Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. *ctag* – Correlation Tag
See definition in input parameters section [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

4. *rid* – Ring Identification

This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value shall be unique for all protection groups of type 2F or 4F within the NE.

Type: text string of chars allowed for TID strings.

Range: 1 to 15 characters.

Default: NONE.

5. *mapsrc* – Map source

This parameter specifies, how the ring map is derived. The value DCCEI is used if the ring map is derived via the DCF function. The value NVMRING is used if the ring map is derived from non-volatile memory as used by the MS-SPRing/BLSR protection group. The value MANUAL shall be used, if the ring map data which was manually populated by the user and stored in RAM shall be shown.

Note: If NVMRING is specified and there is a valid and complete ringmap in NVM, it will be reported. Otherwise, nothing will be reported.

Type: alphanumeric value set.

Range: DCCEI, NVMRING, MANUAL.

Default: DCCEI.

Output format

After receiving the RTRV-MAP-RING command, the following normal completion response is returned:

```

    sid date time
M  ctag COMPLD
    "aid:rid,localnid:spec_block"
    ...
    ...
    "aid:rid,localnid:spec_block"
;

```

Output parameters

Command parameters

1. **aid** – Access Identifier
This parameter specifies the aid of 2F-/4F MS-SPRing/BLSR protection.
Type: AID
Range: TwoFibre_ProtGrpAID or FourFibre_ProtGrpAID
2. **rid** – Ring Identification
This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value shall be unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE.
3. **localnid** – Local Node ID
This parameter specifies the local node ID of the NE receiving the retrieve request (i.e. the node which has been addressed within RTRV-MAP-Ring command) as used by the MS-SPRing/BLSR APS protocol.
Type: numeric string
Range: 0 .. 15

Spec block parameters

1. **nid** – Node ID
This parameter specifies the node ID of the NE within the ring as used by the MS-SPRing/BLSR APS protocol. It shall correspond to the first TID in the *linkid* block.
Type: numeric string
Range: 0 .. 15
2. **linkId** – Link Identifier
This parameter specifies a link connecting two NEs within the ring. It has the following format:
linkid="{nename,[port],direction},{nename,[port],direction}"
The first value set of *nename*, *port*, *direction* corresponds to the NE as indicated by parameter *nid*.
The second value set of *nename*, *port*, *direction* corresponds to the NE reachable via the link.
The port and direction may be omitted, if the value *mapsrc* is MANUAL.
Type: inner string
Range: see parameter description for *nename*, *port*, *direction* below.
Note: The *linkID* as used in the ring map will refer to the ports of that link which is used for the automatic detection of the ring topology (i.e. to protection ports for asymmetric spans and to worker ports for symmetric spans).

3. *nename* – NE Name
See definition of parameter *tid* “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).
4. *port* – port AID
This parameter specifies the port being a member within the 2-/4-fibre MS-SPRing/BLSR protection group.
Type: AID, in case *nename* denotes the local NE; AID string, in case *nename* denotes another NE in the ring.
Range: SPortAID, in case of an AID; up to 20 characters otherwise
Option: The parameter may be omitted if unknown due to link failure.
5. *direction* – Direction
This parameter specifies the side role of the corresponding port within the protection group. The value E is used for the east side. The value W is used for the west side.
Type: alphanumeric value set
Range: E, W
Option: The parameter may be omitted if unknown due to link failure.
6. *continuity* – Link Continuity Status
This parameter specifies the link continuity status of a port. The following values are supported:
 - UP – The link is working.
 - DOWN – The link has failed.
 - OPEN – The link is non-existent, as in an open ring.
 - UNKNOWN – The link ID has not been established.
 - ISOLATED – The link is in an isolated part of a segmented ring.Type: alphanumeric value set.
Range: UP, DOWN, OPEN, UNKNOWN, ISOLATED.
7. *net* – Network Entity Title
This parameter specifies the NSAP (Network Service Access Point) with the last byte (SEL byte – see NSAP format) set to 00 (hex) for the node with TID as specified for the first *nename* within *linkid* list.
Type: Hexadecimal digit string
Range: 40 characters

Detailed behavior description

For open rings, the output starts at the end with the lower *nid* value and continuous to the other end. For closed rings, the output starts at the node with the lowest *nid* value and continues in the direction of the first node’s east neighbor.

RTRV-NADR: Retrieve ONNS Network (Domain) Address Data Repository

Overview

The RTRV-NADR command requests information of the ONNS Network (Domain) Address Data Repository, which contains address information of the own domain about TNA type, TNA address, logical port IDs for UNI and EDGE ports and associated client nodes for UNI ports.

The RTRV-NADR command operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local data repository. Data from other ONNS nodes is acquired by the flooding and exchange of LSAs.

Retrieving ALL Network address data repository (NADR) records

When the *dataType*=ALL, Network Navigator shall respond to a request to retrieve its Network Address Data Repository (NADR) by sending a complete report of the contents of the data repository specified. The request shall cause the ONNS node to send all information in the specified data repository. When the Network address data repository is retrieved, each TL1 response message contains a record with all of the data relevant to the address information part of the LSA.

Retrieving Network address data repository (NADR) records for any ASTN node ID

The command RTRV-NADR with *dataType*=LSAID and *componentID*=ASTNNodeID shall retrieve the LSA address records that relates to the specified node with the ASTNNodeID. This ASTNNodeID can be the address of any node in the ONNS domain.

Retrieving Network address data repository (NADR) records for a specific port class

The command RTRV-NADR with *dataType*=portClass and *componentID*=UNI or EDGE shall retrieve the LSA address records that relates to the specified portClass.

REPT PTHCHG or REPT NNCHG is not generated

The RTRV-NADR command shall not generate a REPT PTHCHG or REPT NNCHG notification.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No

Input format

The RTRV-NADR command has an input parameter *dataType* that defines what type of information is expected in the *componentID* field that determines what portion of the data repository records is retrieved.

Command Syntax: RTRV-NADR:*srcTid*:*srcAid*:*ctag*::*dataType*[,*componentID*];

Input parameters

Command parameters

1. *srcTid*
Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique Tid used by Host NE. See also the definition of tid in RTRV-HDR.
Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.
Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. *srcAid*
Source node ONNS application access identifier *srcAid* of the ONNS controller OS command interface port.
Type: AID.
Range: *snn*
The keyword *all* is allowed up to shelf level.
3. *ctag*
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
4. *dataType*
This parameter specifies, which part of the address information is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype*=ALL *componentID* must not be specified.
Type: alphanumeric value set
Range: ALL - retrieves the entire (NADR) Network address data repository in RAM; LSAID - retrieves the LSA address record related to the ASTN node ID specified in the *componentID* must be an *ASTNnodeID*, PORTUSAGE - retrieves the LSA address records related to the port class specified in the *componentID* must be UNI or EDGE.
5. *componentID*
componentID depends on the previous *dataType* parameter and is one of:
not represented, when *datatype*=ALL
nodeID, when *datatype*=LSAID (any ASTN node ID)
portClass, when *datatype*=PORTUSAGE
nodeID - Node Identifier:
Identifier of an ASTN node.

Type: Four dot separated numeric strings.

Range: 0..255, for each numeric string.

portClass

Ports used by ONNS with additional address information.

Type: alphanumeric value set

Range:

- EDGE ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection
- UNI ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection

Output format

The Network address data repository (NADR) record structure

The complete NADR of one node consists of *LSAAddrRecords* for all known nodes (including the reporting node itself) in the topology. Within a *LSAAddrRecord* all individual TNARrecords with the associated logical port IDs are listed.

Network address data repository (NADR) without data

An addressed node without data in the NADR shall response only the HeaderRecord with *NumberOfLSAs* = 0. The network address data repository (NADR) Record is composed of an NADR_HeaderRecord and multiple *LSAAddrRecords* which are described below:

- NADR_Record ::=
 <NADR_HeaderRecord>
 <LSAAddrRecord_1>

 <LSAAddrRecord_m>
- NADR_HeaderRecord ::=
 "nadrID,dataType[=componentID],srcNodeASTNNodeID,
 NumberOfLSAs=LSA_Count"
- LSAAddrRecord ::=
 <LSAAddr_HeaderRecord>
 <TNARrecord_1>
 <LogicalPortIDList_1>

 <TNARrecord_n>
 <LigicalPoerList_n>
- LSAAddr_HeaderRecord ::=
 "LSAAdvertisedRouter=origNodeASTNNodeID,TNACount=TNACount, portclass"

- TNARrecord ::=
"TNARtype=TNARaddress[,ClientNodeID=nodeID]"
- LogicalPortIDList ::=
"LogicalPortIDs=lpid_1[&lpid_2&...&lpid_5]"
["LogicalPortIDs=lpid_6&lpid_7&...&lpid_10"]
.....
["LogicalPortIDs=lpid_n-4&lpid_n-3&...&lpid_n"]
There shall be not more than 5 logical port IDs per line to avoid a line break.

Output format with normal data retrieve completion report for *dataType=ALL*

If the RTRV-NADR request completes successfully, then the following normal completion response is returned:

```

srcTid date time
M ctag RTRV
  "NADR_HeaderRecord"
  "LSAAddr_HeaderRecord1"
    "TNARrecord_1-1"
      "LogicalPortIDList_1-1"
    "TNARrecord_1-2"
      "LogicalPortIDList_1-2"
  ...
  "LSAAddr_HeaderRecord4"
    "TNARrecord_4-1"
      "LogicalPortIDList_4-1"
    "TNARrecord_4-2"
      "LogicalPortIDList_4-2"
    "TNARrecord_4-3"
      "LogicalPortIDList_4-3"
>
srcTid date time
M ctag COMPLD
  "LSAAddr_HeaderRecord5"
    "TNARrecord_5-1"
      "LogicalPortIDList_5-1"
    "TNARrecord_5-2"
      "LogicalPortIDList_5-2"
    "TNARrecord_5-3"
      "LogicalPortIDList_5-3"
    "TNARrecord_5-4"
      "LogicalPortIDList_5-4"
  ...
  "LSAAddr_HeaderRecord9"
    "TNARrecord_9-1"
      "LogicalPortIDList_9-1"
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the Output parameters section of the “[RTRV-PATH: Retrieve ONNS connection data](#)” (p. 4-2526) command.

NADR_HeaderRecord

1. *nadrID*
Indicator for the responded data repository
Type: alphanumeric value set
Range: NADR, Network address data repository in RAM.
2. *dataType*
This parameter specifies, which part of the address information is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype=ALL* *componentID* must not be specified.
Type: alphanumeric value set
Range:
 - ALL: retrieves the entire (NADR) Network address data repository in RAM.
 - LSAID: retrieves the LSA address records related to the ASTN *nodeID* specified in the *componentID* must be an *ASTNnodeID*
 - PORTUSAGE: retrieves the LSA address records related to the port class specified in the *componentID* must be UNI or EDGE
3. *componentID*
This parameter depends on the previous *dataType* parameter and is one of: not represented (when *datatype = ALL*), *nodeID* (when *datatype = LSAIP* (any node ID)), *portClass* (when *datatype=PORTUSAGE*).
nodeID - Node Identifier
Identifier of an ASTN node.
Type: Four dot separated numeric strings.
Range: for each numeric string: 0..255
portClass
Ports used by ONNS with additional address information.
Type: alphanumeric value set
Range:
 - EDGE ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection
 - UNI ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connectionNote: If *dataType = ALL*, *componentID* and the “=” sign are not reported.
4. *srcNodeASTNNodeID* - Reporting Node ID
This parameter is the ASTN node ID of the ONNS node replying to this command.
Values: Four dot separated numeric strings, 0 - 255 for each numeric string.

5. LSA_Count

This parameter indicates the number of LSA address records in the report.

Type: Integer

Range:

- >0: number of LSAs with address records
- 0: no EDGE or UNI port(s) with additional address information are defined at this node or within the network

In case of LSA_Count = 0 only the *NADR_HeaderRecord* shall be displayed in the output.

LSAAddrRecord

For each reported node of the topology one LSAAddrRecord per reported port class shall be reported.

1. LSAAddrHeaderRecord

All parameters in the LSAAddrHeaderRecord describe properties of the *LSAAdvertisedRouter*.

a. origNodeASTNNodeID

The ASTN node ID of the advertiser of the LSA with the address data following the *LSAAddrHeaderRecord*.

Type: Four dot separated numeric strings.

Range: 0 - 255 for each numeric string.

b. TNACount

Number of reported TNAs of *LSAAdvertisedRouter* are provisioned on this node.

Range: >0

c. portClass

Ports used by ONNS with additional address information.

Type: alphanumeric value set

Range:

– EDGE ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection

– UNI ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection

TNARecord

For each TNA within the LSAAddrRecord one TNARecord shall be reported.

1. TNAType

This parameter specifies the address type of the TNA address.

Type: alphanumeric value set

Range:

- IPV4TNAADDR (default), TNA address is a IPv4 address
- IPV6TNAADDR, TNA address is a IPv6 address
- NSAPTNAADDR, TNA address is a NSAP address

2. TNAAddress

TNAAddress depends on the previous TNAType parameter and is one of:

- IPv4TNAAddress, when TNAType=IPV4TNAADDR
Identifier of a TNA address in IPv4 format.
Type: Four dot separated numeric strings.
Range: 0 ... 255, for each numeric string.
- IPv6TNAAddress, when TNAType=IPV6TNAADDR
Identifier of a TNA address in IPv6 format.
Type: Eight hyphen separated hexadecimal numbers.
Range: 0 ... FFFF, for each hexadecimal number.
- NSAPTNAAddress, when TNAType=NSAPTNAADDR
Identifier of a TNA address in NSAP format.
Type: alphanumeric value set (20byte)
Range: up to 20 alphanumeric strings with hexadecimal values 00..FF.

3. nodeID – Client Node ID

IP address of the UNI client derived from the TNAAddress. This parameter is optional and only available for ports of portClass UNI.

Type: Four dot separated numeric strings. Example: 135.13.44.61

Range: 0 ... 255, for each numeric string.

4. LogicalPortIDList

The list of *LogicalPortIDs* is a list of numeric values indicating specific physical ports within a TNAAddress. The *logicalPortID* values are shown in the form: lpid1([&lpid2& ...&lpidx]).

Type: &-separated list of numeric strings.

Range: lpid1([&lpidX]) * where X <= 512 where lpidn = 0 ... 42946967295. The value 512 for X results as theoretical value from the number of slots multiplied by number of possible ports per slot in LambdaUnite.

Example input/output

Example NADR output for the RTRV-NADR command with ALL

The RTRV-NADR command with *dataType*=ALL produces this example output result:

RTRV-NADR:LT-ONNS-61::123456::ALL;

```

RTRV-NE: Retrieve NE

The RTRV-NE command retrieves DCN attributes associated with the NE at the system level but not associated with any particular facility or equipment unit.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: RTRV-NE:*tid*::*ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Description: Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *ctag* – Correlation Tag
Description: Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
Type: CTAG.

Output format

If the RTRV-NE request is successful, the following normal completion message is returned:

```
      sid date time
M  ctag COMPLD
   ":spec_block"
   .      .      .
   .      .      .
   .      .      .
   ":spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Spec block parameters

1. **ftamftpgw** - File Transfer Translation Device (FT-TD) function
This parameter is used to enable or disable the File Transfer Translation Device (FT-TD) function.
Type: Value set.
Range: ENABLE, DISABLE (default).
2. **lsprepholdoff** - LSP Repair Hold-off Time
This parameter indicates the LSP Repair Hold-off time in minutes.
Type: numeric string
Range: 1 ... 43830 (default=15). The maximum value corresponds to the average duration of one month.
3. **tl1tcpipegw** - TL1 Translation Device (T-TD) function
This parameter is used to enable or disable the TL1 Translation Device (T-TD) function.
Type: Value set.
Range: ENABLE, DISABLE (default).
4. **dcnpn** - DCN ASAP Profile Name
Type: Alphanumeric string. A hyphen (-) is additionally allowed in the name.
Range: up to 24 characters.
Default: DEFAULT.
5. **scnpn** - SCN ASAP Profile Name
Type: Alphanumeric string. A hyphen (-) is additionally allowed in the name.
Range: up to 24 characters.
Default: DEFAULT.

Detailed behavior description

The command retrieves system parameters as described in the Output parameter section.

Example input/output

The following example shows the result of a RTRV-NE command:

```
RTRV-NE:LT-UNITE::123456;
  LT-UNITE 00-11-01 08:00:00
M 123456 COMPLD

RTRV-NE-SECU: Retrieve NE security

The RTRV-NE-SECU command can be initiated by a user to retrieve global security information in the NE. The current login sessions in the NE identified by the *uid* which established the session will also be retrieved using the RTRV-NE-SECU command.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: No

Input format

Command Syntax: RTRV-NE-SECU:*tid*::*ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
See definition of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
2. *ctag* – Correlation Tag
See definition of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) .

Output format

There is one output line for each session. The first line contains user information for the user and session that issued the RTRV-NE-SECU command.

After receiving the RTRV-NE-SECU command, the following normal completion response is returned:

```
      sid date time
M  ctag COMPLD
   "uid::spec_block"
   "uid"
   .
   .
   "uid"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command parameters

1. *uid* – User ID

ID of the user that initiated the RTRV-NE-SECU command. Listed below this *uid* are *uids* of all the other sessions. If the user from which the RTRV-NE-SECU command was issued is logged on via other sessions, the *uid* list will contain each other instance of the *uid*, but the additional listing is just like the listing of any other user, without the additional user information.

Spec block parameters

1. *age* – Lockout Aging Period

The time interval during which the number of invalid login attempts are counted. When *age* expires after the last invalid login attempt, the counter of invalid login attempts by that *uid* is reset to zero.

Type: numeric string

Range: 1 – 999 [minute]

Default: 60

2. *intrvl* – Lockout Period

The time during which login attempts using that *uid* will not be allowed. This occurs when the number of consecutive invalid login attempts by a *uid* reaches *thrshld*. When *intrvl* expires, login attempts will again be allowed from that *uid*. If this parameter is set to 0 (zero), the lockout feature is disabled.

Type: numeric string

Range: 0 – 99 [minute]

Default: 10

3. *thrshld* – Lockout Threshold

The maximum number of consecutive invalid login attempts that are allowed by a *uid*. If the count of invalid login attempts is equal to the threshold, the *uid* is locked out for *intrvl* period of time. If a login attempt is successful, the count of *invalid* login attempts by that *uid* is reset to zero.

Type: numeric string

Range: 2 – 99

Default: 5

4. *usrage* – User ID Aging Period

If a *uid* has never been used to perform a successful login during a specified time interval it shall be disabled. A value of 0 disables user ID aging.

The *usrage* does not apply to the super-users. Super-users will be never disabled.

Type: numeric string

Range: 0 – 999 [days]

Default: 10

Example input/output

The following example shows the successful completion of the RTRV-NE-SECU command by the NE:

```
RTRV-NE-SECU:LT-UNITE-123::123456;  
  
    LT-UNITE-123 00-01-01 08:00:00  
M 123456 COMPLD  
    "nbguser1::thrshld=3,intrvl=1,age=60,usrage=10"  
    "njsmith"  
    "hugo"  
    "airmail"  
;
```

RTRV-NNCNFG: Retrieve ONNS configuration data

Overview

The RTRV-NNCNFG command retrieves ONNS system configuration parameters (fixed and user-provisionable). It also retrieves ONNS software version information. The data is retrieved from the ONNS system configuration data repository.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

Command Syntax: RTRV-NNCNFG:*srcTid*[:*srcAid*]:*ctag*;

Input parameters

Command parameters

1. *srcTid* – Source Target Identifier.
The TID of the NE to which the command is addressed.
See the parameter description in the [“RTRV-PATH: Retrieve ONNS connection data”](#) (p. 4-2526) Input parameters section. NN uses the same *tid* used by the Host NE.
2. *srcAid*
ONNS application access identifier: *snn*.
3. *ctag* – Correlation Tag
The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing).
It should be a unique value for each new command.

Output format

If the RTRV-NNCNFG request completes successfully, then the following normal completion response is returned:

```
srcTid date time
M ctag COMPLD
"specBlock"
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the OUTPUT PARAMETERS section of the [“RTRV-PATH: Retrieve ONNS connection data”](#) (p. 4-2526) command.

Spec block parameters

This block contains the descriptions and allowed values for the reported output parameters.

1. *AdminCostEscalation*
Determines whether a cost escalation algorithm is applied or not. This algorithm raises the cost of a link bundle to reduce the attractiveness when the link bundle fills up.
Type: alphanumeric value set
Range: DISABLE, ENABLE (default).
2. *DefaultRstrPriority*
Determines the connection restoration priority default to be used if a value is not specified in the ENT-PATH command. Lower values denote higher priority.
Note: Though the parameter *DefaultRstrPriority* can be set via ED-NNCNFG, it is for future use only, i.e. an actual value different from 0 will not be considered on connection setup. If no restoration priority is given via the ENT-PATH command, the priority of the corresponding connection is always 0, no matter of the actual value of *DefaultRstrPriority*.
Type: Integer
Range: 0 - 7 (default = 0, highest priority).
3. *LBA_Threshold*
The LinkBundle Availability threshold determines the percent change in bandwidth availability necessary to trigger an immediate LSA distribution.
Type: Integer
Range: 10 - 65 %
Default: 50 %
4. *LBA_UpdateTimer*
LinkBundleAvailability Update Timer determines the maximum interval for LSA distribution of bandwidth availability changes which have not exceeded threshold.
Type: Integer
Range: 1 - 25 minutes
Default: 15 minutes
5. *LB_UsageThreshold*
The LinkBundle usage threshold determines the percent link bundle usage that triggers cost escalation on the bundle.
Type: Integer
Range: 50 - 95 %
Default: 70 %

6. **MaxExplicitNodeList**
This parameter determines the maximum number of intermediate nodes that will be accepted in the ENT-PATH explicit node list.
Type: Integer
Range: 25 (default).
7. **MaxExcludeNodeList**
Determines the maximum number of nodes that will be accepted in the ENT-PATH exclude *nodeList*.
Type: Integer
Range: 25 (default).
8. **MaxSRLGList**
Determines the maximum number of SRLG values that will be accepted in the ENT-PATH SRLG exclude list.
Type: Integer
Range: 25 (default).
9. **NN_BldInfo**
Version of path calculation engine. Consists of:
 - NType
 - NN_SWVersion
 - Operating systemType: alphanumeric string
Range: *ORPx.y* for NType, x, y digits, *LU-NNx.y.z* for NN_SWVersion, x, y, z digits, *Chorus* for Operating System
10. **NN_BldVersion**
ONNS Build version and date in format *xxx-mmddyy*, since there is no difference any longer between the ONNS and host build version, this field is set to a default value. See corresponding parameters in RTRV-PRMTR-SWTFR and ACT-USER.
Type: two - separated numeric strings
Range: 000-000000 (default).
11. **NNFunctionUpgradeState**
After a software upgrade, new ONNS functionality must be explicitly enabled. This parameter indicates whether this has been done or not.
Type: alphanumeric value set
Range:
 - DISABLE: New ONNS functionality not yet enabled
 - ENABLE (default): New ONNS functionality already enabled.
12. **NN_HostName**
Host name of the Host NE.
Type: alphanumeric string
Range: LambdaUnite (default).

13. **NN_SigIpAddress**
Signaling IP address of the SCN.
Type: Four dot separated integers.
Range: 0 - 255 for each integer.
14. **NN_SWVersion**
ONNS software version number in the format x.y.z, where
- x=release,
 - y= point release,
 - z=development integration release.
- Type: Three dot separated integers.
Range: 0 ... 99 for each integer.
15. **NN_SystemMode**
NN system mode status describes the operational state of ONNS.
Type: alphanumeric value set
Range:
- INIT: Initializing
 - MAINT: in maintenance condition (MCOND)
 - RUNNING: in normal operation
16. **NN_UiIpAddress**
UI IP address (currently not used).
Type: Four dot separated integers.
Range: 0 - 255 for each integer.
17. **NodeID**
Identifier of the ASTN node to which the RTRV-NNDR command is sent.
Type: Four dot separated numeric string
Range: 0 - 255 for each numeric string.
18. **PathRestoreRetryMax**
Determines how many retries ONNS makes during the path restoration
Type: Integer
Range: 0 - 5
Default: 1
19. **PathSetupRetryMax – Maximum Path Restoration Retries**
Determines how many retries ONNS makes after the initial path setup.
Type: Integer
Range: 0 - 5
Default: 1

20. `Perm1plus1HoldOffTimer` – Permanent 1+1 Hold Off Timer
Determines how long a worker or protection path of a permanent 1+1 connection must be steadily failed before the failed path is restored non-revertively by a new path. Applies only to a permanent 1+1 connections.
Type: Integer
Range: 15 - 600 seconds in 1 second steps.
Default: 360 seconds
21. `RestorationRetryTimer`
Path Restoration Queue timer, sets the time between checks to restore from the queue.
Type: Integer
Range: 90 - 700 seconds
Default: 324 seconds
22. `TCAThresholdHigh`
Upper threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status HIGH for this link bundle
Type: Integer
Range: 10 - 100 %
Default: 70 %
23. `TCAThresholdLow`
Lower threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status LOW or HIGH for this link bundle.
Type: Integer
Range: 10 - 100 %
Default: 40 %
24. `tid` - Node Target Identifier
Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.
See also the definition of *tid* in RTRV-HDR.
Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.
Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
25. `WaitToRevertTimer`
Determines how long an original path must be steadily OK before it is made active again through tear-down of the restoration path. Applies to auto-reroute revertive connections. This parameter shall apply to M:N protected connections as well.
Type: Integer
Range: 60 - 1800 seconds
Default: 300 seconds

Example input/output

The following is an example shows a successful execution of the RTRV-NNCNFG command:

```
RTRV-NNCNFG:DIETMAR:snn:C1;
```

```
DIETMAR 2003-06-06 10:21:57
M C1 COMPLD
  "TID = DIETMAR,
  NodeId = 29.54.174.87,
  NN_SWVersion = 2.0.0,
  NN_BldVersion = 042-032603,
  NN_BldInfo = ORP2.0, LU-NN2.0.0, Sun/Chorus,
  NN_HostName = LambdaUnite,

  NN_SigIpAddress = 172.16.1.250,
  NN_UiIpAddress = 0.0.0.0,
  AdminCostEscalation = DISABLE,
  PathSetupRetryMax = 1,
  PathRestoreRetryMax = 1,
  DefaultRstrPriority = 0,
  RestorationRetryTimer = 324 seconds,
  Perm1plus1HoldOffTimer = 15 seconds,
  WaitToRevertTimer = 300 seconds,
  LBA_UpdateTimer = 15 minutes,
  LBA_Threshold = 50 %,
  LB_UsageThreshold = 70 %,
  TCAThresholdLow = 42 %,
  TCAThresholdHigh = 69 %,
  MaxExplicitNodeList = 8,
  MaxExcludeNodeList = 15,
  MaxSRLGList = 10,
  NNFunctionUpgradeState = ENABLE"
```

```
;
```

RTRV-NNDR: Retrieve ONNS neighbor nodal data repository

Overview

The RTRV-NNDR command retrieves information stored in the NNDR data repository that is in RAM memory. The RTRV-NNDR command operates on the current, active-memory-resident, ONNS data. ONNS writes port/connPt/pathID data to NVM shortly after each cross-connect setup of a path transaction completes. The NVM data is used in conjunction with port update messages from the NE during initialization to recover the ONNS NNDR data repository.

The NNDR record structure

The NNDR record is composed of an NNDR_HeaderRecord and multiple PortRecords which are described below, see the Output format and Output parameter sections for more detail.

Retrieving the NNDR records by ALL or by *portID*

ONNS responds to a RTRV-NNDR request to retrieve its NNDR by sending a report of the contents of the data repository. The command RTRV-NNDR with *dataType* = ALL shall cause the ONNS node to send all information in the NNDR data repository. When the NNDR is retrieved, each TL1 response message contains multiple PortRecords. If *dataType* = ALL, there must be no *componentID*. When *dataType* = PORT and a *componentID* = *portID* are specified as input parameters in RTRV-NNDR, the NNDR data repository records relating to that *portID* shall be returned

Retrieving the NNDR records by *neighborASTNNodeID* or *UNIClientNodeID*

When *dataType* = NBRIP and *componentID* = *neighborASTNNodeID* is specified, the response returns all NNDR PortRecords related to the link bundles between the reporting node and its neighbor node with the *neighborASTNNodeID*.

When *dataType*=NBRID and *componentID*=UNIClientNodeID is specified, the response returns all Neighbor Nodal data repository (NNDR) PortRecords related to the port connections between the reporting node and its neighbor node with the *UNIClientNodeID*.

The command will fail if the *neighborASTNNodeID* or the *UNIClientNodeID* is not a neighbor of the reporting node.

Retrieving the NNDR records by *PortUsage*

When *dataType* = PORTUSAGE and a *componentID* = *portClass* is specified, the response returns all NNDR records relating to ports with the *portClass* specified in the *componentID* field.

The RTRV-NNDR command sends a maximum of 4 PortRecords per block of data returned if there are no associated cross connects on the ports. PortRecords with *TribConnRecords* will be send in data blocks that are less than 4096 characters. On all

messages but the last, a RTRV completion code is used and the semicolon (;) is replaced with a (>) terminator. Then, on the last record block, the COMPLD completion code is used with the final semicolon (;) terminator.

Data blocks in PortRecords with TribConnRecords shall contain complete TribConnRecords only including leading and trailing double quotes (").

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

Command Syntax: RTRV-NNDR:srcTid:[srcAid]:ctag::dataType[,componentID];

Input parameters

Command parameters

1. srcTid – Target Identifier.
Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.
Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. srcAid
Source node ONNS application access identifier of the ONNS controller OS command interface port.
Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. ctag – Correlation Tag
This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing).
4. dataType
This parameter specifies, which part of the NNDR is to be retrieved. Furtheron it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

Values:

- **ALL**: retrieves the entire NNDR in RAM.
- **PORT**: retrieves NNDR port data, *componentID* must be a *portID*.
- **NBRID**: retrieves all NNDR port data for link bundles and port connections respectively between the local and neighbor node, *componentID* must be a *neighborASTNNodeID* or a *UNIClientNodeID*.
- **PORTUSAGE**: retrieves all NNDR port data of ports of a specified port class, *componentID* must be a *portClass*.

5. ComponentID

This parameter depends on the previous *dataType* parameter and is one of: not represented (when *datatype* = ALL), *portID* (when *datatype* = PORT, see definition of output parameter *portID* in RTRV-PATH), *nodeID* (when *datatype* = NBRID), *portClass* (when *datatype* = PORTUSAGE).

The detailed parameter format of the choices is described below:

- **portID** - Port Identifier
Port ID for which the NNDR data shall be retrieved. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #.
Type: dash-separated list of 4 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16).
- **nodeID** - Neighbor Node Identifier
This parameter identifies a neighbor ASTN node or a neighbor UNI client.
Type: Four dot separated numeric strings (0 - 255 for each numeric string).
- **portClass**
This parameter specifies which type of port to include in the report, it determines how ONNS uses the port: EDGE (ONNS client port, where the signal enters/leaves the ONNS domain); INNI (ONNS port within the ONNS domain, topology relevant); ENNI (ONNS port, where the signal enters/leaves the ONNS domain from/to a other domain), UNI (ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client).

Output format

If the RTRV-NNDR request completes successfully, then the following normal completion response is returned:

```
srcTid date time
M ctag RTRV
  "NNDR_HeaderRecord"
  "PR:PortStatusRecord_1,PortAttributeRecord_1"
  ...
  "PR:PortStatusRecord_4,PortAttributeRecord_4"
>
```

```

srcTid date time
M ctag COMPLD
  "PR:PortStatusRecord_5,PortAttributeRecord_5"
  ...
  "PR:PortStatusRecord_8,PortAttributeRecord_8"
;

```

The RTRV-NNDR command will send a maximum of 4 port records per block. On all messages but the last, a RTRV completion code is used and the semicolon(;) is replaced with a (>) terminator. Then, on the last record block, the COMPLD completion code is used with the final semicolon (;) terminator.

If the RTRV-NNDR request completes successfully, then the following normal NNDR_Report with TribConnRecords will be returned, when there are tributary connections:.

```

srcTid date time
M ctag RTRV
  "NNDR,ALL,srcNodeASTNNodeID,NumberOfRecords=portCount"
  "PR:PortStatusRecord1,PortAttributeRecord1
  ["TR:TribPathRecord_1[:TribPathRecord_1b]"
  ...
  ["TR:TribPathRecord_n[:TribPathRecord_nb]"
"
  .....
  .....
  "PR:PortStatusRecord4,PortAttributeRecord4
  ["TR:TribPathRecord_1[:TribPathRecord_1b]"
  ["TR:TribPathRecord_2[:TribPathRecord_2b]"
  ["TR:TribPathRecord_3[:TribPathRecord_3b]"
  ["TR:TribPathRecord_4[:TribPathRecord_4b]"
  >

srcTid date time
M ctag COMPLD
  "PR:PortStatusRecord5,PortAttributeRecord5
  ["TR:TribPathRecord_1[:TribPathRecord_1b]"
  ...
  ["TR:TribPathRecord_n[:TribPathRecord_nb]"
  .....
  .....
  "PortStatusRecord8,PortAttributeRecord8
  ["TR:TribPathRecord_1[:TribPathRecord_1b]"
  ["TR:TribPathRecord_2[:TribPathRecord_2b]"

```

```
["TR:TribPathRecord_3[:TribPathRecord_3b]"]
["TR:TribPathRecord_4[:TribPathRecord_4b]"]
["TR:TribPathRecord_5[:TribPathRecord_5b]"]
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the Output parameters section of the “[RTRV-PATH: Retrieve ONNS connection data](#)” (p. 4-2526) command.

NNDR_HeaderRecord

1. *nnDrID*
ONNS Data Repository *dataID* to be returned: NNDR, Neighbor Nodal data repository in RAM.
2. *dataType*
This parameter specifies, which part of the NNDR is to be retrieved. Furtheron it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
Values:
 - ALL: retrieves the entire NNDR in RAM.
 - PORT: retrieves NNDR port data, *componentID* must be a *portID*.
 - NBRIP: retrieves all NNDR port data for link bundles and port connections respectively between the local and neighbor node, *componentID* must be a *neighborASTNNodeID* or a *UNIClientNodeID*.
 - PORTUSAGE: retrieves all NNDR port data of ports of a specified port class, *componentID* must be a *portClass*.
3. *componentID*
This parameter depends on the previous *dataType* parameter and is one of: not represented (when *datatype* = ALL), *portID* (when *datatype* = PORT, see definition of output parameter *portID* in RTRV-PATH), *nodeID* (when *datatype* = NBRIP), *portClass* (when *datatype* = PORTUSAGE).
The detailed parameter format of the choices is described below:
 - *portID* – Port Identifier
Port ID for which the NNDR data shall be retrieved. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #.
Type: dash-separated list of 4 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16).
 - *nodeID* – Neighbor Node Identifier
This parameter identifies a neighbor ASTN node.
Type: Four dot separated numeric strings (0 - 255 for each numeric string).
 - *portClass*

This parameter specifies which type of port to include in the report, it determines how ONNS uses the port: EDGE (ONNS client port, where the signal enters/leaves the ONNS domain), INNI (ONNS port within the ONNS domain, topology relevant), ENNI (ONNS port, where the signal enters/leaves the ONNS domain from/to a other domain), UNI (ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client).

4. **srcNodeASTNNodeID** - Source Node ASTN Node ID
Identifier of the ASTN node to which the RTRV-NNDR command is sent.
Range: Four dot separated numeric strings, 0 - 255 for each numeric string.
5. **NumberOfRecords**
This parameter indicates the number of PortRecords returned in this query.
Values: number of NNDR records 0 - 1000.

PortRecord - PortStatusRecord

Two PortStatusRecords are present per reported port, one for each direction (see parameter pdir below).

1. **portID** - port identifier
portID for which the NNDR data is retrieved. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #.
Type: dash-separated list of 4 numeric strings.
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16).
2. **portClass**
The *portClass* specifies how ONNS uses the port.
Values:
 - INNI, ONNS port within the ONNS domain, topology relevant, bandwidth on this port is managed by ONNS
 - EDGE, ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection.
 - ENNI, ONNS port, where the signal enters/leaves the ONNS domain from/to another domain
 - UNI, ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection
 - NA, Traditional (non-NN) port, they are normally not included in the ONNS data repository (exception: connections with EDGE ports exist).
3. **pdir** - Port Direction
This parameter specifies whether the PortRecord is for the port in receive or transmit direction.
Values:
 - TX: PortRecord is for transmit side of port
 - RX: PortRecord is for receive side of port

4. neighbor - Neighbor Information

The neighbor information consists of &-separated *neighborNodeID* and *neighborPortID* parameter.

- neighborNodeID

Identifier of the peer node (neighbor node) with respect to output parameter *portID*. This peer node can be a peer ASTN node or a peer UNI client node. The special value 0.0.0.0 indicates that the neighbor node ID is unknown. The *neighborNodeID* shall get the value "0.0.0.0" if the neighbor node is node of another domain.

Type: Four dot separated numeric strings, (0 - 255) for each numeric string

- neighborPortID

PortID for which the NNDR data shall be retrieved. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #..

Type: dash-separated list of 4 numeric strings.

Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16).

The special value 0-0-0-0 indicates that the neighbor *portID* of an ASTN node is unknown. The *neighborPortID* shall get the value "0-0-0-0" if the neighbor node is a UNI client node or a node of an other domain.

5. lineSigStatus - Port Line Signal Status

Line Signal Status indicates the fault status of the line signal on the port as reported to ONNS from the Host..

Values:

- GOOD (ONNS assumes that the port can be used for transmission)
- BAD (ONNS assumes that the port can not be used for transmission)
- UNKNOWN (ONNS couldn't derive status information from the Host).

6. portEqptState

This parameter indicates the fault status of the equipment associated with the port as reported to ONNS by the Host..

Values: OK (ONNS assumes that the equipment is ok and that the associated port can be used for transmission), FAILED (ONNS assumes that the equipment is failed and that the associated port can not be used for transmission), UNKNOWN (ONNS couldn't derive status information from the Host).

7. portAdminMode - Port Control

This attribute determines the mode of operation of this port.

Values: NORMAL (Port is for unrestricted use by ONNS), LOCKOUT (ONNS is not allowed to use the port for new connections, note: ONNS might delete existing connections from that port).

PortRecord - PortAttributeRecord

Two PortAttributeRecords are present per reported port, one for each direction (see parameter *pdir* above).

1. portRate

This parameter is the bandwidth / port rate of the port.

Values:

- STS3 (STM1E, STM1, OC3 port), STS12 (STM4, OC12 port), STS48 (STM16, OC48 port), STS192 (STM64, OC192 port), GE1 (GE1 port), STS768 (STM256, OC768 port).

2. propagationDelay

Propagation delay in milliseconds through the port connection between the pair of ports on the path. The time needed for a signal to traverse from this node to the neighbor node. A propagation delay of 1 milliseconds corresponds to about 450 km of fiber length.

Range: 0 - 255, default = 0.

Propagation delay parameter is not applicable for EDGE, ENNI and UNI ports and is set to the default value.

3. Cost - Administrative Cost

Provisioned administrative cost of the port connection when used in a connection path.

Range: 1 - 65535

Administrative cost parameter is not applicable for EDGE ports and is set to the default value. Administrative cost parameter is not applicable for UNI ports and is set to the default value.

4. SRLG - SRLG list

Shared Risk Link Group Identifier list. See also parameter srlgList in RTRV-rr. The max. number of identities that can be provisioned per port may be release dependent.

Type: Up to ten &-separated integers

Examples:

198&233&0&0&0&0&0&0&0

10&20&30&40&0&0&0&=&0&0

89&1000&4&10&20&31&111&231&300&777

Range: Each value: 0 - 65535.

Default: 0, means no SRLG provisioned.

SRLG list is not applicable for EDGE ports and is set to the default value. SRLG list is not applicable for UNI ports and is set to the default value.

5. IncludeID - VPN ID

Values: 0 - 65535. default: = 0, means *includeID* provisioned.

VPN ID is not applicable for EDGE, ENNI and UNI ports and shall be set to the default value.

6. XCRate (minXCrate)- Cross-connection rate

The XCRate consists of minXCrate&maxXCrate with

- *minXCrate* denotes the smallest signal rate granularity used to provision a port into trib's,
- *maxXCrate* denotes the largest signal rate granularity used to provision a port into trib's.

Type: two &-separated alphanumeric value sets

Range *minXCrate*: STS1 (for all STMm, OCn ports), STS1 (for 1 GbE ports in SONET mode), STS3 (for 1 GbE ports in SDH mode).

Range *maxXCrate*: STS1 (for all STMm, OCn ports), STS3 (for all STMm, OCn ports), STS12 (for all STMm, OCn ports, with m=4,16,64 and n=12,48,192), STS48 (for all STMm, OCn ports, with m=16,64 and n=48,192), STS192 for all STMm, OCn ports, with m=64 and n=192), STS1 (for 1 GbE ports in SONET mode), STS3 (for 1 GbE ports in SDH mode).

7. BundleID - Link Bundle identifier

This parameter is a unique numeric ID assigned to a link bundle or TNA address on this node.

There are two preconditions for link bundling:

- A number of parameters with same values, e.g. propagationDelay, provisioned on iNNI ports.
- Same TNA address, provisioned on UNI ports.

Range: 1 .. 32767 (valid BundleID), 0 (for EDGE and ENNI ports).

TribPathRecord

For ports with *portClass*=INNI one TribPathRecord shall be present per cross connection associated with the port. For ports with *portClass*=EDGE, *portClass*=UNI or *portClass*=ENNI two TribPathRecords shall be present per bridged cross connection and one TribPathRecord shall be present per non-bridged cross connection associated with the port.

1. tribID - Tributary Identifier

Identifier of the tributary whose *pathID* and cross-connect information is included below. The *tribID* also denotes the timeslot of the reported cross-connection in the reported port.

Range: 1 - n

- with n=3 for STM1E, STM1, OC3 ports
- with n=12 for STM4, OC12 ports
- with n=48 for STM16, OC48 ports

- with n=192 for STM64, OC192 ports
 - with n=21 for GE1 ports
2. **pathID** - Path Identifier
The *pathID* of the associated cross-connection. The special value 0.0.0.0-0 indicates, that there is no associated pathID, i.e. the port has a non-ONNS cross-connection.
Type: character string of length up to 20.
Range: nodeID-Index; nodeID: four dot separated numeric strings: each string 0..255, Index: Numeric string.
Example: 135.13.196.203-432165
 3. **connPtA** - Connection Point A
The *connPoint* on the reporting port of the cross-connection *connPoint* pair. The *connPtA* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # .
Type: dash-separated list of 5 numeric strings.
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16), Tributary # (1 - 128).
 4. **connInd** - Connection Indicator
Seperator for better readability. -X- (cross-connection setup)
 5. **connPtB**
The *connPoint* opposite to the reporting port of the cross-connection *connPoint* pair. The *connPtB* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
Type: dash-separated list of 5 numeric strings.
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16), Tributary # (1 - 128) Slot/Pack ## Port ## Tributary ##.
Value # for Slot/Pack, Port and Tributary indicates default tributary AID used for reporting the open end in not existing xcons in the A-node or Z-node for a protecting NN connection of an M:N protected connection group.
Slot/Pack #*, Port #*, Tributary #*.
Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter *connPtA*) is allocated by one or more LO traditional cross connections.
Slot/Pack #@, Port #@, Tributary #@.
Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by *connPtA* is involved as EDGE-prt tributary in an OUC.
 6. **RsvStatus** - Reservation Status
Indicator whether the cross-connection has been allocated to a path by ONNS..
When *RsvStatus* = 0 and *XCStatus* = 1, this is a Host NE initiated cross-connection.
Reserved (by ONNS) = 1; Unreserved = 0; default = 1.

7. XCStatus

Indicator whether the cross-connect operation was successful.

When *RsvStatus* = 0 and *XCStatus* = 1, this is a Host NE initiated cross-connection.

Range: Success = 1 (default); Failed = 0

2 = Reserved, for cross-connections, that are not physically switched, i.e.

cross-connections in A- and Z-node for protecting NN connections within M:N protected connection groups.

3 = Reserved, for cross-connections, that are not switched on higher order, but the corresponding HO tributary is blocked by a LO cross-connection on a substructure.

4 = Reserved, for cross-connections, that are switched to/from an EDGE tributary involved as EDGE-prt in an OUC.

8. tribWidth - Tributary Width

The used bandwidth of the cross-connections expressed in multiples of STS1s.

Range: STS1, STS3, STS12, STS48, STS192.

9. tribSigStatus - Tributary Signal Status

This parameter indicates the fault status of the *connPtA* incoming signal on a path.

Range: OK, FAILED.

Note: In the reply to the TL1 command RTRV-NNDR the parameter *tribSigStatus* is missing. This parameter is sent per tributary path record being sent for all connected tributaries of all ports reported and gives the state of the incoming signal at the corresponding tributary (value OK or FAILED). As tributary record information from RTRV-NNDR is not displayed at the GUI, this issue is only recognized when checking TL1 logfiles. Workaround: To get state information at least for paths as a whole, RTRV-PATH can be executed or the corresponding GUI screens can be used.

Example input/output

Example NNDR output for the RTRV-NNDR command with a INNI *portID*:

RTRV-NNEVT-TCA

Overview

The RTRV-NNEVT-TCA command retrieves the Threshold Control Alert (TCA) Status of the link bundles and operates on the current Neighbour Nodal Data Repository (NNDR) based local view on the bandwidth availability.

Retrieving all TCA status records

Network Navigator responds to a request to retrieve its TCA Status by sending a complete report of the corresponding contents of the NNDR for the local node.

The command RTRV-NNEVT-TCA ALL is supported, and it retrieves the entire TCA Status of the local node when the dataType field = ALL.

The RTRV-NNEVT-TCA command sends a maximum of 64 output lines per block. If possible, the next block shall start with the next LSA_Link_Record.

Retrieving TCA status by neighbour ASTN node ID

The command RTRV-NNEVT-TCA with dataType = NBRID and a neighborASTNNodeID as componentID retrieves all of the TCA status records that relate to the link between the local node and the neighbor node with that neighborASTNNodeID. The componentID is a single specific ASTN node ID of a neighbor node (ONNS adjacent node).

REPT PTHCHG or REPT NNCHG is not generated

The RTRV-NNEVT-TCA command do not generate a REPT PTHCHG or REPT NNCHG message.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

The RTRV-NNEVT-TCA command has a parameter dataType that defines what type of information is expected in the componentID field that determines what portion of the data repository records is retrieved.

Command Syntax: RTRV-NNEVT-TCA:srcTid:[srcAid]:ctag::dataType[,componentID];

Input parameters

Command parameters

1. **srcTid** – Source Target Identifier
Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
Type: identifier, in addition the special character underscore (“_”) and the password characters are allowed.
Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set.
2. **srcAid**
Source node ONNS application access identifier of the ONNS controller OS command interface port.
Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: *snn*.
3. **ctag** – Correlation Tag
This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing).
4. **dataType**
This parameter indicates the data input parameter type of the *componentID* in the next field. The input parameters in the next field may change with each *dataType* to suit the requirements of the requested *dataType*. ALL is supported in this field and requires no *componentID* in the next field.
Type: alphanumeric value set.
Range:
 - *ALL*: retrieve all TCA Status information
 - *NBRID*: next field will contain a Neighbor ASTN node ID, not valid without a matching appropriate value in the *componentID* field except for *dataType* = *ALL*.
5. **componentID**
This parameter allows the user to specify a portion of TCA Status information such as an ASTN node ID for a neighbor node to return the TCA Status for all bundles of a link. The TCA Status records for the specified *componentID* will be returned. *componentID* depends on the previous *dataType* parameter and is one of:
 - not represented when *datatype*=*ALL*, to get all TCA Status information
 - *nodeID*: when *datatype*=*NBRID*, to get the part of the TCA status of the link between that neighbor node and this node.Description of *nodeID* (Neighbor Node Identifier):

Identifier of a neighbor ASTN node or a neighbor UNI client.

Type: Four dot separated numeric strings.

Range: 0 ... 255, for each numeric string.

Output format

The RTRV-NNEVT-TCA with *dataType*=ALL produces this example output result with the complete TCA status information of the local node:

```
RTRV-NNEVT-TCA:LT-ONN61:snn:123456::ALL;

RTRV-NNEVT-TCA:LT-ONN61:snn:123456::ALL;
LT-ONN61 2002-01-14 09:45:28
M 123456 COMPLD
"nndrID,ALL,srcNodeASTNNodeID"
"LinkId=origNodeASTNNodeID&neighborASTNNodeID1"
":BundleID=bundleID1,TCAStatus=TCA_Status1"
":BundleID=bundleID3,TCAStatus=TCA_Status3"
"LinkId=origNodeASTNNodeID&neighborASTNNodeID9"

":BundleID=bundleID3,TCAStatus=TCA_Status3"
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the Output parameters section of the RTRV-PATH command.

Header_Record

1. *nnDrID* – ONNS Data Repository dataID to be returned
Type: alphanumeric value set.
Range: NNDR-TCA: TCA portion of Neighbour Nodal data repository.
2. *dataType*
See definition of *dataType* in Input parameters section above.
3. *componentID*
See definition of *componentID* in Input parameters section above.
4. *nodeID* - Neighbor Node Identifier
Identifier of a neighbor ASTN node or a neighbor UNI client.
Type: Four dot separated numeric strings
Range: for each numeric string: 0 ... 255
5. *origNodeASTNNodeID* – ASTN node ID of the originating node.
Type: Four dot separated numeric strings.
Range: for each numeric string: 0..255.

Link_Header_Record

1. *LinkID*
LinkID is the ASTN node ID of the originating node plus that of the neighbor node that uniquely identifies the link.
Type: Two &-separated node IDs, each node ID consists of four dot separated numeric strings.
Example: 135.13.44.61&135.13.3.86
Range: for each numeric string: 0..255.

LinkBundle_Data Record

1. *BundleID*
This parameter is a unique numeric ID assigned to the link bundle on this node..
Type: integer.
Range: >0.
2. *TCAStatus* - Status of the TCA of this link bundle
Type: alphanumeric value set.
Range: INACTIVE (default), LOW, HIGH

Example input/output

Output for the RTRV-NNEVT-TCA command by neighbor ASTN node ID.

The RTRV-NNEVT-TCA command with *datatype*=NBRID produces this example output result with all bundles between two neighbor nodes:

```

RTRV-NNEVT-TCA:LT-ONNS61:snn:123456::NBRID,135.13.44.86;

```

The RTRV-NNEVT-TCA command will send a maximum of 64 lines per block.

Error responses

Invalid *componentID* parameter

The validity of the *componentID* parameter shall be checked. If it is invalid an appropriate error response shall be returned.

The following error responses is returned for an ASTN node ID which is not that of a neighbor:

Error code: E512 - IINI Error - Input, Invalid Neighbor node ID

RTRV-NTDR: Retrieve ONNS network topology data repository

Overview

The RTRV-NTDR command retrieves information stored in the NTDR data repository that is in RAM Memory. The RTRV-NTDR command operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local NTDR data repository. Data from other ONNS nodes is acquired by the flooding and exchange of LSA's.

Retrieving ALL NTDR records

When the *dataType* = ALL, Network Navigator responds to a request to retrieve its NTDR by sending a complete report of the contents of the data repository specified. The request causes the ONNS node to send all information in the specified data repository. When the NTDR is retrieved, each TL1 response message contains a record with all of the data relevant to a ONNS link group or LSA. The RTRV-NTDR command will send a maximum of 14 LSA linkBundle records per block.

Retrieving NTDR records for any ASTN node ID

The command RTRV-NTDR with *dataType* = LSAID and *componentID* = ASTNNodeID retrieves the NTDR LSA records that relate to all of the links from the specified node with the *ASTNNodeID* to adjacent nodes. This *ASTNNodeID* can be the address of any node in the ONNS domain.

Retrieving NTDR records for a neighbor ASTN node ID

The command RTRV-NTDR with *dataType* = NBRID and *componentID* = neighborASTNNodeID retrieves all of the NTDR LSA records that relate to the links between the current node and the neighbor node with the *neighborASTNNodeID*. The *componentID* is a single specific ASTNNodeID. The *neighborASTNNodeID* must be the ID of a neighbor node (ONNS adjacent node).

REPT PTHCHG or REPT NNCHG is not generated

The RTRV-NTDR command shall not generate a REPT PTHCHG or REPT NNCHG notification.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

Command Syntax: RTRV-NTDR:*srcTid*:*srcAid*:*ctag*::*dataType*[,*componentID*];

Input parameters

Command parameters

1. *srcTid* – Source Target Identifier
Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
Type: identifier, in addition the special character underscore (“_”) and the password characters are allowed.
Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set.
2. *srcAid*
Source node ONNS application access identifier of the ONNS controller OS command interface port.
Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: *snn*.
3. *ctag* – Correlation Tag
This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing).
4. *dataType*
This parameter specifies, which part of the NNTR is to be retrieved. Furtheron it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
Values:
 - ALL: retrieves the entire NTDR in RAM.
 - LSAID: retrieves the LSA in NTDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
 - NBRID: retrieves the LSA in NTDR between the current and the specified neighbor node, *componentID* must be a *neighborASTNNodeID*.
5. *componentID*
This parameter depends on the previous *dataType* parameter and is one of: not represented (when *datatype* = ALL), *nodeID* (when *datatype* = LSAID (any node ID) or *datatype*=NBRID (neighbor node ID)).
The details for *nodeID* are described below.
 - *nodeID* - Node Identifier
Identifier of an ASTN node.
Type: Four dot separated numeric strings.
Range: 0 - 255 for each numeric string.

Output format**The Neighbor Topology data repository (NTDR) record structure**

The complete NTDR of one node consists of LSARecords for all known nodes (including the reporting node itself) in the topology. Within a LSARecord Level 1 Routing Controller information is kept in L1Routing and all (direct) neighborhood relationships are kept in LinkRecords (one record for each neighbor relation). Within a LinkRecord the individual LinkBundleRecords are listed.

Neighbor Topology data repository (NTDR) without data

An addressed node without data in the NTDR shall response only the HeaderRecord with NumberOfLSAs = 0. The Neighbor Topology data repository (NTDR) Record is composed of an NTDR_HeaderRecord and multiple LSARecords which are described below:

NTDR_Record ::=

<NTDR_HeaderRecord>

<LSARecord_1>

.....

<LSARecord_n>

NTDR_HeaderRecord ::=

ndrID,dataType[=componentID],srcNodeASTNNodeID,NumberOfLSAs=LSA_Count

LSARecord ::=

<LSAHeaderRecord>

<L1Routing>

<LinkRecord_1>

.....

<LinkRecord_n>

LSAHeaderRecord ::=

*LSAAdvertisedRouter=origNodeASTNNodeID,LinkCount=linkCount,nodeTid,
UIIPAddr=nodeUI_IPAddr,SIGIPAddr=nodeIPAddr*

L1Routing::=

*L1Routing=routeFunc,RoutingAreaID=routeAreaID,ParentRoutingAreaID
=prouteAreaID,L1RoutingControllerID=routeControlID,L1RoutingControllerIPAddr=
routeControlIPAddr,AbstractModel=abstractModel,AbstractNodeID=abstractNodeID*

LinkRecord ::=

<Link_HeaderRecord>

<LinkBundleRecord_1>

.....

<LinkBundleRecord_o>

Link_HeaderRecord ::=

LinkId=LsaLinkId,BundleCount=bundleCount

LinkBundleRecord ::=

BundleID=linkBundleID,Delay=delay,Cost=adminCost,

SRLG=srlgList1,IncludeId=0,AtMinRate=minXCrate,

TotalBandwidth=totalBandwidth,AvailBandwidth=availableBandwidth,

AtMaxRate=maxXCrate,AvailBandwidth=availableBW_MaxXCrate

Output format with normal data retrieve completion report for dataType=ALL

If the RTRV-NTDR request completes successfully, then the following normal completion response is returned:

```

    srcTid date time
M   ctag RTRV
    "nndrID,ALL,srcNodeASTNNodeID,NumberOfLSAs=LSA_Count"
    "LSAHeaderRecord_1::
    Link_HeaderRecord_1:
    LinkBundleRecord_1-1
    ...
    LinkBundleRecord_1-n"
    ...
    "LSAHeaderRecord_4:L1Routing_4:
    Link_HeaderRecord_4:
    LinkBundleRecord_4-1"
>
    srcTid date time
M   ctag COMPLD
    "LSAHeaderRecord_5::
    Link_HeaderRecord_5:
    LinkBundleRecord_5-1
    ...
    LinkBundleRecord_5-n"
    ...
    "LSAHeaderRecord_m::
    Link_HeaderRecord_m:
    LinkBundleRecord_m-1
    ...
    LinkBundleRecord_m-n"
;

```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the Output parameters section of the “[RTRV-PATH: Retrieve ONNS connection data](#)” (p. 4-2526) command.

NTDR_HeaderRecord

1. *nndrID*
 NN Data Repository *dataID* to be returned
 Type: alphanumeric value set
 Range: NTDR, Network Topology data repository in RAM
2. *dataType*
 This parameter specifies, which part of the ELDR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype=ALL* *componentID* must not be specified.
 Type: alphanumeric value set
 Range:
 - ALL: retrieves the entire external link data repository in RAM
 - LSAID: retrieves the LSA in ELDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
 - NBRID: retrieves the LSA in NTDR between the current and the specified neighbor node, *componentID* must be a *neighborASTNNodeID*.
 This parameter specifies, which part of the NNTR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype=ALL* *componentID* must not be specified.
 Type: alphanumeric value set
 Range:
 - ALL: retrieves the entire (NTDR) Neighbor Topology data repository in RAM
 - LSAID: retrieves the LSA in NTDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
 - NBRID: retrieves the LSA in NTDR between the current and the specified neighbor node, *componentID* must be a *neighborASTNNodeID*.
3. *componentID*
 This parameter depends on the previous *dataType* parameter and is one of: not represented (when *datatype = ALL*); *nodeID* (when *datatype=LSAID* (any node ID) or *datatype=NBRID* (neighbor node ID)), or *L1RCID* (when *datatype=LSAID*). The detailed parameter format of the choices is described below.

nodeID – Node Identifier

- Identifier of an ASTN node.
- Type: Four dot separated numeric strings
- Range: for each numeric string: 0..255.

Note: If *dataType=ALL*, *componentID* and the = sign are not reported.

L1RCID – Level 1 Routing Controller ID

- *routeControlID* defines the identity of the Level 1 routing controller
- Type: four dot separated numeric string
- Range: for each numeric string: 0..255.

Note: If *dataType=ALL*, *componentID* and the “=” sign are not reported.

4. srcNodeASTNNodeID - Reporting Node ID

ASTN node ID of the ONNS node replying to this command.

Type: Four dot separated numeric strings

Range: for each numeric string: 0..255

5. LSA_Count

The parameter indicates the number of LSA records in the report. Also equals number of NE nodes in the network for *dataType=ALL*.

Type: Integer

Range:

- >0: number of LSAs with topology data records
- 0: no topology data at this node or within the network available

LSARecord

For each reported node of the topology one LSARecord shall be reported.

1. LSAHeaderRecord

a. origNodeASTNNodeASTNNodeID – Node ID of Advertising Node

This is the ASTN node ID of the node advertising this LSA data record.

Type: Four dot separated numeric strings.

Range: 0 - 255 for each numeric string.

b. linkCount

Number of reported links of *LSAAdvertisedRouter* towards other nodes in the network.

Type: Integer

Range: >0

c. nodeTid

Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.

See also the definition of *tid* in RTRV-HDR.

Type: identifier, in addition the special character underscore (“_”) and the password characters are allowed.

Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. L1Routing

The L1Routing object shall be optional and only visible for the *LSAAdvertisedRouter* with the value PRIMARY for the parameter *routeFunc*.

- a. *routeFunc* – Level 1 Routing Function
routeFunc defines if the *LSAAdvertisedRouter* has Level 1 routing controller functionality.
Type: alphanumeric value set
Range: PRIMARY (ONNS node is the primary level 1 routing controller)
- b. *routeAreaID* – Routing Area ID
routeAreaID defines the identity of the routing area.
Type: four dot separated numeric string
Range: 0 - 255 for each numeric string.
- c. *prouteAreaID* – Parent Routing Area ID
prouteAreaID defines the identity of the parent routing area.
Type: four dot separated numeric string
Range: 0 - 255 for each numeric string.
- d. *routeControlID* – Level 1 Routing Controller ID
routeControlID defines the identity of the Level 1 routing controller.
Type: four dot separated numeric string
Range: 0 - 255 for each numeric string.
- e. *routeControlIPAddr* – Level 1 Routing Controller IP Address
routeControlIPAddr defines the IP address for this routing controller node as level 1 routing controller address.
Type: four dot separated numeric string
Range:
For first numeric string: 0 ... 223
For second to fourth numeric string: 0 ... 255
The values 0.0.0.0 and 1.1.1.1 are excluded.
- f. *abstractModel* – Abstraction Model
abstractModel defines the abstraction model used by the level 1 routing controller.
Type: alphanumeric value set
Range: ABSTRACTNODE
- g. *abstractNodeID*
abstractNodeID shall be defined in case the *abstractModel* is ABSTRACTNODE. This parameter specifies the abstract node ID, which is advertised in the level 1 area.
Type: four dot separated numeric string
Range: 0 - 255 for each numeric string.

LinkRecord

For each neighborhood of the *LSAAdvertisedRouter* one LinkRecord shall be reported.

1. Link_HeaderRecord

a. LsaLinkID

LsaLinkID consists of the advertising ASTN nodeID and a neighbor ASTN nodeID, which together uniquely identify a link. The two IDs are separated by a &.

Type: Two times four dot separated numeric strings, separated by &.

Example: 135.13.44.61&135.13.3.86

Range: 0 - 255 for each numeric string.

b. bundleCount

Number of LinkBundles within the LinkRecord.

Type: Integer

Range: >0

2. LinkBundleRecord

For each link bundle within the LinkRecord one LinkBundleRecord shall be reported.

a. linkBundleID

This parameter is a unique numeric ID assigned to the link bundle on this node.

Range: 0 .. 32767

b. delay- Propagation Delay

Propagation delay in milliseconds through the port connection between the pair of ports on the path. The time needed for a signal to traverse from this node to the neighbor node. A propagation delay of 1 milliseconds corresponds to about 450 km of fiber length.

Type: Integer

Range: 0 (default) - 255

Propagation delay parameter is not applicable for EDGE, ENNI and UNI ports and is set to the default value.

c. adminCost - Administrative Cost

Provisioned administrative cost of the port connection when used in a connection path.

Type: Integer

Range; 1 (default) - 65535

Administrative cost parameter is not applicable for EDGE ports and is set to the default value. Administrative cost parameter is not applicable for UNI ports and is set to the default value.

d. srlgList - Shared Risk Link Group Identifier list.

The max. number of identities that can be provisioned per port may be release dependent.

Type: Up to ten &-separated integers

Examples:

198&233&0&0&0&0&0&0&0

10&20&30&40&0&0&0&=&0&0

89&1000&4&10&20&31&111&231&300&777

Range: Each value: 0 (default) - 65535. 0 means no SRLG provisioned

SRLG list is not applicable for EDGE ports and is set to the default value.

SRLG list is not applicable for UNI ports and is set to the default value.

e. IncludeID - VPN ID

Type: Integer

Range: 0 (default) - 65535. 0 means no includeID provisioned

VPN ID is not applicable for EDGE, ENNI and UNI ports and is set to the default value.

f. minXCrate

minXCrate denotes the smallest signal rate granularity used to provision a port into trib's.

Values: STS1 (link bundle consists of STMm, OCn ports), STS3 (link bundle consists of GE1 ports in SDH mode), STS1 (link bundle consists of GE1 ports in SONET mode).

g. totalBandwidth

This parameter is a numeric value indicating the total bandwidth in this *linkBundle* as multiples of *minXCrate*.

Type: Integer

Range: >2

h. availableBandwidth (for *minXCrate*)

This parameter is a numeric value indicating the available (i.e. non-used) bandwidth in this *linkBundle* as multiples of *minXCrate*.

Type: Integer

Range: ≥0

i. maxXCrate

This parameter denotes the largest signal rate granularity used to provision a port into trib's.

Type: alphanumeric value set

Range: STS1, STS3, STS12, STS48, STS192 (link bundle consists of all STMm, OCn ports), STS1 (link bundle consists of GE1 ports in SONET mode), STS3 (link bundle consists of GE1 ports in SDH mode).

j. availableBW_MaxXCrate

This parameter is a numeric value indicating the available (i.e. non-used) bandwidth in this *linkBundle* as multiples of *maxXCrate*.

Type: Integer

Range: ≥0

Newlines between LinkID's are optional.

Error responses

Invalid componentID parameter II

The command shall be rejected when for the *datatype*=LSAID the received *ASTNNodeID* is invalid.

Error code: E511 - IINO - Input, Invalid node ID

Error code: E512 - IINI Error - Input, Invalid Neighbor node ID

The following list identifies conditions that will be returned, if access to the topology database is not possible due to internal problems:

E002 - SICE Error - Status, Inter-Processor Communication Error caused cmd failure

E003 - SNTT Error - Status, Network Topology database Timed out

RTRV-OC3: Retrieve OC3 port

The RTRV-OC3 command is used to retrieve all parameters related to the optical OC3 port.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-OC3:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Access Identifier of an OC3 port.
Type: AID.
Range: SPortAID of OC3 port.
The keyword *all* is allowed up to shelf level.
3. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-OC3 command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
Type: AID.
Range: OC3 port AID.

Spec block parameters

1. *adminCost*- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* INNI.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default).....65535
2. *brstintvl*– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. *brstthr* – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, ... 50.
Default: 30.
4. *clientNodeID* – Client Node Identifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter shall be supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0...255
Default: 0.0.0.0

5. *crstat* – Constituent Rates Status list

This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.

When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.

For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.

6. *exprstrc* – Value of Expected J0

Expected regenerator section trace identifier.

The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.

Type: Hexadecimal digits

Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 89hex followed by 15 bytes 00hex

7. *felpm* – Far-end Line PM Enable

Enable or disable of the performance monitoring of the Far-end Line.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

8. *frcdus* – Force to DUS

Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

Type: alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

9. *fsflpbkstat* – Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

10. *inputsig* – Tributary Input Signal Rate List

This parameter is a list of STSn rates across the port's bandwidth.

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is setable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.

Default: 31.

Example: An O-3 signal might be represented by 31 which implies 3 STS1's or 13 which implies 1 STS3C.

11. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET.

Type: alphanumeric value set.

Range: SONET.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

12. *linkResCls* – Link Resource Class

The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Default: 00 for each alphanumeric character

13. *localLinkID* – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

14. *localLPID* – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

16. *maxNNXCRate* – Maximum NN Cross Connect Rate

The *maxNNXCRate* identifies the maximum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: STS1 or STS3 (default)

17. *minNNXCRate* – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: STS1 (default) or STS3.

18. *ndetmd* – Neighbor Detection Mode

The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set.

Range:

For *portClass*=INNI: AUTO (default) or MAN

For *portClass*=ENNI: MAN (default)

19. *neighborASTNNodeID* – Neighbor ASTN Node Id

This parameter identifies the unique node identifier of the neighbor node of ports of *portClass*=INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0 If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered".

20. *neighborNodeID* - Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN. If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0

If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered"

21. *neighborPortID* – Neighbor Port Id

This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.

Range: Each numeric string: 0...255.

Default: 0-0-0-0.

Interpretation: For UNITE ports the contents of this parameter shall be interpreted as SPort AID, a value of a-b-c-d shall be interpreted as the SPortAID a-b-#-#-c-d.

22. *neighborSigPCID* – Neighbor Signaling PC Identity

The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

23. *neighborSigPCIPAddr* – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

24. *nelpm* – Near-End Line PM Enable

Enable or disable near-end multiplex section (near-end line) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

25. *networkTNAType* – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: alphanumeric value set

Range:

- IPV4 (default)
- IPV6
- NSAP

26. *networkTNAAddress* – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type:

- *networkTNAType*= IPV4: Four dot separated numeric string (represents 4 Bytes)
- *networkTNAType*= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- *networkTNAType*= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0...255
- IPV6: Each hexadecimal number: 0000...FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000...
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. *opdis* – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set.

Range:

- VERY-SHORT-REACH
- SHORT-REACH
- INTERMEDIATE-REACH
- LONG-REACH
- VERY-LONG-REACH
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME.
- NA.

28. opw1 – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 1471 ... 1611 (for CWDM) NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

29. outq1 – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.

Type: alphanumeric value set.

Range:

- PRS
- STU
- ST2
- ST3
- DUS (default).

30. pmmsfes – Performance Monitoring Line/MS Far-End SES Threshold

This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-1/OC-3: 1 – 192000.

Default: The default values differ for SDH and SONET:

- STM1: 28800
- OC3: 154.

31. `pmmsneses` – Performance Monitoring Line/MS Near-End SES Threshold

This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-1/OC-3: 1 – 192000.

Default: The default values differ for SDH and SONET and the different rates:

- STM1: 28800
- OC3: 154.

32. `pmode` – Port Mode

This parameter sets the mode of the port. In the case of AUTO the `pmode` state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

33. `pmrsneses` – Performance Monitoring Section/RS Near-End SES Threshold

This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of allowed ranges for SDH and SONET): 1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

34. *portClass* – Port Class

This parameter identifies the port class of the AID.

In which role the port is used by the ONNS application is specified by this parameter *portClass*.

Type: alphanumeric value set.

Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) shall be used as default value. Otherwise, the default value shall be TRADITIONAL.

35. *portControl* – Port Control (PortAdministrative Mode)

The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

Type: alphanumeric value set

Range: NORMAL (default), LOCKOUT

36. *propagationDelay* - Propagation Delay

This parameter identifies the provisioned propagation delay value for ports of *portClass*=INNI. For all ports with other values of *portClass* this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

propagationDelay is used by the ONNS application.

Type: Numeric string

Range: 0(sedault) ...25. The unit of this value is "milliseconds".

37. *ptype* – Port Type

This identifies the port type of the AID.

Type: alphanumeric value set.

Range: OC3.

38. *remAdvNodeID* – Remote Advertised Node IDentity

The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

39. remLinkID – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

40. remRAID – Remote Routing Area IDentity

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

41. remTID – Remote TID

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: TID or empty-string

Range: Please refer to the TID definition in the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) description.

Default: empty string: ""

42. rstimca – RS TIM Consequent Action Enable

Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range:

- ENABLE: enable consequent action for TIM
- DISABLE (default): disable consequent action for TIM.

43. `rstimmon` – RS TIM Monitor Enable

Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

44. `sdsfmode` – Signal Degrade/Signal Fail Mode

The degraded state is detected in Burst or Poisson mode.

Type: alphanumeric value set.

Range:

- BURST
- POISSON (default).

45. `sdthr` – Signal Degrade Threshold

Signal degrade threshold in a range from 10exp-5 to 10exp-9 . This parameter applies when *sdsfmode*=POISSON.

Type: numeric value set.

Range (as exponents of 10): -5; -6; -7; -8; -9.

46. `servcond` – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

47. `sfthr` – Signal Failure Threshold

Signal failure threshold in a range from 10exp-5 to 10exp-9 . This parameter applies when *sdsfmode*=POISSON.

Type: numeric value set.

Range (as exponents of 10): -5; -6; -7; -8; -9.

Default: -6.

48. `sltca` – Section and Line TCA Profile Pointer

Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

Type: alphanumeric string.

Range: String with maximum of 24 characters.

Default: DEFAULT0.

49. sonet – SONET ASAP

SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see “[RTRV-STM4: Retrieve STM4 port](#)” (p. 4-2693), output parameter *sdhpn*) to be compatible with current generation applications.

Type: alphanumeric string.

Range: String with a maximum of 24 characters. A hyphen (-) is additionally allowed in the name.

Default: DEFAULT.

50. spm – Section PM Enable

Enable or disable regenerator section (section) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

51. srlgList – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones shall be set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0...65535.

Default: 0-0-0-0-0-0-0-0-0-0.

52. strc – Value of incoming J0

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter

strc is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. *strcfmt* – Format of incoming J0

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

54. *strcout* – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. *strcst* – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

56. *strcwfmt* – Format of outgoing J0

The write format of J0, the outgoing section trace (*strcout*). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

57. *trbmd* – Tributary mode

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in [“RTRV-STM16: Retrieve STM16 port” \(p. 4-2711\)](#) for SDH equivalent.

Type: alphanumeric value set.

Range:

- ADAPTIVE
- FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)” \(p. 4-2242\)](#) command.

58. *unequiposig* – Unequipped Output Signal List

This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.

Default: 3 1 = all STS1.

59. *z0outmode* – Mode of outgoing Z0 byte insertion

The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).

Type: alphanumeric value set.

Range:

- FIXEDCC (default): for inserting the fixed value CChex
- STSID: for inserting the STS-Id of the current frame.

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-OC3 command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-OC3 command. Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-OC3:LT-UNITE:1-1-#-#-1-1:123456;
```

```
LT-UNITE 00-11-27 08:00:00
M 123456 COMPLD
"1-1-#-#-1-1:ptype=OC3,frcdus=DISABLE,sfthr=-3,sdthr=-6,
  pmode=MON,..... pmmsneses=15,pmrsneses=30"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-OC3 command.

Check CCB against *ptype* and *istd*

See definition of error response in [“RTRV-STM16: Retrieve STM16 port”](#) (p. 4-2711).

References

GR-199-CORE (RTRV-rr)

RTRV-OC12: Retrieve OC12 port

The RTRV-OC12 command is used to retrieve all parameters related to the optical OC12 port.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-OC12:*tid*:*aid*:*tag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Access Identifier of an OC12 port.
Type: AID.
Range: SPortAID of OC12 port.
The keyword *all* is allowed up to shelf level.
3. *tag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-OC12 command, the following output report is returned:

```
sid date time
M  tag COMPLD
   "aid[:spec_block]"
   ...
   ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *tag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
Type: AID.
Range: OC-12 port AID.

Spec block parameters

1. *adminCost*- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* INNI.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default).....65535
2. *brstintvl*– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. *brstthr* – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, ... 50.
Default: 30.
4. *clientNodeID* – Client Node Identifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter shall be supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0...255
Default: 0.0.0.0

5. *crstat* – Constituent Rates Status list

This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.

When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.

For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.

6. *exprstrc* – Value of Expected J0

Expected regenerator section trace identifier.

The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.

Type: Hexadecimal digits

Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 89hex followed by 15 bytes 00hex

7. *felpm* – Far-end Line PM Enable

Enable or disable of the performance monitoring of the Far-end line.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

8. *frcdus* – Force to DUS

Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

Type: alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

9. *fsflpbkstat* – Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

10. *inputsig* – Tributary Input Signal Rate List

This parameter is a list of STSn rates across the port's bandwidth.

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.

Default: 121.

Example:

An OC12 signal might be represented by 31-33 which implies 3 STS1's, 3 STS3C's.

11. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET.

Type: alphanumeric value set.

Range: SONET.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

12. *linkResCls* – Link Resource Class

The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Default: 00 for each alphanumeric character

13. *localLinkID* – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

14. *localLPID* – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

16. *maxNNXCRate* – Maximum NN Cross Connect Rate

The *maxNNXCRate* identifies the maximum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: STS1, STS3 or STS12 (default)

17. *minNNXCRate* – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: STS1 (default), STS3 or STS12.

18. *ndetmd* – Neighbor Detection Mode

The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set.

Range:

For *portClass*=INNI: AUTO (default) or MAN

For *portClass*=ENNI: MAN (default)

19. *neighborASTNNodeID* – Neighbor ASTN Node Id

This parameter identifies the unique node identifier of the neighbor node of ports of *portClass*=INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0 If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered".

20. *neighborNodeID* - Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN. If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0

If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered"

21. *neighborPortID* – Neighbor Port Id

This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.

Range: Each numeric string: 0...255.

Default: 0-0-0-0.

Interpretation: For UNITE ports the contents of this parameter shall be interpreted as SPort AID, a value of a-b-c-d shall be interpreted as the SPortAID a-b-#-#-c-d.

22. *neighborSigPCID* – Neighbor Signaling PC Identity

The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0...255
Default: 0.0.0.0

23. *neighborSigPCIPAddr* – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0...255
Default: 0.0.0.0

24. *nelpm* – Near-End Line PM Enable

Enable or disable near-end multiplex section (near-end line) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

25. *networkTNAType* – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: alphanumeric value set

Range:

- IPV4 (default)
- IPV6
- NSAP

26. *networkTNAAddress* – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type:

- *networkTNAType*= IPV4: Four dot separated numeric string (represents 4 Bytes)
- *networkTNAType*= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- *networkTNAType*= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0...255
- IPV6: Each hexadecimal number: 0000...FFFF
- NSAP: Hexadecimal number:
000000000000000000000000000000000000...
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. *opdis* – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set.

Range:

- VERY-SHORT-REACH
- SHORT-REACH
- INTERMEDIATE-REACH
- LONG-REACH
- VERY-LONG-REACH
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

28. opw1 – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 1471 ... 1611 (for CWDM) NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

29. outq1 – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.

Type: alphanumeric value set.

Range:

- PRS
- STU
- ST2
- ST3
- DUS (default).

30. pmmsfes – Performance Monitoring Line/MS Far-End SES Threshold

This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-4/OC-12: 1 – 768000.

Default: The default values differ for SDH and SONET:

- STM4: 115200
- OC12: 615.

31. `pmmsneses` – Performance Monitoring Line/MS Near-End SES Threshold

This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-4/OC-12: 1 – 768000.

Default: The default values differ for SDH and SONET and the different rates:

- STM4: 115200
- OC3: 615.

32. `pmode` – Port Mode

This parameter sets the mode of the port. In the case of AUTO the `pmode` state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

33. `pmrsneses` – Performance Monitoring Section/RS Near-End SES Threshold

This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of allowed ranges for SDH and SONET): 1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

34. *portClass* – Port Class

This parameter identifies the port class of the AID.

In which role the port is used by the ONNS application is specified by this parameter *portClass*.

Type: alphanumeric value set.

Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) shall be used as default value. Otherwise, the default value shall be TRADITIONAL.

35. *portControl* – Port Control (PortAdministrative Mode)

The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

Type: alphanumeric value set

Range: NORMAL (default), LOCKOUT

36. *propagationDelay* - Propagation Delay

This parameter identifies the provisioned propagation delay value for ports of *portClass*=INNI. For all ports with other values of *portClass* this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

propagationDelay is used by the ONNS application.

Type: Numeric string

Range: 0(sedault) ...25. The unit of this value is "milliseconds".

37. *ptype* – Port Type

This identifies the port type of the AID.

Type: alphanumeric value set.

Range: OC12.

38. *remAdvNodeID* – Remote Advertised Node IDentity

The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

39. remLinkID – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

40. remRAID – Remote Routing Area IDentity

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

41. remTID – Remote TID

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: TID or empty-string

Range: Please refer to the TID definition in the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) description.

Default: empty string: ""

42. rstimca – RS TIM Consequent Action Enable

Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range:

- ENABLE: enable consequent action for TIM
- DISABLE (default): disable consequent action for TIM.

43. `rstimmon` – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* shall be autonomously set by the neighbour detection mechanism.
Type: alphanumeric value set.
Range:
 - ENABLE: enable TIM Monitor
 - DISABLE (default): disable TIM Monitor
44. `sdsfmode` – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: alphanumeric value set.
Range:
 - BURST
 - POISSON (default).
45. `sdthr` – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
Type: numeric value set.
Range (as exponents of 10): -5; -6; -7; -8; -9.
Default: -6.
46. `servcond` – Service Condition
This parameter indicates its status concerning service involvement.
Type: alphanumeric value set.
Range:
 - INSERVICE (default): Provisioning values for service are accepted
 - OUTOFSERVICE: Provisioning values for service are not accepted.
47. `sfthr` – Signal Failure Threshold
Signal failure threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
Type: numeric value set.
Range (as exponents of 10): -5; -6; -7; -8; -9.
48. `sltca` – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

49. sonet – SONET ASAP

SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see “[RTRV-STM4: Retrieve STM4 port](#)” (p. 4-2693), output parameter *sdhpn*) to be compatible with current generation applications.

Type: alphanumeric string.

Range: String with a maximum of 24 characters. A hyphen (-) is additionally allowed in the name.

Default: DEFAULT.

50. spm – Section PM Enable

Enable or disable regenerator section (section) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

51. srlgList – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones shall be set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0...65535.

Default: 0-0-0-0-0-0-0-0-0.

52. strc – Value of incoming J0

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter

strc is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. *strcfmt* – Format of incoming J0

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

54. *strcout* – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. *strcst* – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

56. *strcwfmt* – Format of outgoing J0

The write format of J0, the outgoing section trace (*strcout*). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

57. *trbmd* – Tributary mode

If *trbmd* is FIXED, then *inputsig* constrains the cross connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in RTRV-STM16 for SDH equivalent.

Type: alphanumeric value set.

Range:

- ADAPTIVE
- FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242) command.

58. *unequiposig* – Unequipped Output Signal List

This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.

Default: 121 = all STS1 (fixed).

59. *z0outmode* – Mode of outgoing Z0 byte insertion

The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).

Type: alphanumeric value set.

Range:

- FIXEDCC (default): for inserting the fixed value CChex
- STSID: for inserting the STS-Id of the current frame.

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-OC12 command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-OC12 command.

Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-OC12:LT-UNITE:1-1-#-#-1-1:123456;
```

```
LT-UNITE 00-11-27 08:00:00
M 123456 COMPLD
"1-1-#-#-1-1:ptype=OC12,frcdus=DISABLE,sfthr=-3,
sdthr=-6, pmode=MON,..... pmmsneses=15,pmrsneses=30"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-OC12 command.

Check CCB against ptype and istd

See definition of error response in [“RTRV-STM16: Retrieve STM16 port”](#) (p. 4-2711).

References

GR-199-CORE (RTRV-rr)

RTRV-OC48: Retrieve OC48 port

The RTRV-OC48 command is used to retrieve all parameters related to the optical OC48 port.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-OC48:tid:aid:ctag;

Input parameters

Command parameters

1. tid – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. aid – Access Identifier
Access Identifier of an OC-48 port.
Type: AID.
Range: SPortAID of OC48 port.
The keyword all is allowed up to shelf level.
3. ctag – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-OC48 command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
Type: AID.
Range: OC-48 port AID.

Spec block parameters

1. *adminCost*- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* INNI.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default).....65535
2. *brstintvl*– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. *brstthr* – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, ... 50.
Default: 30.
4. *clientNodeID* – Client Node Identifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter shall be supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0...255
Default: 0.0.0.0

5. *crstat* – Constituent Rates Status list

This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.

When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.

For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1, 3, 12, 48 representing STS1, STS3C, STS12C, STS48C.

6. *exprstrc* – Value of Expected J0

Expected regenerator section trace identifier.

The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.

Type: Hexadecimal digits

Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 89hex followed by 15 bytes 00hex

7. *felpm* – Far-end Line PM Enable

Enable or disable of the performance monitoring of the Far-end Line.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

8. *frcdus* – Force to DUS

Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

Type: alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

9. *fsflpbkstat* – Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

10. *inputsig* – Tributary Input Signal Rate List

This parameter is a list of STSn rates across the port's bandwidth.

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.

Default: 481.

Example: An OC-48 signal might be represented by 91-13-112-241 which implies 9 STS1's, 1 STS3C, 1 STS12C, 24 STS1's.

11. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET.

Type: alphanumeric value set.

Range: SONET.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

12. *linkResCls* – Link Resource Class

The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Default: 00 for each alphanumeric character

13. *localLinkID* – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

14. *localLPID* – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

16. *maxNNXCRate* – Maximum NN Cross Connect Rate

The *maxNNXCRate* identifies the maximum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: STS1, STS3, STS12 or STS48 (default)

17. *minNNXCRate* – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: STS1 (default), STS3, STS12 or STS48.

18. *ndetmd* – Neighbor Detection Mode

The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set.

Range:

For *portClass*=INNI: AUTO (default) or MAN

For *portClass*=ENNI: MAN (default)

19. *neighborASTNNodeID* – Neighbor ASTN Node Id

This parameter identifies the unique node identifier of the neighbor node of ports of *portClass*=INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0 If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered".

20. *neighborNodeID* - Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN. If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0

If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered"

21. *neighborPortID* – Neighbor Port Id

This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.

Range: Each numeric string: 0...255.

Default: 0-0-0-0.

Interpretation: For UNITE ports the contents of this parameter shall be interpreted as SPort AID, a value of a-b-c-d shall be interpreted as the SPortAID a-b-#-#-c-d.

22. *neighborSigPCID* – Neighbor Signaling PC Identity

The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

23. *neighborSigPCIPAddr* – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

24. *nelpm* – Near-End Line PM Enable

Enable or disable near-end multiplex section (near-end line) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

25. *networkTNAType* – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: alphanumeric value set

Range:

- IPV4 (default)
- IPV6
- NSAP

26. *networkTNAAddress* – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type:

- *networkTNAType*= IPV4: Four dot separated numeric string (represents 4 Bytes)
- *networkTNAType*= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- *networkTNAType*= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0...255
- IPV6: Each hexadecimal number: 0000...FFFF
- NSAP: Hexadecimal number:
000000000000000000000000000000000000...
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. *opdis* – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set.

Range:

- VERY-SHORT-REACH
- SHORT-REACH
- INTERMEDIATE-REACH
- LONG-REACH
- VERY-LONG-REACH
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

28. opw1 – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 1471 ... 1611 (for CWDM) NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

29. outq1 – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.

Type: alphanumeric value set.

Range:

- PRS
- STU
- ST2
- ST3
- DUS (default).

30. pmmsfes – Performance Monitoring Line/MS Far-End SES Threshold

This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

31. `pmmsneses` – Performance Monitoring Line/MS Near-End SES Threshold

This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

32. `pmode` – Port Mode

This parameter sets the mode of the port. In the case of AUTO the `pmode` state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

33. *pmrsneses* – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of allowed ranges for SDH and SONET): 1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

34. *portClass* – Port Class

This parameter identifies the port class of the AID.

In which role the port is used by the ONNS application is specified by this parameter *portClass*.

Type: alphanumeric value set.

Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) shall be used as default value. Otherwise, the default value shall be TRADITIONAL.

35. *portControl* – Port Control (PortAdministrative Mode)

The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

Type: alphanumeric value set

Range: NORMAL (default), LOCKOUT

36. *propagationDelay* - Propagation Delay

This parameter identifies the provisioned propagation delay value for ports of *portClass*=INNI. For all ports with other values of *portClass* this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

propagationDelay is used by the ONNS application.

Type: Numeric string

Range: 0 (default) ...25. The unit of this value is "milliseconds".

37. ptype – Port Type

This identifies the port type of the AID.

Type: alphanumeric value set.

Range: OC48.

38. remAdvNodeID – Remote Advertised Node IDentity

The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter. The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

39. remLinkID – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

40. remRAID – Remote Routing Area IDentity

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

41. `remTID` – Remote TID

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: TID or empty-string

Range: Please refer to the TID definition in the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) description.

Default: empty string: ""

42. `rstimca` – RS TIM Consequent Action Enable

Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range:

- ENABLE: enable consequent action for TIM
- DISABLE (default): disable consequent action for TIM.

43. `rstimmon` – RS TIM Monitor Enable

Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

44. `sdsfmode` – Signal Degrade/Signal Fail Mode

The degraded state is detected in Burst or Poisson mode.

Type: alphanumeric value set.

Range:

- BURST
- POISSON (default).

45. `sdthr` – Signal Degrade Threshold

Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.

Type: numeric value set.

Range (as exponents of 10): -5; -6; -7; -8; -9.

Default: -6.

46. *servcond* – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- *INSERVICE* (default): Provisioning values for service are accepted
- *OUTOFSERVICE*: Provisioning values for service are not accepted.

47. *sfthr* – Signal Failure Threshold

Signal failure threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=*POISSON*.

Type: numeric value set.

Range (as exponents of 10): -5; -6; -7; -8; -9.

Default: -6.

48. *sltca* – Section and Line TCA Profile Pointer

Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

Type: alphanumeric string.

Range: String with maximum of 24 characters.

Default: *DEFAULT0*.

49. *sonet* – SONET ASAP

This parameter sets a SONET ASAP profile name of type *PORT* to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (see [“RTRV-STM16: Retrieve STM16 port” \(p. 4-2711\)](#), output parameter *sdhpn*) to be compatible with current generation applications.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: *DEFAULT*.

50. *spm* – Section PM Enable

Enable or disable regenerator section (section) performance monitoring.

Type: alphanumeric value set.

Range:

- *ENABLE*
- *DISABLE* (default).

51. *srlgList* – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones shall be set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0...65535.

Default: 0-0-0-0-0-0-0-0-0-0.

52. *strc* – Value of incoming J0

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then *strc* contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter *strc* is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the *strcfmt* parameter).

53. *strcfmt* – Format of incoming J0

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

54. *strcout* – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. *strcst* – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

56. *strcwfmt* – Format of outgoing J0

The write format of J0, the outgoing section trace (*strcout*). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

57. *trbmd* – Tributary mode

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect.

Type: alphanumeric value set.

Range:

- ADAPTIVE
- FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242) command.

58. *unequiposig* – Unequipped Output Signal List

This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is

ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.

Default: 481 = all STS1 (fixed).

59. z0outmode – Mode of outgoing Z0 byte insertion

The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).

Type: alphanumeric value set.

Range:

- FIXEDCC (default): for inserting the fixed value CChex
- STSID: for inserting the STS-Id of the current frame.

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-OC48 command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-OC48 command. Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-OC48:LT-UNITE:1-1-#-#-1-1:123456;
```

```
LT-UNITE 00-11-27 08:00:00
M 123456 COMPLD
"1-1-#-#-1-1:ptype=OC48,frcdus=DISABLE,sfthr=-3,
sdthr=-6, pmode=MON,..... pmmsneses=15,pmrsneses=30"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-OC48 command.

Check CCB against ptype and istd

See definition of error response in [“RTRV-STM16: Retrieve STM16 port”](#) (p. 4-2711).

RTRV-OC48T: Retrieve OC48T port

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-OC48T:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Access Identifier of an OC-48 port.
Type: AID.
Range: SPortAID of OC48 port.
The keyword *all* is allowed up to shelf level.
3. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-OC48T command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
Access Identifier of an OC-48 port.
Type: AID.
Range: SPortAID of OC48 port.
The keyword *all* is allowed up to shelf level.

Spec block parameters

1. *exprstrc* – Value of Expected J0
For RTRV-OC48T this parameter refers to the incoming (ingress) direction.
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex
2. *exprstrcout* - Value of Expected J0 in outgoing direction
Expected regenerator section trace identifier in outgoing (egress) direction.
The parameter *expstrcout* specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format *strcfmtout* is set to 16 (16-byte-specific-string mode).
Type: Hexadecimal digits
Range: 16 byte string. Each byte shall be expressed as two hexadecimal digits (example value: 6D). The first byte value shall be in the range from 80 to FF. The other byte values shall be in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex
3. *fsflpbkstat* – Far Side Facility Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: alphanumeric value set.
Range:
 - YES
 - NO (default).

4. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET.

Type: alphanumeric value set.

Range: SONET.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

5. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

6. *opdis* – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set.

Range:

- VERY-SHORT-REACH
- SHORT-REACH
- INTERMEDIATE-REACH
- LONG-REACH
- VERY-LONG-REACH
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

7. *opwl* – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 1471 ... 1611 (for CWDM) NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

8. pmode – Port Mode

This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

9. pmrsneses – Performance Monitoring Section/RS Near-End SES Threshold

For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

Type: numeric value set.

Range (superset of allowed ranges for SDH and SONET): 1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

10. pmrsnesesout - Performance Monitoring Section/RS Near-End SES Threshold in Outgoing Direction

This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

Type: numeric value set

Range (superset of allowed ranges for SDH and SONET): 1 - 64000

Default:

The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392

11. ptype – Port Type

This identifies the port type of the AID.

Type: alphanumeric value set.

Range: OC48T.

12. `rstimmon` – RS TIM Monitor Enable

For RTRV-OC48T this parameter refers to the incoming (ingress) direction. Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

13. `rstimmonout` - RS TIM Monitor Enable in Outgoing direction

Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set

Range: ENABLE - enable TIM Monitor, DISABLE (default) - disable TIM Monitor

14. `servcond` – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

15. `sltca` – Section and Line TCA Profile Pointer

Definition of the section and line threshold crossing alarm profile pointer.

Type: alphanumeric string.

Range: String with maximum of 24 characters.

Default: DEFAULT0.

16. `sonet` – SONET ASAP

This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (*sdhpn*) to be compatible with current generation applications.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

17. `spm` – Section PM Enable

For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

Enable or disable section performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

18. *spmout* - Section PM Enable in Outgoing Direction

Enable or disable section performance monitoring for the outgoing (egress) direction.

Type: alphanumeric value set.

Range: ENABLE, DISABLE (default).

19. *strc* – Value of incoming J0

For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then *strc* contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter *strc* is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the *strcfmt* parameter).

20. *strcfmt* – Format of incoming J0

For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

21. *strcfmtout* - Format of outgoing J0

The read format of J0 in outgoing (egress) direction, the outgoing section trace (*strcout*) and the expected section trace (*exprstrcout*).

Type: numeric string

Range:

- 1, for specific repeating byte (SONET)
- 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)

- 16, for 16 byte specific string (ITU/ETSI mode 1)
- 64, for 64 byte string (SONET).

22. strcout – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

23. strcst - Format of incoming J0

For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

24. strcstout - Status of outgoing J0

This parameter shows the status of the value of the RS/Section Trace Identifier in outgoing (egress) direction which is available with parameter *strcout*.

alphanumeric value set

Range:

- NORMAL, *strcout* contains a valid value
- UNAVAILABLE, no value for *strcout* could be obtained by the system
- AIS, no value for *strcout* due to an SF condition

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-OC48T command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-OC48T command. Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-OC48T:LT-UNITE:1-1-#-#-1-1:123456;  
  
LT-UNITE 00-11-27 08:00:00  
M 123456 COMPLD  
"1-1-#-#-1-1:ptype=OC48T,pmode=MON,.....,  
pmrsneses=30,pmrsnesesout=30"  
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-OC48T command.

Check CCB against *ptype* and *istd*

See definition of error response in [“RTRV-STM16: Retrieve STM16 port”](#) (p. 4-2711).

Input format

Command Syntax: RTRV-OC192:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Access Identifier of an OC192 port.
Type: AID.
Range: SPortAID of OC192 port.
The keyword *all* is allowed up to shelf level.
3. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-OC192 command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command parameters

1. **aid** – Access Identifier
Access Identifier of the OC192 port.
Type: AID.
Range: SPortAID of OC192 port.
The keyword **all** is not allowed.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* INNI.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default).....65535
2. **brstintvl**– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. **brstthr** – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, ... 50.
Default: 30.
4. **clientNodeID** – Client Node Identifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems

reasonable for a possible extension of this attribute to other port classes in future.

This parameter shall be supported by ports of *portClass* UNI.

Type: IPv4 format: Four dot separated numeric string.

Range: Each numeric string: 0...255

Default: 0.0.0.0

5. *crstat* – Constituent Rates Status list

This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.

When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.

For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the tributary input rate signal list.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C, STS192C.

6. *exprstrc* – Value of Expected J0

Expected regenerator section trace identifier.

The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.

Type: Hexadecimal digits

Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 89hex followed by 15 bytes 00hex

7. *fec* – FEC Enable

Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.

Type: alphanumeric value set.

Range:

DISABLE (only) for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768/STM256 basis low cost intra office 1310 nm optics.

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

ENABLE (only) for:

- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G

Default:

DISABLE for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768/STM256 basis low cost intra office 1310 nm optics.

ENABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

8. `felpm` – Far-end Line PM Enable

Enable or disable of the performance monitoring of the Far-end Line.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

9. `frcdus` – Force to DUS

Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

Type: alphanumeric value set.

Range:

- ENABLE: (set a forced DUS/DNU)
- DISABLE (default): (clear a forced DUS/DNU).

10. *fsflpbkstat* – Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

11. *inputsig* – Tributary Input Signal Rate List

This parameter is a list of STSn rates across the port's bandwidth.

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C or STS192C.

Default: 1921.

12. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET.

Type: alphanumeric value set.

Range: SONET.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

13. *linkResCls* – Link Resource Class

The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Default: 00 for each alphanumeric character

14. *localLinkID* – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

15. *localLPID* – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

16. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

17. *maxNNXCRate* – Maximum NN Cross Connect Rate

The *maxNNXCRate* identifies the maximum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: STS1, STS3, STS12, STS48 or STS192 (default)

18. *minNNXCRate* – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: STS1 (default), STS3, STS12, STS48 or STS192.

19. *msrei* – MS-REI mode

An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.

Type: alphanumeric value set

Range: SINGLE or EXTENDED (default).

20. *ndetmd* – Neighbor Detection Mode

The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set.

Range:

For *portClass*=INNI: AUTO (default) or MAN

For *portClass*=ENNI: MAN (default)

21. neighborASTNNodeID – Neighbor ASTN Node Id

This parameter identifies the unique node identifier of the neighbor node of ports of *portClass*=INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0 If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered".

22. neighborNodeID - Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0

If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered"

23. neighborPortID – Neighbor Port Id

This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborPortID is used by the application.

Type: Four dash separated numeric string.

Range: Each numeric string: 0...255.

Default: 0-0-0-0.

Interpretation: For UNITE ports the contents of this parameter shall be interpreted as SPort AID, a value of a-b-c-d shall be interpreted as the SPortAID a-b-#-#-c-d.

24. neighborSigPCID – Neighbor Signaling PC IDentity

The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

25. neighborSigPCIPAddr – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

26. ne1pm – Near-End Line PM Enable

Enable or disable near-end multiplex section (near-end line) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

27. networkTNAType – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: alphanumeric value set

Range:

- IPV4 (default)
- IPV6
- NSAP

28.networkTNAAddress – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0...255
- IPV6: Each hexadecimal number: 0000...FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000...
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCDD213141515A6A7EB2D433221100AAFF

Default:

- [illegible]

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. och – optical channel enable

Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don't have any impact on transmission.

Type: alphanumeric value set.

Range:

- for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
- for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
- for ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
- for client ports on packs which support OTN: DISABLE: disable, optical channel not applicable.

Default:

- for OP10 and OP40 packs, which cannot support OCH: DISABLE
- for OP10 packs, which can support OCH: ENABLE
- or OP10 and OP40 packs, which only support OCH: ENABLE
- for client ports on packs which support OTN: DISABLE.

30. opdis – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set.

Range:

- VERY-SHORT-REACH
- SHORT-REACH
- INTERMEDIATE-REACH
- LONG-REACH
- VERY-LONG-REACH
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

31. `opwl` – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 1471 ... 1611 (for CWDM) NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

32. `otnclient` – OTN Client Port

This parameter indicates whether the port is an OTN Client Port or an optical SDH/SONET port.

Type: alphanumeric value set.

Range: YES for OTN client port. NO for optical SDH/SONET port.

33. `outq1` – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.

Type: alphanumeric value set.

Range:

- PRS
- STU
- ST2
- ST3
- DUS (default).

34. `pmmsfes` – Performance Monitoring Line/MS Far-End SES Threshold

This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459

- SONET OC192: 9835
- SONET OC768: 39340.

35. `pmmsneses` – Performance Monitoring Line/MS Near-End SES Threshold

This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

36. `pmode` – Port Mode

This parameter sets the mode of the port. In the case of AUTO the `pmode` state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start. The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

Default:

- AUTO for optical SDH/SONET ports
- NMON for client ports.

37. *pmrsneses* – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET): 1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
- SDH (all rates): 2400
 - SONET OC48: 2392
 - SONET OC192: 8554
 - SONET OC768: 22776.
38. *polynomial* - Optical Channel Scrambling Polynomial
This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (*och* == ENABLE).
Type: numeric value set.
Range: $1x^7 + x + 1$; $2x^{16} + x^{12} + x^3 + x + 1$.
Default: 2.
39. *portClass* – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) shall be used as default value. Otherwise, the default value shall be TRADITIONAL.
40. *portControl* – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: alphanumeric value set
Range: NORMAL (default), LOCKOUT
41. *propagationDelay* - Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass*=INNI. For all ports with other values of *portClass* this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string
Range: 0 (sedault) ...25. The unit of this value is "milliseconds".

42. ptype – Port Type

This identifies the port type of the AID.

It is derived from the functional name and functional qualifier of a circuit pack. If the functional qualifier indicates a pack with 10GE_WANPHY interfaces the port type has the value 10GE_WANPHY, else OC192.

Type: alphanumeric value set.

Range: OC192.

43. remAdvNodeID – Remote Advertised Node IDentity

The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter. The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

44. remLinkID – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

45. remRAID – Remote Routing Area IDentity

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

46. *remTID* – Remote TID

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: TID or empty-string

Range: Please refer to the TID definition in the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) description.

Default: empty string: ""

47. *rstimca* – RS TIM Consequent Action Enable

Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range:

- ENABLE: enable consequent action for TIM
- DISABLE (default): disable consequent action for TIM.

48. *rstimmon* – RS TIM Monitor Enable

Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

49. *sdsfmode* – Signal Degrade/Signal Fail Mode

The degraded state is detected in Burst or Poisson mode.

Type: alphanumeric value set.

Range:

- BURST
- POISSON (default).

50. *sdthr* – Signal Degrade Threshold

Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.

Type: numeric value set.

Range (as exponents of 10): -5; -6; -7; -8; -9.

Default: -6.

51. *servcond* – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- *INSERVICE* (default): Provisioning values for service are accepted
- *OUTOFSERVICE*: Provisioning values for service are not accepted.

52. *sfthr* – Signal Failure Threshold

Signal failure threshold in a range from 10exp-5 to 10exp-9 . This parameter applies when *sdsfmode*=*POISSON*.

Type: numeric value set.

Range (as exponents of 10): -5; -6; -7; -8; -9.

Default: -6.

53. *sltca* – Section and Line TCA Profile Pointer

Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

Type: alphanumeric string.

Range: String with maximum of 24 characters.

Default: *DEFAULT0*.

54. *sonet* – SONET ASAP

This parameter sets a SONET ASAP profile name of type *PORT* to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (*sdhpn*) to be compatible with current generation applications.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: *DEFAULT*.

55. *spm* – Section PM Enable

Enable or disable regenerator section (section) performance monitoring.

Type: alphanumeric value set.

Range:

- *ENABLE*
- *DISABLE* (default).

56. *srlgList* – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones shall

be set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0...65535.

Default: 0-0-0-0-0-0-0-0-0.

57. *strc* – Value of incoming J0

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then *strc* contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter *strc* is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the *strcfmt* parameter).

58. *strcfmt* – Format of incoming J0

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

59. *strcout* – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

60. *strcst* – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

61. *strcwfmt* – Format of outgoing J0

The write format of J0, the outgoing section trace (*strcout*). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

62. *trbmd* – Tributary mode

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in [“RTRV-STM16: Retrieve STM16 port” \(p. 4-2711\)](#) for SDH equivalent.

Type: alphanumeric value set.

Range:

- ADAPTIVE
- FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in “[RTRV-EQPT \(system\): Retrieve Equipment \(system\)](#)” (p. 4-2242) command.

63. *unequippedsig* – Unequipped Output Signal List

This parameter is a list of STSn rates across the port’s bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequippedsig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port is allowed. If *trbmd* is ADAPTIVE, then *unequippedsig* is settable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 1, 3, 12, 48 or 192 representing STS1, STS3C, STS12C, STS48C or STS192C.

Default: 1921 = all STS1 (fixed).

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-OC192 command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-OC192 command. Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-OC192:LT-UNITE:1-1-#-#-1-1:123456;

LT-UNITE 00-11-27 08:00:00
M 123456 COMPLD
"1-1-#-#-1-1:ptype=OC192,frcdus=DISABLE,sfthr=-3,
sdthr=-6,emi=TRUE, pmode=M0N,..... pmmsneses=15,
pmrsneses=30"
;
```

Error responses

Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-OC192 command.

Check CCB against ptype and istd

See definition of error response in “[RTRV-STM16: Retrieve STM16 port](#)” (p. 4-2711).

GR-199-CORE (RTRV-rr)

RTRV-OTU2: Retrieve OTU2 port

The RTRV-OTU2 command is used to retrieve all parameters related to the OTU2 port.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-OTU2:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
This parameter is the currently active name of the NE to which the command is addressed. The *tid* is a case insensitive character string.
Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.
Range: 1 to 20 characters.
2. *aid* – Access Identifier
Access Identifier of an OTU2 port.
Type: AID
Range: OTNPortAID of OTU2 port.
The keyword "otall" shall be allowed at port level, "all" up to shelf level.
3. *ctag* – Correlation Tag
This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
Type: alphanumeric string.
Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831

Output format

In response to a valid RTRV-OTU2 command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
```

;

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
Type: AID.
Range: OTNPort AID.
The AID value “otall” shall not be allowed in the response.

Spec block parameters

1. *expotutti* – Expected OTU TTI
Expected OTU trail trace identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the expected OTU TTI.
Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
Range: 15 byte hexadecimal string
Default: 15 bytes each with value 00.
2. *fectype* – FEC Type
Forward error correction type.
Type: alphanumeric value set.
Range: RS_FEC, V_FEC (default).
3. *ochpm* – OCH PM Enable
Enable or disable optical channel performance monitoring.
Type: alphanumeric value set.
Range: ENABLE, DISABLE (default).
4. *opwind* – Optical Window
Optical window (L-Band, C-Band) supported by the port.
Type: alphanumeric value set
Range: BAND_L for L-Band, or BAND_C for C-Band.
5. *opw1* – Optical Wavelength
Optical Wavelength in nanometers.
Type: numeric value set
Range:
 - 35 wavelengths in C-Band (1554.537 ... 1568.362), i.e:

1554.537, 1554.940, 1555.343, 1555.747, 1556.151, 1556.555, 1556.959, 1557.363, 1557.768, 1558.173, 1558.578, 1558.983, 1559.389, 1559.794, 1560.200, 1560.606, 1561.013, 1561.419, 1561.828, 1562.233, 1562.640, 1563.047, 1563.455, 1563.863, 1564.271, 1564.679, 1565.087, 1565.496, 1565.905, 1566.314, 1566.723, 1567.133, 1567.542, 1567.952, 1568.362

- 93 wavelengths in L-Band (1568.773 ... 1607.466), i.e:

1568.773, 1569.183, 1569.594, 1570.005, 1570.416, 1570.828, 1571.239, 1571.651, 1572.063, 1572.476, 1572.888, 1573.301, 1573.714, 1574.127, 1574.540, 1574.954, 1575.368, 1575.782, 1576.196, 1576.610, 1577.025, 1577.440, 1577.855, 1578.270, 1578.686, 1579.102, 1579.518, 1579.934, 1580.350, 1580.767, 1581.184, 1581.601, 1582.018, 1582.436, 1582.854, 1583.271, 1583.690, 1584.108, 1584.527, 1584.946, 1585.365, 1585.784, 1586.203, 1586.623, 1587.043, 1587.463, 1587.884, 1588.304, 1588.725, 1589.146, 1589.568, 1589.989, 1590.411, 1590.833, 1591.255, 1591.678, 1592.100, 1592.523, 1592.946, 1593.369, 1593.793, 1594.217, 1594.641, 1595.065, 1595.489, 1595.914, 1596.339, 1596.764, 1597.189, 1597.615, 1598.041, 1598.467, 1598.893, 1599.320, 1599.746, 1600.173, 1600.600, 1601.028, 1601.455, 1601.883, 1602.311, 1602.740, 1603.168, 1603.597, 1604.026, 1604.455, 1604.885, 1605.314, 1605.744, 1606.174, 1606.605, 1607.035, 1607.466

- Value 0 (default) (i.e. undefined).

6. otnasap – OTN ASAP

OTN Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type OTN to which the designated AID points.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: DEFAULT.

7. otutimca – OTU TIM Consequent Action Enable

OTU Trail Trace Identifier Mismatch consequent action enable. Enabling or disabling the the TIM consequent action shall also enable or disable the TIM detection.

Type: alphanumeric value set

Range: ENABLE: enable consequent action for TIM (default), DISABLE: disable consequent action for TIM.

8. pmode – Port Mode

This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default):
indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON:
indicates that alarm monitoring is taking place on the port.
- NMON:

means that alarm monitoring is not occurring on the port.

9. `ptype` – Port Type

This identifies the port type of the AID.

Type: alphanumeric value set

Range: OTU2

10. `strecotutti` – Status of incoming OTU TTI

This parameter shows the status of the value of the OTU Trail Trace Identifier which is available with parameter `voturectti`.

Type: alphanumeric value set.

Range:

- NORMAL: `voturectti` contains a valid value
- UNAVAILABLE: no value for `voturectti` could be obtained by the system
- AIS: no value for `voturectti` due to an SF condition.

11. `txenable` – Optical Output Enable

Optical output enabling.

Type: alphanumeric value set.

Range:

- DISABLE (default): optical output disabled
- ENABLE: optical output enabled.

12. `voturectti` – Value of incoming OTU TTI

Value of the received OTU Trail Trace Identifier. The status of this value is contained in parameter `strecotutti`. If `strecotutti` indicates NORMAL, then `voturectti` contains a valid value. If `strecotutti` indicates UNAVAILABLE or AIS, then no incoming OTU TTI could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter `voturectti` is omitted from the response. The parameter indicates the Source Point Access Identifier (SAPI) of the received OTU TTI.

Type: hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 15 byte SAPI (Source Access Point Identifier).

13. `votutti` – Value of outgoing OTU TTI

Value of the transmitted OTU Trail Trace Identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the transmitted OTU TTI.

Type: hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 15 byte SAPI (Source Access Point Identifier).

Default: 15 bytes each with value 00.

Detailed behavior description

The command retrieves the parameters as described above. The RTRV-OTU2 command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-OTU2 command:

```
RTRV-OTU2:LT-UNITE:1-1-#-#-1-1:123456;

LT-UNITE 06-06-30 08:00:00
M 123456 COMPLD
"1-1-#-#-1-
  1:expotutti=4C5543454E544E45312D504F525431,fectype=G709VFEC,
  ochpm=ENABLE,opwind=L,opwl=1569.183,otuasap=DEFAULT,otutimca=DISABLE,
  pmode=MON,ptype=OTU2,streco tutti=NORMAL,txenable=ENABLE,
  voturectti=4C5543454E544E45312D504F525431,
  votutti=4C5543454E544E45322D504F525433"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-OTU2 command.

RTRV-OW: Retrieve Orderwire and User Bytes

General

The RTRV-OW command can be initiated by a user to retrieve the overhead access ports and any associated optical port (OPn) in the NE.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-OW:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier

This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.

Type: identifier, in addition the special character underscore ("*_*") and the password characters are allowed.

Range: 1 to 20 characters

2. *aid* – Access Identifier

The parameter *aid* (Access Identifier) specifies the overhead access port.

Type: *UserBytePortAID*.

Range: As given by the *UserBytePortAID* definition, the value "*ubioall*" is supported.

3. *ctag* – Correlation Tag

This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

Type: alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

Output format

In response to a valid RTRV-OW command, the following output is returned:

```
sid date time
M ctag COMPLD
  "aid:spec_block"
```

;

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
This parameter specifies the overhead access port for which the following *spec_block* parameters are returned.
Type: UserBytePortAID.
Range: As given by the UserBytePortAID definition, the value “ubioall” is not allowed.

Spec block parameters

1. *intfctype* – Interface Type
This parameter specifies which electrical interface standard of the overhead access port is used.
Two different settings are possible:
 - electrical interface according to G.703
 - electrical interface according to V.11.Note: The overhead access ports with AIDs ubio1, .. ubio4 are configurable to either G703 or V11. The overhead access ports with AIDs ubio5, ubio6 are fixed to V11.
Type: Alphanumeric value set.
Range: G703, V11.
Default: G703 (for the overhead access ports given by the AIDs ubio1 .. ubio4); V11 (for the overhead access ports given by the AIDs ubio5, ubio6 - fixed to V11).
2. *ohbyte* – Overhead-Byte
This parameter specifies which of the overhead bytes is used.

Three channels are possible:

- E1 and F1 in the RSOH (section overhead)
- E2 in the MSOH (line overhead).

Type: Alphanumeric value set.

Range: E1, F1, E2.

Default: E1.

Note: In output direction the empty string appears as \"\".

3. portaid

This parameter specifies the optical port (of an OPn) with which the overhead access port (given by the output parameter aid) is associated.

The parameter value NOCONNECT is used to indicate that the port given by portaid is not associated to the overhead access port given by the parameter aid.

Type: In case an association is established: SPortAID; In case an association is no established: Alphanumeric value set (i.e. the string "NOCONNECT").

Range: In case an association is established: SPortAID (No "all" value is supported); in case an association is no established: NOCONNECT.

Default: NOCONNECT.

Detailed behavior description

The RTRV-OW command retrieves the overhead access ports and any associated optical port (OPn) in the NE.

Example input/output

Example 1

Suppose the UserByte port ubio6 is associated with the port-4 of an OP2G5 in slot03 (the intfctype is fixed to V11 for ubio5 and ubio6):

```
RTRV-OW:UNITE-NE:1-1-ubio6:123456
```

```

sid date time
M ctag COMPLD
  "1-1-ubio6:portaid=1-1-#-#-3-4,ohbyte=E1,intfctype=V11"
;
```

Example 2

Suppose the

- UserByte port ubio1 (V11,E1) is associated with the port-4 of an OP2G5 in slot03
- UserByte port ubio3 (G703,E2) is associated with the port-1 of an OP10G in slot07
- UserByte port ubio6 (V11,F1) is associated with the port-4 of an OP10G in slot34
- The other UserByte ports (ubio2, ubio4, ob05) are not associated:

```
RTRV-OW:UNITE-NE:1-1-ubioall:123456
```

```
sid date time
M ctag COMPLD
  "1-1-ubio1:portaid=1-1-#-#-3-4,ohbyte=E1,intfctype=V11"
  "1-1-ubio2:portaid=NOCONNECT,ohbyte=E1,intfctype=G703"
  "1-1-ubio3:portaid=1-1-#-#-7-1,ohbyte=E2,intfctype=G703"
  "1-1-ubio4:portaid=NOCONNECT,ohbyte=E1,intfctype=G703"
  "1-1-ubio5:portaid=NOCONNECT,ohbyte=E1,intfctype=V11"
  "1-1-ubio6:portaid=1-1-#-#-34-4,ohbyte=F1,intfctype=V11"
;
```

Related TL1 messages

RTRV-OUC: Retrieve ONNS to UPSR/SNCP constructs

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command Syntax:

RTRV-OUC:*tid*:*wrk_aid*:*ctag*[::*ouc_dir*];

Input parameters

Command parameters

1. *tid* – Target Identifier

This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.

Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.

Range: 1 to 20 characters

2. *wrk_aid* – Working Tributary Access Identifier

This parameter specifies the working tributary of the OUC.

Type: STS1NumAID

Range:

- The 1-1-#-#-all-all-all-value shall be accepted in general for this parameter.
- The *all* value shall not be accepted, if specified only for the slot-, port- or tributary part of this parameter.
- The 1-1-#-#-all-all-all-value shall not be accepted, if the parameter *ouc_dir* is present.

3. *ctag* – Correlation Tag

This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

Type: alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

4. *ouc_dir* – OUC Directionality

Directionality of the OUC

Type: alphanumeric value set

Range:

- BIDIR
- UNIDIR-ADD
- UNIDIR-DROP.

Output format

In response to a valid RTRV-OUC command, the following output shall be returned:

```

    sid date time
M  ctag COMPLD
    "wrk_aid,prt_aid:ouc_dir,ouc_rate"
;
or in case of more than one OUC retrieved:
```

```

    sid date time
M  ctag COMPLD
    "wrk_aid,prt_aid:ouc_dir,ouc_rate"
    ...
    ...
    "wrk_aid,prt_aid:ouc_dir,ouc_rate"
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command parameters

1. *wrk_aid* – Working Tributary Access Identifier
This parameter specifies the working tributary of the OUC.
Type: STS1NumAID
Range: n.a. (*all values shall never occur as part of an output parameter*)
2. *prt_aid* – Protection Tributary Access Identifier
This parameter specifies the protection tributary of the OUC.
Type: STSNumAID
Range: n.a. (*all values shall never occur as part of an output parameter*)
3. *ouc_dir* – OUC Directionality
Directionality of the OUC
Type: alphanumeric value set

Range:

- BIDIR (default)
- UNIDIR-ADD
- UNIDIR-DROP

4. *ouc_rate* – OUC Rate

The parameter *ouc_rate* indicates the rate of the OUC, which shall be determined by the cross-connection rate of the associated cross-connections. For a detailed description please refer to parameter *rate* in RTRV-CRS.

Type: alphanumeric value set

Range:

- VC3
- VC4
- VC44C
- VC416C
- VC464C
- STS1
- STS3
- STS12
- STS48
- STS192

Example input/output

Retrieval of the single bidirectional OUC with working tributary 1-1-#-#-1-1-4:

RTRV-OUC:UNITE-NE:1-1-#-#-1-1-4:123456::BIDIR;

```

UNITE-NE 00-11-14 12:00:00
M 123456 COMPLD
  "1-1-#-#-1-1-4,1-1-#-#-2-2-12:BIDIR,STS1"
;
    
```

Retrieval of all OUCs in an NE:

RTRV-OUC:UNITE-NE:1-1-#-#-all-all-all:123456;

```

UNITE-NE 00-11-14 12:00:00
M 123456 COMPLD
  "1-1-#-#-1-1-4,1-1-#-#-2-2-4:BIDIR,VC4"
  "1-1-#-#-1-1-7,1-1-#-#-2-4-7:UNIDIR-DROP,VC3"
  "1-1-#-#-1-1-10,1-1-#-#-2-2-10:UNIDIR-ADD,VC4"
    
```

;

Error responses

Validation rule: Invalid wildcarding

OUC command processing shall verify that no wildcard is applied for *wrk_aid* on slot, port or trib level or if *ouc_dir* is present.

Error code: IDNV - Input, Data Not Valid, Invalid Wildcarding for wrk_aid

RTRV-PATH: Retrieve ONNS connection data

Overview

The RTRV-PATH command requests information on an ONNS path which begins in the source node to which the message was addressed. The ONNS source node determines the status of the connection from the information stored in the Network Navigator databases.

The query must be directed to the source node. Querying an existing ONNS path by its *ConnectionID* or *ConnAlias* alone will return the status on all paths associated with the *ConnectionID*. The query response includes a status message like Connected and OK (CON&OK), the list of network element nodes that the path utilizes, and the list of constraint parameters for the connection.

ONNS supports querying all connections by sending RTRV-PATH with *connID* = ALL. When all of the records of the connection data repository are retrieved by RTRV-PATH with *connID* = ALL, each connection record will be the same format as the RTRV-PATH ConnID response message format.

ONNS supports querying all connections of a connection group, i.e. all connections starting at VCGTRIBs of one single VCG, by sending RTRV-PATH with the ALL qualifier for the tributary number within the *connID*. When several records of the connection data repository are retrieved by RTRV-PATH with qualifier ALL for the tributary number in *connID*, each connection record will be the same format as the standard RTRV-PATH *ConnID* response message format. The *connAlias* will not be accepted as input to retrieve the connections of a group and will be ignored, if set.

ONNS supports querying all connections of an M:N protection group, i.e. working as well as protecting connections, by sending RTRV-PATH with the M:N protection group ID within the *connID*. In this case each connection record will be in the same format as the standard RTRV-PATH ConnID response message format.

The connection records will be sorted by their route membership. The connection records of each route will be headlined by a route indicator, the number of connections per route and an group asymmetry indicator.

Additionally querying of single working or protecting connections of an M:N protection group is supported by sending RTRV-PATH with the ID of the corresponding connection within the *connID*.

RTRV-PATH RetrieveDetail_Route parameters

The RTRV-PATH command supports the RetrieveDetail_Route function. RetrieveDetail_Route is only available when a single connection ID (*connID*) is requested. The RetrieveDetail_Route function retrieves data from the network.

RetrieveDetail_Route data is not be stored in the ONNS source node or any other node. RetrieveDetail_Route only operates on stable ONNS connections, with no other ONNS operations pending (including pending RetrieveDetail_Route operations).

RetrieveDetail_Route request is sent to the source node for the specific connection. The message data from individual nodes on the nodelist of the path that is traced is returned to the source node. Each node shall send the node ID, portID, and the timeslot (trib), for each connPoint involved in the path connection specified by pathID. The ability to trace the path though an intermediate node that has had its path cross connection deleted is supported.

The message data from path nodes is collected, sort by nodeList order, organized by path, and sent as a second response block to the RTRV-PATH command. The initial RTRV-PATH response block contains the current connection data from the ONNS connection database, uses the RTRV completion code, and is terminated with a ">". The second RTRV-PATH response block has the same header line and is terminated with a ",".

The ONNS process that controls and receives the RetrieveDetail_Route signaling request responses waits for up to 60 seconds to accumulate the signaling request response messages and then send the data received via TL1 as the second and concluding response block to the RTRV-PATH command. The RetrieveDetail_Route response indicates any nodes that did not return path data by an node ID entry with no data, and indicates missing cross-connections as needed.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No.

Input format

A user defined connection alias (an alternate name) may be optionally specified with the RTRV-PATH command. The alias is specified in the spec block as ConnAlias="...." (upto 83 printable ASCII characters+NULL; excluded are the following characters: colon, semicolon, double-quotes, comma). If no *connAlias* is specified, the *connID* is used as the key. If both *connAlias* and *connID* are specified then *connID* is used as the key. If neither is specified the command is denied.

Command Syntax: RTRV-PATH:srcTid:[srcAid]:ctag::[servID]:[connID][:specBlock];

Input parameters

Command parameters

1. **srcTid**
 Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
 Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.
 Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **srcAid**
 Source node ONNS application access identifier of the ONNS controller OS command interface port.
 Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: *snn*.
3. **ctag – Correlation Tag**
 This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
 The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing).
4. **srvID – Service Identifier**
 This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
 The *srvID* parameter is an integer value range = 1 - 20,000,000. Only one *srvID* is accepted. ALL is not supported.
5. **connID – Connection ID for an existing ONNS optical path connection service**
 This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and *IngressPort#* and an index # where LambdaUNITE uses bay = 1 = shelf.
 Type: Character string of length up to 39.
 Range: *ALL* - special value to retrieve all connection records
 Range: *nodeID&Tributary AID&Index* - to retrieve a specific entry, with
 - *nodeID*: four dot separated numeric strings: each string 0..255
 - *Tributary AID*: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:
 Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16), Tributary # (1 - 192).
 - *Index*: Numeric string 0-4294967295
 The *nodeID* for LambdaUnite starts always with 29.x.x.x.
 Example: 29.13.196.203&1-1-13-15-1&271584

Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with:

- *nodeID*: four dot separated numeric strings: each string 0..255
- *Tributary AID*: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:
Bay/Frame #(1), Shelf #(1), Slot/Pack #(1..39), Port #(1..8), Tributary #ALL - special value to retrieve all connection records associated with the port ID.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG. The *nodeID* for LambdaUnite starts always with 29.x.x.x

Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

Range: *nodeID Tributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with:

- *nodeID*: four dot separated numeric strings: each string 0..255
- *defaultTributary AID*: five dash separated numeric strings with:
Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#)
- *Index*: Numeric string 0-4294967295

The *nodeID* for LambdaUnite starts always with 29.x.x.x

Range: *nodeID&groupindex* -to retrieve all connections belonging to an M:N protected connection group, with:

- *nodeID*: four dot separated numeric strings: each string 0..255;
- *groupIndex*: integer value specifying a connection group within *nodeID* 0-65535.

The *nodeID* for LambdaUnite starts always with 29.x.x.x

Spec block parameters

1. DetailRoute

DetailRoute = ON will return the portID / trib information from all nodes in each path of the *connID* specified in the second block of the response message.

DetailRoute is ignored if *connID* = ALL.

The command is rejected, if *DetailRoute*=ON and *connID* contains a tributary ID with qualifier ALL instead of a single Tributary number.

Range: OFF (default), ON.

2. connAlias - connection alias

This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.

Type: Character string up to length 83.

Range: The string consists of printable ASCII characters+NULL. The following characters cannot be used in the string: colon, semi-colon, comma, double quotes, equal, ampersand, greater than. Additionally the string shall start with a letter.

Output format

If the RTRV-PATH request completes successfully with a normal NCDR record, then the following completion response is returned:

```

srcTid date time
M ctag COMPLD
  "ConnID=connID,PathID=pathID1,ConnAlias=connAlias,:
srcNIP,srcInPortID,-X-,srcOutPortID,:
node1-IP,node1-InPortID,-X-,node1-OutPortID,:
node2IP,node2InPortID,-X-,node2OutPortID,:
node3IP,node3InPortID,-X-,node3OutPortID,:
Node72IP, , , ,NO_REPLY:
.....
node7IP,node7InPortID,-X-,node7OutPortID,:
destNIP,destInPortID,-X-,destOutPortID,"

  "ConnID=connID,PathID=pathID2,ConnAlias=connAlias,:
srcNIP,srcInPortID,-X-,srcOutPortID,:
node6IP,node6InPortID,-X-,node6OutPortID,:
node8IP,node8InPortID,-X-,node8OutPortID,:
node9IP,node9InPortID,-X-,node9OutPortID,:
node55IP,node55InPortID, ,node55OutPortID,:
destNIP,destInPortID,-X-,destconnPtB,"
;

```

If the RTRV-PATH request with *connID* = ALL completes successfully, then the following normal completion response is returned:

```

srcTid date time
M ctag RTRV
  "ConnectionID1_dataRecord"
  ...
  "ConnectionID4_dataRecord"

srcTid date time
M ctag RTRV
  "ConnectionID5_dataRecord"
>
srcTid date time
M ctag COMPLD
  "ConnectionID6_dataRecord"
  ...
  "ConnectionID11_dataRecord"
;

```

The RTRV PATH (connID=ALL) command will send a maximum of 8 connection records per block. On all large output message blocks but the last, the continuation RTRV completion code is used and the semicolon(;) is replaced with a (>) terminator. Then on the last record block, the COMPLD completion code is used with the final semicolon (;) data block terminator.

Note: This RTRV PATH <ALL> command can produce large amounts of data. This will require proper sizing of the receive buffer of the OS system.

Output parameters

Command parameters

1. **srcTid** – Source Node Identifier
See definition of this parameter in Input Parameters section.
2. **date**
This parameter is set to the date when the output message is generate: YY-MM-DD where YY=00-99, MM=01-12, DD=01-31.
3. **time**
This parameter is set to the time when the output message is generated: HH:MM:SS where HH=00-23,MM=00-59, SS=00-59.
4. **ctag** – Correlation Tag
See the parameter description in the Input parameters section above.
5. **completionCode**
Standard TL1 completion code result.
Type: value set
Range: COMPLD (default) for success: RTRV for data continuation.
6. **route - M:N Route**
Indicates the M:N route in front of a group of M:N protected connections with the same node list. This parameter is only used for retrival of all connections belonging to an M:N protected group.
Type: alphanumeric string
Range: WorkerRoute1, WorkerRoute2, WorkerRoute3, ProtectionRoute1
7. **numberOfConnections - Number of Connections per Route**
NumberOfConnections=x indicates the number of connections per route of a M:N protection group. This parameter is only used for retrival of all connections belonging to an M:N protected group.
Type: integer
Range: 1-96 (number of connections per route).

8. groupAsymmetry - M:N Group Asymmetry

GroupAsymmetry = x indicates the connection asymmetry between the routes of a M:N protection group. This parameter is only used for retrieval of all connections belonging to an M:N protected group.

Type: integer

Range: na = not applicable (value of asymmetry for the protection route); 0 - 255 indicates the difference between the number of actual worker connections within this route and the ceiling average value of worker connections per route based on the protection group.

9. connID

See the parameter description in the Input parameters section above.

10. connAlias

See the parameter description in the Input parameters section above.

11. connStatus

ConnStatus = pst&sst[&tst]

Connection status is the overall status of the connection *connID* which may be different than the status of an individual *pathID* in that connection.

connStatus is composed out of

- pst (PrimaryState)
- sst (SecondaryState)
- tst (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a sst/tst parameter. The two values must be separated by an ampersand (“&”). Individual status values are 7 characters or less.

Type: up to three &-separated value sets.

Range *pst* values:

- CON: Connected
- DLT: Deleted
- NOCON: Not Connected
- MAINT: Maintenance Mode
- UNKNOWN: Conn state unknown.

Range *sst* & *tst* values:

- OK: Conn good
- FAILED: Conn failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed

- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- PREMPT: Path pre-empted
- SETUPFL: Connection SetUp Failed
- FL-NVM: Not saved in NVM
- WTORV: Waiting to revert path
- EPRTFLEDGE: Port Failed
- BAD-IN Conn failed, Bad signal in
- BRDGD Path bridged

Note: Some states listed in this list will only occur within a DLT-PATH command response or within a REPT PTHCHG or REPT PTHEVT notification message.

Range sst values:

- STBY: Standby (for protecting connections within an M:N protection group, when connection is not protecting a working connection)
- USED: Used (for protecting connections within an M:N protection group, when connection is currently protecting a working connection)

Range tst values:

- DEGRADED: Non-revertive restoration was not possible if the worker or a permanent 1+1 protected connection fails.

12. connControl -Connection Control

This parameter indicates whether the ONNS connection is controlled by ONNS or by external control (UNI, eNNI connections).

Range:

- ONNS (ONNS connections, created via ENT-PATH)
- EXT (ONNS connections, created via ENT-CONN, UNI or eNNI)

13. pdir – Path Direction Topology

Uni-directional A-Z (1WAY) or Bi-directional (2WAY).

For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bi-directional (2WAY) shall be supported.

Type: value set

Range: 1WAY (default), 2WAY

14. protectionClass

This parameter defines the type of restoration protection assigned to the path connection during path setup or after path modification.

Range:

- UNPROT (path from source to destination is un-protected)
- AUTONR (path from source to destination is a non-revertive auto-reroute path connection)

- N1PLUS1 (paths from source to destination is set up as a 1+1 protected connection)
 - AUTORV (path from source to destination is a revertive auto-reroute path connection)
 - YCONN (paths from the same source to two different destinations are set up as a bridged connection).
 - MBYNWRK (working connection in an M:N connection group)
 - MBYNPRT (protecting connection in an M:N connection group)
 - P1PLUS1NR (paths from source to destination is set up as a 1+1 protected connection with an additional non-revertive restoration path applied in case the worker or protection path fails.)
15. *bandwidth* - Requested bandwidth/signalRate
 Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.
 Range: STS1, STS3, STS12 STS48, STS192.
16. *maxDelay* - Maximum transport delay
 Maximum transport delay through all nodes in the path. Total path delay must not exceed this value.
 Range: 0 (default), is used to select no delay limit; 1 - 32767, maximum transport delay in milliseconds.
17. *srvID* - Service Identifier
 This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
 The *srvID* parameter is an integer value range = 1 - 20,000,000. Only one *srvID* is accepted. ALL is not supported.
18. *nodeListUsage1*
 For connection setup NN used/uses the list of nodes included in the *nodeList1* array block in a manner specified by the *nodeListUsage1* variable. Both, *nodeListUsage1* and *nodeList1*, fields belong together and shall be reported when supplied as input to the ENT-PATH command. An EXCLUDE list usage applies to all paths created (as in a N1PLUS1NR or N1PLUS1RV). A non-existent *nodeID* will be ignored in EXCLUDE *nodeList1* during path setup. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.
 Range:
- EXPLICIT, *nodeList1* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.)
 - EXCLUDE, nodes in the *nodeList1* must all be excluded from the path created. In the case when the *protectionClass* is either YCONN, N1PLUS1NR or N1PLUS1RV the nodes in the *nodeList1* below also apply to the second or restoration path.

19. *nodeList1*

When *nodeListUsage1* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: *nid1*([&*nid2*& ...&*nidx*]).

When *nodeListUsage1* = EXCLUDE: List of nodes that must all be excluded from both paths. The *nodeID* values are shown in the form: *nid1*([&*nid2*& ...&*nidx*]). If the preceding required *nodeListUsage1* field is not supplied, this field must not be present. If user specifies empty EXCLUDE *nodeList1*, the connection should use indirect path from source node to destination node (i.e., at least one intermediate node is needed). If user specifies empty EXPLICIT *nodeList1*, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).

Type: &-separated list of *nodeID*s. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 - 255.

Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

Range: *nid1*([&*nidx*])* or empty list (where X <= 25 when *nodeListUsage1* = EXPLICIT) (where X <= 25 when *nodeListUsage1* = EXCLUSIVE)

20. *nodeListUsage2*

For connection setup NN used/uses the list of nodes included in the *nodeList2* array block in a manner specified by the *nodeListUsage2* variable. Both, *nodeListUsage2* and *nodeList2*, fields belong together and shall be reported when supplied as input to the ENT-PATH command. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.

This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.

This parameter shall also be allowed when *protectionClass* is P1PLUS1NR.

Type: value set

Range: EXPLICIT, *nodeList2* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.).

21. *nodeList2*

When *nodeListUsage2*=EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: *nid1*([&*nid2*& ...&*nidx*])).

If the preceding required *nodeListUsage2* field is not supplied, this field must not be present. If user specifies empty EXPLICIT *nodeList2*, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).

This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.

This parameter shall also be allowed when *protectionClass* is P1PLUS1NR

Type: &-separated list of *nodeIDs*. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 - 255.

Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

Range: nid1([&nidX])* or empty list where X <= 8 when *nodeListUsage1* = EXPLICIT.

22. srlgExcludeList - SRLG Exclude List

List of Shared Risk Link Group identifiers that are to be used to exclude links from the connection path(s) being created.

Type: &-separated list of numeric strings | empty | 0

Example: 33&49&64

Range: up to 10 numeric strings, each in the range 1 - 65535. The value 0 (default) or an empty field indicates no constraint are applied.

23. linkIncludeID - VPN Identifier

A connection constraint link property such as *linkIncludeID* that must be valid to include the link in the connection path(s) to be created. *linkIncludeID* is a link connection property that can be used to group and classify links. VPNID is a special case of this associative property.

Type: Integer

Range: 1 ... 65535; 0 or an empty field indicates no VPN constraint is applied.

Note: Since the corresponding value is not supported as Host port parameter any input different from 0 will lead to DENY of the command.

24. srcNID - Source nodeID

ONNS source nodeID. Together with the following *srcPortID* field defines the associated Ingress *connPoint* that connects the source node to the edge/gateway switch or client router.

Range: Four dot separated numeric strings. 0 - 255 for each numeric string.

25. srcPortID - Source PortID

ONNS source node ingress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *srcNID* ingress *connPoint*. ONNS assumes a bidirectional port pair.

Value: dash-separated list of 5 numeric strings

Example: 1-1-3-1-4

Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16),

Tributary # (1 - 128).

Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port # #, Tributary ##. This range is valid for protecting connections in M:N connection groups

26. destNID - Destination nodeID

ONNS destination nodeID. Together with the following *destPortID* field defines the associated Egress *connPoint* that connects the destination node to the edge/gateway switch or client router.

Type: Four dot separated numeric strings. 0 - 255 for each numeric string.

27. *destPortID* - Destination PortID

ONNS destination node egress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *destNID* egress *connPoint*.

Value: dash-separated list of 5 numeric strings

Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16), Tributary # (1 - 128).

Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. This range is valid for protecting connections in M:N connection groups

See the parameter description in the [“ENT-PATH: Create ONNS path connection”](#) (p. 4-1583) Input parameters section.

28. *brDestNID* - Bridged Destination NodeID

ONNS bridged destination nodeID. Together with the following *brDestPortID* field defines the second associated Egress *connPoint* that connects the destination node to the edge/gateway switch or client router in case of protectionClass YCONN.

Type: Four dot separated numeric strings. 0 - 255 for each numeric string.

29. *brDestPortID* - Bridged Destination PortID

ONNS bridged destination node egress *portID* in case *protectionClass* = YCONN. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *brDestNID* egress *connPoint*. 4.1; 5; 6

Value: dash-separated list of 5 numeric strings

Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16), Tributary # (1 - 128).

30. *pathID1* - Path ID 1

The PathID of the 1st path that was created.

Type: character string of length up to 20.

Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 - 255) (Index: Numeric string 0-65535).

The *nodeID* for LambdaUnite starts always with 29.x.x.x

Example: 29.13.196.203-65111

31. *pathState1* - Path State 1

Path State1 = *pst*& *sst*[&*tst*]. *pathState1* represents the status of the first path of the connection which may be different than the status of the overall connection in *connStatus*.

PathState1 is composed out of *pst* (PrimaryState), *sst* (SecondaryState) and *tst* (TertiaryState, optional) Up to two of the allowed values are simultaneously permitted as a *sst/tst* parameter. The two values must be separated by an ampersand (“&”). Individual status values are 7 characters or less.

Type: up to three &-separated value sets.

Range *pst* values:

- CON: Connected
- NOCON: Not Connected
- DLT: Deleted
- MAINT: Maintenance mode.

Range *sst* & *tst* values

- OK: Conn good
- FAILED-PATH: failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

Range *pst* values:

- RSVD: Reserved, for paths associated to protecting connections within an M:N protection group, while not protecting a working traffic.

32. *pNodeList1* - Path Node List 1

The path node list contains the list of nodes that the 1st path (*pathID1*) traverses in A-Z order from the source node.

Type: &-separated list of nodeIDs. A nodeID is represented as four dot separated numeric string with each numeric string between 0 - 255.

Range: *nid1*([&*nidX*])*

Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

33. *pathID2* - Path ID 2

The PathID of the 2nd path (if existing) that was created.

Type: character string of length up to 20.

Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 - 255), (Index: Numeric string 0-65535).

The nodeID for LambdaUnite starts always with 29.x.x.x.

Example: 29.13.196.203-65111

34. pathState2 - Path State 2

pathState2 = *pst*&*sst*[&*tst*]. *pathState2* represents the status of the second path (if existing) of the connection which may be different than the status of the overall connection in *connStatus*.

PathState2 is composed out of

- *pst* (PrimaryState)
- *sst* (SecondaryState)
- *tst* (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a *sst/tst* parameter. The two values must be separated by an ampersand ("&"). Individual status values are 7 characters or less.

Type: up to three &-separated value sets

Range *pst* values:

- CON: Connected
- NOCON: Not Connected
- DLT: Deleted
- MAINT: Maintenance mode.

Range *sst* & *tst* values

- OK: Conn good
- FAILED-PATH: failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREEMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed

- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

35. pNodeList2 - Path Node List 2

The path node list contains the list of nodes that the 2nd path (pathID1, if existing) traverses in A-Z order from the source node.

Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 - 255.

Range: nid1([&nidX])*

Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

Spec block parameters

1. connMode - Connection Mode

The connection mode determines ONNS treatment of the failed path after an auto-reroute restoration.

Example: *connMode* = NONREVERTIVE causes path setup to be auto-reroute non-revertive.

Range:

- UNPROT: converts a auto connection to a unprotected
- N1PLUS1: Network 1+1 protected connection
- NONREVERTIVE: Auto-reroute non-revertive
- REVERTIVE: Auto-reroute revertive
- YCONN: Y-connection
- BRIDGEY: Y connection Protection
- MBYNWRK: Working connection within an M:N protection group
- MBYNPRT: Protecting connection within an M:N protection group.

2. rstrPriority - Restoration Priority

This parameter describes the restoration priority of the connection.

Range: 0 (default) - 7. Lower values represent higher priority.

3. detailRoute

See definition of this parameter in Input parameters section above.

4. connectionPriority - Connection Priority

Connection priority allows connection setup of a higher priority connection to utilize the existing path through the network when the existing connection is pre-emptible.

Range: 0 (default) - 7. 0 = locked, 1 - 7 = Priority, Connection may be pre-empted.

5. disjointness

The actual level of disjointness of the calculated and established connection. The parameter is not filled when protectionClass is UNPROT.

Type: alphanumeric value set

Range:

- COMPLETE: fully node and SRLG disjoint path
- FULLYSRLG: maximal node and fully SRLG disjoint path
- MAXIMAL: maximal node disjoint path.

6. connGrpID

Connection Group ID for an existing ONNS connection to report the connection group the connection is member of or "UNDEFINED", if connection is not member of a group.

For connection groups identified by A VCG EDGE port, connGrpID is formed from the *SrcNodeID* and the Ingress Port #, where LambdaUNITE uses bay =1= shelf. The connection group ID is automatically assigned to a connection, when it is setup. The connection group ID will consist of the *nodeID* and the EDGE port AID in case the EDGE port is a VCG. The connection group ID will be "UNDEFINED" otherwise. For M:N protected connection groups, *connGrpID* is formed from the *SrcNodeID* and a group index chosen by the source node to be unique within this node. The connection group ID is automatically assigned to a connection, when it is setup. The connection group ID will consist of the node ID and a group index in case the connection is member of an M:N connection group. The connection group ID will be "UNDEFINED" otherwise.

Type: Character string of length up to 25.

Range: UNDEFINED - special value for connections not being member of a group
 nodeID&Prt AID - value for connections being member of a "GbE Connection Group"
 nodeID&groupIndex - value for connections being member of a "M:N Connection Group"

- nodeID: four dot separated numeric strings: each string 0..255
- Port AID: four dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port # with: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1..39), Port # (1..8).
- groupIndex: integer value specifying an M:N connection group 0-65535.

The nodeID for LambdaUnite starts always with 29.x.x.x

7. protRatio - Protection ratio

For each working or protecting connection of an M:N protected connection group this parameter will report the concrete protection ratio as specified on creation of the group. For connections not being member of an M:N protected connection group, this parameter shall not be reported at all.

Type: alphanumeric value set

Range. BY1 (ratio of 1 to 1 in number of protecting and working connections), 1BY2 (ratio of 1 to 2 in number of protecting and working connections), 1BY3 (ratio of 1 to 3 in number of protecting and working connections).

8. assocConnID - Associated Connection ID

Associated Connection ID for an existing ONNS connection of an M:N connection group to report the connection ID of the associated connection within the group, when a protection switch is active, i.e. for a working connection the ID of the associated protecting connection and for a protecting connection the ID of the associated working connection is reported. The associated connection ID will be "OPEN" for connections of an M:N connection group not involved in a protection switch. The associated *connectionID* will not be reported for connections not being member of an M:N connection group.

Type: Character string of length up to 39.

Range: ALL - special value to retrieve all connection records | nodeID&Tributary AID&Index - to retrieve a specific entry, with

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:
Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16), Tributary # (1 - 192).
- Index: Numeric string 0-4294967295

The *nodeID* for LambdaUnite starts always with 29.x.x.x.

Example: 29.13.196.203&1-1-13-15-1&271584

nodeID&Tributary AID range - if port # specifies a VCG to retrieve a connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:
Bay/Frame #(1), Shelf #(1), Slot/Pack #(1..39), Port #(1..8), Tributary #ALL - special value to retrieve all connection records associated with the *portID*.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG. The *nodeID* for LambdaUnite starts always with 29.x.x.x

Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

nodeID Tributary AID&Index - to retrieve a protecting connection of an M:N connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- defaultTributary AID: five dash separated numeric strings with:
Bay/Frame #(1), Shelf #(1), Slot/Pack ##, Port ##, Tributary ##
- Index: Numeric string 0-4294967295

The *nodeID* for LambdaUnite starts always with 29.x.x.x

nodeID&groupindex -to retrieve all connections belonging to an M:N protected connection group, with:

nodeID: four dot separated numeric strings: each string 0..255; *groupIndex*: integer value specifying a connection group within *nodeID* 0-65535.

The *nodeID* for LambdaUnite starts always with 29.x.x.x

9. detailPath Record

One or two detailPath records will be reported when *detailRoute* = ON.

a. connID - Connection ID

See description in the Input parameters section below.

b. pathID - Path ID

See description in the Output parameters section below.

c. connAlias - connection alias

See description in the Input parameters section below.

d. xcon Record

An xcon record will be reported for each node in the path when *DetailRoute* = ON. Records are ordered in A-Z direction from the source node:

nodeID: ID of the node which reports the xcon record. Type: Four dot separated numeric strings. Range: 0 - 255 for each numeric string.

connPtID1 - Connection Point ID 1: ONNS connection point identifier for the ingress connection point of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #. Type: dash-separated list of 5 numeric strings. Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16), Tributary # (1 - 128).

Slot/Pack ##, Port ##, Tributary ##. Value # for Slot/Pack, Port and Tributary indicates default tributary AIDs used for reporting open ends in not existing xcons in the A-node or Z-node for a protecting NN connection of an M:N protected connection group.

connInd - Connection Indicator: Indicator whether cross-connection is setup. Type: alphanumeric value set. Range: -X- (cross-connection setup).

connPtID2 - Connection Point ID 2: ONNS connection point identifier for the egress connection point of the cross connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #. Type: dash-separated list of 5 numeric strings. Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 - 39), Port # (1 - 16), Tributary # (1 - 128).

protConnPtID - Protection Connection Point ID: ONNS connection point identifier for the ingress or egress connection point of the protected OUC cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #. Type: dash-separated list of 5 numeric strings. Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1..39), Port # (1..16), Tributary # (1..128).

detailRouteStatus - Detail Route Node/XC Status: This parameter indicates the status of a node and/or its cross-connection. Range: NO_REPLY (no reply from node) (no cross-connection found).

Example input/output

Normal system response to RTRV-PATH with connID = ALL with no NCDR records

If the RTRV-PATH ALL request completes successfully with an empty NCDR, then the following normal completion response is returned to the command:

```
RTRV-PATH:srcTid:srcAid:ctag::srvID:ALL;.
```

```
srcTid date time
M ctag COMPLD
;
```

Input/Output example for a auto-reroute connection

The following example shows the successful completion of a RTRV-PATH command by the Network Element for a (non-revertive) auto-reroute connection:

```
RTRV-PATH:LT-ONNS-789:snn:193456::1351379:135.13.196.203&1-6-5-3-1&1;
```

Error responses

connID Non-Existant (ICNE)

If the source node receives a command and the specified *connID* does not exist, then the following error response is returned:

Error code: E220:13513794 - Input, ConnectionID Non-Existent

Invalid srvID

If the source node receives a command with an invalid ServiceID (srvID) parameter value, then the following error response is returned:

Error code:

"E030:SMcon135*7.92468:\\"Syntax, Parameter Data Invalid\\",Invalid_parameter=SrvID"

Invalid command

If an unrecognized or unsupported command is received, then the following error response is returned:

Error code: E235 - Input, Invalid CoMmand, Command not found or recognized

Syntax, Invalid punctuation

If a command is received that contains incorrect punctuation, then one of the following error responses is returned:

Error code: E240 - Syntax, InValid Punctuation

Syntax invalid or unimplemented parameter

If a command is received that contains an empty field that requires a parameter, or if a parameter input has not an allowed value for the field, then the following error response is returned:

Error code: E246 - Syntax, Parameter Not Implemented

The following list identifies conditions that will cause similiar error responses :

Error code:

E030 - SPDI Error - Syntax, Parameter Data Invalid, invalid_parameter=fieldName

Error code:

E037 - INCS Error - Input, Neither ConnID nor ConnAlias Specified

Error code: E040 - SDNC Error - Syntax, Data Not Consistent

Error code: E221 - IANE Error - Input, ConnectionAlias Non-Existent

Invalid target identifier

If a command is received with an invalid Target Identifier, then one of the following error responses is returned:

Error code: E250 - Input, Invalid TArget Identifier

Error code: E805 - Input, Missing Target Identifier (TID)

Invalid access identifier

If a command is received with an invalid access identifier, then the following error response is returned:

Error code: E260 - Input, Invalid ACcess identifier

Invalid correlation tag (CTAG) or RequestID

If a command is received with an invalid correlation tag, then one of the following error responses is returned:

Error code: E265 - Input, Invalid Correlation Tag

Error code: E266 - Input, Missing Correlation Tag

Status, All Resources Busy

If a command can not be completed due to insufficient processing resources or the system is in maintenance mode, then the following error response is returned:

Error code: E280 - Status, All Resources Busy

The following list identifies conditions that will cause similiar error responses:

- **Error code:**
E281 - Status, Busy, NVM Write in Progress for same connection
- **Error code:** E282 - Status, Conn State Invalid for this Operation

Requested Operation Failed (SROF)

If a command can not be completed due an internal hardware or software failure, then the following error response is returned:

Error code: E290 - Status, Requested Operation Failed

Error Responses Specific to RTRV-PATH

The following list identifies conditions that will cause error responses specific to RTRV-PATH commands:

Error code:

E226 - IDNA - Input, RetrieveDetail_Route Not allowed for RTRV-PATH ALL

The following list identifies conditions that will cause error responses specific to RTRV-PATH commands sent with detail_route option:

E227 - SRDE -Status, RetrieveDetail_Route Error

E283 - SCRP - Status, Conn/Path Retrieve in Progress

Retrieve path - Invalid connection ID for group retrieval

If the source node Network Element receives a TL1 command containing a connID with tributary# = ALL, but the corresponding port is not a VCG, then one of the following error response is returned:

Error code:

E050 - IICG - Input, Invalid connection ID for connection group/conn ID

Error code: E051 - IIDG - Input, detailRoute invalid for group retrieve

Example: The command RTRV-PATH:LT-SNNS9:snn:123456:::123.198.42.233&1-2-32-4-ALL:detailRoute=ON; will produce the output E051.

The following error response will be raised in case connection alias and connection ID specified in the command do not match:

Error code: E038 - IICS - Input, Inconsistent connAlias Specified

RTRV-PM: Retrieve performance monitoring

The RTRV-PM command is initiated by a user to request the NE to send the current and/or historical Performance Monitoring (PM) data associated with one or more facilities. For each value in the *montype* parameter of the RTRV-PM Input parameters section PM counter values will be stored in the current 15-minute period, the 32 previous 15-minute periods (past 8 hours worth of data), current day, and previous day periods.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

Input format

Command Syntax:

RTRV-PM-modifier:tid:aid:ctag::[montype], [monlev], [locn],,tmper, [mondatt], [montm];

Input parameters

Command parameters

1. modifier

This parameter indicates the port type or tributary on which the RTRV-PM command is to act on.

Type: alphanumeric value set

Range: The following values are for SONET only: STS1, STS3C, STS12C, STS48C, STS192C, OC3, OC12, OC48, OC48T, OC192, OC768, T3.

The following values are for SDH only: VC3, VC4, VC44C, VC416C, VC464C, STM1E, STM1, STM4, STM16, STM16T, STM64, STM256, ODU1.

The following value is for OTN only: OTU2

Although the ODU layer is independent of SONET/SDH, the ODU1 modifier is listed here in the SDH section. This is because the ODU1 function is used for the Transparency feature, which is only supported for SDH.

2. tid – Target Identifier

See definition in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

3. aid – Access Identifier

Type: AID

Range: For STM<N>, STM<N>T, OC<N>, EC1 and OC<N>T modifiers: SPortAID.

For T3 modifier: APortAID

For OTU modifier: OTNPortAID

For ODU<N> modifiers: VCGAID

For VC3, VC4, VC44C, VC416C, VC464C, STS1, STS3C, STS12C, STS48C and STS192C modifiers only: STS1NumAID.

And for modifiers VC4 and STS1: VCGNumAID.

Range is supported up to shelf level or system level; i.e.

ALL-ALL-#-#-ALL-ALL (on port level).

ALL-ALL-#-#-ALL-ALL-ALL (on tributary level).

4. ctag – Correlation Tag

See definition in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

5. montype – Monitored parameter type

This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.

Type: value set

Range: The following values are for all OC<N> and the EC1 modifiers: CVS, ESS, SESS, SEFS-S, LOSS-S, CVL, ESL, SESL, UASL, AISS-L, FC-L, CV-LFE, ES-LFE, SES-LFE, UAS-LFE, FC-LFE.

The following values are for all OC<N>T modifiers: CVS, ESS, SESS, SEFS-S, LOSS-S.

The following values are for all OC<N>T modifiers only: CVS-EGR, ESS-EGR, SESS-EGR, SEFS-S-EGR.

The following values are also for OC192 and OC768 modifiers only: FECC-L.

The following values are for STS1 (path) and are also applicable to STS3C, STS12C, STS48C and STS192C modifiers only: CVP, ESP, SESP, UASP, FC-P, CV-PFE, ES-PFE, SES-PFE, UAS-PFE, FC-PFE, PPJC-PGEN, NPJC-PGEN, PPJC-PDET, NPJC-PDET

The following values are for all STM<N> modifiers: RS-N-ES, RS-N-SES, RS-N-BBE, RS-N-UAS, MS-N-ES, MS-N-SES, MS-N-BBE, MS-N-UAS, MS-F-ES, MS-F-SES, MS-F-BBE, MS-F-UAS.

The following values are for all STM<N>T modifiers: RS-N-ES, RS-N-SES, RS-N-BBE, RS-N-UAS

The following values are for all STM<N>T modifiers only: RS-N-ES-EGR, RS-N-SES-EGR, RS-N-BBE-EGR, RS-N-UAS-EGR

The following values also are for STM64 and STM256 modifiers only: MS-N-FECC.

The following values are for T3 modifier: CVL, ESL, ESA-L, ESB-L, SESL, LOSS-L, CVP, ESP, ESA-P, ESB-P, SESP, UASP, FC-P, SEFS-P, SAS-P, AISS-P, CV-PFE, ES-PFE, ESA-PFE, ESB-PFE, SES-PFE, UAS-PFE, FC-PFE, SAS-PFE, CVP-EGR, ESP-EGR, ESA-P-EGR, ESB-P-EGR, SESP-EGR, UASP-EGR, FC-P-EGR, SEFS-P-EGR, SAS-P-EGR, AISS-P-EGR, CV-PFE-EGR, ES-PFE-EGR, ESA-PFE-EGR, ESB-PFE-EGR, SES-PFE-EGR, UAS-PFE-EGR, FC-PFE-EGR, SAS-PFE-EGR

The following values are for all ODU<N> modifiers only: ODU-N-ES, ODU-N-SES, ODU-N-BBE, ODU-N-UAS, ODU-F-ES, ODU-F-SES, ODU-F-BBE, ODU-F-UAS

The following values are for VC3, VC4, VC44C, VC416C and VC464C modifiers

only: VC-N-ES, VC-N-SES, VC-N-BBE, VC-N-UAS, VC-F-ES, VC-F-SES, VC-F-BBE, VC-F-UAS, PJCPOS, PJCNEG

The following values are for OTU modifiers only: OTN-LOSS, OTN-FECC

The following value is also allowed for all input modifiers: ALL.

Default: ALL.

6. **monlev** – Monitored Level

This parameter provides the level for the monitored PM parameter. The parameter is only evaluated if the value of *montype* parameter is ALL.

Type: value set.

Range:

- 1-UP: Means the NE will report all non-zero data and all data which is marked as non-valid (parameter validity).
- 0-UP: Means the NE will report zero and all positive data.

If *monlev* is 0-UP, AID ranging must be below slot level.

Default: 1-UP.

7. **locn** – Location

Location for which the PM data is monitored. The parameter value is only considered if the *montype* value is ALL; otherwise it is ignored for the calculation of the command reply (i.e has no impact on the command).

Type: value set.

Range:

- NEND: Near-End PM data is requested.
- FEND: Far-End PM data is requested.
- ALL: All near-end and far-end data is requested. It applies only to input direction.

Default: ALL.

8. **tmper** – Time Period

This requests PM data for a specified time interval.

Type: value set.

Range:

- 15-MIN: This requests PM data in 15-minute intervals
- 1-DAY: This requests daily PM data.

9. **mondatt** – Monitored Date

This requests the beginning date of the interval for which the PM data is to be reported. For both values of *tmper* parameter, the maximum allowable range of valid dates includes the current and previous one day.

Type: value set.

Range:

- MM-DD: Month-Day. A leading zero (first M or first D) is optional and may be omitted.
- ALL: Current and previous day.

Default: Current date

10. montm – Monitored Time

This parameter specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. The user is able to specify a monitored time in three modes:

- A monitored time interval (i.e., from hour-minutes to hour-minutes: HOD-MOH&&THOD-TMOH).
- A single time interval (i.e., the hour and minutes for the appropriate 15 minute data: HOD-MOH).
- All applicable beginning times for the given *mondatt* value (i.e., all).

Where HOD-MOH represents the start of the requested PM retrieval period (hours and minutes) and THOD-TMOH represents the end of the requested PM retrieval period. The value ALL must be used if the *mondatt* value provided is ALL.

Type: character string.

Range:

- HOD-MOH: This specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. This parameter may be omitted or have one of the following values: Hour Of Day- Minute Of Hour, where HOD ranges from 0 to 23 and MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.
- THOD-TMOH: To Hour Of Day-To Minute Of Hour, where THOD ranges from 0 to 23 and TMOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0. Parameter grouping is used when specifying THOD-TMOH. For example, 08-15&&09-00 specifies the HOD-MOH and THOD-TMOH of 08-15 and 09-00, respectively. THOD-TMOH of \$\$-\$\$ indicates the current Hour Of Day-Minute Of Hour. THOD-TMOH of ##-## indicates the previous 15-min interval.
- ALL: All applicable beginning times for the given *mondatt* value.

If the *tmper* value is 1-DAY, the *montm* parameter will not be used.

Default:

If THOD-TMOH is not specified, only the PM data for the retrieval period specified by HOD-MOH will be retrieved.

If HOD-MOH is omitted, the PM period for the current time will be reported.

Output format

If the NE fully complies with the RTRV-PM request, the following normal completion response is returned:

```
sid date time
```

```

M  ctag COMPLD
   "aid:montype,monval,[validity],[tca],[locn],,tmper,
   [mondatt],[montm]"
   . . . . .
   . . . . .
   . . . . .
;

```

Note: The trailing comma has to be present even if the optional parameter is not supported for a dedicated release.

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Normal completion message – empty reply

If there is no PM data stored within the NE, then the following response is returned:

```

      sid date time
M  ctag COMPLD
;

```

Output parameters

1. *aid* – Access Identifier
 Description: Access identifier.
 Type: AID
 Range: For STM<N>, STM<N>T, OC<N>, EC1 and OC<N>T modifiers only: SPortAID.
 For T3 modifier: APortAID
 For OTU modifier: OTNPortAID
 For ODU<N> modifiers only: VCGAID
 For VC3, VC4, VC44C, VC416C, VC464C, STS1, STS3C, STS12C, STS48C and STS192C modifiers only: STS1NumAID.
 And for modifiers VC4, VC464C, STS1, STS3C and STS192C: VCGNumAID
2. *montype* – Monitored Parameter Type
 See *montype* in the input parameters section.
3. *monval* – Monitored Value
 This parameter specifies the measured value of the parameter specified in *montype*.
 Type: integer.
 Range: 0-4294967295
 The specified range is the maximal range taking all PM parameters into consideration. Specific PM parameters may have a smaller range.

W.r.t. value range for the specific PM parameters see

- Output Parameters section in [“RTRV-TCA-PROF: Retrieve TCA Profile”](#) (p. 4-2794) (if thresholding is applicable for that parameter)
- PM parameter introduction section (if thresholding is not applicable for that parameter).

4. validity – validity indicator

This parameter indicates the validity of the PM data.

Type: integer.

Range: 1: valid; (omitted): non-valid.

5. tca – Threshold Crossing Alert

Type: value set.

Range for the current interval:

- in TCA mode TR, that the current value exceeds the provisioned threshold
- in TCA mode TR-RTR, that a *tca* occurred since the beginning of this; interval or that the tca reset condition was not fulfilled in any previous; interval since the last tca occurred

If the value is omitted, it indicates

- in TCA mode TR, that the current value is below the provisioned threshold
- in TCA mode TR-RTR, that no tca occurred since the beginning of this; interval and that the tca reset condition was fulfilled at least in one previous , interval

For previous intervals, the tca parameter indicates the state at the end of the interval.

6. locn – Location

Location for which the PM data is monitored.

Type: value set.

Range:

- NEND: Near-End PM data is requested
- FEND: Far-End PM data is requested.

7. tmper – Time Period

See in the input parameters section.

8. mondat – Monitored Date

This parameter specifies the beginning date of the interval for which the PM data is reported. The parameter can be omitted in case of current date.

Type: value set.

Range: MM-DD: Month-Day

Default: Current date

9. montm – Monitored Time

This parameter specifies the beginning time of day for the reported pm register. The parameter is optional and may be omitted for the reporting of current bins (registers).

Type: character string.

Range: HOD-MOH: HOD ranges from 0 to 23; MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.

Example input/output

The following example shows the successful completion of a RTRV-PM command by the NE for a VC3:

```
RTRV-PM-vc3:UNITE-NE:1-1-#-#-5-1-27:123456::vc-f-es,1-up,,,15-min , ,
00-00&&08-00;
  UNITE-NE 00-01-01 08:00:00
M 123456 COMPLD
  "1-1-#-#-5-1-27:vc-f-es,17,,tca,,,15-min,,00-00"
  "1-1-#-#-5-1-27:vc-f-es,10,,tca,,,15-min,,00-15"
  . . .
  "1-1-#-#-5-1-27:vc-f-es,15,,tca,,,15-min,,08-00"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-PM command. See also subsection ‘Partial Completion on RTRV Commands’ w.r.t. handling of internal error (e.g. communication to XC320 fails) for a subset of replies.

RTRV-PREDEFRAG: Perform an ONNS fragmentation analysis

Overview

The RTRV-PREDEFRAG command is used to perform an analysis about the fragmentation status of a link or other entity.

This command is used by an operator in preparation for doing a defrag operation on a port or between multiple ports in a link between two nodes.

The command causes the receiving node to do an analysis of the level of fragmentation that currently exists on the specified port or link. An analysis is performed of how much usable bandwidth will be gained if defragmentation were to be done, and the time slot structure as it would be following a defragmentation operation is computed. Note that all this is done in an analysis mode. No real defragmentation is done until a subsequent “operate defrag” command is issued. The rtrv-predefrag command causes the network element to send the results of the defrag analysis in a status report back to the management system in a TL1 response.

As above stated the RTRV-PREDEFRAG is done in an analysis mode and does not guarantee the same result for *Gain* and *PostLDGrouping* after real defragmentation.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No.

Input format

Command syntax: RTRV-PREDEFRAG:*srcTid:srcAid:ctag::scope:targetID*;

Input parameters

Command parameters

1. *srcTid*

Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.

Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.

Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. *ctag* – Correlation Tag

This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing).

3. *srcAid*

Source node ONNS application access identifier of the ONNS controller OS command interface port.

Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: *snn*.

4. *scope*

This parameter specifies the scope of the defrag operation: intra port or inter port (intra link).

Range

- **PORT:** specifies the defrag is intra-fiber operation on a specific port. In this case *targetID* specifies the local port id same as the *portAID*. The corresponding neighbor node and neighbor *portAID* can be deduced from the *targetID*.
- **LINK:** specifies the link defrag is inter fiber but within a link bundle. Also, the link defrag operation is performed on all the bundles between the two neighboring nodes. *TargetID* specifies the neighbor nodes ASTN node ID.

5. *targetID*

The specification of the *targetID* depends on the setting of the parameter *scope*: **PORT** specifies the AID of the port on the local node that is to be defragmented; **LINK** specifies the ASTN node ID of the neighbor node of the link that is to be defragmented.

Type: Four dash separated numeric string for the *portAID*. Four dot separated numeric string for the neighbor ASTN node ID.

Range. Each numeric string: 0...255.

Output format

If the RTRV-PREDEFRAG request completes successfully, the following normal completion response is returned:

```

src-Tid date time
M ctag COMPLD
  PreLDGrouping=Num&NaM&....
  PostLDGrouping=Num&Num&...
  Gain=NSTSn&..
;
```

The pre and post defrag time slot structure is indicated by two strings consisting of "&" separated substrings. The substrings have the form NuM or NaM where N is a number indicating the number of STS1s that make up that slot and M indicates the rate (3C, 12C etc.). The letters "u" and "a" indicate whether the time slot is used or is available respectively. The value of M while specifying the number of available STS1s is always blank. Thus 2a means two STS1 slots are available.

The gain parameter indicates number of additional time slots that will become available once defrag is done. The highest rate time slots are indicated first, followed by the lower rates, with each signal rate substring being separated by an &. The fractional STS1s that form the remainder are not indicated. If there is nothing to be gained from the defrag operation, the gain parameter will say NONE.

Normal system response to RTRV-PREDEFRAG for inter port (link) defragmentation

If the RTRV-PREDEFRAG request completes successfully, the following normal completion response is returned:

```

src-Tid date time
M ctag COMPLD
  "BundleID=bundlID_1,Gain=NSTSn&...."
  "PortID=portID_1,
  PreLDGrouping=Num&NaM&....
  PostLDGrouping=Num&Num&...
  ...
  "PortID=portID_m,
```

```

    PreLDGrouping=Num&Na&....
    PostLDGrouping=Num&Na&...."
    ...

    "BundlID=bundleID_m,Gain=NSTSn&...."
    "PortID=portID_1,
    PreLDGrouping=Num&Na&....
    PostLDGrouping=Num&Na&...."
    ...

    "PortID=portID_m,
    PreLDGrouping=Num&Na&....
    PostLDGrouping=Num&Na&...."

;

```

The pre and post defrag time slot structure is indicated by two strings consisting of "&" separated substrings. The substrings have the form NuM or Na where N is a number indicating the number of STS1s that make up that slot and M indicates the rate (3C, 12C etc.). The letters "u" and "a" indicate whether the time slot is used or is available respectively. The available timeslots are ever shown in STS1s and no additional rate value M is needed. Thus 2a means two STS1 slots are available.

The gain parameter indicates number of additional time slots that will become available once defrag is done. The highest rate time slots are indicated first, followed by the lower rates, with each signal rate substring being separated by an &. The fractional STS1s that form the remainder are not indicated. If there is nothing to be gained from the defrag operation, the gain parameter will say NONE.

The inter port defragmentation record will be send in data blocks that are less than 4096 characters. A data block will end with the pre and post defrag timeslot structure. On all messages but the last, a RTRV completion code is used and the semicolon (;) is replaced with a (>) terminator. Then, on the last record block, the COMPLD completion code is used with the final semicolon (;) terminator.

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, completion code and their syntax are included in the Output parameters section of the “[RTRV-PATH: Retrieve ONNS connection data](#)” (p. 4-2526) command.

1. **bundleID**
A unique numeric ID assigned to the link bundle on this node.
Type: Integer
Range: >0
2. **portID**
Port ID for which the NNDR data shall be retrieved. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port # .
Type: dash-separated list of 4 numeric strings
Range: Bay/Frame #1, Shelf #1, Slot/Pack #1,..39 Port #1..16,
3. **PreLDGrouping**
An ordered & separated string of numbers indicating the availability or unavailability of a group of time slots of different rates. The unit of measure is STS1. Availability is indicated by “a” and unavailability (used) by “u”. Thus 1u3 indicates that one STS3c slot is used up, and 2a indicates that two STS1 slots are available. Notice that the available timeslots are always specified in terms of the number of STS1s. Hence, the “1” at the end is understood and not included to conserve space.
Type: &-separated list of numbers.
Example for an OC12 port:
PreLDGrouping=1u3&2a&1u1&1u3&1u1,2a, indicates one used STS3c, two available STS1, one used STS1, one used STS3c, 1 used STS1, two available STS1.
The size of the output string will vary depending on whether the port is OC3, OC12, OC48, OC192, OC768 and also on the distribution of the used/available time slots. For an OC192 port, the output string would indicate the STS48c, STS12c, STS3c and STS1 slots used up and the remaining unused STS1 slots.
4. **PostLDGrouping**
An ordered string formatted the same way as the *PreLinkDefragGrouping* string, indicating the time slot structure once the defrag operation is completed.
Type: &-separated list of numbers
Example for the above case of the OC12 port, the PostLDGrouping=2u3&2u1&4a, indicating that two STS3c slots are used, two STS1 are used and four STS1 slots are available. Thus another STS3c can be accommodated.
5. **Gain**
A parameter indicating whether the defrag will result in an improvement or not. “NONE” indicates no improvement, any other value indicates the “delta” improvement over the existing time slot structure. The delta is computed in terms of the additional signals that can be accommodated as a result of the defrag starting with the highest signal rate possible for that port. The improvement is represented

as a string composed of one or more of the following substrings: "STS3c", "STS12c", "STS48c", "STS192c". Each substring has a numeric string preceding it indicating the number of timeslots of that type that will be available once defrag is performed. The highest signal rate is stated first, then the next highest rate and so on.

Type: &-separated list of numbers concatenated with value set or the special value NONE.

Range: The value is "NONE" if no gain. Else it indicates the additional timeslot that are now available. In the above example: Gain=1STS3C. Gain will be an &-separated list if there are multiple gains. E.g: 1STS12c& 3STS3c would mean that 1 STS12c and 3 STS3c connections could be accommodated on that port once the defrag is done. Note only the additional available timeslots are included in the response.

Example input/output

The following example shows a successful completion of a RTRV-PREDEFRAG command: *NN001:snn:ed01::PORT,1-1-2-1;*

```

NN001 2002-01-12 01:03:16
M ctag COMPLD
  "PreLDGrouping=1u3&2a&1u1&1u3&1u1&2a
  PostLDGrouping=2u3&2u1&4a
  Gain=1STS3C"
;
```

Error responses

Invalid *PortID*

If the NE receives an RTRV-PREDEFRAG command with an *PortID* parameter value that is invalid the following error response is returned:

Error code: E410 - Input, Invalid PortID

Invalid *ASTNNodeID*

If the NE receives an RTRV-PREDEFRAG command with an *ASTNNodeID* parameter value that is invalid the following error response is returned.

Error code: E512 - Input, Invalid Neighbor node ID

RTRV-PRMTR-DATA: Retrieve parameter data

The RTRV-PRMTR-DATA command retrieves information about the databases being in NVM. It identifies the databases' release numbers and provides also other information such as their states.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 2

Abortable: No

Input format

Command Syntax: RTRV-PRMTR-DATA:tid::ctag::[amount];

Input parameters

Command parameters

1. tid- Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. ctag – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
3. amount – Amount Of Data To Return
This parameter specifies whether the current generic or previous generic or both shall be returned. If a value is omitted, then the current (active) generic is returned.
Type: alphanumeric value set.
Range: CURRENT (default), PREVIOUS, ALL.
Default: CURRENT.

Output format

The following normal completion response is returned, if the RTRV-PRMTR-DATA request completes successfully:

```
sid date time
M ctag COMPLD

  ...
  ...
  "nvm:spec_block"
;
```

Output parameters

Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command Output parameters section for a normal completion response. The output parameters listed there also apply to the RTRV-PRMTR-DATA command. Additional parameters that specifically apply to this command are defined in the following:

1. **nvm** – Non Volatile Memory Identifier

This parameter specifies the region of non volatile memory data (current or previous).

Type: Value set.

Range:

- NVM-A: for current NVM Data
- NVM-B: for previous NVM-Data.

Default: Only current NVM data is reported except for *amount* having been specified to ALL.

Spec block parameters

This parameter provides information about the stored database. It contains the parameters *release*, *size*, *backuptime*, *restoretime*, *backupfile*, *restorefile*, *priorbackuptime*, *priorbackupfile*, *priorrestoretime*, *priorrestorefile*, *state*, *tid* and *serialnumber*.

When software is being downloaded to previous NVM, the database parameters for NVM-B do not need initialization because they still reflect information pertaining to the currently executing generic.

During installation, the following parameters are omitted (initialized to a blank field) for NVM-A:

backuptime, *restoretime*, *backupfile*, *restorefile*, *priorbackuptime*, *priorirrestoretime*, *priorbackupfile*, *priorrestorefile*.

When a backup is performed for the database in current NVM, the values of *restoretime*, *restorefile*, *priorbackuptime*, *priorbackupfile* shall not be modified.

1. *release* – Release Number

This parameter represents the release number contained in the file. The parameter will be omitted if state is 'INITIAL'.

Type: value set of the form x.y.z

Range: x, y, z are integer numbers from 00 to 99 in two-digit form, that means leading zeros are not suppressed. x shall not be 00.

2. *size* – Size Of Allocated NVM

This parameter indicates the allocated NVM size in bytes.

It is not dynamically updated within the generic until data migration or software upgrade which may change the budget of NVM space used for database files.

Type: numeric string

Range: 0 to 999999999

Default: In case the software generic on the NVM is empty, the value 0 is reported.

3. *backuptime*

This parameter provides time and date when the last backup to a remote file store has been finished. It is omitted if the system has never been backed up.

The NE updates *backuptime* at the OS just before file transfer starts and then update the value of current NVM's *backuptime* when the backup finishes.

This implies the value of *backuptime* contained in backupfile at the OS will represent a slightly earlier time than the value contained in current NVM's database.

backuptime is updated whether or not the file transfer was successful.

Type: value set of the format: YY-MM-DD HH-MM-SS.

Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

4. *restoretime*

This parameter reflects the time and date when the last restore from a remote file store has been finished. It is omitted, if the system has never been restored.

When a backup is performed for the database in current NVM, the values of *restoretime* (in current NVM, previous NVM) are not modified.

Only database files at the current or previous NVMs shall have values for *restoretime*.

Type: value set of the format: YY-MM-DD HH-MM-SS

Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

5. *backupfile*

This parameter indicates the remote location where the last backup is stored.

Omitted if never backed up.

The NE will update *backupfile* before the file transfer starts.

Thus, both the source (current NVM) and the destination (*Navis*® Optical EMS or CIT) will have the same value for *backupfile*.

Type: text string.

Range: The parameter has one of the following formats:

- *"CIT,filename"*
- *"EMS,filename"*
- *"FTTD",FTP URL"*

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.

Because a (\) is interpreted as the escape character, it will be represented in the output reply as a double backslash (\\).

The FTP URL must be in the format:

ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: "anonymous"
- <password>: default for <login> "anonymous" is "" (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

6. *restorefile*

This parameter reflects the remote location where the last restore came from.

Omitted if never restored.

When a backup is performed for the database in current NVM, the values of *restorefile* (in current NVM, previous NVM, the destination) will not be modified. *restorefile* is updated whether or not the file transfer was successful.

Type: text string.

Range: *restorefile* has one of the following formats:

- *"CIT,filename"*
- *"EMS,filename"*
- *"FTTD",FTP URL"*

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.

Because a (\) is interpreted as the escape character, it will be represented in the output as a double backslash (\\).

The FTP URL must be in the format:

ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: "anonymous"
- <password>: default for <login> "anonymous" is "" (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

7. priorbackuptime

This parameter gives the time and date when the next-to-last backup to a remote file store finished. It is omitted, if there is no next-to-last-backup.

When a backup is performed for the database in current NVM, the values of *priorbackuptime* (in current NVM, previous NVM, the destination) will not be modified.

Type: value set of the format: YY-MM-DD HH-MM-SS

Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

Default: n. a.

8. priorrestorettime

This parameter specifies the time and date when the next-to-last restore from a remote file store finished. It is omitted, if there is no next-to-last restore.

Type: value set of the format: YY-MM-DD HH-MM-SS.

Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

9. *priorbackupfile*

This parameter indicates the remote location where the next-to-last backup is stored. It is omitted, if there is no next-to-last backup.

When a backup is performed for the database in current NVM, the values of *priorbackupfile* (in current NVM, previous NVM, the destination) will not be modified.

Type: text string

Range: *priorbackupfile* has one of the following formats:

- *"CIT,filename"*
- *"EMS,filename"*
- *"FTTD",FTP URL"*

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file system, forward slashes (/) should be used.

Because a (\) is interpreted as the escape character, it will be represented in the output reply as a double backslash (\\).

The FTP URL must be in the format:

ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: "anonymous"
- <password>: default for <login> "anonymous" is "" (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

10. *priorrestorefile*

This parameter reflects the remote location where the next-to-last restore came from. It is omitted, if there is no next-to-last restore.

Type: text string

Range: *priorrestorefile* has one of the following formats:

- *"CIT,filename"*
- *"EMS,filename"*
- *"FTTD",FTP URL"*

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.

Because a (\) is interpreted as the escape character, it will be represented in the output reply as a double backslash (\\).

The FTP URL must be in the format:

ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: "anonymous"
- <password>: default for <login> "anonymous" is "" (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

11. state – State of the Database

This parameter describes the state of the database per NVM region:

- CORRUPT (current, previous): Unavailable for invocation or execution.(e.g. corrupted check sum)
- DOWNLOADED (previous): Applies to the previous bin of database. Database just downloaded or ready for installation.
- INITIAL (current): Nothing in NVM.
- INITIAL (previous): Nothing in previous partition of NVM.
- INPROGRESS (current): Backup or restore in progress.
- INPROGRESS (previous): Restore is in progress.
- PREVIOUS (previous): A previously active database.
- PRESERVED (previous): Previously active database during trial state
- RUNNING (current): The currently active database.

The normal database states of current NVM are: RUNNING and INPROGRESS.

Most of the time its state is equal to RUNNING, signifying that it contains a copy of the database that is currently in use. When a backup or a restore makes the NVM inaccessible, current NVM will have a database state of INPROGRESS.

The normal database states of previous NVM are: PREVIOUS and INPROGRESS. Most of the time its state is equal to PREVIOUS, signifying that it contains a copy of the database that was used with the previous generic. The state PRESERVED indicates a copy of the previously active database after application of a new SW generic, while the new SW generic is in trial phase. During the trial phase a switch back to the previously installed SW generic and the previously active database is possible. When a restore makes the NVM inaccessible, previous NVM will have a database state of INPROGRESS.

If an NVM has never contained a database, then the RTRV-PRMTR-DATA output for that NVM will consist of *state* INITIAL and size 0.

If an NVM is failed or missing, then RTRV-PRMTR-DATA will report only the

state output variable for that NVM. *state* will have the value CORRUPT.

Type: alphanumeric value set.

Range: CORRUPT, DOWNLOADED, INITIAL, INPROGRESS, PREVIOUS, PRESERVED, RUNNING.

Default: INITIAL

12. *tid* – target identifier

This parameter gives the TID that was stored in this NVM. The parameter will be omitted if state is INITIAL.

This parameter is not evaluated in the NE. *serialnumber* will be used to check whether database belongs to correct NE.

See “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) for allowable tid values and details.

13. *serialnumber* – serial number

This parameter gives the NE serial number from the database control information showing to which NE the database belongs to. Comparing this serial number with the actual NE serial number from the backplane EEPROM may help troubleshooting when being in maintenance mode. The parameter will be omitted if state is INITIAL.

Type: alphanumeric value set.

Range: 12 times the space character or the 12 byte serial number of electronic label.

Default: 12 times the space character.

Example input/output

In the following example for the RTRV-PRMTR-DATA command, current NVM contains a copy of the RUNNING database. The database was last backedup at 9:00 and the backup was to CIT:

```
RTRV-PRMTR-DATA:LT-UNITE::123456;
  LT-UNITE 00-11-01 09:45:28
M 123456 COMPLD
  "NVM-A:release=01.02.04,size=8234567,backuptime=
  00-11-01 09-00-00,backupfile=\"CIT,\\data\\00_11_01B
  \",priorbackuptime=00-11-01 08-00-00,priorbackupfile=
  \"CIT,\\data\\00_11_01A\",state=running,tid=LT-UNITE,
  serialnumber=01NB12345678"
;
```

Related TL1 messages

- “[APPLY: Apply software generic](#)” (p. 4-34)
- “[CPY-MEM: Copy memory](#)” (p. 4-105)
- “[RTRV-PRMTR-SFTWR: Retrieve parameter software](#)” (p. 4-2574)

RTRV-PRMTR-SFTWR: Retrieve parameter software

The RTRV-PRMTR-SFTWR command retrieves information about the software generics being in NVM. It identifies the generics' release number and provides also other information such as its state.

RTRV-PRMTR-SFTWR can be used to determine what generic is currently executing. It can also be used to determine what generic was previously executing. If a generic was downloaded but not installed, then the output describes the downloaded generic instead of the previously executing generic.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 2

Abortable: No

Input format

Command Syntax: RTRV-PRMTR-SFTWR:*tid::ctag::[amount]*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
3. *amount* – Amount Of Data To Return
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

If the NE fully complies with the RTRV-PRMTR-SFTWR command and the *amount* request is specified to all, then the following normal completion response is returned:

```

sid date time
M ctag COMPLD
  "nvm:spec_block"
  ...
  ...
  "nvm:spec_block"
;
```

Output parameters

Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command output parameters section for a normal completion response. The output parameters listed there also apply to the RTRV-PRMTR-SFTWR command. Additional parameters that specifically apply to this command are defined in the following:

1. **nvm** – non volatile memory identifier

This parameter specifies the version of NVM software (current or previous).

Type: value set.

Range: NVM-A for Current NVM-Software, NVM-B for Previous NVM-Software.

Default: Only current NVM software is reported except for *amount* having been specified to ALL.

Spec block parameters

This parameter provides information about the stored software. It contains the parameters *release*, *size*, *supplier*, *type*, *delivered*, *installed*, *path*, *state*.

1. **release** – Release Number

Type: value set of the form x.y.z

Range: x, y, z are integer numbers from 00 to 99 in two-digit form, that means a leading zeros are not suppressed. x shall not be 00.

Default: 01.00.00.

2. **buildnmbr** - Build Number

This parameter identifies the software load contained in the file. The Build Number is reported for the SW load in the current NVM. For the previous NVM the default value is reported. In contrast to the release parameter, which is the same for all software loads for a product release, the *buildnmbr* is different for all loads which are produced e.g. for test purposes.

Type: Text string

Range: Up to 20 characters The buildnmbr shall contain the load number and optional information to identify the specific SW load.

Default: UNKNOWN.

3. **size** – Program Size

This parameter indicates the software generic size in bytes.

Type: numeric string.

Range: 0 to 999999999.

Default: In case the software generic on the NVM is empty, the value 0 is reported.

4. **supplier**

This parameter provides the supplier of generic.

Type: value set.

Range: 0 to 128 characters

Default: Alcatel-Lucent..

5. type – System Type

This parameter specifies the type of system.

Type: value set

Range: WaveStar_UNITE

Default: WaveStar_UNITE.

6. delivered

This parameter specifies the time and date when the download finished.

Type: value set of the format: YY-MM-DD HH-MM-SS.

Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

Default: 00-01-01 00-00-00.

7. installed

This parameter specifies date and time when the installation started.

Type: value set of the format: YY-MM-DD HH-MM-SS

Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

Default: 00-01-01 00-00-00.

8. path

This parameter specifies the location in a remote file system from where the SW Generic has been downloaded. In the case of a factory installed SW generic the parameter shall have the value "PRE-LOADED".

Type: text string.

Range: The path parameter has one of the following formats (see description for details):

- "CIT,psel,ssel,tsel,nsap,filename"
- "EMS,psel,ssel,tsel,nsap,filename"
- "FTTD,psel,ssel,tsel,nsap,FTP URL"
- "PRE-LOADED"

The sizes for *psel*, *ssel*, *tsel*, *nsap* are as follows:

- *psel* (path selector): 0-4 bytes (0-8 hex characters)
- *ssel* (section selector): 0-4 bytes (0-8 hex characters)
- *tsel* (transport selector): 0-16 bytes (0-32 hex characters)
- *nsap* (network service access point): 20 bytes (40 hex characters).

There can only be an even number of hex characters since they are generated from bytes and each byte corresponds to 2 hex characters.

From MSB (Most Significant Byte) to LSB (Least Significant Byte), these bytes are (the number in parenthesis equals the number of bytes): IDP(3), DFI(1), ORG(3), RES(2), RD(2), AREA(2), SYS(6), SEL(1). The SEL field of the *nsap* is

also called the NSEL.

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.

Because a (\) is interpreted as the escape character, it will be represented in the RTRV-PRMTR-SFTWR output as a double backslash (\\).

When the CIT is used to enter a file name for download backup, or restore, the craft is not required to enter a double backslash; the CIT software will enter the extra backslash into the TL1 CPY-MEM command.

For FT-TD *psel*, *ssel*, *tsel* and *nsap* of the GNE is reported. The FTP URL contains the CIT or EMS and the filename.

The FTP URL must be in the format:

ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: "anonymous"
- <password>: default for <login> "anonymous" is "" (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

9. state

This parameter describes the state of the generic per NVM region:

state (NVM):description

- CORRUPT (current, previous): Unavailable for invocation or execution.(e.g. corrupted check sum)
- DOWNLOADED (previous): Applies to the previous bin of database. Database just downloaded or ready for installation.
- INITIAL (current): Nothing in NVM.
- INITIAL (previous): Nothing in previous partition of NVM.
- INPROGRESS (current): Installation is in progress..
- INPROGRESS (previous): Previously executing generic. Available for installation
- RUNNING (current): Currently executing generic.
- PRESERVED (previous): Previously executing generic in trial phase
- PREVIOUS (previous): Previously executing generic.

The normal (as contrasted with CORRUPT) states of current NVM are: RUNNING and INPROGRESS. The state is usually equal to RUNNING, signifying that it contains a copy of the generic that is currently executing. When an installation is in progress, current NVM will have a state of INPROGRESS.

The normal states of previous NVM are: PREVIOUS, DOWNLOADED and INPROGRESS. INPROGRESS means that a download is in progress. When the download terminates successfully, the state transitions to generic is installed, the NVM pointer is adjusted, and the NVM partition then identified as previous NVM will have the state set to PREVIOUS. The state PRESERVED indicates the trial phase after application of a new SW generic. During the trial phase a switch back to the previously installed SW generic and the previously active database is possible.

If an NVM has never contained a software generic, then the RTRV-PRMTR-SFTWR output for that NVM will consist of State=INITIAL.

If an NVM is corrupt, failed or missing, the RTRV-PRMTR-SFTWR output for that NVM will consist only of a single line containing State=CORRUPT.

Type: alphanumeric value set.

Range: CORRUPT, DOWNLOADED, INITIAL, INPROGRESS, PREVIOUS, PRESERVED, RUNNING.

Default: INITIAL.

Example input/output

In the following example for the RTRV-PRMTR-SFTWR command, current NVM has a copy of the executing program (normal condition), and previous NVM has a copy of the previous generic. Also, it was assumed, that the CIT is DOS based and Navis[®] Optical EMS UNIX based. This was done to illustrate the different formats for path. Notice that the current and previous NVM indicate the same number for free (and also unavailable) space since current and previous information is stored in the same physical NVM.

```
RTRV-PRMTR-SFTWR:LT-UNITE::123456::ALL;
LT-UNITE 00-11-01 09:45:28
M 123456 COMPLD
"NVM-A:release=01.02.04,size=11423175,supplier=Lucent,
type=Unite,delivered=00-11-02 08-00-10,
installed=00-11-02 08-00-13,path=\"CIT,01,01,03,

RTRV-PROTN-GRP: Retrieve protection group

The RTRV-PROTN-GRP command retrieves protection group information for all existing protection group entities. The command can be used to retrieve also sets of protection groups by using ranges. The general format can be used to retrieve protection group information for different protection group types.

Input parameters for RTRV-PROTN-GRP identify the type of protection group that is of interest and also a specific member (or perhaps a range of members) of that protection group. If the specified member does not belong to a protection group, then the command returns COMPLD, but contains no information about the protection group. This means that the AID is unprotected.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

1+1 equipment protection group

Command Syntax: RTRV-PROTN-GRP:*tid:aid:ctag::prototype*;

multiplex section/line protection group

Command Syntax: RTRV-PROTN-GRP:*tid:aid:ctag::prototype*;

2-/4-fibre MS-SPRing/BLSR protection group

Command Syntax: RTRV-PROTN-GRP:*tid:[aid]:ctag::prototype,[rid]*;

Path protection group

Command Syntax: RTRV-PROTN-GRP:*tid:[aid]:ctag::prototype, , [ppgname][,aid1]*;

The second comma in front of *ppgname* is needed since *rid* is omitted.

The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

Important! The TL1 command RTRV-PROTN-PPG which retrieves all used path protection group names is not supported. Therefore its difficult to get an overview about all already used/defined protection group names.

The operator can use the TL1 command RTRV-PROTN-GRP and use bay-shelf-#-#-all-all-all as value for the input parameter *aid* in order to derive all path protection groups (see *aid* - Access Identifier in [“Command parameters \(path protection group\)”](#) (p. 4-2583)). Then he gets the used path protection group names per protection group in the command reply.

Input parameters

Command parameters (1+1 Equipment protection group)

1. **tid** – Target Identifier
This is the currently active name of the NE to which the command is addressed.
The tid is a case insensitive character string.
Type: identifier, in addition the special character underscore (“_”) and the password characters (see [23] SRD_SecurityManagement ID95 and ID178) are allowed
Range: 1 to 20 characters
2. **aid** – Access Identifier
Description: The parameter specifies the aid of 1+1 equipment protection group.
Type: AID
Range: 1-1-eall or SwitchAndTmgProtGrpAID or CtlProtGroupAID or EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID.
When using aid 1-1-eall, all actual existing equipment protection groups will be returned:
 - for high order switch fabric and timing group (referenced by SwitchAndTmgProtGrpAID)
 - for system controller group (referenced by CtlProtGroupAID)
 - for electrical 155 MBit/s groups (referenced by EP155ProtGroupAID)
 - for electrical 51 MBit/s groups (referenced by EP51ProtGroupAID)
 - for low order switch fabric groups (referenced by LOXCProtGroupAID).
3. **ctag** – Correlation Tag
This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
Type: alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.
4. **protype** – Protection Type
The parameter specifies the type of the 1+1 equipment protection group for retrieving the information. The parameter evaluation is case insensitive.
Type: alphanumeric value set.
Range:
 - ALL, if *aid* is 1-1-eall;
 - EQPTSWFBR, if *aid* is SwitchAndTmgProtGrpAID;
 - EQPTCTL, if *aid* is CtlProtGroupAID;
 - EQPTEP155, if *aid* is EP155ProtGroupAID;
 - EQPTEP51, if *aid* is EP51ProtGroupAID;
 - EQPTLOXC, if *aid* is LOXCProtGroupAID.

Command parameters (multiplex section/line protection group)

1. **tid** – Target Identifier
This is the currently active name of the NE to which the command is addressed.
The tid is a case insensitive character string.
Type: identifier, in addition the special character underscore ("_") and the password characters (see [23] SRD_SecurityManagement ID95 and ID178) are allowed
Range: 1 to 20 characters
2. **aid** – Access Identifier
This parameter specifies the *aid* of a 1+1 multiplex section/line protection group or the *aid* of a 1:1 multiplex section/line protection group (only R3.0 and later) or an port *aid* being a member of the group.
Type: AID
Range: *bay-shelf-oall* (ranged over *OnePlusOne_ProtGrpAID*) or *OnePlusOne_ProtGrpAID* (not ranged) or *NByOne_ProtGrpAID* (not ranged) or *SPortAID* (not ranged)
3. **ctag** – Correlation Tag
This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
Type: alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.
4. **protype** – Protection Type
This parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1xNOPT (only R3.0 and later)
Type: value set
Range: 1+1 or 1xNOPT

Command parameters (2-/4-fibre MS-SPRing/BLSR protection group)

1. **tid** – Target Identifier
This is the currently active name of the NE to which the command is addressed.
The tid is a case insensitive character string.
Type: identifier, in addition the special character underscore ("_") and the password characters (see [23] SRD_SecurityManagement ID95 and ID178) are allowed
Range: 1 to 20 characters
2. **aid** – Access Identifier
This parameter specifies the aid of a MS-SPRing/BLSR protection group or an port aid being a member of the group.
Option: If *rid* is specified, then *aid* can be omitted.
Type: AID
Range: *bay-shelf-tall* (ranged over *TwoFibre_ProtGrpAID*) or *bay-shelf-fall* (ranged over *FourFibre_ProtGrpAID*) or *TwoFibre_ProtGrpAID* (not ranged) or *FourFibre_ProtGrpAID* (not ranged) or *SPortAID* (not ranged).

3. **ctag** – Correlation Tag
This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
Type: alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.
4. **protype** – Protection Type
This parameter specifies the protection group type for which the information is retrieved.
Type: alphanumeric value set
Range: 2F or 4F
5. **rid** – Ring Identification
This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value shall be unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE.
Option: If *aid* is specified, then *rid* can be omitted.

Command parameters (path protection group)

1. **tid** – Target Identifier
This is the currently active name of the NE to which the command is addressed.
The *tid* is a case insensitive character string.
Type: identifier, in addition the special character underscore ("_") and the password characters (see [23] SRD_SecurityManagement ID95 and ID178) are allowed
Range: 1 to 20 characters
2. **aid** – Access Identifier
This parameter specifies a path protection group *aid* or an input tributary *aid* being a member of the group in combination with *ppgname*.
This parameter specifies an input tributary *aid* when used in combination with parameter *aid1*.
Option: If *ppgname* is specified, then *aid* can be omitted or used as an input tributary *aid*.
As *ppgname* is not supported for low order path protections, the *aid* parameter must specify a path protection group AID for those protection groups.
The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
If the parameter *aid* specifies a HO tributary on a port of port class EDGE and this tributary is combined with another HO tributary within an OUC, then RTRV-PROTN-GRP shall operate on all protection groups of type PATHDRI identified by these two HO tributaries, if existing.

This option is also be applied, if wild cards are used in aid. The system discards duplicate responses if several tributaries of the same OUC are within the AID range specified by the wild cards.

When parameter *aid* is used in combination with parameter *aid1*, then RTRV-PROTN-GRP shall operate on all protection groups of type PATHDRI having the AIDs given in parameters *aid* and *aid1* as input tributaries. In this option the use of wildcards shall not be allowed.

Type: AID

Range: STS1NumAID or VCGNumAID or GenLOTribAID.

The usage of wild cards shall not be restricted. This range equals to the definition of Path_ProtGrpAID. ny defined wild cards (e.g. "all" or "vall" or "usall" in various positions) are allowed.

3. ctag – Correlation Tag

This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

Type: alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

4. prototype – Protection Type

This parameter specifies the protection group type for which the information is retrieved.

Type: alphanumeric value set

Range: PATHDRI

5. ppgname – Path protection group Name

The parameter shall specify the path protection group name. Storage and retrieval of the ppgname shall be case sensitive, but actual use of the ppgname to determine the corresponding protection group is case insensitive.

Option for high order path protection groups:

For high order path protections, if aid is specified, then *ppgname* can be omitted.

For low order path protections, the *ppgname* shall be omitted as not being supported at all.

If an input value is specified for *ppgname* and none is specified for *aid*, then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified path protection group name.

If input values are specified for *aid* and *ppgname* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified *aid*, *ppgname* pair.

The command will complete successfully if there is no protection group described by *aid*, *ppgname*, but no data will be returned.

The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

Type: text string

Range: 1 to 24 characters

6. aid1 – Access Identifier 1

When parameter *aid1* is applied together with parameter *aid*, these parameters shall specify a pair of input tributaries for accessing emulated selector bridges in one command.

If input values are specified for *aid* and *aid1* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have these specified tributaries as inputs. If an input value is specified for *aid1*, no value must be specified for *ppgname*.

The command will complete successfully if there is no protection group described by *aid* and *aid1*, but no data will be returned. The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

Type: AID

Range: STS1NumAID

The usage of wild cards shall not be allowed.

Output format

After receiving the RTRV-PROTN-GRP command, the following normal completion response is returned in case of prototypes unequal to PATHDRI::

```

    sid date time
M  ctag COMPLD
    "aid:[spec_block]"
        ...
        ...
    "aid:[spec_block]"
;

```

After receiving the RTRV-PROTN-GRP command, the following normal completion response is returned in case of PATHDRI protection group:

```

    sid date time
M  ctag COMPLD
    "aid:[spec_block]"
    "outtribaid,CML:<CML block>"
        .
        .
    "outtribaid,CML:<CML block>"
        ...
        ...

```

```

"aid:[spec_block]"
"outtribaid,CML:<CML block>"
.
.
"outtribaid,CML:<CML block>"
;

```

Both completion formats have a common generic format for the third and the following lines. This generic format is: "aid[,CML]:[spec_block]" Nevertheless it was decided to specify them differently to express that – spec block may be either the spec block for the protection group parameters or the spec block for the CML parameters – *aid* may be either the protection group aid or the output tributary aid

If no protection group entity exists matching the specified values of the input parameters *aid*, *rid* then the following response is returned:

```

sid date time
M ctag COMPLD
;

```

If no protection group entity exists matching the specified *ppgname* value, then no response shall be returned.

Output parameters

Command parameters (1+1 Equipment protection group)

1. aid – Access Identifier

This parameter specifies the AID of the 1+1 protection equipment group.

Type: AID

Range: SwitchAndTmgProtGrpAID or CtlProtGroupAID or EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID.

All actual existing equipment protection groups will be returned with a specific AID:

- SwitchAndTmgProtGrpAID for high order switch fabric and timing group
- CtlProtGroupAID for system controller group
- EP155ProtGroupAID for electrical 155 MBit/s groups
- EP51ProtGroupAID for electrical 51 MBit/s groups
- LOXCProtGroupAID for low order switch fabric groups..

Command parameters (multiplex section/line protection group)

1. **aid** – Access Identifier
This parameter specifies the aid of a 1+1 multiplex section/line protection group or the aid of a 1:1 multiplex section/line protection group (only R3.0 and later).
Type: AID
Range: OnePlusOne_ProtGrpAID or NByOne_ProtGrpAID

Command parameters (2-fibre MS-SPRing/BLSR protection group)

1. **aid** – Access Identifier
This parameter specifies the AID of the 2 fibre MS-SPRing/BLSR protection group.
Type: AID
Range: TwoFibre_ProtGrpAID
Default: No default

Command parameters (4-fibre MS-SPRing/BLSR protection group)

1. **aid** – Access Identifier
This parameter specifies the AID of the 4 fibre MS-SPRing/BLSR protection group.
Type: AID
Range: FourFibre_ProtGrpAID

Command parameters (Path protection group)

1. **aid** – Access Identifier
This parameter specifies the AID of the path protection group.
Type: AID
Range: STS1NumAID or VCGNumAID or GenLOTribAID
The usage of wild cards shall not be allowed for any part of the AID. This range equals to the definition of Path_ProtGrpAID.
2. **outtribaid** – Output Tributary Access Identifier
This parameter specifies the output tributary AID for a constituent signal within the protection group. One value is returned for each constituent signal together with the corresponding CML (Constituent Member List) block.
Type: AID
Range: STS1NumAID or VCGNumAID or GenLOTribAID
The usage of wild cards shall not be allowed for any part of the AID. This range equals to the definition of Path_ProtGrpAID.

Spec block parameters (1+1 Equipment protection group)

1. **actunit** – Active Unit State
This parameter specifies which unit is currently selected within the protection group as active unit.
The value WKG specifies that the worker unit is active.
The value PROTN specifies that the protection unit is active.
Type: alphanumeric value set
Range: WKG, PROTN

Default: For switching protection group instance: The first provisioned/auto-created circuit pack shall be the default active unit. For controller protection group instance: the active controller unit at the moment of creation of the CTL protection group. For EP155 protection group instance: The worker shall be the default active unit.

2. *nvmdate* – NVM Active Date

This parameter shall specify the date of the last successful update of NVM of the current active CTL in the format YY-MM-DD.

A value of 00-00-00 shall be reported in case the date information is unavailable.

Option: This parameter shall be reported only if *prototype*=EQPTCTL, otherwise it shall be omitted.

Type: value set

Range: YY-MM-DD with value ranges for YY: 00 to 99 for MM: 00 to 12 for DD: 00 to 31

Default: None

3. *nvmtime* – NVM Active Time

This parameter shall specify the time of the last successful update of NVM of the current active CTL in the format HH-MM-SS.

A value of 00-00-00 shall be reported in case the date information is unavailable.

Option: This parameter shall be reported only if *prototype*=EQPTCTL, otherwise it shall be omitted.

Type: value set

Range: HH-MM-SS with value ranges for HH: 00 to 23 for MM: 00 to 59 or SS: 00 to 59

Default: None

4. *nvmsdate* – NVM Standby Date

This parameter shall specify the date of the last successful update of NVM of the current standby CTL in the format YY-MM-DD.

A value of 00-00-00 shall be reported in case the date information is unavailable.

Option: This parameter shall be reported only if *prototype*=EQPTCTL, otherwise it shall be omitted.

Type: value set

Range: YY-MM-DD with value ranges for YY: 00 to 99 for MM: 00 to 12 for DD: 00 to 31

Default: None

5. *nvms time* – NVM Standby Time

This parameter shall specify the time of the last successful update of NVM of the current standby CTL in the format HH-MM-SS.

A value of 00-00-00 shall be reported in case the date information is unavailable.

Option: This parameter shall be reported only if *prototype*=EQPTCTL, otherwise it

shall be omitted.

Type: value set

Range: HH-MM-SS with value ranges for HH: 00 to 23 for MM: 00 to 59 or SS: 00 to 59

Default: None

6. nvmstat – NVM Synchronization State

This parameter shall specify the current state of NVM synchronisation of the Duplex Control Protection Group.

Option: This parameter shall be reported only if *protype* = EQPTCTL, otherwise it shall be omitted.

Type: alphanumeric value set

Range:

- INSYNC – if NVM of both control units are fully synchronized
- OUTOFSYNC – if either the standby control unit is not accessible or is in the process of re-synchronizing its NVM
- REPAIRING – synchronisation has been interrupted and not yet restarted

Default: None

7. protn – Protection Unit

The parameter specifies the protection circuit pack AID being a member of the 1+1 equipment protection group.

Type: AID

Range: CpAID, if *protype* is not EQPTLOXC or LoxcAID, if *protype* is EQPTLOXC.

Default:

- 1-1-#-#-xcp-cp (if *protype* is EQPTSWFBR)
- 1-1-#-#-ctlp-cp (if *protype* is EQPTCTL)

For all other equipment protection groups there is no default value as the slot of the protection unit will be dynamically assigned during creation of the group. For rules applying to the selection of the slot for the protection unit refer to ENT-PROTN-GRP.

8. protnsiglvl – Protection Fault Status

This parameter specifies the current fault status w.r.t. the protection unit as used by the protection state machine.

The value EF (Equipment Failed) is used if an equipment defect used as switch criteria is currently present for the protection unit.

The value NONE is used if no such defect is currently present.

Type: alphanumeric value set

Range: EF, NONE

Default: NONE

9. protype – Protection Type

This parameter specifies the type of the protection group.

Type: alphanumeric value set

Range:

- EQPTSWFBR, if aid is SwitchAndTmgProtGrpAID
- EQPTCTL, if aid is CtlProtGroupAID
- EQPTEP155, if aid is EP155ProtGroupAID
- EQPTEP51, if aid is EP51ProtGroupAID
- EQPTLOXC, if aid is LOXCProtGroupAID.

10. swreq – Switch Request State

This parameter specifies the current switch request state of the protection state machine.

The value EQPTFAILED (Equipment Failed) is used if an equipment failed condition is the current state.

The value FS (Forced Switch) is used if a forced switch is the current state.

The value MS (Manual Switch) is used if a manual switch is the current state.

The value NR (No Request) is used if no request is the current state.

Type: alphanumeric value set

Range: EQPTFAILED, FS, MS, NR for switch fabric protection and EP155 protection; EQPTFAILED, MS, NR for controller protection.

Default: NR

11. wkg – Worker Unit

This parameter specifies the worker circuit pack AID being a member of the 1+1 equipment protection group.

Type: AID

Range: CpAID, if *protype* is not EQPTLOXC or LoxcAID, if *protype* is EQPTLOXC.

Default:

- 1-1-#-#-xcw-cp (if *protype* is EQPTSWFBR)
- 1-1-#-#-ctlw-cp (if *protype* is EQPTCTL)

For all other equipment protection groups there is no default value as the slot of the worker unit will be dynamically assigned during creation of the group. For rules applying to the selection of the slot for the worker unit refer to ENT-PROTN-GRP.

12. wkgsiglvl – Worker Fault Status

This parameter specifies the current fault status w.r.t. worker unit as used by the protection state machine.

The value EF (Equipment Failed) is used if an equipment defect used as switch criteria is currently present for the worker unit.

The value NONE is used if no such defect is currently present.

Type: alphanumeric value set

Range: EF, NONE

Default: NONE; i.e. the default is the value 'NONE'

Spec block parameters (multiplex section/line protection group)

1. **actunit** – Active Unit State
This parameter specifies which port is currently selected within the protection group as active port.
The value WKG specifies that the worker port is active.
The value PROTN specifies that the protection port is active.
Type: alphanumeric value set
Range: WKG, PROTN
Default: WKG
2. **actunitfe** – Far-End Incoming Requested Selection
This parameter is derived from the incoming K1 [5..8] overhead byte.
The value WKG is used if accepted K byte value is equal to 0.
The value PRTON is used if the accepted K byte value is equal to 1.
The value UNAVAILABLE is used if an SF condition is active for the protection line.
The value NONE shall be used if there is no request from the far end for 1+1 optimized (only R3.0 and later)
The value INV (InValid) is used in all other cases.
Type: alphanumeric value set
Range: WKG, PROTN, UNAVAILABLE, NONE, INV
Default: WKG
3. **actunitne** – Near-End Outgoing Requested Selection
This parameter is derived from the sent K1 [5..8] overhead byte.
The value WKG is used if sent K byte value is equal to 0.
The value PRTON is used if the sent K byte value is equal to 1.
Type: alphanumeric value set
Range: WKG, PROTN
Default: WKG
4. **aps** – Far-End Incoming APS
This parameter is derived from the incoming K1 [1..4] overhead byte.
It indicates the type of request as follows:
 - DNR: Do Not Revert
 - EXER: Exercise
 - INV: Invalid (unused codes)
 - UNAVAILABLE: Not Available (SF condition pending for protection line)
 - FS: Forced Switch
 - LO: Lockout of Protection
 - MS: Manual Switch
 - NR: No Request
 - RR: Reverse Request
 - SF-H: Signal Fail High

- SF-L: Signal Fail Low
- SD-H: Signal Degrade High
- SD-L: Signal Degrade Low
- WTR: Wait to restore (for MSP 1+1, MSP 1:1 / only used if protection group is revertive) / Wait to rename (for MSP 1+1 Optimized).

The APS code "WTR" has a different meaning depending on the protection type which shall be visible to the user. However, in the standards only "Wait to restore" is defined independent of the protection type.

The mapping of K1 overhead byte values to output parameter values is standards dependent. The correctness of the parameter values can only be guaranteed, if the system which sends the K1 bytes is based on the same standards.

Type: alphanumeric value set.

Range: DNR, EXER, INV, NA, FS, LO , MS, NR, RR, SF-H, SF-L, SD-L, SD-H, WTR

Default: NR

5. apscout – Near-End Outgoing APS

This parameter is derived from the sent K1 [1..4] overhead byte.

It indicates the type of request as follows:

- DNR: Do Not Revert
- FS: Forced Switch
- LO: Lockout of Protection
- MS: Manual Switch
- NR: No Request
- RR: Reverse Request
- SF-H: Signal Fail High
- SF-L: Signal Fail Low
- SD-H: Signal Degrade High
- SD-L: Signal Degrade Low
- WTR: Wait to restore (for MSP 1+1, MSP 1:1 / only used if protection group is revertive). Wait to rename (for MSP 1+1 Optimized).

The APS code "WTR" has a different meaning depending on the protection type which shall be visible to the user. However, in the standards only "Wait to restore" is defined independent of the protection type.

Type: alphanumeric value set

Range: DNR, FS, LO , MS, NR, RR, SF-H, SF-L, SD-H, SF-L, WTR

Default: NR

6. **apspn – MSP-APS ASAP Pointer**
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MSP-APS (Multiplex Section Protection – Automatic protection switching).
Type: alphanumeric string
Range: 1-24 characters including character '-'.
Default: DEFAULT
7. **dcclmsprotmd – DCC Line/MS Protection Mode**
The parameter shall specify, whether the line/MS dcc channel is switched as part of the line/MS protection group. The value ENABLE shall be used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED shall be used.
Type: alphanumeric value set 3;
Range: ENABLE, DISABLE
Default: DISABLE
8. **dcclrsprotmd – DCC Sect/RS Protection Mode**
The parameter shall specify, whether the section/RS dcc channel is switched as part of the line/MS protection group. The value ENABLE shall be used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED shall be used.
Type: alphanumeric value set
Range: ENABLE, DISABLE
Default: DISABLE
9. **pgrate – protection group Rate**
This parameter is derived from the interface rate of the ports within the protection group. It indicates the same value as for the two ports.
Type: alphanumeric value set
Range: OC3, OC12, OC48, OC192, OC768, STM1, STM4, STM16, STM64, STM256
Default: The default value is the interface rate of the worker port.
10. **protn – Protection Unit**
This parameter specifies the protection port AID being a member of the line protection/ MS protection group.
Type: AID
Range: SPortAID
11. **protnsiglvl – Protection Fault Status**
This parameter specifies the current fault status w.r.t. port as used by the protection state machine.
The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the protection port.
The value SD (Signal Degrade) is used if a defect defined as signal degraded

condition is currently present for the protection port.

The value NONE is used if no such defect is currently present.

Type: alphanumeric value set

Range: SF, SD, NONE

Default: NONE

12. protocol – APS Protocol

This parameter specifies the protocol used by the protection state machine. The value 1+1_UNI is used for 1+1 unidirectional switching.

The value 1xN_BIDIR is used for 1:1 bidirectional switching (N=1) (only R3.0 and later).

The value 1+1_OPTM is used for 1+1 optimized, bidirectional switching (only R3.0 and later). The value 1+1_BIDIR is used for 1+1 bidirectional switching (only R4.0 and later).

The value 1+1_BIDIR is used for 1+1 bidirectional switching (only R4.0 and later). Note that “OPTIMIZED” describes rather the protection type than a protocol. Only for compatibility reasons of TL1 the parameter ‘protocol’ is used for its selection.

Type: alphanumeric value set

Range: 1+1_UNI, 1xN_BIDIR, 1+1_OPTM It can also be used to convert a 2-side node to an asymmetric node and vice versa.

In mind the ‘N’ in 1xN_BIDIR is considered to be always equal ‘1’. The value 1+1_OPTM implicitly specifies bidirectional operation mode.

Default: 1+1_UNI, in case of prototype = 1+1; 1xN_BIDIR, in case of prototype = 1xNOPT (i.e. protection type 1:1).

13. prototype – Protection Type

This parameter specifies the type of the protection group. The value for the 1+1 line/MS protection group shall be 1+1. The value for the 1:1 line/MS protection group shall be 1xNOPT (only R3.0 and later).

In mind the ‘N’ in 1xNOPT is considered to be always equal ‘1’. The ‘OPT’ in 1xNOPT is not related to MSP 1+1 optimized, but has any historical reasons. For MSP 1+1 optimized the prototype is rather 1+1.

Type: value set

Range: 1+1 or 1xNOPT.

Default: 1+1

14. rme – Protection Reversion

The parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection group. The value ENABLE shall be used if the protection group operates in revertive mode. The value DISABLE shall be used if the protection group operates in non-revertive mode.

Type: alphanumeric value set

Range: ENABLE, DISABLE in case of prototype = 1+1; ENABLE in case of prototype = 1xNOPT. ENABLE is not valid for protocol = 1+1_OPTM

Default: DISABLE, in case of prototype = 1+1; ENABLE, in case of prototype = 1xNOPT (i.e. protection type 1:1)

The *protocol* = OPTM can only be chosen in case of *prototype* = 1+1, thus default is DISABLE then.

15. ssi – Secondary Section Indication

The parameter shall indicate the 'Secondary Section' (line).

Type: AID

Range: WKG, PROTN; WKG denotes working section 1, PROTN denotes working section 2 according ITU-T G.841 Annex B.

Default: PROTN

16. swreq – Switch Request State

This parameter specifies the current switch request state of the protection state machine.

It shall have the following values:

- DNR: Do Not Revert
- FS: Forced Switch
- LO: Lockout of Protection
- MS: Manual Switch
- SF: Signal Fail
- SD: Signal Degrade
- WTR: Wait to restore (for MSP 1+1, MSP 1:1 / only used if protection group is revertive). Wait to rename (for MSP 1+1 Optimized)
- FOP: Failure Of Protocol
- NR: No Request.

The APS code "WTR" has a different meaning depending on the protection type which shall be visible to the user. However, in the standards only "Wait to restore" is defined independent of the protection type.

Type: alphanumeric value set

Range: DNR, FS, LO , MS, SF, SD, WTR, FOP, NR

Default: NR

17. wkg – Worker Unit

This parameter specifies the worker port AID being a member of the 1+1 line/MS protection group.

Type: AID

Range: SPortAID

18. wkgsiglvl – Worker Fault Status

This parameter specifies the current fault status w.r.t. port as used by the protection state machine.

The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the worker port.

The value SD (Signal Degrade) is used if a defect defined as signal degraded

condition is currently present for the worker port.

The value NONE issued if no such defect is currently present.

Type: alphanumeric value set.

Range: SF, SD, NONE.

Default: NONE.

19. wtr – Wait To Restore Time / Wait to Rename Time

The parameter shall specify the 'wait to restore' time used by the protection state machine operating in revertive mode (MSP1+1, MSP1:1). In case of MSP 1+1

Optimized the same parameter shall be used for the 'wait to rename' time.

Type: numeric string [minute]

Range: 0 - 60

Default: 5.

Spec block parameters (2-fibre MS-SPRing/BLSR protection group)

1. ard – Automatic Ring Discovery

If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value manually with ED-MAP-RING and supply the ring map information to each node on the ring for the BLSR protocol to operate. It is necessary to activate this user-provisioned information with SET-MAP-RING. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.

Type: alphanumeric string.

Range: ENABLE, DISABLE.

Default: ENABLE.

2. asmc – Automatic Squelch Map Calculation

If this parameter is enabled, the automatic squelch map calculation is switched on.

If disabled, the function is switched off.

Type: alphanumeric string.

Range: ENABLE, DISABLE (default).

3. blsrpn – MSSPRING-BLSR ASAP Pointer

This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MSSPRING-BLSR.

Type: alphanumeric string

Range: 1-24 characters including character '-'.

Default: DEFAULT

4. eapschst – Incoming East APS Channel Status

This parameter is derived from the incoming K2 [6..8] overhead byte of the east port.

It indicates the status as follows:

- IDLE: Idle
- BRIDGED: Bridged
- BANDS: Bridged & Switched

- XTRFC: Extra Traffic on protection channels
- NOTUSED: Not Used – Reserved for future use
- RDIL: RDI-L/MS-RDI (Remote Defect Indication -Line/Multiplex Section)
- AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section)

Type: alphanumeric value set

Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, RDIL, AISL

Default: IDLE

5. eapsgnid – Incoming East APS Destination Node Id

This parameter is derived from the incoming K1 [5..8] overhead byte of the east port. It specifies the node ID for which the K1 byte is destined.

The value UNAVAILABLE is used in case of an pending SF condition.

Type: alphanumeric value set

Range: 0-15 or UNAVAILABLE

Default: 0

6. eapsgprotn – Incoming East APS Protection Path

This parameter is derived from the incoming K2 overhead byte of the east port.

It indicates the protection path as follows:

- 0: short path code (S)
- 1: long path code (L)

The value UNAVAILABLE is used in case of an pending SF condition.

Type: alphanumeric value set

Range: 0, 1, UNAVAILABLE

Default: 0

7. eapsgsnid – Incoming East APS Source Node Id

This parameter is derived from the incoming K2 [1..4] overhead byte of the east port. It specifies the node ID which sourced the K1 byte.

The value UNAVAILABLE is used in case of an pending SF condition.

Range: 0-15 or UNAVAILABLE

Default: 0

8. eapsgssw – Incoming East APS Switch Priority

This parameter is derived from the incoming K1 [1..4] overhead byte of the east port.

It indicates the switch priority/bridge request code as follows:

- LPS: Lockout of Protection Span
- FSS: Forced Switch Span (4F only)
- FSR: Forced Switch Ring
- SFS: Signal Fail Span (4F only)
- SFR: Signal Fail Ring
- SDP: Signal Degrade Protection (4F only)
- SDS: Signal Degrade Span (4F only)

- SDR: Signal Degrade Ring
- MSS: Manual Switch Span (4F only)
- MSR: Manual Switch Ring
- WTR: Wait to Restore
- EXERS: Exerciser Span (4F only)
- EXERR: Exerciser Ring
- RRS: Reverse Request Span
- RRR: Reverse Request Ring
- NR: No Request.

The value UNAVAILABLE is used in case of an pending SF condition.

Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.

Default: NR.

9. east – East Port

This parameter specifies the port being a member in the role of the east port for a 2-fibre MS-SPRing/BLSR protection group.

Type: AID

Range: SPortAID

10. elprotnsw – East Last protection switch Attempt

This parameter specifies, whether the last switch request for the east side succeeded or not.

The values have the following semantics:

- SUCCESS: last request did succeed
- DENY: last request was denied due a validation rule
- FAILURE: last request could not be completed because far end node did not response with proper K-byte.

Type: alphanumeric value set.

Range: SUCCESS, DENY, FAILURE

Default: SUCCESS.

11. eswreq – East Switch Request State

This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value will be derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value shall be 'NR'.

It has the following values:

- LPS: Lockout of Protection Span
- FSR: Forced Switch of Service to Protection – Ring
- SFR: Signal Fail – Ring
- SDR: Signal Degrade – Ring

- MSR: Manual Switch of Service to Protection – Ring
- WTR: Wait to Restore
- NR: No Request.

Type: alphanumeric value set.

Range LPS, FSR, SFR, SDR, MSR, WTR, NR.

Default: NR.

12. *pgrate* – protection group Rate

This parameter is derived from the interface rate of the ports within the protection group. It indicates the same value as for the two ports.

Type: alphanumeric value set.

Range: OC48, OC192, OC768, STM16, STM64, STM256

Default: The default value shall be the interface rate of the east port.

13. *protype* – Protection Type

This parameter specifies the type of the protection group. The value for the 2-fibre MS-SPRing/BLSR protection group is 2F.

Type: alphanumeric value set.

Range: 2F.

14. *rcamode* – Ring Circuit Alarm Mode

This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local Squelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If *rcamode* is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.

Type: alphanumeric value set.

Range: ENABLE (default), DISABLE

15. *rid* – Ring Identification

This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value shall be unique for all protection groups of type 2F or 4F within the NE.

Type: text string of chars allowed for TID strings.

Range: 1 to 15 characters.

Default: NONE.

16. *ringndst* – Ring Node APS State

This parameter specifies the ring node APS state.

It shall have the following values under normal conditions: IDLE, SWITCHING, PASSTHROUGH

It shall have in addition the following values if protection state machine is suspended: SUSPENDED-IDLE, SUSPENDED-SWITCHING,

SUSPENDED-PASSTHROUGH

Type: alphanumeric value set.

Range: IDLE, SWITCHING, PASSTHROUGH, SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH.

Default: SUSPENDED-IDLE.

17. wapschst – Incoming West APS Channel Status

This parameter is derived from the incoming K2 [6..8] overhead byte of the west port.

It indicates the status as follows:

- IDLE: Idle BRIDGED Bridged
- BANDS: Bridged & Switched
- XTRFC: Extra Traffic on protection channels
- NOTUSED: Not Used – Reserved for future use
- RDIL: RDI-L/MS-RDI (Remote Defect Indication – Line/Multiplex Section).
- AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section).

Type: alphanumeric value set.

Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, RDIL, AISL.

Default: IDLE.

18. wapsdnid – Incoming West APS Destination Node Id

This parameter is derived from the incoming K1 [5..8] overhead byte of the west port. It specifies the node ID for which the K1 byte is destined. The value UNAVAILABLE is used in case of an pending SF condition.

Type: alphanumeric string.

Range: 0-15 or UNAVAILABLE.

Default: 0.

19. wapsprotn – Incoming West APS Protection Path

This parameter is derived from the incoming K2 overhead byte of the west port.

It indicates the protection path as follows:

- 0: short path code (S)
- 1: long path code (L)

The value UNAVAILABLE is used in case of an pending SF condition.

Type: alphanumeric value set.

Range: 0, 1, UNAVAILABLE.

Default: 0.

20. wapssnid – Incoming West APS Source Node Id

This parameter is derived from the incoming K2 [1..4] overhead byte of the west port. It specifies the node ID which sourced the K1 byte. The value UNAVAILABLE is used in case of an pending SF condition.

Type: alphanumeric string.

Range: 0-15 or UNAVAILABLE.

Default: 0.

21. wapssw – Incoming West APS Switch Priority

This parameter is derived from the incoming K1 [1..4] overhead byte of the west port.

It indicates the switch priority/bridge request code as follows:

- LPS: Lockout of Protection Span
- FSS: Forced Switch Span (4F only)
- FSR: Forced Switch Ring
- SFS: Signal Fail Span (4F only)
- SFR: Signal Fail Ring
- SDP: Signal Degrade Protection (4F only)
- SDS: Signal Degrade Span (4F only)
- SDR: Signal Degrade Ring
- MSS: Manual Switch Span (4F only)
- MSR: Manual Switch Ring
- WTR: Wait to Restore
- EXERS: Exerciser Span (4F only)
- EXERR: Exerciser Ring
- RRS: Reverse Request Span
- RRR: Reverse Request Ring
- NR: No Request.

The value UNAVAILABLE is used in case of an pending SF condition.

Type: alphanumeric value set.

Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.

Default: NR.

22. west – West Port

This parameter specifies the port being a member in the role of the west port for a 2-fibre MS-SPRing/BLSR protection group.

Type: AID.

Range: SPortAID.

Default: None.

23. wlprotnsw – West Last protection switch Attempt

This parameter specifies, whether the last switch request for the west side succeeded or not.

The values have the following semantics:

- SUCCESS: last request did succeed
- DENY: last request was denied due a validation rule
- FAILURE: last request could not be completed because far end node did not response with proper K-byte.

Type: alphanumeric value set.

Range: SUCCESS, DENY, FAILURE

Default: SUCCESS.

24. wswreq – West Switch Request State

This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value is derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value shall be 'NR'.

It have the following values:

- LPS: Lockout of Protection Span
- FSR: Forced Switch of Service to Protection – Ring
- SFR: Signal Fail – Ring
- SDR: Signal Degrade – Ring
- MSR: Manual Switch of Service to Protection – Ring
- WTR: Wait to Restore
- NR: No Request.

Type: alphanumeric value set.

Range LPS, FSR, SFR, SDR, MSR, WTR, NR.

Default: NR.

25. wtr – Wait To Restore Time

This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.

Note: If *wtr* time is set to infinite, the switch request state shall be WTR until a higher request occurs.

Type: numeric string [minute].

Range: 0 – 12 in 1 minute increments and 99.

Default: 5.

Spec block parameters (4-fibre MS-SPRing/BLSR protection group)

1. **ard** – Automatic Ring Discovery
If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value and supply the ring map information to each node on the ring for the BLSR protocol to operate. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
Type: alphanumeric string.
Range: ENABLE, DISABLE.
Default: ENABLE.
2. **asmc** – Automatic Squelch Map Calculation
If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
Type: alphanumeric string.
Range: ENABLE, DISABLE (default).
3. **blsrpn** – MSSPRING-BLSR ASAP Pointer
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MSSPRING-BLSR.
Type: alphanumeric string.
Range: 1-24 characters including character '-'.
Default: DEFAULT.
4. **eactunit** - East Active Unit State
The parameter shall specify whether the traffic associated with the east worker port is physically running over the east worker port (i.e. value WKG is used in that case) or over a protection port (i.e. value PROTN is used in that case). The protection port can be the east protection port in case of span switch or the west protection port in case of a loopback switch. The value of the parameter is derived from the internal handled active line state of the service port and the active line state of the protection ports. *eactunit* = WKG: active line state of east worker port is active. *eactunit* = PROTN: active line state of east worker port is standby.
Type: alphanumeric value set.
Range: WKG, PROTN.
Default: WKG.
5. **eapschst** – Incoming East APS Channel Status
This parameter is derived from the incoming K2 [6..8] overhead byte of the east port.
It indicates the status as follows:
 - IDLE: Idle
 - BRIDGED: Bridged
 - BANDS: Bridged & Switched
 - XTRFC: Extra Traffic on protection channels

- NOTUSED: Not Used – Reserved for future use
- RDIL: RDI-L/MS-RDI (Remote Defect Indication -Line/MultiplexSection)
- AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section)
- Extension for TOP-EX

In case of *protnmode* = TOPEX the following additional value shall be supported: (ACT) command to ACT to complete the Switch.

Type: alphanumeric value set.

Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, ACT, RDIL, AISL.

Default: IDLE.

6. *eapsdnid* – Incoming East APS Destination Node Id
This parameter is derived from the incoming K1 [5..8] overhead byte of the east port. It specifies the node ID for which the K1 byte is destined.
The value UNAVAILABLE is used in case of an pending SF condition.
Type: alphanumeric string.
Range: 0-15 or UNAVAILABLE.
Default: 0.
7. *eapsprotn* – Incoming East APS Protection Path
This parameter is derived from the incoming K2 overhead byte of the east port.
It indicates the protection path as follows:
 - 0: short path code (S)
 - 1: long path code (L)The value UNAVAILABLE is used in case of an pending SF condition.
Type: alphanumeric value set.
Range: 0, 1, UNAVAILABLE.
Default: 0.
8. *eapssnid* – Incoming East APS Source Node Id
This parameter is derived from the incoming K2 [1..4] overhead byte of the east port. It specifies the node ID which sourced the K1 byte.
The value UNAVAILABLE is used in case of an pending SF condition.
Type: alphanumeric string.
Range: 0-15 or UNAVAILABLE.
Default: 0.
9. *eapssw* – Incoming East APS Switch Priority
This parameter is derived from the incoming K1 [1..4] overhead byte of the east port.
It indicates the switch priority/bridge request code as follows:
 - LPS: Lockout of Protection Span
 - FSS: Forced Switch Span (4F only)
 - FSR: Forced Switch Ring
 - SFS: Signal Fail Span (4F only)
 - SFR: Signal Fail Ring

- SDP: Signal Degrade Protection (4F only)
- SDS: Signal Degrade Span (4F only)
- SDR: Signal Degrade Ring
- MSS: Manual Switch Span (4F only)
- MSR: Manual Switch Ring
- WTR: Wait to Restore
- EXERS: Exerciser Span (4F only)
- EXERR: Exerciser Ring
- RRS: Reverse Request Span
- RRR: Reverse Request Ring
- NR: No Request.

The value UNAVAILABLE is used in case of an pending SF condition.

The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.

Type: alphanumeric value set.

Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.

Default: NR.

10. eastprotn - East Protection Port

This parameter shall specifies the port being a member in the role of the east protection port for a 4-fibre MS-SPRing/BLSR protection group.

Type: AID

Range: SPortAID

11. eastwkg - East Worker Port

This parameter specifies the port being a member in the role of the east worker port for a 4-fibre MS-SPRing/BLSR protection group.

Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID.

Range: In case of an asymmetric ring: NOTUSED. In all other cases: SPortAID.

12. elprotnsw – East Last protection switch Attempt

This parameter specifies, whether the last switch request for the east side succeeded or not.

The values have the following semantics:

- SUCCESS: last request did succeed
- DENY: last request was denied due a validation rule
- FAILURE: last request could not be completed because far end node did not response with proper K-byte.

Type: alphanumeric value set.

Range: SUCCESS, DENY, FAILURE.

Default: SUCCESS.

13. eswreq - East Switch Request State

This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value shall be derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value shall be 'NR'.

It has the following values:

- LPS: Lockout of Protection Span
- FSS: Forced Switch of Service to Protection - Span
- FSR: Forced Switch of Service to Protection - Ring
- SFS: Signal Fail - Span
- SFR: Signal Fail - Ring
- SDS: Signal Degrade - Span
- SDR: Signal Degrade - Ring
- SDP : Signal Degrade - Protection
- MSS: Manual Switch of Service to Protection - Span
- MSR: Manual Switch of Service to Protection - Ring
- WTR: Wait to Restore
- NR: No Request.

Type: alphanumeric value set.

Range: LPS, FSS, FSR, SFS, SFR, SDS, SDR, SDP, MSS, MSR, WTR, NR The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.

Default: NR.

14. pgrate – protection group rate

This parameter is derived from the interface rate of the ports within the protection group. It indicates the same value as for the four ports.

Type: alphanumeric value set.

Range: OC48, OC192, STM16, STM64.

If *protnmode* = TOPEX, then the range shall be restricted to: STM64 only

Default: The default value is the interface rate of the east port.

15. protnmode - Protection Switch Mode

The parameter specifies the protection switch mode. The value LOOPBACK shall be used for the classical ring application. The value SHORTENED shall be used for transmission delay sensitive applications. The value TOPEX (only R3.0 - R3.2 and R8.0.1 and later) shall be used for the so called transoceanic application, which allows extra traffic, improves restorability and improves delay as well as in SHORTENED mode.

In case of a ring switch ... LOOPBACK performs the bridge and switch function in that nodes which are most close to the failed span. SHORTENED performs the

bridge function at the add node respectively the switch function at the drop node of each ring circuit. It is an application only similar to the transoceanic protocol. TOPEX allows, compared to SHORTENED mode, additionally the traffic restoration of not affected spans. It is the transoceanic protocol application.

Consistent Protection Switch Mode Setting

The Protection Switch Mode must be set consistently on all nodes in the ring. E.g. for all UNITE NEs in a TOP+EX ring the parameter *protnmode* must be set to TOPEX. In a ring with inconsistent Protection Switch Mode, there will be no protection switching. The UNITE NEs will raise an Inconsistent Ring Protection Mode alarm.

Type: alphanumeric value set.

Range: LOOPBACK, SHORTENED, TOPEX.

Default: LOOPBACK.

16. *protype* – Protection Type

This parameter specifies the type of the protection group. The value for the 4-fibre MS-SPRing/BLSR protection group is 4F.

Type: alphanumeric value set.

Range: 4F.

17. *rcamode* – Ring Circuit Alarm Mode

This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local Squelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If *rcamode* is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.

Type: alphanumeric value set

Range: ENABLE (default), DISABLE

18. *rid* – Ring Identification

This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value shall be unique for all protection groups of type 2F or 4F within the NE.

Type: text string of chars allowed for TID strings.

Range: 1 to 15 characters.

Default: NONE

19. *ringndst* – Ring Node APS State

This parameter specifies the ring node APS state.

It shall have the following values under normal conditions: IDLE, SWITCHING, PASSTHROUGH

It shall have in addition the following values if protection state machine is suspended: SUSPENDED-IDLE, SUSPENDED-SWITCHING,

SUSPENDED-PASSTHROUGH.

Type: alphanumeric value set.

Range: IDLE, SWITCHING, PASSTHROUGH, SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH.

Default: SUSPENDED-IDLE.

20. swtr - Span Wait To Restore Time

The parameter specifies the wait to restore time for span switches used by the protection state machine operating in revertive mode. The protection shall operate in revertive mode if the wait-to-restore time is in the range 0-12. The protection shall operate in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.

Note: If *wtr* time is set to infinite, the switch request state shall be WTR until a higher request occurs.

Type: numeric string [minute].

Range: 0 - 12 in 1 minute increments and 99.

Default: 5.

21. wactunit - West Active Unit State

The parameter specifies whether the traffic associated with the west worker port is physically running over the west worker port (i.e. value WKG is used in that case) or over a protection port (i.e. value PROTN is used in that case). The protection port can be the west protection port in case of span switch or the east protection port in case of a loopback switch. The value of the parameter is derived from the internal handled active line state of the service port and the active line state of the protection ports. wactunit = WKG: active line state of west worker port is active wactunit = PROTN: active line state of west worker port is standby.

Type: alphanumeric value set.

Range: WKG, PROTN.

Default: WKG.

22. wapschst – Incoming West APS Channel Status

This parameter is derived from the incoming K2 [6..8] overhead byte of the west port.

It indicates the status as follows:

- IDLE: Idle
- BRIDGED: Bridged
- BANDS: Bridged & Switched
- XTRFC: Extra Traffic on protection channels
- NOTUSED: Not Used – Reserved for future use
- RDIL: RDI-L/MS-RDI (Remote Defect Indication – Line/Multiplex Section)
- AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section)
- Extension for TOP-EX

In case of *protnmode* = TOPEX the following additional value shall be supported: (ACT) command to ACT to complete the Switch.

Type: alphanumeric value set.

Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, ACT, RDIL, AISL.

Default: IDLE.

23. *wapsdnid* – Incoming West APS Destination Node Id

This parameter is derived from the incoming K1 [5..8] overhead byte of the west port. It specifies the node ID for which the K1 byte is destined. The value UNAVAILABLE is used in case of an pending SF condition.

Type: alphanumeric string.

Range: 0-15 or UNAVAILABLE.

Default: 0.

24. *wapsprotn* – Incoming West APS Protection Path

This parameter is derived from the incoming K2 overhead byte of the west port. It indicates the protection path as follows:

- 0: short path code (S)
- 1: long path code (L)

The value UNAVAILABLE is used in case of an pending SF condition.

Type: alphanumeric value set.

Range: 0, 1, UNAVAILABLE.

Default: 0.

25. *wapssnid* – Incoming West APS Source Node Id

This parameter is derived from the incoming K2 [1..4] overhead byte of the west port. It specifies the node ID which sourced the K1 byte. The value UNAVAILABLE is used in case of an pending SF condition.

Type: alphanumeric string.

Range: 0-15 or UNAVAILABLE.

Default: 0.

26. *wapssw* – Incoming West APS Switch Priority

This parameter is derived from the incoming K1 [1..4] overhead byte of the west port.

It indicates the switch priority/bridge request code as follows:

- LPS: Lockout of Protection Span
- FSS: Forced Switch Span
- FSR: Forced Switch Ring
- SFS: Signal Fail Span
- SFR: Signal Fail Ring
- SDP: Signal Degrade Protection
- SDS: Signal Degrade Span
- SDR: Signal Degrade Ring
- MSS: Manual Switch Span

- MSR: Manual Switch Ring
- WTR: Wait to Restore
- EXERS: Exerciser Span
- EXERR: Exerciser Ring
- RRS: Reverse Request Span
- RRR: Reverse Request Ring
- NR: No Request

The value UNAVAILABLE is used in case of an pending SF condition.

The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.

Type: alphanumeric value set.

Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.

Default: NR.

27. westprotn - West Protection Port

This parameter specifies the port being a member in the role of the west protection port for a 4-fibre MS-SPRing/BLSR protection group.

Type: AID

Range: SPortAID

28. westwkg - West Worker Port

This parameter specifies the port being a member in the role of the west worker port for a 4-fibre MS-SPRing/BLSR protection group

Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID

Range: In case of an asymmetric ring: NOTUSED; in all other cases: SPortAID.

29. wlpnsw - West Last protection switch Attempt

This parameter specifies, whether the last switch request for the west side succeeded or not.

The values have the following semantics:

- SUCCESS: last request did succeed
- DENY: last request was denied due a validation rule
- FAILURE: last request could not be completed because far end node did not response with proper K-byte

Type: alphanumeric value set.

Range: SUCCESS, DENY, FAILURE.

Default: SUCCESS.

30. wswreq - West Switch Request State

This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value is derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value shall be 'NR'.

It have the following values:

- LPS: Lockout of Protection Span
- FSS: Forced Switch of Service to Protection - Span
- FSR: Forced Switch of Service to Protection – Ring
- SFS: Signal Fail – Span
- SFR: Signal Fail – Ring
- SDS: Signal Degrade – Span
- SDR: Signal Degrade – Ring
- SDP: Signal Degrade - Protection
- MSS: Manual Switch of Service to Protection - Span
- MSR: Manual Switch of Service to Protection – Ring
- WTR: Wait to Restore
- NR: No Request.

Type: alphanumeric value set.

Range LPS, FSS, FSR, SFS, SFR, SDS, SDR, SDP, MSS, MSR, WTR, NR The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.

Default: NR.

31. wtr – Wait To Restore Time

This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.

Note: If wtr time is set to infinite, the switch request state shall be WTR until a higher request occurs.

Type: numeric string [minute].

Range: 0 – 12 in 1 minute increments and 99.

Default: 5.

Spec block parameters (path protection group)

1. **cst** – Constituent Signal Type
This parameter specifies the rate of the path protection group.
Type: alphanumeric value set
Range: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C
2. **dripathpn** – SNCP-UPSR ASAP Pointer
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type SNCP-UPSR.
Type: alphanumeric string.
Range: 1-24 characters including character '-'.
Default: DEFAULT.
3. **htmr** – Hold-Off Time
This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.
Type: numeric string [ms].
Range for high order path protection groups: 0 .. 99 msec in 1 msec steps and 100 .. 10000 msec in 100 msec steps.
Range for low order path protection groups: 0, 25, 50, 75 msec (in steps of 25 msec) and 100 .. 10000 msec in 100 msec steps.
4. **ppgname** – Path protection group Name
This parameter specifies the path protection group name. Storage and retrieval of the *ppgname* is case sensitive, but actual use of the *ppgname* to determine the corresponding protection group is case insensitive.
This parameter is omitted for low order path protection groups.
Type: text string.
Range: 0 to 24 characters.
Default: empty string
5. **protn** – Protection Tributary
This parameter specifies the protection input tributary AID being a member of the path protection group.
Type: AID.
Range: STS1NumAID or VCGNumAID or GenLOTribAID.
The usage of wild cards shall not be allowed for any part of the AID.
6. **protype** – Protection Type
This parameter specifies the type of the protection group. The value for the path protection group is PATHDRI.
Type: alphanumeric value set.
Range: PATHDRI.
Default: PATHDRI.

7. rme – Protection Reversion

This parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection group.

The value ENABLE is used if the protection operates in revertive mode.

The value DISABLE is used if the protection operates in non-revertive mode.

Type: alphanumeric value set.

Range: ENABLE, DISABLE.

8. snctype – SNC Protection Type

This parameter specifies the type of the path protection w.r.t. switch criteria used by the protection state machine.

The value SNCI (Inherent) is used if server signal fail is used as switch criteria.

The value SNCN (Non-Intrusive) is used if server signal fail and defects supervised by a non-intrusive path monitor are used as switch criteria

The value NA is used if one of the tributary inputs is related to a port operating in SONET mode.

Type: alphanumeric value set.

Range: SNCI, SNCN, NA.

9. wkg – Worker Tributary

This parameter specifies the worker input tributary AID being a member of the path protection group.

Type: AID.

Range: STS1NumAID or VCGNumAID or GenLOTribAID.

The usage of wild cards is not allowed for any part of the AID.

10. wtr – Wait To Restore Time

This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.

Type: numeric string [minute].

Range: 0 – 60.

CML Block parameters (path protection group)

The CML (Constituent Member List) block is only used in the context of the path protection group. One block will be returned for each constituent signal within the protection group.

1. **actunit** – Active Unit State

This parameter specifies which input tributary is currently selected within the protection group as active input.

The value WKG specifies that the worker tributary is active.

The value PROTN specifies that the protection tributary is active.

Type: alphanumeric value set.

Range: WKG, PROTN.

Default: WKG.

2. **actunitaid** – Active Unit State AID

This parameter specifies the input tributary AID of the constituent signal which is currently selected within the protection group as active input for the dedicated constituent tributary output (see parameter outtribaid).

Type: AID.

Range: STS1NumAID or VCGNumAID or GenLOTribAID.

The usage of wild cards is not allowed for any part of the AID.

Default: AID of the worker tributary.

3. **cst** – Constituent Signal Type

This parameter specifies the rate of the constituent signal within the path protection group.

Type: alphanumeric value set.

Range: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C.

Default: The default value is derived from the tributary input signal rate list in case of fixed mode.

4. **protnsiglvl** – Protection Fault Status

This parameter specifies the current fault status w.r.t. tributary as used by the protection state machine.

The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the protection tributary.

The value SD (Signal Degrade) is used if a defect defined as signal degrade condition is currently present for the protection tributary.

The value NONE is used if no such defect is currently present.

Type: alphanumeric value set.

Range: SF, SD, NONE.

Default: NONE.

5. **swreq** – Switch Request State

This parameter specifies the current switch request state of the protection state machines.

It have the following values:

- LO: Lockout of Protection
- FS: Forced Switch
- MS: Manual Switch
- SF: Signal Fail
- SD: Signal Degrade
- WTR: Wait to restore (only used if protection group is revertive)
- NR: No Request.

Type: alphanumeric value set.

Range: LO ,FS, MS, SF, SD , WTR, NR.

Default: NR.

6. wkgsiglvl – Worker Fault Status

This parameter specifies the current fault status w.r.t. tributary as used by the protection state machine.

The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the worker tributary.

The value SD (Signal Degrade) is used if a defect defined as signal degrade condition is currently present for the worker tributary.

The value NONE is used if no such defect is currently present.

Type: alphanumeric value set.

Range: SF, SD, NONE.

Default: NONE.

Detailed behavior description

The system shall allow to retrieve path protection groups at VCG tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID shall be allowed with or without the leading "v".

Example input/output

1+1 Equipment Protection Group

The following example retrieves 1+1 equipment protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-estgrp:123456::EQPTSWFBR;
```

```
LT-UNITE 98-01-01 08:00:00
```

```
M 123456 COMPLD
```

```
"1-1-estgrp:protn=EQPTSWFBR,wkg=1-1-#-#-xcw-cp,protn=1-1-#-#-xcp-  
cp,actunit=
```

```
WKG,protnsiglvl=NONE,wkgsiglvl=NONE,swreq=NR"
```

```
;
```

The following example retrieves 1+1 equipment protection group information for the Duplex Control Protection Group while both NVMs are fully synchronized:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-ectlgrp:123456::EQPTCTL;
  LT-UNITE 06-10-11 11:15:00
M 123456 COMPLD
  "1-1-ectlgrp:prototype=EQPTCTL,actunit=WKG,nvmadate=2006-10-
    11,nvmatime=09-17-43,nvmsdate=2006-10-11,nvmstime=09-17-
    43,nvmstat=INSYNC,protn=1-1-#-#-ctlp-
    cp,protnsiglvl=NONE,swreq=NR,wkg=1-1-#-#-ctlw-cp,wkgsiglvl=NONE"
;
```

Multiplex section/line protection group (1+1)

The following example retrieves 1+1 multiplex section/line protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-o001:123456::1+1;
  LT-UNITE 98-01-01 08:00:00
M 123456 COMPLD
  "1-1-o01:prototype=1+1,wkg=1-1-#-#-13-1,
    protn=1-1-#-#-14-1,wtr=5,apspn=DEFAULT,
    dcclmsprotmd=DISABLE,dccsrsprotmd=DISABLE,
    protocol=1+1_UNI,rme= DISABLE,swreq=NR,
    actunit=WKG,actunitfe=WKG,actunitne=WKG,aps=NR,
    apsout=NR,pgrate=OC192,wkgsiglvl=NONE,protnsiglvl=NONE"
;
```

The following example retrieves 1+1 optimized multiplex section/line protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-o001:123456::1+1;
  LT-UNITE 98-01-01 08:00:00
M 123456 COMPLD
  "1-1-o001:prototype=1+1,wkg=1-1-#-#-13-1,protn=
    1-1-#-#-14-1,wtr=5,apspn=DEFAULT,
    dcclmsprotmd=DISABLE,dccsrsprotmd=DISABLE,
    protocol=OPTM,rme=DISABLE,swreq=NR,ssi=WKG,
    actunit=WKG,actunitfe=NONE, actunitne=WKG,aps=NR,
    apsout=NR,pgrate=STM64,wkgsiglvl=NONE,
    protnsiglvl=NONE"
;
```

Multiplex Section/Line protection group (1:1)

The following example retrieves 1:1 multiplex section/line protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-n001:123456::1x1;
  LT-UNITE 98-01-01 08:00:00
M 123456 COMPLD
  "1-1-n001:prototype=1xNOPT,wkg=1-1-#-#-13-1,
  protn=1-1-#-#-14-1,wtr=5,apspn=DEFAULT,
  dclmsprotmd=DISABLE,dccsrprotmd=DISABLE,
  protocol=BIDIR,rme= ENABLE,swreq=NR,actunit=WKG,
  actunitfe=WKG,actunitne=WKG,aps=NR,apsout=NR,
  pgrate=STM64,wkgsiglvl=NONE,protnsiglvl=NONE"
;
```

2 fibre MS-SPRing/BLSR protection group

The following example retrieves 2F MS-SPRing/BLSR protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-t001:123456::2F;
  LT-UNITE 98-01-01 08:00:00
M 123456 COMPLD
  "1-1-t001:prototype=2F,east=1-1-#-#-13-1,
  west=1-1-#-#-14-1,rid=\"denver\",wtr=5,
  blsrpn=DEFAULT,eswreq=NR,wsreq=NR,pgrate=OC192,
  eapschst=IDLE,eapsdnid=0, eapsprotn=0,eapssnid=0,
  eapssw=NR,elprotnsw=SUCCESS,ringndst=IDLE,
  wapschst=IDLE, wapsdnid=0,wapsprotn=0,wapssnid=0,
  wapssw=NR,wlprotnsw=SUCCESS"
;
```

4 fibre MS-SPRing/BLSR protection group

The following example retrieves 4F MS-SPRing/BLSR protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-f001:123456::4F;
  LT-UNITE 98-01-01 08:00:00
M 123456 COMPLD
  "1-1-f001:prototype=4F,eastwkg=1-1-#-#-13-1,
  eastprotn=1-1-#-#-15-1,westwkg=1-1-#-#-14-1,
  westwkg=1-1-#-#-16-1,rid=\"denver\",
  protnmode=LOOPBACK,swtr=5,wtr=5, blsrpn=DEFAULT,
  eswreq=NR,eactunit=WKG,wsreq=NR,wactunit=WKG,

  eapssnid=0,eapssw=NR,elprotnsw=SUCCESS,
  ringndst=IDLE,wapschst=IDLE, wapsdnid=0,wapsprotn=0,
  wapssnid=0,wapssw=NR,wlprotnsw=SUCCESS"
;
```

Path protection group

Constituent Member List – Path protection group Examples: To help understand a PATHDRI examples that will be given below, it will be helpful to summarize some facts pertaining to DRIs. The first output line for a PATHDRI gives information about the DRI as a entity.

The following output line gives information about the constituent members. Even for a fixed rate path DRI, there will be two output lines. The constituent member that is described by the second line will have a rate equal to the DRIs rate.

A path DRI has two input legs, one referred to as the working leg and the other as the protection leg. It is possible for RTRV-PROTN-GRP to indicate some constituent members have been selected from the working leg while others have been selected from the protection leg. To determine whether or not all constituent members have been selected from the same leg, it is necessary to look at the *actunitaid* for each constituent member and determine if they are from the same leg.

Constituent Member List – Path protection group example for fixed mode :

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-10-1-25:123456::PATHDRI;
```

```
LT-UNITE 98-01-01 08:00:00
M 123456 COMPLD
"1-1-#-#-10-1-25:prototype=PATHDRI,cst=STS12C,
wkg=1-1-#-#-08-1-25,protn=1-1-#-#-06-1-1,
ppgname="\group018\",htmr=100,wtr=5,dripathp=path2,
rme=DISABLE,snctype=NA""1-1-#-#-10-1-25,
CML:cst=STS12C,swreq=NR,actunit=WKG,
actunitaid=1-1-#-#-08-1-25,wkgsiglvl=NONE,
protnsiglvl=NONE"
;
```

Constituent Member List – Path protection group example for pipe mode: The examples shows an STS12 pipe with 10 constituent members.

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-10-1-25:123456::PATHDRI;
```

```
LT-UNITE 98-01-01 08:00:00
M 123456 COMPLD
"1-1-#-#-10-1-25: prototype=PATHDRI,htmr=100,rme=ENABLE,

protnsiglvl=NONE"
"1-1-#-#-10-1-35,CML:cst=STS1,swreq=NR,actunit=PROTN,
actunitaid=1-1-#-#-06-1-11,wkgsiglvl=NONE,
protnsiglvl=NONE"
"1-1-#-#-10-1-36,CML:cst=STS1,swreq=NR,actunit=WKG,
actunitaid=1-1-#-#-08-1-36,wkgsiglvl=NONE,
protnsiglvl=NONE"
;

```

Low Order Path Protection Group Example:

```

RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-39-16-3-28:123456::PATHDRI;
LT-UNITE 98-01-01 08:00:00

M 123456 COMPLD
"1-1-#-#-39-16-3-28:protn=PATHDRI,cst=LOVT1,
wkg=1-1-#-#-39-14-3-28,\protn=1-1-#-#-39-15-3-28,
htmr=75,wtr=5,dripathpn=path2,\rme=DISABLE,snctype=NA"
"1-1-#-#-39-16-3-28,CML:cst=LOVT1,swreq=NR,actunit=WKG,\
actunitaid=1-1-#-#-39-14-3-28,wkgsiglvl=NONE,
protnsiglvl=NONE"
;

```

Example for Path Protection Group Retrieval using *aid* and *aid1* for addressing via input tributaries:

In this example there exist two path protection groups on the same pair of input tributaries 1-1-#-#-8-1-25 and 1-1-#-#-6-1-25 forming an emulated selector bridge. The output tributary for one of these groups is 1-1-#-#-10-1-25 and for the other one it is 1-1-#-#-4-1-25.

Both groups will be reported after this request. Note, that the parameter values for both groups are identical.

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-8-1-25:123456::PATHDRI,,
1-1-#-#-6-1-25;
```

```
LT-UNITE 98-01-01 08:00:00
M 123456 COMPLD
"1-1-#-#-10-1-25:protype=PATHDRI,cst=STS12C,wkg=1-1-#-#-08-1-25,
protn=1-1-#-#-06-1-25,ppgname=\"group018\",htmr=100,wtr=5,
dripathpn=path2,rme=DISABLE,snctype=NA"
"1-1-#-#-10-1-25,CML:cst=STS12C,swreq=NR,actunit=WKG,
actunitaid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE"
"1-1-#-#-4-1-25:protype=PATHDRI,cst=STS12C,wkg=1-1-#-#-08-1-25,
protn=1-1-#-#-06-1-25,ppgname=\"group018\",htmr=100,wtr=5,
dripathpn=path2,rme=DISABLE,snctype=NA"
"1-1-#-#-4-1-25,CML:cst=STS12C,swreq=NR,actunit=WKG,
actunitaid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE"
;
```

Error responses (general)

Validation rule: consistent *aid* and *protype*

If a range is specified for *aid* and *protype* is not consistent with that AID (for example, an AID of 1-1-fall and a protype value of 2F), then the following error response is returned.

Error code: IDNV - Input, Data Not Valid, inconsistent aid and protype

Error responses (2-/4-fibre MS-SPRing/BLSR protection group)

Validation rule: consistent *aid* and *rid*

If both an *aid* and an *rid* are specified as input parameters and they are inconsistent, then the following error response is returned

Error code: IDNV - Input, Data Not Valid, inconsistent aid and rid

Validation rule: *aid* range and *rid*

Validation rule: If a range is specified for *aid* and an *rid* is also specified as input parameters, then the following error response is returned:

Error code:

IDNV - Input, Data Not Valid, no aid range in combination with rid

Error responses (path protection group)

Validation rule: *ppgname* and low order path protections

If a *ppgname* is given as input parameter while the *aid* references a low order tributary, then the following error response is returned:

Error code:

IDNV - Input, Data Not Valid, ppgname not supported for this transmission rate

Validation rule: *ppgname* and *aid1*

If a *aid1* is given as input parameter and additionally a value is given for parameter *ppgname*, then the following error response is returned:

Error code:

IDNV - Input, Data Not Valid, ppgname not allowed if aid1 is given

Validation rule: No wilddarding on access via *aid* and *aid1*

If *aid* and *aid1* is given as input parameters for accessing via input tributaries and wilddarding is used for any of both, then the following error response is returned:

Error code:

IDNV - Input, Data Not Valid, No wilddarding for access via input tribs

Wrong system behavior

If 4F is used in the RTRV-PROTN-GRP command line although the used port AID belongs to a 2F protection group, or if 2F is used in the RTRV-PROTN-GRP command line although the used port AID belongs to a 4F protection group, the system shows a wrong behavior. Expected is an empty COMPLD report, however the command COMPLDs *and* the 2F/4F group is displayed.

RTRV-PTF: Retrieve tributary with Path Termination Function (PTF)

The RTRV-PTF command retrieves the attributes of a tributary with path termination function.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: RTRV-PTF-*modifier:tid:aid:ctag[:::spec_block]*;

Input parameters

Command parameters

1. *modifier*
The modifier specifies the type of the tributary. The purpose is to distinguish the standard and type of the PTF.
Type: alphanumeric value set.
Range: ALL, STS, HOSTS1, HOVC4
2. *tid* - Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
3. *aid* - Access Identifier
AID of a PTF tributary. The keyword “all” shall be allowed on slot, port and tributary level.
The so called “dynamic parameters” shall not be reported, if a “all” is used at the tributary level. The “dynamic parameters” are:
 - *ptrc*, *ptrcst*, *rsiglb*, *trailstate*Type: AID
Range: PTNumAID
4. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Spec block parameters1. *dyn* - Retrieve Dynamic Parameters

This parameter controls whether dynamic parameters shall be reported with the command reply or not. It shall be given only when using any of the wildcard values *all*, *usall* or *vall* at the appropriate positions of the input AID. For input AIDs not using *all*, *usall* or *vall* this parameter shall not be allowed.

The following output parameters of a PTF tributary are affected:

- *ptrc*, *ptrcst*, *rsiglb*, *trailstate*

Type: alphanumeric value set.

Range:

- YES: Report dynamic parameters in the reply as well
- NO (default): Do not report dynamic parameters in the reply.

Output format

If the NE fully complies with the RTRV-PTF request, the following normal completion response shall be returned:

```
sid date time
M ctag COMPLD
  "aid,aidtype::spec_block"
  ...
  ...
  "aid,aidtype::spec_block"
;
```

Output parameters**Command parameters**1. *aid* - Access Identifier

The access identifier shall specify the PTF tributary whose attributes are reported.

Type: AID

Range: PTNumAID as defined in AID structure with exception of value *all*.

2. *aidtype* - Access Identifier Type

The aidtype shall specify the type of the tributary.

Type: alphanumeric value set

Range: STS, HOSTS1, HOVC4.

Spec block parameters1. *brstintvl* - Bursty Interval

The parameter *brstintvl* shall specify the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstintvl* has no affect to NE behaviour.

The parameter *brstintvl* is not supported for modifiers HOVC4 and HOSTS1.

Limitation for PTF related to T3 ports: Path terminations related to T3 ports

provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

Option: If the parameter *brstintvl* is not supported, then the parameter shall be omitted.

Type: integer.

Range: 2, 3, ..., 10 [seconds]

Default: 7 [seconds].

2. *brstthr* – Bursty Error Threshold

The parameter *brstthr* shall specify the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behaviour.

The parameter *brstthr* is not supported for modifiers HOVC4 and HOSTS1.

Limitation for PTF related to T3 ports: Path terminations related to T3 ports provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

Option: If the parameter *brstthr* is not supported, then the parameter shall be omitted.

Type: integer.

Range: 5, 10, 15, ... 50 [%].

Default: 30.

3. *crslpbkstat* - Crossconnect Loopback Status

The parameter *crslpbkstat* reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to OPR-LPBK of section Transmission and Cross-Connection Handling, Tributary.

The parameter *crslpbkstat* is not supported for modifiers HOVC4 and HOSTS1.

Option: If the parameter *crslpbkstat* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set

Range: YES, for enabled loopback; NO, for disabled loopback

4. *degthr* – Signal Degrade Threshold

This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behaviour. For the definition of *sdsfmode* refer to RTRV-PTF Output parameters.

The parameter *degthr* is not supported for modifiers HOVC4 and HOSTS1.

Limitation for PTF related to T3 ports: Path terminations related to T3 ports provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

Type: integer.

Range (as exponents of 10): -5; -6; -7; -8; -9.

Default: -6.

5. *dexcthr* – Excessive Degrade Threshold

This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behaviour. For the definition of *sdsfmode* refer to RTRV-PTF Output parameters.

The parameter *dexcthr* is not supported for modifiers HOVC4 and HOSTS1.

Limitation for PTF related to T3 ports: Path terminations related to T3 ports provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

Type: integer

Range (as exponents of 10): -3; -4; -5.

Default: -3.

6. *exphptrc* - Expected HP trace identifier

This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value shall be in the range from 80 to FF (MSB always set to 1). The other byte values shall be in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.

Type: hexadecimal number without a preceeding 'H'.

Range: length: 32 hexadecimal digits; value:specific string acc. ITU/ETSI mode 1.

Default: 89000000000000000000000000000000

7. *feppm* - Far End Path PM Enable

The parameter *feppm* specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.

This parameter shall be omitted for PTF entities which have been created due to a substructured SONET/SDH signal.

Limitation for PTF related to T3 ports: Path terminations related to T3 ports provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

8. *hptimais* - HP Trace Identifier Mismatch AIS Insertion

The parameter *hptimais* shall specifies if a detected TIM will cause AIS insertion.

This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE.

Default: The default value depends on interface standard specified by *ptfstd* for the PTF tributary. DISABLE, if *ptfstd*=SONET

9. *hptimmon* - HP Trace Identifier Mismatch Monitor

This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. *inputsig* - Tributary Input Signal Rate List

This parameter specifies the input LO signal structure. The parameter *inputsig* is only supported for modifiers HOVC4 and HOSTS1.

Option: If the parameter *inputsig* is not supported, then the parameter shall be omitted.

Type: numeric value set

Range: NX-NX-... (N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).

The possible values (SDH) are: 6312 (default), 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33

The possible values (SONET) are: 2811 (default)

Restricted Range with AU3/AU4 Conversion Cross Connections:

If *modifier* = HOVC4 and the HO PTF is used for conversion cross connections, then the range of *inputsig* shall be restricted to: 33.

11. *neppm* - Near End Path PM Enable

This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.

This parameter shall be omitted for PTF entities which have been created due to a substructured SONET/SDH signal.

Limitation for PTF related to T3 ports: Path terminations related to T3 ports provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

12. *pmhpfeses* - PM HP Far End SES Threshold

This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behaviour depends on interface standard specified by *ptfstd* for the PTF tributary. If *ptfstd* is not set to SDH then *pmhpfeses* has no affect to NE behaviour.

This parameter shall be omitted for PTF entities which have been created due to a substructured SONET/SDH signal.

Limitation for PTF related to T3 ports: Path terminations related to T3 ports provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

Type: integer.

Range: 1, 2, 3, ..., 63998, 63999, 64000. Includes SDH/SONET range.

Default: 2400

13. *pmhpnese*s - PM HP Near End SES Threshold

This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behaviour depends on interface standard specified by *ptfstd* for the tributary. If *ptfstd* is not set to SDH then *pmhpnese*s has no affect to NE behaviour.

This parameter shall be omitted for PTF entities which have been created due to a substructured SONET/SDH signal.

Limitation for PTF related to T3 ports: Path terminations related to T3 ports provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

Type: integer.

Range: 1, 2, 3, ..., 63998, 63999, 64000. Includes SDH/SONET range.

Default: 2400

14. *ptca* - Path TCA Profile Pointer

This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

This parameter shall be omitted for PTF entities which have been created due to a substructured SONET/SDH signal.

Type: alphanumeric value set.

Range: 1 ... 24 characters.

Default: DEFAULT0

15. *ptfstd* - Path Termination Standard

Standard of the tributary with Path Termination Function.

This is currently a read-only parameter.

Type: alphanumeric value set.

Range:

- SDH (only if modifier=HOVC4)
- SONET (only if modifier= STS or HOSTS1)

Default:

- SDH (if modifier=HOVC4)
- SONET (if modifier= STS or HOSTS1).

16. *ptpn* - Path Terminating ASA Profile Name

This parameter points to a tributary ASAP profile name *pfname* for the designated AID.

Type: alphanumeric value set. A hyphen (-) is additionally allowed in the name.

Range: 1 ... 24 characters

Default: DEFAULT

17. *ptrc* - Incoming Path Trace

This parameter reports the accepted higher order path trace identifier (J1). The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter *ptrc* is omitted from the response.

Type: hexadecimal

Range: the range depends on the parameter *ptrcrfmt* specified in RTRV-PTF Output parameters

- 2: hexadecimal digits if *ptrcrfmt*=2
- 32: hexadecimal digits if *ptrcrfmt*=16
- 128: hexadecimal digits if *ptrcrfmt*=64.

18. *ptrcrfmt* - Path Trace Read Format

The parameter *ptrcrfmt* shall specify the format of the path trace (J1 byte) to be received (sink).

Type: numeric string

Range:

- 2: for non-specific repeating byte
- 16: for 16 byte specific string
- 64: for 64 byte string.

19. *ptrcst* - Status of Incoming Path Trace

This parameter shows the status of the value of the incoming Path Trace Identifier (J1) which is available with parameter *ptrc*.

Type: alphanumeric value set

Range:

- NORMAL: ptrc contains a valid value
- UNAVAILABLE: no valid value for *ptrc* could be obtained by the system
- AIS: no valid value for *ptrc* could be obtained due to SF condition.

20. *ptrcwfmt* - Path Trace Write Format

The parameter *ptrcwfmt* shall specify the format of the path trace (J1 byte) to be sent (source).

Type: numeric string

Range:

- 2: for non-specific repeating byte
- 16: for 16 byte specific string
- 64: for 64 byte string.

Default: 2.

21. *rsiglb* - Received Signal Label

This parameter reports the accepted trail signal label (C2). The parameter shall not be reported if the *trailst* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE.

Type: alphanumeric value set.

Range: 00, 01, ..., FE, FF i.e. two hexadecimal digits.

22. *sdsfmode* - Signal Degrade/Signal Fail Mode

This parameter specifies the determination mode of degraded defect for transmission. The parameter *sdsfmode* is not supported for modifiers HOVC4 and HOSTS1.

Limitation for PTF related to T3 ports: Path terminations related to T3 ports provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

Option: If the parameter *sdsfmode* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range: BURST, POISSON

Default: The default value depends on interface standard specified by *ptfstd* for the tributary. POISSON, if *ptfstd*=SONET.

23. *substr* - Substructured

The parameter *substr* indicates if the PTF is substructured.

Additional Description for LOXC

This parameter indicates if the PTF is configured for AU3/AU4 conversion cross connections.

The parameter *substr* shall be set autonomously when an AU3/AU4 conversion

cross connection is created. A PTF, which is configured for AU3/AU4 conversion cannot be used to set up HO cross connections.

The parameter *substr* shall only be supported, if *modifier* = STS.

If the parameter *substr* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range:

- CNV: In use for HO side of a conversion cross connection
- NO (default): Not used for conversion cross connections

24. *tcamd* - TCA mode

Limitation for PTF related to T3 ports: Path terminations related to T3 ports provide no near end performance monitoring. The parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

25. *tmonmd* - Tributary Monitoring Mode

This parameter specifies the monitoring mode for the tributary.

Type: alphanumeric value set.

Range: MON, NMON (default).

26. *trailst* - Trail Status

This parameter reports the accepted trail status value.

Type: alphanumeric value set.

Range:

- AIS for Alarm Indication Signal in case of Trail Signal Fail Condition
- UNAVAILABLE for unavailable
- NORMAL

27. *trc* - Outgoing Path Trace

This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule shall be applied: The first byte value shall be in the range from 80 to FF (MSB always set to 1). The other byte values shall be in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt*=2).

Type: hexadecimal number without a preceeding.

Range: the range depends on the parameter *ptrcwfmt* specified in RTRV-PTF Output parameters

- length: 32 hexadecimal digits, if *ptrcwfmt*=16; 128 hexadecimal digits, if *ptrcwfmt*=64
- value: specific string string acc. ITU/ETSI mode 1, if *ptrcwfmt*=16; 64 byte string if *ptrcwfmt*=64

Default: 00. This implies also that *ptrcwfmt* is set to 2.

28. *tslmmmon* - Trail Signal Label Mismatch Monitor

The parameter *tslmmmon* shall specify the mode of the TSL mismatch detection.

Type: alphanumeric value set.

Range: DISABLE, ENABLE (default).

29. *unequiposig* - Unequipped Output Signal List

The parameter *unequiposig* shall specify the output LO signal structure, independent whether the signal is connected or not. The parameter *unequiposig* is only supported for modifiers HOVC4 and HOSTS1.

Option: If the parameter *unequiposig* is not supported, then the parameter shall be omitted.

Type: numeric value set

Range: NX-NX-...(N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).

The possible values (SDH) are: 6312 (default), 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33

The possible values (SONET) are: 2811 (default)

Restricted Range with AU3/AU4 Conversion Cross Connections:

If *modifier* = HOVC4 and the HO PTF is used for conversion cross connections, then the range of *unequiposig* shall be restricted to: 33.

Detailed behavior description

The RTRV-PTF does not generate a REPT DBCHG message. The command retrieves all port parameter as described in section Output parameters.

Dependencies

brstintvl, *brstthr* and *sdsfmode* are not supported for modifiers HOVC4 and HOSTS1, and will therefore not be reported in this case.

For all other PTFs:

- *brstintvl* and *brstthr* are only meaningful if *sdsfmode* is set to BURST.
- *degthr* and *dexcthr* are only meaningful if *sdsfmode* is set to POISSON.

Parameters which are not meaningful in the current provisioning status shall be reported with their default values, nevertheless.

Behaviour in the case of Conversion Cross-Connections

The RTRV-PTF command does not return data for the HO sides of conversion cross-connections at synchronous optical and electrical ports.

PTFs exist at the LO side of conversion cross-connections, and if the HO side is at DS3 ports, also at the HO side of conversion cross-connections.

No PTFs exist at the HO side of conversion cross connections, when the HO side is at a synchronous optical or electrical port.

Example input/output

```
RTRV-PTF-ST5:LT-UNITE:1-1-#-#-21-4-1:123456;

```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there apply to the RTRV-PTF command, too.

Validation rule: Check CCB against *ptfstd*

Check whether the CCB fits to *ptfstd* of the tributary.

Error Code:

ICNV - Input, Command Not Valid, Interface Standard does not match

E.g. DENY, if a command with modifier=VC is made on a port which is provisioned as *ptfstd*=SONET.

Related TL1 messages

RTRV-RC-NEIGHBOR: Retrieve all neighboring routing controllers

The RTRV-RC-NEIGHBOR command is used to retrieve all neighboring routing controllers that have been provisioned using the ENT-RC-NEIGHBOR command.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: RTRV-RC-NEIGHBOR:*tid*::*ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.
Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.
Range: 1 to 20 characters
2. *ctag* – Correlation Tag
This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
Type: alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters.
Note: Current implementation also allows '0' as valid *ctag*, which is an extension to GR-831.

Output format

If the RTRV-RC-NEIGHBOR command is successful, the following normal completion response shall be returned:

```
sid date time
M ctag COMPLD
  "[rate]:thru[,lpaid]:spec_block"
  ...
  "[rate]:thru[,lpaid]:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command.

Output parameters

Spec block parameters

1. **remrcid** – Remote Routing Controller Identifier
This parameter shall be used to indicate the Id of the remote routing controller.
Type: Four dot separated numeric strings.
Range: Each numeric string: 0 .. 255.
2. **remrcscn** – Remote Routing Controller SCN IP Address
This parameter shall be used to indicate the IP address of the remote routing controller.
Type: Four dot separated numeric strings.
Range: Each numeric string: 0 .. 255.
3. **remrcraid** – Remote Routing Controller Routing Area ID
This parameter shall be used to indicate the routing area ID of the level 0 area of a neighboring route controller.
Type: Four dot separated numeric strings.
Range: Each numeric string: 0 .. 255.
0.0.0.0 is not allowed.
4. **remrcospfFlooding** – Remote Routing Controller OSPF Flooding
This parameter indicates whether OSPF flooding is enabled to the remote RC or not.
Type: Alphanumeric value set.
Range: DISABLE or ENABLE.

Detailed behavior description

The command shall retrieve all routing controller neighbors.

Example input/output

The following example shows the result of a RTRV-RC-NEIGHBOR command:

```
RTRV-MAP-NEIGHBOR:LT-UNITE::123456;
  LT-UNITE 00-11-01 15:00:00
M 123456 COMPLD
  "STM256:DCC,1-1-#-#-1-1:
  nsap=39840F80000000000000000000000000a400,
  npaid=1-1-#-#-1-1,tid=LT-UNITE2,dcctype=SECTION"
  "STM256:DCC,1-1-#-#-1-1:
  nsap=39840F80000000000000000000000000a400,
  npaid=1-1-#-#-1-1,tid=LT-UNITE2,dcctype=LINE"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command Error responses section. The error responses listed there apply to the RTRV-RC-NEIGHBOR command.

Validation Rule: RC must be created

If the RC is not created (via ACT-L1ROUTING), then the command shall be denied.

Error Code: IDNV - Input, Data Not Valid, RC not created

Related TL1 messages

- [“ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers” \(p. 4-1666\)](#)

RTRV-RSVP: Retrieve RSVP parameters

The RTRV-RSVP command retrieves RSVP related parameters applicable for UNI or ENNI signaling on system level.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: *RTRV-RSVP-modifier:tid::ctag;*

Input parameters

To retrieve RSVP parameters related to UNI signalling the TL1 command RTRV-RSVP is only valid with modifier UNI, i.e. RTRV-RSVP-UNI!

Command parameters

1. *modifier*

The parameter modifier indicates the communication function entity for which the RSVP parameters apply.

Type: Alphanumeric value set.

Range: UNI or ENNI.

2. *tid* – Target Identifier

This is the currently active name of the NE to which the command is addressed.

The tid is a case insensitive character string.

Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.

Range: 1 to 20 characters.

3. *ctag* – Correlation Tag

This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

Type: alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid *ctag*.

Output format

If the RTRV-RSVP request is successful, the following normal completion message shall be returned:

sid date time

```
M ctag COMPLD
  ":spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) .

Output parameters

Spec block parameters

1. *hellointerval* - Hello Interval
This parameter shall be used to indicate the time between two succeeding HELLO messages to be sent to any neighbor in hello interworkings.
Type: Numeric string
Range: 1 ... 60
2. *maxhelloretransmit* – Maximum Hello Retransmissions
This parameter shall be used to indicate the number of Hello Intervals without any HELLO_REQUEST or HELLO_ACK object received from a neighbor after which communication to this neighbor is considered as lost.
Type: Numeric string.
Range: 1 to 10.
Default: 3
3. *srefreshtimer* – Srefresh Timer
This parameter shall be used to indicate the time between two succeeding SREFRESH (Summary Refresh) messages to be sent to any neighbor in srefresh interworkings.
Type: Numeric string
Range: 1 ... 60 indicating the Srefresh Time in seconds.
Default: 15.

Detailed behavior description

The command shall retrieve the RSVP related parameters from the system for the node specified by the command modifier.

Example input/output

The following example shows the result of RTRV-RSVP for UNI:

```
RTRV-RSVP-UNI:NE-UNITE::123456;
  NE-UNITE 06-06-30 11:01:00
M 123456 COMPLD
  ":hellointerval=5000,maxhelloretransmit=3,
  srefreshtimer=15"
```

;

Error responses

Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command Error responses section. The error responses listed there apply to the RTRV-RSVP command.

Validation rule: ENNI node must be created

If the command is executed with *modifier*=ENNI while the ENNI Node is not created (by provisioning of the sigPCIP_Address in ENT-ULS), then the command shall be denied.

Error code:

SNVS - Status, Not in Valid State, ENNI Node IP Address not provisioned

Validation rule: UNI node must be created

If the command is executed with *modifier*=UNI while the UNI Node is not created, then the command shall be denied.

Error code:

SNVS - Status, Not in Valid State, UNI Node IP Address not provisioned

RTRV-SCN-NEIGHBOR: Retrieve SCN neighbor

The RTRV-SCN-NEIGHBOR command retrieves entries from the routing table of the SCN stack.

Note that the information on neighbors given in the RTRV-SCN-NEIGHBOR command is related to the SCN, i.e. to the control plane of ONNS, whereas the neighbor information given in the RTRV-rr commands relates to the transmission plane of ONNS. In general the information given in RTRV-SCN-NEIGHBOR includes DCC and (ISIS) LAN neighbors which are assigned to the SCN.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: RTRV-SCN-NEIGHBOR:*tid::ctag::;*

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command for the input parameter syntax and description of this parameter.
Type: TID.
2. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command for the input parameter syntax and description of this parameter.
Type: CTAG.

Output format

If the RTRV-SCN-NEIGHBOR request is successful, the following normal completion message shall be returned:

```
sid date time
M ctag COMPLD
  "[rate]:thru[,lpaid]:spec_block"
  ...
  "[rate]:thru[,lpaid]:spec_block"
;
```

Output parameters

Command parameters

1. rate – DCC Port Rate

This parameter is only available for an SCN neighbor on DCC and provides the port rate as used in RTRV-rr.

Type: value set.

Range:

- STM1
- STM1E
- STM4
- STM16
- STM64
- STM256
- OC3
- OC12
- OC48
- OC192
- OC768

Default: n/a – as determined by the port type.

2. thru – Connected Through

The type of connectivity between the NE and its SCN neighbor.

Type: value set

Range: DCC, LAN.

Default: n/a – as determined by the type of connection.

3. lpaid – Local Port AID

This parameter provides the SPortAID of the optical port in case thru=DCC or the LanPortAID in case thru=LAN.

Type: AID

Range: SPortAID in case thru=DCC or LanPortAID in case thru=LAN as defined in section AID Structure.

Note: Since LAN1 can not be assigned to the SCN it will never appear in the output.

Spec block parameters

1. *dcctype*
This parameter specifies, whether MS(LINE)-DCC or RS(SECTION)-DCC is used for IP communication with the neighbor. This parameter is only available when *thru=DCC*.
Type: alphanumeric value set
Range: SECTION, LINE
2. *neighbor_ip* – Neighbor IP Address
This parameter shall be used to retrieve the IPv4 address of the LAN or DCC neighbor.
Type: Four dot separated numeric strings or empty string.
Range: Each numeric string: 0 .. 255 or empty string.
Note: The empty string is shown when the IP address can not be retrieved. In output direction the empty string is represented as `\"`.
Type: Four dot separated numeric strings or empty string.
Range: Each numeric string: 0 .. 255 or empty string.
Note: The empty string is shown when the IP address can not be retrieved. In output direction the empty string is represented as `\"`.
3. *neighbor_sid* – Neighbor SID
This parameter shall be used to display the SID of the neighbor.
Note: Since the SID (MAC address) is unique it might be used to detect misconfigurations of duplicate IP addresses.
Type: hexadecimal number.
Range: 000000000000 - FFFFFFFF.

Detailed behavior description

The command shall retrieve the *spec_block* parameters as described in the Output parameter section.

A neighbor entry shall not appear in the report for LANs and DCC channels allocated to an *OSI_node_AID* or the *UNI_node_AID* or the *ENNI_node_AID*.

Behaviour if no neighbors present

An empty spec block shall be returned, if no neighbors are present.

Example input/output

The following example shows the result of a RTRV-SCN-NEIGHBOR command:

```
RTRV-SCN-NEIGHBOR:LT-UNITE::123456::;
  LT-UNITE 00-11-01 08:00:00
M 123456 COMPLD
  "0C48:DCC,1-1-#-#-1-1:dcctype=LINE,neighbor_ip=192.168.200.1,neighbor
    _sid=123456789012"
  ...
  ":LAN,lan2: neighbor_ip=192.168.200.4,neighbor_sid=123456789024"

Error responses

Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command Error responses section. The error responses listed there apply to the RTRV-SCN-NEIGHBOR command.

RTRV-SPANSWS: Retrieve SPAN switch state

General

RTRV-SPANSWS requests the NE to report the current switch states of a MSSPRING TOP+EX ring protection group related to the cross-connections either being added or dropped, ingressing or egressing extra traffic cross connections and addressed to a specified side of the NE.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: RTRV-SPANSWS:*tid*:[*aid*]:*ctag*::*side*,*rcrole*,[*rid*];

Input parameters

Command parameters

1. *tid* – Target Identifier
This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.
identifier, in addition the special character underscore ("_") and the password characters (see [23] SRD_SecurityManagement ID95 and ID178) are allowed.
Range: 1 to 20 characters
2. *aid* – Access Identifier
This parameter specifies the aid of a MS-SPRing/BLSR protection group or an service port aid being a member of the group.
Option: If *rid* is specified, then *aid* can be omitted.
Type: AID.
Range: FourFibre_ProtGrpAID or SPortAID.
SPortAID identifies the protection group only, it will not be evaluated if it is located on east or west side. For this purpose specify the *side* parameter.
3. *ctag* – Correlation Tag
This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
Type: alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters
Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

4. *side* – side identifier of protection group
This parameter specifies the ring side of the ring protection group.
Type: alphanumeric value set
Range: EAST, WEST
5. *rcrole* – ring cross-connection role
This parameter specifies the cross-connection role of the ring node.
Type: alphanumeric value set.
Range:
 - ADD, service cross connections added to the ring
 - DROP, service cross connections dropped from the ring
 - INGRESSING, ingressing extra traffic cross connections
 - EGRESSING, egressing extra traffic cross connections
6. *rid* – Ring Identification
The parameter specifies the ring identification name. Storage and retrieval of the *rid* shall be case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value shall be unique for all protection groups of type 2F or 4F within the NE.
Type: Text string of chars allowed for TID strings
Range: 1 to 15 characters
Option: If *aid* is specified, then *rid* can be omitted.

Output format

The general format of a RTRV-SPANSWS message is as follows:

```
tid date time
M 123456 COMPLD
"aid:rid:side,rcrole"
"fstslpos:rate:protsiglvl"
"fstslpos:rate:protsiglvl"
...
...
"fstslpos:rate:protsiglvl"
;
```

Output parameters

Command parameters

1. **aid** – Access Identifier
This parameter titles the listing with the AID of the reported protection group.
Type: AID
Range: FourFibre_ProtGrpAID
2. **rid** – Ring Identification
This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value shall be unique for all protection groups of type 2F or 4F within the NE.
Type: Text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE.
3. **side** – side identifier of protection group
This parameter titles the listing with the reported ring side of the ring protection group.
Type: alphanumeric value set.
Range: EAST, WEST.
4. **rcrole** – ring cross-connection role
This parameter titles the listing with the reported cross-connection role of the ring node.
Type: alphanumeric value set.
Range:
 - ADD, service cross connections added to the ring
 - DROP, service cross connections dropped from the ring
 - INGRESSING, ingressing extra traffic cross connections
 - EGRESSING, egressing extra traffic cross connections
5. **fsts1pos** – first STS-1 tributary position
The parameter specifies the first 'STS1NumAID' of the listed constituent signal of the protection group, i.e. the first STS-1 position of the tributary. Each row of the list of reported constituent signals shall start with this parameter. The parameter *fsts1pos* is comparable to the parameters *in_aid* and *out_aid* of the RTRV-CRS output.
Type: AID
Range: STS1NumAID, the part Simple_STS1NumAID of this STS1NumAID is currently limited to 1 ... 192.

6. *rate* – cross-connection rate

The parameter specifies the cross-connection rate.

Type: alphanumeric value set.

Range: VC3, VC4, VC44C, VC416C, VC464C.

All rates shall be shown as SDH rates here. Internal conversion may be needed, see chapter 'Detailed behaviour'. Refer also to *rate* in output parameters section of “RTRV-PROTN-GRP: Retrieve protection group” (p. 4-2580).

7. *protsiglvl* – protection signal level

The parameter specifies the current protection state of locally added or dropped service cross-connection for the TOP+EX application. The information includes the current state of either the switches or the bridges of one side of a TOP+EX protection group. It does not represent the switch request state.

Type: alphanumeric value set

Range for cross-connections fulfilling the add role:

- AFFBR, affected and bridged
- AFFNOBR, affected but not bridged
- NOTAFF, not affected OR bridging not allowed in general
- UNKNOWN, unknown, ring communication in progress

Range for cross-connections fulfilling the drop role:

- AFFSW, affected and switched
- AFFNOSW, affected but not switched
- NOTAFF, not affected OR switching not allowed in general
- UNKNOWN, unknown, ring communication in progress.

Range for extra traffic cross connections (ingressing and egressing):

- AFFRSTBL, affected and reestablished
- AFFPREMT, affected and preempted
- AFFNORST, affected, but not reestablished
- NOTAFF, not affected.

Detailed behaviour description

Source and presentation of rate

The source of the parameter *rate* shall be the cross-connection rate, i.e. that value which had been provisioned before by means of the ENT-CRS-*modifier* command. The presentation of the parameter *rate* shall be always the SDH nomenclature. For the case that the cross-connection had been entered in the SONET nomenclature a conversion to SDH nomenclature shall be performed. Keep in mind that only service traffic cross-connections are presented.

Example input/output

The following example shows a RTRV-SPANSWS report:

```
M  LT-UNITE 99-01-10 08:12:00
    123456 COMPLD
    "1-1-f001:\ring01\":EAST,DROP"
    "1-1-#-#-1-1-6:VC3:AFFSW"
    "1-1-#-#-1-1-7:VC4:AFFSW"
    "1-1-#-#-1-1-10:VC44C:AFFSW"
    "1-1-#-#-1-1-22:VC416C:AFFNOSW"
    "1-1-#-#-1-1-103:VC464C:NOTAFF"
;
```

Error responses

Validation Rule: RTRV-SPANSWS only for TOPEX

The system shall reject all RTRV-SPANSWS commands if the addressed protection group is not provisioned for MSSPRING TOP+EX (*protnmode* != TOPEX)

Error code:

SNVS - Status, Not in Valid State, command supported for MSSPRING TOPEX only

Validation Rule: RTRV-SPANSW needs functioning XC pack

The command shall be denied if the XC pack is not present or in failed state.

Error code: SPFA - Status, Protection unit FAiled The RTRV-SPANSW command uses the protection state machine running on the XC pack.

RTRV-STATE-EQPT (CP): Retrieve equipment state (circuit pack)

The RTRV-STATE-EQPT command retrieves the state information for circuit packs in the NE.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-STATE-EQPT:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.
Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.
Range: 1 to 20 characters.
2. *aid* – Access Identifier
The AID of a circuit pack.
Type: AID
Range:
 - CpAID ::= SlotAID-cp for circuit pack in any slot
 - LoxcAID ::= UnivSlotAID-loxc for LOXC pack in universal slots.The keyword *xcall* is allowed for Simple_XCSlotAID
The keyword *ctla11* is allowed for Simple_CTLSlotAID
The keyword *a11* is allowed for Simple_SlotAID
Refer to the AID syntax description.
3. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

If the RTRV-STATE-EQPT command completes successfully, then the following normal completion response is returned:

sid date time

```

M  ctag COMPLD
   "aid:spec_block"
   ...
   ...
   "aid:spec_block"
;

```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command Parameter

1. aid – Access Identifier

The AID of a circuit pack.

Type: AID

Range:

- CpAID ::= SlotAID-cp for circuit pack in any slot
- LoxcAID ::= UnivSlotAID-loxc for LOXC pack in universal slots.

The keyword *usa11* is allowed for Simple_UnivSlotAID

The keyword *xca11* is allowed for Simple_XCSlotAID

The keyword *ctla11* is allowed for Simple_CTLSlotAID

The keyword *a11* is allowed for Simple_SlotAID

Refer to the AID syntax description.

Spec block parameters

1. opstate – Operational State

Each circuit pack has a retrievable attribute indicating whether circuit pack is operational for the system internal communication.

Type: alphanumeric value set

Range:

- OS_ENABLED
- OS_DISABLED (default).

Detailed behavior description

The system retrieves the state information for the CP as specified by the spec block parameters.

Example input/output

```
RTRV-STATE-EQPT:UNITE-NE:1-1-#-#-2-cp:123456;
```

```
UNITE-NE 00-11-03 08:00:00
```

```
M 123456 COMPLD
```

```
"1-1-#-#-2-cp:opstate=OS_ENABLE"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-STATE-EQPT command.

RTRV-STATE-EQPT (slot): Retrieve equipment state (slot)

The RTRV-STATE-EQPT command retrieves the state information for slots in the NE.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: RTRV-STATE-EQPT:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
The AID of a slot.
Type: AID
Range:
 - SlotAID
 - UnivSlotAID
 - XCSlotAID
 - CTLSlotAID.The keyword *usa11* is allowed for Simple_UnivSlotAID.
The keyword *xca11* is allowed for Simple_XCSlotAID.
The keyword *cta11* is allowed for Simple_CTLSlotAID.
The keyword *a11* is allowed for Simple_SlotAID.
The keyword *a11* is not allowed on bay/shelf level.
3. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

If the RTRV-STATE-EQPT command completes successfully, then the following normal completion response is returned:

```
sid date time
M ctag COMPLD
"aid:spec_block"
```

```

    ...
    ...
    "aid:spec_block"
;

```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

aid – Access Identifier

See definition of output parameter *aid* in [“RTRV-EQPT \(slot\): Retrieve Equipment \(slot\)”](#) (p. 4-2228).

Spec block parameters

1. holdst – Holder Status

Each provisionable slot has an attribute indicating its equipage state.

Type: alphanumeric value set

Range:

- EMPTY. The system uses the value “EMPTY” if no circuit pack is equipped in that slot.
- VALID. The system shall use the value “Valid” if a circuit pack is equipped in that slot as provisioned.
- UNEXPECTED. The system shall use the value “Unexpected” if a different circuit pack is equipped in that slot as provisioned or if the circuit pack is not acceptable for this slot.
- UNKNOWN. The system shall use the value “Unknown” if a circuit pack is equipped in that slot with non-readable functional type or illegal values for the functional type.

Default: EMPTY.

Detailed behavior description

The system retrieves the output parameters as described above.

Example input/output

```
RTRV-STATE-EQPT:UNITE-NE:1-1-#-#-2:123456;
```

```

UNITE-NE 00-11-03 08:00:00
M 123456 COMPLD
  "1-1-#-#-2:holdst=VALID"
;

```

Error responses

RTRV-STATE-EQPT (Socket): Retrieve equipment state

The RTRV-STATE-EQPT command shall retrieve the state information for sockets in the NE.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-STATE-EQPT:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
The AID of a socket.
Type: AID.
Range: SocketAID. The keyword *usall* or *all* shall be allowed for Simple_UnivSlotAID. The keyword *scall* shall be allowed for Simple_SocketAID. The keyword *all* is not allowed on bay/shelf level.
3. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

If the RTRV-STATE-EQPT command completes successfully, then the following normal completion response shall be returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_ block]"
  ... ..
  "aid[:spec_ block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command Parameter

1. **aid** – Access Identifier

The AID of a socket.

Type: AID.

Range: SocketAID. The keywords *all* / *usall* / *scall* shall are not allowed on any level.

Spec block parameters

1. **holdst** – Holder Status

Each provisionable socket shall have an attribute indicating its equipage state.

Type: alphanumeric value set.

Range:

- **EMPTY**, the system shall use the value "EMPTY" if no module is equipped in that socket.
- **VALID**, the system shall use the value "Valid" if a module is equipped in that socket as provisioned.
- **UNEXPECTED**, the system shall use the value "Unexpected" if a different module is equipped in that socket as provisioned or if the module is not acceptable for this socket.
- **UNKNOWN**, the system shall use the value "Unknown" if a module is equipped in that socket with non-readable functional type or illegal values for the functional type.

For further details w.r.t. state transitions for holder status - see SRD_Configuration-Management.

Default: EMPTY.

Detailed behavior description

The system shall retrieve the output parameters as described above.

Example input/output

This example shows a RTRV-STATE-EQPT command for a socket:

```
RTRV-STATE-EQPT:UNITE- NE:1-1-#-#-5-sc2:123456;
```

```
UNITE- NE 00-11-03 08:00:00
M 123456 COMPLD
"1- 1-#-#-5-sc2:holdst=VALID"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command Error responses section. The error responses listed there also apply to the ED-STATE-EQPT command.

GR-833-CORE

RTRV-STATE-EQPT (system): Retrieve equipment state

The RTRV-STATE-EQPT command retrieves the state information on system (NE) level.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-STATE-EQPT:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
The aid of the system itself.
Type: AID
Range: system; the usage of the keyword all on system level is not allowed.
Default: system
3. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

If the RTRV-STATE-EQPT command completes successfully, then the following normal completion response is returned:

```
sid date time
M ctag COMPLD
  "system:spec_block"
  ...
  ...
  "system:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

1. aid – Access Identifier
The aid of the system itself.
Type: AID
Range: system; the usage of the keyword all on system level is not allowed.
Default: system

Spec block parameters

1. commitstate – SW Commitment Status
The system provides an indication of the SW generic commitment status.
Type: alphanumeric value set.
Range:
 - PENDING = the SW generic is in trial phase, switch back to previous generic possible
 - COMMITTED = the SW generic is committed, no switch back possible.
2. dbstate – Data Base Change State
The system provides an indication of the validity of the active data base.
Type: alphanumeric value set.
Range:
 - EMPTY = data base state empty.
 - NEW = data base state new
 - VALID = database state valid
 - UNKNOWN = database state is not known.Default: UNKNOWN.
3. mcond – Maintenance Condition
This parameter denotes whether the system condition is in maintenance condition or not.
Type: alphanumeric value set.
Range:
 - Y = maintenance mode
 - N = normal mode.

Detailed behavior description

The RTRV-STATE-EQPT command on system level (AID = system) retrieves the current mode of the system.

The system provides the maintenance mode besides the normal operation mode in order to – handle error conditions the system can not autonomously manage – apply privileged commands.

In this maintenance mode acceptance of commands is restricted in the following way:

- commands allowed in maintenance AND normal mode:
 - get any provisionable parameter: any RTRV command
 - get any non-provisionable parameter: any RTRV command
 - set interface standard default mode: ED-EQPT (system)
 - set tributary default mode: ED-EQPT (system)
 - set maximum switch capacity: ED-EQPT (system)
 - ED-EQPT (system)
 - database download to restore empty/corrupt DBCPY-MEM
 - set time: ED-DAT
 - set date: ED-DAT
 - set IP parameter: ENT-ULS
(note: restrictions depend on parameter base, details see command)
 - set LAN parameter: ENT-FECOM-LAN
(note: restrictions depend on parameter base, details see command).
- commands ONLY allowed in maintenance mode:
 - set TID SET-SID
 - set SONET/SDH synchronisation default
 - leave maintenance mode (accept data base): ED-STATE-EQPT (system)

Accepting the database will be a direct result of leaving the maintenance mode.

The system autonomously leaves maintenance mode without accepting the data base after a data base download from the management interface.

The RTRV-STATE-EQPT command does not generate a REPT DBCHG message.

Example input/output

```
RTRV-STATE-EQPT:UNITE-NE:system:123456;

UNITE-NE 00-11-03 08:00:00
M 123456 COMPLD
"system:dbstate=EMPTY"
"system:mcond=Y"
;
```

RTRV-STM1E: Retrieve STM1E port

The RTRV-STM1E command shall be used to retrieve all parameters related to the electrical STM1E port.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-STM1E:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Access Identifier of an STM1E port.
Type: AID.
Range: SPortAID of STM1E port.
The keyword *all* is allowed up to shelf level.
3. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-STM1E command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command Parameter

1. **aid** – Access Identifier
Access Identifier of STM1 port.
Type: AID.
Range: SPortAID of STM1E port.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* INNI.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default).....65535
2. **brstintvl**– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. **brstthr** – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, ... 50.
Default: 30.
4. **clientNodeID** – Client Node Identifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter shall be supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0...255
Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list
This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-...
N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.
6. **degthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
Type: numeric value set.
Range (as exponents of 10): -5; -6; -7; -8; -9.
Default: -6.
7. **dexcthr** – Excessive Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
Type: numeric value set.
Range (as exponents of 10): -5; -6; -7; -8; -9.
Default: -6.
8. **exprstrc** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex
9. **femspm** – Far-end Multiplex Section PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: alphanumeric value set.
Range:
 - ENABLE
 - DISABLE (default).
10. **frcdus** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.
Type: alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. *fsflpbkstat* – Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

12. *inputsig* – Tributary Input Signal Rate List

This parameter is a list of VCn rates across the port's bandwidth.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

Default: 14.

13. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

Type: alphanumeric value set.

Range: SDH.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

14. *localLPID* – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

16. *maxNNXCRate* – Maximum NN Cross Connect Rate

This identifies the maximum rate at which cross connections shall be allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

maxNNXCRate is introduced specifically for use by ONNS application.

Type: alphanumeric value set.

Range: VC4 (default), VC3.

17. *minNNXCRate* – Minimum NN Cross Connect Rate

This identifies the minimum rate at which cross connections shall be allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

minNNXCRate is introduced specifically for use by ONNS application.

Type: alphanumeric value set.

Range: VC3 (default), VC4.

18. *ndetmd* – Neighbor Detection Mode

The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set.

Range:

For *portClass*=INNI: AUTO (default) or MAN

For *portClass*=ENNI: MAN (default)

19. neighborASTNNodeID – Neighbor ASTN Node Id

This parameter identifies the unique node identifier of the neighbor node of ports of portClass=INNI to be used for ONNS application. For all ports with other values of portClass, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN.

If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0 If portClass=INNI, the default value shall have the meaning of "no neighbor discovered".

20. neighborNodeID - Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of portClass=INNI. For all ports with other values of portClass, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0

If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered"

21. neighborPortID – Neighbor Port Id

This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborPortID is used s by the ONNS application.

Type: Four dash separated numeric string.

Range: Each numeric string: 0...255.

Default: 0-0-0-0.

Interpretation: For UNITE ports the contents of this parameter shall be interpreted as SPort AID, a value of a-b-c-d shall be interpreted as the SPortAID a-b-#-#-c-d.

22. nemspm – MS Near-End PM Enable

Enable or disable near-end multiplex section (near-end line) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

23. networkTNAType – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: alphanumeric value set

Range:

- IPV4 (default)
- IPV6
- NSAP

24. networkTNAAddress – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0...255
- IPV6: Each hexadecimal number: 0000...FFFF
- NSAP: Hexadecimal number:
000000000000000000000000000000000000...
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter in case explicit setting of the default value is allowed.

25. outq1 – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

Type: alphanumeric value set

Range:

- PRC
- SSUL
- SSUT
- SEC
- DNU (default).

26. `pmmsfeses` – Performance Monitoring MS Far-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severely errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default: for STM1: 28800.
27. `pmmsneses` – Performance Monitoring MS Near-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severely errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default: for STM1: 28800.
28. `pmode` – Port Mode
This parameter sets the mode of the port. In the case of AUTO the `pmode` state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: alphanumeric value set
Range:
 - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
 - MON indicates that alarm monitoring is taking place on the port.
 - NMON means that alarm monitoring is not occurring on the port.
29. `pmrsneses` – Performance Monitoring RS Near-End SES Threshold
This parameter describes the RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severely errored.
Type: numeric value set.
Range: 1 – 64000.
Default: for STM1: 2400.
30. `portClass` – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

31. *portControl* – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: alphanumeric value set
Range: NORMAL (default), LOCKOUT
32. *propagationDelay* - Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass*=INNI. For all ports with other values of *portClass* this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string
Range: 0(sedault) ...25. The unit of this value is "milliseconds".
33. *ptype* – Port Type
This identifies the port type of the AID.
Type: alphanumeric value set.
Range: STM1E.
34. *rsmstca* – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.
35. *rspm* – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: alphanumeric value set.
Range:
 - ENABLE
 - DISABLE (default).
36. *rstimca* – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: alphanumeric value set.
Range:
 - ENABLE (default): enable consequent action for TIM
 - DISABLE: disable consequent action for TIM.

37. `rstimmon` – RS TIM Monitor Enable

Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

38. `sdhpn` – SDH ASAP

This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

39. `sdsfmode` – Signal Degrade/Signal Fail Mode

The degraded state is detected in Burst or Poisson mode.

Type: alphanumeric value set.

Range:

- BURST (default)
- POISSON.

40. `servcond` – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

41. `srlgList` – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones shall be set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0...65535.

Default: 0-0-0-0-0-0-0-0-0-0.

42. *strc* – Value of incoming J0

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then *strc* contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter *strc* is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the *strcfmt* parameter).

43. *strcfmt* – Format of incoming J0

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*).

Type: numeric string

Default: 2

44. *strcout* – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

45. *strcst* – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

46. *strcwfmt* – Format of outgoing J0

The write format of J0, the outgoing section trace (*strcout*).

Type: numeric string

Default: 2

47. *tcamd* – TCA mode

This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (Iso known as the implicit reset method)
- TR-RTR (Iso known as the explicit reset method).

Type: alphanumeric value set.

Range: TR or TRRTR (default).

48. *trbmd* – Tributary mode

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

Type: alphanumeric value set.

Range: ADAPTIVE, FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242) command.

49. *unequipsig* – Unequipped Output Signal List

This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequipsig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

Default: 14.

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-STM1E command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-STM1E command. Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-STM1E:LT-UNITE:1-1-#-#-1-1:123456;
```

```
LT-UNITE 00-11-24 08:00:00
M 123456 COMPLD
"1-1-#-#-1-1:ptype=STM1E,frcdus=DISABLE,dexcthr=-3,degthr=-6,
  pmode=MON,...,pmmsneses=15,pmrsneses=30"
```

;

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-STM1E command.

Check CCB against ptype and istd

See definition of error response in [“RTRV-STM16: Retrieve STM16 port”](#) (p. 4-2711).

References

GR-199-CORE (RTRV-rr)

RTRV-STM1: Retrieve STM1 port

The RTRV-STM1 command is used to retrieve all parameters related to the optical STM1 port.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-STM1:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Access Identifier of an STM1 port.
Type: AID.
Range: SPortAID of STM1 port.
The keyword *all* is allowed up to shelf level.
3. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-STM1 command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command Parameter

1. *aid* – Access Identifier
Access Identifier of STM1 port.
Type: AID.
Range: SPortAID of STM1 port.

Spec block parameters

1. *adminCost*- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* INNI.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default).....65535
2. *brstintvl*– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. *brstthr* – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, ... 50.
Default: 30.
4. *clientNodeID* – Client Node Identifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “*uniClientNodeID*”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter shall be supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0...255
Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list
This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-... N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
6. **degthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
Type: numeric value set.
Range (as exponents of 10): -5; -6; -7; -8; -9.
Default: -6.
7. **dexcthr** – Excessive Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
Type: numeric value set.
Range (as exponents of 10): -5; -6; -7; -8; -9.
Default: -6.
8. **exprstrc** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex
9. **femspm** – Far-end Multiplex Section PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: alphanumeric value set.
Range:
 - ENABLE
 - DISABLE (default).
10. **frcdus** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.
Type: alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. *fsflpbkstat* – Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

12. *inputsig* – Tributary Input Signal Rate List

This parameter is a list of VCn rates across the port's bandwidth.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

Default: 14.

13. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

Type: alphanumeric value set.

Range: SDH.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

14. *linkResCls* – Link Resource Class

The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Default: 00 for each alphanumeric character

15. *localLinkID* – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

16. *localLPID* – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

18. *maxNNXCRate* – Maximum NN Cross Connect Rate

The *maxNNXCRate* identifies the maximum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: VC3 or VC4 (default)

19. *minNNXCRate* – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: VC3 (default) or VC4.

20. *ndetmd* – Neighbor Detection Mode

The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set.

Range:

For *portClass*=INNI: AUTO (default) or MAN

For *portClass*=ENNI: MAN (default)

21. *neighborASTNNodeID* – Neighbor ASTN Node Id

This parameter identifies the unique node identifier of the neighbor node of ports of *portClass*=INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0 If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered".

22. *neighborNodeID* - Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN. If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0

If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered"

23. *neighborPortID* – Neighbor Port Id

This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string

Range: Each numeric string: 0...255

Default: 0-0-0-0

24. *neighborSigPCID* – Neighbor Signaling PC IDentity

The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

25. *neighborSigPCIPAddr* – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

26. *nemspm* – MS Near-End PM Enable

Enable or disable near-end multiplex section (near-end line) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

27. *networkTNAType* – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: alphanumeric value set

Range:

- IPV4 (default)
- IPV6
- NSAP

28. *networkTNAAddress* – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0...255
- IPV6: Each hexadecimal number: 0000...FFFF
- NSAP: Hexadecimal number:
000000000000000000000000000000000000...
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. opdis – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set

Range:

- INTRA-OFFICE
- SHORT-HAUL
- LONG-HAUL
- VERY-LONG-HAUL
- OLS_PASSIVE
- OLS_400G

- OLS_800G
- XTREME
- NA

30. opwl – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 1471 ... 1611 (for CWDM), NA (for client ports). T

he value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

31. outql – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

Type: alphanumeric value set

Range:

- PRC
- SSUL
- SSUT
- SEC
- DNU (default).

32. pmmsfes – Performance Monitoring Line/MS Far-End SES Threshold

This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-1/OC-3: 1 – 192000.

Default: The default values differ for SDH and SONET:

- STM1: 28800
- OC3: 154.

33. *pmmsneses* – Performance Monitoring Line/MS Near-End SES Threshold

This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-1/OC-3: 1 – 192000.

Default: The default values differ for SDH and SONET and the different rates:

- STM1: 28800
- OC3: 154.

34. *pmode* – Port Mode

This parameter sets the mode of the port. In the case of AUTO the *pmode* state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

35. *pmrsneses* – Performance Monitoring Section/RS Near-End SES Threshold

This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of allowed ranges for SDH and SONET): 1 – 64000.

Default: The default values differ for SDH and SONET and the different rates:

- STM1: 2400
- OC3: 155.

36. *portClass* – Port Class

This parameter identifies the port class of the AID.

In which role the port is used by the ONNS application is specified by this parameter *portClass*.

Type: alphanumeric value set.

Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) shall be used as default value. Otherwise, the default value shall be TRADITIONAL.

37. *portControl* – Port Control (PortAdministrative Mode)

The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

Type: alphanumeric value set

Range: NORMAL (default), LOCKOUT

38. *propagationDelay* - Propagation Delay

This parameter identifies the provisioned propagation delay value for ports of *portClass*=INNI. For all ports with other values of *portClass* this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

propagationDelay is used by the ONNS application.

Type: Numeric string

Range: 0(sedault) ...25. The unit of this value is "milliseconds".

39. *ptype* – Port Type

This identifies the port type of the AID.

Type: alphanumeric value set.

Range: STM1.

40. *remAdvNodeID* – Remote Advertised Node IDentity

The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

41. *remLinkID* – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

42. *remRAID* – Remote Routing Area IDentity

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

43. *remTID* – Remote TID

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: TID or empty-string

Range: Please refer to the TID definition in the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) description.

Default: empty string: ""

44. *rsmstca* – RS/MS TCA Profile Pointer

Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

Type: alphanumeric string.

Range: String with maximum of 24 characters.

Default: DEFAULT0.

45. *rspm* – RS PM Enable

Enable or disable regenerator section (section) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

46. *rstimca* – RS TIM Consequent Action Enable

Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimca* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE (default): enable consequent action for TIM
- DISABLE: disable consequent action for TIM.

47. *rstimmon* – RS TIM Monitor Enable

Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

48. *sdhpn* – SDH ASAP

This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

49. *sdsfmode* – Signal Degrade/Signal Fail Mode

The degraded state is detected in Burst or Poisson mode.

Type: alphanumeric value set.

Range:

- BURST (default)
- POISSON.

50. *servcond* – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

51. *srlgList* – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones shall be set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0...65535.

Default: 0-0-0-0-0-0-0-0-0.

52. *strc* – Value of incoming J0

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then *strc* contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter *strc* is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the *strcfmt* parameter).

53. *strcfmt* – Format of incoming J0

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

54. *strcout* – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. *strcst* – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

56. *strcwfmt* – Format of outgoing J0

The write format of J0, the outgoing section trace (*strcout*). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

57. *tcamd* – TCA mode

This parameter shows the modulus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (also known as the implicit reset method)
- TR-RTR (also known as the explicit reset method).

Type: alphanumeric value set.

Range: TR or TRRTR (default).

58. *trbmd* – Tributary mode

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

Type: alphanumeric value set.

Range: ADAPTIVE, FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242) command.

59. *unequiposig* – Unequipped Output Signal List

This parameter is a list of VCn rates across the port’s bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

Default: 14.

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-STM1 command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-STM1 command.

Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-STM1:LT-UNITE:1-1-#-#-1-1:123456;
```

```
LT-UNITE 00-11-24 08:00:00
M 123456 COMPLD
"1-1-#-#-1-1:ptype=STM1,frcdus=DISABLE,dexctr=-3,degthr=-6,
  pmode=MON,...,pmmsneses=15,pmrsneses=30"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-STM1 command.

Check CCB against ptype and istd

See definition of error response in [“RTRV-STM16: Retrieve STM16 port”](#) (p. 4-2711).

RTRV-STM4: Retrieve STM4 port

The RTRV-STM4 command is used to retrieve all parameters related to the optical STM4 port.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-STM4:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Access Identifier of an STM4 port.
Type: AID.
Range: SPortAID of STM4 port.
The keyword *all* is allowed up to shelf level.
3. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-STM4 command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command Parameter

1. **aid** – Access Identifier
Access Identifier of STM-4 port.
Type: AID.
Range: SPortAID of STM-4 port.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* INNI.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default).....65535
2. **brstintvl**– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. **brstthr** – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, ... 50.
Default: 30.
4. **clientNodeID** – Client Node Identifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter shall be supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0...255
Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list
This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-...
N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.
6. **degthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
Type: numeric value set.
Range (as exponents of 10): -5; -6; -7; -8; -9.
Default: -6.
7. **dexcthr** – Excessive Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
Type: numeric value set.
Range (as exponents of 10): -5; -6; -7; -8; -9.
Default: -6.
8. **exprstrc** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex
9. **femspm** – Far-end Multiplex Section PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: alphanumeric value set.
Range:
 - ENABLE
 - DISABLE (default).
10. **frcdus** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.
Type: alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. *fsflpbkstat* – Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

12. *inputsig* – Tributary Input Signal Rate List

This parameter is a list of VCn rates across the port's bandwidth.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3, 4 or 4C representing VC3, VC4 or VC4-4C.

Default: 44.

13. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

Type: alphanumeric value set.

Range: SDH.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

14. *linkResCls* – Link Resource Class

The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Default: 00 for each alphanumeric character

15. *localLinkID* – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

16. *localLPID* – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

18. *maxNNXCRate* – Maximum NN Cross Connect Rate

The *maxNNXCRate* identifies the maximum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: VC3, VC4 or VC44C (default)

19. *minNNXCRate* – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: VC3 (default), VC4 or VC44C

20. *ndetmd* – Neighbor Detection Mode

The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set.

Range:

For *portClass*=INNI: AUTO (default) or MAN

For *portClass*=ENNI: MAN (default)

21. *neighborASTNNodeID* – Neighbor ASTN Node Id

This Parameter identifies the unique node identifier of the neighbor node of ports of *portClass*=INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0 If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered".

22. *neighborNodeID* - Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN. If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0

If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered"

23. *neighborPortID* – Neighbor Port Id

This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.

Range: Each numeric string: 0...255.

Default: 0-0-0-0.

Interpretation: For UNITE ports the contents of this parameter shall be interpreted as SPort AID, a value of a-b-c-d shall be interpreted as the SPortAID a-b-#-#-c-d.

24. *neighborSigPCID* – Neighbor Signaling PC IDentity

The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

25. *neighborSigPCIPAddr* – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

26. *nemspm* – MS Near-End PM Enable

Enable or disable near-end multiplex section (near-end line) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

27. *networkTNAType* – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: alphanumeric value set

Range:

- IPV4 (default)
- IPV6
- NSAP

28. *networkTNAAddress* – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type:

- *networkTNAType*= IPV4: Four dot separated numeric string (represents 4 Bytes)
- *networkTNAType*= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- *networkTNAType*= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0...255
- IPV6: Each hexadecimal number: 0000...FFFF
- NSAP: Hexadecimal number:
000000000000000000000000000000000000...
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. *opdis* – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set

Range:

- INTRA-OFFICE
- SHORT-HAUL
- LONG-HAUL
- VERY-LONG-HAUL
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

30. opwl – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 471 ... 1611 (for CWDM), NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

31. outql – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

Type: alphanumeric value set

Range:

- PRC
- SSUL
- SSUT
- SEC
- DNU (default).

32. pmmsfes – Performance Monitoring Line/MS Far-End SES Threshold

This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-4/OC-12: 1 – 768000.

Default: The default values differ for SDH and SONET:

- STM4: 115200
- OC12: 615.

33. `pmmsneses` – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-4/OC-12: 1 – 768000.

Default: The default values differ for SDH and SONET and the different rates:

- STM4: 115200
- OC3: 615.

34. `pmode` – Port Mode

This parameter sets the mode of the port. In the case of AUTO the `pmode` state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

35. `pmrsneses` – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of allowed ranges for SDH and SONET): 1 – 64000.

Default: The default values differ for SDH and SONET and the different rates:

- STM4: 2400
- OC12: 616.

36. *portClass* – Port Class

This parameter identifies the port class of the AID.

In which role the port is used by the ONNS application is specified by this parameter *portClass*.

Type: alphanumeric value set.

Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) shall be used as default value.

Otherwise, the default value shall be TRADITIONAL.

37. *portControl* – Port Control (PortAdministrative Mode)

The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

Type: alphanumeric value set

Range: NORMAL (default), LOCKOUT

38. *propagationDelay* - Propagation Delay

This parameter identifies the provisioned propagation delay value for ports of *portClass*=INNI. For all ports with other values of *portClass* this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

propagationDelay is used by the ONNS application.

Type: Numeric string

Range: 0(sedault) ...25. The unit of this value is "milliseconds".

39. *pType* – Port Type

This identifies the port type of the AID.

Type: alphanumeric value set.

Range: STM4.

40. *remoteAdvNodeID* – Remote Advertised Node IDentity

The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

41. *remLinkID* – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

42. *remRAID* – Remote Routing Area IDentity

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

43. *remTID* – Remote TID

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: TID or empty-string

Range: Please refer to the TID definition in the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) description.

Default: empty string: ""

44. *rsmstca* – RS/MS TCA Profile Pointer

Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

Type: alphanumeric string.

Range: String with maximum of 24 characters.

Default: DEFAULT0.

45. *rspm* – RS PM Enable

Enable or disable regenerator section (section) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

46. *rstimca* – RS TIM Consequent Action Enable

Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimca* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE (default): enable consequent action for TIM
- DISABLE: disable consequent action for TIM.

47. *rstimmon* – RS TIM Monitor Enable

Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

48. *sdhpn* – SDH ASAP

This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

49. *sdsfmode* – Signal Degrade/Signal Fail Mode

The degraded state is detected in Burst or Poisson mode.

Type: alphanumeric value set.

Range:

- BURST (default)
- POISSON.

50. *servcond* – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- **INSERVICE** (default): Provisioning values for service are accepted
- **OUTOFSERVICE**: Provisioning values for service are not accepted.

51. *srlgList* – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones shall be set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0...65535.

Default: 0-0-0-0-0-0-0-0-0-0.

52. *strc* – Value of incoming J0

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then *strc* contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter *strc* is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the *strcfmt* parameter).

53. *strcfmt* – Format of incoming J0

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)

- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

54. *strcout* – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. *strcst* – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

56. *strcwfmt* – Format of outgoing J0

The write format of J0, the outgoing section trace (*strcout*). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

57. *tcamd* – TCA mode

This parameter shows the modulus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (also known as the implicit reset method)
- TR-RTR (also known as the explicit reset method).

Type: alphanumeric value set.

Range: TR or TRRTR (default).

58. *trbmd* – Tributary mode

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

Type: alphanumeric value set.

Range: ADAPTIVE, FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)” \(p. 4-2242\)](#) command.

59. *unequiposig* – Unequipped Output Signal List

This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

Default: 14.

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-STM4 command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-STM4 command.

Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-STM4:LT-UNITE:1-1-#-#-1-1:123456;
```

```
LT-UNITE 00-11-24 08:00:00
M 123456 COMPLD
"1-1-#-#-1-1:ptype=STM4,frcdus=DISABLE,dexctr=-3,degthr=-6,
  pmode=MON,...,pmmsneses=15,pmrsneses=30"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command Error responses section. The error responses listed there also apply to the RTRV-STM4 command.

Check CCB against ptype and istd

See definition of error response in [“RTRV-STM16: Retrieve STM16 port” \(p. 4-2711\)](#).

RTRV-STM16: Retrieve STM16 port

The RTRV-STM16 command is used to retrieve all parameters related to the optical STM16 port.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-STM16:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Description: Access Identifier of an STM16 port.
Type: AID.
Range: SPortAID of STM16 port.
The keyword *all* is allowed up to shelf level.
3. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-STM16 command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command Parameter

1. **aid** – Access Identifier
Access Identifier of STM16 port.
Type: AID.
Range: SPortAID of STM16 port.
The keyword **all** is not allowed.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* INNI.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default).....65535
2. **brstintvl**– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. **brstthr** – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, ... 50.
Default: 30.
4. **clientNodeID** – Client Node Identifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems

reasonable for a possible extension of this attribute to other port classes in future.

This parameter shall be supported by ports of *portClass* UNI.

Type: IPv4 format: Four dot separated numeric string.

Range: Each numeric string: 0...255

Default: 0.0.0.0

5. *crstat* – Constituent Rates Status list

This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.

6. *degthr* – Signal Degrade Threshold

Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.

Type: numeric value set.

Range (as exponents of 10): -5; -6; -7; -8; -9.

Default: -6.

7. *dexcthr* – Excessive Degrade Threshold

Retrieving of the excessive degrade/signal failure threshold in exponent of 10. This parameter is available when *sdsfmode*=POISSON

Type: numeric value set.

Range (as exponent of 10): -3; -4; -5.

Default: -3.

8. *exprstrc* – Value of Expected J0

Expected regenerator section trace identifier.

The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.

Type: Hexadecimal digits

Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 89hex followed by 15 bytes 00hex

9. *femspm* – Far-end Multiplex Section PM Enable

Enable or disable of the performance monitoring of the multiplex section.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. *frcdus* – Force to DUS

Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.
Type: alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. *fsflpbkstat* – Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: alphanumeric value set.

Range:

- YES
- NO (default).

12. *inputsig* – Tributary Input Signal Rate List

This parameter is a list of VCn rates across the port's bandwidth.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.

Default: The initial value of X is 4.

Example:

An STM-16 signal might be represented by 93-14-14C-243 which implies 9 VC3s, 1 VC4, 1 VC4-4C, 24 VC3s. The representation is not unique, for example it could also be 33-63-14-14C-243. Worst case of string length for STM16: 47 characters.

13. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

Type: alphanumeric value set.

Range: SDH.

Default: As specified via *istddflt* on system level, see definition in ["RTRV-EQPT \(system\): Retrieve Equipment \(system\)"](#) (p. 4-2242).

14. *linkResCls* – Link Resource Class

The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Default: 00 for each alphanumeric character

15. *localLinkID* – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

16. *localLPID* – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

18. *maxNNXCRate* – Maximum NN Cross Connect Rate

The *maxNNXCRate* identifies the maximum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: VC3, VC4, VC44C or VC416C (default)

19. *minNNXCRate* – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: VC3 (default), VC4, VC44C or VC416C

20. *ndetmd* – Neighbor Detection Mode

The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set.

Range:

For *portClass*=INNI: AUTO (default) or MAN

For *portClass*=ENNI: MAN (default)

21. *neighborASTNNodeID* – Neighbor ASTN Node Id

This parameter identifies the unique node identifier of the neighbor node of ports of *portClass*=INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If

ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0 If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered".

22. *neighborNodeID* - Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN. If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0

If *portClass*=INNI, the default value shall have the meaning of "no neighbor discovered"

23. *neighborPortID* – Neighbor Port Id

This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass*=INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd*=MAN.

If *ndetmd*=MAN, this parameter shall indicate the value set by the operator. If *ndetmd*=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.

Range: Each numeric string: 0...255.

Default: 0-0-0-0.

Interpretation: For UNITE ports the contents of this parameter shall be interpreted as SPort AID, a value of a-b-c-d shall be interpreted as the SPortAID a-b-#-#-c-d.

24. *neighborSigPCID* – Neighbor Signaling PC IDentity

The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

25. *neighborSigPCIPAddr* – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

26. *nemspm* – MS Near-End PM Enable

Enable or disable near-end multiplex section (near-end line) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

27. *networkTNAType* – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: alphanumeric value set

Range:

- IPV4 (default)
- IPV6
- NSAP

28. *networkTNAAddress* – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type:

- *networkTNAType*= IPV4: Four dot separated numeric string (represents 4 Bytes)
- *networkTNAType*= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- *networkTNAType*= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0...255
- IPV6: Each hexadecimal number: 0000...FFFF
- NSAP: Hexadecimal number:
000000000000000000000000000000000000...
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. *opdis* – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set

Range:

- INTRA-OFFICE
- SHORT-HAUL
- LONG-HAUL
- VERY-LONG-HAUL
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME
- NA.

30. opwl – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 1471 ... 1611 (for CWDM), NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

31. outql – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

Type: alphanumeric value set

Range:

- PRC
- SSUL
- SSUT
- SEC
- DNU (default).

32. pmmsfeses – Performance Monitoring Line/MS Far-End SES Threshold

This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

33. `pmmsneses` – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

34. `pmode` – Port Mode

This parameter sets the mode of the port. In the case of AUTO the `pmode` state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

35. *pmrsneses* – Performance Monitoring Section/RS Near-End SES Threshold

This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

Type: numeric value set.

Range (superset of allowed ranges for SDH and SONET): 1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

36. *portClass* – Port Class

This parameter identifies the port class of the AID.

In which role the port is used by the ONNS application is specified by this parameter *portClass*.

Type: alphanumeric value set.

Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) shall be used as default value. Otherwise, the default value shall be TRADITIONAL.

37. *portControl* – Port Control (PortAdministrative Mode)

The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

Type: alphanumeric value set

Range: NORMAL (default), LOCKOUT

38. *propagationDelay* - Propagation Delay

This parameter identifies the provisioned propagation delay value for ports of *portClass*=INNI. For all ports with other values of *portClass* this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

propagationDelay is used by the ONNS application.

Type: Numeric string

Range: 0(sedault) ...25. The unit of this value is "milliseconds".

39. ptype – Port Type

This identifies the port type of the AID.

Type: alphanumeric value set.

Range: STM16.

40. remAdvNodeID – Remote Advertised Node IDentity

The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter. The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

41. remLinkID – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

42. remRAID – Remote Routing Area IDentity

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

43. *remTID* – Remote TID

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: TID or empty-string

Range: Please refer to the TID definition in the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) description.

Default: empty string: ""

44. *rsmstca* – RS/MS TCA Profile Pointer

Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

Type: alphanumeric string.

Range: String with maximum of 24 characters.

Default: DEFAULT0.

45. *rspm* – RS PM Enable

Enable or disable regenerator section (section) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

46. *rstimca* – RS TIM Consequent Action Enable

Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimca* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE (default): enable consequent action for TIM
- DISABLE: disable consequent action for TIM.

47. *rstimmon* – RS TIM Monitor Enable

Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

48. *sdhpn* – SDH ASAP

This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in “[RTRV-OC48: Retrieve OC48 port](#)” (p. 4-2466)) to be compatible with current generation applications.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

49. *sdsfmode* – Signal Degrade/Signal Fail Mode

The degraded state is detected in Burst or Poisson mode.

Type: alphanumeric value set.

Range:

- BURST (default)
- POISSON.

50. *servcond* – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

51. *srlgList* – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones shall be set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0...65535.

Default: 0-0-0-0-0-0-0-0-0-0.

52. *strc* – Value of incoming J0

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then *strc* contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter *strc* is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the *strcfmt* parameter).

53. *strcfmt* – Format of incoming J0

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

54. *strcout* – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. *strcst* – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

56. *strcwfmt* – Format of outgoing J0

The write format of J0, the outgoing section trace (*strcout*). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

57. *tcamd* – TCA mode

This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (also known as the implicit reset method)
- TR-RTR (also known as the explicit reset method).

Type: alphanumeric value set.

Range: TR or TRRTR (default).

58. *trbmd* – Tributary mode

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

Type: alphanumeric value set.

Range: ADAPTIVE, FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242) command.

59. *unequiposig* – Unequipped Output Signal List

This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.

Default: 164 = all VC4.

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-STM16 command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-STM16 command.

Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-STM16:LT-UNITE:1-1-#-#-1-1:123456;  
  
LT-UNITE 00-11-24 08:00:00  
M 123456 COMPLD  
"1-1-#-#-1-1:ptype=STM16,frcdus=DISABLE,dexcthr=-3,degthr=-  
6,pmode=MON,...,pmmsneses=15,pmrsneses=30"  
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-STM16 command.

Validation rule: Check CCB against *ptype* and *istd*

Check whether the CCB fits to *ptype* and *istd*.

Error code:

ICNV - Input, Command Not Valid, Interface Standard does not match.

E.g. DENY, if a command with *rr*=STM16 is made on a OP2G5 port which is provisioned as *istd*=SONET and *ptype*=OC48.

GR-199-CORE (RTRV-*rr*)

RTRV-STM16T: Retrieve STM16T port

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-STM16T:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Description: Access Identifier of an STM16T port.
Type: AID.
Range: SPortAID of STM16T port.
The keyword *all* is allowed up to shelf level.
3. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-STM16 command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command Parameter

1. **aid** – Access Identifier
Access Identifier of STM16 port.
Type: AID.
Range: SPortAID of STM16 port.
The keyword **all** is not allowed.

Spec block parameters

1. **exprstrc** – Value of Expected J0
For RTRV-STM16T this parameter refers to the incoming (inress) direction
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex
2. **exprstrcout** - Value of Expected J0 in outgoing direction
Expected regenerator section trace identifier in outgoing (egress) direction.
The parameter *expstrcout* specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format *strcfmtout* is set to 16 (16-byte-specific-string mode).
Type: Hexadecimal digits
Range: 16 byte string. Each byte shall be expressed as two hexadecimal digits (example value: 6D). The first byte value shall be in the range from 80 to FF. The other byte values shall be in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex
3. **fsflpbkstat** – Far Side Facility Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: alphanumeric value set.
Range:
 - YES
 - NO (default).

4. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

Type: alphanumeric value set.

Range: SDH.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

5. *lpbk* – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

6. *opdis* – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set

Range:

- INTRA-OFFICE
- SHORT-HAUL
- LONG-HAUL
- VERY-LONG-HAUL
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME.

7. *opwl* – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 1471 ... 1611 (for CWDM), NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

8. pmode – Port Mode

This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

9. pmrsneses – Performance Monitoring Section/RS Near-End SES Threshold

This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

Type: numeric value set.

Range (superset of allowed ranges for SDH and SONET): 1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

10. pmrsnesesout - Performance Monitoring Section/RS Near-End SES Threshold in outgoing direction

This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

Type: numeric value set

Range (superset of allowed ranges for SDH and SONET): 1 - 64000

Default:

The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392

11. ptype – Port Type

This identifies the port type of the AID.

Type: alphanumeric value set.

Range: STM16T.

12. `rsmstca` – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.
13. `rspm` – RS PM Enable
For RTRV-STM16T this parameter refers to the incoming (ingress) direction.
Enable or disable regenerator section (section) performance monitoring.
Type: alphanumeric value set.
Range:
 - ENABLE
 - DISABLE (default).
14. `rspmout` - RS PM Enable in Outgoing Direction
Enable or disable regenerator section (section) performance monitoring for the outgoing (egress) direction.
Type: alphanumeric value set.
Range: ENABLE, DISABLE (default).
15. `rstimmon` – RS TIM Monitor Enable
For RTRV-STM16T this parameter refers to the incoming (Ingress) direction.
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter portClass is set to INNI and ndetmd is set to AUTO, the parameter rstimmon shall be autonomously set by the neighbour detection mechanism.
Type: alphanumeric value set.
Range:
 - ENABLE: enable TIM Monitor
 - DISABLE (default): disable TIM Monitor
16. `rstimmonout` - RS TIM Monitor Enable in Outgoing direction
Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: alphanumeric value set
Range: ENABLE - enable TIM Monitor, DISABLE (default) - disable TIM Monitor

17. *sdhpn* – SDH ASAP

This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in “[RTRV-OC48: Retrieve OC48 port](#)” (p. 4-2466)) to be compatible with current generation applications.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

18. *servcond* – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- *INSERVICE* (default): Provisioning values for service are accepted
- *OUTOFSERVICE*: Provisioning values for service are not accepted.

19. *strc* – Value of incoming J0

For RTRV-STM16T this parameter refers to the incoming (Ingress) direction.

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port.

The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then *strc* contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter *strc* is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the *strcfmt* parameter).

20. *strcfmt* – Format of incoming J0

For RTRV-STM16T this parameter refers to the incoming (Ingress) direction.

The read format of J0, the incoming section trace (*strc*) and the expected section

trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to

AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

21. *strcfmtout* - Format of outgoing J0

The read format of J0 in outgoing (egress) direction, the outgoing section trace (*strcout*) and the expected section trace (*exprstrcout*).

Type: numeric string

Range:

- 1, for specific repeating byte (SONET)
- 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
- 16, for 16 byte specific string (ITU/ETSI mode 1)
- 64, for 64 byte string (SONET).

22. *strcout* – Value of outgoing J0

For RTRV-STM16T this parameter refers to the outgoing (egress) direction.

This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcwfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcwfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

23. *strcst* – Status of incoming J0

For RTRV-STM16T this parameter refers to the incoming (ingress) direction.

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: *strc* contains a valid value; UNAVAILABLE: no value for *strc* could be obtained by the system; AIS: no value for *strc* due to an SF condition.

24. *strcstout* - Status of outgoing J0

This parameter shows the status of the value of the RS/Section Trace Identifier in outgoing (egress) direction which is available with parameter *strcout*.
alphanumeric value set

Range:

- NORMAL, strcout contains a valid value
- UNAVAILABLE, no value for strcout could be obtained by the system
- AIS, no value for strcout due to an SF condition

25. tcamd – TCA mode

This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (also known as the implicit reset method)
- TR-RTR (also known as the explicit reset method).

Type: alphanumeric value set.

Range: TR or TRRTR (default).

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-STM16T command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-STM16T command.

Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-STM16T:LT-UNITE:1-1-#-#-1-1:123456;

LT-UNITE 00-11-24 08:00:00
M 123456 COMPLD
"1-1-#-#-1-1:ptype=STM16T,pmode=MON,...,pmrsneses=30,
pmrsfes=30"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-STM16T command.

Validation rule: Check CCB against *ptype* and *istd*

Check whether the CCB fits to *ptype* and *istd*.

Error code:

ICNV – Input, Command Not Valid, Interface Standard does not match.

E.g. DENY, if a command with *rr*=STM16T is made on a OPT2G5 port which is provisioned as *istd*=SONET and *ptype*=OC48T.

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
Access Identifier of an STM64 port.
Type: AID.
Range: SPortAID of ST-64 port.
The keyword *all* is allowed up to shelf level.
3. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-STM64 command, the following output report is returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command Parameter

1. *aid* – Access Identifier
Type: AID
Range: STM-64 port AID

Spec block parameters

1. *adminCost*- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter shall be supported by ports of *portClass* INNI.
This parameter shall be supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default).....65535
2. *brstintvl*– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. *brstthr* – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
This parameter applies when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, ... 50.
Default: 30.
4. *clientNodeID* – Client Node Identifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “*uniClientNodeID*”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter shall be supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0...255
Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list
 This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
 Type: numeric value set.
 Range: NX-NX-NX-...
 N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC-64C.
6. **degthr** – Signal Degrade Threshold
 Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
 Type: numeric value set.
 Range (as exponents of 10): -5; -6; -7; -8; -9.
 Default: -6.
7. **dexcthr** – Excessive Degrade Threshold
 Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode*=POISSON.
 Type: numeric value set.
 Range (as exponents of 10): -5; -6; -7; -8; -9.
 Default: -6.
8. **exprstrc** – Value of Expected J0
 Expected regenerator section trace identifier.
 The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* shall be autonomously set by the neighbour detection mechanism.
 Type: Hexadecimal digits
 Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
 Default: 89hex followed by 15 bytes 00hex
9. **fec** – FEC Enable
 Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.
 Type: alphanumeric value set.
 Range:
 DISABLE (only) for:
 - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
 - OC192 / STM64 intermediate reach / SH passive WDM compatible optics
 - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
 - OC192 / STM64 low cost intra office 1310 nm optics

- OC192 / STM64 client ports (related to OTN ports)
- OC768 / STM256 basis low cost intra office 1310 nm optics.

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

ENABLE (only) for:

- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G.

Default:

DISABLE for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768 / STM256 basis low cost intra office 1310 nm optics.

ENABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

10. femspm – Far-end Multiplex Section PM Enable

Enable or disable of the performance monitoring of the multiplex section.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

11. frcdus – Force to DUS

Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

Type: alphanumeric value set.

Range:

- ENABLE: (set a forced DUS/DNU)
- DISABLE (default): (clear a forced DUS/DNU).

12. *fsflpbkstat* – Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

13. *inputsig* – Tributary Input Signal Rate List

This parameter is a list of VCn rates across the port's bandwidth.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.

Default: 644.

14. *istd* – Interface Standard

Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

Type: alphanumeric value set.

Range: SDH.

Default: As specified via *istddflt* on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)”](#) (p. 4-2242).

15. *linkResCls* – Link Resource Class

The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Default: 00 for each alphanumeric character

16. *localLinkID* – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can

be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

17. localLPID – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

18. lpbk – Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

19. maxNNXCRate – Maximum NN Cross Connect Rate

The *maxNNXCRate* identifies the maximum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: VC3, VC4, VC44C, VC416C or VC464C (default)

20. *minNNXCRate* – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross connections shall be allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set

Range: VC3 (default), VC4, VC44C, VC416C or VC464C

21. *msrei* – MS-REI mode

An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.

Type: alphanumeric value set.

Range: SINGLE or EXTENDED (default)

22. *ndetmd* – Neighbor Detection Mode

The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: alphanumeric value set.

Range:

For *portClass*=INNI: AUTO (default) or MAN

For *portClass*=ENNI: MAN (default)

23. *neighborASTNNodeID* – Neighbor ASTN Node Id

This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.

If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0 If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered".

24. *neighborNodeID* - Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborNodeID is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0...255.

Default: 0.0.0.0

If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

25. *neighborPortID* – Neighbor Port Id

This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.

If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.

Range: Each numeric string: 0...255.

Default: 0-0-0-0.

Interpretation: For UNITE ports the contents of this parameter shall be interpreted as SPort AID, a value of a-b-c-d shall be interpreted as the SPortAID a-b-#-#-c-d.

26. *neighborSigPCID* – Neighbor Signaling PC IDentity

The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

27. *neighborSigPCIPAddr* – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

28. *nemspm* – MS Near-End PM Enable

Enable or disable near-end multiplex section (near-end line) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

29. *networkTNAType* – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type: alphanumeric value set

Range:

- IPV4 (default)
- IPV6
- NSAP

30. *networkTNAAddress* – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *portClass* UNI.

This parameter shall be supported by ports of *portClass* EDGE.

Type:

- *networkTNAType*= IPV4: Four dot separated numeric string (represents 4 Bytes)
- *networkTNAType*= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- *networkTNAType*= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0...255
- IPV6: Each hexadecimal number: 0000...FFFF
- NSAP: Hexadecimal number:
000000000000000000000000000000000000...
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

31. *och* – optical channel enable

Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don’t have any impact on transmission.

Type: alphanumeric value set.

Range:

- for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
- for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
- for ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
- for client ports on packs which support OTN: DISABLE disable, optical channel not applicable.

Default:

- for OP10 and OP40 packs, which cannot support OCH: DISABLE
- for OP10 packs, which cannot support OCH: ENABLE
- for OP10 and OP40 packs, which only support OCH: ENABLE
- for client ports on packs which support OTN: DISABLE.

32. opdis – Optical Distance

It shows the type of application for which the optical transmitter on this port is suited.

Type: alphanumeric value set

Range:

- INTRA-OFFICE
- SHORT-HAUL
- LONG-HAUL
- VERY-LONG-HAUL
- OLS_PASSIVE
- OLS_400G
- OLS_800G
- XTREME.

33. opwl – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 ... 1562.640 (i.e. C-Band); 1553.731 ... 1608.329 (i.e. L-Band), 1471 ... 1611 (for CWDM), NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

34. `otnclient` – OTN Client Port

This parameter indicates whether the port is an OTN Client Port or an optical SDH/SONET port..

Type: alphanumeric value set

Range: YES for OTN client port; NO for optical SDH/SONET port.

35. `outq1` – Outgoing timing quality

This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

Type: alphanumeric value set

Range:

- PRC
- SSUL
- SSUT
- SEC
- DNU (default).

36. `pmmsfeses` – Performance Monitoring Line/MS Far-End SES Threshold

This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

37. `pmmsneses` – Performance Monitoring Line/MS Near-End SES Threshold

This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

38. `pmode` – Port Mode

This parameter sets the mode of the port. In the case of AUTO the `pmode` state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.

The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.

- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

Default: AUTO for optical SDH/SONET ports; NMON for client ports.

39. `pmrsneses` – Performance Monitoring Section/RS Near-End SES Threshold

This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of allowed ranges for SDH and SONET): 1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

40. *polynomial* - Optical Channel Scrambling Polynomial

This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (*och* = ENABLE).

Type: numeric value set.

Range: $1x^7 + x + 1$; $2x^{16} + x^{12} + x^3 + x + 1$.

Default: 2.

41. *portClass* – Port Class

This parameter identifies the port class of the AID.

In which role the port is used by the ONNS application is specified by this parameter *portClass*.

Type: alphanumeric value set.

Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) shall be used as default value. Otherwise, the default value shall be TRADITIONAL.

42. *portControl* – Port Control (PortAdministrative Mode)

The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

Type: alphanumeric value set

Range: NORMAL (default), LOCKOUT

43. *propagationDelay* - Propagation Delay

This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter shall not be relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

propagationDelay is used by the ONNS application.

Type: Numeric string

Range: 0(default) ...25. The unit of this value is "milliseconds".

44. *pType* – Port Type

Definition: This identifies the port type of the AID.

It is derived from the functional name and functional qualifier of a circuit pack. If the functional qualifier indicates a pack with 10GE_WANPHY interfaces the port type has the value 10GE_WANPHY, else STM64.

Type: alphanumeric value set.

Range: STM64.

45. *remAdvNodeID* – Remote Advertised Node IDentity

The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter. The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

46. *remLinkID* – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port shall be assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

47. *remRAID* – Remote Routing Area IDentity

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

48. *remTID* – Remote TID

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter shall be supported by ports of *portClass* ENNI.

Type: TID or empty-string

Range: Please refer to the TID definition in the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) description.

Default: empty string: ""

49. *rsmstca* – RS/MS TCA Profile Pointer

Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

Type: alphanumeric string.

Range: String with maximum of 24 characters.

Default: DEFAULT0.

50. *rspm* – RS PM Enable

Enable or disable regenerator section (section) performance monitoring.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

51. *rstimca* – RS TIM Consequent Action Enable

Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimca* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE (default): enable consequent action for TIM
- DISABLE: disable consequent action for TIM.

52. *rstimmon* – RS TIM Monitor Enable

Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* shall be autonomously set by the neighbour detection mechanism.

Type: alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

53. *sdhpn* – SDH ASAP

This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in “[RTRV-OC192: Retrieve OC192 port](#)” (p. 4-2492)) to be compatible with current generation applications.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

54. *sdsfmode* – Signal Degrade/Signal Fail Mode

The degraded state is detected in Burst or Poisson mode.

Type: alphanumeric value set.

Range:

- BURST (default)
- POISSON.

55. *servcond* – Service Condition

This parameter indicates its status concerning service involvement.

Type: alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

56. *srlgList* – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones shall be set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter shall be supported by ports of *portClass* INNI.

This parameter shall be supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0...65535.

Default: 0-0-0-0-0-0-0-0-0-0.

57. *strc* – Value of incoming J0

This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then *strc* contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter *strc* is omitted from the response.

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range: 1 byte string, 16 byte string, 64 byte string (dependent on the *strcfmt* parameter).

58. *strcfmt* – Format of incoming J0

The read format of J0, the incoming section trace (*strc*) and the expected section trace (*exprstrc*). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* shall be autonomously set by the neighbour detection mechanism.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

59. *strcout* – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcfmt* parameter.

If ITU/ETSI mode 2 is selected (*strcfmt* = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the *strcfmt* parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

60. strcst – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: alphanumeric value set.

Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

61. strcwfmt – Format of outgoing J0

The write format of J0, the outgoing section trace (strcout). If the parameter portClass is set to INNI, the system shall autonomously set the parameter strcwfmt according to the actually outgoing J0.

Type: numeric string

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

62. tcamd – TCA mode

This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (also known as the implicit reset method)
- TR-RTR (also known as the explicit reset method).

Type: alphanumeric value set.

Range: TR or TRRTR (default).

63. trbmd – Tributary mode

If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

Type: alphanumeric value set.

Range: ADAPTIVE, FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in [“RTRV-EQPT \(system\): Retrieve Equipment \(system\)” \(p. 4-2242\)](#) command.

64. unequipsig – Unequipped Output Signal List

This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequipsig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.

Type: numeric value set.

Range: NX-NX-NX-...

N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.

Default: 644 = all VC4.

Detailed behavior description

The command retrieves the parameters as described above.

The RTRV-STM64 command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-STM64 command. Not all output parameters are listed (missing ones indicated by ...):

```
RTRV-STM64:LT-UNITE:1-1-#-#-1-1:123456;  
  
LT-UNITE 00-11-24 08:00:00  
M 123456 COMPLD  
"1-1-#-#-1-1:ptype=STM64,frcdus=DISABLE,dexctr=-3,degthr=-6,  
pmode=MON,...,pmmsneses=15,pmsneses=30"  
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-STM64 command.

Check CCB against ptype and istd

See definition of error response in [“RTRV-STM16: Retrieve STM16 port”](#) (p. 4-2711).

RTRV-STs1: Retrieve STs1 tributary

General

The RTRV-STs1 command is used to retrieve all parameters related to the STs1 tributary.

Note: If a tributary AID (Access IDentifier) is specified in the RTRV-STs1 request for a slot provisioned with a GE1 pack (e.g. 1-1-#-#-1-1-1 is used), then an empty reply is returned instead of: IENE - Input, Entity Not Exists.

For GE1 the “[RTRV-VCGTRIB: Retrieve virtual concatenation group tributary](#)” (p. 4-2899) command must be used.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-STs1:*tid:aid:ctag*;

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
AID of an SDH tributary. The keyword *all* is allowed on slot, port and tributary level. The so called “dynamic parameters” shall be reported, if a *all* is used at the tributary level.
The “dynamic parameters” are:
 - *ptrc*, *ptrcst*, *siglb*, *trailstate*.Type: AID
Range: STs1NumAID.
3. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Important! To retrieve the dynamic parameters (*ptrc*, *ptrcst*, *siglb*, *trailstate*) of all tributaries use the “[RTRV-ALL: Retrieve all \(trib\)](#)” (p. 4-2075) command and set the parameter *dyn* to YES.

Output format

In response to a valid RTRV-STST1 command, the following output report is returned:

```

sid date time
M ctag COMPLD
  "aid[:spec_block]"
    ...
    ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
AID of the SONET tributary. The keyword *all* is not allowed on any level.
Type: AID
Range: STS1NumAID

Spec block parameters

1. *brstintvl* – Bursty Interval
If the STS-1 tributary is related to a EC1 port, then the parameter *sdsfmode* is fixed to POISSON. As a consequence, the parameter *brstintvl* will never be used by the system in this case.
Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
2. *brstthr* – Bursty Error Threshold
If the STS-1 tributary is related to a EC1 port, then the parameter *sdsfmode* is fixed to POISSON. As a consequence, the parameter *brstthr* will never be used by the system in this case.
The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, 15, 20, 25, 30, ... 50.
Default: 30.

3. *crslpbkrate* – Cross-connect loopback Rate

It is independent from the current interface standard and therefore both SDH and SONET values are allowed.

The parameter *crslpbkrate* is not reported if the parameter *crslpbkstat* indicates that no loopback is set.

Type: alphanumeric value set.

Range:

- VC3
- VC4
- VC44C
- VC416C
- VC464C
- STS1
- STS3
- STS12
- STS48
- STS192

4. *crslpbkstat* – Cross-connect loopback status

State of cross- connect loopback.

Type: alphanumeric value set.

Range:

- YES = Cross-connect loopback is provisioned
- NO (default) = No cross-connect loopback is provisioned.

5. *degthr* – Signal Degrade Threshold

The setting of this parameter are used when *sdsfmode*=POISSON

Type: numeric value set.

Range (as exponents of 10): –5; –6 (default); –7; –8; –9

6. *dexcth* – Excessive Degrade Threshold

The setting of this parameter are used when *sdsfmode*=POISSON. The values are set as exponent of 10.

Type: numeric value set.

Range (as exponent of 10) –3 (default); –4; –5.

7. *exphptrc* – Expected Path Trace (J1)

The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

Type: Hexadecimal digits

Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 89hex followed by 15 bytes 00hex.

8. **feppm** – Far-End Path PM Enable
It indicates whether this performance monitoring feature is enabled or disabled.
Type: alphanumeric value set.
Range:
 - ENABLE
 - DISABLE (default).
9. **loca** – Ring A-node TID
This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* =EDGE being members in BLSR/MSSPRING protection groups. The *loca* parameter value shall be an empty string for all other tributaries.
loca is introduced specifically for use related to ONNS application.
Type: TID or empty-string.
Range: Please refer to the TID definition in [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) description.
Default: empty string: `""`. This is displayed as `\"` in output direction.
10. **locz** – Ring Z-node TID
This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass*=EDG E being members in BLSR/MSSPRING protection groups. The *locz* parameter value shall be an empty string for all other tributaries.
locz is introduced specifically for use related to ONNS application.
Type: TID or empty-string.
Range: Please refer to the TID definition in the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) description.
Default: empty string: `""`. This is displayed as `\"` in output direction.
11. **hptimmon** – Path Trace Monitoring Enable (J1)
Description: High order path trace (J1) identifier mismatch (TIM) monitor enable. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
Type: alphanumeric value set.
Range:
 - ENABLE
 - DISABLE (default).
12. **neppm** – Near-End Path PM Enable
It indicates whether this performance monitoring feature is enabled or disabled.
Type: alphanumeric value set.
Range:
 - ENABLE
 - DISABLE (default).

13. *pjepm* – Pointer Justification Event PM Enable

It indicates whether this performance monitoring feature is enabled or disabled.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

14. *pmhpfses* – Performance Monitoring Path Far-End SES Threshold

This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of ranges for SDH and SONET): 1-64000.

Default: 2400.

15. *pmhpneses* – Performance Monitoring Path Near-End SES Threshold

This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of ranges for SDH and SONET): 1-64000.

Default: 2400.

16. *pse* – PDI-P Switching Enable

The PDI-P Switching Enable parameter indicates if the PDI-P contributes to the automatic path protection switch criteria.

Type: alphanumeric value set

Range:

- ENABLE
- DISABLE (default).

17. *ptca* – Path TCA Profile Pointer

Type: alphanumeric string.

Range: string with up to 24 characters.

Default: DEFAULT0.

18. *ptrc* – Path Trace (J1)

This parameter shows the value of the path trace identifier on the incoming path overhead J1 byte of a non-terminated tributary. The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to a signal-fail condition or intra-NE

communication problems, and the output parameter ptrc is omitted from the response. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range:

- 1 byte for non-specific repeating byte
- 16 byte: These 16 byte shall consist of 15 byte information and the CRC7 byte
- 64 bytes: This is a pure byte stream without any restrictions.

19. ptrcrfmt – Path Trace Read Format (J1)

The read format of J1, the incoming path trace (ptrc).

Type: numeric string.

Range:

- 2: for non-specific repeating byte
- 16: for 16 byte specific string.
- 64: for 64 byte string.

Default: 2.

20. ptrcst - Status of Incoming Path Trace (J1)

This parameter shows the status of the value of the incoming path trace identifier which is available with parameter ptrc. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

Type: alphanumeric value set.

Range:

- NORMAL: ptrc contains a valid value
- UNAVAILABLE: no valid value for ptrc could be obtained by the system
- AIS: no valid value for ptrc due to an SF condition.

21. sdsfmode – Signal Degrade/Signal Fail Mode

The degraded state is detected in BURST or POISSON mode.

Type: alphanumeric value set.

Range:

- BURST
- POISSON (default).

If the tributary is related to a EC1 port, then the range shall be limited to:
POISSON

22. siglb - Signal Label

This parameter shows the value of the signal label on the incoming path overhead C2 byte of a non-terminated VC tributary.

The parameter shall not be reported if the *trailstate* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

Type: alphanumeric value set.

Range: 00, 01, ..., FE, FF; i.e. two hexadecimal digits.

23. substr - Substructured

This parameter indicates if the tributary is substructured.

Substructure for LO cross-connections:

A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross connections.

The parameter *substr* is set autonomously when LO cross connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower order cross connection creation/deletion behaviour description for the commands ENT-CRS and DLT-CRS).

A sub structured HO tributary cannot be used to set up HO cross connections. The parameter *substr* shall be set autonomously when the LO substructure is created or deleted using the ED-SUBS command.

Substructure for conversion cross-connections:

A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross connections.

The parameter *substr* shall be set autonomously when an AU3/AU4 conversion cross-connection is created.

A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross connections.

Type: alphanumeric value set.

Range:

- YES: Automatically sub structured for LO cross connections
 - MANSUB: Manually sub structured for LO cross connections
 - CNVSUB: Automatically sub structured for the LO side of conversion cross connections
 - NO (default): Not sub structured, not used for conversion cross connections
- If the STS-1 tributary is related to a EC1 port, then no LO cross connections are allowed. As a consequence, the parameter *substr* can only have the values CNV and NO in this case.

24. tmonmd – Tributary Monitoring Mode

This parameter indicates the mode of the tributary.

Type: alphanumeric value set.

Range:

- MON = alarm monitoring is taking place on the port.
- NMON (default) = alarm monitoring is not occurring on the port.

25. trailstate - Trail State (C2)

It shall be possible to read the accepted trail value status (C2) of every VC which is terminated/monitored in the system. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

Type: alphanumeric value set.

Range:

- NORMAL: for accepted TSL which has valid payload type
- AIS: for SSF, VC-AIS, dTIM or dUNEQ
- UNAVAILABLE: for TSL which does not meet the acceptance criteria or no reporting is possible.

Default: UNAVAILABLE.

26. tribsonetpn – Tributary Alarm Severity Assignment Profile

This parameter points to a tributary ASAP profile name of type PATH for the designated AID.

Type: Alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

Detailed behavior description

Applicability for STS3c and concatenated signals

The RTRV-STS1 command is also applicable to STS3c tributaries. Even though a STS3c signal is not a concatenated STS1 signal in a strict sense, from a pointer processor viewpoint it can be considered to be comprised of three STS1 signals which have the properties of a concatenated signal. Thus it is not necessary to have a separate RTRV command for STS3c. Similarly, RTRV-STS1 is also applicable to other "concatenated" signals.

Retrieval of concatenated tributaries

The rules as defined for RTRV-VC3 apply as well.

Behavior for non-existing entities

If the specified VC3/VC4 tributaries do not exist, the command shall return an empty response. E.g. if an attempt is made, to retrieve VC3/VC4 tributaries on a GbE circuit pack.

Example input/output

```
RTRV-STS1:LT-UNITE:1-1-#-#-3-1-1:123456;
```

```
LT-UNITE 00-11-27 08:00:00
```

```
M 123456 COMPLD
"1-1-#-#-3-1-1:crslpbkstat=NO,tmonmd=NM0N,
tribsonetpn=Default,ptca=Default0,feppm=DISABLE,
pmhpnases=30,pmhpfeses=30,degthr=-6,...,
ptrcrfmt=1,dexcthr=-3,ptrc=00,ptrcst=NORMAL,
sdsfmode=POISSON"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there also apply to the RTRV-STS1 command.

Check CCB against *istd* of related port

See definition of error response in [“RTRV-VC3: Retrieve VC3 tributary”](#) (p. 4-2863).

RTRV-SYNCN: Retrieve synchronization

The command displays the provisioning and operational information of the synchronization attributes as set by the SET-SYNCN command and after initial system start-up. It also displays the status of the external timing reference input and output ports.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-SYNCN:*tid*:[*aid*]:*ctag*;

Input parameters

Command parameters

1. *tid* – target identifier
See definition of *tid* – *target identifier* in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
2. *aid* – access identifier
This parameter is used to identify the timing related settings. The AID separates the parameter in system timing related parameter, output timing related parameters, parameters related to assigned timing references and parameters for external timing input and external timing output. The *all* AID retrieves all retrievable parameters for synchronization. If the AID is omitted, the outputs for the whole synchronization area are given.
Type: AID
Range:
 - SystemAID
 - Timing_Output_AID
 - External_timing_ref_AID
 - Line_timing_ref_AID
 - External_Timing_input_port_AID
 - External_Timing_output_port_AID
 - all.Default: all.
3. *ctag* – correlation tag
See definition of *ctag* – *correlation tag* in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output format

After receiving the RTRV-SYNCN command, the following normal completion response is returned:

```

    sid date time
M  ctag COMPLD
    "aid:spec_block"
    ...
    ...
    "aid:spec_block"
;

```

Output parameters

Command parameters

1. **aid** – access identifier
 This parameter specifies the timing related settings.
 Type: AID
 Range:
 - SystemAID
 - Timing_Output_AID
 - External_timing_ref_AID
 - Line_timing_ref_AID
 - External_Timing_input_port_AID
 - External_Timing_output_port_AID
 Default: Not applicable.

Spec block parameters

1. System Timing
 - a. **active_ref** – active timing reference status
 This parameter displays the active timing reference, which the system clock is currently using for locked mode of system timing.
 The value NONE shall be reported in the following cases:
 - no timing reference is assigned (or all references are failed or locked-out)
 - the system is in free-running mode
 Type: text string
 Range: External_timing_ref_AID, Line_timing_ref_AID; NONE
 Default: NONE.
 - b. **clkmod** – clock mode
 This parameter specifies the provisioned operational mode of the system timing. In the clockmod == FREE-RUNNING mode the system clock process uses the internal oscillator as reference. In the clockmod == LOCKED mode the system clock process uses the input signal from the system.

Type: Alphanumeric value set.

Range: FREE-RUNNING, LOCKED.

Default: FREE-RUNNING.

c. `clkmod_stat` – system clock mode status

This parameter specifies the state of the system clock. The range is depending on the system synchronization characteristic.

NORMAL: This operational mode indicates either the NE derives timing from the internal oscillator when `clockmod == FREE-RUNNING`, or the system timing is locked to a timing reference signal when `clockmod == LOCKED` and the reference is derived from one of the timing input signals. Refer to `clkmod` parameter.

AUTONOMOUS-HOLDOVER: This state indicates that all references are failed and no higher priority request is present.

FORCED-HOLDOVER: This operational mode is caused by a Clock Backup Request.

FAST-START: This operational mode indicates for fast pull-in of the clock when recovering from holdover (for SONET only).

The values AUTONOMOUS-HOLDOVER, FORCED-HOLDOVER and FAST-START are only possible when `clockmod == LOCKED`.

Type: Alphanumeric value set.

Range:

SONET: NORMAL, AUTONOMOUS-HOLDOVER, FORCED-HOLDOVER, FAST-START.

SDH: NORMAL, AUTONOMOUS-HOLDOVER, FORCED-HOLDOVER.

Default: NORMAL

d. `refsw_stat` – reference switch status

The System Timing Reference Switch Request State is a state of the system timing.

The value FORCED means, the system enters the Forced Switch state upon the initiation and successful completion of the Forced Switch command. While in the Forced Switch state the system may not switch the active timing reference, neither automatically nor by means of the Forced Switch or Manual Switch command.

The value MANUAL means, the system enters the Manual Switch state upon the initiation and successful completion of the Manual Switch command. While in the Manual Switch state the system may switch the active timing reference automatically if required for protection switching.

The parameter NO-REQUEST indicates, this is the routine-operation quiet state in which no external command activities are occurring. The system enters this state upon initial start-up, and following a clear command, or the clearing of an automatic switch.

Type: Alphanumeric value set.

Default: NO-REQUEST.

e. `stratum_level` – stratum level status

This parameter provides information about the level of the system clock. The parameter is depending from the system synchronization characteristic.

Type: Alphanumeric value set

Range:

SONET: 3

SDH: SEC

Default:

SONET: 3

SDH: SEC.

f. `syncmsg` – system synchronization status messaging mode

This parameter is used to ENABLE or DISABLE the SSM protocol.

The parameter provisions the automatic reference selection process to use the incoming QLs in QL-enabled mode or to ignore them in QL-disabled mode. In case of DISABLE, for SDH all output SSMs shall be set to DNU, for SONET all output SSMs shall be set to STU.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: ENABLE.

g. `sysql_stat` – system quality level status

This parameter indicates the overall system timing quality level status. If the system configured as SONET then the SONET related values are indicated and if the system configured as SDH the SDH related values are indicated.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3, DUS

SDH: PRC, SSUL, SSUT, SEC, DNU.

Default:

SONET: DUS

SDH: DNU.

h. `timing` – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1.. 24 characters). A hyphen (-) is additionally allowed in the name.

Default: Default

i. `wtr` – wait to restore

This parameter specifies the provisioned wait to restore timer used for all timing ports for revertive switching. This is the amount of time it takes to switch from lower priority to higher priority references. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: 0SEC, 20SEC, 0...60MIN (1 minute steps), 99 (infinite).

SDH: 0SEC, 0...60MIN (1 minute steps); the values "0SEC" and "0MIN" can be used for SONET and SDH to provision a zero wait to restore time.

Default:

SONET: 20SEC

SDH: 5MIN

j. `wu_stat` – warm up status

This parameter is an attribute of the timing pack hardware design.

At initial start up of the system and at replacing of the active or standby timing function the system is in warm-up state. DNU/DUS is transmitted during this state on all ports. The clock would be expected to warm up for a temporary period of time before transition to NORMAL.

Type: Alphanumeric value set.

Range: NORMAL, WARMING-UP.

Default: NORMAL.

2. Output Timing (instance only valid for SDH)

a. `active_oref_stat` – active output timing reference status

This parameter displays the current selected timing reference of the timing link switch for the external output.

The value NONE shall be reported in the following cases:

- the external output timing is not locked to system timing (i.e. `extout_prov` ≠ SETG) AND none of the six `line_timing` instances (`line1` to `line6`) is enabled OR all are failed OR locked out
- the external output timing is locked to system timing (i.e. `extout_prov` = SETG)

Type: text string.

Range: `Line_timing_ref_AID`, NONE.

Default: NONE.

b. `orefswr_stat` – output timing reference switch request status

This parameter indicates the output timing reference switch request state.

The value MANUAL means, a manual switch is active to the external timing output. The value FORCED means, a forced switch is active to the external timing output. The value NO-REQUEST means, no external command activities are occurring at the external timing output.

Type: Alphanumeric value set.

Default: NO-REQUEST.

3. Assigned Timing Reference

a. `extout_pri` – timing output reference priority

This parameter specifies the priority assignment of the timing link switch of the external output timing. This parameter is only for SDH and for line timing references.

The greater the number the lower the priority. The number "1" indicates the highest priority. The priority "0" means not assigned for external output.

Type: Numeric value set.

Range: 0 (means DISABLED), 1, 2, 3, 4, 5, 6.

Default: 0 (means DISABLED).

b. `inq1` – assigned timing reference quality value

This parameter displays the input synchronization message for each port of the timing link switch provisioning of the system timing and of the output timing. In the output timing context the values for SDH are valid only. In case of invalid SSM, the value DNU or DUS is displayed. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range: SONET: PRS, STU, ST2, ST3, DUS

SDH: PRC, SSUT, SSUL, SEC, DNU.

Default: Not applicable.

c. `inq1_stat` – input quality status

This parameter indicates the synchronization messaging quality level status for the specified timing reference.

The parameter describes the validity of the incoming quality level and take the following values: VALID, when the QL is a valid SSM and stable, INVALID, when the QL is not a valid SSM, or unstable, NOT-SUPPORTED, when SSM reception is not supported on that interface due to HW capabilities or the chosen format of the input signal (such as 2MHz), NOT-APPLICABLE, when no port is assigned to the current timing reference or the assigned timing reference experiences a reference fail.

Type: Alphanumeric value set.

Range: VALID, INVALID, NOT-SUPPORTED, NOT-APPLICABLE.

Default: NOT-APPLICABLE.

d. `q1_prov` – quality provisioned

This parameter defines the quality for the specified timing reference to a fixed SSM value. It is the provisioned quality level sync message value that will be received on timing references.

This parameter is related to all assigned timing references (both external timing references and line timing references) and overrides what is received for the respective timing reference. The AUTO value implies sync message support. The AUTO value is rejected if SSM is not supported for the assigned timing reference (i.e. for DS1 SF). The value range depends from the system synchronization characteristic. Per default shall be:

AUTO – for STM-N/OC-N line, 2Mbit/s framed or DS1 ESF with SSM,

SSUT – for 2MHz, 2Mbit/s unframed or framed without SSM

STU – for DS1 SF or DS1 ESF without SSM

Type: Alphanumeric value set.

Range:

SONET: AUTO, PRS, STU, ST2, ST3

SDH: AUTO, PRC, SSUL, SSUT, SEC.

Default:

SONET: AUTO (External_timing_ref_AID, Line_timing_ref_AID)

SDH: AUTO (Line_timing_ref_AID) SSUT (External_timing_ref_AID).

e. `ref_lock` – timing reference lockout status

This parameter displays the timing reference lockout state to the specified timing reference. It is the input status for each port of the timing link switch provisioning of the system timing.

The value LOCKOUT means, the assigned reference has been locked out by the user, and cannot be used as a timing reference signal until the lockout is cleared.

Type: Alphanumeric value set.

Range: LOCKOUT, NO-LOCKOUT.

Default: NO-LOCKOUT.

f. `ref_stat` – assigned timing reference signal status

The Assigned Timing Reference Signal Status is a status of each timing reference.

The status NORMAL means, the timing reference is available and operating normally without faults. The status FAILED means, the timing reference is failed. The status WAIT-TO-RESTORE means, the wait to restore timer is active before transition to NORMAL. The status NOT-CONNECTED means, there is no timing reference signal connected to the timing port.

Type: Alphanumeric value set.

Range: NORMAL, FAILED, WAIT-TO-RESTORE, NOT-CONNECTED.

Default: NOT-CONNECTED.

g. `sclkref_lockstat` – station clock output timing reference lockout state

This parameter indicates the assigned station clock output timing reference lockout state. This parameter is only for SDH and for line timing references.

Type: Alphanumeric value set.

Range: LOCKOUT, NO-LOCKOUT.

Default: NO-LOCKOUT.

h. `syncref_pri` – system timing reference priority

This parameter defines the priority for assigned timing references.

When multiple input references have been given the same priority value, it implies non-revertive switching between the associated references. Otherwise, it implies revertive switching to the reference with the highest assigned priority. When the QL-control is disabled, the selection process is controlled by signal status and port priority. The greater the number, the lower the priority. Priority "0" means not assigned.

Type: Numeric value set.

Range: 0 (means DISABLE), 1, 2, 3, 4, 5, 6, 7, 8.

Default: 0 (means DISABLE).

i. `timing` – ASAP name

See definition in [“RTRV-SYCN: Retrieve synchronization” \(p. 4-2767\)](#) section system timing of this parameter.

j. `tpmode` – timing port mode monitoring

This parameter specifies the monitoring status of the timing port. If the timing port is in the MONITORED mode and the reference is in FAILED status alarms are active for this port. The value NOT-MONITORED means that alarm monitoring is not occurring on the port.

Type: Alphanumeric value set.

Range: MONITORED, NOT-MONITORED.

Default: NOT-MONITORED.

k. `tpql_in` – incoming SSM value of the timing port

This parameter indicates the QL value for the timing port. The value range depends on the system synchronization characteristic.

The parameter describes the incoming SSM and takes the following values:

PRS – Stratum-1 Traceable STU – Synchronized Traceability Unknown

ST2 – Stratum-2

ST3 – Stratum-3

DUS/DNU – Don't Use for Synchronization

PRC – Primary Reference Clock

SSUT – Synchronization Supply Unit Transit node

SSUL – Synchronization Supply Unit Local node

SEC – SDH Equipment Clock

SSMn – other SSM values with invalid state (for SDH)

UNSTABLE – value is unstable

NONE – SSM value not supported by hardware

Type: Alphanumeric value set.

Range:

SONET: PRS (0001), STU (0000), ST2 (0111), ST3 (1010), DUS (1111),
NONE

SDH: PRC (0010), SSUT (0100), SSUL (1000), SEC (1011), DNU (1111),
SSM0 (0000), SSM1 (0001), SSM3 (0011), SSM5 (0101), SSM6 (0110), SSM7
(0111), SSM9 (1001), SSM10 (1010), SSM12 (1100), SSM13 (1101), SSM14
(1110), UNSTABLE, NONE.

Default: Not applicable.

l. `tref_aid` – timing reference assigned port AID

This parameter specifies the port AID of the assigned timing reference AID.

The parameter is rejected, if the timing reference already assigned to a timing port, or if the reference does not support SSM and timing port is provisioned AUTO, or if the unit which delivers the reference is not present or pre-provisioned. It is not possible to assign more than one reference from a unit. It is not possible to un-assign units from which a reference is assigned to a timing port. It is also not possible to assign a reference from a protection port in a protection group. The value NOT-CONNECTED means no reference is assigned to current timing port.

Type: AID.

Range: External_Timing_input_port_AID, SPortAID, NOT-CONNECTED.

Default: NOT-CONNECTED.

4. External Timing Input

a. `ext_if` – external input signal format

This parameter specifies the format of the external timing input.

The value range depends on the system synchronization characteristic. The external timing input format can be set at both external timing inputs individually. The reference is rejected, if the reference does not support SSM and the timing port is provisioned AUTO.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

b. `ext_isa` – external input sa bit location

This parameter defines the external input Sa bit location. It is only valid for the external timing input format “2Mbit/s” framed; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The location of the Sa bit is can be set at both external timing inputs individually. One of the Sa4 to Sa8 bits of the 2Mbit/s sub-multiframe is allocated for Synchronization Status Messages (SSM).

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

c. `ext_issm` – external input ssm support

This parameter specifies if the SSM mode is supported or not on the external timing input port.

The parameter is adjustable individually to both external timing input ports.

Type: Alphanumeric value set.

Range: SUPPORTED, NOT-SUPPORTED.

Default: SONET: SUPPORTED, SDH: NOT-SUPPORTED.

5. External Timing Output

a. `ext_equ` – cable equalization

This parameter specifies the timing output cable equalization to adjust the specified timing reference output signal power. This parameter is valid only for DS1 (SONET).

This parameter is rejected for all input interfaces except DS1. The values are represented by percentage (3.0dB=100%; 2.4dB=80%; 1.8dB=60%; 1.2dB=40%; 0.6dB=20%).

Type: Numeric value set.

Range: 20, 40, 60, 80, 100.

Default: 20.

b. `ext_of` – external output signal format

This parameter specifies the external output signal format. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

c. `ext_osa` – external output sa bit location

This parameter defines the external output Sa bit location. This parameter is only valid for external timing output format “2Mbit/s framed”; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

d. `ext_out_sig_stat` – external output signal status

This parameter indicates the external output signal status.

The value NORMAL indicates when the output timing signal is enabled and providing a correctly synchronized output timing signal. The value DISABLED indicates when the output timing signal has been disabled by means of user provisioning. The value UNACCEPTABLE indicates when the output timing signal is enabled but the timing output does not provide a suitable timing reference signal. This is caused by failed reference into the timing output process or references rejected based on threshold AIS criteria.

Type: Alphanumeric value set

Range: NORMAL, DISABLED, UNACCEPTABLE.

Default: DISABLED.

e. `extout_en` – external timing output enabling/disabling

This parameter specifies whether the external timing output is enabled or disabled.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

f. `extout_prov` – external timing output selection

This parameter specifies the operation mode of the external output timing.

The value SETG means the system clock. The value TLS means the output. For SONET both values are fixed to the respective external timing output. The value range depends on the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG, TLS.

Default: SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG.

g. extout_ssm – external timing output AIS mode

This parameter specifies which value will be send when the signal level is below the quality acceptance level or when *frcdus* is enabled. The parameter is valid depending from the system synchronization characteristic, for SDH 2Mbit/s framed and for SONET DS1 ESF; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The value AISMODE means AIS is inserted in the external timing output signal. The value QLMODE means DUS is inserted in the external timing output signal.

Type: Alphanumeric value set.

Range: AISMODE, QLMODE.

Default: QLMODE.

h. frcdus – forced DNU/DUS

This parameter specifies the synchronization messaging forced DNU/DUS enable or disable for the timing output port. DUS applies to SONET and DNU applies to SDH. This is only valid for '2Mbit/s framed' and 'DS1 ESF'; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

i. loopdelay – timing regenerator loop delay

This parameter indicates the delay in the SASE/BITS loop operation. The values are represented by seconds in steps of 1 seconds per loop.

Type: Numeric value set.

Range: 0...60 (1 seconds steps).

Default: 10.

j. ql_out – quality of the external timing output port

This parameter indicates the quality value on the signal for the timing output port.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3, DUS

SDH: PRC, SSUL, SSUT, SEC, DNU.

Default: Not applicable.

k. qlout_tais – acceptance quality level for output threshold AIS

This parameter is the provisioned quality acceptance level for external timing output. When the incoming message is below this level, AIS or DUS (depending from the *extout_ssm* value) will be inserted into the external timing output. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3

SDH: PRC, SSUT, SSUL, SEC.

Default:

SONET: ST3

SDH: SEC.

l. *regen_loop* – timing regenerator loop

This parameter specifies the avoiding of loops over the SASE/BITS clocks.

When this parameter is set to ENABLED, the synchronization message DUS will be inserted in the traffic output port associated with the traffic input port used as source for the station clock. The parameter is selectable for both external timing outputs individually.

Type: Alphanumeric value set.

Range:

SONET: DISABLE, ENABLE

SDH: DISABLE, EXTREF1, EXTREF2, BOTH.

Default:

SONET: ENABLE

SDH: DISABLE.

m. *timing* – ASAP name

See definition in [“RTRV-SYNCN: Retrieve synchronization” \(p. 4-2767\)](#) section system timing of this parameter.

Detailed behavior description

The RTRV-SYNCN command retrieves the output parameters values for the specified input AID as described in [“RTRV-SYNCN: Retrieve synchronization” \(p. 4-2767\)](#) output parameters section.

Example input/output

The following is an example of the RTRV-SYNCN command:

```
RTRV-SYNCN:LT-UNITE:extrefall:123456;
```

```
LT-UNITE 00-11-13 12:00:00
M 123456 COMPLD
"EXTREF1:tref_aid=EXTTMG0,syncref_pri=2,ref_stat=NORMAL,
ref_lock=NO-LOCKOUT,inql=SSUT,inql_stat=NOT-SUPPORTED"
"EXTREF2:tref_aid=EXTTMG1,syncref_pri=3,ref_stat=NORMAL,
ref_lock=NO-LOCKOUT,inql=SSUT,inql_stat=NOT-SUPPORTED"
```

;

RTRV-T3: Retrieve DS3 port

The RTRV-T3 command shall be used to retrieve all parameters related to the electrical DS3 port.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command Syntax:

RTRV-T3:*tid:aid:ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
See definition in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
2. *aid* – Access Identifier
Access Identifier of a DS3 port.
Type: AID
Range: APortAID of DS3 port. The keyword “all” shall be allowed up to shelf level.
3. *ctag* – Correlation Tag
See definition in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output format

In response to a valid RTRV-T3 command, the following output report shall be returned:

```
sid date time
M ctag COMPLD
  "aid[:spec_block]"
  ...
  ...
  "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the RTRV-HDR command.

Output parameters

Command parameters

1. *aid* – access identifier
Type: AID
Range: APortAID of DS3 port

Spec block parameters

1. *cbitmis* - C-bit Signal Format Mismatch
DS3 C-bit Signal Format Mismatch parameter indicates a mismatch between the C-bit parity format and the format of the incoming DS3 signal (ingress direction). The DS3 C-bit Signal Format Mismatch parameter shall have the value:
 - NORMAL, if the Signal Format (*fmt*) is set to C-BIT and a DS3 signal in C-bit parity channelized DS3 format is received
 - MISMATCH, if the Signal Format (*fmt*) is set to C-BIT and a DS3 signal in M23 channelized DS3 format is received
 - NA, if the Signal Format (*fmt*) is set to C-BIT and one of the alarms DS3LOS, DS3LOF, DS3AIS, DS3IDLE is present, or if the Signal Format (*fmt*) is set to another value than C-BIT, or if the value cannot be determined because *pmode* is set to AUTO or NMON or the circuit pack is not present or other system internal reasons.Type: alphanumeric value set
Range: NORMAL, MISMATCH, NA.
2. *ds3pn* - DS3 ASAP
DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.
Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
3. *eif* - Electrical Interface Type
The parameter *eif* indicates the type of input the port has been provisioned to receive.
Type: alphanumeric value set.
Range: DS3
4. *feac* - Far-End Alarm and Control
The parameter *feac* indicates the status of the FEAC channel of the incoming C-bit parity formatted DS3 signal. The parameter is only applicable, if *fmt* is set to C-BIT. The parameter shall have the value "NA" if the parameter is not applicable (*fmt* = M23 or UNFRAMED-CC), or the value for the parameter is not available because it cannot be determined.
Type: alphanumeric string.
Range: String with 6 characters.

5. `fmt` - Signal Format

This parameter shows the format for the DS3 signal

Type: alphanumeric value set. A hyphen (-) is additionally allowed in the alphanumeric values.

Range:

- C-BIT (default): C-bit parity channelized DS3 format
- M23: M23 channelized DS3 format
- UNFRAMED-CC: UNFRAMED and CLEAR-CHANNEL format

6. `fsflpbkstat` - Far Side Facility Loopback Status

This parameter specifies the current far-side facility loopback status of the considered output aid. A far-side loopback means that the signal on the outgoing port is looped to the incoming port - this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed - if NO then there is no (far-side) loopback exististing for the aid.

Note: not both loopbacks (`lpbk` and `fsflpbkstat`) can be set to YES at the same time

Type: alphanumeric value set

Range: YES, NO (default)

7. `infepm` - Incoming DS3 Far End Path PM Enable

This parameter enables/disables the incoming DS3 far end path performance monitoring.

Type: alphanumeric value set.

Range: ENABLE, DISABLE (default).

8. `inlnpm` - Incoming DS3 Line PM Enable

This parameter enables/disables the incoming DS3 line performance monitoring.

Type: alphanumeric value set.

Range: ENABLE, DISABLE (default).

9. `inpm` - Incoming DS3 Near End Path PM Enable

This parameter enables/disables the incoming DS3 near end path performance monitoring.

Type: alphanumeric value set.

Range: ENABLE, DISABLE (default).

10. `lbo` - Line Build Out

This parameter defines the cable length applicable for the DS3 port.

Type: alphanumeric value set.

Range:

- SHORT (default): 0 ... 68.5 m (0 ... 225 ft)
- LONG: 68.5 ... 137 m (225 ... 450 ft).

11. lpbk - Loopback

This parameter specifies the current near-side loopback status of the considered output *aid*.

A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: alphanumeric value set.

Range:

- YES
- NO (default).

12. outmntc - Outgoing Maintenance Signal

This parameter determines whether an AIS, a DS3AIS or IDLE signal is transmitted in response to an unconnected input.

Type: alphanumeric value set.

Range: AIS (default), DS3AIS, IDLE

13. outfepm - Outgoing DS3 Far End Path PM Enable

This parameter enables/disables the outgoing DS3 far end path performance monitoring.

Type: alphanumeric value set.

Range: ENABLE, DISABLE (default).

14. outpm - Outgoing DS3 Near End Path PM Enable

This parameter enables/disables the outgoing DS3 near end path performance monitoring.

Type: alphanumeric value set.

Range: ENABLE, DISABLE (default).

15. pmode - Port Mode

This parameter sets the mode of the port. In the case of AUTO the *pmode* state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: alphanumeric value set

Range: AUTO (default): indicates that, when a signal is detected at the port, then alarm monitoring will start. MON: indicates that alarm monitoring is taking place on the port. NMON: means that alarm monitoring is not occurring on the port.

16. pmsesl - PM Threshold for SES - Line

PM Threshold (errors in a second) for declaring SES - Line

Type: numeric value set.

Range: 1 ... 8000

Default: 44

17. pmsesp - PM Threshold for SES - Path Incoming

PM Threshold (errors in a second) for declaring SES - Path in incoming direction.

Type: numeric value set.

Range: 1 ... 8000

Default: 44

18. **pmsespfe** - PM Threshold for Far-End SES - Path Incoming
PM Threshold (errors in a second) for declaring Far-End SES - Path in incoming direction.
Type: numeric value set.
Range: 1 ... 8000
Default: 44
19. **pmsespfeout** - PM Threshold (errors in a second) for declaring Far-End SES - Path in outgoing direction.
Type: numeric value set.
Range: 1 ... 8000
Default: 44
20. **pmsespout** - PM Threshold for SES - Path Outgoing
PM Threshold (errors in a second) for declaring SES - Path in outgoing direction.
Type: numeric value set.
Range: 1 ... 8000
Default: 44
21. **ptype** - Port Type
This parameter identifies the port type of the AID.
Type: alphanumeric value set.
Range: T3
22. **sdthr** - Signal Degrade Threshold
Signal degrade threshold in a range from 10×10^{-3} to 10×10^{-9} .
Type: numeric value set.
Range: (as exponents of 10): -3, -4, -5 -6 (default), -7, -8, -9
23. **servcond** - Service Condition
This parameter indicates its status concerning service involvement.
Type: alphanumeric value set.
Range:
 - **INSERVICE** (default): Provisioning values for service are accepted
 - **OUTOFSERVICE**: Provisioning values for service are not accepted.
24. **tca** - DS3 PM TCA
The parameter tca assigns an DS3 PM TCA profile name to the designated AID.
Type: alphanumeric value set. A hyphen (-) is additionally allowed in the name.
Range: String with a maximum of 24 characters, DEFAULT, DEFAULT0 (default).
25. **vmr** - Violation Monitoring Mode
This parameter indicates the status of the DS3 P-bit parity violation monitoring and removal.
Type: alphanumeric value set. A hyphen (-) is additionally allowed in the alphanumeric values.
Range: VMR, VM, NO-VM (default)

Detailed behavior description

The command shall retrieve the parameters as described above. The RTRV-T3 command do not generate a REPT DBCHG message.

Example input/output

The following example shows the successful execution of a RTRV-T3 command. Not all output parameters are listed (missing ones indicated by ...).

```
RTRV-T3:LT-UNITE:1-1-#-#-21-1:123456;
```

```
LT-UNITE 00-11-13 12:00:00
M 123456 COMPLD
"1-1-#-#-21-1:cbitmis=NORMAL,eif=DS3,ptype=T3,
fmt=C-BIT,....sigmis=NORMAL,vmr=NO-VM"
;
```

Error responses

See definition in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command error responses section for general validation rules. The error responses listed there also apply to the RTRV-T3 command.

Validation rule: Check CCB against *ptype* and *eif*

Check whether the CCB fits to *ptype* and *eif*.

Error Code: ICNV - Input, Command Not Valid, Interface Type does not match

RTRV-TACC: Retrieve test access

General

The RTRV-TACC command is used to retrieve the test access-related information on one or all of the test tributaries in the NE. Only the primary test tributary is retrieved.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): T1

Priority: 1

Abortable: Yes

Input format

Command Syntax: *RTRV-TACC-modifier:tid:aid:ctag;*

Input parameters

Command parameters

1. modifier

This parameter indicates the cross-connection rate on which the retrieve test access command is to act.

A distinction of the modifier usage has to be made between the retrieval (RTRV-TACC-modifier) and the other test access related commands (CONN-TACC-modifier, DISC-TACC-modifier, CHG-ACCMD-modifier):

- The establishment (CONN-TACC-modifier), removal (DISC-TACC-modifier) or modification (CHG-ACCMD-modifier) of test access sessions is independent of the provisioned port interface-standard. I.e., either the SDH-rates (VC3, VC4 etc.) or the corresponding SONET-rates (STS1, STS3 etc.) can be used as modifier and no command validation between port interface-standard and modifier will be performed.
- For the RTRV-TACC-modifier command the following holds: Again, no command validation between port interface-standard and modifier will be performed. The output parameter *rate*, however, is filled with the *rate* which was used with the CONN-TACC-modifier command.

Type: alphanumeric value set.

Range:

- ALL
- SDH modifier: VC3, VC4, VC44C, VC416C, VC464C
- SONET modifier: LOVT1, STS1, STS3, STS12, STS48, STS192.

2. **tid** – Target Identifier

This is the currently active name of the network element to which the command is addressed. The tid is a case insensitive character string.

Type: identifier, in addition the special character underscore (“_”) and the password characters are allowed.

Range: 1 to 20 characters

3. **aid** – Access Identifier

AID of a SONET or SDH tributary. The keyword “all” is allowed on slot, port and tributary level.

Type: AID.

Range: STS1NumAID or GenLOTribAID.

The usage of “all” or “usall” or “vall”-values at all defined positions within the AID shall be allowed.

4. **ctag** – Correlation Tag

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-TACC command, the following output report shall be returned:

```

    sid date time
M  ctag COMPLD
    "tatrib1:rate[:spec_block]"
        ...
        ...
    "tatrib1:rate[:spec_block]"
;

```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

The NE returns the following normal completion response for a successful RTRV-TACC command if no test access activity is found on the specified tributaries in the system:

```

    sid date time
M  ctag COMPLD
;

```

This output format is only valid if 'all' is used in the *aid*. Otherwise the validation rule leads to an error message.

Output parameters

Command parameters

1. **tatrib1** – primary Test Access Tributary
AID of the primary test access tributary. The keyword *all* is not allowed on any level.
Type: AID
Range: STS1NumAID or GenLOTribAID.
The usage of "all" or "usall" or "vall"-values at any position of the aid shall not be allowed.
2. **rate** – Test Access rate
This parameter specifies the rate of the signal that is being tested.
Type: alphanumeric value set.
Range: VC3, VC4, VC44C, VC416C, VC464C, LOVT1, STS1, STS3, STS12, STS48, STS192.

Spec block parameters

1. **eomode** – output mode of the E-tributary
This parameter is only present if the test session is created on a 2-way cross-connection. The parameter is omitted for test sessions on 1-way cross-connections or on idle E-tributaries.
Type: alphanumeric value set.
Range:
 - NORM: this is the normal output i.e. the signal from the F-tributary is passed through to the E-tributary
 - AIS: this mode outputs an AIS signal.Default:
 - NORM, if the referring Ttest mode does not disconnect the output of the original cross-connection to this tributary
 - AIS, in all other case.
2. **etrib** – AID of the E-tributary
AID of the E-tributary for the test session.
Type: AID
Range: GenTribAID or GenLOTribAID.
The usage of "all" or "usall" or "vall"-values at any position of the aid shall not be allowed.
3. **fomode** – output mode of the F-tributary
This parameter is only present if the test session is created on a 1-way or 2-way cross-connection. The parameter is omitted for test sessions on idle E-tributaries.
Type: alphanumeric value set.

Range:

- NORM: this is the normal output i.e. the signal from the E-tributary is passed through to the F-tributary
- AIS: this mode outputs an AIS signal.

Default:

- NORM, if the referring test mode does not disconnect the output of the original cross-connection to this tributary
- AIS, in all other cases.

4. **ftrib** – AID of the F-tributary

AID of the F-tributary for the test session. If there is no cross-connection at the E-tributary, this parameter is omitted.

Type: AID.

Range: GenTribAID or GenLOTribAID.

The usage of "all" or "usall" or "vall"-values at any position of the aid shall not be allowed.

5. **tatrib2** – secondary Test Access Tributary

AID of the secondary Test Access Tributary. In the case of test access modes with single test tributary the parameter is omitted.

Type: AID.

Range: STS1NumAID or GenLOTribAID.

The usage of "all" or "usall" or "vall"-values at any position of the aid shall not be allowed.

6. **tstmde** – Test Access Mode

Type: alphanumeric value set

Range: Allowed values:

- MONE - Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection.
- MONF- Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection.
- MONEF - Monitor E-end and F-end mode of test access. This test access mode monitors (E end and F end) both directions of a 2WAY cross-connection.
- SPLTE - Split access E-end mode of test access. This test access mode splits the connection between the E end and F end of a 1WAY cross-connection or a leg of 2WAY cross-connection. Can also be used in an idle tributary.
- SPLTF - Split access F-end mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing at the F-end.
- SPLTEF - Split E-end and F-end mode of test access. This test access mode splits both directions of a 2WAY cross-connection to allow testing at both the E end and F end.

Example input/output

```
RTRV-TACC-STS1:LT-UNITE:1-1-#-#-3-1-1:123456;
```

```
LT-UNITE 02-10-01 08:00:00
M 123456 COMPLD
"1-1-#-#-3-1-1:STS1:TSTMDE=MONEF,TATRIB2=1-1-#-#-4-1-1,ETRIB=1-1-#-#-6-1-1,EOMODE=NORM,FTRIB=1-1-#-#-7-1-1,FOMODE=NORM"
;
```

For Lower-order test access sessions:

```
RTRV-TACC-LOVT1:LT-UNITE:1-1-#-#-3-1-1-28:123456;
```

```
LT-UNITE 02-10-01 08:00:00
M 123456 COMPLD
"1-1-#-#-3-1-1-28:LOVT1:TSTMDE=MONEF,\
TATRIB2=1-1-#-#-4-1-1-28,ETRIB=1-1-#-#-6-1-1-28,\
EOMODE=NORM,FTRIB=1-1-#-#-7-1-1-28,FOMODE=NORM"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command error responses section. The error responses listed there also apply to the RTRV-TACC command.

Validation Rule: Tributary is not assigned as a test tributary

If the aid is not assigned as a test tributary and 'all' is not used in the aid, the following error message shall be returned:

Error Code:

SNVS - Status, Not in Valid State, Tributary not assigned as a test tributary

RTRV-TCA-ASGNMT: Retrieve TCA assignment

The RTRV-TCA-ASGNMT command allows the user to retrieve a list of AIDs that have been assigned to the specified profile type and name.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

Input format

Command Syntax:

RTRV-TCA-ASGNMT:*tid::ctag::pftype,pfname*;

Input parameters

Command parameters

1. *tid* – Target Identifier
See definition in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
2. *ctag* – Correlation Tag
See definition in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
3. *pftype* – Profile Type
This indicates the type of PM TCA profile for the selected facility.
Type: value set.
Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3.
4. *pfname* – Profile Name
This indicates the name of the PM TCA profile which was already established by the command ENT-TCA-PROF. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
Type: alphanumeric string.
Range: This is an alphanumeric character string with a maximum of 24 characters.
Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Output format

If the NE fully complies with the RTRV-TCA-ASGNMT request, the following normal completion response is returned:

```

      sid date time
M   ctag COMPLD
    "pftype,pfname:aid"
      .      .      .
      .      .      .
;

```

Output parameters

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

1. *aid* – Access Identifier
 Type: AID
 Range: SPortAID, STSNumAID, EPortAID, VCGAID, VCGNumAID, PTNumAID, GenLOTribAID.
2. *pftype* – Profile Type
 This indicates the type of PM TCA profile for the selected facility.
 Type: value set.
 Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3.
3. *pfname* – Profile Name
 This indicates the name of the PM TCA profile which was already established by the command ENT-TCA-PROF. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
 Type: alphanumeric string.
 Range: This is an alphanumeric character string with a maximum of 24 characters.
 Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Example input/output

The following example shows the successful completion of a RTRV-TCA-ASGNMT command by the NE:

```

RTRV-TCA-ASGNMT:UNITE-NE::123456::section-line,ATT;
UNITE-NE 00-01-01 08:00:00

```

```
M 123456 COMPLD
  "section-line,ATT:1-1-#-#-22-1"
  "section-line,ATT:1-1-#-#-23-1"
  "section-line,ATT:1-1-#-#-24-1"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there apply to the RTRV-TCA-ASGNMT command. See also subsection ‘Partial Completion on RTRV Commands’ w.r.t. handling of internal error (e.g. communication to XC320 fails) for a subset of replies.

Validation rule: profile name does not exist

If the profile name specified does not exist.

Error code: IDNV - Input, Data Not Valid, TCA profile does not exist

RTRV-TCA-PROF: Retrieve TCA Profile

General

The RTRV-TCA-PROF command allows the user to retrieve either a list of profile names that have been created for a specific profile type or the contents of a profile whose type and name are given in this command. The system supports two default sets of profiles called "DEFAULT" and "DEFAULT0".

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

Input format

Command Syntax:

RTRV-TCA-PROF:*tid::ctag::pftype*;

Input parameters

Command parameters

1. *tid* – Target Identifier
See definition in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
2. *ctag* – Correlation Tag
See definition in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
3. *pftype* – Profile Type
This indicates the type of PM TCA profile for the selected facility.
Type: value set.
Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3.
4. *pfname* – Profile Name
This indicates the name of the PM TCA profile which was already established by the command ENT-TCA-PROF. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
Type: alphanumeric string.
Range: This is an alphanumeric character string with a maximum of 24 characters.
Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Output format

If the system receives this command and the profile name is NULL, the following response is returned:

```

      sid date time
M  ctag COMPLD
    "pftype:pfname"
    "pftype:pfname"
    "pftype:pfname"
    .      .      .      .      .      .
    .      .      .      .      .      .
;

```

If the system receives this command with a valid profile name, the following response is returned:

```

      sid date time
M  ctag COMPLD
    "pftype,pfname:spec_block"
;

```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command parameters - general profile

1. *pftype* – Profile Type
 This indicates the type of PM TCA profile for the selected facility.
 Type: value set.
 Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3.
2. *pfname* – Profile Name
 This indicates the name of the PM TCA profile which was already established by the command ENT-TCA-PROF. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
 Type: alphanumeric string.
 Range: This is an alphanumeric character string with a maximum of 24 characters.
 Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Command parameters - profile parameters of type SECTION-LINE

1. qhcvsoc3
15-minute threshold for CV-S bin for OC-3.
Type: integer
Range: 0-57599100
Default: 140.
2. daycvsoc3
Day threshold for CV-S bin of OC-3.
Type: integer
Range: 0-4294967295
Default: 1344.
3. qhcvsoc12
15-minute threshold for CV-S bin for OC-12.
Type: integer
Range: 0-57599100
Default: 560.
4. daycvsoc12
Day threshold for CV-S bin for OC-12.
Type: integer
Range: 0-4294967295
Default: 5376.
5. qhcvsoc48
15-minute threshold for CV-S bin for OC-48.
Type: integer
Range: 0-57599100
Default: 2240.
6. daycvsoc48
Day threshold for CV-S bin for OC-48.
Type: integer
Range: 0-4294967295
Default: 21504.
7. qhcvsoc192
15-minute threshold for CV-S bin for OC-192.
Type: integer
Range: 0-57599100
Default: 8960.
8. daycvsoc192
Day threshold for CV-S bin for OC-192.
Type: integer
Range: 0-4294967295
Default: 86016.

9. qhcvsoc768
15-minute threshold for CV-S bin for OC-768.
Type: integer
Range: 0-57599100
Default: 35840.
10. daycvsoc768
Day threshold for CV-S bin for OC-768.
Type: integer
Range: 0-4294967295
Default: 344064.
11. qhcvsec1
15-minute threshold for CV-S bin for EC-1.
Type: integer
Range: 0-57599100
Default: 47
12. daycvsec1
Day threshold for CV-S bin of EC-1
Type: integer
Range: 0-4294967295
Default: 448
13. qhess
15-minute threshold for ES-S bin.
Type: integer
Range: 0-900
Default: 25.
14. dayess
Day threshold for ES-S bin.
Type: integer
Range: 0-86400
Default: 250.
15. qhsess
15-minute threshold for SES-S bin.
Type: integer
Range: 0-810
Default: 10.
16. daysess
Day threshold for ES-S bin.
Type: integer
Range: 0-77760
Default: 40.

17. qhsefss
15-minute threshold for SEFS-S bin.
Type: integer
Range: 0-900
Default: 5.
18. daysefss
Day threshold for SEFS-S bin.
Type: integer
Range: 0-86400
Default: 10.
19. qhcvloc3
15-minute threshold for CV-L and CV-LFE bin for OC-3.
Type: integer
Range: 0-172799100
Default: 140.
20. daycvloc3
Day threshold for CV-L bin and CV-LFE for OC-3.
Type: integer
Range: 0-4294967295
Default: 1344.
21. qhcvloc12
15-minute threshold for CV-L and CV-LFE bin for OC-12.
Type: integer
Range: 0-691199100
Default: 560.
22. daycvloc12
Day threshold for CV-L bin and CV-LFE for OC-12.
Type: integer
Range: 0-4294967295
Default: 5376.
23. qhcvloc48
15-minute threshold for CV-L and CV-LFE bin for OC-48.
Type: integer
Range: 0-2764799100
Default: 2240.
24. daycvloc48
Day threshold for CV-L and CV-LFE bin for OC-48.
Type: integer
Range: 0-4294967295
Default: 21504.

- 25. qhcvloc192
15-minute threshold for CV-L and CV-LFE bin for OC-192.
Type: integer
Range: 0-4294967295
Default: 8960.
- 26. daycvloc192
Day threshold for CV-L and CV-LFE bin for OC-192.
Type: integer
Range: 0-4294967295
Default: 86016.
- 27. qhcvloc768
15-minute threshold for CV-L and CV-LFE bin for OC-768.
Type: integer
Range: 0-4294967295
Default: 35840.
- 28. daycvloc768
Day threshold for CV-L and CV-LFE bin for OC-768.
Type: integer
Range: 0-4294967295
Default: 344064.
- 29. qhcvlec1
15-minute threshold for CV-L and CV-LFE bin for EC-1
Type: integer
Range: 0-57599100
Default: 47
- 30. daycvlec1
Day threshold for CV-L bin and CV-LFE for EC-1.
Type: integer
Range: 0-4294967295
Default: 448
- 31. qhes1
15-minute threshold for ES-L and ES-LFE bin.
Type: integer
Range: 0-900
Default: 25.
- 32. dayes1
Day threshold for ES-L and ES-LFE bin.
Type: integer
Range: 0-86400
Default: 250.

33. qhfeccloc192
15-minute threshold for FECC-L bin for OC-192.
Type: integer
Range: 0 - 4294967295
Default: 5184.
34. dayfeccloc192
Day threshold for FECC-L bin for OC-192.
Type: integer
Range: 0 - 4294967295
Default: 497644.
35. qhfeccloc768
15-minute threshold for FECC-L bin for OC-768.
Type: integer
Range: 0 - 4294967295
Default: 20736.
36. dayfeccloc768
Day threshold for FECC-L bin for OC-768.
Type: integer
Range: 0 - 4294967295
Default: 1990656.
37. qhses1
15-minute threshold for SES-L and SES-LFE bin.
Type: integer
Range: 0-810
Default: 10.
38. dayses1
Day threshold for SES-L and SES-LFE bin.
Type: integer
Range: 0-77760
Default: 40.
39. qhuas1
15-minute threshold for UAS-L and UAS-LFE bin.
Type: integer
Range: 0-900
Default: 10.
40. dayuas1
Day threshold for UAS-L and UAS-LFE bin.
Type: integer
Range: 0-86400
Default: 10.

Command parameters - profile parameters of type RS-MS

1. qhrsnbbe
15-minute threshold for RS_N_BBE bin.
Type: integer
Range: 0-7199100
Default: 9000.
2. dayrsnbbe
Day threshold for RS_N_BBE bin.
Type: integer
Range: 0-691113600
Default: 48000.
3. qhrsnes
15-minute threshold for RS_N_ES bin.
Type: integer
Range: 0-900
Default: 180.
4. dayrsnes
Day threshold for RS_N_ES bin.
Type: integer
Range: 0-86400
Default: 1500.
5. qhrsnses
15-minute threshold for RS_N_SES bin.
Type: integer
Range: 0-810
Default: 15.
6. dayrsnses
Day threshold for RS_N_SES bin.
Type: integer
Range: 0-77760
Default: 20.
7. qhrsnuas
15-minute threshold for RS_N_UAS bin.
Type: integer
Range: 0-900
Default: 15.
8. dayrsnuas
Day threshold for RS_N_UAS bin.
Type: integer
Range: 0-86400
Default: 20.

9. qhmsbbestm1
15-min threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
Type: integer
Range: 0-172799100
Default: 228000.
10. daymsbbestm1
Day threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
Type: integer
Range: 0-4294967295
Default: 432000.
11. qhmsbbestm4
15-min threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
Type: integer
Range: 0-691199100
Default: 912000.
12. daymsbbestm4
Day threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
Type: integer
Range: 00-4294967295
Default: 1728000.
13. qhmsbbestm16
15-min threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
Type: integer
Range: 0-2764799100
Default: 3648000.
14. daymsbbestm16
Day threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
Type: integer
Range: 0-4294967295
Default: 6912000.
15. qhmsbbestm64
15-min threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
Type: integer
Range: 0-4294967295
Default: 14592000.
16. daymsbbestm64
Day threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
Type: integer
Range: 0-4294967295
Default: 27648000.

17. qhmsbbestm256
15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
Type: integer
Range: 0-4294967295
Default: 58368000.
18. daymsbbestm256
Day threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
Type: integer
Range: 0-4294967295
Default: 110592000.
19. qhmses
15-minute threshold for MS_N_ES and MS_F_ES bin.
Type: integer
Range: 0-900
Default: 50.
20. daymses
Day threshold for MS_N_ES and MS_F_ES bin.
Type: integer
Range: 0-86400
Default: 150.
21. qhmsnfecccstm64
15-minute threshold for MS-N-FECC bin forSTM-64.
Type: integer
Range: 0 - 4294967295
Default: 5184.
22. daymsnfecccstm64
Day threshold for MS-N-FECC bin forSTM-64.
Type: integer
Range: 0 - 4294967295
Default: 49764.
23. qhmsnfecccstm256
15-minute threshold for MS-N-FECC bin forSTM-256.
Type: integer
Range: 0 - 4294967295
Default: 20736.
24. daymsnfecccstm256
Day threshold for MS-N-FECC bin forSTM-256.
Type: integer
Range: 0 - 4294967295
Default: 1990656.

25. qhmsses
15-minute threshold for MS_N_SES and MS_F_SES bin.
Type: integer
Range: 0-810
Default: 10.
26. daymsses
Day threshold for MS_N_SES and MS_F_SES bin.
Type: integer
Range: 0-77760
Default: 15.
27. qhmsuas
15-min threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
Type: integer
Range: 0-900
Default: 15.
28. daymsuas
Day threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
Type: integer
Range: 0-86400
Default: 20.

Command parameters - reset profile parameters of type RS-MS

1. qhrtrrsnbbe
15-minute reset threshold for RS_N_BBE bin.
Type: integer
Range: 0-7199100
Default: 200.
2. dayrtrrsnbbe
Day reset threshold for RS_N_BBE bin.
Type: integer
Range: 0-691113600
Default: 4800.
3. qhrtrrsnes
15-minute reset threshold for RS_N_ES bin.
Type: integer
Range: 0-900
Default: 20.
4. dayrtrrsnes
Day reset threshold for RS_N_ES bin.
Type: integer
Range: 0-86400
Default: 150.

5. qhrtrrsnses
15-minute reset threshold for RS_N_SES bin.
Type: integer
Range: 0-810
Default: 0.
6. dayrtrrsnses
Day reset threshold for RS_N_SES bin.
Type: integer
Range: 0-77760
Default: 0.
7. qhrtrrsnuas
15-minute reset threshold for RS_N_UAS bin.
Type: integer
Range: 0-900
Default: 0.
8. dayrtrrsnuas
Day reset threshold for RS_N_UAS bin.
Type: integer
Range: 0-86400
Default: 0.
9. qhrtrmsbbestm1
15-min reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
Type: integer
Range: 0-172799100
Default: 2400.
10. dayrtrmsbbestm1
Day reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
Type: integer
Range: 0-4294967295
Default: 43200.
11. qhrtrmsbbestm4
15-min reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
Type: integer
Range: 0-691199100
Default: 9600.
12. dayrtrmsbbestm4
Day reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
Type: integer
Range: 0-4294967295
Default: 172800.

13. qhrtrmsbbestm16
15-min reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
Type: integer
Range: 0-2764799100
Default: 38400.
14. dayrtrmsbbestm16
Day reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
Type: integer
Range: 0-4294967295
Default: 691200.
15. qhrtrmsbbestm64
15-min reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
Type: integer
Range: 0-4294967295
Default: 153600.
16. dayrtrmsbbestm64
Day reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
Type: integer
Range: 0-4294967295
Default: 2764800.
17. qhrtrmsbbestm256
15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
Type: integer
Range: 0-4294967295
Default: 614400.
18. dayrtrmsbbestm256
Day reset threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
Type: integer
Range: 0-4294967295
Default: 11059200.
19. qhrtrmses
15-minute reset threshold for MS_N_ES and MS_F_ES bin.
Type: integer
Range: 0-900
Default: 5.
20. dayrtrmses
Day reset threshold for MS_N_ES and MS_F_ES bin.
Type: integer
Range: 0-86400
Default: 15.

21. qhrtrmsnfecdstm64
15-minute reset threshold for MS-N-FECC bin forSTM-64.
Type: integer
Range: 0 - 4294967295
Default: 0.
22. dayrtrmsnfecdstm64
Day reset threshold for MS-N-FECC bin forSTM-64.
Type: integer
Range: 0 - 4294967295
Default: 0.
23. qhrtrmsnfecdstm256
15-minute reset threshold for MS-N-FECC bin forSTM-256.
Type: integer
Range: 0 - 4294967295
Default: 0.
24. dayrtrmsnfecdstm256
Day reset threshold for MS-N-FECC bin forSTM-256.
Type: integer
Range: 0 - 4294967295
Default: 0.
25. qhrtrmsses
15-minute reset threshold for MS_N_SES and MS_F_SES bin.
Type: integer
Range: 0-810
Default: 0.
26. dayrtrmsses
Day reset threshold for MS_N_SES and MS_F_SES bin.
Type: integer
Range: 0-77760
Default: 0.
27. qhrtrmsuas
15-min reset threshold for MS_N_UAS and MS_F_UAS.
Type: integer
Range: 0-900
Default: 0.
28. dayrtrmsuas
Day reset threshold for MS_N_UAS and MS_F_UAS.
Type: integer
Range: 0-86400
Default: 0.

Command parameters - profile parameters of type ODU

1. qhodupbbeodu1
15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: integer
Range: 0-18377100
Default: 32000.
2. dayodupbbeodu1
Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: integer
Range: 0-1764201600
Default: 61000.
3. qhodupes
15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
Type: integer
Range: 0-900
Default: 50.
4. dayodupes
Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
Type: integer
Range: 0-86400
Default: 150.
5. qhodupses
15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
Type: integer
Range: 0-810
Default: 10.
6. dayodupses
Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
Type: integer
Range: 0-77760
Default: 15.
7. qhodupuas
15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
Type: integer
Range: 0-900
Default: 15.
8. dayodupuas
Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
Type: integer
Range: 0-86400
Default: 20.

Command parameters - reset profile parameters of type ODU

1. qhrtrodupbbeodul
15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: integer
Range: 0-18377100
Default: 200.
2. dayrtrodupbbeodul
Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: integer
Range: 0-1764201600
Default: 4800.
3. qhrtrodupes
15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
Type: integer
Range: 0-900
Default: 5.
4. dayrtrodupes
Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
Type: integer
Range: 0-86400
Default: 15.
5. qhrtrodupses
15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
Type: integer
Range: 0-810
Default: 0.
6. dayrtrodupses
Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
Type: integer
Range: 0-77760
Default: 0.
7. qhrtrodupuas
15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
Type: integer
Range: 0-900
Default: 0.
8. dayrtrodupuas
Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
Type: integer
Range: 0-86400
Default: 0.

Command parameters - profile parameters of type HO-VC

1. qhvcbbbev3
15-minute threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
Type: integer
Range: 0-7199100
Default: 36000.
2. dayvcbbbev3
Day threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
Type: integer
Range: 0-691113600
Default: 48000.
3. qhvcbbbev4
15-minute threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
Type: integer
Range: 0-7199100
Default: 36000.
4. dayvcbbbev4
Day threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
Type: integer
Range: 0-691113600
Default: 48000.
5. qhvcbbbev44c
15-minute threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
Type: integer
Range: 0-7199100
Default: 36000.
6. dayvcbbbev44c
Day threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
Type: integer
Range: 0-691113600
Default: 48000.
7. qhvcbbbev416c
15-minute threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
Type: integer
Range: 0-7199100
Default: 36000.
8. dayvcbbbev416c
Day threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
Type: integer
Range: 0-691113600
Default: 48000.

9. qhvcbbbevc464c
15-minute threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
Type: integer
Range: 0-7199100
Default: 36000.
10. dayvcbbbevc464c
Day threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
Type: integer
Range: 0-691113600
Default: 48000.
11. qhvcesvc3
15-minute threshold for VC_N_ES and VC_F_ES VC3 bin.
Type: integer
Range: 0-900
Default: 150.
12. dayvcesvc3
Day threshold for VC_N_ES and VC_F_ES VC3 bin.
Type: integer
Range: 0-86400
Default: 600.
13. qhvcesvc4
15-minute threshold for VC_N_ES and VC_F_ES for VC4 bin.
Type: integer
Range: 0-900
Default: 180.
14. dayvcesvc4
Day threshold for VC_N_ES and VC_F_ES for VC4 bin.
Type: integer
Range: 0-86400
Default: 1500.
15. qhvcesvc44c
15-minute threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: integer
Range: 0-900
Default: 180.
16. dayvcesvc44c
Day threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: integer
Range: 0-86400
Default: 1500.

17. qhvcsescvc416c
15-minute threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: integer
Range: 0-900
Default: 180.
18. dayvcsescvc416c
Day threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: integer
Range: 0-86400
Default: 1500.
19. qhvcsescvc464c
15-minute threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: integer
Range: 0-900
Default: 180.
20. dayvcsescvc464c
Day threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: integer
Range: 0-86400
Default: 1500.
21. qhvcsescvc3
15-minute threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: integer
Range: 0-810
Default: 15.
22. dayvcsescvc3
Day threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: integer
Range: 0-77760
Default: 20.
23. qhvcsescvc4
15-minute threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: integer
Range: 0-810
Default: 15.
24. dayvcsescvc4
Day threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: integer
Range: 0-77760
Default: 20.

25. qhvcsesvc44c
15-minute threshold for VC_N_SES and VC_F_SES for VC44C bin.
Type: integer
Range: 0-810
Default: 15.
26. dayvcsesvc44c
Day threshold for VC_N_SES and VC_F_SES for VC44C bin.
Range: 0-77760
Default: 20.
27. qhvcsesvc416c
15-minute threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: integer
Range: 0-810
Default: 15.
28. dayvcsesvc416c
Day threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: integer
Range: 0-77760
Default: 20.
29. qhvcsesvc464c
15-minute threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: integer
Range: 0-810
Default: 15.
30. dayvcsesvc464c
Day threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: integer
Range: 0-77760
Default: 20.
31. qhvcuasvc3
15-minute threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: integer
Range: 0-900
Default: 15.
32. dayvcuasvc3
Day threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: integer
Range: 0-86400
Default: 20.

33. qhvcuasvc4
15-minute threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: integer
Range: 0-900
Default: 15.
34. dayvcuasvc4
Day threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: integer
Range: 0-86400
Default: 20.
35. qhvcuasvc44c
15-minute threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
Type: integer
Range: 0-900
Default: 15.
36. dayvcuasvc44c
Day threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
Type: integer
Range: 0-86400
Default: 20.
37. qhvcuasvc416c
15-minute threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
Type: integer
Range: 0-900
Default: 15.
38. dayvcuasvc416c
Day threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
Type: integer
Range: 0-86400
Default: 20.
39. qhvcuasvc464c
15-minute threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
Type: integer
Range: 0-900
Default: 15.
40. dayvcuasvc464c
Day threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
Type: integer
Range: 0-86400
Default: 20.

41. qhpjcpo
15-minute threshold for positive PJC bin.
Type: integer
Range: 0-1800000
Default: 30.
42. daypjcpo
Day threshold for positive PJC bin.
Type: integer
Range: 0-172800000
Default: 2880.
43. qhpjcneg
15-minute threshold for negative PJC bin.
Type: integer
Range: 0-1800000
Default: 30.
44. daypjcneg
Day threshold for negative PJC bin.
Type: integer
Range: 0-172800000
Default: 2880.

Command parameters - reset profile parameters of type HO-VC

1. qhrtrvcbbbev3
15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
Type: integer
Range: 0-7199100
Default: 200.
2. dayrtrvcbbbev3
Day reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
Type: integer
Range: 0-691113600
Default: 4800.
3. qhrtrvcbbbev4
15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
Type: integer
Range: 0-7199100
Default: 200.
4. dayrtrvcbbbev4
Day reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
Type: integer
Range: 0-691113600
Default: 4800.

5. qhrtrvcbbbev44c
15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
Type: integer
Range: 0-7199100
Default: 200.
6. dayrtrvcbbbev44c
Day reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
Type: integer
Range: 0-691113600
Default: 4800.
7. qhrtrvcbbbev416c
15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
Type: integer
Range: 0-7199100
Default: 200.
8. dayrtrvcbbbev416c
Day reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
Type: integer
Range: 0-691113600
Default: 4800.
9. qhrtrvcbbbev464c
15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
Type: integer
Range: 0-7199100
Default: 200.
10. dayrtrvcbbbev464c
Day reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
Type: integer
Range: 0-691113600
Default: 4800.
11. qhrtrvcsv3
15-minute reset threshold for VC_N_ES and VC_F_ES VC3 bin.
Type: integer
Range: 0-900
Default: 10.
12. dayrtrvcsv3
Day reset threshold for VC_N_ES and VC_F_ES VC3 bin.
Type: integer
Range: 0-86400
Default: 60.

13. qhrtrvcsvc4
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
Type: integer
Range: 0-900
Default: 20.
14. dayrtrvcsvc4
Day reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
Type: integer
Range: 0-86400
Default: 150.
15. qhrtrvcsvc44c
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: integer
Range: 0-900
Default: 20.
16. dayrtrvcsvc44c
Day reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: integer
Range: 0-86400
Default: 150.
17. qhrtrvcsvc416c
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: integer
Range: 0-900
Default: 20.
18. dayrtrvcsvc416c
Day reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: integer
Range: 0-86400
Default: 150.
19. qhrtrvcsvc464c
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: integer
Range: 0-900
Default: 20.
20. dayrtrvcsvc464c
Day reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: integer
Range: 0-86400
Default: 150.

21. qhrtrvcscsvc3
15-minute reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: integer
Range: 0-810
Default: 0.
22. dayrtrvcscsvc3
Day reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: integer
Range: 0-77760
Default: 0.
23. qhrtrvcscsvc4
15-minute reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: integer
Range: 0-810
Default: 0.
24. dayrtrvcscsvc4
Day reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: integer
Range: 0-77760
Default: 0.
25. qhrtrvcscsvc44c
15-minute reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
Type: integer
Range: 0-810
Default: 0.
26. dayrtrvcscsvc44c
Day reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
Type: integer
Range: 0-77760
Default: 0.
27. qhrtrvcscsvc416c
15-minute reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: integer
Range: 0-810
Default: 0.
28. dayrtrvcscsvc416c
Day reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: integer
Range: 0-77760
Default: 0.

29. qhrtrvcseSvc464c
15-minute reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: integer
Range: 0-810
Default: 0.
30. dayrtrvcseSvc464c
Day reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: integer
Range: 0-77760
Default: 0.
31. qhrtrvcuasvc3
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: integer
Range: 0-900
Default: 0.
32. dayrtrvcuasvc3
Day reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: integer
Range: 0-86400
Default: 0.
33. qhrtrvcuasvc4
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: integer
Range: 0-900
Default: 0.
34. dayrtrvcuasvc4
Day reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: integer
Range: 0-86400
Default: 0.
35. qhrtrvcuasvc44c
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
Type: integer
Range: 0-900
Default: 0.
36. dayrtrvcuasvc44c
Day reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
Type: integer
Range: 0-86400
Default: 0.

37. qhrtrvcuasvc416c
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
Type: integer
Range: 0-900
Default: 0.
38. dayrtrvcuasvc416c
Day reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
Type: integer
Range: 0-86400
Default: 0.
39. qhrtrvcuasvc464c
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
Type: integer
Range: 0-900
Default: 0.
40. dayrtrvcuasvc464c
Day reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
Type: integer
Range: 0-86400
Default: 0.
41. qhrtrpjcpo
15-minute reset threshold for positive PJC bin.
Type: integer
Range: 0-1800000
Default: 0.
42. dayrtrpjcpo
Day reset threshold for positive PJC bin.
Type: integer
Range: 0-172800000
Default: 0.
43. qhrtrpjcneg
15-minute reset threshold for negative PJC bin.
Type: integer
Range: 0-1800000
Default: 0.
44. dayrtrpjcneg
Day reset threshold for negative PJC bin.
Type: integer
Range: 0-172800000
Default: 0.

Command parameters - profile parameters of type PATH

1. qhcvpsts1
15-minute threshold for CV-P and CV-PFE bin for STS1.
Type: integer
Range: 0-57599100
Default: 15.
2. daycvpsts1
Day threshold for CV-P and CV-PFE bin for STS1.
Type: integer
Range: 0-4294967295
Default: 125.
3. qhcvpsts3c
15-minute threshold for CV-P and CV-PFE bin for STS3C.
Type: integer
Range: 0-57599100
Default: 25.
4. daycvpsts3c
Day threshold for CV-P and CV-PFE bin for STS3C.
Type: integer
Range: 4294967295
Default: 250.
5. qhcvpsts12c
15-minute threshold for CV-P and CV-PFE bin for STS12C.
Type: integer
Range: 0-57599100
Default: 75.
6. daycvpsts12c
Day threshold for threshold for CV-P and CV-PFE bin for STS12C.
Type: integer
Range: 4294967295
Default: 750.
7. qhcvpsts48c
15-minute threshold for CV-P and CV-PFE bin for STS48C.
Type: integer
Range: 0-57599100
Default: 300.
8. daycvpsts48c
Day threshold for CV-P and CV-PFE bin for STS48C.
Type: integer
Range: 4294967295
Default: 3000.

9. qhcvpsts192c
Day threshold for CV-P and CV-PFE bin for STS192C.
Type: integer
Range: 0-57599100
Default: 1200.
10. daycvpsts192c
Day threshold for CV-P and CV-PFE bin for STS192C.
Type: integer
Range: 0-4294967295
Default: 12000.
11. qhespsts1
15-minute threshold for ES-P and ES-PFE bin for STS1.
Type: integer
Range: 0-900
Default: 12.
12. dayespsts1
Day threshold for ES-P and ES-PFE bin for STS1.
Type: integer
Range: 0-86400
Default: 100.
13. qhespsts3c
15-minute threshold for ES-P and ES-PFE bin for STS3C.
Type: integer
Range: 0-900
Default: 20.
14. dayespsts3c
Day threshold for ES-P and ES-PFE bin for STS3C.
Type: integer
Range: 0-86400
Default: 200.
15. qhespsts12c
15-minute threshold for ES-P and ES-PFE bin for STS12C.
Type: integer
Range: 0-900
Default: 60.
16. dayespsts12c
Day threshold for ES-P and ES-PFE bin for STS12C.
Type: integer
Range: 0-86400
Default: 600.

17. qhespsts48c
15-minute threshold for ES-P and ES-PFE bin for STS48C.
Type: integer
Range: 0-900
Default: 240.
18. dayespsts48c
Day threshold for ES-P and ES-PFE bin for STS48C.
Type: integer
Range: 0-86400
Default: 2400.
19. qhespsts192c
Day threshold for ES-P and ES-PFE bin for STS192C.
Type: integer
Range: 0-900
Default: 240.
20. dayespsts192c
Day threshold for ES-P and ES-PFE bin for STS192C.
Type: integer
Range: 0-86400
Default: 9600.
21. qhseesp
15-minute threshold for SES-P and SES-PFE bin.
Type: integer
Range: 0-810
Default: 3.
22. dayseesp
Day threshold for SES-P and SES-PFE bin.
Type: integer
Range: 0-77760
Default: 7.
23. qhuasp
15-minute threshold for UAS-P and UAS-PFE bin.
Type: integer
Range: 0-900
Default: 10.
24. dayuasp
Day threshold for UAS-P and UAS-PFE bin.
Type: integer
Range: 0-86400
Default: 10.

- 25. qhppjcgen
15-minute threshold for PPJC-PGen bin.
Type: integer
Range: 0-1800000
Default: 30.
- 26. dayppjcgen
Day threshold for PPJC-PGen bin.
Type: integer
Range: 0-172800000
Default: 2880.
- 27. qhnpjcgen
15-minute threshold for NPJC-PGen bin.
Type: integer
Range: 0-1800000
Default: 30.
- 28. daynpjcgen
Day threshold for NPJC-PGen bin.
Type: integer
Range: 0-172800000
Default: 2880.
- 29. qhppjcdet
15-minute threshold for PPJC-PDet bin.
Type: integer
Range: 0-1800000
Default: 30.
- 30. dayppjcdet
Day threshold for PPJC-PDet bin.
Type: integer
Range: 0-172800000
Default: 2880.
- 31. qhnpjcdet
15-minute threshold for NPJC-PDet bin.
Type: integer
Range: 0-1800000
Default: 30.
- 32. daynpjcdet
Day threshold for NPJC-PDet bin.
Type: integer
Range: 0-172800000
Default: 2880.

Command parameters - profile parameters of type ENET

1. qhpdege
15-minute threshold for PDE bin for GE.
Type: integer
Range: 0-183000000
Default: 187500.
2. daypdege
Day threshold for PDE bin for GE.
Type: integer
Range: 0-4294967295
Default: 9000000.
3. qhpdevcg
15-minute threshold for PDE bin for VCG.
Type: integer
Range: 0-183000000
Default: 10.
4. daypdevcg
Day threshold for PDE bin for VCG.
Type: integer
Range: 0-4294967295
Default: 50.
5. qhedfelge
15min EDFE for 1GbE Ethernet port
Type: integer
Range: 0-1371951220
Default: 1875000
6. dayedfelge
24 h EDFE for 1GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 9000000
7. qhedfc1ge
15min EDFC for 1GbE Ethernet port
Type: integer
Range: 0-1371951220
Default: 20.
8. dayedfc1ge
24 h EDFC for 1GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 50.

9. qhedfe10ge
15min EDFE for 10GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 18750000.
10. dayedfe10ge
24 h EDFE for 10GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 90000000
11. qhedfc10ge
15min EDFC for 10GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 100.
12. dayedfc10ge
24 h EDFC for 10GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 500.
13. qhedfelgevcg
15min EDFE for 1GbE VCG port
Type: integer
Range: 0-1371951220
Default: 10.
14. dayedfelgevcg
24 h EDFE for 1GbE VCG port
Type: integer
Range: 0-4294967295
Default: 50.
15. qhedfc1gevcg
15min EDFC for 1GbE VCG port
Type: integer
Range: 0-1371951220
Default: 10.
16. dayedfc1gevcg
24 h EDFC for 1GbE VCG port
Type: integer
Range: 0-4294967295
Default: 50.

17. qhedfe10gevcg
15min EDFE for 10GbE VCG port
Type: integer
Range: 0-4294967295
Default: 100.
18. dayedfe10gevcg
24 h EDFE for 10GbE VCG port
Type: integer
Range: 0-4294967295
Default: 500.
19. qhedfc10gevcg
15min EDFC for 10GbE VCG port
Type: integer
Range: 0-4294967295
Default: 100.
20. 2.2.1.5.1.10.20
24 h EDFC for 10GbE VCG port
Type: integer
Range: 0-4294967295
Default: 500.

Command parameters - reset profile parameters of type ENET

1. qhrtrpdege
15-minute reset threshold for PDE bin for GE.
Type: integer
Range: 0-183000000
Default: 937500.
2. dayrtrpdege
Day reset threshold for PDE bin for GE.
Type: integer
Range: 0-4294967295
Default: 4500000.
3. qhrtrpdevcg
15-minute reset threshold for PDE bin for VCG.
Type: integer
Range: 0-183000000
Default: 2.
4. dayrtrpdevcg
Day reset threshold for PDE bin for VCG.
Type: integer
Range: 0-4294967295
Default: 5.

5. qhrtredfelge
15min reset threshold for EDFE of 1GbE Ethernet port.
Type: integer
Range: 0-1371951220
Default: 937500.
6. dayrtredfelge
24h reset threshold for EDFE of 1GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 4500000.
7. qhrtredfc1ge
15min reset threshold for EDFC of 1GbE Ethernet port.
Type: integer
Range: 0-1371951220
Default: 2.
8. dayrtredfc1ge
24h reset threshold for EDFC of 1GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 5.
9. qhrtredfe10ge
15min reset threshold for EDFE of 10GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 9375000
10. dayrtredfe10ge
24h reset threshold for EDFE of 10GbE Ethernet port
Type: integer
Range: 0-4294967295
Default: 45000000.
11. qhrtredfc10ge
15min reset threshold for EDFC of 10GbE Ethernet port.
Type: integer
Range: 0-4294967295
Default: 20.
12. dayrtredfc10ge
24h reset threshold for EDFC of 10GbE Ethernet port.
Type: integer
Range: 0-4294967295
Default: 50.

13. qhrtredfelgevcg
15min reset threshold for EDFE of 1GbE VCG port
Type: integer
Range: 0-1371951220
Default: 2.
14. dayrtredfelgevcg
24h reset threshold for EDFE of 1GbE VCG port.
Type: integer
Range: 0-4294967295
Default: 5.
15. 15 qhrtredfc1gevcg
15min reset threshold for EDFC of 1GbE VCG port
Type: integer
Range: 0-1371951220
Default: 2.
16. dayrtredfc1gevcg
24h reset threshold for EDFC of 1GbE VCG port.
Type: integer
Range: 0-4294967295
Default: 5.
17. qhrtredfe10gevcg
15min reset threshold for EDFE of 10GbE VCG port
Type: integer
Range: 0-4294967295
Default: 20.
18. dayrtredfe10gevcg
24h reset threshold for EDFE of 10GbE VCG port.
Type: integer
Range: 0-4294967295
Default: 50.
19. qhrtredfc10gevcg
15min reset threshold for EDFC of 10GbE VCG port.
Type: integer
Range: 0-4294967295
Default: 20.
20. dayrtredfc10gevcg
24h reset threshold for EDFC of 10GbE VCG port
Type: integer
Range: 0-4294967295
Default: 50.

Command parameters - profile parameters of type LOVC

1. qhvcbbbevc12
15-minute threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
Type: integer
Range: 0-1799100
Default: 9000.
2. dayvcbbbevc12
Day threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
Type: integer
Range: 0-172713600
Default: 12000.
3. qhvcbbelovc3
15minute threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
Type: integer
Range: 0-7199100
Default: 36000.
4. dayvcbbelovc3
Day threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
Type: integer
Range: 0-691113600
Default: 48000.
5. qhvcesvc12
15-minute threshold for VVC_N_ES and VC_F_ES for VC12 bin.
Type: integer
Range: 0-900
Default: 120.
6. dayvcesvc12
Day threshold for VC_N_ES and VC_F_ES for VC12 bin.
Type: integer
Range: 0-86400
Default: 350.
7. qhvceslov3
15-minute threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
Type: integer
Range: 0-900
Default: 150.
8. dayvceslov3
Day threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
Type: integer
Range: 0-86400
Default: 600.

9. qhvcse_{svc12}
15-minute threshold for VC_N_SES and VC_F_SES for VC12 bin.
Type: integer
Range: 0-810
Default: 15.
10. dayvcse_{svc12}
Day threshold for VC_N_SES and VC_F_SES for VC12 bin.
Type: integer
Range: 0-77760
Default: 20.
11. qhvcse_{lovc3}
15-minute threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
Type: integer
Range: 0-810
Default: 15.
12. dayvcse_{lovc3}
Day threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
Type: integer
Range: 0-77760
Default: 20.
13. qhvcu_{svc12}
15-minute threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
Type: integer
Range: 0-900
Default: 15.
14. dayvcu_{svc12}
Day threshold for VC_N_UAS and VC_F_UAS for VC12 bin..
Type: integer
Range: 0-86400
Default: 20.
15. qhvcu_{lovc3}
15-minute threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin..
Type: integer
Range: 0-900
Default: 15.
16. dayvcu_{lovc3}
Day threshold for VC_N_UAS and C_F_UAS for lower order VC3 bin.
Type: integer
Range: 0-86400
Default: 20.

Command parameters - reset profile parameters of type LOVC

1. qhrtrvcbbbev12
15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
Type: integer
Range: 0-1799100
Default: 50.
2. dayrtrvcbbbev12
Day reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
Type: integer
Range: 0-172713600
Default: 1200.
3. qhrtrvcbbbelovc3
15-minute reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
Type: integer
Range: 0-7199100
Default: 200.
4. dayrtrvcbbbelovc3
Day reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
Type: integer
Range: 0-691113600
Default: 4800.
5. qhrtrvcsv12
15-minute reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
Type: integer
Range: 0-900
Default: 5.
6. dayrtrvcsv12
Day reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
Type: integer
Range: 0-86400
Default: 35.
7. qhrtrvcsl12
15-minute reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
Type: integer
Range: 0-900
Default: 10.
8. dayrtrvcsl12
Day reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
Type: integer
Range: 0-86400
Default: 60.

9. qhrtrvcse¹vc12
15-minute reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
Type: integer
Range: 0-810
Default: 0.
10. dayrtrvcse¹vc12
Day reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
Type: integer
Range: 0-77760
Default: 0.
11. qhrtrvcse¹lovc3
15-minute reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
Type: integer
Range: 0-810
Default: 0.
12. dayrtrvcse¹lovc3
Day reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
Type: integer
Range: 0-77760
Default: 0.
13. qhrtrvcuasvc12
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
Type: integer
Range: 0-900
Default: 0.
14. dayrtrvcuasvc12
Day reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
Type: integer
Range: 0-86400
Default: 0.
15. qhrtrvcuaslovc3
15-minute reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
Type: integer
Range: 0-900
Default: 0.
16. dayrtrvcuaslovc3
Day reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
Type: integer
Range: 0-86400
Default: 0.

Command parameters - profile parameters of type LOPATH

1. qhcvvt1
15-minute threshold for CV-P and CV-PFE bin for VT1.
Type: integer
Range: 0-14399100
Default: 75.
2. daycvvt1
Day threshold for CV-P and CV-PFE bin for VT1.
Type: integer
Range: 0-1382313600
Default: 750.
3. qhesvt1
15-minute threshold for ES-P and ES-PFE bin for VT1.
Type: integer
Range: 0-900
Default: 40.
4. dayesvt1
Day threshold for ES-P and ES-PFE bin for VT1.
Type: integer
Range: 0-86400
Default: 900.
5. qhsesvt1
15-minute threshold for SES-P and SES-PFE bin for VT1.
Type: integer
Range: 0-810
Default: 40.
6. daysesvt1
Day threshold for SES-P and SES-PFE bin for VT1.
Type: integer
Range: 0-77760
Default: 900.
7. qhuasvt1
15-minute threshold for UAS-P and UAS-PFE bin for VT1.
Type: integer
Range: 0-900
Default: 40.
8. dayuasvt1
Day threshold for UAS-P and UAS-PFE bin for VT1.
Type: integer
Range: 0-86400
Default: 900.

Command parameters - profile parameters of type DS3

1. qhcvl
15-minute threshold for CV-L bin of DS3 Line.
Type: integer
Range: 0-7200000
Default: 387.
2. daycvl
Day threshold for CV-L bin of DS3 Line.
Type: integer
Range: 0- 691200000
Default: 3865.
3. qhesl
15-minute threshold for Es-L bin of DS3 Line.
Type: integer
Range: 0-900
Default: 25.
4. dayesl
Day threshold for ES-L bin of DS3 Line.
Type: integer
Range: 0-86400
Default: 250.
5. qhesal
15-minute threshold for ESA-L bin of DS3 Line.
Type: integer
Range: 0-900
Default: 25.
6. dayesal
Day threshold for ESB-L bin of DS3 Line.
Type: integer
Range: 0-86400
Default: 250.
7. qhesbl
15-minute threshold for ESB-L bin of DS3 Line.
Type: integer
Range: 0-900
Default: 25.
8. dayesbl
Day threshold for ESB-L bin of DS3 Line.
Type: integer
Range: 0-86400
Default: 250.

9. qhsesl
15-minute threshold for SES-L bin of DS3 Line.
Type: integer
Range: 0-810
Default: 4.
10. daysesl
Day threshold for SES-L bin of DS3 Line.
Type: integer
Range: 0-77760
Default: 40.
11. qhcvp
15-minute threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-7200000
Default: 382.
12. daycvp
Day threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-691200000
Default: 3820.
13. qhesp
15-minute threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-900
Default: 25.
14. dayesp
Day threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-86400
Default: 250.
15. qhesap
15-minute threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-900
Default: 25.

16. **dayesap**
Day threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-86400
Default: 250.
17. **qhesbp**
15-minute threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-900
Default: 25.
18. **dayesbp**
Day threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-86400
Default: 250.
19. **qhseap**
15-minute threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-810
Default: 4.
20. **daysesp**
Day threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-77760
Default: 40.
21. **qhhuasp**
15-minute threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-900
Default: 10.
22. **dayhuasp**
Day threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-86400
Default: 10.

23. qhsasp
15-minute threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-900
Default: 2.
24. daysasp
Day threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
Type: integer
Range: 0-86400
Default: 8.

Detailed behaviour description

The command shall retrieve the list of profile names of the specified profile type, if only the profile type is specified in the command. If profile type and profile name is specified, and a profile with the specified name exists, then the parameters of the profile shall be retrieved. If the profile does not exist, the system shall not return a response to the command.

Example input/output

The following example shows the successful completion of a RTRV-TCA-PROF command by the NE:

```
RTRV-TCA-PROF:UNITE-NE::123456::section-line;  
UNITE-NE 00-01-01 08:00:00  
M 123456 COMPLD  
"SECTION-LINE:DEFAULT"  
"SECTION-LINE:DEFAULT0"  
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there apply to the RTRV-TCA-PROF command.

RTRV-ULS: Retrieve upper layer stack

The RTRV-ULS command is used to retrieve global parameters of the TCP/IP stack.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: **RTRV-ULS**:tid::ctag;

Input parameters

Command parameters

1. tid – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for input parameter syntax and description of this parameter.
2. ctag – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for input parameter syntax and description of this parameter.

Output format

If the RTRV-ULS request is successful, the following normal completion message shall be returned:

```
      sid date time
M  ctag COMPLD
   "spec_block"
   .      .      .
   .      .      .
   .      .      .
   "spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) .

Output parameters

1. **ip_ad_astn** – IP Address of ASTN
This parameter shall be used to set or retrieve the router ID for the SCN and the ONNS node.
Note: As a consequence, if ip_ad_astn is not configured the whole SWISS application can not be enabled. See also parameter xcsetup in RTRV/ED-EQPT (system).
Type: Four dot separated numeric strings OR empty string.
The empty string value is used as indication for an undefined IP address.
Range: Each numeric string: 0 .. 255.
Default: empty string.
2. **ip_ad_uni** – IP address for UNI
This parameter is used to retrieve the UNI node IP address.
Type: Four dot separated numeric strings OR empty string The empty string value is used as indication for an undefined IP address.
Range:
 - For first numeric string: 0 .. 223
 - For second to fourth numeric string: 0 .. 255.The values 0.0.0.0 and 1.1.1.1 are not allowed.
Default: empty string.
3. **sigPCIP_Address** – IP address for Signaling Controller (E-NNI node)
This parameter shall be used to retrieve the signaling controller (E-NNI node) IP address.
Type: Four dot separated numeric strings OR empty string The empty string value is used as indication for an undefined IP address.
Range:
 - For first numeric string: 0 .. 223
 - For second to fourth numeric string: 0 .. 255.The values 0.0.0.0, 1.1.1.1, and 127.0.0.1 are not allowed.
Default: empty string.
4. **sigPCID** – ID of the Signaling Controller (E-NNI node)
This parameter shall be used to retrieve the signaling controller (E-NNI node) ID.
Type: Four dot separated numeric strings OR empty string The empty string value is used as indication for an undefined IP address.
Range: Four times numeric string: 0 .. 255
Default: empty string.
5. **ip_drad** – IP Default Router Address
This parameter shall be used to set or retrieve the IP default router address (IPv4) to which the host points to, needed for the T-TD functionality.
Type: Four dot separated numeric strings OR empty string. The empty string value is used as indication for an invalid/undefined IP address.
Range: Each numeric string: 0 .. 255.
Default: empty string.

6. `ip_drlan` – IP Default Router LAN port AID
 This parameter specifies with which LAN port the default router is associated.
 Type: AID.
 Range: LanPortAID. The value lanall is not allowed.
 Default: 1-1-lan1.
7. `lv_port` – T-TD Length Value Port
 This parameter shall be used to set or retrieve the port number over which the T-TD function is accessible using the Length Value encoding method.
 Type: Numeric string
 Range: Each numeric string: 0 .. 65535, except the value 3083.
 Default: 3081.
8. `raw_port` – T-TD Raw Mode Port
 This parameter shall be used to set or retrieve the port AID of number over which the T-TD function is accessible using raw-mode encoding.
 Type: Numeric string
 Range: Each numeric string: 0 .. 65535, except the value 3083.
 Default: 3082.

Detailed behavior description

The command retrieves system parameters as described in the Output parameter section.

Example input/output

The following example shows the result of a RTRV-ULS command:

```
RTRV ULS:LT UNITE::123456;

LT-UNITE 06-06-30 08:00:00
M 123456 COMPLD
"ip_ad_astn=127.93.94.10"
"ip_ad_uni=221.131.82.1"
"ip_drad=198.84.65.20"
"ip_drlan=1-1-lan1"
"lv_port=3081"
"raw_port=3082"
;
```

The following example shows the result of a RTRV-ULS command:

```
RTRV ULS:LT UNITE::123456;

LT-UNITE 06-06-30 08:00:00
M 123456 COMPLD
"ip_ad_astn=127.93.94.10"
"ip_ad_uni=221.131.82.1"
"ip_drad=198.84.65.20"
```

```
"ip_dr1an=1-1-1an1"
"lv_port=3081"
"raw_port=3082"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command Error responses section. The error responses listed there apply to the RTRV-NE command.

Related TL1 Messages

[“ENT-ULS: Enter upper layer stack” \(p. 4-1815\)](#)

RTRV-ULSDCC-L3: Retrieve layer 3 related parameters

The RTRV-ULSDCC-L3 command is used to retrieve the layer 3 parameters of the OSI nodes or the SCN node. Up to 8 independent OSI nodes can exist in an NE: Node-1 has an NSAP and is created by default. Node 2-8 have each a Network Entity Title (NET). NSAP = NET + SEL . Node 2-8 can be created and deleted, see commands ENT-ULSDCC-L3, DLT-ULSDCC-L3. The SCN node is created when an ASTN IP address is defined (see ENT-ULS), for this node the command retrieves only the NSAP parameter used by I-ISIS. For OSI nodes the parameters of the NSAP field, IS level, IS domain, RA prefix and RA destination node are retrieved.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: RTRV-ULSDCC-L3:*tid*::*ctag*[::*osinode*];

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for input parameter syntax and description of this parameter.
2. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for input parameter syntax and description of this parameter.
3. *osinode*
A *LambdaUnite*® MSS NE can have up to 8 instances of the OSI stack and one SCN node. Node-1 is default. Node 2-8 can be created and configured, see command ENT-ULSDCC-L3. The SCN node is created when an ASTN IP address is defined, see ENT-ULS.
Type AID.
Range: OSI_node_AID | SCN_node_AID.
Default: If this field is omitted then the command shall provide output for all nodes which are created.

Output format

If the RTRV-ULSDCC-L3 is successful, the following normal completion response is returned:

```
sid date time
```

```

M  ctag COMPLD
   "osinode:spec_block"
   ...
   "osinode:spec_block"
;

```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) .

Output parameters

Command parameters

1. *osinode*
See definition of input parameter *osinode* in RTRV-ULSDCC-L3 The value *osinodeall* is not allowed as output parameter.

Spec block parameters

1. *l3afi* – NSAP/NET Authority and Format Identifier
This parameter sets or retrieves the format for the rest of the address.
Type: hexadecimal number.
Range: 10 – 99
Default: 39. This value identifies the iso_dcc format.
2. *l3idi* – NSAP/NET initial Domain Identifier
This parameter consists of two values:
 - a 3 semi-octet (3-digit hexadecimal) IDI part to specify the country code indicating the registration authority responsible for the allocation and assignment of the NSAP address.
 - a 1 semi-octet (1-digit hexadecimal) IDI pad part. The parameter is used for set and retrieve values.
 Type: hexadecimal number.
Range: 0000 – FFFF
Default:
SONET: IDI = 840; IDI pad = F
SDH: IDI = 000; IDI pad = 0.
3. *l3dfi* – NSAP/NET DSP Format Identifier
This parameter (2-digit hex) NSAP is used to set or retrieve the format for the rest of the address.
Type: hexadecimal number.
Range: 00 – FF.
Default: 80. This value represents the SONET DSP format.

4. 13org – NSAP/NET Organization Identifier
This parameter of NSAP is used to set or retrieve the NSP (allocated Company Code).
Type: hexadecimal number.
Range: 000000 – FFFFFFFF.
Default: 000000.
5. 13res – NSAP/NET Reserved
This NSAP part currently has not been assigned a specific purpose.
Type: hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.
6. 13rd – NSAP/NET Routing Domain
This parameter of NSAP is used to set or retrieve a unique routing domain within an administrative domain. A standard for use has not been defined until now.
Type: hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.
7. 13area – NSAP/NET Area Identifier
This parameter of NSAP is used to set or retrieve the area. So NEs can be identified in the same area.
Type: hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.
8. 13sys – NSAP/NET System Identifier
This system parameter of the NSAP is set by the Equipment Manufacturer. The value is fix and globally unique among all NEs. For values of NSAP/NET system parameter see chapter Default below.
Type: hexadecimal number.
Range: 000000000000 – FFFFFFFFFFFFFFFF
Default:
 - Node-1: IEEE-MAC address of LAN1
 - Node-2: IEEE-MAC address of LAN1 +1
 - Node-3: IEEE-MAC address of LAN1 +2
 - Node-4: IEEE-MAC address of LAN1 +3
 - Node-5: IEEE-MAC address of LAN1 +4
 - Node-6: IEEE-MAC address of LAN1 +5
 - Node-7: IEEE-MAC address of LAN1 +6
 - Node-8: IEEE-MAC address of LAN1 +7
 - scnnode: IEEE-MAC address of LAN1 +8 (default)

9. l3sel – NSAP Selector

This parameter serves to differentiate multiple access points (NSAPs) for the same NE (node-1). The values cannot be set manually. The NET addresses of node 2-8 have *l3sel=00*.

Type: hexadecimal number.

Range: 00 – FF. Values:

- 1D: For TP4 PDUs, when TP4 runs over CLNP, Also used for SDH supporting NEs
- 00: For NET, used for exchanging PDUs in the ES-IS and IS-IS routing exchange protocols
- 04: For NSAP of CLNP PDUs, encapsulated IP packets
- AF: For TARP PDUs, when TARP is run over CLNP.

Default: 1D, see NET addresses of node 2-8 are reported as NSAP with *l3sel=00*.

10. l3isisnl – Layer 3 IS Level

This parameter indicates the network router type: ES-IS (level1, value L1), IS-IS (level2, value L2) and partition repair capability (value3).

Note: This parameter is not reported when output parameter *osinode=scnnode*.

Type: alphanumeric string.

Range:

- L1: this means level1, IS-IS, only allowed when parameter *l3radesnode=0*
- L12: this means level2, IS-IS which contains also level1, ES-IS
- L12PRC : this means partition repair capable (PRC) and contains also level1 and level2.

Default: L1.

11. l3domain – Layer3 IS Domain

Per node in a NE, a domain group must be specified. This will be done with this parameter which can be set and retrieved. All nodes in the NE with the same domain-number are interconnected and can communicate without the need for inter-domain routing via RA-PREFIX.

Note: This parameter is not reported when output parameter *osinode=scnnode*.

Type: alphanumeric string.

Range:

- 1 for *osinode1*
- 1 – 2 for *osinode2* to *osinode8*.

Default: 1.

12. l3raprefix – Layer3 Reachable Address Prefix

This value specifies an area address or a part of an area address representing an area address group. This parameter is needed when nodes in different routing domains (see *l3domain*) must communicate. The node must forward then CLNP PDUs to the RA-Destination-Node if the destination NSAPs of CLNP PDUs match with the PA-Prefix.

Note: This parameter is not reported when output parameter *osinode=scnnode*.

Type: hexadecimal number.

Range:

- NONE,
- a string of 1 to 13 bytes: first byte (most significant): 10 – 99; rest: 0000 – FFFF.

The value represents an area address or a part of an area address beginning with AFI.

Default: empty string.

13. l3radesnode – Layer3 Reachable Address Destination Node

This parameter is in combination with parameter *l3raprefix* necessary. The value represents the destination node in the same NE. An internal connection over a domain-boundary is established between this node and the RA-Destination-Node, with IS-IS disabled over that connection.

Note: This parameter is not reported when output parameter *osinode=scnnode*.

Type: AID and digit value.

Range:

- 0, *osinode*{2-8} for *osinode1*
- 0, *osinode1* for *osinode2* to *osinode 8*.

Value 0 indicates that functionality of RA-Prefix is disabled.

Default: 0.

14. nsapcount - Number of OSI Nodes in Level 1 Area

This parameter indicates the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the *osinode* parameter is located. When the number of OSI nodes in the level 1 area is more than the maximum supported number (250), the value of this parameter is shown as "250+", which indicates a

state of NSAP count overflowed. The parameter shall be omitted for the SCN node.

Type: value set

Range: 1 - 250 if the number of nodes is less or equal to 250. 250+ if the number of nodes exceeds 250.

Default: 1

15. nsapthlev - Number of OSI Nodes Threshold Level

This parameter indicates the NSAP count threshold level for monitoring the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the *osinode* parameter is located. A threshold value of zero (0) indicates that NSAP threshold alarming is disabled. The parameter shall be omitted for the SCN node.

Type: numeric string

Range: 0 no alarming; 1 - 250 threshold alarming

Default: 0

Detailed behavior description

The command retrieves system parameter as described in the Output parameter section.

Example input/output

The following example shows the result of RTRV-ULSDCC-L3:

```
RTRV-ULSDCC-L3:NE-UNITE::123456::osinode1;
NE-UNITE 00-12-24 11:01:59
M 123456 COMPLD
"osinode1:L3AFI=39,L3IDI=840F,L3DFI=80,
L3ORG=100100,L3res=0000,L3RD=0000,L3AREA=0000,
L3SYS=08006A112345,L3SEL=1D,L3ISISNL=L12PRC,
L3DOMAIN=1,L3RADESNODE=0,NSAPCOUNT=2,NSAPTHLEV=0"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there apply to the RTRV-ULSDCC-L3 command.

Related TL1 messages

- [“ENT-ULSDCC-L3: Create a further OSI node”](#) (p. 4-1822)
- [“ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.”](#) (p. 4-1228)
- [“DLT-ULSDCC-L3: Delete a node ID other than node-1”](#) (p. 4-244)

RTRV-ULSDCC-L4: Retrieve OSI layer 4 related parameters

The RTRV-ULSDCC-L4 command is used to retrieve layer 4 parameters of the OSI stacks. Layer 4 include some TARP parameter which can be modified and the TARP Manual Adjacencies parameter which can be provided, modified or deleted.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: RTRV-ULSDCC-L4:*tid::ctag[::osinode]*;

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for input parameter syntax and description of this parameter.
2. *ctag* – Correlation Tag
Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command for input parameter syntax and description of this parameter.
3. *osinode*
A *LambdaUnite*® MSS NE can have up to 8 instances of the OSI stack and one SCN node. Node-1 is default. Node 2-8 can be created and configured, see command ENT-ULSDCC-L3. The SCN node is created when an ASTN IP address is defined, see ENT-ULS.
Type AID.
Range: OSI_node_AID | SCN_node_AID.
Default: If this field is omitted then the command shall provide output for all nodes which are created.

Output format

If the RTRV-ULSDCC-L4 is successful, the following normal completion response is returned:

```
sid date time
M ctag COMPLD
  "osinode:spec_block"
  ...
  "osinode:spec_block"
```

;

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) .

Manual adjacencies

If more than one manual adjacency is defined for one osinode, they appears on separate output lines.

Example:

```

    sid date time
M  ctag COMPLD
    "osinode1:<other spec_block parameters>"
    "osinode1:14ajnsap=39840F80000000000000000000000001
    23456789ABC00"
    "osinode1:14ajnsap=39840F80000000000000000000000002
    3456789ABCD00"
;
```

Output parameters

Command parameters

1. osinode

A *LambdaUnite*® MSS NE can have up to 8 instances of the OSI stack and one SCN node. Node-1 is default. Node 2-8 can be created and configured, see command ENT-ULSDCC-L3. The SCN node is created when an ASTN IP address is defined, see ENT-ULS.

Type AID.

Range: OSI_node_AID | SCN_node_AID.

Default: If this field is omitted then the command shall provide output for all nodes which are created.

Spec block parameters

1. **l4etdc** - TARP Data Cache
This parameter is only valid for node-1. It is used to enable or disable TARP data cache.
Type: Alphanumeric value set
Range: ENABLE (default), DISABLE.
2. **l4etof** - TARP origination
This parameter only valid for node-1. It is used to enable or disable TARP Origination function and is valid for all interfaces of a node.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE.
Default: ENABLE (for osinode1), DISABLE (for osinode2-8, fixed).
3. **l4etpf** – TARP propagation
This parameter is used to enable or disable TARP Propagation function for a node.
Type: Alphanumeric value set.
Range:
 - ENABLE (default)
 - DISABLE.
4. **l4etrf** – TARP responder
This parameter is only valid for node-1. It is used to enable or disable TARP responder function
Type: Alphanumeric value set
Range:
 - ENABLE
 - DISABLE.Default: For node-1: ENABLE DISABLE (fixed for nodes 2-8).
5. **l4ajnsap** – TARP Manual Adjacency List
This parameter specifies the NSAP address portion of an entry in the TARP Manual Adjacent NE list. Up to two addresses are possible for each node in a *LambdaUnite*® MSS NE.
Type: hexadecimal number or alphanumeric value set.
Range: NONE, 20 octet (40-digit hex) long address.
The NSAP address / NET is composed of the following components:
 - l4ajafi 10 – 99
 - l4ajidi 0000 – FFFF
 - l4dfi 00 – FF
 - l4alorg 000000 – FFFFFFFF
 - l4ajres 0000 – FFFF
 - l4jrd 0000 – FFFF
 - l4jarea 0000 – FFFF

- 14ajsys 000000000000 – FFFFFFFFFF
 - SEL 00 The last byte indicates the selector and is not to set.
- Note: For more details see description of ENT-ULSDCC-L3.
Default: NONE (no TARP manual adjacencies).

Detailed behavior description

The command retrieves system parameter as described in the Output parameter section.

Example input/output

The following example shows the result of RTRV-ULSDCC-L4:

```
RTRV-ULSDCC-L4:NE-UNITE::456789::osinode1;
```

```
NE-UNITE 01-17-01 18:11:01
M 456789 COMPLD
"OSINODE1:14etof=DISABLE,14etpf=ENABLE,14etrf=ENABLE,
14etdc=ENABLE,
14ajnsap=39840F80000000000000000000000000123456789ABC00"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there apply to the RTRV-ULSDCC-L4 command.

RTRV-USER: Retrieve user

The RTRV-USER command retrieves a user's own security information.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S2

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-USER:*tid*::*ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
See definition of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
2. *ctag* – Correlation Tag
See definition of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output format

After receiving the RTRV-USER command, the following normal completion response is returned:

```
      sid date time
M    ctag COMPLD
      "uid::spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command parameters

1. *uid* – User ID
User ID whose security parameters are to be retrieved.
This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of *uid* values for the ACT-USER command are not allowed. Valid *uid* values for the ACT-USER command are case-sensitive

alphanumeric strings which have been previously provisioned as valid login IDs in the NE.

Type: alphanumeric string (case-sensitive)

Range: 5 - 10 characters. The uid ALL is not allowed in any combination of upper or lower cases.

Spec block parameters

1. page – Password Aging Interval

This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.

Type: integer

Range: 0, 7-999 [days]

Default: 90

2. screen – Message Screening

This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)

Type: alphanumeric string An '&' is also allowed for concatenation of values.

Range:

- DBCHG

Data Base Change notifications – changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes). The user will receive REPT DBCHG messages.

- STCHG

State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive REPT DBCHG messages.

- PSCHG

Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.

- ALARMS

Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.

- ONNS

ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.

- OWN

Responses to own commands. The user will receive no other notifications.

Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.

- NA

Not applicable. This value is reserved for users with uidclass=MEMADMIN.

The notification behavior is controlled in this case by the user class.

Default: OWN

If more than one value is set the values will be concatenated by '&'.

Example: DBCHG&STCHG&ALARMS

3. **tmout** – Inactivity Timeout Period

If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.

Type: integer

Range: 0 – 999 [minutes]

Default: 30

4. **uidclass** – UID Class

This is the user class of a *uid*.

Type: alphanumeric value set

Range:

- **OTHER** – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
- **MEMADMIN** – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command RTRV-AO.

Default: OTHER

5. **upc** – User Privilege Code List

This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands (&). If a user try to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.

Type: alphanumeric string Also allowed is '&' for concatenation.

Range: Pi, Mi, Ti, Si, PMi, Di where "i" is an integer ranging from 0 to 5, with i=0 implying that there is no authorization for the functional category. S0 is not allowed.

Default: P1&M1&T1&S1&PM1 except for super users: P5&M5&T5&S5&PM5

Note: The system does not support commands for the D (DEBUG) category.

Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.

See also [“List of user privilege codes”](#) (p. 15-2).

Example input/output

The following example shows the successful completion of RTRV-USER command by the NE:

```
RTRV-USER:LT-UNITE-123::123456;
```

```
LT-UNITE-123 00-01-01 08:00:00
M 123456 COMPLD
```

```
"nbguser1::upc=P3&M3,screen=DBCHG&STCHG&ALARMS,page=999,  
uidclass=OTHER,tmout=3"  
;
```

RTRV-USER-SECU: Retrieve user security

The RTRV-USER-SECU command can be initiated by a user to retrieve user security information of one or all the users in the NE.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-USER-SECU:*tid*:[*uid*]:*ctag*;

Input parameters

Command parameters

1. *tid* – Target Identifier
See definition of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
2. *uid* – User ID
If this parameter is omitted, all *uids* will be retrieved.
See definition of [“ACT-USER: Activate user”](#) (p. 4-23).
3. *ctag* – Correlation Tag
See definition of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output format

If the NE has logins to report, the following normal completion response is returned:

```
sid date time
M ctag COMPLD
  "uid::spec_block"
  .
  .
  "uid::spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command parameters

1. uid – User ID

This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of uid values for the ACT-USER command are not allowed. Valid uid values for the ACT-USER command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.

Type: alphanumeric string (case-sensitive)

Range: 5 - 10 characters. The uid ALL is not allowed in any combination of upper or lower cases.

Spec block parameters

1. alw_login – Allow Login

This parameter displays the enable/disable state of a User ID.

A User ID can be automatically disabled by the system when the time specified by parameter *usrage* (see [“RTRV-NE-SECU: Retrieve NE security” \(p. 4-2384\)](#)) expires or via the ED-USER-SECU command. A User ID can be enabled via the ED-USER-SECU command.

If a User ID is disabled, logins with that User ID are denied.

Type: alphanumeric value set

Range:

- YES: User ID is enabled
- NO: User ID is disabled

Default: YES

2. initobs – Initialization Observability

This parameter allows the system to accept commands before it has completed initialization. Do not enable this parameter in networks using a Telcordia operations system.

Type: alphanumeric value set

Range: DISABLE – The feature is disabled.

Default: DISABLE

Note: *LambdaUnite*® MSS does not support Initialization Observability feature.

This parameter is only for compatibility. The DISABLE value will be returned as fixed value.

3. page – Password Aging Interval

This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.

Type: integer

Range: 0, 7-999 [days]

Default: 90

4. screen – Message Screening

This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)

Type: alphanumeric string An '&' is also allowed for concatenation of values.

Range:

- DBCHG
Data Base Change notifications: changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes).
File Transfer In-progress notifications: The user will receive REPT DBCHG and REPT EVT FXFR messages.
- STCHG
State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive REPT DBCHG messages.
- PSCHG
Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.
- ALARMS
Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.
- ONNS
ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.
- SECURITY: Security event notifications
- OWN
Responses to own commands. The user will receive no other notifications.
Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.
- NA
Not applicable. For users with uidclass=MEMADMIN only this value is allowed. The notification behavior is controlled in this case by the user class. If the value NA is applied for users of other user classes, then the value has the same effect as DBCHG.

Default: OWN

If more than one value is set the values will be concatenated by '&'.

Example: DBCHG&STCHG&ALARMS

5. **tmout** – Inactivity Timeout Period
 If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.
 Type: integer
 Range: 0 – 999 [minutes]
 Default: 30
6. **ucpl** – User Community Priority Level
 This parameter specifies with which priority the commands of a user will be operated by the NE. Input commands from users with higher priority are executed before commands from users with lower priority.
 Type: integer
 Range: 1
 Default: 1
 Note: *LambdaUnite*® MSS does not support User Community Priority Level's. Only the default value 1 will be reported. The value is not settable.
7. **uidclass** – UID Class
 This is the user class of a *uid*.
 Type: alphanumeric value set
 Range:
 - **OTHER** – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
 - **MEMADMIN** – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command RTRV-AO.
 Default: OTHER
8. **upc** – User Privilege Code List
 This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands (&). If a user try to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.
 Type: alphanumeric string Also allowed is '&' for concatenation.
 Range: Pi, Mi, Ti, Si, PMi, Di where "i" is an integer ranging from 0 to 5, with i=0 implying that there is no authorization for the functional category. S0 is not allowed.
 Default: P1&M1&T1&S1&PM1 except for super users: P5&M5&T5&S5&PM5
 Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.
 See also [“List of user privilege codes”](#) (p. 15-2).

Example input/output

Example for specified user:

The following example shows the successful completion of RTRV-USER-SECU command by the NE. The example below retrieves the security information associated with the user specified in the uid field:

```
RTRV-USER-SECU:LT-UNITE-123:nbguser1:123456;

LT-UNITE-123 00-01-01 08:00:00
M 123456 COMPLD
"nbguser1::upc=P3&M3,screen=DBCHG&STCHG&ALARMS,page=90,
tmout=30,alw_login=YES,uidclass=OTHER"
;
```

Example for all users:

The following example shows the successful completion of RTRV-USER-SECU command by the NE. The example below retrieves the security information associated with all the users from the NE:

```
RTRV-USER-SECU:LT-UNITE-123::123456;

LT-UNITE-123 00-01-01 08:00:00
M 123456 COMPLD
"LUC01::upc=S5,screen=DBCHG&STCHG&PSCHG&ALARMS,
page=90,tmout=30,alw_login=YES,uidclass=OTHER"
"LUC02::upc=S5,screen=DBCHG&STCHG&PSCHG&ALARMS,
page=47,tmout=11,alw_login=YES,uidclass=OTHER"
"hugo::upc=P3&M3,screen=DBCHG&STCHG&ALARMS,page=999,
tmout=3,alw_login=YES,uidclass=OTHER"
"egon::upc=P3&M3&T3&PM3,screen=PSCHG,page=7,
tmout=999,alw_login=NO,uidclass=OTHER"
"ronald::upc=T2,screen=DBCHG&STCHG&PSCHG&ALARMS,
page=0,tmout=0,alw_login=YES,uidclass=OTHER"
"cathrin::upc=T2,screen=OWN,page=90,tmout=30,
alw_login=YES,uidclass=OTHER"
;
```

Error responses

Validation rule: invalid uid

If the NE receives an RTRV-USER-SECU command with an invalid (unknown) Only the own uid value.

Error code: IDNV - Input, Data Not Valid, invalid UID

RTRV-VC3: Retrieve VC3 tributary

General

The RTRV-VC3 command is used to retrieve all parameters related to a VC3 tributary.

Note: If a tributary AID (Access IDentifier) is specified in the RTRV-VC3 request for a slot provisioned with a GE1 pack (e.g. 1-1-#-#-1-1-1 is used), then an empty reply is returned instead of: IENE - Input, Entity Not Exists.

For GE1 the “[RTRV-VCGTRIB: Retrieve virtual concatenation group tributary](#)” (p. 4-2899) command must be used.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-VC3:*tid:aid:ctag*;

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.
2. *aid* – Access Identifier
AID of a SDH tributary. The keyword *all* is allowed on slot, port and tributary level. The so called “dynamic parameters” shall be reported, if a *all* is used at the tributary level.
The “dynamic parameters” are:
 - *ptrc*, *ptrcst*, *siglb*, *trailstate*.Type: AID
Range: STS1NumAID.
3. *ctag* – Correlation Tag
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and description of this parameter.

Important! To retrieve the dynamic parameters (*ptrc*, *ptrcst*, *siglb*, *trailstate*) of all tributaries use the (“[RTRV-ALL: Retrieve all \(trib\)](#)” (p. 4-2075)) command and set the parameter *dyn* to YES.

Output format

In response to a valid RTRV-VC3 command, the following output report is returned:

```

sid date time
M ctag COMPLD
  "aid[:spec_block]"
    ...
    ...
  "aid[:spec_block]"
;

```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
Description: AID of the SDH tributary. The keyword *all* is not allowed on any level.
Type: AID
Range: STS1NumAID

Spec block parameters

1. *brstintvl* – Bursty Interval
Measurement period for determining bursty errors. The setting of this parameter is used when *sdsfmode*=BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
2. *brstthr* – Bursty Error Threshold
The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode*=BURST.
Type: numeric value set.
Range (as percentage): 5, 10, 15, 20, 25, 30, ... 50.
Default: 30.
3. *crslpbkrate* – Cross-connect loopback Rate
It is independent from the current interface standard and therefore both SDH and SONET values are allowed.
The parameter *crslpbkrate* is not reported if the parameter *crslpbkstat* indicates that no loopback is set.
Type: alphanumeric value set.

Range:

- VC3
- VC4
- VC44C
- VC416C
- VC464C
- STS1
- STS3
- STS12
- STS48
- STS192

4. *crslpbkstat* – Cross-connect loopback status

State of cross- connect loopback.

Type: alphanumeric value set.

Range:

- YES = Cross-connect loopback is provisioned
- NO (default) = No cross-connect loopback is provisioned.

5. *degthr* – Signal Degrade Threshold

The setting of this parameter are used when *sdsfmode*=POISSON

Type: numeric value set.

Range (as exponents of 10): –5; –6 (default); –7; –8; –9

6. *dexcthr* – Excessive Degrade Threshold

The setting of this parameter are used when *sdsfmode*=POISSON. The values are set as exponent of 10.

Type: numeric value set.

Range (as exponent of 10) –3 (default); –4; –5.

7. *exhptrc* – Expected Path Trace (J1)

The parameter *exhptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

Type: Hexadecimal digits

Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 89hex followed by 15 bytes 00hex.

8. *feppm* – Far-End Path PM Enable

It indicates whether this performance monitoring feature is enabled or disabled.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

9. *hptimmon* – Path Trace Monitoring Enable (J1)

Description: High order path trace (J1) identifier mismatch (TIM) monitor enable.

This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. *loca* – Ring A-node TID

This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* =EDGE being members in BLSR/MSSPRING protection groups. The *loca* parameter value shall be an empty string for all other tributaries.

loca is introduced specifically for use related to ONNS application.

Type: TID or empty-string.

Range: Please refer to the TID definition in “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) description.

Default: empty string: "". This is displayed as "" in output direction.

11. *locz* – Ring Z-node TID

This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass*=EDG E being members in BLSR/MSSPRING protection groups. The *locz* parameter value shall be an empty string for all other tributaries.

locz is introduced specifically for use related to ONNS application.

Type: TID or empty-string.

Range: Please refer to the TID definition in the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) description.

Default: empty string: "". This is displayed as "" in output direction.

12. *neppm* – Near-End Path PM Enable

It indicates whether this performance monitoring feature is enabled or disabled.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

13. *pjepm* – Pointer Justification Event PM Enable

It indicates whether this performance monitoring feature is enabled or disabled.

Type: alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

14. *pmhpfses* – Performance Monitoring Path Far-End SES Threshold

This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of ranges for SDH and SONET): 1-64000.

Default: 2400.

15. *pmhpneses* – Performance Monitoring Path Near-End SES Threshold

This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of ranges for SDH and SONET): 1-64000.

Default: 2400.

16. *ptca* – Path TCA Profile Pointer

Type: alphanumeric string.

Range: string with up to 24 characters.

Default: DEFAULT0.

17. *ptrc* – Path Trace (J1)

This parameter shows the value of the path trace identifier on the incoming path overhead J1 byte of a non-terminated tributary. The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to a signal-fail condition or intra-NE communication problems, and the output parameter *ptrc* is omitted from the response. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

Type: hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range:

- 1 byte for non-specific repeating byte
- 16 byte: These 16 byte shall consist of 15 byte information and the CRC7 byte
- 64 bytes: This is a pure byte stream without any restrictions.

18. *ptrcrfmt* – Path Trace Read Format (J1)

The read format of J1, the incoming path trace (*ptrc*).

Type: numeric string.

Range:

- 2: for non-specific repeating byte
- 16: for 16 byte specific string.
- 64: for 64 byte string.

Default: 2.

19. *ptrcst* - Status of Incoming Path Trace (J1)

This parameter shows the status of the value of the incoming path trace identifier which is available with parameter *ptrc*. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

Type: alphanumeric value set.

Range:

- NORMAL: *ptrc* contains a valid value
- UNAVAILABLE: no valid value for *ptrc* could be obtained by the system
- AIS: no valid value for *ptrc* due to an SF condition.

20. *sdsfmode* – Signal Degrade/Signal Fail Mode

The degraded state is detected in BURST or POISSON mode.

Type: alphanumeric value set.

Range:

- BURST (default)
- POISSON

21. *siglb* - Signal Label

This parameter shows the value of the signal label on the incoming path overhead C2 byte of a non-terminated VC tributary. The parameter shall not be reported if the *trailstate* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE. For concatenated tributaries the system shall not return this parameter (see detailed behavior below) .

Type: alphanumeric value set.

Range: 00, 01, ..., FE, FF; i.e. two hexadecimal digits.

22. *substr* - Substructured

This parameter indicates if the tributary is substructured.

Substructure for LO cross-connections:

A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross connections.

The parameter *substr* is set autonomously when LO cross connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower order cross connection creation/deletion behaviour description for the commands ENT-CRS and DLT-CRS).

A sub structured HO tributary cannot be used to set up HO cross connections. The parameter *substr* shall be set autonomously when the LO substructure is created or deleted using the ED-SUBS command.

Substructure for conversion cross-connections:

A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross connections.

The parameter *substr* shall be set autonomously when an AU3/AU4 conversion cross-connection is created.

A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross connections.

Type: alphanumeric value set.

Range:

- YES: Automatically sub structured for LO cross connections
- MANSUB: Manually sub structured for LO cross connections
- CNVSUB: Automatically sub structured for the LO side of conversion cross connections
- NO (default): Not sub structured, not used for conversion cross connections

23. *tcamd* – TCA mode

This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (also known as the implicit reset method)
- TR-RTR (also known as the explicit reset method).

Type: alphanumeric value set.

Range: TR, TRRTR (default).

24. *tmonmd* – Tributary Monitoring Mode

This parameter indicates the mode of the tributary.

Type: alphanumeric value set.

Range:

- MON = alarm monitoring is taking place on the port.
- NMON (default) = alarm monitoring is not occurring on the port.

25. *trailstate* - Trail State (C2)

It shall be possible to read the accepted trail value status (C2) of every VC which is terminated/monitored in the system. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

Type: alphanumeric value set.

Range:

- **NORMAL:** for accepted TSL which has valid payload type
- **AIS:** for SSF, VC-AIS, dTIM or dUNEQ
- **UNAVAILABLE:** for TSL which does not meet the acceptance criteria or no reporting is possible.

Default: UNAVAILABLE.

26. `tribsdhpn` – Tributary Alarm Severity Assignment Profile

This parameter points to a tributary ASAP profile name of type PATH for the designated AID.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: string with a maximum of 24 characters.

Default: DEFAULT.

Detailed behavior description

Applicability for VC4 and concatenated signals

The RTRV-VC3 command is also applicable to VC4 tributaries. Even though a VC4 signal is not a concatenated VC3 signal in a strict sense, from a pointer processor viewpoint it can be considered to be comprised of three VC3 signals which have the properties of a concatenated signal. Thus it is not necessary to have a separate RTRV command for VC4.

Retrieval of concatenated tributaries

It is allowed to retrieve data from concatenated tributaries and the system responds by returning all parameters which are not derived from traffic. The details can be found in the parameter description.

Concatenated tributaries are such tributaries, that are not the leftmost ones in concatenated signals, e.g. if an OC 48 port is provisioned for a fixed traffic of AU4-16c, STS-1 #1 represents the VC4-16c defined and all other STS-1s #2 to #48 do currently not represent valid substructures and thus are concatenated tributaries. The retrievable values e.g. for the STS-1s #2 to #48 are irrelevant for transmission.

Parameters derived from traffic are data like trace identifiers and signal labels which are collected from the actual input signal and thus do not exist for concatenated tributaries.

Behavior for non-existing entities

If the specified VC3/VC4 tributaries do not exist, the command shall return an empty response. E.g. if an attempt is made, to retrieve VC3/VC4 tributaries on a GbE circuit pack.

Example input/output

```
RTRV-VC3:LT-UNITE:1-1-#-#-3-1-1:123456;

LT-UNITE 00-11-27 08:00:00
M 123456 COMPLD
"1-1-#-#-3-1-1:crslpbkstat=NO,tmonmd=NMON,
tribsdhpn=Default,ptca=Default0,neppm=DISABLE,
pmhpnese=30,pmhpfese=30,degthr=-6,...,
ptrcrfmt=1,dexcthr=-3,ptrc=00,ptrcst=NORMAL,
sdsfmode=POISSON"
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command Error responses section. The error responses listed there also apply to the RTRV-VC3 command.

Check CCB against istd for related port

Validation rule: Check CCB against *istd*

Check whether the CCB fits to *istd* of the related port.

Error code:

ICNV - Input, Command Not Valid, Interface Standard does not match.

E.g. DENY, if a command with rr=VC3 is made on a port which is provisioned as *istd*=SONET.

References

GR-199-CORE (RTRV-rr)

RTRV-VCG: Retrieve virtual concatenation group

The RTRV-VCG command retrieves the attributes of a virtual concatenation group.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: RTRV-VCG[-modifier]:tid:aid:ctag[:::spec_block];

Input parameters

Command parameters

1. *modifier*

The modifier shall specify the type of the virtual concatenation group of the unit. Implicit, it indicates the transmission rate for which VCG related data shall be retrieved. The parameter modifier must be given if a virtual concatenation group on a GE10PL1 pack shall be addressed. Otherwise this parameter has to be omitted.

Type: alphanumeric value set

Range: 1GEPL representing a 1 GE port on the GE10PL1 pack; 10GEPL representing a 10 GE port on the GE10PL1 pack,

2. *tid* – Target Identifier

This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.

Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.

Range: 1 to 20 characters

3. *aid* – Access Identifier

This parameter specifies the virtual concatenation group (VCG) to be operated on.

Type: AID.

Range: VCGAID as defined in AID structure. The values

- *vall* for Simple_VCGAID and
- *usall* for Simple_UnivSlotAID
- *all* for Simple_UnivSlotAID

- *all* for Simple_ShelfAID and
 - *all* for BayAID
- are accepted.
4. **ctag** – Correlation Tag
 This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
 Type: alphanumeric string
 Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

Spec block parameter

1. **dyn** - Retrieve Dynamic Parameters
 This parameter controls whether dynamic parameters shall be reported with the command reply or not. It shall be given only when using any of the wildcard values *usall* or *vall* at the appropriate positions of the input AID. For input AIDs not using *usall* or *vall* this parameter is not allowed. This implies that with such input AIDs the dynamic parameters are always returned.
 The following output parameters of a vcgport port are affected: *mfiv*, *macaddr*, *stmd*, *stpop*, *stpid*, *stprole*, *vss*, *vvidlsd*.
 Note that not only those parameters have to be returned which are supported by the related ethernet pack. Not all ethernet packs support all listed parameters. For details refer to the detailed specification of those output parameters.
 Type: alphanumeric value set.
 Range:
 - YES: Report dynamic parameters in the reply as well
 - NO (default): Do not report dynamic parameters in the reply.

Output format

If the NE fully complies with the RTRV-VCG request, the following normal completion response is returned:

```
sid date time
M ctag COMPLD
  "aid::spec_block"
    <1 or more of the line above>
  "tribaid:mfiv,MFIV"
    <no such line, if the virtual concatenation mode is disabled, else
    no such line, if no dynamic data are retrieved, else
    one or more lines, one for each tribaid belonging to aid>
    ...
    ...
  "aid::spec_block"
    <1 or more of the line above>
  "tribaid:mfiv,MFIV"
    <no such line, if the virtual concatenation mode is disabled, else
```

```

no such line, if no dynamic data are retrieved, else
one or more lines, one for each tribaid belonging to aid>
;

```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
 This parameter specifies the VCG to be operated on.
 Type: AID.
 Range: VCGAID as defined in AID structure. The values
 - *vall* for Simple_VCGAID and
 - *usall* for Simple_UnivSlotAID
 - *all* for Simple_UnivSlotAID
 - *all* for Simple_ShelfAID and
 - *all* for BayAID
 are excluded.
2. *tribaid* – Tributary Access Identifier
 The tributary access identifier shall specify a tributary belonging to the virtual concatenation group (VCG) given by the *aid* above.
 Type: AID.
 Range: VCGNumAID as defined in AID structure. The values
 - *all* for Simple_VCGNumAID,
 - *vall* for Simple_VCGAID,
 - *usall* for Simple_UnivSlotAID
 - *all* for Simple_UnivSlotAID
 - *all* for Simple_ShelfAID and
 - *all* for BayAID
 are excluded.
3. *mfiv* - Multiframe Indicator Value
 This parameter reports the differential delay between the tributary addressed by *tribaid* (see above) and the fastest tributary of the VCG. The fastest tributary has the value zero. For each retrieve of a VCG there is a report of *mfiv* for all tributaries belonging to the VCG.
 Type: alphanumeric value set.

Range:

- 0, 125, 250, 375, ..., 511750, 511875 [microseconds]
- NA
- UNAVAILABLE

In fact the reported range for delay is 0 ... 255875 microseconds. Other values can only be reported as raw values without a delay calculation between the tributaries. UNAVAILABLE is reported when the accepted MFI contents do not meet the basic acceptance criteria (multiframe alignment not completed), or intra-NE communication with the reporting entity is disrupted. NA (Not Applicable) shall be reported under defect conditions detected by the Sn[i] termination function or the VC-n is not part of an S-n-Xv group.

Spec block parameters

1. *clientNodeID* – Client Node IDentifier

The *clientNodeID* identifies the IP address of a client node attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *eportClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

This attribute replaces attribute “*uniClientNodeID*”, as a more generic name seems reasonable for a possible extension of this attribute to other *eportClass* UNI.

This parameter shall be supported by ports of *eportClass* UNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0...255

Default: 0.0.0.0

2. *cnprole* – Customer/Network Port Role

This parameter specifies whether the addressed port is used as a customer WAN port or a network WAN port.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *cnprole* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range: CUSTOMER, for a customer WAN port. NETWORK (default), for a network WAN port.

3. *dftpri* – Default User Priority

This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *dftpri* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range:

- HIGH
- LOW (default).

4. *dftvlan* – Default VLAN Identifier

The parameter *dftvlan* shall specify the value of the VLAN identifier which is applied to ingressing frames (tagging) . This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *dftvlan* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range: 1, 2, 3, ... 4092, 4093; UNAVAILABLE (default)

To express the state UNAVAILABLE system internally the invalid VLAN ID 4094 is used.

5. *enetpn* – Ethernet Alarm Severity Assignment Profile Name

This parameter points to an ASAP profile name of type ENET for the designated AID.

Ethernet port and VCG port have the same ASAP profile named ENET.

Type: Alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: 1 ... 24 characters length.

Default: DEFAULT.

6. *enettca* – Ethernet TCA Profile Name

This parameter specifies the name of the threshold crossing alert (TCA) profile used for the VCG.

Type: alphanumeric string.

Range: 1 ... 24 characters length.

Default: DEFAULT0.

7. *eportClass* – Ethernet Port Class

This identifies the ethernet port class of the AID. *eportClass* is used to specify ethernet ports for use by NN application.

Type: alphanumeric value set.

Range: TRADITIONAL , EDGE, UNI.

Default: Depends on the modifier and the system parameters Cross Connect Setup (*xcsetup*) and Port Class Default (*portclassdefault*): if *xcsetup* is TRADITIONAL, then the default value shall be TRADITIONAL; if modifier is 10GEPL, then the default value shall be TRADITIONAL; if *xcsetup* is SWISS and modifier is 1GE or 1GEPL, then the value of *portclassdefault* shall be used as default value.

8. **eportControl** – Ethernet Port Control (Ethernet Port Administrative Mode)
This identifies the administrative mode of ethernet ports of *eportclass*=EDGE or UNI. For ethernet ports of other ethernet port class this parameter shall not be relevant. *eportControl* is introduced specifically for use by NN application.
Type: alphanumeric value set.
Range: NORMAL (default), MAINT, LOCKOUT .
9. **htmr** – Hold-Off Time
The parameter *htmr* shall specify the hold off time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it goes to state faulty then this tributary is taken out of transmission by LCAS after the hold off time. This time is configured on group level, i.e. all tributaries have the same value for hold-off time. This parameter only affects NE behaviour if *lcasmd*=ENABLE.
Type: numeric value set.
Range: 0 (default), 100, 200, ..., 9900, 10000 [milliseconds].
10. **inputsig** – Tributary Input Signal Rate List
This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure depends on interface standard specified for this VCG by *istd* . For definition of *istd* refer to [“RTRV-VCG: Retrieve virtual concatenation group”](#) (p. 4-2872) Output parameters.
If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the possible tributary structures depends on interface standard specified for this VCG by *istd* and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to RTRV-VCG Output Parameters.
Type: numeric string of the form NX
 - N shall specify the count of container type X
 - X shall specify the container type (or envelope).
 Range:
 - Values: N = 7, X = 4; Modifier=omitted; Interface Standard=SDH; Virtual Concatenation=not applicable; Represented Signal Structure: 7 times VC4
 - Values: N = 7, X = 4; Modifier=1GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times VC4
 - Values: N = 64, X = 4; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times VC4
 - Values: N = 1, X = c64; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times VC4-64C
 - Values: N = 21, X = 1; Modifier=omitted; Interface Standard=SONET; Virtual Concatenation=not applicable; Represented Signal Structure: 21 times STS-1
 - Values: N = 21, X = 1; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 21 times STS-1
 - Values: N = 7, X = 3; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times STS-3C

- Values: N = 192, X = 1; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 921 times STS-1
- Values: N = 64, X = 3; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times STS-3C
- Values: N = 1, X = 192; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times STS-192C

Default:

- modifier = omitted, Interface Standard=SDH, Default Value = 74
- modifier = 1GEPL, Interface Standard=SDH, Default Value = 74
- modifier = 10GEPL, Interface Standard=SDH, Default Value = 644
- modifier = omitted, Interface Standard=SONET, Default Value = 211
- modifier = 1GEPL, Interface Standard=SONET, Default Value = 211
- modifier = 10GEPL, Interface Standard=SONET, Default Value = 1921

11. *istd* – Interface Standard

This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.

Type: alphanumeric value set.

Range:

- SDH
- SONET.

Default: *modifier*: 1GEPL or 10GEPL: The value shall be derived from the circuit pack parameter *istd*. no *modifier*: As derived from parameter *istddflt* specified at configuration management, section System RTRV-EQPT.

12. *lcasmd* – LCAS Mode

This parameter specifies the operation mode of the Link Capacity Adjustment Scheme for this VCG. This value is bi-directional.

Type: alphanumeric value set.

Range:

- DISABLE
- ENABLE (default).

13. *localLPID* – Local Logical Port IDentity

The *localLPID* provides a unique logical identification of a single port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view.

Depending on the *eportClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *eportClass* values not supporting this parameter, the parameter

shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkLPID”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *eportClass* UNI.

Type: numeric value set.

Range: 0 to 4294967295

Default: 0

14. *macaddr* – Port MAC Address

This parameter specifies the MAC address of the WAN port.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *macaddr* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range: 000000000000 to FFFFFFFF or UNAVAILABLE if the value can not be retrieved.

15. *networkTNAType* – Network TNA Type

The *networkTNAType* identifies the type of the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *eportClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAType”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *eportClass* UNI.

Type: alphanumeric value set.

Range: IPV4 (default), IPV6 or NSAP

16. *networkTNAAddress* – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *eportClass* values not supporting this parameter, the parameter shall not be relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.

This parameter shall be supported by ports of *eportClass* UNI.

Type:

networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)

networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16

Bytes)

networkTNAType= NSAP: Hexadecimal number (represents 20 Bytes)

Range:

IPV4: Each numeric string: 0...255

IPV6: Each hexadecimal number: 0000...FFFF

NSAP: Hexadecimal number:

000000000000000000000000000000000000 ...

FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

IPV4: 129.12.3.178

IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E

NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

IPV4: 0.0.0.0

IPV6: 0-0-0-0-0-0-0-0

NSAP: 000000000000000000000000000000000000

17. plcrthr – Threshold for Partial Loss of Capacity (Receive)

The parameter plcrthr shall specify the acceptable limit of valid VCG members in receive direction (refer to the outmbs parameter of all related VCGTRIB entities) for which the PLCR alarm will not yet be raised. The PLCR alarm will be raised if the actual number of those VCG members is between [1 ... (value of the plcrthr parameter - 1)] (if $plcrthr \geq 2$). The PLCR alarm shall never be raised if plcrthr is set to 1.

The PLCR alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the plcrthr parameter (or if the number of those VCG members is 0 - in this case the TLCT alarm will be raised instead). This parameter is not supported if the input parameter modifier is omitted. If the parameter plcrthr is not supported, then the parameter shall be omitted.

Type: numeric value set.

Range: 1, 2, 3, ..., 192

Default:

- modifier = 1GEPL, Input Signal Structure=74, Default Value = 7
- modifier = 1GEPL, Input Signal Structure=211, Default Value = 21
- modifier = 10GEPL, Input Signal Structure=644, 1c64, Default Value = 64
- modifier = 10GEPL, Input Signal Structure=1921, 1192, Default Value = 192

18. plctthr – Threshold for Partial Loss of Capacity (Transmit)

The parameter plctthr shall specify the acceptable limit of valid VCG members in transmit direction (refer to the inmbs parameter of all related VCGTRIB entities) for which the PLCT alarm will not yet be raised. The PLCT alarm will be raised if the actual number of those VCG members is between [1 ... (value of the plctthr parameter - 1)] (if $plctthr \geq 2$). The PLCT alarm shall never be raised if plctthr is set to 1.

The PLCT alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the plctthr parameter (or if the number of those

VCG members is 0 - in this case the TLCT alarm will be raised instead). This parameter is not supported if the input parameter modifier is omitted. If the parameter plctthr is not supported, then the parameter shall be omitted.

Type: numeric value set.

Range: 1, 2, 3, ..., 192

Default:

- modifier = 1GEPL, Input Signal Structure=74, Default Value = 7
- modifier = 1GEPL, Input Signal Structure=211, Default Value = 21
- modifier = 10GEPL, Input Signal Structure=644, 1c64, Default Value = 64
- modifier = 10GEPL, Input Signal Structure=1921, 1192, Default Value = 192

19. stdis – Spanning Tree Protocol Disable

This parameter allows to enable or disable the Spanning Tree Protocol for the given port. If the input parameter modifier is omitted, then this parameter is supported but applicable only if the port is a network port (cnprole = NETWORK). For customer ports (cnprole = CUSTOMER) this parameter has no effect. However, changes shall be stored in the database.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *stdis* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range: DISABLESTP is disabled, i.e. the port is not used to build the spanning tree. ENABLESTP (default) is enabled, i.e. the port is used to build the spanning tree.

As VCGs are by default network ports the default value is to enable STP.

20. stmd – Spanning Tree Protocol Mode

This parameter retrns whether the normal STP according to IEEE802.1D or the rapid spanning tree protocol rSTP according to IEEE802.1w is used on the given port. If the input parameter *modifier* = 1GE, then this parameter is applicable meaningful only if the port is a network port (cnprole = NETWORK). For customer ports (cnprole = CUSTOMER) this parameter has no effect. However, changes shall be stored in the database.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *stmd* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range:

- 802.1D, for the normal ST
- 802.1W, for rSTP
- UNAVAILABLE if the value can not be retrieved.

Default: There is no default value.

21. stpcost – Spanning Tree Path Cost

This parameter specifies the STP-related cost of the path egressing the given port. If the input parameter modifier is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes shall be stored in the database.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter shall be omitted.

Type: integer.

Range: 1 to 200000000.

Default: 20000.

The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approx. 1 Gbit is supported the default value is as shown above.

22. stpid – Spanning Tree Port Identifier

The port identifier is a 16 bit parameter consisting of the port priority (high-order bits) and the port number (low-order bits). The port number is assigned by the system to a port and is not provisionable.

If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes shall be stored in the database.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpid is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range: 0 to 65535 and UNAVAILABLE if the value can not be retrieved.

23. stpop – Spanning Tree Protocol Operational

This parameter indicates whether the Spanning Tree Protocol is operational or not. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes shall be stored in the database.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpop is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range: YES, operational; NO, not operational, UNAVAILABLE if the value can not be retrieved.

24. stpp – Spanning Tree Port Priority

The parameter stpp shall specify the priority of the given port for the Spanning Tree Protocol. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes

shall be stored in the database.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *stpp* is not supported, then the parameter shall be omitted.

Type: integer.

Range: 0 to 255.

The stepping as recommended by the standard (steps of 16 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction "0 to 240" is not done by the NE.

Default: 128.

25. *stprole* – Spanning Tree Protocol Role

The parameter *stprole* shall report the role of the given port in rSTP. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK) and operates in rSTP mode (*stmd* = 802.1W). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes shall be stored in the database.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *stprole* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range:

- ROOT, root
- DESG, designated
- ALT, alternative
- BACKUP, backup
- UNAVAILABLE if the value can not be retrieved.

26. *tcamd* – TCA Mode

This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable: TR-only, (also known as the implicit reset method). TR-RTR, (also known as the explicit reset method).

Type: alphanumeric value set.

Range: TR, TRRTR.

Default: TRRTR in SDH mode; TR in SONET mode.

27. *unequiposig* – Unequipped Tributary Output Signal Rate List

The parameter *unequiposig* shall specify the tributary structure and the capacity of the VCG port in output direction. As long as there is no cross-connection applied the specified tributaries shall be occupied by an unequipped signal. The parameter will implicitly give the maximum capacity of the VCG port, too.

If the input parameter *modifier* is omitted, then the tributary structure depends on interface standard specified for this VCG by *istd*. For definition of *istd* refer to RTRV-VCG Output Parameters.

If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the range of possible tributary structures depends on interface standard specified for this VCG by *istd* and on the virtual concatenation mode *vc*at. For definitions of *istd* and *vc*at refer to RTRV-VCG Output Parameters. The signal will be immediately terminated on the unit. So no unequipped signal is visible to the outside world.

Type: numeric string of the form NX

- N shall specify the count of container type X
- X shall specify the container type (or envelope).

Range:

- Values: N = 7, X = 4; Modifier=omitted; Interface Standard=SDH; Virtual Concatenation=not applicable; Represented Signal Structure: 7 times VC4
- Values: N = 7, X = 4; Modifier=1GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times VC4
- Values: N = 64, X = 4; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times VC4
- Values: N = 1, X = c64; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times VC4-64C
- Values: N = 21, X = 1; Modifier=omitted; Interface Standard=SONET; Virtual Concatenation=not applicable; Represented Signal Structure: 21 times STS-1
- Values: N = 21, X = 1; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 21 times STS-1
- Values: N = 7, X = 3; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times STS-3C
- Values: N = 192, X = 1; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 192 times STS-1
- Values: N = 64, X = 3; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times STS-3C
- Values: N = 1, X = 192; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times STS-192C

Default:

- modifier = omitted, Interface Standard=SDH, Default Value = 74
- modifier = 1GEPL, Interface Standard=SDH, Default Value = 74
- modifier = 10GEPL, Interface Standard=SDH, Default Value = 644
- modifier = omitted, Interface Standard=SONET, Default Value = 211
- modifier = 1GEPL, Interface Standard=SONET, Default Value = 211
- modifier = 10GEPL, Interface Standard=SONET, Default Value = 1921

28. *vcat* – Virtual Concatenation

This parameter *vcat* shall specify whether the ethernet signal is mapped to a number of virtually concatenated tributaries (value = ENABLE) or into a contiguously concatenated tributaries (value = DISABLE). In the latter case, LCAS related parameters become insignificant (values set to default, values cannot be changed). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *vcat* is not supported, then the parameter shall be omitted.
Type: alphanumeric value set.

Range:

- ENABLE (default)
- DISABLE.

29. *vmode* – VCG Monitoring Mode

The parameter *vmode* shall specify the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.
Type: alphanumeric value set.

Range:

- MON, for monitored
- NMON (default), for not monitored.

30. *vpm* – VCG Performance Monitoring

The parameter *vpm* shall specify whether the performance monitoring is enabled or disabled for this port.

Type: alphanumeric value set.

Range:

- DISABLE (default)
- ENABLE.

31. *vrtswid* – Virtual Switch Identifier

This parameter identifies the instance of the virtual switch.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *vrtswid* is not supported, then the parameter shall be omitted.

Type: integer

Range: 1 - Currently this is the only allowed value

32. *vss* – Spanning Tree Status

This parameter returns the status of the spanning tree protocol for the given port. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes shall be stored in the database.

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL.

The name of this parameter originally stands for VCG STP status which is

somewhat misleading for an EPORT but is kept for consistency reasons with other products. (When using an EPORT as a network port it participates in STP and therefore also has status information.) If the parameter *vss* is not supported, then the parameter shall be omitted.

Type: alphanumeric value set.

Range:

- FWG, Forwarding
- LRG, Learning
- LIS, Listening (IEEE8102.D/STP only)
- BLK, Blocking (IEEE8102.D/STP only)
- DISF, Disabled due to a failure (IEEE8102.D/STP only)
- DISA, Disabled via provisioning
- BRK, Broken (IEEE8102.w/rSTP only)
- DCD, Discarding (IEEE8102.w/rSTP only)
- UNAVAILABLE if the value can not be retrieved.

33. *vvidls* – Valid VLAN Identifier List (static)

This parameter specifies a list of all static VLAN identifiers allowed for this port. The list shall be ampersand grouped (& and &&). The list shall be packed by the NE and the management systems as good as possible by using '&' and '&&'. The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list *vvidlsd*. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter *dftvlan* of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (*cnprole* = NETWORK).

This parameter is not supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *vvidls* is not supported, then the parameter shall be omitted.

Type: alphanumeric string and the character '&'.

Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, ..., 4092, 4093
- In case the list has no members (empty list) -1.

The length of the list is limited only by the usual system limitations like e.g. TL1 line length. The number of entries in this list is limited to 64 by some NE-internal restrictions. Ranging and grouping by using the operators '&' and '&&' has no impact on the number of entries, it only reduces the length of the list being transported to/from CIT/EMS.

Default: -1.

Example 1:

`vvidls=-1`. The list has no members (empty list).

Example 2:

`vvidls=3&5&40&&45`. This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.

Example 3:

`vvidls=1&&4093` This list has the members 1,2, 3, ..., 4092, 4093.

34. `vvidlsd` - Valid VLAN Identifier List (dynamic)

This parameter gives the list of all dynamic VLAN identifiers allowed for this port as gathered autonomously via GVRP. The list is ampersand grouped (& and &&). The vlan identifier of an incoming frame must be a member of this dynamic VLAN Id list or the static VLAN Id list `vvidls`. Frames tagged by a vlan identifier not member of these lists will be discarded. This parameter is also used in transparent tagging mode to report the list of valid customer tags (CIDs) for network ports (*cnprole* = NETWORK) collected by GVRP.

This parameter shall not be supported if the input parameter: *modifier* = 1GEPL, or *modifier* = 10GEPL.

If the parameter `vvidlsd` is generally not supported, then the parameter shall be always omitted. Otherwise, this parameter is reported only if

- the virtual switch entity exists (i.e. the VLAN tagging mode *vlantagmd* of the slot the addressed EPort belongs to is set to 802.1TAG) AND
- GVRP is enabled on the virtual switch (*gvrpmode* = ENABLED)
- the port is a NETWORK port (*cnprole* = NETWORK).

Type: alphanumeric string and the character '&'.

Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, ..., 4092, 4093
- In case the list has no members (empty list) -1.

If the value can not be retrieved: UNAVAILABLE

Default: There is no default value.

Example 1:

`vvidlsd=-1` The list has no members (empty list).

Example 2:

`vvidlsd=3&5&40&&45` This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.

35. `wtr` – Wait To Restore Time

The parameter `wtr` shall specify the wait to restore time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it recovers from a faulty state then this tributary is taken in again to transmission by LCAS after the wait-to-restore time. This time is configured on group level, i.e. all tributaries have the same value for the wait-to-restore time. This parameter only affects NE behaviour if *lcasmd*=ENABLED.

Type: alphanumeric value set.

Range: 0, 1, 2, ..., 59, 60 [minutes].

Default: 0.

Detailed behavior description

The RTRV-VCG does not generate a REPT DBCHG message. The command retrieves all VCG parameters as described in section Output parameters.

The values of the following parameters are directly requested from the hardware:

- mfiv
- macaddr
- stmd
- stpop
- stpid
- stprole
- vss
- vvidlsd.

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there apply to the RTRV-VCG command, too.

Validation rule: Command only allowed for VCG on GEN circuit packs

If the command is not applied to a VCG on a GEN pack, then the command shall be denied.

Error Code: IENE - Input, Entity Not Exists

Validation rule: *modifier* mandatory for the GE10PL1 circuit pack

The system shall verify that the modifier parameter is provided by the command if the related slot has been successfully provisioned with a GE10PL1 circuit pack.

Error Code:

IDNC - Input, Data Not Consistent, modifier is required for this circuit pack type

Validation rule: *modifier* consistent with given port-rate

The system shall verify that a given modifier parameter is consistent with the rate of the port (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the RTRV-VCG command for applicable combinations.

Error Code:

IDNC - Input, Data Not Consistent, modifier is inconsistent with existing port rate

Related TL1 messages

[“ED-VCG: Edit virtual concatenation group” \(p. 4-1270\)](#)

RTRV-VCG-TRANS: Retrieve virtual concatenation group transparent

The RTRV-VCG-TRANS command retrieves the attributes of a virtual concatenation group, used for fully transparent applications.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command Syntax: RTRV-VCG-TRANS:*tid:aid:ctag[:::spec_block]*;

Input parameters

Command parameters

1. *tid* – Target Identifier
This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.
Type: identifier, in addition the special character underscore (" _ ") and the password characters are allowed.
Range: 1 to 20 characters
2. *aid* – Access Identifier
This parameter specifies the virtual concatenation group (VCG) to be operated on.
Type: AID.
Range: VCGAID as defined in AID structure. The values
 - *vall* for Simple_VCGAID and
 - *usall* for Simple_UnivSlotAIDare accepted.
3. *ctag* – Correlation Tag
This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
Type: alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

Spec block parameter**1. dyn - Retrieve Dynamic Parameters**

This parameter controls whether dynamic parameters shall be reported with the command reply or not. It shall be given only when using any of the wildcard values *usall* or *vall* at the appropriate positions of the input AID. For input AIDs not using *usall* or *vall* this parameter shall not be considered. This implies that with such input AIDs the dynamic parameters are always returned.

The following output parameters of a *vcgport* port are affected: *mfiv*, *rplt*.

Type: alphanumeric value set.

Range:

- YES: Report dynamic parameters in the reply as well
- NO (default): Do not report dynamic parameters in the reply.

Output format

If the NE fully complies with the RTRV-VCG request, the following normal completion response is returned:

```
sid date time
M ctag COMPLD
  "aid::spec_block"
    <1 or more of the line above>
  "tribaid:mfiv,MFIV"
    <no such line, if the virtual concatenation mode is disabled, else
      no such line, if no dynamic data are retrieved, else
      one or more lines, one for each tribaid belonging to aid>
    ...
    ...
  "aid::spec_block"
    <1 or more of the line above>
  "tribaid:mfiv,MFIV"
    <no such line, if the virtual concatenation mode is disabled, else
      no such line, if no dynamic data are retrieved, else
      one or more lines, one for each tribaid belonging to aid>
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier

This parameter specifies the VCG to be operated on.

Type: AID.

Range: VCGAID as defined in AID structure with the exception of the value *vall*.

2. *tribaid* – Tributary Access Identifier

The tributary access identifier shall specify a tributary belonging to the virtual concatenation group (VCG) given by the *aid* above.

Type: AID.

Range: VCGNumAID as defined in AID structure with the exception of the value *all*.

3. *mfiv* - Multiframe Indicator Value

This parameter reports the differential delay between the tributary addressed by *tribaid* (see above) and the fastest tributary of the VCG. The fastest tributary has the value zero. For each retrieve of a VCG there is a report of *mfiv* for all tributaries belonging to the VCG.

Type: alphanumeric value set.

Range:

- 0, 125, 250, 375, ..., 511750, 511875 [microseconds]
- NA
- UNAVAILABLE

In fact the reported range for delay is 0 ... 255875 microseconds. Other values can only be reported as raw values without a delay calculation between the tributaries. UNAVAILABLE is reported when the accepted MFI contents do not meet the basic acceptance criteria (multiframe alignment not completed), or intra-NE communication with the reporting entity is disrupted. NA (Not Applicable) shall be reported under defect conditions detected by the Sn[i] termination function or the VC-n is not part of an S-n-Xv group.

Spec block parameters

1. **camd - Consequent Action Mode**
This parameter specifies the mode of the consequent action to be executed in egress direction (to the synchronous port) on detected signal fail conditions (dPLM, AI_TSF or detected generic AIS) on the ODU layer
Type: alphanumeric value set.
Range: GENERICAIS (default), MSAIS, LASEROFF
2. **enetpn – Ethernet Alarm Severity Assignment Profile Name**
This parameter points to an ASAP profile name of type ENET for the designated AID.
Some VCG related alarms have to be referenced via the ASAP profile named ENET.
Type: Alphanumeric string. A hyphen (-) is additionally allowed in the name.
Range: 1 ... 24 characters length.
Default: DEFAULT.
3. **fevpm - Far End VCG Performance Monitoring**
The parameter fevpm shall specify whether the far end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer. This parameter enables/disables therefore far end PM on the ODUkP layer.
Type: alphanumeric value set.
Range: DISABLE (default), ENABLE
4. **inputsig – Tributary Input Signal Rate List**
This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure is independent from the interface standard istd specified for this VCG.
Type: numeric string of the form NX
 - N shall specify the count of container type X
 - X shall specify the container type (or envelope).Range:
 - N=17,
 - X = 4 for VC-4 / STS3.Default: 174.
5. **istd – Interface Standard**
This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.
Type: alphanumeric value set.
Range:
 - SDH
 - SONET.Default: As derived from parameter *istddflt* specified at configuration management, section System RTRV-EQPT.

6. **nevp** - Near End VCG (ODUkP) Performance Monitoring
This parameter specifies whether the near end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer and on the VCG level. This parameter enables/disable therefore near end PM on the ODUkP layer.
Type: alphanumeric value set.
Range: DISABLE (default), ENABLE
7. **pmvcgfeses** - Performance Monitoring VCG (ODUkP) Far-End SES Threshold
This parameter describes the ODUkP Far-End SES threshold value. It indicates the number of errored blocks per second to declare a second as severely errored. The default value is defined in G.8201 for OTN. If the interface standard is changed the current default value is not changed.
Type: numeric value set.
Range (the range depends on the ODUkP rate): ODU1P: 1 - 20420
Default: ODU1P: 3064
G.8201 defines block based PM on the ODUkP layer.
8. **pmvcgneses** - Performance Monitoring VCG (ODUkP) Near-End SES Threshold
This parameter describes the VCG (actually ODUkP) Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the ODUkP rate): ODU1P: 1 - 20420
Default: ODU1P: 3064
G.8201 defines block based PM on the ODUkP layer.
9. **rp1t** - Reported Payload Type
The parameter rp1t shall report the received payload type for the constant bit rate mapping on the ODU layer.
Type: alphanumeric value set.
Range:
 - 00, 01, ..., FE, FF i.e. two hexadecimal digits
 - UNAVAILABLE
10. **tcamd** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable: TR-only, (also known as the implicit reset method). TR-RTR, (also known as the explicit reset method).
Type: alphanumeric value set.
Range: TR, TRRTR.
Default: TRRTR in SDH mode; TR in SONET mode.

11. transpn - Transparent Alarm Severity Assignment Profile Name

This parameter points to a ASAP profile name of type TRANSPARENCY for the designated AID.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: 1 ... 24 characters length

Default: DEFAULT.

12. transtca - Transparent TCA Profile Name

The parameter transtca shall specify the name of the threshold crossing alert (TCA) profile used for the VCG..

Type: alphanumeric string.

Range: 1 ... 24 characters length

Default: DEFAULT0

13. unequipo sig - Unequipped Tributary Output Signal Rate List

This parameter specifies the tributary structure and the capacity of the VCG port in output direction. As long as there is no cross-connection applied the specified tributaries shall be occupied by an unequipped signal. The parameter will implicitly give the maximum capacity of the VCG port, too. The tributary structure is independent of the interface standard specified for this VCG.

The signal will be immediately terminated on the unit. So no unequipped signal is visible to the outside world.

Type: numeric string of the form NX.

- N shall specify the count of container type X
- X shall specify the container type (or envelope)

Range:

- N = 17
- X = 4 for VC-4 / STS-3C

Default: 174

14. vmode - VCG Monitoring Mode

This parameter wtr specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.

Type: alphanumeric value set.

Range: MON: for monitored; NMON (default): for not monitored.

Detailed behavior description

The RTRV-VCG-TRANS does not generate a REPT DBCHG message. The command retrieves all VCG parameters as described in section Output parameters.

The values of the following parameters are directly requested from the hardware:

- *mfiv*
- *rplt*

Thus the value "UNAVAILABLE" is reported, if the CP HW is not available in the system.

Example input/output

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command Error responses section. The error responses listed there apply to the RTRV-VCG-TRANS command, too.

Validation rule: Command only allowed for VCG on Transparent Packs

If the command is not applied to a VCG on a transparent pack, then the command shall be denied.

Error Code: IENE - Input, Entity Not Exists

Related TL1 messages

[“ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application”
\(p. 4-1308\)](#)

RTRV-VCGTRIB: Retrieve virtual concatenation group tributary

The RTRV-VCGTRIB command retrieves the attributes of a VCG tributary used for 1 and 10 GbE or fully transparent applications.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-VCGTRIB-*modifier:tid:aid:ctag[:spec_block]*;

Input parameters

Command parameters

1. *modifier*

This parameter specifies the type of the tributary. The purpose is to distinguish between SDH/SONET tributaries and between the application of the VCG the tributary belongs to. Current applications are GE1 and fully transparency.

Type: alphanumeric value set.

Range:

- ALL
- STS
- VC.
- STST
- VCT.

To distinguish the fully transparent application from a GE application, a letter "T" is appended. There is no distinction between VCGTRIB entities of the GE1 pack from the GE10PL1 pack needed. In particular, the transmission rate in case the parameter *modifier* = STS needs to be derived from the parameters *inputsig* and *unequipsig* of the related VCG entity.

2. *tid* – Target Identifier

This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.

Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.

Range: 1 to 20 characters

3. aid – Access Identifier

This parameter specifies VCG tributary to be operated on.

Type: AID.

Range: VCGNumAID as defined in AID structure. The values

- *all* for Simple_VCGNumAID
- *vall* for Simple_VCGAID
- *usall* for Simple_UnivSlotAID
- *all* for Simple_UnivSlotAID
- *all* for Simple_ShelfAID and
- *all* for BayAID

shall be accepted.

4. ctag – Correlation Tag

This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

Type: alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

Spec block parameter**dyn - Retrieve Dynamic Parameters**

This parameter controls whether dynamic parameters shall be reported with the command reply or not. It shall be given only when using any of the wildcard values *all*, *usall* or *vall* at the appropriate positions of the input AID. For input AIDs not using *all*, *usall* or *vall* this parameter shall not be allowed.

The following output parameters of a vcgtrib are affected:

- aseqno
- tseqno
- ptrc
- ptrcst
- rsiglb
- trailst.

Type: alphanumeric value set.

Range: YES: Report dynamic parameters in the reply as well; NO (default): Do not report dynamic parameters in the reply.

Output format

If the NE fully complies with the RTRV-VCGTRIB request, the following normal completion response is returned:

```

sid date time
M ctag COMPLD
  "aid::spec_block set1"
    <1 or more of the line above,
      or no lines, depending on dynamic data retrieval mode>
  "aid,aidtype::spec_block set2"
    <1 or more of the line above>
    ...
    ...
  "aid::spec_block set1"
    <1 or more of the line above,
      or no lines, depending on dynamic data retrieval mode>
  "aid,aidtype::spec_block set2"
    <1 or more of the line above>
;

```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output Parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Output parameters

Command parameters

1. *aid* – Access Identifier
This parameter specifies the VCG tributary whose attributes are reported.
Type: AID.
Range: VCGNumAID as defined in AID structure with exception of value all.
2. *aidtype* - Access Identifier Type
This parameter specifies the type of the tributary.
Type: alphanumeric value set.
Range: STS or VC or STST or VCT.

To distinguish the fully transparent application from a GE application, a letter “T” is appended. There is no distinction between VCGTRIB entities of the GE1 pack from the GE10PL1 pack needed. In particular, the transmission rate in case the parameter *modifier* = STS needs to be derived from the parameters *inputsig* and *unequipoisig* of the related VCG entity.

Spec block parameters Set 1

1. *aseqno* - Accepted Sequence Number
This parameter reports the accepted sequence number of the tributary. In case of a disrupted intra-NE communication with the reporting entity “not available” shall be reported.
In case that the received sequence no. does not meet the basic acceptance criteria

or under defect conditions a value shall be reported, which is outside of the designated range (see parameter *tseqno* for the designated range).

If the tributary to be reported is no configured member of the VCG “not applicable” shall be reported.

Type: alphanumeric value set.

Range:

- 0, 1, 2, ..., 254, 255
- NA, for not applicable
- UNAVAILABLE, for not available/unavailable.

Although the normal accepted sequence no. is limited to the designated range (see parameter *tseqno* for the designated range), the NE is not prevented to report a higher number (accompanied by a proper alarm).

2. *tseqno* - Transmitted Sequence Number

This parameter reports the transmitted sequence number of the tributary. In case of a disrupted intra-NE communication with the reporting unit ‘not available’ shall be reported. If the tributary to be reported is no configured member of the VCG ‘not applicable’ shall be reported.

Type: alphanumeric value set.

Range:

- For modifier STS: 0, 1, 2, ..., 190, 191
- For modifier VC: 0, 1, 2, ..., 62, 63
- For modifier STST or VCT: 0, 1, 2, ..., 15, 16
- For modifier STS or VC: NA for not applicable
- For all modifiers: UNAVAILABLE for not available/unavailable.

Possible value ranges for the various pack types:

- Pack Type=GE1, modifier = STS, *tseqno* range= 0, [1, ..., 20], depends also on configured and actual membership
- Pack Type=GE1, modifier = VC, *tseqno* range= 0, [1, ..., 6]
- Pack Type=GE10PL1, modifier = STS, *tseqno* range= 0, [1, ..., 20], if VCGTRIB entities belong to 1 GE interface depends also on configured and actual membership
- Pack Type=GE10PL1, modifier = VC, *tseqno* range= 0, [1, ..., 6]
- Pack Type=GE10PL1, modifier = STS, *tseqno* range= 0, [1, ..., 191], if VCGTRIB entities belong to 1 GE interface depends also on configured and actual membership
- Pack Type=GE10PL1, modifier = VC, *tseqno* range= 0, [1, ..., 63]
- Pack Type=OPT2G5, modifier = STST, *tseqno* range= 0, 1, ..., 16, always all 17 are needed and no LCAS is supported
- Pack Type=OPT2G5, modifier = VCT

- Pack Type=<all>, modifier = <all>, tseqno range= NA, if not applicable
- Pack Type=<all>, modifier = <all>, tseqno range= UNAVAILABLE, if not available/unavailable.

Values for the parameters are derived from the VCGTRIB number as follows:

- modidier=STS, Tributary rate=STS-1, tseqno calculation: VCGTRIB No. - 1
- modidier=STS, Tributary rate=STS-3c, tseqno calculation: (VCGTRIB No. - 1) / 3 for VCGTRIB ∈ {1, 4, ..., 190} otherwise NA
- modidier=VC, Tributary rate=VC-4, tseqno calculation: (VCGTRIB No. - 1) / 3 for VCGTRIB ∈ {1, 4, ..., 190} otherwise NA
- modidier=STST, Tributary rate=STS-3c, tseqno calculation: VCGTRIB No. - 1
- modidier=VCT, Tributary rate=VC-4.

Intra NE communication is not needed to derive these values, therefore.

Spec block parameters Set 2

Mode STS | VC

Some of the spec block parameters set 2 depend on the *modifier* (for RTRV) or *aidtype* (for ED, ED Not. and ENT Not.). Those parameters are only applicable for the given mode, i.e in the other mode they shall be neither reported nor modifiable.

1. brstintvl- Bursty Interval

This parameter specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstintvl* has no affect to NE behaviour. The parameter *brstintvl* is only valid for modifiers different from STST and VCT, .e. shall be omitted in the command response for STST and VCT.

Type: integer..

Range: 2, 3, ..., 10 [seconds].

Default: 7 [seconds].

2. brstthr - Bursty Error Threshold

This parameter specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behaviour. The parameter *brstthr* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: integer.

Range: 5, 10, 15, ... 50 [%].

Default: 30 [%].

3. crslpbkstat - Cross-connect Loopback Status

This parameter reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to “[OPR-LPBK \(here cross-connection loopback\)](#)” (p. 4-1895).

Type: alphanumeric value set.

Range: YES, for enabled loopback; NO, for disabled loopback.

4. *degthr* - Signal Degrade Threshold

This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behaviour. For the definition of *sdsfmode* refer to the Output parameters section. The parameter *degthr* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: integer.

Range: -5, -6, -7, -8, -9 i.e. range is 10exp-9 to 10exp-5.

Default: -6

5. *dexcthr* - Excessive Degrade Threshold

This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behaviour. For the definition of *sdsfmode* refer to the Output parameters section. The parameter *dexcthr* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: integer.

Range: -3, -4, -5 i.e. range is 10exp-5 to 10exp-3.

Default: -3.

6. *exphptrc* - Expected HP trace identifier

This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value shall be in the range from 80 to FF (MSB always set to 1). The other byte values shall be in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.

Type: hexadecimal number without a preceding 'H'.

Range: length, 32 hexadecimal digits; value, specific string acc. ITU/ETSI mode 1.

Default: 89000000000000000000000000000000.

7. *feppm* - Far End Path PM Enable

This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary. The parameter *feppm* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: alphanumeric value set.

Range: DISABLE (default), ENABLE.

8. *hptimais* - HP Trace Identifier Mismatch AIS Insertion

This parameter specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range: DISABLE , ENABLE.

Default: The default value depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to “[RTRV-VCG: Retrieve virtual concatenation group](#)” (p. 4-2872) Output parameters. DISABLE, if *istd*=SONET; ENABLE, if *istd*=SDH.

9. *hptimmon* - HP Trace Identifier Mismatch Monitor

This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

Type: alphanumeric value set.

Range: DISABLE (default), ENABLE.

10. *inmbs* - Input Membership

This parameter specifies if the tributary shall take part to the transmission of its owning VCG in input direction. Input direction in this case means from the LCAS source on the GE1 pack to the cross-connect pack XCn. The addressing scheme of the tributaries by using VCGNumAIDs is ensuring that only legal AIDs are used. So no consideration about the 'illegal' tributaries (e.g. 1-1-#-#-1-1-3 for VC-4) is necessary. The parameter *inmbs* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

The system shall not evaluate the parameter *inmbs* if the parameter *vcat* of the related VCG is set to DISABLE. The parameter shall be retrievable.

Type: alphanumeric value set.

Range: DISABLE , ENABLE.

Default: for modifiers STST or VCT:ENABLE. for all other modifiers:DISABLE.

The VCG has as default the size 0, i.e. it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE.

11. *inmbst* - Input Member Status

This parameter reports the status of the tributary related to its VCG membership in input direction. The parameter *inmbst* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: alphanumeric value set.

Range:

- for modifiers STST or VCT always ACTIVE shall be reported
- for all other modifiers:
- NA, for not applicable, i.e. if the trib. is no member of the VCG or if virtual concatenation is disabled
- ADD, the tributary is in the LCAS state "Wait-for-Add", "Add" or "Wait-for-ACK"
- ACTIVE, the tributary is member of the VCG and working

- FAILED, the tributary is member of the VCG but taken off by LCAS (incoming failed condition for the sink tributary)
- UNAVAILABLE, for not available, i.e. the trib. is member of the VCG but the current data is not retrievable for any reason.

The state FAILED can only be reported if *lcsmd* is set to ENABLE for the VCG owning this tributary. For parameter *lcsmd* refer to the Output parameters section of [“RTRV-VCG: Retrieve virtual concatenation group”](#) (p. 4-2872).

12. neppm - Near End Path PM Enable

This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary. The parameter *neppm* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: alphanumeric value set.

Range:

- DISABLE (default)
- ENABLE.

13. outmbs - Output Membership

This parameter specifies if the tributary shall take part to the transmission of its owning VCG in input direction. Output direction in this case means from the cross-connect pack XCn to the LCAS sink on the GE1 pack. The parameter *outmbs* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

The system shall not evaluate the parameter *outmbs* if the parameter *vcac* of the related VCG is set to DISABLE. The parameter shall be retrievable.

Type: alphanumeric value set.

Range:

- DISABLE
- ENABLE.

Default: for modifiers STST or VCT: ENABLE. for all other modifiers:DISABLE.

The GEN VCG has as default the size 0, i.e. it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE.

14. outmbst - Output Member Status

This parameter reports the status of the tributary related to its VCG membership in output direction. The parameter *outmbst* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: alphanumeric value set.

Range:

- for modifiers STST or VCT always ACTIVE shall be reported, for all other modifiers:
- NA, for not applicable, i.e. if the trib. is no member of the VCG or if virtual concatenation is disabled

- ADD, the tributary is in the LCAS state "Wait-for-Add" or "Wait-for-Data"
- ACTIVE, the tributary is member of the VCG and working
- FAILED, the tributary is member of the VCG but not working due to a failure condition. Includes period during "Hold-Off".
- WTR, failure condition has cleared, tributary is in wait to restore condition.
- UNAVAILABLE, for not available, i.e. the trib. is member status is not retrievable for any reason.

The state WTR can only be reported if *lcasmd* is set to ENABLE for the VCG owning this tributary. For parameter *lcasmd* refer to RTRV-VCGRIB Output Parameters. For a detailed explanation of the ADD state in the LCAS protection scheme, please refer to SRD_DATA_Virtual_Concatenation.

15. *pmhpfeses* - PM HP Far End SES Threshold

This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behaviour depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of "[RTRV-VCGRIB: Retrieve virtual concatenation group](#)" (p. 4-2872). If *istd* is not set to SDH then *pmhpfeses* has no affect to NE behaviour. The parameter *pmhpfeses* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT..

Type: integer.

Range: 1, 2, 3, ..., 63998, 63999, 64000, includes SDH/SONET range.

Default: 2400.

16. *pmhpneses* - PM HP Near End SES Threshold

This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behaviour depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of "[RTRV-VCGRIB: Retrieve virtual concatenation group](#)" (p. 4-2872). If *istd* is not set to SDH then *pmhpneses* has no affect to NE behaviour.

The parameter *pmhpneses* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: integer.

Range: 1, 2, 3, ..., 63998, 63999, 64000, includes SDH/SONET range.

Default: 2400.

17. *ptca* - Path TCA Profile Pointer

This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

The parameter *ptca* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: alphanumeric string.

Range: 1 ... 24 characters.

Default: DEFAULT0.

18. *ptpn* - Path Terminating ASA Profile Name

This parameter points to a tributary ASAP profile name *pfname* for the designated AID.

Type: alphanumeric string. A hyphen (-) is additionally allowed in the name.

Range: 1 ... 24 characters.

Default: DEFAULT.

19. *ptrc* - Incoming Path Trace

This parameter reports the accepted higher order path trace identifier (J1). The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter *ptrc* is omitted from the response.

Type: hexadecimal.

Range: the range depends on the parameter *ptrcrfmt* specified in RTRV-VCGTRIB Output Parameters

- 2 hexadecimal digits, if *ptrcrfmt*=2
- 32 hexadecimal digits, if *ptrcrfmt*=16
- 128 hexadecimal digits, if *ptrcrfmt*=64.

20. *ptrcrfmt* - Path Trace Read Format

This parameter specifies the format of the path trace (J1 byte) to be received (sink).

Type: numeric string.

Range:

- 2, for non-specific repeating byte
- 16, for 16 byte specific string
- 64, for 64 byte string.

Default:

For VCG Tributaries located on GE1 packs: 2

For VCG Tributaries located on GE10PL1 packs: 16 if *istd* = SDH, 64 if *istd* = SONET.

21. *ptrcst* - Status of Incoming Path Trace

This parameter shows the status of the value of the incoming Path Trace Identifier (J1) which is available with parameter *ptrc*.

Type: alphanumeric value set.

Range:

- NORMAL, *ptrc* contains a valid value
- UNAVAILABLE, no valid value for *ptrc* could be obtained by the system
- AIS, no valid value for *ptrc* could be obtained due to SF condition.

22. *ptrcwfmt* - Path Trace Write Format

This parameter specifies the format of the path trace (J1 byte) to be sent (source).

Type: numeric string.

Range:

- 2, for non-specific repeating byte
- 16, for 16 byte specific string
- 64, for 64 byte string.

Default:

For VCG Tributaries located on GE1 packs: 2

For VCG Tributaries located on GE10PL1 packs: 16 if *istd* = SDH, 64 if *istd* = SONET.

23. *rsiglb* - Received Signal Label

This parameter reports the accepted trail signal label (C2). The parameter shall not be reported if the *trailst* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE.

Type: alphanumeric value set.

Range: 00, 01, ..., FE, FF, i.e. two hexadecimal digits.

24. *sdsfmode* - Signal Degrade/Signal Fail Mode

This parameter specifies the determination mode of degraded defect for transmission. The parameter *sdsfmode* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

Type: alphanumeric value set.

Range: BURST or POISSON.

Default: For VCG tributaries located on a GE10PL1 pack, the default is: BURST.

For VCG tributaries located on other packs, the default value depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to RTRV-VCG Output Parameters. POISSON, if *istd*=SONET; BURST, if *istd*=SDH.

25. *tcamd* - TCA mode

This parameter is only available for SDH mode and the modifier must be VC. The parameter shows the modus of the PM thresholding. Two thresholding methods are applicable for SDH: TR-only (also known as the implicit reset method), TR-RTR (also known as the explicit reset method). For SONET the parameter *tcamd* does not exist. SONET ports only support "TR-only" mode. Thus the mode must be

internally set to "TR-only".

Type: alphanumeric value set.

Range: TR, TRRTR.

Default: SDH mode: TRRTR. SONET mode: TR (internal). For SONET the parameter *tcamd* does not exist. SONET ports only support "TR-only" mode. Thus the mode must be internally set to "TR-only".

The parameter *tcamd* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

26. *tmonmd* - Tributary Monitoring Mode

This parameter specifies the monitoring mode for the tributary.

Type: alphanumeric value set.

Range: MON or NMON (default).

27. *trailst* - Trail Status

This parameter reports the accepted trail status value.

Type: alphanumeric string.

Range:

- AIS, for Alarm Indication Signal in case of Trail Signal Fail Condition
- UNAVAILABLE, for unavailable
- NORMAL.

28. *trc* - Outgoing Path Trace

This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule shall be applied: The first byte value shall be in the range from 80 to FF (MSB always set to 1). The other byte values shall be in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcfmt*=2).

Type: hexadecimal number without a preceding H'.

Range: the range depends on the parameter *ptrcfmt* specified in RTRV-VCGTRIB Output parameters length

- 32, hexadecimal digits, if *ptrcfmt*=16
- 128, hexadecimal digits, if *ptrcfmt*=64
- value: specific string acc. ITU/ETSI mode 1, if *ptrcfmt*=16; 64 byte string, if *ptrcfmt*=64.

Default: 00. This implies also that *ptrcfmt* is set to 2. Refer to [18] for details.

29. *tslmon* - Trail Signal Label Mismatch Monitor

This parameter specifies the mode of the TSL mismatch detection.

Type: alphanumeric value set.

Range:

- DISABLE
- ENABLE (default).

Detailed behavior description

The RTRV-VCGTRIB does not generate a REPT DBCHG message. The command retrieves all port parameter as described in section Output parameters.

Dependencies

brstintvl and *brstthr* are only meaningful if *sdfsmode* is set to BURST. *degthr* and *dexcthr* are only meaningful if *sdfsmode* is set to POISSON.

Parameters which are not meaningful at the moment are reported with their default values, nevertheless.

Error responses

Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command Error responses section. The error responses listed there apply to the RTRV-VCGTRIB command, too.

Validation rule: Check *modifier* against circuit pack type

If the command is applied

- with modifier = VC or STS to a VCG Tributary on a Transparent pack or
- with modifier = VCT or STST to a VCG Tributary on a GEN pack, then the command shall be denied.

Error Code: IENE - Input, Entity Not Exists

Validation rule: Check CCB against *istd* of related VCG

Check whether the CCB fits to *istd* of the related VCG.

Error code:

ICNV - Input, Command Not Valid, Interface Standard does not match.

E.g. DENY, if a command with modifier=VC or modifier=VCT is made on a port which is provisioned as istd=SONET.

- “[OPR-VCGTRIB: Operate virtual concatenation group tributary](#)” (p. 4-1938)

RTRV-VRTSW: Retrieve Virtual Switch

The RTRV-VRTSW command retrieves the attributes of a virtual switch of a GE1 pack.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command Syntax: RTRV-VRTSW:*tid:aid:ctag*[::*spec_block*];

Input parameters

Command parameters

1. *tid* – Target Identifier
Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command for the input parameter syntax and the description of this parameter.
2. *aid* – Access Identifier
The access identifier specifies the slot containing a GE1 pack.
Type: AID.
Range: UnivSlotAID as defined in AID structure.
The values
 - *all* and
 - *usall* for Simple_UnivSlotAIDshall be accepted.
3. *ctag* – Correlation Tag
See definition of *ctag* in “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Spec block parameters

1. *dyn* – Retrieve Dynamic Parameters
This parameter controls whether dynamic parameters shall be reported with the command reply or not. It shall be given only when using any of the wildcard values *all* or *usall* at the appropriate positions of the input AID. For input AIDs not using *all* or *usall* this parameter shall not be allowed. This implies that with such input AIDs the dynamic parameters are always returned.
The following output parameters of a virtual switch are affected:
 - *macaddr*
 - *rootpriority*
 - *rootmacaddr*

- *rootcost*
- *rootport*.

Type: alphanumeric value set.

Range: YES, report dynamic parameters in the reply as well. NO (default), do not report dynamic parameters in the reply.

Output format

After receiving the RTRV-VRTSW command, the following normal completion response is returned:

```

      sid date time
M  ctag COMPLD
   "aid:vrtswid:spec_block"
   <this entire block is repeated for another vrtswid>
   <this entire structure is repeated for another slot>
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the Output parameter section of.

The output is in the form of a nested list. The primary list is based on the slot AID. For each slot AID, there is a nested list for each instance of a virtual switch giving the *spec_block* parameters.

Output parameters

Command parameters

1. aid – Access Identifier

This parameter specifies the slot containing a GE1 pack to be operated on.

Type: AID.

Range: UnivSlotAID as defined in AID structure with the exception of the value all and usall.

2. vrtswid - Virtual Switch Identifier

This parameter identifies the instance of the virtual switch.

- A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
- There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.

Type: integer.

Range: 1 - Currently this is the only allowed value.

Default: 1.

Spec block parameters

1. ep1st – EPORT AID list

This parameter specifies a list of EPORT instances connected to the virtual switch instance as specified by *vrtswid*.

In R3 there is only one virtual switch instance to which all ports are mapped. Therefore this list is fix.

Type: AID list.

Range: A list of EPortAIDs as specified in the AID definition section with the exception of the values all and usall in the respective components of the AID, separated by an ampersand ('&')

Example: If all four EPORTs of a GE1 are mapped to one virtual switch:

1-#-#-1-1-1&1-#-#-1-1-2&1-#-#-1-1-3&1-#-#-1-1-4

2. ethertype – VLAN tag protocol ID

This parameter specifies the VLAN tag protocol ID necessary for interworking purposes. This parameter is used to control whether the virtual switch operates in IEEE802.1Q tagging mode (i.e. set to 0x8100) or in transparent tagging mode (i.e. set to value different to 0x8100).

Type: hexadecimal value.

Range: 0x0600 .. 0xFFFF.

The following values have a specific meaning:

- 0x8100: virtual switch operates in IEEE802.1Q tagging mode
- any other value: virtual switch operates in transparent tagging mode.

Default: 0x8100.

3. gvrpmode – GVRP mode

The parameter *gvrpmode* allows to control the dynamic VLAN registration mode.

Type: alphanumeric value set.

Range: ENABLED, GVRP is enabled. DISABLED (default), GVRP is disabled.

4. macaddr – Bridge ID address

The parameter *macaddr* specifies the bridge address field of the bridge identifier.

Type: alphanumeric value set.

Range: 000000000000 to FFFFFFFF (hexadecimal value) and UNAVAILABLE, if the value can not be retrieved.

5. rootcost – Cost of Path to root bridge

This parameter specifies the cost of the path to the root bridge as determined by the *Spanning Tree Protocol*.

Type: alphanumeric value set.

Range: 0 to 4 294 967 295 and UNAVAILABLE if the value can not be retrieved.

6. rootmacaddr – Root bridge ID address

This parameter specifies the bridge identifier of the root bridge as determined by the *Spanning Tree Protocol*.

Type: alphanumeric value set.

Range: 000000000000 to FFFFFFFF (hexadecimal value) and UNAVAILABLE if the value can not be retrieved.

7. **rootport** – Root port identifier
This parameter specifies the identifier of the root port, which offers the lowest cost path from the virtual switch to the root bridge.
Type: AID or alphanumeric string.
Range: *EPortAID* or *VCGAID* as specified in the AID definition section with the exception of the values *all*, *usall* and *vall* in the respective components of the AID; UNAVAILABLE.
The value UNAVAILABLE is returned when the addressed virtual switch is currently the spanning tree root bridge. This is also the case if STP is disabled for all ports belonging to the virtual switch. The Value UNAVAILABLE is returned if the value can not be retrieved from the HW.
8. **rootpriority** – Root bridge priority
The parameter *rootpriority* specifies the priority of the root bridge as determined by the Spanning Tree Protocol.
The virtual switch defined with the lowest value for its bridge priority compared to other virtual switches in the network will be elected as the root bridge.
Type: AID or alphanumeric string.
Range: 0 to 65535 and UNAVAILABLE if the value can not be retrieved.
Default: 32768.
9. **rstpmd** - Rapid Spanning Tree Protocol Mode
This parameter allows to enable or disable the Rapid Spanning Tree Protocol for the given virtual switch.
Type: alphanumeric value set.
Range: DISABLE (rSTP is disabled, i.e. the virtual switch only supports normal STP (IEEE802.1D)); ENABLE (rSTP is enabled, i.e. the virtual switch also supports rSTP (IEEE802.1w)).
Default: ENABLE
10. **stbrpriority** – Spanning tree bridge priority
This parameter specifies the priority of the bridge to be used by the Spanning Tree Protocol.
Type: integer.
Range: 0 to 65535.
The stepping as recommended by the standard (steps of 4096 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction "0 to 61440" is not done by the NE.
Default: 32768.
11. **stfdtm** – Spanning Tree forward delay timer
The parameter *stfdtm* specifies the rSTP-related bridge forward delay timer. This parameter is relevant for both rSTP and STP.
Type: integer.
Range: 1 .. 255.
Default: 15.

12. *sthellotm* – Spanning Tree hello timer

The parameter *sthellotm* specifies the rSTP-related bridge hello timer. This parameter is relevant for both rSTP and STP.

Type: integer.

Range: 1 .. 225.

Default: 2.

13. *stmaxage* – Spanning Tree maximum age timer

The parameter *stmaxage* specifies the rSTP-related maximum PDU transmission delay timer. This parameter is relevant for both rSTP and STP.

Type: integer.

Range: 1 .. 255.

Default: 20.

14. *vcglst* – VCG AID list

The parameter *vcglst* specifies a list of VCG instances connected to the virtual switch instance as specified by *vrtswid*.

In R3 there is only one virtual switch instance to which all eports are mapped. Therefore this list is fix.

Type: AID list.

Range: A list of VCGAIDs as specified in the AID definition section with the exception of the values *all*, *usall* and *vall* in the respective components of the AID, separated by an ampersand ('&').

Example: If all four VCGs of a GE1 are mapped to one virtual switch:

1-#-#-1-1-v1&1-#-#-1-1-v2&1-#-#-1-1-v3&1-#-#-1-1-v4.

Detailed behavior description

Omit dynamic parameters if not accessible

If the system cannot access dynamic data related to the addressed slot, e.g. due to a missing or defect pack or a system-internal communication outage, the following parameters shall response the value "UNAVAILABLE":

- *macaddr*
- *rootpriority*
- *rootmacaddr*
- *rootcost*
- *rootport*.

Example input/output

```
RTRV-VRTSW:LT-UNITE:1-1-#-#-1:123456;
LT-UNITE 02-05-15 13:31:30
M 123456 COMPLD
"1-1-#-#-1:1:ep1st=1-1-#-#-1-1&1-1-#-#-1-2&
1-1-#-#-1-3&1-1-#-#-1-4,gvrpmode=ENABLE,
macaddr=010203040506,rootcost=1234567890,
rootmacaddr=112233445566,rootport=1-1-#-#-1-v2,
```

```
rootpriority=32678,stbrpriority=32768,stfdtm=15,  
sthellotm=2,stmaxage=20,ethertype=0x8100,  
vcglst=1-1-#-#-1-v1&1-1-#-#-1-v2&1-1-#-#-1-v3&  
1-1-#-#-1-v4"  
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header” \(p. 4-2260\)](#) command Error responses section. The error responses listed there apply to the RTRV-EPORT command.

Security event notification

Output format

Syntax:

```
REPT EVT modifier aid:condtype,condeff,ocrdat,ocrtm:conddescr;
```

Output parameters

Command parameters

1. **modifier** - Modifier
The parameter shall specify the value 'COM' as an event that applies to the whole NE.
Type: alphanumeric value set
Range: COM
2. **aid** - Access Identifier
Type: AID
Range: SystemAID
3. **condtype** - Condition Type
This parameter specifies/identifies the type of security event being reported.
Type: alphanumeric value set
Range:
 - SEC-LOGIN: Successful user login
 - SEC-USERLOGOUT: Logout by user
 - SEC-FORCEDLOGOUT: Forced logout by security administrator
 - SEC-SESSIONTIMEOUT: User session time out
 - SEC-DISCONNECTED: User session disconnected
4. **condeff** - Condition Effect
The parameter shall indicate the effect of the reported security event on the NE.
Type: alphanumeric value set
Range: SC, for condtype = LOGIN; C, for condtype = {USERLOGOUT | FORCEDLOGOUT | SESSIONTIMEOUT | DISCONNECTED}.
5. **ocrdat** - Occurrence Date
The parameter shall indicate the date of the security event being reported.
Type: value set of format MM-DD
Range: M, D are digits. Leading zeros are not suppressed. MM represents month, DD the day.
6. **ocrtm** - Occurrence Time
The parameter shall indicate the time of the security event being reported.
Type: value set of format HH-MM-SS
Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.

7. conddescr - Condition Description

The parameter shall provide additional information w.r.t. the security event.

Type: inner string

Range:

The string shall depend on the security event as follows:

- condtype - conddescr
- SEC-LOGIN \"login - <uid>\"
- SEC-USERLOGOUT \"logout - <uid>\"
- SEC-FORCEDLOGOUT \"forced logout - <uid> \"
- SEC-SESSIONTIMEOUT \"inactivity timeout - \"
- SEC-DISCONNECTED \"logout, disconnected - <uid> \"

The security event notification is related to the user session which is indicated by the user ID (uid).

Example output

```
LT-UNITE 03-01-10 08:12:00
A 002 REPT EVT COM
"system:SEC-LOGIN,SC,01-10,08-12-00:\"login - USER1\""
```

SET-ATTR-CONT: Set attribute control

The SET-ATTR-CONT command can be initiated by users to set the description associated with an MDO port (Miscellaneous Discrete Output / external discrete control).

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

Input format

Command Syntax: SET-ATTR-CONT:*tid:aid:ctag::contmsg[,asgcond]*;

Input parameters

Command parameters

1. *tid* – Target Identifier
See definition of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).
2. *aid* – Access Identifier
This is the address of the MDO port entities on which the command operates. If *misc_outall* is specified the configuration of all MDO's will be retrieved.
Type: AID
Range: Miscellaneous_out_discreteAID
Default: *misc_outall* (if the *aid* is omitted).
3. *ctag* – Correlation Tag
See definition of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).
4. *contmsg* – Control Message
This is the name associated to a MDO port (environmental control).
Type: text string
Range: A string of up to 26 characters, any character except " and \, upper and lower cases considered. An empty string is allowed. The value would be "".
5. *asgncond* – Assigned Condition Type
This parameter identifies the probable cause (type of alarm indication) which is assigned to an MDO port (external control). If one or more alarm(s) of this probable cause appears then the MDO port (external control) will be switched on.
Type: alphanumeric value set. Additionally a "-" will be allowed (not the first character).
Range: All defined probable causes and UNDEF: if no probable cause is assigned.
Default: UNDEF.
If the value is omitted, then the actual value shall not be changed.

Output format

The following example shows the successful completion of the SET-ATTR-CONT command by the NE:

```
      sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Detailed behavior description

The name of a MDO via the aid specified will be updated according the value of *contmsg*. The update will be reported via a SET-ATTR-CONT - REPT DBCHG message. Refer to the definition of the SET-ATTR-CONT notification.

Example input/output

The following example shows the successful completion of the SET-ATTR-CONT command by the NE:

```
SET-ATTR-CONT:LT-UNITE-123:MISC_OUT3:123456:,"fan 3",,FANF;
```

```
      LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

The following example shows the successful completion of the SET-ATTR-CONT command by the NE if the *asgncond* parameter will be unchanged:

```
SET-ATTR-CONT:LT-UNITE-123:MISC_OUT3:123456:,"fan 3";
```

```
      LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command error responses section. The error responses listed there also apply to the SET-ATTR-CONT command.

SET-ATTR-CONT notification

Output format

The SET-ATTR-CONT notification has the following specific syntax:

SET-ATTR-CONT:*aid::contmsg,,asgncond*

Output parameters

Command parameters

1. *aid* - Access Identifier
This is the address of the MDO port entity for which the configuration is retrieved or on which an operation is performed.
Type: AID.
Range: Miscellaneous_out_discreteAID. misc_outall must not be reported or used.
2. *contmsg* - Control Message
This is the name associated to a MDO port (environmental control). It is a description which can be retrieved by the management system.
Type: inner string.
Range: string up to 26 characters, any character except " and \, upper and lower cases considered. A empty string is allowed. The value would be \".
Default: MDO port #n. n is the number of the port 1 ... 8.
3. *asgncond* - Assigned Condition Type
This parameter identifies the probable cause (type of alarm indication) which is assigned to an MDO port (external control). If one or more alarm(s) of this probable cause appears then the MDO port (external control) will be switched on.
Type: alphanumeric value set. Additionally a "-" will be allowed (not the first character).
Range: All defined probable causes and UNDEF: if no probable cause is assigned.
Default: UNDEF.

Example output

The example shows a normal SET-ATTR-CONT notification:

```
LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
"TIME=08-00-12,DATE=00-01-01:SET-ATTR-CONT:MISC_OUT3::\"fan 3\",,FANF"
;
```

SET-ATTR-ENV: Set attribute environment

ET-ATTR-ENV: Set Attribute Environment The SET-ATTR-ENV command can be used to set the alarm message, name and assigned ASAP of an miscellaneous discrete input (MDI/environmental point).

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

Input format

Command Syntax: SET-ALM-ENV:*tid:aid:ctag::,almmsg,envname:spec_block;*

Input parameters

Command parameters

- *tid* – Target Identifier
See definition of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
- *aid* – Access Identifier
This is the address of the MDI port entities for which an alarm condition or the configuration is being reported. If *misc_inall* is specified the information for all entities will be retrieved.
Type: AID.
Range: Miscellaneous_in_discreteAID.
Default: *misc_inall* (if the *aid* is omitted).
- *ctag* – Correlation Tag
See definition of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

- **almmsg** – Alarm Message
This is the condition description which is associated with the MDI port (environmental point). This description will be sent with the alarm generated from the MDI port.
Type: inner string.
Range: a string up to 32 characters, any character except " and \, upper and lower cases are considered.
Default: Miscellaneous Discrete #<N> with N = 1 .. 8 for the different MDI ports.
- **envname** – Environmental Point Name
This is the name associated to a MDI port (environmental point). It is a description which can be retrieved by the management system. It is not to be mixed up with the envmsg parameter. The envname is just a name of the MDI port and not reported via the condition description of an alarm.
Type: inner string
Range: a string up to 26 characters, any character except " and \, upper and lower cases considered.
Default: MDI port #n; n is the number of the port 1 ... 8.

Spec block parameters

- **envinv** – Environmental Alarm Inversion
This parameter indicates for the MDI (environmental point) whether an alarm shall be generated if the port is on or if the port is off.
Type: alphanumeric value set.
Range:
– YES: The alarm will be inverted
– NO: The alarm will be not inverted.
- **pfname** – Profile Name
This is the name of the ASAP that is assigned to the MDI port (environmental point). The ASAP must be of the type ENV.
Type: alphanumeric character string. A hyphen (-) is additional allowed in the name.
Range: string up to 24 characters.
Default: DEFAULT.

Output format

The following example shows the successful completion of the SET-ATTR-ENV command by the NE:

```
sid date time
M ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Detailed behavior description

The SET-ATTR-ENV command updates the configuration of the almmsg, envname, pfname of the via aid specified MDI port. The changes will be reported via a REPT DBCHG message. See definition of SET-ATTR-ENV notification.

Example input/output

The following example shows the successful completion of the SET-ATTR-ENV command by the NE:

```
SET-ATTR-ENV:LT-UNITE-123:MISC_IN7:123456::,,,"open
door","door":pfname=ENV_NM,envinv=YES;
```

```
LT-UNITE-123 00-01-01 08:00:00
M 123456 COMPLD
;
```

Error responses

Refer to the [“RTRV-HDR: Retrieve header”](#) (p. 4-2260) command error responses section. The error responses listed there also apply to the RTRV-ATTR-ENV command.

Validation Rule: *pfname* does not exist

An ASAP with the name pfname does not exist for an ASAP type ENV.

Error Code: IDNV - Input Data Not Valid, ASAP profile does not exist

SET-ATTR-ENV notification

Output format

The SET-ATTR-ENV notification has the following specific syntax:

SET-ATTR-ENV:*aid*,,*almmsg*,*envname*:*spec_block*;

Output parameters

Command parameters

- **aid** – Access Identifier
This is the address of the MDI port entities for which an alarm condition or the configuration is being reported. If *misc_inall* is specified the information for all entities will be retrieved.
Type: AID.
Range: Miscellaneous_in_discreteAID.
Default: *misc_inall* (if the *aid* is omitted).
- **almmsg** – Alarm Message
This is the condition description which is associated with the MDI port (environmental point). This description will be sent with the alarm generated from the MDI port.
Type: inner string.
Range: a string up to 32 characters, any character except " and \, upper and lower cases are considered.
Default: Miscellaneous Discrete #<N> with N = 1 .. 8 for the different MDI ports.
- **envname** – Environmental Point Name
This is the name associated to a MDI port (environmental point). It is a description which can be retrieved by the management system. It is not to be mixed up with the *envmsg* parameter. The *envname* is just a name of the MDI port and not reported via the condition description of an alarm.
Type: inner string
Range: a string up to 26 characters, any character except " and \, upper and lower cases considered.
Default: MDI port #*n*; *n* is the number of the port 1 ... 8.

Spec block parameters

- **envinv** – Environmental Alarm Inversion
This parameter indicates for the MDI (environmental point) whether an alarm shall be generated if the port is on or if the port is off.
Type: alphanumeric value set.

Range:

- YES: The alarm will be inverted
- NO: The alarm will be not inverted.
- pfname – Profile Name
This is the name of the ASAP that is assigned to the MDI port (environmental point). The ASAP must be of the type ENV.
Type: alphanumeric character string. A hyphen (-) is additional allowed in the name.
Range: string up to 24 characters.
Default: DEFAULT.

Example output

The example shows a normal notification after an SET-ATTR-ENV Command:

```
LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
  "TIME=08-00-12,DATE=00-01-01:SET-ATTR-ENV:MISC_IN7::,,\"open
  door\\",\"door\\":pname=ENV_NM,envinv=YES"
;
```

SET-MAP-RING: Set map ring

The SET-MAP-RING command writes the transitional, manually provisioned ring map to NVM for use by the MS-SPRing/BLSR protection group.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

Input format

Command Syntax: SET-MAP-RING:*tid*[:*aid*]:*ctag*::[*rid*];

Input parameters

Command parameters

1. *tid* – Target Identifier
See definition in input parameters section [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
2. *aid* – Access Identifier
This parameter specifies the aid of a MS-SPRing/BLSR protection group or an port aid being a member of the group.
Option: If *rid* is specified, then *aid* can be omitted.
Type: AID.
Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. *ctag* – Correlation Tag
See definition in input parameters section [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
4. *rid* – Ring Identification
This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value shall be unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE.
Option: If *aid* is specified, then *rid* can be omitted.

Output format

After receiving the SET-MAP-RING command, the following normal completion response is returned:

```
    sid date time
M  ctag COMPLD
;
```

Output parameters

1. **sid** - Source Identifier
This is the currently active name of the network element to which the command is addressed. The tid is a case insensitive character string.
Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.
Range: 1 to 20 characters.
2. **date** - Date
Date when output message is generated. This has the format YY-MM-DD (year-month-day)
Type: value set.
Range: for YY 00 to 99, for MM 01 to 12, for DD 01 to 31
TL1 messages use YY-MM-DD for the format of a date, meaning that the year only has two digits. This is consistent with Telcordia requirements. Internally, however, the system does use a 4-digit year. When the year appears in a response, the internal 4-digit year is truncated to two digits. When the year appears as an input parameter, for example in the ED-DAT command, years in the range 90-99 will represent 1990-1999, and years in the range 00-37 will represent 2000-2037.
Default: 00-01-01
3. **time** - Time
Time when output message is generated. This has the format HH:MM:SS (hours:minutes:seconds).
Type: value set
Range: for HH 00 to 23, for MM 00 to 59, for SS 00 to 59.
Default: 00:00:00
4. **M** - Message
M indicates that the output message is generated in response to a manual command.
Type: value set
Range: M

5. ctag - Correlation Tag

This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

Type: alphanumeric string

Range: Non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

6. IP - In Progress

IP is sent in response to all commands with the exception of commands that result in error code output.

Type: value set

Range: IP

7. RL - Repeat Later

The requested command cannot be executed due to unavailable system resources. The command may be entered again later.

Type: value set

Range: RL

8. COMPLD - Completion Code

It indicates that the command has been completed.

COMPLD for successful command execution: For a command that is decomposed into a set of atomic commands a COMPLD completion code means that the command was successful for all atomic commands (e.g. AID ranges, group alias).

COMPLD for no changes: If a parameter has a current value, and a provisioning command attempts to reprovision the parameter with a value that is the same as its current value, the command will return a COMPLD completion code.

Type: value set

Range: COMPLD.

Detailed behavior description

The SET-MAP-RING command is used to move the transitional manually provisioned ring map to NVM for use by the BLSR port protection group. This command will be denied if automatic ring discovery is enabled.

The SET-MAP-RING command is also denied if the list does not contain the local node, if the list does not contain at least 2 nodes, or if duplicate nid values appear in the list. The SET-MAP-RING command generates a REPT DBCHG message.

Example input/output

The following is an example of a SET-MAP-RING command:

```
SET-MAP-RING:NENAME-1::123456::rid1;  
NENAME-1 98-01-01 08:00:00  
M 123456 COMPLD  
;
```

Error responses

Validation rule: Automatic ring discovery to be disabled

If the automatic ring discovery is enabled, the following error response shall be returned:

Error Code: SNVS - Status, Not Valid State

Validation rule: consistent aid and rid

If both an aid and an rid are specified as input parameters and they are inconsistent, then the following error response is returned

Error Code: IDNV - Input, Data Not Valid, inconsistent aid and rid

SET-MAP-RING: notification

Output format

Command Syntax: SET-MAP-RING:*aid*[:*rid*];

Output parameters

Command parameters

1. *aid* – Access Identifier
This parameter specifies the aid of a MS-SPRing/BLSR protection group or an port aid being a member of the group.
Option: If *rid* is specified, then *aid* can be omitted.
Type: AID.
Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
2. *rid* – Ring Identification
This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value shall be unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE.
Option: The rid is only included in the SET-MAP-RING notification if the rid has been specified in the SET-MAP-RING command.

Example input/output

The following example reports the creation of a ring map in LT-UNITE's NVM:

```
LT-UNITE 00-11-03 15:00:00
A 000 REPT DBCHG
"TIME=15-00-00,DATE=00-11-03:SET-MAP-RING:rid1"
;
```

□

SET-OW: Set Orderwire and User Bytes

General

The SET-OW command associates the overhead byte (E1 or E2 or F1) on an optical port to an overhead access port or removes this association. Furthermore the port-interface (either G.703 or V.11) of the overhead access port can be specified.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

Input format

Command Syntax: SET-OW:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. *tid* – Target Identifier

This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.

Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.

Range: 1 to 20 characters

2. *aid* – Access Identifier

The parameter *aid* specifies the overhead access port to be used for association (or removing the association).

Type: UserBytePortAID.

Range: As given by the UserBytePortAID definition, the value "ubioall" is not allowed.

3. *ctag* – Correlation Tag

This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

Type: alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.

Spec block parameters

1. *intfctype* – Interface Type

This parameter specifies which electrical interface standard of the overhead access port is used.

Two different settings are possible:

- electrical interface according to G.703
- electrical interface according to V.11.

Note: The overhead access ports with AIDs ubio1, .. ubio4 are configurable to either G703 or V11. The overhead access ports with AIDs ubio5, ubio6 are fixed to V11.

Type: Alphanumeric value set.

Range: G703, V11.

Default: G703 (for the overhead access ports given by the AIDs ubio1 .. ubio4); V11 (for the overhead access ports given by the AIDs ubio5, ubio6 - fixed to V11).

2. ohbyte – Overhead-Byte

This parameter specifies which of the overhead bytes is used.

Three channels are possible:

- E1 and F1 in the RSOH (section overhead)
- E2 in the MSOH (line overhead).

Type: Alphanumeric value set.

Range: E1, F1, E2.

Default: E1.

Note: In output direction the empty string appears as \"\".

3. portaid – Port Access Identifier

This parameter specifies the optical/electrical port (of an OPn/EPn) of the userbyte to which the overhead access port (given by the command parameter aid) is associated, respectively dis-associated.

Type: In case an association is established: SPortAID; in case an association will be removed: Alphanumeric value set (i.e. the string "NOCONNECT").

Range: In case an association is established: SPortAID (No "all" value is supported); in case an association will be removed: NOCONNECT.

Default: NOCONNECT.

Output format

If the SET-OW command completes successfully, then the following normal completion response is returned:

```
sid date time
M ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Detailed behavior description

The attributes *portaid*, *ohbyte* and *intfctype* of the entity Userbyte port shall be updated by this command.

This update shall be reported by a SET-OW notification.

Example:

```
SET-OW:UNITE-NE:ubio3:123456:::portaid=1-1-#-#-5-1,ohbyte=E2,intfctype=V11;
```

```
REPT DBCHG
```

```
SET-OW:ubio3::port_aid=1-1-#-#-5-1,ohbyte=E2,intfctype=V11;
```

Circuit pack type related restrictions

The Orderwire and User Byte access is only functioning on the following circuit pack types: OP155, EP155, OPLB, all OP10xx packs.

Update affected entities

Apart from the Userbyte port entity no further entities are affected by the SET-OW command.

Example input/output

Example 1

Suppose the Userbyte port given by AID ubio1, to be configured to V11, shall be associated to the E1-Byte channel of the optical port of an OP10G in slot 10:

```
SET-OW:UNITE-NE:1-1-ubio1:123456:::portaid=1-1-#-#-10-1-1,ohbyte=E1,intfctype=V11;
```

```
LT-UNITE 00-11-14 12:00:00
M 123456 COMPLD
;
```

Example 2

Suppose the association as made in Example-1 shall be removed (i.e. dis-associated):

```
SET-OW:UNITE-NE:1-1-ubio1:123456:::portaid=NOCONNECT,ohbyte=E1,intfctype=V11;
```

```
LT-UNITE 00-11-14 12:00:00
M 123456 COMPLD
;
```

Error responses

Validation Rule: Interface type compliant with port

Command processing shall verify that setting the interface type to G.703 is only possible for the UserByte-Ports *ubio1*, .. *ubio4* (but not for *ubio5* and *ubio6*).

Error Code:

IDNV - Input, Data Not Valid, Interface type not settable for specified UserByte-Port

Validation rule: No association present (when associating)

Command processing shall verify that when setting up an association no association is already present.

This means, that only a one to one relation is allowed between the specified:

- Userbyte of a SDH/SONET optical/electrical port and
- UserByte port.

Error Code: SNVS - Status, Not in Valid State, association already exists

Validation rule: Association present (when dis-associating)

Command processing shall verify that an association exists when trying to remove it.

Error Code:

IENE - Input, Entity Not Exists, Specified association does not exist

Validation rule: *ohbyte* and *intfctype* values correct (when dis-associating)

Command processing shall verify in case of removing the association that the entered value for the parameters *ohbyte* and *intfctype* are identical with the current ones.

Error Code:

IDNV - Input, Data Not Valid, discrepancy between entered values and current value of spec-block parameters

Validation rule: Port exists (when associating)

When setting up an association, the command processing shall verify that the specified SDH/SONET optical/electrical port exists.

Error Code:

IENE - Input, Entity Not Exists, Specified port does not exist

Validation rule: No Userbyte access at EC1 ports on EP51 pack

When setting up an association, the command processing shall verify that the specified port is not a EC1 port on an EP51 pack.

Error Code:

IDNV - Input, Data Not Valid, No Userbyte access at the specified port

Related TL1 messages

SET-OW notification

General

Command Syntax: SET-OW:*aid::spec-block*;

Output parameters

Command parameters

1. *aid* – Access Identifier
This parameter specifies the overhead access port for which the following *spec_block* parameters are returned.
Type: UserBytePortAID.
Range: As given by the UserBytePortAID definition, the value "ubioall" is not allowed.

Spec block parameters

1. *intfctype* – Interface Type
This parameter specifies which electrical interface standard of the overhead access port is used.
Two different settings are possible:
 - electrical interface according to G.703
 - electrical interface according to V.11.Note: The overhead access ports with AIDs ubio1, .. ubio4 are configurable to either G703 or V11. The overhead access ports with AIDs ubio5, ubio6 are fixed to V11.
Type: Alphanumeric value set.
Range: G703, V11.
Default: G703 (for the overhead access ports given by the AIDs ubio1 .. ubio4); V11 (for the overhead access ports given by the AIDs ubio5, ubio6 - fixed to V11).
2. *ohbyte* – Overhead-Byte
This parameter specifies which of the overhead bytes is used.

Three channels are possible:

- E1 and F1 in the RSOH (section overhead)
- E2 in the MSOH (line overhead).

Type: Alphanumeric value set.

Range: E1, F1, E2.

Default: E1.

Note: In output direction the empty string appears as \".

3. portaid – Port Access Identifier

This parameter specifies the optical/electrical port (of an OPn/EPn) of the userbyte to which the overhead access port (given by the command parameter aid) is associated, respectively dis-associated.

Type: In case an association is established: SPortAID; in case an association will be removed: Alphanumeric value set (i.e. the string "NOCONNECT").

Range: In case an association is established: SPortAID (No "all" value is supported); in case an association will be removed: NOCONNECT.

Default: NOCONNECT.

Behaviour description

Refer to the *Detailed behaviour description* of ["SET-OW: Set Orderwire and User Bytes"](#) (p. 4-2936).

SET-SID: Set SID

SET-SID is used to change the target/source identification of the NE. The SET-SID command is denied if the system is not in maintenance condition.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: no

Input format

Command Syntax: SET-SID:*tid::ctag::newsid*;

Input parameters

Command parameters

1. *tid* – Target Identifier
This is the currently active name of the network element to which the command is addressed. The *tid* is a case insensitive character string.
Type: identifier, in addition the special character underscore ("_") and the password characters are allowed.
Range: 1 to 20 characters
2. *ctag* – Correlation Tag
This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
Type: alphanumeric string
Range: non-zero decimal number or identifier of up to 6 characters.
Note: Current implementation also allows '0' as valid CTAG, which is an extension to GR-831.
3. *newsid* – New Target/Source Identification
This is the new name of the NE. Future commands must use this name instead of the current name.
Type: identifier, in addition the special character underscore ("_") and the password characters are allowed, except the characters plus sign ("+"), number sign ("#") and percent sign ("%").
Range: 1 to 20 characters.

Output format

If the NE fully complies with the SET-SID request, the normal completion response is returned as shown below:

```
sid date time
```

```
M ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of “[RTRV-HDR: Retrieve header](#)” (p. 4-2260).

Detailed behavior description

This command provides a new name to the NE.

The update is reported by means of an SET-SID notification.

The SET-SID command is denied if the system is not in maintenance condition. Maintenance condition applies only to NE.

The new SID will come into effect only after reset of the CTL. This reset takes place autonomously when the maintenance condition is left. Commands after the reset must use the new SID instead of the current name.

The response as well as corresponding REPT DBCHG notification use the old SID in the *sid* parameter.

The SET-SID command generates a REPT DBCHG message.

Updated affected entities

There is no further entities affected.

If the NE is a node in a BLSR ring/MS-SPRing and the TID is changed, then this may impact cross-connection entities of ring neighbors. Since these updates are reported by NEs not addressed in the command request, these events are treated like autonomous events. For further details see corresponding section in the transmission chapter – entity cross-connection.

Example input/output

The following shows an example of the SET-SID command where the target/source identification of the NE was changed to HARRY:

```
SET-SID:LT-UNITE::123456::HARRY;
```

```
LT-UNITE 00-11-15 08:00:00
M 123456 COMPLD
;
```

Error responses

Refer to the “[RTRV-HDR: Retrieve header](#)” (p. 4-2260) command Error responses section. The error responses listed there also apply to the SET-SID command.

Validation rule: Check of Maintenance Condition

If a SET-SID command is entered when the administrative state of the system is not in maintenance condition, the following error response is returned.

Error code:

SNVS - Status, Not in Valid State, not in Maintenance Condition

Validation rule: Uniqueness of TID within Ringmaps

If the new sid conflicts with an existing TID in at least one of the valid ringmaps, the following error response is returned.

Error code:

IDNV - Input, Data Not Valid, sid is already used by another BLSR/MS-SPRing Node

;
```

SET-SYNCN: Set synchronization

The SET-SYNCN command is used to provision system timing clock mode, assign timing references, and external input and output timing port attributes. The command is used not only to assign system timing attributes but also to modify or remove them.

Properties

Login Privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

Input format

Command Syntax: SET-SYNCN:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. *tid* – target identifier
See definition of *tid – target identifier* in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).
2. *aid* – access identifier
This parameter specifies the timing related settings. The AID separates the parameter in system timing related parameter, parameters related to assigned timing references and parameters for port provisioning. The values all or *someprefix* all are not allowed in this context.
Type: AID
Range: SystemAID, External_timing_ref_AID, Line_timing_ref_AID, External_Timing_input_port_AID, External_Timing_output_port_AID
Default: Not applicable.
3. *ctag* – correlation tag
See definition of *ctag – correlation tag* in [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Spec block parameters

1. System Timing
 - a. *clkmod* – clock mode
This parameter specifies the provisioned operational mode of the system timing. In the *clockmod == FREE-RUNNING* mode the system clock process uses the internal oscillator as reference. In the *clockmod == LOCKED* mode the system clock process uses the input signal from the system.
Type: Alphanumeric value set.
Range: FREE-RUNNING, LOCKED.

Default: FREE-RUNNING.

b. `syncmsg` – system synchronization status messaging mode

This parameter is used to ENABLE or DISABLE the SSM protocol.

The parameter provisions the automatic reference selection process to use the incoming QLs in QL-enabled mode or to ignore them in QL-disabled mode. In case of DISABLE, for SDH all output SSMs shall be set to DNU, for SONET all output SSMs shall be set to STU.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: ENABLE.

c. `timing` – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1... 24 characters). A hyphen (-) is additionally allowed in the name.

Default: Default

d. `wtr` – wait to restore

This parameter specifies the provisioned wait to restore timer used for all timing ports for revertive switching. This is the amount of time it takes to switch from lower priority to higher priority references. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: 0SEC, 20SEC, 0...60MIN (1 minute steps), 99 (infinite).

SDH: 0SEC, 0...60MIN (1 minute steps); the values "0SEC" and "0MIN" can be used for SONET and SDH to provision a zero wait to restore time.

Default:

SONET: 20SEC

SDH: 5MIN

2. Assigned Timing Reference

a. `extout_pri` – timing output reference priority

This parameter specifies the priority assignment of the timing link switch of the external output timing. This parameter is only for SDH and for line timing references.

The greater the number the lower the priority. The number "1" indicates the highest priority. The priority "0" means not assigned for external output.

Type: Numeric value set.

Range: 0 (means DISABLED), 1, 2, 3, 4, 5, 6.

Default: 0 (means DISABLED).

b. `ql_prov` – quality provisioned

This parameter defines the quality for the specified timing reference to a fixed SSM value. It is the provisioned quality level sync message value that will be received on timing references.

This parameter is related to all assigned timing references (both external timing references and line timing references) and overrides what is received for the respective timing reference. The AUTO value implies sync message support. The AUTO value is rejected if SSM is not supported for the assigned timing reference (i.e. for DS1 SF). The value range depends from the system synchronization characteristic. Per default shall be:

AUTO – for STM-N/OC-N line, 2Mbit/s framed or DS1 ESF with SSM,

SSUT – for 2MHz, 2Mbit/s unframed or framed without SSM

STU – for DS1 SF or DS1 ESF without SSM

Type: Alphanumeric value set.

Range:

SONET: AUTO, PRS, STU, ST2, ST3

SDH: AUTO, PRC, SSUL, SSUT, SEC.

Default:

SONET: AUTO (External_timing_ref_AID, Line_timing_ref_AID)

SDH: AUTO (Line_timing_ref_AID) SSUT (External_timing_ref_AID).

c. `syncref_pri` – system timing reference priority

This parameter defines the priority for assigned timing references.

When multiple input references have been given the same priority value, it implies non-revertive switching between the associated references. Otherwise, it implies revertive switching to the reference with the highest assigned priority. When the QL-control is disabled, the selection process is controlled by signal status and port priority. The greater the number, the lower the priority. Priority "0" means not assigned.

Type: Numeric value set.

Range: 0 (means DISABLE), 1, 2, 3, 4, 5, 6, 7, 8.

Default: 0 (means DISABLE).

d. `timing` – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1... 24 characters). A hyphen (-) is additionally allowed in the name.

Default: Default

e. `tpmode` – timing port mode monitoring

This parameter specifies the monitoring status of the timing port. If the timing port is in the MONITORED mode and the reference is in FAILED status alarms are active for this port. The value NOT-MONITORED means that alarm monitoring is not occurring on the port.

Type: Alphanumeric value set.

Range: MONITORED, NOT-MONITORED.

Default: NOT-MONITORED.

f. `tref_aid` – timing reference assigned port AID

This parameter specifies the port AID of the assigned timing reference AID.

The parameter is rejected, if the timing reference already assigned to a timing port, or if the reference does not support SSM and timing port is provisioned AUTO, or if the unit which delivers the reference is not present or pre-provisioned. It is not possible to assign more than one reference from a unit. It is not possible to un-assign units from which a reference is assigned to a timing port. It is also not possible to assign a reference from a protection port in a protection group. The value NOT-CONNECTED means no reference is assigned to current timing port.

Type: AID.

Range: External_Timing_input_port_AID, SPortAID, NOT-CONNECTED.

Default: NOT-CONNECTED.

3. External Timing Input

a. `ext_if` – external input signal format

This parameter specifies the format of the external timing input.

The value range depends on the system synchronization characteristic. The external timing input format can be set at both external timing inputs individually. The reference is rejected, if the reference does not support SSM and the timing port is provisioned AUTO.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

b. `ext_isa` – external input sa bit location

This parameter defines the external input Sa bit location. It is only valid for the external timing input format “2Mbit/s” framed; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The location of the Sa bit is can be set at both external timing inputs individually. One of the Sa4 to Sa8 bits of the 2Mbit/s sub-multiframe is allocated for Synchronization Status Messages (SSM).

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

4. External Timing Output

a. `ext_equ` – cable equalization

This parameter specifies the timing output cable equalization to adjust the specified timing reference output signal power. This parameter is valid only for DS1 (SONET).

This parameter is rejected for all input interfaces except DS1. The values are represented by percentage (3.0dB=100%; 2.4dB=80%; 1.8dB=60%; 1.2dB=40%; 0.6dB=20%).

Type: Numeric value set.

Range: 20, 40, 60, 80, 100.

Default: 20.

b. `ext_of` – external output signal format

This parameter specifies the external output signal format. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

c. `ext_osa` – external output sa bit location

This parameter defines the external output Sa bit location. This parameter is only valid for external timing output format “2Mbit/s framed”; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

d. `extout_en` – external timing output enabling/disabling

This parameter specifies whether the external timing output is enabled or disabled.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

e. `extout_prov` – external timing output selection

This parameter specifies the operation mode of the external output timing. The value SETG means the system clock. The value TLS means the output. For SONET both values are fixed to the respective external timing output. The value range depends on the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG, TLS.

Default: SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG.

f. `extout_ssm` – external timing output AIS mode

This parameter specifies which value will be send when the signal level is below the quality acceptance level or when *frcdus* is enabled. The parameter is valid depending from the system synchronization characteristic, for SDH 2Mbit/s framed and for SONET DS1 ESF; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The value AISMODE means AIS is inserted in the external timing output signal. The value QLMODE means DUS is inserted in the external timing output signal.

Type: Alphanumeric value set.

Range: AISMODE, QLMODE.

Default: QLMODE.

g. *frcdus* – forced DNU/DUS

This parameter specifies the synchronization messaging forced DNU/DUS enable or disable for the timing output port. DUS applies to SONET and DNU applies to SDH. This is only valid for '2Mbit/s framed' and 'DS1 ESF'; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

h. *loopdelay* – timing regenerator loop delay

This parameter indicates the delay in the SASE/BITS loop operation. The values are represented by seconds in steps of 1 seconds per loop.

Type: Numeric value set.

Range: 0...60 (1 seconds steps).

Default: 10.

i. *qlout_tais* – acceptance quality level for output threshold AIS

This parameter is the provisioned quality acceptance level for external timing output. When the incoming message is below this level, AIS or DUS (depending from the *extout_ssm* value) will be inserted into the external timing output. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3

SDH: PRC, SSUT, SSUL, SEC.

Default:

SONET: ST3

SDH: SEC.

j. *regen_loop* – timing regenerator loop

This parameter specifies the avoiding of loops over the SASE/BITS clocks.

When this parameter is set to ENABLED, the synchronization message DUS will be inserted in the traffic output port associated with the traffic input port used as source for the station clock. The parameter is selectable for both external timing outputs individually.

Type: Alphanumeric value set.

Range:

SONET: DISABLE, ENABLE

SDH: DISABLE, EXTREF1, EXTREF2, BOTH.

Default:

SONET: ENABLE

SDH: DISABLE.

k. **timing** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1... 24 characters). A hyphen (-) is additionally allowed in the name.

Default: Default

Output format

After receiving the SET-SYNCN command, the following normal completion response is returned:

```
sid date time
M ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section of [“RTRV-HDR: Retrieve header”](#) (p. 4-2260).

Detailed behavior description

After successful receiving the SET-SYNCN command a REPT DBCHG database change notification is returned. This notification consists the same parameter as per delivered by the command. Notifications are sent whenever a user-provisionable parameter has been changed.

When the system receives a SET-SYNCN command with changing of the clock mode, a REPT EVT report event notification is returned.

If the system receives a SET-SYNCN command with changing of the active timing reference, a REPT EVT report event notification is returned.

It is not possible to assign a reference from a protection port in a protection group.

If the system synchronization characteristic is SONET and the SSM is invalid the value DUS shall be displayed for QL values.

It is possible to provision a QL acceptance level to the external timing output. If the system quality below this acceptance QL level and QL control is enabled and the external timing output is enabled then an AIS signal or DUS, depending on settings of parameter *extout_ssm*, shall be substituted in the output.

If the system timing QL mode is DISABLED for SDH all output SSMs shall be set to DNU, for SONET all output SSMs shall be set to STU.

If the system synchronization characteristic is SDH and the external timing input format is either 2MHz or 2Mbit/s unframed or 2Mbit/s framed without SSM then the assigned timing reference status shall be default SSUT. If the system synchronization characteristic is SONET and the external timing input format is either SF or ESF without SSM then the assigned timing reference status shall be default STU. The value AUTO shall be rejected if SSM is not supported for the assigned timing reference.

It is possible to provision the automatic reference selection process to use the incoming QLs in QL-enabled mode. The input with the highest quality level is selected. If there is more than one input with the same highest quality level, then the input with the highest port priority is selected. In QL-disabled mode the reference selection is working by priority provisioning. It is possible to assign the same priority to multiple inputs. In this case, it implies non revertive switching between the associated references.

A MS-SPRing/BLSR span or MSP pair is handled as one transport port, so also counts as one reference signal. If one of the sections of the pair do not support SSM, the reported QL status is NOT-SUPPORTED.

If the timing port is in the NOT-MONITORED mode then no Timing Link Fail alarm will be active when reference is in FAILED status or no Timing Link Unequipped alarm will be active when the reference is in NOT-CONNECTED state.

If the external input signal format *ext_if* is changed to an unframed mode without also specifying the external input ssm support *ext_issm* then the external input ssm support *ext_issm* is set to NOT-SUPPORTED autonomously if not already having this value. The change is reported via a SET-SYNCN notification.

Example input/output

The following is an example of the SET-SYNCN command for System Timing:

```
SET-SYNCN:LT-UNITE:system:123456:::clkmod=LOCKED,wtr=1MIN;
```

```
LT-UNITE 00-11-14 12:00:00
M 123456 COMPLD
;
```

The following is an example of the SET-SYNCN command for Assigned Timing Reference:

```
SET-SYNCN:LT-UNITE:extref1:123456:::tref_aid=EXTTMG0,  
ql_prov=SSUL;
```

```
    LT-UNITE 00-11-14 12:00:00  
M 123456 COMPLD  
;
```

The following is an example of the SET-SYNCN command for External Timing Input:

```
SET-SYNCN:LT-UNITE:exttmg1:123456:::ext_if=2MHZ;
```

```
    LT-UNITE 00-11-14 12:00:00  
M 123456 COMPLD  
;
```

The following is an example of the SET-SYNCN command for External Timing Output:

```
SET-SYNCN:LT-UNITE:exttmg0_out:123456:::ext_of=2MHZ,extout_en=ENABLE;
```

```
    LT-UNITE 00-11-14 12:00:00  
M 123456 COMPLD  
;
```

Error responses

Validation rule: Timing reference already assigned

If a timing reference already assigned to a timing port or circuit pack the system responds with:

Error code: SDNC - Status, Data Not Consistent, reference already assigned

Validation rule: One timing port for a circuit pack

If a second port of a circuit pack is assigned to a timing reference the system responds with:

Error code:

SDNC - Status, Data Not Consistent, other port already assigned

Validation rule: No timing port on protection pack of an MS protected timing port

If another port of a circuit pack where the protection port of an MS protection group is located whose associated worker port for this span has already a timing reference being assigned the system shall respond with:

Error Code:

SDNC - Status, Data Not Consistent, other port already assigned

"MS protection group" denotes an MSP/APS or a 4 fibre MS SPRING/BLSR group.

Validation rule: No out-of-service state for timing port

If an 'out of service' port (i.e. the port attribute *servcond* has the value 'OUTOFSERVICE') is assigned to a timing reference the system responds with:

Error code: SDNC - Status, Data Not Consistent, port is out-of-service

A port must be in the out-of-service before any port loop can be switched. Therefore it is sufficient to request for a timing reference assignment, that a port is not in the out-of-service state in order to prevent timing loops caused by port loops; i.e. a port that is not in out-of-service state will not have a switched port loop.

Validation rule: Timing reference from a protection port in a protection group only allowed in asymmetric spans of a ring

If a timing reference shall be assigned from a protection port in a protection group which is not part of an asymmetric span, the system shall respond with:

Error Code:

SDNC - Status, Data Not Consistent, reference in protection group

The characteristic of an asymmetric ring is that one or more spans have only protection lines, no working lines (asymmetric spans). In these asymmetric spans it must be possible to use the protection ports for timing.

Validation rule: Port is already assigned to another timing reference

Ports can be assigned only one. If a port already assigned to a timing reference the system responds with:

Error code: SDNC - Status, Data Not Consistent, port already assigned

Validation rule: Command rejection if quality evaluation disabled

If the quality mode disabled the setting to forced DUS/DNU or the setting the quality output threshold AIS shall be rejected and the system responds with:

Error code:

SDNC - Status, Data Not Consistent, quality evaluation disabled

Validation rule: No transparent port as line timing reference

The system shall not allow to use a Transparent Port, i.e. ports with a rate of STM16T or OC48T, as line timing reference.

Error Code:

IDNV - Input, Data Not Valid, Transparent Ports not allowed as line timing reference

Validation rule: No DS3 Port as line timing reference

The system shall not allow to use a DS3 Port, i.e. a port with a rate of T3, as line timing reference.

Error Code:

IDNV - Input, Data Not Valid, DS3 Ports not allowed as line timing reference

Validation rule: No EC1 Port as line timing reference

The system shall not allow to use a EC1 Port as line timing reference.

Error Code:

IDNV - Input, Data Not Valid, EC1 Ports not allowed as line timing reference

Validation rule: SSM not supported

SSM support shall be rejected for invalid input or output format types and the system responds with:

Error code:

IDNV - Input, Data Not Valid, SSM not supported for this format

Validation rule: SSM not supported for unframed formats

Setting an invalid combination of external input frame format (ext_if) and external input SSM support (ext_issm) by changing one or both parameters shall be rejected and the system shall respond with:

Error code:

IDNV - Input, Data Not Valid, SSM not supported for this format

Validation rule: Format not supported for forced DNU/DUS

DNU/DUS provisioning shall be rejected for invalid output format types and the system responds with:

Error code:

IDNV - Input, Data Not Valid, forced DUS not supported for this format

Validation rule: Input / Output format not supported for Sa bit settings

Sa bit location setting is rejected for invalid input or output format types and the system responds with:

Error code: IDNV - Input, Data Not Valid, Sa bit location not supported

Validation rule: SSM not supported if timing port provisioned AUTO

If a timing port provisioned AUTO and the reference which is being assigned does not support SSM, the assignment request is rejected and the system responds with:

Error code:

IDNV - Input, Data Not Valid, SSM not supported for provisioned QL

Validation rule: Output type not supported for AIS mode

If the AIS mode is provisioned to a not supported output type then the system responds with:

Error code: IDNV - Input, Data Not Valid, AIS mode not valid

Validation rule: Cable equalization not supported

If the cable equalization is provisioned to a not supported output type or if the system synchronization characteristic is SDH then the system responds with:

Error code: IDNV - Input, Data Not Valid, cable equalization not supported

Validation rule: Timing clock mode inconsistent

If the NE receives a command with FREE-RUNNING provisioning while the clock mode switch request state is forced holdover, the following error response is returned:

Error code: SNVS, Not in Valid State, timing clock mode inconsistent

Validation rule: Regenerator loops with SETG as timing output

If the output timing source selection is set to SETG and the timing regenerator loop is provisioned, then the system responds with:

Error code:

IDNV - Input, Data Not Valid, no regen loop with SETG as timing output

SET-SYNCN notification

Output format

Syntax: The SET-SYNCN notification has the following specific syntax:

SET-SYNCN:*aid*::*spec_block*

Output parameters

Command parameters

1. *aid* – access identifier

The AID shall be used to specify the timing related settings. The AID separates the parameter in system timing related parameter, parameters related to assigned timing references and parameters for port provisioning. The values all or some prefix all are not allowed in this context.

Type: AID

Range:

- SystemAID
- External_timing_ref_AID
- Line_timing_ref_AID
- External_Timing_input_port_AID
- External_Timing_output_port_AID

Spec block parameters

1. System Timing

a. *clkmod* – clock mode

This parameter specifies the provisioned operational mode of the system timing. In the *clockmod* = FREE-RUNNING mode the system clock process uses the internal oscillator as reference. In the *clockmod* = LOCKED mode the system clock process uses the input signal from the system.

Type: Alphanumeric value set.

Range: FREE-RUNNING, LOCKED.

Default: FREE-RUNNING.

b. *syncmsg* – system synchronization status messaging mode

This parameter is used to ENABLE or DISABLE the SSM protocol.

The parameter provisions the automatic reference selection process to use the incoming QLs in QL-enabled mode or to ignore them in QL-disabled mode. In case of DISABLE, for SDH all output SSMs shall be set to DNU, for SONET all output SSMs shall be set to STU.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: ENABLE.

c. *timing* – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1... 24 characters). A hyphen (-) is additionally allowed in the name.

Default: Default

d. `wtr` – wait to restore

This parameter specifies the provisioned wait to restore timer used for all timing ports for revertive switching. This is the amount of time it takes to switch from lower priority to higher priority references. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: 0SEC, 20SEC, 0...60MIN (1 minute steps), 99 (infinite).

SDH: 0SEC, 0...60MIN (1 minute steps); the values "0SEC" and "0MIN" can be used for SONET and SDH to provision a zero wait to restore time.

Default:

SONET: 20SEC

SDH: 5MIN

2. Assigned Timing Reference

a. `extout_pri` – timing output reference priority

This parameter specifies the priority assignment of the timing link switch of the external output timing. This parameter is only for SDH and for line timing references.

The greater the number the lower the priority. The number "1" indicates the highest priority. The priority "0" means not assigned for external output.

Type: Numeric value set.

Range: 0 (means DISABLED), 1, 2, 3, 4, 5, 6.

Default: 0 (means DISABLED).

b. `q1_prov` – quality provisioned

This parameter defines the quality for the specified timing reference to a fixed SSM value. It is the provisioned quality level sync message value that will be received on timing references.

This parameter is related to all assigned timing references (both external timing references and line timing references) and overrides what is received for the respective timing reference. The AUTO value implies sync message support. The AUTO value is rejected if SSM is not supported for the assigned timing reference (i.e. for DS1 SF). The value range depends from the system synchronization characteristic. Per default shall be:

AUTO – for STM-N/OC-N line, 2Mbit/s framed or DS1 ESF with SSM,

SSUT – for 2MHz, 2Mbit/s unframed or framed without SSM

STU – for DS1 SF or DS1 ESF without SSM

Type: Alphanumeric value set.

Range:

SONET: AUTO, PRS, STU, ST2, ST3

SDH: AUTO, PRC, SSUL, SSUT, SEC.

Default:

SONET: AUTO (External_timing_ref_AID, Line_timing_ref_AID)

SDH: AUTO (Line_timing_ref_AID) SSUT (External_timing_ref_AID).

c. `syncref_pri` – system timing reference priority

This parameter defines the priority for assigned timing references.

When multiple input references have been given the same priority value, it implies non-revertive switching between the associated references. Otherwise, it implies revertive switching to the reference with the highest assigned priority. When the QL-control is disabled, the selection process is controlled by signal status and port priority. The greater the number, the lower the priority. Priority "0" means not assigned.

Type: Numeric value set.

Range: 0 (means DISABLE), 1, 2, 3, 4, 5, 6, 7, 8.

Default: 0 (means DISABLE).

d. `timing` – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1... 24 characters). A hyphen (-) is additionally allowed in the name.

Default: Default

e. `tpmode` – timing port mode monitoring

This parameter specifies the monitoring status of the timing port. If the timing port is in the MONITORED mode and the reference is in FAILED status alarms are active for this port. The value NOT-MONITORED means that alarm monitoring is not occurring on the port.

Type: Alphanumeric value set.

Range: MONITORED, NOT-MONITORED.

Default: NOT-MONITORED.

f. `tref_aid` – timing reference assigned port AID

This parameter specifies the port AID of the assigned timing reference AID.

The parameter is rejected, if the timing reference already assigned to a timing port, or if the reference does not support SSM and timing port is provisioned AUTO, or if the unit which delivers the reference is not present or pre-provisioned. It is not possible to assign more than one reference from a unit. It is not possible to un-assign units from which a reference is assigned to a timing port. It is also not possible to assign a reference from a protection port in a protection group. The value NOT-CONNECTED means no reference is assigned to current timing port.

Type: AID.

Range: External_Timing_input_port_AID, SPortAID, NOT-CONNECTED.

Default: NOT-CONNECTED.

3. External Timing Input

a. ext_if – external input signal format

This parameter specifies the format of the external timing input.

The value range depends on the system synchronization characteristic. The external timing input format can be set at both external timing inputs individually. The reference is rejected, if the reference does not support SSM and the timing port is provisioned AUTO.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

b. ext_isa – external input sa bit location

This parameter defines the external input Sa bit location. It is only valid for the external timing input format “2Mbit/s” framed; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The location of the Sa bit is can be set at both external timing inputs individually. One of the Sa4 to Sa8 bits of the 2Mbit/s sub-multiframe is allocated for Synchronization Status Messages (SSM).

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

4. External Timing Output

a. ext_equ – cable equalization

This parameter specifies the timing output cable equalization to adjust the specified timing reference output signal power. This parameter is valid only for DS1 (SONET).

This parameter is rejected for all input interfaces except DS1. The values are represented by percentage (3.0dB=100%; 2.4dB=80%; 1.8dB=60%; 1.2dB=40%; 0.6dB=20%).

Type: Numeric value set.

Range: 20, 40, 60, 80, 100.

Default: 20.

b. ext_of – external output signal format

This parameter specifies the external output signal format. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

c. `ext_osa` – external output sa bit location

This parameter defines the external output Sa bit location. This parameter is only valid for external timing output format “2Mbit/s framed”; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

d. `extout_en` – external timing output enabling/disabling

This parameter specifies whether the external timing output is enabled or disabled.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

e. `extout_prov` – external timing output selection

This parameter specifies the operation mode of the external output timing.

The value SETG means the system clock. The value TLS means the output. For SONET both values are fixed to the respective external timing output. The value range depends on the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG, TLS.

Default: SONET: LINE1 [fix for output 1], LINE2 [fix for output 2]

SDH: SETG.

f. `extout_ssm` – external timing output AIS mode

This parameter specifies which value will be send when the signal level is below the quality acceptance level or when *frcdus* is enabled. The parameter is valid depending from the system synchronization characteristic, for SDH 2Mbit/s framed and for SONET DS1 ESF; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The value AISMODE means AIS is inserted in the external timing output signal. The value QLMODE means DUS is inserted in the external timing output signal.

Type: Alphanumeric value set.

Range: AISMODE, QLMODE.

Default: QLMODE.

g. `frcdus` – forced DNU/DUS

This parameter specifies the synchronization messaging forced DNU/DUS enable or disable for the timing output port. DUS applies to SONET and DNU applies to SDH. This is only valid for '2Mbit/s framed' and 'DS1 ESF'; i.e. for ports with format unequal to "2Mbit/s framed" or "DS1 ESF" the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

h. `loopdelay` – timing regenerator loop delay

This parameter indicates the delay in the SASE/BITS loop operation. The values are represented by seconds in steps of 1 seconds per loop.

Type: Numeric value set.

Range: 0...60 (1 seconds steps).

Default: 10.

i. `qlout_tais` – acceptance quality level for output threshold AIS

This parameter is the provisioned quality acceptance level for external timing output. When the incoming message is below this level, AIS or DUS (depending from the `extout_ssm` value) will be inserted into the external timing output. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3

SDH: PRC, SSUT, SSUL, SEC.

Default:

SONET: ST3

SDH: SEC.

j. `regen_loop` – timing regenerator loop

This parameter specifies the avoiding of loops over the SASE/BITS clocks.

When this parameter is set to ENABLED, the synchronization message DUS will be inserted in the traffic output port associated with the traffic input port used as source for the station clock. The parameter is selectable for both external timing outputs individually.

Type: Alphanumeric value set.

Range:

SONET: DISABLE, ENABLE

SDH: DISABLE, EXTREF1, EXTREF2, BOTH.

Default:

SONET: ENABLE

SDH: DISABLE.

k. `timing` – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1... 24 characters). A hyphen (-) is additionally allowed in the name.

Default: Default

Example output

The following is an example of the SET-SYNCN notification for System Timing:

```
LT-UNITE 00-11-16 12:00:00
A 000 REPT DBCHG
"TIME=12-00-00,DATE=00-11-16:SET-SYNCN:SYSTEM::wtr=2MIN"
;
```

The following is an example of the SET-SYNCN notification for Assigned Timing Reference:

```
LT-UNITE 00-11-16 12:00:00
A 000 REPT DBCHG
"TIME=12-00-00,DATE=00-11-16:SET-SYNCN:LINE2::ql_prov=PRC"
;
```

The following is an example of the SET-SYNCN notification for External Timing Input:

```
LT-UNITE 00-11-16 12:00:00
A 000 REPT DBCHG
"TIME=12-00-00,DATE=00-11-16:SET-SYNCN:EXTTMG0::ext_isa=SA5,
ext_if=2MBIT-FRAMED"
;
```

The following is an example of the SET-SYNCN notification for External Timing Output:

```
LT-UNITE 00-11-16 12:00:00
A 000 REPT DBCHG
"TIME=12-00-00,DATE=00-11-16:SET-SYNCN:EXTTMG1_OUT::ql_out=SEC,
extout_ssm=AISMODE"
;
```

TCA notification

Output format

Command syntax: REPT EVT *modifier*
aid:condtype,condeff,ocrdat,ocrtm,,,,thlev,tmper:conddescr

Output parameter

1. *modifier*

This parameter indicates the port type or tributary on which the INIT-REG command is to act on.

Type: alphanumeric value set.

Range:

The following values are for SONET only:

- STS1, STS3C, STS12C, STS48C, STS192C, OC3, OC12, OC48, OC48T, OC192, OC768, T3, EC1, LOVT1.

The following values are for SDH only:

- VC3, VC4, VC44C, VC416C, VC464C, STM1E, STM1, STM4, STM16, STM16T, STM64, STM256, ODU1, LOVC3, LOVC12

The following value is for Ethernet only: ENET, 1GEPL, 10GEPL.

2. *aid* – Access Identifier

Type: AID

Range:

- For STM<N>, STM<N>T, OC<N>, EC1 and OC<N>T ports: SPortAID
- For Ethernet ports: EPortAID VCGAID
- For DS3 ports: APortAID
- For ODU terminations: VCGAID
- For STS/VC tribs: STS1NumAID
- For VCG tribs: VCGNumAID
- For LOXC related LO tribs: GenLOTribAID.

3. *condeff* – Condition Effect

This parameter indicates the effect of the reported event on the NE. It is used to distinguish between persistent and transient alarms/events.

Two state transitions can be distinguished for a persistent alarm/event:

- raise transition: state change from not present to present
- clear transition: state change from present to not present.

A transient alarm/event has no 'presence' state; i.e. just the occurrence of that event/alarm is reported. ABN condition are always persistent and not transient.

Type: alphanumeric value set.

Range:

- CL: Standing condition cleared for a persistent alarm/event.
- SC: Standing condition raised for a persistent alarm/event
- TC: Transient condition occurred for a transient alarms/events.

4. conddescr – Description Of The Condition

The general format is: category, entity, description, additional text. If there is no additional text, then the trailing comma may be omitted.

Type: inner string

Range:

- For STM<N>, STM<N>T, OC<N>T, OC<N> and EC1: Quality of service, {rr} port, TCA where rr is equal to the port rate
- For ODU<N>: Quality of service, {rr} path, TCA where rr is equal to the ODU rate (e. g., ODU1)
- For not terminated VC12, VC3, VC4, VC44C, VC416C, VC464C, VT1, STS1, STS3C, STS12C, STS48C and STS192C: Quality of service, {rr} CS, TCA where rr is equal to the signal rate
- For terminated VC4 and STS1 signals: Quality of service, {rr} path, TCA where rr is equal to the Constituent Signal (CS) rate
- For GE port: Quality of service, {ge_rate}GE, TCA where ge_rate is the signal rate of the GE port
- For VCG port: Quality of service, VCG, TCA.
- For DS3 port: Quality of service, T3 port, TCA

5. condtype – Condition Type

This parameter identifies the type of event indication being reported.

Type: inner string with the Format: T-<montype>.

Range:

The following values are for all OC<N> and EC1 signals: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVL, T-ESL, T-SESL, T-UASL, T-CV-LFE, T-ES-LFE, T-SES-LFE, T-UAS-LFE.

The following values are for all OCN<N>T signals: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVS-EGR, T-ESS-EGR, T-SESS-EGR, T-SEFS-S-EGR

The following values are also for OC192 and OC768 signals: T-FECC-L.

The following values are for STS1, STS3C, STS12C, STS48C and STS192C tributaries: T-CVP, T-ESP, T-SESP, T-UASP, T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE, PPJC-PDet, NPJC-PDet, NPJC-PDet, NPJC-PGen

The following values are for VT1 tributaries: T-CVP, T-ESP, T-SESP, T-UASP, T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

The following values are for all STM<N> signals: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-MS-N-ES, T-MS-N-SES, T-MS-N-BBE, T-MS-N-UAS, T-MS-F-ES, T-MS-F-SES, T-MS-F-BBE, T-MS-F-UAS.

The following values are for all STM<N>T signals: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-RS-N-ES-EGR, T-RS-N-SES-EGR,

T-RS-N-BBE-EGR, T-RS-N-UAS-EGR

The following values are for all ODU<N> signals: T-ODU-N-ES, T-ODU-N-SES, T-ODU-N-BBE, T-ODU-N-UAS, T-ODU-F-ES, T-ODU-F-SES, T-ODU-F-BBE, T-ODU-F-UAS

The following values also are for STM64 and STM256 signals: T-MS-N-FECC.

The following values are for T3 modifier: T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-SESL, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-SESP, T-UASP, T-SAS-P, T-CV-PFE, T-ES-PFE, T-ESA-PFE, T-ESB-PFE, T-SES-PFE, T-UAS-PFE, T-SAS-PFE, T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

The following values are for VC3, VC4, VC44C, VC416C and VC464C tributaries: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, cVC-F-BBE, T-VC-F-UAS, T-PJE+/-

The following values are for VC12 tributaries: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, T-VC-F-BBE, T-VC-F-UAS

For ENET signals: T-PDE, T-EDFE, T-EDFC.

6. ocrdat – Occurrence Date

This parameter indicates the raising / clearing date of the alarm.

Type: value set of the format MM-DD.

Range: MM represents the month, DD represents the day, leading zeros are not suppressed.

7. ocrtm – Occurrence Time

This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.

Type: value set of the format HH-MM-SS.

Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.

8. thlev – Threshold Level

This parameter is only used for Threshold Crossing Alerts (TCAs). It reports the threshold level value which is set by ED-TCA-PROF.

The two applicable thresholding methods (tcamd) must be distinguished. For TR-only mode:

- the raise TCA threshold value is reported.

For TR-RTR mode:

- the raise TCA threshold value is reported for the raise event
- the reset TCA threshold value is reported for the clear event.

Type: integer.

Range: >1 (1 ... 4294967295). Leading zeros will be suppressed.

9. **tmper** – Time Period

This parameter reports the monitored time interval. This parameter is only used for Threshold Crossing Alerts (TCAs).

Type: value set.

Range: 15-MIN, 1-DAY.

Example input/output

TCA alarm for an STS-1 SES of slot 14 for port 3 STS-12 (24h register):

```
UNITE-NE 00-01-01 08:00:50
A 009 REPT EVT STS1
  "1-1-#-#-14-3-2:T-SESP,TC,01-10,08-00-49,,,,,250,1-DAY:\\"Quality of
    service, STS1 CS, TCA\\""
;
```

5 TL1 messages - administration & security

Overview

Purpose

This section lists the TL1 interface definition for the domain “administration and security”.

Contents

Session	5-2
List of commands	5-3
NE security administration	5-4
List of commands	5-5
User administration	5-6
List of commands	5-7
Security Activity Log	5-8
List of commands	5-9

Session

Overview

Purpose

This entity list the parameters which handle the establishment and removal of sessions between the NE and the Managers.

Contents

List of commands	5-3

List of commands

- “ACT-USER: Activate user” (p. 4-23)
- “CANC-USER: Cancel user” (p. 4-57)
- “CANC-USER-SECU: Cancel user security” (p. 4-59)

NE security administration

Overview

Purpose

This entity lists the NE security parameters which are defined for the whole NE.

Contents

List of commands	5-5

List of commands

- “RTRV-NE-SECU: Retrieve NE security” (p. 4-2384)
- “RTRV-BANNER” (p. 4-2117)
- “ED-NE-SECU: Edit NE security” (p. 4-403)
- “ED-NE-SECU notification” (p. 4-406)
- “ENT-BANNER” (p. 4-1350)
- “ENT-BANNER notification” (p. 4-1352)

User administration

Overview

Purpose

This entity refers to the User Security Data.

Contents

List of commands	5-7

List of commands

- “RTRV-USER-SECU: Retrieve user security” (p. 4-2857)
- “RTRV-USER: Retrieve user” (p. 4-2853)
- “ENT-USER-SECU: Enter user security” (p. 4-1841)
- “ENT-USER-SECU notification” (p. 4-1846)
- “ED-USER-SECU: Edit user security” (p. 4-1244)
- “ED-USER-SECU notification” (p. 4-1251)
- “ED-USER: Edit user” (p. 4-1239)
- “ED-USER notification” (p. 4-1242)
- “ED-PID: Edit password identifier” (p. 4-737)
- “ED-PID notification” (p. 4-741)
- “DLT-USER-SECU: Delete user security” (p. 4-251)
- “DLT-USER-SECU notification” (p. 4-254)

Security Activity Log

Overview

Purpose

This entity lists to the security activity log data.

Contents

List of commands	5-9

- “REPT DBCHG: Report data base change” (p. 4-1973)
- “ED-DAT: Edit date and time” (p. 4-287)
- “ED-DAT notification” (p. 4-290)
- “SET-SID: Set SID” (p. 4-2943)
- “SET-SID notification” (p. 4-2946)
- “INIT-SYS: Initialize System” (p. 4-1886)

Autonomous notifications

Change acceptable type list for CTL

During system startup it shall be detected which CTL type is plugged in.

Appropriate to this CTL the acceptable type list of the second controller slot shall be changed

- If the first controller is a CTL, the second controller can be CTL or CTL/2
- If the first controller is a CTL/2, the second controller must be CTL/2.

The term *first* and *second* is related on installation time. No database change notification will be send out during system initialization.

Change of the data base change status

The data base change state (see *dbstate* parameter in [“RTRV-STATE-EQPT \(system\): Retrieve equipment state”](#) (p. 4-2657)) can change autonomously. This change is reported by means of an ED-STATE-EQPT notification.

System start-up with default DB

The system autonomously create the entity *system* when starting up with the default database. No notification is sent.

Bay

Overview

Purpose

This section lists the bay level configuration messages.

Contents

RTRV-EQPT: Retrieve equipment (bay)	6-7
Autonomous notifications	6-8

RTRV-EQPT: Retrieve equipment (bay)

For description of this parameter refer to “[RTRV-EQPT \(bay\): Retrieve Equipment \(bay\)](#)” (p. 4-2216).

Autonomous notifications

System start-up with default DB

The system autonomously create the entity *bay* when starting up with the default database. No notification is sent.

Shelf

Overview

Purpose

This section lists the shelf level configuration messages.

Contents

List of commands	6-10
Autonomous notifications	6-11

List of commands

- [“RTRV-EQPT \(shelf\): Retrieve Equipment \(shelf\)” \(p. 4-2225\)](#)
- [“ED-EQPT \(shelf\): Edit equipment \(shelf\)” \(p. 4-333\)](#)
- [“ED-EQPT \(shelf\) notification” \(p. 4-336\)](#)

Autonomous notifications

System start-up with default DB

The system autonomously create the entity *shelf* when starting up with the default database. No notification is sent.

Slot

Overview

Purpose

This section lists the slot level configuration messages.

Contents

List of commands	6-13
Autonomous notifications	6-14

List of commands

- “RTRV-EQPT (slot): Retrieve Equipment (slot)” (p. 4-2228)
- “ENT-EQPT (slot): Enter equipment (slot)” (p. 4-1441)
- “ED-EQPT (slot): Edit equipment (slot)” (p. 4-338)
- “ED-EQPT (slot) notification” (p. 4-343)
- “DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167)
- “RTRV-STATE-EQPT (slot): Retrieve equipment state (slot)” (p. 4-2651)
- “ED-STATE-EQPT (slot) notification” (p. 4-795)
- “INIT-EQPT (slot): Initialize equipment (slot)” (p. 4-1883)

Autonomous notifications

Circuit pack plug in

Autoprovisioning

If a circuit pack is plugged into an allowed slot, which is not provisioned to any circuit pack, this slot is auto-provisioned to this plugged-in pack. This change is reported by means of an ED-EQPT notification for this slot for the *nvmname*, *nvmqual* parameters and an ED-STATE-EQPT notification for the *holdst* parameter.

Unexpected, not acceptable, not recognizable CP handling

If an unexpected or not acceptable circuit pack or a circuit pack which inventory data can not be read is plugged into the slot only the holder status is changed and this is notified by an ED-STATE-EQPT notification.

For all these cases alarms will be sent out in addition.

Report of inventory data

In addition to the notifications above the system reports an ED-EQPT (slot) notification for the parameters *name*, *qual*, *app*, *ssn*, *clei*, *eci*, *sln*.

In case the inventory data can not be read the fields shall be reported as empty ("").

If circuit packs will be plugged in containing plugged in modules or fixed mounted modules implicit the socket entities will be updated and created according description of auto provisioning of modules.

Create CTL protection group- when plugging a second CTL

When plugging in a second CTL the system shall create one instance of 1+1 equipment protection group of type EQPTCTL

This shall be reported by means of ENT-PROTNGRP notification for 1+1 equipment protection group. The initial protection state shall be reported by means of a protection switch notification for the 1+1 equipment protection group.

Circuit pack plug out

If a circuit pack is plugged out the holder state for this board will change. This change is reported by means of an ED-STATE-EQPT notification for the *holdst* parameter.

In addition to the notification above the system reports an ED-EQPT (slot) notification for the parameters *name*, *qual*, *app*, *ssn*, *clei*, *eci*, *sln*.

If a circuit pack is plugged out which contains sockets with plugged in modules, then implicitly the socket entities shall be updated as required for the case of plug out of modules.

Change of functional type for neighbor slots

If a multislot circuit pack with *nvmname*=<XXX> is provisioned to slot n the parameters *nvmname*, *nvmqual* of each slots m to n-1 (n>m) change to <XXX>, EXTENDED and the parameter *actlname* is set to empty (i.e. the output contains one row with *actlname*="", see also Example Input/output section of ED-EQPT(slot) notification). This change is reported by means of ED-EQPT notification for slot m to n-1 for *nvmname*, *nvmqual*, *actlname* parameters.

If a circuit pack is provisioned and as side effect it is no longer possible to use one of the neighbor slot for a multislot CP, the parameter *actlname* for this slot is changed and all multislot CPs are removed. This change is reported by means of an ED-EQPT notification.

If a multislot circuit pack of slot n is deprovisioned the parameters *nvmname*, *nvmqual* of each slots m to n-1 (n>m) change to UNDEFINED, UNDEF and the parameters *actlname* changes to list of acceptable CPs. This change is reported by means of ED-EQPT notifications for slot m to n-1 for *nvmname*, *nvmqual*, *actlname* parameters.

If a circuit pack is deprovisioned and as side effect it becomes now possible to use one of the neighbor slot for a multislot CP, the parameter *actlname* for this slot is changed and all multislot CPs are added. This change is reported by means of an ED-EQPT notification.

System start-up with default DB

The system shall autonomously create all entities addressable by SlotAID when starting up with the default database. No notification is sent.

Socket

Overview

Purpose

Circuit packs can contain sockets where modules can be plugged in. For unite in the current version Pluggable Interfaces mainly optical modules will be plugged in. A module with a pluggable interface will be only related to one port (e.g. a STM64 port). The relation is done in that way that a socket number n is related to a port number n of the same slot (e.g.port 1-1-#-#-1-sc3 is related to socket 1-1-#-#-1-3) The port functionality (and the related e.g. tributaries) is not available as long no module is provisioned by a provisioning command or by plugging in. This means the related entities will be only available if a module is provisioned. A socket behaves similar like a slot. That means there can be inventory data of the module read out, it can be (pre- or auto-) provisioned and also the acceptable type list for the socket is available. Also the rules how and when a module can be provisioned or de provisioned are similar.

Contents

List of commands	6-17

- “DLT-EQPT (Socket) notification” (p. 4-185)
- “RTRV-STATE-EQPT (Socket): Retrieve equipment state ” (p. 4-2654)
- “ED-STATE-EQPT (Socket) notification” (p. 4-797)

Autonomous notifications

Module plug in

Auto provisioning

If a module will be plugged into a not provisioned socket the socket will be auto provisioned to the plugged in module if the plugged in module type matches the acceptable type list of the socket. This shall be reported by means of the ED-EQPT (socket) notification. In addition also all entities will be created and updated as described in the detailed behaviour of the ENT-EQPT (socket) command. The update of the holder status of the socket will be reported by means of the ED-STATE-EQPT (socket) notification.

Unexpected, not acceptable, not recognizeable module handling

If an unexpected or not acceptable module or a module from which inventory data can not be read is plugged into the socket only the holder status is changed and this is notified by an ED-STATE-EQPT(socket) notification. For all these cases alarms will be sent out in addition , either Optical Module Type Mismatch or Optical Module EPROM Access Fail.

Report of inventory data

In addition to the notifications above the system shall report an ED-EQPT (socket) notification for the affected parameters.

Affected parameters for Optical Modules with SFP or XFP EEPROM format:

- *app, clei, ccode, compatibilitybyte, connectortype, datecde, interchangemarker, name, physicalid, prodid, qual, transceivercode, uniquenumber, vendorname, vendoroui, vendorpartno, vendorrevlvl, vendorsln, wesserialno, wesvendorid.*

Affected parameters for Optical Modules with Small EEPROM format:

- *app, clei, eci, name, qual, sln, ssn.*

In case the inventory data can not be read the fields shall be reported as empty ("").

Auto provisioning of CPs with plugged in modules

If a circuit pack is auto provisioned which contains already plugged in modules or fixed installed modules or an already provisioned circuit pack will be plugged in where the modules are not provisioned but already plugged in or fixed mounted then is the behaviour the same as the module will be auto provisioned by plugging in a module into a socket of the circuit pack. It can be seen as two independent actions, which will be performed one after the other: (auto) provisioning of the circuit pack with following auto provisioning of modules.

Module plug out

If a module is plugged out the holder state for this socket will change. This change shall be reported by means of an ED-STATE-EQPT (socket) notification for the holdst parameter.

In addition to the notification above the system reports an ED-EQPT (socket) notification for the affected parameters with the defined default value (empty string "").

Affected parameters for Optical Modules with SFP EEPROM format:

- *app, clei, ccode, compatibilitybyte, connectortype, datecde, interchangemarket, name, physicalid, prodid, qual, transceivercode, uniquenumber, vendorname, vendoroui, vendorpartno, vendorrevl, vendorsln, wesserialno, wesvendorid.*

Affected parameters for Optical Modules with Small or XFP EEPROM format:

- *app, clei, eci, name, qual, sln, ssn.*

The parameter set in the ED-EQPT (socket) Notification depends on the EEPROM format of the Optical Module which is plugged out.

Circuit pack plug out with plugged in modules

If a circuit pack will be plugged out with plugged in modules or with fixed mounted modules the system behaves like two independent actions, which will be performed one after the other: plug out of the plugged in or fixed mounted modules and plug out of the circuit pack. Regarding modules notifications will be sent as described for module plug out.

Circuit pack pre-provisioning

If a circuit pack, which supports sockets, is pre-provisioned using the ENT-EQPT command for a slot, then the creation of the socket entities shall be reported via ENT-EQPT notifications for sockets with empty spec block. Example:

```
LT-UNITE^06-03-15^11:14:13
A 004^REPT^DBCHG
"TIME=11-14-13,DATE=06-03-15:ENT-EQPT:1-1-#-#-39-scl::"
```

Circuit pack

Overview

Purpose

This section lists the circuit pack level configuration messages.

Contents

List of commands	6-21
Autonomous notifications	6-22

List of commands

- “RTRV-EQPT (CP): Retrieve equipment (circuit pack)” (p. 4-2218)
- “ENT-EQPT (CP) notification” (p. 4-1439)
- “ED-EQPT (cp): Edit equipment (circuit pack)” (p. 4-322)
- “ED-EQPT (cp) notification” (p. 4-330)
- “DLT-EQPT (CP) notification” (p. 4-183)
- “RTRV-STATE-EQPT (CP): Retrieve equipment state (circuit pack)” (p. 4-2648)
- “ED-STATE-EQPT (CP) notification” (p. 4-794)

Autonomous notifications

System start-up with default DB

The system autonomously creates the following entities when starting up with the default database:

- backplane (backpl)
- user panel (upl)
- fan unit (fan)
- two TIs (tia and tib)
- CI-CTL (cictl)
- two PIs (pia and pib)
- CTL (ctlw-cp).

No notifications is sent.

Change of the operational state

A change of the operational state is autonomously reported by means of an ED-STATE-EQPT notification for this circuit pack.

Port

Overview

Purpose

The term port is defined as physical interface of the EP51, EP155 and OPn packs including the 10-Gigabit Ethernet WANPHY interface variant. The ports of the OPn packs can work in SDH or SONET mode. Therefore SDH and SONET related commands are defined for physically identical ports. The ports of the EP155 packs can only work in SDH mode. Therefore only SDH related commands are defined.

TL1 commands related to gigabit Ethernet LAN ports (GE1 packs) are described in the “Virtual switch” (p. 8-16) section.

Tributary

Overview

Purpose

The following chapter lists the commands for VC-3/STS-1 tributaries and path termination functions. The tributaries are related to the synchronous optical/electrical interfaces (e.g. on OPn or EP155). The tributaries with path termination function are related to asynchronous ports (e.g. DS3 port on EP51).

SONET and SDH tributaries are supported to keep the compatibility to current generation equipment as far as possible and to be compatible with the Telcordia manager.

- “ED-PTF notification” (p. 4-781)
- “DLT-PTF notification” (p. 4-227)

Autonomous notification

Impact of ONNS cross-connection creation

On creation of an ONNS cross-connection (*xconcls*=NN), which involves tributaries on EDGE ports (*portClass*=EDGE) which are part of a BLSR/MS-SPRING protection group the non-empty *loca*, *locz* information of the tributaries are copied into the corresponding attributes of the cross-connection and the *loca*, *locz* parameters in the tributaries are reset to its default values.

The reset of the *loca*, *locz* parameters in the tributaries are reported by means of an ED-STS (*istd* of related port SONET) or ED-VC3 (*istd* of related port SDH) notification.

7 TL1 messages - fault management

Overview

Purpose

This section lists the TL1 interface definition for the domain *fault management*.

Introduction

Overview

Purpose

This chapter presents general information necessary to understand the subsequent sections.

Contents

Alarms, events, ASAPs	7-4
MDI / MDO	7-6

Alarms, events, ASAPs

Alarms/events

The system reports failures via alarms and events. An alarm/event can be persistent or transient. If it is persistent then a declaration (when the alarm will be raised) and a clear (when the alarm will be cleared) message will be sent by the NE. If it is transient only a declaration message will be sent.

Each one has a probable cause assigned. This is an identifier for the alarm/event. It will be reported via the *condtype* parameter in several commands/messages.

Alarms (conditions) with the severity Critical, Major, or Minor – will be reported via REPT ALM and can be retrieved via RTRV-ALM. Events/Alarms (conditions) with severity Warning/Not-Alarmed – will be reported via REPT EVT and can be retrieved via RTRV-COND. Alarms of environmental points will be not reported and retrieved via this commands. Refer to MDI/MDO description. The different reporting messages and retrieve commands are because of TL1 requirements.

Service affecting / non service affecting

An alarm can be service affecting (sa) or non service affecting (nsa). This indicates if transmission on a path may be affected (sa) or not (nsa). It is only a well educated guess based on the limited view of a single NE.

Alarm severity

Each alarm/event will be reported with a severity. The severity specifies the urgency of the alarm/event. The severity which will be sent for a specific probable cause can be configured via ASAPs.

The NE supports the following severities:

- CR – Critical (ITU / Telcordia)
- MJ – Major (ITU / Telcordia)
- MN – Minor (ITU / Telcordia)
- NA – Warning (ITU) / Not-Alarmed (Telcordia)
- NR – Non-Alarmed (ITU) / Not-Reported (Telcordia).

ASAPs

Alarm Severity Assignment Profiles (ASAP) assign for each probable cause and if applicable service affecting and non service affecting independent a severity. Each ASAP parameter of an ASAP refers to a probable cause and if applicable for service affecting or not. There are different types of ASAPs which defines the severities for different sets of probable causes. An entity which can raise an alarm/event will be

assigned an ASAP which defines for the specific alarms/events of the entity the severity. For each ASAP type a default ASAP exists in the NE, which cannot be deleted. ASAPs can be created via ENT-ASAP-PROF, edited via ED-ASAP-PROF, deleted via DLT-ASAP-PROF and retrieved via RTRV-ASAP-PROF.

SONET / SDH Mode

The NE does not distinguish between SONET and SDH. For both the same alarms will be reported and only one set of severities is supported. Alarms use probable causes there applicable from the Telcordia ("SONET world") standard. For alarm description is system specific and not adapted to Telcordia standards.

For severities the notation is used like described in the TL1 standards of telcordia. For explanation the meaning in the SONET and SDH world is added.

MDI / MDO

MDI

Miscellaneous Discrete Inputs (MDI / environmental point) are used to have some external input which can raise alarms like from a fire detector. The name and alarm description of an MDI can be configured. The general discussion for alarms/events is also true for MDIs. Only the alarms will be reported via REPT-ALM-ENV and can be retrieved via RTRV-ALM-ENV. The configuration of MDIs can be edited via SET-ATTR-ENV and retrieved via RTRV-ATTR-ENV.

MDO

Miscellaneous Discrete Outputs (MDO / external control) are outputs which can operate equipment outside of the NE like a lamp. Each MDO has a name which can be configured. MDOs can be configured via SET-ATTR-CONT and can be retrieved via RTRV-ATTR-CONT.

MDOs can be operated in two modes: automatically and via management commands. For the automatic mode a MDO gets assigned a probable cause. If at least one alarm of this probable cause is active then the MDO will be operated. For operation with the management commands no probable cause must be assigned to the MDO. The MDO can be operated via OPR-EXT-COND and RLS-EXT-COND. The control state of a MDO can be retrieved with the RTRV-EXT-CONT command.

Alarm assignment profiles

Overview

Purpose

This section comprises messages to handle alarm assignment profiles (ASAPs).

Contents

List of commands	7-8

List of commands

- “RLS-EXT-CONT notification” (p. 4-2038)

Alarm, event, ASAP tables

Overview

Purpose

This section describes which alarms and events in the system can occur.

For each possible alarm following will be described:

condtype

The *condtype*, it represents the probable cause.

sa/nsa

States if it is service affecting (sa) or/and non service affecting (nsa).

conddescr

The *conddescr* related to the alarm. It is of the format:

1. \"<category>, <entity>, <description>, <additional text>\"
2. \"<category>, <entity>, <description>, <additional text>-cleared\".

If there is no additional text, then the trailing comma may be omitted.

The *conddescr* has two forms for persistent alarms:

1. It is used when the alarm is raised.
2. The string: \"-cleared\" is appended. It is used when the alarm will be cleared.
Transient alarms uses only the first form.

The description in the tables below defines the text for each part of the *conddescr*. The leading and ending ' \" ' are omitted.

ASAP Parameter

The ASAP parameter which are used in the RTRV-ASAP-PROF, ED-ASAP-PROF, ENT-ASAP-PROF commands for the specific ASAP type.

The name of service affected related ASAP parameters starts with the prefix \"sa_\", for non service affected one with \"nsa_\". The prefix can be omitted if the one probable cause reports only for service affected or non service affected.

default severity

The default alarm severity which is assigned to the ASAP parameter.

Description

A description for explanation.

modifier/aidtype

The to the alarm related *modifier* and *aidtype*.

AID

The AIDs which can be reported related to the alarms. All wildcard aids like `all` must not be used.

Alarm duration

It describes if the alarm is a persistent one or a transient one.

There are separate ASAP parameter for `sa` and `nsa` alarms. There applicable each parameter will be described separately together with their default values.

The Alarms will be described per ASAP type.

Please refer also to other fragments of the TL1 documentation where REPT EVT messages related to this fragment will be defined.

Remark to TCA: The alarm level of threshold crossing alarms (TCA) shall always be “not alarmed”, and it is not user provisionable. The system shall not allow the user to change any attribute of TCA alarm through ASA profile. All the attributes, such as TCA reporting enable/disable, that will affect TCA reporting shall be handled by the TCA profile.

ASAP Type DCN

Properties of all alarms

modifier/aidtype: COM

AID: SystemAID

Alarm duration: persistent.

condtype: PARARREP

sa/nsa: nsa

conddescr: Communication-DCN, DCN, Partitioned Area Repair

ASAP parameter: *pararrep* default severity: MN.

condtype: PROVINVAL

Important! *Please note that this condtype is not supported by the current release.*

sa/nsa: nsa

conddescr: Communication-DCN, DCN, DCN Provisioning Not Valid

ASAP parameter: *provinval* default severity: MJ.

condtype: ADDROV

sa/nsa: nsa

conddescr: Communication-DCN, DCN, Address List Overflow

ASAP parameter: *addrov* default severity: MJ.

condtype: ASTNNBRNAV

sa/nsa: nsa

conddescr: Communication-SCN, SCN, ASTN Neighbor Not Available

ASAP parameter: *astnnbrnav* default severity: MJ.

modifier/aidtype: COM

AID: SystemAID

The alarm information also includes the IP address of the affected ASTN neighbor, which has to be mapped into the *conddescr*.

condtype: NSAPHIGH

sa/nsa: nsa

conddescr: Communication-DCN, DCN, NSAP counter exceeds threshold

ASAP parameter: *nsaphigh* default severity: MN.

condtype: BUFROVLD

sa/nsa: nsa

conddescr: Communication-DCN, DCN, NSAP counter over maximum

ASAP parameter: *bufrovld* default severity: MJ.

ASAP Type DS3

Properties of all alarms

modifier/aidtype: T3

AID: APortAID

Alarm duration: persistent.

condtype: DS3LOS

sa/nsa: sa

conddescr: Communication-Transport, T3 port, DS3 Loss of Signal

ASAP parameter: *sa_ds3los* (service affecting).

default severity: MJ

condtype: DS3LineDEG

sa/nsa: sa

conddescr: Communication-Transport, T3 port, Degraded DS3 Line signal

ASAP parameter: *sa_ds3deg* (service affecting).

default severity: MJ

condtype: DS3LOF

sa/nsa: sa

conddescr: Communication-Transport, T3 path, DS3 Loss of Frame

ASAP parameter: *sa_ds3lof* (service affecting).

default severity: MJ

condtype: DS3AIS

modifier/aidtype: 1GE, 1GEPL, 10GEPL

AID: EPortAID.

condtype: LANANM

sa/nsa: nsa

conddescr: Communication-Transport, {aidtype}, LAN Auto Negotiation Mismatch

ASAP parameter: sa_lan_anm (service affecting), default severity: MN

ASAP parameter: nsa_lan_anm (non service affecting), default severity: NA

modifier/aidtype: 1GE, 1GEPL, 10GEPL

AID: EPortAID.

condtype: MACVLANOVFW

sa/nsa: nsa

conddescr: Communication-Transport, 1GE, max no of VLAN instances reached

ASAP parameter: nsa_vlan_maxno (service affecting), default severity: MN

modifier/aidtype: 1GE

AID: EPortAID.

Per Gigabit Ethernet card one virtual switch is available, therefore the alarm is always raised against the first port of the card. Also the alarm configuration is related to the first port. condtype: LANPHYNOSYNC

sa/nsa: sa / nsa

conddescr: Communication-Transport, {aidtype}, Loss of Synchronisation Eport

ASAP parameter: sa_lan_nosync (service affecting), default severity: MN

ASAP parameter: nsa_lan_nosync (non service affecting), default severity: MN

modifier/aidtype: 1GEPL, 10GEPL

AID: EPortAID.

ASAP Type ENV

Properties of all alarms

modifier/aidtype: ENV

AID: Miscellaneous_in_DiscreteAID

Alarm duration: persistent.

Reference ASAP Type ENV

Refer to the *envmsg* parameter in the output parameters section of the “[RTRV-ATTR-ENV: Retrieve attribute environment](#)” (p. 4-2102) command for string values as part of *conddescr*.

condtype: MISC_1

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: environ_1

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_2

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: environ_2

Default severity: NA

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_3

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: environ_3

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_4

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: environ_4

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_5

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: environ_5

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_6

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: environ_6

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_7

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: environ_7

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

condtype: MISC_8

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: environ_8

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

ASAP Type EQUIP-PROT

Properties of all alarms

modifier/aidtype: EQPT

Alarm duration: persistent

condtype: EQPT

sa/nsa: sa / nsa

conddescr: Equipment, {cpname}/{cpqual}, Circuit Pack Clock Failure

ASAP parameter: sa_eqpt; default severity: CR

ASAP parameter: nsa_eqpt; default severity: MN

AID: CpAID.

condtype: CPTEMP

sa/nsa: sa / nsa

conddescr: Equipment, {cpname}/{cpqual}, Unit Temperature too High

ASAP parameter: sa_cptemp; default severity: MJ

ASAP parameter: nsa_cptemp; default severity: MN

AID: CpAID.

condtype: PRCDRERR

sa/nsa: sa / nsa

conddescr: Equipment, slot, Circuit Pack Type Mismatch

ASAP parameter: sa_prcdrerr; default severity: MJ

ASAP parameter: nsa_prcdrerr; default severity: MN

AID: SlotAID.

condtype: REPLUNITMISS

sa/nsa: sa / nsa

conddescr: Equipment, slot, Circuit Pack not Present

ASAP parameter: sa_replunitmiss; default severity: CR

ASAP parameter: nsa_replunitmiss; default severity: MN

AID: SlotAID.

condtype: TXInF

sa/nsa: sa / nsa

conddescr: Equipment, {cpname}/{cpqual}, TXI Failure

ASAP parameter: sa_txif; default severity: CR

ASAP parameter: nsa_txif; default severity: MN

AID: CpAID.

Description: The n in the condtype expresses the individual TXI line for which the alarm is reported. The maximum of n depends on the card type. The condtype will be reported as: TXI1F, TXI2F.

condtype: CPFAIL

sa/nsa: sa / nsa

conddescr: Equipment, {cpname}/{cpqual}, Circuit Pack Failure

ASAP parameter: sa_cpfail; default severity: CR

ASAP parameter: nsa_cpfail; default severity: MN

AID: CpAID.

condtype: PIMISS

sa/nsa: sa / nsa

conddescr: Equipment, shelf, Power Interface not Present

ASAP parameter: sa_pimiss; default severity: MJ

ASAP parameter: nsa_pimiss; default severity: MN

AID: PowerAID.

condtype: PIEF

sa/nsa: nsa

conddescr: Equipment, shelf, Power Interface Read Failure

ASAP parameter: nsa_pief; default severity: MN

AID: PowerAID.

condtype: POWF

sa/nsa: sa / nsa

conddescr: Equipment, shelf, System Power Failure

ASAP parameter: sa_powf; default severity: MJ

ASAP parameter: nsa_powf; default severity: MN

AID: PowerAID.

condtype: ONIFW

sa/nsa: nsa

conddescr: Equipment, {cpname}/{cpqual}, ONI Failure on working CTL slot

ASAP parameter: sa_onifw; default severity: MN

AID: CpAID.

condtype: ONIFP

sa/nsa: nsa

conddescr: Equipment, {cpname}/{cpqual}, ONI Failure on protecting CTL

ASAP parameter: nsa_onifp; default severity: MN

AID: CpAID.

condtype: DCTLUNAVAIL

sa/nsa: nsa

conddescr: Equipment, SYSTEM, Duplex Control not Present

ASAP parameter: nsa_dctlunavail; default severity: NR

AID: SystemAID.

condtype: BKUPMEMP

sa/nsa: nsa

conddescr: Equipment, {cpname}/{cpqual}, IDE Flash Card Access Fail

ASAP parameter: nsa_bkupmemp default severity: MJ

AID: CpAID

condtype: OMMISMA

Entity – ASAP relation

Introduction

This section describes which entity is related to which ASAP.

Entities

For description of the entities see in the fragments of the TL1 message description which defines and describes the entities. (Example: The slot entity is described in the configuration fragment.)

The entity of an alarm can be retrieved from the entity in the *condescr* in the ASAP descriptions above so it is not explicitly listed here.

If an entity has a relation to at least one ASAP does it mean that this entity will raise alarms for this entity.

Entity – ASAP relation

For each ASAP type must exist one ASAP pointer for the entity. Each ASAP pointer is related to only one ASAP type. That means that for some entities more than one ASAP pointer exist.

8 TL1 messages - transmission and cross-connect handling

Overview

Purpose

This section lists the TL1 interface definition for the

- high-order and low-order transmission domain
- user byte access functionality
- gigabit ethernet virtual switch configuration
- gigabit ethernet port (GEn) configuration
- virtual concatenation (Group and Tributary) configuration for GEn applications
- high-order and low-order remote test access function.

Cross-connection

Overview

Purpose

The cross-connection (CRS) commands cover all type of

- creating (ENT-CRS),
- removing (DLT-CRS),
- modifying (ED-CRS) and
- retrieving (RTRV-CRS) cross-connections.

Furthermore the commands ENT-ROLL directly affect existing cross-connections by rolling the input of an existing cross-connection towards another input while keeping the output unchanged.

Cross-connections and tributaries

Physically crossconnections are transport channels between tributaries within an NE. These crossconnections are logically modelled by the entity crossconnection and include provisionable parameters which describe the behaviour of these channels.

Tributaries are pathlevel units of bandwidth within ports. With the introduction of the LOXC feature, there has been a second level of tributary added: Low-order tributaries are contained in high-order tributaries within ports.

These tributaries may belong

- either as high-order tributaries to SDH/SONET ports located on I/O packs (e.g. OPn), which are to be addressed via the STS1NumAIDs,
- or as high-order tributaries to Virtual Concatenation Group ports (VCG ports) located on referring I/O packs (e.g. GEn) which are to be addressed via the VCGNumAIDs,
- or as low-order tributaries to high-order tributaries of SDH/SONET ports located on I/O packs (e.g. OPn) which are to be addressed via the LONumAIDs.

In the following, the general AID GenTribAID is used to reference high-order tributaries if AIDs STS1NumAID and VCGNumAID need not to be distinguished.

In the following, the general AID GenLOTribAID is used to reference low-order tributaries if AIDs of LONumAID need not to be distinguished.

High-order tributary-rate provisioning versus cross-connection-rate

For fixed-rate provisioned ports the high-order crossconnection-rate (either the SDH-rate or its equivalent SONET-rate) must match with the high-order tributary-rate.

As an example a tributary provisioned to vc44c can be crossconnected only at a rate of vc44c (or STS12, which is equivalent) - requests with other rates will be rejected. This restriction concerning the consistency of tributary-rate and crossconnection-rate does NOT hold in the case the port is provisioned as adaptive (which is only possible in case of a SONET-port).

Low-order tributary-rate provisioning versus crossconnection-rate

For SONET low-order tributaries, only one type is allowed (VT1.5) which causes to match its rate with the referring cross-connection rate.

For SDH low-order tributaries, two types are allowed (LO-VC3 and VC12). VC12 tributaries are created by default. However, if a cross-connection request allows to adapt the signal structure to the requested rate then this request will be granted.

As an example, a high-order VC4 tributary has been substructured to 63 times VC12 signals (e.g. because a first VC12 cross-connection has been previously established for the first timeslot out of the 63). A cross-connection request to cross-connect the last third of the VC4 as a low-order cross-connection at a LO-VC3 will be granted since an adaptation is possible (no VC12 cross-connection present yet). Thus, the NE does an automatic correction of the substructure (in this case it changes to 42 times VC12 plus 1 times LO-VC3), before the cross-connect request will be successfully executed.

Please note that the following features are not part of the current *LambdaUnite*® MSS release and are thus not specified here:

- provisioning of adjunct path-protected cross-connection (no adjunct related parameter)
- changing working and protection leg for path-protected cross-connections (no TL1 command OPR-WKGLEG)
- no adaptive-mode is allowed for both *in_aids* of a path-protected cross-connection.

AU3/AU4 Conversion Cross-Connections

AU3/AU4 conversion cross-connections allow the conversion of a HO STS1 (SONET) or VC3 (SDH) to a LO SDH VC3, and the mapping into a HO VC4.

From cross-connection provisioning point of view, an AU3/AU4 conversion cross-connection is a cross-connection between a HO STS1 or VC3 tributary and a LO VC3 tributary.

A conversion cross connection has a HO or AU3 side and a LO or TU3 side.

In the requirements the terms “HO side” and “LO side” are used, to show the similarity of a conversion cross-connection with a HO cross-connection at one side and a LO cross-connection at the other side.

- “CNVT-CCT: Convert cross-connection topology” (p. 4-67)

Autonomous notification

TID Change

***loca*, *locz* auto notification for service traffic**

If a source TID (*loca*) or destination TID (*locz*) is changed due to a TID change of one NE within a BLSR ring/MS-SPRing, the update is reported by means of corresponding ED-CRS notifications.

No auto notification for *loca* and *locz* change for extra traffic

For extra traffic the *loca/z* info are generated automatically, for this reason they will change after an initialization or a recovery. Too many intermediate, void changes would be detected and notified.

No notification for *sqfa* and *sqfz* change

If a source TID (*loca*) or destination TID (*locz*) is changed due to a TID change of one NE within a MS-SPRing with the *protnmode* = TOPEX, the related parameters *sqfa* and *sqfz* will change to AINVALID respectively to MINVALID for an intermediate time, depending on internal processing speed and fault conditions of the ring. Finally they will again change to other values. Due to this transient behaviour it is only suitable to make it retrievable on demand.

No auto notification for *loca* and *locz* change caused by Automatic Squelch Map Calculation

If Automatic Squelch Map Calculation is used in a BLSR/MS-SPRING, then changes of *loca/locz* and the related status information *locastate/loczstate* caused by the Automatic Squelch Map Calculation shall not be notified. *loca/locz* and the related status information *locastate/loczstate* are generated automatically. For this reason they will change after an initialisation or a recovery. Too many intermediate, void changes would be detected and notified.

ONNS triggered changes

The ONNS TL1 command ENT-PATH shall lead to ENT-CRS notifications in the NEs along the route of the new path. In case of a 1+1 protected ONNS path there are also ENT-PROTN-GRP notifications in the source and destination NE of the ONNS path.

The ONNS TL1 command DLT-PATH shall lead to DLT-CRS notifications in the NEs along the route of the deleted path. In case of a 1+1 protected path there are also DLT-PROTN-GRP notifications in the source and destination NE of the ONNS path.

The ONNS TL1 command ED-PATH-ROLL

- shall lead to ENT-CRS and ENT-PROTN-GRP notifications in the two NEs where the bridge/merge function is performed
- shall lead to ENT-CRS notifications in the NEs along the new route of the path

- shall lead to DLT-CRS notifications in the NEs along the old route of the path
- shall lead to DLT-CRS and DLT-PROTN-GRP notifications in the two NEs where the bridge/selector is removed. The ONNS TL1 command ED-PATH-PROT
- shall lead to ENT-CRS notifications along the route of the new protecting path and ENT-PROTN-GRP notifications in the A and Z node when a modification from unprotected to 1+1 protected is performed
- shall lead to DLT-CRS notifications along the route of the new protecting path and DLT-PROTN-GRP notifications in the A and Z node when a modification from 1+1 protected to unprotected is performed
- shall not lead to additional host notifications when a modification from unprotected to auto-reroute or vice versa is performed.

The (non-revertive) restoration of an ONNS path shall lead to ENT-CRS notifications in the NEs along the restored route of the path, and to DLT-CRS notifications in the NEs along the route of the failed path.

The revertive restoration of an ONNS path shall lead to ENT-CRS notifications in the NEs along the restored route of the path, and to ENT-PROTN-GRP notifications in the A and Z node of the path. When the restoration reverts, it shall lead to DLT-CRS notifications in the NEs along the restored route of the path, and to DLT-PROTN-GRP notifications in the A and Z node of the path.

UserByte port

Overview

Purpose

Physically the UserByte-Port is a physical transmission interface, consisting of both an input and an output, which can be used to carry traffic through channels given by the E1- or F1-Byte (located in the RSOH) or the E2-Byte (located in the MSOH).

Logically an UserByte-Port is an entity within an NE which models the function of the physical UserByte-Port.

Six UserByte-Ports are available (with AIDs denoted ubio1 .. ubio6) each of which can be associated to an optical port of an OPn either to the E1- or E2- or F1-Byte. The association is always bidirectional. Four of these six UserByte-Ports (AIDs: ubio1 .. ubio4) are provisionable to either the G703- or V11-interface, while the others (AIDs: ubio5,ubio6) are fixed to V11-interface.

The association as well as this mode setting can be done via the SET-OW-command. Furthermore the SET-OW command allows to release the association (dis-association). With the RTRV-OW command the information related to an UserByte-Port can be retrieved from the NE.

Note: Throughout this section the term order-wire (OW) is retained in the command names for "historical" reasons although the name user-byte would be more appropriate, because these ports can not only be used for order-wire purposes.

Start-up with default database

The event *Start-up with default DB* causes the 6 instances of type UserByte port to be created.

Virtual switch

Overview

Purpose

Starting with the entity Virtual Switch the TL1 commands for all entities of the GE1 functionality will be described in the following chapters.

These are in detail:

- Virtual switch (VRTSW)
- Ethernet port (EPORT)
- Virtual concatenation group (VCG)
- Virtual concatenation tributary (VCGTRIB).

Each GE1 circuit pack consists of the following entities as shown in the following figure. The number of EPORT and VCG instances connected to the virtual switch is fixed. The number of VCGTRIBs per VCG depends on whether operating in SDH or SONET mode. In SDH mode there are 7 VCGTRIBs of type VC4 whereas in SONET mode there are 21 VCGTRIBs of type STS1s.

Commands for the entity *Virtual switch* allow to retrieve and modify its parameters. These commands are applicable to the GE1 circuit pack which supports one virtual switch instance.

The virtual switch as part of the physical switch on the GE1 pack is created by software. It serves to group and separate traffic within the physical switch via VLAN tagging.

The virtual switch is not applicable on the GE10PL1 pack.

- [“DLT-VRTSW notification” \(p. 4-259\)](#)

Ethernet port

Overview

Purpose

Starting with the entity Ethernet port the TL1 commands for all entities of the GE1 functionality will be described in the following chapters. These are in detail:

- Ethernet port (EPORT)
- Virtual concatenation group (VCG)
- Virtual concatenation group tributary (VCGTRIB).

GE1 circuit pack

Commands for the entity ethernet port cover the parameters for

- physical link layer (layer 1) and
- data link layer (layer 2)

of the LAN side of Gigabit Ethernet. These commands are applicable to the GE1 circuit pack which has 4 LAN ports.

Those ethernet ports are mainly intended to connect several parts of a LAN via standard transmission technique like SDH or SONET.

There is no interworking with the Data Communications Network application (which uses Ethernet-LAN ports, too) used to control the NEs. The latter one is specified in another section.

GE10PL1 pack

Modelling of the transmission path

On the GE10PL1 pack, transmission functionality will be described by the following entities:

- Ethernet Port (EPORT)
- Virtual Concatenation Group (VCG)
- Virtual Concatenation Tributary (VCGTRIB).

Transmission entities on the GE10PL1/1A8

The GE10PL1/1A8 circuit pack consists of:

- 9 EPORTs (8 as 1 GE interface, 1 as 10GE interface)
- 9 VCGs (1 per EPORT)
- 192 VCGTRIBs (shared among the VCGs).

Existence of EPORT entities

EPORT entities exist only if the referring pluggable module has been successfully pre- or auto-provisioned. The first 8 ports are reserved for 1GE interface types while the 9th port is reserved for 10GE interface types. There will be only one transmission rate being accepted at the same time (either 8 times 1GE ports or 1 times 10GE port). Each entity represents functionality always bidirectionally.

Existence of VCG entities

VCG entities exist only if the referring pluggable module has been successfully pre- or auto-provisioned and are therefore created in conjunction to the referring EPORT entity. The same constraints are applicable here. Each entity represents functionality always bidirectionally.

Existence of VCGTRIB entities

VCGTRIB entities exist only if the referring pluggable module has been successfully pre- or auto-provisioned and are therefore created in conjunction to the referring VCG entity.

The number and address of the entities depend on the VCG type as follows:

VCG No. X exists	Existing VCGTRIB No.'s
No	None
Yes, for X=1...8	Yes, with 1...21
Yes, for X=9	Yes, with 1...192

Significance of VCGTRIB entities (general)

Out of the created VCGTRIB entities for a specific VCG, not all of them may be significant (configurations have no effect). This depends on the configured transmission rate and on the membership configuration.

The following table illustrates those dependencies:

Signal structure	VCG membership	VCGTRIB significance
211 (21 times STS1) or 1921 (192 times STS1)	Enable	Significant
	Disable	Insignificant
73 (7 times STS3C) or 74 (7 times VC4) or 644 (64 times CV4)	Enable	Significant (each third VCGTRIB only) [if (VCGTRIB No. 1) modulo 3 == 0] Insignificant otherwise
	Disable	Insignificant

Significance of 10GE VCGTRIB entities (contiguous concatenation mode)

For the 10GE VCG, it is possible to configure a signal mapping into a contiguous concatenated signal instead of a mapping into a number of virtual concatenated signals. The mapping is controlled by the VCG parameter vcat. In this case, the first VCGTRIB entity remains significant while the other 191 entities will become insignificant (if not yet insignificant before). Note that the parameters of the VCG and VCGTRIB entities which are not applicable in the contiguous concatenation mapping mode will be set to default and cannot be altered as long this mode is present.

Meaning of the terms "Existing" and "Significance"

If an entity does not exist then any operation for this instance will be rejected. If an entity is insignificant then all allowed operation may be executed. Configured values will be stored in the database and can be retrieved. However, the settings have no impact to the transmission flow in the hardware.

List of commands

- “RTRV-EPORT: Retrieve Ethernet port” (p. 4-2201)
- “ENT-EPORT notification” (p. 4-1431)
- “ED-EPORT: Edit Ethernet port” (p. 4-303)
- “ED-EPORT notification” (p. 4-315)
- “DLT-EPORT notification” (p. 4-166)

Autonomous notifications

GE1 circuit pack is auto-provisioned

If a GE1 circuit pack is auto-provisioned a GE1PORT instance will be created with the given default parameter values for all GE1 ports of the circuit pack.

This change is reported via the ENT-EPORT notification.

Optical Module for a GE10PL1/1A8 Circuit Pack is Auto-provisioned

If an optical module is successfully auto-provisioned as a socket of the GE10PL1/1A8 circuit pack then a related EPORT instance will be created with the specified default parameter values. In case that the socket with the Simple_SocketAID = sc9 has been created, the EPORT shall reflect an instance with a parameter value modifier = 10GEPL, otherwise with a parameter value modifier = 1GEPL. All applicable parameters listed in the ENT-EPORT notification shall be reported in a referring single ENT-EPORT notification.

Virtual concatenation group

Overview

Purpose

The Virtual Concatenation Group is an entity which exists for Gigabit Ethernet and Fully Transparent applications. For both applications the parameter set is slightly different, making a distinction of the related commands via a modifier for the Fully Transparent application necessary (e.g no LCAS is supported for the fully transparent application).

Overview of GE1 Application

Commands for the entity virtual concatenation group (VCG) cover the parameters for both

- the Ethernet side (WAN ports) and
- the EoS (Ethernet over SDH/SONET).

These commands are applicable to the GE1 circuit pack which has 4 WAN ports.

Note: The virtual concatenation group (VCG) and its tributaries (VCGTRIB) have some direction dependent parameters. Following the semantic for optical ports the direction indicators input and output are used.

Input direction

WAN → VCG → VCGTRIB → Cross-connect

As those tributaries have termination function this is also often called source.

Output direction

Cross-connect → VCGTRIB → VCG → WAN

As those tributaries have termination function this is also often called sink.

Overview of OPTn Application

Commands for the entity virtual concatenation group (VCG) cover the parameters for both

- the ODU layer and
- the Virtual Concatenation functionality.

These commands are applicable to the OPT2G5 circuit pack which has 3 client ports (one-to-one relationship to the VCG ports).

Note: The virtual concatenation group (VCG) and its tributaries (VCGTRIB) have some direction dependent parameters. Following the semantic for optical ports the direction indicators input and output are used. Also the equivalent terms ingress and egress are applicable.

Input direction

Client Port → VCG (including ODU) → VCGTRIB → Cross-connect

As those tributaries have termination function this is also often called source.

Output direction

Cross-connect → VCGTRIB → VCG (including ODU) → Client Port

As those tributaries have termination function this is also often called sink.

- “DLT-VCG-TRANS notification” (p. 4-257)

Autonomous notifications

GE1 circuit pack is auto-provisioned

If a GE1 circuit pack is auto-provisioned a VCG instance will be created with the given default parameter values for all VCGs of the circuit pack.

This change is reported via the ENT-VCG notification.

OPTn Circuit Pack is Auto-provisioned

If an OPTn circuit pack is auto-provisioned a VCG instance will be created with the given default parameter values for all Virtual Concatenation Groups of the circuit pack. This change shall be reported via the ENT-VCG-TRANS notification.

Virtual concatenation group tributary

Overview

Purpose

For an overview of the GE1 related entities EPORT, VCG and VCGTRIB see [“ENT-EQPT \(slot\): Enter equipment \(slot\)”](#) (p. 4-1441).

Commands for the entity virtual concatenation group tributary cover the parameters for

- standard termination as for other tributaries
- tributary related parameters of virtual concatenation.

Each virtual concatenation tributary can be configured independently.

Contents

List of commands	8-30
Autonomous notifications	8-31

List of commands

- “RTRV-VCGTRIB: Retrieve virtual concatenation group tributary” (p. 4-2899)
- “ENT-VCGTRIB notification” (p. 4-1870)
- “ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319)
- “ED-VCGTRIB notification” (p. 4-1331)
- “DLT-VCGTRIB notification” (p. 4-258)
- “OPR-VCGTRIB: Operate virtual concatenation group tributary” (p. 4-1938)

Autonomous notifications

GE1 Circuit Pack is auto-provisioned

If a GE1 circuit pack is auto-provisioned 7 VC4 or 21 STS1 VCGTRIB instances will be created (dependent on the attribute *istddflt*) with the given default parameter values for all VCGs of the circuit pack.

This change is reported via the ENT-VCGTRIB notification.

OPTn Circuit Pack is Auto-provisioned

If an OPTn circuit pack is auto-provisioned 17 VC4 or STS3c VCGTRIB instances will be created (dependent on the attribute *istddflt*) with the given default parameter values for all Virtual Concatenation Groups of the circuit pack.

This change shall be reported via the ENT-VCGTRIB notification.

OPTn Circuit Pack is Auto-provisioned

If an optical module is successfully auto-provisioned as a 1 GE socket of the GE10PL1/1A8 circuit pack then 21 VCGTRIB instances will be created with the specified default parameter values.

If an optical module is successfully auto-provisioned as a 10 GE socket of the GE10PL1/1A8 circuit pack then 192 VCGTRIB instances will be created with the specified default parameter values.

All applicable parameters listed in the ENT-VCGTRIB notification shall be reported in a referring single ENT-VCGTRIB notification.

Group notifications for VCG tributaries

For efficiency reasons the notifications for VCG tributaries shall be sent out as a single notification (so-called group notification) using a range over the aid which depends on the used mapping of the associated vcg port, i.e. the Simple_VCGNumAID field in the VCGNumAID is set to

- 1&&-<N> for sequential range
- 1&-4 .. &-<N> for non-sequential range

with N is maximal legal VCG tributary number.

Example:

The AID field in a group notification for VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like:

1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping)

1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping)

For efficiency reasons the notifications for tributaries shall be sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to

- 1&&-<N>

with N is maximal legal STS-1/AU-3 number.

Example:

The AID field in a group notification for tributaries related to port 1 for a OP10 pack in slot 1 looks like:

1-1-#-#-1-1-1&&-192

Incoming VCG tributary is dropped or added

If an incoming (sink direction) VCG tributary is dropped or added due to manual operation or a failure event, the parameter *outmbst* shall be set to the corresponding value considering the current LCAS mode. This change shall be reported via the ED-VCGTRIB notification with the parameter *outmbst*.

For the modifiers VCT or STST tributaries will be added or dropped only via manual operation.

Outgoing VCG tributary is dropped or added

If an outgoing (source direction) VCG tributary is dropped or added due to manual operation or a failure event, the parameter *inmbst* shall be set to the corresponding value considering the current LCAS mode. This change shall be reported via the ED-VCGTRIB notification with the parameter *inmbst*.

For the modifiers VCT or STST tributaries will be added or dropped only via manual operation.

Low Order Tributaries

Overview

Purpose

HO tributaries on I/O packs (e.g. OPn, EP155) can be substructured as follows:

- HO path termination function (PTF, see SRD_TL1_Configuration)
- LO non-intrusive monitoring function (see below).

Following substructures are supported:

- SDH: VC4 PTF entity and 3 VC3 or 63 VC12 LONIM entities - or a mix of it,
- SONET: STS1 PTF entity and 28 VT1.5 LONIM entities.

The following figure shows an example:

Example

Remote Test Access

Overview

Purpose

Test access consists of a set of non-intrusive operations (“monitoring” modes) and intrusive operations (“split modes”) that aid users in turning up facilities and in fault sectionalization of existing service circuits.

Basic user capabilities in test access include:

- assigning available tributary(ies) as “test access tributary(ies)”, whose line interface(s) will be connected by the user to the external testing system. These test access tributaries are assigned and released as part of establishing or disconnecting test access sessions.
- establishing test access cross-connections from tributaries to be tested to the test access tributary(ies) that either monitor or “split” connections for testing purposes.
- retrieving information about test access connections present on the system.
- releasing test access connections and test tributaries, upon which the system automatically restores any pre-existing cross-connections that were affected.

The architecture and nomenclature depicted below help to explain how test access is defined and used.

The E-Tributary and F-Tributary are the tributaries under test. The E and F tributaries are the ends of a one-way or two-way cross-connection, with the dashed lines indicating the signal traveling through the system. The signal path from the E-end to the F-end is referred to as the “A” direction; the opposite direction as the “B” direction. If there is only a one-way cross-connection, the signal travels in the A direction. If an idle (un-cross-connected) tributary is the focus of test access, it is always the E-end.

The following table shows the supported test access modes.

Two groups of test access modes are defined:

- single test access tributary modes
- dual test access tributary modes.

Mode	Description	Group
MONE	Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection.	Single
MONF	Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection.	Single
MONEF	Monitor E-end and F-end mode of test access. This test access mode monitors (E end and F end) both directions of a 2WAY cross-connection.	Dual
SPLTE	Split access E-end mode of test access. This test access mode splits the connection between the E end and F end of a 1WAY cross-connection or a leg of 2WAY cross-connection. Can also be used in an idle tributary.	Single
SPLTF	Split access F-end mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing at the F-end.	Single
SPLTEF	Split E-end and F-end mode of test access. This test access mode splits both directions of a 2WAY cross-connection to allow testing at both the E end and F end.	Dual
SPLTA	Split access “A” direction mode of test access. This test access mode splits the connection between the E and F tributaries of a one-way or two-way cross-connection to allow testing in the “A” direction.	Single

Mode	Description	Group
SPLTB	Split access “B” direction mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing in the “B” direction.	Single
SPLTAB	Split access A and B directions mode of test access. This test access mode splits both directions of a two-way cross-connection to allow testing in both the A and B directions.	Dual
TERME	Terminated test access mode. This test access mode splits the signal, sending the input to the testing system and injecting AU-AIS/AIS-P toward the path selector to allow monitoring the incoming signal of the leg that is not currently carrying service traffic without the risk that the path selector will switch away from the service-carrying leg.	Single

Topology in Remove Crossconnection Command (TL1-parameter: <i>cct</i>)	Topology of Existing Atomic Crossconnection (internal parameter: “Atomic crossconnection topology” as described in the RTRV-CRS section in the <i>repleg</i> context)	Leg Status of Existing Atomic Crossconnection (internal parameter: “Leg status” as described in the RTRV-CRS section in the <i>repleg</i> context)	Validation Response (“Accept” means that the command is replied by a COMPLD, “Deny” means, that the command is rejected with the Error Code as stated above)

Protection group

Overview

Purpose

The protection group commands covers all types of protections within the system. The following protection group types can be distinguished:

- 1+1 equipment protection group
- 1+1 multiplex section/line protection group
- 2-fibre MS-SPRing/BLSR protection group
- 4-fibre MS-SPRing/BLSR protection group
- Path protection group.

Dedicated subsections corresponding to these protection group types will cover the specific behavior. If such a separation is not made, the description is valid for all protection group types. In addition common properties are also described in a dedicated General section.

Three operation modes can be distinguished for a 4-fibre MS-SPRing/BLSR protection group:

1. 2-sided node: An east side (protection and worker) and a west side (protection and worker) is provisioned for that group. Therefore, four ports are members within that protection group.
2. 1-sided node: Only one side is provisioned for the protection group. That can be either the east or the west side. Therefore, two ports are members within that protection group. This mode is used in context of an open 4-fiber ring w.r.t. end node in that chain.
3. Asymmetric node: Both protection ports are members of the protection group and only one or zero worker ports are assigned externally.

All attributes/parameters specifying east/or west side properties are optional and will be omitted if the corresponding side is not provisioned in case of an 1-sided node.

Note: 1-sided node (open ring) is not supported in R1. As indication if and when this feature is supported use the following criteria (supported if criteria is met): Ports can be added/removed to/from one side of the protection group (conversion from 1-side node to 2-side node and vice versa). Be aware to differentiate that scenario from switching from an asymmetric node to a non-asymmetric and vice versa. The combination of a 1-sided and asymmetric node is not allowed..

Introduction to protection groups

General information

The following section presents an overview of all attributes of the different protection types and their use within the different commands. The information is derived from the corresponding sections describing the commands and notifications.

Note: The following tables are specifying the superset of operations, notifications and attributes for protection groups. They do not consider any release information. Please check in the corresponding sections, in which release the functionality is supported.

wkgsiglvl – Worker Fault Status	RTRV		state	(4)

Note 1: Initial value has to be specified as part of ENT-CRS/ENT-ROLL command.

Note 2: Parameter is called *newppgname* in the context of ED-PROTN-GRP command.

Note 3: Updated either via protection switch commands (OPR-PROTNSW, RLS-PROTNSW) or autonomous switch events.

Note 4: Parameter may change dynamically if path-protection uses tributaries of ports in the adaptive mode.

Note 5: Parameter not supported for low order path protection groups.

List of commands

- “RTRV-PROTN-GRP: Retrieve protection group” (p. 4-2580)
- “ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
- “ENT-PROTN-GRP notification” (p. 4-1645)
- “ED-PROTN-GRP: Edit protection group” (p. 4-742)
- “ED-PROTN-GRP notification” (p. 4-760)
- “DLT-PROTN-GRP: Delete protection group” (p. 4-215)
- “DLT-PROTN-GRP notification” (p. 4-224)
- “OPR-PROTNSW: Operate protection switch” (p. 4-1913)
- “RLS-PROTNSW: Release protection switch” (p. 4-2050)
- “REPT SW: Report switch” (p. 4-2034)

Autonomous notifications

1+1 equipment protection group

If the second switch circuit pack is auto created, the 1+1 switch equipment protection group entity shall be created. This entity creation shall be reported by means of ENT-PROTN-GRP notification.

Auto creation of the second switch circuit pack

If the second switch circuit pack is auto created, the 1+1 switch equipment protection group entity is created. This shall be reported by means of ENT-PROTN-GRP notification for 1+1 equipment protection group. The initial protection state shall be reported by means of a protection switch notification for the 1+1 equipment protection group.

Protection switch

A protection switch notification (i.e. protection state change) is triggered by means equipment fail condition change as specified for the corresponding protection state machine.

Deletion of the second switch circuit pack

If the second switch circuit pack is deleted, the 1+1 switch equipment protection group entity shall be deleted. This entity deletion shall be reported by means of DLT-PROTN-GRP notification.

Deletion of the second controller circuit pack

If the second switch circuit pack is deleted, the 1+1 switch equipment protection group entity shall be deleted. This entity deletion is reported by means of DLT-PROTN-GRP notification for the 1+1 protection group.

Multiplex section/Line protection group

Protection switch and related events

A protection switch notification (i.e. protection state change) is triggered by means of

- fault condition change
- wait to restore timer expiry
- switch command received via APS message as specified for the corresponding protection state machine.

A protection switch notification shall be triggered upon a change of the Secondary Section Identifier (spec block parameter 'ssi'). This applies to MSP 1+1 optimized only. This requirement gives additionally to other requirements a further trigger for the

autonomous notification for a MSP protection group. It does not require necessarily a separate notification beside other notifications of the same MSP protection group at the same time.

2-/4-fibre MS-SPRing/BLSR protection group

Protection switch

A protection switch notification (i.e. protection state change) is triggered by means of

- fault condition change
- wait to restore timer expiry
- switch command received via APS message as specified for the corresponding protection state machine.

Path protection group

Protection switch

A protection switch notification (i.e. protection state change) is triggered by means of

- fault condition change
- wait to restore timer expiry as specified for the corresponding protection state machine.

Protection log

Overview

Purpose

Each NE stores protection switch events in a protection log. The NE administrates the log autonomously. Therefore only a retrieve operation is defined for log the entity.

Contents

List of commands	9-16
Autonomous notifications	9-17

List of commands

- [“RTRV-LOG-PROTNSW: Retrieve log protection switch” \(p. 4-2313\)](#)

Autonomous notifications

System start-up with default DB

The system will start-up with an empty protection log as part of the default DB.

System start-up after DB transformation

The system will start-up with an empty protection log after a database transformation has taken place in context of an SW upgrade.

Ring map

Overview

Purpose

Each NE within a 2-/4fibre MS-SPRing/BLSR ring will maintain a ring map entity for each MS-SPRing/BLSR protection group entity. The ring map either will be discovered automatically by the NEs (default) or manually be entered by the user (see also parameter [ard](#) in [“ENT-PROTN-GRP: Enter protection group”](#) (p. 4-1621)).

The ring map consists of:

- the nodes within the ring
- the links connecting the nodes.

If the automatic ring discovery is disabled and the ring map is entered manually, the links connecting the nodes may not be retrievable. The ring map can be edited manually with ED-MAP-RING and is then stored in volatile memory. With SET-MAP-RING, the new ring map is written to NVM and activated.

Contents

List of commands	9-19

List of commands

- “RTRV-MAP-RING: Retrieve map ring” (p. 4-2364)
- “ED-MAP-RING: Edit map ring” (p. 4-392)
- “SET-MAP-RING: Set map ring” (p. 4-2931)
- “SET-MAP-RING: notification” (p. 4-2935)
- “ED-FETID: Edit Far End Target Identifier” (p. 4-373)
- “ED-FETID notification” (p. 4-377)

PM parameters

PM parameter overview

This section gives an overview of all PM parameters and the associated TCA profiles. Overview tables are given for the entities supporting of PM parameters:

- SONET ports/tribs
- SDH ports/tribs
- Ethernet ports
- DS3 ports
- OTN ports.

Note: In Ethernet, DS3 and Transparency application, the tributaries are acting as path terminations.

Each table consists of the following rows:

- PM parameter short name (as defined in the *montype* parameter)
- PM parameter long name
- associated TCA profile type (as defined in the *pftype* parameter).

Note: If thresholding is not applicable for a PM parameter, the value 'None' is specified as associated profile type.

SONET PM parameter table

Short name	Long name	Profile type
CVS	Code Violation Section	SECTION-LINE

Details for PM parameters with no thresholding

Below those PM parameters are described which do not support thresholding. All other parameters which support thresholding are described in the Output Parameters section of RTRV-TCA-PROF.

SONET PM parameters

1. qhaissl
Description: 15-minute AISS-L bin for SONET Line.
The 15-minute AISS-L bin shall be supported for OC-n Line. The 15-minute AISS-L bin shall be supported for EC-1 Line.
Type: integer
Range: 0-900
2. dayaissl
Description: Day AISS-L bin for SONET Line.
The Day AISS-L bin shall be supported for OC-n Line. The Day AISS-L bin shall be supported for EC-1 Line.
Type: integer
Range: 0-86400
3. qhlosss
Description: 15-minute LOSS-S bin for ONET Section.
The 15-minute LOSS-S bin shall be supported for OC-n Section. The 15-minute LOSS-S bin shall be supported for EC-1 Section.
Type: integer
Range: 0-900
4. daylosss
Description: Day LOSS-S bin for SONET Section.
The Day LOSS-S bin shall be supported for OC-n Section. The Day LOSS-S bin shall be supported for EC-1 Section.
Type: integer
Range: 0-86400
5. qhfcl
Description: 15-minute FC-L and FC-LFE bin for OC-n lines.
The 15-minute FC-L and FC-LFE bin shall be supported for OC-n Line. The 15-minute FC-L and FC-LFE bin shall be supported for EC-1 Line.
Type: integer
Range: 0-900

6. dayfcl
Description: Day FC-L and FC-LFE bin for SONET Line.
The Day FC-L and FC-LFE bin shall be supported for OC-n lines. The Day FC-L and FC-LFE bin shall be supported for EC-1 lines.
Type: integer
Range: 0-86400
7. qhfcf
Description: 15-minute FC-P and FC-PFE bin for STS1 and STS1-xC (x=3, 12, 48, 192) tributaries
Type: integer
Range: 0-900
8. dayfcf
Description: Day FC-P and FC-PFE bin for STS1 and STS1-xC (x=3, 12, 48, 192) tributaries
Type: integer
Range: 0-86400

Ethernet PM parameters

1. qhcbr
Description: 15-minute CBR for a Ethernet port
Type: integer
Range: 0-110000
2. daycbr
Description: Day CBR for a Ethernet port.
Type: integer
Range: 0-10560000
3. qhcbs
Description: 15-minute CBS for a Ethernet port
Type: integer
Range: 0-110000
4. daycbs
Description: Day CBS for a Ethernet port.
Type: integer
Range: 0-10560000
5. qheinb1ge
Description: 15 minute EINB for a 1 GbE LAN and WAN port
Type: integer
Range: 0-112500000000
6. dayeinb1ge
Description: Day EINB for a 1 GbE LAN and WAN port
Type: integer
Range: 0-10800000000000

7. qheonb1ge
Description: 15 minute EONB for a 1 GbE LAN and WAN port.
Type: integer
Range: 0-112500000000
8. dayeonb1ge
Description: Day EONB for a 1 GbE LAN and WAN port.
Type: integer
Range: 0-10800000000000
9. qheinf1ge
Description: 15 minute EINF for a 1 GbE LAN and WAN port
Type: integer
Range: 0-1371951220
10. dayeinf1ge
Description: Day EINF for a 1 GbE LAN and WAN port
Type: integer
Range: 0-131707317073
11. qheonf1ge
Description: 15 minute EONF for a 1 GbE LAN and WAN port
Type: integer
Range: 0-1371951220
12. dayeonf1ge
Description: Day EONF for a 1 GbE LAN and WAN port
Type: integer
Range: 0-131707317073
13. qheinb10ge
Description: 15 minute EINB for a 10 GbE LAN and WAN port
Type: integer
Range: 0-1125000000000
14. dayeinb10ge
Description: Day EINB for a 10 GbE LAN and WAN port
Type: integer
Range: 0-108000000000000
15. qheonb10ge
Description: 15 minute EONB for a 10 GbE LAN and WAN port
Type: integer
Range: 0-1125000000000
16. dayeonb10ge
Description: Day EONB for a 10 GbE LAN and WAN port
Type: integer
Range: 0-108000000000000

17. qheinf10ge
Description: 15 minute EINF for a 10 GbE LAN and WAN port
Type: integer
Range: 0-13719512195
18. dayeinf10ge
Description: Day EINF for a 10 GbE LAN and WAN port
Type: integer
Range: 0-1317073170732 Default
19. qheonf10ge
Description: 15 minute EONF for a 10 GbE LAN and WAN port
Type: integer
Range: 0-13719512195
20. dayeonf10ge
Description: Day EONF for a 10 GbE LAN and WAN port
Type: integer
Range: 0-1317073170732

DS3 PM Parameters

1. qhaissp
Description: 15-minute AISS-P bin for DS3
Type: integer
Range: 0-900
2. dayaissp
Description: Day AISS-P bin for DS3.
Type: integer
Range: 0-86400
3. qhfcsp
Description: 15-minute FC-P and FC-PFE bin for DS3
Type: integer
Range: 0-900
4. dayfcsp
Description: Day FC-P and FC-PFE bin for DS3
Type: integer
Range: 0-86400
5. qhsefsp
Description: 15-minute SEFS-P bin for DS3.
Type: integer
Range: 0-900
6. daysefsp
Description: Day SEFS-P bin for DS3
Type: integer
Range: 0-86400

7. qhlossl
Description: 15-minute LOSS-L bin for DS3.
Type: integer
Range: 0-900
8. daylossl
Description: Day LOSS-L bin for DS3.
Type: integer
Range: 0-86400

OTN PM Parameters

1. qhotnloss
Description: 15-minute LOSS bin for OTN
Type: integer
Range: 0-900
2. dayotnloss
Description: Day LOSS bin for OTN
Type: integer
Range: 0-86400
3. qhotnfecc
Description: 15-minute FECC bin for OTN
Type: integer
Range: 0-4294967295
4. dayotnfecc
Description: Day FECC bin for OTN
Type: integer
Range: 0-4294967295

TCA Profile

Overview

Purpose

This section contains the TL1 interface definitions listed below.

Contents

TCA Profile	10-14
List of commands	10-16
System Start-up with Default DB	10-17

TCA Profile

General

The threshold settings for the different PM parameters supporting thresholding is provisionable by means of TCA profiles. The profiles of a certain type contains all pm parameters related to a certain entity supporting enabling/disabling of performance monitoring. Therefore the following profiles types are defined:

- SECTION-LINE - used/referenced by SONET port entities
- RS-MS - used/referenced by SDH port entities
- PATH - used/referenced by SONET tributary entities
- HO-VC - used/referenced by SDH tributary entities
- ENET - used/referenced by Ethernet port entities
- ODU - used/referenced by ODU/VCG entities
- DS3 - used/referenced by DS3 port entities
- LOXC-PATH - used/referenced by SONET lower order tributary and higher order path termination entities related to the LOXC
- LOXC-VC - used/referenced by SDH lower order tributary and higher order path termination entities related to the LOXC

All threshold data of one certain profile type is sometimes also called a profile image. This term may be used in other TCA profiles commands as parameter name. It is then used as an alias for all PM thresholds parameters of the corresponding profile type.

TCA supression can be provisioned by means of setting the corresponding profile parameter to zero.

The system supports two default sets of profiles for each type of TCA profile. One set of default profiles shall contain zero threshold value for each parameter in the profile. Another set of default profiles contains real non-zero threshold value for each parameter in the profile. The name of the zero threshold value default profile shall be "Default0" and the name of the non-zero threshold value default profile shall be "Default".

The number of TCA profiles are limited to a specific number per profile type. This number also includes the system default profiles.

The maximum numbers are for:

- PATH SDH and PATH SONET together (higer order) 80
- RSMS SDH and section/line SONET together 30
- for ENET and ODU together
- DS3 10
- LOXC PATH SDH and SONET together 20.

The user is able to change the threshold values of the non-zero default profile, but will not be allowed to change its name. The user is not allowed to change the name or the threshold values of the zero default profile.

All the profile pointers are pointed to zero threshold value default profiles when the ports are provisioned. That is, thresholding is not performed as a default. All the profile pointers are pointed to non-zero threshold value default profiles when thresholding is to be performed.

Threshold parameters names are defined using the following pattern:

<bintype>[rtr]<montype>[<port/trib rate|port type|monitoring point> with:

- bintype = day (for 24h) or qh (for 15 Min)
- [rtr] = rtr is inserted if the clear threshold is mentioned
- montype = montype as defined in RTRV-PM command
- portrate = ec1, oc3, oc12, oc48, oc192, oc768, stm1, stm4, stm16, stm64, stm256, odu1
- trib rate = sts1, sts3c, sts12c, sts48c, sts192c or vc3, vc4, vc44c, vc416c, vc464c, hosts1, vt1, hovc4, lovc3, vc12
- porttype = ge, 1ge, 10ge, vcg
- monitoring point = l, p.

List of commands

- “RTRV-TCA-PROF: Retrieve TCA Profile” (p. 4-2794)
- “RTRV-TCA-ASGNMT: Retrieve TCA assignment” (p. 4-2791)
- “ENT-TCA-PROF: Enter TCA Profile” (p. 4-1768)
- “ENT-TCA-PROF notification” (p. 4-1771)
- “ED-TCA-PROF: Edit TCA profile” (p. 4-1138)
- “ED-TCA-PROF notification” (p. 4-1184)
- “DLT-TCA-PROF: Delete TCA Profile” (p. 4-240)
- “DLT-TCA-PROF notification” (p. 4-243)

System Start-up with Default DB

General

The system shall create during start-up with default DB two TCA profiles per supported profile type with profile name "DEFAULT" and "DEFAULT0". The values for profile "DEFAULT" shall be as specified in corresponding default requirements for each profile parameter. The values for profile "DEFAULT0" shall be '0' for each profile parameter.

11 TL1 messages - synchronization

Overview

Purpose

This section contains the TL1 commands related to the synchronization management. The synchronization commands covers types of assigning, modifying or removing and retrieving system timing attributes. Furthermore they are initiating switch requests and releasing requests.

It contains following commands and levels.

- RTRV-SYNCN
 - System Timing
 - Output Timing
 - Assigned Timing Reference
 - External Timing Input
 - External Timing Output
- SET-SYNCN
 - System Timing
 - Assigned Timing Reference
 - External Timing Input
 - External Timing Output
- OPR-SYNCNSW
- RLS-SYNCNSW.

For the system, the choice between SONET and SDH is determined by the system synchronization characteristic. The system synchronization characteristic may only be adjustable in the MCOND state. If the system synchronization characteristic is SONET, all SONET related parameter and settings are valid. All SSM messages, based on the SDH market are handled as being invalid. If the system synchronization characteristic is SDH, all SDH related parameter and settings are valid. All SSM messages, based on the SONET market are handled as being invalid.

The values of a number of parameters will be distinguished from the system synchronization characteristic. The parameter *syncrtc* in RTRV-EQPT and ED-EQPT determines whether the system synchronization characteristic, and therewith the NE, is in SDH or in SONET mode.

Contents

List of commands	11-3
Synchronization protection switch notification	11-4
Autonomous notifications	11-9

List of commands

- “RTRV-SYNCN: Retrieve synchronization” (p. 4-2767)
- “SET-SYNCN: Set synchronization” (p. 4-2947)
- “SET-SYNCN notification” (p. 4-2959)
- “OPR-SYNCNSW: Operate synchronization switch ” (p. 4-1933)
- “RLS-SYNCNSW: Release synchronization switch” (p. 4-2062)

Synchronization protection switch notification

Output format

Syntax: The REPT EVT notification has following specific syntax:

REPT EVT *modifier aid:condtype,condeff,ocrdat,ocrtm:conddescr*

Output parameters

System timing

1. Clock Mode Protection Type

a. modifier – message modifier

This parameter indicates on which entity the report event belongs.

Type: Alphanumeric value set.

Range: SYST (means System Timing).

b. aid – access identifier

This parameter indicates on which AID the report event belongs.

Type: Alphanumeric value set.

Range: SYSTEM

c. condtype – condition type

This parameter specifies the type of event being reported.

Type: alphanumeric value set.

Range: See [Table 11-1, “Range of condtype \(clock mode protection type\)” \(p. 11-5\)](#).

Default: none

d. conddescr – description of the condition

This parameter is a textual description of the condition.

Type: inner string.

Range: See [Table 11-2, “Range of conddescr \(clock mode protection type\)” \(p. 11-5\)](#).

2. Timing Reference Protection Type

a. modifier – message modifier

See definition above.

b. aid – access identifier

This parameter indicates on which AID the report event belongs. The values all or *someprefix* all are not allowed in this context.

Type: Alphanumeric value set.

Range:

– External_timing_ref_AID

– Line_timing_ref_AID

– NONE.

The value NONE shall be reported when the last timing reference is failed.

c. condtype – condition type

This parameter specifies the type of event being reported.

Type: alphanumeric value set.

Range: See Table 11-3, “Range of condtype (timing reference protection type)” (p. 11-5).

d. conddescr – description of the condition

This parameter is a textual description of the condition.

Type: inner string.

Range: See Table 11-4, “Range of conddescr (timing reference protection type)” (p. 11-6).

Table 11-1 Range of condtype (clock mode protection type)

Selection State	Attribute	Condtype
free running	clkmod = FREE-RUNNING clkmod_stat = NORMAL	FRNGSYNC
forced holdover	clkmod = LOCKED clkmod_stat = FORCED-HOLDOVER	HLDOVRSYNC
autonomous holdover	clkmod = LOCKED clkmod_stat = AUTONOMOUS-HOLDOVER	HLDOVRSYNC
locked	clkmod = LOCKED clkmod_stat = NORMAL	SYNCCLK

Table 11-2 Range of conddescr (clock mode protection type)

Selection State	Conddescr
free running	Protection switch, clock mode, Freerunning
forced holdover	Protection switch, clock mode, Forced Holdover
autonomous holdover	Protection switch, clock mode, Holdover
locked	Protection switch, clock mode, Locked

Table 11-3 Range of condtype (timing reference protection type)

Selection State / Lockout State	Attribute	Condtype
manual	refsw_stat = MANUAL	PS
forced	refsw_stat = FORCED	PS
no request	refsw_stat = NO-REQUEST	PS
lockout	ref_lock = LOCKOUT	INHSWPR
no lockout	ref_lock = NO-LOCKOUT	INHSWPR

Table 11-4 Range of conddescr (timing reference protection type)

Selection State / Lockout State	Conddescr
manual	Protection switch, sync reference, Manual switch
forced	Protection switch, sync reference, Forced switch
no request	Protection switch, sync reference, No Request
lockout	Protection switch, sync reference, Lockout
no lockout	Protection switch, sync reference, No Lockout

Output timing (only for SDH)**1. Output Timing Reference Protection Type****a. modifier – message modifier**

This parameter indicates on which entity the report event belongs.

Type: Alphanumeric value set.

Range: OUTT (means Output Timing).

b. aid – access identifier

This parameter indicates on which AID the report event belongs. The values all or *someprefix* all are not allowed in this context.

Type: Alphanumeric value set.

Range:

– Line_timing_ref_AID

– NONE.

The value NONE shall be reported when the last timing reference is failed.

c. condtype – condition type

This parameter specifies the type of event being reported.

Type: alphanumeric value set.

Range: See [Table 11-5, “Range of condtype \(Output timing reference protection type\)”](#) (p. 11-6).

d. conddescr – description of the condition

This parameter is a textual description of the condition.

Type: inner string

Range: See [Table 11-6, “Range of conddescr \(Output timing reference protection type\)”](#) (p. 11-7).

Table 11-5 Range of condtype (Output timing reference protection type)

Selection State / Lockout State	Attribute	Condtype
manual	orefswr_stat = MANUAL	PS
forced	orefswr_stat = FORCED	PS

Table 11-5 Range of condtype (Output timing reference protection type) (continued)

Selection State / Lockout State	Attribute	Condtype
no request	orefswr_stat = NO-REQUEST	PS
lockout	sclkref_lockstat = LOCKOUT	INHSWPR
no lockout	sclkref_lockstat = NO-LOCKOUT	INHSWPR

Table 11-6 Range of conddescr (Output timing reference protection type)

Selection State / Lockout State	Conddescr
manual	Protection switch, output reference, Manual switch
forced	Protection switch, output reference, Forced switch
no request	Protection switch, output reference, No Request
lockout	Protection switch, output reference, Lockout
no lockout	Protection switch, output reference, No Lockout

Example output

The following is an example of a protection switch notification for clock mode protection type:

```
LT-UNITE 00-11-09 12:00:00
A 000 REPT EVT SYST
"SYSTEM:HLDVRSYNC,TC,11-09,12-00-00,,,:\"Protection switch,clock
mode,Forced Holdover\"";
```

The following is an example of a protection switch notification for timing reference protection type:

```
LT-UNITE 00-11-09 12:00:00
A 000 REPT EVT SYST
"EXTREF1:PS,TC,11-09,12-00-00,,,:\"Protection switch,sync
reference,Manual switch\"";
```

The following is an example of a protection switch notification for timing reference protection type when the last reference has failed:

```
LT-UNITE 07-01-26 14:41:00
A 000 REPT EVT SYST
"NONE:PS,TC,07-01-26,14-40-30,,,:\"Protection switch,sync
reference,No Request\"";
```

;

The following is an example of a protection switch notification for output timing reference protection type:

```
LT-UNITE 00-11-09 12:00:00
A 000 REPT EVT OUTT
  "LINE2:INHSPWR,SC,11-09,12-00-00,,,:\"Protection switch,output
    reference,Lockout\""
```

;

The following is an example of a protection switch notification for output timing reference protection type when the last timing reference has failed:

```
LT-UNITE 07-01-26 14:42:00
A 000 REPT EVT OUTT
  "NONE:PS,TC,07-01-26,14-41-30,,,:\"Protection switch,output
    reference,No Request\""
```

;

□

Autonomous notifications

System initialization with default values

After first system initialization for all parameters the described default values are valid and no timing reference is assigned. No database change notification will be returned during database auto creation.

System initialization after system synchronization characteristic change

It is possible to change the system synchronization characteristic later on. For this case, the system will behave as a new created node. All assigned timing references are un-assigned before and after changing in the MCOND state the system will start-up with the default values. No database change notification will be returned after changing the system synchronization characteristic and reset to default values.

Autonomous clock switch

If the provisioned clockmod = LOCKED and a failure of all timing references active, the system switches in autonomous-holdover state and return a report event and a report alarm notification to the management system. If at least one fault-free timing reference is available, the system switches back to the locked state autonomously. The following parameter are affected by the autonomous clock mode switch: clkmod_stat = [AUTONOMOUS-HOLDOVER, NORMAL].

Autonomous reference switch for system timing

The autonomous reference switching is initiated by the failure of a reference. The autonomous reference switching results also after a SSM change of the active reference or of any of the standby references. The choice for the next active timing reference primarily depends on provisioned QL values if QL mode is enabled and subsequent on provisioned priorities for each reference. In consequence of identical QL values and priorities the system supports non-revertive switching. The autonomous reference switch returns a protection switch notification for System Timing. The following parameter are affected by the autonomous timing reference switch: active_ref = [External_timing_ref_AID, Line_timing_ref_AID, NONE].

Autonomous reference switch for output timing (only for SDH)

The autonomous reference switching is initiated by the failure of a reference. The autonomous reference switching might also switch after a SSM change. The choice for the next active timing reference is primarily depending on provisioned QL values if QL mode is enabled and subsequent on provisioned priorities for each reference. In consequence of similar QL values and priorities the system supports non-revertive

switching. The autonomous reference switch returns a protection switch notification for Output Timing. The following parameter are affected by the autonomous timing reference switch: active_oref_stat = Line_timing_ref_AID, NONE.

Synchronization instances

The following instances are created during system initialization:

- one system timing entity
- one output timing entity (only for SDH)
- two timing reference entities for external timing input
- six timing reference entities for line timing for

SDH only:

- one external timing output port entity

for SONET only:

- two external timing output port entities.

12 TL1 messages - software & database management

Overview

Purpose

This section contains the TL1 interface definition for the domain *software and database management*.

Background information:

In the Non Volatile Memory (NVM) of the NE, there are two regions: current and previous. Each region contains a software generic (code and static data) and a database.

The properties of the databases and the software generics can be retrieved by RTRV-PRMTR-DATA and RTRV-PRMTR-SFTWR.

The restore option of CPY-MEM is used to copy a database from a remote file store into previous NVM and then to install it as the working database. The backup option of CPY-MEM is used to copy the database that is in current NVM to a remote file store.

The download option of CPY-MEM is used to download new generics to previous NVM. Installation via APPLY causes the contents of previous NVM to be installed. Following installation, a "pointer" is changed so that what is identified as current NVM contains the currently executing generic and previous NVM contains the previous generic.

List of commands	13-20

MAPs	13-21
List of commands	13-22
Control Channel Provisioning	13-23
List of commands	13-24

General DCN parameters

Overview

Purpose

This section describes TL1 messages for DCN which have effects on system wide DCN configurations.

Contents

List of Commands	13-4

List of Commands

- [“RTRV-NE: Retrieve NE” \(p. 4-2381\)](#)
- [“ED-NE: Edit NE” \(p. 4-398\)](#)
- [“ED-NE notification” \(p. 4-401\)](#)

DCC terminations

Overview

Purpose

This section lists TL1 commands for section RS-DCC and Line MS-DCC: provisioning, modification and status retrieval.

Contents

List of commands	13-6

List of commands

- “RTRV-FECOM: Retrieve DCC related parameters” (p. 4-2249)
- “ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
- “ED-FECOM notification” (p. 4-370)
- “ENT-FECOM notification” (p. 4-1472)
- “DLT-FECOM notification” (p. 4-186)

Transparent DCC cross-connection

Overview

Purpose

Transparent DCC cross-connections allows to cross-connect DCC channels (either DCC-R or DCC-M) of an OPn/EPn on the XCn without adding/dropping them to/from the OHI bus to/from the CTL/DCF. As such there is no processing on the DCF for those channels a transparent DCC cross-connection allows to transparently pass-through certain DCC channel without any processing by the system. The transparent DCC cross-connections are complete independent from the transmission cross C-connection. The transparent DCC cross-connections are always bidirectional. The system supports up to 25 bidirectional transparent DCC cross-connections.

Contents

List of commands	13-8

List of commands

- “RTRV-CRS-FECOM: Retrieve transparent DCC cross-connection” (p. 4-2172)
- “ENT-CRS-FECOM: Enter transparent DCC cross-connection” (p. 4-1405)
- “ENT-CRS-FECOM notification” (p. 4-1409)
- “DLT-CRS-FECOM: Delete transparent DCC cross-connection” (p. 4-145)
- “DLT-CRS-FECOM notification” (p. 4-148)

LAN

Overview

Purpose

This section lists TL1 commands applicable to the LAN for *WaveStar*® CIT respectively *Navis*® Optical EMS access.

Contents

List of commands	13-10
Autonomous notification	13-11

List of commands

- [“RTRV-FECOM-LAN: Retrieve LAN channel related parameters” \(p. 4-2255\)](#)
- [“ENT-FECOM-LAN: Enter LAN related parameters” \(p. 4-1475\)](#)
- [“ENT-FECOM-LAN notification” \(p. 4-1485\)](#)

Autonomous notification

Start-up with default database

The event "Start-up with default DB" causes that the three LAN instances with AIDs lan1, lan2, lan3 are created. No notifications shall be sent.

OSI network layer

Overview

Purpose

This section lists TL1 commands applicable to layer 3 of the OSI stack.

Contents

List of commands	13-13
Autonomous notification	13-14

List of commands

- “RTRV-ULSDCC-L3: Retrieve layer 3 related parameters” (p. 4-2843)
- “ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822)
- “ENT-ULSDCC-L3 Notification” (p. 4-1828)
- “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
- “ED-ULSDCC-L3 notification” (p. 4-1235)
- “DLT-ULSDCC-L3: Delete a node ID other than node-1” (p. 4-244)
- “DLT-ULSDCC-L3 notification” (p. 4-247)

Autonomous notification

Start-up with default database

The event "Start-up with default DB" causes that the OSI node 1 with AID osinode1 is created.

OSI transport layer and TARP

Overview

Purpose

This section lists TL1 commands applicable to layer 4 of the OSI stacks.

Contents

List of commands	13-16

List of commands

- “RTRV-ULSDCC-L4: Retrieve OSI layer 4 related parameters” (p. 4-2849)
- “ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 4-1832)
- “ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 4-1832)
- “DLT-ULSDCC-L4: Delete TARP manual adjacent NSAP address in layer 4 of the specified OSI stack” (p. 4-248)
- “DLT-ULSDCC-L4 notification” (p. 4-250)

TCP/IP parameters

Overview

Purpose

This section lists TL1 commands applicable to the TCP/IP stack.

Contents

List of commands	13-18

List of commands

- “RTRV-ULS: Retrieve upper layer stack” (p. 4-2839)
- “ENT-ULS: Enter upper layer stack” (p. 4-1815)
- “ENT-ULS Notification” (p. 4-1820)

IP Map

Overview

Purpose

This section describes commands dealing with the IP map:

- the IP map provides T-TD access to the NE via one of the LANs that is assigned to node 1. Only managers registered in the IP map are allowed to access the NE via TCP/IP unless the wildcard (255.255.255.255) is entered into the list. In this case the access restriction is disabled.
- historically, the application context identifier for TL1 over OSI connections has been used to tailor the characteristics of the TL1 session (e.g. which events are reported using TL1 notifications) to the calling manager.
- ADM40G bases the characteristics of a TL1 session on the user name passed in the ACT-USER command rather than the application context identifier.
- still, for backwards compatibility, the feature of having the application context identifier being determined by the address of the calling manager is required on the T-TD.

Contents

List of commands	13-20

List of commands

- “RTRV-IP-MAP: Retrieve TCP/IP map” (p. 4-2279)
- “ENT-IP-MAP: Enter TCP/IP map” (p. 4-1488)
- “ENT-IP-MAP Notification” (p. 4-1491)
- “DLT-IP-MAP: Delete TCP/IP map” (p. 4-187)
- “DLT-IP-MAP notification” (p. 4-189)

MAPs

Overview

Purpose

This section lists TL1 commands applicable to Maps.

Contents

List of commands	13-22

List of commands

- [“RTRV-MAP-NEIGHBOR: Retrieve map neighbor” \(p. 4-2354\)](#)
- [“RTRV-MAP-NETWORK: Retrieve network map” \(p. 4-2358\)](#)
- [“RTRV-SCN-NEIGHBOR: Retrieve SCN neighbor” \(p. 4-2639\)](#)

Control Channel Provisioning

Overview

Purpose

This section lists TL1 commands applicable to control channel provisioning.

Contents

List of commands	13-24

List of commands

- “DLT-ENNIMANROUTE: Delete manual route from the E-NNI node” (p. 4-153)
- “DLT-MANROUTE-LAN: Delete manual route at LAN port” (p. 4-191)
- “DLT-RC-NEIGHBOR: Delete a routing controller from the list of neighboring routing controllers” (p. 4-228)
- “ENT-ENNIMANROUTE: Enter manual route to the E-NNI node” (p. 4-1415)
- “ENT-MANROUTE-LAN: Enter manual route at LAN port” (p. 4-1497)
- “ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers” (p. 4-1666)
- “RTRV-ENNIMANROUTE: Retrieve all manual routes of the E-NNI node” (p. 4-2191)
- “RTRV-MANROUTE-LAN: Retrieve manual route at LAN port” (p. 4-2351)
- “RTRV-RC-NEIGHBOR: Retrieve all neighboring routing controllers” (p. 4-2633)
- “RTRV-RSVP: Retrieve RSVP parameters” (p. 4-2636)
- “ED-RSVP: Modify RSVP parameters” (p. 4-789)

14 Error codes

Overview

Purpose

The following table lists the error codes.

Contents

List of error codes	14-2

List of error codes

Errorcode	Meaning (validation rule)	Related to command ...
EATN - Status, incorrect equipage, unrecognized CP for this slot	check whether CP is acceptable	“ENT-EQPT (slot): Enter equipment (slot)” (p. 4-1441), “ED-EQPT (slot): Edit equipment (slot)” (p. 4-338)
	check exchangeability rules for XC-packs	“ED-EQPT (slot): Edit equipment (slot)” (p. 4-338)
	check exchangeability rules for optical packs	
EATN - Status, incorrect equipage, unrecognized module for this socket	check whether module is acceptable	“ENT-EQPT (Socket): Enter equipment” (p. 4-1451), “ED-EQPT (socket): Edit equipment” (p. 4-347)
	check exchangeability rules for optical modules	“ED-EQPT (socket): Edit equipment” (p. 4-347)
ENEQ - Equipage, Not Equipped, insufficient file space	insufficient file space	“CPY-MEM: Copy memory” (p. 4-105), “COPY-RFILE: Copy remote file” (p. 4-98)
ENEQ - Equipage, Not Equipped, LOXC destination slot empty	No forced switch to empty LOXC slot (LOXC Protection Group)	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)
ENEQ - Equipage, Not Equipped, osinode	validation rule for parameter osinode	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475), “ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot	Check whether CP is acceptable	“ED-EQPT (slot): Edit equipment (slot)” (p. 4-338)
	Check exchangeability rules for optical packs	
	Check exchangeability rules for XC Packs	
	Check exchangeability rules for electrical packs	

Errorcode	Meaning (validation rule)	Related to command ...
ENRE - Equipage, Not Recognized Equipage, unrecognized module for this socket	Invalid module plugged in	“ED-EQPT (socket): Edit equipment” (p. 4-347)
ENSG - Equipage, Not Software Generic, generic not available	generic not available	“APPLY: Apply software generic” (p. 4-34), “CPY-MEM: Copy memory” (p. 4-105)
IANE Error - Input, connAlias Non Existant	Path <i>ConnectionID</i> does not exist	“DLT-PATH: Delete ONNS path Connection” (p. 4-205)
ICNV - Input, Command Not Valid, directory/URL must be specified	Directory/URL not specified for restoration	“COPY-RFILE: Copy remote file” (p. 4-98)
	Directory/URL not specified for backup	
ICNV - Input, Command Not Valid, FTTD must be specified	FT-TD device not specified	“COPY-RFILE: Copy remote file” (p. 4-98)
ICNV - Input, Command Not Valid, file must be specified	directory/URL not specified	“CPY-MEM: Copy memory” (p. 4-105), “COPY-RFILE: Copy remote file” (p. 4-98)
ICNV - Input, Command Not Valid, inmbst not NA	correct state of tributary for being added (source)	“ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319)

Errorcode	Meaning (validation rule)	Related to command ...
ICNV - Input, Command Not Valid, Interface Standard does not match	check CCB against <i>ptype</i> and <i>istd</i>	“RTRV-STM1E: Retrieve STM1E port” (p. 4-2661), “ED-STM1E: Edit STM1E port” (p. 4-802), “RTRV-STM1: Retrieve STM1 port” (p. 4-2675), “RTRV-STM4: Retrieve STM4 port” (p. 4-2693), “RTRV-STM16: Retrieve STM16 port” (p. 4-2711), “RTRV-STM64: Retrieve STM64 port” (p. 4-2738), , “RTRV-OC3: Retrieve OC3 port” (p. 4-2430), “RTRV-OC12: Retrieve OC12 port” (p. 4-2448), “RTRV-OC48: Retrieve OC48 port” (p. 4-2466) , “RTRV-OC192: Retrieve OC192 port” (p. 4-2492), , “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), , “ED-OC48T: Edit OC48 transparent port” (p. 4-598), “ED-PTF: Edit tributary with Path Termination Function (PTF)” (p. 4-770), “RTRV-OC48T: Retrieve OC48T port” (p. 4-2484), “RTRV-STM16T: Retrieve STM16T port” (p. 4-2729)

Errorcode	Meaning (validation rule)	Related to command ...
ICNV - Input, Command Not Valid, Interface Standard does not match	check CCB against <i>istd</i>	“RTRV-VC3: Retrieve VC3 tributary” (p. 4-2863)
	check CCB against <i>istd</i> of related VCG	“RTRV-VCGTRIB: Retrieve virtual concatenation group tributary” (p. 4-2899)
	check CCB against <i>ptfstd</i>	“RTRV-PTF: Retrieve tributary with Path Termination Function (PTF)” (p. 4-2622)
	<i>modifier</i> consistent with given port's interface standard	“OPR-LPBK: Operate loopback (here facility loopback)” (p. 4-1904), “RLS-LPBK: Release loopback (here facility loopback)” (p. 4-2045)
ICNV - Input, Command Not Valid, Interface Type does not match	check CCB against <i>pctype</i> and <i>eif</i>	“RTRV-T3: Retrieve DS3 port” (p. 4-2780)
ICNV - Input, Command Not Valid, outmbst not NA	correct state of tributary for being added (Sink)	“ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319)
ICNV - Input, Command Not Valid, Protocol Failure in Receive Direction	LCAS failure of protocol present in sink direction	“ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319)
ICNV - Input, Command Not Valid, Protocol Failure in Transmit Direction	LCAS failure of protocol present in source direction	
ICNV - Input, Command Not Valid	login on established session	“ACT-USER: Activate user” (p. 4-23)
IDRG - Input, Data Range Error, osinode	TARP origination only valid for node-	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822)

Errorcode	Meaning (validation rule)	Related to command ...
IDNC - Input, Data Not Consistent	disabling of superusers	“ED-USER-SECU: Edit user security” (p. 4-1244)
	l4ajsys must be supplied	“ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 4-1832)
	Can't enable <i>lanstat</i> when <i>ip_lanstat</i> and <i>osi_lanstat</i> are disabled	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)
	Can't enable <i>ip_lanstat</i> and/or <i>osi_lanstat</i> when <i>lanstat</i> is disabled	
	Can't assign same IP address to several LANs	
	all or no traffic for SCN node	
	can't enable <i>isis_lanstat</i> without enabling <i>osi_lanstat</i>	
IDNC - Input, Data Not Consistent, 2f-BSLR: rate exceeds half of the port rate	rate must not exceed half of the port rate (2f-BSLR only)	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IDNC - Input, Data Not Consistent, 'ALL' qualifier for port aid not allowed	ALL qualifier used for wrong parameters	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), “ED-VCG: Edit virtual concatenation group” (p. 4-1270)

Errorcode	Meaning (validation rule)	Related to command ...
IDNC - Input, Data Not Consistent, a new trace value must also be supplied for a trace format change	supply of outgoing J0 trace	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
IDNC - Input, Dat, Not Consistent, a new trc must also be supplied for a path trace mode change	supply of transmitted path trace	“ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319), “ED-PTF: Edit tributary with Path Termination Function (PTF)” (p. 4-770)
IDNC - Input, Data Not Consistent, Bridging rate is not compliant with exisisting leg	both legs must have same rate	“ENT-CRS: Enter cross-connection” (p. 4-1361), “CNVT-CCT: Convert cross-connection topology” (p. 4-67)
IDNC - Input, Data Not Consistent, Corresponding loca/locz information is missing	Corresponding loca/locz information is missing	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IDNC - Input, Data Not Consistent, cross-connection-existence not consistent with cmdmde-value	cmdmde matches cross-connection non-/existence	“OPR-LPBK (here cross-connection loopback)” (p. 4-1895)
IDNC - Input, Data Not Consistent, default profile	<i>pfname</i> is default	“DLT-ASAP-PROF: Delete alarm severity assignment profile” (p. 4-124)
	deleting the system default profile	“DLT-TCA-PROF: Delete TCA Profile” (p. 4-240)

Errorcode	Meaning (validation rule)	Related to command ...
IDNC - Input, Data Not Consistent, Default VLAN ID is already assigned for this System	default VLAN ID is already assigned for this system	“ED-EPORT: Edit Ethernet port” (p. 4-303)
IDNC - Input, Data Not Consistent, Default VLAN ID is not an allowed member of valid VLAN list	default VLAN ID is no allowed member of valid VLAN list	
IDNC - Input, Data Not Consistent, in_aid or ppgname needed	<i>in_aid</i> or ppgname existence	“RTRV-CRS: Retrieve cross-connection” (p. 4-2150)
IDNC - Input, Data Not Consistent, inconsistent ASAP parameter	inconsistent severity level	“ED-ASAP-PROF: Edit alarm severity assignment profile” (p. 4-260)
IDNC - Input, Data Not Consistent, Inconsistent loca/locz information	Consistent <i>loca/locz</i> for all low-order cross-connections using the same HO PTF at a MS-SPRING port	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IDNC - Input, Data Not Consistent, Inconsistent loopback type w.r.t. aid	valid loopback type	“OPR-LPBK (here cross-connection loopback)” (p. 4-1895)
IDNC - Input, Data Not Consistent, It is not allowed to specify loca/locz for EXTRA TRAFFIC	loca/locz information only retrievable for EXTRA TRAFFIC	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IDNC - Input, Data Not Consistent, level2 not allowed for scnnode	level2 parameter must not be present when <i>osinode=scnnode</i>	“RTRV-MAP-NETWORK: Retrieve network map” (p. 4-2358)
IDNC - Input, Data Not Consistent, LO tributary not supported by that pack (e.g. OPT2G5, EP51, GE1)	Pack restrictions for LOXC cross-connection sources	“ENT-CRS: Enter cross-connection” (p. 4-1361)

Errorcode	Meaning (validation rule)	Related to command ...
IDNC - Input, Data Not Consistent, modifier is inconsistent with existing interface standard	modifier consistent with given port's interface standard	"RTRV-LPBK: Retrieve loopback (here facility loopback)" (p. 4-2346)
IDNC - Input, Data Not Consistent, modifier is inconsistent with existing port rate	modifier consistent with given port-rate	
IDNC - Input, Data, Not Consistent, MSP 1+1_Optimized is always non-revertive	MSP type 1+1_optimized is never revertive	"ENT-PROTN-GRP: Enter protection group" (p. 4-1621), "ED-PROTN-GRP: Edit protection group" (p. 4-742)
IDNC - Input, Data, Not Consistent, MSP 1+1_optimized not supported for SONET mode	No MSP 1+1 optimized protection for SONET	
IDNC - Input, Data Not Consistent, MSP Protection Type 1x1 is always revertive	MSP type 1:1 is never non-revertive	
IDNC - Input, Data Not Consistent, MSP 1+1_BIDIR is always non-revertive	MSP type 1:1 bidirectional is never revertive	"ED-PROTN-GRP: Edit protection group" (p. 4-742)
IDNC - Input, Data Not Consistent, new name for default profile	rename of default ASAP	"ED-ASAP-PROF: Edit alarm severity assignment profile" (p. 4-260)
	rename default profile name	"ED-TCA-PROF: Edit TCA profile" (p. 4-1138)
IDNC - Input, Data Not Consistent, No BLSR inter-working with low-order traffic	No low-order cross-connection with BLSR ports	"ENT-CRS: Enter cross-connection" (p. 4-1361)
IDNC - Input, Data Not Consistent, no allowed topology conversion	Topology conversion command must be consistent	"CNVT-CCT: Convert cross-connection topology" (p. 4-67)

Errorcode	Meaning (validation rule)	Related to command ...
IDNC - Input, Data Not Consistent, No low-order path protection with input tributaries from BLSR/MS-SPRing ports	No low-order path protection with input tributaries from BLSR/MS-SPRing ports	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IDNC - Input, Data Not Consistent, No MSP protection supported for SONET mode	No MSP 1:1 protection for SONET	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
IDNC - Input, Data Not Consistent, not own uid	not the own uid specified	“CANC-USER: Cancel user” (p. 4-57)
IDNC - Input, Data Not Consistent, only dccstat or scndccstat allowed	single occurrence of dccstat or scndccstat parameter	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
IDNC - Input, Data Not Consistent, Optimized exists only with 1+1 Protection Type	only MSP 1+1 can be optimized	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
IDNC - Input, Data Not Consistent, port_aid1 and port_aid2 not different	different Port AIDs	“ENT-CRS-FECOM: Enter transparent DCC cross-connection” (p. 4-1405)
IDNC - Input, Data Not Consistent, protection mode supported for 4F applications only	TOPEX and SHORTENED applicable with prototype=4F only	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
IDNC - Input, Data Not Consistent, Rate is inconsistent with existing cross-connection	valid rate	“DLT-CRS: Delete cross-connection” (p. 4-134), “OPR-LPBK (here cross-connection loopback)” (p. 4-1895), “RLS-LPBK: Release loopback (here cross-connection loopback)” (p. 4-2041), “CNVT-CCT: Convert cross-connection topology” (p. 4-67)

Errorcode	Meaning (validation rule)	Related to command ...
IDNC - Input, Data Not Consistent, revertive mode not supported for MSP Protection Type 1+1 unidirectional	MSP type 1+1 unidirectional and revertive is not supported	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621), “ED-PROTN-GRP: Edit protection group” (p. 4-742)
IDNC - Input, Data Not Consistent, SNC Type not compliant with existing path-protected cross-connection	SNC type compliance	“ENT-CRS: Enter cross-connection” (p. 4-1361), “CNVT-CCT: Convert cross-connection topology” (p. 4-67)
IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate	rate consistency for VCG tributaries	“ENT-CRS: Enter cross-connection” (p. 4-1361)
	Restrictions for LOXC cross-connection rates	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IDNC - Input, Data Not Consistent, Specified new Tributary does not support the indicated rate	New Tributary rate validity	“CNVT-CCT: Convert cross-connection topology” (p. 4-67)
IDNC - Input, Data Not Consistent, strcout length must match the given outgoing J0 trace mode	transmitted path trace length	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), , “ED-EC1: Edit EC1 port” (p. 4-291)
IDNC - Input, Data Not Consistent, trc length must match the given path trace mode		“ED-PTF: Edit tributary with Path Termination Function (PTF)” (p. 4-770)

Errorcode	Meaning (validation rule)	Related to command ...
IDNC - Input, Data Not Consistent,, Tributaries must not be on ports of portClass INNI	LO Tributaries must not belong to ports of <i>portClass</i> INNI	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IDNC - Input, Data Not Consistent, This MSP protection type not supported for a port with the indicated rate	No MSP 1+1 bidirectional and non-revertive on other than STM-64	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
IDNC - Input, Data Not Consistent, TOP supported only for 4F applications only	TOP applicable with prototype=4F only	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
IDNC - Input, Data Not Consistent, trc length must match the given path trace mode	transmitted path trace length	“ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319)
IDNC - Input, Data Not Consistent, Tributary boundary is inconsistent with the indicated rate	AID boundary and rate consistency	“ENT-CRS: Enter cross-connection” (p. 4-1361), “OPR-LPBK (here cross-connection loopback)” (p. 4-1895), “CONN-TACC: Connect test access” (p. 4-87)
IDNC - Input, Data Not Consistent, tributary occupation not consistent with portcontrol value	portcontrol matches tributary occupied by NN	“OPR-LPBK (here cross-connection loopback)” (p. 4-1895)
IDNC - Input, Data Not Consistent, value change not allowed for profile Default0	Value change of default profile Default0	“ED-TCA-PROF: Edit TCA profile” (p. 4-1138)
IDNC - Input, Data Not Consistent, VGC-trib as input-trib in path-protected cross-connection	no VCG-trib as in_aid (for path-protected cross-connection)	“ENT-CRS: Enter cross-connection” (p. 4-1361), “CNVT-CCT: Convert cross-connection topology” (p. 4-67)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid	input parameters not specified	“CPY-MEM: Copy memory” (p. 4-105), “COPY-RFILE: Copy remote file” (p. 4-98)
	invalid uid/or pid	“ACT-USER: Activate user” (p. 4-23)
	disabled user ID	
	expired password and unsuccessful change of password	
	presence of spec_block parameter	“ED-CRS: Edit cross-connection” (p. 4-268)
	Check for that either dccstat or scn_dccstat is present	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
IDNV - Input, Data Not Valid, Automatic Squelch Map Calculation only allowed with Automatic Ring Discovery	Automatic squelch map calculation only with automatic ring discovery	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621), “ED-PROTN-GRP: Edit protection group” (p. 4-742)
IDNV - Input, Data Not Valid, additional parameter required	additional parameters required when setting <i>ndetmd</i> to MAN	“ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037),
IDNV - Input, Data Not Valid, additional parameters neighborNodeID and neighborPortID required		“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
IDNV - Input, Data Not Valid, AIS mode not valid	output type not supported for AIS mode	“SET-SYCN: Set synchronization” (p. 4-2947)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, all tributaries must be different	All tributaries must be different	“CONN-TACC: Connect test access” (p. 4-87)
IDNV - Input, Data Not Valid, ASAP profile does not exist	check for ASAP profile existence	“ED-EQPT (shelf): Edit equipment (shelf)” (p. 4-333), “ED-EQPT (slot): Edit equipment (slot)” (p. 4-338), “ED-EQPT (socket): Edit equipment” (p. 4-347), “ED-EQPT (system): Edit equipment (system)” (p. 4-359)
	pfname does not exist	“SET-ATTR-ENV: Set attribute environment” (p. 4-2926)
	validate ASAP profile	“ED-EQPT (cp): Edit equipment (circuit pack)” (p. 4-322)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, ASAP profile does not exist	ASAP profile exists	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), , “ED-VC3: Edit VC3 tributary” (p. 4-1255), “ED-STS1: Edit STS1 tributary” (p. 4-1101), “ED-EPORT: Edit Ethernet port” (p. 4-303), “ED-VCG: Edit virtual concatenation group” (p. 4-1270), “ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319), “ED-OC48T: Edit OC48 transparent port” (p. 4-598), “ED-PTF: Edit tributary with Path Termination Function (PTF)” (p. 4-770), “ED-STM16T: Edit STM16T port” (p. 4-1021), “ED-T3: Edit DS3 port” (p. 4-1126), “ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application” (p. 4-1308), “ED-LONIM: Edit Low Order Non-Intrusive Monitor” (p. 4-379), “ED-EC1: Edit EC1 port” (p. 4-291)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, Assigned bandwidth exceeds half port's bandwidth	Enough bandwidth reserved for 2F protection group	“ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
IDNV - Input, Data Not Valid. Attempting to delete an administrator login. Two administrator user logins are required at all times	attempt to delete administrator's uid	“DLT-USER-SECU: Delete user security” (p. 4-251)
IDNV - Input, Data Not Valid, Both input tributaries are identical	path-protected cross-connection has unique input AIDs	“ENT-CRS: Enter cross-connection” (p. 4-1361), “CNVT-CCT: Convert cross-connection topology” (p. 4-67)
IDNV - Input, Data Not Valid, cable equalization not supported	cable equalization not supported	“SET-SYCN: Set synchronization” (p. 4-2947)
IDNV - Input, Data not Valid, can't change l3domain for osinode1	l3domain can not be changed for osinode1	“ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
IDNV - Input, Data not Valid, constraint l3radesnode	l3radesnode value and l3isisnl Value	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822), “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
IDNV - Input, Data Not Valid, DCC on EC1 Ports not allowed	No DCC on EC1 ports	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459), “ENT-CRS-FECOM: Enter transparent DCC cross-connection” (p. 4-1405)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, DCC on DS3 Ports not allowed	No DCC on DS3 ports	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459), “ENT-CRS-FECOM: Enter transparent DCC cross-connection” (p. 4-1405)
IDNV - Input, Data Not Valid, DCC on Transparent Ports not allowed	No DCC on transparent ports	
IDNV - Input, Data Not Valid, DCC type SECTION not allowed for SCN	RS-DCC not allowed for DCN	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
IDNC - Input, Data Not Consistent, Default VLAN ID is already assigned for this System	Default VLAN ID is already assigned for this system	“ED-VCG: Edit virtual concatenation group” (p. 4-1270)
IDNC-Input, Data Not Consistent, Default VLAN ID is not an allowed member of valid VLAN list	Default VLAN ID is no allowed member of valid VLAN list for this system	“ED-VCG: Edit virtual concatenation group” (p. 4-1270)
IDNV - Input, Data Not Valid, DS3 Ports not allowed as line timing reference	No DS3 Port as line timing reference	“SET-SYNCN: Set synchronization” (p. 4-2947)
IDNV - Input, Data Not Valid, duplicate neighbor port information	No setting of duplicate <i>neighborASTNNodeID</i> and <i>neighborPortID</i> parameter combination	“ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)
IDNV - Input, Data Not Valid, EC1 Ports not allowed as line timing reference	No EC1 Port as line timing reference	“SET-SYNCN: Set synchronization” (p. 4-2947)

Errorcode	Meaning (validation rule)	Related to command ...
IDNC - Input, Data Not Consistent, It is not allowed to specify loca/locz for EXTRA TRAFFIC	loca/locz information only retrievable for EXTRA TRAFFIC	“ED-CRS: Edit cross-connection” (p. 4-268)
IDNV - Input, Data Not Valid, default profiles cannot be deleted	deleting the system default profile	“DLT-TCA-PROF: Delete TCA Profile” (p. 4-240)
IDNV - Input, Data Not Valid, discrepancy between entered values and current value of spec-block parameters	ohbyte and intfctype values correct (when dis-associating)	“SET-OW: Set Orderwire and User Bytes” (p. 4-2936)
IDNV - Input, Data Not Valid, duplicate IP Map entry.	Check for duplicate entries	“ENT-IP-MAP: Enter TCP/IP map” (p. 4-1488)
IDNV - Input, Data Not Valid, duplicate UID	entering user’s own or existing uid	“ENT-USER-SECU: Enter user security” (p. 4-1841)
	newuid has the same value of an existing uid	“ED-USER-SECU: Edit user security” (p. 4-1244)
IDNV - Input, Data Not Valid, E and F tributaries not cross-connected	E tributary and F tributary not cross-connected	“CONN-TACC: Connect test access” (p. 4-87)
IDNV - Input, Data not Valid, equal l3domain	l3domain value must be different for current node and l3radesnode	“ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
IDNV - Input, Data not Valid, equal node IDs	l3radesnode value must be different from osinode	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822), “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
IDNV - Input, Data Not Valid, forced DUS not supported for this format	format not supported for forced DNU/DUS	“SET-SYCN: Set synchronization” (p. 4-2947)
IDNV - Input, Data Not Valid, incompatible screen, uidclass parameters	compatibility screen, uidclass parameter	“ENT-USER-SECU: Enter user security” (p. 4-1841), “ED-USER-SECU: Edit user security” (p. 4-1244)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, incomplete switch command	complete switch command	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)
IDNV - Input, Data Not Valid, inconsistent <i>aid</i> and <i>monlev</i>	<i>aid</i> range and <i>monlev</i>	“RTRV-PM: Retrieve performance monitoring” (p. 4-2551), “RTRV-LOXCPM: Retrieve Performance Monitoring Data of LOXC pack” (p. 4-2334)
IDNV - Input, Data Not Valid, inconsistent <i>aid</i> and <i>protype</i>	consistent aid and protype	“RTRV-PROTN-GRP: Retrieve protection group” (p. 4-2580), “OPR-PROTNSW: Operate protection switch” (p. 4-1913), “RLS-PROTNSW: Release protection switch” (p. 4-2050)
IDNV - Input, Data Not Valid, inconsistent <i>aid</i> and <i>rid</i>	consistent aid and rid	“RTRV-PROTN-GRP: Retrieve protection group” (p. 4-2580), “OPR-PROTNSW: Operate protection switch” (p. 4-1913), “RLS-PROTNSW: Release protection switch” (p. 4-2050), “ED-PROTN-GRP: Edit protection group” (p. 4-742), “DLT-PROTN-GRP: Delete protection group” (p. 4-215), “ED-MAP-RING: Edit map ring” (p. 4-392)
IDNV - Input, Data not Valid, inconsistency l3domain with l3radesnode	consistency l3domain with l3radesnode for nodes 2 to 8	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822), “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
IDNV - Input, Data Not Valid, incorrect date/time format	incorrect date/time format	“ED-DAT: Edit date and time” (p. 4-287)
IDNV - Input, Data Not Valid, incorrect new_pid	missing or invalid or syntactically incorrect <i>new_pid</i>	“ED-PID: Edit password identifier” (p. 4-737)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, Interface type not settable for specified UserByte-Port	interface type compliant with port	“SET-OW: Set Orderwire and User Bytes” (p. 4-2936)
IDNV - Input, Data Not Valid, invalid <i>atagseg</i>	valid <i>atagseg</i>	“RTRV-AO: Retrieve Autonomous Output” (p. 4-2087)
IDNV - Input, Data Not Valid, invalid LO switch capacity for LOXC in this slot	LO switch capacity setting only for LOXC in worker slots	“ED-EQPT (cp): Edit equipment (circuit pack)” (p. 4-322)
IDNV - Input, Data Not Valid, Invalid loopback for EPort	for GE (EPort) only far-side loopback allowed	“OPR-LPBK: Operate loopback (here facility loopback)” (p. 4-1904)
IDNV - Input, Data Not Valid, invalid profile type or name	invalid profile type or name	“ENT-TCA-PROF: Enter TCA Profile” (p. 4-1768), “ED-TCA-PROF: Edit TCA profile” (p. 4-1138), “DLT-TCA-PROF: Delete TCA Profile” (p. 4-240)
IDNV - Input, Data Not Valid, invalid sc	invalid switch command	“OPR-SYNCNSW: Operate synchronization switch ” (p. 4-1933)
IDNV - Input, Data Not Valid, invalid switch command	supported switch command	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)
IDNV - Input, Data Not Valid, invalid test access mode	MONF or MONEF test access mode not allowed on a 1WAY cross-connection from E to F tributary	“CONN-TACC: Connect test access” (p. 4-87)
IDNV - Input, Data Not Valid, invalid UID	invalid <i>uid</i>	“ED-USER-SECU: Edit user security” (p. 4-1244), “DLT-USER-SECU: Delete user security” (p. 4-251), “RTRV-USER-SECU: Retrieve user security” (p. 4-2857)
IDNV - Input, Data Not Valid, invalid UPC	invalid <i>upc</i>	“ED-USER-SECU: Edit user security” (p. 4-1244), “ENT-USER-SECU: Enter user security” (p. 4-1841)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, Invalid Wildcarding for wrk_aid	Invalid wildcarding	“RTRV-OUC: Retrieve ONNS to UPSR/SNCP constructs” (p. 4-2522)
IDNV - Input, Data not Valid, l3prefix and l3radesnode inconsistent	consistency of <i>l3radesnode</i> with <i>l3raprefix</i>	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822), “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
IDNV - Input, Data Not Valid, l4ajsys/osinode not unique	<i>l4ajsys</i> per osinode must be different	“ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 4-1832)
IDNV - Input, Data Not Valid, Low-order cross-connections of this interface standard not supported	Entities must fit LOXC interface standard	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IDNV - Input, Data Not Valid, Min. and max. NN XC rates incompatible	No setting of <i>minNNXCRate</i> to values larger than value of <i>maxNNXCRate</i> and vice versa	“ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037)
IDNV - Input, Data Not Valid, missing F tributary	Missing F tributary	“CONN-TACC: Connect test access” (p. 4-87)
IDNV - Input, Data Not Valid, newuid for non superuser	newuid defined for non superuser uid	“ED-USER-SECU: Edit user security” (p. 4-1244)
IDNV - Input, Data Not Valid, No Access via AID located on INNI port	Access via tributary on INNI port	“ED-PROTN-GRP: Edit protection group” (p. 4-742), “OPR-PROTNSW: Operate protection switch” (p. 4-1913), “RLS-PROTNSW: Release protection switch” (p. 4-2050)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, no aid range in combination with rid	<i>aid</i> range and <i>rid</i>	“RTRV-PROTN-GRP: Retrieve protection group” (p. 4-2580)
IDNV - Input, Data Not Valid, node itself is not a valid neighbor	No setting of <i>neighborASTNNodeID</i> and <i>neighborNodeID</i> parameter combination	“ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478)
	No setting of <i>neighborASTNNodeID</i> or <i>neighborNodeID</i> to corresponding IDs of local node	“ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037)
IDNV - Input, Data Not Valid, No path protection group parameters allowed for directionality UNIDIR-ADD	No path protection group parameters must be given for Setup of a unidirectional-add OUC	“ENT-OUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)
IDNV - Input, Data Not Valid, no regen loop with SETG as timing output	regenerator loops with SETG as timing output	“SET-SYCN: Set synchronization” (p. 4-2947)
IDNV - Input, Data Not Valid, not possible for NNI port to assign both channels to MCN.	prevent that both DCCs of a port are assigned to the MCN, when portClass = INNI	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
IDNV - Input, Data Not Valid, not possible to assign both channels to SCN	prevent that both DCCs of a port are assigned to the SCN	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
IDNV - Input, Data Not Valid, No Userbyte access at the specified port	No Userbyte access at EC1 ports on EP51 pack	“SET-OW: Set Orderwire and User Bytes” (p. 4-2936)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, No wilddcarding for access via input tribs	No wilddcarding on access via <i>aid</i> and <i>aid1</i>	“RTRV-PROTN-GRP: Retrieve protection group” (p. 4-2580)
IDNV - Input, Data not Valid, NSAP Area Address matches with RA-Prefix	Address Area Value – RA-Prefix Value	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822), “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
IDNV - Input, Data not Valid, only a single node in seperate domain supported	only one single node in a seperate domain supported	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822), “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
IDNV - Input, Data not Valid, osinode cannot be changed for LAN1	only osinode1 for LAN 1	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)
IDNV - Input, Data Not Valid, parameter not required	parameter not supported for modifier	“OPR-SYNCNSW: Operate synchronization switch ” (p. 4-1933)
IDNV - Input, Data Not Valid, Parameter not supported	change of FEC parameters only if supported by the current circuit pack	“ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC192: Edit OC192 port” (p. 4-613),
	enabling of optical channel only if supported by the current circuit pack	
IDNV - Input, Data Not Valid, Parameter(s) out of allowed value range	all parameter are specified with allowed values	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IDNV - Input, Data Not Valid, Parameter(s) present which are not allowed	only those parameter present which are needed	

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, ppgname not allowed if aid1 is given	<i>ppgname</i> and <i>aid1</i>	“RTRV-PROTN-GRP: Retrieve protection group” (p. 4-2580), “ED-PROTN-GRP: Edit protection group” (p. 4-742), “OPR-PROTNSW: Operate protection switch” (p. 4-1913), “RLS-PROTNSW: Release protection switch” (p. 4-2050)
IDNV - Input, Data Not Valid, ppgname not supported for this transmission rate	<i>ppgname</i> and low order path protections	“RTRV-PROTN-GRP: Retrieve protection group” (p. 4-2580), “OPR-PROTNSW: Operate protection switch” (p. 4-1913), “RLS-PROTNSW: Release protection switch” (p. 4-2050)
IDNV - Input, Data Not Valid, profile name already exists for the type	profile name already exists	“ED-TCA-PROF: Edit TCA profile” (p. 4-1138)
IDNV - Input, Data Not Valid, profile name already exists for this profile type	TCA profile already exist	“ENT-TCA-PROF: Enter TCA Profile” (p. 4-1768)
IDNV - Input, Data Not Valid, profile name does not exist	profile name does not exist	“DLT-TCA-PROF: Delete TCA Profile” (p. 4-240)
IDNV - Input, Data Not Valid, profile name does not exist	profile name does not exist	“RTRV-TCA-PROF: Retrieve TCA Profile” (p. 4-2794)
IDNV - Input, Data Not Valid, profile type does not exist	profile type does not exist	
IDNV - Input, Data Not Valid, portClass must be INNI	consistency of input parameters with portClass INNI	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
IDNV - Input, Data Not Valid, provisioning of lapdmode and lapdrl not possible	invalid input parameters	

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data not Valid, RA-Prefix matches with the NSAP Area Address	RA-Prefix Value – Address Area Value	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822), “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
IDNV - Input, Data Not Valid, related portClass not EDGE or port not in BLSR/MS-SPRING group	loca, locz changes only allowed when portClass=EDGE and part of a BLSR/MS-SPRING group	“ED-VC3: Edit VC3 tributary” (p. 4-1255), “ED-ST51: Edit ST51 tributary” (p. 4-1101)
IDNV - Input, Data Not Valid, rid is already used by another protection group	unique rid	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621), “ED-PROTN-GRP: Edit protection group” (p. 4-742)
IDNV - Input, Data Not Valid, Sa bit location not supported	input / output format not supported for Sa bit settings	“SET-SYCN: Set synchronization” (p. 4-2947)
IDNV - Input, Data Not Valid, screen value was not set by security administrator	screen value not allowed for uid	“ED-USER: Edit user” (p. 4-1239)
IDNV - Input, Data Not Valid, side information is not complete	complete side information	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
IDNV - Input, Data Not Valid, sid is already used by another BLSR/MS-SPRING Node	uniqueness of TID within ringmaps	“SET-SID: Set SID” (p. 4-2943)
IDNV - Input, Data Not Valid, side information is not complete	complete side information	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
IDNV - Input, Data Not Valid, Slot still provisioned	slot must not be provisioned	“ENT-EQPT (slot): Enter equipment (slot)” (p. 4-1441)
IDNV - Input, Data Not Valid, Socket still provisioned	socket must not be provisioned	“ENT-EQPT (Socket): Enter equipment” (p. 4-1451)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, SSM not supported for provisioned QL	SSM not supported if timing port provisioned AUTO	“SET-SYCN: Set synchronization” (p. 4-2947)
IDNV - Input, Data Not Valid, SSM not supported for this format	SSM not supported	
IDNV - Input, Data Not Valid, switch capacity cannot be decreased	No decrease of maximum switch capacity	“ED-EQPT (system): Edit equipment (system)” (p. 4-359)
IDNV - Input, Data Not Valid, TCA profile does not exist	TCA profile exists	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), , “ED-VC3: Edit VC3 tributary” (p. 4-1255), “ED-ST51: Edit ST51 tributary” (p. 4-1101), “ED-EPORT: Edit Ethernet port” (p. 4-303), “ED-VCG: Edit virtual concatenation group” (p. 4-1270), “ED-STM1E: Edit STM1E port” (p. 4-802), “ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319), “ED-LONIM: Edit Low Order Non-Intrusive Monitor” (p. 4-379), “ED-EC1: Edit EC1 port” (p. 4-291)
	profile name does not exist	“RTRV-TCA-ASGNMT: Retrieve TCA assignment” (p. 4-2791)

Errorcode	Meaning (validation rule)	Related to command ...
IDNV - Input, Data Not Valid, Transparent Ports not allowed as line timing reference	No transparent port as line timing reference	“SET-SYNCN: Set synchronization” (p. 4-2947)
IDNV - Input, Data Not Valid, tributary already part of a cross-connection	<i>loca</i> , <i>locz</i> changes only allowed when tributary already involved in a cross-connection	“ED-VC3: Edit VC3 tributary” (p. 4-1255) , “ED-STS1: Edit STS1 tributary” (p. 4-1101)
IDNV - Input, Data Not Valid, uid must not be the own uid	<i>uid</i> must not be the own <i>uid</i>	“CANC-USER-SECU: Cancel user security” (p. 4-59)
IDNV - Input, Data Not Valid, uid not in NE data base	<i>uid</i> not in NE data base	
IDNV - Input, Data Not Valid, wrong old_pid	invalid <i>old_pid</i>	“ED-PID: Edit password identifier” (p. 4-737)
IDNV - Input, Data Not Valid, zero values can only be set for all neighbor information consistently	Setting of neighbor information to UNKNOWN	“ED-STM1E: Edit STM1E port” (p. 4-802) , “ED-STM1: Edit STM1 port” (p. 4-845) , “ED-STM4: Edit STM4 port” (p. 4-903) , “ED-STM16: Edit STM16 port” (p. 4-961) , “ED-STM64: Edit STM64 port” (p. 4-1037) , “ED-OC3: Edit OC3 port” (p. 4-419) , “ED-OC12: Edit OC12 port” (p. 4-478) , “ED-OC48: Edit OC48 port” (p. 4-537) , “ED-OC192: Edit OC192 port” (p. 4-613)
IDRG - Input, Data Range Error	Check <i>aid</i> and <i>dyn</i> consistency	“ENT-LONIM notification” (p. 4-1492)
IDRG - Input, Data Range Error, <i>osinode</i>	TARP origination only valid for node-1	“ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 4-1832)
	TARP responder only valid for node-1	
	TARP data cache enabling only valid for node-1	

Errorcode	Meaning (validation rule)	Related to command ...
IDRG - Input, Data Range Error, threshold value is out of range	IDRG-range error	“ED-TCA-PROF: Edit TCA profile” (p. 4-1138)
IEAE - Input Entity Already Exists, duplicate profile name	duplicate <i>pfname</i>	“ENT-ASAP-PROF: Enter alarm severity assignment profile” (p. 4-1345)
	duplicate <i>newname</i>	“ED-ASAP-PROF: Edit alarm severity assignment profile” (p. 4-260)
	profile name already exists	“ENT-TCA-PROF: Enter TCA Profile” (p. 4-1768), “ED-TCA-PROF: Edit TCA profile” (p. 4-1138)
IEAE - Input Entity Already Exists, cross-connection exists on test tributary	Cross-connection exists on the test tributary	“CONN-TACC: Connect test access” (p. 4-87)
IEAE - Input Entity Data Already Exists, osinode	OSI node is already created	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822)
IEAE - Input Entity Already Exists, test access connection exists	Test tributary already connected	“CONN-TACC: Connect test access” (p. 4-87)

Errorcode	Meaning (validation rule)	Related to command ...
IENE - Input Entity Not Exists	reject request for protection CTL slot	“ENT-EQPT (slot): Enter equipment (slot)” (p. 4-1441), “DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167), ,
	directory not accessible	“CPY-MEM: Copy memory” (p. 4-105)
	command only allowed for VCG on Transparent Packs	“ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application” (p. 4-1308), “RTRV-VCG-TRANS: Retrieve virtual concatenation group transparent” (p. 4-2891)
	Check <i>modifier</i> against Circuit Pack type	“RTRV-VCGTRIB: Retrieve virtual concatenation group tributary” (p. 4-2899), “ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319)
	Check CCB against <i>ptype</i> and <i>elf</i>	“RTRV-EC1: Retrieve EC1 port” (p. 4-2175), “ED-EC1: Edit EC1 port” (p. 4-291)
	Protection Group must exist	“ED-PROTN-GRP: Edit protection group” (p. 4-742), “OPR-PROTNSW: Operate protection switch” (p. 4-1913), “RLS-PROTNSW: Release protection switch” (p. 4-2050)
	Check LONIM::modifier against PTF::istd	“ENT-LONIM notification” (p. 4-1492)
IENE - Input, Entity Not Exists, aid not part of substructure	Check <i>aid</i> against PTF substructure	“ED-LONIM: Edit Low Order Non-Intrusive Monitor” (p. 4-379)
IENE - Input Entity Not Exists, cannot change system default profile	Changing default profile name	“ED-TCA-PROF: Edit TCA profile” (p. 4-1138)
IENE - Input, Entity Not Exists, constituent member does not exist	Boundary consistency for constituent members	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)

Errorcode	Meaning (validation rule)	Related to command ...
IENE - Input Entity Not Exist, profile does not exist	no matching profile name	“RTRV-ASAP-ASGNMT: Retrieve ASAP assignment” (p. 4-2090)
IENE - Input, Entity Not Exists, Not for this interface standard	Entities must fit to the interface standard	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IENE - Input Entity Not Exists, Specified association does not exist	association present (when dis-associating)	“SET-OW: Set Orderwire and User Bytes” (p. 4-2936)
IENE - Input Entity Not Exists, Specified cross-connection does not exist	entity (cross-connection) must exist	“ED-NNCRS: Edit NN cross-connection” (p. 4-415), “ED-CRS: Edit cross-connection” (p. 4-268), “DLT-CRS: Delete cross-connection” (p. 4-134), “CNVT-CCT: Convert cross-connection topology” (p. 4-67)
	LO cross connection with specified topology must exist	“DLT-CRS: Delete cross-connection” (p. 4-134)
IENE - Input, Entity Not Exists, Specified low-order tributary/tributaries do not exist/cannot be created (possibly connected at high-order level)	Entities must be creatable for LO cross-connections	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IENE - Input, Entity Not Exists, Specified OUC does not exist	Entity (OUC) must exist	“DLT-OUC: Delete ONNS to UPSR/SNCP constructs” (p. 4-201)
IENE - Input Entity Not Exists, Specified port does not exist	Port exists (when associating)	“SET-OW: Set Orderwire and User Bytes” (p. 4-2936)
IENE - Input Entity Not Exists, Specified Transparent DCC Cross Connection does not exist	entity (transparent DCC cross-connection) must exist	“DLT-CRS-FECOM: Delete transparent DCC cross-connection” (p. 4-145)

Errorcode	Meaning (validation rule)	Related to command ...
IENE - Input Entity Not Exists, Specified tributary/tributaries do not exist	entities (tributaries) must exist	“ED-NNCRS: Edit NN cross-connection” (p. 4-415), “ED-CRS: Edit cross-connection” (p. 4-268), “DLT-CRS: Delete cross-connection” (p. 4-134), “CNVT-CCT: Convert cross-connection topology” (p. 4-67), “CONN-TACC: Connect test access” (p. 4-87), “ENT-OUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)
IENE - Input, Entity Not Exists, Substructure cannot be adapted	Entities must be adaptable for LO cross-connections	“ENT-CRS: Enter cross-connection” (p. 4-1361)
IIAC - Input, Invalid ACcess identifier, incorrect syntax	consistent aid and prototype	“OPR-PROTNSW: Operate protection switch” (p. 4-1913), “RLS-PROTNSW: Release protection switch” (p. 4-2050)
IIDP - Input, Invalid Destination Port type for M:N group setup	NN PortID parameter value is not valid	“ENT-PATH: Create ONNS path connection” (p. 4-1583)
IIGT - Input, Parameter grpSetupType only allowed if protType is UNPROT	NN PortID parameter value is not valid	“ENT-PATH: Create ONNS path connection” (p. 4-1583)
IISP - Input, Invalid Source Port type for M:N group setup	NN PortID parameter value is not valid	“ENT-PATH: Create ONNS path connection” (p. 4-1583)
Input, Invalid deletion of connection of protection class MBYNWRK or MBYNPRT	Connection is member of an M:N protected connection group	“DLT-PATH: Delete ONNS path Connection” (p. 4-205)
INUP - Input, Non-null Unimplemented Parameter	Less than 2 nodes specified	“ED-MAP-RING: Edit map ring” (p. 4-392)

Errorcode	Meaning (validation rule)	Related to command ...
INUP - Input Non-null Unimplemented Parameter, secondary test tributary not allowed	Secondary test tributary not needed for MONE test modes	“CONN-TACC: Connect test access” (p. 4-87)
IPMS -Input Parameter Missing	pathprotected crossconnection: parameters missing	“CNVT-CCT: Convert cross-connection topology” (p. 4-67)
IPMS -Input Parameter Missing. <parameter name> is missing	path-protected cross-connection: missing parameters	“ENT-CRS: Enter cross-connection” (p. 4-1361), “CNVT-CCT: Convert cross-connection topology” (p. 4-67)
IPNE - Input, No EXPLICIT routing allowed for M:N group setup	NN PortID parameter value is not valid	“ENT-PATH: Create ONNS path connection” (p. 4-1583)
IPNC - Input, Parameter Not Consistent, 64 byte path trace not allowed	Check <i>modifier</i> and <i>ptrcrfmt</i> consistency	“ED-LONIM: Edit Low Order Non-Intrusive Monitor” (p. 4-379)
IPNC - Input Parameter Not Consistent, Rate inconsistent with cross-connection rate	specified rate consistent with the cross-connection rate	“ED-NNCRS: Edit NN cross-connection” (p. 4-415), “ED-CRS: Edit cross-connection” (p. 4-268)
	Inconsistent tributary rate	“CONN-TACC: Connect test access” (p. 4-87), “CHG-ACCMD: Change access mode” (p. 4-62), “DISC-TACC: Disconnect test access” (p. 4-118)
IPNC - Input, Parameter Not Consistent, SES threshold out of range for this modifier	Check <i>modifier</i> and <i>pmlpnese/pmlpnese</i> consistency	“ED-LONIM: Edit Low Order Non-Intrusive Monitor” (p. 4-379)
IPNC - Input, Parameter Not Consistent, TCA mode not allowed	Check <i>modifier</i> and <i>tcamd</i> consistency	“ED-LONIM: Edit Low Order Non-Intrusive Monitor” (p. 4-379)

Errorcode	Meaning (validation rule)	Related to command ...
IPNC - Input Parameter Not Consistent, TID not compliant with cross-connection configuration	TID validation	“ED-CRS: Edit cross-connection” (p. 4-268)
PICC - Privilege, Illegal Command Code, invalid user class	user class	“RTRV-AO: Retrieve Autonomous Output” (p. 4-2087)
SAOP - Status, already operated, loopback already exists	loopback must not already exist	“OPR-LPBK (here cross-connection loopback)” (p. 4-1895) “OPR-LPBK: Operate loopback (here facility loopback)” (p. 4-1904)
SARB - Status, All Resources Busy	maximum logins exceeded	“ACT-USER: Activate user” (p. 4-23)
	temporary exhaustion of resources	“CPY-MEM: Copy memory” (p. 4-105), “COPY-RFILE: Copy remote file” (p. 4-98)
	APPLY already in progress	“APPLY: Apply software generic” (p. 4-34)
SARB - Status, All Resources Busy, LOXC capacity exhausted	Spare capacity for HO cross-connection legs on LOXC	“ENT-CRS: Enter cross-connection” (p. 4-1361)
SARB - Status, All Resources Busy, system limit exceeded	temporary system exhaustion	“APPLY: Apply software generic” (p. 4-34)
SDNC - Status, Data Not Consistent	file inappropriate	“APPLY: Apply software generic” (p. 4-34)
	source product type does not match network product type	“CPY-MEM: Copy memory” (p. 4-105)
	additional directory/URL specified	“APPLY: Apply software generic” (p. 4-34), “COPY-RFILE: Copy remote file” (p. 4-98)
	Additional directory/URL specified for restoration	“COPY-RFILE: Copy remote file” (p. 4-98)
	Additional directory/URL specified for backup	

Errorcode	Meaning (validation rule)	Related to command ...
SDNC - Status, Data Not Consistent, <i>asgncond</i> not empty	probable cause assigned to MDO port	“OPR-EXT-CONT: Operate External Control” (p. 4-1892), “RLS-EXT-CONT: Release external control” (p. 4-2036)
SDNC - Status, Data Not Consistent, invalid ASAP parameter	ASAP parameter does not exist	“ED-ASAP-PROF: Edit alarm severity assignment profile” (p. 4-260)
SDNC - Status, Data Not Consistent, invalid combination of osinode parameter with dccstat, <i>scn_dccstat</i>	combination of osinode parameter with <i>scn_dccstat</i>	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
SDNC - Status, Data not consistent, invalid file or directory	invalid file or directory name	“CPY-MEM: Copy memory” (p. 4-105)
SDNC - Status, Data Not Consistent, invalid instance of profile	pfname does not exist	“ED-ASAP-PROF: Edit alarm severity assignment profile” (p. 4-260), “DLT-ASAP-PROF: Delete alarm severity assignment profile” (p. 4-124)
SDNC - Status, Data Not Consistent, other port already assigned	one timing port for a circuit pack	“SET-SYCN: Set synchronization” (p. 4-2947)
	No timing port on protection pack of an MS protected timing port	
SDNC - Status, Data Not Consistent, pgid is already used by another protection group of the same type	unique pgid	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
SDNC - Status, Data Not Consistent, port already assigned	port is already assigned to another timing reference	“SET-SYCN: Set synchronization” (p. 4-2947)
SDNC - Status, Data Not Consistent, port is out-of-service	no out-of-service state for timing port	
	for service condition	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)

Errorcode	Meaning (validation rule)	Related to command ...
SDNC - Status, Data Not Consistent, profile in use	ASAP in use	“DLT-ASAP-PROF: Delete alarm severity assignment profile” (p. 4-124)
SDNC - Status, Data Not Consistent, quality evaluation disabled	command rejection if quality evaluation disabled	“SET-SYNCN: Set synchronization” (p. 4-2947)
SDNC - Status, Data Not Consistent, reference already assigned	timing reference already assigned	
SDNC - Status, Data Not Consistent, reference in protection group	timing reference from a protection port in a protection group only allowed in asymmetric spans of a ring	
SLEM - Status, List Exceeds Maximum UIDs	maximum number of uids reached	“ENT-USER-SECU: Enter user security” (p. 4-1841)
SNVS - Status, Not in Valid State	automatic ring discovery to be disabled	“SET-MAP-RING: Set map ring” (p. 4-2931), “ED-FETID: Edit Far End Target Identifier” (p. 4-373), “ED-MAP-RING: Edit map ring” (p. 4-392)
	deemed source file	“CPY-MEM: Copy memory” (p. 4-105)
	second APPLY on same software	“APPLY: Apply software generic” (p. 4-34)
	validation rule for enabled DCC channels	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
	Restrictions for LO path protection	“ENT-CRS: Enter cross-connection” (p. 4-1361)
	no SW installation during DB backup and restore	“APPLY: Apply software generic” (p. 4-34)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Active Repeater Mode for this Port does not allow dftvlan to be modified	default VLAN ID not allowed in Repeater Mode	“ED-EPORT: Edit Ethernet port” (p. 4-303)
SNVS - Status, Not in Valid State, Active Repeater Mode for this Port does not allow vvidls to be modified	VLAN filtering database not allowed in Repeater Mode	
SNVS - Status, Not in Valid State, Assigned Node not allowed for IP	Assignmet of OsiNode without IP support	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)
	only osinode1 supports IP	
SNVS - Status, Not in Valid State, association already exists	no association present (when associating)	“SET-OW: Set Orderwire and User Bytes” (p. 4-2936)
SNVS - Status, Not in Valid State, a loopback is existing	no loopbacks for istd change	“ED-STM1: Edit STM1 port” (p. 4-845) , “ED-STM4: Edit STM4 port” (p. 4-903) , “ED-STM16: Edit STM16 port” (p. 4-961) , “ED-STM64: Edit STM64 port” (p. 4-1037) ,
	no loopbacks for interface standard change	“ED-VCG: Edit virtual concatenation group” (p. 4-1270) , “ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application” (p. 4-1308)
	no loopbacks for <i>istd</i> , <i>trbmd</i> change	“ED-OC3: Edit OC3 port” (p. 4-419) , “ED-OC12: Edit OC12 port” (p. 4-478) , “ED-OC48: Edit OC48 port” (p. 4-537) , “ED-OC192: Edit OC192 port” (p. 4-613) ,
	no loopbacks for <i>ptfstd</i> change	“ED-PTF: Edit tributary with Path Termination Function (PTF)” (p. 4-770)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, a protection group is existing	no protection for <i>istd</i> change	“ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037),
	no protection groups allowed	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167)
SNVS - Status, Not in Valid State, a protection group is existing	no protection for <i>istd</i> , <i>trbmd</i> change	“ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
SNVS - Status, Not in Valid State, a path protection group is existing	no path protection for <i>trbmd</i> change to ADAPTIVE	
SNVS - Status, Not in Valid State, at least one port used as timing reference	not used as timing reference	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167), “DLT-EQPT (Socket): Delete equipment” (p. 4-177)
SNVS - Status, Not in Valid State, at least one port of the protection pack is used as timing reference		“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
SNVS - Status, Not in Valid State, a test access session exists	no test access session for interface type change	“ED-T3: Edit DS3 port” (p. 4-1126), “ED-EC1: Edit EC1 port” (p. 4-291)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, a test access session exists	no test access session for <i>istd</i> , <i>trbmd</i> change	“ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), “ED-OC192: Edit OC192 port” (p. 4-613),
	Setting of <i>portClass</i> to INNI only possible, if no test access session active

	no cross-connections for interface type change	“ED-T3: Edit DS3 port” (p. 4-1126), “ED-EC1: Edit EC1 port” (p. 4-291)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Cross connection involved in Test Access Session	Cross-connection not involved in Test Access Session	“ED-NNCRS: Edit NN cross-connection” (p. 4-415)
SNVS - Status, Not in Valid State, Cross connection not of class NN	Cross-connection must have xconcls=NN	
SNVS - Status, Not in Valid State, Cross connection must not be of xconcls NN	Cross connection must not be of xconcls NN	“ED-CRS: Edit cross-connection” (p. 4-268), “DLT-CRS: Delete cross-connection” (p. 4-134), “CNVT-CCT: Convert cross-connection topology” (p. 4-67),
SNVS - Status, Not in Valid State, cross-connections or substructure still exist	XC are assigned to proposed protection EPn pack	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
	no HO/LO cross-connection or LO substructure at protection tribs	
	no HO/LO cross-connection or LO substructure at tributaries	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621), “ED-PROTN-GRP: Edit protection group” (p. 4-742), “DLT-PROTN-GRP: Delete protection group” (p. 4-215)
SNVS - Status, Not in Valid State, Cross-connections still existing	setting of <i>portClass</i> to INNI only possible, if no cross-connection existing	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Database already installed	Second APPLY on same database	“APPLY: Apply software generic” (p. 4-34)
SNVS - Status, Not in Valid State, database not compatible	No DB restore with incompatible database	“CPY-MEM: Copy memory” (p. 4-105) , “COPY-RFILE: Copy remote file” (p. 4-98)
SNVS - Status, Not in Valid State, DCC channels are active for this port	<i>servcond</i> must be enabled when DCC enabled	“ED-STM1E: Edit STM1E port” (p. 4-802) , “ED-STM1: Edit STM1 port” (p. 4-845) , “ED-STM4: Edit STM4 port” (p. 4-903) , “ED-STM16: Edit STM16 port” (p. 4-961) , “ED-STM64: Edit STM64 port” (p. 4-1037) , , “ED-OC3: Edit OC3 port” (p. 4-419) , “ED-OC12: Edit OC12 port” (p. 4-478) , “ED-OC48: Edit OC48 port” (p. 4-537) , “ED-OC192: Edit OC192 port” (p. 4-613) ,
SNVS - Status, Not in Valid State, DCC channel already enabled	DCC channels enabled	“ENT-CRS-FECOM: Enter transparent DCC cross-connection” (p. 4-1405)
SNVS - Status, Not in Valid State, DCC channel occupied by MSP/APS DCC protection	DCC protection	
SNVS - Status, Not in Valid State, DCC channel can not be assigned to MCN and SCN at the same time	independent use of DCC channel for MCN or SCN	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
SNVS - Status, Not in Valid State, DCC channel used in transparent DCC cross connection	Transparent DCC for DCC Line/MS Protection Mode	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
	Transparent DCC for DCC Sect/RS Protection Mode	
	Transparent DCC cross-connection	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, DCC/LAN channels assigned	reject deletion when node is assigned to LAN or DCC	“DLT-ULSDCC-L3: Delete a node ID other than node-1” (p. 4-244)
SNVS - Status, Not in Valid State, DCC on SCN may not be enabled	changing of <i>portClass</i> from INNI to EDGE or TRADITIONAL only possible, if no DCC for SCN is enabled on the port	“ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)
SNVS - Status, Not in Valid State, dcc protection side carries traffic	dcc protection: protection side is active	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, DCC needed for BLSR/MS-SPRING	for 2/4 fiber BLSR/MS-SPRING	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
SNVS - Status, Not in Valid State, DCC protection available	DCC Protection	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
SNVS - Status, Not in Valid State, default router LAN port not configured	check for correct configured Default Router LAN Port	“ENT-ULS: Enter upper layer stack” (p. 4-1815)
SNVS - Status, Not in Valid State, Different interface standards for input tributaries	path-protected cross-connection has inputs from ports with same interface standards	“ENT-CRS: Enter cross-connection” (p. 4-1361), “CNVT-CCT: Convert cross-connection topology” (p. 4-67)
SNVS - Status, Not in Valid State, Different interface standards for working and protection tributaries	Tributaries must belong to ports of equal interface standards	“ENT-OUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, DS3AIS or IDLE not allowed with Unframed Clear-Channel	DS3AIS or IDLE not allowed with unframed clear-channel	“ED-T3: Edit DS3 port” (p. 4-1126)
SNVS - Status, Not in Valid State, DS3 path PM not allowed with Unframed Clear-Channel	DS3 path PM not allowed with unframed clear-channel	“ED-T3: Edit DS3 port” (p. 4-1126)
SNVS - Status, Not in Valid State. Duplex Control Recovery in progress	no SW installation during Duplex Control Recovery	“APPLY: Apply software generic” (p. 4-34)
SNVS - Status, Not in Valid State, EDGE port carrying EDGE-prt must not be in LOCKOUT	Affected EDGE port the EDGE-prt tributary is located on must not be in LOCKOUT state	“ENT-OUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)
SNVS - Status, Not in Valid State, EDGE ports must not be in line or equipment protection schemes	Affected EDGE ports must not be in a line or equipment protection scheme	“ENT-OUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)
SNVS - Status, Not in Valid State, extra traffic cross-connections are still existing	No cross-connections allowed when leaving TOPEX	“ED-PROTN-GRP: Edit protection group” (p. 4-742), “DLT-PROTN-GRP: Delete protection group” (p. 4-215)
SNVS - Status, Not in Valid State, facility loopbacks still exist	No facility loopbacks for interface type change	“ED-T3: Edit DS3 port” (p. 4-1126), “ED-EC1: Edit EC1 port” (p. 4-291)
SNVS- Status, Not in Valid State, facility loopbacks still exist	no facility loopbacks allowed	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167), “DLT-EQPT (Socket): Delete equipment” (p. 4-177) (
SNVS - Status, Not in Valid State, facility loopbacks still exist at the protection pack		“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Facility Loopback is active for this port	<i>servcond</i> must be disabled for facility loopback	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), , “ED-EPORT: Edit Ethernet port” (p. 4-303), “ED-STM16T: Edit STM16T port” (p. 4-1021), “ED-T3: Edit DS3 port” (p. 4-1126), “ED-EC1: Edit EC1 port” (p. 4-291)
SNVS - Status, Not in Valid State, implicit channel re-assignment	implicit status changes of dccstat, scn_dccstat	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
SNVS - Status, Not in Valid State, incompatibility istddflt and trbmddflt	compatibility istddflt and trbmddflt	“ED-EQPT (system): Edit equipment (system)” (p. 4-359)
SNVS - Status, Not in Valid State, incomplete IP configuration	check for correct IP configuration	“ED-NE: Edit NE” (p. 4-398), “ENT-IP-MAP: Enter TCP/IP map” (p. 4-1488), “ENT-ULS: Enter upper layer stack” (p. 4-1815)
	compatibility xcsetup and IP configuration for SCN	“ED-EQPT (system): Edit equipment (system)” (p. 4-359)
SNVS - Status, Not in Valid State, input port(s) for LOXC cross-connection in adaptive mode	LO cross-connections only in fixed mode	“ENT-CRS: Enter cross-connection” (p. 4-1361)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, input port(s)for pathprot. crossconnecton in adaptive mode	pathprotected cross-connection: both inputs in fixed-mode	“CNVT-CCT: Convert cross-connection topology” (p. 4-67)
SNVS - Status, Not in Valid State, Input tributary shared with other path protection group	SNC Type change on higher order path protection groups sharing input tributaries	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, Interfering cross connection existing on protection tributary	No interfering cross connection must exist on protection tributary	“ENT-OUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)
SNVS - Status, Not in Valid State, invalid IP configuration	check IP configuration	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)
SNVS - Status, Not in Valid State, invalid test access mode	Invalid test access mode change request	“CHG-ACCMD: Change access mode” (p. 4-62)
SNVS - Status, Not in Valid State, Invalid topology	valid topology	“DLT-CRS: Delete cross-connection” (p. 4-134)
SNVS - Status, Not in Valid State, J0 parameters can not be set for INNI ports	some parameters not setable for ports of <i>portClass=INNI</i>	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, l3radesnode not in created state	l3radesnode must be in the created state	“ENT-ULSDCC-L3: Create a further OSI node” (p. 4-1822), “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228)
SNVS - Status, Not in Valid State, LAN is in use for Default Router	IP disabling while used as IP Default Router LAN	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)
SNVS - Status, Not in Valid State, LAN1 can not be disabled	can't disable LAN1	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)
SNVS - Status, Not in Valid State, loopback does not exist	loopback must exist	“RLS-LPBK: Release loopback (here cross-connection loopback)” (p. 4-2041) - tributary, “RLS-LPBK: Release loopback (here facility loopback)” (p. 4-2045) - port
SNVS - Status, Not in Valid State, loopbacks present	setting of <i>portControl</i> to NORMAL only possible if no cross-connection loopbacks existing	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), “ED-VCG: Edit virtual concatenation group” (p. 4-1270)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, lower order cross-connections are still existing	No lower order cross-connections allowed	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167), “DLT-EQPT (Socket): Delete equipment” (p. 4-177)
	Setting of <i>portClass</i> to INNI only possible, if no lower order cross-connections exist	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)
	No lower order cross-connections for <i>istd</i> change	“ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037),
	No lower order cross-connections for <i>istd</i> , <i>trbmd</i> change	“ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
	HO cross-connections not on substructured tributaries	“ENT-CRS: Enter cross-connection” (p. 4-1361), “CNVT-CCT: Convert cross-connection topology” (p. 4-67), “OPR-LPBK (here cross-connection loopback)” (p. 4-1895)
	HO TACC sessions not on substructured tributaries	“CONN-TACC: Connect test access” (p. 4-87)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, LOXC destination not usable	No forced switch to unusable LOXC slot (LOXC Protection Group)	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)
SNVS - Status, Not in Valid State, LOXC switch capacity invalid	LOXC pack with more than 0G switch capacity	“ENT-CRS: Enter cross-connection” (p. 4-1361)
SNVS - Status, Not in Valid State, maintenance condition	check whether system is maintenance condition	“ENT-EQPT (slot): Enter equipment (slot)” (p. 4-1441) , “ED-EQPT (slot): Edit equipment (slot)” (p. 4-338) , “DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167) , “ENT-EQPT (Socket): Enter equipment” (p. 4-1451) , “ED-EQPT (socket): Edit equipment” (p. 4-347) , “DLT-EQPT (Socket): Delete equipment” (p. 4-177) , “ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475) , “ENT-ULS: Enter upper layer stack” (p. 4-1815) , “ED-T3: Edit DS3 port” (p. 4-1126) , “ED-EC1: Edit EC1 port” (p. 4-291)
SNVS - Status, Not in Valid State, Manual Switch to Worker for Protection Type 1x1 not allowed	MSP type 1:1 does not allow manual switch requests to worker	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)
SNVS - Status, Not in Valid State, Manual Switch for Protection Type 1+1_Optimized not allowed	MSP type 1+1_optimized does not allow manual switch commands	
SNVS - Status, Not in Valid State, Modification of flow control mode not allowed	No modification of <i>fcmd</i> if <i>vlantagmd</i> = 802.1TAG	“ED-EPORT: Edit Ethernet port” (p. 4-303)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Modification not allowed	No Modification of rptmode if vlantagmd = 802.1TAG	“ED-EPORT: Edit Ethernet port” (p. 4-303)
SNVS - Status, Not in Valid State, Modification not allowed in Backward Compatible Mode	Parameter modification not allowed in backward compatible mode	“ED-VCG: Edit virtual concatenation group” (p. 4-1270) , “ED-EPORT: Edit Ethernet port” (p. 4-303) ,
SNVS - Status, Not in Valid State, multiple added XCs for MSSPRING TOP	no multiple added XCs for MSSPRING TOP	“ENT-CRS: Enter cross-connection” (p. 4-1361) , “CNVT-CCT: Convert cross-connection topology” (p. 4-67) , “ED-PROTN-GRP: Edit protection group” (p. 4-742)
	no multiple added XCs for TOP	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, MS-DCC may not be enabled	changing of <i>portClass</i> only possible, if MS-DCC is not enabled on the port	“ED-STM1E: Edit STM1E port” (p. 4-802) ,
SNVS - Status, Not in Valid State, new Tributary has existing loopback	No crossconnection loopback existing	“CNVT-CCT: Convert cross-connection topology” (p. 4-67)
SNVS - Status, Not in Valid State, new tributary used in test access session	Tributary not used in a test access session	

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, ndetmd must not be AUTO	Some parameters not settable for ports of <i>ndetmd</i> AUTO	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
SNVS - Status, Not in Valid State, no dcc channel enabled	dcc enabled	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
	dcc enabled on protection port	
SNVS - Status, Not in Valid State, node in use as RA destination node	reject deletion when node is used as RA destination node by OSI node 1	“DLT-ULSDCC-L3: Delete a node ID other than node-1” (p. 4-244)
SNVS - Status, Not in Valid State, node not in idle state	idle ring node for protocol conversion	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS Status, Not in Valid State, no matching log entry	no matching log entry	“RTRV-LOG-NTFCN: Retrieve notification Log” (p. 4-2309), “RTRV-LOG-PROTNSW: Retrieve log protection switch” (p. 4-2313)
SNVS - Status, Not in Valid State, No matching NN cross connection existing on working tributary	NN connection of matching directionality must exist on working tributary	“ENT-OUUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)
SNVS - Status, Not in Valid State, no other LAN port with IP enabled for T-TD or FTDD available	can't assign LAN to SCN Node when T-TD or FTDD is enabled and no other LAN port with IP configuration is available	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, no SCN IP address provisioned	for provisioned SCN IP address	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
	can't assign LAN to scnnode when no ASTN IP address is provisioned	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)
SNVS - Status, Not in Valid State, no Swiss capable HW	compatibility xcsetup and HW configuration	“ED-EQPT (system): Edit equipment (system)” (p. 4-359)
SNVS - Status, Not in Valid State, no test access session on the test tributary	No test access session on the test tributary	“CHG-ACCMD: Change access mode” (p. 4-62), “DISC-TACC: Disconnect test access” (p. 4-118)
SNVS - Status, Not in Valid State, not in Maintenance Condition	check of the maintenance condition	“ED-EQPT (system): Edit equipment (system)” (p. 4-359), “SET-SID: Set SID” (p. 4-2943), “ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)
SNVS - Status, Not in Valid State, no XC reservations allowed for change of INNI parameters	Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, no XCs allowed for change of INNI parameters	setting of some INNI properties only possible, if no cross-connection existing	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)
SNVS - Status, Not in Valid State, NVM size not sufficient	Compatibility xcsetupand NVM size	“ED-EQPT (system): Edit equipment (system)” (p. 4-359)
	NVM size sufficient for database with NN objects	“CPY-MEM: Copy memory” (p. 4-105)
SNVS - Status, Not in Valid State, one port of protection unit is assigned as timing reference	Working port to be added is assigned as timing reference	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, ONNS is active	Deletion of XC circuit packs while ONNS is active	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167)
	SW installation in trial phase while ONNS is active	“APPLY: Apply software generic” (p. 4-34)
SNVS - Status, Not in Valid State, Optical Channel must be enabled	enabling of outband FEC only if optical channel is enabled	“ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC192: Edit OC192 port” (p. 4-613),
SNVS - Status, Not in Valid State, osinode not in created state	osinode must be in the created state	“ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack.” (p. 4-1228), “DLT-ULSDCC-L3: Delete a node ID other than node-1” (p. 4-244)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, other port of protection unit is assigned to a line timing reference	no timing reference on other port of protection unit	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
SNVS - Status, Not in Valid State, OUC to different protection tributary already exists	No OUC must already exist on working tributary to different protection tributary	“ENT-OUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)
SNVS - Status, Not in Valid State, Output is already crossconnected	output not in use	“ENT-CRS: Enter cross-connection” (p. 4-1361)
SNVS - Status, Not in Valid State, P-bit parity violation monitoring not allowed with Unframed Clear-Channel	P-bit parity violation monitoring not allowed with unframed clear-channel	“ED-T3: Edit DS3 port” (p. 4-1126)
SNVS - Status, Not in Valid State, parameter required	parameter sc or dest is missing	“OPR-SYNCNSW: Operate synchronization switch ” (p. 4-1933)
SNVS - Status, Not in Valid State, Parameter(s) present which are not allowed	Only those parameter present which are needed	“CNVT-CCT: Convert cross-connection topology” (p. 4-67)
SNVS - Status, Not in Valid State, Parameter value for SNC Type not compliant to interface standard of working and protection tributaries	SNC Type must comply with interface standard of affected EDGE ports	“ENT-OUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)
SNVS - Status, Not in Valid State, part of 1+1 MSP protection	DCC Protection	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
SNVS - Status, Not in Valid State, portClass of protection port must not be EDGE	supported portClass: protection ports must not be of portClass EDGE	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, portClass must not be EDGE	Some parameters not settable for ports of <i>portClass</i> EDGE	“ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)
	No port in portClass EDGE	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
SNVS - Status, Not in Valid State, portClass must not be EDGE for TOP	setting of <i>portClass</i> for TOP	“ED-STM64: Edit STM64 port” (p. 4-1037), “ENT-PROTN-GRP: Enter protection group” (p. 4-1621), “ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, Port Class must not be EDGE or INNI	Not allowed to change the <i>portClass</i> directly from INNI to EDGE or EDGE to INNI	“ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, portClass must not be INNI	Some parameters not settable for ports of <i>portClass</i> INNI	“ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-STM16: Edit STM16 port” (p. 4-961), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
	supported <i>portClass</i>	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
	<i>hptimmon</i> changes to ENABLE only allowed when corresponding port is not of portClass INNI	“ED-VC3: Edit VC3 tributary” (p. 4-1255), “ED-STS1: Edit STS1 tributary” (p. 4-1101)
	No port in portClass INNI	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
SNVS - Status, Not in Valid State, portClass may not be EDGE	no EDGE protection port for 1+1 MSP	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
	no EDGE protection port for 1:1 MSP	
SNVS - Status, Not in Valid State, portClass may not be UNI	no UNI protection port for 1+1 MSP	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
	no UNI protection port for 1:1 MSP	
	supported <i>portClass</i>	

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Port in out of service state	setting of <i>portClass</i> to INNI only possible, if service condition not OUTOFSERVICE	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)
SNVS - Status, Not in Valid State, Port is not out-of-service	port is out-of-service	“OPR-LPBK: Operate loopback (here facility loopback)” (p. 4-1904)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Port is still in use	setting of <i>portClass</i> away from INNI only possible, if the port is not in use	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
	setting of <i>portClass</i> from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by SNN	
	setting of <i>portClass</i> away from INNI only possible, if the port is not in use by M:N reservation	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)
SNVS - Status, Not in Valid State, Port is still in use by ONNS	No port on protection pack in <i>portClass</i> EDGE	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
	check if related port is not in use by ONNS	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167), “DLT-EQPT (Socket): Delete equipment” (p. 4-177)
	No port on protection pack in <i>portClass</i> UNI	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, port mode change not allowed for INNI ports	Port mode not settable for ports of <i>portClass</i> =INNI	“ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), “ED-STM64: Edit STM64 port” (p. 4-1037)
SNVS - Status, Not in Valid State, Port must not be a 1+1 protection port	setting of <i>portClass</i> from TRADITIONAL to EDGE	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
SNVS - Status, Not in Valid State, Port must not be a 1:1 protection port		“ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Port must not be member of a protection group	setting of <i>portClass</i> to INNI not possible for ports in protection groups	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
SNVS - Status, Not in Valid State, Port must not be of portClass INNI	No loopbacks on tributaries below ports of <i>portClass</i> INNI	“OPR-LPBK (here cross-connection loopback)” (p. 4-1895), “OPR-LPBK: Operate loopback (here facility loopback)” (p. 4-1904)
SNVS - Status, Not in Valid State, Port must not be of portClass EDGE	No loopbacks on tributaries below ports of <i>portClass</i> EDGE	“OPR-LPBK (here cross-connection loopback)” (p. 4-1895)
SNVS - Status, Not in Valid State, port numbers cannot be changed when T-TD is enabled	no TCP port number change with enabled T-TD function	“ENT-ULS: Enter upper layer stack” (p. 4-1815)
SNVS - Status, Not in Valid State, port used for NN application	Port used for NN application	“CONN-TACC: Connect test access” (p. 4-87)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, ports must be on different circuit packs	port on different packs	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621) , “ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, ports have different interface types	common interface type	
SNVS - Status, Not in Valid State, port is already used in another protection group	port is only in one group	
SNVS - Status, Not in Valid State, port rate not supported for this protection type	supported port rate	
SNVS - Status, Not in Valid State, ports have different port rates	common port rate	
SNVS - Status, Not in Valid State, protection port is assigned to a line timing reference	no timing reference on protection port	
SNVS - Status, Not in Valid State, protection port is out-of-service	no out-of-service state on protection port	
SNVS - Status, Not in Valid State, protection port is assigned as timing reference	Timing Reference Assigned on Protection Unit	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, port used for Linear MSP	port used for Linear MSP	“CONN-TACC: Connect test access” (p. 4-87)
SNVS - Status, Not in Valid State, port used for MSSPRING/BLSR	port used for MSSPRING/BLSR	
SNVS - Status, Not in Valid State, protection dcc channel is enabled	dcc protection side is enabled	“ED-PROTN-GRP: Edit protection group” (p. 4-742)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, protection group still exist	no protection groups allowed	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167), “DLT-EQPT (Socket): Delete equipment” (p. 4-177)
SNVS - Status, Not in Valid State, protection tributary is used in cross-connection	No XC on protection tribs	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
SNVS - Status, Not in Valid State, Protection switch with current combination of XC circuit pack types is traffic affecting	No manual protection switch if the switchover leads to traffic impairments	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)
SNVS - Status, Not in Valid State, reference unavailable	reference switching during lockout or disabled state	“OPR-SYNCNSW: Operate synchronization switch ” (p. 4-1933)
SNVS - Status, Not in Valid State, request not practicable	no change of the request state, request not practicable	
	forced or manual switch request while reference is in forced state	
SNVS - Status, Not in Valid State, resources in use by Swiss	setting xcsetup back to TRADITIONAL	“ED-EQPT (system): Edit equipment (system)” (p. 4-359)
SNVS - Status, Not in Valid State, signal structure cannot be changed for connected parts of a fixed port	<i>inputsig</i> consistent with existing cross-connections	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037),
	<i>unequiposig</i> consistent with existing cross-connections	
	<i>inputsig</i> consistent with existing cross-connections for fixed tributary mode	“ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613),
	<i>unequiposig</i> consistent with existing cross-connections for fixed tributary mode	

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, socket is not provisioned	Socket must already be provisioned	“ED-EQPT (socket): Edit equipment” (p. 4-347), “DLT-EQPT (Socket): Delete equipment” (p. 4-177)
SNVS - Status, Not in Valid State, SONET port not allowed for TOP	SDH ports for TOP	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621), “ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, static VLAN configuration not cleared	check whether VLAN lists are empty	“ED-EQPT (cp): Edit equipment (circuit pack)” (p. 4-322)
SNVS - Status, Not in Valid State, SW generic is in trial phase	No SW download or DB restore during trial phase	“CPY-MEM: Copy memory” (p. 4-105), “COPY-RFILE: Copy remote file” (p. 4-98)
	Compatibility <i>xcsetup</i> and software state	“ED-EQPT (system): Edit equipment (system)” (p. 4-359)
SNVS - Status, Not in Valid State, Swiss access possible	no ONNS for interface standard change	“ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), “ED-VCG: Edit virtual concatenation group” (p. 4-1270)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Swiss not enabled	<i>portClass</i> only settable when xcsetup=SWISS	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037) “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), , “ED-VCG: Edit virtual concatenation group” (p. 4-1270)
	do not accept NN TL1 commands when xcsetup=TRADITIONAL	“ED-EQPT (system): Edit equipment (system)” (p. 4-359)
	Modification of SCN related parameters only while ONNS is enabled	“ED-NE: Edit NE” (p. 4-398)
SNVS - Status, Not in Valid State, switch back to previous software only allowed in trial phase	Switch back to previous SW only during trial phase	“APPLY: Apply software generic” (p. 4-34)
SNVS - Status, Not in Valid State, switch capacity below provisioned XC CP switch capacity	Switch capacity according XC CP	“ED-EQPT (system): Edit equipment (system)” (p. 4-359)
SNVS - Status, Not in Valid State, switch command not allowed for actual protection state	allowed switch command in that state	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)
SNVS - Status, Not in Valid State, TARP not enabled	check for correct TARP configuration	“ED-NE: Edit NE” (p. 4-398)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, TARP origination function disabled	TARP data cache change only if TARP origination enabled	“ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 4-1832)
SNVS - Status, Not in Valid State, TARP propagation can not be disabled	Can't disable TARP propagation while LAN TARP Storm Suppression is enabled	“ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 4-1832)
SNVS - Status, Not in Valid State, TCA profile assigned	modifying the name of an active profile	“ED-TCA-PROF: Edit TCA profile” (p. 4-1138) , “DLT-TCA-PROF: Delete TCA Profile” (p. 4-240)
SNVS - Status, Not in Valid State, Test Access not allowed on bridged cross connections	not allowed for bridged cross connections	“CONN-TACC: Connect test access” (p. 4-87)
SNVS - Status, Not in Valid State, Test Access not allowed with path protected tributaries	Not allowed for path protected tributaries	
SNVS - Status, Not in Valid State, the CP is not plugged out	CP must be plugged out	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167)
SNVS - Status, Not in Valid State, the Module is not plugged out	Invalid module plugged in	“ED-EQPT (socket): Edit equipment” (p. 4-347)
SNVS - Status, Not in Valid State, This Change of Protection Architecture not allowed, dep provision first	no change between MSP type 1+1_optimized and other MSP types	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, TID inconsistent with existing cross-connection	TIDs consistent with existing cross-connection	“ENT-CRS: Enter cross-connection” (p. 4-1361)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, timing clock mode inconsistent	timing clock mode inconsistent	“SET-SYCN: Set synchronization” (p. 4-2947)
SNVS - Status, Not in Valid State, Timing reference is assigned to this port	servcond must be enabled when timing source	“ED-STM1E: Edit STM1E port” (p. 4-802), “ED-STM1: Edit STM1 port” (p. 4-845), “ED-STM4: Edit STM4 port” (p. 4-903), “ED-STM16: Edit STM16 port” (p. 4-961), “ED-STM64: Edit STM64 port” (p. 4-1037), , “ED-OC3: Edit OC3 port” (p. 4-419), “ED-OC12: Edit OC12 port” (p. 4-478), “ED-OC48: Edit OC48 port” (p. 4-537), “ED-OC192: Edit OC192 port” (p. 4-613), ,
SNVS - Status, Not in Valid State, Too many cross-connection originating from same tributary	restrict number of cross-connection using same input tributary	“ENT-CRS: Enter cross-connection” (p. 4-1361), “CNVT-CCT: Convert cross-connection topology” (p. 4-67)
SNVS - Status, Not in Valid State, transparent DCC connections are existing at protection pack	Transparent DCC connections	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
SNVS - Status, Not in Valid State, transparent DCC connections are still existing	no transparent DCC connections	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167), “DLT-EQPT (Socket): Delete equipment” (p. 4-177) (
SNVS - Status, Not in Valid State, Trial to change loopback type	no change of loopback allowed	“OPR-LPBK: Operate loopback (here facility loopback)” (p. 4-1904)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Tributary has existing loopback	no cross-connection loopback existing	“ENT-CRS: Enter cross-connection” (p. 4-1361) “DLT-CRS: Delete cross-connection” (p. 4-134), “CONN-TACC: Connect test access” (p. 4-87)
SNVS - Status, Not in Valid State, tributary is not in state wait-to-restore	wait-to-restore is not pending	“OPR-VCGTRIB: Operate virtual concatenation group tributary” (p. 4-1938)
SNVS - Status, Not in Valid State, tributary is used in cross-connection loopback	no XC loopbacks on tribs	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621), “DLT-PROTN-GRP: Delete protection group” (p. 4-215), “ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, tributary not assigned as a test tributary	Tributary is not assigned as a test tributary	“RTRV-TACC: Retrieve test access” (p. 4-2786)
SNVS - Status, Not in Valid State, trib of 1+1/1x1 port as input-trib in pathprotected crossconnection	No trib of 1+1 port protection as newinaid (for path-protected cross-connection)	“CNVT-CCT: Convert cross-connection topology” (p. 4-67)
SNVS - Status, Not in Valid State, trib of MSP 1+1/1x1 port as input-trib in pathprotected crossconnection	No input tributary of path-protected cross-connection on the ports	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, trib of MSP 1+1/1x1 port as input-trib in pathprotected crossconnection	No trib of any MSP port as in_aid (for path-protected cross-connection)	“ENT-CRS: Enter cross-connection” (p. 4-1361)
SNVS - Status, Not in Valid State, Tributaries must not be on ports of portClass INNI	Tributaries must not belong to ports of portClass INNI	
SNVS - Status, Not in Valid State, Tributaries must be on ports of portClass EDGE	Tributaries must belong to ports of <i>portClass</i> EDGE	“ENT-OUC: Enter ONNS to UPSR/SNCP constructs” (p. 4-1573)
SNVS - Status, Not in Valid State, tributary rate not supported for protection with this port rate	trib bandwidth is not greater as service bandwidth	“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
SNVS - Status, Not in Valid State, Tributary used in test access session	No test access session	“ENT-CRS: Enter cross-connection” (p. 4-1361), , “OPR-LPBK (here cross-connection loopback)” (p. 4-1895), “ENT-PROTN-GRP: Enter protection group” (p. 4-1621), “DLT-PROTN-GRP: Delete protection group” (p. 4-215), “DLT-EQPT (Socket): Delete equipment” (p. 4-177)
	Tributaries not used in a test access session when removing a path protection	“CNVT-CCT: Convert cross-connection topology” (p. 4-67)
SNVS - Status, Not in Valid State, T-TD enabled	not allowed to disable TARP when T-TD is enabled	“ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 4-1832)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, Unframed Clear-Channel not allowed with DS3 path PM	unframed clear-channel not allowed with DS3 path PM	“ED-T3: Edit DS3 port” (p. 4-1126)
SNVS - Status, Not in Valid State, Unframed Clear-Channel not allowed with P-bit parity violation monitoring	unframed clear-channel format not allowed with P-bit parity violation monitoring	
SNVS - Status, Not in Valid State, unknown IP address within MAP	check for known IP address	“DLT-IP-MAP: Delete TCP/IP map” (p. 4-187)
SNVS - Status, Not in Valid State, unknown module equipage	Equipage status and inventory data of module must be accessible	“ED-EQPT (socket): Edit equipment” (p. 4-347), “DLT-EQPT (Socket): Delete equipment” (p. 4-177)
SNVS - Status, Not in Valid State, unknown TARP Manual Adjacent NSAP	Check for Existing TARP Manual Adjacent NSAP	“DLT-ULSDCC-L4: Delete TARP manual adjacent NSAP address in layer 4 of the specified OSI stack” (p. 4-248)
SNVS - Status, Not in Valid State, unsupported MS - SPRing/BLSR DNI/DRI	supported MS-SPRing/BLSR DNI/DRI	“ENT-CRS: Enter cross-connection” (p. 4-1361) , “CNVT-CCT: Convert cross-connection topology” (p. 4-67)
SNVS - Status, Not in Valid State, VCG is still in use	Setting of <i>eportClass</i> from EDGE to TRADITIONAL only possible, if the VCG tributaries on the port are not in use by ONNS	“ED-VCG: Edit virtual concatenation group” (p. 4-1270)
SNVS - Status, Not in Valid State, working dcc channel is disabled	dcc protection: working side is disabled	“ED-PROTN-GRP: Edit protection group” (p. 4-742)
SNVS - Status, Not in Valid State, wrong IP configuration	Check for correct OSI node configuration	“ENT-ULS: Enter upper layer stack” (p. 4-1815)
	Check for IP default router LAN	“ENT-FECOM-LAN: Enter LAN related parameters” (p. 4-1475)

Errorcode	Meaning (validation rule)	Related to command ...
SNVS - Status, Not in Valid State, XC destination not usable	No forced switch to unusable XC slot (Switching Protection Group)	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)
SNVS - Status, Not in Valid State, XC loopbacks still exist	no XC loopbacks for interface type change	“ED-T3: Edit DS3 port” (p. 4-1126), “ED-EC1: Edit EC1 port” (p. 4-291)
SNVS - Status, Not in Valid State, XC loopbacks still exist	no XC loopbacks allowed	“DLT-EQPT (slot): Delete equipment (slot)” (p. 4-167), “DLT-EQPT (Socket): Delete equipment” (p. 4-177) (
SNVS - Status, Not in Valid State, XC loopbacks still exist at the protection pack.		“ENT-PROTN-GRP: Enter protection group” (p. 4-1621)
SNVS - Status, Not in Valid State, xcon must not be of class NN	Tributaries occupied by ONNS	“OPR-LPBK: Operate loopback (here facility loopback)” (p. 4-1904)
SNVS - Status, Not in Valid State, XC Pack not provisioned	XC pack is (pre-)provisioned	“ENT-CRS: Enter cross-connection” (p. 4-1361), “ENT-PROTN-GRP: Enter protection group” (p. 4-1621), “CONN-TACC: Connect test access” (p. 4-87)
SNVS - Status, Not in Valid State, xcsetup must be TRADITIONAL	Check of xcsetup for ip_ad_astn change	“ENT-ULS: Enter upper layer stack” (p. 4-1815)
SPFA - Status, Protection unit FAiled	succeeding switch command	“OPR-PROTNSW: Operate protection switch” (p. 4-1913), “RLS-PROTNSW: Release protection switch” (p. 4-2050)
	XC pack is not present or in failed state	“RTRV-SPANSWS: Retrieve SPAN switch state” (p. 4-2643)
SPFA - Status, Protection unit FAiled, APS did not succeed	APS switch time constraint	“OPR-PROTNSW: Operate protection switch” (p. 4-1913)

Errorcode	Meaning (validation rule)	Related to command ...
SRAC - Status, Requested Access Configuration invalid, retrieved file NE mismatch	product mismatch	“CPY-MEM: Copy memory” (p. 4-105), “COPY-RFILE: Copy remote file” (p. 4-98)
SROF - Status, Requested Operation Failed	non-hardware system difficulties	“APPLY: Apply software generic” (p. 4-34)
	no more than two TARP manual adjacencies per node	“ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 4-1832)
	Provisioning of TARP manual adjacencies only if TARP enabled	
SROF - Status, Requested Operation Failed, other system failure	APPLY applied on corrupted software	“APPLY: Apply software generic” (p. 4-34)
SROF - Status, Requested Operation Failed, external communications failure	external communication failure	“CPY-MEM: Copy memory” (p. 4-105)
SROF - Status, Requested Operation Failed, unsuccessful file transfer	transferred file is deemed invalid	
SRQN - Status, invalid request, uid not logged in	user with uid not logged in	“CANC-USER-SECU: Cancel user security” (p. 4-59)
SSRD - Status, Switch Request Denied, clock mode inconsistent	clock backup switch request when clock mode is free running	“OPR-SYCNCSW: Operate synchronization switch ” (p. 4-1933)
SSRE - Status, System Resources Exceeded, allowed limit of DCC channels exceeded	validation rule for max number of DCC channels for MS/RS-DCC reached	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
	validation rule if more than 64 DCC channels are assigned to node-1	

Errorcode	Meaning (validation rule)	Related to command ...
SSRE - Status, System Resources Exceeded, allowed limit of SCN DCC channels exceeded	maximum number of channels assigned to SCN	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
SSRE - Status, System Resources Exceeded, allowed number of active LOXC packs exceeded	Check number of active LOXC packs	“ED-EQPT (cp): Edit equipment (circuit pack)” (p. 4-322)

Errorcode	Meaning (validation rule)	Related to command ...
SSRE - Status, System Resources Exceeded, limit of PM monitors exceeded	maximum number of enabled PM monitors	“ED-STM1E: Edit STM1E port” (p. 4-802) , “ED-STM1: Edit STM1 port” (p. 4-845) , “ED-STM4: Edit STM4 port” (p. 4-903) , “ED-STM16: Edit STM16 port” (p. 4-961) , “ED-STM64: Edit STM64 port” (p. 4-1037) , , “ED-OC3: Edit OC3 port” (p. 4-419) , “ED-OC12: Edit OC12 port” (p. 4-478) , “ED-OC48: Edit OC48 port” (p. 4-537) , “ED-OC192: Edit OC192 port” (p. 4-613) , , “ED-VC3: Edit VC3 tributary” (p. 4-1255) , “ED-STS1: Edit STS1 tributary” (p. 4-1101) , “ED-EPORT: Edit Ethernet port” (p. 4-303) , “ED-VCG: Edit virtual concatenation group” (p. 4-1270) , “ED-VCGTRIB: Edit virtual concatenation group tributary” (p. 4-1319) , “ED-OC48T: Edit OC48 transparent port” (p. 4-598) , “ED-PTF: Edit tributary with Path Termination Function (PTF)” (p. 4-770) , “ED-STM16T: Edit STM16T port” (p. 4-1021) , “ED-T3: Edit DS3 port” (p. 4-1126) , “ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application” (p. 4-1308) , “ED-EC1: Edit EC1 port” (p. 4-291)
SSRE - Status, System Resources Exceeded, limit of ppgnames exceeded	maximum number of <i>ppgnames</i> exceeded	“ENT-CRS: Enter cross-connection” (p. 4-1361) , “ED-PROTN-GRP: Edit protection group” (p. 4-742) , “CNVT-CCT: Convert cross-connection topology” (p. 4-67)

Errorcode	Meaning (validation rule)	Related to command ...
SSRE - Status, System Resources Exceeded, limit of profiles exceeded	maximum number of profiles	“ENT-ASAP-PROF: Enter alarm severity assignment profile” (p. 4-1345)
	maximum number of TCA profiles reached	“ENT-TCA-PROF: Enter TCA Profile” (p. 4-1768)
SSRE - Status, System Resources Exceeded, limit of transparent DCC Cross Connectins exceeded	maximum of DCC CCs exceeded	“ENT-CRS-FECOM: Enter transparent DCC cross-connection” (p. 4-1405)
	Maximum of DCC CCs exceeded with CTL/3	“ENT-CRS-FECOM: Enter transparent DCC cross-connection” (p. 4-1405)
SSRE - Status, System Resources Exceeded, limit of tribs with loca, locz exceeded	maximum number of tributaries with loca, locz entries must not exceed 100	“ED-VC3: Edit VC3 tributary” (p. 4-1255), “ED-STS1: Edit STS1 tributary” (p. 4-1101)
SSRE - Status, System Resources Exceeded, limit of VLAN Identifiers exceeded	Maximum number of entries in valid VLAN ID list exceeded	“ED-EPORT: Edit Ethernet port” (p. 4-303)
SSRE - Status, System Resources Exceeded, max. no. of profiles reached	Maximum number of TCA profiles reached	“ENT-TCA-PROF: Enter TCA Profile” (p. 4-1768)
SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded	Maximum number of channels assigned to MCN and SCN	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
	Maximum nr. of channels assigned to MCN and SCN on CTL/3	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)
	Maximum number of channels assigned to MCN and SCN on CTL4	“ENT-FECOM: Enter DCC channel related parameters” (p. 4-1459)

Errorcode	Meaning (validation rule)	Related to command ...
SSRE - Status, System Resources Exceeded (sent by T-TD, TL1_TTD)	Maximum number of user sessions via T-TD on Gateway NE with CTL/4	“ACT-USER: Activate user” (p. 4-23)
	Maximum number of user sessions via T-TD on Gateway NE per TCP connection	
	Maximum number of user sessions via T-TD on Gateway NE	
STSF - Status, Connection torn down due to M:N group setup failure	NN PortID parameter value is not valid	“ENT-PATH: Create ONNS path connection” (p. 4-1583)

15 User privilege codes

Overview

Purpose

The following table lists the user privilege codes

Contents

List of user privilege codes	15-2

List of user privilege codes

TL1 command	User privilege code (UCFC/UCAL)
ACT-USER: Activate user	Any
ALW-MSG: Allow message	M3§
APPLY: Apply software generic	S4
CANC-USER: Cancel user	Any
CANC-USER-SECU: Cancel user security	S5
CPY-MEM: Copy memory	S4
DLT-ASAP-PROF: Delete ASAP profile	M3
DLT-CRS: Delete Cross-connection	P3
DLT-CRS-FECOM: Delete transparent DCC cross-connection	M3
DLT-EQPT (slot): Delete equipment (slot)	P3
DLT-EQPT (Socket): Delete equipment	
DLT-IP-MAP: Delete TCP/IP map	S3
DLT-OUC: Delete ONNS to UPSR/SNCP constructs	P3
DLT-PROTN-GRP: Delete protection group	M4
DLT-TCA-PROF: Delete TCA Profile	PM3
DLT-ULSDCC-L3: Delete a node ID other than node-1	S3
DLT-ULSDCC-L4: Delete TARP manual adjacent NSAP address in layer 4 of the specified OSI stack	
DLT-USER-SECU: Delete user security	S5
ED-ASAP-PROF: Edit alarm severity assignment profile	M3
ED-CRS: Edit Cross-connection	P3
ED-DAT: Edit date and time	S4
ED-EC1: Edit EC1 port	P3
ED-EPORT: Edit Ethernet port	P3
ED-EQPT (CP): Edit equipment (circuit pack)	
ED-EQPT (shelf): Edit Equipment (shelf)	
ED-EQPT (slot): Edit Equipment (slot)	
ED-EQPT (Socket): Edit equipment	
ED-EQPT (system): Edit Equipment (system)	

TL1 command	User privilege code (UCFC/UCAL)
ED-FETID: Edit Far End Target Identifier	S3
ED-LONIM: Edit Low Order Non-Intrusive Monitor	P3
ED-MAP-RING: Edit map ring	M3
ED-NE: Edit NE	S3
ED-NE-SECU: Edit NE security	S5
ED-NNCRS: Edit NN cross connection	P5
ED-OC3: Edit OC3 port	P3
ED-OC12: Edit OC12 port	
ED-OC48: Edit OC48 port	
ED-OC48T: Edit OC48T port	
ED-OC192: Edit OC192 port	
ED-OC768: Edit OC768 port	
ED-PTF: Edit Tributary with Path Termination Function (PTF)	
ED-OTU2: Edit OTU2 port	
ED-PID: Edit password identifier	S1
ED-PROTN-GRP: Edit protection group	M4
ED-STATE-EQPT (system): Edit equipment state	
ED-RSVP: Modify RSVP parameters	S3
ED-STM1: Edit STM1 port	P3
ED-STM1E: Edit STM1E port	
ED-STM4: Edit STM4 port	
ED-STM16: Edit STM16 port	
ED-STM16T: Edit STM16T port	
ED-STM64: Edit STM64 port	
ED-STM256: Edit STM256 port	
ED-STS1: Edit STS1 tributary	
ED-T3: Edit DS3 port	
ED-TCA-PROF: Edit TCA Profile	PM3
ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack	S4
ED-USER: Edit user	S1
ED-USER-SECU: Edit user security	S5

TL1 command	User privilege code (UCFC/UCAL)
ED-VC3: Edit VC3 tributary	P3
ED-VCG: Edit virtual concatenation group	
ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application	
ED-VCGTRIB: Edit virtual concatenation group tributary	
ED-VRTSW: Edit Virtual Switch	
ENT-ASAP-PROF: Enter alarm severity assignment profile	M3
ENT-CRS: Enter cross-connection	P3
ENT-CRS-FECOM: Enter transparent DCC cross-connection	M3
ENT-EQPT (slot): Enter Equipment (slot)	P3
ENT-EQPT (Socket): Enter equipment	
ENT-FECOM: Enter DCC channel related parameters	S3
ENT-FECOM-LAN: Enter LAN related parameters	S4
ENT-MANROUTE-LAN: Enter manual route at LAN port	
ENT-IP-MAP: Enter TCP/IP map	S3
ENT-OUC: Enter ONNS to UPSR/SNCP constructs	P3
ENT-PROTN-GRP: Enter protection group	M4
ENT-ROLL: Enter roll	P3
ENT-TCA-PROF: Enter TCA Profile	PM3
ENT-ULS: Enter upper layer stack	S4
ENT-ULSDCC-L3: Create a further OSI node	
ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks	
ENT-USER-SECU: Enter user security	S5
INIT-EQPT (slot): Initialize equipment (slot)	M4
INH-MSG: Inhibit message	M3
INIT-REG: Initialize Register	PM3
INIT-SYS: Initialize System	S4
OPR-EXT-CONT: Operate External Control	M3
OPR-LPBK: Operate loopback	T4
OPR-PROTNSW: Operate protection switch	M4
OPR-SYNCNSW: Operate synchronization switch	

TL1 command	User privilege code (UCFC/UCAL)
OPR-VCGTRIB: Operate virtual concatenation group tributary	M3
RLS-EXT-CONT: Release external control	M3
RLS-LPBK: Release loopback	T4
RLS-PROTNSW: Release protection switch	M4
RLS-SYNCNSW: Release synchronization switch	
RTRV-ALL: Retrieve all	P1
RTRV-ACTLCP: Retrieve acceptable circuit pack list	
RTRV-ACTL-CONT	M1
RTRV-ALM: Retrieve alarm	
RTRV-ALM-ENV: Retrieve alarm environment	
RTRV-AO: Retrieve Autonomous Output	S1
RTRV-ASAP-ASGNMT: Retrieve ASAP assignment	M1
RTRV-ASAP-PROF: Retrieve ASAP profile	
RTRV-ATTR-CONT: Retrieve attribute control	
RTRV-ATTR-ENV: Retrieve attribute environment	
RTRV-ATTR-MSG: Retrieve attribute message	
RTRV-COND: Retrieve condition	
RTRV-CRS: Retrieve cross-connection	P1
RTRV-CRS-FECOM: Retrieve transparent DCC cross-connection	M1
RTRV-EC1: Retrieve EC1 port	P1
RTRV-EPORT: Retrieve Ethernet port	P1
RTRV-EQPT (bay): Retrieve Equipment (bay)	
RTRV-EQPT (CP): Retrieve equipment (circuit pack)	
RTRV-EQPT (shelf): Retrieve Equipment (shelf)	
RTRV-EQPT (slot): Retrieve Equipment (slot)	
RTRV-EQPT (Socket): Retrieve equipment	
RTRV-EQPT (system): Retrieve Equipment (system)	
RTRV-EPM: Ethernet performance monitoring	PM1
RTRV-EXT-CONT: Retrieve external control	M1
RTRV-FECOM: Retrieve DCC related parameters	
RTRV-FECOM-LAN: Retrieve LAN channel related parameters	S1

TL1 command	User privilege code (UCFC/UCAL)
RTRV-HDR: Retrieve header	Any
RTRV-IP-MAP: Retrieve TCP/IP map	S1
RTRV-LOG-ALM: Retrieve log alarm	
RTRV-LOG-ERROR: Retrieve Error Log	
RTRV-LOG-NNEVT: Retrieve NN Event Log	
RTRV-LOG-NTFCN: Retrieve notification Log	
RTRV-LOG-PROTSW: Retrieve log protection switch	
RTRV-LONIM: Low-Order Non-Intrusive Monitor	P1
RTRV-LOXCPM: Retrieve Performance Monitoring Data of LOXC pack	PM1
RTRV-LPBK Retrieve loopback	T1
RTRV-MAP-NEIGHBOR: Retrieve map neighbor	S1
RTRV-MAP-NETWORK: Retrieve network map	
RTRV-MAP-RING: Retrieve map ring	M1
RTRV-NE: Retrieve NE	S1
RTRV-NE-SECU: Retrieve NE security	
RTRV-NUDR: Retrieve ONNS network UNI data repository	P1
RTRV-OC3: Retrieve OC-3 port	
RTRV-OC12: Retrieve OC-12 port	
RTRV-OC48: Retrieve OC-48 port	
RTRV-OC48T: Retrieve OC-48T port	
RTRV-OC192: Retrieve OC-192 port	
RTRV-OC768: Retrieve OC-768 port	
RTRV-OUC: Retrieve ONNS to UPSR/SNCP constructs	
RTRV-PATH-UNI: Retrieve UNI specific information of a UNI connection data	
RTRV-PTF: Retrieve Tributary with Path Termination Function (PTF)	
RTRV-OTU2: Retrieve OTU2 port	
RTRV-OW: Retrieve Orderwire and User Bytes	M1
RTRV-PM: Retrieve performance monitoring	PM1
RTRV-PRMTR-DATA: Retrieve parameter data	S1
RTRV-PRMTR-SFTWR: Retrieve parameter software	

TL1 command	User privilege code (UCFC/UCAL)
RTRV-PROTN-GRP: Retrieve protection group	M1
RTRV-RSVP: Retrieve RSVP parameters	S1
RTRV-SCN-NEIGHBOR: Retrieve SCN neighbor	
RTRV-STATE-EQPT (CP): Retrieve equipment state (circuit pack)	M1
RTRV-STATE-EQPT (slot): Retrieve equipment state (slot)	
RTRV-STATE-EQPT (Socket): Retrieve equipment state	
RTRV-STATE-EQPT (system): Retrieve equipment state	
RTRV-STM1: Retrieve STM-1 port	P1
RTRV-STM1E: Retrieve STM1E port	
RTRV-STM4: Retrieve STM-4 port	
RTRV-STM16: Retrieve STM-16 port	
RTRV-STM16T: Retrieve STM-16T port	
RTRV-STM64: Retrieve STM-64 port	
RTRV-STM256: Retrieve STM-256 port	
RTRV-STS1: Retrieve STS1 tributary	
RTRV-T3: Retrieve DS3 port	
RTRV-SYCN: Retrieve synchronization	M1
RTRV-TCA-PROF: Retrieve TCA profile	PM1
RTRV-ULS: Retrieve upper layer stack	S1
RTRV-ULSDCC-L3: Retrieve layer 3 related parameters	S1
RTRV-ULSDCC-L4: Retrieve OSI layer 4 related parameters	
RTRV-USER: Retrieve user	S2
RTRV-USER-SECU: Retrieve user security	S4
RTRV-VC3: Retrieve VC3 tributary	P1
RTRV-VCG: Retrieve virtual concatenation group	
RTRV-VCG-TRANS: retrieve virtual concatenation group for fully transparent application	
RTRV-VCGTRIB: Retrieve virtual concatenation group tributary	
RTRV-VRTSW: Retrieve Virtual Switch	

TL1 command	User privilege code (UCFC/UCAL)
SET-ATTR-CONT: Set attribute control	M3
SET-ATTR-ENV: Set attribute environment	
SET-MAP-RING: Set map ring	
SET-OW: Set Orderwire and User Bytes	M3
SET-SID: Set SID	S4
SET-SYNCN: Set synchronization	M3

16 Optical network navigation system (ONNS)

Overview

Purpose

This chapter contains detailed information about the TL1 commands related to the so-called Optical Network Navigation System (ONNS) feature.

The ONNS system component name is often shortened to SNN or NN.

Contents

ONNS system parameters	16-2
List of commands	16-3
ONNS data repositories	16-4

ONNS system parameters

Overview

Purpose

This section lists information about the TL1 commands related to the ONNS system parameters.

Contents

List of commands	16-3

List of commands

- “RTRV-NNCNFG: Retrieve ONNS configuration data” (p. 4-2387)
- “ED-NNCNFG: Modify ONNS system configuration” (p. 4-408)
- “RTRV-NNEVT-TCA” (p. 4-2411)
- “REPT-NNCHG Notification: Report ONNS data repository changes” (p. 4-1992)
- “REPT-NNEVT Notification: Report ONNS internal events” (p. 4-1997)

ONNS data repositories

Overview

Purpose

This section lists information about the TL1 commands related to the ONNS data repositories.

Contents

List of commands	16-5

List of commands

- “RTRV-NNDR: Retrieve ONNS neighbor nodal data repository” (p. 4-2393)
- “RTRV-NTDR: Retrieve ONNS network topology data repository” (p. 4-2417)
- “RTRV-NADR: Retrieve ONNS Network (Domain) Address Data Repository” (p. 4-2371)

Path

Overview

Purpose

This section contains information about the TL1 commands related to the Path.

Contents

List of commands	16-7
Connection and path state definitions	16-8

List of commands

- “RTRV-PATH: Retrieve ONNS connection data” (p. 4-2526)
- “ENT-PATH: Create ONNS path connection” (p. 4-1583)
- “ED-PATH: Add or modify alias of ONNS connection” (p. 4-686)
- “ED-PATH-PROT: Modify ONNS connection parameters or protection type” (p. 4-700)
- “ED-PATH-ROLL: Modify ONNS connection route” (p. 4-722)
- “DLT-PATH: Delete ONNS path Connection” (p. 4-205)
- “REPT-PTHCHG Notification” (p. 4-2003)
- “REPT-PTHEVT Notification” (p. 4-2023)

Connection and path state definitions

Overview

The Connection `connStatus` and the `pathState` variables are related, and the `connStatus` can be derived from the `pathState`. The two tables below show the possible states.

The column `State Type` characterizes the codes further:

- ES: connection/path is in a stable and active End State
- FR: Final Report state (indicates that the connection/path is no longer active)
- TS: Transient State
- RQ connection/path on Restoration Queue.

`connStatus` Codes

TL1 <i>connStatus</i> code	Description	State Type
CON&OK	Normal Connection Status	ES
CON&FAILED	Connection failure	ES
CON&NO-IN	No Input, source or destination (Initial setup)	ES
CON&FAILED&RSTRFL	Restoration attempt failed / connection going to the Restoration Queue	TS
CON&TRDOWN	Connection Delete (In Progress)	TS
DLT	Connection Deleted	FR
CON&DLT-FL	Conn Delete Failed, path not deleted	ES
CON&OK&RSTRD	Auto-Reroute Revertive Connection Status (after initial restoration)	ES
NOCON&SETUP	Initial connection setup in progress	TS
NOCOM&PREMPTD	Connection has been disconnected from original path	TS
CON&OK&WTORV	AUTORV Path ready, waiting for WTR (wait-to-revert) timer to revert to original path	TS
NOCON&WTORSTR	Preempted path removed & Connection has been added to the Restoration Queue.	ES / RQ

TL1 <i>connStatus</i> code	Description	State Type
CON&FAILED&WTORSTR	Auto Connection failed & has been added to the Restoration Queue.	ES / RQ
CON&SETUP	Initial connection setup completed, waiting for check of signal	TS
NOCON&SETUPFL	Initial connection setup failed	FR
NOCON	Connection has been disconnected from original path by maintenance operation	TS
CON&STBY	Protecting connection not being allocated for protecting a working one	ES
CON&USED	Protecting connection not being allocated for protecting a working one	ES
CON&UNKNOWN	Connection Status is not known after a recovery until the fault status is retrieved from the z-node	TS
CON&OK&DEGRADED	Path failure of a permanent 1+1 TS connection can't be restored by a new path	TS

PathState Codes

TL1 <i>pathState</i> code	Description	State Type
CON&OK	Normal Path Status	ES
CON&FAILED	Path failure	ES
CON&TRDOWN	Path Delete in progress	TS
DLT	Path Delete complete	FR
CON&NO-IN	No Input, source or destination, during initial setup	ES/TS
CON&OK&RSTRD	Auto-Reroute Revertive Restoration	ES
NOCON&SETUP	Initial connection setup in progress	TS
CON&DLT-FL	Path delete failed	ES

TL1 <i>pathState</i> code	Description	State Type
NOCON&PREMPTD	Path has been disconnected from original EDGE port and will be re-used on another restored connection	TS
CON&OK&WTORV	AUTORV Path ready, waiting for WTR (wait-to-revert) timer to revert to original path	TS
NOCON	Pre-calculated restore path available for use	ES
CON&SETUP	Initial connection setup completed, waiting for signal confirmation from the egress node	TS
CON&FAILED&WTORSTR	Restoration attempt failed and will be restored when a new path is available	ES
NOCON&SETUPFL	Initial connection setup failed	ES
RSVD&OK	Normal Path Status while associated to a protecting connection	ES
RSVD&FAILED	Path Failure while associated to a protecting connection	ES
RSVD&DLT-FL	Path delete failed for a path associated to a protecting connection	ES
RSVD&SETUPFAIL	Initial connection setup failed for protecting connection	ES
RSVD&TRDOWN	Path Delete in progress for path associated to protecting connection	TS
RSVD&SETUP	Initial connection setup completed, for path associated to protecting connection, waiting for signal confirmation from the egress node	TS
CON&UNKNOWN	Path State is not known after a recovery until the fault status is retrieved from the z-node.	TS
RSVD&UNKNOWN	Path State for a path associated to a protecting connection is not known after a recovery until the fault status is retrieved from the z-node.	TS

Network optimization

Overview

Purpose

This section contains information about the TL1 commands related to the network optimization.

Contents

List of commands	16-12

List of commands

- “RTRV-PREDEFRAG: Perform an ONNS fragmentation analysis” (p. 4-2559)
- “OPR-DEFRAG: Perform defragmentation ” (p. 4-1888)

Maintenance

Overview

Purpose

This section contains information about the TL1 commands related to the maintenance.

Contents

List of commands	16-14

List of commands

- “RTRV-AUDLOG: Retrieve audit result log for ONNS connection data” (p. 4-2108)
- “AUD: Perform audit data” (p. 4-42)
- “ED-SYNCDATA: Synchronization of ONNS data” (p. 4-1122)

UNI commands

Overview

Purpose

This section contains information about the TL1 commands related to the UNI feature.

Contents

List of commands	16-16

List of commands

- “DLT-CONN: Delete a Network Connection” (p. 4-129)
- “ENT-CONN” (p. 4-1353)
- “REPT CONNCHG notification” (p. 4-1960)
- “RTRV-CONN: Retrieve data relevant for network connections” (p. 4-2138)
- “RTRV-NADR: Retrieve ONNS Network (Domain) Address Data Repository” (p. 4-2371)
- “RTRV-NNDR: Retrieve ONNS neighbor nodal data repository” (p. 4-2393)
- “RTRV-PATH: Retrieve ONNS connection data” (p. 4-2526)

ENNI commands

Overview

Purpose

This section contains information about the TL1 commands related to the ENNI feature.

Contents

List of commands	16-18

List of commands

- “ACT-L1Routing” (p. 4-14)
- “CANC-L1Routing” (p. 4-51)
- “DLT-CONN: Delete a Network Connection” (p. 4-129)
- “ENT-CONN” (p. 4-1353)
- “REPT CONNCHG notification” (p. 4-1960)
- “REPT L1Routing notification” (p. 4-1988)
- “REPT-PTHCHG Notification” (p. 4-2003)
- “RTRV-CONN: Retrieve data relevant for network connections” (p. 4-2138)
- “RTRV-ELDR: Retrieve ONNS external link data repository.” (p. 4-2182)
- “RTRV-L1ADR: Retrieve Level 1 Address Data Repository” (p. 4-2282)
- “RTRV-L1TDR: Retrieve level 1 topology data repository” (p. 4-2289)
- “RTRV-NADR: Retrieve ONNS Network (Domain) Address Data Repository” (p. 4-2371)
- “RTRV-NNDR: Retrieve ONNS neighbor nodal data repository” (p. 4-2393)
- “RTRV-NTDR: Retrieve ONNS network topology data repository” (p. 4-2417)
- “RTRV-PATH: Retrieve ONNS connection data” (p. 4-2526)

17 Amendments

Overview

Purpose

The following amendments are divided in

- general amendments
- TL1 related amendments.

The syntax of the amendment number (e.g. Amendment 2.0 -nb12345) is as follows:

- first part: the amendment is known since this release
- second part: internal number.

Contents

General amendments	17-2
General	17-3
Configuration management	17-4
Optical network navigation system (ONNS)	17-6
Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)	17-7
Area DCN/DCC management	17-8
TL1 amendments	17-9
Transmission and cross-connection handling	17-10
Configuration management	17-16
Optical network navigation system (ONNS)	17-17
Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)	17-21
Fault/Alarm management	17-24
Remote test access	17-25
DCN/DCC management	17-26

General amendments

Overview

Purpose

This section lists the general amendments.

Contents

General	17-3
Configuration management	17-4
Optical network navigation system (ONNS)	17-6
Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)	17-7
Area DCN/DCC management	17-8

General

Amendment 9.0 - nb74169

Traffic hits of about 2 ms when plugging the standby XC

When plugging the standby XC pack unexpected traffic hits of about 2 ms can be observed.

Configuration management

Amendment 3.0.1 - nb19693

Unallowed changes of cross-connection parameters while remote test access sessions are provisioned are not rejected properly

If the operator attempts to change the interface standard or tributary mode while a test access session for this cross-connection is active then a slightly wrong error message will be returned.

Amendment 3.0.1 - nb03284

IDNV TL1 error code without parameter name

A simple parameter problem within a TL1 command (e.g. parameter out of range) will result in an anonymous IDNV error, without mentioning the affected parameter:

```
IDNV /*Input, Data Not Valid */
```

In most cases the TL1 commands are hidden behind the GUI (of e.g. CIT or EMS), which does those checks up-front or does not allow to enter wrong values.

Amendment 8.0 - nb56630

Not possible to set LO switch capacity and ASAPs for LOXC pack together

If the command ED-EQPT is executed for a LOXC pack which has the LO switch capacity (parameter *loswcap*) and the ASAPs (parameters *eqptpn* and *eqptprotpn*) specified, then the command is denied.

Workaround: The operator should change LO switch capacity and ASAPs in two sprarate commands.

Amendment 9.1 - nb75167

Wrong (too high) PM thresholds are not rejected for Ethernet counters

If for Ethernet counters PM thresholds for EDFE and EDFC, 15 minutes and 24 hrs registers is set to values of above $2^{31}-1$ or (2147483647) these are truncated to exactly this value and accepted except for the 1GE 15 min counters. There is no error response. So manual care has to be taken to set these thresholds to the right value. The truncated value is stored in this register while the customer may believe the higher entered value is stored.

Workaround: The user has to take care to enter the values below $2^{31}-1$ or (2147483647) only for the thresholds in question.

Amendment 9.1 - nb75207**Wrong error codes for EDGE port related validations**

The following validations for port class EDGE return wrong error codes:

- Setting of port class to EDGE, while port is in adaptive mode and cross connections exist is denied with the wrong error code:
SNVS - Status, Not in Valid State, a cross connect loopback exists
(should be:
SNVS - Status, Not in Valid State, Cross Connections for trbmd adaptive still exist)
- Setting *trbmd* to adaptive while port class is EDGE is denied with the wrong error code:
SNVS - Status, Not in Valid State, Cannot change trbmd for this port class
(should be:
SNVS - Status, Not in Valid State, portClass must not be EDGE)

Amendment 9.1 - nb76683**Inconsistent error codes sent in case of missing mandatory parameters when setting port class to ENNI**

In case a command to set the port class of a port to ENNI must be rejected, because one or more mandatory ENNI parameters are missing in the command, the error response text sent may vary depending on the specific parameter(s) missing.

The following error responses may appear:

- IDNV - Input, Data Not Valid, Valid values for ENNI parameters required
- IDNV - Input, Data Not Valid, additional parameters required
- IDNV - Input, Data Not Valid, additional ENNI parameters required
- IDNV - Input, Data Not Valid

Amendment 9.1 - nb78220**Wrong error code when setting port class away from UNI while DCC assigned to UNI node**

If it is tried to set the port class of a UNI port to TRADITIONAL, while a DCC of the port is still assigned to the UNI node, then the ED-rr command is denied with the wrong error code:

SNVS - Status, Not in Valid State

The required error code is:

SNVS - Status, Not in Valid State, DCC must not be assigned to UNINode

Optical network navigation system (ONNS)

Amendment 9.1 -nb73563

In many cases only unspecific error code sent in case of defects wrt. network connection activities via ENNI or UNI

In case of failures during network or UNI connection setup or other activities under many circumstances not the appropriate error code for the specific error situation will be generated, but only a standard code, which might be misleading. This standard code generated is RSVP error code 24/5 represented by error code

E009 - Service affecting defect

in TL1 notifications.

Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)

Amendment 8.0.1 - nb68076

RTRV-CKT does not return the actual AID for add and drop tributaries in the local node

The Retrieve Circuit TL1 command (RTRV-CKT) provides the view of the local node on MS SPRING / BLSR service and extra traffic circuits.

Currently the command does not return the actual AID of tributaries with ring add or drop cross-connections in the local node. Instead the string "REMAID" is returned as it is also done for tributaries of add and drop cross-connections in remote nodes.

Amendment 8.0.1 - nb68388

RTRV-CKT command on non existing tributary does not complete

If RTRV-CKT is used for a tributary, which does not exist (e.g. at an empty/unprovisioned slot), then the command does not complete. That means, after the IP (in progress) response there is no further output.

This behavior will lead to time-out of the command on management system or CIT. The user will not get an indication, why the command failed. The expected response from the system would be an IENE error code.

Area DCN/DCC management

Amendment 3.0.1 - nb17090

No specific error message when 64 DCC channel limit is reached

When the maximum number of available DCC channels is reached, the supplied error message does not distinguish the possible reasons and always replies with:

SSRE, System Resources Exceeded, allowed limit of DCC channels exceeded.

There is no distinction if the number of

- SCN (Signaling Communication Network) assignments or
- MCN (Management Communication Network) assignments or
- a combination of both.

is exceeded.

TL1 amendments

Overview

Purpose

This section lists the amendments related to the TL1 commands.

Contents

Transmission and cross-connection handling	17-10
Configuration management	17-16
Optical network navigation system (ONNS)	17-17
Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)	17-21
Fault/Alarm management	17-24
Remote test access	17-25
DCN/DCC management	17-26

Transmission and cross-connection handling

Amendment 6.2 - nb56131

Wrong error code if CNVT-CCT command with invalid *htmr* value is executed

If a lower order 1-WAY cross connection is converted to a path protected cross connection and the value of the parameter *htmr* in the CNVT-CCT command is invalid, then the command is denied with the incorrect error code:

SCNF - Status, Command Not Found, command not recognized or command parameters not valid

The expected error response is:

IDNV - Input, Data Not Valid

Amendment 6.2 - nb56132

Wrong error code if CNVT-CCT command with invalid *snctype* value is executed (SDH only)

If a lower order 1-WAY SDH cross connection is converted to a path protected cross connection and the value of the parameter *snctype* in the CNVT-CCT command is invalid, then the command is denied with the incorrect error code:

SCNF - Status, Command Not Found, command not recognized or command parameters not valid

The expected error response is:

IDNV - Input, Data Not Valid

Amendment 6.2 - nb56133

Wrong error code if CNVT-CCT command with invalid *wtr* value is executed

If a lower order 1-WAY cross connection is converted to a path protected cross connection and the value of the parameter *wtr* in the CNVT-CCT command is invalid, then the command is denied with the incorrect error code:

SCNF - Status, Command Not Found, command not recognized or command parameters not valid

The expected error response is:

IDNV - Input, Data Not Valid

Amendment 6.2 - nb56134

Wrong error code if CNVT-CCT command with empty *rme* value is executed (SDH only)

If a lower order 1-WAY SDH cross connection is converted to a path protected cross connection and the value of the parameter *rme* in the CNVT-CCT command is empty, then the command is denied with the incorrect error code:

SCNF - Status, Command Not Found, command not recognized or command parameters not valid

The expected error response is:

IDNV - Input, Data Not Valid

Amendment 9.0 - ch00071

Wrong error code when creating conversion cross connection with not allowed parameters

If an AU3/AU4 conversion cross connection is created, and path protection related parameters are specified in the ENT-CRS command, then the command is denied with one of the wrong error codes:

Status - Not in Valid State, Parameter(s) present which are not allowed

Status - Command Not Found, command not recognized or command parameters not valid

The expected error response is:

Input - Data Not Valid, Parameter(s) present which are not allowed

Amendment 9.0 - nb74322

Wrong error code when changing port from DS3 to EC1 with existing cross connections

If it is tried to change the interface type (parameter *ei*) of a DS3 port to EC1, while a cross connection exists at the DS3 port, then the ED-T3 command is denied with the wrong error code:

SNVS - Status, Not in Valid State, a cross connect loopback exists

The correct error code is:

SNVS - Status, Not in Valid State, Cross-connections still existing

Amendment 9.0 - nb74338

Wrong error code when changing interface standard of VCG on OPT with existing cross connections

When it is tried to change the interface standard of a VCG on an OPT pack, while a cross connection exists at a VCG tributary related to the VCG, then the ED-VCG-TRANS command is denied with the wrong error code:

SNVS - Status, Not in Valid State, a cross connect loopback exists

The correct error code is:

SNVS - Status, Not in Valid State, cross-connections are still existing

Amendment 9.1 - nb58910

Running LOXC script causes system to respond with “Status, All Resources Busy, System limit exceed”, setup or roll of LO-cross-connections on LOXC40 might fail when issued too fast, e.g. via TL1-script

When setting up or rolling a lot of LO-cross-connections being switched on a LambdaUnite NE equipped with LOXC40 it must be avoided to issue the ENT-CRS or ENT-ROLL commands too fast.

If the command sequence is sent to the NE too fast some LO-cross-connection might not be setup correctly on LOXC40 even though all commands are correctly acknowledged by the COMPLD indication.

A reboot by applying a controller reset to the CTL or to the LOXC40 cleans up configuration and ensures to have all cross-connections set up correctly in HW. Waiting for the COMPLD is not sufficient.

When using the ranging support of CIT to setup LO-cross-connections the issue does not occur because at most 63 LO-cross-connections can be set up with a single request which does not yet lead to the overload condition on LOXC40.

Workaround:

When issuing a lot of ENT-CRS commands to setup LO-cross-connections or ENT-ROLL commands to roll LO-cross-connections (e.g. via TL1-script),

- limit the number of instances for one command series to 63,
- make the script wait for the NE reaction (COMPLD or DENY) after each single TL1-command sent to the Unite NE before sending the next one, and
- add delays of 500 ms, especially in the case of VC12 and VT1.5 connections, 800 ms in the case of LO-VC3 connections between the e.g. ENT-CRS commands.

See script examples adding delay below.

Sample of current script:

#delay=500

```

ENT-CRS-LOVT1:WESTFORD:1-1-##-35-1-192-28,1-1-##-35-2-1-1:26882::1WAY;

ENT-CRS-LOVT1:WESTFORD:1-1-##-35-2-1-24,1-1-##-35-2-1-25:26906::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-##-35-2-1-25,1-1-##-35-2-1-26:26907::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-##-35-2-1-26,1-1-##-35-2-1-27:26908::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-##-35-2-1-27,1-1-##-35-2-1-28:26909::1WAY;

```

#delay=500

A) adding a delay of 500 ms or more if required, will prevent the CTL reboot

Example:

#delay=500, where the delay value is in milliseconds (i.e. 500 ms).

B) adding delay more frequently through the script, will also prevent the CTL reboot

Example:

```
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-1-192-28,1-1-#-#-35-2-1-1:26882::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-1,1-1-#-#-35-2-1-2:26883::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-2,1-1-#-#-35-2-1-3:26884::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-3,1-1-#-#-35-2-1-4:26885::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-4,1-1-#-#-35-2-1-5:26886::1WAY;
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-5,1-1-#-#-35-2-1-6:26887::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-6,1-1-#-#-35-2-1-7:26888::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-7,1-1-#-#-35-2-1-8:26889::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-8,1-1-#-#-35-2-1-9:26890::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-9,1-1-#-#-35-2-1-10:26891::1WAY;
#delay=500

ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-14,1-1-#-#-35-2-1-15:26896::1WAY;
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-15,1-1-#-#-35-2-1-16:26897::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-16,1-1-#-#-35-2-1-17:26898::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-17,1-1-#-#-35-2-1-18:26899::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-18,1-1-#-#-35-2-1-19:26900::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-19,1-1-#-#-35-2-1-20:26901::1WAY;
#delay=500
```

Should the system still exhibit undesired behavior, increase the delay times by a factor of at least 2. If there is a suspicion that not all LO-cross-connections have been setup as expected, apply a controller reset to the CTL or LOXC pack.

Amendment 9.1 - nb75220

Wrong error code when changing interface standard of a STM-64 port to SONET while cross-connections exist

If it is tried to change the interface standard of a STM-64 port to SONET, while a cross connection exists at the SDH port, then the ED-STM64 command is denied with the wrong error code:

SNVS - Status, Not in Valid State, a cross connect loopback exists

The correct error code is:

SNVS - Status, Not in Valid State, cross-connections are still existing

The same problem exists for VCGs, with the TL1 command ED-VCG.

Amendment 9.1 - nb74339

Wrong error code when creating conversion cross connection with not allowed parameters

If an AU3/AU4 conversion cross connection is created, and path protection related parameters are specified in the ENT-CRS command, then the command is denied with one of the wrong error codes:

Status - Not in Valid State, Parameter(s) present which are not allowed

Status - Command Not Found, command not recognized or command parameters not valid

The correct error code is:

Input - Data Not Valid, Parameter(s) present which are not allowed

Amendment 9.1 - ch00147

Wrong error code for test access with not supported pack

If it is tried to create a test access session with test access tributaries on packs that do not support test access tributaries (OPT5G5, GE1, GE10PL1), then the CONN-TACC command is denied with the wrong error code:

IDNC - Input, Data Not Consistent, conversion cross-connection not supported by that pack

The required error code is:

IDNC - Input, Data Not Consistent, primary/secondary test access tributary not supported by that pack

Configuration management

Amendment 9.1 - nb77499

Wrong error code for missing parameter in ENT-RC-NEIGHBOR

If the ENT-RC-NEIGHBOR is used and a mandatory spec block parameter is not specified in the command, then the command is denied with the wrong error code:

INUP - Input, Non-null Unimplemented Parameter

The correct error code would be:

SNVS - Status, Not in Valid State, implicit channel re-assignment

Amendment 9.1 - ch00133

Parameters missing in RTRV response and ENT notification for OTN client port

The problem is related to the OC192/STM64 OTN client port on an OP10/XTT pack. In the ENT-OC192/ENT-STM64 notification for an OTN client port the ENNI parameters *clientNodeID*, *linkResCls*, *localLinkID*, *localLPID*, *neighborSigPCID*, *neighborSigPCIPAddr*, *remAdvNodeID*, *remLinkID* and *remRAID* are missing.

Because the OP10/XTT pack will not be used with ENNI in R9.1 and later, this problem is acceptable for customers. In the RTRC-OC192/RTRV-STM64 response for an OTN client port the parameters *opdis* and *opwl* are missing. The parameters *opdis* and *opwl* are always set to “NA” for client ports at the OP10/XTT, the customer will not lose relevant information.

Amendment 9.1 - nb77810

Wrong error code when path protected cross connection is converted to 1-Way without specifying the leg to be dropped

When CNVT-CCT command is used to convert a LO path protected cross connection to a 1-Way cross connection, and the parameter *in_aid2* with the leg to be dropped is not specified in the command, then the command is denied with the wrong error code:

SNVS - Status, Not in Valid State, Parameter(s) present which are not allowed

The preferred error code for a missing parameter is:

IPMS - Input, Parameter Missing, <parameter name> is missing

Because *in_aid2* is one of the command parameters, also this error code would be possible:

SCNF - Status, Command Not Found, command not recognized or command parameters not valid

Optical network navigation system (ONNS)

Amendment 5.0.1 - nb31503

Grouped NN connection setup via TL1 cut-through accepted with egress EDGE port not being a VCG

When using TL1 cut-through commands it is possible to switch a group of more than one NN connection with ingress EDGE port being a VCG as required, but with the EDGE port being a standard SDH/SONET port.

The connections will be switched according to the ingress and egress tributary number association restrictions as defined for grouped connection setup between VCGs, i.e. there will be a one-to-one mapping of the egress tributary numbers to the ingress tributary numbers selected, egress tributary numbers will not be selectable separately.

Thus, connections out of this grouped setup might not be switched, if e.g. corresponding egress tributaries are occupied already. Connection that are switched, however, will work properly.

Workaround: Be careful in choosing egress EDGE VCG identifier, if using ENT-PATH command in cut-through mode to execute grouped NN connection setup with VCGs.

Connections that might have been setup by accident between a VCG and an SDH/SONET EDGE port can be deleted using the normal connection deletion facility.

Amendment 7.0 - nb42305

Wrong notifications for autorv-connections

Some information in the PTHEVT notifications of a restored autorevertive connection by a signal change from no incoming signal to a valid incoming signal is misleading.

The event text of the PTHEVT notification of the failed path of a restored autorevertive connection is incorrect and shall be ignored. The text should indicate that the failed path of a successful restored connection is still available.

Amendment 8.0 - nb51731

Misleading error-message in case of failed path-roll

When setup a path with 3 legs using ED-PATH the following error message can occur:

Error=E018:\” Status, Edge Port Used up \”:NodeID=29.54.173.73&1-1-5-1-4

Amendment 8.0 - nb61009

Inconsistent PTHEVT if trib is outside portrange In case an ONNS connection setup is issued with an EDGE tributary on a GE1 port given, that is out of the allowed range, additionally to the expected rejection with the failure reason "Invalid EDGE port" and a corresponding REPT PTHEVT notification with the same failure reason a second REPT PTHEVT notification is sent with the incorrect and misleading failure reason "EDGE port used up" is sent.

Amendment 8.0 - nb61009**Inconsistent and confusing notifications in a special case of failing ONNS connection setup**

In case an ONNS connection setup is issued with an EDGE tributary on a GE1 port given, that is out of the allowed range, additionally to the expected rejection with the failure reason "Invalid EDGE port" and a corresponding REPT PTHEVT notification with the same failure reason a second REPT PTHEVT notification is sent with the incorrect and misleading failure reason "EDGE port used up".

Amendment 9.0 - nb73435**Error response may be misleading when trying to manually reroute a restoration protected connection (via ED-PATH-ROLL) in a state with two paths assigned**

Manually rerouting a restoration protected connection (AUTORV or AUTONR) is not possible in a state of the affected connection with two paths assigned (e.g. in case of AUTONR with the original path in state DLT-FL). Such an action is correctly denied. However, in some cases the error response may be misleading, i.e. the response may be

E336 - SCTP ERROR - Status, Invalid command for protection class
N1PLUS1 or YCONN

Amendment 9.0 - nb74407**RTRV-CONN erroneously reports existing network connections, when called with non-existing CallID**

The RTRV-CONN command, when executed specifying a value for the input parameter *CallID*, will report all existing network connections in the system, even if these network connections are not assigned to the specified *CallID* or are not assigned to any *CallID* at all.

Therefore the RTRV-CONN command should not be executed with the input parameter *CallID*.

Amendment 9.0 - nb74505**Meaningless parameter TunnelIfID sent on RTRV-CONN with unsupported zero value**

On execution of a RTRV-CONN command for all connections reported the parameter “TunnelIfID” with value 0.0.0.0-0 will be included, although this parameter is currently not supported and should additionally not show a zero (default) value.

Therefore the parameter “TunnelIfID” can be ignored on RTRV-CONN output.

Amendment 9.1 - nb73792**RTRV-CONN command completed instead of denied**

A RTRV-CONN command with a invalid connection ID or a invalid TNA-address or a not matching connection ID and TNA-address is completed without output instead of denied.

Amendment 9.1 - nb75055**Misleading ED-PATH-ROLL error response**

A manual rerouting of a permanent SNCP/UPSR connection via the TL1 command ED-PATH-ROLL is denied with the misleading error message:

```
E336::\"Status, Invalid command for protection class N1PLUS1 or YCONN\".
```

Amendment 9.1 - nb76980**REPT PTHEVT notification for setup failure of YCONN due to error code E022 reports “wrong” node ID in error data field**

In case the setup of an ONNS connection of protection type YCONN fails due to the fact, that the setup of one of both paths fails because of error E022 (signal transmission failure at egress node), in the “error data” field of the REPT PTHEVT notification sent the node ID of the “wrong” destination node is reported (i.e. of the one of both destination nodes, that did not detect the failure).

Amendment 9.1 - nb77865**Specific error codes for TL1 command ENT-CONN not available**

Invalid input parameters of the TL1 command ENT-CONN are always denied with the error code

IDNV - Input, Data Not Valid, invalid TNA address

This error code is sent for invalid source/destination TNA address, source logical port ID or source label as also if the specified label and bandwidth are not matching.

Amendment 9.1 - nb78136**SRLGS not shown in output of RTRV-L1TDR**

The TL1 command RTRV-L1TDR does not show shared risk link groups (SLRGs).

Amendment 9.1 - nb78498**Link defragmentation (OPR-DEFRAG) executed to ports of port class other than INNI formally accepted or denied with misleading error code**

Although link defragmentation including “empty port” is only supported for INNI links, i.e. can only be executed to ports of port class INNI, the following misbehaviour may be observed:

If OPR-DEFRAG executed to a port of port class other than INNI, the action may be formally answered with completion code (thus pretending acceptance) or may be rejected with the misleading error response:

E621, No Target Port available

However, also if command is wrongly formally accepted, no action will be really executed and no traffic will be affected.

Workaround:

Take care to execute link defragmentation (including “empty port”) only to INNI ports. Otherwise ignore responses as described above.

Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)

Amendment 3.0.1 - nb 18762

MSP 1+1 accept incomplete Operate Protection Switch commands

For MSP 1+1 incomplete Operate Protection Switch commands are accepted:

- Operate Protection Switch command with parameter source *sc=lockout* and without parameter destination *dest* is accepted. This is not a real problem, because the *dest* is redundant information.
- Operate Protection Switch command with parameter destination *dest=wkg* should not be accepted without the source information. The resultant state Manual Switch is not worse because it does not prevent further automatic switching.

Amendment 6.0 - nb35660

Wrong error code if tributary of OPT2G5 is used as input for path protection

If a path protected cross-connection is created with a tributary of an OPT2G5 as protection leg, then the command is denied with the unspecific error code:

IDNV - Input, Data Not Valid

The expected error code is:

IDNC - Input, Data Not Consistent, no OPT2G5-trib as input-trib in pathprotected crossconnection

(This correct error code is returned if the working leg is on an OPT2G5.)

Amendment 6.0 - nb40929

Unprecise error message for ED-MAP-RING

When the TL1 command ED-MAP-RING is used to provision the MS SPRING / BLSR ring topology and different numbers of ring node identifiers and ring node target identifiers are entered, the command is denied. However, the related error message is not precise enough, but it simply states:

Input, Data Not Valid

The expected error code is:

Input, Data Not Valid, different number of values in rnids and rtids

Amendment 8.0 - nb64066

Incorrect error code when test access tributary or tributary under test are on a port which shall become part of an MS SPRING / BLSR protection group

When a tributary in a port is a tributary under test or a test access tributary of a HO Remote Test Access session and it is then attempted to create an MS SPRING / BLSR group involving this port, the system denies with the wrong error code:

SNVS - Tributary is used in cross-connection

The expected error code is:

SNVS - Tributary used in test access session

Workaround: Check that no tributaries are used in test access sessions when the above mentioned error code is received on trying to create an MS SPRING/ BLSR protection group.

Amendment 8.0 - nb64251

Wrong error code when locz/loca is entered on creation of a HO crossconnection to/from the protection bandwidth of an MS SPRING / BLSR

When the locz parameter is present for the ENT-CRS command which tries to provision a Higher Order add crossconnection to the protection bandwidth of a 2 fibre MS SPRING / BLSR or when the loca parameter is present for an attempt to provision a Higher Order drop crossconnection from the protection bandwidth of a 2 fibre MS SPRING / BLSR, the system denies the command with an incorrect error code:

IDNV: Input Data Not Valid

The expected error code is:

SNVS - Command refers to protection tributaries of a BLSR/MS-SPRing protection

Amendment 9.0 - nb74289

Wrong error code when creating TOPEX protection group with SONET ports

When it is tried to create a 4F TOPEX protection group using 4 SONET ports, then the ENT-PROTN-GRP command is denied with the wrong error code:

SNVS - Status, Not in Valid State, port rate not supported for this protection type

The correct error code is:

SNVS - Status, Not in Valid State, SONET port not allowed for TOP

Amendment 9.0 - nb74319

Wrong error code when creating MSP/APS protection group with existing cross connections

If it is tried to create a MSP/APS protection group while cross connections exist at the dedicated protection port, then the ENT-PROTN-GRP command is denied with the wrong error code:

SNVS - Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist

The correct error code is:

SNVS - Status, Not in Valid State, cross-connections or substructure still exist

Fault/Alarm management

Amendment 3.0.1 - nb20283

Changes of tributary output modes for test access sessions are not notified

Changing test modes of a remote test access session does not generate change notification for *eomode* or *fomode*, but the value really changes. However the retrieval of this test access session delivers the correct values.

Amendment 3.0.1 - nb19569

Establishment of remote test access for bridged cross-connections is not rejected properly

If an operator attempts to create a remote test access session on a cross-connection which is bridged (broadcast) then the operator gets a wrong error message.

Remote test access

Amendment 4.0 - nb20634

Changes of tributary output modes of test access sessions are not notified

Changing test modes of remote test access session does not generate change notification for *eomode* or *fomode* if the value really changes. However the retrieval of this test access session is correct.

DCN/DCC management

Amendment 3.0.1 - nb21562

No specific error message when 64 DCC channel limit reached

When the maximum number of available DCC channels is reached, the supplied error message does not distinguish the possible reasons and always replies with:

SSRE, System Resources Exceeded, allowed limit of DCC channels exceeded

In case the maximum number is exceeded due to SCN assignments, expected message is:

SSRE, System Resources Exceeded, allowed limit of SCN DCC channels exceeded

In case the maximum number is exceeded due to combined MCN+SCN assignments, expected message is:

SSRE, System Resources Exceeded, overall limit of DCC channels exceeded

Amendment 9.0 - nb74167

Wrong error code on ENT-FECOM with more than one dccstat parameter

If ENT-FECOM is executed with 2 or more of the parameters *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* specified (only one is allowed), then the command is denied with the wrong error code:

SDNC - Status, Data Not Consistent, invalid combination of osinode parameter with *dccstat*, *scn_dccstat*

The expected error code is:

IDNC - Input, Data Not Consistent, only one of *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* allowed

Amendment 9.0 - nb74459

Wrong error code when disabling incorrect DCC status parameter

When it is tried to disable one of the parameters *inni_dccstat*, *uni_dccstat* or *enni_dccstat* while *dccstat* is set to ENABLE, then the ENT-FECOM command is denied with one of the following wrong error codes:

IDNV - Input, Data Not Valid, portClass must be UNI

IDNV - Input, Data Not Valid, portClass must be ENNI

IDNV - Input, Data Not Valid, portClass must be INNI

The correct error code in all these cases is:

SNVS - Status, Not in Valid State, implicit channel re-assignment

Amendment 9.1 - nb74871**Wrong error code when using ENT-FECOM without any dccstat parameter**

If the ENT-FECOM command is used with none of the parameters *dccstat*, *scn_dcnstat*, *uni_dccstat* or *enni_dccstat* specified, then the command is denied with the wrong error code:

SDNC - Status, Data Not Consistent, invalid combination of osinode parameter with dccstat, scn_dccstat

The correct error code is:

IDNV - Input, Data Not Valid

Amendment 9.1 - nb77101**Wrong error code if LAN port is assigned to UNI/ENNI node while ASTN and ENNI IP address is not configured**

If it is tried to assign a LAN port to the UNI or ENNI node, while no ASTN and ENNI node IP address is configured (and therefore also SwiSS is not enabled), then the ENT-FECOM-LAN command is denied with an error code that differs from the currently required error code. The returned error code is:

SNVS - Status, Not in Valid State, SwiSS not enabled

Amendment 9.1 - nb77673**Wrong error code when trying to delete a not existing DCC cross connection**

When the DLT-CRS-FECOM is used with ports specified in the command where no transparent DCC connection exists, the command is denied with an error code different from the required error code. The returned error code is:

IDNV - Input Data Not Valid

The required error code is:

IENE - Input, Entity Not Exists, Specified Transparent DCC Cross Connection does not exist

Amendment 9.1 - nb77910**Wrong error code on ENT-FECOM command with not created osinode**

When ENT-FECOM is used to assign a DCC channel to an *osinode*, and the *osinode* specified in the command is not yet created, then the command is denied with the unspecific error code:

IDNV - Input, Data Not Valid

The required error code is:

ENEQ - Equipage, Not Equipped, osinode

Amendment 9.1 - nb74689

Incorrect Error Code when enabling *enni_dccstat* for a DCC that is assigned to UNI

When it is tried to enable *enni_dccstat* for a DCC that is currently assigned to UNI, then the command is correctly rejected, but with the following wrong error code:

IDNV - Input, Data Not Valid, portClass must be ENNI

The required error code is:

SNVS - Status, Not in Valid State, DCC channel can not be assigned to more than one of MCN, SCN, UNI and E-NNI at the same time
