNI), communications interface (CI), disk unit (DISK), link number (LINK), main controller (MC), main processor (MP), network processing circuit (NPC), secondary storage controller (SSC), synchronizer (SYNC), tape unit (TAPE), time slot interchange (TSI), and FTU, DSPC, or DS3 unit.
DISC - BDCST - T0	Disconnect a broadcast connection (from source NPC) to a multiple number of other terminations in one direction of transmission.
DISC - CRS - T0	Disconnect a two-way cross-connect circuit or a range of two-way circuits.
DISC - CRS1 - T0	Disconnect a one-way cross-connect circuit or a range of one-way circuits.
DISC - EQPT	Disconnect (degrowth) equipment, multiple interface units, and/or multiplexers.
DISC - TACC - T0	Disconnect a test access session under a specified test port and restore the original cross-connection.
DLT - CRS	Delete a cross-connection from the system data base.
DLT - FPKG	Delete a feature package from the system data base.
DLT - LGN	Delete a password and user identification code. Only the superuser can invoke this command.
DLT - MACRO, MAP	Delete a macro or map.
DLT - PRMTR	Delete a parameter from the system data base.
ED - CNFGRN - EQPT	Edit the current connectivity and entity state of a specified equipment unit.

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
ED-CONN	Edit a connection.
ED-CRTE	Edit a create activity.
ED-DATE	Edit the system date and time clock.
ED-ADD-MAP	Enter NPCs into the map.
ED-DLT-MAP	Delete NPCs from the map.
ED-OPT-T1	Edit the programmable thresholds for the facility performance parameters of an NPC.
ED-PRMTR-EQPT	Modify the provisioning information associated with equipment.
ED-PRMTR-LINK	Modify the provisioning information associated with user interface links.
ED-PRMTR-MAP, MACRO	Modify the existing map or macro with new information.
ED-PRMTR-NE	Modify the provisioning information associated with the DACS II network element.
ED-PRMTR-T0	Modify the provisioning information associated with digroup.
ED-STATE-EQPT	Edit the maintenance state of equipment in ways other than via a remove or restore function.
ENT-EQPT	Manually provision equipment entities (those that are not automatically provisioned).
ENT-MACRO, MAP	Manually create the open session of an alternate map or a macro.
EXC-MACRO, MAP	Execute the existing map or macro.
INH-LPBK	Inhibit an automatic loopback switch protection.
INH-SW	Inhibit an automatic switch protection.
INIT-LOG	Initialize the ERR log file.
INIT-REG	Initialize the DACS II registers.
INIT-SYS	Initialize the DACS II processor system.
LGN-USER	Allow the user to identify himself/herself to the system with his/her <id>.
LGT-USER	Allow the user to logoff from the system.

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
OPR-ACO-ALL	Cut off the office audible alarm indications without changing the local alarm indications. This function does not clear other alarm indicators and does not disable future alarms from sounding audibles (so a release ACO function is not needed).
OPR-LPBK-T0	Request a loopback on a specified equipment unit or facility in the system.
RLS-LPBK-T1	Release the 1.544 Mb/s loopback.
REPT-ALM-EQPT	Report alarms associated with equipment failures.
REPT-ALMDET-EQPT	Supplement the information about the trouble generated by the REPT-ALM.
REPT-ALM-T0	Report alarms associated with DS0 facility failures.
REPT-CMPR-MEM	Report frame audit memory comparison mismatches.
REPT-DGN-EQPT	Report the results of diagnostic routines that have been initiated autonomously by the system.
REPT-EVT-EQPT	Report events which do not require alarm notifications but indicate the maintenance condition of the system.
REPT-RMV-EQPT	Report the autonomous removal of equipment from service.
REPT-RST-EQPT	Report the autonomous restoral of equipment to service.
REPT-SW-EQPT	Report the autonomous switch of an entity to protection (auto-removal) or to working (auto-restoration).
RMV-CNFGRN	Remove connectivity equipment from service.
RMV-EQPT	Remove equipment from service.
RMV-LINK	Remove a user interface link from service.
RST-CNFGRN	Restore connectivity equipment to service.
RST-EQPT	Restore equipment to service.
RST-PASSWD	Restore or recover the frame administrator password.
RST-LINK	Restore a user interface link to service.

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
RTRV-ALM-EQPT	Retrieve the current status of all automatically-reported equipment indicators (alarm or status).
RTRV-ALM-NE	Retrieve the current alarm state of the DACS II network element.
RTRV-ALM-T0	Retrieve the current status of all automatically-reported digroup indicators (alarm or status).
RTRV-BDCST-T0	Retrieve the cross-connect map for a single NPC or a range of NPCs.
RTRV-BKUP-SCHED	Retrieve the scheduled autonomous backup from a primary memory to a local nonvolatile backup memory.
RTRV-COND-EQPT	Retrieve condition types associated with equipment indicators (alarm or status).
RTRV-COND-T0	Retrieve condition types associated with NPC indicators (alarm or status).
RTRV-CNFGRN-EQPT	Retrieve the current connectivity and entity state of a specified equipment unit.
RTRV-CRS-T1	Retrieve the cross-connect map information associated with NPCs.
RTRV-HDR	Retrieve the header information associated with the DACS II network element.
RTRV-LOC-EQPT	Retrieve a physical location of a plug-in entity.
RTRV-LOG	Request to dump the contents of the log file.
RTRV-MAP-COM, EQPT	Query the map.
RTRV-MACRO-COM	Query the macro.
RTRV-OPT-T1	Retrieve the option (threshold) value for parameter.
RTRV-PRMTR-EQPT	Retrieve the provisioning information and service data associated with equipment.
RTRV-PRMTR-LINK	Retrieve provisioning information and service data associated with user interface links.
RTRV-PRMTR-MACRO, MAP	Retrieve information of the components associated with the macro or map.

Table 1. Verb/Keyword and/or Modifier(s) (Contd)

VERB/KEYWORD	MEANING
RTRV-PRMTR-NE	Retrieve provisioning information and service data associated with the network element.
RTRV-PRMTR-T0	Retrieve the provisioning information and service data associated with NPC channels.
RTRV-PRVG-USER LINK	Retrieve privilege parameters associated with login users or link.
RTRV-RECOVY-EQPT	Retrieve information of the error source register (ESR) for a specific processor.
RTRV-REG-EQPT	Retrieve information of the error source register (ESR) for the main processor.
RTRV-STATE-COM	Retrieve the common information associated with equipment (such as TLIs and SYNCs).
RTRV-STATE-EQPT	Retrieve the state information associated with equipment.
RTRV-STATE-T0	Retrieve the state information associated with NPCs.
RTRV-TACC-T1	Retrieve information about all test access activity of the test port.
RTRV-TACC-T0	Retrieve information about all test access activity in the system.
SCHED-BKUP-MEM	Schedule an autonomous backup from a primary memory to a local nonvolatile memory.
SCHED-PMREPT-ALL	Schedule an autonomous midnight performance monitoring report.
SET-ATTR-EQPT	Set the attributes that are associated with a specified event.
SET-PRVG-USER TERM	Assign user or link privilege for input prioritization and output screening.
STA-LOCL-RST	Transfer the database from DISK to RAM or from TAPE to RAM.
SW-DX-EQPT	Request all digroup circuits to select data and clocks from cross-connect side A.

Table 2. Error Codes and Conditions

CODE	CONDITION
AETN	Not valid for access type
ENAC	Equipage, not equipped with alarm cutoff
ENDG	Equipage, not equipped with diagnostic capability
ENDS	Equipage, not equipped with duplex switching
ENEC	Equipage, not established channel
ENEQ	Equipage, not equipped
ENFE	Equipage, feature not provided
ENIE	Equipage, not identical entities
ENMB	Equipage, not a multipoint bridge
ENMD	Equipage, not equipped with memory device
ENRE	Equipage, not recognized
ERLC	Equipage, a red-lined circuit
IBEX	Input, extra block
IBNC	Input, block not consistent
ICNV	Input, command not valid
IDMS	Input, data missing
IDNV	Input, data not valid
IDRG	Input, data out of range
IAC	Input, invalid access identifier
IICM	Input, invalid command
IICT	Input, invalid correlation tag
IIDT	Input, invalid data parameter
IIFM	Input, invalid data format
IITA	Input, invalid TID (target identifier)
INAC	Input, access number not correct
IORD	Input, out of range of data
IPNV	Input, parameter not valid
ISCH	Input, syntax character error
ISPC	Input, syntax punctuation error
NCON	No condition
PICC	Privilege, illegal command code
PIOC	Privilege, illegal operations channel
PIPW	Privilege, illegal password/user id code
RABY	Resource, all test ports busy
RTBY	Resource, request test port busy
RTEN	Resource, request test port does not exist
SAAL	Status, already allowed

Table 2. Error Codes and Conditions (Contd)

CODE	CONDITION
SAAS	Status, already assigned
SABT	Status, aborted
SACC	Status, already cross-connected
SADC	Status, already disconnected
SAIN	Status, already inhibited
SAIS	Status, already in-service
SAMS	Status, already in maintenance state
SAOS	Status, already out-of-service
SARL	Status, already released
SAWS	Status, already in working state
SCAT	Status, circuit already connected to another test port
SCNA	Status, command not able to be aborted
SCNS	Status, circuit not in split condition
SCOS	Status, channel out of service
SDAS	Status, diagnostic already started
SDFA	Status, duplex unit failed
SDNA	Status, duplex unit not available
SDNS	Status, diagnostic not started yet
SNAS	Status, not in pending state
SNCC	Status, not cross-connected
SNIS	Status, not in-service
SNML	Status, no monitor line established
SNOS	Status, not out-of-service
SNST	Status, execution could not be started
SNVS	Status, not in valid state
SOSF	Status, out-of-service, failed
SOST	Status, out-of-service testing
SPFA	Status, protection unit failed
SRCN	Status, request condition already exists
SROF	Status, requested operation failed
SRTN	Status, unable to release test port
SSTP	Status, execution stopped before completion
STAB	Status, test aborted
STOS	Status, test port out of service
STTI	Status, test port idle
SWFA	Status, working unit failed

DACS II Administrative Links

The DACS II can be administered (managed, operated) from a local terminal or remotely from an OS connected via an administrative link. Six physical links can be connected to the DACS II frame. Links 1–4 are asynchronous and links 5 and 6 can be asynchronous or

synchronous depending on the communications interface. Sixteen virtual circuits may be established on a synchronous link.

Variables *n* and *vv* are used within the message formats to represent the physical and virtual link numbers, respectively.

A level of message screening can be assigned to each link. A user may choose to always receive responses to his/her commands, to receive selected messages, or to receive all messages from the other links. Autonomous messages may be blocked for a particular link to prevent other output messages from being interspersed among the user's messages. Some examples of uses of an administrative link are:

- Common equipment and feature equipment provisioning and maintenance
- Equipment and channel status information
- Facility provisioning and maintenance
- Facility performance readings.

An output message is sent from the DACS II over one or more administrative links in response to one of the following occurrences:

- An input command

The output message reports that the input command was either completed successfully or denied; additionally, it may contain information requested by the input command. A *normal response* is an output message reporting a successful completion; an *error response* is an output message reporting a denial.

- An autonomous change in DACS II operation state

The output message reports the information on DACS II system operation state changes which includes alarms and other trouble indications. This output message is referred to as an *autonomous response*.

NPC Addressing

Two addressing or numbering methods for network processing circuits are available: the **nonhierarchical or extended format** and the **hierarchical**. These numbering methods are used to provide a means of locating network processing circuits.

Hierarchical Numbering

The **hierarchical method** consists of three parts: the unit number (uv), the module or group number within the unit (m), and the NPC number within the module (np) for a total of five digits (uv-m-np) with dashes separating the parts.

Nonhierarchical Numbering

The nonhierarchical or extended method uses consecutive numbering to count through the units in the frame. Each unit has a fixed starting number (for example, [0]061 for unit 2; [0]321 for unit 3; [0]481 for unit 4). The starting number is the same for the FTU or the DSPU type units.

On-Line Help Feature

Description

The DACS II provides on-line assistance to the user when constructing commands at the terminal. This assistance is in the form of a menu-driven help routine. Different menus are displayed during the routine to provide the user with information on all the command fields. The menu items include:

- Verbs (Action or command)
- Applicable keywords for a command
- Possible choices or number range for a variable field
- Definitions of keywords.

An inappropriate selection will bring an error response.

The help routine can be used to the degree needed to complete the command: either through the entire command in every field or only for a particular part of the command. Using help to construct the entire command will probably not be applicable after some experience is gained at entering commands, since all the commands are documented and the direct entry of commands is so much faster.

There are two operators or keyboard controls used to invoke the different levels of the help routine. These operators are: **SHIFT** **?** and **RETURN**. The question mark is used to initiate the routine or to go into a deeper level (more explanation), and the **RETURN** is used to see the alternative choices at a given point. The dialogue can be terminated either by entering a CTRL-x or by completing the current command line when it is displayed.

Summary: The Help Feature

By entering **SHIFT** **?** , the user may ask DACS II for help at any time before or during the construction of an input command.

In the help mode, DACS II will offer the user menus for the selection of the message keywords and/or prompt for values of variable fields. Entering **SHIFT** **?** provides a greater detail of information on the keywords or variables.

When looking at a menu of choices for a command field, you can select an item and then either continue the process or return to the current position on the command line. To continue the process, use the question mark and the next menu will appear. To return to the command line, use the **RETURN** key. When looking at a prompt to enter a value, you can enter a value, look at the next choice, or request more information. To look at the next choice or to repeat the choices, use the **RETURN** key. To obtain more information in order to enter a value, use the question mark. You can continue this process using the question mark after each entry to complete and submit the command via the dialogue. Alternatively, you can use the **RETURN** key after an entry to obtain the current command line. Then, you can directly enter the remainder of the command line just as you would any DACS command.

Constructing an Entire Command Using Help

The following demonstrates how the menus in the help routine can be used for constructing a simple RTRV (retrieve) command. Only portions of the long menus are shown, but these examples serve to demonstrate how selections are made.

- (1) To invoke the help routine at the start level, enter **SHIFT** **?** . The DACS will respond with OK and the following menu:

Select from:

1. ABT
2. ALW
3. CHG
- .
- .
- .
25. SW

Selection?

- (2) To obtain more of an explanation, enter **SHIFT** **?**. The DACS will respond with OK and the following list:

Select from:

- 1. ABT (perform an abort)
- 2. ALW (perform an allow operation)
- 3. CHG (perform a change)
- 4. CONN (perform a cross-connection)
- .
- .
- .
- 21. RTRV (perform a retrieve information)

Selection?

- (3) You may enter either 21 or RTRV followed by **SHIFT** **?**. The DACS responds with this menu:

Select from:

- 1. ALM
- 2. BDCST
- .
- .
- .
- 21. STATE
- 22. TACC

Selection?

- (4) Again you select the desired verb modifier by entering either 21 or STATE.

- (5) The DACS responds with:

Select from:

- 1. COM
- 2. EQPT
- 3. T3
- 4. TS

- (6) Select 2 and enter **RETURN** to see the command line developed so far.

RTRV-STATE-EQPT

- (7) Enter **SHIFT** **?** to see the next part of the command which is:
1-20 character Target Id (optional).
Since the frame target ID is optional, it can be omitted which is confirmed by entering **RETURN** . This lists the alternative go to address block (YES/NO)?
- (8) Answer Y and notice the double colons that are added to the end of the command line to close the target ID field. After this, enter a ? to obtain the next selection.
units (YES/NO)?
specify ftu unit number (YES/NO)?
specify dspc unit number (YES/NO)?
specify ds3u unit number (YES/NO)?
timeslot interchange (YES/NO)?
- (9) Select 4, bringing the resultant command line. Entering a question mark brings the response
1-10 character Correlation Tag (optional)
Again this is optional, and entering a **RETURN** requests that you go on to the next field EQPD block (YES/NO)?, which is the alternative to entering the Correlation Tag.
- (10) Answer Y and after the current command line is displayed, enter **RETURN** . At this point, the DACS returns the command line as follows:
RTRV-STATE-EQPT::TSI::EQPD;
The command line is complete.
EXECUTE (YES/NO)?
- (11) Now simply answer Y followed by **RETURN** and the command will be executed.

Obtaining Help at a Particular Point on a Command Line

DACS II's on-line help not only can be used to construct a command from scratch, it can also be used to obtain information on particular fields of a command. If the command format is not known or if the keywords or variables are not clear, the help dialogue can be initiated at any point by entering **SHIFT** **?** .

- (1) Assume the following multipoint circuit CONN-CRS command was entered and denied because one of the NPCs named in the command must be an MB-type.

```
CONN-CRS-T0::01-1-01-01,01-1-02-03::TRSP::SYM,LEG::; ?D
xy 90-10-15 13:12:10 LINK-4
M CMD ::::INERR,BAD_SYNTAX STOPPED
/* [0.01131] */
/* CONN-CRS-T0::01-1-01-01,01-1-02-03::TRSP::=SYM,LEG::; */
;
```

- (2) The equal signs around the word SYM indicate a problem because it is a multipoint bridge circuit.
- (3) Start over using the help command to obtain information. For example, enter

CONN-CRS-T0:: and ?

The DACS responds with

ds3u unit number = OK

ftu unit number =

Since you are working with a DMB which is in a DSPU, if you enter only RETURN, the next option will be displayed, which turns out to be

dspu unit number =

- (4) To get more information at this point, enter SHIFT ?. The DACS responds with:

dspu unit number = OK

/* decimal integer:, range 1 - 6 */

- (5) This is where the trouble occurred; one of the NPCs in the range must be an MB-type.

- (6) Enter "05" after the equal sign. The DACS responds with:

CONN-CRS-T0::05

dspu module number = OK

/* decimal integer:, range 1 - 8 */

- (7) Enter "1" after the question mark. The DACS responds with:

CONN-CRS-T0::05-1

dspu npc number = OK

/* decimal integer:, range 1 - 2 */

- (8) Enter "1" after the question mark. The DACS responds with:
- ```
dspu npc number = 1 OK
CONN-CRS-T0:05-1-1
dmb conference number = OK
/* decimal integer:, range 1 - 85 */
```
- (9) In response to dmb conference number =, enter the **SHIFT** **?** to get more information. The DACS responds with:
- ```
/*decimal integer, range 1 - 85 */
dmb conference number =
```
- (10) Enter your conference number (2 for example), and **SHIFT** **?**.
- (11) In response to ftu npc number =, enter a question mark to get more information. The DACS responds with:
- ```
/* 3 digit decimal integer, range 01-10-1--04-4-32 */
ftu npc number =
```
- (12) Now that the difference between the NPC numbers for the DSPU and FTU sides of the circuit is clear, terminate the dialogue by entering the required ftu npc number followed by a **RETURN**. This will cause the command line developed through the dialogue to be displayed. Enter the remaining information from the original command to complete the command.

## **System Configuration**

---

### **Frame Configuration and Bay Growth**

---

This section discusses the frame configuration for a standard DACS II Capacity Expansion Frame (CEF) and for a retrofitted CEF. In addition, it details the bay growth schemes and requirements for the CEF. The same command is used to configure a non-CEF system, however, the responses will vary since a non-CEF system can have a maximum of two interface bays.

#### **Frame Configuration**

A DACS II CEF supports one switch bay and up to six interface bays. The switch bay, always bay 2, controls the overall DACS II system operations and provides the switch matrix, power, timing and alarm, and administrative links connections. The interface bay terminates digital facilities and/or provides the digital signal processing function. Interface bays 1, 3, 4, and 5 support three unit positions, while interface bays 6 and 7 support two units. Therefore, a CEF can be equipped with a total of 16 units. Two interface bay types

are supported:

- Original Interface Bay

The original interface bay supports two facility terminating units (FTUs) in its two upper unit positions and one digital signal processing unit (DSPU) or DS3 unit (DS3U) in its lower unit position. The original interface bay only appears in a retrofitted CEF. An interface bay used for a CEF can be an original interface bay only if the frame is a retrofit CEF. In such a case, the original interface bay can only be in bays 1 and 3. Bay 3 can be an original interface bay only if the CEF is retrofitted from a 3-bay frame. If bay 3 of a CEF is an original interface bay, bay 1 must also be an original interface bay.

- Flexible Interface Bay

The flexible interface bay allows fully flexible unit provisioning. Each of the unit positions can be independently equipped as an IFTU, DSPU, or DS3U. The flexible interface bay can occupy any interface bay location; that is, it can occupy bay 1, 3, 4, 5, 6, or 7. The flexible interface bay is the standard interface bay type for the CEF.

## Bay Growth

The minimum bay equipage for a CEF is two bays: Bay 1 (an interface bay) and bay 2 (the switch bay). DACS II allows additional peripheral units and/or bays to be added to an in-service CEF without causing a hit to the existing service.

The bay choices and growth are provisioned by entries to the configuration file using the configuration file command:

```
[I.35021]
```

```
INIT-SYS:[xy]:FRAME:[ww];
```

After all data is entered into the configuration file and it is accepted, DACS II outputs the following response:

```
[0.35021]
```

```
xy yy-mm-dd hh:mm:ss <link number>
```

```
M INIT SYS::FRAME:[ww] COMPLD
```

```
;
```

## **Procedure For Configuring the Frame**

---

When the configuration file command is entered, DACS II leads the user to complete the entry of the file by displaying the Main Menu below:

- 1: Initialize/Reset Configuration File
- 2: Add new bay(s) and unit(s)
- 3: Add unit(s) to existing bay(s)
- 4: Change unit(s) type
- 5: Remove unit(s) OR bay(s) and unit(s)
- 6: Recall configuration data
- 7: Exit

### **Option 1, Initialize/Reset Configuration File**

If Option 1 (initializing or resetting the configuration file) is selected, DACS II leads the user through the steps detailed below.

**Note:** A default option has been assigned to each step and each time a step is entered, DACS II presents its default option unless a user has previously selected an option. In such case, the user-selected option is displayed.

Step 1. Choose the Software Serial Number.

Default = 1234567890.

Step 2. Choose the height of the bay.

The options are:

- 1: 7'0''
- 2: 11'6''

Default = 7'0''.

Step 3. Choose the Cross-Connect Network designation.

Choose ECCN for a CEF  
Choose CCN1 for a non-CEF multibay frame  
Choose CCN2 for a single-bay frame (SBF)

Step 4. Choose the allowable nonhierarchical NPC addressing scheme.

The options are:

- 1: Both 3-digit and 4-digit are allowed
- 2: Only 3-digit is allowed
- 3: Only 4-digit is allowed

Default = Option 1 (both 3-digit and 4-digit).

Selection of option 1 or 3 will be denied if the frame is non-CEF. Selection of option 3 on a CEF will be denied if there is one or more administrative link or if the user has chosen the 3-digit scheme. Similarly, the selection of option 2 on a CEF will be denied if there is one or more administrative links or users using the 4-digit scheme. The denial causes an error message to be displayed; after that, DACS II returns to the Main Menu. In this case, all the choices entered in the previous steps are discarded. Once the Main Menu is shown, the user can either exit to change the provisioning of the link (or user) or select another option from the menu.

Note that for domestic DACS II frames, the 3-digit NPC addressing scheme is the default for DACS II administrative links/users. Also, since the hierarchical NPC addressing scheme does not restrict the frame configuration, there is no selection needed here.

Step 5. Choose total number of bays.

The options are:

- 1: 1 bay
- 2: 2 bays
- 3: 3 bays
- 4: 4 bays
- 5: 5 bays
- 6: 6 bays
- 7: 7 bays

Default = 2 bays (Option 2).

Option 1 above (1 bay) is not allowed for a CEF. Options 4 through 7 must not be selected for a non-CEF. Options 4 through 7 are allowed only if the 4-digit scheme (i.e., Option 3 of Step 4) is selected. Otherwise, an error message will be generated and Step 4 will be displayed again.

## Step 6. Choose bays.

Step 6.1 If the total number of bays selected is 2, choose bays 1 and 2.

Choose bay 1 type. In the figure below, the boxes shown represent the physical relationship between the switch bay (bay 2) and the bay selected; that is, the one surrounded by asterisks (\*).

```

*****_-----
* | |
* Bay 1 | ECCN |
* | |
*****_-----

```

SELECT BAY 1 TYPE

1: Flexible Interface Bay (Units 1, 2, 5)  
2: Original Interface Bay (Units 1, 2, 5)

Default = Option 1 (Flexible Interface Bay).

Step 6.2 If the total number of bays selected is 3, choose the third bay as below.

```

*****_-----*****
* | | | *
* Bay 4 | Bay 1 | ECCN | Bay 3 *
* | | | *
*****_-----*****

```

SELECT THE NEXT BAY POSITION

1: Bay 3, Flexible Interface Bay (Units 3, 4, 6)  
2: Bay 3, Original Interface Bay (Units 3, 4, 6)  
3: Bay 4 (Units 7, 8, 11)

Default = Option 1 Bay 3, Flexible Interface Bay

Step 6.3 If the total number of bays selected is 4, select the fourth bay.

Depending on which bay is selected as the third bay, the options chosen for the fourth bay will be one of the following:

Step 6.3.1 If bay 3 is the third bay configured, the fourth bay can only be one of the following:

```
*****_-----*****
* | | | | *
* Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 *
* | | | | *
*****_-----*****
```

SELECT THE NEXT BAY POSITION

- 1: Bay 4 (Units 7, 8, 11)
- 2: Bay 5 (Units 9, 10, 12)

Default = Option 1.

Step 6.3.2 If bay 4 is the third bay configured, the fourth bay can only be one of the followings:

```
*****_-----*****
* | | | | *
* Bay 6 | Bay 4 | Bay 1 | ECCN | Bay 3 *
* | | | | *
*****_-----*****
```

SELECT THE NEXT BAY POSITION

- 1: Bay 3, Flexible Interface Bay (Units 3, 4, 5)
- 2: Bay 3, Original Interface Bay (Units 3, 4, 5)
- 3: Bay 6 (Units 13, 14)

Default = Option 1.

Bay 1 must also be an original interface bay. If this rule is violated, the type for both bays (bays 1 and 3) must be reentered.

Step 6.4 If the total number of bays is 5, choose the fifth bay.

Depending on the third and fourth bays selected, the selection for the fifth bay will be one of the following:

Step 6.4.1 If bays 3 and 4 are the third and fourth bays (in any order), the options are:

```

***** _ _ _ _ _ *****
* | | | | | *
* Bay 6 | Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 *
* | | | | | *
***** _ _ _ _ _ *****

```

SELECT THE NEXT BAY POSITION

1: Bay 5 (Units 9, 10, 12)  
2: Bay 6 (Units 13, 14)

Default = Option 1.

Step 6.4.2 If bays 3 and 5 are the third and fourth bays (in any order), the options are:

```

***** _ _ _ _ _ *****
* | | | | | *
* Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 | Bay 7 *
* | | | | | *
***** _ _ _ _ _ *****

```

SELECT THE NEXT BAY POSITION

1: Bay 4 (Units 7, 8, 11)  
2: Bay 7 (Units 15, 16)

Default = Option 1.

Step 6.4.3 If bays 4 and 6 are the third and fourth bays, the options are:

```

-----*****
Bay 6	Bay 4	Bay 1	ECCN	Bay 3
-----	-----	-----	-----	-----	*****

```

SELECT THE NEXT BAY POSITION

- 1: Bay 3, Flexible Interface Bay (Units 3, 4, 6)
- 2: Bay 3, Original Interface Bay (Units 3, 4, 6)

Default = Option 1.

**Note:** Option 2 is allowed only if bay 1 is an original interface bay. If this rule is violated, the bay type for both bays (bays 1 and 3) must be reentered.

Step 6.5 If the total number of bays is 6, choose the sixth bay.

Depending on which bays are already configured, the option displayed will be one of the following:

Step 6.5.1 If bays 3, 4, and 5 were chosen, select the next bay.

```

*****-----*****
* | | | | | | |
* Bay 6 | Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 | Bay 7 *
* | | | | | | |
*****-----*****

```

SELECT THE NEXT BAY POSITION

- 1: Bay 6 (Units 13, 14)
- 2: Bay 7 (Units 15, 16)

Default = Option 1.

Step 6.5.2 If bay 4 has not been chosen, choose bay 4 as the sixth bay configured.

```

*****-----
* | | | | | |
* Bay 4 | Bay 1 | ECCN | Bay 3 | Bay 5 | Bay 7 |
* | | | | | |
*****-----

```

THE NEXT BAY IS BAY 4

Step 6.5.3 If bay 5 was not selected, choose bay 5 as the sixth bay configured.

```

-----*****
Bay 6	Bay 4	Bay 1	ECCN	Bay 3	Bay 5
-----*****

```

THE NEXT BAY IS BAY 5

Step 6.6 If the 7-bay option is selected, determine if the bay type for bays 1 and 3 has already been stored in the data base. If so, go to Step 7. Otherwise, choose these two bays.

Step 6.6.1 Choose the type for bay 1:

```

-----*****
Bay 6	Bay 4	Bay 1	ECCN	Bay 3	Bay 5	Bay 7
-----*****

```

SELECT BAY 1 TYPE

- 1: Flexible Interface Bay (Units 1, 2, 5)
- 2: Original Interface Bay (Units 1, 2, 5)

Default = Option 1.

Step 6.6.2 Choose the type for bay 3:

```

-----*****
Bay 6	Bay 4	Bay 1	ECCN	Bay 3	Bay 5	Bay 7
-----*****

```

SELECT BAY 3 TYPE

- 1: Flexible Interface Bay (Units 3, 4, 6)
- 2: Original Interface Bay (Units 3, 4, 6)

Default = Option 1.

Step 7. Choose unit types.

Step 7.1 For original interface bay 1, the unit types are:

Units 1, 2: FTU or NONE

Unit 5: DS3U, DSPU, or NONE

Default for units 1 and 2 = FTU.

Default for unit 5 = DSPU.

Step 7.2 For the flexible interface bay 1, unit types are:

Units 1, 2, 5: IFTU, DSPU, DS3U or NONE

Default = IFTU. Only one type of IFTU is available in Release 5.0. Thus, no version selection is necessary.

Step 7.3 For original interface bay 3, the unit types are:

Units 3, 4: FTU or NONE

Unit 6: DSPU, DS3U or NONE

Default for units 3 and 4 = FTU.

Default for unit 6 = DSPU.

Step 7.4 For flexible interface bay 3, the unit type can be:

Units 3, 4, 6: IFTU, DSPU, DS3U or NONE

Default = IFTU.

Step 7.5 Bay 4 is restricted to the flexible interface bay type, and the unit type can be:

Units 7, 8, 11: IFTU, DSPU, DS3U or NONE

Default = IFTU.

Step 7.6 Bay 5 is restricted to a flexible interface bay type, and the unit type can be:

Units 9, 10, 12: IFTU, DSPU, DS3U or NONE

Default = IFTU.

Step 7.7 Bay 6 is restricted to the flexible interface bay type, and the unit type can be:

Units 13, 14: IFTU, DSPU, DS3U or NONE

Default = IFTU.

Step 7.8 Bay 7 is restricted to a flexible interface bay type, and the unit type can be:

Units 15, 16: IFTU, DSPU, DS3U or NONE

Default = IFTU.

**Note:** It is acceptable for all units to be configured with the option NONE. Also, if the software used on the frame does not support the DS3 termination feature, the DS3U option will not be displayed.

Step 8. After all unit types are chosen and accepted by DACS II, the following will be displayed:

Are the Frame # and UID to be unprotected?

1: YES

2: NO

Default = unprotected.

When all required data for initializing/resetting the configuration file is entered, the user must press the carriage return to view the Main Menu. Recalling data, changing data or exiting must be implemented through the Main Menu. Note that DACS II does not back up the configuration data to DISK until the user exits.

To interrupt the data entry and exit, press the DELETE key followed by the RETURN key. Once this interrupt signal is received, DACS II denies the input command, and all newly entered data is discarded. In this case, the input message I.35021 must be reentered to

allow initialization or editing of the configuration file.

### **Option 2, Add New Bay(s) and Unit(s)**

To add new bay(s) and/or unit(s) from the Main Menu, DACS II first verifies that the action is allowed. The action of adding new bay(s) and/or unit(s) (option 2 from Main Menu) will be denied if any of the following conditions exist:

- a. The configuration file is not initialized.
- b. All bays are configured.
- c. DACS II is a single bay frame (SBF) or a 3-bay non-CEF.
- d. DACS II is a 3-bay CEF equipped with bays 1, 2 and 3, and at least one of its links/users is using the 3-digit scheme.

Once the selection is accepted, DACS II displays the allowable nonhierarchical NPC addressing scheme. If DACS II is currently a 2-bay frame, DACS II displays the same choices as displayed above, except that, instead of the default option, the currently recorded option is displayed.

If the frame is already equipped with three or more bays, DACS II displays the following:

THE NONHIERARCHICAL NPC ADDRESS SCHEME IS THE 4-DIGIT SCHEME

### **Option 3, Add Unit(s) to Existing Bay(s)**

To add unit(s) to an existing bay from the Main Menu, enter option 3. Units listed are those configured as type NONE. DACS II lists the units in ascending order, with the first unit listed being the default.

Once the unit is selected, DACS II displays the unit type as shown in Step 7 of Option 1. However, DACS II only shows up to three options (IFTU/FTU, DSPU, and DS3U) for each unit, depending on the feature package used. The NONE option will not be shown.

After the unit type is selected, if there are other units configured as NONE, DACS II asks the user if another unit is to be added. If the answer is yes, the unit list will be shown again and the same procedure must be repeated. Otherwise, DACS II will allow the user to return to the Main Menu.

The selection of option 3 from the Main Menu will be denied if either of the following two conditions exists:

- a. The configuration file is not initialized.
- b. No units are configured as NONE.

**Option 4, Change Unit(s) Type**

To change the unit(s) type, enter option 4 from the Main Menu. Units listed are types IFTU, DSPU and DS3U. Note that an FTU cannot be changed to another unit type and vice versa. DACS II lists the units in ascending order. The first unit listed is the default.

Once the unit is selected, DACS II shows the two allowable choices of the new unit type.

If the original unit type is IFTU, the choice is:

- 1: DSPU
- 2: DS3U

If the original unit type is DSPU, the choice is:

- 1: IFTU
- 2: DS3U

If the original unit type is DS3U, the choice is:

- 1: IFTU
- 2: DSPU

**Note:** The DS3U option will not be displayed if the DS3 termination feature is not supported by the frame.

After the new type unit is selected, DACS II asks the user if another unit is to be changed to a new type. If the answer is yes, the same procedure must be repeated.

The choice of option 4 from the Main Menu will be denied if one of the following conditions exists:

- a. The configuration File is not initialized.
- b. The selected unit is grown by the GRTH command.
- c. All units are configured with type NONE or FTU.

**Option 5, Delete Unit(s) or Bay(s) and Unit(s)**

To delete unit(s) or bay(s) and units(s) from the Main Menu choose the unit number. The units listed are those of a type other than NONE. DACS II lists the units in ascending order, and the first unit listed is the default.

Once the unit is selected, DACS II shows that the unit type is NONE and asks if another unit is to be deleted. If the answer is yes, the same procedure must be repeated. If the answer is no, DACS II then checks to verify if there is a bay with all units as type NONE. If such a bay exists and the bay is not bay 1, DACS II queries the user if the bay is to be deleted. If the response is yes, DACS II deletes the bay and its units from the configuration file. DACS II repeats the routine for each qualified bay. Note that although all three units of bay 1 can be designated as NONE, bay 1 cannot be deleted from the frame. After

verification is completed, DACS II continues completion of the configuration.

**Note:** If all units are configured as type NONE when the option is selected, DACS II immediately starts the bay deletion check.

The deletion of the unit is denied if either of the following conditions exists:

- a. The configuration file is not initialized.
- b. The selected unit is grown by the GRTH command.

### Option 6, Recall Configuration Data

If option 6 is entered from the Main Menu, DACS II presents the configuration file from the most recently completed session. If no session has previously been completed, the file stored before the current command is entered will be displayed.

A 7-bay configuration is shown below as an example:

|        |        |       |      |       |        |        |
|--------|--------|-------|------|-------|--------|--------|
| Bay6   | Bay4   | Bay1  | Bay2 | Bay3  | Bay5   | Bay7   |
| Unit14 | Unit8  | Unit2 |      | Unit4 | Unit10 | Unit16 |
| TYPE   | TYPE   | TYPE  |      | TYPE  | TYPE   | TYPE   |
| Unit13 | Unit7  | Unit1 | ECCN | Unit3 | Unit9  | Unit15 |
| TYPE   | TYPE   | TYPE  |      | TYPE  | TYPE   | TYPE   |
| -----  | Unit11 | Unit5 |      | Unit6 | Unit12 | -----  |
|        | TYPE   | TYPE  |      | TYPE  | TYPE   |        |

|                                     |                             |
|-------------------------------------|-----------------------------|
| Bay 1 Type:                         | Original Interface Bay      |
| Bay 3 Type:                         | Flexible Interface Bay      |
| Height of Bay:                      | 7'0''                       |
| Software Serial Number:             | 1234567890                  |
| Frame Number:                       | UNINITIALIZED (UNPROTECTED) |
| Unique Id:                          | UNINITIALIZED               |
| Nonhierarchical NPC Address Scheme: | 4 digits                    |

Note that the TYPE can be IFTU, DSPU, DS3U, or NONE, depending on the type provisioned. The bay type for bays 1 and 3 can be either the original interface bay or flexible interface bay. The word "UNINITIALIZED" is shown for the frame number and for the unique ID number if these numbers are not entered. Otherwise, the number and/or identification stored will be output instead of the word "UNINITIALIZED." DACS II shows whether or not the frame number is protected (in parentheses).

If a specific bay has not been selected, its space will be filled with blanks. An example of a 3-bay frame configuration follows:

|       |      |       |
|-------|------|-------|
| Bay1  | Bay2 | Bay3  |
| Unit2 |      | Unit4 |
| TYPE  |      | TYPE  |
| Unit1 | ECCN | Unit3 |
| TYPE  |      | TYPE  |
| Unit5 |      | Unit6 |
| TYPE  |      | TYPE  |

After the configuration file is recalled, DACS II instructs the user to return to the Main Menu.  
If the configuration file is not initialized, the recall option will be denied.

### Option 7, Exit

If option 7 is selected from the Main Menu, DACS II shows all data in the configuration file as if the "recall" option were chosen. In addition, DACS II displays the following:

```
Is the above data correct ? (if not, reenter the data)
 1: YES
 2: NO
IS DATA CORRECT ?
```

If the answer is yes, DACS II displays the following menu:

```
Preparing to write Configuration File to DISK
Please wait while writing to disk
Are you sure? (YES/NO)
```

If the answer is yes, DACS II begins writing the configuration file to DISK. When the configuration file backup is completed, output message O.35021 appears. DACS II backs up the configuration file to DISK before generating message O.35021.

**Note:** DACS II generates the completion message even if the content of the configuration file is unchanged.

### Configuration File Completion

This configuration file command can be executed only if the conditions listed are met:

1. The MC is in maintenance condition.
2. The command is entered from link 1.
3. The command is entered by the superuser.

The configuration file command allows the configuration information to be entered all at once or at the time that a new bay or unit is added to the frame. The entry of unit types into the unit positions in the configuration file does not equip these units; rather it limits unit equipage to be consistent with the configuration file and makes the equipment locate function available to assist the craft installation operations before the equipment has been placed in service.

## Documentation Support

The following sections provide descriptions of the following types of DACS II documents:

- Customer Reference Manual
- Operation and Maintenance Manual
- Command and Message Manual
- Quick Reference Guide
- Customer Information Releases

### Customer Reference Manual

This manual provides the overall description of the DACS II equipment and features including physical, functional, application, and capability considerations and administrative link connections.

The following table lists the Customer Reference Manual by select code, issue, and applicable software release.

| Document #    | Subject                           | Iss. | Release |   |   |   |   |   |
|---------------|-----------------------------------|------|---------|---|---|---|---|---|
|               |                                   |      | 1       | 2 | 3 | 4 | 5 | 6 |
| 365-301-002   | DACS II Customer Reference Manual | 1    | X       |   |   |   |   |   |

## **Operation and Maintenance Manuals**

---

The operation and maintenance manuals contain instructions on how to operate the DACS II and how to clear trouble messages. These manuals are intended to be the guide for daily use and for troubleshooting before requesting technical help. The operation and maintenance manuals for the basic core software and all features are available in both MML and PDS versions.

The following table lists the Operation and Maintenance Manual by select code, issue, and applicable software release.

| Operation and Maintenance Manual |                                                           |       |         |   |   |   |   |   |   |   |
|----------------------------------|-----------------------------------------------------------|-------|---------|---|---|---|---|---|---|---|
| Document #                       | Subject                                                   | Iss.  | Release |   |   |   |   |   |   |   |
|                                  |                                                           |       | 1       | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 365-301-601                      | DACS II Operation and Maintenance Manual                  | 1     | X       |   |   |   |   |   |   |   |

## Command and Message Manuals

The command and message manuals are the reference documents for all the input and output messages and explanations of all message fields. These manuals are available in both MML and PDS versions.

The following table lists the Command and Message Manuals by select code, title, issue, and applicable software release.

| Command and Message Manuals |                                                  |      |         |   |   |   |   |   |   |   |

## **Quick Reference Guides**

---

These guides contain frequently used commands organized into categories of functions, tables and illustrations of cross-connections, a summary of corrective action for frame audit messages, and for PDS, the meanings of the command denial condition codes. The guides are intended to support the experienced user and to serve as a handy reference for commands. Different guides cover two feature set: 2.048 Mb/s alone or subrate SLC<sup>®</sup> carrier, DS1, DS3, and clear-DS1. Both MML and PDS versions are available for each feature set.

The following table lists each Quick Reference Guide by select code, title, issue, and applicable software release.

## Customer Information Releases

Customer Information Releases (CIRs) are designed both to assist sales personnel and as a vehicle to get new feature information to customers.

The following table lists CIRs by number, issue and title.

| Customer Information Releases |      |                                                                                                |
|-------------------------------|------|------------------------------------------------------------------------------------------------|
| CIR No.                       | Iss. | Title                                                                                          |
| 365-099-031NP                 | 2    | Digital Access and Cross-Connect System II                                                     |

## **Glossary**

---

Note: Some keywords are used in a generic manner by DACS II. For example, CCN also represents ECCN. Some other keywords used in this manner are: MIU and EMIU, MXR and EMXR, and FTU and IFTU. The Glossary is located in Volume III.

---

### **Summary of Input Commands**

This section provides a summary of the DACS II/Rel 8.2.3 Release 8.2.3 input commands. The commands are presented in an alphabetical and numerical order.

## **Alphabetic Command Summary**

---

[l.55711]

**ABT-CMD;**

[l.39311]

**ABT-PROC:** [<xy>]:[ww]:[l[mm]];

[l.35301]

**ALW-SW-EQPT:** [<xy>]:UNIT-[q]q:[ww]:MMFG-c[&&-d]:{PROTN|WKG};

[l.19041]

**APPEND:** [<xy>]:{<line number>|END}: [ww]:;

[l.20101]

**CHG-ACCMD-T1:** [<xy>]:[s]abc[&[t]def]: [ww]:<tmode>:[AIS]:[INCL];

[l.20101]

**CHG-ACCMD-T1:** [<xy>]:uv-m-np[&wx-k-qr]: [ww]:<tmode>:[AIS]:[INCL];

[l.38301]

**CHG-LGN:** [<xy>]:[ww]:[<old password>:<new password>];

[l.38301]

**CHG-LGN:** [<xy>]:[ww];

**OLD PASSWD:** (user enters the old password)

**NEW PASSWD:** (user enters the new password)

**PASSWD:** (user re-enters the new password \  
for verification)

[l.18001]

**CHG-RPATH-T0:** [<xy>]:[s]abc-ddd[&[t]ghi-jjj[&[u]klm-nnn&...]: [ww]\  
:[INCL];

[l.18001]

**CHG-RPATH-T0:** [<xy>]:uv-m-np-ddd[&wx-k-qr-jjj&ed-h-fg-nnn&...]\  
:[ww]:[INCL];

[l.18011]

**CHG-RPATH-T1:** [<xy>]:[s]ghi[&[t]jkl][&[v]mno][...]: [ww]:[INCL];

[l.18011]

**CHG-RPATH-T1:** [<xy>]:uv-m-np[&wx-k-qr][&ed-h-fg][...]: [ww]\  
:[INCL];

[l.21011]

**CHG-TACC-T0:** [<xy>]:[ww]:kk::MON;

[I.23001]

**CHG-TACC-T0:** [<xy>]::[ww]:kk:SPLT;

[I.21031]

**CHG-TACC-T0:** [<xy>]::[ww]:TG-mmm:MON;

[I.23021]

**CHG-TACC-T0:** [xy]::[ww]:TG-mmm:SPLT;

[I.20111]

**CHG-TACC-T1:** [<xy>]:[s]abc[&[t]def]:[ww]:\  
{[<emode>][,<fmode>]}:[INCL];

## List of Autonomous Messages

---

### **Autonomous Messages**

This section provides a summary of the autonomous messages that can appear on the DAC II/Rel 8.2.3 Release 8.2.3 output printer. The following are the categories of autonomous messages:

- Alarms Messages
- Audits Messages
- Error Recovery Messages
- Event Reporting Messages
- Input Denial Messages
- Scheduled PM Reporting Messages
- Startup Messages

## Alarms Messages

---

[O.65011]

## **ABT — APPEND**

---

### **ABT — APPEND**

This section documents the commands **ABT** through **APPEND**.

## **ABT,CMD**

### **ABORT**

#### **Explanation Of Command**

The abort command enables a user to stop a currently executing abortable task previously initiated by the same user from continuing execution. This command is helpful to use when a task is producing large amounts of output that the user does not wish to view, or to stop a task that is operating over a range of entities.

If no users are logged in, a command entered on one link CANNOT be aborted from another link. If the same user is logged in on two different links, commands entered from one link CAN be aborted from another link. Only USER DAX can abort commands entered on any link issued by any user.

When an abortable task is operating over a range of entities, DACS II will complete the task on the current entity, and then stop the task for the remaining entities in the specified range. Since the abort command will also delete all messages queued for output for the link or virtual circuit on which the ABT command was entered, the user should use appropriate query commands to determine which entities in the range have been operated upon before the task was stopped.

In the case where a task has already executed, or no task is executing when the abort command is entered, the abort command will not take effect. Any remaining output will not be generated, and DACS II will not generate a completion message or an ABT completion message.

The following commands may be aborted:

**31341 GRTH::NPC**  
**31352 GRTH::NPC**  
**31362 GRTH::NPC**  
**31363 GRTH::NPC**

### Command

---

[I.55711]

ABT-CMD;

### **Completion Message**

---

[O.55711]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M CMD:::00:ABT COMPL
 /* [O.55711] */
 "<text of aborted command>"
;
```

### **Denial Message**

---

Not applicable.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**ABT** - Abort

**e** - Number of lines in the message

**command** - The text of the aborted command

The response to an abort command echoes the text of the aborted command. The text of the aborted command is always echoed exactly as it was received by the system. The echoed text is shown in the language of the link on which the command was received. If a system is operating with both PDS and MML languages simultaneously on different administrative links, this can result in a response that is mixed PDS and MML.

## **ABT,PROC**

### **STOP MACRO**

#### **Explanation Of Command**

This command is used to stop the execution of a macro.

A regular DACS II user can use the link number option to stop macro execution on the link he or she is currently using. A frame administrator may use this option to stop macro execution on any link.

If this command was entered by the frame administrator then output from this command will be sent only to the link on which the frame administrator entered the command.

#### **Command**

[I.39311]

**ABT-PROC:[<xy>]::[ww]:[l[mm]];**

#### **Completion Message**

[O.39311]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]]
M ABT PROC:::[ww]:[l[mm]] COMPLD
 /* [O.39311] */
 "<macro name>"
;
```

### Denial Message

---

[O.39311.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M ABT PROC:::[ww]:[l[mm]] DENY
 mmmm
 /* [0.39311.01] */
 /* <explanation of error condition code> */
;
```

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

**MACRO** - Macro

**l[mm]** - Administrative link number

**l** - Physical link number (1 through 6)  
**mm** - Virtual circuit number (01 through 16)

Variable m is the virtual circuit number in the administrative link.  
mm may only be specified when l is 5 or 6.

**COND** - Condition

**mmmm** - Error condition code

**mmmm**    *Explanation*

**SNVS**    No macro is currently executing  
**SNVS**    Command is Frame administrator (DAX) only.

## **ALW,SW,EQPT,UNIT,MMFG,PROTN,WKG**

### **ALLOW SWITCH OF MMFG**

#### **Explanation Of Command**

This command requests removal of the inhibition of automatic protection switching from a range of service multiplexer-multiple interface unit functional groups (MMFG) in a DS3 unit (DS3U) or a Hybrid DS3 unit (HDS3U) to the protection MMFG in that unit or the automatic switch back from the protection MMFG of a DS3U or a HDS3U to the service MMFG c[-d] of that unit. Only automatic protection switches due to failure will be affected by this message.

The command will always specify the number of the service MMFG involved, even in the case of the command to allow switch back from a protection MMFG.

When the **WKG** keyword is specified, a range of MMFGs is not acceptable and the command will be denied by the parser.

This command may cause an immediate protection switching/switch back if the original MMFG is out-of-service or is pested. In this case, an autonomous message that indicates the occurrence of the switch will be printed out.

#### **Command**

[I.35301]

**ALW-SW-EQPT : [<xy>] : UNIT - [q]q : [ww] : MMFG - c [&&-d] : {PROTN|WKG};**

### Completion Message

---

[O.35301]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M ALW SW EQPT::UNIT-[q]q:[ww]:MMFG-c[&&-d]:{PROTN|WKG} COMPLD
/* [O.35301] */
/* MMFG-number */
"a"
;
```

### Denial Message

---

[O.35301.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M ALW SW EQPT::UNIT-[q]q:[ww]:MMFG-c[&&-d]:{PROTN|WKG} DENY
mmmm
/* [O.35301.01] */
/* <explanation of error condition code> */
/* MMFG-number */
"a"
;
```

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**MMFG** - Multiplexer-multiple interface unit functional group

**c, d** - The number of the MMFG within the unit (1 through 6)

**PROTN** - The message requests permission of automatic protection switching to the protection MMFG

**WKG** - The message requests permission of automatic switching to the service MMFG. A Range of MMFG is not acceptable if the WKG is specified. The command will be denied by the parser.

**a** - The number of the service MMFG within the range c and d

**mmmm** - Error condition code

**mmmm** *Explanation*

**ENEQ** Unit is not equipped

**SAOS** UC is out of service

**SNVS** UC is in service but failed

**SAAL** The switch is allowed (not inhibited)

## **APPEND,END**

---

### **APPEND COMPONENT COMMAND**

#### **Explanation Of Command**

---

This message is used, during a macro session, to add one or more commands to an existing macro. Commands are added following the location specified by **line number** or **END**. If neither **line number** or **END** is specified then the command(s) being added will be added on the line following the current position of the line pointer. This position may be determined by use of the LINE command.

#### **Command**

---

[I.19041]

```
APPEND[:[<xy>]:{<line number>|END}:[ww]:];
```

#### **Completion Message**

---

[O.19041]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M APPEND::[{<line number>|END}]:[ww] COMPLD
/* [O.19041] */
;
```

#### **Denial Message**

---

[O.19041.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M APPEND::[{<line number>|END}]:[ww] DENY
mmmm
/* [O.19041.01] */
/* <explanation of error condition code> */
;
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

#### **line number**

- Line number at which to begin appending (0, 1, 2, 3, ...)

If a line number is specified, a command being added will be appended to this line. That is, the new command will be placed on the line following the line pointed to by the line number. The line pointer will then move down to point to the position of the new command. If more than one command has been entered the line pointer will move to the position of the last line entered.

#### **END** - End

End is a special line number that marks the position of the last line in the macro. If END is specified, the new command will be placed on the line following the line pointed to by END. The line pointer will then move down to point to the position of the new command. END will then be the line number of the new command. If more than one command has been entered, END will be the line number of the last line entered.

#### **mmmm** - Error condition code

**mmmm**    *Explanation*

**SNVS**    User macro/map space is full

**IDNV**    Invalid line number

**SNVS**    No edit session active

## **BADVERB — BX2**

---

### **BADVERB — BX2**

This section documents the commands **BADVERB** through **BX2**.

## **BADVERB,CMD,BAD,SYNTAX,STOPPED**

### **INPUT DENIAL**

#### **Explanation Of Command**

Processing of the input message is **STOPPED** because the action verb is unrecognized (**BADVERB**) or the frame or sequence number is incorrect (**FRMERR** or **SEQERR**).

Output from this command is sent only to the link on which the command was input.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01101]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M {BADVERB|FRMERR|SEQERR|CMD}:::[ww]:BAD-SYNTAX STOPPED
/* [0.01101] */
/* <first 70 characters of input message> */
/* <remaining text of input message> */
;
```

### **Explanation Of Parameters**

---

**BADVERB**

- Bad verb

The action verb was not recognized.

**FRMERR**

- Frame error

Incorrect frame number

**SEQERR**

- Sequence error

Incorrect sequence number

**CMD**

- Command

Other command error

**BAD**

- Bad

**STOPPED**

- Stopped

**SYNTAX**

- Syntax

**e**

- Number of lines in the message

## **BADVERB,CMD,INERR,STOPPED**

### **INPUT DENIAL**

#### **Explanation Of Command**

If the message reports STOPPED it means that the input command has been stopped or has been denied processing.

If the message reports DENY it means that an attempt has been made to execute an unlicensed or inactive command.

Note that the error field, action verb, and category are optional; a reason will always be given.

Attempts to address entities (units and NPCs) dependent upon nonconfigured units will result in the following message:

**BAD ARG CONFIG ERR.**

Output from this command is sent only to the link on which the command was input.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

### **Autonomous Message**

---

[O.01131.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M [<BADVERB|FRMERR|SEQERR|CMD>|<actverb>]::[ww]:\
[<INERR>,<reason> {STOPPED|DENY}
/* [0.01131] */
/* <First 70 characters of input message> */
[/* <Text continued from input message */]
/* <Remaining text of input message> */
;
```

### **Explanation Of Parameters**

---

#### **BADVERB**

- Bad verb

The action verb was not recognized

#### **FRMERR**

- Frame error

Incorrect frame number

#### **SEQERR**

- Sequence error

Incorrect sequence number

#### **actverb**

- Action verb

A valid action verb of the stopped or denied command

#### **CMD**

- Command

Other command error

**INERR** - Input error

#### **STOPPED**

- Stopped

**e** - Number of lines in the message

**reason**            - Reason for stop or denial

*reason*

*Explanation*

BAD ARG

Bad argument

BAD ARG CONFIG ERR

Bad argument and configuration  
error; attempted to address  
entities such as units and  
Network Processing Circuits  
(NPCs) dependent on  
non-configured units

BAD SYNTAX

Bad syntax

CMD NOT ALLOWED

Command is not allowed in a  
macro or alternative map

RESTRICTED

Command is restricted to frame  
administrator only

ERR CMD ABT

Command error and aborted

INACT

Command is for a feature package  
which currently is inactive

MC OOS,MCOND,INSERVICE

Main Controller is out-of-service,  
maintenance condition, or in-service

RANGE ERROR

Range error

## **BOOT, FROM, PMEM, FAILED, ATTEMPTING, TO**

### **STARTUP**

#### **Explanation Of Command**

If the Primary memory Card (PMEM) had a corrupted generic load or the generic is absent from the PMEM, the bootstrap loader will display this message.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

#### **Autonomous Message**

[O.01242]

**BOOT FROM PMEM FAILED  
ATTEMPTING TO BOOT FROM SMEM**

### **Explanation Of Parameters**

---

- BOOT** - Boot.
- PMEM** - Primary memory card.
- SMEM** - Secondary memory card.

## **BOOT, FROM, PMEM, SMEM**

### **STARTUP**

#### **Explanation Of Command**

The main processor has successfully loaded the boot program from either the Primary Memory (PMEM) or the Secondary Memory (SMEM).

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01241]

**BOOT FROM {PMEM|SMEM}**

### **Explanation Of Parameters**

---

|             |                     |
|-------------|---------------------|
| <b>BOOT</b> | - Boot              |
| <b>PMEM</b> | - Primary memory.   |
| <b>FROM</b> | - From              |
| <b>SMEM</b> | - Secondary memory. |

## **BX2,STF,ATP**

### **BUS EXTENDER STARTUP**

#### **Explanation Of Command**

This message indicates that the communications interface bus extender has initialized itself and has performed self-diagnostics. The results of these diagnostics are reported as some tests failed or all tests passed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01271]

**BX2 {STF|ATP}**

### **Explanation Of Parameters**

---

- BX2**        - Bus extender
- STF**        - Some tests failed
- ATP**        - All tests passed  
              For ATP no action is required.

---

## **CHG — CRTE**

---

### **CHG — CRTE**

This section documents the commands **CHG** through **CRTE**.

## **CHG,ACCMD,T1,AIS,INCL**

### **NON-CANNELIZED TEST, MONITOR,SPLIT,LOOP**

#### **Explanation Of Command**

For a one-way circuit under test, the test mode can only be MONE or SPLTA. The FROM and TO NPCs must be entered as the E- and F-end NPCs, respectively.

The AIS keyword is required for test modes SPLTE, SPLTF, SPLTEF, LOOPE and LOOPF, to indicate the idle signal for any idle output port that resulted from the interruption.

The INCL keyword is required if one or more of the NPC(s) under test is marked Red or Customer-controlled, except when changing to a monitor mode.

Once a test connection is set up, this command can be entered with either one or both FADs, in any order. The original order of FAD assignment will be used until test access is released.

The E- and F-end NPCs for non-channelized test access correspond to the FROM and TO NPCs of a cross-connection, respectively. The test session is the circuit connection under test.

During a test session, if a hard-reset or link failure occurs, the test session is released automatically. However, if the failure is such that it prevents release at the time of logoff or if the FAD fails, the test session is NOT automatically released and can be released by manual disconnection.

#### **Command**

#### **Nonhierarchical**

[I.20101]

## Explanation Of Parameters

---

**tmode** - Test mode

| <i>tmode</i> | <i>Explanation</i>                                                                                                        |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| MONE         | Monitor signal from equipment end (E-end) NPC to facility end (F-end) NPC of unmapped or one-/two-way mapped test session |
| MONF         | Monitor signal from F-end NPC to E-end NPC of a two-way mapped test session                                               |

|        |                                                                                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MONEF  | Monitor a two-way mapped connection in both directions; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs         |
| SPLTA  | Split the A signal from the equipment E-end NPC to the facility F-end NPC of one-/two-way mapped test session                                                                 |
| SPLTB  | Split the B signal from the F-end NPC to the E-end NPC of a mapped two-way test session                                                                                       |
| SPLTAB | Split both A and B signals of a two-way test session; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs           |
| SPLTE  | Split the input and output ports of E-end NPC of an unmapped or two-way mapped test session                                                                                   |
| SPLTF  | Split the input and output ports of F-end NPC of a two-way mapped test session                                                                                                |
| SPLTEF | Split a two-way mapped test session in both directions; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs         |
| LOOPE  | Loop the E-end input port to the output port, and connect the looped signal to the FAD; the test session may include an unmapped or two-way mapped connection                 |
| LOOPF  | Loop the F-end input port to the output port, and connect the looped signal to the FAD; only for a two-way mapped test session; not allowed for one-way broadcast tributaries |

**[s]abc** - The 3- or 4-digit nonhierarchical number of test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this is one of two test NPCs;  
the message is denied if this NPC is currently not a FAD

**[t]def** - Nonhierarchical number of second test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this number can be entered or  
omitted; either and/or both of [s]abc and [t]def can be entered,  
in any order, the original order of FAD assignment will be used;  
the message is denied if this NPC is currently not a FAD

**[u]ghi** - Nonhierarchical number of E-end NPC, this is the reference NPC for the test session; it is a mapped or unmapped NPC, or the backbone of a broadcast circuit, depending on the test session specified

**[v]jkl** - Nonhierarchical number of current F-end NPC of the test session. It is defined only if it is mapped to the E-end NPC; if it is omitted, the NPC mapped to the E-end NPC becomes the F-end NPC, or if the test session involves a broadcast circuit, the full tributary becomes the F-end NPC, if one does not exist, the parameter must be given to specify the tributary being tested; it must be omitted if the E-end NPC is unmapped.

**[t]klm** - Nonhierarchical number of problematic NPC.

The valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 |

**uv-m-np**

- Hierarchical NPC number for FAD

**wx-k-qr**

- Hierarchical NPC number of second FAD

**eg-h-ij**

- Hierarchical E-end NPC number of test session

**jk-l-mn**

- Hierarchical F-end NPC number of a mapped test session

**gh-k-lm**

- Hierarchical number of problematic NPC

**uv,wx,eg,jk,gh**

- Unit number

m,k,h,l - Module number

**np,qr,ij,mn,lm**

- NPC number

The valid values are listed below:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**AIS** - Alarm indication signal.

May be specified to be idle signal. Quasi-random signal source (QRSS) is the default idle signal. If QRSS is not provisioned or in service, AIS must be entered for all test modes resulting in idle output port(s): SPLTE, SPLTF, SPLTEF, LOOPE, and LOOPF. AIS input shall be denied for test access of an unmapped NPC, and all other test modes.

**INCL** - Inclusive

Required for test session with red or customer-controlled NPC(s), except for MONE, MONF and MONEF modes.

**RDLD** - Red lined circuit

Test session has red NPC(s)

**CUS** - Customer

Customer-controlled circuit  
Test session has Customer-controlled NPC(s)

**ONEWAY** - One way cross-connection

Test session has one-way cross-connection

**UMPD** - Unmapped

Test session has unmapped NPC

*emode*

*fmode* *Explanation*

**NORM** - The circuit under test is not terminated in this direction

**TERM** - The circuit under test terminated in this direction

The emode output is omitted for one-way circuits

Both emode and fmode are omitted for unmapped circuits

mmmm - Error condition code

| mmmm        | <i>Explanation</i>                                                    |
|-------------|-----------------------------------------------------------------------|
| <b>ENEQ</b> | Subject entity is not equipped                                        |
| <b>SAOS</b> | Subject entity is out of service                                      |
| <b>ERLC</b> | Customer control or red circuit exists                                |
| <b>SAOS</b> | NPC out of service or failed                                          |
| <b>SWFA</b> | Active CCN side not IS or failed or pested or hardware OOS            |
| <b>ENEQ</b> | UNIT not equipped, not in service, or failed                          |

| <b>IDNC</b> | The two FADS entered are not associated with one another.             |

## **CHG,LGN,PASSWD**

### **CHANGE USER PASSWORD**

#### **Explanation Of Command**

This message requests a change of a previously created password by any user of DACS II.

For an X.25 link, <old pswd>:<new pswd> option must be used. DACS II will not prompt the user for old and new password.

For a SCCSAI (Snider) link, <old pswd>:<new pswd> option cannot be used.

For a Snider link, DACS II will prompt the user for the old and new password. Neither new nor old password characters will be echoed by DACS II.

Output from this command is sent only to the link on which the command was input.

### **Command**

---

[I.38301]

**CHG-LGN:[<xy>]::[ww]:[<old password>:<new password>];**

If the user is on a Snider protocol administrative link, the message is entered as follows:

[I.38301]

**CHG-LGN:[<xy>]::[ww];**

Then DACS II will prompt the user for the old and new password:

**OLD PASSWD: (user enters the old password)**  
**NEW PASSWD: (user enters the new password)**  
**PASSWD: (user re-enters the new password \**  
**for verification)**

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**PASSWD** - Password

**OLD** - Old

**old password**

- Old password, where password is at least six alphanumeric characters.

**NEW** - New

**new password**

- New password where password is at least six alphanumeric characters.

**mmmm** - Error condition code

**mmmm** *Explanation*

**SNVS** Incorrect or missing password

**SNVS** User is not logged in

## **CHG,RPATH,T0,INCL**

### **CHANGE CIRCUIT PARAMETERS**

#### **Explanation Of Command**

This message switches return paths to the digroups and ranges beginning with the initial channels given in the TO end argument list.

This message requests a change in a broadcast multipoint circuit, switching the full tributary circuit leg (one that can both receive and transmit to the multipoint source) to another leg. Up to eight multipoint circuits can be changed with this command. Arguments [s]abc-ddd, [t]ghi-yyy, and [u]klm-nnn etc., represent TO terminations Arguments [s]abcddd, [t]ghijjj, and [u]klmnnn etc., represent TO terminations from different broadcast circuits (allowing multiple switches to be performed with a single message). That is, these arguments specify the new full tributaries in up to eight different broadcast circuits.

#### **Command**

##### **Nonhierarchical**

[I.18001]

**CHG-RPATH-T0:[<xy>]:[s]abc-ddd[&[t]ghi-yyy&[u]klm-nnn&...]:[ww]\

**wx-k-qr**  
- Hierarchical TO NPC number

**ed-h-fg**  
- Hierarchical TO NPC number

**uv,wx,ed**  
- Unit number

**m,k,h**  
- Module number

**np,qr,fg**  
- NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number

**jjj** - TO channel number

**nnn** - TO channel number

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**INCL** - Inclusive

To change a circuit or range of circuits including one or more circuits previously marked as a Red Circuit or under Customer Control, use the INCL (inclusive) option. If this option is not used, the message will be denied if any circuits in the range are red circuits or customer controlled.

**[t]wxy-zzz**

- Nonhierarchical number of circuit leg on which problem occurred.

**op-j-st-zzz**

- Hierarchical number of circuit leg on which problem occurred.

**BCAST** - Broadcast

Denial specific to a broadcast conference.

**CUS** - Customer

NPC is a customer-controlled circuit

**RDLD** - Red lined

NPC is a Red lined circuit

**mmmm** - Error condition code

**mmmm**      *Explanation*

|             |                                                            |
|-------------|------------------------------------------------------------|
| <b>IDRG</b> | Invalid range for specified NPC type                       |
| <b>IIDT</b> | No RDLD or CUS circuits and INCL keyword used              |
| <b>IIDT</b> | No NPC's out of service and OOS keyword used               |
| <b>SAOS</b> | NPC out of service or failed                               |

| <b>SWFA</b> | Active CCN side not IS or failed or pested or hardware OOS |
| <b>ENEQ</b> | UNIT not equipped, not in service, or failed               |

**mmmm**    *Explanation*

**ENEQ**    CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS  
**ENEQ**    FTMI not equipped, not in service, or failed  
**ENEQ**    FC not eqd, not IS, or failed or inactive side FC not eqd or not IS  
**ENEQ**    TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS  
**SNVS**    Termination is under test  
**SNVS**    Termination is a test port  
**SNVS**    Termination is under customer control (CUS)  
**SNVS**    Termination is protected (RDLD)  
**SNVS**    TO side of two-way to be converted is not an FTU NPC  
**SNVS**    TO is not a leg of this/any conference  
**SNVS**    TO is the backbone leg of a conference  
**SNVS**    Conference is NTR: has no switchable return leg  
**SNVS**    Conference is LPD: has no switchable return leg  
**SNVS**    TO is already the return leg  
**ENRE**    Corresponding NPC for FROM virtual channel is not provisioned  
**ENRE**    Corresponding NPC for TO virtual channel is not provisioned  
**IDNV**    Invalid FROM channel number  
**IDNV**    Invalid TO channel number  
**IDRG**    Invalid FROM channel number range  
**IDRG**    Invalid TO channel number range  
**IDNV**    Invalid channel 000 cross-connection specified  
**IDNV**    Invalid channel 031 cross-connection specified

## **CHG,RPATH,T1,INCL**

### **CHANGE SWITCH, TOX**

#### **Explanation Of Command**

This message changes a non-channelized digital signal broadcast circuit by switching a specified tributary network processing circuit (NPC) to be the full tributary NPC. Up to eight broadcast circuits can be changed by specifying the respective full tributary NPCs, all of which are non-channelized NPCs currently part of different broadcast circuits and may belong to different Units.

## **CHG,TACC,T0,MON**

### **TWO-WAY TEST ACCESS MONITOR TEST PORT**

#### **Explanation Of Command**

This command requests a change of a test port's mode from split to monitor.

**Note:** If the test port is already in the monitor mode, DACS II will deny the execution of the message.

**Autonomous Message**

---

Not applicable.

**Explanation Of Parameters**

---

**kk** - Test port number (01 through 96)

The test port is mapped to predesignated channels of a network processing circuit for test ports (NPCTP) during the provisioning of that test port. The NPC types that can be provisioned as NPCTP are all domestic non-SLC NPC types and all CEPT types that have been provisioned for channel associated signaling (CAS). For the mapping between the test ports and the channels of the test NPCs, see Message No. 31411.

**[t]ghi** - Non-hierarchical TO NPC number

**[s]abc** - NPC number that support the termination that is cross-connected to channel [t]ghi-jjj.

**[t]pqr** - Non-hierarchical TO NPC number

**[s]klm** - NPC number that support the termination that is cross-connected to channel [t]pqr-sss.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |

**uv-m-np**

- Hierarchical TO NPC number

**wx-k-qr**

- Hierarchical FROM NPC number that supports the termination that is cross-connected to channel uv-m-np-jjj.

**op-j-st**

- Hierarchical TO NPC number

**ed-h-fg**

- Hierarchical FROM NPC number that supports the termination that is cross-connected to channel op-j-st-jjj.

**uv,wx,op,ed**

- Unit number

**m,k,j,h**

- Module number

**np,qr,st,fg**

- NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**jjj, sss**

- TO direction channel number.

**ddd, nnn**

- FROM direction channel number of the termination

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**klm-nnn**

- Non-hierarchical format termination being tested as FROM on test port kk. If this field is all zeroes, test port kk is assigned to an unmapped termination.

**ed-h-fg-nnn**

- Hierarchical format termination being tested as FROM on test port kk. If this field is all zeroes, test port kk is assigned to an unmapped termination.

**pqr-sss**

- Non-hierarchical format termination being tested as TO on test port kk.

**op-j-st-sss**

- Hierarchical format termination being tested as TO on test port kk.

**T** - Transparent

**C** - Channel Associated

F FROM NPC is in CGA or PBA  
0 FROM NPC is not in CGA or PBA

T TO NPC is in CGA or PBA  
0 TO NPC is not in CGA or PBA

P Test port NPC is in CGA or PBA  
0 Test port NPC is not in CGA or PBA

**RDLD** - Red lined

The cross-connection tested is a red circuit.

**CUS** - Customer

Customer-controlled circuit

The cross-connection tested is a customer controlled circuit.

**ONEWAY** - One-way

The cross-connection tested is a one-way circuit.

**ASGN** - The test port is already assigned to another termination, denoted by klmnnn,pqrsss (or edhfgnnn,opjstsss)

mmmm - Error condition code

## **CHG,TACC,T0,SPLT**

### **TWO-WAY TEST ACCESS**

#### **Explanation Of Command**

This command splits a mapped circuit in the normal circuit state. Also, in the normal circuit state, it connects both directions of an unmapped termination to test port **kk** (01 through 48). If the test port is connected to an unmapped termination, this command will connect both directions of an unmapped termination to the test port.

This command does **not** split any connections inside a Digital Signal Processing Platform (DSPP) application, such as the DDS Subrate and MJU application, the X.50 International subrate application, or the DMB application. However, test ports may be established to any of the applications via application commands, and may then be used, again via application commands, to monitor or split circuits within the application. If a test port has been established to an application, then that test port will always appear as a split connection in an invocation of the RTVE-TACC-T1 command, regardless of whether that test port is in monitor, split, or release mode inside the application.

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

**TP** - Test port

**kk** - Test port number (01 through 96)

The test port is mapped to predesignated channels of a network processing circuit for test ports (NPCTP) during the provisioning of that test port. The NPC types that can be provisioned as NPCTP are all domestic non-SLC NPC types and all CEPT types that have been provisioned for channel associated signaling (CAS). For the mapping between the test ports and the channels of the test NPCs, see Message No. 31411.

The DACS II test ports are either static or dynamic, as defined in Message No. I.31411.

**SPLT** - Split

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |

**uv-m-np**

- Hierarchical TO NPC number

**wx-k-qr**

- Hierarchical FROM NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number

**jjj** - TO channel number

The valid values are:

Channel numbers

000-030 CEPT type NPCs grown as CAS

000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

001-085 (MB NPC)

**NOTE:** If the field [s]abcddd (or wxkqrddd in Hierarchical addressing) is all zeroes, then this test port is assigned to a unmapped termination.

**CUS** - Customer

Customer-controlled circuit.

**RDLD** - Red lined

The tested circuit is a red circuit.

**TERM** - Terminate

**s** - Termination state of the circuit:

| <i>s</i> | <i>Explanation</i>                   |
|----------|--------------------------------------|
| R        | RELEASED. Neither side is terminated |
| F        | FROM side is terminated              |
| T        | TO side is terminated                |
| B        | BOTH sides are terminated            |

**st** - Status

| <i>st</i>        | <i>Explanation</i>                                         |
|------------------|------------------------------------------------------------|
| <b>F FAIL</b>    | FROM side NPC is marked failed                             |
| <b>F OOS</b>     | FROM side NPC (abc) is out of service                      |
| <b>MCOND</b>     | An entity in the network is OOS or failed                  |
| <b>NA</b>        | DACS CCN or UNIT involved cannot perform the cross-connect |
| <b>NMON</b>      | Not Monitor, the testport is not currently in monitor mode |
| <b>SIG TS NS</b> | Signaling timeslot (CAS TS16) cannot be split              |
| <b>T FAIL</b>    | TO side NPC is marked failed                               |
| <b>T OOS</b>     | TO side NPC is Out Of Service                              |

## **CHG,TACC,T0,TG,MON**

**NX64Kbit/s TWO-WAY TEST ACCESS, MONITOR**

### **Explanation Of Command**

This command is used to change the mode of a test-access group, that is currently in the split mode, to the monitor mode.

**Note:** If the test-access group is already in the monitor mode this command will be denied.

### **Command**

[I.21031]

### Autonomous Message

Not applicable.

### Explanation Of Parameters

**TG** - Test-access group

**mmm** - Test-access group number (001 through 400)

The TG is designated as in message 31421, and must have the same width as the number of channels specified in this message.

**MON** - Monitor

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM Channel numbers

|          |                                                          |
|----------|----------------------------------------------------------|
| 001-031* | Primary NPCs grown as Channel Associated Signaling (CAS) |
| 001-031  | Primary NPCs grown as Non Signaling Associated (NSA)     |

\*Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If TO channel is mapped to a channel 000, the circuit can only be tested as N = 1, the corresponding FROM channel ddd will be '000'.

**tc** - Trunk conditioning

For mapped circuits, <tc> will be omitted.  
For unmapped circuits, the effective <tc> will be output.

|          |                                         |
|----------|-----------------------------------------|
| <i>g</i> | <i>Explanation</i>                      |
| T        | All channels are Transparent (TRSP)     |
| C        | One or more channels is CAS or non-TRSP |

**CGA** - Carrier group alarm

**PBA** - Primary block alarm

**ftb** - CGA or PBA state

|          |                               |
|----------|-------------------------------|
| <i>f</i> | <i>Explanation</i>            |
| F        | FROM NPC is in CGA or PBA     |
| 0        | FROM NPC is not in CGA or PBA |

*t*      *Explanation*

T      TO NPC is in CGA or PBA  
0      TO NPC is not in CGA or PBA

*b*      *Explanation*

E      East-bundle NPCTG in CGA or PBA  
W      West-bundle NPCTG in CGA or PBA  
B      NPCTG(s) supporting both bundles in CGA or PBA  
0      NPCTG(s) not in CGA or PBA

**RDLD**   - Red lined

The cross-connection tested is a red circuit.

**CUS**     - Customer

The cross-connection tested is a customer-controlled circuit.

**ONEWAY**   - One-way

The cross-connection tested is a one-way circuit.

**BCAST**   - Broadcast

The cross-connection tested is part of a broadcast circuit.

*s*      *Explanation*

R      All channels are released  
F      One or more FROM channel is terminated  
T      One or more TO channel is terminated  
B      One or more of FROM and TO channels are terminated

**UNMAP**   - Unmapped

The circuit under test is unmapped.

mmmm - Error condition code

mmmm *Explanation*

| <b>ENEQ</b> | test group unequipped                                                  |
| <b>SNIS</b> | NPC not in service or failed                                           |
| <b>SNVS</b> | invalid test access mode                                               |

## **CHG,TACC,T0,TG,SPLT**

### **NX64Kbit/s TWO-WAY TEST ACCESS, SPLIT**

#### **Explanation Of Command**

This command is used to split each direction of transmission of an Nx64Kbit/s circuit that is currently under test access in monitor mode.

The optional keyword NOYLW is added to allow DACS II to disable the yellow alarm transmission while the facility is connected to a Test Group which is set to split mode via this command with NOYLW option.

**Note:** If the test-access group is connected to an unmapped Nx64Kbit/s termination, this command connects both directions of the unmapped termination to the test-access group's west bundle.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**TG** - Test-access group

**mmm** - Test-access Group number (001 through 400)

The TG is designated as in message 31421

**SPLT** - Split

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM Channel numbers

|          |                                                          |
|----------|----------------------------------------------------------|
| 001-031* | Primary NPCs grown as Channel Associated Signaling (CAS) |
| 001-031  | Primary NPCs grown as Non Signaling Associated (NSA)     |

\*Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If TO channel is mapped to a channel 000, the circuit can only be tested as N = 1, the corresponding FROM channel ddd will be '000'.

**tc** - Trunk conditioning

For mapped circuits, <tc> will be omitted.  
For unmapped circuits, the effective <tc> will be output.

|          |                                         |
|----------|-----------------------------------------|
| <i>g</i> | <i>Explanation</i>                      |
| T        | All channels are Transparent (TRSP)     |
| C        | One or more channels is CAS or non-TRSP |

**CGA** - Carrier group alarm

**PBA** - Primary block alarm

**ftb** - CGA or PBA state

|          |                               |
|----------|-------------------------------|
| <i>f</i> | <i>Explanation</i>            |
| F        | FROM NPC is in CGA or PBA     |
| 0        | FROM NPC is not in CGA or PBA |

*t Explanation*

T TO NPC is in CGA or PBA  
0 TO NPC is not in CGA or PBA

*b Explanation*

E East-bundle NPCTG in CGA or PBA  
W West-bundle NPCTG in CGA or PBA  
B NPCTG(s) supporting both bundles in CGA or PBA  
0 NPCTG(s) not in CGA or PBA

**RDLD** - Red lined

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

*s Explanation*

R All channels are released  
F One or more FROM channel is terminated  
T One or more TO channel is terminated  
B One or more of FROM and TO channels are terminated

**mmmm** - Four-character error condition code.

**mmmm** - Error condition code

*mmmm Explanation*

**SNVS** Illegal test access mode for TS0  
**IDNV** TS16 specified for test with width not 1  
**SNVS** Illegal test access mode for TS16  
**IDNC** TG width incompatible with circuit  
**SNIS** NPC not in service or failed  
**SNVS** invalid test access mode

## **CHG,TACC,T1,INCL**

### **NON-CANNELIZED TEST FAD, EMODE, FMODE**

#### **Explanation Of Command**

This message changes the output mode (also known as termination status) of a non-channelized circuit under test. The status can be normal data transmission (NORM), or terminate (TERM) and send idle signal(s) to output port(s). The change can be selectively specified for the circuit's E-end and/or F-end NPCs. At least one of the two <e/fmode> fields must be entered, or the message is denied.

If the cross-connected circuit is terminated before a test session is set up, this command can be used to change the state from TERM to NORM. When the test session is released, the most recent state remains until a change (CHG) termination command is entered.

During a test session, if a hard-reset or link failure occurs, the test session is released automatically. However, if the failure is such that it prevents release at the time of logout or if the FAD fails, the test session is NOT automatically released and can be released by manual disconnection.

The E- and F-end NPCs for non-channelized test access correspond to the FROM and TO NPCs of a cross connection, respectively. A test session is the circuit connection under test.

#### **Command**

#### **Nonhierarchical**

### Autonomous Message

---

Not applicable.

## Explanation Of Parameters

- [s]abc** - The 3- or 4-digit nonhierarchical number of test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this is one of two test NPCs;  
the message is denied if this NPC is currently not a FAD
- [t]def** - Nonhierarchical number of second test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this number can be entered or  
omitted; either and/or both of [s]abc and [t]def can be entered,  
in any order, the original order of FAD assignment will be used;  
the message is denied if this NPC is currently not a FAD
- [u]ghi** - Nonhierarchical number of E-end NPC of circuit under test
- [v]jkl** - Nonhierarchical number of current F-end NPC
- [t]klm** - Nonhierarchical number of problematic NPC

The valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical NPC number for FAD

**wx-k-qr**

- Hierarchical NPC number of second FAD

**eg-h-ij**

- Hierarchical E-end NPC number of test session

**jk-l-mn**

- Hierarchical F-end NPC number of a mapped test session

**gh-k-lm**

- Hierarchical number of problematic NPC

**uv,wx,eg,jk,gh**

- Unit number

m,k,h,l - Module number

**np,qr,ij,mn,lm**

- NPC number

The valid values are listed below:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**FMODE** - Facility-end mode

**fmode** - Facility-end termination status

*emode*

*fmode Explanation*

NORM The circuit under test is not terminated in this direction

TERM The circuit under test terminated in this direction

The emode cannot be changed and is omitted for one-way circuits

The fmode cannot be changed for modes SPLTE, SPLTEF and LOOPE

For an unmapped circuit neither the EMODE or FMODE can be changed.

If emode or fmode is omitted, the parameter retains its current value.

If either the E- or F-end NPC is out of service or failed, then is subsequently restored to service, the output modes remain as they were before the failure.

**RDLD** - Red lined

Test session has NPC(s) designated as red circuits

**CUS** - Customer

Test session has Customer-controlled NPC(s)

**INCL** - Inclusive

Required for circuits with customer-controlled or red NPC(s)

**ONEWAY** - One-way

Test session has a one-way cross-connection

**mmmm** - Error condition code

|             |              |                                                            |

## **CHG,TL,T0,TERM,F,T,B,L,G,A,NOT**

### **TWO-WAY TEST ACCESS**

#### **Explanation Of Command**

This message is used to modify the terminate and leave activate status of one or both ends of the cross-connected channel associated with the specified test port. The test port is mapped to a predesignated channel of a network processing circuit for test ports during the provisioning of that test port. All domestic NPC types except SLC® NPCs can be provisioned as NPC test ports (NPCTP). All CEPT NPC types that have been provisioned with channel associated signaling may be provisioned as NPC test ports (NPCTP).

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

**TERM** - Terminate

**m** - The end of the tested circuit that must be put into the TLA state.  
Set m to one of the values given below:

| <i>m</i> | <i>Explanation</i>        |
|----------|---------------------------|
| F        | Apply TLA to the FROM end |
| T        | Apply TLA to the TO end   |
| B        | Apply TLA to BOTH ends    |

The following apply only to a DMB/conference

|   |                                          |
|---|------------------------------------------|
| L | Apply TLA on all legs towards facilities |
| G | Apply TLA on all legs towards bridge     |
| A | Apply TLA on all legs in both directions |

The end or ends of the channel to which termination has been applied will transmit the idle code specified in the insertion word entered in the CRTE-EQPT::NPC message, or its default, instead of passing data from the other end of the circuit. If the growth insertion word is MUX (X'1A), the terminate transmit word is the UMC code (X'18).

This message will be denied if test port kk is not in the monitor or split mode or if the tested circuit is already in the specified termination state.

**[t]rst** - The 3- or 4-digit nonhierarchical NPC number of a termination that must not be affected by this command.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

**uv-m-np**

- Hierarchical TO NPC number of a termination that must not be affected by this command.

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

|           |          |              |                                 |
|-----------|----------|--------------|---------------------------------|
| Unit      | Module   | NPC          |                                 |
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**vvv** - Channel or conference number

Channel numbers

000-030        CEPT type NPCs grown as CAS  
000-031        CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

001-085        (MB NPC)

001-500        (Virtual NPC)

**NOT**        - Not

Not means that the following channel number must not be affected by this command. This field is only valid if the termination state is equal to L, G, or A.

**kk**        - Test port number (01 through 96)

The test port is mapped to predesignated channels of a Network Processing Circuit for test ports (NPCTP) during the provisioning of that test port.

For information on the mapping between the test ports and the channels of the test NPCs (NPCTP), see CRTE-EQPT::TP-kk::[<tc>].

**[s]abc**        - The 3- or 4-digit nonhierarchical FROM NPC number with the same valid values as [t]rst.

**[t]ghi**        - The 3- or 4-digit nonhierarchical TO NPC number with the same valid values as [t]rst.

**wx-k-qr**

- Hierarchical NPC number of the TO termination of the circuit assigned to the test port (with the same valid values as uv-m-np).

**ed-h-fg**

- Hierarchical NPC number side of the FROM termination of the circuit assigned to the test port. If the test port is assigned to an unmapped termination, this field will be all zeroes (with the same valid values as uv-m-np).

**ed,wx** - Unit number  
**h,k** - Module number  
**fg,qr** - NPC number

**jjj** - TO channel number with the same value as vvv.  
**ddd** - FROM channel number with the same value as vvv.

**B** BOTH sides are terminated  
**F** FROM side is terminated  
**R** RELEASED. Neither side is terminated  
**T** TO side is terminated

**RDLD** - Red lined

**CUS** - Customer  
Customer-controlled circuit

**T UASGN** - The test port is assigned to an unmapped termination.  
**PTLA** - The requested TLA state is the present TLA state.

**reason** - Denial reason

## **CHG,TL,T0,TG,TERM,F,T,B**

**NX64Kbit/s TWO-WAY TEST ACCESS, TERMINATE-  
AND-LEAVE-ACTIVE**

### **Explanation Of Command**

This command is used to terminate one or both ends of an Nx64Kbit/s cross-connection associated with a test-access group.

**Note:** In the terminated state the data normally transmitted over the circuit is replaced by the trunk conditioning specified when the cross-connection was made. The Nx64Kbit/s circuit must be an unterminated, mapped one-way or two-way circuit that is currently in the Monitor or Split test access mode.

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM Channel numbers

001-031\*     Primary NPCs grown as Channel Associated Signaling (CAS)  
001-031     Primary NPCs grown as Non Signaling Associated (NSA)

\*Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If TO channel is mapped to a channel 000, the circuit can only be tested as N = 1, the corresponding FROM channel ddd will be '000'.

**RDLD**   - Red lined

The cross-connection tested is a red circuit.

**CUS**   - Customer

The cross-connection tested is a customer-controlled circuit.

**TERM**   - Terminate

*m*       *Explanation*

F       FROM side is terminated  
T       TO side is terminated  
B       BOTH sides are terminated

*s*       *Explanation*

F       One or more FROM channel is terminated  
T       One or more TO channel is terminated  
B       One or more of FROM and TO channels are terminated

**UNMAP**   - Unmapped

Circuit under test is unmapped.

**mmmm**   - Four-character error condition code.

mmmm - Error condition code

mmmm *Explanation*

|             |                                                                        |
|-------------|------------------------------------------------------------------------|
| <b>SWFA</b> | Active CCN side not IS or failed or pested or hardware OOS             |

## **CI,ECI,RESET**

### **STARTUP**

#### **Explanation Of Command**

DACS II outputs this message immediately after a hardware reset. The message notifies remote systems by the major alarm state (indicated by \*\*) that the frame has reset.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01201]

**\*\*{CI|ECI} RESET**

### **Explanation Of Parameters**

---

**CI** - Communications interface

**ECI** - Enhanced communications interface

**RESET** - Reset

Indicates a hardware reset of the frame

## **CI,ECI,STARTUP,STF,ATP**

### **STARTUP**

#### **Explanation Of Command**

The communications interface or enhanced communications interface has initialized itself and has performed self-diagnostics. The results of these diagnostics are reported as some tests failed or all tests passed.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01211]

{CI|ECI} STARTUP {STF|ATP}

### **Explanation Of Parameters**

---

**CI** - Communications interface

**ECI** - Enhanced communications interface

**STARTUP**

- Startup

Indicates initialization

**STF** - Some tests failed

**ATP** - All tests passed

## **CMD,MC,OOS,MCOND,INSERVICE,MPDBASE**

### **INPUT DENIAL**

#### **Explanation Of Command**

This autonomous message indicates that processing of the input message is **STOPPED** because the main controller is either out of service, in maintenance condition, in service, or the main processor data base is not loaded.

Output from this command is sent only to the link on which the command was input.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01111]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M CMD::MC:[ww]:{OOS|MCOND|INSERVICE|MPDBASE} STOPPED
/* [O.01111] */
/* <first 70 characters of input message> */
/* <remaining text of input message> */
;
```

### **Explanation Of Parameters**

---

**e** - Number of lines in message

**OOS** - Out-of-service

**MCOND** - Maintenance condition

#### **INSERVICE**

- In-service

#### **MPDBASE**

- MP data base

The main processor data base is not loaded

#### **STOPPED**

- Stopped

## **CONN,BDCST,T0**

---

### **BROADCAST TS0 to non-TS0 CROSS- CONNECTIONS**

#### **Explanation Of Command**

---

This command sets up a broadcast from a TS0 channel of a (FROM) NPC to up to eight non-TS0 tributary channels of (TO) receiving NPCs in the same broadcast. The FROM NPC must be grown as a PA or TH type. The broadcast connection defaults to NTR - no return leg. The broadcast connection defaults to NAM- no a-law to u-law conversion. The TS0 source defaults to NFW-non frame word mode. The broadcast connection defaults to TRSP-transparent signalling and uses a default insertion word of X'FF. This message is also used to add multiple TOs to an existing broadcast connection based on the specified FROM. Each of the TOs will be connected to the specified FROM. There will be at most eight TOs allowed in the argument list to the TO keyword.

The **FROM** field designates the source termination.

The fields following the SOURCE designation assign the tributaries to be connected to the backbone. Although a conference may have any number of tributaries (limited only by frame configuration), at most eight at a time may be added using this command.

More tributaries can be added by subsequent **CONN-BDCST** commands.

If a command attempts to cross-connect a channel to the 24th channel of a DS1 provisioned with the T1DM format, the command will be denied.

#### **Command**

---

##### **Nonhierarchical**

- Hierarchical TO NPC numbers

**uv,wx,ed**

- Unit number

**m,k,h** - Module number**np,qr,fg**

- NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**000** - FROM channel number is 000**jjj** - TO channel number

000-030 CEPT type NPCs grown as CAS

000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**Table 8-1. Allowable Cross-Connected Time slot Consequence Action**

| Allowable <tc><br>Time slot X-connect<br>keyword | Resulting Cross-Connected<br>Time slot Consequence Action<br>TO | Resulting Disconnect<br>Code (when used)<br>TO |
|--------------------------------------------------|-----------------------------------------------------------------|------------------------------------------------|
| Omitted                                          | X'FF                                                            | X'FF                                           |
| IW X'pq*                                         | X'FF                                                            | X'pq                                           |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**[t]wxy** - NPC number involved in the denial; otherwise, the same as [s]abc.

**zzz** - Channel number involved in the denial; otherwise, the same as ddd.

**op-j-st**

- Hierarchical NPC number involved in the denial, otherwise the same as uv-m-np

**BCAST** - Denial specific to broadcast conferences

**mmmm** - Error condition code

## **CONN,BDCST,T0,NAM,RDLD,CUS,INCL,NTR**

### **BROADCAST CROSS-CONNECTIONS**

#### **Explanation Of Command**

This command sets up a broadcast from a source (FROM) NPC to up to eight tributary (TO) receiving NPCs in the same broadcast. This message is also used to add multiple TOs to an existing broadcast connection based on the specified FROM. Each of the TOs will be connected to the specified FROM. There will be at most eight TOs allowed in the argument list to the TO keyword. Note that no channel range can be specified on the TO arguments.

The channel range from 001 to 031 channels is determined by the range given for the FROM.

The **FROM** field designates the source termination. The optional range field **[&&-eee]** indicates the width of the conference backbone.

The allowable width ranges from 001 to 031 channels and must be the same as the width of the existing conference backbone (if any).

The fields following the SOURCE designation assign the tributaries to be connected to the backbone. Although a conference may have any number of tributaries (limited only by frame configuration), at most eight at a time may be added using this command.

More tributaries can be added by subsequent **CONN-BDCST** commands. Each specified tributary will have the same range width as the backbone.

If a command attempts to cross-connect a channel to the 24th channel of a DS1 provisioned with the T1DM format, the command will be denied.

For broadcast circuits (in contrast to two-point circuits) the A-law to  $\mu$ -law conversion is turned on as a default. Therefore, all broadcast connections dealing with E1 circuits need to use the NAM keyword to turn the A-law to  $\mu$ -law conversion off, if that is desired.

There is an exception. If the broadcast circuit is started as a two-way connection between E1 circuits that are later on converted to broadcast connections using the CONV keyword, then the default for E1 two-way connections governs, and there is no A-law to  $\mu$ -law conversion. In fact a broadcast circuit that is started as a two-way circuit can never be operated with A-law to  $\mu$ -law conversion on. If A-law to  $\mu$ -law conversion is desired for the broadcast connections, then the user must provision the circuit immediately as a broadcast circuit.

## Autonomous Message

---

Not applicable.

## Explanation Of Parameters

---

**FROM** - From

The first termination entered in the command is the source termination.

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

**[u]klm** - The 3- or 4-digit nonhierarchical TO NPC number

The values are as follows:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

- NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number

**eee** - FROM channel number denoting the end of the range

**jjj** - TO channel number

**nnn** - TO channel number denoting the end of the range

000-030 CEPT type NPCs grown as CAS

000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

The optional range field *eee* indicates the width of the conference backbone. The range field must not be repeated on the tributary legs' specification. A termination cannot be broadcast connected to itself. The desired effect can be reached by specifying the LPD option. If this message is used to add tributary legs, the width must be the same as the width of the existing conference backbone. However, a conference can have an unlimited number of tributaries, limited only by the frame configuration. More tributaries can be added by subsequent commands.

For CEPT type NPCs, CAS channel 031 (TS16) is not allowed in a range of channel numbers.

**tc** - Trunk conditioning

**tc** represents the desired cross-connected signaling and insertion word applied when a failure occurs. The signaling and the insertion word specification are entered separately, with a comma as the delimiter, which have the following form:

<tc\_sig>,<tc\_iw>

The following signaling options are allowed:

| <i>tc_sig</i>        | <i>Explanation</i>                                                                                                                                                           |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC-ijkl,mnop         | 2-way, 4-state signaling in binary. For ESF type framing format, software will expand 4-state to 16-state by duplicating the format on the remaining frames on a superframe. |
| TC-efghijkl,mnopqrst | 2-way, 16-state in binary. Only valid for ESF and CEPT framing formats.                                                                                                      |
| TC-X-ab,X-cd         | 2-way, 16-state in hexadecimal. Only valid for ESF and CEPT framing formats.                                                                                                 |
| TRSP                 | Transparent, no signaling                                                                                                                                                    |

The following insertion word options are allowed:

| <i>tc_iw</i> | <i>Explanation</i>                                                                                                                       |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW-X-pq      | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| TRB          | Standard trouble code, equal to IW-X-E4, not valid for CEPT.                                                                             |
| MUX          | MUX out of sync code, equal to IW-X-1A, not valid for CEPT.                                                                              |
| Omitted      | Only valid for CEPT, will default to IW-X-FF.                                                                                            |

Additional rules apply for CEPT cross-connections. See the following tables.

**Table 8-2. Allowable Signaling Type and Signaling Consequent Action**

| Primary Type<br>in<br>Cross-connect | Allowable<br><tc><br>Signaling<br>Specification | Resulting<br>Signaling<br>Code<br><br>FROM, TO    | Resulting<br>Signaling<br>Consequent<br>Action<br>(Hardware)<br>FROM, TO | Resulting<br>Signaling<br>Consequent<br>Action<br>(Firmware)<br>FROM, TO | Resulting<br>Disconnect<br>(When DCC used<br>in disconnect<br>command) |

| NSA ↔ NSA                           | <b>TRSP/Omitted</b>                             | Not appl.                                         | Not appl.                                                                | Not appl.                                                                | Not appl.                                                              |

\* For TCON and TCNT TC is X-uv,X-yz.  
For OCON, OCNT and BCON TC is --,X-yz.

**Table 8-3. Allowable Cross-Connected Time slot Consequence Action**

| Allowable <tc><br>Time slot X-connect<br>keyword | Resulting Cross-Connected<br>Time slot Consequence Action<br>TO | Resulting Disconnect<br>Code (when used)<br>TO |
|--------------------------------------------------|-----------------------------------------------------------------|------------------------------------------------|
| Omitted                                          | X'FF                                                            | X'FF                                           |
| IW X'pq*                                         | X'FF                                                            | X'pq                                           |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC-abcd,efgh**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NTR** - No transmit

All tributaries are broadcast only. There is no return path to the source.

**LPD** - Looped

The source loops its broadcast back to itself. All the tributaries are broadcast only.

When the LPD keyword is used, the signaling conversion of the FROM side will override that of the TO side.

If neither NTR nor LPD is used, and the source (FROM abcdde[-eee]) is being established for the first time, ghijj is a full tributary, capable of transmitting back to the source. If the source has been previously established, all tributaries are broadcast only.

**CONV** - Convert

CONV is given to convert a two-way, two-point circuit to a broadcast circuit.

The first termination (NPC and channel) listed in the input message is the FROM (or source) termination in the current two-point connection. The termination next following in the command is the full tributary leg to be added in the conversion to a broadcast connection. Additional legs may be added simultaneously by specifying additional terminations.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

E1 to E1      Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

E1 to DS1 or      Same explanation as E1 to E1.  
DS1 to E1

DS1 to DS1      Not applicable.

**CUS** - Customer

Indicates a Customer-controlled Circuit

**RDLD** - Red lined

This keyword will cause the associated circuits to be flagged as red circuits.

**INCL** - Inclusive

To connect a circuit or range of circuits including one or more circuits previously marked as customer controlled, use the INCL (inclusive) option. If this option is not used, the message will be denied if any circuits in the range are customer controlled. INCL is not needed to connect a circuit or circuits previously marked as red circuits.

**[t]wxy** - NPC number involved in the denial; otherwise, the same as [s]abc.

**zzz** - Channel number involved in the denial; otherwise, the same as ddd.

**op-j-st**

- Hierarchical NPC number involved in the denial, otherwise the same as uv-m-np

**BCAST** - Denial specific to broadcast conferences

**mmmm** - Error condition code

## **CONN,BDCST,T0,NAM,RDLD,CUS,INCL,NTR**

### **BROADCAST CROSS-CONNECTION**

#### **Explanation Of Command**

This command adds a single tributary leg to a broadcast cross-connection. It cross-connects the tributary to the indicated source.

It can be used to create a new one-way cross-connection from an existing broadcast source to the specified tributary channel. It can also be used to convert an existing two-way, two-point cross-connection to a broadcast cross-connection while adding a new tributary leg.

Data received on the broadcast tributary leg is discarded because a one-way cross-connection is created. Only data from the full tributary leg is returned to the broadcast source.

The FROM end field designates the conference backbone (source). The optional range fields indicate the conference width.

The allowable range is from 01 to 31 channels.

The FROM end will receive return data from the TO end, if and only if

- the TO end is the initial connection (first tributary), and
- the FROM end is not provisioned with the LPD or NTR keywords.

The field in the TO end designates the tributary. The width of the tributary is indicated by a range designation and must match the backbone width. If necessary, more tributaries can be added by subsequent broadcast cross-connect commands. Received data from broadcast-only TO terminations will be dead-ended as it enters DACS II.

**Note:** Broadcast cross-connections are not allowed from or to the 24th channel of a DS1 using the T1DM framing format.

For broadcast circuits (in contrast to two-point circuits) the A-law to  $\mu$ -law conversion is turned on as a default. Therefore, all broadcast connections dealing with E1 circuits need to use the NAM keyword to turn the A-law to  $\mu$ -law conversion off, if that is desired.

There is an exception. If the broadcast circuit is started as a two-way connection between E1 circuits that are later on converted to broadcast connections using the CONV keyword, then the default for E1 two-way connections governs, and there is no A-law to  $\mu$ -law conversion. In fact a broadcast circuit that is started as a two-way circuit can never be operated with A-law to  $\mu$ -law conversion on. If A-law to  $\mu$ -law conversion is desired for the broadcast connections, then the user must provision the circuit immediately as a broadcast circuit.

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd,**

**jjj**

- Channel numbers for beginning of channel range

**eee,**

**kkk**

- Channel numbers for end of channel range

000-030 CEPT type NPCs grown as CAS

000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

For CEPT type NPCs, channel associated signaling (CAS) channel 031 (TS16) is not allowed in a range of channel numbers.

**tc** - Trunk conditioning

The desired cross-connected signaling and insertion word applied when a failure occurs. The signaling and the insertion word specification are entered separately, with a comma as the delimiter.

The following signaling options are allowed:

| <i>signaling</i>     | <i>Explanation</i>                                                                                                                                                                  |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC-efghijkl,mnopqrst | 2-way, 16-state in binary formats.                                                                                                                                                  |
| TC-X-ab,X-cd         | 2-way, 16-state in hexadecimal.                                                                                                                                                     |
| TRSP                 | Transparent, no signaling (that is, channel 000 in TS16).                                                                                                                           |
| Omitted              | Will default to TC-X-FF,X-FF) if both terminations are channel associated signaling type. It will default to TRSP if one of the terminations is nonsignaling associated (NSA) type. |

The following insertion word options are allowed:

| <i>insertion word</i> | <i>Explanation</i>                                                                                                                       |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW-X-pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| Omitted               | Will default to IW-X-FF.                                                                                                                 |

Additional rules apply for CEPT cross-connections. See Table 1 for allowable signaling type and signaling consequence action and Table 2 for allowable cross-connected time slot consequence action.

**Table 8-4. Allowable Signaling Type and Signaling Consequent Action**

| Primary Type<br>in X-connect | Allowable<br><tc> sig. type/<br>type/ sig.<br>consequent<br>action<br>keyword | Resulting<br>Signaling<br>consequent<br>action<br>TO | Resulting<br>sig.<br>Code<br>(when used)<br>TO | Resulting<br>Disconnect |
|------------------------------|-------------------------------------------------------------------------------|------------------------------------------------------|------------------------------------------------|-------------------------|

|                              | TC(--,X'tu)                                                                   | CAS                                                  | X'F                                            | X'u                     |
|                              | Omitted                                                                       | CAS                                                  | X'F                                            | X'F                     |
| NSA→ CAS<br>or<br>CAS→ NAS   | TRSP/Omitted<br>X'D in CAS<br>direction)                                      | None (fixed at<br>X'D in CAS<br>direction            | Sig. fixed at<br>direction                     | X'D in CAS              |
| NSA→ NSA                     | TRSP/Omitted                                                                  | None                                                 | Not appl.                                      | Not appl.               |

**Table 8-5. Allowable Cross-Connected Time slot Consequent Action**

| Allowable <tc><br>Time slot X-connect<br>keyword | Resulting Cross-Connected<br>Time slot Consequent Action<br>TO | Resulting Disconnect<br>Code (when used)<br>TO |
|--------------------------------------------------|----------------------------------------------------------------|------------------------------------------------|
| Omitted                                          | X'FF                                                           | X'FF                                           |
| IW X'pq*                                         | X'FF                                                           | X'pq                                           |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC-abcd,efgh**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NTR** - No Transmit

All tributaries are broadcast only. There is no return path to the source.

**LPD** - Looped.

The source loops its broadcast back to itself. All the tributaries are broadcast only. When the LPD keyword is used, the signaling conversion of the FROM side will override that of the TO side.

If neither NTR nor LPD is used, and the source (FROM abcd[ddd[-eee]]) is being established for the first time, ghij is a full tributary, capable of transmitting back to the source. If the source has been previously established, all tributaries are broadcast only.

**CONV** - Convert

CONV is given to convert a two-way, two-point circuit to a broadcast circuit.

The first termination (NPC and channel) listed in the input message is the FROM (or source) termination in the current two-point connection. The termination next following in the command is the full tributary leg to be added in the conversion to a broadcast connection.

If the range fields eee and kkk are used, the entire width of the conference tributaries must be indicated.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

E1 to E1      Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

E1 to DS1 or      Same explanation as E1 to E1.  
DS1 to E1

DS1 to DS1      Not applicable.

**CUS** - Customer

Indicates a customer controlled circuit

**RDLD** - Red lined

This keyword will cause the associated circuit to be flagged as a red circuit.

**INCL** - Inclusive

To connect a circuit or range of circuits including one or more circuits previously marked as Customer Controlled, use the INCL (inclusive) option. If this option is not used, the message will be denied if any circuits in the range are customer controlled. INCL is not needed to connect a circuit or circuits previously marked as Red Circuits.

[t]wxy

- The 3- or 4-digit nonhierarchical NPC number involved in the denial, otherwise the same as [s]abc

**op-j-st**

- Hierarchical NPC number involved in the denial; otherwise, the same as uv-m-np.

**zzz** - Channel number involved in the denial; otherwise, the same as ddd.

**BCAST** - Denial specific to broadcast conferences.

**NORM** - Normal

**mmmm** - Error condition code

| <b>mmmm</b> | <b>st</b> | <i>Explanation</i>                                                    |

## **CONN,BDCST,T1,RDLD,CUS,INCL,NTR,LPD**

### **BROADCAST CONNECT**

#### **Explanation Of Command**

This message cross connects a new broadcast circuit from a non-channelized source network processing circuit (NPC) to up to eight non-channelized tributaries. The NPCs can belong to different units. This message can be used to add up to eight non-channelized tributaries to an existing conference.

This message is also used to add the indicated tributaries and convert (CONV) a two-way, two-point circuit to a broadcast circuit. When a failure occurs, or during an alarm state, the alarm-indication signal (AIS-all ones) is transmitted to the failed tributaries or all tributaries if the source NPCs fail. If the failure occurs during the execution of this command, the message is canceled and no broadcast circuit is set up.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**Note:** An NPC cannot be broadcast-connected to itself. The desired effect can be achieved by specifying the LPD option.

[s]abc - The 3- or 4-digit nonhierarchical FROM NPC number  
[t]def - The 3- or 4-digit nonhierarchical TO NPC number  
[u]ghi - Same definition as [t]def  
[v]jkl - Same definition as [t]def  
[t]mno - Same definition as [t]def

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

**uv-m-np**

- Hierarchical number of non-channelized source NPC

**wx-k-qr**

- Hierarchical tributary NPC number.

**ed-f-hg**

- Same definition as wx-k-qr

**st-m-no**

- Same definition as wx-k-qr

**uv,wx,ed,st**

- Unit number

**m,k,f**

- Module number

**np,qr,hg,no**

- NPC number within the module

The values are:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**RDLD** - Red lined

**CUS** - Customer

Customer-controlled circuit

**INCL** - Inclusive

Option will remove CUS marking

**NTR** - No transmit

No transmit or return path, all tributaries are broadcast only

**LPD** - Looped

One signal is looped back to source

If neither the NTR nor the LPD keyword is specified and the broadcast conference is being established for the first time, the first tributary is a full tributary, capable of transmitting back to the source; if the source has been previously established then all tributaries are broadcast only.

**CONV** - Convert

Convert a two-way, two-point circuit to a broadcast circuit by adding the indicated tributaries

The first termination (NPC and channel) listed in the input message is the FROM (or source) termination in the current two-point connection. The termination next following in the command is the full tributary leg to be added in the conversion to a broadcast connection. Additional legs may be added simultaneously by specifying additional terminations.

**[t]qrs** - The 3- or 4-digit backbone leg (bbl) or tributary NPC involved in denial

**op-q-rs** - Hierarchical number of the backbone leg or tributary NPC involved in denial.

**st** - Status  
Status of denial

**mmmm** - Error condition code

## **CONN,BDCST,T1,RDLD,CUS,INCL,NTR,LPD**

### **BROADCAST CONNECT**

#### **Explanation Of Command**

This message connects a new broadcast circuit from a non-channelized source network processing circuit (NPC) to a single non-channelized tributary. It also adds a single non-channelized tributary to an existing conference.

This message also adds the indicated tributary and converts (CONV) a two-way, two-point circuit to a broadcast conference.

When a failure occurs or during an alarm state, the alarm-indication signal (AIS or all ones signal) is transmitted to the failed tributaries or to all tributaries if the source NPCs fail. If the failure occurs during the execution of this command, it is canceled and no broadcast circuit is set up.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

[s]abc - The 3- or 4-digit non-hierarchical non-channelized source (backbone)  
NPC number  
[t]def - The 3- or 4-digit non-hierarchical non-channelized tributary NPC  
number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

**wx-k-qr**

- Hierarchical number of non-channelized tributary NPC

**uv-m-np**

- Hierarchical number of non-channelized source NPC

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number

The values are listed below:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**Note:** An NPC cannot be broadcast-connected to itself. The desired effect can be achieved by specifying the LPD option.

**RDLD** - Red lined

**CUS** - Customer  
Customer-controlled circuit

**INCL** - Inclusive  
The INCL keyword will remove CUS marking

**NTR** - No transmit  
No transmit or return path, the tributary is broadcast only

**LPD** - Looped  
One signal is looped back to source  
If neither the NTR nor LPD keyword is specified and the broadcast conference is being established for the first time, the tributary is a full tributary, capable of transmitting back to the source; if the source has been previously established then the tributary is broadcast only.

**CONV** - Convert  
CONV is given to convert a two-way, two-point circuit to a broadcast circuit.

The first termination (NPC and channel) listed in the input message is the FROM (or source) termination in the current two-point connection. The termination next following in the command is the full tributary leg to be added in the conversion to a broadcast connection.

**[t]ghi** - The 3- or 4-digit backbone leg (bbl) or tributary NPC number causing denial

**ed-f-hg**  
- Hierarchical number of the backbone leg or tributary NPC causing denial

**st** - Status  
Status of denial

**mmmm** - Error condition code

## **CONN,CRS,T0,CB,CUS,RDLD,INCL**

### **TWO-WAY C-BIT CROSS-CONNECTS**

#### **Explanation Of Command**

This message establishes a cross-connection between signaling timeslot 16 (channel 031) of the PB- or PC-type NPC provisioned for channel associated signaling and the C-bit (CB) type NPC on the DSPU. The software automatically assigns the CB number and the channel number on the CB.

#### **Command**

#### **Nonhierarchical**

**Note:** The comma in front of RDLD or INCL cannot follow the colon as implied by the message representation below. The comma is used when necessary to separate the three keywords CUS, RDLD, and INCL. If there is no keyword between the colon and RDLD or INCL then the comma may be omitted.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**FROM** - From

FTU NPC identifier keyword

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

#### uv-m-np

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

Values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

#### CB

- C-bit  
C-bit processing NPC identifier keyword

**Note:** The CB number and the channel number on the CB are automatically assigned by software.

#### CUS

- Customer  
Specify that this cross-connect is customer controlled

#### RDLD

- Red lined  
Specify that this is a red-lined circuit

**INCL** - Inclusive

Specify that red circuits and/or customer controlled circuits are to be included. A termination designated as a CUS or a RDC cannot be disconnected or modified without using the INCL keyword in the message. An NPC which supports these circuits cannot be manually removed unless the INCL keyword is given in the remove message.

**d** - Direction

**d**      *Explanation*

F      FROM

T      TO

B      Both

**st** - Status**mmmm** - Error condition code

## **CONN,CRS,T0,NAM,RDLD,CUS,INCL,NORM**

### **TWO-WAY CROSS-CONNECTION**

#### **Explanation Of Command**

This command requests the two-point two-way connection of two specified cross-connect circuits or a range of cross-connected circuits.

If the user wants to cross-connect Nx64 kbits/s circuits, then the range feature of this command should be used.

#### **Command**

##### **Nonhierarchical**

[I.11001]

```
CONN-CRS-T0:[<xy>]:[s]abc-ddd[&&-eee],[t]ghi-jjj[&&-kkk]:[<ww>]:\
[<tc>][,<sc>][,NAM]:[RDLD][,{CUS|INCL}]::\
[{NORM,NORM|TERM,TERM}]:[PRIOUT];
```

##### **Hierarchical**

[I.11001]

```
CONN-CRS-T0:[<xy>]:uv-m-np-ddd[&&-eee],wx-k-qr-jjj[&&-kkk]:[<ww>]:\
[<tc>][,<sc>][,NAM]:[RDLD][,{CUS|INCL}]::\
[{NORM,NORM|TERM,TERM}]:[PRIOUT];
```

## Completion Message

## Autonomous Message

---

Not applicable.

## Explanation Of Parameters

### [s]abc-ddd

- Nonhierarchical termination in from direction

[s]abc - The 3- or 4-digit NPC number  
ddd - Channel number, beginning of range

### [s]ghi-jjj

- Nonhierarchical termination in to direction

[s]ghi - The 3- or 4-digit NPC number  
jjj - Channel number, beginning of range

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 |
|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       |
| 0001-0032 | 0161-0192 | 0321-0352 | 0481-0512 |
| 0041-0072 | 0201-0232 | 0361-0392 | 0521-0552 |
| 0081-0112 | 0241-0272 | 0401-0432 | 0561-0592 |
| 0121-0152 | 0281-0312 | 0441-0472 | 0601-0632 |
| Unit<br>5 | Unit<br>6 | Unit<br>7 | Unit<br>8 |
| NPC       | NPC       | NPC       | NPC       |
| 0641-0672 | 0801-0832 | 0961-0992 | 1121-1152 |
| 0681-0712 | 0841-0872 | 1001-1032 | 1161-1192 |
| 0721-0752 | 0881-0912 | 1041-1072 | 1201-1232 |
| 0761-0792 | 0921-0952 | 1081-1112 | 1241-1272 |

|                  |                  |                  |                  |
|------------------|------------------|------------------|------------------|
| Unit<br>9        | Unit<br>10       | Unit<br>11       | Unit<br>12       |

| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np-ddd**

- Hierarchical termination in from direction

**wx-k-qr-jjj**

- Hierarchical termination in to direction

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

**ddd,jjj**

- Channel number, beginning of range

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

If the channel being connected is an FDL (Facility Data Link), then **ddd**

(**jjj**) is **000** and signaling type should be of type **TC-ijkl,mnop**.

Only the FDL of a DE type NPC with ESF Format can be cross-connected.

**eee, kkk**

- Channel numbers for end of channel range

To connect a range of channels, use the optional fields **eee** and **kkk**.

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Channel 000 and channel 031 (that is, TS16 of a CEPT type NPC) are not allowed in a range of channel numbers.

**tc**      - Trunk conditioning

Defines the cross-connected signaling and insertion word applied to the circuit during a failure condition. The signaling and insertion word are separately specified, using a comma as the delimiter using the form:

<tc\_sig>,<tc\_iw>

where: tc\_sig is the **signaling** portion of trunk conditioning and  
tc\_iw is the **insertion word** portion of trunk conditioning.

Valid values for two-way cross-connects are:

*4-state signaling*

**TC-ijkl,mnop,IW-X-nn**

*16-state signaling*

**TC-efghijkl,mnopqrst,IW-X-nn**  
**TC-X-uv,X-yz,IW-X-nn**

*Transparent signaling*

**TRSP,IW-X-nn**  
**TRSP**

**Note:** 4-state signaling will be expanded to 16-state by duplicating the bits.

**Note:** If <tc> is omitted and both terminations are Channel Associated Signaling (CAS) types, it will default to 16-state signaling with all ones and an insertion word of all ones.

Example:

**TC-X-FF,X-FF,IW-X-FF**

**Note:** If <tc> is omitted, and one or both terminations are Non-Signaling Associated (NSA) types, it will default to transparent signaling with no insertion word.

Example:

**TRSP**

**ijkl** - 4-state binary signaling value - From direction

**mnop** - 4-state binary signaling value - To direction

**efghijkl**

- 16-state binary signaling value - From direction

**mnopqrst**

- 16-state binary signaling value - To direction

**uv** - 16-state hexadecimal signaling value - From direction

**yz** - 16-state hexadecimal signaling value - To direction

**nn** - Hexadecimal Insertion Word

**TRSP** - Transparent

Outgoing signaling will be fixed at **1101** (hex **D**) in slot 16 for Channel Associated Signaling (CAS) primaries. **TRSP** is the only allowable option for Non-Signaling Associated (NSA) primaries.

**Note:** When the provisioning insertion word (PIW) is assigned in the **CRTE-EQPT : :NPC** command, a four-bit pattern is inserted into the associated portion of time slot 16 for CAS circuits when the circuit is disconnected.

Additional rules apply for 2.048 Mbit/s termination cross-connects.

The allowable signaling type and signaling consequent action are shown in the following table.

**Table 8-6. Allowable Signaling Type and Signaling Consequent Action**

| Primary Type<br>in<br>Cross-connect | Allowable<br><tc><br>Signaling<br>Specification | Resulting<br>Signaling<br>Code<br><br>FROM, TO    | Resulting<br>Signaling<br>Consequent<br>Action<br>(Hardware)<br>FROM, TO | Resulting<br>Signaling<br>Consequent<br>Action<br>(Firmware)<br>FROM, TO | Resulting<br>Disconnect<br>(When DCC used<br>in disconnect<br>command) |
|-------------------------------------|-------------------------------------------------|---------------------------------------------------|--------------------------------------------------------------------------|--------------------------------------------------------------------------|------------------------------------------------------------------------|
| CAS ↔ CAS                           | <b>TRSP</b>                                     | Fixed at <b>X-D</b>                               | Fixed at <b>X-D</b>                                                      | Fixed at <b>X-D</b>                                                      | <b>X-D</b>                                                             |
|                                     | <b>TC-X-uv, X-yz*</b>                           | CAS<br>(Passed Through)                           | <b>X-F</b>                                                               | <b>X-uv, X-yz</b>                                                        | <b>X-v, X-z</b>                                                        |
|                                     | Omitted                                         | CAS<br>(Passed Through)                           | <b>X-F</b>                                                               | <b>X-F</b>                                                               | <b>X-F</b>                                                             |
| NSA ↔ CAS                           | <b>TRSP/Omitted</b>                             | None (Fixed at<br><b>X-D</b> in CAS<br>direction) | Fixed at<br><b>X-D</b> in CAS<br>direction                               | Fixed at<br><b>X-D</b> in CAS<br>direction                               | <b>X-D</b> in CAS<br>direction                                         |
| NSA ↔ NSA                           | <b>TRSP/Omitted</b>                             | Not appl.                                         | Not appl.                                                                | Not appl.                                                                | Not appl.                                                              |

\* For TCON and TCNT TC is X-uv,X-yz.  
For OCON, OCNT and BCON TC is --,X-yz.

The allowable cross-connected time slot consequent action are shown in the following table.

**Table 8-7. Allowable Cross-Connected Time Slot Consequent Action**

| Allowable <tc><br>Insertion<br>Word | Resulting Cross-Connected<br>Time Slot Consequent Action<br>FROM, TO | Resulting Disconnect<br>Code (When DCC used<br>in disconnect command) |
|-------------------------------------|----------------------------------------------------------------------|-----------------------------------------------------------------------|
| Omitted                             | X-FF, X-FF                                                           | X-FF                                                                  |
| <b>IW X-pq *</b>                    | X-FF, X-FF                                                           | X-pq                                                                  |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC-abcd,efgh**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Two-Point:*

**E1 to DS1** Gateway cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law conversion set as a default. The **NAM** keyword is used to disable the conversions.

**E1 to E1** Default, the **NAM** keyword may be used but there is no need to specify **NAM** explicitly since A-law to  $\mu$ -law and  $\mu$ -law to A-law conversion is not needed, and therefore not performed, for a pure E1 cross-connect.

**DS1 to DS1** Not applicable.

**CUS** - Customer

This optional keyword is used to flag a circuit as a customer controlled circuit. On output it indicates that the circuit is customer controlled.

**RDLD** - Red lined

This optional keyword is used to mark a circuit as a Red Circuit. On output it indicates that the circuit is a Red Circuit.

**INCL** - Inclusive

A termination designated as a customer controlled circuit or a red circuit cannot be disconnected or modified without using this keyword in the message. Also, an NPC which supports these circuits cannot be manually removed unless this keyword is given in the remove command.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**NORM** - Normal

**NORM, NORM** means that the cross-connection will come up in the normal state.

**TERM** - Terminate

**TERM, TERM** means that the cross-connection will come up in the terminated state.

**mmm** - The From-direction channel number involved in denial (**ddd** through **eee**).

**nnn** - The To-direction channel number involved in denial (**jjj** through **kkk**).

**d** - Direction

## **CONN,CRS,T0,NAM,RDLD,CUS,INCL,NTR,NORM**

### **TWO-WAY CROSS-CONNECT FROM, TO MULTIPOINT MODE**

#### **Explanation Of Command**

This command requests a multipoint two-way cross-connection between the specified FROM and TO end terminations and is used to connect a DS0 leg to a multipoint circuit, or to cross-connect a leg, consisting of a single or a contiguous range of DS0 channels, to a multipoint circuit in the virtual network processing circuit. Cross-connections may be between various network processing circuit types.

If the user wants to cross-connect Nx64 kbits/s circuits, then the range feature of this command should be used.

#### **Command**

Not applicable.

### Explanation Of Parameters

- [s]abc - The 3- or 4-digit nonhierarchical FROM NPC number  
[t]ghi - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |
| <b>0081-0112</b> | <b>0241-0272</b> | <b>0401-0432</b> | <b>0561-0592</b> |
| <b>0121-0152</b> | <b>0281-0312</b> | <b>0441-0472</b> | <b>0601-0632</b> |
| Unit<br>5        | Unit<br>6        | Unit<br>7        | Unit<br>8        |
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0641-0672</b> | <b>0801-0832</b> | <b>0961-0992</b> | <b>1121-1152</b> |
| <b>0681-0712</b> | <b>0841-0872</b> | <b>1001-1032</b> | <b>1161-1192</b> |
| <b>0721-0752</b> | <b>0881-0912</b> | <b>1041-1072</b> | <b>1201-1232</b> |
| <b>0761-0792</b> | <b>0921-0952</b> | <b>1081-1112</b> | <b>1241-1272</b> |
| Unit<br>9        | Unit<br>10       | Unit<br>11       | Unit<br>12       |
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1281-1312</b> | <b>1441-1472</b> | <b>1601-1632</b> | <b>1761-1792</b> |
| <b>1321-1352</b> | <b>1481-1512</b> | <b>1641-1672</b> | <b>1801-1832</b> |
| <b>1361-1392</b> | <b>1521-1552</b> | <b>1681-1712</b> | <b>1841-1872</b> |
| <b>1401-1432</b> | <b>1561-1592</b> | <b>1721-1752</b> | <b>1881-1912</b> |

| Unit<br>13       | Unit<br>14       | Unit<br>15       | Unit<br>16       |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |

| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number

Unit Type VI (Virtual)

| Unit      | Module   | NPC          |                                 |
|-----------|----------|--------------|---------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**ddd,**

**jjj**

- Channel or conference numbers

**eee,**

**kkk**

- Channel or conference numbers denoting the end of range specification

Channel numbers

000-030        CEPT type NPCs grown as CAS  
000-031        CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

001-085        (MB NPC)

001-500        (Virtual NPC)

Cross-connections may be between various Network Processing Circuit (NPC) types:

DMB and DMB

For DMB circuits, there are four possible values for fmd and tmd:

**fmd**

**tmd**

SYM    For legs of a symmetrical multipoint circuit (must be a DMB channel)  
BRD    For nonbackbone (tributary) legs of a broadcast multipoint circuit (must be a DMB channel)  
BBL    For the backbone leg of a broadcast multipoint circuit (must be a DMB channel)  
LEG    For the end that does not terminate on the multipoint circuit (must be an FTU/DS3U/HDS3U channel)

For virtual NPC circuits, there are three possible values for fmd and tmd:

**fmd**

**tmd**

BRD    For nonbackbone legs of a broadcast multipoint circuit (must be a virtual NPC channel)  
BBL    For the backbone leg of a broadcast multipoint circuit (must be a virtual NPC channel)  
LEG    For the end that does not terminate on the multipoint circuit (must be FTU/DS3U/HDS3U channels)

The valid combinations of fmd and tmd are:

For within a DMB or virtual conference:

LEG,BBL or BBL,LEG  
LEG,BRD or BRD,LEG  
SYM,LEG or LEG,SYM (only for DMB)

For concatenation of conferences:

BRD,BBL or BBL,BRD  
BBL,BBL  
SYM,SYM

**Note:** Default values for noise guard (NG) and echo suppression (ES) are applied to symmetrical bridges (multipoint mode SYM) and polling circuits (multipoint mode BBL,BRD). These default values are:

|                     |            |            |
|---------------------|------------|------------|
| Symmetrical bridges | NG = -18db | ES = -18db |
| Polling circuits    | NG = 0db   | ES = 0db   |

**Note:** To avoid possible transmission delays in the conferencers, DACS II will not allow DMB broadcast conferences to be concatenated more than six deep. However, each concatenated conference will support the maximum allowable number of legs. This allows conferences to branch out at any point in the daisy chain, as long as each branch does not concatenate more than six conferences from the backbone leg.

**tc** - Trunk conditioning, which has the input form:

**TRSP, {IW-X-pq | TRB | MUX}**

Represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. The TRSP (transparent) signaling specification is the only one allowed.

The following signaling options are allowed:

| <i>signaling</i> | <i>Explanation</i>        |
|------------------|---------------------------|
| TRSP             | Transparent, no signaling |

The following insertion word options are allowed:

| <i>IW</i> | <i>Explanation</i>                                                                                                                       |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW-X-pq   | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| TRB       | Standard trouble code, equal to IW-X-E4, not valid for CEPT.                                                                             |
| MUX       | MUX out of sync code, equal to IW-X-1A, not valid for CEPT.                                                                              |
| Omitted   | Only valid for CEPT, will default to IW-X-FF.                                                                                            |

All leg connections to multipoint circuits using a DMB NPC or a Virtual NPC must use TRSP signaling. The insertion word is user specified and may be varied from leg to leg.

For all multipoint to multipoint conference cross-connections (DMB concatenated conferences) only TRSP signaling is allowed and is the default hence it need not be specified. The insertion word is not valid for concatenated conferences.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**NTR** - No Transmit

**m** - The direction toward which transmission is shut off

| <i>m</i> | <i>Explanation</i> |
|----------|--------------------|
| F        | FROM               |
| T        | TO                 |

The NTR option is used to set up one-way connections; that is, to shut off transmission towards the specified FROM or TO termination. If NTR m is specified on the BBL (backbone leg) of a multipoint circuit, then the BRD (broadcast) legs of this circuit have their outward transmission turned off.

The NTR field is optional if the virtual NPC is part of the circuit. The direction of the data flow is indicated by the MPM (fmd,tmd) field.

**CUS** - Customer

All legs on a multipoint customer controlled circuit must be designated as CUS. A disconnected termination previously marked CUS remains as a customer controlled termination.

**INCL** - Inclusive

The INCL keyword must be used to reconnect a termination to other terminations. However, if they are reconnected without the CUS keyword, they lose their customer controlled status.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

E1 to E1      Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

E1 to DS1 or      Same explanation as E1 to E1.  
DS1 to E1

DS1 to DS1      Not applicable.

**RDLD** - Red lined

If the optional RDLD field is present, the circuit will be flagged as a Red Circuit. All legs on a multipoint Red Circuit must be designated RDC.

**NORM** - Normal

NORM,NORM means that the cross-connection will come up in the normal state.

**TERM** - Terminated

TERM,TERM means that the cross-connection will come up in the terminated state.

**NOBBL** - No backbone leg

If the type of circuit was a broadcast circuit, the optional NOBBL indicates that no backbone leg is yet specified in either the FROM or TO direction. This argument will appear until a backbone leg is specified for this circuit.

**F** - From

**T** - To

**mmm** - FROM channel number involved in the denial (ddd through eee)

**nnn** - TO channel number involved in the denial (jjj through kkk)

**st** - Status

**d** - Direction

*d Explanation*

F FROM

T TO

B BOTH

**mmm** - Error condition code

*mmm st Explanation*

**IDRG INERR** Invalid range for specified FROM NPC type

**IDRG INERR** Invalid range for specified TO NPC type

**IIFM INERR** Invalid FROM NPC type for AIS insertion

**IIFM INERR** Invalid TO NPC type for AIS insertion

**SWFA MCOND** Active CCN side not IS or failed or pested or hardware OOS

**ENEQ MCOND** UNIT not equipped, not in service, or failed

**ENEQ MCOND** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS

**ENEQ MCOND** FTMI not equipped, not in service, or failed

**ENEQ MCOND** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**ENEQ MCOND** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**ENEQ MCOND** DSPI not equipped, not in service, or failed

**SNVS MCOND** Line format types are incompatible

**IIDT MCOND** Trunk conditioning is invalid

**IIFM MCOND** FMC cannot be cross-connected in this format

**ENIE INERR** Two confs. were prev. connected or the concat. cause BRD-BBL loop

**SNVS INERR** Trunk conditioning doesn't match that of conference

**SNVS INERR** CUS flag doesn't match that of conference

**SNVS INERR** RDLD flag doesn't match that of conference

| mmm  | st      | Explanation                                                          |

## **CONN,CRS,T0,PFW,NFW,NORM,TERM**

### **TWO-WAY CROSS-CONNECTIONS**

#### **Explanation Of Command**

This command requests a TS0 to non-TS0 cross-connection. A cross-connect mode must be chosen to prevent the TS0 Frame Alignment Signal from being transmitted in a non-TS0 timeslot.

#### **Command**

##### **Nonhierarchical**

[I.11051]

```
CONN-CRS-T0:[<xy>]:[s]abc-ddd,[t]ghi-jjj:[ww]:\
[{PFW-abcdefg&ijklmno|NFW}] : [{NORM,NORM|TERM,TERM}] ;
```

##### **Hierarchical**

[I.11051]

```
CONN-CRS-T0:[<xy>]:uv-m-np-ddd,wx-k-qr-jjj:\
[{PFW-abcdefg&ijklmno|NFW}] : [{NORM,NORM|TERM,TERM}] ;
```

## Completion Message

Not applicable.

### Explanation Of Parameters

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |
| <b>0081-0112</b> | <b>0241-0272</b> | <b>0401-0432</b> | <b>0561-0592</b> |
| <b>0121-0152</b> | <b>0281-0312</b> | <b>0441-0472</b> | <b>0601-0632</b> |
| Unit<br>5        | Unit<br>6        | Unit<br>7        | Unit<br>8        |
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0641-0672</b> | <b>0801-0832</b> | <b>0961-0992</b> | <b>1121-1152</b> |
| <b>0681-0712</b> | <b>0841-0872</b> | <b>1001-1032</b> | <b>1161-1192</b> |
| <b>0721-0752</b> | <b>0881-0912</b> | <b>1041-1072</b> | <b>1201-1232</b> |
| <b>0761-0792</b> | <b>0921-0952</b> | <b>1081-1112</b> | <b>1241-1272</b> |

| Unit<br>9        | Unit<br>10       | Unit<br>11       | Unit<br>12       |

| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Channel number for FROM NPC

**jjj** - Channel number for TO NPC

000-030        on CEPT type NPCs grown as CAS  
000-031        on CEPT type NPCs grown as NSA

**Note:** One of the channel numbers specified (ddd or jjj) must be channel 000 (TS0), while the other channel number (jjj or ddd) must be a number other than channel 000 (non-TS0).

The NPC containing the TS0 channel must be a PA or TH type NPC, while the NPC containing the non-TS0 channel can be either a PA, PB or PC or TH type NPC.

Channel 000 is not allowed in a range of channels.

**PFW**    - Pseudo Frame Word

The PFW parameter is used to select Mode 1 of TS0 Cross-Connect: In both directions of transmission the Frame Word is replaced by a Pseudo Frame Word.

abcdefg - Value of the Pseudo Frame Word

This value replaces the Frame Alignment Signal (Bits 2 - 8) of the Frame Word being transmitted from the TO NPC to the FROM NPC.

The characters in the field represent the following bits:

|          |                           |
|----------|---------------------------|
| <b>a</b> | - Pseudo Frame Word Bit 2 |
| <b>b</b> | - Pseudo Frame Word Bit 3 |
| <b>c</b> | - Pseudo Frame Word Bit 4 |
| <b>d</b> | - Pseudo Frame Word Bit 5 |
| <b>e</b> | - Pseudo Frame Word Bit 6 |
| <b>f</b> | - Pseudo Frame Word Bit 7 |
| <b>g</b> | - Pseudo Frame Word Bit 8 |

Values for bits a - g:

|     |                                     |
|-----|-------------------------------------|
| "0" | - Sets the corresponding bit to "0" |
| "1" | - Sets the corresponding bit to "1" |

ijklmno - Value of the Pseudo Frame Word

This value replaces the Frame Alignment Signal (Bits 2 - 8) of the Frame Word being transmitted from the FROM NPC to the TO NPC.

The characters in the field represent the following bits:

|          |                           |
|----------|---------------------------|
| <b>i</b> | - Pseudo Frame Word Bit 2 |
| <b>j</b> | - Pseudo Frame Word Bit 3 |
| <b>k</b> | - Pseudo Frame Word Bit 4 |
| <b>l</b> | - Pseudo Frame Word Bit 5 |
| <b>m</b> | - Pseudo Frame Word Bit 6 |
| <b>n</b> | - Pseudo Frame Word Bit 7 |
| <b>o</b> | - Pseudo Frame Word Bit 8 |

Values for bits i - o:

|     |                                     |
|-----|-------------------------------------|
| "0" | - Sets the corresponding bit to "0" |
| "1" | - Sets the corresponding bit to "1" |

**Note:** Bit 2 of timeslot 0 in a 2Mbit/s signal is used to distinguish the Frame Word from the Non Frame Word and it must always be '0' in the FW and '1' in the NFW. When defining the Pseudo Frame Word the user must make sure that the Pseudo Frame Word can be distinguished from the Non Frame Word.

**NFW** - Non frame word

The NFW parameter is used to select Mode 2 of TS0 Cross-Connect. In both directions of transmission the Frame Word is replaced by the Non Frame Word, thus repeating the content of the Non Frame Word in consecutive frames.

If no mode is selected in the command, the default shall be NFW, that is, the default mode of operation is Mode 2.

**NORM** - Normal

NORM,NORM means that the cross-connection will come up in the normal state. The NORM keyword corresponds to the PDS TCON command.

**TERM** - Terminate

TERM,TERM means that the cross-connection will come up in the terminated state. The TERM keyword corresponds to the PDS TCNT command.

**d** - Direction

| <b>d</b> | <b>Explanation</b> |
|----------|--------------------|
| F        | From               |
| T        | To                 |
| B        | Both               |

**st** - Status

**mmmm** - Error condition code

| <b>mmmm</b> | <b>st</b>    | <i>Explanation</i>                                                    |
|-------------|--------------|-----------------------------------------------------------------------|
| <b>IDRG</b> | <b>INERR</b> | Invalid range for specified FROM NPC type                             |
| <b>IDRG</b> | <b>INERR</b> | Invalid range for specified TO NPC type                               |
| <b>IIFM</b> | <b>INERR</b> | Invalid FROM NPC type for AIS insertion                               |
| <b>IIFM</b> | <b>INERR</b> | Invalid TO NPC type for AIS insertion                                 |
| <b>SWFA</b> | <b>MCOND</b> | Active CCN side not IS or failed or pested or hardware OOS            |

## **CONN,CRS,T1,RDLD,CUS,INCL,NORM,TERM**

### **TWO-WAY NON-CANNELIZED DIGITAL SIGNAL CROSS CONNECTION**

#### **Explanation Of Command**

This message is used to form a two-way cross-connection between two non-channelized network processing circuits (NPCs). It is also used to form a terminated two-way cross-connection. The idle code is the alarm-indication signal (AIS, all ones) and does not need to be specified. The disconnect code (DCC) for 64 kbit/s disconnection cannot be used for non-channelized NPCs.

When a failure occurs or during an alarm state, the AIS is transmitted toward the TO NPC.

NPCs with customer-controlled marking retain the CUS status when disconnected. When the NPCs are reconnected without CUS or inclusive (INCL) keyword, the command will be denied. If the NPCs are reconnected with INCL keyword, they lose the CUS status.

Red circuit marking is removed when the circuit is disconnected.

#### **Command**

##### **Nonhierarchical**

[I.11011]

```

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The values are listed below:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**RDLD** - Red lined

**CUS** - Customer

Indicates a customer-controlled Circuit

**INCL** - Inclusive

Inclusive option must be used to remove CUS marking

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

NORM,NORM|TERM,TERM - {From | To} Output Termination State in MML

**NORM, NORM** - means that the cross-connection will come up in the normal state. NORM,NORM corresponds to the PDS TCON command.

**TERM, TERM** - means that the cross-connection will come up in the terminated state. TERM,TERM corresponds to the PDS TCNT command (12031).

**st** - Status of denial

**d** - Direction

**ddd,**

**jjj** - Channel numbers

**eee,**

**kkk** - Channel numbers denoting the end of a range

000-030      CEPT type NPCs grown as CAS  
000-031      CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Channel 000 and CAS channel 31 (that is, TS16 of a CEPT-type NPC) are not allowed in a range of channel numbers.

**tc**      - Trunk conditioning

tc represents the desired cross-connected signaling and insertion word applied when a failure occurs. The signaling and the insertion word specification are entered separately, with a comma as the delimiter, which have the following form:

<tc\_sig>,<tc\_iw>

The following signaling options are allowed:

| <i>tc_sig</i>    | <i>Explanation</i>                                                                                                                                                                                                     |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC----,mnop      | 1-way, 4-state signaling in binary. For CEPT type framing format, software will expand 4-state to 16-state by duplicating the format on the remaining frames on a superframe.                                          |
| TC-----,mnopqrst | 1-way, 16-state in binary. Only valid for CEPT framing formats.                                                                                                                                                        |
| TCX---,X-cd      | 1-way, 16-state in hexadecimal.                                                                                                                                                                                        |
| TRSP             | Transparent, no signaling.                                                                                                                                                                                             |
| Omitted          | Only valid for CEPT cross-connections, defaults to TCX---,X-FF if both terminations are channel associated signaling type. It will default to TRSP if one of the terminations is a nonsignaling associated (NSA) type. |

The following insertion word options are allowed:

| <i>tc_iw</i> | <i>Explanation</i>                                                                                                                    |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------|
| IW-X-pq      | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted to the downstream direction of a failure on the line. |
| Omitted      | Only valid for CEPT, will default to IW-X-FF.                                                                                         |

Besides that, additional rules apply for CEPT cross-connections.

Allowable signaling types and signaling consequent actions are given in Table 1 and allowable cross-connected time slot consequent actions are given in Table 2.

**TC** - Trunk conditioning

When the DCC option is provided in the disconnect command, a 4-bit pattern is inserted into the associated portion of time slot 16 for CAS circuits when the circuit is disconnected.

**CAS** - Channel associated signaling

Channel associated signaling in time slot 16

**TRSP** - Transparent

No signaling sent out in the associated portion of time slot 16 for CAS primaries. TRSP is the only option for NSA primaries.

**Table 8-8. Allowable Signaling Type and Signaling Consequent Action**

| Primary Type in Cross-connect | Allowable <tc> Signaling Specification | Resulting Signaling Code<br><br>FROM, TO    | Resulting Signaling Consequent Action (Hardware)<br>FROM, TO | Resulting Signaling Consequent Action (Firmware)<br>FROM, TO | Resulting Disconnect (When DCC used in disconnect command) |
|-------------------------------|----------------------------------------|---------------------------------------------|--------------------------------------------------------------|--------------------------------------------------------------|------------------------------------------------------------|
| CAS ↔ CAS                     | <b>TRSP</b>                            | Fixed at <b>X-D</b>                         | Fixed at <b>X-D</b>                                          | Fixed at <b>X-D</b>                                          | <b>X-D</b>                                                 |
|                               | <b>TC-X-uv, X-yz*</b>                  | CAS (Passed Through)                        | <b>X-F</b>                                                   | <b>X-uv, X-yz</b>                                            | <b>X-v, X-z</b>                                            |
|                               | Omitted                                | CAS (Passed Through)                        | <b>X-F</b>                                                   | <b>X-F</b>                                                   | <b>X-F</b>                                                 |
| NSA ↔ CAS                     | <b>TRSP/Omitted</b>                    | None (Fixed at <b>X-D</b> in CAS direction) | Fixed at <b>X-D</b> in CAS direction                         | Fixed at <b>X-D</b> in CAS direction                         | <b>X-D</b> in CAS direction                                |
| NSA ↔ NSA                     | <b>TRSP/Omitted</b>                    | Not appl.                                   | Not appl.                                                    | Not appl.                                                    | Not appl.                                                  |

\* For TCON and TCNT TC is X-uv,X-yz.  
For OCON, OCNT and BCON TC is --,X-yz.

| Allowable <tc> Time slot X-connect keyword | Resulting Cross-Connected Time slot Consequent Action TO | Resulting Disconnect Code (when DCC used in disconnect command) |
|--------------------------------------------|----------------------------------------------------------|-----------------------------------------------------------------|
| Omitted                                    | X-FF                                                     | X-FF                                                            |
| IW X-pq*                                   | X-FF                                                     | X-pq                                                            |

\* Only used as a means of providing per time slot DCC codes. If the DCC code is not used when issuing the disconnect command, then the insertion word at the time the NPC was grown is used. This growth insertion word defaults to hex "D5" if not explicitly specified at growth time.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**sc** - Signaling control

The variable **sc** represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC-----,efgh**

**efgh** - To direction

Where **efgh** represents the four time slot 16 signaling bits to be controlled. All 4 bits can be controlled independently. Control is applied by replacing each character in the variable **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

|          |                        |
|----------|------------------------|
| <b>P</b> | Pass through unchanged |
| <b>V</b> | Pass through inverted  |
| <b>0</b> | Set output to 0        |
| <b>1</b> | Set output to 1        |

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To directions. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Two-Point:*

- |            |                                                                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E1 to DS1  | Gateway cross-connects have A-law to $\mu$ -law and $\mu$ -law to A-law conversion set as a default. The <b>NAM</b> keyword is used to disable the conversions.                                                                         |
| E1 to E1   | Default, the <b>NAM</b> keyword may be used but there is no need to specify <b>NAM</b> explicitly since A-law to $\mu$ -law and $\mu$ -law to A-law conversion is not needed, and therefore not performed, for a pure E1 cross-connect. |
| DS1 to DS1 | Not applicable.                                                                                                                                                                                                                         |

**CUS** - Customer

Used to indicate a customer-controlled circuit

**RDLD** - Red lined

**INCL** - Inclusive

A termination designated as customer controlled or a red circuit cannot be disconnected or modified without using the INCL keyword in the message. Also, an NPC which supports these circuits cannot be manually removed unless the inclusive keyword is given in the remove message.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**NORM** - Normal

NORM indicates that the cross-connection will come up in the normal state. This corresponds to the PDS OCON command.

**TERM** - Terminate

TERM indicates that the cross connection will come up in the terminated state. This corresponds to the PDS OCNT command.

**mmm** - FROM channel number involved in the denial (ddd through eee)

**nnn** - TO channel number involved in the denial (jjj through kkk)

**st** - Status of denial

**d** - Direction

| UTST  | {F T B} | Under Test                   |

## **CONN,CRS1,T0,NAM,RDLD,CUS,INCL,NORM**

### **ONE WAY CROSS-CONNECTIONS**

#### **Explanation Of Command**

This command requests a one-way cross-connection from the specified FROM termination(s) and to the TO termination. It is used to construct a one-way multipoint circuit. The backbone and broadcast terminations are on the virtual NPCs.

If the user wants to cross-connect Nx64 kbits/s circuits, then the range feature of this command should be used.

### Explanation Of Parameters

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC                                   |
|-----------|----------|---------------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02 (DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06 (DACS II CEF frames)</b>     |

**ddd,**

**jjj** - Channel numbers

**eee,**

**kkk** - Channel numbers denoting the end of a range specification

000-030          CEPT type NPCs grown as CAS  
000-031          CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

001-500          (Virtual NPC)

**Note:** Range values -eee, -kkk apply only to the FTU/DS3U/HDS3U end of an FTU/DS3U/HDS3U Virtual NPC circuit, that is, they cannot apply to the Virtual NPC end of the circuit.

*fmd*

tmd      Explanation

LEG      Non-VI circuit end of the cross connections. Must be an FTU/DS3U/HDS3U channel.

BRD      Nonbackbone leg of a virtual conference. Must be a virtual NPC channel.

BBL      Backbone leg of a virtual conference. Must be a Virtual NPC channel.

For OCON multipoint circuits, there are two valid combinations for fmd and tmd:

|         |                                                        |
|---------|--------------------------------------------------------|
| fmd,tmd | Explanation                                            |
| LEG,BBL | For the backbone leg of a broadcast multipoint circuit |
| BRD,LEG | For the broadcast legs of the multipoint circuit.      |

**Note:** Default values for noise guard (NG) and echo suppression (ES) are applied to symmetrical bridges (multipoint mode SYM) and polling circuits (multipoint mode BBL,BRD). These default values are:

|                     |            |            |
|---------------------|------------|------------|
| Symmetrical bridges | NG = -18db | ES = -18db |
| Polling circuits    | NG = 0db   | ES = 0db   |

**tc**      - Trunk conditioning, which has the input form:

**TRSP, {IW-X-pq|TRB|MUX}**

Represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. The TRSP (transparent) signaling specification is the only one allowed.

The following signaling option is allowed:

| <i>tc</i> | <i>Explanation</i>         |
|-----------|----------------------------|
| TRSP      | Transparent, no signaling. |

The following insertion word options are allowed:

| <i>IW</i> | <i>Explanation</i>                                                                                                                       |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW-X-pq   | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| TRB       | Standard trouble code, equal to IW-X-E4, not valid for CEPT.                                                                             |
| MUX       | MUX out of sync code, equal to IW-X-1A, not valid for CEPT.                                                                              |
| Omitted   | Only valid for CEPT, will default to IW-X-FF.                                                                                            |

In addition, for CEPT and gateway connections, the terms CAS, TRSP, and IW defined below are used in Tables A and B. Hex notation is shown for brevity, but binary is allowed.

**CAS** - Channel associated signaling

Indicates that channel associated signaling has been applied in time slot 16.

**TRSP** - Transparent

No signaling sent out in the associated portion of time slot 16 for CAS primaries.

**IW** - Insertion word

The insertion word is provided with the DCC option, an 8-bit pattern that is inserted in the specified time slot when the circuit is disconnected.

During the alarm state, AIS (all ones) is sent out in the specified time slot.

All leg connections to multipoint circuits using a Virtual NPC must use TRSP signaling (no signaling). The insertion word portion is user specified as noted above and may be varied from leg to leg.

**Note:** In a gateway application, when E1 channels are connected to T1 channels, the following rules apply to the transmittal of the Insertion Word (IW) towards the facility. If the Insertion Word needs to be transmitted towards the facility as a result of consequent action, then the Insertion Word transmitted by the T1 NPC towards its transmission facility is the Insertion Word specified in this command; however, the Insertion Word transmitted by the E1 NPC towards its facility is always X'FF.

**NAM** - No A-law to  $\mu$ -law

The A-law to  $\mu$ -law and  $\mu$ -law to A-law code translators on the E1 type NPC are disabled. This keyword is valid in the following types of cross-connects:

*Multi-Point:*

E1 to E1      Multi-point cross-connects have A-law to  $\mu$ -law and  $\mu$ -law to A-law set as a default. This conversion is performed on pure E1 multi-point connections in case a DS1 leg is ever added to the broadcast connection. The **NAM** keyword is used to disable the conversions. It may be desirable to disable conversions in a pure E1 multi-point cross-connect since such a connection has more quantization noise than a pure E1 two-point cross-connect. This is due to the back to back A-law to  $\mu$ -law and  $\mu$ -law to A-law conversions which are taking place.

E1 to DS1 or      Same explanation as E1 to E1.  
DS1 to E1

DS1 to DS1      Not applicable.

**CUS** - Customer

Customer-controlled circuit

The optional CUS field indicates a customer controlled circuit. All legs on a multipoint customer-controlled circuit must be designated CUS.

**INCL** - Inclusive

A disconnected termination previously marked CUS remains as a customer controlled termination. The INCL keyword must be used to reconnect this termination to other terminations. However, if they are reconnected without the CUS keyword, they lose their customer controlled status.

**RDLD** - Red lined

All legs on a multipoint red circuit must be designated RDLD.

**NORM** - Normal

**TERM** - Terminate

NORM|TERM- Output Termination State

NORM is the equivalent for OCON command in PDS (default)  
TERM is the equivalent for OCNT command in PDS  
(Message number 12121)

ddd,jjj -Channel numbers

mmm - FROM channel number involved in the denial ( $ddd \leq mmm \leq eee$ )

st - Status

d - Direction (F = From, T = To, B = Both)

mmm - Error condition code

| mmm  | st      | Explanation                                                           |

## **CONN,CRS1,T1,RDLD,CUS,INCL,NORM,TERM**

### **ONE-WAY NON-CHANNELIZED DIGITAL SIGNAL CROSS CONNECT**

#### **Explanation Of Command**

This message requests a one-way cross-connection between two non-channelized network processing circuits.

The idle code is the alarm-indication signal (AIS-all ones), and does not need to be specified. The disconnect code for 64 kbit/s disconnection cannot be used for non-channelized network processing circuits.

When a failure occurs or during an alarm state, the AIS is transmitted toward the TO network processing circuits.

## **CONN,HUB,T0,NAM**

### **TWO-WAY TEST ACCESS, HUB**

#### **Explanation Of Command**

This command requests a hubbing mode test access via a specified test port (TP) to the TO termination. In the hubbing mode, DACS II is used as a test access concentrator to connect a local TP to a remote TP. The cross-connection will be made between TP **kk** and two 64-kb/s channels, the TO end of which is specified in the command. Successive termination numbers **jjj** and **ddd** correspond to lower and upper channels of the test port, respectively. These two channels are from a test port in another DACS II or other test access device to be cross-connected. DACS II does not know if the requested access is, in fact, to a hubbed test port on another frame; however, the request will be denied if either channel is mapped, under test, or if channel **jjj** would be out of range on the NPC.

Trunk conditioning **<tc>** may be specified, however, it only has an effect on Gateway (T1-E1) conversion circuits. For hub test access of non-Gateway circuits, any trunk conditioning values entered by the user will be overwritten by all one values for the circuit's signaling and insertion word.

#### **Command**

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical TO NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**jjj** - TO channel number

The TO channel number must correspond to a lower channel of a test port for CEPT and Primary digroups

**tc** - Trunk conditioning

tc represents the desired cross-connected signaling and insertion word applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. The signaling and the insertion word specification are entered separately, with a comma as the delimiter.

| <i>signaling</i>     | <i>Explanation</i>                                                                                                                                                                |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC-ijkl,mnop         | 2-way, 4-state signaling in binary. For CEPT and ESF type framing format, software will expand 4-state to 16-state by duplicating the bits.                                       |
| TC-efghijkl,mnopqrst | 2-way, 16-state in binary.                                                                                                                                                        |
| TC-X-ab,X-cd         | 2-way, 16-state in hexadecimal.                                                                                                                                                   |
| TRSP                 | Transparent, no signaling.                                                                                                                                                        |
| Omitted              | Default is TC-X-FF,X-FF if both terminations are channel associated signaling types (CAS). Default will be TRSP if one of the terminations is nonsignaling associated (NSA) type. |

| <i>insertion word</i> | <i>Explanation</i>                                                                                                                       |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW-X-pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| Omitted               | Will default to IW-X-FF.                                                                                                                 |

**mmm** - Channel number

Variable mmm is equal to jjj + 1. Must be an even number.

**kk** - Test port number (01 through 96)

- F** - FROM NPC is in CGA  
**0** - FROM NPC is not in CGA  
**T** - TO NPC is in CGA  
**0** - TO NPC is not in CGA  
**P** - Test port NPC is in CGA  
**0** - Test port NPC is not in CGA

**Note:** FROM test port NPC will never appear in the CGA condition.

Signaling mode of port

- T** - Transparent  
**R** - Robbed bit Signaling  
**C** - Channel associated signaling (CAS)  
**H** - Hubbing

**ASGN** - Assigned

The test port is already assigned.

**NMON** - Not monitor

The test port is not in monitor mode.

**st** - Status

**Note:** When st is set to "T NOT LOWER", for CEPT type NPCs, jjj must be one of the following channels:

005, 007, 009, 011, 013, 016, 018, 020, 022, 024, 026, or 028.

| <b>st</b>      | <i>Explanation</i>                   |
|----------------|--------------------------------------|
| <b>BADCCB</b>  | CCB OOS or failed                    |
| <b>BADCCN</b>  | CCN OOS or failed                    |
| <b>BADCHAN</b> | Bad channel number was specified     |
| <b>BADFC</b>   | FC OOS or failed                     |
| <b>BADFCB</b>  | FCB OOS or failed                    |
| <b>BADFLI</b>  | FLI OOS or failed                    |
| <b>BADFMT</b>  | FMT (Formatter) OOS or failed        |
| <b>BADFTMI</b> | FTMI OOS or failed                   |
| <b>BADMIU</b>  | MIU OOS or failed                    |
| <b>BADMXR</b>  | MXR OOS or failed                    |
| <b>BADNPC</b>  | Bad NPC number                       |
| <b>BADTSI</b>  | TSI OOS or failed                    |
| <b>BADUNIT</b> | UNIT OOS or failed                   |
| <b>EVEN</b>    | TO termination is not an odd channel |
| <b>FAIL</b>    | Test port Group NPC failed           |

| <b>st</b>          | <i>Explanation</i>                                         |
|--------------------|------------------------------------------------------------|
| <b>IMPR TC</b>     | Improper trunk conditioning specification                  |
| <b>MCOND</b>       | An entity in the network is OOS or failed                  |
| <b>NA</b>          | DACS CCN or UNIT involved cannot perform the cross-connect |
| <b>NAM_NA</b>      | NAM keyword is not applicable to the cross-connection type |
| <b>NOT IDLE</b>    | Test port is not idle                                      |
| <b>OOS</b>         | Test port Group NPC out of service                         |
| <b>SG COND 02</b>  | Test port is static                                        |
| <b>T CLR</b>       | The TO NPC is a clear-DS1 or clear-2Mb NPC                 |
| <b>T FAIL</b>      | TO side NPC is marked failed                               |
| <b>T NOT CAS</b>   | TO termination not CAS.                                    |
| <b>T NOT LOWER</b> | TO termination is not the lower test access channel        |
| <b>T OOS</b>       | TO side NPC is Out Of Service                              |
| <b>T UEQD</b>      | TO side NPC is Unequipped                                  |
| <b>T UTST</b>      | TO termination is under test                               |

| <b>T_SCDG</b>      | TO termination is an RT (DL) termination                   |
| <b>UEQD</b>        | The test port Group NPC is unequipped                      |

---

## CONN,HUB,T0,TG

---

### NX64Kbit/s TWO-WAY TEST ACCESS, HUB

#### Explanation Of Command

---

To set up an Nx64Kbit/s hub test access connection via a test-access group to an Nx64Kbit/s TO termination. The TO termination consists of two Nx64Kbit/s bundles that will be connected to the test-access group's east and west bundles. These channel bundles must be of the same width as the test-access group. If all of the channels, starting at the number specified for the TO termination, are not available the first unavailable channel encountered will cause the command to be denied. The channel that caused the denial will be reported in the denial message.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**TG** - Test (access) group

**mmm** - Test access group number (001 through 400)

TG is designated as in the GRTH,TG,NPCTG command.

**HUB** - Hub

**[s]abc** - 3- or 4-digit non-hierarchical first TO NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical second TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical first TO NPC number

**wx-k-qr**

- Hierarchical second TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Starting channel number of first TO NPC  
**jjj** - Starting channel number of second TO NPC  
**ppp** - First channel causing denial

|         |                                                          |
|---------|----------------------------------------------------------|
| 001-030 | Primary NPCs grown as Channel Associated Signaling (CAS) |
| 001-031 | Primary NPCs grown as Non Signaling Associated (NSA)     |

**tc** - Trunk conditioning

For TGs supported by NSA NPCTG(s), the TO NPC(s) must be NSA type also. The default and the only allowed <tc> is TRSP IW FF. Any other input will result in denial.

For TGs supported by CAS NPCTG(s), the TO NPC(s) must be CAS type also. If TRSP is entered as <tc>, TRSP IW FF will be used as <tc>. If anything else or nothing is entered, TC(FF,FF) IW FF is used.

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC-abcd,efgh**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**CGA** - Carrier group alarm

**PBA** - Primary block alarm

**F** First TO NPC is in CGA or PBA

**0** First TO NPC is not in CGA or PBA

**S** Second TO NPC is in CGA or PBA

**0** Second TO NPC is not in CGA or PBA

E East-bundle NPCTG in CGA or PBA  
W West-bundle NPCTG in CGA or PBA  
B NPCTG(s) supporting both bundles in CGA or PBA  
0 NPCTG(s) not in CGA or PBA

**RDLD** - Red lined

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

**NN** - TG width (1 through 31)

**mmmm** - Error condition code

**mmmm** *Explanation*

**SNVS** NPC type error  
**SWFA** Active CCN side not IS or failed or pested or hardware OOS  
**ENEQ** UNIT not equipped, not in service, or failed  
**ENEQ** CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS  
**ENEQ** FTMI not equipped, not in service, or failed  
**ENEQ** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS  
**ENEQ** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS  
**ENEQ** DSPI not equipped, not in service, or failed  
**ENEQ** Required FLI not equipped, not in service, or failed  
**ENEQ** Required MXR not equipped, not in service, or failed  
**ENEQ** Reqd FMT not eqd,not IS,or failed,or inact side FMT not eqd, or not IS  
**ENEQ** Required MIU not equipped, not in service, or failed  
**ENEQ** ETSI not equipped, not in service, or failed  
**IDNV** TS0 specified with width not 1  
**SNVS** Illegal test access mode for TS0  
**IDNV** TS16 specified for test with width not 1  
**SNVS** Illegal test access mode for TS16  
**IDNV** Invalid channel number  
**ENEQ** test group unequipped  
**SAAS** channel part of a TP or TG  
**SAAS** channel already under test  
**SNVS** Gateway test access not supported  
**IDNC** TG width incompatible with circuit  
**IDNC** inconsistent HUB width for specified TG  
**IDNV** Invalid TC specification  
**SNIS** NPC not in service or failed  
**IDNV** Inconsistent Signaling on CEPT NPCTGs  
**SNVS** invalid test access mode

mmm Explanation

**IDRG** input channel out of range (SLC not supported)  
**SAAS** circuit contains mapped channels for HUB request  
**IDNV** TG East/West type inconsistent with each other or circuit  
**IDNC** incompatible HUB feature types

## **CONN,HUB,T1,INCL**

---

### **NON-CANNELIZED TEST HUB**

#### **Explanation Of Command**

---

This message sets up a non-channelized hub connection between a facility access digroup (FAD), or test network processing circuit (NPC) and a remote FAD. The FAD is connected to an NPC which is connected to a remote test NPC. The NPCs cannot be part of an existing mapped circuit or test connection.

During a hub test session if a hard-reset or link failure occurs the hub test session is released automatically. However, if the failure is such that it prevents release at the time of logout, or if the FAD fails, the hub test session is NOT automatically released and can be released by manual disconnection.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

[s]abc - The 3- or 4-digit nonhierarchical number of test NPC or Facility Access Digroup (FAD).  
[t]jkl - The 3- or 4-digit nonhierarchical number of TO NPC connected to the remote FAD

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

## **CONN,TACC,T0,NAM,MON**

### **TWO-WAY TEST ACCESS, MONITOR**

#### **Explanation Of Command**

This command can be used to do one of two things:

1. To set up a previously unassigned test port to monitor a particular termination.
2. To change a previously assigned test port to monitor mode.

If the test port is already in the monitor mode, DACS II will deny the execution of the message.

The trunk conditioning (**tc**) specified in this command applies only when accessing an unmapped termination. For an access to a mapped circuit, **tc** is adopted from the circuit being accessed and, therefore, will be ignored if specified.

The DACS II test ports are either static or dynamic. A test port is defined as static when trunk conditioning is specified in a test port provisioning command otherwise it is a dynamic test port. If this test port is static, trunk conditioning must be specified.

If the test port is in the split mode, do not specify the TO NPC number.

For Broadcast (BCON) connections test access shall be denied except for the TS0 to non-TS0 connection.

This command does **not** monitor any connections inside a Digital Signal Processing Platform (DSPP) application, such as the DDS Subrate and MJU application, the X.50 International subrate application, or the DMB application. However, test ports may be established to any of the applications via application commands, and may then be used, again via application commands, to monitor or split circuits within the application. If a test port has been established to an application, then that test port will always appear as a split connection in an invocation of the RTVE-TACC-T1 command, regardless of whether that test port is in monitor, split, or release mode inside the application.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**kk** - Test port number (01 through 96)

A test port is mapped to predesignated channels of a network processing circuit for test ports (NPCTP) during the provisioning of that test port.

Only NPC types that have been provisioned for channel associated signaling (CAS) can be provisioned as an NPCTP.

For the mapping between the test ports and the channels of the test NPCs, see the CRTE-EQPT::TP Message

The DACS II test ports are either static or dynamic, as defined in the CRTE-EQPT::TP message.

If the test port is in the split mode, TO [t]ghi-jjj may not be specified.

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

#### uv-m-np

- Hierarchical TO NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

#### jjj - TO Channel number

Channel numbers

000-030 CEPT type NPCs grown as CAS  
000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

001-085 (MB NPC)

**tc** - Trunk conditioning

If the tc option was not furnished in the test port provisioning command, it must be furnished in this input command to provide a test connection for unmapped circuits; otherwise, the test access will be denied.

Represents the desired signaling and insertion word to be applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. For example, TRSP,IW-X-pq (input form).

For channel 031 on a CAS primary, tc must take on the value TRSP, and will override any tc option provided in the input command.

**Note:** For mapped terminations, tc takes on the mapped cross-connect tc value and overrides any tc option provided in the input command.

For unmapped terminations, trunk conditioning will be applied as follows:  
If tc is omitted from this command and was omitted in the test port provisioning command, the command will be denied (unless CAS channel 031).

If tc is omitted from this command but was provided in the test port provisioning command, the tc value provided in the provisioning command is applied.

If tc is provided in this command, it overrides the value, (if provided), in the test port provisioning command.

| <i>signaling</i>     | <i>Explanation</i>                                                                                                                                                          |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC-ijkl,mnop         | 2-way, 4-state signaling in binary. For CEPT and ESF type framing format, software will expand 4-state to 16-state by duplicating the bits.                                 |
| TC-efghijkl,mnopqrst | 2-way, 16-state in binary.                                                                                                                                                  |
| TC-X-ab,X-cd         | 2-way, 16-state in hexadecimal.                                                                                                                                             |
| TRSP                 | Transparent, no signaling.                                                                                                                                                  |
| Omitted              | Default is TC-X-FF,X-FF if both terminations are channel associated signaling types. Default will be TRSP if one of the terminations is nonsignaling associated (NSA) type. |

| <i>insertion word</i> | <i>Explanation</i>                                                                                                                       |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW-X-pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| Omitted               | Will default to IW-X-FF.                                                                                                                 |

For 4-state signaling, the A/B signaling bits of both test port channels are specified by ijkl for the receive time slot interchange (RTSI), and by mnop for the transmit time slot interchange (TTSI).

For 16-state signaling, the A/B/C/D signaling bits of both test port channels are specified by efghijkl (or hexadecimal digits ab) for the RTSI, and by mnopqrst (or hexadecimal digits cd) for the TTSI.

**NAM** - No A to Mu (conversion)

This keyword is used to disable the A- to  $\mu$ -law conversions on CEPT type NPCs which can be either the tested circuit or a test port itself.

The NAM keyword will have this meaning only on the following three configurations; in other test access configurations the DACS II will provision the accessed circuits appropriately and therefore the NAM keyword will be ignored.

Unmapped domestic termination accessed via a CEPT test port

Unmapped CEPT termination accessed via a domestic test port

Mapped pure domestic circuit accessed via a CEPT test port

- [s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number
- [s]klm** - The 3- or 4-digit nonhierarchical FROM NPC number
- [t]pqr** - The 3- or 4-digit nonhierarchical TO NPC number

**wx-k-qr**

- Hierarchical FROM NPC number.

Supports the termination that is cross-connected to channel ghi-jjj.

**[s]klm-nnn**

- Nonhierarchical format termination being tested as FROM on test port kk otherwise the same as [s]abcdddd. If this field is all zeroes, test port kk is assigned to an unmapped termination.

**ed-h-fg-nnn**

- Hierarchical format of [s]klm-nnn

pqr-sss - Nonhierarchical format termination being tested as TO on test port kk;  
otherwise, the same as abc-ddd.

**op-j-st-sss**

- Hierarchical format of [t]pqr-sss

**ddd** - FROM channel number of the termination that is cross-connected to

**nnn** - FROM channel number of the termination that is cross-connected to  
channel [t]ghi-jjj.

**sss** - TO channel number

**SG** - Signaling

**g** - Signaling mode of test port kk

*g Explanation*

C Channel Associated Signaling (CAS)

R Robbed Bit Signaling

T Transparent

T TO NPC is in PBA

0 TO NPC is not in PBA

P Test port NPC is in PBA

0 Test port NPC is not in PBA

**RDLD** - Red lined

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer controlled circuit.

**ONEWAY**

- One-way

The cross-connection tested is a one-way circuit.

R RELEASED. Neither side is terminated

F FROM side is terminated

T TO side is terminated

B BOTH sides are terminated

**ASGN** - Assigned

The test port is already assigned to another termination, denoted by [s]klm-nnn,[t]pqr-sss (or ed-h-fg-nnn,op-j-st-sss)

**reason** - Reason for denial

**mmmm** - Error condition code

## **CONN,TACC,T0,TG,MON**

### **NX64Kbit/s TWO-WAY TEST ACCESS, MONITOR**

#### **Explanation Of Command**

This command is used to request a monitor test access of a specified group of Nx64Kbit/s terminations. Monitor test access of a broadcast TS0 to non-TS0 connection will not use this command but will use I.21001 instead. The test access is made through the test-access group specified in the command line.

The N TO channels to be tested may be entered as a range, a list, or a combination of both, in ascending order. For two-point circuits, the numbers do not have to be consecutive, and the circuits may have been cross-connected separately. For a one-way circuit under test, the other direction of the same termination cannot be tested at the same time. For Nx64Kbit/s broadcast circuits, the channels have to be consecutive and must have been set up together for the same broadcast circuit.

The primary output line will not echo the input with range(s) of channels, but will show a list of all channels.

Not applicable.

## Explanation Of Parameters

**MON** - Monitor

**T0** - To

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uv-m-np**  
- Hierarchical FROM NPC number

**wx-k-qr**  
- Hierarchical TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

For an unmapped TO termination, or a backbone leg (BBL) without return, the FROM NPC number will be shown as zeroes.

**ddd** - FROM Channel number  
**jjj, kkk, lll**  
- TO Channel numbers  
**ppp** - First TO Channel number causing denial

kkk is shown as an example of a range jjj-kkk of TO channels, and lll is an example of an item on a list of TO channels.

001-031\*      Primary NPCs grown as Channel Associated Signaling (CAS)  
001-031      Primary NPCs grown as Non Signaling Associated (NSA)

\* Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If channel jjj is mapped to a channel 000, the circuit can only be tested as N = 1, and the corresponding FROM channel ddd will be '000'.

**tc**      - Trunk conditioning

For mapped circuits, regardless of what is specified here, the circuit's tc will be used but not shown in the output response.

For unmapped circuits, if the static tc was not furnished when the TG was provisioned, it must be dynamically specified in this command or the test access will be denied. A dynamic tc will override any static tc. The effective tc will be used for all channels under test, and will be shown in the output.

For any unmapped circuits tested by NSA TGs, TRSP must be entered for tc or the command will be denied.

For channel 031 on a CAS primary, any tc value specified will be replaced by TRSP.

**TG**      - Test-access Group

**mmm**      - Test-access Group number (001 through 400)

The TG is designated as in CRTE-EQPT::TG and must have the same width as the number of channels specified in this message.

|          |                                         |
|----------|-----------------------------------------|
| <i>g</i> | <i>Explanation</i>                      |
| T        | All channels are Transparent (TRSP)     |
| C        | At least one channel is CAS or non-TRSP |

**CGA** - Carrier group alarm

**PBA** - Primary block alarm

**ftb** - CGA or PBA state

*f Explanation*

F FROM NPC is in CGA or PBA  
0 FROM NPC is not in CGA or PBA

*t Explanation*

T TO NPC is in CGA or PBA  
0 TO NPC is not in CGA or PBA

*b Explanation*

B NPCTG(s) supporting both bundles in CGA or PBA  
E East-bundle NPCTG in CGA or PBA  
W West-bundle NPCTG in CGA or PBA  
0 NPCTG(s) not in CGA or PBA

**RDLD** - Red lined

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

**ONEWAY** - One-way

The cross-connection tested is a one-way circuit.

**BCAST** - Broadcast

The cross-connection tested is part of a broadcast circuit.

*s Explanation*

R All channels are released  
F At least one FROM channel is terminated  
T At least one TO channel is terminated  
B At least one FROM and TO channel is terminated

**UNMAP** - Unmapped

The circuit under test is unmapped.

**mmmm** - Error condition code

## **CONN,TACC,T1,AIS,INCL**

### **NON-CANNELIZED TEST ACCESS (MONITOR, SPLIT, OR LOOP)**

#### **Explanation Of Command**

This message sets up non-channelized test access in the monitor modes MONE, MONF, MONEF; the split modes SPLTA, SPLTB, SPLTAB, SPLTE, SPLTF, SPLTEF; and the loop modes LOOPE or LOOPF. The circuit under test can be one unmapped Network Processing Circuit (NPC), or a pair of mapped NPCs. The mapped circuit may be a one-way, two-way or broadcast circuit. A one-way circuit can only be tested in modes MONE and SPLTA. Only one test connection can exist at a time for any circuit.

For test modes MONEF, SPLTAB and SPLTEF two Facility Access Digroups (FADs), or test NPCs, are connected. The first FAD number is required; the second FAD can be user specified, or assigned by default to be NPC numbered n+1, where n is the NPC number of the first FAD. If n is the highest NPC number on the DACS II frame, the first NPC on the frame will be used as default for the second FAD. Whether a FAD is user specified or assigned by DACS II, the command will be denied if the FAD is assigned or has invalid type. One FAD is connected for all other modes.

During a test session, if a hard-reset or link failure occurs, the test session is released automatically. However, if the failure is such that it prevents release at the time of logoff, or if the FAD fails, the test session is NOT automatically released and can be released by manual disconnection.

The E- and F-end NPCs for non-channelized test access correspond to the FROM and TO NPCs of a cross-connection, respectively. For a broadcast circuit the full tributary is considered to be a two-way connection, and all other tributaries are one-way connections. Only one test session can exist for a circuit at a time. The FAD or test NPC corresponds to test ports for DS0 test access.

For modes SPLTE and LOOPE, the idle output port of the F-end NPC, and any other output ports the E-end is transmitting to, must be set to AIS.

For modes SPLTF and LOOPF, the idle output port of the E-end NPC, and any other output ports the F-end is transmitting to, must be set to AIS.

The output signal on all idle output ports related to a test session are restored to their previous values when the test modes are changed or test access is released. The OUTPUT modes can be overwritten when the NPC is test accessed.

## Command

---

### Nonhierarchical

---

[I.20001]

```

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**tmode** - Test mode

| <i>tmode</i> | <i>Explanation</i>                                                                                                                                                    |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MONE         | Monitor signal from equipment E-end NPC to facility F-end NPC of unmapped or one-/two-way mapped test session                                                         |
| MONF         | Monitor signal from F-end NPC to E-end NPC of a two-way mapped test session                                                                                           |
| MONEF        | Monitor a two-way mapped connection in both directions; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs |
| SPLTA        | Split the A signal from the equipment E-end NPC to the facility F-end NPC of one-/two-way mapped test session                                                         |
| SPLTB        | Split the B signal from the F-end NPC to the E-end NPC of a mapped two-way test session                                                                               |
| SPLTAB       | Split both A and B signals of a two-way test session; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs   |
| SPLTE        | Split the input and output ports of E-end NPC of an unmapped or two-way mapped test session                                                                           |
| SPLTF        | Split the input and output ports of F-end NPC of a two-way mapped test session                                                                                        |
| SPLTEF       | Split a two-way mapped test session in both directions; two FADs are connected for the test session, and test mode can only be changed to another mode using two FADs |

**LOOPE**            Loop the E-end input port to the output port, and connect the looped signal to the FAD; the test session may include an unmapped or two-way mapped connection

**LOOPF**            Loop the F-end input port to the output port, and connect the looped signal to the FAD; only for a two-way mapped test session; not allowed for one-way broadcast tributaries

**[s]abc**            - The 3- or 4-digit nonhierarchical number of test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this is the first of two test NPCs; the message is denied if this NPC is assigned

**[t]def**            - The 3- or 4-digit nonhierarchical number of second test NPC or FAD  
For MONEF, SPLTAB and SPLTEF modes this number can be user specified, if none is entered the next higher NPC number to [s]abc is used; the message is denied if it is assigned

**[u]ghi**            - Nonhierarchical number of E-end NPC.  
This is the reference NPC for the test session; it is a mapped or unmapped NPC, or the backbone of a clear-DS1 broadcast circuit, depending on the test session specified

**[v]jkl**            - Nonhierarchical number of current F-end NPC of the test session.  
This NPC is defined only if it is mapped to the E-end NPC. If this NPC is omitted from the input command, the NPC mapped to the E-end NPC becomes the F-end NPC or if the test session involves a broadcast circuit, the full tributary becomes the F-end NPC. If a full tributary does not exist, the NPC must be given to specify the tributary being tested. Omit this NPC if the E-end NPC is unmapped.

**[t]klm**            - The 3- or 4-digit nonhierarchical number of problematic NPC

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

**uv-m-np**

- Hierarchical number of test NPC or FAD

**wx-k-qr**

- Hierarchical number of second FAD

**eg-h-ij**

- Hierarchical number of E-end NPC

**jk-l-mn**

- Hierarchical number of F-end NPC of the test session.

**gh-k-lm**

- Hierarchical number of problematic NPC

**uv,wx,eg,jk,gh**

- Unit number

m,k,h,l - Module number

**np,qr,ij,mn,lm**

- NPC number

The valid values are listed below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**AIS** - Alarm indication signal.

May be specified to be idle signal. AIS must be entered for all test modes resulting in idle output port(s): SPLTE, SPLTF, SPLTEF, LOOPE, and LOOPF. AIS input will be denied for test access of an unmapped NPC, and all other test modes.

**INCL** - Inclusive

Required for test session with red or customer-controlled NPC(s), except for MONE, MONF and MONEF modes. INCL will be ignored if the circuit is NOT RDC or CUS.

**RDLD** - Red lined circuit

Test session has red NPC(s)

**CUS** - Customer

Customer-controlled circuit. Test session has Customer-controlled NPC(s)

**ONEWAY** - One way cross-connection

Test session has one-way cross-connection

**UMPD** - Unmapped

Test session has unmapped NPC

*emode*

*fmode Explanation*

**NORM** - The circuit under test is not terminated in this direction

**TERM** - The circuit under test is terminated in this direction

The emode output is omitted for one-way circuits

Both emode and fmode are omitted for unmapped circuits

**mmmm** - Error condition code

## **COPY,EQPT,NPC**

### **COPY NPC**

#### **Explanation Of Command**

This command is used to copy provisioning information from a previously provisioned network processing circuit (NPC) to an NPC to be provisioned (the destination NPC). It is used for international NPC types PA, PB, PC and TH. Intervention Level data for the NPC is also copied. Copying is limited to the combinations given below:

- PA to PA
- PB to PB
- PC to PC
- PB to PC
- PC to PB
- TH to TH

One output message is printed for each NPC successfully copied and provisioned.

When a range address crosses a Unit boundary, the command will be denied. The NPC numbers which are divisible by four with a remainder of zero are not a valid Hybrid DS3 Unit THxyz type NPC. However, the range of THxyz type NPC numbers is still supported with the understanding that there may be gaps in the NPC number range.

When an NPC range specified within a Unit crosses a Facility Terminating Module (FTM) boundary and the FTM type differs from that specified in this command then that FTM will be skipped and a summary denial message will be output. This message will give the range of NPCs for which the denial is effective and the reason for the denial. The NPC range covers successive NPCs in the range that are denied for the same reason.

Execution of the command then resumes at the NPC following the last one in the summary denial message and continues to the end of the specified range.

This command is very similar to the GRTH command. The input parameters that can be specified on the GRTH command will be copied from the source NPC to the destination NPC. The performance monitoring threshold parameters are also copied. Others that are defaulted by the GRTH command will be defaulted.

## Completion Message

### Nonhierarchical

If the destination NPC is PB or PC type, the output format is:

[O.31521]

```

 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M COPY EQPT::NPC-[s]abc,[t]def[&&-[u]ghi]:[ww] COMPLD
 /* [O.31521] */
 /* DM:SERS:ERS:US:SLIPS (24 Hour Thresholds) */
 "nnnnn:ppppp:qqqqq:rrrrr:sssss"
 /* DM:SERS:ERS:US:SLIPS (Options) */
 "e:f:g:h:i"
 /* DM:SERS:ERS:US:SLIPS (Short Interval Thresholds) */
 "nnnnn:ppppp:qqqqq:rrrrr:sssss"
 /* DM:SERS:ERS:US:SLIPS (Options) */
 "e:f:g:h:i"
[/* IW-X-pqr: 'pqr' is the default hex value of the \
Insertion Word */]
["IW-X-pqr"]
 /* TS0-abcdefgh, gives the default values of the bits set\
in Time Slot 0 */
 "TS0-abcdefgh"
 /* TS0M-abcdefgh, default values of bits set for monitor \
in Time Slot 0 */
 "TS0M-abcdefgh"
 /* NPC number */
 "[s]jkl"
;

```

If the destination NPC is PA or TH type, the output format is:

[O.31521]

```

<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M COPY EQPT::NPC-[s]abc,[t]def[&&-[u]ghi]:[ww] COMPLD
/* [O.31521] */
/* CRC:FRER:OFS:ES:SES:CSS:CV (Daily Thresholds) */

## Autonomous Message

---

Not applicable.

---

## Explanation Of Parameters

---

**NPC** - Network processing circuit

**TO** - to

**TYPE** - type

**mnxyz** - NPC type identifier

| <i>mn</i> | <i>Explanation</i>              |
|-----------|---------------------------------|
| PA        | CEPT NPC (75- or 120-ohm)       |
| PB        | CEPT NPC (120-ohm twisted pair) |
| PC        | CEPT NPC (75-ohm coaxial)       |

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, denoting the source of the provisioning information.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, denoting the start of a range.

**[u]ghi** - The 3- or 4-digit nonhierarchical NPC number, denoting the end of a range.

**[s]jkl** - The 3- or 4-digit nonhierarchical NPC number of the NPC that was successfully equipped.

**[t]mno** - The 3- or 4-digit nonhierarchical NPC number of the first NPC in a range to be denied.

**[u]vwx** - The 3- or 4-digit nonhierarchical NPC number of the last NPC in a range to be denied.

**bc-d-fe**  
- Hierarchical NPC number of the first NPC in a range to be denied.

**ef-h-ed**  
- Hierarchical NPC number of the last NPC in a range to be denied.

**gh-i-kl**  
- Hierarchical NPC number of the last NPC in a range to be equipped.

**uv-j-kl**  
- Hierarchical NPC number of the NPC that was successfully equipped.

**uv-m-np**  
- Hierarchical NPC number denoting the source of the provisioning information to be copied.

**wx-k-qr**  
- Hierarchical NPC number of the NPC to be equipped or the first NPC in a range to be equipped.

**bc, ef, gh, uv, wx**  
- Unit number

**d, h, i, j, k, m**  
- Module number

**fe, ed, kl, np, qr**  
- NPC number within the module

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |

| NPC        | NPC        | NPC        | NPC        |
| 1921-1952  | 2081-2112  | 2241-2272  | 2401-2432  |
| 1961-1992  | 2121-2152  | 2281-2312  | 2441-2472  |
| 2001-2032  | 2161-2192  | 2321-2352  | 2481-2512  |
| 2041-2072  | 2201-2232  | 2361-2392  | 2521-2552  |

If NPC numbers are expressed in hierarchical form, the valid values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

**IW** - Insertion word

**pq** - Hexadecimal value of the insertion word.

An eight-bit code, called the growth insertion word, is transmitted by this NPC on unassigned DS0 channels. This code is specified by the optional keyword IW and its argument pq. This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the cross-connect insertion word, which is transmitted when the disconnect message with the DDC specified is used.

Although any 2-digit hexadecimal code may be used, the default values are:

| <i>pq</i> | <i>Explanation</i>                                                                                                                                                                                                                         |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7F        | Unassigned Channel Code (UAC), the default value for DE/TE type, DA/TA type, and DS type NPCs provisioned with D4 or ESF framing.                                                                                                          |
| 18        | Unassigned Multiplex Code (UMC), the default value for DA/TA type NPCs provisioned with T1DM framing. This value should only be provisioned with T1DM framing (DE4yz/TE4yz, DA4yz/TA4yz), so the growth command enforces this restriction. |
| FF        | This is recommended for unconnected channels in the SLC® interface and CPI applications.                                                                                                                                                   |

For Clear-DS1 NPCs, the insertion word option is **NOT** available and the message will be denied if this option is entered. The alarm indication signal (AIS) is transmitted in the disconnect or idle state.

**AIS** - Alarm indication signal

**INFO** - Information

Information message (not an alarm).

**MJ** - Major (alarm)  
**MN** - Minor (alarm)  
**BER** - Bit Error Rate  
**ERS** - Errored seconds  
**SERS** - Severe errored seconds  
**COFA** - Change of frame alignment  
**mmm** - SLIP major alarm threshold (0 through 255)  
**nnn** - SLIP minor alarm threshold (0 through 255)  
**e** - SLIP major option selection (0 through 3)  
**f** - SLIP minor option selection (0 through 3)  
  
**p** - BER major alarm threshold (4 through 6)  
**q** - BER minor alarm threshold (4 through 6)  
**g** - BER major option selection (0 through 3)  
**h** - BER minor option selection (0 through 3)  
  
**rrrrr** - ERS threshold (1 through 65535)  
**i** - ERS option selection (0 through 3)  
  
**sss** - SERS threshold (1 through 255)  
**j** - SERS option selection (0 through 3)  
  
**ttt** - COFA major alarm threshold (1 through 511)  
**uuu** - COFA minor alarm threshold (1 through 255)  
**k** - COFA major option selection (0 through 3)  
**l** - COFA minor option selection (0 through 3)  
  
**xxxxx** - SANE threshold (0 through 65535)  
  
**zzzzz** - SAFE threshold (0 through 65535)

**Note:** For clear-DS1 FTU NPC only SLIP and BER parameters are listed.  
For clear-DS1 DS3U NPC only SLIP parameters are listed.

The SANE and SAFE parameters are not applicable to DS1yz and DS7yz type NPCs.

Except for BER, major thresholds may not be equal to or less than the minor thresholds. The BER major threshold can be equal to the BER minor threshold.

**PL** - Payload loopback

**ENA** - Enabled

Payload loopback commands received from far-end equipment on the ESF data link are recognized and performed by the ANSI NPC. This is the default option.

**DSA** - Disabled

Payload loopback commands received from far-end equipment on the ESF data link are ignored by the ANSI NPC. This prevents customer equipment from controlling network configurations.

**CVP** - Path Coding Violations

**ESP** - Path Errored Seconds

**SESP** - Path Severely Errored Seconds

**SEFS** - Severely Errored Framing Seconds

**CSSP** - Path Controlled Slip Seconds

**UASP** - Path Unavailable Seconds

**CVL** - Line Coding Violations

**ESL** - Line Errored Seconds

**SESL** - Line Severely Errored Seconds

aaaaaaaa

- Daily near-end path coding violation threshold, (000000000 through 134217727)

**a** - Daily near-end path coding violation threshold selection, (0 through 3)

**bbbbbb** - Daily near-end path errored second threshold, (00000 through 86400)

**b** - Daily near-end path errored second threshold selection, (0 through 3)

**cccccc** - Daily near-end path severely errored second threshold, (00000 through 86400)

**c** - Daily near-end path severely errored second threshold selection, (0 through 3)

**dddddd** - Daily near-end severely errored framing second threshold, (00000 through 86400)

**d** - Daily near-end severely errored framing second threshold selection, (0 through 3)

**eeeeee** - Daily near-end controlled slip second threshold, (00000 through 86400)

**e** - Daily near-end controlled slip second threshold selection,  
(0 through 3)

(000 through 900, or --- if not applicable)

**l** - 15-Minute far-end path severely errored second threshold selection,  
(0 through 3)

**mmm** - 15-Minute far-end severely errored framing second threshold,  
(000 through 900, or --- if not applicable)

**m** - 15-Minute far-end severely errored framing second threshold selection,  
(0 through 3)

- nnn** - 15-Minute far-end controlled slip second threshold,  
(000 through 900, or --- if not applicable)
- n** - 15-Minute far-end controlled slip second threshold selection,  
(0 through 3)
- ooo** - 15-Minute far-end unavailable second threshold,  
(000 through 900)
- o** - 15-Minute far-end unavailable second threshold selection,  
(0 through 3)
- ppp** - 15-Minute far-end line errored second threshold,  
(000 through 900, or --- if not applicable)
- p** - 15-Minute far-end line errored second threshold selection,  
(0 through 3)

**Note:** A threshold of zero for any parameter inhibits threshold crossing monitoring for that parameter.

**For PB/PC type:**

Note that:

- If the NPC is not located in a sync NPC location, bit "b" set to "1" will be denied.
- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.
- For NSA NPCs (bit d = 0), bits "f" and "g" are don't cares: any values are accepted.
- If bit "d" is set to "1" (that is, a CAS NPC) and "jkl" is "110" (that is, Transmic 1G), the command will be denied.
- If bit "d" is set to "1" (that is, a CAS NPC) and bit "e" is "1" for time slot channel numbering, the command will be denied.

- m** - Facility performance parameter threshold index (0 through 10 hexadecimal)

Variable m is used to select threshold values previously programmed for rr. The default threshold value for each parameter is shown in the table below under the column heading "Default Threshold Value". This is the value selected by m = 0, 1, or 2 in the table of m values following the parameter table. A given value of m selects both the performance monitoring threshold level and the alarm type associated with it as shown in that table. Threshold values selected by values of m greater than 2 must exist, that is, must have been programmed, prior to being selected. These other thresholds can be set by using the ED-OPT-T1 command. Thresholds of all unspecified parameters will be set to the default value associated with m=0. Although the NPC type field is optional for PB and PC types, the options field must not be given without the NPC type field.

**For PB and PC type NPCs:**

| rr | Parameter                          | Threshold Value Range | Default Threshold Value |
|----|------------------------------------|-----------------------|-------------------------|
| 31 | Degraded Minutes, 1 hour           | 1-60                  | 60                      |
| 32 | Degraded Minutes, 24 hours         | 1-1440                | 1440                    |
| 33 | Severely Errored Seconds, 15 mins  | 1-900                 | 900                     |
| 34 | Severely Errored Seconds, 24 hours | 1-65535               | 65535                   |
| 35 | Errored Seconds, 15 minutes        | 1-900                 | 900                     |
| 36 | Errored Seconds, 24 hours          | 1-65535               | 65535                   |
| 37 | Unavailable Seconds, 15 minutes    | 1-900                 | 900                     |
| 38 | Unavailable Seconds, 24 hours      | 1-65535               | 65535                   |
| 39 | Slips, 15 minutes                  | 1-900                 | 900                     |
| 40 | Slips, 24 hours                    | 1-65535               | 65535                   |

**Note 1:** 24-hour thresholds must be greater than their respective 15-minute or 1-hour threshold.

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m> | Threshold Value    | Alarm Type                             |
|-----|--------------------|----------------------------------------|
| 0   | Default            | MI (Maintenance Information)           |
| 1   | Default            | DMA (Deferred Maintenance Minor Alarm) |
| 2   | Default            | PMA (Prompt Maintenance Major Alarm)   |
| 3   | Set 1              | MI                                     |
| 4   | Set 1              | DMA                                    |
| 5   | Set 1              | PMA Major                              |
| 6   | Set 2              | MI                                     |
| 7   | Set 2              | DMA                                    |
| 8   | Set 2              | PMA Major                              |
| 9   | Set 3              | MI                                     |
| a   | Set 3              | DMA                                    |
| b   | Set 3              | PMA Major                              |
| c   | Threshold disabled | no alarm                               |
| d   | Default            | PMA Critical                           |
| e   | Set 1              | PMA Critical                           |
| f   | Set 2              | PMA Critical                           |
| 10  | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable m can be used to select threshold levels and alarm types other than the defaults.

**Note:** If the queried NPC can not be accessed for some reason, for example because the Facility Terminating Module is not equipped or the FTMI or Unit Controller is out of service, then the NPC's parameter count fields are printed as a string of dashes to indicate that the counts are not available. The parameter thresholds and options will still be correctly output.

In addition, certain parameters do not apply. In the cases where specific parameters do not apply to the queried NPC, the respective parameter count fields, threshold values and threshold options are all displayed as a string of dashes.

IW - Insertion Word

pq[r] - Hexadecimal value of the Growth Insertion Word (GIW)

Used in the transmit direction on unassigned channels for CEPT NPCs.

pq transmitted data information  
r transmitted signaling information

A special code, called the Growth Insertion Word (GIW), is transmitted by this NPC on unassigned channels. This code is specified by the optional keyword **IW** and its argument **pq**.

*This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the CONN Insertion Word, which is transmitted when the "DISC-CRS-T0: . . . , INCL, OOS, DCC" command is used.*

**IW** - Insertion word

**pqr** - Hexadecimal value of the insertion word.

For PB and PC type NPCs, the IW argument is X'pq[r], and the default GIW code is X'D5D (Binary: 11010101 1101). Hexadecimal digits "pq" represent the CEPT insertion word for cross-connected time slots and hexadecimal digit "r" represents the CEPT signaling option. The "r" digit is needed to accommodate the cross-connected CEPT time slot and its associated portion of TS16 used for signaling when provisioned for channel associated signaling (CAS).

Although the "r" digit is accepted on input, for NSA NPCs, it has no significance.

**AIS** - Alarm indication signal

AIS is not detected by unframed clear (unchannelized) 2Mbit/s PAXDz type NPCs. Therefore, specifying AIS with one of the alarm level types MI, DMA, or PMA, is unnecessary. However, the command will not be denied if AIS is specified with an alarm level for unframed clear PAXDz NPCs. AIS with its alarm level will simply never be reported for unframed clear PAXDz NPCs.

**MI** - Maintenance information

This is the default option.

**PMA** - Prompt Maintenance Action Major Alarm

**PMC** - Prompt Maintenance Action Critical Alarm

**DMA** - Deferred Maintenance Action Minor Alarm

For each NPC listed, this message prints out values of the states, counts, thresholds and options of the following facility performance parameters and the spare international and national bits in time slot 0 for CEPT NPCs.

For PB and PC type NPCs:

**DM** - Degraded Minutes

**nnnnn** - 24-hour Degraded Minutes threshold

**nnnnn** - 1-hour DM threshold

**e** - 24-hour Degraded Minutes threshold/alarm selection

**e** - 1-hour DM threshold/alarm selection

**SERS** - Severely Errored Seconds

**ppppp** - 24-hour Severely Errored Seconds threshold

**ppppp** - 15-minute SERS threshold

**f** - 24-hour Severely Errored Seconds threshold/alarm selection

**f** - 15-minute SERS threshold/alarm selection

**ERS** - Errored Seconds

**qqqqq** - 24-hour Errored Seconds threshold

**qqqqq** - 15-minute ERS threshold

**g** - 24-hour Errored Seconds threshold/alarm selection

**g** - 15-minute ES threshold/alarm selection

**US** - Unavailable Seconds

**rrrrr** - 24-hour Unavailable Seconds threshold

**rrrrr** - 15-minute US threshold

**h** - 24-hour Unavailable Seconds threshold/alarm selection

**h** - 15-minute US threshold/alarm selection

**SLIP** - Slip Events

**sssss** - 24-hour Slip Events threshold

**sssss** - 15-minute SLIP threshold

**i** - 24-hour Slip threshold/alarm selection

**i** - 15-minute SLIP threshold/alarm selection

For SHORT INTERVAL, DM is calculated hourly and SERS, ERS, US, and SLIP are calculated at 15 minute intervals.

The **TS0 abcdefgh** variables represent international and national bits in time slot'0, as defined by:

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

These variables are set to their default values "11011111" by this command, except for the Transmic'1G option, where the default is "11000000."

The variables may later be changed by setting the abcdefgh parameters in the TS0 field of the ED-PRMTR-EQPT::NPC command.

Each of the variables may then be set to "0", "1", or "P." "P" indicates that the incoming bit will be cross-connected unchanged.

When TS0 is cross-connected, the TS0 bits will be either passed, or set to "0" or "1" as indicated by the "abcdefgh" variable values. Note that bits which are used for alarms (bit 3 always; bits 4 and 5 if provisioned by the **mnxyz** values) may not be set to "P."

This is also true for NPCs assigned as test port NPCs.

The **TS0M abcdefgh** field allows monitoring of state changes in the received spare international bits, where the "abcdefgh" variables refer to the same TS0 bits as defined above for the TS0 "abcdefgh" variables.

The TS0M variables are specified for monitoring in the command as:

The default values for TS0M variables are **abcdefgh=00000000**, unless the **xyz** parameters set them differently, that is, for Transmic'1G the abcdefgh=00111111. The TS0M variables may later be provisioned by the CHG::TS0M'abcdefgh or the ED-PRMTR-EQPT TS0M-abcdefgh (38323) command.

**For PA type:**

Note that:

- If the NPC is not located in a sync NPC location, the value of "x" must be in the range 0 - 3 or 8 - B. Otherwise the command will be denied.
- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.
- If the value of "y" is 0, 2, 4 or 6 (i.e., a CAS NPC) and the value of "z" is C (i.e. Transmic 1G), the command will be denied.

**For TH type:**

Note that:

- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.

<m> - Facility performance parameter threshold index (0 through 10 hexadecimal)

Variable <m> is used to select the threshold value and alarm type previously programmed for parameter rr. There are four possible alarm thresholds and 4 different alarm levels. A given value of <m> selects one combination of threshold value and alarm level. The combinations of these two result in 16 possible values of m. There is a 17th <m> value which is used to disable the alarm threshold and the alarm. The values of <m> that produce the default values of the thresholds and alarms are shown in the table below under the column heading "Threshold Value". Threshold and alarm combinations selected by m = 3 through b and d-10 must exist, that is, must have been programmed, prior to being selected. The thresholds are programmed by using the ED-OPT-T1 command. Thresholds of all unspecified parameters will be set to the default value associated with m=0. Setting <m> = c disables thresholding for a given parameter.

For PA type NPCs:

**Table 8-10. Parameter Register Threshold Range and Default Values**

| rr | Parameter                        | Interval | Threshold Value Range | Default Threshold Value |
|----|----------------------------------|----------|-----------------------|-------------------------|
| 11 | CRC Block Errors                 | DAILY    | 1 - 79056000          | 176947                  |
| 12 | Framing Errors                   | DAILY    | 1 - 345600000         | 176947                  |
| 13 | Out of Frame Seconds             | DAILY    | 1 - 86400             | 4                       |
| 14 | Errored Seconds                  | DAILY    | 1 - 86400             | 4320                    |
| 15 | Severely Errored Seconds         | DAILY    | 1 - 86400             | 90                      |
| 16 | Controlled Slip Seconds          | DAILY    | 1 - 86400             | 4                       |
| 17 | Coding Violations                | DAILY    | 1 - 176947200         | 176947                  |
| 18 | Unavailable Seconds              | DAILY    | 1 - 86400             | 90                      |
| 19 | Unavailable Time Count           | DAILY    | 1 - 4320              | 9                       |
| 20 | Multiframe Errors                | DAILY    | 1 - 86400             | 4095                    |
| 21 | Far End Block Errors             | DAILY    | 1 - 79056000          | 176947                  |
| 22 | Far End Errored Seconds          | DAILY    | 1 - 86400             | 4320                    |
| 23 | Far End Severely Errored Seconds | DAILY    | 1 - 86400             | 90                      |
| 24 | Far End Unavailable Seconds      | DAILY    | 1 - 86400             | 90                      |

| 93 | Far End Severely Errored Seconds | 15MIN    | 1 - 900               | 30                      |
| 94 | Far End Unavailable Seconds      | 15MIN    | 1 - 900               | 30                      |

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m>       | Threshold Value    | Alarm Type                             |
|-----------|--------------------|----------------------------------------|
| <b>0</b>  | Default            | MI (Maintenance Information)           |
| <b>1</b>  | Default            | DMA (Deferred Maintenance Minor Alarm) |
| <b>2</b>  | Default            | PMA (Prompt Maintenance Major Alarm)   |
| <b>3</b>  | Set 1              | MI                                     |
| <b>4</b>  | Set 1              | DMA                                    |
| <b>5</b>  | Set 1              | PMA Major                              |
| <b>6</b>  | Set 2              | MI                                     |
| <b>7</b>  | Set 2              | DMA                                    |
| <b>8</b>  | Set 2              | PMA Major                              |
| <b>9</b>  | Set 3              | MI                                     |
| <b>a</b>  | Set 3              | DMA                                    |
| <b>b</b>  | Set 3              | PMA Major                              |
| <b>c</b>  | Threshold disabled | no alarm                               |
| <b>d</b>  | Default            | PMA Critical                           |
| <b>e</b>  | Set 1              | PMA Critical                           |
| <b>f</b>  | Set 2              | PMA Critical                           |
| <b>10</b> | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable m can be used to select threshold levels and alarm types other than the defaults.

IW - Insertion Word

pq[r] - Hexadecimal value of the Growth Insertion Word (GIW)

Used in the transmit direction on unassigned channels for CEPT NPCs.

pq transmitted data information  
r transmitted signaling information

A special code, called the Growth Insertion Word (GIW), is transmitted by this NPC on unassigned channels. This code is specified by the optional keyword **IW** and its argument **pq**.

*This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the CONN Insertion Word, which is transmitted when the "DISC-CRS-T0: . . . , INCL, OOS, DCC" command is used.*

**IW** - Insertion word

**pqr** - Hexadecimal value of the insertion word.

For PA type NPCs, the IW argument is X'pq[r]', and the default GIW code is X'D5D (Binary: 11010101 1101). The "pq" hex digits represent the CEPT insertion word for cross-connected time slots and the "r" hex digit represents the CEPT signaling options. The "r" digit is needed to accommodate the cross-connected CEPT time slot and its associated portion of TS16 used for signaling when provisioned for CAS.

Although the "r" digit is accepted on input, for NSA NPCs, it has no significance.

For each NPC listed, this message prints out values of the states, counts, thresholds and options of the following facility performance parameters and the spare international and national bits in time slot 0 for CEPT DPCs.

| parameter | explanation                      |
|-----------|----------------------------------|
| CRC       | CRC Block Errors                 |
| FRER      | Framing Errors                   |
| OFS       | Out of Frame Seconds             |
| ES        | Errored Seconds                  |
| SES       | Severely Errored Seconds         |
| CSS       | Controlled Slip Seconds          |
| CV        | Coding Violations                |
| UAS       | Unavailable Seconds              |
| UATC      | Unavailable Time Count           |
| MER       | Multiframe Errors                |
| FEBE      | Far End Block Errors             |
| FES       | Far End Errored Seconds          |
| FSES      | Far End Severely Errored Seconds |
| FUAS      | Far End Unavailable Seconds      |

Two sets of thresholds are kept for each parameter: One for DAILY intervals and one for 15 MINUTE intervals.

**For PA type NPCs:**

Depending on which interface functions are enabled by the provisioning values of xyz, some parameters may not be applicable. In this case the threshold value, the parameter count (if present in the message) and the selection value will appear as dashes ("-"). In the table below "N/A" indicates that a parameter is not applicable for the given value of x or y.

Also, if the selection value m=c has been chosen for a parameter, the threshold value and the parameter count (if present in the message) will appear as dashes.

| For PA Type NPCs |                                    |                                            |                             |                                 |
|------------------|------------------------------------|--------------------------------------------|-----------------------------|---------------------------------|
| Parameter        | CRC-4 Mode Disabled<br>(x=A,B,E,F) | Far-End PM Disabled<br>(x=0,2,4,6,A,B,E,F) | CAS Disabled<br>(y=8,9,C,D) | Unframed Clear 2Mbit/s<br>(y=D) |

aaaaaaa

- Daily CRC block error threshold value.

**a**

- Daily CRC block error threshold selection, (0 through 3)

bbbbbbbb

- Daily framing error threshold value.

**b**

- Daily framing error threshold selection, (0 through 3)

cccc

- Daily out of frame seconds threshold value.

**c**

- Daily out of frame seconds threshold selection, (0 through 3)

---

**dddd** - Daily errored second threshold value.

**d** - Daily errored second threshold selection, (0 through 3)

**eeee** - Daily severely errored second threshold value.

**e** - Daily severely errored second threshold selection, (0 through 3)

**ffff** - Daily controlled slip second threshold value.

**f** - Daily controlled slip second threshold selection, (0 through 3)

**gggggggg** - Daily coding violation threshold value.

**g** - Daily coding violation threshold selection, (0 through 3)

**hhhh** - Daily unavailable second threshold value.

**h** - Daily unavailable second threshold selection, (0 through 3)

**iiii** - Daily unavailable time count threshold value.

**i** - Daily unavailable time count threshold selection, (0 through 3)

**jjjj** - Daily multiframe alignment error threshold value.

**j** - Daily multiframe alignment error threshold selection, (0 through 3)

**kkkkkkkk** - Daily far-end block error threshold value.

**k** - Daily far-end path block error selection, (0 through 3)

**lllll** - Daily far-end errored second threshold value.

**l** - Daily far-end path second threshold selection, (0 through 3)

**mmmm** - Daily far-end severely errored second threshold value.

**m** - Daily far-end severely errored second threshold selection, (0 through 3)

**nnnn** - Daily far-end unavailable second threshold value.

**n** - Daily far-end unavailable second threshold selection, (0 through 3)

**a a a a a** - 15-Minute CRC block error threshold value.

**a** - 15-Minute CRC block error threshold selection, (0 through 3)

- n** - 15-Minute far-end unavailable second threshold selection,  
(0 through 3)

The options {a,b,c,d,e,f,g,h,i,j,k,l,m,n} and {a,b,c,d,e,f,g,h,i,j,k,l,m,n} are **m values** as previously shown and specify the threshold sets of the performance parameters listed.

The **TS0 abcdefgh** variables represent international and national bits in time slot'0, as defined by:

- ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

- c** - Remote Alarm Indication
- de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.
- f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW  
if provisioned for RPSFI otherwise spare national bit.
- gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

These variables are set to their default values "11011111" by this command, except for the Transmic'1G option, where the default is "11000000."

The variables may later be changed by setting the abcdefgh parameters in the TS0 field of the ED-PRMTR-EQPT::NPC or CHG::NPC (38321) command. Each of the variables may then be set to "0", "1", "P" or "V." "P" indicates that the incoming bit will be cross-connected unchanged; "V" indicates that the bit received will be inverted.

When TS0 is cross-connected, the TS0 bits will be either passed, inverted or set to "0" or "1" as indicated by the "abcdefgh" variable values. Note that bits which are used for alarms (bit 3 always; bits 4 and 5 if provisioned by the **mnxyz** values) may not be set to "P."

This is also true for NPCs assigned as test port NPCs.

The **TS0M abcdefgh** field allows monitoring of state changes in the received spare international bits, where the "abcdefgh" variables refer to the same TS0 bits as defined above for the TS0 "abcdefgh" variables.

The TS0M variables are specified for monitoring in the command as:

The default values for TSOM variables are **abcdefgh=00000000**, unless the **xyz** parameters set them differently, i.e., for Transmic'1G the abcdefgh=00111111. The TSOM variables may later be provisioned by the CHG::TSOM'abcdefgh or the ED-PRMTR-EQPT TSOM-abcdefgh (38323) command.

## **CPY, MEM, PROG, INCL, UPGRD**

### **BACKUP MEMORY TRANSFER**

#### **Explanation Of Command**

This command performs the following functions:

1. When the MC is in-service, it may be used to request a transfer of database information from working (random access) memory (WKG) to the memory device (MEM) or devices that are in-service. The Primary Memory (PMEM) device will always be in-service. The Secondary Memory (SMEM) device may or may not be in-service. If SMEM is in-service, then a transfer of database information will be performed from WKG to SMEM.
2. When the MC is in maintenance condition (MCOND), it may be used to request a transfer of executables or database information between PMEM and SMEM or between SMEM and PMEM. If the optional PROG keyword is **not** used, only database information will be transferred. If the PROG keyword is used only executables will be transferred.
3. During a release upgrade procedure, when in MCOND, it transfers the database and DSP Platform Applications, if any, from SMEM to PMEM. The UPGRD keyword must be used in that case. Note that the UPGRD keyword is only available to user DAX with the frame in MCOND.

Restricted maintenance privilege is required for transfers of executables or database information from SMEM to PMEM.

Every ten minutes the state of the frame is checked to look for changes in provisioning and/or cross connections. If a change has occurred within that period, an autonomous request is made to transfer data base information from WKG to MEM.

If the user issues a command transferring database information or executables from PMEM to SMEM, the command is executed immediately; however, if the transfer occurs from SMEM to PMEM the following message will appear (see below when the UPGRD keyword is used):

**ARE YOU SURE? (YES/NO)**

Only if the answer is YES, will the command be executed. If the answer is not YES or the user does not respond within 60 seconds, the following will be displayed:

**COMMAND ABORTED**

When transferring executables between PMEM and SMEM in either direction, Digital Signal Processing Platform (DSPP) application executables (if present) are treated as follows:

1. If executables for a particular application are on the source card, but not on the destination card, the transfer of those application executables takes place.
2. If executables for a particular application are on the destination card, but not on the source card, the application executables are not erased, even if executables for another application are copied from source to destination card.
3. If executables of the same application (the "x" in SDxyz is the same) that have the same version identifiers are on both the source and the destination card, then both executables remain untouched and no transfer takes place for that application.
4. If different versions of the executables of the same application are on the source and the destination card respectively, then this command is denied. The user must invoke the INSTALL command to first list and then remove one or the other version of the application before invoking this command again.

The **UPGRD** keyword must only be used during an upgrade procedure for the purpose of copying the database and previously installed DSP Platform Applications from SMEM to PMEM. The following restrictions apply for the use of the UPGRD keyword.

1. Only a copy from SMEM to PMEM is allowed.
2. The PROG keyword is not allowed.
3. The INCL keyword is not allowed.
4. The Main Controller must be in Maintenance Condition (MCOND).
5. The user must be user DAX.
6. The release identifier for the executables on the PMEM card must refer to a newer release than the release identifier of the database on the SMEM card; i.e., this must be a genuine upgrade situation.

At the beginning of the invocation of this utility with the UPGRD keyword the following message will appear:

**WARNING - YOU HAVE INVOKED THE "UPGRD" KEYWORD.  
THE "UPGRD" KEYWORD SHOULD ONLY BE USED DURING A GENERIC UPGRADE.  
DO YOU WISH TO CONTINUE? (YES/NO)**

The user should respond with a **YES** if and only if an upgrade for the DACS II generic is to be done.

During the execution of this copy utility during an upgrade procedure (i.e., with the UPGRD keyword), the database is copied from SMEM to PMEM and a retrofit of the size of the database takes place if needed. In addition, all the applications residing on SMEM, if any, are copied to PMEM.

New PMEM cards with new DACS II executable software should **not** have any application software on them. Therefore, if for some reason, a different version of the same application resides on the PMEM card that resides on the SMEM card, then this command will be denied.

## Explanation Of Parameters

**from** - Source for copy memory

**to** - Destination for copy memory

|      |                                |
|------|--------------------------------|
| WKG  | Working (Random access memory) |
| PMEM | Primary memory device          |
| SMEM | Secondary memory device        |
| MEM  | PMEM, SMEM or both             |

**Note:** The only permissible combinations are listed below:

| <b>from</b> | <b>to</b> |
|-------------|-----------|
| WKG         | MEM       |
| PMEM        | SMEM      |
| SMEM        | PMEM      |

**PROG** - Program

Transfer generic program only. May not be used when transferring memory contents from WKG to MEM. Frame must be in maintenance condition state (MCOND) when transferring generic program from PMEM to SMEM or SMEM to PMEM. Additionally, SMEM to PMEM requires restricted maintenance (RMON) privileges.

**INCL** - Inclusive

The INCL keyword is used to request that the data base on PMEM be transferred to SMEM excluding the generic journal files. This keyword cannot be combined with the PROG keyword. INCL may not be used when copying WKG to MEM.

The INCL keyword is used only as a preparatory step before starting a generic upgrade. It makes sure that the database residing on the SMEM card has no journal files before the upgrade is started. This is different from an invocation of this utility to copy from WKG to MEM, which converts the journals to the database leaving the journal files empty, but which does not remove the journal files.

**UPGRD** - Upgrade

The UPGRD keyword must be used only during a DACS II Release upgrade for the purpose of copying the database and any previously installed DSP Platform Applications from SMEM to PMEM. It is an assumption that the PMEM card has the new executables and nothing else, while the SMEM card contains the old executables, all installed DSPP Applications, and a complete database with no remaining journal entries. Only user DAX may use this keyword; also, the MC must be in MCOND.

**mmmm** - Error condition code

**mmmm** *Explanation*

|             |                                                           |

| <b>SNVS</b> | DB retrofit fail                          |

## **CRTE,CNFGRN,EQPT,UNIT**

### **PROVISION A UNIT**

#### **Explanation Of Command**

This command requests the provisioning of a DACS II unit.

For a NonCEF frame this will result in the provisioning of all cross-connect and time slot interchange circuit packs. For a CEF frame this will result in the provisioning of the expanded time slot interchanger. When this request has completed, all circuit packs required by the subject unit to cross-connect to other equipped units have been provisioned.

The unit type is optionally specified in the **TYPE** field.

The unit type can be a facility terminating unit, a DS3 terminating unit, a Hybrid DS3 terminating unit, or a digital signal processing unit.

If the unit is a digital signal processing unit, its associated digital signal processing interface is also provisioned. If the unit is a DS3 or a Hybrid DS3 facility terminating unit, both of its associated service and protection facility line interface packs, both sides of its formatter or hybrid formatter packs (side 0 and 1), and its protection multiplexer or hybrid multiplexer are also provisioned. Only facility line interface packs, Hybrid Formatter packs (HFMT), and Hybrid Multiplexer packs (HMXR) can be equipped in the Hybrid DS3 facility terminating unit. Therefore, FMT and MXR as shown in the command output messages should be interpreted as HFMT and HMXR when the Hybrid DS3 Unit type HT100 is provisioned.

**Note:** DMB, TSI, and FMT/HFMT circuit packs must be inserted into the inactive side of

DACS II. Inserting circuit packs into the active side may result in transmission "hits."

## Command

For DACS II Non-CEF frames:  
[I.31211]

**CRTE-CNFGRN-EQPT:[<xy>]:UNIT-q:[ww]:\  
[a[,b[,c[,d[,e [,f]]]]]]:[utxyz];**

For DACS II CEF frames:  
[I.31211]

**CRTE-CNFGRN-EQPT:[<xy>]:UNIT-[q]q:[ww]::[utxyz];**

## Completion Message

For DACS II Non-CEF frames:

[O.31211]

```

 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M CRTE CNFGRN EQPT::UNIT-q:[ww]:[a[,b[,c[,d[,e[,f]]]]]]\

```

For DACS II CEF frames:

[O.31211.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M CRTE CNFGRN EQPT::UNIT-qq:[ww]::[utxyz] DENY
mmmm
/* [O.31211.01] */
/* <explanation of error condition code> */
[/* {EQD-uexyz|NSUP} */]
;
```

### Autonomous Message

---

Not applicable.

## Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**utxyz** - Unit type as submitted in the input message

**uexyz** - Type of unit already equipped as  
*uexyz* *Explanation*

FT100 FT = Facility Terminating Unit

DP100 DP = Digital Signal Processing Unit

HT100 HT = Hybrid DS3 Facility Terminating Unit

The unit type is optionally specified in the TYPE utxyz field. The unit type can be an FTxyz (Facility Terminating Unit), , a HTxyz (Hybrid DS3 Terminating Unit) or a DPxyz (Digital Signal Processing Unit) type.

Currently, only FT100, HT100, and DP100 types are supported by DACS II.

The unit type entered must be consistent with the unit type entered for the configuration file.

If the unit is a DPxyz type, its associated DSPI (Digital Signal Processing Interface) is also provisioned.

If the unit is a DTxyz or HTxyz type, both of its associated Service and Protection Facility Line Interface (FLI) packs, both sides of its Formatter (FMT) or Hybrid Formatter (HFMT) packs (side 0 and 1), and its Protection Multiplexer(MXR) or Hybrid Multiplexer (HMXR) pack are also provisioned.

For both Non-CEF and CEF frames, if the unit type is not entered, the unit type will default to FT100.

For Non-CEF frames, the optional [:[a[,b[,c[,d[,e[,f]]]]]] field is used if only a partial complement of the unit's TSI circuit packs is to be provisioned. If this field is not used, all TSI circuit packs are provisioned and the unit has full connectivity with other provisioned units.

**a, b, c, d, e, f**

- Time slot interchange numbers

A partial complement of the unit's TSIs have been provisioned. (If this field is absent, all of the unit's TSIs were provisioned.)

---

|             |                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>CCB</b>  | - Cross-connect buffer                                                                                                             |
| <b>0q</b>   | - CCB number side 0                                                                                                                |
| <b>1q</b>   | - CCB number side 1                                                                                                                |
|             | 0q and 1q identify the cross-connect buffer(s) provisioned. q is the unit number (see UNIT above).                                 |
| <b>tt</b>   | - Total number of provisioned TSIs in frame (02 through 72)                                                                        |
| <b>NEW</b>  | - New                                                                                                                              |
| <b>TSIS</b> | - Time slot interchangers                                                                                                          |
| <b>nn</b>   | - Number of TSIs provisioned by command (02 through 22)                                                                            |
| <b>sft</b>  | - TSI equipped status                                                                                                              |
| <b>s</b>    | - Service side number (0 or 1)                                                                                                     |
| <b>f</b>    | - Equipped FROM unit number (1 through 6) if equipped                                                                              |
| -           | - Not equipped                                                                                                                     |
| <b>t</b>    | - Equipped TO unit number (1 through 6) if equipped                                                                                |
| -           | - Not equipped                                                                                                                     |
| <b>ETSI</b> | - Expanded timeslot interchanger                                                                                                   |
| <b>0qq</b>  | - ETSI number side 0                                                                                                               |

## **CRTE,EQPT,NPC**

### **PROVISION DIGITAL SIGNAL PROCESSING PLATFORM NPC**

#### **Explanation Of Command**

This command is used to request the provisioning of a Digital Signal Processing Platform (DSPP) circuit pack. A DSPP circuit pack is used to run one of the following applications:

1. The X.50/X.57 International Subrate application, which has the type field SD111.
2. The Digital Multipoint Bridge (DMB) application, which has the type field SD311 (this application is similar to the DMB feature that may be provisioned in the DSPU).
3. The DDS Subrate and Multipoint Junction Unit application, which has the type field SD411 (this application is similar to the SRM and MJU features that may be provisioned in the DSPU). This application supports 19.2 MJU circuits, which the DSPU MJU does not support.
4. Any future application, which has a type field of the form SDxyz.

The DSPP circuit pack may be provisioned in an FTU, IFTU, or IFTU2. In those units it may be provisioned in a North American module or in an International module. When being provisioned in an International module a full complement of 64 channels are usable, unless the application itself restricts the number of channels. A total number of 16 DSPP circuit packs may be provisioned in an International module. When being provisioned in a North American module a maximum number of 50 channels are available to the application running on the circuit pack. A total of 20 DSPP circuit packs may be provisioned in a North American module. Customers running a North American DACS II installation may want to set one or more FTU (IFTU or IFTU2) modules aside and provision them as International modules for running the DSPP circuit packs with a maximum of 64 channels.

Only odd numbered DSPP NPCs may be provisioned. The next higher even numbered NPC is not available for other NPC types and must be unequipped when an SDxyz NPC is provisioned. When specifying a range of NPCs to be provisioned the beginning and end of the range should be specified as odd numbers.

DSPP applications are separately orderable products and are shipped with their own documentation. See command I.55721 INSTALL on how to install an application.

Not applicable.

## Explanation Of Parameters

- NPC** - Network Processing Circuit
- [s]abc** - The 3- or 4-digit nonhierarchical NPC number
- [t]def** - The 3- or 4-digit nonhierarchical NPC number designating the end of a range specification

If NPC numbers are expressed in three digits, the valid values are:

SD type NPC numbers listed by unit number, within an **International module** in Unit Type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| NPC            | NPC            | NPC            | NPC            | NPC            | NPC            |

### **PROVISION DIGITAL SIGNAL PROCESSING UNIT NPC**

#### **Explanation Of Command**

This command requests the provisioning of a digital signal processing unit type (non-FTU) network processing circuit (NPC). This DSPU type NPC can be either type MB (digital multipoint bridge) or type CB (c-bit processor).

The growth command results in the provisioning of all NPCs in the circuit pack on both duplicated sides. For CEPT circuit packs, there is only one NPC per circuit pack.

[I.31351]

**CRTE-EQPT : [<xy>] : NPC-uv-m-np : [ww] : mnxyz [ : CBTIMER- [t]v] ;**

**Caution 1:** The NPC should be restored immediately (both duplicated sides, 0 and 1) using Message No. I.34351 (RST-EQPT::NPC) after being grown to avoid having both sides out of service. If this is not possible, the NPC should be degrown immediately using Message No. 32341 (DISC-EQPT::NPC).

**Caution 2:** The NPC and (Expanded) Time Slot Interchanger (TSI/ETSI) circuit packs must be inserted into the inactive side of DACS II. Inserting circuit packs into the active side may result in transmission "hits."

**uv-m-np**

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid NPC numbers are:

CB type NPC numbers listed by unit, module, and NPC Number  
Unit Type DP (DSPU)

| Unit         | Module     | NPC       |
|--------------|------------|-----------|
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

**mnxyz** - NPC type

*mnxyz Explanation*

CB10z C-bit processor  
MB100 Digital Multipoint Bridge

Explanation for type CB10z

**z** - Network alarm timeout

*z Timeout range in milliseconds*

|   |              |
|---|--------------|
| 0 | 600 to 750   |
| 1 | 1500 to 1650 |
| 2 | 2400 to 2550 |
| 3 | 4650 to 4800 |

**[t]def** - Nonhierarchical NPC numbers applicable only to MBxyz type NPCs.

**uv-m-qr**

- Hierarchical NPC numbers applicable only to MBxyz type NPCs. The valid NPC numbers are:

CBTIMER

- C-bit timer; can only be used with CB10z NPC types.

**[t]v** - A timer value 1-10

**EQD** - Equipped

**mmm** - Error condition code

*mmm Explanation*

|             |                                                              |

| <b>ENEQ</b> | Unit is not equipped                                         |
| <b>SAOS</b> | UC is out of service                                         |
| <b>SNVS</b> | UC is in service but failed                                  |
| <b>SNVS</b> | Maximum number of CPRs have already been grown for this unit |

## **CRTE,EQPT,NPC,IW,X,AIS,MI,PMA,DMA,PMC**

### **GROWTH NPC for PA and TH TYPES**

#### **Explanation Of Command**

This command is used to request the provisioning of one or more PA type or TH type network processing circuits (NPCs). (See command I.31362 for PB and PC type NPCs.) PA type NPCs are provisioned in a facility terminating unit (FTU, IFTU, or IFTU2). TH type NPCs are provisioned in a Hybrid DS3 Unit (HDS3U). It is also used to enable the minor bit error rate (MBER) and Signaling Freeze Delay Time Features. For the MBER feature, CTS0 NFW bit 4 is used as RBER. CTS0 NFW bit 4 use as REER is not supported.

One output message is printed for each NPC requested and successfully provisioned.

Provisioning commands where the specified NPC range crosses a Unit boundary will be denied.

For TH type NPCs, the NPC numbers which are divisible by four with a remainder of zero are not valid NPCs. However, the range of THxyz type NPC numbers is still supported with the understanding that there may be gaps in the NPC number range.

When a provisioning command addressing a range of NPCs is denied for successive NPCs in the range for the same reason, a summary denial message will be output, giving the range of NPC numbers denied and the reason for the denial.

If the type field is inconsistent with the first FTM specified or the first FTM specified is unequipped, the entire command is denied. Otherwise, the specified type field is applied to the entire NPC range.

When a provisioning command addressing a range of NPCs within a unit crosses a facility terminating module (FTM) boundary, and if that subsequent FTM is unequipped or provisioned inconsistently with respect to the first FTM, then that FTM will be skipped as a whole, with a summary denial message.

The execution of normal completions, or of denials for reasons other than diagnostic failures, then resumes at the next NPC and continues until the end of the range.

### Autonomous Message

Not applicable.

### Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number,  
the first NPC of a range specification.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number,  
the last NPC of a range specification.

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**np, qr** - NPC number within the module

The allowable values are:

PA type numbers listed by unit, module, and NPC Number  
 Unit Type FT (FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**TYPE** - Type

**mnxyz** - NPC-type identifier  
**mn** - NPC Type

|           |                       |
|-----------|-----------------------|
| <i>mn</i> | <i>Explanation</i>    |
| PA        | 2Mbit/s Interface NPC |
| TH        | 2Mbit/s HDS3U NPC     |

For PA type NPCs the impedance will automatically be set according to the configuration of the FTMI. If the NPC type field is omitted, the NPC type will default to PB100 or PC100 depending on how the FTMI is grown (75- or 120-ohm NPCs) (see command 31362).

The argument xyz is to be interpreted as a 3-digit hexadecimal number. The 3 digits in xyz indicate the selection of provisioning options for the NPC. A detailed discussion of these provisioning options for both the PA and TH type NPCs is given below.

### PA-Type xyz fields

The provisioning values of *x*, *y*, and *z* for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (*x*, *y* or *z*) provisioning value):

**Table 8-11. Provisioning values for *x***

| <b>x<br/>value</b> | <b>CRC-4<br/>Mode</b> | <b>Automatic<br/>CRC-4</b> | <b>Far-End<br/>PM</b> | <b>NPC used as<br/>Sync Source</b> | <b>TS0 Bit 5<br/>used for SFI</b> |
|--------------------|-----------------------|----------------------------|-----------------------|------------------------------------|-----------------------------------|
| <b>0</b>           | Y                     |                            |                       |                                    |                                   |
| <b>1</b>           | Y                     |                            | Y                     |                                    | Y                                 |
| <b>2</b>           | Y                     |                            |                       |                                    | Y                                 |
| <b>3</b>           | Y                     |                            | Y                     |                                    |                                   |
| <b>4</b>           | Y                     |                            |                       | Y                                  |                                   |
| <b>5</b>           | Y                     |                            | Y                     | Y                                  | Y                                 |
| <b>6</b>           | Y                     |                            |                       | Y                                  | Y                                 |
| <b>7</b>           | Y                     |                            | Y                     | Y                                  |                                   |
| <b>8</b>           |                       | Y                          | Y                     |                                    |                                   |
| <b>9</b>           |                       | Y                          | Y                     |                                    | Y                                 |
| <b>A</b>           |                       |                            |                       |                                    | Y                                 |
| <b>B</b>           |                       |                            |                       |                                    |                                   |
| <b>C</b>           |                       | Y                          | Y                     | Y                                  |                                   |
| <b>D</b>           |                       | Y                          | Y                     | Y                                  | Y                                 |
| <b>E</b>           |                       |                            |                       | Y                                  | Y                                 |
| <b>F</b>           |                       |                            |                       | Y                                  |                                   |

#### Table Notes:

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled (*x* values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent ED-PRMTR-EQPT::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 8-12. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.

2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected ( $y$  value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected ( $y$  values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For  $y$  values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering ( $y=8$ ) or Timeslot Channel Numbering ( $y=9$ ) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface ( $y=C$ ) or as an unframed clear 2Mbit/s interface ( $y=D$ ). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 8-13. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )
3. z values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For z values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For z values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if z = **1, 3, 5, or 9**  
in **2496 ms**  
if z = **7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:<sup>\*</sup>
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B.**
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when z = 0, 1, 4, 5, 6, 7, A or B. **However**, for z values 2 and 8 the set time is 144 ms and for z values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for z = 4 and 8) or 480 ms (for z = 5 and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the ED-PRMTR-EQPT::NPC:TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms
- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

---

<sup>\*</sup> Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

**z=6 or A** hardware timing

**z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

[ix] To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 8-14. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |

| xD4<br>xD6                                                                                                   | Unframed clear 2Mbit/s ( <i>y</i> value D) cannot be used with <i>z</i> value 4 (NFW Bit 4 used for RAIS) or with <i>z</i> value 6 (NFW Bit 4 used for RBER) because unframed clear signals cannot obtain TS0 framing. |
| x0C<br>x2C<br>x4C<br>x6C                                                                                     | Channel Associated Signaling ( <i>y</i> values 0, 2, 4 and 6) is not valid for TRANSMIC 1G ( <i>z</i> value C).                                                                                                        |

**Table Notes:**

1. If framed clear 2Mbit/s (*y* value C) is selected with *z* value 4 (NFW Bit 4 used for RAIS) only the receive side of this function will be enabled. Outgoing RAIS indicators cannot be transmitted during clear signal operation.
2. If framed clear 2Mbit/s (*y* value C) is selected with *z*= value 6 (NFW Bit 4 used for RBER) only the receive side of this function will be enabled. Outgoing RBER indicators cannot be transmitted during clear signal operation.

**Table 8-16. Combinations of  $x$  and  $z$  Values**

| Invalid<br>xyz<br>Combinations                       | Explanation                                                                                                                                                                                                                                             |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4yC<br>5yC<br>6yC<br>7yC<br>CyC<br>DyC<br>EyC<br>FyC | Use of NPC as Sync Source ( $x$ 4, 5, 6, 7, C, D, E and F) is not valid for TRANSMIC 1G ( $z$ value C). This is because the TSO Monitoring scheme used in TRANSMIC 1G prevents incoming SFI indicators from cutting off the signal to the Synchronizer. |

Additionally:

- If the NPC is not located in a sync NPC location, the value of "x" must be in the range 0 - 3 or 8 - B. Otherwise the command will be denied.
- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.
- If the value of "y" is 0, 2, 4 or 6 (i.e., a CAS NPC) and the value of "z" is C (i.e. Transmic 1G), the command will be denied.

**OPTS** - Options

**rr** - Facility performance parameter number

Variable rr specifies the parameter whose alarm threshold is being selected.

**<m>** - Facility performance parameter threshold index (0 through X'10' )

Variable <m> is used to select the threshold value and alarm type previously programmed for parameter rr. There are four possible alarm thresholds and 4 different alarm levels. A given value of <m> selects one combination of threshold value and alarm level. The combinations of these two result in 16 possible values of <m>. There is a 17th <m> value which is used to disable the alarm threshold and the alarm. The values of <m> that produce the default values of the thresholds and alarms are shown in the table below under the column heading "Threshold Value". Threshold and alarm combinations selected by m = 3 through b or d-X'10 must exist, that is, must have been programmed, prior to being selected. The thresholds are programmed by using the ED-OPT-T1 command. Thresholds of all unspecified parameters will be set to the default value associated with m=0. Setting m = c disables thresholding for a given parameter.

**For PA type NPCs:**

**Table 8-17. Parameter Register Threshold Range and Default Values**

| rr | Parameter                        | Interval | Threshold Value Range | Default Threshold Value |
|----|----------------------------------|----------|-----------------------|-------------------------|
| 11 | CRC Block Errors                 | DAILY    | 1 - 79056000          | 176947                  |
| 12 | Framing Errors                   | DAILY    | 1 - 345600000         | 176947                  |

| 92 | Far End Errored Seconds          | 15MIN    | 1 - 900               | 300                     |
| 93 | Far End Severely Errored Seconds | 15MIN    | 1 - 900               | 30                      |
| 94 | Far End Unavailable Seconds      | 15MIN    | 1 - 900               | 30                      |

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m>       | Threshold Value    | Alarm Type                             |
|-----------|--------------------|----------------------------------------|
| <b>0</b>  | Default            | MI (Maintenance Information)           |
| <b>1</b>  | Default            | DMA (Deferred Maintenance Minor Alarm) |
| <b>2</b>  | Default            | PMA (Prompt Maintenance Major Alarm)   |
| <b>3</b>  | Set 1              | MI                                     |
| <b>4</b>  | Set 1              | DMA                                    |
| <b>5</b>  | Set 1              | PMA Major                              |
| <b>6</b>  | Set 2              | MI                                     |
| <b>7</b>  | Set 2              | DMA                                    |
| <b>8</b>  | Set 2              | PMA Major                              |
| <b>9</b>  | Set 3              | MI                                     |
| <b>a</b>  | Set 3              | DMA                                    |
| <b>b</b>  | Set 3              | PMA Major                              |
| <b>c</b>  | Threshold disabled | no alarm                               |
| <b>d</b>  | Default            | PMA Critical                           |
| <b>e</b>  | Set 1              | PMA Critical                           |
| <b>f</b>  | Set 2              | PMA Critical                           |
| <b>10</b> | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable **m** can be used to select threshold levels and alarm types other than the defaults.

IW - Insertion Word

pq[r] - Hexadecimal value of the Growth Insertion Word (GIW)

Used in the transmit direction on unassigned channels for CEPT NPCs.

|    |                                   |
|----|-----------------------------------|
| pq | transmitted data information      |
| r  | transmitted signaling information |

A special code, called the Growth Insertion Word (GIW), is transmitted by this NPC on unassigned channels. This code is specified by the optional keyword **IW** and its argument **pq**.

*This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the CONN Insertion Word, which is transmitted when the "DISC-CRS-T0: . . . , INCL, OOS, DCC" command is used.*

For PA type NPCs, the IW argument is X'pq[r], and the default GIW code is X'D5D (Binary: 11010101 1101). The "pq" hex digits represent the CEPT insertion word for cross-connected time slots and the "r" hex digit represents the CEPT signaling options. The "r" digit is needed to accommodate the cross-connected CEPT time slot and its associated portion of TS16 used for signaling when provisioned for CAS.

Although the "r" digit is accepted on input, for NSA NPCs, it has no significance.

For clear E1 NPCs (y value "C" or "D") the insertion word option is **not** available and the message will be denied if this option is entered. The alarm indication signal (AIS) is transmitted in the disconnected or idle state for clear E1 NPCs.

**AIS** - Alarm indication signal

AIS is not detected by unframed clear (unchannelized) 2Mbit/s PAXDz type NPCs. Therefore, specifying AIS with one of the alarm level types MI, DMA, or PMA, is unnecessary. However, the command will not be denied if AIS is specified with an alarm level for unframed clear PAXDz NPCs. AIS with its alarm level will simply never be reported for unframed clear PAXDz NPCs.

**MI** - Maintenance information

This is the default option.

**PMA** - Prompt maintenance major alarm

**PMC** - Prompt maintenance critical alarm

**DMA** - Deferred maintenance minor alarm

**LEV** -Intervention Level

**g** - Intervention Level Setting (1-6)

Intervention Level is a feature that changes the Alarm Severity of an alarm based on the alarm severity and the Intervention Level setting.

**[s]jkl** - Nonhierarchical NPC number ([s]abc ≤ [s]jkl ≤ [t]def)

**[t]mno** - Nonhierarchical NPC number ([s]jkl ≤ [t]mno ≤ [t]def)

**uv-j-kl**

- Hierarchical NPC number ( $uv-m-np \leq uv-j-kl \leq uv-k-qr$ )

**uv-m-no**

- Hierarchical NPC number ( $uv-j-kl \leq uv-m-no \leq uv-k-qr$ )

**Note:** uv-j-kl and uv-k-qr are in the **same** unit.

**ss/n** - First improper value of "rr/<m>" for which the message is denied.

For each NPC listed, this message prints out values of the states, counts, thresholds and options of the following facility performance parameters and the spare international and national bits in time slot 0 for CEPT DPCs.

| parameter | explanation                      |
|-----------|----------------------------------|
| CRC       | CRC Block Errors                 |
| FRER      | Framing Errors                   |
| OFS       | Out of Frame Seconds             |
| ES        | Errored Seconds                  |
| SES       | Severely Errored Seconds         |
| CSS       | Controlled Slip Seconds          |
| CV        | Coding Violations                |
| UAS       | Unavailable Seconds              |
| UATC      | Unavailable Time Count           |
| MER       | Multiframe Errors                |
| FEBE      | Far End Block Errors             |
| FES       | Far End Errored Seconds          |
| FSES      | Far End Severely Errored Seconds |
| FUAS      | Far End Unavailable Seconds      |

**Note** that parameters CV, FEBE, FES, FSES and FUAS do not apply to TH type NPCs.

Two sets of thresholds are kept for each parameter: One for DAILY intervals and one for 15 MINUTE intervals.

### For PA type NPCs:

Depending on which interface functions are enabled by the provisioning values of xyz, some parameters may not be applicable. In this case the threshold value, the parameter count (if present in the message) and the selection value will appear as dashes ("-"). In the table below "N/A" indicates that a parameter is not applicable for the given value of x or y.

Also, if the selection value m=c has been chosen for a parameter, the threshold value and the parameter count (if present in the message) will appear as dashes.

| For PA Type NPCs |                                    |                                            |                             |                                 |
|------------------|------------------------------------|--------------------------------------------|-----------------------------|---------------------------------|
| Parameter        | CRC-4 Mode Disabled<br>(x=A,B,E,F) | Far-End PM Disabled<br>(x=0,2,4,6,A,B,E,F) | CAS Disabled<br>(y=8,9,C,D) | Unframed Clear 2Mbit/s<br>(y=D) |

| <b>m</b>                    | - 15-Minute far-end severely errored second threshold selection,<br>(0 through 3) |

- nnn** - 15-Minute far-end unavailable second threshold value.
- n** - 15-Minute far-end unavailable second threshold selection, (0 through 3)

The options {a,b,c,d,e,f,g,h,i,j,k,l,m,n} and {a,b,c,d,e,f,g,h,i,j,k,l,m,n} are **m values** as previously shown and specify the threshold sets of the performance parameters listed.

The **TS0 abcdefgh** variables represent international and national bits in time slot'0, as defined by:

- ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

- c** - Remote Alarm Indication
- de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.
- f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.
- gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

These variables are set to their default values "11011111" by this command, except for the Transmic'1G option, where the default is "11000000."

The variables may later be changed by setting the abcdefgh parameters in the TS0 field of the ED-PRMTR-EQPT::NPC or CHG::NPC (38321) command. Each of the variables may then be set to "0", "1", "P" or "V." "P" indicates that the incoming bit will be cross-connected unchanged; "V" indicates that the bit received will be inverted.

When TS0 is cross-connected, the TS0 bits will be either passed, inverted or set to "0" or "1" as indicated by the "abcdefgh" variable values. Note that bits which are used for alarms (bit 3 always; bits 4 and 5 if provisioned by the **mnxyz** values) may not be set to "P."

This is also true for NPCs assigned as test port NPCs.

The **TS0M abcdefgh** field allows monitoring of state changes in the received spare international bits, where the "abcdefgh" variables refer to the same TS0 bits as defined above for the TS0 "abcdefgh" variables.

The TS0M variables are specified for monitoring in the command as:

The default values for TS0M variables are **abcdefgh=00000000**, unless the **xyz** parameters set them differently, i.e., for Transmic'1G the abcdefgh=00111111. The TS0M variables may later be provisioned by the ED-PRMTR-EQPT TS0M-abcdefgh (I.38323) command.

**mmmm** - Error condition code

## **CRTE,EQPT,NPC,IW,X,AIS,MI,PMA,PMC,DMA**

### **GROWTH NPC for PB and PC TYPES**

#### **Explanation Of Command**

This message requests the equipage of one or more primary block or primary block coaxial network processing circuits in a facility terminating unit within a CEPT or Gateway frame. The system uses type PB with 120-ohm and type PC with 75-ohm facility terminating module interfaces.

This message is also used to enable the minor bit error rate (MBER) and signaling freeze delay time features.

When a range of NPCs is being equipped, the execution of this command may be aborted by entering the ABT-CMD command.

Although the NPC type field is optional for PB and PC types, it is required if the options field is specified.

One output message is printed for each NPC requested and successfully provisioned.

Provisioning commands where the specified NPC range crosses a Unit boundary will be denied.

When a provisioning command addressing a range of NPCs is denied for successive NPCs in the range for the same reason, a summary denial message will be output, giving the range of NPC numbers denied and the reason for the denial.

When a provisioning command addressing a range of NPCs within a unit crosses a facility terminating module (FTM) boundary, if the FTM is unequipped or provisioned as a CEPT module, then the FTM will be skipped as a whole, with a summary denial message, as noted below.

- If the type field is specified, and it is inconsistent with the first FTM specified or the first FTM specified is unequipped, the entire command is denied. Otherwise, the specified type field is applied to the entire NPC range.
- If the type field is omitted, the NPC type will default to the type of the first FTM, either domestic or CEPT.

Whether or not the type field is specified, if an FTM, beyond the first one addressed, is of a different type, that entire FTM will be denied.

The execution of the normal completions, or of denials for a reason other than diagnostic failures, then resumes at the next NPC and continues until the end of the range.

A summary denial message will not be issued for denial of range NPC RESTORE commands if the reason is an NPC diagnostic failure. In this case, there is one output message for each NPC in the range.

## **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, the first NPC of a range specification.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, the last NPC of a range specification.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

**uv-m-np**

- Hierarchical NPC number, the first NPC of a range specification.

**uv-k-qr**

- Hierarchical NPC number, the last NPC of a range specification.

**uv** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The allowable values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**TYPE** - Type

**mnxyz** - NPC-type identifier

**mn** - NPC Type

*mn*      *Explanation*

PB      CEPT NPC (120-Ohm twisted pair)

PC      CEPT NPC (75-Ohm coaxial)

If the NPC TYPE field is omitted, the NPC type will default to PB100 or PC100 depending on how the FTMI is provisioned (75- or 120-ohm NPCs).

The argument xyz is to be interpreted as a 3-digit hexadecimal number. The 12 bits in xyz, represented as abcd efgh jklm, indicate the selection of provisioning options for the NPC.

#### **PB- and PC-type xyz fields**

**Table 8-18. NPC Provisioning Options**

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                         |
|--------------|------------|--------------|------------------------------------------------------------------------|
| x            | a          | 0            | CRC multiframe in TS0                                                  |
|              |            | 1            | Non-CRC framing in TS0                                                 |
|              | b          | 0            | NPC is not used as a synchronization source                            |
|              |            | 1            | NPC is used as a synchronization source                                |
|              | c          | 0            | CCITT G.732 (hardware controlled) Consequent Actions, AIS in signaling |
|              |            | 1            | Firmware controlled Consequent <i>Actions</i> <sup>[c]</sup>           |
|              | d          | 0            | Non-signaling associated (NSA)                                         |
|              |            | 1            | 16-state channel associated signaling (CAS)                            |

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                                              |
|--------------|------------|--------------|---------------------------------------------------------------------------------------------|
| y            | e          | 0            | Telephone channel numbering                                                                 |
|              |            | 1            | Channel timeslot numbering                                                                  |
|              | f          | 0            | Convert the <i>abcd</i> bits of TS16 to 1111 if 0000                                        |
|              |            | 1            | Transmit the 0000 in the <i>abcd</i> bits transparently                                     |
|              | g          | 0            | AIS applied to received TS16 on detection of RAI, RAIS, or R16                              |
|              |            | 1            | AIS not applied to received TS16 on detection of RAI, RAIS, or R16                          |
|              | h          | 0            | NFW bit 5=Synchronization Failure Indication (SFI) unaffected by Synchronizer Holdover (SH) |
|              |            | 1            | NFW bit 5=SFI inverted on SH on output and detected on input                                |

| <i>Digit</i> | <i>Bit</i> | <i>Value</i> | <i>Meaning</i>                                                                                                                         |
|--------------|------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| z            | jkl        | 000          | NFW bit 3=RAI set in < 2 ms,                                                                                                           |
|              |            | 001          | NFW bit 3=RAI set in time $T^{[c']}$                                                                                                   |
|              |            | 010          | NFW bit 4=RAIS in time $T^{[c']}$ and RAI in < 2 ms                                                                                    |
|              |            | 011          | Enable BER calculations, BER alarm level = DMA, NFW bit 4=RBER, RAI set in < 2 ms, for c=1 (SFDT=2496 ms, CACT=624 $ms^{[jkl]}$ ),     |
|              |            | 100          | NFW bit 4=RAIS and RAI in time $T^{[c']}$ (TRANSMIC 2G)                                                                                |
|              |            | 101          | Enable BER calculations, BER alarm level = DMA, NFW bit 4=disabled, RAI set in < 2 ms, for c=1 (SFDT=2496 ms, CACT=624 $ms^{[jkl]}$ ), |
|              |            | 110          | NFW bits 3-8,in time 144ms (TRANSMIC 1G)                                                                                               |
|              |            | 111          | Unassigned                                                                                                                             |
|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                          |
|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
 if  $jkl \neq 011$  and  $jkl \neq 101$   
 in **2496 ms**  
 if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared.\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when** jkl=011 or jkl=101. **For that case, see note [jkl'].**

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option h=1.

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

If both  $b=1$  and  $h=1$  and the NPC (used as synchronization source) receives NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option  $c$  is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] minor bit error rate and signaling freeze delay time features:

jkl=011 or jkl=101

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

$c=0$  hardware timing

$c=1$  firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

jkl=011

[v] RBER alarm level = MI

[vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

Additionally:

- If the NPC is not located in a sync NPC location, bit "b" set to "1" will be denied.

- For telephone channel numbering, channels 16 to 30 occupy time slots 17 to 31.
- For time slot channel numbering, channels 16 to 30 occupy time slots 16 to 30.
- For NSA NPCs (bit d = 0), bits "f" and "g" are don't cares: any values are accepted.
- If bit "d" is set to "1" (that is, a CAS NPC) and "jkl" is "110" (that is, Transmic 1G), the command will be denied.
- If bit "d" is set to "1" (that is, a CAS NPC) and bit "e" is "1" for time slot channel numbering, the command will be denied.

**OPTS** - Options

**rr** - Facility performance parameter number

Variable rr specifies the parameter whose alarm threshold is being selected.

**<m>** - Facility performance parameter threshold index (0 through X'10')

Variable <m> is used to select threshold values previously programmed for rr. The default threshold value for each parameter is shown in the table below under the column heading "Default Threshold Value". This is the value selected by m = 0, 1, 2 or d in the table of m values following the parameter table. A given value of m selects both the performance monitoring threshold level and the alarm type associated with it as shown in that table. Threshold values selected by values of m other than the default must exist, that is, must have been programmed, prior to being selected. These other thresholds can be set by using the ED-OPT-T1 command. Thresholds of all unspecified parameters will be set to the default value associated with m=0. Although the NPC type field is optional for PB and PC types, the options field must not be given without the NPC type field.

**For PB and PC type NPCs:**

| rr | Parameter                          | Threshold      | Default            |
|----|------------------------------------|----------------|--------------------|
|    |                                    | Value<br>Range | Threshold<br>Value |
| 31 | Degraded Minutes, 1 hour           | 1-60           | 60                 |
| 32 | Degraded Minutes, 24 hours         | 1-1440         | 1440               |
| 33 | Severely Errored Seconds, 15 mins  | 1-900          | 900                |
| 34 | Severely Errored Seconds, 24 hours | 1-65535        | 65535              |
| 35 | Errored Seconds, 15 minutes        | 1-900          | 900                |
| 36 | Errored Seconds, 24 hours          | 1-65535        | 65535              |
| 37 | Unavailable Seconds, 15 minutes    | 1-900          | 900                |
| 38 | Unavailable Seconds, 24 hours      | 1-65535        | 65535              |
| 39 | Slips, 15 minutes                  | 1-900          | 900                |
| 40 | Slips, 24 hours                    | 1-65535        | 65535              |

**Note 1:** 24-hour thresholds must be greater than their respective 15-minute or 1-hour threshold.

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m> | Threshold Value    | Alarm Type                             |
|-----|--------------------|----------------------------------------|
| 0   | Default            | MI (Maintenance Information)           |
| 1   | Default            | DMA (Deferred Maintenance Minor Alarm) |
| 2   | Default            | PMA (Prompt Maintenance Major Alarm)   |
| 3   | Set 1              | MI                                     |
| 4   | Set 1              | DMA                                    |
| 5   | Set 1              | PMA Major                              |
| 6   | Set 2              | MI                                     |
| 7   | Set 2              | DMA                                    |
| 8   | Set 2              | PMA Major                              |
| 9   | Set 3              | MI                                     |
| a   | Set 3              | DMA                                    |
| b   | Set 3              | PMA Major                              |
| c   | Threshold disabled | no alarm                               |
| d   | Default            | PMA Critical                           |
| e   | Set 1              | PMA Critical                           |
| f   | Set 2              | PMA Critical                           |
| 10  | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable m can be used to select threshold levels and alarm types other than the defaults.

**Note:** If the queried NPC can not be accessed for some reason, for example because the Facility Terminating Module is not equipped or the FTMI or Unit Controller is out of service, then the NPC's parameter count fields are printed as a string of dashes to indicate that the counts are not available. The parameter thresholds and options will still be correctly output.

In addition, certain parameters do not apply. In the cases where specific parameters do not apply to the queried NPC, the respective parameter count fields, threshold values and threshold options are all displayed as a string of dashes.

IW - Insertion Word

pq[r] - Hexadecimal value of the Growth Insertion Word (GIW)

Used in the transmit direction on unassigned channels for CEPT NPCs.

pq      transmitted data information  
r        transmitted signaling information

A special code, called the Growth Insertion Word (GIW), is transmitted by this NPC on unassigned channels. This code is specified by the optional keyword **IW** and its argument **pq**.

*This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the CONN Insertion Word, which is transmitted when the "DISC-CRS-T0: : . . . , INCL, 00S, DCC" command is used.*

For PB and PC type NPCs, the IW argument is X'pq[r], and the default GIW code is X'D5D (Binary: 11010101 1101). Hexadecimal digits "pq" represent the CEPT insertion word for cross-connected time slots and hexadecimal digit "r" represents the CEPT signaling option. The "r" digit is needed to accommodate the cross-connected CEPT time slot and its associated portion of TS16 used for signaling when provisioned for channel associated signaling (CAS).

Although the "r" digit is accepted on input, for NSA NPCs, it has no significance.

**AIS** - Alarm indication signal

**LEV** - Intervention Level  
g Intervention Level Setting(1-6)

Intervention Level is a feature that changes the Alarm Severity of an alarm based on the alarm severity and the Intervention Level setting.

**MI** - Maintenance information  
This is the default option.

**PMA** - Prompt maintenance major alarm

**DMA** - Deferred maintenance minor alarm

**PMC** -Prompt Maintenance Critical Alarm

**[s]jkl** - Nonhierarchical NPC number ( $[s]abc \leq [s]jkl \leq [t]def$ )  
**[t]mno** - Nonhierarchical NPC number ( $[s]jkl \leq [t]mno \leq [t]def$ )

**uv-j-kl**  
- Hierarchical NPC number ( $uv-m-np \leq uv-j-kl \leq uv-k-qr$ )

**uv-m-no**  
- Hierarchical NPC number ( $uv-j-kl \leq uv-m-no \leq uv-k-qr$ )

**Note:** uv-j-kl and uv-k-qr are in the **same** unit.

**ss/n** - First improper value of "rr/<m>" for which the message is denied.

For each NPC listed, this message prints out values of the states, counts, thresholds and options of the following facility performance parameters and the spare international and national bits in time slot 0 for CEPT NPCs.

For PB and PC type NPCs:

**DM** - Degraded Minutes

**nnnnn** - 24-hour Degraded Minutes threshold

**nnnnn** - 1-hour DM threshold

**e** - 24-hour Degraded Minutes threshold/alarm selection

**e** - 1-hour DM threshold/alarm selection

**SERS** - Severely Errored Seconds

**ppppp** - 24-hour Severely Errored Seconds threshold

**ppppp** - 15-minute SERS threshold

**f** - 24-hour Severely Errored Seconds threshold/alarm selection

**f** - 15-minute SERS threshold/alarm selection

**ERS** - Errored Seconds

**qqqqq** - 24-hour Errored Seconds threshold

**qqqqq** - 15-minute ERS threshold

**g** - 24-hour Errored Seconds threshold/alarm selection

**g** - 15-minute ES threshold/alarm selection

**US** - Unavailable Seconds

**rrrrr** - 24-hour Unavailable Seconds threshold

**rrrrr** - 15-minute US threshold

**h** - 24-hour Unavailable Seconds threshold/alarm selection

**h** - 15-minute US threshold/alarm selection

**SLIP** - Slip Events

**sssss** - 24-hour Slip Events threshold

**sssss** - 15-minute SLIP threshold

**i** - 24-hour Slip threshold/alarm selection

**i** - 15-minute SLIP threshold/alarm selection

For SHORT INTERVAL, DM is calculated hourly and SERS, ERS, US, and SLIP are calculated at 15 minute intervals.

The **TS0 abcdefgh** variables represent international and national bits in time slot'0, as defined by:

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

These variables are set to their default values "11011111" by this command, except for the Transmic'1G option, where the default is "11000000."

The variables may later be changed by setting the abcdefgh parameters in the TS0 field of the ED-PRMTR-EQPT::NPC command.

Each of the variables may then be set to "0", "1", or "P." "P" indicates that the incoming bit will be cross-connected unchanged.

When TS0 is cross-connected, the TS0 bits will be either passed, or set to "0" or "1" as indicated by the "abcdefgh" variable values. Note that bits which are used for alarms (bit 3 always; bits 4 and 5 if provisioned by the **mnxyz** values) may not be set to "P."

This is also true for NPCs assigned as test port NPCs.

The **TS0M abcdefgh** field allows monitoring of state changes in the received spare international bits, where the "abcdefgh" variables refer to the same TS0 bits as defined above for the TS0 "abcdefgh" variables.

The TS0M variables are specified for monitoring in the command as:

The default values for TS0M variables are **abcdefgh=00000000**, unless the **xyz** parameters set them differently, that is, for Transmic'1G the abcdefgh=00111111. The TS0M variables may later be provisioned by the CHG::TS0M'abcdefgh or the ED-PRMTR-EQPT TS0M-abcdefgh (38323) command.

mmmm - Error condition code

| mmmm        | <i>Explanation</i>                                                     |

Not applicable.

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>0001-0032</b> | <b>0161-0192</b> | <b>0321-0352</b> | <b>0481-0512</b> |
| <b>0041-0072</b> | <b>0201-0232</b> | <b>0361-0392</b> | <b>0521-0552</b> |

| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

#### uv-m-np

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**NPCTG** - NPC (for) test group

**rrr** - Test-access Group NPC number (1 through 400)  
NPC used as a test-access group NPC.

**COND** - Condition

mmmm - Error condition code

mmmm *Explanation*

|             |                                                                  |

## **CRTE,EQPT,NPC,NPCTP**

### **GROWTH TEST PORT NPC**

#### **Explanation Of Command**

This message requests the designation of a Network Processing Circuit as a test port NPC.

The growth of an individual test port is described in CRTE,EQPT,TP.

#### **Command**

##### **Nonhierarchical**

[|.31381]

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uv-m-np**

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**NPCTP** - NPC (for) test ports

**n** - Test Port NPC number (must be in the range from 1 to 8).

**kk, mm** - Test port numbers

| <i>n</i> | <i>kk</i> | <i>mm</i> |
|----------|-----------|-----------|
| 1        | 01        | 12        |
| 2        | 13        | 24        |
| 3        | 25        | 36        |
| 4        | 37        | 48        |
| 5        | 49        | 60        |
| 6        | 61        | 72        |
| 7        | 73        | 84        |
| 8        | 85        | 96        |

**Note:** When a CEPT NPC is grown as a test NPC, it must be grown for CAS-type primaries using the Message Number 31362, otherwise a denial message will occur.

**mmm** - Error condition code

**SNVS**      (Timing Distributor) TLI is not equipped

**SAOS**      Sync 0 is not in-service

**SAOS**      Sync 1 is not in-service

**SAOS**      Both syncs are out-of-service

**SNVS**      Syncs are equipped

**SNVS**      Bad sync mode

## **CRTE,EQPT,SYNC,TLI,SSP,SRC,NPC**

### **PROVISION SYNCHRONIZER TIMING LINK INTERFACE**

#### **Explanation Of Command**

This message requests provisioning of the synchronizer's timing link interface. The TLI can be configured as a timing extractor or as a timing distributor.

If the timing extractor is selected, you must also select synchronizer sync port (SSP) 0 or 1 and its source for priority.

Timing extractor types must be compatible for both **SSP 0** and **SSP 1**.

#### **Command**

##### **Nonhierarchical**

[I.31121]

```
CRTE-EQPT: [<xy>]: SYNC: [ww]: TLI-m: \

/* [0.31121.01] */
/* <explanation of error condition code> */
;
```

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**SYNC** - Synchronizer

**TLI** - Timing link interface

**m** - TLI number (1 through 4)

**texyz** - Timing Extractor type

| <i>te</i> | <i>Explanation</i>                      |
|-----------|-----------------------------------------|
| TC        | Composite Clock Timing Extractor        |
| TE        | DS1 Timing Extractor                    |
| TP        | Primary Block Timing Extractor          |
| TR        | Basic System Reference Frequency (BSRF) |
| TU        | Unipolar Clock Timing Extractor         |

**Note:** For the TC, TU and TR timing extractors the x, y and z parameters can be any value from 0 to 9.

Valid x, y, and z values for the other timing extractors are:

TP-type TLI xyz fields

**x** - Frame format

**x**      *Explanation*

**1,5**    Common Channel Signaling  
**2,6**    Channel Associated Signaling - Mode 0  
**3,7**    Channel Associated Signaling - Mode 1  
**4,8**    European Remote Switching Module  
**0,9**    Invalid

**y** - Line format

**y**      *Explanation*

**0,2**    Alternate Mark Inversion (Bipolar)  
**1,3**    High Density Bipolar (HDB3)  
**4-9**    Invalid

**z** - Channel format

**z**      *Explanation*

**0-9**    Unassigned

**SSP** - Synchronizer synchronization port

**a** - SSP number (0 or 1)

Required when texyz is specified.

**Note:** Timing Extractors must have the same "te" type for both SSP 0 and SSP 1.

**SRC** - Source

**p** - Priority (1 through 8)

Required when texyz is specified. 1 = HIGHEST priority, 8 = LOWEST priority

**TDxyz** - Timing Distributor type

The valid values for x, y, and z are:

TD-type TLI xyz fields

**x** - Timing distributor identification

**x** *Explanation*

**1** Composite Clock Timing Distribution

**2** Sinusoidal 2.048 MHz Timing Distribution

**y** - Unassigned

**z** - Unassigned

**NPC** - Network Processing Circuit

The NPC keyword and its associated parameter are only specified in conjunction with the SSP and SRC keywords for TLI type TUxyz.

This keyword indicates that the synchronization signal is terminated in one of the facility terminating locations. Use of this keyword allows the DACS II system to correlate a synchronizing source failure to either an NPC failure or an NPC input signal failure.

**[0]abc** - The 3- or 4-digit nonhierarchical NPC number

Timing source NPC number

The valid NPC numbers are:

If NPC numbers are expressed in three digits, the valid values are:

PB and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1  | Unit<br>2  |
|------------|------------|
| <b>NPC</b> | <b>NPC</b> |
| <b>030</b> | <b>190</b> |
| <b>032</b> | <b>192</b> |
| <b>070</b> | <b>230</b> |
| <b>072</b> | <b>232</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 |
|-----------|-----------|
| NPC       | NPC       |
| 0030      | 0190      |
| 0032      | 0192      |
| 0070      | 0230      |
| 0072      | 0232      |

#### uv-m-np

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid NPC numbers are:

PB and PC NPC numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit   | Module | NPC    |
|--------|--------|--------|
| 01, 02 | 1, 2   | 30, 32 |

mmmm - Error condition code

mmmm *Explanation*

|             |                                                 |
|-------------|-------------------------------------------------|
| <b>ENRE</b> | Subject entity is equipped                      |
| <b>ENEQ</b> | SYNC TB is not equipped                         |
| <b>SAOS</b> | Sync 0 is not in-service                        |
| <b>SAOS</b> | Sync 1 is not in-service                        |
| <b>SAOS</b> | Both syncs are out-of-service                   |
| <b>SNVS</b> | Timing Extractor type TLI (need SSP info)       |
| <b>SNVS</b> | Not Timing Extractor type TLI (not SSP)         |
| <b>SNVS</b> | Wrong TLI type (need CRO grow command)          |
| <b>SNVS</b> | 3 Timing Distributor type TLIs are equipped     |
| <b>SNVS</b> | Illegal priority value                          |
| <b>SNVS</b> | Illegal SSP type (not same as other SSPs)       |
| <b>SNVS</b> | X option is illegal                             |
| <b>SNVS</b> | Y option is illegal                             |
| <b>SNVS</b> | Z option is illegal                             |
| <b>SNVS</b> | Hardware mismatch or not present                |
| <b>IDNV</b> | NPC parameter only valid with TU type TLI       |
| <b>SNVS</b> | NPC is still provisioned to provide sync timing |
| <b>SNVS</b> | NPC not designated as sync timing source        |
| <b>SAWS</b> | NPC already allocated as sync timing source     |

mmm Explanation

**SAWS** NPC already grown as non-synchronization source  
**IDNV** Parameter only valid with PA, PB, or PC type NPCs  
**SAWS** NPC already has Equipment Loopback

## **CRTE,EQPT,TG**

### **GROWTH TEST-ACCESS GROUP**

#### **Explanation Of Command**

This command is used to provision a test-access group (TG) as a network processing circuit for test groups (NPCTG) covering a specific channel range.

The TG consists of two bundles of n consecutive DS0 channels each. The TG's width is determined by the number of channels within the range specified in the command. The east bundle of the TG is located on the first NPCTG and spans the given channel range; the west bundle is located on the second NPCTG and spans the second channel range. Both bundles may be assigned to the same NPCTG, provided the necessary bandwidth is available.

## **CRTE,EQPT,TP**

### **GROW TEST PORT**

#### **Explanation Of Command**

This message requests the provisioning of a test port.

If trunk conditioning is omitted from the input command the test port is provisioned as a *dynamic* test port. A dynamic test port's trunk conditioning is set to match the trunk conditioning of the circuit under test at the time the circuit is accessed.

If trunk conditioning is given in the input command the test port is provisioned as a *static* test port. A static test port's trunk conditioning is set at the time the port is provisioned. Its trunk conditioning does not change when a circuit is accessed for testing.

The *static* or *dynamic* designations have meaning only for access to unmapped terminations.

For access to a mapped termination, trunk conditioning is always adopted from the circuit under test.

## Explanation Of Parameters

**TP** - Test port

**kk** - Test port number (01 through 96)

A 2Mbit/s NPC will support 12 test ports numbered as follows:

| TA Port                 | Channel |    |
|-------------------------|---------|----|
|                         | FROM    | TO |
| 01,13,25,37,49,61,73,85 | 5       | 6  |
| 02,14,26,38,50,62,74,86 | 7       | 8  |
| 03,15,27,39,51,63,75,87 | 9       | 10 |
| 04,16,28,40,52,64,76,88 | 11      | 12 |
| 05,17,29,41,53,65,77,89 | 13      | 14 |
| 06,18,30,42,54,66,78,90 | 16      | 17 |
| 07,19,31,43,55,67,79,91 | 18      | 19 |
| 08,20,32,44,56,68,80,92 | 20      | 21 |
| 09,21,33,45,57,69,81,93 | 22      | 23 |
| 10,22,34,46,58,70,82,94 | 24      | 25 |
| 11,23,35,47,59,71,83,95 | 26      | 27 |
| 12,24,36,48,60,72,84,96 | 28      | 29 |

**tc** - Trunk conditioning

Represents the desired signaling and insertion word to be applied when a failure occurs. A trunk conditioning specification consists of a combination of a signaling specification followed by an insertion word specification. For example, TRSP,IW-X-pq (input form).

| <i>signaling</i>     | <i>Explanation</i>                                                                                                                                                                             |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TC-ijkl,mnop         | 2-way, 4-state signaling in binary. For CEPT and ESF type framing format, software will expand 4-state to 16-state by duplicating the bits.                                                    |
| TC-efghijkl,mnopqrst | 2-way, 16-state in binary.                                                                                                                                                                     |
| TC-X-ab,X-cd         | 2-way, 16-state in hexadecimal.                                                                                                                                                                |
| TRSP                 | Transparent, no signaling.                                                                                                                                                                     |
| Omitted              | Cross-connections. Default is TC-X-FF,X-FF if both terminations are channel associated signaling types. Default will be TRSP if one of the terminations is nonsignaling associated (NSA) type. |

| <i>insertion word</i> | <i>Explanation</i>                                                                                                                       |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| IW-X-pq               | The 8-bit pattern corresponding to the hexadecimal value of pq will be inserted in the downstream direction of a failure on either line. |
| Omitted               | Will default to IW-X-FF.                                                                                                                 |

For 4-state signaling, the A/B signaling bits of both test port channels are specified by ijkl for the receive time slot interchange (RTSI), and by mnop for the transmit time slot interchange (TTSI).

For 16-state signaling, the A/B/C/D signaling bits of both test port channels are specified by efghijkl (or hexadecimal digits ab) for the RTSI, and by mnopqrst (or hexadecimal digits cd) for the TTSI.

**NPCTP** - NPC for test ports

**UEQD** - Unequipped

**TP NSO** - Test port not in sequence order

**TERM** - Terminated

**IMPR** - Improper

**TC** - Trunk conditioning

**mmmm** - Error condition code

**mmmm**    *Explanation*

**ERLC**    Customer control or red circuit exists

**SNVS**    Can not use 12-th TP when NPCTP is in the T1DM or DMI mode

**SAAS**    Termination is in process of being rolled

**SAAS**    channel already under test

## **CRTE,EQPT,UNIT,FTMI,IMP**

### **PROVISION FACILITY TERMINATING MODULE INTERFACE**

#### **Explanation Of Command**

This message requests provisioning of the facility terminating module (FTM)\ and its interface and format converter in DACS II **UNIT-q** with a specified termination impedance (75 or 120 ohms).

#### **Command**

[I.31321]

**CRTE-EQPT:[<xy>]:UNIT-[q]q:[ww]:FTMI-d:IMP-<imp>;**

#### **Completion Message**

[O.31321]

## Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FC** - Format converter

**0** - FC side 0

**1** - FC side 1

**d** - FC number (1 through 4)

**FTMI** - Facility terminating module interface

**d** - FTMI in the DACS II unit (1 through 4)

**IMP** - Impedance

**imp** - Impedance value

CEPT facility terminating module impedance setting

Valid values are listed below:

| <i>imp</i> | <i>Explanation</i>               |
|------------|----------------------------------|
| 075        | 75-ohm coaxial termination       |
| 120        | 120-ohm twisted pair termination |

**CEPT** - Conference of European Postal and Telecommunications Administration

mmmm - Error condition code

mmmm *Explanation*

|             |                             |
|-------------|-----------------------------|
| <b>ENRE</b> | Subject entity is equipped  |
| <b>ENEQ</b> | Unit is not equipped        |
| <b>SAOS</b> | UC is out of service        |
| <b>SNVS</b> | UC is in service but failed |
| <b>SNVS</b> | Unit type error             |

## **CRTE,LGN,NEW**

### **ADD USER**

#### **Explanation Of Command**

This message is used by the frame administrator to create a new user login identification and password or to reassign a login identification and password to a previous user of DACS II.

The **NEW** keyword indicates that a new user is being created. The frame administrator uses this command without the **NEW** keyword to reassign a password to a user who is currently on DACS II.

A user is identified to DACS II by his or her **user id** associated with the login. The administrator divulges a password to a new user for the initial log on to DACS II. Afterwards, the user can change this initial password through the **CHG-LGN** command to a password known only to him or her.

Output from this command is sent only to the link on which the command was input.

#### **Command**

If the message is entered on a Snider link:

[I.36101]

**CRTE-LGN:[<xy>]::[ww]:<user id>[,NEW];**

DACS II generates the message below and a dialog is started:

**PASSWD:** (The frame administrator enters user password.)

**REENTER PASSWD:** (The frame administrator again enters the user password.)

Note that the user password is not echoed by DACS II.

If the message is entered on an X.25 link:  
[I.36101]

**CRTE-LGN:**[<xy>]::[ww]:<user id>,<user password>;

No dialog is initiated by DACS II.

### **Completion Message**

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**USER** - User

**user id**

- User identifier

User login identification (two to eight alphabetic characters).

**NEW** - New

Create a user identifier for a new user.

**Note:** The "NEW" keyword cannot be used to create a user identifier on a link that is using the X.25 protocol.

**PASSWD** - Password

**user password**

- User password

The password assigned to the user, where password is at least six alphanumeric characters.

**Note:** The "PASSWD" keyword cannot be used to create a user identifier on a link that is using the X.25 protocol.

**mmmm** - Error condition code

**mmmm** *Explanation*

|             |                                            |

## **DELETE — DGN**

---

### **DELETE — DGN**

This section documents the commands **DELETE** through **DGN**.

## **DELETE,END**

### **DELETE LINES FROM MACRO**

#### **Explanation Of Command**

This command is used to delete one or more commands from an existing macro while in a macro session. If neither a range of line numbers nor END is specified then the line pointed to by the line pointer (the current line) is deleted.

#### **Command**

[I.19051]

```
DELETE[:[<xy>]:{<starting line>|END}[-{<ending line>|END}]:\
[ww]:];
```

#### **Completion Message**

[O.19051]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DELETE::[{<starting line>|END}[-{<ending line>\
|END}]]:[ww] COMPLD
 /* [O.19051] */
;
```

### **Denial Message**

---

[O.19051.01]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DELETE::[{<starting line>|END}[-{<ending line>|END}]]:\
[ww] DENY
 mmmm
 /* [O.19051.01] */
 /* <explanation of error condition code> */
;
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

{<starting line>|END}[-{<ending line>|END}] \ {<starting line>|END}[-{<ending line>|END}] \

#### **starting line**

- Beginning line number of a line range (1, 2, ..., n)

Starting line indicates the line number of the first line of a range of lines to be deleted from a macro.

#### **ending line**

- Ending line number of a line range (2, 3, ..., n+1)

Ending line indicates the line number of the last line of a range of lines to be deleted from a macro.

#### **END**

- End

Line number of the line at the end of the macro.

**mmm** - Error condition code

**mmm**    *Explanation*

**IDNV**   Invalid line number

**SNVS**   No edit session active

---

## **DGN,EQPT,CCB,CFT,X**

---

### **DIAGNOSE CROSS-CONNECT BUFFER**

#### **Explanation Of Command**

---

This message requests diagnostics to be run on the cross-connect buffer.

#### **Command**

---

[I.41211]

**DGN-EQPT:[<xy>]:CCB-sf:[ww]:[CFT-X-vwxy];**

#### **Completion Message**

---

[O.41211]

```
<xy> yy-mm-dd hh:mm:ss <link number>
M DGN EQPT::CCB-sf:[ww]:[CFT-X-vwxy] COMPLD
/* [O.41211] */
"ATP"
;
```

[O.41212]

```
<xy> yy-mm-dd hh:mm:ss <link number>
M DGN EQPT::CCB-sf:[ww]:[CFT-X-vwxy] COMPLD
/* [O.41212] */

 "CCB-sf"
;
```

### Explanation Of Parameters

---

**CCB** - Cross-connect buffer

**s** - Cross-Connect Buffer side number (0 or 1)

**f** - Cross-Connect Buffer number (1 through 6)

**CFT** - Craft

The optional craft diagnostic test code field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run.

All tests can be run while out of service. Test 0004 will not run if any TSI on this Cross-connect Buffer (that is, TSI1 through TSI6) is in service.

**vwxy** - Diagnostic test number

| <i>Test</i>                 | <i>vwxy</i> |
|-----------------------------|-------------|
| Sync energy detector test   | 0001        |
| Port alarm test             | 0002        |
| Port alarm test             | 0004        |
| Clock energy detector test. | 0008        |

**ATP** - All tests passed**CATP** - Conditional all tests passed

| <i>cc</i> | <i>Explanation</i>                                             |
|-----------|----------------------------------------------------------------|
| 03        | CCB in service                                                 |
| 39        | Not all buses have mapped time slot, or some TSI is in service |
| 3A        | No unmapped time slots on one of the buses                     |
| 44        | DMB type NPCs on unit f on side s is in service.               |

**STF** - Some tests failed**ppqq** - Trouble number for the craft

pp - Failing diagnostic number in hexadecimal form  
qq - Test number in hexadecimal form.

| <i>ppqq</i> | <i>Explanation</i>                                             |
|-------------|----------------------------------------------------------------|
| 0480        | Clock energy detector test. Circuit pack identification wrong. |
| 0410        | Clock energy detector test. Error bit not set.                 |
| 0440        | Clock energy detector test. Overall error summary not set.     |

**Note:** Involves CCNI register; could be a CCNI problem.

04a0 Clock energy detector test. Error bit not cleared.  
0420 Clock energy detector test. Error returns after clear.  
04b0 Clock energy detector test. Summary returns after clear.

**Note:** Involves CCNI register; could be a CCNI problem.

04f0 Clock energy detector test. Software error.  
0180 Port alarm register test. Circuit pack identification wrong.  
0110 Port alarm register test. Error bit not set.  
0140 Port alarm register test. Overall error summary not set.

**Note:** Involves CCNI register; could be a CCNI problem.

01a0 Port alarm register test. Error bit not cleared.  
0120 Port alarm register test. Error returns after clear.  
01b0 Port alarm register test. Summary returns after clear.

**Note:** Involves CCNI register; could be a CCNI problem.

01f0 Port alarm register test. Software error.  
0280 SYNC energy detector test. Circuit pack identification wrong.  
0210 SYNC energy detector test. Error bit not set.  
0240 SYNC energy detector test. Overall error summary not set.

**Note:** Involves CCNI register; could be a CCNI problem.

02a0 SYNC energy detector test. Error bit not cleared.  
0220 SYNC energy detector test. Error returns after clear.  
02b0 SYNC energy detector test. Summary returns after clear.  
02f0 SYNC energy detector test. Software error.  
031N Port alarm in-service test. Port alarm set in ESR N. N=0-2.  
038N Port Alarm in-service test. Circuit pack identification wrong in ESR N.  
034N Port alarm in-service test. Overall error bit not set when test bus B. B=0-3.

**Note:** Involves CCNI register; could be a CCNI problem.

03aN Port alarm in-service test. Error bit not cleared in ESR N.  
032N Port alarm in-service test. Error returns after clear in ESR N.  
03b0 Port alarm in-service test. Summary returns after clear.

**Note:** Involves CCNI register; could be a CCNI problem.

03f0 Port alarm in-service test. Software error.  
0b00 Could not initialize pack.

**d5 - d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

**d5** - CCNI Error Source Register 5

Each data field contains sixteen bits. The significance of each data field and its individual bits is as follows:

| <i>Bit</i> | <i>Explanation</i>                        |
|------------|-------------------------------------------|
| 15-8       | Don't care                                |
| 7          | Error on autonomous switch enable circuit |
| 6          | Error on BSR parity                       |
| 5          | Parity error on high byte of data         |
| 4          | Parity error on low byte of data          |
| 3          | Address bus parity error                  |
| 2          | Synchronizer error                        |
| 1          | Error on CCB 6                            |
| 0          | Error on CCB 5                            |

**d4** - CCNI Error Source Register 4.

Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i>     |
|------------|------------------------|
| 15         | Error on CCB 4         |
| 14         | Error on CCB 3         |
| 13         | Error on CCB 2         |
| 12         | Error on CCB 1         |
| 11         | Error on FTM 4, Unit 6 |
| 10         | Error on FTM 3, Unit 6 |
| 09         | Error on FTM 2, Unit 6 |
| 08         | Error on FTM 1, Unit 6 |
| 07         | Error on FTM 4, Unit 5 |
| 06         | Error on FTM 3, Unit 5 |
| 05         | Error on FTM 2, Unit 5 |
| 04         | Error on FTM 1, Unit 5 |
| 03         | Error on FTM 4, Unit 4 |
| 02         | Error on FTM 3, Unit 4 |
| 01         | Error on FTM 2, Unit 4 |
| 00         | Error on FTM 1, Unit 4 |

**d3** - CCNI Error Source Register 3.

Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i>     |
|------------|------------------------|
| 15         | Error on FTM 4, Unit 3 |
| 14         | Error on FTM 3, Unit 3 |
| 13         | Error on FTM 2, Unit 3 |
| 12         | Error on FTM 1, Unit 3 |
| 11         | Error on FTM 4, Unit 2 |
| 10         | Error on FTM 3, Unit 2 |

## Explanation Of Parameters

**CCI** - Clock and control interface

**s** - Cross-connect side number (0 or 1)

**CFT** - Craft code

**vwxy** - Diagnostic test number (hexadecimal)

| <i>Test</i>                              | <i>vwxy</i> |
|------------------------------------------|-------------|
| Address and Data Parity Exercise         | 0001        |
| CCI Sync and Clock Exercise              | 0002        |
| ETSI alarm exercise                      | 0004        |
| Sync summary alarm exercise              | 0008        |
| Unit Summary Alarm Exercise              | 0010        |
| CCI Power Alarm Exercise                 | 0020*       |
| Bus Status Register Parity Test          | 0040        |
| Logic Cell Array (LCA) readback Test     | 0080        |
| Bus Termination (BT) Pack Alarm Exercise | 0100        |
| Out-of-service Bus Status Register       |             |
| Diagnostics                              | 0200*       |
| CCI reset register check                 | 0400*       |
| ETSI reset register check                | 0800*       |

\* Can be run only when the Expanded Cross-Connect Network (ECCN) side is out-of-service

The optional craft diagnostic code field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run.

**BT** - Bus termination

**sf** - BT identifier

**s** - Cross-connect side number (0 or 1)

**f** - Failed BT indicator

*f* *Explanation*

1 BT 1

2 BT 2

B Both BTs

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**cc** - Completion condition code (hexadecimal) (see cc for explanation)

**STF** - Some tests failed

**ppqq** - Trouble number for the craft (hexadecimal)

pp - Failing diagnostic number

qq - Test number

| <i>ppqq</i> | <i>Explanation</i>                                    |
|-------------|-------------------------------------------------------|
| 0001        | Address and Data Parity Exercise failed               |
| 0002        | CCI Sync and Clock Exercise failed                    |
| 0004        | ETSI alarm exercise failed                            |
| 0008        | Sync summary alarm exercise failed                    |
| 0010        | Unit Summary Alarm Exercise failed                    |
| 0020*       | CCI Power Alarm Exercise failed                       |
| 0040        | Bus Status Register Parity Test failed                |
| 0080        | Logic Cell Arrays (LCA) readback Test failed          |
| 0100        | Bus Terminator (BT) Pack Alarm Exercise failed        |
| 0200*       | Out-of-service Bus Status Register Diagnostics failed |
| 0400*       | CCI reset register check failed                       |
| 0800*       | ETSI reset register check failed                      |
| 8000        | CCI failed hardware initialization                    |

\* ECCN out-of-service test

wd21, ..., wd00

- Raw data words

These words are related to the diagnostic failure. Each word contains two bytes, and each byte is shown as a 2-digit hexadecimal number.

**cc** **mmmm** - Error condition code

| <b>cc</b> | <b>mmmm</b> | <i>Explanation</i>             |
|-----------|-------------|--------------------------------|
| <b>02</b> | <b>ENEQ</b> | Subject entity is not equipped |
| <b>03</b> | <b>SAIS</b> | Subject entity is in service   |
| <b>55</b> | <b>IDNV</b> | Invalid CFT code               |
| <b>56</b> | <b>IDNV</b> | Unrunnable CFT code            |

## Explanation Of Parameters

**CCNI** - Cross-connect network interface

**s** - Cross-connect side number (0 or 1)

**CFT** - Craft

The optional craft diagnostic code field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run. All diagnostic tests can be run in or out of service.

**vwxy** - Diagnostic test number

| Test                         | vwxy |
|------------------------------|------|
| Unmask test                  | 0001 |
| Lowbyte/highbyte parity test | 0002 |
| ESR/EMR test                 | 0004 |
| Bus status register test     | 0008 |
| Autonomous switch test       | 0010 |
| Address bus parity test      | 0020 |

**ATP** - All tests passed

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

pp - Failing diagnostic number in hexadecimal form

qq - Test number in hexadecimal form

| <i>ppqq</i> | <i>Explanation</i>                                                                                                                                          |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0110        | Autonomous switch enable test: error bit not set                                                                                                            |
| 0120        | Error bit returns after clear                                                                                                                               |
| 01f0        | Software error                                                                                                                                              |
| 0210        | Bus status register test: error bit not set                                                                                                                 |
| 0220        | Error bit returns after clear                                                                                                                               |
| 02f0        | Software error                                                                                                                                              |

**CATP** - Conditional all tests passed

**d5-d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

**d5** - CCNI Error Source Register 5

Each data field contains sixteen bits. The significance of each data field and its individual bits is as follows:

| <i>Bit</i> | <i>Explanation</i>                        |
|------------|-------------------------------------------|
| 15-8       | Don't care                                |
| 7          | Error on autonomous switch enable circuit |
| 6          | Error on BSR parity                       |
| 5          | Parity error on high byte of data         |
| 4          | Parity error on low byte of data          |
| 3          | Address bus parity error                  |
| 2          | Synchronizer error                        |
| 1          | Error on CCB 6                            |
| 0          | Error on CCB 5                            |

**d4** - CCNI Error Source Register 4. Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i>     |
|------------|------------------------|
| 15         | Error on CCB 4         |
| 14         | Error on CCB 3         |
| 13         | Error on CCB 2         |
| 12         | Error on CCB 1         |
| 11         | Error on FTM 4, Unit 6 |
| 10         | Error on FTM 3, Unit 6 |
| 09         | Error on FTM 2, Unit 6 |
| 08         | Error on FTM 1, Unit 6 |
| 07         | Error on FTM 4, Unit 5 |
| 06         | Error on FTM 3, Unit 5 |
| 05         | Error on FTM 2, Unit 5 |
| 04         | Error on FTM 1, Unit 5 |
| 03         | Error on FTM 4, Unit 4 |
| 02         | Error on FTM 3, Unit 4 |
| 01         | Error on FTM 2, Unit 4 |
| 00         | Error on FTM 1, Unit 4 |

**d3** - CCNI Error Source Register 3. Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i>     |
|------------|------------------------|
| 15         | Error on FTM 4, Unit 3 |
| 14         | Error on FTM 3, Unit 3 |
| 13         | Error on FTM 2, Unit 3 |
| 12         | Error on FTM 1, Unit 3 |
| 11         | Error on FTM 4, Unit 2 |
| 10         | Error on FTM 3, Unit 2 |
| 09         | Error on FTM 2, Unit 2 |
| 08         | Error on FTM 1, Unit 2 |
| 07         | Error on FTM 4, Unit 1 |
| 06         | Error on FTM 3, Unit 1 |
| 05         | Error on FTM 2, Unit 1 |
| 04         | Error on FTM 1, Unit 1 |
| 03         | Error on TSI 66        |
| 02         | Error on TSI 56        |
| 01         | Error on TSI 46        |
| 00         | Error on TSI 36        |

**d2** - CCNI Error Source Register 2. Each bit indicates an error on a pack connected to this CCNI.

| <i>Bit</i> | <i>Explanation</i> |
|------------|--------------------|
| 15         | Error on TSI 26    |
| 14         | Error on TSI 16    |
| 13         | Error on TSI 65    |

## **DGN,EQPT,CI,CFT,X**

### **DIAGNOSE COMMUNICATIONS INTERFACE**

#### **Explanation Of Command**

This message requests diagnostics to be run on the communications interface (CI). The optional craft (CFT) field specifies which test(s) vwxy is to be run on the CI. The remainder of the CI diagnostics will then not be run.

An in progress message (O.41004) is output every 20 seconds while CI is being diagnosed until the command response or the autonomous report is output.

#### **Command**

[I.41031]

**DGN-EQPT:[<xy>]:CI:[ww]:[CFT-X-vwxy];**

#### **Completion Message**

[O.41031]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DGN EQPT::CI:[ww]:[CFT-X-vwxy] COMPLD
/* [O.41031] */

### Explanation Of Parameters

---

**CI**            - Communications Interface

**CFT** - Craft

**vwxy** - Diagnostic test number (hexadecimal)

| <i>Test</i>                      | <i>vwxy</i> |
|----------------------------------|-------------|
| CI RAM Test                      | 0001*       |
| CI ROM Test                      | 0002        |
| CI DMA Controller Test           | 0004*       |
| CI LAN Controller Test           | 0008*       |
| CI Acknowledge Test              | 0010        |
| CI Timer Test.                   | 0020        |
| CI Debug Port Test               | 0040*       |
| CI Additional Memory Enable Test | 0080*       |

\*Out-of-service test.

**ATP** - All Tests Passed

**CATP** - Conditional All Tests Passed

**cc** - Hexadecimal completion condition code

*To interpret values of cc see the cc table below.*

**STF** - Some Tests Failed

**ppqq** - Trouble number for the craft (hexadecimal)

pp - Failing diagnostic number

qq - Test number

| <i>ppqq</i> | <i>Explanation</i>                                 |
|-------------|----------------------------------------------------|
| 0101        | RAM Data Fail                                      |
| 0102        | RAM Address Fail                                   |
| 0103        | RAM Access Fault                                   |
| 0104        | RAM Refresh Fail                                   |
| 0105        | RAM Parity Fail                                    |
| 0200        | ROM Fail                                           |
| 0400        | Timer Fail                                         |
| 0500        | Input Port Fail                                    |
| 0600        | DMA Controller Fail                                |

```

### Explanation Of Parameters

**ETSI** - Expanded Time slot Interchanger

**s** - Side number (0 or 1)

**qq** - Unit number (01 through 16)

**CFT** - Craft code

**vwx** - Diagnostic test number (hexadecimal)

| <i>Test</i>                          | <i>vwx</i> |
|--------------------------------------|------------|
| Clock and Sync exercise              | 0001       |
| Control RAM and data RAM memory test | 0002*      |
| Address and data parity exercise     | 0004       |
| Power monitor exercise               | 0008       |
| Data source time slot exercise       | 0010       |
| In-service port alarm exercise       | 0020       |
| Out-of-service port alarm exercise   | 0040*      |
| Data source and access test          | 0080       |
| Receive multiplexer port alarm       | 0100       |
| Control RAM parity exercise          | 0400       |
| Unmapped code test                   | 0800*      |
| Data RAM unmapped test               | 1000*      |

\* Can only be tested if the ETSI is out of service

The optional craft diagnostic test code field indicates which test(s) of the diagnostic is to be run under craft control. If this field is not entered, all tests of this diagnostic will be run.

**nn** - Unit number of the questionable in-service ETSI pack, (01 through 16)

**ATP** - All tests passed

This applies to the diagnostic of the ETSI pack, its connection with other in-service ETSIs and its cable.

**STF** - Some tests failed

This applies to the diagnostic of the ETSI pack, its connection with other in-service ETSIs and its cable.

**ppqq** - Trouble number for the craft (hexadecimal)

pp - Failing diagnostic number

qq - Test number

| <i>ppqq</i> | <i>Explanation</i>                            |
|-------------|-----------------------------------------------|
| 0001        | Clock and sync exercise failed                |
| 0002        | Control RAM and data RAM memory test failed   |
| 0004        | Address and data parity exercise failed       |
| 0008        | Power monitor exercise failed                 |
| 0010        | Data source time slot exercise failed         |
| 0020        | In-service port alarm exercise failed         |
| 0040        | Out-of-service port alarm test failed         |
| 0080        | Data source and access test failed            |
| 0100        | Receive multiplexer port alarm test failed    |
| 0200        | Transmit demultiplexer port alarm test failed |
| 0400        | Control RAM parity exercise failed            |
| 0800        | Unmapped code test failed                     |
| 1000        | Data RAM unmapped test failed                 |
| 8000        | ETSI Hardware initialization failed           |

**wd15, ..., wd00**

- Raw data

Sixteen raw data words relating to the failed diagnostic detected. Each data word contains two bytes, and each byte is presented as a two-digit hexadecimal number. The interpretation of raw data values cannot be done by a craftsman.

|             |                                             |

## **DGN,EQPT,ETISIS,ECCN,ALL**

### **DIAGNOSTICS**

#### **Explanation Of Command**

This message requests diagnostic tests to be run on ALL expanded time slot interchangers (ETISIs) on an expanded cross-connect network (ECCN) side.

#### **Command**

[I.41271]

**DGN-EQPT:[<xy>]:ETISIS:[ww]:ECCN-s:ALL;**

#### **Completion Message**

[O.41271]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DGN EQPT::ETISIS:[ww]:ECCN-s:ALL COMPLD
/* [O.41271] */
"s01,r,nn:s02,r,nn:s03,r,nn:s04,r,nn:s05,r,nn:s06,r,nn:\
s07,r,nn:s08,r,nn"
"s09,r,nn:s10,r,nn:s11,r,nn:s12,r,nn:s13,r,nn:s14,r,nn:\
s15,r,nn:s16,r,nn"
/* TOTAL ETISIs tt*/
"TOTAL:tt"
"COND-kk"
;
```

**Note:** For each ETSI pack that failed diagnostics a separate STF message will be output.

### Denial Message

[O.41271.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DGN EQPT::ETSI:[ww]:ECCN-s:ALL DENY
 mmmm
 /* [O.41271.01] */
 /* <explanation of error condition code> */
;
```

### Autonomous Message

Not applicable.

### Explanation Of Parameters

**ETSI** - Expanded time slot interchangers

**ECCN** - Expanded cross-connect network

**s** - Side number (0 or 1)

**pa** - Priority of action

*pa*            *Explanation*

M^            Manual response  
(The "^" represents a blank space)

**r** - Diagnostic status for an individual ETSI

*r*            *Explanation*

A            All tests passed (ATP)  
C            Conditional all tests passed (CATP)  
S            Some tests failed (STF)  
-            unequipped ETSI

**nn** - Condition code (hexadecimal) for an individual ETSI

**nn**      *Explanation*

--      Unequipped ETSI

To interpret other values of nn see cc below.

**tt** - Total number of ETSIs equipped in the ECCN side (01 through 16)

**kk** - Completion condition code (hexadecimal) for the whole message

To interpret values of kk see cc below.

**cc**    **mmmm** - Error condition code

**cc**    **mmmm**    *Explanation*

**02**    **ENEQ**    Subject entity is not equipped

**03**    **SAIS**    Subject entity is in service

**16**    **ENEQ**    SYNC TB is not equipped

**17**    **SAOS**    SYNC is out of service

**55**    **IDNV**    Invalid CFT code

**56**    **IDNV**    Unrunnable CFT code

**A9**    **SNVS**    No unmapped time slot

**CE**    **SAOS**    CCI is out of service

**CF**    **SNVS**    SYNC is inservice but failed

**D1**    **SNVS**    CCI is not present

**D4**    **SNVS**    CCI is inservice but failed

## **DGN,EQPT,IN,PROGRESS**

### **DIAGNOSTIC IN PROGRESS**

#### **Explanation Of Command**

This message indicates that the diagnosis of the specified entity is in progress. This message will be output every 20 seconds while waiting for the response to the diagnostic command or the autonomous diagnostic report to be output.

#### **Command**

Not applicable.

#### **Completion Message**

[O.41004]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DGN EQPT::<entity>:[ww] IN_PROGRESS
;
```

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.41005]

```
<xy> yy-mm-dd hh:mm:ss
A ff REPT EVT EQPT
/* [O.41005] */
"DGN:<entity>:IN_PROGRESS"
;
```

## **Explanation Of Parameters**

---

**entity** - The name of the entity being diagnosed

| <b>entity</b> | <i>Explanation</i>                       |
|---------------|------------------------------------------|
| CCB           | Cross-connect buffer                     |
| CCI           | Clock and control interface              |
| CCNI          | Cross-connect network interface (NonCEF) |
| CI            | Communications interface                 |
| DISK          | Disk                                     |
| DSPI          | Digital signal processing interface      |
| FC            | Format converter                         |
| FLI           | Facility line interface                  |
| FMT           | Formatter                                |
| FTMI          | Facility terminating module interface    |
| LINK          | Link                                     |
| MC            | Main controller                          |
| MIU           | Multiplexer interface unit               |
| MP            | Main processor                           |
| MXR           | Multiplexer                              |
| NPC           | Network processing circuit               |
| SSC           | Secondary storage controller             |
| SYNC          | Synchronizer                             |
| TAPE          | Tape                                     |
| TLI           | Timing link interface                    |
| TSI           | Time slot interchange                    |
| ETSI          | Expanded time slot interchanger          |
| XC            | Cross-connect                            |
| UC            | Unit controller                          |

## Explanation Of Parameters

**CFT** - Craft

**vwxy** - Diagnostic test number

|                         |             |
|-------------------------|-------------|
| <i>test</i>             | <i>vwxy</i> |
| Link Loopback Test      | 0001        |
| Input Port & Timer Test | 0002        |

**LINK** - Link

**a** - Administrative link number (1 through 6)

**ATP** - All tests passed

**STF** - Some tests failed

**ppqq** - Diagnostic trouble number

| <i>ppqq</i> | <i>Explanation</i>          |
|-------------|-----------------------------|
| 0100        | Link fail                   |
| 0300        | DUART test fail             |
| 0400        | Timer test fail             |
| 0500        | Input/output port test fail |

**pp** - Failing diagnostic number (hexadecimal)

**qq** - Test number (hexadecimal)

**d5,**

**d4,**

**...,**

**d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected

These data bytes can only be interpreted by a Lucent Technologies design engineer.

**mmm** - Error condition code

**mmm** *Explanation*

|             |                                   |
|-------------|-----------------------------------|
| <b>SAIS</b> | Subject entity is in service      |
| <b>SNVS</b> | Hardware mismatch or not present  |
| <b>SNVS</b> | Clock absent for XPC to loop back |

## **DGN,EQPT,MC,CFT,X**

### **DIAGNOSE MAIN CONTROLLER**

#### **Explanation Of Command**

This message requests diagnostics to be run on the main controller (MC). The optional CFT field specifies which test(s) is to be run on the MC.

The DGN <entity> IN PROGRESS message (O.41004) is output every 20 seconds while the MC is being diagnosed until the command response or the autonomous report is output.

#### **Command**

| EMTC/MTC Sanity Reg. Test       | 0080*       |
| EMTC/MTC LAN Disable Test       | 0100*       |
| EMTC/MTC Autonomous Alarm Test  | 0200*       |
| EBX/BX Interrupt Test           | 0400*       |
| EBX/BX Acknowledge Test         | 0800        |
| EBX/BX Data/Address Parity Test | 1000*       |

\*Out-of-service test (not performed if MC is in-service)

†In-service test (not performed if MC is out-of-service or in maintenance condition (MCOND))

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**cc** - Hexadecimal completion condition code

*To interpret values of cc see the table of cc values below.*

**STF** - Some tests failed

**ppqq** - Trouble number for the craft (hexadecimal)

**pp** - Failing diagnostic number  
**qq** - Test number

| <b>ppqq</b> | <i>Explanation</i>               |
|-------------|----------------------------------|
| 0100        | MP Fail                          |
| 0200        | CI Fail                          |
| 0400        | PMEM Fail                        |
| 0500        | SMEM Fail                        |
| 0600        | EMTC/MTC Interrupt Fail          |
| 0700        | EMTC/MTC Acknowledge Fail        |
| 0800        | EMTC/MTC Sanity Reg. Fail        |
| 0900        | EMTC/MTC LAN Disable Fail        |
| 0E00        | EMTC/MTC Autonomous Alarm Failed |

|      |                                 |
|------|---------------------------------|
| 0A01 | EBX/BX RAM Data Fail            |
| 0A02 | EBX/BX RAM Address Fail         |
| 0A03 | EBX/BX RAM Access Fail          |
| 0A04 | EBX/BX RAM Refresh Fail         |
| 0A05 | EBX/BX RAM Parity Fail          |
| 0Bxx | EBX/BX Interrupt Fail           |
| 0C00 | EBX/BX Acknowledge Fail         |
| 0D00 | EBX/BX Data/Address Parity Fail |
| 0D01 | EBX/BX Data Parity Write Failed |
| 0D02 | EBX/BX Data Parity Read Failed  |
| 0D03 | EBX/BX Address Parity Failed    |

**xx** indicates a low level test failure point which can only be interpreted by a Lucent Technologies design engineer.

**d5 - d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.  
These data bytes can only be interpreted by a Lucent Technologies design engineer.  
An in-progress message (O.41004) is output every 20 seconds while the MP is being diagnosed until the command response or the autonomous report is output.

**mmmm** - Error condition code

| <b>mmmm</b> | <i>Explanation</i>                                        |

| <b>SNVS</b> | Problem occurred while accessing PMEM                     |
| <b>SNVS</b> | SMEM is not present                                       |
| <b>SNVS</b> | SMEM unit is not restored                                 |

## **DGN,EQPT,MP,CFT,X**

### **DIAGNOSE MAIN PROCESSOR**

#### **Explanation Of Command**

This message requests diagnostics to be run on the main processor (MP). If the craft (CFT) option is used, the value supplied for *vwxy* will determine the diagnostic run. The remainder of the diagnostics will then not be run. If the CFT option is not used, all the diagnostics listed under *vwxy* will be run.

An in-progress message (O.41004) is output every 20 seconds while the MP is being diagnosed until the command response or the autonomous report is output.

#### **Command**

[I.41021]

**DGN-EQPT:[<xy>]:MP:[ww]:[CFT-X-vwxy];**

#### **Completion Message**

[O.41021]

### Explanation Of Parameters

---

MP            - Main Processor

**CFT** - Craft

**vwxy** - Diagnostic test number

| <i>Test</i>                   | <i>vwxy</i> |
|-------------------------------|-------------|
| <b>MP RAM Test</b>            | 0001*       |
| <b>MP ROM Test</b>            | 0002        |
| <b>MP DMA Controller Test</b> | 0010*       |
| <b>MP LAN Controller Test</b> | 0020*       |
| <b>MP Acknowledge Test</b>    | 0080        |

\*Out-of-service test.

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**cc** - Completion condition code (hexadecimal)

To interpret these codes see cc.

**STF** - Some tests failed

**ppqq** - Trouble number

pp - Failing diagnostic number (hexadecimal)

qq - Test number (hexadecimal)

*ppqq Explanation*

|             |                     |
|-------------|---------------------|
| <b>01xx</b> | RAM Tests Fail      |
| <b>0101</b> | RAM Data Fail       |
| <b>0102</b> | RAM Address Fail    |
| <b>0103</b> | RAM Access Fail     |
| <b>0104</b> | RAM Refresh Fail    |
| <b>02xx</b> | ROM Fail            |
| <b>0500</b> | Input Port Fail     |
| <b>06xx</b> | DMA Controller Fail |
| <b>07xx</b> | LAN Controller Fail |
| <b>0900</b> | Acknowledge Fail    |

**xx** indicates a low level test failure point which can only be interpreted by a Lucent Technologies design engineer.

**d5-d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

These data bytes can only be interpreted by a Lucent Technologies design engineer.

An in-progress message (O.41004) is output every 20 seconds while the MP is being diagnosed until the command response or the autonomous report is output.

**cc**    **mmm**    - Error condition code

**cc**    **mmm**    *Explanation*

**03**    **SAIS**    Subject entity is in service

**55**    **IDNV**    Invalid CFT code

**56**    **IDNV**    Unrunnable CFT code

## **DGN,EQPT,NPC**

### **DIAGNOSE NETWORK PROCESSING CIRCUITS**

#### **Explanation Of Command**

This command requests the diagnosis of a range of network processing circuits (NPCs) in a Facility Terminating Unit (FTU). It cannot be used to request the diagnosis of NPCs in a digital signal processing unit.

This command will be denied if the requested NPC range crosses a unit boundary. This command cannot be used to request the diagnosis of NPCs in a DS3 unit (DS3U) or a Hybrid DS3 unit (HDS3U). If this command is specified for a range of NPCs and the first or last NPC in the range request in is a CEPT GAP the entire command will be denied. If the CEPT GAP is contained within the range requested the gap NPCs are ignored and all equipped NPCs are diagnosed.

#### **Command**

##### **Nonhierarchical**

[I.41361]

**DGN-EQPT : [<xy>] : NPC - [s] abc&& - [t] def : [<ww>] ;**

##### **Hierarchical**

## Explanation Of Parameters

---

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, denoting the beginning of a range.

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, denoting the end of a range.

[s]abc and [t]def must be in the same unit.

**[s]ghi** - Lowest NPC number in the FTM being reported ([s]abc through [s]def)

**[t]jkl** - Highest NPC number in the FTM being reported ([s]abc through [s]def)

The command may specify an NPC range that spans more than one facility terminating module (FTM) in the facility terminating unit or it may specify all or a subset of the NPCs in a given FTM. Hence the NPC numbers reported in a message segment for a given FTM will, in general, be numbers within the range given in the input command and may include the end points of the specified range.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| Unit<br>13       | Unit<br>14       | Unit<br>15       | Unit<br>16       |
|------------------|------------------|------------------|------------------|
| NPC              | NPC              | NPC              | NPC              |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical NPC number, denoting the beginning of a range.

**uv-k-qr**

- Hierarchical NPC number, denoting the end of a range.

**ab-c-de**

- Lowest NPC number in the FTM being reported (**uvmnp** through **uvkqr**)

**ab-c-fg**

- Highest NPC number in the FTM being reported (**uvmnp** through **uvkqr**)

**uv, ab**

- Unit number

**m, k, c**

- Module number

**np, qr, de, fg**

- NPC number within the module

The command may specify an NPC range that spans more than one facility terminating module (FTM) in the facility terminating unit or it may specify all or a subset of the NPCs in a given FTM. Hence the NPC numbers reported in a message segment for a given FTM will, in general, be numbers within the range given in the input command and may include the end points of the specified range.

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**TOT** - Total

**ttt** - Total number of equipped NPCs in a CEPT FTM (**001** through **032**).

**pa** - Priority of action

**pa** *Explanation*

**\*\*** Major

**M** Manual

**r** - Result of diagnostics

**r**      *Explanation*

**A**      All tests passed  
**C**      Conditional all tests passed  
**S**      Some tests failed  
**D**      Diagnostics denied  
**N**      NPC is not in the range  
**-**      NPC is not equipped

If the diagnostic result is Some Test Failed, one output message will be generated for each NPC.

**kk** - Completion condition code for each NPC diagnostic (hexadecimal)

To interpret values of kk see cc in the condition code table. One special value is given below.

**kk**      *Explanation*

**--**      Not applicable

**nn** - Completion condition code for the whole message (hexadecimal)

To interpret values of nn see cc in the condition code table.

**cc**      **mmmm** - Error condition code

**cc**      **mmmm**      *Explanation*

|           |             |                                  |

| <b>FD</b> | <b>IDRG</b> | NPC range crosses unit boundary  |

## **DGN,EQPT,NPC,SIDE,CFT,X**

### **DIAGNOSE NPC**

#### **Explanation Of Command**

This command requests diagnostics to be run on a single network processing circuit (NPC) in a facility terminating unit (FTU) or a digital signal processing unit (DSPU). For a Capacity Expansion Frame (CEF), if the NPC is in a DSPU (that is, NPC types MB or CB), this message also initiates the continuity test for the cable between the NPC and its corresponding expanded time slot interchanger (ETSI). However, the continuity test will not be run if the optional craft code is entered.

This command is not valid for NPCs in a DS3 unit (DS3U) or Hybrid DS3 unit (HDS3U).

**uv-m-np**

- Hierarchical NPC number

**uv** - Unit number

**m** - Module number

**np** - NPC number within the module

The values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

CB type NPC numbers listed by unit, module, and NPC Number  
Unit Type DP (DSPU)

| Unit         | Module     | NPC       |
|--------------|------------|-----------|
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**SIDE** - Side

**s** - Side number (s = 0 or 1)

Side of the duplicated NPC circuit pack in a DSPU that is to be diagnosed.

**CFT** - Craft

**vwxy** - Diagnostic test number

The optional craft code field indicates the diagnostic test(s) to be run. If this field is omitted, all tests of this diagnostic will be run. If the NPC is in-service, only in-service diagnostics are run.

**Craft codes for the CB type NPC are listed below:**

| <i>Test</i>                              | <i>vwxy</i> |
|------------------------------------------|-------------|
| Out of service LCA device initialization | 0001*       |
| Interrupt and mask register test         | 0002*       |
| Out of service RAM test                  | 0004        |
| Status and mask register test            | 0008        |
| Parity checker test                      | 0010        |
| State machine exercise                   | 0020        |
| Receive CCN exercise                     | 0040        |
| Loss of clock exercise                   | 0080        |
| C-bit interface test                     | 0100        |
| In-service RAM test                      | 0200        |

\* Out-of-service only test

**Craft codes for the MB type NPC are listed below:**

| <i>Test</i>                      | <i>vwxy</i> |
|----------------------------------|-------------|
| RAM test                         | 0001*       |
| Interrupt and mask register test | 0002        |
| Data processing error test       | 0004        |
| Clock error test                 | 0008        |
| Serial interface error test      | 0010        |
| Control memory 0 test            | 0020        |
| Control memory 1 test            | 0040        |
| Conference 0 test                | 0080        |
| Conference 1 test                | 0100        |

\* Out-of-service only test

**Craft codes for the PA type NPC are listed below:**

| <i>Test</i>                            | <i>vwx</i> |
|----------------------------------------|------------|
| CI stuck bit test                      | 0001       |
| CI sanity test                         | 0002       |
| CI serial link test                    | 0004       |
| TG192 RAM test                         | 0008       |
| Channel controller tests               | 0010*      |
| Transceiver tests                      | 0020       |
| Miscellaneous register tests           | 0040       |
| Real-time clock test                   | 0080       |
| CC to format converter continuity test | 0100       |

\* In-service test

**Craft codes for the PB and PC type NPCs are listed below:**

| <i>Test</i>                                                                                                                                                 | <i>vwx</i> |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| CI stuck bit and device alarm tests                                                                                                                         | 0001       |
| CI sanity timer test                                                                                                                                        | 0002       |
| CI serial link test                                                                                                                                         | 0004       |
| CC stuck bit test on read and write registers                                                                                                               | 0008       |
| CC Instruction RAM stuck bit test                                                                                                                           | 0010       |
| CC receive data parity alarm test                                                                                                                           | 0020       |
| Memory test                                                                                                                                                 | 0040       |
| DSI LFV exercise and transceiver LFV counter test                                                                                                           | 0080*      |
| Data path, CC monitor, and DSI loopback tests AND CC PCM conversion and signaling mode test AND CC conditional substitution and transceiver EFG source test | 0100       |

|                                                                                                         |       |
|---------------------------------------------------------------------------------------------------------|-------|
| SLIP/SKIP tests                                                                                         | 0200* |
| Line coding format test                                                                                 | 0400* |
| Diframe framing, NSA signaling<br>mode tests AND CRC framing mode<br>tests AND CAS signaling mode tests | 0800* |
| CC device alarm exercises                                                                               | 1000  |
| Transceiver r/w reg. stuck bit test and<br>device alarm exercises                                       | 2000* |
| Miscellaneous register stuck bit test                                                                   | 4000  |
| Time slot 0/16 source test                                                                              | 8000* |

Notes:

1. Only tests 0001 and 1000 can be run when the NPC is in service.
2. If the requested NPC is Out-of-Service and its mate is In Service, only the tests marked with "\*" can be run:
3. If both the requested NPC and its mate are Out-of-Service, any test may be run.

**Craft codes for the SD type NPCs are listed below:**

|                                 |            |
|---------------------------------|------------|
| <i>Test</i>                     | <i>vwx</i> |
| CI stuck bit test               | 0001       |
| CI sanity test                  | 0002       |
| CI serial link test             | 0004       |
| TG193 CC Config. Reg. test      | 0008       |
| TG193 CC IRAM etc. tests        | 0010       |
| TG193 clock & synch error tests | 0020*      |
| TG193 RAM tests                 | 0040       |
| Miscellaneous register test     | 0080       |

**Note:** \* denotes that the test can be run while the NPC is In Service

**[t]def** - The 3- or 4-digit nonhierarchical MB type NPC number  
([t]def= [s]abc + 1)

**uv-m-qr**  
- Hierarchical MB type NPC number

**qr** - MB type NPC number within module "m" (qr = np +1).

**TYPE** - Type

**mnxyz** - NPC type identifier

*mnxyz NPC type*

**CB10z** C-bit processor

**MB100** Digital Multipoint Bridge

**PAxyz** CEPT Type NPC (120-ohm twisted pair or 75-ohm coaxial)

**PBxyz** CEPT Type NPC

**PCxyz** CEPT Type NPC

**SDxyz** DSP Platform Applications

**qq** - Unit number (01 through 16)

**UPN** - Unit plug number

**upn** - The value of the UPN.

**XPN** - ECCN plug number

**xpn** - The value of the XPN

**BIT** - Bit number of the data bus

**TD** - Transmit data

**RD** - Receive data

**bb** - Bit number (00 through 15)

The optional line which contains the unit, port, and pin information will only be output if the NPC is in a DSPU and if the continuity check between the NPC and the ECCN is failed. In addition, the completion condition must always be STF. The valid values and the associated information of the UPN and XPN are shown below. Note that the numbers shown in the output are exactly the same as the numbers on the backplane.

| Unit Plug No. | ECCN Plug No. | Side | Direction | Associated DSP Packs  |
|---------------|---------------|------|-----------|-----------------------|
| P1            | PqqA*         | 0    | Receive   | 1st and 2nd DSP Packs |
| P2            | PqqE          | 0    | Transmit  | 1st and 2nd DSP Packs |
| P3            | PqqB          | 0    | Receive   | 3rd and 4th DSP Packs |
| P4            | PqqF          | 0    | Transmit  | 3rd and 4th DSP Packs |
| P5            | PqqC          | 0    | Receive   | 5th and 6th DSP Packs |
| P6            | PqqG          | 0    | Transmit  | 5th and 6th DSP Packs |
| P7            | PqqD          | 0    | Receive   | 7th and 8th DSP Packs |
| P8            | PqqH          | 0    | Transmit  | 7th and 8th DSP Packs |
| P10           | PqqA          | 1    | Receive   | 1st and 2nd DSP Packs |
| P11           | PqqE          | 1    | Transmit  | 1st and 2nd DSP Packs |
| P12           | PqqB          | 1    | Receive   | 3rd and 4th DSP Packs |
| P13           | PqqF          | 1    | Transmit  | 3rd and 4th DSP Packs |
| P14           | PqqC          | 1    | Receive   | 5th and 6th DSP Packs |
| P15           | PqqG          | 1    | Transmit  | 5th and 6th DSP Packs |
| P16           | PqqD          | 1    | Receive   | 7th and 2nd DSP Packs |
| P17           | PqqH          | 1    | Transmit  | 7th and 8th DSP Packs |

\* qq is the unit number

The bit number (that is, BIT = TDRD bb) will be shown if the software identifies the bit of the data bus as the failed one.

**ATP** - All tests passed

All tests passed on the diagnostic of NPC

**CATP** - Conditional all tests passed

The reason for the conditional completion is indicated by cc.

**STF** - Some tests failed

Some tests failed on the diagnostic of NPC.

**ppqq** - Trouble number for the craft

pp Failing diagnostic number (hexadecimal)

qq Test number (hexadecimal)

**Trouble numbers for the PA type NPC are listed below:**

The TG192 circuit pack can be grown as either a PA or PB/PC type. As a consequence the trouble numbers for the PB type apply in addition to those shown below.

*ppqq Cause of failure*

- 0001** TG192 Initialization - Phase 1
- 0002** TG192 Initialization - Phase 2
- 0003** digroup physical type verification
- 0004** devices/registers on the FC could not be accessed
- 0005** devices/registers on the FTMI could not be accessed
- 01--** CI stuck bit test
- 02--** CI sanity timer test
- 03--** CI serial link test
- 04--** TG192 ram test
- 05--** channel controller driver
- 06--** transceiver driver
- 07--** miscellaneous register tests
- 08--** read-time clock test
- 09--** CC alarm test
- 0A--** CC stuck bit test
- 0B--** CC conditional substitution and SCVR EFG SRC test
- 0C--** CC device initialization test
- 0D--** CC IRAM stuck bit test
- 0E--** CC PCM conversion and signaling mode test
- 0F--** CC receive data parity alarm test
  
- 10--** CI initialization test
- 11--** miscellaneous register R/W test
- 12--** CC and XCVR initialization test
- 13--** XCVR initialization test
- 14--** CC read channel data ABCDEFG bits verification
- 15--** CC read channel data verification
- 16--** XCVR write verification
- 17--** CC IRAM R/W verification
- 18--** XCVR BIST
- 19--** CC to SCVR to DSI data transmission test
- 1A--** LOS and LFV tests
- 1B--** XCVR R/W register test
- 1C--** CC to XCVR to DSI signaling test
- 1D--** CC to FC continuity test

**Note:** "--" indicates a two-digit hexadecimal value indicating a decision point within the source program. This value can only be interpreted by a programmer with access to the source program.

**Trouble numbers for PB and PC type NPCs are listed below:**

The TG192 circuit pack can be grown as either a PA or PB/PC type. As a consequence the trouble numbers for the PA type apply in addition to those shown below.

*ppqq Cause of failure*

|             |                                               |

## DGN,EQPT,PMEM,SMEM,CFT,X,PROG,DBASE

### **RUN DIAGNOSTICS ON NON-VOLATILE MEMORY CARD**

#### **Explanation Of Command**

This command requests diagnostics to be run on the specified non-volatile memory card; either the primary memory card (PMEM) or the secondary memory card (SMEM). The diagnostics test the operation of the underlying hardware of the specified memory card. By default, the entire set of in-service or out-of-service diagnostics are run except for the database and executable tests. If the craft option is used, the value supplied for vwxy will determine the diagnostics run and can include database and executable tests.

Using the optional keywords PROG or DBASE, allows the user to test the system's ability to correctly read either the executable program or the database stored on a memory card. When a single or multiple diagnostic test is specified via the CFT parameter, only those tests specified by the CFT parameter are run, all other possible tests are not run. The **DGN EQPT IN\_PROGRESS** message is output every 20 seconds while the diagnostics are being executed until the command response or the autonomous report is output.

#### **Command**

### Explanation Of Parameters

---

**PMEM** - Primary memory card.

**SMEM** - Secondary memory card.

**CFT** - Craft

**X** - Hexidecimal

**vwxy** - Diagnostic test number

The optional craft code field specifies which test is to be run on the PMEM/SMEM. The card status test is always performed. The remainder of the PMEM/SMEM diagnostics will not be run.

**vwyx** *Test*

**0001** Card Status Test

**0002** Wear Level Test

**0004\*** Card Diagnostic Test

0010\*+ Validate Data Base Test

0020\*% Validate Boot Block Test

0040\*% Validate Executable Header Test

0080\*% Validate Executable Test

**0100\*** Read/Write DGN Volume Test

**0200\*** Mount/Unmount All Volumes Test

\* out-of-service tests (not performed if PMEM/SMEM card is in the in-service state and the main controller is also in the in-service state).

+ Database tests (performed when DBASE keyword is specified).

% Executable tests (performed when PROG keyword is specified).

**DBASE** - Database

This keyword is used to test the ability to correctly read the data base files stored on the PMEM/SMEM. This diagnostic will be run only if the DBASE keyword is entered or if the specific test CFT field is specified.

PMEM/SMEM must be out-of-service (OOS) or the main controller must be in maintenance condition (MCOND) when using this keyword.

**PROG** - Program

This keyword is used to test the ability to correctly read the executables stored on the PMEM/SMEM. This diagnostic will be run only if the PROG keyword is entered or if the specific test CFT field is specified.

PMEM/SMEM must be out-of-service (OOS) or the main controller must be in maintenance condition (MCOND) when using this keyword.

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

**pp** - Failing Diagnostic Number (hexadecimal)

**qq** - Test number (hexadecimal)

| <b>ppqq</b>       | <i>Explanation</i>                                                                               |

## **DGN,EQPT,SYNC,TLI,SSP**

### **DIAGNOSE SYNCHRONIZER TIMING LINK INTERFACE**

#### **Explanation Of Command**

This command requests the diagnosis of a timing link interface on the synchronizer side. If the optional synchronizer sync port parameter is specified, only that single SSP is diagnosed. For autonomous diagnostics of a TD-type TLI circuit pack, the SSP field does not appear in the output message. Both arguments appear for autonomous removal of a timing extractor type TLI.

#### **Command**

[I.41121]

**DGN-EQPT: [<xy>]: SYNC-a: [ww]: TLI-m: [SSP-b];**

#### **Completion Message**

[O.41121]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]

 /* [0.41121.01] */
 /* <explanation of error condition code> */
 /* Diagnosed entity */
 "SYNC-a-TLI-m-[SSP-b[-1]]"
;
```

### Explanation Of Parameters

---

**SYNC** - Synchronizer

**a** - Synchronizer side number (0 or 1)

**TLI** - Timing link interface

**m** - Timing link interface number (1 through 4)

**SSP** - Synchronizer synchronization port

**b** - Synchronizer Synchronization Port number (0 or 1)

**Note 1:** SSP must be specified if the TLI is a timing extractor type NPC.

**Note 2:** If the SSP parameter is supplied, only that SSP is diagnosed. Otherwise both SSPs are diagnosed.

**ATP** - All tests passed

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

Valid values are listed below:

| <i>ppqq</i> | <i>Explanation</i> |
|-------------|--------------------|
|-------------|--------------------|

|      |                               |
|------|-------------------------------|
| 0300 | TLI status query showed error |

| <b>56</b> | <b>IDNV</b> | Unrunnable CFT code            |

## **DGN,EQPT,TSI,CCN,UNIT**

### **DIAGNOSE TIME SLOT INTERCHANGES**

#### **Explanation Of Command**

This command requests diagnostics to be run on all time slot interchangers (TSIs) between **UNIT-q** and the specified units. If the optional connectivity field is omitted, then all TSIs connected to **UNIT-q** will be diagnosed.

#### **Command**

[I.41232]

**DGN-EQPT:[<xy>]:TSI:[ww]:CCN-s:UNIT-q\  
:[a[,b[,c[,d[,e[,f]]]]]]];**

#### **Completion Message**

[O.41232]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]

## **Explanation Of Parameters**

---

**TSIS** - Time slot interchangers

**CCN** - Cross-connect network

**s** - Cross-Connect Network side number (0 or 1)

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**CONN** - Unit connection

**a, b, c, d, e, f**

- Connected unit number

If the connected unit field is omitted, then all TSIs connected to the specified unit will be diagnosed.

**sft** - TSI identifier

**s** - See s under CCN above

**f** - FROM Unit

**t** - TO Unit

**e** - Number of lines in the message

**r** - Diagnostic status for an individual TSI

*r Explanation*

A ATP COMPL (All Tests Passed)

C CATP COMPL (Conditional All Tests Passed)

S STF COMPL (Some Tests Failed)

D DNY (Deny)

- unequipped TSIs

**nn** - Condition code for each TSI addressed (-- for unequipped TSIs)

See cc below to interpret values of nn.

**cc**    **mmm**    - Error condition code

**cc**    **mmm**    *Explanation*

**02**    **ENEQ**    Subject entity is not equipped

**45**    **SAOS**    A DMB on the UNIT is OOS

## **DGN,EQPT,TSI,CFT,X**

### **DIAGNOSE TIME SLOT INTERCHANGE**

#### **Explanation Of Command**

This command requests diagnostics to be run on a specific time slot interchange.

The optional **CFT** field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run.

If there are no mapped TSI slots, DACS II will respond with some tests failed (STF).

#### **Command**

[I.41221]

**DGN-EQPT:[<xy>]:TSI-sft:[ww]:[CFT-X-vwxy];**

### Explanation Of Parameters

**TSI** - Time slot interchange

**s** - Cross-connect network side number (0 or 1)

**f** - FROM unit number (1 through 6)

**t** - TO unit number (1 through 6)

**CFT** - Craft

**vwxy** - Diagnostic test number

| <i>Test</i>                     | <b>vwxy</b> |
|---------------------------------|-------------|
| Output data checker exercise    | 0001        |
| Memory test                     | 0002        |
| Memory diagnostic               | 0004        |
| Address bus parity test         | 0008        |
| Loss of clock exercise 2        | 0010        |
| Loss of clock exercise 1        | 0020        |
| Memory diagnostic exercise      | 0040        |
| Control RAM checker exercise    | 0080        |
| Communication test              | 0100        |
| Memory and Alarms diagnostic(s) | 0200        |

### Note:

1. If the CFT field is omitted, all tests of this diagnostic will be run.
2. Tests 0200, 0040, 0020, 0010, 0004, and 0002 can only be run when the TSI is out-of-service. All other tests can be run when the TSI is in service.

**ATP** - All tests passed

**CATP** - Conditional all tests passed

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

pp - Failing diagnostic number in hexadecimal form

qq - Test number in hexadecimal form.

| <b>ppqq</b> | <i>Explanation</i>                                                                                               |

```

## Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**DSPI** - Digital signal processing interface

**CFT** - Craft

**vwxy** - Diagnostic test number

| Test                                                   | vwxy |
|--------------------------------------------------------|------|
| Processor bus parity checker test<br>(in-service test) | 0001 |
| Interrupt and mask register test<br>(in-service test)  | 0002 |
| Serial interface (in-service test)                     | 0004 |
| Serial interface (out-of-service test)                 | 0008 |

The optional CFT field is used to indicate which diagnostic test(s) is to be run. If this field is omitted, all DSPI diagnostic tests will be run.

**ATP** - All tests passed

**CATP** - Conditional all tests passed

| <i>cc</i> | <i>Explanation</i>                                                                 |
|-----------|------------------------------------------------------------------------------------|
| 03        | Subject entity is in-service                                                       |
| 37        | DSPI out-of-service                                                                |
| 44        | DSPI is out-of-service; Digital Signaling Processing Circuit (DSPC) is in-service. |

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

|    |                                               |
|----|-----------------------------------------------|
| pp | Failing diagnostic number in hexadecimal form |
| qq | Test number in hexadecimal form.              |

| <i>ppqq</i> | <i>Explanation</i>      |
|-------------|-------------------------|
| 0100        | MP Fail                 |
| 0600        | EMTC/MTC Interrupt Fail |
| 0A01        | EBX/BX RAM Data Fail    |
| 0B00        | EBX/BX Interrupt Fail   |
| 0C00        | EBX/BX Acknowledge Fail |

**d5-d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

| <i>Data Byte</i> | <i>Description</i>                       |
|------------------|------------------------------------------|
| d5               | Upper byte of interrupt register 0       |
| d4               | Lower byte of interrupt register 0       |
| d3               | Interrupt register 1                     |
| d2               | Upper byte of side 0 service register 0  |
| d1               | Lower byte of side 0- service register 0 |
| d0               | Unused                                   |

**cc** **mmmm** - Error condition code

| <b>cc</b> | <b>mmmm</b> | <i>Explanation</i>   |
|-----------|-------------|----------------------|
| <b>10</b> | <b>ENEQ</b> | Unit is not equipped |
| <b>11</b> | <b>SAOS</b> | UC is out of service |
| <b>36</b> | <b>ENEQ</b> | DSPI not equipped    |
| <b>4D</b> | <b>SAIS</b> | DSPI is in service   |
| <b>55</b> | <b>IDNV</b> | Invalid CFT code     |
| <b>56</b> | <b>IDNV</b> | Unrunnable CFT code  |

## **DGN,EQPT,UNIT,FC,CFT,X**

### **DIAGNOSE FORMAT CONVERTER**

#### **Explanation Of Command**

This command requests diagnostics to be run on the specified format converter **UNIT-q**.

#### **Command**

[I.41331]

**DGN-EQPT:[<xy>]:UNIT-[q]q:[ww]:FC-sb:[CFT-X-vwxy];**

#### **Completion Message**

 /* Diagnosed entity */
 "UNIT-[q]q-FC-sb"

```

## Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FC** - Format converter

**s** - Side number (0 or 1)

**b** - FC number (1 through 4)

**CFT** - Craft

**vwxy** - Diagnostic test number

| <i>Test</i>      | <i>vwxy</i> |
|------------------|-------------|
| CI device test   | 0001        |
| Receiver test    | 0002        |
| Transmitter test | 0004        |

The optional craft diagnostic test number indicates which test(s) of the diagnostic is to be run under craft control. If this number is omitted, all tests including the continuity check will be run.

**ATP** - All tests passed

**STF** - Some tests failed

**UPN** - Unit plug number

**upn** - The value of UPN.

**XPN** - ECCN plug number

**xpn** - The value of XPN

**BIT** - Bit number of the data bus

**TD** - Transmit data

**RD** - Receive data

**bb** - Bit number (00 through 15)

The optional line which contains the unit, plug, and bit information will only be output if continuity checks between the NPC and the ECCN failed. The bit number (i.e., BIT={TD|RD}bb) will be shown if software identifies the bit of the data bus as the failed one. The optional line will always be output with the STF keyword. Valid values of the UPN and XPN are shown below. Note that the numbers shown in the output are exactly the same as the numbers on the backplane.

| Unit Plug<br>Number(FIB†) | Unit Plug<br>Number(OIB‡) | ECCN Plug<br>Number | Direction | Corresponding<br>FC |
|---------------------------|---------------------------|---------------------|-----------|---------------------|
| P01                       | P02                       | PqqA*               | Receive   | FC 01               |
| P02                       | P01                       | PqqE                | Transmit  | FC 01               |
| P03                       | P07                       | PqqB                | Receive   | FC 02               |
| P04                       | P06                       | PqqF                | Transmit  | FC 02               |
| P05                       | P12                       | PqqC                | Receive   | FC 03               |
| P06                       | P11                       | PqqG                | Transmit  | FC 03               |
| P07                       | P17                       | PqqD                | Receive   | FC 04               |
| P08                       | P16                       | PqqH                | Transmit  | FC 04               |
| P10                       | P05                       | PqqA                | Receive   | FC 11               |
| P11                       | P04                       | PqqE                | Transmit  | FC 11               |
| P12                       | P10                       | PqqB                | Receive   | FC 12               |
| P13                       | P09                       | PqqF                | Transmit  | FC 12               |
| P14                       | P15                       | PqqC                | Receive   | FC 13               |
| P15                       | P14                       | PqqG                | Transmit  | FC 13               |
| P16                       | P20                       | PqqD                | Receive   | FC 14               |

```

## Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FTMI** - Facility Terminating Module Interface

**d** - FTMI number (1 through 4)

**CFT** - Craft

**vwxxy** - Diagnostic test number

| Test                  | vwxxy |
|-----------------------|-------|
| Register test         | 0001  |
| Address parity test   | 0002  |
| High data parity test | 0004  |
| Low data parity test  | 0008  |
| CI A data strobe test | 0010  |
| CI A pack id test     | 0020  |
| CI B data strobe test | 0040  |
| CI B pack id test     | 0080  |
| CI C data strobe test | 0100  |
| CI C pack id test.    | 0200  |

All tests listed above can be run in-service.

**Note:** The optional **CFT** field indicates which test(s) of the diagnostic is to be run under

craft control. If this field is omitted, all tests of this diagnostic will be run.

**ATP** - All tests passed

**STF** - Some tests failed

**ppqq** - Trouble number for the craft

pp Failing diagnostic number in hexadecimal form  
qq Test number in hexadecimal form.

*ppqq Explanation*

|      |                            |
|------|----------------------------|
| 0100 | Register Test Fail         |
| 0200 | Address Parity Test Fail   |
| 0300 | High Data Parity Test Fail |
| 0400 | Low Data Parity Test Fail  |
| 0500 | Data Strobe A Test Fail    |
| 0600 | Pack ID A Test Fail        |
| 0700 | Data Strobe B Test Fail    |
| 0800 | Pack ID B Test Fail        |
| 0900 | Data Strobe C Test Fail    |
| 0A00 | Pack ID C Test Fail        |

**d5-d0** - Raw data

Hexadecimal raw data bytes relating to the failed diagnostic detected.  
These data bytes are only used for system development.

**mmmm** - Error condition code

*mmmm Explanation*

|             |                      |
|-------------|----------------------|
| <b>ENEQ</b> | Unit is not equipped |
| <b>SAOS</b> | UC is out of service |
| <b>ENEQ</b> | FTMI is not equipped |
| <b>IDNV</b> | Invalid CFT code     |
| <b>IDNV</b> | Unrunnable CFT code  |

## **DGN,EQPT,UNIT,UC,CFT,X**

### **DIAGNOSE UNIT CONTROLLER**

#### **Explanation Of Command**

This command requests diagnostics to be run on the specified unit controller.

#### **Command**

[I.41311]

DGN-EQPT: [<xy>]:UNIT-[q]q:[ww]:UC:[CFT-X-vwxy];

#### **Completion Message**

"UNIT-[q]q-UC"
;
```

### Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**UC** - Unit controller

**CFT** - Craft diagnostic test code

**vwxy** - Diagnostic test number (hexadecimal)

| Test                                    | vwxy |
|-----------------------------------------|------|
| UC RAM test (out-of-service test)       | 0001 |
| UC ROM test (in-service test)           | 0002 |
| UC timer test (in-service test)         | 0004 |
| UC DMA test (out-of-service test)       | 0008 |
| UC LAN test (out-of-service test)       | 0010 |
| UC bus error test (in-service test)     | 0020 |
| UBX register test (out-of-service test) | 0040 |
| UBX sanity test (out-of-service test)   | 0080 |

### Notes:

1. The optional **CFT** field indicates which test(s) of the diagnostic is to be run under craft control. If this field is omitted, all tests of this diagnostic will be run.
2. Out-of-service diagnostics on the UC will run successfully only if the UC circuit pack is present in the frame and the diagnostic program can

communicate with the unit. Otherwise, this message will be denied.

3. The UC DMA test cannot be run on the KER6 Unit Controller which is used on Hybrid DS3Us and DS3Us that are shipped with Release 8.0 and later Releases.
4. The UBX tests are only valid on FTUs and IFTUs.

**ATP** - All tests passed

**CATP** - Conditional all tests passed  
The reason for the conditional completion is indicated by cc.

**STF** - Some tests failed

**ppqq** - Trouble number for the craft (hexadecimal)

|             |                                      |
|-------------|--------------------------------------|
| pp          | Failing diagnostic number            |
| qq          | Test number                          |
| <i>ppqq</i> | <i>Explanation</i>                   |
| 0101        | RAM Test Failed - Data Error         |
| 0102        | RAM Test Failed - Address Error      |
| 0103        | RAM Test Failed - Access Error       |
| 0104        | RAM Test Failed - Refresh Error      |
| 0105        | RAM Test Failed - Parity Error       |
| 0200        | ROM Test Failed                      |
| 0400        | Timer Test Failed - Timer Error      |
| 0500        | Timer Test Failed - Input Port Error |
| 0600        | DMA Test Failed                      |
| 0700        | LAN Test Failed                      |
| 0900        | Bus Error Test Failed                |
| 0A00        | UBX Register Test Failed             |
| 0B00        | UBX Sanity Test Failed               |

**d5 - d0** - Hexadecimal raw data bytes relating to the failed diagnostic detected.

|                  |              |
|------------------|--------------|
| <i>Data Byte</i> | <i>Value</i> |
| d5               | Unused       |
| d4               | Unused       |
| d3               | Unused       |
| d2               | Unused       |
| d1               | Unused       |
| d0               | Unused       |

For in-service UC:

- In-service tests will return ATP (All Tests Passed)
- Out-of-service tests will return CATP (Conditional All Tests Passed)

For out-of-service UC:

- In-service tests will return ATP
- Out-of-service tests will return ATP

**cc**    **mmmm**    - Error condition code

| <b>cc</b> | <b>mmmm</b> | <i>Explanation</i>               |
|-----------|-------------|----------------------------------|
| <b>03</b> | <b>SAIS</b> | Subject entity is in service     |

## **DISC — DLT**

---

### **DISC — DLT**

This section documents the commands **DISC** through **DLT**.

## **DISC,BDCST,T0,INCL,OOS,DCC,CONV**

### **BROADCAST DISCONNECTIONS**

#### **Explanation Of Command**

This command requests the disconnection of a broadcast circuit cross-connection. It can be used to disconnect any one-way tributary from a broadcast circuit, or the full tributary once all of the one-way tributaries have been disconnected.

#### **Command**

##### **Nonhierarchical**

[I.15201]

**DISC-BDCST-T0** : [<xy>] : [s]abc-ddd[&&-eee] , [t]ghi-jjj[&&-kkk] : \  
[ww] : [INCL] : [OOS] [ , DCC ] [ , CONV ] ;

##### **Hierarchical**

[I.15201]

**DISC-BDCST-T0** : [<xy>] : uv-m-np-ddd[&&-eee] , wx-k-qr-jjj[&&-kkk] : \  
[ww] : [INCL] : [OOS] [ , DCC ] [ , CONV ] ;

## Completion Message

---

### Nonhierarchical

---

[O.15201]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DISC BDCST T0::[s]abc-ddd[&&-eee],[t]ghi-jjj[&&-kkk]:[ww]:\
[INCL]:[OOS][,DCC][,CONV] COMPLD
/* [O.15201] */
["[RDLD[,CUS][,BRDIS]"]
;
```

**Note:** On output, if the primary line in the MML message exceeds 80-characters in length, it will be split into two lines.

### Hierarchical

---

[O.15201]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DISC BDCST T0::uv-m-np-ddd[&&-eee],wx-k-qr-jjj[&&-kkk]:[ww]:\

### Autonomous Message

Not applicable.

### Explanation Of Parameters

[s]abc - The 3- or 4-digit nonhierarchical FROM NPC number  
[t]ghi - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 |
|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd,jjj**

- Channel number for beginning of channel range

**eee,kkk**

- Channel number for end of channel range.

Without the optional CONV keyword, ddd and jjj must be the lowest numbered channels in the range of channels that make up the broadcast circuit. If the range fields [-eee] and [-kkk] are used, the entire width of the conference tributaries must be indicated.

000-030            CEPT type NPCs grown as CAS  
000-031            CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**CONV** - Convert

The CONV keyword is given to disconnect the specified one-way tributary from the broadcast circuit and convert the circuit to a two-way, two-point circuit. For a command with this option to succeed, only the broadcast source and the full tributary leg must remain on the circuit following the disconnection of the specified one-way tributary. That is, this option will be denied if the user attempts to disconnect the full tributary rather than a one-way tributary, or if any other one-way tributaries remain on the broadcast circuit following the disconnection of the one-way tributary specified in the command.

**OOS** - Out-of-service

An OOS disconnection may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnection will be denied.

**INCL** - Inclusive

Use the optional INCL keyword to disconnect a circuit or range of circuits including one or more circuits marked as a red circuit or under customer control.  
If this option is not used, the message will be denied if any circuits in the range are red circuits or customer controlled.

**DCC** - Disconnect code

If the DCC keyword is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field used to connect the circuit. If the DCC option is not used, the disconnect code specified in the CRTE-EQPT::NPC command will be used.

**[t]wxy** - The 3- or 4-digit nonhierarchical NPC number that caused the denial, with the same valid values as [s]abc.

**ed-h-fg**  
- Hierarchical NPC number that caused the denial

**zzz** - Channel number that caused the denial, with the same valid value as ddd.

**BRDIS** - Broadcast disconnect  
The BRDIS keyword indicates that the conference is entirely disconnected (no tributaries remain).

**CUS** - Customer  
Customer-controlled circuit  
CUS indicates a customer controlled circuit.

**RDLD** - Red lined  
Indicates that the disconnection was performed on a red circuit. This implies that the INCL keyword was given in the input message. If the disconnection was given on more than one circuit, at least one of them was a red circuit or under customer control.

**BCAST** - Broadcast

**mmm** - Error condition code

**mmm**    *Explanation*

|             |                                                            |
|-------------|------------------------------------------------------------|
| <b>IDRG</b> | Invalid range for specified NPC type                       |
| <b>IIDT</b> | No RDLD or CUS circuits and INCL keyword used              |
| <b>IIDT</b> | No NPC's out of service and OOS keyword used               |
| <b>IIDT</b> | Invalid use of CONV keyword                                |
| <b>SAOS</b> | NPC out of service or failed                               |
| <b>ENEQ</b> | NPC not equipped                                           |
| <b>SWFA</b> | Active CCN side not IS or failed or pested or hardware OOS |
| <b>ENEQ</b> | UNIT not equipped, not in service, or failed               |

**mmmm**    *Explanation*

**ENEQ**    CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS  
**ENEQ**    FTMI not equipped, not in service, or failed  
**ENEQ**    FC not eqd, not IS, or failed or inactive side FC not eqd or not IS  
**ENEQ**    TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS  
**SNVS**    Termination is under test  
**SNVS**    Termination is under customer control (CUS)  
**SNVS**    Termination is protected (RDLD)  
**SNVS**    TO side of two-way to be converted is not an FTU NPC  
**SNVS**    Width of existing two way does not match conference width  
**SNVS**    FROM is not a backbone leg  
**SNVS**    Specified width does not match existing conference width  
**SNVS**    NTR invalid since existing conference is not already NTR  
**SNVS**    LPD invalid since existing conference is not already LPD  
**SNVS**    TO is not a leg of this/any conference  
**SNVS**    Can't disconnect return leg unless entire conference disconnected  
**SNVS**    Range overlapping between FROM and TO or between two TOs  
**ENRE**    Corresponding NPC for FROM virtual channel is not provisioned  
**ENRE**    Corresponding NPC for TO virtual channel is not provisioned  
**IDRG**    Invalid FROM channel number range  
**IDRG**    Invalid TO channel number range  
**SNVS**    A loopback is active on the FROM termination  
**SAAS**    Termination is in process of being rolled  
**ENEQ**    ETSI not equipped, not in service, or failed

---

## **DISC,BDCST,T0,INCL,OOS,DCC,CONV**

### **BROADCAST DISCONNECTION**

#### **Explanation Of Command**

This command requests the disconnection of up to eight tributary legs from the source of a broadcast cross-connection circuit.

The **FROM** field designates the source termination. The optional range field **[&&-eee]** indicates the width of the conference backbone. When disconnecting a TS0 to non-TS0 broadcast the width of the conference is one. The allowable width ranges from 001 to 031 channels and must be the same as the width of the existing conference backbone (if any).

The fields in the TO end designate the tributaries to be connected to the backbone. Although a conference may have any number of tributaries (limited only by the frame configuration), at most eight at a time may be disconnected using this command. More tributaries can be disconnected by subsequent broadcast disconnect commands.

## Explanation Of Parameters

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number designating the source termination

**[t]ghi, [u]klm**  
- The 3- or 4-digit nonhierarchical tributary NPC numbers

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

**uv-m-np**

- Hierarchical FROM NPC number designating the source termination (MML)

**wx-k-qr**

- Hierarchical FROM NPC number designating the source termination

**ed-h-fg**

- Hierarchical tributary NPC numbers

**uv,wx,ed**

- Unit number

**m,k,h** - Module number

**np,qr,fg**

- NPC number within the module

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd**

- FROM channel number

**eee**

- FROM channel number denoting end of width

The optional range field [-eee] or [&&-eee] indicates the width of the conference backbone. Note that a range may be specified for the source only.

**jjj**

- Channel number of tributary legs

**nnn**

- Channel number of the last tributary leg of the range

Without the optional CONV keyword, ddd and jjj must be the lowest numbered channels in the range of channels that make up the broadcast circuit. If the range field [-eee] is used, the entire width of the conference tributaries must be indicated.

000-030            CEPT type NPCs grown as CAS  
000-031            CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**NOTE:** Channel 000 of a CEPT NPC(TS0) can be BCONed to a non-TS0 of a CEPT NPC.

The fields following the subsequent channel numbers designate the tributaries that are connected to the backbone.

Although a conference may have any number of tributaries (limited only by frame configuration), at most eight at a time may be disconnected using this command. More tributaries can be disconnected by subsequent commands.

**CONV**   - Convert

The CONV keyword is given to disconnect the specified one-way tributaries from the broadcast circuit and convert the circuit to a two-way, two-point circuit. For a command with this option to succeed, only the broadcast source and the full tributary leg must remain on the circuit following the disconnection of the specified one-way tributaries. That is, this option will be denied if the user attempts to disconnect the full tributary rather than a one-way tributary, or if any other one-way tributaries remain on the broadcast circuit following the disconnection of the one-way tributaries specified in the command.

**OOS**   - Out-of-service

An OOS disconnection may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnection will be denied.

**DCC** - Disconnect code

If the DCC keyword is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field used to connect the circuit. If the DCC option is not used, the disconnect code specified in the CRTE-EQPT::NPC command will be used.

**INCL** - Inclusive

To disconnect a circuit or range of circuits including one or more circuits marked as a red circuit or under customer control, use the INCL option. If this option is not used, the message will be denied if any circuits in the range are red circuits or customer controlled.

**[t]wxy** - The 3- or 4-digit nonhierarchical NPC number involved in the denial.  
(with the same valid value as [s]abc.)

**zzz** - Channel number involved in the denial. Otherwise the same as ddd.

**BCAST** - Broadcast

**mmmm** - Error condition code

**mmmm** *Explanation*

| <b>SNVS</b> | Termination is under customer control (CUS)                           |
| <b>SNVS</b> | Termination is protected (RDLD)                                       |
| <b>SNVS</b> | TO side of two-way to be converted is not an FTU NPC                  |
| <b>SNVS</b> | Width of existing two way does not match conference width             |
| <b>SNVS</b> | FROM is not a backbone leg                                            |
| <b>SNVS</b> | Specified width does not match existing conference width              |
| <b>SNVS</b> | NTR invalid since existing conference is not already NTR              |

**mmmm**    *Explanation*

**SNVS**    LPD invalid since existing conference is not already LPD  
**SNVS**    TO is not a leg of this/any conference  
**SNVS**    Can't disconnect return leg unless entire conference disconnected  
**SNVS**    Range overlapping between FROM and TO or between two TOs  
**ENRE**    Corresponding NPC for FROM virtual channel is not provisioned  
**ENRE**    Corresponding NPC for TO virtual channel is not provisioned  
**IDNV**    Invalid FROM channel number  
**IDNV**    Invalid TO channel number  
**IDRG**    Invalid FROM channel number range  
**IDRG**    Invalid TO channel number range  
**SNVS**    A loopback is active on the FROM termination  
**IDNV**    Invalid channel 000 cross-connection specified  
**IDNV**    Invalid channel 031 cross-connection specified  
**SAAS**    Termination is in process of being rolled  
**ENEQ**    ETSI not equipped, not in service, or failed

## **DISC,BDCST,T1,INCL,OOS,CONV**

### **BROADCAST DISCONNECT**

#### **Explanation Of Command**

This message disconnects upto eight non-channelized tributaries from a non-channelized source network processing circuit (NPC). The NPCs can be in different units. This message also disconnects tributaries and can convert a broadcast conference to a two-way, two-point circuit. When the circuit is disconnected, the idle code (AIS) is transmitted.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

[s]abc - The 3- or 4-digit non-hierarchical non-channelized  
Source(backbone) NPC number  
[t]ghi - The 3- or 4-digit non-hierarchical non-channelized  
tributary NPC number  
[u]jkl - Explained for [t]ghi  
[v]mno - Explained for [t]ghi

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

## **DISC,BDCST,T1,INCL,OOS,CONV**

### **BROADCAST DISCONNECTION**

#### **Explanation Of Command**

This message disconnects a single non-channelized tributary network processing circuit from a non-channelized digital signal broadcast circuit. It also disconnects a single tributary and converts a broadcast conference to a two-way, two-point circuit.

When the circuit is disconnected, the idle code (AIS) is transmitted.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

[s]abc - The 3- or 4-digit non-hierarchical non-channelized source(backbone)  
NPC number  
[t]ghi - The 3- or 4-digit non-hierarchical non-channelized tributary NPC  
number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uv-m-np**

- Hierarchical non-channelized source (backbone) NPC number

**wx-k-qr**

- Hierarchical non-channelized tributary NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The values are listed below:

PA type numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**OOS** - Out-of-service keyword may be specified if one or more of the backbone or tributary NPCs is out of service

**INCL** - Inclusive keyword required for Customer-controlled (CUS) or Red circuits

**CONV** - Convert circuit to a two-way, two-point circuit by disconnecting the indicated tributary; as long as more than two tributaries remain, or no return path exists, the option is denied.

If the indicated tributary is a full tributary, it can be disconnected only when there are no other tributaries.

**[t]qrs** - The 3- or 4-digit nonhierarchical NPC number causing denial

**uv-q-rs**  
- Hierarchical NPC number causing denial

**RDLD** - Red lined  
**CUS** - Customer

Customer-controlled circuit

**BRDIS** - Broadcast conference completely disconnected

**st** - Status of denial

**mmmm** - Error condition code

| <b>mmmm</b> | <b>st</b>    | <i>Explanation</i>                            |

## **DISC,CRS,T0,CB,INCL,OOS**

### **DISCONNECTIONS**

#### **Explanation Of Command**

This message requests a disconnection between the Facility Terminating Unit (FTU) or Hybrid DS3 Unit (HDS3U) type NPC signaling time slot 16 and the C-Bit Processor (CB) type NPC on the Digital Signal Processing Unit (DSPU). The CB number and the channel number on the CB are automatically specified by software.

## **DISC,CRS,T0,INCL,DCC,OOS**

### **TWO-WAY DISCONNECTIONS**

#### **Explanation Of Command**

This message requests a disconnection between the specified FROM and TO end terminations and is used to disconnect a leg or legs from a multipoint circuit.

Disconnections may be between various Network Processing Circuit (NPC) types:

Facility Terminating Unit (FTU)/DS3U/HDS3U NPC and Digital Signal Processing (DSPU) Unit NPC

FTU/DS3U/HDS3U NPC and Virtual NPC

DSPU NPC and DSPU NPC

Not applicable.

## Explanation Of Parameters

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number  
**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |

| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical FROM NPC number for beginning of NPC range

**wx-k-qr**

- Hierarchical TO NPC number for end of NPC range

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number

Unit Type VI (Virtual)

| Unit      | Module   | NPC          |                                 |
|-----------|----------|--------------|---------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**Note:** The range of allowable NPC numbers is dependent on the equipage of the frame.

**ddd** - FROM channel or conference number

**jjj** - TO channel number or conference number

Channel Numbers

000-030        CEPT type NPCs grown as CAS  
000-031        CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

#### Conference Numbers

001-085        (MB NPC)  
001-500        (Virtual NPC)

#### **INCL** - Inclusive

To disconnect a channel or range of channels including one or more channels marked as a Red Circuit, use the INCL (inclusive) option. If this option is not used, the message will be denied if any circuits in the range are Red Circuits.

#### **OOS** - Out-of-service

An Out-Of-Service disconnection may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnection will be denied.

#### **DCC** - Disconnect code

If DCC is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field of the TCON command that initially connected to the channels. If the DCC option is not used, the disconnect code specified in the CRTE-EQPT::NPC command will be used.

#### **mmm, nnn**

- Channel numbers involved in the denial. Otherwise, the same as ddd.

#### **CUS** - Customer

Indicates the circuit is a customer controlled Circuit.

**NOBBL** - No backbone leg

This optional field will appear if the multipoint circuit(s) FROM or TO is in the broadcast mode but has no backbone leg after the TDIS command.

**MPDIS** - Multipoint disconnect

Full disconnection of the multipoint circuits is indicated by MPDIS for FROM, TO, or BOTH.

**RDLD** - Red lined

RDLD indicates that the disconnection was performed on a Red Circuit. This implies that the INCL keyword was given in the input message. If the disconnection was given on more than one circuit, then at least one of them was a Red Circuit.

**d** - Direction

*d Explanation*

**F** - From

**T** - To

**B** - Both

**st** - Status of denial

17 Required ETSI not equipped, not in service, or failed or inactive side ETSI not equipped or not in service

**mmmm** - Error condition code

*mmmm st Explanation*

**IIDT INERR** No NPC's out of service and OOS keyword used

**IDRG INERR** Invalid range for specified FROM NPC type

**IDRG INERR** Invalid range for specified TO NPC type

**SWFA MCOND** Active CCN side not IS or failed or pested or hardware OOS

**ENEQ MCOND** UNIT not equipped, not in service, or failed

**ENEQ MCOND** FTMI not equipped, not in service, or failed

**ENEQ MCOND** FC not eqd, not IS, or failed or inactive side FC not eqd or not IS

**ENEQ MCOND** TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS

**ENEQ MCOND** DSPI not equipped, not in service, or failed

**SNVS CONFERR** Try to delete a BBL leg from VC;however, VC has no BBL leg

**SNVS CONFERR** The NPC of VC BBL leg doesn't match that in the input command

**SNVS CONFERR** The first channel of VC BBL leg doesn't match that in the input command

| mmmm | st      | Explanation                                                             |

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd,jjj**

- Channel numbers

**eee,kkk**

- Channel numbers, denoting the end of a range.

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**INCL** - Inclusive

To disconnect a circuit or range of circuits including one or more circuits marked either RDC or CUS, use the optional INCL keyword. If this keyword is not used, the message will be denied if any circuits in the range are red circuits or customer controlled circuits.

**OOS** - Out of service

An Out-Of-Service disconnection may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnection will be denied. This keyword is not valid if the DSPP NPC is the only NPC out-of-service.

**DCC** - Disconnect code

If the Disconnect Code (DCC) option is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field of the cross connect command that initially connected the channels. Only the post 2.5 second signaling will be inserted in the disconnected channels. If the DCC option was specified on a fully transparent (TRSP with no insertion word) domestic circuit, DACS II will insert the default trouble code X'E4. If the DCC option is not used, the disconnect code specified in the grow NPC command will be used.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**CUS** - Customer

Customer-controlled circuit

Terminations cross-connected using the optional CUS keyword retain their CUS status when disconnected. If the terminations are reconnected without the CUS or INCL keyword, the command will be denied. When they are reconnected with the INCL keyword, they lose their customer controlled status.

**RDLD** - Red lined

**mmm, nnn**

- Channel number involved in the denial. Otherwise the same as ddd.

**d** - Direction

| <b>d</b> | <i>Explanation</i> |
|----------|--------------------|
| F        | From               |
| T        | To                 |
| B        | Both               |

**st** - Status of denial

mmmm - Error condition code

| mmmm | st    | Explanation                                                           |
|------|-------|-----------------------------------------------------------------------|
| IIDT | INERR | No NPC's out of service and OOS keyword used                          |
| IDRG | INERR | Invalid range for specified FROM NPC type                             |
| IDRG | INERR | Invalid range for specified TO NPC type                               |
| SWFA | MCOND | Active CCN side not IS or failed or pested or hardware OOS            |
| ENEQ | MCOND | UNIT not equipped, not in service, or failed                          |
| ENEQ | MCOND | CCB not eqd, not IS, or failed or inactive side CCB not eqd or not IS |
| ENEQ | MCOND | FTMI not equipped, not in service, or failed                          |
| ENEQ | MCOND | FC not eqd, not IS, or failed or inactive side FC not eqd or not IS   |
| ENEQ | MCOND | TSI not eqd, not IS, or failed or inactive side TSI not eqd or not IS |
| IDNV | INERR | Invalid FROM channel number                                           |
| IDNV | INERR | Invalid TO channel number                                             |
| IDRG | INERR | Invalid FROM channel number range                                     |
| IDRG | INERR | Invalid TO channel number range                                       |
| SNVS | INERR | A loopback is active on the FROM termination                          |
| SNVS | INERR | A loopback is active on the TO termination                            |
| IDNV | INERR | Unmatched channel range                                               |
| IDNV | INERR | Invalid channel 000 cross-connection specified                        |
| IDNV | INERR | Invalid channel 031 cross-connection specified                        |
| SNVS | MCOND | DSPP not in service, or failed                                        |
| SAAS | ROLL  | Termination is in process of being rolled                             |
| ENEQ | MCOND | ETSI not equipped, not in service, or failed                          |

| st      | d       | Explanation                         |
|---------|---------|-------------------------------------|
| CUS     | {F T B} | Customer-controlled Circuit         |
| FAIL    | {F T B} | Failed                              |
| INVLD   | {F T B} | Invalid NPC type                    |
| NOMTH   | {F T B} | No Match                            |
| OOS     | {F T B} | Out-of-service                      |

## **DISC,CRS,T1,INCL,OOS,PRIOUT**

### **TWO-WAY DISCONNECTION**

#### **Explanation Of Command**

This message disconnects a two-way cross-connection between two non-channelized network processing circuits. When the circuit is disconnected, the idle code (AIS) is transmitted.

#### **Command**

##### **Nonhierarchical**

### Autonomous Message

Not applicable.

### Explanation Of Parameters

[s]abc - The 3- or 4-digit non-hierarchical non-channelized FROM NPC number  
[t]ghi - The 3- or 4-digit non-hierarchical non-channelized TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 |
|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       |
| 0001-0032 | 0161-0192 | 0321-0352 | 0481-0512 |
| 0041-0072 | 0201-0232 | 0361-0392 | 0521-0552 |

## **DISC,CRS1,T0,INCL,OOS,DCC**

### **ONE-WAY MULTIPOINT DISCONNECTIONS**

#### **Explanation Of Command**

This message requests a one-way disconnection from the specified FROM end termination(s) and to the TO end termination. It is used to disconnect a one-way multipoint circuit.

#### **Command**

##### **Nonhierarchical**

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC          |                                 |
|-----------|----------|--------------|---------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**ddd,jjj**

- Channel number

**eee,kkk**

- Channel number denoting the end of range.

000-030 CEPT type NPCs grown as CAS

000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

The backbone termination is on the Virtual NPC (001 through 500).

**INCL** - Inclusive

To disconnect a channel or range of channels including one or more channels marked as a Red Circuit, use the INCL option.

The message will be denied if any circuits in the range are Red Circuits and the INCL option is not used.

**OOS** - Out of service

At least one end of the circuit must be out-of-service or the OOS disconnect will be denied.

**DCC** - Disconnect code

DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the trunk conditioning field of the TCON command that initially connected the channels.

If the DCC option is not used, the disconnect code specified in the grow NPC command will be used.

**NOBBL** - No backbone leg

The optional NOBBL will appear if the multipoint circuit FROM or TO was in the broadcast mode but has no backbone leg.

**MPDIS** - Multipoint disconnect

**F** - From

**T** - To

Full disconnection of the multipoint circuits is indicated by MPDIS for FROM or TO.

**CUS** - Customer

Customer-control circuit

**RDL** - Red lined

Disconnection was performed on a red lined circuit.

If the disconnection was given on more than one circuit, then at least one of them was a red lined circuit.

**mmm, nnn**

- Channel number involved in denial.

**st** - Status of denial

**d** - Direction

**d** *Explanation*

F From

T To

B Both

**mmmm** - Error condition code

| <b>mmmm</b> | <b>st</b>      | <i>Explanation</i>                                                      |

**uv-m-np**

- Hierarchical FROM NPC number for beginning of NPC range

**wx-k-qr**

- Hierarchical TO NPC number for end of NPC range

The valid values are listed below:

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number

**jjj** - TO channel number

**eee** - FROM channel number denoting the end of a channel range.

**kkk** - TO channel number denoting the end of a channel range.

000-030 CEPT type NPCs grown as CAS

000-031 CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**INCL** - Inclusive

To disconnect a circuit or range of circuits including one or more circuits marked either RDC or CUS, use the optional INCL keyword. If this keyword is not used, the message will be denied if any circuits in the range are red circuits or customer controlled circuits.

**OOS** - Out-of-service

An Out-Of-Service disconnect may be done by giving the optional OOS keyword. At least one end of the circuit must be out-of-service or the OOS disconnect will be denied.

**PRIOUT** - Priority Output

This keyword is used on the command line to prioritize the output response.

**DCC** - Disconnect code

If DCC is specified, DACS II will insert the user-defined disconnect code and signaling into the disconnected channels. This disconnect code and signaling are specified by the <tc> field of the TCON command that initially connected the channels. If the DCC option is not used, the disconnect code specified in the CRTE-EQPT::NPC command will be used.

**RDLD** - Red lined

**CUS** - Customer

Customer-controlled circuit

Terminations cross-connected using the optional CUS keyword retain their CUS status when disconnected. If the terminations are reconnected without the CUS or INCL keyword, the command will be denied. When they are reconnected with the INCL keyword, they lose their customer controlled status.

**mmm, nnn**

- Channel number involved in denial. Otherwise the same as ddd.

**d** - Direction

| <i>d</i> | <i>Explanation</i> |
|----------|--------------------|
| F        | From               |
| T        | To                 |
| B        | Both               |

**st** - Status

mmmm - Error condition code

| mmmm | st    | Explanation                                                           |

## **DISC,CRS1,T1,INCL,OOS,PRIOUT**

### **ONE-WAY DISCONNECT**

#### **Explanation Of Command**

This message disconnects a one-way cross-connection between two non-channelized network processing circuits. When the circuit is disconnected, the idle code (AIS) is transmitted.

#### **Command**

##### **Nonhierarchical**

### Autonomous Message

Not applicable.

### Explanation Of Parameters

[s]abc - The 3- or 4-digit non-hierarchical non-channelized FROM NPC number  
[t]ghi - The 3- or 4-digit non-hierarchical non-channelized TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 |
|-----------|-----------|-----------|-----------|

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical number of non-channelized FROM NPC

**wx-k-qr**

- Hierarchical number of non-channelized TO NPC

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The values are listed below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**INCL** - Inclusive

Required for a customer-controlled circuit or a red circuit

**OOS** - Out-of-Service

May be specified if one or both NPCs are out of service

**RDC** - Red circuit

**RDLD** - Red lined  
Disconnection of Red circuit

**CUS** - Customer  
Disconnection of Customer-controlled circuit

**PRIOUT** - Priority Output  
This keyword is used on the command line to prioritize the output response.

**st** - Status of denial

**d** - Direction {F-from | T-to | B-both}

**mmmm** - Error condition code

| mmmm        | st           | Explanation                                                           |

## **DISC,DSP,T0**

### **DISCONNECTION OF CIRCUITS FROM/TO DSP APPLICATION CARD**

#### **Explanation Of Command**

This command is used to disconnect a circuit (or a range of circuits) between an NPC that is not a DSP application and an NPC that **is** a DSP application NPC. The circuit may be a two-way or a one-way circuit. This command is also used to disconnect a circuit between two application cards.

**This command should only be used for clean-up purposes if the cross-connect cannot be disconnected by commands to the application itself.** Before issuing the command the user should perhaps try to remove and restore the application and try to issue the disconnect command through the application; keeping in mind, however, that a remove and subsequent restore will result in a momentary service loss.

This command is restricted to only the users who have the RMON (Restricted Maintenance privilege ON) privilege. Also, this command is not available via the on-line help feature.

This command will work if the facility terminating NPC and/or the application NPC are/is out-of-service. This command will also work for Red circuits.

This command should also be used if a test port connection to an application has been released using the FRC keyword in the DISC-TACC-T0,FRC command (I.27001), but the cross-connection that was used for the test port connection, which is a cross-connection between two of the application channels, still needs to be disconnected. The user should use the command RTVR-CRS-T1 (I.52011) to find the channel pair used by the application for the test port before executing this command.

### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

**[s]abc** - The From termination NPC number (3- or 4-digit)

**uv-m-np**  
- The From termination NPC number (hierarchical)

**[v]ghi** - The To termination NPC number (3- or 4-digit)

**wx-k-qr**  
- The To termination NPC number (hierarchical)

**ddd, jjj**  
- Channel numbers

**eee, kkk**  
- Channel numbers, denoting the end of a range.

| <b>Range</b>   | <i>Type</i>                                                     |
|----------------|-----------------------------------------------------------------|
| <b>001-024</b> | DE, DA, TE and TA type NPCs                                     |
| <b>000-031</b> | PA, PB, PC and TH type NPCs                                     |
| <b>001-064</b> | SDxyz type application, see your application manual for details |

**OOS** - At least one of the NPCs was out-of-service.

**RDLD** - The disconnected circuit was a Red lined circuit

**mmm, nnn**  
- Channel number involved in the denial. Otherwise the same as ddd.

**d** - Direction

| <b>d</b> | <i>Explanation</i> |
|----------|--------------------|
| <b>F</b> | From               |
| <b>T</b> | To                 |
| <b>B</b> | Both               |

**st** - Status of denial

mmmm - Error condition code

## **DISC,EQPT,NPC**

### **DEGROWTH NPC**

#### **Explanation Of Command**

This command unequips network processing circuits (NPCs) in DACS II Facility Terminating Units (FTU/IFTU/IFTU2), DS3 Units (DS3U), Hybrid DS3 Units (HDS3U) and Digital Signal Processing Units (DSPU).

It may be used to unequip a single NPC or a range of NPCs in an FTU (IFTU or IFTU2), a DS3U or an HDS3U. The HDS3U supports type TExyz and THxyz NPCs. The NPC numbers which are divisible by four with remainder zero, are not valid THxyz NPCs. However, the range of THxyz type NPC numbers is still supported with the understanding that there may be gaps in the NPC number range.

C-bit processing DSPU circuit packs (CB-type NPCs) as well as other DSPU circuit packs must be individually unequipped.

When ranges of NPCs are addressed, the **DISC-EQPT** command will show a completion indication after the last NPC in the range that has been unequipped or the highest numbered NPC that has been successfully unequipped. **Before** the completion indication is output, individual denial messages will be output for each **NPC that is denied unequipage**.

One output message is printed for each NPC that is successfully unequipped.

Degrowth commands where the range address crosses a unit boundary will be completely denied.

Within an NPC range the degrowth command will be denied for specific NPCs or sets of NPCs for any one of the following reasons:

1. A Facility Terminating Module (FTM) within the range is unequipped.
2. The NPC is unequipped.
3. The NPC is in-service.
4. The NPC is a testport or testgroup NPC.

5. The NPC has active terminations or circuits under test.

The denial for two or more successive NPCs that need to be denied for the same reason will be formatted in a summary message using the **Floating Window Denial Message** format. In that format a summary denial message will be output, giving the range of NPCs denied, and the reason. The execution of normal completions or of denials for other reasons then resumes at the next NPC, up to the end of the range.

**uv-m-np, uv-k-qr**

- Hierarchical NPC numbers

**uv** - Unit number  
**m, k** - Module number  
**np, qr** - NPC number within the module

The values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

CB type NPC numbers listed by unit, module, and NPC Number  
Unit Type DP (DSPU)

| Unit         | Module     | NPC       |
|--------------|------------|-----------|
| <b>01-16</b> | <b>1-8</b> | <b>01</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**Note:** Range is not allowed for DSPU NPC degrowth.

With exceptions, an NPC must first be removed from service with the RMV,EQPT,NPC,SIDE,INCL command before it can be degrown.

The exceptions are DSPU NPCs. However, if a cross-connected channel or a channel under test is present on the NPC, the command will be denied.

Degrowth of DMB NPCs results in degrowth of both duplicated NPCs in the DMB circuit packs in the DSPU. For other DSPU NPCs, there is only one NPC per circuit pack. One of the duplicated NPCs may first be removed from service with the RMV,EQPT,NPC,SIDE,INCL message.

If both NPCs are in service, both will be automatically removed during the degrowth of NPC operation. If a cross-connected channel is present on the NPC, the message will be denied.

SLC carrier terminated digroups must be deleted from the SLC carrier bank by executing the DLT,PRMTR,EQPT,DGA,DGB,DGC,DGD,DGP,RT,DL command.

[s]ghi - The 3- or 4-digit nonhierarchical NPC number ([s]abc through [t]def)  
[s]jkl - The 3- or 4-digit nonhierarchical NPC number ([s]abc through [t]mno)  
[t]mno - The 3- or 4-digit nonhierarchical NPC number ([s]ghi through [t]def)

uv-g-hi - Hierarchical NPC number within the range of uv-m-np and uv-k-qr

uv-j-kl - Hierarchical NPC number within the range of uv-m-np and uv-m-no

uv-m-no - Hierarchical NPC number within the range of uv-j-kl and uv-k-qr

**TYPE** - Type

**mnxyz** - NPC-type identifier

|    |             |
|----|-------------|
| mn | Explanation |
|----|-------------|

CB C-bit processor (CPR) NPC

PA CEPT NPC (75- or 120-ohm)

PB CEPT NPC (120-ohm twisted pair)

PC CEPT NPC (75-ohm coaxial)

SD Digital Signal Processing Application Circuit Pack

**UEQD** - Unequipped

The specified NPC is already unequipped

**IS** - In-service

The specified NPC is in service

**NPCTP** - NPC (for) test port

The specified NPC is designated for DS0 test ports

**NPCTG** - NPC (for) test group

The specified NPC is designated for Nx64Kbit/s test groups

**TERM** - Termination

**ASGN** - Assigned

The specified NPC has active or under-test assigned termination

**mmmm** - Error condition code

**mmmm** *Explanation*

**NCON** No conditions

**ENEQ** Unit is not equipped

**SAOS** UC is out of service

**SNVS** UC is in service but failed

**ENEQ** FTMI is not equipped

**ENEQ** NPC is unequipped

**SNVS** Unit type error

**SNVS** NPC has active circuit

**SAWS** Conference exists in a DMB

**SNVS** NPC not deleted

**IICM** SRDC timeslots are allocated on this NPC

**SNVS** Invalid NPC number specified

**IDRG** NPC range crosses unit boundary

**SNVS** Pseudochannels exist which reference this NPC

## **DISC,EQPT,NPC,NPCTG,TGR**

### **DEGROWTH TEST-ACCESS GROUP NPC**

#### **Explanation Of Command**

This command is used to request the removal of the test-access group (TG) designation from a network processing circuit for test-access groups. All TGs associated with this NPCTG must be released before the NPCTG can be deprovisioned. If "TGR" is specified in the command all active TGs will be released and deprovisioned before the NPCTG is deprovisioned. Any out-of-serve (OOS) condition will be bypassed.

A TG may be supported by one or two NPCTGs. Deprovisioning of an NPCTG that supports half (one bundle) of an active TG, will result in the release and deprovisioning of the entire TG; provided "TGR" was specified.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**NPCTG** - NPC (for) test group

**rrr** - NPCTG number (1 through 400)

**TGR** - TG release

This keyword causes any active TGs supported by this NPCTG to be released from testing and degrown before the NPCTG is degrown. It is required if the NPCTG has active TGs.

**TGS** - TGs supported by the NPCTG

**mmm** - TG number (1 through 400)

Lowest TG number supported by the NPCTG. This number will be '000' if all TGs have been degrown.

mmm - Error condition code

mmm *Explanation*

|             |                                                   |
|-------------|---------------------------------------------------|
| <b>ENEQ</b> | NPC is unequipped                                 |

| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |
| <b>1921-1952</b> | <b>2081-2112</b> | <b>2241-2272</b> | <b>2401-2432</b> |
| <b>1961-1992</b> | <b>2121-2152</b> | <b>2281-2312</b> | <b>2441-2472</b> |
| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

#### uv-m-np

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**NPCTP** - NPC test port  
**n** - NPCTP number (1 through 8)

**TPR** - Test port release

This keyword causes any active test ports to be released from service before the test port NPC is degrown. Without the TPR keyword, the test ports must all be idle or the command is denied.

**TPS** - Test ports

**kk** - Beginning test port number

**nn** - Ending test port number

kk and nn indicate the range of test port numbers which the named NPC included

| <i>n</i> | <i>kk</i> | <i>nn</i> |
|----------|-----------|-----------|
| 1        | 01        | 12        |
| 2        | 13        | 24        |
| 3        | 25        | 36        |
| 4        | 37        | 48        |
| 5        | 49        | 60        |
| 6        | 61        | 72        |
| 7        | 73        | 84        |
| 8        | 85        | 96        |

**mmm** - Error condition code

**mmm** *Explanation*

**ENEQ** NPC is unequipped  
**SNVS** NPC is not a NPCTP  
**SNVS** NPC is not designated for this NPCTP/NPCTG  
**ENEQ** NPCTP is not grown  
**SAIS** Test port is not idle or frame is not inservice  
**SRTN** Test Port release failed

## **DISC,EQPT,SYNC,TB**

### **DEGROWTH SYNCHRONIZER TIME BASE**

#### **Explanation Of Command**

This command requests the deprovisioning of the synchronizer time base.

#### **Command**

[I.32101]

**DISC-EQPT:[<xy>]:SYNC:[ww]:TB;**

#### **Completion Message**

[O.32101]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DISC EQPT::SYNC:[ww]:TB COMPLD
/* [0.32101] */
"TYPE-TBpqr"
;
```

#### **Denial Message**

[O.32101.01]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DISC EQPT::SYNC:[ww]:TB DENY
mmmm
"TYPE-TBpqr"
/* [0.32101.01] */
/* <explanation of error condition code> */
/* TYPE-TBpqr */
;
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**TYPE** - Type

**TB** - Time base

**p** - Time base identifier

**qr** - Unassigned

q and r can take any value from 0 through 9

**p**      *Time base*

**0**      Stratum 3

**1**      CEPT Local

**2**      CEPT Toll

**3**      Stratum 2

**Note:** pqr will be shown as "---" if the synchronizer is not equipped.

**mmmm** - Error condition code

**mmmm**      *Explanation*

**ENEQ**      SYNC TB is not equipped

**SAIS**      Both syncs are in-service

---

## **DISC,EQPT,SYNC,TLI,SSP**

---

### **DEPROVISION SYNCHRONIZER TIMING LINK INTERFACE**

#### **Explanation Of Command**

---

This message requests the deprovisioning of the synchronizer's timing link interface.

If the timing link interface was configured as a timing extractor (**TYPE-texyz**), the synchronizer sync port must be specified as well.

On output, note that the NPC option can be a source of synchronization for a timing link interface. When a TU type TLI receiving its input from an NPC is degrown, the NPC must be marked as no longer being a synchronizer source.

#### **Command**

---

[I.32121]

**DISC-EQPT: [<xy>]:SYNC:[ww]:TLI-m:[SSP-a];**

```

### **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**SYNC** - Synchronizer

**TLI** - Timing link interface

**m** - TLI number (1 through 4)

**SSP** - Synchronizer synchronization port

**a** - SSP number (0 or 1)

**SRC** - Source

**p** - Synchronization port priority (1 through 8)

*p* Explanation

1 HIGHEST priority

8 LOWEST priority

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, PB/PC type

The valid values are:

NPC type NPC number

PB,PC [0]030, [0]032, [0]070, [0]072, [0]190, [0]192, [0]230, [0]232

**uv-m-np**

- Hierarchical NPC number, PB/PC type

| NPC type | Unit No. | Module No. | NPC No. |
|----------|----------|------------|---------|
| PB,PC    | 01       | 1,2        | 30,32   |
|          | 02       | 1,2        | 30,32   |

Option NPC ([s]abc or uvmnp) is only used with the SSP variable and TLI type TUxyz.

**TYPE** - Type

**texyz** - Timing extractor type

| <i>texyz</i> | <i>Explanation</i>                                           |
|--------------|--------------------------------------------------------------|
| TCxyz        | Composite Clock Timing Extractor                             |
| TExyz        | DS1 Timing extractor                                         |
| TPxyz        | Primary Block Timing Extractor (xyz values are listed below) |
| TRxyz        | Basic System Reference Frequency                             |
| TUxyz        | Unipolar Clock Timing Extractor                              |
| ----         | Not Equipped                                                 |

TP-type TLI xyz fields

**x** - Frame format

| <b>x</b>   | <i>Explanation</i>                    |
|------------|---------------------------------------|
| <b>1,5</b> | Common Channel Signaling              |
| <b>2,6</b> | Channel Associated Signaling - Mode 0 |
| <b>3,7</b> | Channel Associated Signaling - Mode 1 |
| <b>4,8</b> | European Remote Switching Module      |
| <b>0,9</b> | Invalid                               |

**y** - Line format

| <b>y</b>   | <i>Explanation</i>                 |
|------------|------------------------------------|
| <b>0,2</b> | Alternate Mark Inversion (Bipolar) |
| <b>1,3</b> | High Density Bipolar (HDB3)        |
| <b>4-9</b> | Invalid                            |

**z** - Channel format

| <b>z</b>   | <i>Explanation</i> |
|------------|--------------------|
| <b>0-9</b> | Unassigned         |

TC, TR, and TU-type TLI xyz fields

**x** - Frame format

**y** - Line format

**z** - Channel format

Values for x, y, and z are unassigned.

**TD** - Timing distributor

**p** - Timing distributor identification

Variable TDpqr equals "-----" if the timing distributor is not equipped.

*p*            *Explanation*

1            Composite clock timing distribution

2            Sinusoidal 2.048 MHz timing distribution

**qr**            Unassigned

**TB** - Time base

**p** - Time base identifier

**qr** - Unassigned

q and r can take any value from 0 through 9

*p*            *Time base*

0            Stratum 3

1            CEPT Local

2            CEPT Toll

3            Stratum 2

**Note:** pqr will be shown as "---" if the synchronizer is not equipped.

**cc**            **mmmm** - Error condition code

**cc**            **mmmm**    *Explanation*

02    **ENEQ**    Subject entity is not equipped

03    **SAIS**    Subject entity is in service

A1    **SNVS**    CRO type TLI (SSP portion not required)

A2    **SNVS**    SSP number is illegal

A3    **SNVS**    SSP number required

B8    **SAIS**    CRO is still equipped

BE    **SNVS**    Hardware mismatch or not present

CC    **SNVS**    NPC is still provisioned to provide sync timing

## **DISC,EQPT,TP**

### **DEGROWTH**

#### **Explanation Of Command**

This message requests the unequipage of a specified test port. Any subsequent test access requests for this test port will be denied. Also, if the specified test port is in use, the command will be denied.

When degrowth of the specified test port is completed, the channel units associated with this test port are no longer assumed in place, and no test ports with numbers greater than the one specified remain equipped.

#### **Command**

[I.32411]

**DISC-EQPT:[<xy>]:TP-kk:[ww];**

#### **Completion Message**

[O.32411]

    <xy> yy-mm-dd hh:mm:ss LINK-n[vv]  
**M DISC EQPT::TP-kk:[ww] COMPLD**  
;

### Denial Message

---

[O.32411.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DISC EQPT::TP-kk:[ww] DENY
mmmm
/* [0.32411.01] */
/* <explanation of error condition code> */
/* NPCTP-UEQD */
;
```

[O.32411.02]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DISC EQPT::TP-kk:[ww] DENY

/* [0.32411.03] */
/* <explanation of error condition code> */
/* TPMAX-nn,TP,NS0 */
;
```

### Autonomous Message

---

Not applicable.

### **Explanation Of Parameters**

---

|              |                                    |
|--------------|------------------------------------|
| <b>TP</b>    | - Test port                        |
| <b>kk</b>    | - Test port number (01 through 96) |
| <b>NPCTP</b> | - NPC for test ports               |
| <b>UEQD</b>  | - Unequipped                       |
| <b>TPMAX</b> | - Test port maximum                |
| <b>nn</b>    | - Test port number (01 through 96) |
| <b>NSO</b>   | - Not in sequence order            |

Degrowth of test port kk can be denied under the following conditions:

- The NPCTP (network processing circuit for test ports) has not been designated or UEQD.
- The requested test port is not idle. The test port is currently assigned to a cross-connected channel for test access (NOT-IDLE).
- The requested test port is NSO (not in sequence order) (TPMAX=nn, TP, NSO). That is, kk is not equal to the highest existing test port number nn in the NPCTP.

## **DISC,EQPT,UNIT**

### **DEGROW UNIT**

#### **Explanation Of Command**

This message requests the unequipage of a DACS II unit.

When this request is completed, all cross-connect buffer and time slot interchange circuit packs required by the subject unit to cross-connect to other equipped units are unequipped.

#### **Command**

[I.32211]

**DISC-EQPT: [<xy>]:UNIT-[q]q:[ww];**

### Completion Message

For DACS II Non-CEF frames:

[O.32211]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DISC EQPT::UNIT-q:[ww] COMPLD
/* [O.32211] */

## Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**tt** - Total number of provisioned TSIs in frame after unit is degrown  
(00 through 70)

**dd** - Number of TSIs deprovisioned by command (00 through 22)

**sft** - TSI equipped status

**s** - Service side number (0 or 1)

**f**  
- FROM unit number

| <i>f</i> | <i>Explanation</i>                             |
|----------|------------------------------------------------|
| n        | Unit number n (equals 1 through 6) is equipped |
| -        | Not equipped                                   |

**t**  
- TO unit number

| <i>t</i> | <i>Explanation</i>                             |
|----------|------------------------------------------------|
| n        | Unit number n (equals 1 through 6) is equipped |
| -        | Not equipped                                   |

## DEGROWN

- Degrown

Degrowth of UNIT q (1 through 6) can be denied because:

**kk** - Total number of equipped ETSIs in the frame after the unit is degrown  
(00 through 30)

**ET SIS** - Expanded time slot interchangers

**ET SI** - Expanded time slot interchanger

**0qq** - ETSI number side 0

**1qq** - ETSI number side 1

0qq and 1qq identify the ETSI packs deprovisioned by this command.  
qq is the unit number (see UNIT above).

Three dashes "---" are shown if an ETSI pack is not provisioned.

**0rr** - ETSI number side 0

**1rr** - ETSI number side 1

0rr and 1rr give the ETSIs equipage status. rr is the unit number (see UNIT above)

Three dashes "---" are shown if an ETSI pack is not provisioned.

- The unit is already degrown (UEQD), or
- The FTU is still equipped with m FTMIs (facility terminating module interfaces), or
- The DSPU is supporting l NPCs, or
- The unit controller (UC) is in service (IS)
- The DS3U is still equipped with k multiplexers (MXRs) or Hybrid multiplexers (HMXR) and/or the protection multiple interface unit (MIU P), or
- The DS3U or Hybrid DS3U is supporting at least one in-service facility line interface (FLI),

Note that Hybrid DS3U does not support MIU.

**FLI** - Facility line interface

**S** - Service

**P** - Protection

**FMT** - Formatter or Hybrid Formatter

**0** - Side number 0

**1** - Side number 1

**MIU** - Multiple interface unit

**MXR** - Multiplexer or Hybrid Multiplexer

**P** - Protection

**m** - Number of FTMIs (1 through 4). Will appear if the unit is equipped as an FTU.

**l** - Number of NPCs in DSP unit (1 through 8). Will appear if the unit is equipped as a DSPU.

**k** - Number of MXRs or HMXRs (1 through 6). Will appear if the unit is equipped as a DS3U or a HDS3U.

**c** - Number of FLIs that are in service (1 or 2). Will appear if the unit is equipped as a DS3U or a HDS3U.

**EQD** - Equipped

**mmmm** - Error condition code

**mmmm** *Explanation*

**NCON** No conditions

**SAIS** Subject entity is in service

**SAIS** DSPI is in service

## **DISC,EQPT,UNIT,FTMI**

### **DEPROVISION FACILITY TERMINATING MODULE INTERFACE**

#### **Explanation Of Command**

This command requests unequipage of a DACS II facility terminating module and its associated facility terminating module interface.

#### **Command**

[I.32321]

**DISC-EQPT:[<xy>]:UNIT-[q]q:[ww]:FTMI-d;**

#### **Completion Message**

[O.32321]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]

 mmmm
 /* [0.32321.01] */
 /* <explanation of error condition code> */
 /* {UEQD|EQD|IS} */
[/* {FC-sd|NPC-n} */
;

```

### Autonomous Message

Not applicable.

### Explanation Of Parameters

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**FTMI** - Facility terminating module interface

**d** - FTMI number in the DACS II unit (1 through 4)

**FC** - Format converter

**s** - Side of in-service FC

| <i>s</i> | <i>Explanation</i>    |
|----------|-----------------------|
| 0        | Side 0 FC in-service  |
| 1        | Side 1 FC in-service  |
| 2        | Both sides in-service |

**NPC** - Network processing circuit

**n** - Number of the NPC in the FTM that are still equipped (1 through 40)

**UEQD** - The FTMI is unequipped

**EQD** - Equipped

**IS** - In service

Format converter side (FC sd) is still in-service

mmmm - Error condition code

mmmm *Explanation*

|             |                              |
|-------------|------------------------------|
| <b>NCON</b> | No conditions                |
| <b>SAIS</b> | Subject entity is in service |
| <b>ENEQ</b> | Unit is not equipped         |
| <b>SAOS</b> | UC is out of service         |
| <b>SNVS</b> | UC is in service but failed  |
| <b>SNVS</b> | Unit is not FTU type         |

## **DISC,TACC,T0,ALL,OOS**

### **TEST PORT RELEASE**

#### **Explanation Of Command**

This command requests that all test ports set up by the link on which this command is input be restored to the released mode. An individual output message will be received for each test port released (see REPT,EVT,EQPT,DISC,TACC,T0,OOS)

This output message will be received after all test ports have been released.

Substrate test sessions are also released by this command.

#### **Command**

[I.27002]

**DISC-TACC-T0:[<xy>]::[ww]:ALL:[OOS];**

#### **Completion Message**

[O.27002]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DISC TACC T0:::[ww]:ALL:[OOS] COMPLD
 mmmm
 /* [0.27002.01] */
 /* <explanation of error condition code> */
;
```

#### **Denial Message**

Not applicable.

### Autonomous Message

---

[O.27002]

```
<xy> yy-mm-dd hh:mm:ss
A ff REPT EVT EQPT
 mmmm
 /* [O.27002] */
 /* <explanation of error condition code> */
 /* Test port:Event */
 "ALL:DISC-TACC-T0[,OOS]"
;
```

### Explanation Of Parameters

---

**TPR** - Test Port Release

**ALL** - All

**OOS** - Out-of-service

The OOS keyword is used to release test ports on an out-of-service circuit. Any test port, regardless of the type of circuit accessed, will be released.

**mmm** - Four-character error condition code

**mmm** - Error condition code

| <b>mmm</b> | <i>Explanation</i> |
|------------|--------------------|
|------------|--------------------|

|             |               |
|-------------|---------------|
| <b>NCON</b> | No conditions |
|-------------|---------------|

|             |                                        |
|-------------|----------------------------------------|
| <b>SARL</b> | No test ports were activated by link n |
|-------------|----------------------------------------|

|             |                                              |
|-------------|----------------------------------------------|
| <b>SNVS</b> | One or more test ports could not be released |
|-------------|----------------------------------------------|

## **DISC,TACC,T0,OOS,FRC**

### **TWO-WAY TEST ACCESS**

#### **Explanation Of Command**

This command allows a circuit under test to be put in the release mode and to be restored to its mapped (terminated or normal) state. When the Subrate Feature is used for a circuit termination, the system response will be a Subrate test port release message.

The FRC keyword is only used for an emergency disconnect of a test port from a DSP Platform application in the unlikely event that an application cannot disconnect the test port itself using an application command. The FRC keyword may only be used by users who have the RMON (Restricted Maintenance privilege ON) privilege. After the use of this command with the FRC keyword, the user should use the DISC-DSP-T0 command (I.15061) to disconnect the cross-connect that was used for the test port connection to the application. The RTVR-CRS-T1 command (I.52011) should be used to find the appropriate pair of application channel numbers **before** this command and command I.15061 are used to take the test port and then the cross-connection down.

## Explanation Of Parameters

**kk** - Test port number (01 through 96)

**OOS** - Out-of-service  
Used to release test ports on an out-of-service circuit

**FRC** - Force the disconnect  
This keyword is used only in an emergency, when a DSP Platform application (such as DDS Subrate, X.50 Subrate, or DMB) running on a TG193B circuit pack cannot disestablish a test port via an application command. This keyword is also restricted to users with the RMON privilege.

**[s]abc** - The 3- or 4-digit nonhierarchical FROM NPC number

**[t]ghi** - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |

**uv-m-np**

- Hierarchical TO NPC number of the circuit assigned to the test port.

**wx-k-qr**

- Hierarchical FROM NPC number of the circuit assigned to the test port.

If the test port is assigned to an unmapped termination, this field will be all zeroes.

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC          |                                 |
|-----------|----------|--------------|---------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

SD type NPC numbers listed by unit, module, and NPC Number for **North American modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-39</b> |

SD type NPC numbers listed by unit, module, and NPC Number for **International modules** in Unit type FT (FTU/IFTU/IFTU2). Only odd NPC numbers are valid for SD type NPCs. The even numbered NPCs immediately following an odd SD type NPC are not available for any other NPC type.

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-31</b> |

**ddd** - FROM channel or conference number  
**jjj** - TO channel or conference number

Channel numbers

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

|         |               |
|---------|---------------|
| 001-085 | (MB NPC)      |
| 001-500 | (Virtual NPC) |

**TERM** - Terminate

|   |                                      |
|---|--------------------------------------|
| R | RELEASED. Neither side is terminated |
| F | FROM side is terminated              |
| T | TO side is terminated                |
| B | Both sides are terminated            |

**RDLD** - Red lined

**CUS** - Customer  
Customer-controlled circuit

**NTR** - No transmit

| <b>st</b>     | <i>Explanation</i>                                                        |
|---------------|---------------------------------------------------------------------------|
| <b>BADNPC</b> | Bad NPC number                                                            |

## **DISC,TACC,T0,RLS,F,T,B,L,G,A,NOT**

### **TWO-WAY TEST ACCESS**

#### **Explanation Of Command**

This message is used to modify the Terminate and Leave Release status of one or both ends of the cross-connected channels associated with the specified test port. This message will be denied if the specified test port is not in the monitor or split mode or if the tested circuit is already in the specified termination release state. When used with the Subrate Feature for a circuit termination, the system response will be STST TLA TP or STST TLA MPTM TP. When used with the Subrate Feature for a circuit termination, the system response will be DISC TACC TS RLS or DISC TACC TS RLS MJU.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**RLS** - Release

F Apply RLS to the FROM end

T Apply RLS to the TO end

B Apply RLS to BOTH ends

The following apply only to multipoint circuits

L Apply RLS on all legs towards facilities

G Apply RLS on all legs towards bridge

A Apply RLS on all legs in both directions

**NOT** - Not

NOT means that the termination number following the NOT keyword is not to be affected by this command. This field is only valid for RLS values L, G, or A.

**kk** - Test port number (01 through 96)

The test port is mapped to predesignated channels of a network processing circuit for test ports (NPCTP) during the provisioning of that test port. All domestic nonSLC NPC types can be provisioned as NPCTP. For the mapping between the test ports and the channels of the test NPCs, see the CRTE-EQPT::TP: message.

**[t]rst** - The 3- or 4-digit Nonhierarchical NPC number of a termination that must not be affected by the command.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

#### uv-m-np

- Hierarchical NPC number of a termination that must not be affected by this command

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC          |                                 |
|-----------|----------|--------------|---------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**vvv** - Channel or conference number  
Channel numbers

000-030        CEPT type NPCs grown as CAS  
000-031        CEPT type NPCs grown as NSA

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

001-085        (MB NPC)  
001-500        (Virtual NPC)

**[s]abc**        - The 3- or 4-digit nonhierarchical FROM NPC number with the same valid values as [t]rst.  
**[t]ghi**        - The 3- or 4-digit nonhierarchical TO NPC number with the same valid values as [t]rst.

**wx-k-qr**  
- The hierarchical NPC number of the TO termination of the circuit assigned to the test port with the same valid values as uv-m-np.

**ed-h-fg**  
- The NPC number of the FROM termination of the circuit assigned to the test port. If the test port is assigned to an unmapped termination, this field will be all zeros (with the same valid values as uv-m-np).

**ed,wx** - Unit number  
**h,k**    - Module number  
**fg,qr** - NPC number

**jjj**        - TO channel with the same valid values as vvv.  
**ddd**        - FROM channel with the same valid values as vvv.

**CUS**        - Customer  
The circuit is a Customer-controlled Circuit

**RDLD**      - Red lined  
The tested circuit is a protected circuit

F FROM side is terminated  
T TO side is terminated  
B BOTH sides are terminated  
R Neither side is terminated

**T UASGN**

- The test port is assigned to an unmapped termination

**NTLA** - The requested TLA state is the present TLR (RLS) state

**reason** - Denial reason

## **DISC,TACC,T0,TG,OOS**

### **NX64Kbit/s TWO-WAY TEST ACCESS, TEST- ACCESS GROUP RELEASE**

#### **Explanation Of Command**

This command is used to release one or more currently active test-access groups, and restore any circuits under test to their normal, terminated, or unmapped state. The OOS keyword is required to release a test-access group in two cases:

1. The associated circuit under test is out-of-service.
2. One of both of the NPCs supporting the test-access group is out-of-service.

Where more than one test-access group is specified in the input command the completion message will list the test-access groups in ascending order by the test-access group number and provide information for all test-access groups. If an attempt is made to release a range of test-access groups and no test-access groups in the range have been provisioned the release will be denied. The output for test-access groups testing in other monitor or split modes is printed with a mapping of channels.

When an administrative link fails, all test-access groups associated with that link will be released; automatically. All circuits under test by those TGs will be restored to their normal state; mapped or unmapped. Any termination state entered before or during the test access will remain in effect.

If a failure in an entity involved in an autonomous test-access group release causes the release to fail the release may be performed manually by this command.

### Explanation Of Parameters

**TGR** - Test (access) group release

**TG** - Test (access) group

**mmm** - TG number (001 through 400)

**nnn** - TG number (001 through 400, greater than mmm)

Variable mmm is used to specify a single TG number or to specify the beginning of a range of TG numbers. Variable nnn is used to specify the end of a range of TG numbers.

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number or first TO NPC number if TG is in HUB mode

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number or second TO NPC number if TG is in HUB mode

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical FROM NPC number or first TO NPC number if TG is in HUB mode

**wx-k-qr**

- Hierarchical TO NPC number or second TO NPC number if TG is in HUB mode

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

For an unmapped TO termination, or a backbone leg (BBL) without a return, the FROM NPC number will be shown as zeroes.

**ddd** - FROM channel number or starting channel of first TO NPC in HUB mode  
**jjj** - Starting channel of second TO NPC in HUB mode

|          |                                                          |
|----------|----------------------------------------------------------|
| 001-031* | Primary NPCs grown as Channel Associated Signaling (CAS) |
| 001-031  | Primary NPCs grown as Non Signaling Associated (NSA)     |

\* Circuits involving CAS channel 31 can only be tested for N = 1.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s).  
If channel jjj is mapped to a channel 000 (N = 1 only), the corresponding FROM channel ddd will be '000'.

**OOS** - Out-of-service

**RDL D** - Red lined

The circuit is a red circuit

**CUS** - Customer

The circuit is customer controlled

**TLA** - Terminate and leave active

**TERM** - Terminate

|              |                                                    |

| <b>SNIS</b> | NPC is OOS for a TGR command and OOS keyword not specified             |
| <b>SNIS</b> | NPC not in service or failed                                           |

## **DISC,TACC,T0,TG,RLS,F,T,B**

### **NX64Kbit/s TWO-WAY TEST ACCESS, TERMINATE- AND-LEAVE-RELEASE**

#### **Explanation Of Command**

This command is used to release one or both ends of an Nx64Kbit/s cross-connection associated with the specified test-access group. The circuit to be released must be a terminated, mapped one-way or two-way circuit, that is currently in the Monitor or Split test access mode. Upon release normal data transmission is restored in the direction specified in the command.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**TG** - Test-access group

**mmm** - Test-access Group number (001 through 400)

The TG is designated as in message 31421

**[s]abc** - 3- or 4-digit non-hierarchical FROM NPC number

**[t]ghi** - 3- or 4-digit non-hierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM Channel number

001-031\* Primary NPCs grown as Channel Associated Signaling (CAS)

001-031 Primary NPCs grown as Non Signaling Associated (NSA)

\*Circuits involving CAS channel 31 can only be tested individually.

The FROM channel ddd will be '---' for circuits not involved in this test session. For unmapped TO channel(s) or a BBL without return, ddd will be '000' in the corresponding channel position(s). If TO channel is mapped to a channel 000, the circuit can only be tested as N = 1, the corresponding FROM channel ddd will be '000'.

**RDLD** - Red lined

The cross-connection tested is a red circuit.

**CUS** - Customer

The cross-connection tested is a customer-controlled circuit.

**RLS** - Release

| <i>m</i> | <i>Explanation</i>      |
|----------|-------------------------|
| F        | FROM side is released   |
| T        | TO side is released     |
| B        | BOTH sides are released |

**TERM** - Terminate

| <i>s</i> | <i>Explanation</i>                     |
|----------|----------------------------------------|
| R        | All channels are released              |
| F        | One or more FROM channel is terminated |
| T        | One or more TO channel is terminated   |

**UNMAP** - Unmapped

Circuit under test is unmapped.

**mmmm** - Four-character error condition code.

mmmm - Error condition code

mmmm *Explanation*

|             |                                                                        |
|-------------|------------------------------------------------------------------------|

## **DISC,TACC,T1,ALL,OOS**

### **NON-CANNELIZED TEST NPC RELEASE**

#### **Explanation Of Command**

This message releases ALL non-channelized facility access digroups (FADs), or test network processing circuits (NPCs) activated by the user, and restores the test session to its original mapped or unmapped state.

It is preceded by individual REPT,DISC,TACC,T1,OOS messages printed for each test session which is in progress.

If the circuit under test was a mapped circuit before the test session started, upon release of the FAD, the original cross-connection is restored. If the circuit was unmapped, it is restored to the unmapped or idle state that existed prior to testing.

#### **Command**

[I.20202]

**DISC-TACC-T1:[<xy>]::[ww]:ALL:[OOS];**

#### **Completion Message**

[O.20202]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DISC TACC T1:::[ww]:ALL:[OOS] COMPLD
 mmmm
 /* [0.20202.01] */
 /* <explanation of error condition code> */
;
```

#### **Denial Message**

Not applicable.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**ALL** - All

Release all test NPCs

**OOS** - Out-of-service

The OOS keyword must be entered to release one or more NPC(s) that are OOS. Mapped NPC(s) that are OOS will not be restored to original cross-connection until NPC(s) are returned to service.

**mmmm** - Four-character error condition code

**mmmm** - Error condition code

**mmmm** *Explanation*

**NCON** No conditions

**SARL** No FADs were activated by link n

**SNVS** One or more FADs could not be released

## **DISC,TACC,T1,OOS**

### **NON-CANNELIZED TEST NPC RELEASE**

#### **Explanation Of Command**

This message releases a non-channelized facility access digroup (FAD) or test Network Processing Circuit (NPC) and restores the test session to its original mapped or unmapped state and releases ALL test NPCs activated by the user from the current link.

For test modes using two FADs, if one of the two FADs is entered, both FADs will be released from testing. If both FADs are entered, they must be associated with one another in the same test connection. Both FADs can be entered in any order and will still be released.

If the circuit under test was a mapped circuit before the test session start, upon release of FAD(s), the circuit is restored to cross-connection. If the circuit was unmapped, it is restored to the unmapped or idle state that existed prior to testing.

If the OOS keyword is input, NPC(s) that are out-of-service (OOS) should not be a reason for denial; 'NPC unequipped, failed, or not a test NPC' is a denial condition only for the case of one NPC.

#### **Command**

##### **Nonhierarchical**

## Explanation Of Parameters

- [s]abc - The 3- or 4-digit nonhierarchical test NPC or Facility Access Digroup (FAD) number
- [t]def - The second 3- or 4-digit nonhierarchical FAD number, if applicable
- [u]ghi - The 3- or 4-digit nonhierarchical E-end NPC number of test session. Not applicable to loopback FAD
- [v]jkl - The 3- or 4-digit nonhierarchical F-end NPC number of a mapped test session. Not applicable to loopback FAD

The values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical NPC number for FAD

**wx-k-qr**

- Hierarchical NPC number of second FAD, if applicable

**eg-h-ij**

- Hierarchical E-end NPC number of test session. Not applicable to loopback FAD

**jk-l-mn**

- Hierarchical F-end NPC number of a mapped test session. Not applicable to loopback FAD

**uv,wx,eg,jk**

- Unit number

m,k,h,l - Module number

**np,qr,ij,mn**

- NPC number

The valid values are listed below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**UMPD** - Unmapped

Test session has unmapped NPC

*emode*

*fmode* *Explanation*

**NORM** - The circuit under test is not terminated in this direction

**TERM** - The circuit under test terminated in this direction

The emode output is omitted for one-way circuits

Both emode and fmode are omitted for unmapped circuits

**OOS** - Out-of-service

The OOS keyword must be entered to release one or more NPC(s) that are OOS. Mapped NPC(s) that are OOS will not be restored to original cross-connection until NPC(s) are returned to service.

If the OOS keyword is entered in the input command it will appear in the first line of the output message. A second OOS keyword will appear in the last line of the output message if at least one NPC is out-of-service at the time the command is issued.

**RDLD** - Red lined

Test session has red circuit

**CUS** - Customer

Test session has customer-controlled Circuit

**mmmm** - Error condition code

## **DLT,FPKG**

### **DELETE FEATURE PACKAGE IDENTIFICATION**

#### **Explanation Of Command**

The frame administrator enters this command to change the feature package identification code. This command is used to reduce the feature package set by a single feature at a time.

**Note:** The execution of this command requires DACS II superuser privileges. The frame must be in the **MCOND** (maintenance condition) state at execution.

**WARNING:** A manual backup from Working memory (WKG) to MEM (PMEM and SMEM together) must be invoked prior to entering Maintenance Condition, else the command may not complete.

Because of the impact of this command on the available features, the following dialogue will be displayed by DACS II.

ARE YOU SURE?

The user must respond with an affirmative Y for the command to be executed.

In general a feature package identification code is a combination of several individual feature package numbers. To determine the individual features that make up a feature package it is necessary to decode the feature package identification code. This code is an eight digit hexadecimal number. Each hexadecimal number represents a four-bit binary number. Within this binary number each feature is associated with one particular bit. Consequently to determine the feature list from a feature package identification code it is necessary to convert each hexadecimal digit to its binary equivalent and look up the features in the list above. For example the feature package identification code 0000000F can be converted to the following binary number working from left to right one hex digit at a time.

0000 0000 0000 0000 0000 0000 0000 1111

This number contains eight binary numbers each representing one of the hexadecimal numbers in the feature package identification code 0000000F. The rightmost number of the code contains four features since there are four bits set to one. This would be decoded as follows using the table of features above.

|       | binary | hex | Feature                      |
|-------|--------|-----|------------------------------|
|       | 0001   | 1   | DS1                          |
|       | 0010   | 2   | CEPT                         |
|       | 0100   | 4   | Subrate                      |
|       | 1000   | 8   | Direct SLC                   |
| Total | 1111   | F   | (DS1 + CEPT + Subrate + SLC) |

mmmm - Error condition code

mmmm *Explanation*

**SNIS** Unit(s) OOS, and additional backup required  
**IDNV** Invalid FPI value  
**SNVS** Feature deactivation would leave system with core software  
**SNVS** Disable not allowed - supports another feature  
**SAAL** Feature is active  
**SNVS** Feature not enabled  
**SNVS** Database not loaded  
**SNVS** Reading Feature Package Id from PMEM failed  
**SNVS** Writing Feature Package Id to PMEM failed  
**SNVS** Backup required before executing this command

## **DLT,LGN**

---

### **DELETE USER**

#### **Explanation Of Command**

---

This command requests the deletion of **<user id>** from the DACS II system.

Output from this command is sent only to the link on which the command was input.

#### **⇒ NOTE:**

**Note:** This command may be used only by the DACS II frame administrator. It may be executed on any administrative link.

#### **Command**

---

[I.37101]

DLT-LGN:[<xy>]::[ww]:<user id>;

#### **Completion Message**

---

[O.37101]

    <xy> yy-mm-dd hh:mm:ss LINK-n[vv]  
M DLT LGN::[ww]:<user id> COMPLD  
;

### Denial Message

---

[O.37101.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DLT LGN:::[ww]:<user id> DENY
 mmmm
 /* [0.37101.01] */
 /* <explanation of error condition code> */
;
```

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

#### user id

- User identifier

User login identification (two to eight alphabetic characters)

mmm - Error condition code

| mmm | Explanation |
|-----|-------------|
|-----|-------------|

|      |                                            |
|------|--------------------------------------------|
| SNVS | Command is Frame administrator (DAX) only. |
|------|--------------------------------------------|

|      |                     |

|      |                       |
|------|-----------------------|
| SNVS | User still owns files |
|------|-----------------------|

## **DLT,MACRO,MAP**

### **DELETE MACRO**

#### **Explanation Of Command**

This command requests the deletion of a macro or alternate map from the DACS II system.

**Note:** Only the DACS II frame administrator can remove a public macro or another user's macros and maps. The names of public macros begin with the letter P.

#### **Command**

[I.37201]

```
DLT-{MACRO|MAP}: [<xy>]::[ww]:{<macro name>|<map name>}:\
[<user id>;
```

#### **Completion Message**

[O.37201]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DLT {MACRO|MAP}:::[ww]:{<macro name>|<map name>}:\
[<user id>] COMPLD
;
```

### **Denial Message**

---

[O.37201.01]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M DLT {MACRO|MAP}:::[ww]:{<macro name>|<map name>}:\
[<user id>] DENY
 mmmm
 /* [0.37201.01] */
 /* <explanation of error condition code> */
;
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

#### **macro name**

- Macro name (seven characters maximum length)

The name of a collection of DACS II commands executed as a group.

A macro name is a string of capitalized alphanumeric characters. There are two type of macros; public and private. A private macros is created by a user in space allocated to the user by the system administrator. Only the user that created it can execute or read (LIST) a private macro. A public macro is created by the system administrator and is executable and readable by all users. A public macro name must start with the letter "P". A private macro name must not start with the letter "P".

#### **map name**

- Map name (seven characters maximum length)

The name of a collection of DACS II cross-connect commands that can be activated as a group to produce a new set of cross-connections (a new cross-connect map).

A map name is a string of capitalized alphanumeric characters.

#### **user id**

- User identifier (two to eight alphabetic characters)

The user field is the user's login identifier. It is used only by the frame administrator to delete a private macro or map owned by the user specified. A user does not need to specify this information in order to delete a personally owned (private) macro or map.

mmm - Error condition code

mmm *Explanation*

**SNVS** File is being accessed  
**SNVS** File doesn't exist/can't be accessed  
**SNVS** Command is Frame administrator (DAX) only.  
**SNVS** User does not exist  
**SNVS** No user is logged in on the link/vc

### **Notice**

Every effort was made to ensure that the information in this document was complete and accurate at the time of printing. However, information is subject to change.

### **Security Statement**

In rare instances, unauthorized individuals make connections to the telecommunications network through the use of remote access features. In such event, applicable tariffs require that the customer pay all network charges for traffic. Lucent Technologies cannot be responsible for such charges, and will not make any allowance or give any credit for charges that result from unauthorized access.

### **Documentation Ordering Information**

The ordering number for this document is 365-353-192. To order this document, call the Lucent Technologies Customer Information Center in Indianapolis, Indiana, on 1-888-582-3688. For more ordering information, refer to "How to Order Documentation" in the section "About this Document."

### **Technical Support Telephone Number**

The Lucent Technologies Regional Technical Assistance Center (RTAC) provides a technical assistance telephone number which is staffed 24 hours a day. For technical assistance, simply call 1-800-225-RTAC.

### **Documentation Support Telephone Number**

Lucent Technologies provides a telephone number for you to report errors or to ask questions about the information in this document. The support telephone numbers are:

Outside North Carolina - 1-800-334-0404  
Inside North Carolina - 1-919-727-6681.

## How Are We Doing?

Document Title: DACS II Release 8.2.3, MML 2.048-Mb/s Interface Command and Message Manual Volume II

Document No.: 365-353-252

Issue 1

Date: February 1999

Lucent Technologies welcomes your feedback on this document. Your comments can be of great value in helping us improve our documentation.

1. Please rate the effectiveness of this document in the following areas:

|                      | Excellent | Good | Fair | Poor | Not Applicable   |
|----------------------|-----------|------|------|------|------------------|
| Ease of Use          |           |      |      |      | //////////////// |
| Clarity              |           |      |      |      | //////////////// |
| Completeness         |           |      |      |      | //////////////// |
| Accuracy             |           |      |      |      | //////////////// |
| Organization         |           |      |      |      | //////////////// |
| Appearance           |           |      |      |      | //////////////// |
| Examples             |           |      |      |      |                  |
| Illustrations        |           |      |      |      |                  |
| Overall Satisfaction |           |      |      |      | //////////////// |

2. Please check the ways you feel we could improve this document:

- |                                                            |                                                                     |
|------------------------------------------------------------|---------------------------------------------------------------------|
| <input type="checkbox"/> Improve the overview/introduction | <input type="checkbox"/> Make it more concise/brief                 |
| <input type="checkbox"/> Improve the table of contents     | <input type="checkbox"/> Add more step-by-step procedures/tutorials |
| <input type="checkbox"/> Improve the organization          | <input type="checkbox"/> Add more troubleshooting information       |
| <input type="checkbox"/> Include more figures              | <input type="checkbox"/> Make it less technical                     |
| <input type="checkbox"/> Add more examples                 | <input type="checkbox"/> Add more/better quick reference aids       |
| <input type="checkbox"/> Add more detail                   | <input type="checkbox"/> Improve the index                          |

Please provide details for the suggested improvement. \_\_\_\_\_

## About This Document

---

### **Purpose**

---

The *DACS II Release 8.2.3 Command and Message Manual* describes the input commands and output messages of Release 8.2.3 of the Digital Access and Cross-Connect System II (DACS II). In addition, it provides full support for previous product releases.

**⇒ NOTE:**

Those customers using this manual with Releases 3 through 7.0.3 software should be aware that all features of a particular message shown for Release 8.2.3 may or may not apply to previous releases.

This manual consists of three volumes as follows:

- **Volume I** - This volume contains general information about the document, a detailed introduction that defines DACS II messages, relates how to communicate with DACS II, introduces the administrative links, and discusses in detail NPC addressing, on-line help feature, system configuration and features a listing of related documentation. Message listings in this volume include alphabetical and numerical, summary list of input commands and a list of autonomous messages. A comprehensive presentation of input commands and output messages (ABT through DLT) concludes this volume.
- **Volume II and III** - These two volumes contain input commands and output messages in the following order:
  - **Volume II** - EBX through RMV
  - **Volume III** - RST through SW and the Glossary

---

## **Reason for Issue**

---

The *DACS II Release 8.2.3 Command and Message Manual* has been issued to include updated and new commands applicable to Release 8.2.3.

## **Intended Audiences**

---

This manual is a catalog of messages intended for reference by a technician or craftperson who needs additional details about a message. It provides the user with supplemental information for the Digital Access and Cross-Connect System II (DACS II) that is programmed in the HuMan-Machine Language (MML) language. An example of a user is someone performing a task from an operation and maintenance manual who needs the definition of a specific keyword to complete the task.

## **How to Order Documentation**

---

To order additional copies of this document, send or call in an order as follows:

- To order by Mail:

Lucent Technologies  
Customer Information Center  
Attention: Order Entry Section  
2855 N. Franklin Road  
P. O. Box 19901  
Indianapolis, IN 46219

- 
- To order by Telephone (Monday through Friday);

Within the United States of America:

**1-800-LUCENT8 (582-3688)** (7:30 a.m. to 6:30 p.m. EST)

From Canada:

**1-800-255-1242**

Worldwide:

Toll: **1-317-352-8557**

FAX: **1-317-352-8484**

For RBOC/BOC customers, process orders through your Company Documentation Coordinator.

For commercial customers, a check, money order, purchase order number, or charge card number is required with all orders. Make checks payable to Lucent Technologies.

Lucent Technologies entities should use Form IND 1-80.80 FA, available through the Customer Information Center.

One-time orders include a binder (if applicable) and the document contents for the current issue in effect at the time of order. After placing a one-time order, you can request a standing order for any document revisions *of that software release*. Documents for new software releases do *not* go to standing-order customers. You will only get those documents if you order the new software release.

## **How to Comment on This Document**

A feedback form is located at the beginning of this publication, immediately after the title page. Please fill out the feedback form and return it (postage free) to the address on the back.

If the feedback form is missing, send comment on this publication to:

## **EBX — EXC**

---

## **EBX — EXC**

---

This section documents the commands **EBX** through **EXC**.

## **EBX,STARTUP,STF,ATP**

### **EXPANDED BUS EXTENDER STARTUP**

#### **Explanation Of Command**

This message reports that the expanded bus extender has initialized itself and has performed self-diagnostics. The results of these diagnostics are reported. For all tests passed, no action is required.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01272]

**EBX STARTUP {STF|ATP}**

### **Explanation Of Parameters**

---

**EBX** - Expanded bus extender

**STARTUP**

- Startup

Indicates initialization

**STF** - Some tests failed

**ATP** - All tests passed

## **ED,ADD,MAP,NPC**

### **ADD NETWORK PROCESSING CIRCUIT**

#### **Explanation Of Command**

This message adds one or more network processing circuits (NPCs) of the facility terminating unit (FTU) into an alternate map while in a map session.

#### **Command**

##### **Nonhierarchical**

[I.36021]

**ED-ADD-MAP:** [<xy>]:NPC-{[s]abc&&-[t]def|[s]abc[&-[s]ghi]....\  
[&-[t]def]};

##### **Hierarchical**

[I.36021]

**ED-ADD-MAP:** [<xy>]:NPC-{uv-m-np&&&-wx-k-qr|\  
uv-m-np[&-ab-c-de]....[&-wx-k-qr]};

#### **Completion Message**

If the command is accepted by DACS II, the following input acknowledgement will be output.

**OK**

#### **Denial Message**

Not applicable.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**NPC** - Network processing circuit

**[s]abc, [t]def, [s]ghi**  
- The 3- or 4-digit nonhierarchical NPC numbers

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np,wx-k-qr,ab-c-de**  
- Hierarchical NPC number

**uv,wx,ab**  
- Unit number

**m,k,c**  
- Module number

**np,qr,de**  
- NPC number within the module

The valid values are:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

## **ED,CNFGRN,EQPT,UNIT**

### **CHANGE CONNECTIVITY**

#### **Explanation Of Command**

This command requests a change of a unit's connectivity. Timeslot interchange (TSI) circuit packs will be automatically grown and/ or degrown (deprovisioned) as needed.

New or degrown TSIs are listed at the end of the output message. They are listed pairwise with up to six pairs listed per message line. At most there will be 10 of these pairs when the connectivity of a unit is changed.

#### **Command**

[I.38101]

**ED - CNFGRN - EQPT : [<xy>] : UNIT - q : [ww] : a[, b[, c[, d[, e[, f]]]]];**

### **Explanation Of Parameters**

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**TSI** - Time slot interchange

**CONN** - Connectivity

**a b c d e f**

- The new complement of the subject unit's TSIs is changed to  
(1 through 6)

**tt** - Total number of grown TSIs in frame (02 through 72)

**nn** - Number of TSIs grown by command (00 through 10)

**dd** - Number of TSIs degrown by command (00 through 10)

**sft** - TSI equipped status

**s** - Service side (0 or 1)

**f** - FROM unit number  
1 through 6 if equipped  
- if not equipped

**t** - TO unit number  
1 through 6 if equipped  
- if not equipped

**mmmm** - Error condition code

**mmmm** *Explanation*

**ENEQ** Subject entity is not equipped

**ENRE** Illegal connectivity specified

**SNAS** Connectivity contains unequipped units

**SAIS** Some TSIs to degrow are in service

**SAWS** Mapped slots exist on a tsi

## **ED,DATE,INT**

### **SET DATE**

#### **Explanation Of Command**

This command sets the date (month-day-year or day-month-year) and the interval at which it will be printed for the DACS II clock.

The time (hour, minute, second) can also be set, but not simultaneously with the date.

#### **Command**

[I.51021]

**ED-DATE: [<xy>]::[ww]:[ce]yr-mo-da:[INT-ii];**

---

### Explanation Of Parameters

**mo** - month  
**da** - day  
**ce** - century  
**yr** - year

The 2-digit century (ce) field is optional. If the user enters a 2-digit number for the year field, DACS II assumes a default value of 19 for the century for the range of years between 86 and 99 and a default value of 20 for the century for the range between 00 and 85. Any 4-digit century-year entry from 1986 onward is also acceptable.

**INT** - Interval

The INT option is only allowed with the yr-mo-da portion of the command.

**ii** - Interval at which DACS II will print the date

| <i>ii</i> | <i>Meaning</i>                                        |
|-----------|-------------------------------------------------------|
| 01        | Every hour on the hour                                |
| 02        | Every even hour on the hour                           |
| 04        | Every fourth hour on the hour: 04, 08, 12, 16, 20, 24 |
| 06        | Every sixth hour on the hour: 06, 12, 18, 24          |
| 08        | Every eighth hour on the hour: 08, 16, 24             |
| 12        | Twice daily on the hour: 12, 24                       |
| 24        | Once daily at midnight (default)                      |

#### **hr-mn-sc**

- Time of Day

**hr** - Hours (00 through 23)  
**mn** - Minutes (00 through 59)  
**sc** - Seconds (00 through 59)

**mmmm** - Error condition code

**mmmm** *Explanation*

**IDNV** NPC number does not point to an application card

## **ED,DLT,MAP,NPC**

### **EDIT DELETE MAP**

#### **Explanation Of Command**

This command is only used in the open and create session of the alternate map feature. It is not intended to be used as a regular command under any circumstances.

This message is used to *delete* a single NPC, a range of NPCs, or a list of NPCs, from an alternate map.

To delete circuits from an alternate map, enter the **CONN-CRS** command (I.11001) with the DEL keyword at the end.

The only system response to this command is:

OK

Denials in response to this command are sent only to the link on which the command was input.

#### **Command**

#### **Nonhierarchical**

[I.37001]

**ED-DLT-MAP: [<xy>]:NPC- {[s]abc&&- [s]def | [s]abc [&- [s]ghi] . . . \**  
**[&- [t]def]};**

## Hierarchical

[I.37001]

**ED-DLT-MAP:** [<xy>]:NPC-{uv-m-np&&&-wx-k-qr|uv-m-np\  
[&-ab-c-de]... [&-wx-k-qr]};

## Completion Message

If the command is accepted by DACS II, the following input acknowledgement is output.

**OK**

## Denial Message

Not applicable.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**[s]abc, [t]def, [s]ghi**

- The 3- or 4-digit non-hierarchical NPC numbers

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number

Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**mmm** - Error condition code

**mmm** *Explanation*

**SNVS** The NPC to delete has not been previously added to map

## **ED,MACRO,MAP**

### **CREATE OR EDIT A MACRO OR MAP**

#### **Explanation Of Command**

This command is dual purpose. It can be used to create a new macro or alternate map or to edit an existing macro or map. A macro is a collection of DACS II commands that can be executed as a group by a single command. A map is a collection of DACS II cross-connect commands that can be activated as a group by a single command to create a new cross-connect map.

Once a macro has been created, and is free of errors, it can be executed repeatedly. For commonly used command sequences this saves a lot of typing, speeds execution, and assures the user of repeatability. Similarly a map, once created, can be repeatedly activated. However, prior to each activation of a map the information specified in the map must be edited to create a new map. On the other hand the information in a macro can be changed, without editing, when the command is executed. The new information is inserted into the command line and replaces information within the macro at execution time.

The commands used in the macro, the macro commands, will always be executed in the order they are listed in the macro. However, because the commands can use variables as well as constants, the information within the macro can vary with each execution. A command within the macro that addresses a given NPC can be made to address a different NPC the next time the macro is executed. This is done by replacing the constant, representing the NPC number, listed in the macro command with a variable. Many other command parameters can be changed from execution to execution by the use of variables in the macro commands.

Consider the private macro named "DEMO" below. Some elements of these macro commands have been omitted in order to focus on the use of variables.

```
DISC-CRS-T0::001-001,003-001:STOP;OK
CONN-CRS-T0::001-001,005-001:;;;;;OK
CONN-CRS-T0::001-002,005-002:;;;;;OK
CONN-CRS-T0::001-003,005-003:;;;;;OK
RTRV-CRS-T1::001::MAP;OK
```

This macro will always disconnect, connect, and query the same NPCs. If DEMO were written as follows, using variables, the NPCs affected could be specified each time the macro was executed without having to reenter the macro. A macro written in this manner is referred to as a universal macro. This particular macro would be even more universal if the channel numbers were represented by variables.

```
DISC-CRS-T0::#01-001,003-001:STOP;OK
CONN-CRS-T0::#01-001,#02-001:;;;;;OK
CONN-CRS-T0::#01-002,#02-002:;;;;;OK
CONN-CRS-T0::#01-003,#02-003:;;;;;OK
RTRV-CRS-T1::#01::MAP;OK
```

Variables have replaced some of the constants in macro DEMO. NPC number 001 has been replaced with variable #01 and NPC number 005 has been replaced with variable #02. The numbers in these variable names refer to the position of the replacement in the command used to execute the macro. To execute this macro replacing #01 with 020 and #02 with 040 we would enter the following command.

```
EXC-MACRO::DEMO:020&040;
```

```
DISC-CRS-T0::020-001,003-001:STOP;OK
CONN-CRS-T0::020-001,040-001:;;;;;OK
CONN-CRS-T0::020-002,040-002:;;;;;OK
CONN-CRS-T0::020-003,040-003:;;;;;OK
RTRV-CRS-T1::020::MAP;OK
```

Variables may be used for any macro command parameter except action verbs and punctuation. The number of variables used in a macro is limited to 10. A variable may be used wherever its value is needed, that is, it is not restricted to an NPC number just because it was used for that purpose at some other point in the macro. If the user wished to address NPC number 003 and channel 003 the variable #01 with value 003 could be used for both the NPC number and the channel number. The macro command would look as follows.

CONN-CRS-T0::#01-#01,...;

At execution time this would translate to the following.

CONN-CRS-T0::003-003,...;

 **NOTE:**

To represent hierarchical NPC numbers a variable must be used for each part (unit, module, NPC) of the NPC number. A macro expecting a hierarchical format parameter should not be executed with a nonhierarchical format parameter.

NPC 01101 would be represented in a macro command with variables #01, #02, and #03 as follows.

RTRV-CRS-T1::#01#02#03::MAP;

**WARNING:**

*Any command prompting "Are You Sure?" which is accepted as a macro command will always have the "No" answer to the question.*

The system responds with "OK" when the ED-MAP command is entered.

The system responds with LINE and SAVE messages, as shown below, when the ED-MACRO command is entered.

```
[O.19071]
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M LINE:::[ww] COMPLD
```

;

```
[O.19081]
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M SAVE:::[ww] COMPLD
```

;

A macro session is the period between entering the command to create a macro and entering the command to exit the macro. A line pointer is maintained by the system during the session to mark the position of the current line within the macro. As a line is added to the macro the line pointer moves down a line; tracking the position of the current line. The LINE command is used to determine the current line pointer value and the total number of lines currently in the macro.

The SAVE command is used during a macro session to save the current set of macro commands in the macro represented in the message by "macro name." The macro name is chosen by the user.

The completion messages correspond to the frame response when END or QTEND is entered after completion of editing or creating a macro. The END command saves all the changes before ending (exiting) a macro session. The QTEND command ends the macro session without saving the changes.

Output from this command is sent only to the link on which the command was input.

### Explanation Of Parameters

---

#### macro name

- Macro name (seven characters maximum length)

The name of a collection of DACS II commands executed as a group.

A macro name is a string of capitalized alphanumeric characters. There are two type of macros; public and private. A private macros is created by a user in space allocated to the user by the system administrator. Only the user that created it can execute or read (LIST) a private macro. A public macro is created by the system administrator and is executable and readable by all users. A public macro name must start with the letter "P". A private macro name must not start with the letter "P".

**map name**

- Map name (seven characters maximum length)

The name of a collection of DACS II cross-connect commands that can be activated as a group to produce a new set of cross-connections (a new cross-connect map).

A map name is a string of capitalized alphanumeric characters.

**QTEND** - Quit end

Quit to end a macro or map session without saving any changes to the macro or map.

**COND** - Condition

**cc**     **mmmm**   - Error condition code

| <b>cc</b> | <b>mmmm</b> | <i>Explanation</i>                                         |

## **ED,OPT,T1,NPC,TYPE,ALL**

### **CHANGE/SET OPTIONS**

#### **Explanation Of Command**

This message initializes or changes the DACS II threshold data base, which contains the programmable set of selectable alarm thresholds for facility performance parameters accumulated by DACS II NPCs.

This command will be denied if an attempt is made to set the minor threshold greater than or equal to the major threshold of any parameter specified on *any* NPC currently in the frame.

Threshold values are entered in free format (1 to 9 digits) separated by commas. Enter a hyphen (-) for values that are *not* to be changed. **Note:** This command will not reboot the NPC hardware. Therefore, if any NPCs are in service, use the **UTL : :BOOT, FRAME** command (Message I.58001) to avoid any possible inconsistency. Following DACS II installation, the user-programmable (non-default) values are empty until this **ED-OPT-T1** command enters a value. A user-programmable threshold value must first be initialized by this message before it can be used as an argument to the **OPTS** keyword of the **CRTE-EQPT** (Message I.31352) and **ED-PRMTR** (Message I.38221).

**Note:** This command will not reboot the NPC hardware. Therefore, if any NPCs are in service, use the **STA-LOCL-RST** command (Message I.58001) to avoid any possible inconsistency.

#### **Command**

[I.38201]

**ED-OPT-T1 : [<xy>] : NPC : [ww] : {TYPE-mn|ALL} : rr : a, b, c ;**

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

**OPT** - Option

**rr** - Facility performance parameter number

Variable *rr* specifies the parameter whose alarm threshold is being set or changed. The parameters and their corresponding *rr* values are given in the table below.

The Major and Minor *Slip* threshold crossing alarms can be disabled by programming a value of zero for the Slip Major and Slip Minor thresholds, respectively.

To use this feature, the Slip Major threshold must be disabled before the Slip Minor threshold. This command will be denied if an attempt is made to disable the Minor Slip threshold (by setting its value to zero) before disabling the Major Slip threshold on *any* in-service NPC on the frame.

### For PB and PC type NPCs:

| <b>rr</b> | <b>Parameter</b>                   | <b>Threshold<br/>Value<br/>Range</b> | <b>Default<br/>Threshold<br/>Value</b> |
|-----------|------------------------------------|--------------------------------------|----------------------------------------|
| <b>31</b> | Degraded Minutes, 1 hour           | 1-60                                 | 60                                     |
| <b>32</b> | Degraded Minutes, 24 hours         | 1-1440                               | 1440                                   |
| <b>33</b> | Severely Errored Seconds, 15 mins  | 1-900                                | 900                                    |
| <b>34</b> | Severely Errored Seconds, 24 hours | 1-65535                              | 65535                                  |
| <b>35</b> | Errored Seconds, 15 minutes        | 1-900                                | 900                                    |
| <b>36</b> | Errored Seconds, 24 hours          | 1-65535                              | 65535                                  |
| <b>37</b> | Unavailable Seconds, 15 minutes    | 1-900                                | 900                                    |
| <b>38</b> | Unavailable Seconds, 24 hours      | 1-65535                              | 65535                                  |
| <b>39</b> | Slips, 15 minutes                  | 1-900                                | 900                                    |
| <b>40</b> | Slips, 24 hours                    | 1-65535                              | 65535                                  |

**Note 1:** 24-hour thresholds must be greater than their respective 15-minute or 1-hour threshold.

**For PA type NPCs:**

**Table 11-1. Parameter Register Threshold Range and Default Values**

| rr | Parameter                        | Interval | Threshold Value Range | Default Threshold Value |

| 94 | Far End Unavailable Seconds      | 15MIN    | 1 - 900               | 30                      |

**TYPE** - Type

Type of NPC for which the options are being set. Note that not all parameter threshold options apply to all NPC types.

**mn** - NPC Type prefix

| <b>mn</b> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|           |                                                        |
|-----------|--------------------------------------------------------|
| <b>PA</b> | CEPT NPC type (120-ohm twisted pair or 75-ohm coaxial) |
|-----------|--------------------------------------------------------|

|           |                                      |
|-----------|--------------------------------------|
| <b>PB</b> | CEPT NPC type (120-ohm twisted pair) |
|-----------|--------------------------------------|

|           |                                |
|-----------|--------------------------------|
| <b>PC</b> | CEPT NPC type (75-ohm coaxial) |
|-----------|--------------------------------|

|           |                     |
|-----------|---------------------|
| <b>TH</b> | HDS3U CEPT NPC type |
|-----------|---------------------|

**ALL** - All

All NPC types. If specified, the given thresholds will be written into the secondary data base for all types of NPCs for which the associated parameter is valid.

**a** - Threshold setting 1 (m=1) for given parameter rr

**b** - Threshold setting 2 (m=2) for given parameter rr

**c** - Threshold setting 3 (m=3) for given parameter rr

Thresholds are entered in free format (1 to 9 digits) separated by commas. Enter a "-" (hyphen) for values that are not to be changed.

DACS II provides a set of default threshold values and alarm levels (<m>=0,1,2,d) for each NPC type. Only the default threshold value for each parameter exists in the DACS II database prior to user programming using the ED-OPT-T1 command. Before any non-default threshold value (m=3 to band d-10) can be provisioned to be used by an NPC for performance monitoring, it must be entered in the DACS II database using this command. Otherwise, an error message will occur. When this command is executed, all threshold values in the DACS II frame are changed, including the ones previously set or in use. Performance monitoring thresholds are provisioned for NPCs using the "rr/m" argument of the CRTE-EQPT::NPC or ED-PRMTR-EQPT::NPC command.

The default values are accessed using threshold setting 0 (<m>=0,1,2,d). Threshold settings 1 (<m>=3,4,5,e), 2 (<m>=6,7,8,f), and 3 (<m>=9,a,b,10) are user-programmable. That is, set1, set2, and set3 do not have default values; they must be programmed by the user before they can be used.

**ttttt[tttt]**

- Default threshold value for option rr

**aaaaa[aaaa]**

- Old set1 threshold value

**bbbbbb[bbbb]**

- Old set2 threshold value

**cccccc[cccc]**

- Old set3 threshold value

**pname** - Parameter name

| <i>pname</i>  | <i>Explanation</i>                           |
|---------------|----------------------------------------------|

| UATC, 15MIN | Unavailable Time Count, 15 minute interval           |
| UATC, DAILY | Unavailable Time Count, daily interval               |

**xxxxx[xxxx]**  
- New set1 threshold value  
**yyyyy[yyyy]**  
- New set2 threshold value  
**zzzzz[zzzz]**  
- New set3 threshold value

**Note:** If the "TYPE mn" option is used in the input command to change the thresholds for a single NPC type and a hyphen is entered for at least one of the thresholds to preserve its value, the output response will show that the respective new threshold values are unchanged by outputting the same value for the new threshold that is output for the old threshold.

If the "ALL" types option is used in the input command to change the thresholds for all NPC types and a hyphen is entered for at least one set of thresholds to preserve their values, the output response will show that the respective threshold values are unchanged by outputting "----[----]" (a dash) for the new threshold value and the respective unchanged values in the old threshold fields for each NPC type.

**NPC** - Network processing circuit  
**[s]abc** - The 3- or 4-digit nonhierarchical NPC number of problematic NPC

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|

---

## **ED,OPT,T1,NPC,TYPE,ERB**

### **SET ERRORED BLOCK THRESHOLD RATIO**

#### **Explanation Of Command**

This command allows users to set an error threshold for PA type NPCs that will be used to determine that a severely errored second or a far-end severely errored second has occurred. The threshold is set in terms of a percentage of blocks in error (errored blocks). At system start up, this percentage is set to 81 percent. Execution of this command will change the threshold to the percentage of errored blocks requested in the command for all provisioned PA NPCs. Once the percentage is set by this command it will be applied to all PA NPCs subsequently provisioned.

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**ERB** - Errored Block

**ee** - Percentage of errored blocks (1% through 91%, default is 81%)  
The number of errored blocks, expressed as a percentage, used to declare a severely errored second (SES) or far-end SES (FSES).

**NPC** - Network processing circuit

**TYPE** - Type

**mn** - NPC type identifier

mn Explanation

PA CEPT NPC (75-ohm or 120-ohm)

**Note:** PA is the only value that can be entered in this field.

**mmm** - Error condition code

mmm *Explanation*

**SNVS** NPC type error

## **ED,PRMTR,ALMS,ON,OFF**

**Turn ON or OFF the Alarm Severity Feature**

### **Explanation Of Command**

This command is used to turn ON or OFF the Alarm Severity Feature which is used to change the alarm severity of the system alarms. When this feature is ON, messages I.38365 and I.38375 can be used to change the alarm severity of shelf and facility alarms. This command is restricted to those with super user privileges.

This command can only be used if the alarm severity feature has been purchased as part of the DACS II software generic.

### **Command**

[I.38355]

---

**CHANGE BIT-C TO****Explanation Of Command**

---

This message allows you to send any 15-bit pattern of 0's and 1's on the addressed c-bit circuit. The addressed c-bit circuit must be provisioned as a Director DACS (DD) for the overwrite function (Message I.38331). The pattern can be changed on a single channel or a range of channels without disconnecting and reconnecting the circuits.

abcd is the hexadecimal value of the 15-bit pattern to be sent on the address c-bit circuit(s). Bit 1 is a framing bit generated on the CPR circuit pack. The other 14 bits are specified as follows:

| HEX DIGIT | BIT POSITION       |
|-----------|--------------------|
| a         | Bits 2 and 3*      |
| b         | Bits 4 through 7   |
| c         | Bits 8 through 11  |
| d         | Bits 12 through 15 |

\*Bits 2 and 3 are the two least significant values of Hex digit a. The two most significant values of Hex digit a will always be input as 00. Hex digit a will always be a number between 0 and 3 (0000 - 0011).

## Explanation Of Parameters

**BC** - BIT-C

**abcd** - Hexadecimal representation of bits 2 through 15 of the c-bit transmission pattern (X'0000 through X'3FFF)

**T0** - NPC identifier

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

Valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uv-m-np**

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Channel number at the beginning of a range  
**eee** - Ending channel number

Valid values are listed below:

001-030          CEPT type NPCs grown as CAS

**Note:** Channel 000 of CEPT NPCs (TS0) can be connected to another channel 000 of CEPT NPCs (TS0). Also, the channel 000 of CEPT NPCs can be connected to a channel other than the channel 000 of CEPT NPCs (non-TS0).

Channel 031 of CAS NPCs (TS16) can only be cross-connected to another channel 031 of CAS (TS16) or one-way cross-connected to another channel. Also these two channels can not be part of any conference.

**mmmm** - Error condition code

#### uv-m-np

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - Starting channel number  
**eee** - Ending channel number

Valid values are listed below:

001-030          CEPT type NPCs grown as CAS

**Note:** Channel 000 of CEPT NPCs (TS0) can be connected to another channel 000 of CEPT NPCs (TS0). Also, the channel 000 of CEPT NPCs can be connected to a channel other than the channel 000 of CEPT NPCs (non-TS0).

Channel 031 of CAS NPCs (TS16) can only be cross-connected to another channel 031 of CAS (TS16) or one-way cross-connected to another channel. Also these two channels can not be part of any conference.

## **ED,PRMTR,EQPT,DD**

### **CHANGE DIRECTOR DACS TO**

#### **Explanation Of Command**

This command allows the designation or change of the c-bit signaling bit(s) for the Director DACS (DD) function of monitoring, overwriting, or both; or to stop monitoring, overwriting, or both. This change can be made on a single channel or a range of channels without disconnecting and reconnecting the circuit.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**DD** - Director DACS

**m** - Monitor function parameter for c-bits entering the C-bit Processing Circuit Pack

Valid values are listed below:

| <i>m</i> | <i>Explanation</i>            |
|----------|-------------------------------|
| 0        | Disable the monitor function  |
| 1        | Enable the monitor function   |
| -        | Do not change current setting |

**w** - Write function parameter for c-bits leaving the C-bit Processing Pack

Valid values are listed below:

| <i>w</i> | <i>Explanation</i>            |
|----------|-------------------------------|
| 0        | Disable the write function    |
| 1        | Enable the write function     |
| -        | Do not change current setting |

**[s]abc** - The 3- or 4-digit non-hierarchical NPC number

Valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

## **ED,PRMTR,EQPT,NPC**

### **CHANGE NPC OPTIONS**

#### **Explanation Of Command**

This message changes the facility performance parameter threshold values on a specified Network Processing Circuit (NPC) without disconnecting and reconnecting provisioned circuits.

One or more alarm or information threshold values for the designated NPC may be changed to a value previously stored in the DACS II threshold data base. These previously stored values are selected through use of the indices **rr/m**.

Each facility parameter of an NPC has a default threshold and up to three user-programmable threshold values stored in the DACS II threshold data base. The **ED-OPT-T1** command sets these values.

**Note:** This command will not reboot the NPC hardware. Therefore, if any NPCs are in service, use the **STA-LOCL-RST** command (Message I.58001) to avoid any possible inconsistency.

**uv-m-np**

- Hierarchical NPC number

**uv** - Unit number  
**m** - Module number  
**np** - NPC number within the module

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**rr** - Facility performance parameter number

Variable rr specifies the parameter whose alarm threshold is being selected.

**<m>** - Facility performance parameter threshold index (0 through X'10')

Variable <m> is used to select threshold values and threshold crossing alarm levels previously programmed for rr. The default threshold value for each parameter is shown below under the column heading "Default Threshold Value". Default threshold values are selected by setting m = 0, 1, 2 or d. Each of these m values corresponds to the default threshold but a different alarm level. The default threshold value and alarm level is given by m = 0. Threshold values selected from Set1 (m=3,4,5,e), Set2 (m=6,7,8,f), and Set3 (m=9,a,b,X'10') must exist, that is, they must have been programmed, prior to being selected.

These other thresholds can be set by using the ED-OPT-T1 command.

#### For PB and PC type NPCs:

| <b>rr</b> | Parameter                          | Threshold<br>Value<br>Range | Default<br>Threshold<br>Value |
|-----------|------------------------------------|-----------------------------|-------------------------------|
| <b>31</b> | Degraded Minutes, 1 hour           | 1-60                        | 60                            |
| <b>32</b> | Degraded Minutes, 24 hours         | 1-1440                      | 1440                          |
| <b>33</b> | Severely Errored Seconds, 15 mins  | 1-900                       | 900                           |
| <b>34</b> | Severely Errored Seconds, 24 hours | 1-65535                     | 65535                         |
| <b>35</b> | Errored Seconds, 15 minutes        | 1-900                       | 900                           |
| <b>36</b> | Errored Seconds, 24 hours          | 1-65535                     | 65535                         |
| <b>37</b> | Unavailable Seconds, 15 minutes    | 1-900                       | 900                           |
| <b>38</b> | Unavailable Seconds, 24 hours      | 1-65535                     | 65535                         |
| <b>39</b> | Slips, 15 minutes                  | 1-900                       | 900                           |
| <b>40</b> | Slips, 24 hours                    | 1-65535                     | 65535                         |

**Note 1:** 24-hour thresholds must be greater than their respective 15-minute or 1-hour threshold.

**For PA type NPCs:**

**Table 11-2. Parameter Register Threshold Range and Default Values**

| 94 | Far End Unavailable Seconds      | 15MIN    | 1 - 900               | 30                      |

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m> | Threshold Value    | Alarm Type                             |
|-----|--------------------|----------------------------------------|
| 0   | Default            | MI (Maintenance Information)           |
| 1   | Default            | DMA (Deferred Maintenance Minor Alarm) |
| 2   | Default            | PMA (Prompt Maintenance Major Alarm)   |
| 3   | Set 1              | MI                                     |
| 4   | Set 1              | DMA                                    |
| 5   | Set 1              | PMA Major                              |
| 6   | Set 2              | MI                                     |
| 7   | Set 2              | DMA                                    |
| 8   | Set 2              | PMA Major                              |
| 9   | Set 3              | MI                                     |
| a   | Set 3              | DMA                                    |
| b   | Set 3              | PMA Major                              |
| c   | Threshold disabled | no alarm                               |
| d   | Default            | PMA Critical                           |
| e   | Set 1              | PMA Critical                           |
| f   | Set 2              | PMA Critical                           |
| 10  | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable m can be used to select threshold levels and alarm types other than the defaults.

**TYPE** - Type

**mnxyz** - NPC type

PAxyz - CEPT NPC (120-ohm twisted pair or 75-ohm coaxial)  
PBxyz - CEPT NPC (120-ohm twisted pair)  
PCxyz - CEPT NPC (75-ohm coaxial)

**PA-Type xyz fields**

The provisioning values of  $x$ ,  $y$ , and  $z$  for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding ( $x$ ,  $y$  or  $z$ ) provisioning value):

**Table 11-3. Provisioning values for  $x$**

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |
| B            |               |                    |               |                            |                           |
| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.
4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent ED-PRMTR-EQPT::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 11-4. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the *abcd* bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the *abcd* bits will be transmitted transparently.

If the "AIS in TS16" option is selected ( $y$  value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected ( $y$  values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For  $y$  values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering ( $y=8$ ) or Timeslot Channel Numbering ( $y=9$ ) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface ( $y=C$ ) or as an unframed clear 2Mbit/s interface ( $y=D$ ). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 11-5. Provisioning values for  $z$**

| $z$<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|--------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|              | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0            | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1            |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2            | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3            |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4            | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5            |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6            | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7            |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8            | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9            |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A            | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B            |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C            | Y           |    |              |       |       |               |      |               |       |         |         |
| D            | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. **z** value **F** and **E** are unassigned (i.e. not valid).
2. **z** value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )
3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in 480 ms  
if **z** = **1, 3, 5**, or **9**  
in 2496 ms  
if **z** = **7** or **B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when **z** = 7 or B.**
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z** = 0, 1, 4, 5, 6, 7, A or B. **However,** for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for  $z = 4$  and 8) or 480 ms (for  $z = 5$  and 9) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the ED-PRMTR-EQPT::NPC:TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.
8.  $z$  values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options ( $z = 6-7$  or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

$z=6$  or A hardware timing

$z=7$  or B firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for  $z=6$  or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for  $z= A$  or B**

- [vii] RBER unalarmed
- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of *xyz* for the PA type NPC.

**Table 11-6. Combinations of *x* and *y* Values**

|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                          |
|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option h=1.

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

If both  $b=1$  and  $h=1$  and the NPC (used as synchronization source) receives NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option  $c$  is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] minor bit error rate and signaling freeze delay time features:

jkl=011 or jkl=101

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

$c=0$  hardware timing

$c=1$  firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

jkl=011

[v] RBER alarm level = MI

[vi] NFW bit 4=RBBER:

- DACS II sends a remote indicator in bit 4 (RBBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

**IW** - Insertion word

**pqr** - Insertion word value (hexadecimal)

**pq** - Disconnect code (DCC) or idle code

**r** - Signaling option

The value entered for pq is used as the disconnect code (DCC) or idle code. This value is inserted in the transmit direction on unassigned channels. An insertion word is not allowed for clear-2Mbit NPCs; the all ones signal is transmitted for an idle clear-2Mbit NPC. Thus, information about the disconnect code will not appear for any message involving a clear-2Mbit type NPC.

Variable r is used for circuits provisioned for channel associated signaling (CAS). A value may be entered for r for nonsignaling associated (NSA) NPCs but it has no significance.

*pq Explanation*

D5 Default idle code

*r Explanation*

D Default signaling

This sets signaling bits abcd to the binary value 1101

**For PB and PC type NPCs:**

**DM** - Degraded Minutes

**SERS** - Severely Errored Seconds

**ERS** - Errored Seconds

**US** - Unavailable Seconds

**SLIP** - Slip Events

For SHORT INTERVAL, DM is calculated hourly and SERS, ERS, US and SLIP are calculated at 15-minute intervals.

**nnnnn** - 24-hour Degraded Minutes (DM) threshold

**ppppp** - 24-hour Severely Errored Seconds (SERS) threshold

**qqqqq** - 24-hour Errored Seconds (ERS) threshold

**rrrrr** - 24-hour Unavailable Seconds (US) threshold

**sssss** - 24-hour Slip Events (SLIP) threshold

**e** - 24-hour DM threshold/alarm selection  
**f** - 24-hour SERS threshold/alarm selection  
**g** - 24-hour ERS threshold/alarm selection  
**h** - 24-hour US threshold/alarm selection  
**i** - 24-hour SLIP threshold/alarm selection

**s** - Old 24-hour DM threshold/alarm selection  
**t** - Old 24-hour SERS threshold/alarm selection  
**u** - Old 24-hour ERS threshold/alarm selection  
**v** - Old 24-hour US threshold/alarm selection  
**w** - Old 24-hour SLIP threshold/alarm selection

**nnnnn** - 1-hour DM threshold  
**ppppp** - 15-minute SERS threshold  
**qqqqq** - 15-minute ERS threshold  
**rrrrr** - 15-minute US threshold  
**sssss** - 15-minute SLIP threshold

**e** - 1-hour DM threshold/alarm selection  
**f** - 15-minute SERS threshold/alarm selection  
**g** - 15-minute ES threshold/alarm selection  
**h** - 15-minute US threshold/alarm selection  
**i** - 15-minute SLIP threshold/alarm selection

**s** - 1-hour DM threshold/alarm selection  
**t** - 15-minute SERS threshold/alarm selection  
**u** - 15-minute ES threshold/alarm selection  
**v** - 15-minute US threshold/alarm selection  
**w** - 15-minute SLIP threshold/alarm selection

**For PA type NPCs:**

**CRC** - CRC Block Errors  
**FRER** - Framing Errors  
**OFS** - Out of Frame Seconds

The options can be a value from "0" to "c" as specified for the "m" of the "rr/m" field.

#### **For PA type NPCs:**

Depending on which interface functions are enabled by the provisioning values of xyz, some parameters may not be applicable. In this case the threshold value, the parameter count (if present in the message) and the selection value will appear as dashes ("-"). In the table below "N/A" indicates that a parameter is not applicable for the given value of x or y.

Also, if the selection value m=c has been chosen for a parameter, the threshold value and the parameter count (if present in the message) will appear as dashes.

**For PA type NPCs only:****THMODE** - Thresholding mode**hhh** - Thresholding mode option*hhh*                      *Explanation*

INH                      Inhibit thresholding

ALW                      Allow thresholding

The INH option is used to temporarily inhibit thresholding for all parameters of a PA NPC. The ALW option is used to turn-off the INH option. The default thresholding mode is ALW.

When the INH mode is entered, all thresholds for the NPC are suspended; therefore, no threshold crossing messages will be output after the inhibition. However, the previously programmed threshold values are still stored in the database and will continue to be output for each parameter. Threshold value option changes are permitted while the NPC thresholding is inhibited.

When the ALW mode is entered, the previously programmed threshold values will be re-applied unless they were changed while in the INH mode.

**ss/n** - First improper values of "rr/m" for which message is denied.

mmmm - Error condition code

mmmm *Explanation*

|             |                                                        |
|-------------|--------------------------------------------------------|
| <b>ENEQ</b> | Subject entity is not equipped                         |
| <b>ENEQ</b> | Unit is not equipped                                   |
| <b>SAOS</b> | UC is out of service                                   |
| <b>SNVS</b> | UC is in service but failed                            |

**uv-m-np**

- Hierarchical NPC number at end of range

**wx-k-qr**

- Hierarchical NPC number at end of range

**de-f-gh**

- Hierarchical NPC number between uv-m-np and ij-k-lm

**ij-k-lm**

- Hierarchical NPC number between de-f-gh and wx-k-qr

**uv,wx** - Unit number

**m,k** - Module number in unit uv

**np,qr** - NPC number in module m

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ALMOPT** - Alarm option

**AIS** - Alarm indication signal

Type of alarm. AIS is not detected by unframed clear (unchannelized) 2Mbit/s PAXDz or THxDz type NPCs. Therefore, specifying AIS with one of the alarm level types MI, DMA, PMA, or PMC is unnecessary. However, the command will not be denied if AIS is specified with an alarm level for unframed clear PAXDz or THxDz NPCs. AIS with its alarm level will simply never be reported for unframed clear PAXDz or THxDz NPCs.

**MI** - Maintenance information

Maintenance information message (not an alarm). Default.

**PMC** - Prompt Maintenance Action Critical Alarm

**PMA** - Prompt Maintenance Action Major Alarm.

**DMA** - Deferred Maintenance Action Minor alarm.

**nnn** - Total number of NPCs in the output segment.

**PLOPT** - Payload loopback option

The NPC(s) must be out of service to use this option.

**tttt** - The old AIS alarm option/payload loopback setting for the NPC.

| <i>tttt</i> | <i>Explanation</i> |
|-------------|--------------------|
|-------------|--------------------|

|     |                                                      |
|-----|------------------------------------------------------|
| MI  | AIS programmed for Information message               |

| <b>SNVS</b> | Invalid NPC number specified                      |

## **ED,PRMTR,EQPT,NPC,IW,X**

### **CHANGE NPC TYPE**

#### **Explanation Of Command**

This command is used to change the type and, optionally, the insertion word of a specified network processing Circuit (NPC) equipped in a facility terminating unit (IFTU2/IFTU/FTU). The insertion word field is used to change the NPC's disconnect code (DCC). These changes may be made without disconnecting and reconnecting the provisioned circuits, but the NPC must be out of service when this command is executed.

For PA, PB, and PC type NPCs the y value of the type field may not be changed, because a change in the y value may change the channel numbering for cross-connections that are already provisioned.

The NPC must be out of service to change the facility provisioning. It can be taken out of service using the **RMV-EQPT** command. Changes to the parameters will take effect when the NPC is restored (**RST-EQPT**) to service. When the NPC facility provisioning is changed, all programmable alarm thresholds revert to the default values. These default thresholds are defined in the **CRTE-EQPT : NPC** message. If values other than the defaults are desired, a separate **ED-PRMTR-EQPT** command must be given for each value. Some in-service facility parameter changes are allowed. For in-service changes, the programmable alarm threshold values do not revert to their default values.

**uv-m-np**

- Hierarchical NPC number

**uv** - Unit number

**m** - Module number in unit uv

**np** - NPC number in module m

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

**OLD** - Old

**TYPE** - Type

**mnxyz** - NPC type

*mnxyz Type*

PAxyz CEPT NPC (120-ohm twisted pair or 75-ohm coaxial)

PBxyz CEPT NPC (120-ohm twisted pair)

PCxyz CEPT NPC (75-ohm coaxial)

**ttuvw** - Previous value of mnxyz

**PA-Type xyz fields**

The provisioning values of x, y, and z for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (x, y or z) provisioning value):

**Table 11-10. Provisioning values for  $x$**

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |
| B            |               |                    |               |                            |                           |
| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent ED-PRMTR-EQPT::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 11-11. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 11-12. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2          | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3          |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4          | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5          |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the ED-PRMTR-EQPT::NPC:TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

**z=6 or A** hardware timing

**z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

- [vii] RBER unalarmed

- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 11-13. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz                              | Framed clear 2Mbit/s ( $y$ value C) is valid for all $x$ options except those invoking automatic CRC-4 interworking.<br>The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 9Cz                              |                                                                                                                                                                                                                                    |
| CCz                              |                                                                                                                                                                                                                                    |
| DCz                              |                                                                                                                                                                                                                                    |
| 0Dz                              | Unframed clear 2Mbit/s ( $y$ value D) is only valid for $x$ values B and F. These are the only $x$ options which do not require decoding of TS0 content.                                                                           |
| 1Dz                              |                                                                                                                                                                                                                                    |

| EDz                              |                                                                                                                                                                                                                                    |

**Table Notes:**

1. If framed clear 2Mbit/s is selected with Far-End PM enabled  $z$  values 1, 3, 5 and 7) only the receive side of the feature shall be turned on. No outgoing E-bits may be transmitted during clear signal operation.
2. If framed clear 2Mbit/s is selected with Synchronization Failure Indication (SFI) enables ( $x$  values 1, 2, 5, 6, A and E) only the receive side of the feature shall be turned on. No outgoing SFI may be transmitted in Bit 5 during clear signal operation.

**Table 11-14. Combinations of *y* and *z* Values**

| Invalid<br>xyz<br>Combinations                                                                               | Explanation                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xC1<br>xC3<br>xC5<br>xC7<br>xC8<br>xC9<br>xCB<br>xCC<br>XD1<br>xD3<br>xD5<br>xD7<br>xD8<br>xD9<br>xDB<br>xDC | Clear 2Mbit/s ( <i>y</i> value C or D) cannot be used with Firmware controlled Consequent Action ( <i>z</i> values 1, 3, 5, 7, 9 or B), TRANSMIC 1G ( <i>z</i> value C) or TRANSMIC 2G ( <i>z</i> value 8).            |
| xD4<br>xD6                                                                                                   | Unframed clear 2Mbit/s ( <i>y</i> value D) cannot be used with <i>z</i> value 4 (NFW Bit 4 used for RAIS) or with <i>z</i> value 6 (NFW Bit 4 used for RBER) because unframed clear signals cannot obtain TS0 framing. |
| x0C<br>x2C<br>x4C<br>x6C                                                                                     | Channel Associated Signaling ( <i>y</i> values 0, 2, 4 and 6) is not valid for TRANSMIC 1G ( <i>z</i> value C).                                                                                                        |

**Table Notes:**

1. If framed clear 2Mbit/s (*y* value C) is selected with *z* value 4 (NFW Bit 4 used for RAIS) only the receive side of this function will be enabled. Outgoing RAIS indicators cannot be transmitted during clear signal operation.
2. If framed clear 2Mbit/s (*y* value C) is selected with *z*= value 6 (NFW Bit 4 used for RBER) only the receive side of this function will be enabled. Outgoing RBER indicators cannot be transmitted during clear signal operation.

**Table 11-15. Combinations of  $x$  and  $z$  Values**

| Invalid<br>xyz<br>Combinations | Explanation                                                                                                                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4yC                            | Use of NPC as Sync Source ( $x$ 4, 5, 6, 7, C, D, E and F) is not valid for TRANSMIC 1G ( $z$ value C). This is because the TSO Monitoring scheme used in TRANSMIC 1G prevents incoming SFI indicators from cutting off the signal to the Synchronizer. |
| 5yC                            |                                                                                                                                                                                                                                                         |

|              |            | 100          | NFW bit 4=RAIS and RAI in time $T^{[c']}$ (TRANSMIC 2G)                                                                                |
|              |            | 101          | Enable BER calculations, BER alarm level = DMA, NFW bit 4=disabled, RAI set in < 2 ms, for c=1 (SFDT=2496 ms, CACT=624 $ms^{[jkl]}$ ), |
|              |            | 110          | NFW bits 3-8,in time 144ms (TRANSMIC 1G)                                                                                               |
|              |            | 111          | Unassigned                                                                                                                             |
|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                          |
|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option h=1.

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

If both  $b=1$  and  $h=1$  and the NPC (used as synchronization source) receives NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option  $c$  is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] minor bit error rate and signaling freeze delay time features:

jkl=011 or jkl=101

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

$c=0$  hardware timing

$c=1$  firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

jkl=011

[v] RBER alarm level = MI

[vi] NFW bit 4=RBERT:

- DACS II sends a remote indicator in bit 4 (RBERT) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBERT bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBERT condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBERT unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBERT, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

**IW** - Insertion word

**pq** - Insertion word value (hexadecimal)

Hexadecimal value of the growth insertion word (GIW). Specifies the insertion word sent in the transmit direction on unassigned channels. If this value is not specified, it remains unchanged from its previous value.

An eight-bit code, called the growth insertion word, is transmitted by this NPC on unassigned 64kb/s channels. This code is specified by the optional keyword IW and its argument pq. This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the cross-connect insertion word, which is transmitted when the disconnect message with DDC specified is used.

D5 Unassigned Channel Code (UAC). Default value.

**rs** - Previous value of pq

**r** - Transmitted signaling information

**r** is the portion of TS16 used for signaling when provisioned for CAS (four signaling bits in the associated CAS time slot 16 signaling). If **r** is not specified, it will remain unchanged.

*r Explanation*

D Unassigned channel code (UAC). Default value.

**t** - Previous value of r

**mmm** - Error condition code

*mmm Explanation*

## **ED,PRMTR,EQPT,NPC,IW,X,INCL**

### **CHANGE DS3U NPC TYPE**

#### **Explanation Of Command**

For DACS II DS3 Units (DS3U) or Hybrid DS3 Units (HDS3U), this command changes a single or range of TE or TA type (DS3U Only) Network Processing Circuits (NPCs) to the newly specified type without disconnecting and reconnecting provisioned circuits. The NPCs must be out of service.

The "mn" field, as well as the "xyz" field, of the NPC type parameter ("mnxyz") can be changed by this command. This feature is used to change between the different types (TE and TA) of NPCs supported by the DS3 or Hybrid DS3 Unit line termination circuit packs.

A range is allowed for the NPCs within one DS3 or Hybrid DS3 Unit. The optional insertion word field is used to change the disconnect code (DCC).

The new parameters will take effect when the NPC is restored to service. When the NPC **TYPE** parameters are changed, all programmable alarm thresholds revert to the default values. If values other than defaults are desired, a separate **ED-PRMTR:NPC:TYPE** command must be given for each value. There will be one output completion message for each NPC in the range.

### **Explanation Of Parameters**

---

Use the optional insertion word (IW X'pq) field to change the unassigned channel code.

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC Number

**[t]def** - The 3- or 4-digit nonhierarchical NPC number denoting the end of a range specification.

**uv-m-np**

- Hierarchical NPC number

**uv-k-qr**

- Hierarchical NPC number denoting the end of a range specification

**uv-j-yl**

- Hierarchical NPC number of the first NPC of the denied range

**uv-m-no**

- Hierarchical NPC number of the last NPC of the denied range

**uv-g-hi**

- Hierarchical NPC number within the range of uvmnp and uvkqr

**uv** - Unit number

**m,k,j,m,g**

- Module number

**np,qr,yl,no,hi**

- NPC number within the module

**mnxyz** - NPC-type identifier

*mnxyz Explanation*

TExyz DS3U or HDS3U Enhanced NPC

TAxyz DS3U ANSI NPC

**IW** - Insertion Word

**pq** - Hexadecimal value of the growth insertion word (GIW). Specifies the insertion word in the transmit direction on unassigned channels.

An eight-bit code, called the growth insertion word, is transmitted by this NPC on unassigned DS0 channels. This code is specified by the optional keyword IW and its argument pq. This code was previously called the Disconnect Code (DCC), but that name is properly reserved for the cross-connect insertion word, which is transmitted when the disconnect message with the DDC specified is used.

Although any 2-digit hexadecimal code may be used (see INCL below), the default GIWs are:

| <i>pq</i> | <i>Explanation</i>                                                                                                                                                                                                                    |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7F        | Unassigned Channel Code (UAC), the default value for TE/TA type NPCs provisioned with D4 or ESF framing.                                                                                                                              |
| 18        | Unassigned Multiplex Code (UMC), the default value for TE/TA type NPCs provisioned with T1DM framing. This value should only be provisioned with T1DM framing (DA4yz or TA4yz). The change command does not enforce this restriction. |

**INCL** - Inclusive

As a protection to users, this keyword must be added to provision an NPC with D4 framing and an Insertion Word with bit 2 equal to zero. NPCs grown in the D4 format (TE1yz/TA1yz) transmit a DS1 yellow alarm by setting bit 2 to zero in all 24 DS0 channels. If the Insertion Word "pq" is unknowingly provisioned in this manner, the NPC will transmit a D4 yellow alarm signal when it is restored. The D4 yellow alarm is generated by any Insertion Word with the binary value a0cdefgh, where the letters a-h define the eight bits of the binary word. The D4 yellow alarm is not generated by an Insertion Word with a binary value a1cdefgh.

For Clear-DS1 NPCs, the insertion word option is **NOT** available and the message will be denied if this option is entered. The alarm indication signal (AIS) is transmitted in the disconnect or idle state.

**[s]ghi,**

- The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def

**[s]jkl**

- The 3- or 4-digit nonhierarchical NPC number of the first NPC of a range that is being denied ( $abc \leq jkl \leq mno$ )

**[t]mno** - The 3- or 4-digit nonhierarchical NPC number of the last NPC of a range that is being denied ( $jkl \leq mno \leq def$ )

**ttuvw** - Previous value of mnxyz

**rs** - Previous value of pq

**mmmm** - Error condition code

**mmmm**    *Explanation*

|             |                                                                   |

| <b>SNVS</b> | INCL keyword needed when restricted Insertion Word specified      |

## **ED,PRMTR,EQPT,NPC,LPBK**

### **CHANGE NPC LOOPBACK**

#### **Explanation Of Command**

This command requests a loopback, or the changing of the provisioning of the loopback, for a 2048-kb/s signal received on the addressed NPC(s). It allows changing provisioning for either a single NPC or a range of NPCs.

LPBK controls loopback and provisioning. For PB/PC type NPCs, variable d is not allowed and the variable t may be set as follows:

| LPBK-t |                                                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t      | FUNCTION                                                                                                                                                          |
| A      | Starts looping the signal towards the facility and sends AIS downstream. Turns off facility performance monitoring and freezes alarm states and parameter counts. |
| T      | Transparently passes through the received signal.                                                                                                                 |
| N      | Stops looping the signal.                                                                                                                                         |

For PA type NPCs, variable d and t may be set as follows:

| LPBK-dt |   |                                                                                                                                                                                                                                                |
|---------|---|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| d       | t | FUNCTION                                                                                                                                                                                                                                       |
| F       | A | Starts looping the incoming signal back towards the facility and sends AIS downstream. Turns off facility performance monitoring and freezes alarm states and parameter counts.                                                                |
| F       | B | Starts looping the incoming signal back towards the facility and sends AIS downstream. Performance Monitoring activity and alarm processing is maintained.                                                                                     |
| F       | C | Starts looping the incoming signal back towards the facility and transparently passes through the received signal. Turns off facility performance monitoring and freezes alarm states and parameter counts.                                    |
| F       | T | Starts looping the incoming signal back towards the facility and transparently passes through the received signal. Performance Monitoring activity and alarm processing is maintained.                                                         |
| E       | A | Starts looping the outgoing signal back towards the DACS II equipment and sends AIS upstream. Turns off facility performance monitoring and freezes alarm states and parameter counts.                                                         |
| E       | B | Starts looping the outgoing signal back towards the DACS II equipment and sends AIS upstream. Performance Monitoring activity and alarm processing is maintained.                                                                              |
| E       | C | Starts looping the outgoing signal back towards the DACS II equipment and transparently passes through the outgoing signal in the upstream direction. Turns off facility performance monitoring and freezes alarm states and parameter counts. |
| E       | T | Starts looping the outgoing signal back towards the DACS II equipment and transparently passes through the outgoing signal in the upstream direction. Performance Monitoring activity and alarm processing is maintained.                      |
| N       | N | Stop loopback.                                                                                                                                                                                                                                 |

When the NPC loopback is activated towards the facility, DACS II will no longer output its own clock on the line. Equipment connected to this NPC should not rely on timing from

DACS II in that case.

## Explanation Of Parameters

**NPC** - Network processing circuit

If an NPC range is specified in the input command, the following floating window rules apply:

1. Unequipped NPCs within the requested range will be skipped.
2. If a CEPT gap is within the requested range, the NPCs in the gap will be skipped.
3. If an endpoint of the requested range is in a CEPT gap, then the NPCs in the portion of the range which is in the gap will be denied.

**[s]abc**- The 3- or 4-digit beginning nonhierarchical NPC  
Valid values are listed below:

If NPC numbers are expressed in three digits, the valid values are:

**[t]def** - The 3- or 4-digit ending nonhierarchical NPC number  
Valid values are identical to those for [s]abc.

**uv-m-np**  
- Starting hierarchical NPC number

**wx-k-qr**  
- Ending hierarchical NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number

Valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**LPBK** - Loopback

**d** - Loopback direction specifier; required for PA NPCs, but not allowed for PB/PC NPCs. See previous table for PA type NPCs.

**t** - Loopback signal transmission and performance monitoring specifier. See tables above for PB/PC type NPCs and for PA type NPCs.

For PB/PC type NPCs, only the "t" flag is allowed. If the optional "d" flag is also entered the command will be denied.

The "t" flag is allowed to be changed while a loopback is active. That is, this command can be entered to change the signal transmission and/or the PM options while a loopback is being performed.

The change of the loopback direction for PA NPCs, that is, change the "d" flag between "F" and "E", while a loopback is active is not allowed.

For PB/PC NPCs, a loopback will be stopped when this command is entered with "LPBK N". For PA NPCs, a loopback will be stopped only if this command is entered with "LPBK NN".

For PB/PC NPCs if LPBK T or LPBK N is entered from the LPBK A state, Facility Performance Monitoring is enabled and alarm and parameter counts are reset. For PA NPCs when the "t" flag is changed from "A" or "C" to another state, Facility Performance Monitoring is enabled and alarm and parameter counts are reset.

For a range command, if the "d" field is specified, the command will only be applied to PA NPCs; PB/PC NPCs will be skipped. Similarly, if the "d" field is not entered, the command will only be applied to PB/PC NPCs and will skip PA NPCs. In either cases, if no NPCs with the appropriate NPC type is in the specified range, the command will be denied.

**[v]ghi** - The 3- or 4-digit nonhierarchical NPC number  
([s]abc ≤ [v]ghi ≤ [t]def)

#### **ed-h-fg**

- Hierarchical NPC number (uv-m-np ≤ ed-h-fg ≤ wx-k-qr)

**mmmm**

- Error

condition code

**mmmm** *Explanation*

**ENEQ** Unit is not equipped

**SAOS** UC is out of service

**SNVS** UC is in service but failed

**ENEQ** FTMI is not equipped

**SAOS** FTMI is out of service

**ENEQ** NPC is unequipped

**SNVS** Unit type error

**SROF** NPC Failed or Out of Service

**IDNV** Parameter only valid with PA, PB, or PC type NPCs

mmm *Explanation*

**SNVS** Invalid NPC number specified  
**IDRG** NPC range crosses unit boundary  
**IDNV** The parameter specified does not match with the NPC type  
**IDRG** Command did not execute for any entity specified in the command  
**IDNV** NPC used as a timing reference

## **ED,PRMTR,EQPT,NPC,NFS**

### **CHANGE NPC NON FRAME-WORD SETTING**

#### **Explanation Of Command**

This command allows control of the spare national and international bits in time slot zero (TS0).

Control is exercised through variable "abcdefghi". Each letter in this variable represents one of the spare national or international bits in TS0. The bit represented by a given letter is controlled by assigning an appropriate value to the letter. Each letter may be set to one of the following: **0**, **1**, **p** or **-**. **p** indicates that the incoming bit will be passed through unchanged if cross-connected. A **0** and **1** set for any of the bits (except **c**) will override the cross-connected bits. This applies also to NPCs assigned as test NPCs. A hyphen (-) means that the bit is not affected by this command.

When a command covering a range of NPCs is denied for successive NPCs in the range for the same reason, a summary denial message shall be output, giving the range of NPCs denied and the reason. The execution of the normal completions, or of denials for a reason other than diagnostic failures, then resumes at the next NPC and continues to the end of the range.

## Explanation Of Parameters

- [s]abc** - The 3- or 4-digit nonhierarchical NPC number, start of range
- [t]def** - The 3- or 4-digit nonhierarchical NPC number, end of range, must be in the same unit as [s]abc
- [s]jkl** - The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def.
- [t]mno** - The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def.

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

**uv-m-np**

- Hierarchical NPC number, start of range

**uv-k-qr**

- Hierarchical NPC number, end of range

**uv-j-kl**

- Hierarchical NPC number (uv-m-np through uv-k-qr)

**uv-m-no**

- Hierarchical NPC number (uv-m-np through uv-k-qr)

**uv**

- Unit number

**m, k, j**

- Module number

**np, qr, kl, no**

- NPC number within the module

The allowable values are presented below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

|              |            |              |
|--------------|------------|--------------|
| Unit         | Module     | NPC          |
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**NFS** - Nonframe-word Setting

**abcdefghi**

- Input variables corresponding to spare bits in TS0

**abcdefghi**

- Variables of old spare bits in TS0.

- a: Bit 1 of Frame Word (FW) - International spare bit for TS0 to non-TS0 cross-connect in Mode 2, this variable can only be "-" or "b"
- b: Bit 1 of Non Frame Word (NFW) - International spare bit
- c: Bit 2 of NFW
- d: Bit 3 of NFW - Remote Alarm Indicator
- e-f: Bits 4-5 of Not Frame Word, National spare bits
- g: Bit 6 of Not Frame Word, RPSFI bit if provisioned for RPSFI otherwise a national spare bit.
- h-i: Bits 7-8 of Not Frame Word, National spare bits

|             |                                  |
|-------------|----------------------------------|
| Variable    | Action on corresponding TS0 bit: |
| Input Value |                                  |

|            |                                                                  |
|------------|------------------------------------------------------------------|
| "0" or "1" | Set TS0 bit to this value                                        |
| "V"        | Received bit is inverted and passed through                      |
| "P"        | Received bit is passed through unchanged                         |
| "-"        | Neither the variable nor the TS0 bit is changed by this command. |

The output parameters take on values dependent on the message language (PDS or MML) and position (OLD or NEW) as shown in the following table:

| Input | Output<br>Primary<br>Line<br>(MML) | OLD      | NEW      |
|-------|------------------------------------|----------|----------|
| "0"   | "0"                                | previous | "0"      |
| "1"   | "1"                                | previous | "1"      |
| "V"   | "V"                                | previous | "V"      |
| "P"   | "P"                                | previous | "P"      |
| "_"   | "_"                                | previous | previous |

previous value may be one of "0", "1", "V" or "P"

For example:

11V---00P    11V---00P    0011PPPPV    11V1PP00P

If this command is not entered for a NPC, the default value for all the bits is "P".

## **ED,PRMTR,EQPT,NPC,TS0**

### **CHANGE NPC TIME SLOT ZERO**

#### **Explanation Of Command**

This message allows the changing of the spare national and international bits in TS0.

TS0-abcdefgh is the international and national bit in timeslot 0. Each variable may be set to one of the following: 0, 1, p or -. p indicates that the incoming bit will be passed through unchanged if cross-connected. A 0 and 1 set for any of the bits (except c) will override the cross-connected bits. This also applies to NPCs assigned as test NPCs. A hyphen (-) means that the bit is not affected by this command.

When a range NPC is denied for successive NPCs in the range for the same reason, a summary denial message shall be output, giving the range of NPCs denied and the reason. The execution of the normal completions, or of denials for a reason other than diagnostic failures, then resumes at the next NPC, up to the end of the range.

## Explanation Of Parameters

### [s]abc, [t]def

- The 3- or 4-digit nonhierarchical NPC number, must be in the same unit

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| <b>2001-2032</b> | <b>2161-2192</b> | <b>2321-2352</b> | <b>2481-2512</b> |
| <b>2041-2072</b> | <b>2201-2232</b> | <b>2361-2392</b> | <b>2521-2552</b> |

**uv-m-np**

- Hierarchical NPC number

**uv-k-qr**

- Hierarchical NPC number

**uv** - Unit number

**m, k** - Module number

**np, qr** - NPC number within the module

The allowable values are presented below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**TS0** - Time slot zero (0)

**abcdefgh**

- Spare bits in TS0

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

|             |                                  |
|-------------|----------------------------------|
| Variable    | Action on corresponding TS0 bit: |
| Input Value |                                  |

|            |                           |
|------------|---------------------------|
| "0" or "1" | Set TS0 bit to this value |
|------------|---------------------------|

|     |                                                             |
|-----|-------------------------------------------------------------|
| "P" | Received bit is passed through (cross-connected) unchanged. |
|-----|-------------------------------------------------------------|

|     |                                                                  |
|-----|------------------------------------------------------------------|
| "-" | Neither the variable nor the TS0 bit is changed by this command. |
|-----|------------------------------------------------------------------|

**[s]jkl** - The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def.

**[t]mno** - The 3- or 4-digit nonhierarchical NPC number within the range of [s]abc and [t]def.

**uv-j-kl**  
- Hierarchical NPC number (uv-m-np through wx-k-qr)

**uv-m-no**  
- Hierarchical NPC number (uv-m-np through wx-k-qr)

**abcdefgh**

- Variables to corresponding TS0 bits.

The output parameters take on values dependent on the message language (PDS or MML) and position (OLD or NEW) as shown in the following table:

| Input         | Output<br>Primary<br>Line<br>(MML) | OLD      | NEW      |
|---------------|------------------------------------|----------|----------|
| "0"           | "0"                                | previous | "0"      |
| "1"           | "1"                                | previous | "1"      |
| "P"           | "P"                                | previous | "P"      |
| "V" (PA only) | "V"                                | previous | "V"      |
| "_"           | "_"                                | previous | previous |

previous value may be one of "0", "1", "P", or "V" (for PA NPCs)

For example:

|          |          |          |          |
|----------|----------|----------|----------|
| 11----00 | 11----00 | 0011PPPP | 1111PP00 |
|----------|----------|----------|----------|

**mmmm** - Error condition code

| mmmm        | Explanation                                       |
|-------------|---------------------------------------------------|
| <b>ENEQ</b> | Subject entity is not equipped                    |
| <b>ENEQ</b> | Unit is not equipped                              |
| <b>SAOS</b> | UC is out of service                              |
| <b>SNVS</b> | UC is in service but failed                       |
| <b>ENEQ</b> | FTMI is not equipped                              |
| <b>SAOS</b> | FTMI is out of service                            |
| <b>SNVS</b> | Unit type error                                   |
| <b>SNVS</b> | NPC type error                                    |
| <b>SNVS</b> | Bit c not settable                                |
| <b>SNVS</b> | Bit 6 provisioned for use as RPSFI                |
| <b>SNVS</b> | Bits 3 through 8 are provisioned for Transmic 1G  |
| <b>SNVS</b> | Alarm bits cannot be passed through or inverted   |
| <b>SROF</b> | NPC Failed or Out of Service                      |
| <b>SNVS</b> | Combination of bit g (b7) and h (b8) is invalid   |
| <b>IDNV</b> | Parameter only valid with PA, PB, or PC type NPCs |
| <b>SNVS</b> | Invalid NPC number specified                      |
| <b>SAAS</b> | Termination is in process of being rolled         |
| <b>SNVS</b> | For RPSFI, TS0 bit 6 must be provisioned as 1     |
| <b>ICNV</b> | not allowed for clear 2MB                         |
| <b>ICNV</b> | bit value not allowed for NPC type                |

## **ED,PRMTR,EQPT,NPC,TS0M**

### **CHANGE TIME SLOT ZERO MONITOR**

#### **Explanation Of Command**

This command is used to change the Network Processing Circuit provisioning either to monitor or to stop monitoring the National and International bits in CTS 0 without removing the NPC from service. The provisioning may be specified for one NPC or for a range of NPCs. Note that the NPC numbers which are divisible by four with remainder zero, are not a valid Hybrid DS3 Unit THxyz type NPCs. However, the range of THxyz type NPC numbers is still supported with the understanding that there may be gaps in the NPC number range.

#### **Command**

##### **Nonhierarchical**

| 1961-1992  | 2121-2152  | 2281-2312  | 2441-2472  |
| 2001-2032  | 2161-2192  | 2321-2352  | 2481-2512  |
| 2041-2072  | 2201-2232  | 2361-2392  | 2521-2552  |

**[t]def** - The 3- or 4-digit ending NPC number  
The valid values are identical to those for [s]abc

**uv-m-np**  
- Beginning NPC number

**wx-k-qr**  
- Ending NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number  
The values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit  | Module | NPC   |
|-------|--------|-------|
| 01-16 | 1-4    | 01-32 |

**abcdefgh**  
- Time slot 0 monitor bits

**ab** - Spare international bits  $S_i$

If the NPC is not provisioned for the CRC multiframe format, bits **a** and **b** shall represent the  $S_i$  bits in the Frame Word (FW) and the Non Frame Word (NFW), respectively.

If the NPC is provisioned for the CRC multiframe format, **a** and **b** shall represent the  $S_i$  bits in frames 13 and 15 of the CRC multiframe in the NFW, respectively.

**c** - Remote Alarm Indication

**de** - Two spare national bits  $S_4$  through  $S_5$  in the NFW.

**f** - RPSFI (Remote Power Supply Failure Indicator) bit in the NFW  
if provisioned for RPSFI otherwise spare national bit.

**gh** - Two spare national bits  $S_7$  through  $S_8$  in the NFW

Valid values for bits **a** through **h** are described below:

| <i>Bit<br/>value</i> | <i>Explanation</i>                                                           |
|----------------------|------------------------------------------------------------------------------|
| <b>0</b>             | Do not monitor and therefore do not send a message if this bit changes state |

**SNVS** Bit 4 provisioned for use as RBER  
**SNVS** Bit 5 provisioned for use as SFI  
**SNVS** Bits 3 through 8 are provisioned for Transmic 1G  
**ENFE** Software does not contain Enhanced CEPT feature  
**IDNV** Parameter only valid with PA, PB, or PC type NPCs  
**SNVS** Invalid NPC number specified  
**SAAS** Termination is in process of being rolled

## **ED,PRMTR,EQPT,SYNC,MASTER,SLAVED**

### **CONFIGURE SYNCHRONIZER**

#### **Explanation Of Command**

This command requests configuration of the synchronizer to extract timing from itself (stand-alone or **MASTER** mode) or from external sources (**SLAVED** mode).

The **ED-PRMTR-EQPT** command modifies the Main Controller (MC) data base for the synchronizers, thus allowing appropriate combinations of time bases, timing extractors, and timing distributors to be equipped. This command is also used by the MC to instruct the Digital Phase Locked Loops (DPLLs) to implement the specified architecture. Condition codes for completion indicate architecture states, dependent on the current equipage. Condition codes for denial indicate that the requested architecture is not consistent with the current equipage.

## **ED,PRMTR,EQPT,SYNC,STR2,STR3,TOLL**

### **CONFIGURE SYNCHRONIZER STRATUM**

#### **Explanation Of Command**

This command requests the configuration of the synchronizer at a particular stratum level.

The command can be entered to configure the synchronizer at a lower stratum than the capability of the equipped time bases. The message can also be used to change the operating stratum level of the synchronizer to a higher level if the synchronizer is so equipped.

## **ED,PRMTR,EQPT,SYNC,TLI,SSP,NPC,SRC**

### **CHANGE PRIORITIES AND/OR TYPE, SYNCHRONIZER OR NPC**

#### **Explanation Of Command**

This command changes priorities and network processing circuit (NPC) or type parameters of timing extractor type TLIs/SSPs that have been equipped. One of the following three fields must be given: type/synchronizer sync port, the NPC/SSP, or the source for priority (SRC). Only one type may be changed at a time; the output message will show both types after the change command is completed, if both are equipped, or it will show a "-" for unequipped SSPs.

Only the type and priority data bases are affected by this command. The SSP must be out of service for the command to complete. The RST-EQPT::SYNC,TLI,[SSP]; command must be given to implement the changes for both side 0 and 1.

If the SSP-type is given, you must specify the timing link Interface (TLI-n), SSP-b, and the type.

The NPC parameter (valid only with a TU-type sync) indicates that the specified TLI is receiving its synchronizing signal from the given NPC location. The system allows only one of eight NPC locations per TLI SSP.

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**TLI** - Timing link interface

**m** - Timing link interface number (1 through 4)

**SSP** - Synchronizer sync port

**b** - SSP side (0 or 1)

**texyz** - Timing Extractor or Timing Distributor type

The output message shows the type of SSP for both SSPs on the TLI card  
If one SSP is not equipped, a "-" will appear for the unequipped SSP.

**testu** - The TLI type of the other SSP on the same TLI. If not equipped, this parameter will be output as "-----".

| <i>te</i> | <i>Explanation</i>                      |
|-----------|-----------------------------------------|
| TC        | Composite Clock Timing Extractor        |
| TE        | DS1 Timing Extractor                    |
| TP        | Primary Block Timing Extractor          |
| TR        | Basic System Reference Frequency (BSRF) |
| TU        | Unipolar Clock Timing Extractor         |
| TD        | Timing Distributor                      |

TD-type TLI xyz fields

**x** - Timing distributor identification

**x** *Explanation*

**1** Composite Clock Timing Distribution

**2** Sinusoidal 2.048 MHz Timing Distribution

**z** - Unassigned

TP-type TLI xyz fields

**x** - Frame format

**x**      *Explanation*

**1,5**    Common Channel Signaling

**2,6**    Channel Associated Signaling - Mode 0

**3,7**    Channel Associated Signaling - Mode 1

**4,8**    European Remote Switching Module

**0,9**    Invalid

**y** - Line format

**y**      *Explanation*

**0,2**    Alternate Mark Inversion (Bipolar)

**1,3**    High Density Bipolar (HDB3)

**4-9**    Invalid

**z** - Channel format

**z**      *Explanation*

**0-9**    Unassigned

TC, TR, and TU-type TLI xyz fields

**x** - Frame format

**y** - Line format

**z** - Channel format

Values for x, y, and z are unassigned.

**SRC** - Source

**i** - TLI slot number (1 through 4)  
**a** - TLI i SSP 0 priority (1 through 8)  
**b** - TLI i SSP 1 priority (1 through 8)  
  
**j** - TLI slot number (1 through 4)  
**c** - TLI j SSP 0 priority (1 through 8)  
**d** - TLI j SSP 1 priority (1 through 8)  
  
**k** - TLI slot number (1 through 4)  
**e** - TLI k SSP 0 priority (1 through 8)  
**f** - TLI k SSP 1 priority (1 through 8)  
  
**l** - TLI slot number (1 through 4)  
**g** - TLI l SSP 0 priority (1 through 8)  
**h** - TLI l SSP 1 priority (1 through 8)

**COND** - Condition

**NPC** - Network processing circuit

**[0]abc** - The 3- or 4-digit nonhierarchical NPC number

The valid NPC numbers are:

If NPC numbers are expressed in three digits, the valid values are:

PB and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1  | Unit<br>2  |
|------------|------------|
| <b>NPC</b> | <b>NPC</b> |
| <b>030</b> | <b>190</b> |
| <b>032</b> | <b>192</b> |
| <b>070</b> | <b>230</b> |
| <b>072</b> | <b>232</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1   | Unit<br>2   |
|-------------|-------------|
| <b>NPC</b>  | <b>NPC</b>  |
| <b>0030</b> | <b>0190</b> |
| <b>0032</b> | <b>0192</b> |
| <b>0070</b> | <b>0230</b> |
| <b>0072</b> | <b>0232</b> |

**uv-m-np**

- Hierarchical NPC number

**uv** - Unit number

**m** - Module number

**np** - NPC number within the module

The valid NPC numbers are:

PB and PC NPC numbers listed by unit, module, and NPC Number  
Unit Type FT (FTU)

| Unit          | Module      | NPC           |
|---------------|-------------|---------------|
| <b>01, 02</b> | <b>1, 2</b> | <b>30, 32</b> |

The NPC keyword and its associated parameter are only specified in conjunction with the TLI and SSP keywords for TLI type TUxyz.

The NPC option allows the DACS II system to correlate a synchronizing source failure to either an NPC failure or an NPC input signal failure.

**mmmm** - Error condition code

**mmmm** *Explanation*

|             |                                                   |

| <b>IDNV</b> | Parameter only valid with PA, PB, or PC type NPCs |
| <b>SNVS</b> | Assignment of single priority to multiple SSPs    |
| <b>SAWS</b> | NPC already has Equipment Loopback                |

## **ED,PRMTR,EQPT,TYPE**

### **CHANGE TYPE, OPTIONS**

#### **Explanation Of Command**

This command changes the threshold values for facility performance parameters on all NPCs of a particular type. The threshold values may be changed without disconnecting and reconnecting provisioned circuits.

One or more alarm or information threshold values may be set for all NPCs to a value previously stored in the DACS II threshold data base.

The values stored in the DACS II threshold data base are selected with the indices (**rr/n**).

|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                          |
|              |            | 1            |                                                                                                                                        |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if  $jkl \neq 011$  and  $jkl \neq 101$   
in **2496 ms**  
if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway* **cross-connection** the insertion word always defaults to AIS.

mnxyz bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2 ms. NFW bit 3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144 ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW bit 5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW bit 5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

For Transmic 1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit 5 when option h=1.

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

If both  $b=1$  and  $h=1$  and the NPC (used as synchronization source) receives NFW bit 5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 and is the same as in Basic CEPT when option  $c$  is selected as 0; **that is, within 2 ms after detecting the failure.** If this option is not specified as 000, use of NFW bit 3 as RAI will remain unchanged except the time when NFW bit 3 is set can be changed to 144 ms as opposed to 2 ms after detecting the failure. NFW bit 3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW bit 4 when used as RAIS, and AIS is detected in the received signal, can only be set 144 ms after detecting this condition. Similarly, when the received NFW bit 4 is in the active state, consequent actions are taken 144 ms after detecting this condition.

NFW bit 4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] minor bit error rate and signaling freeze delay time features:

jkl=011 or jkl=101

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

$c=0$  hardware timing

$c=1$  firmware timing (SFDT=2496 ms, CACT=624 ms)

[iv] BER alarm level = DMA

jkl=011

[v] RBER alarm level = MI

[vi] NFW bit 4=RBBER:

- DACS II sends a remote indicator in bit 4 (RBBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144 ms after detecting the minor bit error rate (BER) condition.

DACS II sets the RBBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**jkl=101**

[vii] RBBER unalarmed

[viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBBER/SFDT features, the required xyz options are **ab1d efgh 0110** or **ab1d efgh 1010**. For MBBER *with hardware consequent action timing*, the required xyz options are **ab0d efgh 0110** or **ab0d efgh 1010**.

NFW bit 4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

[m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic 1G the abcdefgh=00111111.

#### PA-Type xyz fields

The provisioning values of x, y, and z for the PA type are shown in the following tables (a 'Y' in a column of the Table indicates that the feature at the top of the column is enabled by the corresponding (x, y or z) provisioning value):

**Table 11-18. Provisioning values for  $x$**

| $x$<br>value | CRC-4<br>Mode | Automatic<br>CRC-4 | Far-End<br>PM | NPC used as<br>Sync Source | TS0 Bit 5<br>used for SFI |
|--------------|---------------|--------------------|---------------|----------------------------|---------------------------|
| 0            | Y             |                    |               |                            |                           |
| 1            | Y             |                    | Y             |                            | Y                         |
| 2            | Y             |                    |               |                            | Y                         |
| 3            | Y             |                    | Y             |                            |                           |
| 4            | Y             |                    |               | Y                          |                           |
| 5            | Y             |                    | Y             | Y                          | Y                         |
| 6            | Y             |                    |               | Y                          | Y                         |
| 7            | Y             |                    | Y             | Y                          |                           |
| 8            |               | Y                  | Y             |                            |                           |
| 9            |               | Y                  | Y             |                            | Y                         |
| A            |               |                    |               |                            | Y                         |
| B            |               |                    |               |                            |                           |
| C            |               | Y                  | Y             | Y                          |                           |
| D            |               | Y                  | Y             | Y                          | Y                         |
| E            |               |                    |               | Y                          | Y                         |
| F            |               |                    |               | Y                          |                           |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent ED-PRMTR-EQPT::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 11-19. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected (y value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected (y values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For y values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering (y=8) or Timeslot Channel Numbering (y=9) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface (y=C) or as an unframed clear 2Mbit/s interface (y=D). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 11-20. Provisioning values for z**

| z<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|            | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0          | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1          |             | Y  | Y            |       |       |               |      |               |       |         |         |

| 6          | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7          |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8          | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9          |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A          | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B          |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C          | Y           |    |              |       |       |               |      |               |       |         |         |
| D          | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1. z value **F** and **E** are unassigned (i.e. not valid).
2. z value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the ED-PRMTR-EQPT::NPC:TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

**z=6 or A** hardware timing

**z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

- [vii] RBER unalarmed

- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 11-21. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations | Explanation                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz                              | Framed clear 2Mbit/s ( $y$ value C) is valid for all $x$ options except those invoking automatic CRC-4 interworking.<br>The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 9Cz                              |                                                                                                                                                                                                                                    |

**Table Notes:**

1. If framed clear 2Mbit/s is selected with Far-End PM enabled  $z$  values 1, 3, 5 and 7) only the receive side of the feature shall be turned on. No outgoing E-bits may be transmitted during clear signal operation.
2. If framed clear 2Mbit/s is selected with Synchronization Failure Indication (SFI) enables ( $x$  values 1, 2, 5, 6, A and E) only the receive side of the feature shall be turned on. No outgoing SFI may be transmitted in Bit 5 during clear signal operation.

**Table 11-22. Combinations of *y* and *z* Values**

| Invalid<br>xyz<br>Combinations                                                                               | Explanation                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xC1<br>xC3<br>xC5<br>xC7<br>xC8<br>xC9<br>xCB<br>xCC<br>XD1<br>xD3<br>xD5<br>xD7<br>xD8<br>xD9<br>xDB<br>xDC | Clear 2Mbit/s ( <i>y</i> value C or D) cannot be used with Firmware controlled Consequent Action ( <i>z</i> values 1, 3, 5, 7, 9 or B), TRANSMIC 1G ( <i>z</i> value C) or TRANSMIC 2G ( <i>z</i> value 8).            |
| xD4<br>xD6                                                                                                   | Unframed clear 2Mbit/s ( <i>y</i> value D) cannot be used with <i>z</i> value 4 (NFW Bit 4 used for RAIS) or with <i>z</i> value 6 (NFW Bit 4 used for RBER) because unframed clear signals cannot obtain TS0 framing. |
| x0C<br>x2C<br>x4C<br>x6C                                                                                     | Channel Associated Signaling ( <i>y</i> values 0, 2, 4 and 6) is not valid for TRANSMIC 1G ( <i>z</i> value C).                                                                                                        |

**Table Notes:**

1. If framed clear 2Mbit/s (*y* value C) is selected with *z* value 4 (NFW Bit 4 used for RAIS) only the receive side of this function will be enabled. Outgoing RAIS indicators cannot be transmitted during clear signal operation.
2. If framed clear 2Mbit/s (*y* value C) is selected with *z*= value 6 (NFW Bit 4 used for RBER) only the receive side of this function will be enabled. Outgoing RBER indicators cannot be transmitted during clear signal operation.

**Table 11-23. Combinations of  $x$  and  $z$  Values**

| Invalid<br>xyz<br>Combinations                       | Explanation                                                                                                                                                                                                                                             |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4yC<br>5yC<br>6yC<br>7yC<br>CyC<br>DyC<br>EyC<br>FyC | Use of NPC as Sync Source ( $x$ 4, 5, 6, 7, C, D, E and F) is not valid for TRANSMIC 1G ( $z$ value C). This is because the TSO Monitoring scheme used in TRANSMIC 1G prevents incoming SFI indicators from cutting off the signal to the Synchronizer. |

**rr** - Facility performance parameter number

Variable rr specifies the parameter whose alarm threshold is being selected

**<m>** - Facility performance parameter threshold index (0 through 10 hex)

Variable <m> is used to select threshold values previously programmed for rr. The default threshold value, the value selected by m=0, for each parameter is shown below for each NPC type under the column heading "Default Threshold Value". Threshold values selected by values of m other than 0 must exist, that is, must have been programmed, prior to being selected. These other thresholds can be set by using the ED-OPT-T1 (38201) command.

**For PB and PC type NPCs:**

| rr | Parameter                          | Threshold      | Default            |
|----|------------------------------------|----------------|--------------------|
|    |                                    | Value<br>Range | Threshold<br>Value |
| 31 | Degraded Minutes, 1 hour           | 1-60           | 60                 |
| 32 | Degraded Minutes, 24 hours         | 1-1440         | 1440               |
| 33 | Severely Errored Seconds, 15 mins  | 1-900          | 900                |
| 34 | Severely Errored Seconds, 24 hours | 1-65535        | 65535              |
| 35 | Errored Seconds, 15 minutes        | 1-900          | 900                |
| 36 | Errored Seconds, 24 hours          | 1-65535        | 65535              |
| 37 | Unavailable Seconds, 15 minutes    | 1-900          | 900                |
| 38 | Unavailable Seconds, 24 hours      | 1-65535        | 65535              |
| 39 | Slips, 15 minutes                  | 1-900          | 900                |
| 40 | Slips, 24 hours                    | 1-65535        | 65535              |

**Note 1:** 24-hour thresholds must be greater than their respective 15-minute or 1-hour threshold.

For PA type NPCs:

**Table 11-24. Parameter Register Threshold Range and Default Values**

| rr | Parameter                        | Interval | Threshold Value Range | Default Threshold Value |

| 94 | Far End Unavailable Seconds      | 15MIN    | 1 - 900               | 30                      |

**For PA, PB, and PC type NPCs:**

In the following table these definitions apply:

|              |                                          |
|--------------|------------------------------------------|
| MI           | Maintenance Information                  |
| DMA          | Deferred Maintenance Action Minor Alarm  |
| PMA Major    | Prompt Maintenance Action Major Alarm    |
| PMA Critical | Prompt Maintenance Action Critical Alarm |

| <m>       | Threshold Value    | Alarm Type                             |
|-----------|--------------------|----------------------------------------|
| <b>0</b>  | Default            | MI (Maintenance Information)           |
| <b>1</b>  | Default            | DMA (Deferred Maintenance Minor Alarm) |
| <b>2</b>  | Default            | PMA (Prompt Maintenance Major Alarm)   |
| <b>3</b>  | Set 1              | MI                                     |
| <b>4</b>  | Set 1              | DMA                                    |
| <b>5</b>  | Set 1              | PMA Major                              |
| <b>6</b>  | Set 2              | MI                                     |
| <b>7</b>  | Set 2              | DMA                                    |
| <b>8</b>  | Set 2              | PMA Major                              |
| <b>9</b>  | Set 3              | MI                                     |
| <b>a</b>  | Set 3              | DMA                                    |
| <b>b</b>  | Set 3              | PMA Major                              |
| <b>c</b>  | Threshold disabled | no alarm                               |
| <b>d</b>  | Default            | PMA Critical                           |
| <b>e</b>  | Set 1              | PMA Critical                           |
| <b>f</b>  | Set 2              | PMA Critical                           |
| <b>10</b> | Set 3              | PMA Critical                           |

**Note 1:** m = 0 is the default.

**Note 2:** Threshold values for Set 1, Set 2, and Set 3 must be set (programmed) by using the command mentioned in the explanation of m above before variable **m** can be used to select threshold levels and alarm types other than the defaults.

|             |                             |
|-------------|-----------------------------|
| <b>SLIP</b> | - Timing slip               |
| <b>BER</b>  | - Bit error rate            |
| <b>ERS</b>  | - Errored seconds           |
| <b>SERS</b> | - Severely errored seconds  |
| <b>COFA</b> | - Change of frame alignment |
| <b>SANE</b> | - Shelf Alarm Near End      |
| <b>SAFE</b> | - Shelf Alarm Far End       |

SLIP

- mmm** - Slip major alarm threshold (0 through 255)
- nnn** - Slip minor alarm threshold (0 through 255)
- e** - Slip major alarm option selection (0 through 3)
- f** - Slip minor alarm option selection (0 through 3)

BER (Bit Error Rate)

- p** - BER major alarm threshold, (1E-p, 3\* through 6†)
- q** - BER minor alarm threshold, (1E-q, 3\* through 6†)
  - \* 4 for clear-DS1 FTU NPC or DS type NPC
  - † 7 on T1DM and Fe framing
- g** - BER major alarm option selection (0 through 3)
- h** - BER minor alarm option selection (0 through 3)

ERS (Errored Seconds)

- rrrrr** - ERS threshold (1 through 65535)
- i** - ERS option selection (0 through 3)

SERS (Severely Errored Seconds)

- sss** - SERS threshold (1 through 255)
- j** - SERS option selection (0 through 3)

COFA (Change of Frame Alignment)

- ttt** - COFA major alarm threshold (1 through 511)
- uuu** - COFA minor alarm threshold (1 through 255)
- k** - COFA major alarm option selection (0 through 3)
- l** - COFA minor alarm option selection (0 through 3)

SANE (Shelf Alarm Near End)

- xxxxx** - SANE alarm threshold (00000 through 65535)
- m** - SANE alarm option selection (0 through 3)

SAFE (Shelf Alarm Far End)

- zzzzz** - SAFE alarm threshold (00000 through 65535)
- n** - SAFE alarm option selection (0 through 3)

For PB and PC type NPCs:

**DM** - Degraded Minutes  
**SERS** - Severely Errored Seconds  
**ERS** - Errored Seconds  
**US** - Unavailable Seconds  
**SLIP** - Slip Events

For SHORT INTERVAL, DM is calculated hourly and SERS, ERS, US and SLIP are calculated at 15-minute intervals.

**nnnnn** - 24-hour Degraded Minutes (DM) threshold  
**ppppp** - 24-hour Severely Errored Seconds (SERS) threshold  
**qqqqq** - 24-hour Errored Seconds (ERS) threshold  
**rrrrr** - 24-hour Unavailable Seconds (US) threshold  
**sssss** - 24-hour Slip Events (SLIP) threshold

**e** - 24-hour DM threshold/alarm selection  
**f** - 24-hour SERS threshold/alarm selection  
**g** - 24-hour ERS threshold/alarm selection  
**h** - 24-hour US threshold/alarm selection  
**i** - 24-hour SLIP threshold/alarm selection

**nnnnn** - 1-hour DM threshold  
**ppppp** - 15-minute SERS threshold  
**qqqqq** - 15-minute ERS threshold  
**rrrrr** - 15-minute US threshold  
**sssss** - 15-minute SLIP threshold

**e** - 1-hour DM threshold/alarm selection  
**f** - 15-minute SERS threshold/alarm selection  
**g** - 15-minute ES threshold/alarm selection  
**h** - 15-minute US threshold/alarm selection  
**i** - 15-minute SLIP threshold/alarm selection

For PA type NPCs:

**CRC** - CRC Block Errors  
**FRER** - Framing Errors  
**OFS** - Out of Frame Seconds  
**ES** - Errored Seconds  
**SES** - Severely Errored Seconds  
**CSS** - Controlled Slip Seconds  
**CV** - Coding Violations  
**UAS** - Unavailable Seconds  
**UATC** - Unavailable Time Count  
**MER** - Multiframe Errors  
**FEBE** - Far End Block Errors  
**FES** - Far End Errored Seconds  
**FSES** - Far End Severely Errored Seconds  
**FUAS** - Far End Unavailable Seconds

**aaaaaaaa**  
- Daily CRC block error threshold value.

**bbbbbbbb**  
- Daily framing error threshold value.

cccc - Daily out of frame seconds threshold value.

dddd - Daily errored second threshold value.

eeee - Daily severely errored second threshold value.

ffff - Daily controlled slip second threshold value.

**gggggggg**  
- Daily coding violation threshold value.

hhhh - Daily unavailable second threshold value.

iiii - Daily unavailable time count threshold value.

jjjj - Daily multiframe alignment error threshold value.

**kkkkkkkk**  
- Daily far-end block error threshold value.

llll - Daily far-end errored second threshold value.

mmmm - Daily far-end severely errored second threshold value.

nnnn - Daily far-end unavailable second threshold value.

- a** - Daily CRC block error threshold selection,
- b** - Daily framing error threshold selection,
- c** - Daily out of frame seconds threshold selection,
- d** - Daily errored second threshold selection,
- e** - Daily severely errored second threshold selection,
- f** - Daily controlled slip second threshold selection,
- g** - Daily coding violation threshold selection,
- h** - Daily unavailable second threshold selection,
- i** - Daily unavailable time count threshold selection,
- j** - Daily multiframe alignment error threshold selection,
- k** - Daily far-end path block error selection,
- l** - Daily far-end path second threshold selection,
- m** - Daily far-end severely errored second threshold selection,
- n** - Daily far-end unavailable second threshold selection,

The options can be from "0" to "c" as specified for the "m" of the "rr/<m>" field.

**aaaaaa** - 15-minute CRC block error threshold value.

**bbbbbb**

- 15-minute framing error threshold value.

**ccc** - 15-minute out of frame seconds threshold value.

**ddd** - 15-minute errored second threshold value.

**eee** - 15-minute severely errored second threshold value.

**fff** - 15-minute controlled slip second threshold value.

**ggggggg**

- 15-minute coding violation threshold value.

**hhh** - 15-minute unavailable second threshold value.

**ii** - 15-minute unavailable time count threshold value.

**jjj** - 15-minute multiframe alignment error threshold value.

**kkkkkk** - 15-minute far-end block error threshold value.

**lll** - 15-minute far-end errored second threshold value.

**mmm** - 15-minute far-end severely errored second threshold value.

**nnn** - 15-minute far-end unavailable second threshold value.

- a** - 15-minute CRC block error threshold selection,
- b** - 15-minute framing error threshold selection,
- c** - 15-minute out of frame seconds threshold selection,
- d** - 15-minute errored second threshold selection,
- e** - 15-minute severely errored second threshold selection,
- f** - 15-minute controlled slip second threshold selection,
- g** - 15-minute coding violation threshold selection,
- h** - 15-minute unavailable second threshold selection,
- i** - 15-minute unavailable time count threshold selection,
- j** - 15-minute multiframe alignment error threshold selection,
- k** - 15-minute far-end path block error selection,
- l** - 15-minute far-end path second threshold selection,
- m** - 15-minute far-end severely errored second threshold selection,
- n** - 15-minute far-end unavailable second threshold selection,

The options can be from "0" to "c" as specified for the "m" of the "rr/<m>" field.

**For PA type NPCs:**

Depending on which interface functions are enabled by the provisioning values of xyz, some parameters may not be applicable. In this case the threshold value, the parameter count (if present in the message) and the selection value will appear as dashes ("-"). In the table below "N/A" indicates that a parameter is not applicable for the given value of x or y.

Also, if the selection value m=c has been chosen for a parameter, the threshold value and the parameter count (if present in the message) will appear as dashes.

**THMODE** - Thresholding mode (for PA NPCs only)

**hhh** - Thresholding mode option

| <i>hhh</i> | <i>Explanation</i>   |
|------------|----------------------|
| INH        | Inhibit thresholding |
| ALW        | Allow thresholding   |

The INH option is used to temporarily inhibit thresholding for all parameters of all NPCs provisioned with TYPE mnxyz whether the thresholding for a specific NPC is already inhibited or not. When it is entered, all thresholds for those NPCs are suspended; therefore, no new threshold crossing messages will be output after the inhibition.

The ALW option is the default option and can be used to turn-off the thresholding inhibition. Note that, this command with the "ALW" option can be used for TYPE mnxyz NPCs whose thresholding capability is inhibited due to the entry of command I.38221

When the "ALW" is entered, the thresholds applied before the inhibition will be re-applied unless the thresholds were changed during the inhibition. Option change requests are permitted while the NPC thresholding is inhibited.

**vv/k** - Parameter/option involved in denial

mmmm - Error condition code

## **ED,PRMTR,EQPT,TYPE**

### **CHANGE TYPE AND THRESHOLD MODE**

#### **Explanation Of Command**

This command inhibits or allows the threshold-crossing messages for all unequipped NPCs that will be provisioned as the specified NPC type. After the execution of this command, any NPCs that are subsequently provisioned as the specified NPC type will have their threshold-crossing messages inhibited or allowed.

The only NPC type that can be specified in this command is the PA type and no xyz options shall be specified in this command.

When this command is entered for inhibiting threshold-crossing messages, it shall not be denied even if the threshold-crossing messages are already inhibited; when this command is entered for allowing threshold-crossing messages, it shall not be denied even if the threshold-crossing messages are already allowed. In addition, if this command is never entered for a given NPC type, the threshold-crossing messages will be allowed for all NPCs that will be provisioned as that NPC type.

The execution of this command does not require any Unit or CCN/ECCN hardware entities to be in service, except for the Main Controller.

In contrast, the ED,PRMTR,EQPT,TYPE command (I.38231) can be used to inhibit or allow the threshold-crossing messages for all equipped NPCs that have been provisioned as PA type with the specified xyz option; the ED,PRMTR,EQPT,NPC command (I.38221) can be used to inhibit or allow the threshold-crossing messages for the specified NPC that has been provisioned as PA type.

#### **Command**

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

**TYPE**        - Type

**mn**           - NPC type

| <i>mn</i> | <i>Explanation</i> |
|-----------|--------------------|
|-----------|--------------------|

|    |                                                   |
|----|---------------------------------------------------|
| PA | CEPT NPC (120-ohm twisted pair or 75-ohm coaxial) |
|----|---------------------------------------------------|

**THMODE** - Thresholding mode

**hhh** - Threshold-crossing message mode

| <i>hhh</i> | <i>Explanation</i>                  |
|------------|-------------------------------------|
| INH        | Inhibit threshold-crossing messages |
| ALW        | Allow threshold-crossing messages   |

The INH option is used to inhibit (turn off) the threshold-crossing messages for all NPCs that will be provisioned as the specified NPC type. After this option is selected, no threshold-crossing messages will be output for all NPCs that will be provisioned as the specified NPC type.

The ALW option can be used to allow (turn on) the threshold-crossing messages for all NPCs that will be provisioned as the specified NPC type. After this option is selected, threshold-crossing messages will be output for all NPCs that will be provisioned as the specified NPC type.

**SNVS** NPC type error

## **ED,PRMTR,FALMS,PMACR,PMAMJ,DMAMN,MI**

### **CHANGE Facility Alarms Severity**

#### **Explanation Of Command**

This command is used to change the Alarm Severity of the system facility alarms. The Alarm Severity must be turned ON via I.38355 to use this command. If a specific type is specified the command does not verify whether the facility alarm being changed is supported by that type.

| C                  |                       | Y                          | Y                     | Y                                  |                                   |
| D                  |                       | Y                          | Y                     | Y                                  | Y                                 |
| E                  |                       |                            |                       | Y                                  | Y                                 |
| F                  |                       |                            |                       | Y                                  |                                   |

**Table Notes:**

1. The columns "Automatic CRC-4\*" and "Far-End PM" are new functions which were not available on the PB or PC types.
2. If the CRC-4 mode is enabled ( $x$  values 0-7) the NPC will compute checksums over the transmitted data and transmit the checksum as part of the CRC-4 multiframe pattern in TS0. The NPC will also monitor the incoming CRC-4 multiframe and verify the CRC checksum. If the CRC-4 multiframe can not be found as per the CRC-4 reframe algorithm, the NPC will declare an alarm.

If the automatic CRC-4 option is selected ( $x$  values 8-9 and C-D), the NPC will perform all the functions of the CRC-4 mode. However, if the CRC-4 multiframe is lost, the NPC will not declare an alarm or apply consequent actions.

3. If the Far-End PM (Performance Monitoring) option is selected ( $x$  values 1, 3, 5, 7-9, and C-D), the E-bits contained within the CRC-4 multiframe are used to compute Far-End performance monitoring parameters.

---

\* Automatic CRC-4 is also known as CRC-4 Interworking.

4. If the NPC is to be used as a Sync Source ( $x$  values 4-7 and C-F), the clock from the NPC to the synchronizer will be enabled.
5. When the SFI (Synchronization Failure Indication) option is selected ( $x$  values 1-2, 5-6, 9-A and D-E), bit 5 of the TS0 Non Frame Word (NFW) is controlled by DACS II software. It will force the NPC to invert Bit 5 (or set to an alarm state) when the Synchronizer enters the holdover mode. The idle state of NFW bit 5 will default to a '1' when the NPC is grown. The idle state can be changed to a '0' with a subsequent ED-PRMTR-EQPT::NPC,TS0 command.

If the NPC is also used as a synchronization source and NFW bit 5 is received in the alarm state, that NPC will squelch the clock it puts out. If the DACS II is using this clock as a sync source, the sync pack terminating this clock will recognize that it is receiving a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

6.  $x$  value B does not enable any of the features shown in the Table; this is a valid option.

**Table 11-26. Provisioning values for  $y$**

| $y$<br>value | CAS<br>Mode | NSA<br>Mode | Telephone<br>Numbering | Timeslot<br>Numbering | Convert<br>CTS 16 | AIS in<br>CTS 16 | Framed<br>Clear | Unframed<br>Clear |
|--------------|-------------|-------------|------------------------|-----------------------|-------------------|------------------|-----------------|-------------------|
| 0            | Y           |             | Y                      |                       | Y                 | Y                |                 |                   |
| 2            | Y           |             | Y                      |                       | Y                 |                  |                 |                   |
| 4            | Y           |             | Y                      |                       |                   | Y                |                 |                   |
| 6            | Y           |             | Y                      |                       |                   |                  |                 |                   |
| 8            |             | Y           | Y                      |                       |                   |                  |                 |                   |
| 9            |             | Y           |                        | Y                     |                   |                  |                 |                   |
| C            |             |             |                        |                       |                   |                  | Y               |                   |
| D            |             |             |                        |                       |                   |                  |                 | Y                 |

**Table Notes:**

1. The columns "Framed Clear" and "Unframed Clear" are new functions which were not available on the PB or PC types.
2.  $y$  values 1, 3, 5, 7, A-B and E-F are unassigned (that is, invalid).
3. For  $y$  values 0, 2, 4 and 6 Channel Associated Signaling (CAS) is enabled. In this mode the Telephone Channel Numbering system is always used.

If the "Convert TS16" option is selected ( $y$  values 0 and 2), the  $abcd$  bits of TS16 will be converted to '1111' if they are received as '0000'. This is to prevent false framing in the TS16 multiframe. If this option is not selected ( $y$  values 4 and 6), a value of '0000' in the  $abcd$  bits will be transmitted transparently.

If the "AIS in TS16" option is selected ( $y$  value 0 and 4), AIS will always be applied to received TS16 signaling channels on detection of RAI (Remote Alarm Indication, Bit 3 of TS0 NFW), RAIS (Remote AIS Indication, Bit 4 of TS0 NFW, if provisioned) or R16 (Remote Alarm Indication received in TS16). If this option is not selected ( $y$  values 2 and 6), AIS will not be applied on detection of RAI, RAIS, or R16.

4. For  $y$  values 8 and 9 the NPC will be Non Signaling Associated (NSA). In this mode, Telephone Channel Numbering ( $y=8$ ) or Timeslot Channel Numbering ( $y=9$ ) may be selected).
5. The NPC can be set up as a framed clear 2Mbit/s interface ( $y=C$ ) or as an unframed clear 2Mbit/s interface ( $y=D$ ). When provisioned as a clear 2 Mbit/s interface, an NPC does not modify the cross-connected data in any way. This means that the following functions are not performed in the clear 2 Mbit/s mode:
  - Outgoing CRC4 checksum generation (applies to framed clear 2 Mbit/s interfaces with CRC4 option enabled).
  - Remote alarm indications (line format errors are reported locally, but no alarm indicators are sent in TS0 to the remote end).

**Table 11-27. Provisioning values for  $z$**

| $z$<br>value | C.A. Timing |    | RAI Set Time |       |       | NFW Bit 4 Use |      | RAIS Set Time |       | MBER    | RPSFI   |
|--------------|-------------|----|--------------|-------|-------|---------------|------|---------------|-------|---------|---------|
|              | HW          | FW | 2ms          | 144ms | 480ms | RAIS          | RBER | 144ms         | 480ms | Enabled | Enabled |
| 0            | Y           |    | Y            |       |       |               |      |               |       |         |         |
| 1            |             | Y  | Y            |       |       |               |      |               |       |         |         |
| 2            | Y           |    |              | Y     |       |               |      |               |       |         |         |
| 3            |             | Y  |              |       | Y     |               |      |               |       |         |         |
| 4            | Y           |    | Y            |       |       | Y             |      | Y             |       |         |         |
| 5            |             | Y  | Y            |       |       | Y             |      |               | Y     |         |         |
| 6            | Y           |    | Y            |       |       |               | Y    |               | Y     |         |         |
| 7            |             | Y  | Y            |       |       |               | Y    |               | Y     |         |         |
| 8            | Y           |    |              | Y     |       | Y             |      | Y             |       |         |         |
| 9            |             | Y  |              |       | Y     | Y             |      |               | Y     |         |         |
| A            | Y           |    | Y            |       |       |               |      |               |       | Y       |         |
| B            |             | Y  | Y            |       |       |               |      |               |       | Y       |         |
| C            | Y           |    |              |       |       |               |      |               |       |         |         |
| D            | Y           |    | Y            |       |       | Y             |      | Y             |       |         | Y       |

**Table Notes:**

1.  $z$  value **F** and **E** are unassigned (i.e. not valid).
2.  $z$  value **C** selects TRANSMIC 1G. (see Section 6.2.1 of )

3. **z** values **8, 9** select TRANSMIC 2G. (see Section 6.2.2 of )
4. For **z** values **1, 3, 5, 7, 9**, and **B** the Consequent Action (C. A.) timing is under Firmware control. For **z** values **0, 2, 4, 6, 8, A, C** and **D** the Consequent Action timing is under Hardware control.

The G.732 Consequent Action of inserting the AIS in data channels is applied within 2 ms whether the timing is under HW control or FW control, but when under FW control, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
if **z = 1, 3, 5, or 9**  
in **2496 ms**  
if **z = 7 or B**

The Insertion Word pattern can be specified in the cross-connect command; on 2Mbit/s NPCs in a *gateway* **cross-connection** the Insertion Word always defaults to AIS.

The selection of HW or FW control is also used to provision the consequent actions on signaling bits. On detection of loss of frame alignment (LOFA) or multiframe alignment (MFA) error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When HW control is used, the AIS in signaling bits is applied within 2 ms, overriding the signaling freeze. When FW control is used, the trunk conditioning pattern from the AMS overrides the signaling freeze once the 2Mbit/s NPC goes into the alarm state.

5. The Consequent Action timing also selects the time after which the **local** alarms are declared and cleared:\*
  - HW Control: **Both** remote and local alarms are declared and cleared in 144 ms.
  - FW Control: Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms, **except when z = 7 or B**.
6. NFW bit 3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section 2.3.2 (**that is, within 2 ms after detecting the failure**) when **z = 0, 1, 4, 5, 6, 7, A or B**. **However**, for **z** values 2 and 8 the set time is 144 ms and for **z** values 3 and 9 the set time is 480 ms. NFW bit 3 is always set to 0 for non-alarm condition and is set to 1 for alarm conditions.
7. When NFW bit 4 is used as RAIS (Remote AIS) indicator, NFW bit 4 will be set in 144 ms (for **z = 4 and 8**) or 480 ms (for **z = 5 and 9**) after AIS is detected in the received signal. The default idle state for Bit 4 is a '1'. The idle state can be changed to a '0' with the ED-PRMTR-EQPT::NPC:TS0 command. The bit is put into the active state by inverting the value of the idle state. Similarly, if NFW bit 4 is in the active state in the received signal, consequent actions are taken 144 ms after detecting this condition.

---

\* Local alarms are those generated for the events: PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the events: RAI, RAIS, RBER, and R16.

8. z values 6-7 and A-B enable the Minor Bit Error Rate and Signaling Freeze Delay Time Features.

**Common Options (z = 6-7 or A-B)**

- [i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

- [ii] RAI set in 2 ms

- [iii] Signaling Freeze Delay Timing, Consequent Action Clear Timing:

**z=6 or A** hardware timing

**z=7 or B** firmware timing (SFDT=2496 ms, CACT=624 ms)

- [iv] BER alarm level = DMA

**Specific Options for z= 6 or 7**

- [v] RBER alarm level = MI

- [vi] NFW bit 4=RBER:

- DACS II sends a remote indicator in bit 4 (RBER) of the time slot 0 Not Frame Word (NFW) upstream to the far end 144 ms after detecting the Minor Bit Error Rate (BER) condition.

DACS II sets the RBER bit to its idle state, on clearing of the BER condition.

- DACS II detects the remote setting of the received bit 4 as an RBER condition and generates an appropriate message. Consequent actions are taken 144 ms after detecting this condition.

DACS II generates an appropriate retirement message when the received bit 4 returns to the idle state.

**Specific Options for z= A or B**

- [vii] RBER unalarmed

- [viii] NFW bit 4=disabled

NFW bit 4 is NOT used as RBER, although the local Minor Bit Error Rate (BER) condition is detected and cleared with the alarm state consequent actions.

9. To provision RPSFI, TS0 bit 5 used for SFI and CAS must be provisioned.

The following tables provide a summary of invalid combinations of  $xyz$  for the PA type NPC.

**Table 11-28. Combinations of  $x$  and  $y$  Values**

| Invalid<br>$xyz$<br>Combinations                                                               | Explanation                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8Cz<br>9Cz<br>CCz<br>DCz                                                                       | Framed clear 2Mbit/s ( $y$ value C) is valid for all $x$ options except those invoking automatic CRC-4 interworking.<br>The interworking algorithm requires setting of outgoing E-bits, which is not permitted for a clear signal. |
| 0Dz<br>1Dz<br>2Dz<br>3Dz<br>4Dz<br>5Dz<br>6Dz<br>7Dz<br>8Dz<br>9Dz<br>ADz<br>CDz<br>DDz<br>EDz | Unframed clear 2Mbit/s ( $y$ value D) is only valid for $x$ values B and F. These are the only $x$ options which do not require decoding of TS0 content.                                                                           |

**Table Notes:**

1. If framed clear 2Mbit/s is selected with Far-End PM enabled  $z$  values 1, 3, 5 and 7) only the receive side of the feature shall be turned on. No outgoing E-bits may be transmitted during clear signal operation.
2. If framed clear 2Mbit/s is selected with Synchronization Failure Indication (SFI) enables ( $x$  values 1, 2, 5, 6, A and E) only the receive side of the feature shall be turned on. No outgoing SFI may be transmitted in Bit 5 during clear signal operation.

**Table 11-29. Combinations of *y* and *z* Values**

| Invalid<br>xyz<br>Combinations                                                                               | Explanation                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xC1<br>xC3<br>xC5<br>xC7<br>xC8<br>xC9<br>xCB<br>xCC<br>XD1<br>xD3<br>xD5<br>xD7<br>xD8<br>xD9<br>xDB<br>xDC | Clear 2Mbit/s ( <i>y</i> value C or D) cannot be used with Firmware controlled Consequent Action ( <i>z</i> values 1, 3, 5, 7, 9 or B), TRANSMIC 1G ( <i>z</i> value C) or TRANSMIC 2G ( <i>z</i> value 8).            |
| xD4<br>xD6                                                                                                   | Unframed clear 2Mbit/s ( <i>y</i> value D) cannot be used with <i>z</i> value 4 (NFW Bit 4 used for RAIS) or with <i>z</i> value 6 (NFW Bit 4 used for RBER) because unframed clear signals cannot obtain TS0 framing. |
| x0C<br>x2C<br>x4C<br>x6C                                                                                     | Channel Associated Signaling ( <i>y</i> values 0, 2, 4 and 6) is not valid for TRANSMIC 1G ( <i>z</i> value C).                                                                                                        |

**Table Notes:**

1. If framed clear 2Mbit/s (*y* value C) is selected with *z* value 4 (NFW Bit 4 used for RAIS) only the receive side of this function will be enabled. Outgoing RAIS indicators cannot be transmitted during clear signal operation.
2. If framed clear 2Mbit/s (*y* value C) is selected with *z*= value 6 (NFW Bit 4 used for RBER) only the receive side of this function will be enabled. Outgoing RBER indicators cannot be transmitted during clear signal operation.

**Table 11-30. Combinations of *x* and *z* Values**

| Invalid<br>xyz<br>Combinations                       | Explanation                                                                                                                                                                                                                                                       |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4yC<br>5yC<br>6yC<br>7yC<br>CyC<br>DyC<br>EyC<br>FyC | Use of NPC as Sync Source ( <i>x</i> 4, 5, 6, 7, C, D, E and F) is not valid for TRANSMIC 1G ( <i>z</i> value C). This is because the TSO Monitoring scheme used in TRANSMIC 1G prevents incoming SFI indicators from cutting off the signal to the Synchronizer. |

|              |            | 111          | Unassigned                                                                                                                              |
|              | m          | 0            | Unassigned, only m=0 is valid                                                                                                           |
|              |            | 1            |                                                                                                                                         |

**Table Notes:**

- [b] Clock from NPC to synchronizer shall be enabled if this option bit is set to 1, otherwise it is disabled.
- [c] The G.732 Consequent Action of inserting the AIS in data channels is applied within 2'ms whether mnxyz bit c=0 or c=1; but when c=1, the AIS in data channels is overridden by the Insertion Word sourced from the Alternate Message Store (AMS) after detection of the local alarm:

in **480 ms**  
 if  $jkl \neq 011$  and  $jkl \neq 101$   
 in **2496'ms**  
 if  $jkl = 011$  or  $jkl = 101$ . See note [jkl].

The insertion word pattern can be specified in the cross-connect command; on CEPT NPCs in a *gateway cross-connection* the insertion word always defaults to AIS.

mnxyz'bit c is also used to provision the consequent actions on signaling bits. On detection of any single framing error or multiframe error, the hardware immediately applies a signaling freeze by using the last good frame's signaling information. The signaling freeze remains in effect until two multiframes without errors are received. When c=0, the AIS in signaling bits is applied within 2'ms, overriding the signaling freeze. When c=1 if the primary goes into the alarm state then the trunk conditioning pattern from the AMS overrides the signaling freeze.

In basic CEPT only, option c=0 is supported and both the AIS and RAI will be applied in less than 2'ms. NFW'bit'3 of TS0 in enhanced CEPT is controlled by selecting the jkl options. Also see note [jkl'].

[c'] Option c also selects the time after which the **local** alarms are declared and cleared:\*

c=0      **Both** remote and local alarms are declared and cleared in 144 ms.

c=1      Only remote alarms are declared and cleared in 144 ms. The **local** alarms are declared and cleared in 480 ms **except when jkl=011 or jkl=101. For that case, see note [jkl']**.

[c''] Time T will be 144'ms when option c=0 and 480 ms when option c=1.

[g] Option g has meaning only if the NPC is provisioned for CAS; that is, option d=1, otherwise it is ignored. If option g=0 is selected, the AIS will always be applied to received TS16 on detection of RAI and will also be applied on detection of RAIS if the NPC is provisioned for RAIS.

If option g=1 is selected, the AIS will not be applied on detection of RAI, RAIS, or R16.

[h] NFW'bit'5 when used as SFI, and h=1, is controlled by DACS II software that will force the NPC to invert (or set to an alarm state) when the synchronizer enters the holdover mode.

NFW'bit'5 will default to 1 when the NPC is grown, without regard of whether option h was selected as either 0 or 1, unless it is later set to 0 by setting parameter e=0 in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

For Transmic'1G the information message REPT STATE EQPT (O.65201) is output. For all other combinations of xyz the alarm message REPT ALARM EQPT (O.65011) is output on detection of change of state of NFW spare bit'5 when option h=1.

---

\* Local alarms are those generated for the table entries PWR, PBF, BER, AIS, LMA, and A16. Remote alarms are those generated for the table entries RAI, RAIS, RBER, and R16.

If both  $b=1$  and  $h=1$  and the NPC (used as synchronization source) receives NFW bit'5 in the alarm state, that NPC will squelch the clock it outputs. If the DACS II is using this clock as a sync source the sync pack terminating this clock will recognize that it receives a faulty clock and it will take appropriate actions which are the same as when the external sync source is detected to be faulty.

[jkl]

[000] NFW bit'3, the remote alarm indication (RAI), will be processed as specified in CCITT Recommendation G.704 Section'2.3.2 and is the same as in Basic CEPT when option  $c$  is selected as 0; **that is, within 2'ms after detecting the failure.** If this option is not specified as 000, use of NFW bit'3 as RAI will remain unchanged except the time when NFW bit'3 is set can be changed to 144'ms as opposed to 2 ms after detecting the failure. NFW'bit'3 is always set to 0 for nonalarm conditions and is set to 1 for alarm conditions.

[010 or 100]

NFW'bit'4 when used as RAIS, and AIS is detected in the received signal, can only be set 144'ms after detecting this condition. Similarly, when the received NFW bit'4 is in the active state, consequent actions are taken 144'ms after detecting this condition.

NFW'bit'4 use as REER is not supported in G4.0.

[111] The jkl=111 option will be denied.

[jkl'] minor bit error rate and signaling freeze delay time features:

jkl=011 or jkl=101

[i] Enable BER calculations, and when in the BER state:

DACS takes the alarm state consequent actions: sending a message, and activating appropriate alarm relays and summary LEDs.

When out of the BER state, DACS retires the alarm state consequent actions: sends a retirement message, and deactivates appropriate alarm relays and summary LEDs.

[ii] RAI set in 2 ms

[iii] Signaling freeze Delay timing, consequent action clear timing:

$c=0$  hardware timing

$c=1$  firmware timing (SFDT=2496'ms, CACT=624'ms)

[iv] BER alarm level = DMA

jkl=011

[v] RBER alarm level = MI

[vi] NFW'bit'4=RBBER:

- DACS'II sends a remote indicator in bit'4 (RBBER) of the timeslot 0 not frame word (NFW) upstream to the far end 144'ms after detecting the minor bit error rate (BER) condition.
- “ DACS'II sets the RBBER bit to its idle state, on clearing of the BER condition.
- DACS'II detects the remote setting of the received bit'4 as an RBBER condition and generates an appropriate message. Consequent actions are taken 144'ms after detecting this condition.
- “ DACS II generates an appropriate retirement message when the received bit'4 returns to the idle state.

jkl=101

- [vii] RBBER unalarmed  
[viii] NFW'bit'4=disabled

NFW'bit'4 is NOT used as RBBER, although the local minor bit error rate (BER) condition is detected and cleared with the alarm state consequent actions.

For the MBBER/SFDT features, the required xyz options are **ab1d'efgh'0110** or **ab1d'efgh'1010**. For MBBER *with hardware consequent action timing*, the required xyz options are **ab0d'efgh'0110** or **ab0d'efgh'1010**.

NFW'bit'4 will default to 1 when the NPC is grown. It may later be set to 0 by setting parameter **d=0** in the TS0 field of the ED-PRMTR-EQPT::NPC (O.38321) command.

- [m] The option bit "m" is unassigned. Its default value is "0". The equipage command must deny "m" specified as "1".

The default values for TS0 parameters are **abcdefgh=11011111** (as per CCITT recommendations when crossing the international borders), unless the xyz parameters set them differently, that is, for Transmic'1G the abcdefgh=11000000.

The default values for TS0M parameters are **abcdefgh=00000000**, unless the xyz parameters set them differently, that is, for Transmic'1G the abcdefgh=00111111.

**falm** - Facility Alarms

**falm** *Explanation*

For PA type NPCs, valid values are:

**RPSFI** Remote Power Supply Failure Indicator  
**LOS** Loss of Signal  
**LOF** Loss of Frame  
**AIS** Alarm Indication Signal  
**EER** Excessive Error Rate  
**BER** Bit Error Rate  
**LCMA** Loss of CRC-4 Multiframe Alignment  
**FLC** Far End Loss of CRC-4 Multiframe Alignment  
**RAI** Remote Alarm Indication  
**RBER** Remote Bit Error Rate  
**SFI** Sync failure Indication  
**POF** Psuedo Frame Word Out of Frame  
**TAI** TS-16All Ones Alarm  
**RAIS** Remote AIS  
**LMA** Loss of Multiframe  
**RABS** Remote Alarm bit 6,TS16  
**PBF** Primary Block Failure  
**ALL** ALL above identified facility alarms

For PB and PC type NPCs, valid values are:

**RPSFI** Remote Power Supply Failure Indicator  
**AIS** Alarm Indication Signal  
**EER** Excessive Error Rate  
**BER** Bit Error Rate  
**RAI** Remote Alarm Indication  
**RBER** Remote Bit Error Rate  
**SFI** Sync failure Indication  
**TAI** TS-16All Ones Alarm  
**RAIS** Remote AIS  
**LMA** Loss of Multiframe  
**RABS** Remote Alarm bit 6,TS16  
**PBF** Primary Block Failure  
**ALL** ALL above identified facility alarms

**NOTE:** The command does not check for valid facility alarm - NPC type combinations.

**PMACR** - Prompt Maintenance Action CRITICAL alarm severity

**PMAMJ** - Prompt Maintenance Action MAJOR alarm severity

**DMAMN** - Deferred Maintenance Action MINOR alarm severity

**MI** - MESSAGE INFORMATION alarm severity

**RESET** - Reset Alarm Severity to default value

mmmm - Error condition code

mmmm *Explanation*

| <b>SAAS</b> | Alarm Severity of facility Alarm not changed                      |

## **ED,PRMTR,INTV,NPC,ALL,TLI,SYNC,CCN,LEV**

### **CHANGE INTERVENTION LEVEL**

#### **Explanation Of Command**

This command is used to change the Intervention Level Setting for the following resources:

NPC  
SYNC  
TLI

For an NPC the Intervention Level setting will affect the alarm severity level reported for all NPC alarms including the facility and performance monitoring alarms. The escalation for greater than 5 NPC alarms will not happen when Intervention Level is ON. For an SYNC and TLI, all alarms associated with these resources will be affected by Intervention Level and the escalation mechanism associated with these resources will occur. This command can be executed while the resource is in service.

**Turn ON or OFF the Intervention Level Setting  
Feature**

### **Explanation Of Command**

This command is used to turn ON or OFF the Intervention Level Setting Feature, which is used to change the intervention level of the alarm severities for various system resources. When this feature is ON, message I.31363 can be used to change the intervention level of NPCs. This command is restricted to users with superuser privileges.

This command can only be used if the intervention level feature has been purchased as part of the DACS II software generic.

## **ED,PRMTR,LINK,PTCOL,S,X,T,M,BAUD,ALM**

### **ADD LINK, PROTOCOL, BAUD**

#### **Explanation Of Command**

This command is used to provision (add) a Snider, X.25, or TABS administrative link.

This command can also be used to initialize or change the performance parameters of the link, including the protocol (PTCOL), link speed (BAUD), alarm class (ALM), backspace (BS), Xon/Xoff flow control (XON), and Enq/Ack flow control (ENQ) provisioning.

At least one parameter must be given.

On input, if a virtual circuit range is specified as zero (0), the corresponding group number specified is ignored by DACS II.

#### **Command**

[I.36001]

**ED-PRMTR-LINK: [<xy>] : j : [ww] : PTCOL - {S|X|T|M} [ , BAUD-bb ] \**  
**[ , ALM-k ] [ , BS-e ] [ , ENQ-q ] [ , XON-x ] : [INIT];**

If the protocol is Snider:

[I.36001]

**ED-PRMTR-LINK: [<xy>] : j : [ww] : PTCOL-S [ , BAUD-bb ] [ , ALM-k ] \**  
**[ , BS-e ] [ , ENQ-q ] [ , XON-x ] : [INIT];**

If the protocol is X.25:

[I.36001]

**ED-PRMTR-LINK: [<xy>] : j : [ww] : PTCOL-X [ , ALM-k ] : [INIT];**

If the protocol is TABS:  
[I.36001]

**ED-PRMTR-LINK:** [<xy>]:j:[ww]:PTCOL-T[,BAUD-bb][,ALM-k]\  
:[INIT];

If the protocol is Modified Snider:  
[I.36001]

**ED-PRMTR-LINK:** [<xy>]:j:[ww]:PTCOL-M[,ALM-k]:[INIT];

### **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

**LINK** - Link

**j** - Administrative link number (1 through 6)

**PTCOL** - Protocol

**S** - SCCSAI (Snider protocol)

**X** - X.25 Synchronous protocol

**T** - TABS (Telemetry Asynchronous Block Serial protocol)

**M** - Modified Snider Protocol (requires baud rate of 1200)

**BAUD** - Baud

**bb** - Baud rate

The baud rate is not provisioned for synchronous X.25 links. Timing for X.25 links is received from the connected X.25 network or device. Provisioning the baud rate applies only to asynchronous Snider links.

| <i>bb</i> | <i>Rate</i> |
|-----------|-------------|
| 03        | 300         |
| 06        | 600         |
| 12        | 1200        |
| 24        | 2400        |
| 48        | 4800        |
| 96        | 9600        |

**ALM** - Alarm

**k** - Alarm class for link hardware failures

| <i>k</i> | <i>Alarm Class</i> |
|----------|--------------------|
| 1        | Minor (default)    |
| 2        | Major              |

**BS** - Backspace

**e** - Character echoed for backspace or control-h

| <i>e</i> | <i>Character</i>              |
|----------|-------------------------------|
| 0        | Backspace is echoed (default) |
| 1        | Underscore is echoed          |

**ENQ** - Enquire

**q** - ENQ/ACK Protocol Enable/Disable Control

*q* ENQ/ACK Protocol Provisioning

0 Disabled

1 Enabled (default)

If the DACS II frame has been set to expect the ENQ/ACK Protocol Enable/Disable Control and the sending terminal is not set up properly to send the ACK in response to ENQ, then after several attempts to receive ACK the DACS II frame will autonomously declare a protocol OOS for ENQ/ACK, remove the link, perform diagnostics and then restore the link. At this point the ENQ/ACK protocol is set to disabled.

**XON** - XON

**x** - XON/XOFF Protocol Enable/Disable Control

*x* XON/XOFF Protocol Provisioning

0 Disabled (default)

1 Enabled

The XON/XOFF Protocol Enable/Disable Control will only take effect when the DACS II frame is in output mode. The effect of XOFF lasts for 60 seconds or until an XON is received. If the frame has data to be output on the given link (that is, from a command executed on that link, or output data from another monitored link), and XOFF's are received in a manner such that at the end of an 60 second OFF interval a new 60 second OFF interval begins, thus preventing the frame from delivering output data, then the frame will declare a software error based on the assumption that a software communications error exists. The link will be autonomously removed, diagnosed, and restored. Following restoral, queued output data will be flushed. The XON protocol will still be in effect after the link is restored.

**INIT** - Initialize

Initialize the administrative link; all parameters are set to default except those specified in the command.

mmm - Error condition code

mmm *Explanation*

|             |                                                        |

### **ADD X.25 LINK PARAMETERS**

#### **Explanation Of Command**

This command allows a user to provision an X.25 administrative link with packet layer parameters.

If a virtual circuit (VC) range is specified as zero (0), the corresponding group number specified in **gghh** is ignored by DACS II.

Parameters T20, R20, DBIT, and VC() are per-link parameters and the remaining parameters are per-VC parameters.

If a 3-digit link+VC number (501, 502, ..) is used and only per-VC parameters are specified, then the command is accepted and the values apply only to the specified VC.

If a 3-digit link+VC number is used and at least one per-link parameter is specified, then the command is denied.

If a 1-digit link number (5 or 6) is used and any per-link and/or per-VC parameter is specified, then the command is accepted and the values apply to all VCs in the link. To ensure proper interface between DACS II and the packet network, packet layer parameters at DACS II and network ends of the X.25 link must be identical.

#### **Command**

[I.36005]

```
ED-PRMTR-LINK: [<xy>]: l[mm]: [ww]: [W-c][, P-ddd][, T20-iii]\

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

**LINK** - Link

**j[mm]** - Administrative link number

**j** - Physical link number (l is either 5 or 6)

**mm** - Virtual circuit number (01 through 16)

**W** - Window

**c** - Window size (1 through 7). Default window size is 2.

**P** - Packet

**ddd** - Packet size. Can be 128, 256, 512 octets. Default is 128 octets.

**T20** - Restart request response timer

**iii** - Timer setting (10 through 180 seconds). Default is 180 seconds.

T20 is valid only on a per link basis and will be denied on an individual virtual circuit.

| <b>VC</b>                | - Virtual circuit                                                                                                                                                                             |
| <b>ppss</b>              | - Virtual circuit number                                                                                                                                                                      |
| <b>pp</b>                | - Range of PVCs                                                                                                                                                                               |
| <b>ss</b>                | - Range of SVCs                                                                                                                                                                               |

The sum of the number of PVCs and SVCs must be equal to 16.

Table 1 shows the default values for these fields.

Table 1 and Table 2 show the acceptable values for these fields, allowing for an LCN numbering scheme of 00-255.

TABLE 1

| "pp" | "ss" | Number<br>of PVCs | Number<br>of SVCs | Starting LCN for first<br>PVC Channel | Starting LCN for first<br>SVC Channel |

**gghh** - Group number

**gg** - Group number for all PVCs (00 through 15).

**hh** - Group number for all SVCs (00 through 15).

VC() is valid only on a per link basis and will be denied on an individual virtual circuit.

**DBIT** - D-bit

*v* - X.25 d-bit setting

**v**      *Explanation*

0      Off (unset) (acknowledgement done from local DTE). Default

1      On (set) (acknowledgement done from remote DTE)

DBIT is valid only on a per link basis and will be denied on an individual virtual circuit.

**mmmm** - Error condition code

**mmmm**    **st**    *Explanation*

**SAIS**      Subject entity is in service

**SNVS**      Command and protocol are inconsistent

**IDNV**      Invalid link number specified

**IDNV**    **IS**    Can't Use LCN 0/LGN 0 - designated as a supervisory channel only

## **ED,PRMTR,MACRO,MAP**

### **CHANGE MACRO SPACE**

#### **Explanation Of Command**

This command is used by the frame administrator to request a change in the amount of memory space allocated to macros or maps for all users of the system.

#### **Command**

[I.38501]

**ED-PRMTR-{MACRO|MAP}: [<xy>]::[ww]:sss;**

#### **Completion Message**

[O.38501]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M ED PRMTR {MACRO|MAP}:::[ww]:sss COMPLD
/* [O.38501] */
/* New space, Old space */
"sss,ttt"
;
```

#### **Denial Message**

[O.38501.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M ED PRMTR {MACRO|MAP}:::[ww]:<user macro space> DENY
mmmm
/* [O.38501.01] */
/* <explanation of error condition code> */
;
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**ttt** - Old user macro space allocation (000 through 100 percent)

Variable ttt represents the space previously allocated to user macros for the entire DACS II system as a percentage of the system macro space.

**mmm** - Error condition code

**mmm**    *Explanation*

**SNVS**    Command is Frame administrator (DAX) only.

---

## ED,PRMTR,MAP

---

### CREATE PICTURE ALTERNATE MAP

#### Explanation Of Command

---

This command takes a **PIC** (picture) of currently-implemented cross-connections and stores them in the **new map name**. **reference map name** is the name of the map that contains the desired list of cross-connections.

**one to seven characters long.**

Output from this command is sent only to the link on which the command was input.

#### Command

---

[I.19031]

```
ED-PRMTR-MAP:[<xy>]::[ww]:<new map name>,\

## **Autonomous Message**

---

Not applicable.

## **Explanation Of Parameters**

---

**MAP** - Map

new map name

- The new alternate map to be created by this message

"new map name" is a string of capitalized alphanumeric characters. The first character must be an alphabetic character. The maximum length of a map name is seven characters.

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

This number identifies the first NPC that contains either a non-two-way, two-point cross-connection, or a cross-connection with a termination on an NPC not found in the reference alternate map.

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |

## **ED,PRMTR,MSGLOG,ON,OFF**

Turn ON or OFF the Message Logging feature

### **Explanation Of Command**

This command is used to turn ON or OFF the Message Logging feature, which is used to log the MML messages, so they can be retrieved at a later time. Turning ON the Message Logging feature resets the Message Log Number to 1. This command is restricted to those with superuser permissions.

This command can only be used if the message logging feature has been purchased as part of the DACS II software generic.

## **ED,PRMTR,NE,FRAME,CHAR**

### **GROWTH FRAME**

#### **Explanation Of Command**

This command allows the optional frame identifier and unique frame identifier to be set.

Until this command is used, the frame identifier defaults to 00.

#### **⇒ NOTE:**

**Note:** If the frame identifier is protected (hard wired), it cannot be changed by this command.

The **CHAR** field determines the number of characters in the frame identifier (2 is the default).

For DACS II Capacity Expansion Frames (CEF), this command also results in the provisioning of virtual NPCs [9]961, [9]962, [9]963, [9]964, [9]965, and [9]966 (99101, 99102, 99103, 99104, 99105, and 99106 in the hierarchical NPC numbering format), default type VI100.

For Non-CEF frames, this command also results in the provisioning of virtual NPCs 961 and 962 (99101 and 99102 in the hierarchical NPC numbering format), default type VI100. This NPC type may be changed if necessary by the **ED-PRMTR-EQPT::NPC, TYPE** command (Message 38211).

```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**FRAME** - Frame

**fg** - Frame identifier. (alphanumeric, 01 through ZZ).

The frame identifier is optional. If the disk-stored frame identifier is 00, then this command sets the frame identifier to fg. Until the ED PRMTR NE command is used, the frame identifier defaults to 00.

The frame identifier is used in input and output messages.

**CHAR** - Character

**m** - The number of characters in the frame identifier. (2 or 3).

The uid is required. It is also referred to as the target id (tid) when directing a command to a specific frame. It should not be confused with the frame identifier fg.

**mmm** - Error condition code

**mmm** *Explanation*

**SAPS** Frame ID is protected

---

## **ED,PRMTR,SALMS,PMACR,PMAMJ,DMAMN,MI**

### **CHANGE SHELF ALARMS SEVERITY**

#### **Explanation Of Command**

This command is used to change the Alarm Severity of the system shelf alarms. The Alarm Severity must be turned ON via I.38355 to use this command.

**PMACR** - CRITICAL alarm severity

**PMAMJ** - MAJOR alarm severity

**DMAMN** - MINOR alarm severity

**MI** - MESSAGE INFORMATION alarm severity

**RESET** - Reset Alarm Severity to default value

mmmm - Error condition code

mmmm *Explanation*

**SNVS** Alarm Severity Feature (already) OFF  
**SAAS** Alarm Severity of Shelf Alarm not changed  
**SNVS** Shelf escalation less than source severity

## **ED,PRMTR,T0,INCL,TERM,RLS,F,T,B,L,G,A**

### **CHANGE CROSS-CONNECT TERMINATION STATUS**

#### **Explanation Of Command**

This command is used to request a change in the termination status of the specified cross-connected circuit or range of circuits which were established by a two-point or multipoint cross-connect command.

If successful, the requested change is echoed ([NOT [u]rst-vvv]{TLA|TLR}{F|T|B|L|G|A}), followed by the new termination state (**NEW STATE**) of the circuit. If the range option was given, the new states of the circuits in the range may differ, noted by the **RNG** keyword.

#### **Command**

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**ed-f-hg**

- Hierarchical NPC number not affected by this message

**uv,wx,ed**

- Unit number

**m,k,f**

- Module number

**np,qr,hg**

- NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

VI NPC numbers listed by unit, module, and NPC Number  
Unit Type VI (Virtual)

| Unit      | Module   | NPC          |                                 |
|-----------|----------|--------------|---------------------------------|
| <b>99</b> | <b>1</b> | <b>01-02</b> | <b>(DACS II Non-CEF frames)</b> |
| <b>99</b> | <b>1</b> | <b>01-06</b> | <b>(DACS II CEF frames)</b>     |

**ddd** - FROM channel number

**jjj** - TO channel number

**eee** - FROM channel number denoting the end of the range

**kkk** - TO channel number denoting the end of range

**vvv** - Channel number not affected by this command.

The valid channel numbers are:

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

Conference numbers

001-085 (MB NPC)

001-500 (Virtual NPC)

**TERM** - Terminate

**s** - Direction of transmission to be terminated

If the cross-connection is between a facility terminating unit (FTU) and a virtual NPC (VI type NPC), once terminated, the FTU NPC will send out its provisioning insertion word (PIW) as the idle code.

**RLS** - Release

**s** *Explanation*

**A** Towards the facilities and the bridge (multipoint only)

**B** Towards both terminations

**F** Towards the FROM termination

**G** Towards the bridge (multipoint connection only)

**L** Towards the facilities (multipoint connection only)

**T** Towards the TO termination

**INCL** - Inclusive

Use this keyword, to change the termination status on a channel or range of channels including one or more channels marked as a red. The command will otherwise be denied if one or more of the cross-connected circuits in the range are marked as red.

**NOT** - Not

The LEG is not affected by this command

**mmm, nnn**

- Channel number involved in the denial.

Otherwise, the same as **ddd**.

**RNG** - Range

**RDLD** - Red lined

The change in termination status was performed on a red circuit. If the command specified a range of circuits, then at least one of the circuits involved was a red circuit. This keyword will appear only if the **INCL** keyword was specified in the command.

**CUS** - Customer

The change in termination status was performed on a customer controlled circuit. If the command specified a range of circuits, then at least one of the circuits involved was a customer controlled circuit.

**d** - Direction

**d**      *Direction*

**F**      From

**T**      To

**B**      Both

**st** - Status

**mmm** - Error condition code

## **ED,PRMTR,T0,INCL,TLP,NG,ES**

### **CHANGE CIRCUIT PARAMETERS**

#### **Explanation Of Command**

This message requests DACS II to change the parameters of a multipoint circuit leg. Termination [s]abcddd must be either a termination on an FTU (facility terminating unit), IFTU (integrated Facility Terminating Unit), DS3U (DS3 Unit), HDS3U (Hybrid DS3 Unit) or DSPU (Digital Signal Processing Unit) NPC. Termination [t]ghijj must be a termination on a DSPU NPC.

## Autonomous Message

Not applicable.

## Explanation Of Parameters

[s]abc - The 3- or 4-digit nonhierarchical FROM NPC number  
[t]ghi - The 3- or 4-digit nonhierarchical TO NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|
| <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       | <b>NPC</b>       |

**uv-m-np**

- Hierarchical FROM NPC number

**wx-k-qr**

- Hierarchical TO NPC number

**uv,wx** - Unit number  
**m,k** - Module number  
**np,qr** - NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd** - FROM channel number

|         |                             |
|---------|-----------------------------|
| 000-030 | CEPT type NPCs grown as CAS |
| 000-031 | CEPT type NPCs grown as NSA |

**Note:** Channel 000 of a CEPT NPC (TS0) can be connected to another channel 000 of a CEPT NPC (TS0).

Channel 031 of a CAS NPC (TS16) can only be cross-connected to another channel 031 of a CAS NPC (TS16) or one-way cross-connected to another channel. Also these two channels cannot be part of any conference.

**jjj** - TO channel number

|         |          |
|---------|----------|
| 001-085 | (MB NPC) |
|---------|----------|

**TLP** - Transmission level point

Specify the incoming and outgoing gain adjustments relative to the TO multipoint circuit by using the TLP (snn,smm) field. Gain adjustment snn is applied as the signal enters the bridge, while smm is applied as the signal leaves.

- snn** - Incoming gain adjust parameter  
**smm** - Outgoing gain adjust parameter  
**s** - Sign (+ or -)  
**nn** - Incoming gain adjust value (-90 through +88)  
**mm** - Outgoing gain adjust value (-90 through +88)

These are the parameters requested for the TO termination. Values are given in steps of two and the units are tenths of a db.

Certain situations require replacement of the gain adjust parameter values with "---". In general "---" is used for either snn or smm (but not both) when no change is to be made to that parameter. This feature allows changing only one of the two parameters if desired. Also, if the cross-connection was provisioned with the NTR (no transmit) option, the gain adjustment in the direction for which transmission is shut off MUST be ---. See the table below to see what situations require "---".

| <i>FROM</i> | <i>TO</i> | <i>snn</i>          | <i>smm</i> |
|-------------|-----------|---------------------|------------|
| BRD         | BBL       | ---                 | smm        |
| BBL         | BRD       | snn                 | ---        |
| LEG         | BBL       | ---                 | smm        |
| LEG         | BRD       | snn                 | ---        |
| LEG         | SYM       | snn                 | smm        |
| BBL         | LEG       | Invalid combination |            |
| BBL         | SYM       | Invalid combination |            |
| BRD         | LEG       | Invalid combination |            |
| BRD         | SYM       | Invalid combination |            |

- NG** - Noise guard  
**nn** - Requested NG level setting (00, 06, 12, or 18) db

To specify the noise guard level setting, use NG nn. The following default values apply:

For Symmetrical bridges Default: NG = -18 db  
For Polling circuits Default: NG = 0 db

- ES** - Echo suppression  
**ee** - Requested ES level setting (00, 06, 12, or 18) db

To specify the echo suppression level setting, use ES ee. The following default values apply:

For Symmetrical bridges Default: ES = -18 db  
For Polling circuits Default: ES = 0 db

At least one of the three parameters (TLP, NG, ES) must be specified.

Since a BBL (backbone leg) has no input to the bridge and the bridge has no output to a BRD (broadcast) leg, transmission values in these directions cannot be changed.

**INCL** - Inclusive

INCL is used to change the parameters on a circuit marked either as a red or a customer controlled circuit. If this option is not used, the command will be denied such a circuit.

**spp, sqq**

- New gain setting. Otherwise, the same as snn and smm.

**ff**

- New noise guard setting. Otherwise, the same as nn.

**hh**

- New echo suppression setting. Otherwise, the same as ee.

**RDL D** - Red lined

These keywords indicate the connection is marked as a red circuit.

**CUS** - Customer

The connection is a Customer-controlled Circuit.

**mmmm** - Error condition code

**mmmm** *Explanation*

|             |                                                                      |
|-------------|----------------------------------------------------------------------|
| <b>IIDT</b> | No RDL D or CUS circuits and INCL keyword used                       |
| <b>ENEQ</b> | UNIT not equipped, not in service, or failed                         |

| <b>IIDT</b> | Illegal SYM BRD combination                                          |
| <b>IIDT</b> | Illegal BRD SYM combination                                          |
| <b>IIDT</b> | Illegal BBL SYM combination                                          |
| <b>IIDT</b> | Illegal SYM BBL combination                                          |
| <b>SNVS</b> | Delete or change a leg from a conference that has no leg             |
| <b>IIDT</b> | Transmission parameters in command will not change existing settings |
| <b>SNVS</b> | Trying to change level out on BRD leg                                |
| <b>SNVS</b> | Trying to change level in on BBL leg                                 |
| <b>IIDT</b> | TO side is not a DMB type NPC                                        |
| <b>IDNV</b> | A subrate circuit pack is specified in the command line              |
| <b>IDNV</b> | CPR circuit pack specified in the command                            |
| <b>ENRE</b> | FROM NPC is not provisioned as DGA                                   |

mmm *Explanation*

**ENRE** Corresponding NPC for FROM virtual channel is not provisioned

**IDNV** Invalid FROM channel number

**SNVS** Trying to change in NTR direction

## **ED,PRMTR,T1,INCL,TERM,RLS,F,T,B,A,NOT**

### **CHANGE CIRCUIT PARAMETERS**

#### **Explanation Of Command**

This message changes the termination state of a cross-connected non-channelized network processing circuit. This command can affect either a two-way, a one-way or a broadcast non-channelized digital signal cross-connection. This command has the ability to change the termination states of all of the legs of a broadcast circuit. However, an option is provided to exclude one of the legs from being changed. The idle code for non-channelized digital signal cross-connections is the alarm indication signal which is transmitted over a terminated connection.

#### **Command**

## Autonomous Message

---

Not applicable.

### Explanation Of Parameters

- [s]abc** - The 3- or 4-digit nonhierarchical non-channelized  
FROM NPC number
- [t]ghi** - The 3- or 4-digit nonhierarchical non-channelized  
TO NPC number
- [u]rst** - The 3- or 4-digit nonhierarchical non-channelized  
NPC number that is not affected by this command.

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

**uv-m-np**

- Hierarchical number of non-channelized FROM NPC

**wx-k-qr**

- Hierarchical number of non-channelized TO NPC

**ed-h-fg**

- Hierarchical number of a leg of a non-channelized digital signal broadcast circuit that is not affected by this command.

**uv,wk,ed**

- Unit number

**m,x,h**

- Module number

**np,qr,fg**

- NPC number within the module

The values are listed below:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**INCL** - Inclusive

Inclusive keyword, required if one or more circuits are marked Customer-controlled (CUS) or Red (RDC)

**TERM** - Terminate  
**RLS** - Release

The direction in which TERM or RLS is to be applied is specified by the use of F, T, B, A, and NOT as defined below:

**F** - Towards the FROM NPC  
**T** - Towards the TO NPC  
**B** - In both directions  
**A** - All directions of a broadcast circuit  
**NOT** - In conjunction with the A options, all directions of a broadcast circuit except the one specified

**RDLD** - Red lined  
NPC is a red lined circuit

**CUS** - Customer  
NPC is a Customer-controlled Circuit

**d** - direction

|   |             |
|---|-------------|
| d | Explanation |
| F | From        |
| T | To          |
| B | Both        |
| A | All         |

**st** - Status of denial

**mmmm** - Error condition code

| mmmm        | st           | Explanation                                                           |

## **EMTC,STARTUP,STF,ATP**

### **EXPANDED MAINTENANCE STARTUP**

#### **Explanation Of Command**

This message reports that the expanded maintenance circuit has initialized itself and has performed self-diagnostics. The results of these diagnostics are reported. For all tests passed, no action is required.

#### **Command**

Not applicable.

#### **Completion Message**

Not applicable.

#### **Denial Message**

Not applicable.

#### **Autonomous Message**

[O.01282]

**EMTC STARTUP {STF|ATP}**

### **Explanation Of Parameters**

---

**EMTC** - Expanded maintenance circuit

**STF** - Some tests failed

**ATP** - All tests passed

## **ENT,EQPT,SYNC,FPLL**

### **CONFIGURE SYNCHRONIZER**

#### **Explanation Of Command**

This command requests the fast start of the phase-locked loop in a synchronizer.

#### **Command**

```
[I.35011]
ENT-EQPT:[<xy>]:SYNC-a:[ww]:FPLL;
```

#### **Completion Message**

```
[O.35011]
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M ENT EQPT::SYNC-a:[ww]:FPLL COMPLD
 /* [0.35011] */
;
```

#### **Denial Message**

```
[O.35011.01]
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M ENT EQPT::SYNC-a:[ww]:FPLL DENY
 mmmm
 /* [0.35011.01] */
 /* <explanation of error condition code> */
;
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**SYNC** - Synchronizer

**a** - Synchronizer number (0 or 1)

**FPLL** - Fast start phase-locked loop

**mmmm** - Error condition code

## **EXC,DSPC**

---

### **DIGITAL SIGNAL PROCESSING PLATFORM APPLICATION COMMANDS**

#### **Explanation Of Command**

---

This command explains the command syntax from the DACS II point of view for all applications that run on the Digital Signal Processing Platform (DSPP) circuit pack (TG193). All applications use a prefix system for both input commands and output messages of all types for communication between the user and the application. This prefix system is defined in the subsequent commands and messages. The prefix system permits DACS II to send a command to an application without parsing and/or examining that command. Any return message from the application uses a prefix also, which is simply prepended to the return message from the application by DACS II. Similarly, an autonomous message from an application is prepended with a prefix that identifies the NPC number of the particular DSPP circuit pack on which the message was issued.

The commands for a particular application are given in detailed form in the documentation package for that application. In that documentation the prefix notation that is explained here is also given, so that the user sees a complete command structure. Depending on the individual command that command may be sent to an individual DSPP circuit pack running that application, a range of circuit packs running that application, or all circuit packs running that application restored in the frame.

```
 [<xy>] yy-mm-dd hh:mm:ss
A ff REPT ALM TS DSPC uv-m-np <mml_application_autonomous_message>
```

## Explanation Of Parameters

---

### EXC-DSPC

- Execute <mml\_application\_command> on  
Digital Signal Processing Platform (DSPP)

**[s]aaa** - NPC number of DSPP Platform running application that will  
receive command or NPC number at beginning of range  
(3- or 4-digit)

### uv-m-np

- NPC number of DSPP Platform running application that will  
receive command or NPC number at beginning of range  
(hierarchical)

**[v]bbb** - NPC number for end of range specified or last NPC number  
in frame of type SDxyz (3- or 4-digit)

**wx-k-qr** - NPC number for end of range specified or last NPC number  
in frame of type SDxyz (hierarchical)

**SDxyz** - Type designation for DSPP Platform running application "x".

This addresses all DSPP circuit packs that run application "x". Where "x" is a hexadecimal number that identifies the application. Values "y" and "z" are ignored, because they are possibly used internally by the application at the time the application is restored. Please note that "SDxyz" is also used at the time a DSPP circuit pack is grown to run a particular application.

**<mml\_application\_command>** - This is an MML command string that is sent  
to the application.

**<mml\_application\_response for NPC hhh>** - This is an application command  
response in MML for a particular  
NPC designated by the number hhh

**<mml\_application\_error\_response for NPC hhh>**- This is an MML error message  
generated when the application  
running on NPC hhh found an  
error in a command

**<mml\_application\_autonomous\_message>** - This is an application autonomous  
message in MML

Beyond the prefix notation that is explained here no specific conventions for an application are documented here. Instead, the exact command structure for commands that are handled by an application is given by the documentation for that application. This includes such items as terminating "!" for PDS strings and terminating ";" for MML strings. All error messages and condition codes generated by the application are given in the application documentation.

mmm - Error condition code

mmm *Explanation*

|             |                                                                |
|-------------|----------------------------------------------------------------|
| <b>ENEQ</b> | Subject entity is not equipped                                 |
| <b>SAOS</b> | Subject entity is out of service                               |
| <b>SNVS</b> | NPC type error                                                 |
| <b>SAOS</b> | Application circuit pack is out of service                     |
| <b>SNVS</b> | Invalid NPC number specified                                   |
| <b>SROF</b> | Platform Communication Error                                   |
| <b>SNVS</b> | The (last) destination NPC denies the DSPC command             |
| <b>SNVS</b> | The (last) destination NPC failed, and was rebooted            |
| <b>SNVS</b> | Initialization of application in progress, retry command later |

## **EXC,MACRO**

---

### **EXECUTE MACRO**

#### **Explanation Of Command**

---

This message requests the execution of macro **<name>**. The optional fields **p1**, **p2**, etc., specify parameters used in the macro.

To list the contents of a macro, use the **RTRV-MACRO-COM** command, Message I.54131.

The **NULL** keyword may be used as a parameter.

#### **Command**

---

[I.39301]

```
EXC-MACRO:[<xy>]::[ww]:<macro name>:[<p1>[&<p2>[&<p3>\
[&...[&<p10>]]]]];
```

#### **Completion Message**

---

[O.39301]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]

```

### Autonomous Message

---

Not applicable.

### Explanation Of Parameters

---

p1,  
p2,  
p3,  
...,  
p10 - Macro parameter values (1 to 7 uppercase alphanumeric characters)

Within a macro a parameter is referred to by #nn. The # sign indicates a parameter reference follows and the nn indicates the position in the command line from which the parameter value will be taken. That is, if the parameter reference #03 is contained in a line within a macro then the third parameter on the EXC-MACRO command line will be substituted for each appearance of the parameter reference #03.

A maximum of 10 parameters can be specified.

**macro name**

- Macro name (seven characters maximum length)

The name of a collection of DACS II commands executed as a group.

A macro name is a string of capitalized alphanumeric characters. There are two type of macros; public and private. A private macros is created by a user in space allocated to the user by the system administrator. Only the user that created it can execute or read (LIST) a private macro. A public macro is created by the system administrator and is executable and readable by all users. A public macro name must start with the letter "P". A private macro name must not start with the letter "P".

**STOP** - Indicates that macro execution is stopped

**mmm** - Error condition code

| <b>mmm</b> | <i>Explanation</i> |
|------------|--------------------|
|------------|--------------------|

|             |                                      |
|-------------|--------------------------------------|
| <b>SNVS</b> | File is being accessed               |
| <b>SNVS</b> | File doesn't exist/can't be accessed |
| <b>SNVS</b> | Incorrect language/addressing mode   |
| <b>SNVS</b> | Incorrect number of parameters       |
| <b>SNVS</b> | No user is logged in on the link/vc  |

## **EXC,MAP,CLR,INCL**

### **ACTIVATE ALTERNATE MAPS**

#### **Explanation Of Command**

This command requests the activation of an alternate map.

DACS II will not generate individual completion messages for each successful cross-connection; however, it will generate individual denial messages. Moreover, the individual denial messages will only be output to the link/user where the alternate map command was entered, independent of the output screening level.

When only one end of a TCON is remapped via this command, the trunk conditioning specified for a particular cross-connection when that cross-connection was first established will be applied to a disconnected channel.

#### **Command**

[I.39201]

**EXC-MAP:[xy]::[ww]:<map name>:[CLR][,INCL];**

#### **Completion Message**

#### **Nonhierarchical**

[O.39201]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M EXC MAP:::[ww]:<map name>:[CLR][,INCL] COMPLD
/* [O.39201] */
"COND-cc"
"NPC [s]abc"
;
```

### **Hierarchical**

---

[O.39201]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M EXC MAP:::[ww]:<map name>:[CLR][,INCL] COMPLD
/* [O.39201] */
"COND-cc"
"NPC uv-m-np"
;
```

### **Denial Message**

---

### **Nonhierarchical**

---

[O.39201.02]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M EXC MAP:::[ww]:<map name>:[CLR][,INCL] DENY
mmmm
/* [O.39201.02] */
/* <explanation of error condition code> */
/* Component that failed */
"CONN-CRS-TO::[s]jkl-ddd[&&-eee],[t]ghi-jjj[&&-kkk]\
:[<tc>,<sc>,<NAM>]:[RDLD,CUS,INCL]"
;
```

**Note:** If an individual cross-connection fails within the map, DACS II will indicate it with the above message.

## **Hierarchical**

---

[O.39201.02]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M EXC MAP:::[ww]:<map name>:[CLR][,INCL] DENY
 mmmm
 /* [0.39201.02] */
 /* <explanation of error condition code> */
 /* Component that failed */
 "CONN-CRS-TO::ed-h-fg-ddd[&&-eee],wx-k-qr-jjj[&&-kkk]\
: [<tc>,<sc>,<NAM>:[RDLD,CUS,INCL]"
;
```

**Note:** If an individual cross-connection fails within the map, DACS II will indicate it with the above message.

## **Common**

---

[O.39201.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M EXC MAP:::[ww]:<map name>:[CLR][,INCL] DENY
 mmmm
 /* [0.39201.01] */
 /* <explanation of error condition code> */
;
```

[O.55703]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M EXC MAP:::[ww] IN_PROGRESS
;
```

**Note:** As the alternate map is being executed, DACS II will generate the above IN PROGRESS message every 20 seconds.

## **Autonomous Message**

---

Not applicable.

## Explanation Of Parameters

### map name

- Map name (1 to 7 uppercase alphanumeric characters)

Name of an already existing alternate map.

### CLR - Clear

Clear all cross-connections on all NPCs included in the map before activating the alternate map.

### INCL - Inclusive

When an alternate map is activated, existing circuits that are marked CUS or RDLD will be overwritten only if the INCL keyword has been specified. Otherwise, a denial will be issued as is currently done for channels under test, etc.

### NPC - Network processing circuit

[s]abc - The first 3- or 4-digit nonhierarchical NPC number of NPC containing a non-two-way, two-point cross-connect.

### [s]jkl, [t]ghi

- The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number

Unit Type FT (IFTU2/IFTU/FTU)

**uv-m-np**

- First hierarchical NPC number of NPC containing a non-two-way,  
two-point cross-connect.

**ed-h-fg**

- Hierarchical NPC number

**wx-k-qr**

- Hierarchical NPC number

**uv,wx,ed**

- Unit number

**m,k,h** - Module number

**np,qr,fg**

- NPC number within the module

The valid values are listed below:

PA, PB, and PC type numbers listed by unit, module, and NPC Number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**ddd,jjj**

- Channel number, the first channel of a range

**eee,kkk**

- Channel number, the last channel of a range

000-031          CEPT

**tc**

- Trunk conditioning

**sc** - Signaling control

This variable represents the optional signaling bit control specification and is used only in the Channel Associated Signaling (CAS) to CAS application with CAS signaling.

If this option is not used, all four cross-connected time slot 16 (**abcd**) signaling bits in each direction will be cross-connected unchanged.

Signaling control is specified as follows:

**SC-abcd,efgh**

**abcd** - Time slot 16 signalling bits, From direction

**efgh** - Time slot 16 signalling bits, To direction

All 8 bits can be controlled independently. Control is applied by replacing each character in variable **abcd** or **efgh** with the appropriate control character.

The allowable control characters are:

*Bit*

*Setting Explanation*

**P** Pass through unchanged

**V** Pass through inverted

**0** Set output to 0

**1** Set output to 1

The effect of the **V** control character depends upon whether the connection is international or gateway.

International: Inversion takes place on both the From and To-direction sides. The net effect is to cancel out the inversion. Hence it will appear that no inversion took place.

Gateway: Inversion takes place only on the international side of the connection. The effect is an inversion.

**NAM** - No A to Mu (conversion)

A- to  $\mu$ -law conversion is inhibited.

**mmm** - Error condition code

**mmm** *Explanation*

**NCON** No conditions

**SNVS** File is being accessed

**SNVS** File doesn't exist/can't be accessed

**SNVS** Some circuits not activated,cleared or pictured

**SNVS** The reference map does not exist

**SNVS** The map is not valid

| <b>mmmm</b> | <i>Explanation</i>                                                    |
|-------------|-----------------------------------------------------------------------|
| <b>SNVS</b> | Both sides of CCN are OOS                                             |

Not applicable.

**Explanation Of Parameters**

---

Not applicable.

## INH,SW,EQPT,UNIT,MMFG,PROTN,WKG

### INHIBIT SWITCH MMFG

#### Explanation Of Command

This message requests the inhibition of automatic protection switching from multiplexer-multiple interface unit functional group (MMFG) c on a DS3 unit (DS3U) or a Hybrid DS3 unit (HDS3U) to MMFG P or the automatic switchback from MMFG P to service MMFG c (when MMFG c becomes in-service). Only automatic switches due to failure will be affected by this message.

If **PROTN** is specified and MMFG P is already protecting the MMFG c's facility, the command will be denied.

If **WKG** is specified and MMFG c is not under protection, the command will be denied.

This inhibition will be removed if a switch occurs from the "selected" MMFG.

#### Command

[I.35311]

**INH-SW-EQPT : [<xy>] : UNIT - [q]q : [ww] : MMFG-c [&&-d] : {PROTN|WKG};**

#### Completion Message

[O.35311]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M INH SW EQPT::UNIT-[q]q:[ww]:MMFG-c[&&-d]:{PROTN|WKG} COMPLD
/* [0.35311] */
/* MMFG-number */
"a"
;
```

### **Denial Message**

---

[O.35311.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M INH SW EQPT::UNIT-[q]q:[ww]:MMFG-c[&&-d]:{PROTN|WKG} DENY
 mmmm
 /* [0.35311.01] */
 /* <explanation of error condition code> */
 /* MMFG-number */
 "a"
;
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**UNIT** - Unit

**[q]q** - Unit number (1 through 16)

**MMFG** - Multiplexer-multiplexer interface unit functional group

**c, d** - The number of the MMFG within the unit (1 - 6)

**PROTN** - Protection

The command requests the inhibition of automatic protection switching to the protection MMFG

**WKG** - Working

The command requests the inhibition of automatic switching to the service MMFG. A range of MMFGs is not acceptable if this keyword is specified; the command will be denied.

**a** - The number of the service MMFG within the range c and d

mmmm - Error condition code

mmmm *Explanation*

## **INIT,LOG,ERR,HWER,SWER**

### **UTILITY CLEAR HARDWARE/SOFTWARE ERROR RECOVERY LOG FILE**

#### **Explanation Of Command**

This message clears the DACS II error rate (ERR) recovery log. The log is a file that contains the history of the recovery events.

#### **Command**

[I.56061]

**INIT-LOG:[<xy>]::[ww]:ERR:{HWER|SWER};**

#### **Completion Message**

[O.56061]

<xy> yy-mm-dd hh:mm:ss LINK-n[vv]  
**M INIT LOG:[<xy>]::[ww]:ERR:{HWER|SWER} COMPLD**  
;

#### **Denial Message**

[O.56061.01]

<xy> yy-mm-dd hh:mm:ss LINK-n[vv]  
**M INIT LOG:[<xy>]::[ww]:ERR:{HWER|SWER} DENY**  
mmmm  
/\* [O.56061.01] \*/  
/\* <explanation of error condition code> \*/  
;

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

**HWER** - Hardware error recovery log file

**SWER** - Software error recovery log file

**mmm** - Error condition code

**mmm**    *Explanation*

**SAOS**    File has already been cleared

## **INIT,MSGLOG,RSTNUM**

### **CLEAR MESSAGE LOG**

#### **Explanation Of Command**

This message will clear the Message Log. Using this command does not automatically reset the message log counter to 1, however there is an option provided that will allow the counter to be reset. This command is restricted to those with superuser permissions.

#### **Command**

Not applicable.

#### **Completion Message**

[O.57031]

```
 [<xy>] yy-mm-dd hh:mm:ss LINK-n[vv]
M INIT MSGLOG::::[RSTNUM] COMPLD
;
```

#### **Denial Message**

[O.57031.01]

```
 [<xy>] yy-mm-dd hh:mm:ss LINK-n[vv]
M INIT MSGLOG::::[RSTNUM] DENY
 mmmm
 /* [O.57031.01] */
 /* <explanation of error condition code> */
;
```

#### **Autonomous Message**

Not applicable.

### **Explanation Of Parameters**

---

**MSGLOG** - Message Log

**CLR** - Clear

**RSTNUM** - Reset the message log counter to 1

**mmmm** - Error condition code

**mmmm** *Explanation*

**ENEQ** Feature is (already) off

## **INIT,REG,ALL**

### **UTILITY CLEAR**

#### **Explanation Of Command**

This message requests a clear of the counters or state on a specified facility performance parameter for all in-service network processing circuits (NPCs) which have the specified parameter.

DACS II will silently skip NPCs which can not be cleared.

#### **Command**

[I.56011]

**INIT-REG:[<xy>]::[ww]:<parameter>:ALL;**

#### **Completion Message**

[O.56011]

<xy> yy-mm-dd hh:mm:ss LINK-n[vv]  
**M INIT REG:::[ww]:<parameter>:ALL COMPLD**

**Explanation Of Parameters**

---

**CLR** - Clear

**parameter**

- Facility performance monitoring parameter

The addition to this message requests a clear of the counters or state of the facility performance PM 24 hour, PM previous 15 minute and PM current 15 minute or the total since "local midnight" for the parameters listed below for all in-service PB and or PC type NPCs.

| <i>parameter</i> | <i>Explanation</i>                                      |
|------------------|---------------------------------------------------------|
| CRC              | CRC-4 check block error events                          |
| FRER             | Framing error events                                    |
| LOFA             | Loss of frame alignment events                          |
| MER              | Multiframe error alignment events (time slot 16)        |
| PM               | Performance monitoring. Clears the following registers: |
|                  | DM Degraded Minutes                                     |
|                  | ERS Errored Seconds                                     |
|                  | SERS Severely Errored Seconds                           |
|                  | SLIP Slip Events                                        |
|                  | US Unavailable Seconds                                  |

mmm - Error condition code

mmm *Explanation*

|             |                                                          |
|-------------|----------------------------------------------------------|
| <b>SAOS</b> | Subject entity is out of service                         |

## Autonomous Message

Not applicable.

## Explanation Of Parameters

**CLR** - Clear

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number, the first NPC number of a range

**[t]def** - The 3- or 4-digit nonhierarchical NPC number, the last NPC number of a range

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:  
PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |

| <b>IDNV</b> | The parameter specified does not match with the NPC type |

## **INIT,REG,NPC**

### **CLEAR FACILITY PERFORMANCE PARAMETERS**

#### **Explanation Of Command**

This message requests the facility performance parameters be cleared of the values or state for one network processing circuit (NPC).

This message clears all facility performance parameters except the loss of frame alignment (LOFA) parameter on one CEPT PB or PC type NPC.

#### **Command**

##### **Nonhierarchical**

[I.56051]

**INIT-REG: [<xy>]:NPC-[s]abc:[ww];**

**Autonomous Message**

Not applicable.

**Explanation Of Parameters**

**NPC** - Network processing circuit

**[s]abc** - The 3- or 4-digit nonhierarchical NPC number

If NPC numbers are expressed in three digits, the valid values are:

PA, PB, and PC type NPC numbers listed by unit number,  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1      | Unit<br>2      | Unit<br>3      | Unit<br>4      | Unit<br>5      | Unit<br>6      |
|----------------|----------------|----------------|----------------|----------------|----------------|
| <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     | <b>NPC</b>     |
| <b>001-032</b> | <b>161-192</b> | <b>321-352</b> | <b>481-512</b> | <b>641-672</b> | <b>801-832</b> |
| <b>041-072</b> | <b>201-232</b> | <b>361-392</b> | <b>521-552</b> | <b>681-712</b> | <b>841-872</b> |
| <b>081-112</b> | <b>241-272</b> | <b>401-432</b> | <b>561-592</b> | <b>721-752</b> | <b>881-912</b> |
| <b>121-152</b> | <b>281-312</b> | <b>441-472</b> | <b>601-632</b> | <b>761-792</b> | <b>921-952</b> |

If NPC numbers are expressed in four digits, the valid values are:

PA, PB and PC type NPC numbers listed by unit number  
Unit Type FT (IFTU2/IFTU/FTU)

| Unit<br>1        | Unit<br>2        | Unit<br>3        | Unit<br>4        |
|------------------|------------------|------------------|------------------|

| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

#### PARAMS

- Parameters

For CEPT NPCs, the parameters which will be cleared with this command are:

| <i>Parameter</i> | <i>Explanation</i>                               |
|------------------|--------------------------------------------------|
| CRC              | Cyclic Redundancy Code                           |
| FRER             | Framing Error                                    |
| MER              | Multiframe Alignment Error Events (time slot 16) |
| DM               | Degraded minutes                                 |
| ERS              | Errored Seconds                                  |
| SERS             | Severe Errored Seconds                           |
| US               | Unavailable seconds                              |
| SLIP             | Slip count                                       |

**Note:** BER condition is not clearable for CEPT type NPCs, even though it is clearable for domestic type NPCs.

*mmmm Explanation*

**SNOS** Subject PWR to be cleared is not failed

## **INIT,REG,T1,NPC,ALL**

### **UTILITY CLEAR DA/TA/PA/TH NPC PARAMETERS**

#### **Explanation Of Command**

This message clears the facility performance monitoring parameter counts of DA, TA, TH, and PA type NPCs.

This command will handle NPC addressing in the input command as follows: If only a single NPC is addressed in the input command, then either a completion or denial response will be generated for the addressed NPC. DACS II will always deny invalid commands to specifically addressed NPCs.

If a range of NPCs is addressed or the ALL NPC keyword is used and the feature applies to one or more NPCs within the range, DACS II will perform the operation on the NPCs in the range that support the requested feature, but skip the NPCs which do not support the requested feature. DACS II provides a variety of line termination types which support different features and can be randomly mixed within the frame. If at least one of the NPCs in the addressed range supports the requested feature, DACS II will generate a completion response for the entire range of NPCs; individual denial responses will not be generated for NPCs within the range which do not support the feature. If *none* of the NPCs in the addressed range support the requested feature, DACS II will generate a range denial response. NPC - Network processing circuit

If an NPC range is specified in the input command, the following floating window rules apply:

1. Unequipped NPCs within the requested range will be skipped.
2. If a CEPT gap is within the requested range, the NPCs in the gap will be skipped.
3. If an endpoint of the requested range is in a CEPT gap, then the command will be denied."

## Autonomous Message

---

Not applicable.

## Explanation Of Parameters

---

NPC - Network processing circuit

### uv-m-np

- Hierarchical NPC number

### wx-k-qr

- Hierarchical NPC number

uv,wx - Unit number

m,k - Module number

np,qr - NPC number within the module

The valid values are:

ALL - All

This keyword is a valid option for NPCs rather than specifying a single or range of NPCs. It is used to clear a single parameter on all PA/TH type NPCs. If the ALL NPC option is selected, the input command must specify only a single facility parameter. An input command with the ALL NPC key word and any facility parameter groupings, i.e., ALLPM, ALLE or ALLF, will be denied.

[s]abc - The 3- or 4-digit nonhierarchical NPC number

[t]def - The 3- or 4-digit nonhierarchical NPC number

The valid values are:

If NPC numbers are expressed in three digits, the valid values are:

PA type NPC numbers listed by unit number, Unit Type FT (FTU)

| Unit<br>1 | Unit<br>2 | Unit<br>3 | Unit<br>4 | Unit<br>5 | Unit<br>6 |
|-----------|-----------|-----------|-----------|-----------|-----------|
| NPC       | NPC       | NPC       | NPC       | NPC       | NPC       |
| 001-032   | 161-192   | 321-352   | 481-512   | 641-672   | 801-832   |
| 041-072   | 201-232   | 361-392   | 521-552   | 681-712   | 841-872   |
| 081-112   | 241-272   | 401-432   | 561-592   | 721-752   | 881-912   |
| 121-152   | 281-312   | 441-472   | 601-632   | 761-792   | 921-952   |

If NPC numbers are expressed in four digits, the valid values are:

**uv-m-np**

- Hierarchical NPC number

**wx-k-qr**

- Hierarchical NPC number

**uv,wx** - Unit number

**m,k** - Module number

**np,qr** - NPC number within the module

The valid values are:

PA type numbers listed by unit, module, and NPC Number

Unit Type FT (FTU)

| Unit         | Module     | NPC          |
|--------------|------------|--------------|
| <b>01-16</b> | <b>1-4</b> | <b>01-32</b> |

**parameter**

- Parameter name

The type of monitored parameter accumulation registers which are to be reset. If only a single NPC is specified in the input command, all types of its parameter accumulators may be reset (possibly restricted by the choices of other input parameters) by selecting the value ALLPM in the <parameter> field. If more than one NPC is specified in the input command, then ALLPM, ALLE, and ALLF are not valid values for parameter.

The values ALLE or ALLF may be selected to clear all Near-end or all Far-end parameters, respectively, as a group. The far-end parameters are: FEBE, FES, FSES, and FUAS. All other parameters are near-end parameters. **Note that parameters FEBE, FES, FSES and FUAS are not applicable for the TH type NPCs.**

**parameter**      *Explanation*

|       |                                      |
|-------|--------------------------------------|
| ALLE  | All Near-end parameters listed below |
| ALLF  | All Far-end parameters listed below  |
| ALLPM | All parameters listed below          |
| CRC   | CRC Block Errors                     |
| CSS   | Controlled Slip Seconds              |
| CV    | Coding Violations                    |
| ES    | Errored Seconds                      |
| FEBE  | Far End Block Errors                 |
| FES   | Far End Errored Seconds              |
| FRER  | Framing Errors                       |
| FSES  | Far End Severely Errored Seconds     |
| FUAS  | Far End Unavailable Seconds          |
| MER   | Multiframe Errors                    |
| OFS   | Out of Frame Seconds                 |
| SES   | Severely Errored Seconds             |
| UAS   | Unavailable Seconds                  |
| UATC  | Unavailable Time Count               |

**AI** - Accumulation interval

**aaaaa** - The accumulation time period for the specified parameter

If the ALLAI option is specified, the command will be applied to all 15-minute and daily accumulators. That is, all accumulators will be reset.

**aaaaa** *Explanation*

15MIN Parameter count from a 15-minute accumulator

ALLAI Parameter counts from both 15-minute and daily accumulators

DAILY Parameter count from a daily accumulator

**MONDAT** - Monitored Date

**dddd** - This option specifies the performance monitoring period to be reset. It is used to allow users to specify the counts of which 24-hour period (current or previous) are to be cleared. Therefore, this option is applicable only if the AI option is entered with "DAILY". If the "AI DAILY" option is entered without this "MONDAT" field, both the current and previous 24-hour counts will be cleared. The "MONDAT" option cannot be specified with the AI option being 15MIN or ALLAI.

**dddd** *Explanation*

CURD Current day

HIST Previous 24-hour period

**MONTIM** - Monitored Time

**tttt** - This option specifies the performance monitoring period to be reset and can be entered. It is used to allow users to specify the counts of which 15-minute period (current or previous) are to be cleared. Therefore, this option is applicable only if the AI option is entered with "15MIN". If the "AI 15MIN" option is entered without this "MONTIM" field, both the current and previous 15-minute counts will be cleared. The "MONTIM" option cannot be specified with the AI option being DAILY or ALLAI.

**tttt** *Explanation*

CURT Current 15-minute period

HIST Previous 15-minute period

mmmm - Error condition code

mmmm *Explanation*

| <b>IPNV</b> | Interval is not valid/not available                             |

## **INIT,SYS,FRAME**

### **CONFIGURE FRAME**

#### **Explanation Of Command**

This command is used to initialize or change the frame configuration. After this command is successfully completed, DACS II will autonomously update the location information for the packs in the frame.

**WARNING:** A manual backup from Working to MEM must be invoked prior to entering Maintenance Condition, else the command may not complete.

Entering this message will cause DACS II to present the user with self-explanatory menus. These menus allow the user to select the total number of bays and units to be equipped and to specify the bay and unit type for each of them. With the user specified information, DACS II will then determine the physical location of each circuit pack in the frame. The completion message will be output when the user exits from the menu mode.

This command can only be entered under the following conditions:

- It is entered from link 1
- The frame is in the maintenance condition
- The user is a superuser

#### **Command**

## INSTALL

---

### UTILITY FOR APPLICATION SOFTWARE RELEASE INSTALLATION, REMOVAL, AND UPGRADE

#### **Explanation Of Command**

---

Software that runs on the Digital Signal Processing Platform (DSPP) circuit pack is called application software because it is treated by DACS II as a separate and distinct application that interacts with the DACS II generic software through an operating system like interface. Applications for the DSPP circuit pack are packaged and shipped as separately orderable software releases on PCMCIA cards. Documentation for an individual application is also separate from regular DACS II documentation and is shipped together with the PCMCIA card containing that application.

This command (**INSTALL**) performs installation services for application releases. These services consist of:

1. Listing application releases currently installed.
2. Installation of a new application release.
3. Upgrading an older release of an application with a newer release of that application.
4. Removal of an application release.

Usage of this command is limited to the Frame Administrator and users with Restricted Maintenance privileges. The following configuration must be present for a successful application installation, removal, or upgrade.

1. The Main Controller (MC) must be in Maintenance Condition (MCOND).
2. The SMEM slot of the MC must contain the following depending on the task:
  - For installing or upgrading an application the SMEM slot must have inserted into it a PCMCIA card purchased from Lucent Technologies that contains the application to be installed or upgraded.
  - For removing an application the SMEM slot should contain the normal DACS II card with the current executables and system database.

This command allows the listing of application version information, but DACS II must be in MCOND for this to work. Command I.51001 RTVR-MEMSTAT should be used for listing application version information while DACS II is in-service.

The customer must perform the following steps to install an application:

1. The Main Controller must be placed in Maintenance Condition (MCOND).
2. The regular memory card in the SMEM slot must be removed logically and physically.
3. The memory card with the application must be inserted into slot SMEM and then must be restored.
4. The customer must invoke the INSTALL command as shown in the input command format section.
5. The INSTALL command appears as shown in Menu Display 1 below. The user is asked to respond with a number between "1" and "3" or with a "Q" to quit. A response of "1" initially generates a response as shown in Menu Display 1, which shows that in the PMEM slot there is a regular DACS II memory card. This card does not have an application program, thus no application line is shown. The memory card in the SMEM slot is identified as an application distribution card (called DSP DISTRIBUTION CARD), and it **does** have an application on it. Note that the type, the version, and the date stamp of when the application was built is given; this is the identity of the application.
6. The actual install happens when the user responds with a "2" to the INSTALL menu. This is shown in Menu Display 4.
7. Then the user can quit out of the install menu as shown in Menu Display 9. After quitting the install menu the user should remove the application card from the SMEM slot both logically and physically and then restore the regular DACS II memory card in the SMEM slot that had previously been removed.
8. Next the user must copy the executables from the regular PMEM card to the regular SMEM card by executing the command:

**CPY-MEM : : : PMEM, SMEM : PROG ;**

This copying step is mandatory in order to ensure that the application does also reside on SMEM.

9. The user can now verify that the application resides on both memory cards by invoking the INSTALL menu one more time. A listing of the application will be like the one shown in Menu Display 2.
10. The user is now ready to put the Main Controller (MC) back into service.

Upgrading an application from one version to another is a very similar procedure as given above. The memory card carrying the new version of the application must be in the SMEM slot. Menu Display 3 shows what a listing of the applications looks like. Notice that the

regular DACS II card in PMEM has the application version that is to be replaced, while the application card in the SMEM slot has the application version that is to replace the current version. Menu Display 5 shows how the actual upgrade takes place if no NPCs are actually running the application. Menu Display 6 shows how the actual upgrade takes place if at least one NPC is running the application. The user gets a chance to reconsider the upgrade, which must be responded to with a "Y", before the actual upgrade takes place. Please note that as part of the upgrade the application is downloaded into the appropriate DSPP Circuit Pack(s) if they are in service and each affected DSPP Circuit Pack is then rebooted after the download is complete. This last step happens at the time the MC is placed back into service.

Menu Display 7 shows how to remove an application from the regular DACS II memory card. Again, the user is required to respond to "ARE YOU REALLY SURE" questions to ensure that no inadvertent mistakes are made. Menu Display 8 shows what happens when an attempt is being made to remove an application when at least one NPC is still running that application. The removal attempt is denied.

As previously stated, the execution of the **INSTALL** command generates a menu for the user. These menus are shown in nine displays next:

Menu Display 1:

Listing application releases (No application installed, but application card in SMEM slot):

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:1

DSP LOADS ON MEMORY CARDS:

```
===== LOADS ON PMEM: (DACS II CARD) =====
NAME BYTES TYPE VERSION DATE BUILT

```

```
===== LOADS ON SMEM: (DSP DISTRIBUTION CARD) =====
NAME BYTES TYPE VERSION DATE BUILT

```

```
SDxload bbbbbb SDx g.ii.rr yy/mm/dd hh:mm:ss

```

Menu Display 2:

Listing application releases (Both PMEM and SMEM have the same application):

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:1

DSP LOADS ON MEMORY CARDS:

```
===== LOADS ON PMEM: (DACS II CARD) =====
NAME BYTES TYPE VERSION DATE BUILT

SDxload bbbbbbb SDx g.ii.rr yy/mm/dd hh:mm:ss
=====
===== LOADS ON SMEM: (DACS II CARD) =====
NAME BYTES TYPE VERSION DATE BUILT

SDxload bbbbbbb SDx g.ii.rr yy/mm/dd hh:mm:ss

```

Menu Display 3:

Listing application releases (PMEM and SMEM have different versions of the same application, SMEM has an application card)

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:1

DSP LOADS ON MEMORY CARDS:

```
===== LOADS ON PMEM: (DACS II CARD) =====
NAME BYTES TYPE VERSION DATE BUILT

SDxload bbbbbbb SDx g.ii.rr yy/mm/dd hh:mm:ss
=====
===== LOADS ON SMEM: (DSP DISTRIBUTION CARD) =====
NAME BYTES TYPE VERSION DATE BUILT

SDxload bbbbbbb SDx g.ii.rr yy/mm/dd hh:mm:ss

```

Menu Display 4:

Installing a new application release:

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:2

Installing DSP load file: x.xx/SDxload, bbbbbbb bytes from SMEM to PMEM

Installation Complete, Number of files installed from SMEM to PMEM: 1.

Menu Display 5:

Upgrading an older release of an application with a newer release of that application:

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:2

WARNING: different SDxload file exists on target: PMEM

OLD (PMEM): SDxxx g.ii.rr yy/mm/dd hh:mm:ss

NEW (SMEM): SDxxx g.ii.rr yy/mm/dd hh:mm:ss

0 NPCs may be affected

Do you wish to continue overwrite of this file? [y/N]:Y

Installing DSP load file: x.xx/SDxload, bbbbbbb bytes from SMEM to PMEM

Installation Complete, Number of files installed from SMEM to PMEM: 1.

Menu Display 6:

Upgrading an older release of an application with a newer release  
of that application while at least one NPC is running the application.

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:2

WARNING: different SDxload file exists on target: PMEM

OLD (PMEM): SDxxx g.ii.rr yy/mm/dd hh:mm:ss

NEW (SMEM): SDxxx g.ii.rr yy/mm/dd hh:mm:ss

x NPCs may be affected

Do you wish to continue overwrite of this file? [y/N]:Y

Installing DSP load file: x.xx/SDxload, bbbbbb bytes from SMEM to PMEM

Installation Complete, Number of files installed from SMEM to PMEM: 1.

Menu Display 7:

Removing an application release:

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:3

WARNING: This function will REMOVE a DSP PLATFORM load  
from the ISX flash card you specify.

Are you REALLY SURE you wish to proceed? [y/N]: Y

Enter Device [A=PMEM, B=SMEM]: A

----- REMOVE FILES: PMEM DEVICE -----

1. Remove SDxload ( bbbbbb bytes)
- Q. QUIT

Enter File number to remove, or "Q" to QUIT: 1

WARNING: This will remove SDxload on PMEM.

Are you REALLY sure? [y/N]: Y

File SDxload removed from PMEM.

Menu Display 8:

Attempting to remove an application release when NPCs are running that application:

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:3

WARNING: This function will REMOVE a DSP PLATFORM load  
from the ISX flash card you specify.

Are you REALLY SURE you wish to proceed? [y/N]: Y

Enter Device [A=PMEM, B=SMEM]: A

----- REMOVE FILES: PMEM DEVICE -----

1. Remove SDxload ( bbbbbbb bytes) 1 NPCs using load!
- Q. QUIT

Enter File number to remove, or "Q" to QUIT: 1

Can't remove file SDxload, there are 1 NPCs using this load

Menu Display 9:

Quitting the INSTALL menu:

\*\*\*\*\* DSP PLATFORM - LOAD INSTALLATION UTILITY \*\*\*\*\*

1. List DSPP Load Files
2. Install DSPP Load Files
3. Remove DSPP Load Files

Enter number of command [1-3], or Q to QUIT:Q

INSTALL QUIT

### **Command**

```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

#### **INSTALL**

- Invoke the install menu to list, install, upgrade, or remove application files.

**g.ii.rr** - Generic.issue.release string that identifies the version of the application

**SDx** - The "x" in the type field SDx identifies the application

**SD1** X.50/X.57 Subrate application

**SD3** Digital Multipoint Bridge application

**SD4** DDS Subrate and Multipoint Junction Unit application

**SDx** Any future application with identity "x"

**bbbbbb** - Number of bytes in this version of the application

## **LGN,USER**

### **LOG ON TO DACS II**

#### **Explanation Of Command**

**Note:** Before logging on to DACS II for the first time, it is suggested that the user thoroughly read the documentation for this message.

This command allows a user or frame administrator to identify himself/herself to DACS II by an identification code, the **user id**, on any link.

DACS II checks the user id and password against entries previously stored in the data base. If the user is not authorized, DACS II will deny the input command.

A user can log on to DACS II from more than one link.

*If on a Snider administrative link, the command must be entered as follows:*

**LGN-USER:[xy]::[ww]:<user id>;**

The DACS II system will respond with the following dialogue:

PASSWORD: The user enters a password. Note that the password characters are not echoed by DACS II.

*If on an X.25 administrative link, the command must be entered as follows:*

**LGN-USER:[xy]::[ww]:<user id>,<user password>;**

Output from this command is sent only to the link on which the command was input.

### **Command**

---

[I.39001]

**LGN-USER:[<xy>]::[ww]:<user id>[,<user password>];**

If the user is on a Snider administrative link, the message is entered as follows:

[I.39001]

**LGN-USER:[<xy>]::[ww]:<user id>;**

Then DACS II will prompt the following:

PASSWD: (user enters the user password)

### **Completion Message**

| <b>SNVS</b> | Incorrect or missing password |
|-------------|-------------------------------|

## **LGT,TERM,USER,INCL**

### **LOG OFF USER OR LINK**

#### **Explanation Of Command**

This command requests DACS II to log off a user or a link. A user is specified by his or her **<user id>**; a link, by its physical link number. The virtual circuit number is optional. The INCL keyword is also optional. The virtual circuit number and INCL are mutually exclusive. The INCL keyword must be specified to log off all virtual circuits of an X.25 link (5 or 6).

The DACS II frame administrator can use the **<user id>** option from any link to log off any user on another link. If the user is logged in on more than one link and is not the frame administrator, DACS II will log the user off every link. An autonomous message will appear on the user's link if the frame administrator logs a user out.

Output from this command is sent only to the link on which the command was input.

#### **Command**

[I.39101]

**LGT-{TERM|USER}:[<xy>]::[ww]:{l[mm][,INCL]|<user id>;**

#### **Completion Message**

[O.39101]

    <xy> yy-mm-dd hh:mm:ss LINK-n[vv]  
**M LGT {TERM|USER}:::[ww]:{l[mm][,INCL]|<user id> COMPLD**  
**;**

### **Denial Message**

---

[O.39101.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M LGT {TERM|USER}:::[ww]:{l[mm][,INCL]|<user id>} DENY
 mmmm
 /* [0.39101.01] */
 /* <explanation of error condition code> */
;
```

### **Autonomous Message**

---

This message will be received only on the link affected.

[O.39101]

```
<xy> yy-mm-dd hh:mm:ss
A ff REPT LGT TERM
 /* [0.39101] */
 "l[mm]"
```

This message will be received only on the link of the user being logged out.

[O.39101]

```
<xy> yy-mm-dd hh:mm:ss
A ff REPT LGT USER
 /* [0.39101] */
 "<user id>"
```

### **Explanation Of Parameters**

---

**USER** - User

**user id**

- User identifier (two to eight alphabetic characters)

User login identification

**TERM** - Terminal (link)

**j[mm]** - Administrative link number

**j** - Physical link number (1 through 6)

**mm** - Virtual circuit number (01 through 16)

The virtual circuit number must be entered when logging off a single virtual circuit of an X.25 link.

**INCL** - Inclusive

Include virtual circuits of links 5 and 6. The INCL keyword can only be entered with X.25 links 5 and 6, and no virtual circuit number is allowed when this keyword is used. That is, "mm" and "INCL" are mutually exclusive. In addition, the INCL keyword is also mutually exclusive with the "<user id>". When the INCL keyword is entered, it means that the logoff applies to all the virtual circuits of X.25 link (5 or 6).

**COND** - Condition

**mmmm** - Error condition code

| <b>mmmm</b> | <i>Explanation</i>                             |
|-------------|------------------------------------------------|
| <b>SNVS</b> | User does not exist                            |

---

## LINE

---

### QUERY LINE NUMBER

---

#### Explanation Of Command

---

This command retrieves the current line number and the total number of lines within the macro while in a macro session.

---

#### Command

---

[I.19071]

LINE[: [<xy>]::[ww]:];

---

#### Completion Message

---

[O.19071]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M LINE:::[ww] COMPLD
 /* [0.19071] */
 /* Line <line pointer>,Total <line total> */
;
```

---

#### Denial Message

---

Not applicable.

---

#### Autonomous Message

---

Not applicable.

### **Explanation Of Parameters**

---

**LINE** - Line

**line pointer**

- Current line number

**TOTAL** - Total

**line total**

- Total number of lines within the macro

## **LIST,END**

### **LIST MACRO CONTENTS**

#### **Explanation Of Command**

This command is used to list the contents of a macro. If neither a range of line numbers nor END is specified then the line pointed to by the line pointer (the current line) is listed.

#### **Command**

[I.19061]

```
LIST[:[<xy>]:{<starting line>|END}[-{<ending line>|END}]:\
[ww]:];
```

#### **Completion Message**

If the macro contains no component command,

[O.19061]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M LIST::[{<starting line>|END}[-{<ending line>|END}]]:\
[ww] COMPLD
 /* [O.19061] */
 /* NONE */
;
```

If the macro contains one or more component commands,

[O.19062]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M LIST::[{<starting line>|END}[-{<ending line>|END}]]:\
[ww] COMPLD
 /* [O.19062] */
 /* 00001 <first 65 characters of 1st component command \
text> */
 /* <remaining characters of 1st component command text>\
 */
 .
 .
 .
 /* mmmmm <first 65 characters of mth component command \
text> */
 /* <remaining characters of mth component command text>\
 */
>
 .
 .
 .
>
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M LIST::[{<starting line>|END}[-{<ending line>|END}]]:[ww] \
COMPLD
 /* [O.19062] */
 /* nnnnn <first 65 characters of nth component command text>\
 */
 /* <remaining characters of nth component command text>\
 */
 .
 .
 .
 /* ppppp <first 65 characters of pth component command text>\
 */
 /* <remaining characters of pth component command text>\
 */
>
```

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M LIST::[{<starting line>|END}[-{<ending line>|END}]]:[ww] \
COMPLD
 /* [0.19062] */
 /* qqqqq <first 65 characters of qth component command text>\
*/
 /* <remaining characters of qth component command text>\
*/
 .
 .
 .
 /* zzzzz <first 65 characters of zth component command text>\
*/
 /* <remaining characters of zth component command text>\
*/
 ;
```

### Denial Message

---

[O.19061.01]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M LIST::[{<starting line>|END}[-{<ending line>|END}]]:\
[ww] COMPLD
 mmmm
 /* [0.19061.01] */
 /* <explanation of error condition code> */
 ;
```

### Autonomous Message

---

Not applicable.

## **Explanation Of Parameters**

---

### **starting line**

- Beginning line number of a line range (1, 2, ..., n)

Starting line indicates the line number of the first line of a range of lines within a macro that are to be listed.

### **ending line**

- Ending line number of a line range (2, 3, ..., n+1)

Ending line indicates the line number of the last line of a range of lines within a macro that are to be deleted.

**END** - End

Line number of the line at the end of the macro.

**00001,**

**mmmmm,**

**nnnnn,**

**ppppp,**

**qqqqq,**

**zzzzz** - Component command line numbers (00001 through 99999)

**mmmm** - Error condition code

## **MOVE — MTC**

---

### **MOVE — MTC**

This section documents the commands **MOVE** through **MTC**.

## **MOVE,END**

---

### **MOVE MACRO LINES**

#### **Explanation Of Command**

---

This command is used to move one or more lines and place them after a specified line in the macro while in a macro session.

If only one line is specified, the **starting line** or **END**, then only that line is moved to **destination line**.

#### **Command**

---

[I.19091]

```
MOVE:[<xy>]:{<starting line>|END}[-{<ending line>|END}],\
{<destination line>|END}:[ww];;
```

#### **Completion Message**

---

[O.19091]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M MOVE::{<starting line>|END}[-{<ending line>|END}],\
{<destination line>|END}:[ww] COMPLD
 /* [O.19091] */
;
```

### **Denial Message**

---

[O.19091.01]

```
<xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M MOVE::{<starting line>|END}[-{<ending line>|END}],\
{<destination line>|END}:[ww] DENY
 mmmm
 /* [O.19091.01] */
 /* <explanation of error condition code> */
;
```

### **Autonomous Message**

---

Not applicable.

### **Explanation Of Parameters**

---

#### **starting line**

- Beginning line number of a line number range (1, 2, ..., n)

Starting line indicates the first line of the group of lines to be moved.

#### **ending line**

- Ending line number of a line number range (2, 3, ..., n+1)

Ending line indicates the end line of the group of lines to be moved.

#### **END** - End

END is a special line number that marks the position of the last line in the macro. If END is specified in place of ending line then the lines from starting line through END will be moved to destination line. If END is specified as destination line then the line range specified in the command will be moved, as a unit, to the line following END. The line number associated with END will change to the new line number of the last line moved.

#### **destination line**

- Destination line number for the move (0, 1, 2, ..., n)

The first line of the lines to be moved will be placed on the line following destination line.

mmm - Error condition code

mmm *Explanation*

**IDNV** Invalid line number

## **MP,STARTUP,STF,ATP**

### **STARTUP**

#### **Explanation Of Command**

This message indicates that The main processor has initialized itself, established local area network communications between itself and the communications interface or the enhanced communications interface and has performed self-diagnostics. The results of these diagnostics are reported as some tests failed or all tests passed.

#### **Command**

Not applicable.

## OPR

---

## OPR

---

This section documents the **OPR** command.

## **OPR,ACO,ALL**

### **ALARM CUTOFF**

#### **Explanation Of Command**

This message executes an audible alarm cutoff (ACO), silencing any currently active central office audible frame alarms. DACS II also illuminates the green ACO LED on the front status panel. The ACO remains active and the green LED remains illuminated until all frame alarms are retired or a new alarm appears on the system.

Note that executing an ACO **does not** inhibit subsequent audible alarms from being generated for additional failures. In addition, the ACO does not retire local or remote **visible** indications and does not cause the system to issue an alarm clear notification.

Executing an ACO by inputting this command is equivalent to pressing the status panel ACO push-button. When the ACO push-button is pressed, a message indicating that the ACO has been activated is generated by the system.

#### **Command**

[I.51111]

**OPR-ACO-ALL:[<xy>]::[ww];**

#### **Completion Message**

[O.51111]

```
 <xy> yy-mm-dd hh:mm:ss LINK-n[vv]
M OPR ACO ALL:::[ww] COMPLD
 /* [0.51111] */
 /* ACO STATUS */
 " {ACTIVE|INACT} "
;
```

**Denial Message**

---

Not applicable.

**Autonomous Message**

---

Not applicable.

**Explanation Of Parameters**

---

**ACO** - Alarm cutoff

**INACT** - Inactive alarm

The appearance of this keyword indicates that there were no alarms on the system and the audible alarm cutoff was not activated.
